Christiana Figueres : There ’ s no doubt that we are facing exponential impacts of climate change. There is also, however, no doubt that that is being met with exponential progress of the technologies that can help to address climate change. So what we have here is, frankly, a race between two exponential curves. By 2030, we collectively will have chosen between door number one. And door number two. Julio Friedmann : The question I am most commonly asked about climate change is :”Should I be optimistic or pessimistic?”Cynthia Williams : Here ’ s what we need to do to make sure that we ’ re ready for an all-electric future. Anika Goss : Being financially secure and climate resilient should be the most important priority. Faustine Delasalle : It ’ s really easy when you look at where we are today and where we ought to be by 2030, to feel like there ’ s a huge gap that will never be filled. But we have good reasons to say that that gap is actually fixable. Nigel Topping : If you ’ re not worried or anxious, you ’ re probably not paying attention. But we should also not be defeatist. We shouldn ’ t say,”We ’ ve done nothing, we ’ re failing.”We ’ ve really started 20 years too late, but it takes a long time to get the flywheel of momentum going. Kingsmill Bond : The tide of change is coming. The costs keep falling. The political pressure keeps increasing. JF : We ’ re going to build a thriving, exciting world. AG : We can do this. JF : Full of potential. AG : We have to do this. [TED Explores A New Climate Vision] Manoush Zamorodi : When it comes to climate change, are you an optimist or a pessimist? News about the climate can be overwhelming and emotional, to the point that many of us just feel numb. I ’ m Manoush Zomorodi, a longtime public media journalist and host of the TED Radio Hour. And today, we want to bring you something **special** : an hour of nuance, of real people and clarity about what is happening to our planet and what we ’ re doing about it. Because we all know there ’ s plenty of bad news when it comes to the climate crisis. But guess what? There ’ s also some really good news. That ’ s why we ’ re here in Detroit at the TED Countdown Summit, where a cross-section of people who know the most and who are doing the most have gathered to share their ideas and plans with each other and with you. You ’ re going to hear from some incredible speakers about their personal stories and tested solutions. But first, let ’ s get a quick reminder on the basics : climate change in a minute or so. [Prologue : What is Climate Change?] David Biello : The air we breathe has changed. The mix of gases is shifting, with more and more greenhouse gases like carbon dioxide. And the shift is happening faster each year. In just a few hundred years, fossil fuels formed over eons have been burned as coal, oil and gas. The exhaust has transformed the entire atmosphere and ocean. It ’ s like a pollution blanket. And the result we know as climate change. The planet has already warmed more than one degree Celsius and is on a path to heat up even more. That may not seem like a lot, but it ’ s already caused major destruction across the globe. To give us some room to breathe, the world must reduce greenhouse gas pollution by more than seven percent each year, every year of this decade. There are a number of ways to do that. Let ’ s start by looking at the greenhouse gases themselves. CO2 makes up nearly 75 percent of the pollution emitted each year. And then there ’ s methane or natural gas, which makes up 17 percent. Finally, there ’ s nitrous oxide, making up six percent of the problem. There are other greenhouse gases, but these three make up the bulk of the climate challenge. Where do they come from? There are several ways to break down the sources of greenhouse gas emissions. Here we ’ re using the public Climate Watch data. Start with energy. The majority of modern energy comes from burning fossil fuels, which makes the energy sector 76 percent of the climate challenge, including the fuels used for transportation, industrial processes and agricultural production. Farming and animal raising also have to change, as agriculture accounts for 12 percent of greenhouse gas pollution. The remaining 12 percent comes from a grab bag of human activities like industrial heating, clearing forests and more. This is the climate challenge we face : going from adding billions of metric tons of greenhouse gases to the air each year to adding zero. Will it be easy? No. Can we do it? Yes, if we choose to. MZ : OK, so that ’ s the situation. Where do we go from here? Well, we ’ ve all heard of a tipping point, that moment when an idea or concept finally takes hold and then changes the world. Well, the UN ’ s climate chief, Simon Stiell, believes we are almost at a tipping point for massive **action** on climate change. And to get you ready, he wants to take you back to the early ’ 90s, when he was an executive at Nokia, and the world wasn ’ t sending text messages yet. [Chapter 1 : Exponential Change] Simon Stiell : I want you to imagine it ’ s 1992, and you ’ re talking to a telecoms expert. She tells you that **mobile** phone text messaging is going to fundamentally change the way we communicate. You think, why on Earth am I going to go from this to tapping on a screen with my fingers and my thumbs? But then, after a slow start, text-based **services** exploded. Today, over 23 billion messages are sent every single day. This paved the way for the smartphone revolution. I know how much we **struggle** to comprehend and predict what exponential change means, because I was at Nokia in 1993 when that technological revolution started. And now, as head of UN climate change, I ' m here to tell you that what was true for **mobile** phones is also true for climate **action** today. We ' re here in Detroit, the heart of car manufacturing. Take a look at this graph. Electric vehicle sales are expected to increase to become 70 percent by 2030. Another example, solar energy. Between 2010 and 2020, we moved from 20 gigawatts of solar energy installed to 150 gigawatts. And by 2030, that number is expected to increase again, to 1, 000 gigawatts per year. Change can come fast. FD : So exponential change means that change happens very slowly at first and then comes a tipping point. And suddenly things accelerate and accelerate and accelerate. NT : It ' s a mathematical term, but it means basically stuff happens very slowly and then it goes really fast. Tessa Kahn : Governments and experts have consistently underestimated the pace and scale at which we can deploy renewable energy and how quickly renewable energy and associated technologies become affordable. Ramez Naam : I predicted in 2011 that we ' d have solar as cheap as coal in some parts of the world by 2015 and half the cost of coal by 2020, and everyone thought I was crazy, I ' ve got to say, almost. And in fact, I was wrong. The actual decline in the cost of solar happened twice as fast as I thought it would. Solar prices today are a century ahead of where the world ' s leading energy experts thought they ' d be in 2010. KB : It ' s now spreading from solar, so it ' s happening also in the wind sector, it ' s happening in the battery sector, it ' s happening in the electric vehicle sector. CF : I don ' t think that we do a good job at communicating the fact that we are progressing more than is commonly known. Nili Gilbert : The human brain is trained best at thinking about linear change. But when you think about an exponential curve, next to a line, at first the exponential curve is below the line, and so it ' s moving more slowly than you would think. And then it crosses the line and it ' s moving faster than you would think. Habiba Daggash : We call it cautious optimism. We ' re very hopeful about the trajectories that we ' ve seen. But we shouldn ' t let up yet. KB : So we can make this change happen slow or we can make it happen fast. The key point to say is we have agency. MZ : This idea of exponential growth sounds awesome. It sounds amazing, but is it actually happening? Well, I ' m headed into a workshop with industry and climate leaders to find out. The moderators of the workshop challenged us to hold two competing ideas in our minds at the same time. NT : What we ' re really going to explore today is two apparently opposing realities, and they ' re often two opposing narratives. The one which is true, right, is that in terms of the Paris goals, we ' re way off track. We ' re deep into the emergency. But what we ' re going to explore today is the other reality that we know what to do. Exponential change is happening, but it doesn ' t happen by magic. MZ : So what are we seeing in different industries? Well, let ' s start with one that ' s known to be really difficult to decarbonize : cement. Vicente Saiso Alva : I think everything converges into making climate a huge urgent matter for society. We started to feel the pressure from all different types of stakeholders, and in one year of running this program, we realized how fast we could move and how fast we were going in reducing CO2 emissions, which means now to go from 40 to close to 50 percent reduction by 2030. MZ : Encouraging, but to tackle that remaining 50 percent may require technologies that don ' t exist at scale yet. OK, what about shipping? Narin Phol : In Maersk, a few years back, we came out with a net-zero ambition by 2050, and in a few years later, based on the data that we have got, we ' ve really seen a path that we can really accelerate that one. That ' s why the revised target of 2040 came in. MZ : The news in offshore wind was quite dramatic. Jennie Dodson : So my moment of **mindset** shift was in 2019. The government put out a request to bid for offshore wind permits. And that year the price that came in was two thirds less than just four years before. And really critically, it was the same price as the mainstream market. And that was transformative. Nobody expected that when they started. MZ : The conversation got pretty technical and a bit wonky. NP : So to drive exponential growth, you focus on a reinforcing loop to make sure it works and you slow down on the balancing loop. MZ : But the takeaway is that certain sectors, like EVs and renewables, are being upended, while others, like cement and heavy industry are further behind. But generally across every industry – JD : It ' s amazing stuff. MZ : There ' s an understanding that they all need to work together. And the message? Big change can happen. It ' s going to be hard, but some of us are already doing it, so learn from us. [Chapter 2 : The Electric Vehicle Revolution] OK, we are in an exponential **mindset**. And as you heard, one example of exponential growth might be sitting in your driveway right now. Electric vehicles are finally really happening, which means that people here in Detroit are **rethinking** the auto industry. They ' re **rethinking** their jobs, their identity. Take Cynthia Williams, head of sustainability at Ford. I sat down with her at Lucky Detroit, a local coffee and barber shop, where she told me that there are three things that need to happen for electric vehicles to go to the next level, from this tipping point to exponential growth. CW : The three things for me are change, collaboration and capacity. So the change piece of it is changing the way folks think about the vehicle, making sure that they understand we ' re bringing a better vehicle to the customers. MZ : So you don ' t have to make a sacrifice. CW : I think one of the things we need to do is actually get people in the cars and show them how fun it is. And it ' s no different, it ' s just powered by a battery. We are at a tipping point. We ' re at a point of acceleration of electric vehicles. Many are calling it the electric vehicle revolution. Now with that comes unprecedented change that will require us to build new capacity and collaborate in ways that we ' ve never seen before. To make things happen faster, you have to think differently. You can ' t just collaborate with the same people because you get the same answer, right? You need to broaden your collaboration space. Go outside of your industry, understand what worked in Norway, for example, to get them to where they are. MZ : Where ' s the weak link, Cynthia? What ' s the thing that you ' re like, that if we don ' t push through that, we may not get to this full adoption? CW : The critical things that we hear from the consumers is they need infrastructure. That ' s what it ' s taking for us to work with governments to make sure that we bring more charging to everyone, whether it ' s rural, urban, wealthy, low-income, we all need chargers. And I ' m not saying we need one on every corner, but we do need many, many more. When we start building out the charging infrastructure, we need lighting. We need, you know, security, shelter, we need restrooms. We need other amenities so that people know where to go, where to charge. Next comes capacity. We have to invest in new facilities and talent. Now, that ' s true for any industry transitioning to greener goals and strategies. And we ' re investing in talent, we ' re investing in education and training, and we ' re also listening to the communities where we live and operate. MZ : So a young Cynthia Williams, now, your counterpart who ' s studying engineering, will she be learning something very different if she wants to go and work in the automotive industry in Detroit? CW : There will be different options, right. And so, I ' m a mechanical engineer by trade, but I think there will be opportunities for electrical engineering, software engineering. And there ' s even certificates that students can get instead of going through a four-year college. It ' s the proper training to get them right, to be dedicated, to build the vehicles that we need for the future. At the end of this year, globally, we ' ll have the ability to produce 600, 000 electric vehicles. And in 2026, we ' ll have a global goal to produce two million electric vehicles. And it just goes up from there. MZ : What is this going to look like, this growth for me in the next couple of years, in five years, in 20 years? CW : Clean air. That ' s what I look at. If you think about when we were, during the pandemic, when everybody stopped driving and they were at home, clear skies and moving to zero tailpipe emission vehicles. And if you chose an electric vehicle, that ' s you participating and you contributing to a better world, to a better future. We have come a long way. It ' s so gratifying to see electric vehicles on the road, to move from aspiration to reality. To see plants dedicated to building electric vehicles. We have the technology, we have the leadership, we have the ingenuity to respond to the environmental crisis with courage. And I ' ll tell you, as a person who ' s dedicated my entire career to sustainability, the road ahead is paved with promise. TED-Ed : If you were buying a car in 1899, you would have had three major options to choose from. You could buy a steam-powered car, typically relying on gas-powered boilers. These could drive as far as you wanted, provided you also wanted to lug around extra water to refuel and didn ' t mind waiting 30 minutes for your engine to heat up. Alternatively, you could buy a car powered by gasoline. However, the internal combustion engines in these models required dangerous hand cranking to start and emitted loud noises and foul smelling exhaust while driving. So your best bet was probably option number three : a battery-powered electric vehicle. These cars were quick to start, clean and quiet to run, and if you lived somewhere with access to electricity, easy to refuel overnight. If this seems like an easy choice, you ' re not alone. By the end of the 19th century, nearly 40 percent of American cars were electric. In cities with early electric systems, battery-powered cars were a popular and reliable alternative to their occasionally explosive competitors. But electric vehicles had one major problem. Batteries. MZ : Flash forward to the present and batteries are still on everyone ' s mind. So I visited Mujeeb Ijaz, the founder of the energy storage company One, who also happens to be an electric vehicle history buff. Mujeeb Ijaz : So this is a 1922 Detroit Electric. MZ : OK, so 100-year-old vehicle. MI : That ' s right, electric vehicle. And then this was Walter Baker. He developed the Baker Electric. And he made the range run 201 miles on a single charge. He also felt strongly that you should be able to wear your top hat, you know, so he has a taller carriage. These had lead acid batteries to begin with. And then Thomas Edison introduced the nickel-iron battery. So this is the battery compartment, one of the battery compartments. And this is where you would charge. MZ : Right there? MI : And we ' re building on what these original pioneers did. And I think it ' s important to not think about us starting from scratch now. But go backwards, think about how they solved the problem, what disrupted their ability to advance this to the market, and then pick those problems up and make sure we don ' t get stuck again. MZ : So we ' ve been here before, a moment when electric vehicles could have taken off but didn ' t. So what do we need to do differently this time? MI : Electric vehicles were able to deal with mobility in urban areas, but there were charging deserts where rural **driving** resulted in no way to get back because you couldn ' t find electric charging everywhere. And that was a problem. MZ : And that ' s what people are worried about right now. We ' re at the same thing. We ' re worried about range, we ' re worried about accessibility. All of the things are the same. But the key difference being that we now know that our planet can ' t keep going like this. MI : That ' s right. Had the vision of the Model T assembly line and mass manufacturing been applied to electric car, the electric car would have also dropped in price, but range and charging deserts would have still been the obstruction. MZ : OK. We didn ’ t have the technology, but we do now. MI : We do now. MZ : In the US, there hasn ’ t been a mass move to electric vehicles... yet. Mujeeb ’ s company is one of many who want to change that by building batteries that give drivers longer range. And these batteries aren ’ t just for cars. MI : So we produce battery packs for transportation, but we ’ ve also started developing the same battery products into grid batteries. So micro-grids are those technologies that combine solar and storage and replace a coal plant or a natural gas plant for generating electricity. So buildings and industry and transportation all working together. And that ’ s an exciting future, is all these industries working together, that makes me more confident that we ’ re at the time in history where this transition will take place. MZ : How many years till we get to that? MI : I think it ’ s within 10 years. MZ : No way, 10 years? MI : We ’ re in a place where that transition is going to be much more visible, and then we just need technologies to drive it up to the mass markets. MZ : I am so excited. Like, genuinely so excited. Everyone everywhere driving electric sounds great, but that also means that the power to charge all those vehicles needs to be green. And that brings us to the energy sector, which is also changing at an incredible pace, even though renewable energy has been years in the making. [Chapter 3 : Renewables] TED-Ed : In the spring of 1954, the press excitedly gathered around Bell Laboratories ’ latest invention : a silicon-based solar cell that could efficiently convert the sun ’ s energy into electrical current. The creation was celebrated as the dawn of a new era, as **reporters** touted that civilization would soon run on the sun ’ s limitless energy. But the dream had a catch. As this first commercially sold solar cell cost around 300 dollars per watt, meaning at its current rate it would cost well over a million dollars to buy a unit large enough to power a single home. But today, in many countries, solar is the cheapest form of energy to produce, surpassing fossil fuel alternatives like coal and natural gas. Millions of homes are equipped with rooftop solar, with most units paying for themselves in their first seven to 12 years and then generating further savings. So how did solar become so affordable? A turning point in solar ’ s price history occurred on the floor of Germany ’ s parliament, where in 2000, Hermann Scheer introduced the Renewable Energy Sources Act. This legislation laid out a vision for the country ’ s energy future in solar and wind. It incentivized citizens to personally invest in rooftop solar panels by guaranteeing payment to homeowners for the renewable energy they generated and sold to the grid. The pay rate for this electricity was highly subsidized, at times reaching four times the market price. Several other countries soon followed Germany ’ s example, implementing similar policies and incentives to drive their country ’ s solar use. This created unprecedented demand for solar panels worldwide. Manufacturers were able to scale up production and innovate in ways that cut costs. As a result, solar panel prices dropped while efficiency grew. HD : We see the cost reduction in solar and other renewable energy technologies has been so steep, but a lot of it is because of the enabling regulatory and policy environments created in places like the European Union and the US. Akil Callender : We cannot divert catastrophic climate change without addressing emissions coming from our energy systems. Currently, emissions from the energy system account for around two thirds of global greenhouse gas emissions. So the good news is, yes, we are seeing tremendous progress across the globe in renewable energy. It ’ s rolling out faster than ever before. Luisa Neubauer : The brilliant thing about energy supply in the world is that we have alternatives. So we don ’ t need fossil fuels to provide safe and equitable access to energy systems. Ramón Méndez Galain : Almost 90 percent of the total new installed capacity all over the world is just renewable. This is a tremendous change. AC : There ’ s more finance than ever before going into clean energy. In many countries, it is the largest contributor to their electricity system for the first time ever. KB : And also because China is the leading manufacturing nation in the world, change is happening there much faster. And those innovations are then spreading around the world. Hongquiao Liu : China ’ s coal demand might not have **peaked**, and China will continue to consume quite a lot of coal in the next few years. But the decarbonization is happening. It ’ s happening faster than anyone has expected, and China is adding an astonishing amount of wind and solar to its grid every year. Eduarda Zoghbi : I think one of the biggest **obstacles** today are natural resources, in the sense that we ’ re talking more and more about critical minerals and the role that they have. And batteries are demanding a lot of critical minerals that are present in most of the developing countries. So I think that even though costs are decreasing, we have to be more and more creative when it comes to recycling the batteries. We also have to think of how they ’ re impacting local communities. KB : So to give you the numbers, we extract, at the moment, 15, 000 million tons of fossil fuels every year. The International Energy Agency says that we will need about 43 million tons of critical materials in order to build out the clean energy economy. So that ’ s 300 times less stuff that is required. It ’ s worth saying that the impact of extracting 300 times less stuff upon nature is dramatically lower. And I know that it ’ s often argued that the renewable economy may be damaging for nature. Again, this is a completely false statement. It ’ s in fact, our only chance of reducing the pressure upon our natural resources, because there ’ s far less of it. MZ : Of course, transitioning to using clean energy, upending industries, it has to happen across the world, not just here in the US. And it can be hard to even imagine what life will be like. But carbon scientist and futurist Julio Friedmann can help us. Julio Friedmann : I think we need a compelling vision of the future that gets people excited about the energy transition and solving climate change. Right now, it ’ s like we ’ re at a restaurant and there ’ s two options : burnt toast, unflavored oatmeal. And people are not excited about either, right? The burnt toast option for me is what I call the big switch. Everything ’ s the same, it ’ s just clean, but it costs a lot of money and it ’ s **super** hard to do. The other vision is kind of like,”Thou shalt not.”That vision is a narrower sort of,”eat your peas,”hair shirt kind of vision of the future. And a lot of people don ’ t want that either. And there ’ s nothing in the physics, chemistry or biology that says we can ’ t have a **super** interesting, exciting, vibrant world. And that is compelling in a way that we have not heard yet. MZ : Help me out here, what does that even look like? JF : So, for lack of a better word, like, I like the Marvel cinematic universe. MZ : OK, I ’ ll go with you. JF : So a place like Wakanda, right? It ’ s got flying cars, it ’ s got maglev trains, and it ’ s a totally fabulous place to live. Like, they ’ ve got lots of food. That is built on abundant, sustainable, cheap energy. MZ : OK, so like, we ’ re not Wakanda, we ’ re not in the Marvel universe. This is real life, sort of. How do we make this possible? JF : So what can you actually do here on Earth, constrained by economics and engineering and all the rest of it, right? And the answer is we can do an incredible amount. Abundant, available where you want it, when you want it. Everybody should have energy, including the three billion people who use less electricity than my refrigerator uses. Well, the good news is, every day, the Earth receives 163, 000 terawatts of energy from the sun. About half of that bounces back to space, but about 80, 000 terawatts arrive at the Earth in a form we can use. For reference, today, the world uses about 26 terawatts of energy, and we got more than solar and wind.

We have geothermal, we have hydro, we have nuclear. There ' s other kinds of clean energies. And some of the best resources are, in fact, in the Global South. These places are not simply future climate victims. These places are latent energy superpowers. My favorite example of this is Chile. Almost eight years ago now their government said, wait a second, we can make the cheapest green electricity on Earth. We have hydropower, we have solar power, we have wind power and the best resources anywhere in the world. So let ' s start by making a lot of green electricity. And then they said, because of that, we can also make green hydrogen cheaper than anywhere else. And then Japan was like, hello, we want your green hydrogen. Can you ship it to us? MZ : Is that possible? JF : Totally. And Japan is like, we will also give you money to pay for these projects. We ' ll loan you money to pay for these projects. Could you please use Japanese technology? So they ' re using Japanese turbines, electrolyzers, they ' re using Japanese ships to haul the ammonia around. So Japan gets rich on this, Chile gets rich on this. MZ : Win-win. JF : Totally win-win. MZ : Win-win-win, planet, too. JF : And that model, other countries are looking at that, going, I want some of that. And that ' s why I like this vision of abundance. 15 years ago, solar was the most expensive power. Now it is the cheapest form of electricity, right? Which is astonishing, it ' s totally amazing. And a whole bunch of people are like, now we ' re done. And I ' m like, no, we can do that with everything. We can do that with wind. We can do that with nuclear, we can do that with geothermal. But these projects take time, money and people. We need to develop the human capital as part of these investment projects for decades. And innovation, we need much more energy in many places, much cheaper. That ' s an innovation agenda. For solar, that was the United States, Germany, China and others acting together. Well, if that ' s the recipe, we can do that again. We ' re already doing it with electric vehicles and clean hydrogen production. We can certainly do it by turning electricity into fuels. MZ : It sounds like the climate discussion needs to be kind of like improv, that it ' s a"yes and"sort of thing. JF : I ' m so glad you said that. So many people don ' t understand my love of improv comedy. Yes, it is a"yes and"circumstance. Because mostly it is about room for agreement. Where do you find the point where everybody is like, I can agree on that? One of the things I love about the infrastructure bill, one of the things I love about the Inflation Reduction Act, neither of them had the word climate in it. They were both massive climate bills, right? That was a way to get everybody on the same page. Nationwide, they basically tripled the clean energy research budget. That ' s a good start. But that made it all of one percent of GDP. And for comparison, we spend twice that on pharmaceuticals. So I think it ' s fair to say we should get going. We should spend a lot more money. We ' ve done stuff like this before. We ' ve done World War II, we ' ve done the Marshall Plan, like, we ' ve done the space shot, like we actually know how to move really quickly as a nation. We did this for COVID. Collective **action**, building together is what makes the difficult possible and nourishes the soul through **mission** and purpose. We know what to do and we can act, not out of anger or fear, but out of generosity and common purpose, bringing aspiration and humility together. We ' re going to build a thriving, vibrant, exciting world full of potential that ' s going to be built on the back of infrastructure, innovation and investment that will harness the abundant, sustainable, cheap energy that is our planet ' s endowment. Thank you. [Chapter 4 : A Just Transition] FD : There is a high risk that when those exponential kick in, we see businesses running after those opportunities. But then the distribution of the benefits being very unequal. EZ : Many people like discussing the importance of the just energy transition. And a lot of people don ' t understand what justice really means. If we are to reach a revolution, a renewable energy future has to be inclusive. AC : We have this push for what we ’ re calling a just and equitable energy transition. We need to make sure that we are not exacerbating inequality, but rather we are ensuring that that gap is closed and that the groups that have been historically marginalized are not once again being marginalized in a new way. NT : Most of emissions come from wealthy, energy-guzzling citizens, but a lot of the economic benefit and human development benefit will come not from decarbonizing high-carbon lives and lifestyles, but from providing clean, distributed energy and tools and solutions to those who don ’ t have access to any of them. LN : When we speak of countries in need of economic development, we mostly speak of countries that are hit by the climate crisis the hardest right now. It should be the biggest wish and job and task for all those countries who have burned so much fossil fuel already to support any other country in the so-called Global South, to get an economy running without fossil fuels, to not repeat all the mistakes that we have made. HD : To ensure that the solar revolution that has been seen around the world comes to places like Africa, we need to be really conscious that the history and the lived experience when it comes to energy is very different for poor countries. Rebekah Shirley : We love to remind Global South communities, especially Africa, about the vast renewable energy potential that they have, which is true. But the finance flows to deliver on that potential remain very scarce. Africa, despite being 90 percent of those across the entire globe that still do not have access to electricity and being 17 percent of the global population, we ’ re actually two percent of international finance. Money doesn ’ t actually flow to these spaces naturally, and we need to do a lot of work to get global finance to these spaces. MZ : A world of abundant clean energy for everyone. That is the goal. But what about in the short term? Take Detroit. This once-wealthy city has been through some seriously hard times. How is it rebuilding itself so that everyone here can thrive while dealing with extreme heat, flooding, and other climate problems? Anika Goss is looking to Detroit ’ s past to plan its future. AG : I am a third-generation Detroiter. My grandmother moved to Detroit in 1936 during the Great Migration and brought all of her southern ways with her. She owned a home and knew that home **ownership** would create wealth and opportunity for her growing family. Up until the late 1950s, Detroit was a haven for middle-class families living in neighborhoods where there was green space and community connectivity and opportunity. My grandmother, she had this amazing garden, and it was just abundant. There were all kinds of flowers and food. You know, she grew vegetables back there, and it was just a magical place for a little girl. MZ : I mean, what you ’ re describing is a Detroit that, yes, has huge problems, segregation. But at the same time, a woman, she can have a job, she can own a house, she can raise her family, she can have fresh fruits and vegetables. AG : It was certainly a place where you could gain economic opportunity faster than you can now. My grandmother ’ s Detroit is not the Detroit that I live in today. All of those sites where there was manufacturing and industrial sites that led to our economic boom, many stand vacant and abandoned. These industrial sites have led to dangerous contamination to our land and our water and our air. MZ : So, just lay it out for us. For people who maybe don ’ t see, like, how is there a link between economic inequality and climate change? AG : You know, I ’ m so surprised that it feels like separate problems. But I ’ m also really glad that people are asking. Because if you ’ re living around and working in a community that is low-income, where there are fewer jobs, the housing is deteriorated, this is a neighborhood that ’ s also more likely to be closer to a factory that ’ s emitting pollutants, likely to have water that ’ s contaminated, probably has fewer parks and fewer intentional green spaces. The people who are living in those communities are at risk for climate impacts first. So we have to do something in those neighborhoods right away. MZ : So what can this healthier future look like? Anika showed me some of the work she ' s done in partnership with different neighborhoods in Detroit, to make them both more enjoyable and more resilient. First, she took me to the Circle Forest. It ' s an oasis right in the middle of the city. AG : This is six lots that were vacant, and we all worked together with this community to build a forest. MZ : Beautiful and a great example of how nonprofits can work with communities to transform them into sustainable, welcoming places. AG : We might have a good idea about gardens and tree planting, but this is where people live. And so you ask first. This is a new effort, of this idea of a resilient neighborhood or calling it that. So these are large tracts of vacancy that can be used to provide environmental sustainability, community resilience and beauty. Watch for the poison ivy. It ' s not pretend. MZ : Next we met up with Katrina Watkins, the founder and CEO of the Bailey Park Neighborhood Development Corporation, a group revitalizing this historic area by turning vacant lots into parks that can stand up to extreme weather. Katrina Watkins : My family has been in this neighborhood since 1946. I grew up hearing the stories from my dad, him telling me about how people thought it was a ghetto, but it wasn ' t. Those were families, and people worked and had businesses, and people looked out for each other. And it was those type of stories that made me say, wow, we just really need to bring that back. MZ : So then briefly fill us in about how things changed. KW : Things deteriorated in this neighborhood. The homes got torn down, left just a lot of vacant lots, a lot of overgrowth. It wasn ' t safe. I would see my little nieces and nephews. They would just be on their little skateboards, you know, not paying attention, the stop sign is covered. And me and my dad was like, we just have to do something. So we started out as Bailey Park Project, focusing on the park and green infrastructure and trees and flowers. And then over the course of the years, we started doing more community development. MZ : I wonder, like, how do you describe it to people when you explain what ' s happening, what you ' re trying to do for your neighborhood, the changes that you ' re making and how it relates to climate change? KW : One really great example, when people come to the park, like right now, this is like, literally a heat island because our trees haven ' t grown. So it is very hot. So sometimes it ' s so hot that the kids don ' t come out and play until the evening. That education of knowing the benefit of trees and cooling down an environment, how it makes the air cleaner. There ' s a lot of people that suffer from asthma. So trees can make a difference. And if you go to places like Grosse Pointe, you will see this beautiful tree canopy down. Like their homes are probably 20 degrees cooler you know, than our homes, AG : Having a lot of green space actually contributes to the climate resiliency for this neighborhood. So all of this grass actually can manage stormwater better. The idea of leading new development in this neighborhood with green, what it says to me is that the residents are really envisioning the neighborhood that they want to live in. And that I just – I ' m really excited about that. MZ : Turning great loss and upheaval into even greater opportunities. These Detroiters are creating a blueprint for an urban future that every city can learn from. [Chapter 5 : Agriculture] TED-Ed : About 10, 000 years ago, humans began to farm. This agricultural revolution was a turning point in our history that enabled people to settle, build and create. In short, agriculture enabled the existence of civilization. Today, approximately 40 percent of our planet is farmland. Spread all over the world, these agricultural lands are the pieces to a global puzzle we are all facing. In the future, how can we feed every member of a growing population a healthy diet? Meeting this goal will require nothing short of a second agricultural revolution. The first agricultural revolution was characterized by expansion and exploitation, feeding people at the expense of forests, wildlife and water, and destabilizing the climate in the process. That ' s not an option the next time around. Agriculture depends on a stable climate with predictable seasons and weather patterns. This means we can ' t keep expanding our agricultural lands, because doing so will undermine the environmental conditions that make agriculture possible in the first place. Instead, the next agricultural revolution will have to increase the output of our existing farmland for the long term while protecting biodiversity, conserving water, and reducing pollution and greenhouse gas emissions. So what will the future farms look like? In Bangladesh, Cambodia and Nepal, new approaches to rice production may dramatically decrease greenhouse gas emissions in the future. Rice is a staple food for three billion people and the main source of livelihood for millions of households. More than 90 percent of rice is grown in flooded paddies, which use a lot of water and release 11 percent of annual methane emissions, which accounts for one to two percent of total annual greenhouse gas emissions globally. By experimenting with new strains of rice, irrigating less and adopting less labor-intensive ways of planting seeds, farmers in these countries have already increased their incomes and crop yields while cutting down on greenhouse gas emissions. MZ : Related technologies are also taking root in the US. Father and daughter farmers, Jim and Jessica Whitaker, have come up with their own strategies to reduce methane that are working on their farm in Arkansas. But convincing everyone else to change is their next big challenge. So let ' s go back to how you got to be such a big supplier of rice in this country. You tell a story about how you were 22 and you were like, I ' m going to start my own farm, but – not that easy. Jim Whitaker : No, it ' s not. Let me tell you something about renting a farm when you ' re 22 years old. No one rents you a farm unless no one else wants to rent it. It was a big piece of land, it was cash rent, I mean, the stakes were set. We were doomed to fail. And we weren ' t focused on environmental sustainability back then. We were focused on economic sustainability. How do we make higher yield? How do we use less fertilizer? How do we get to the next year and feed our family? It happens that economic and environmental sustainability go hand in hand along with social sustainability. As we used less fertilizer, used less water, our yield started going up. MZ : Can you spell out for me what the problem is with rice when it comes to the environment? JW : Soil is full of microbes. And what they ' re doing in the soil on a basic level is they ' re down there chewing away, eating up the biomass that ' s left over from the crop before. And out of that comes methane, the same way it happens in cattle operations or whatever. MZ : But you decided to do it a different way. JW : We do it a little bit differently. Arkansas is a very water-rich state, but we have a dry season, right in the middle of summer is a dry season. So when we dry the soil, that anaerobic microbial that ' s living in that soup, that mushy soil, either dies or goes dormant. So we break his life cycle. MZ : Oh! JW : And then it stops emitting methane. But it doesn ' t hurt the rice. That actually helps rice, when you use less water. We have less runoff, less erosion, less nutrients leaving our field. Nothing leaves our field unless we want it to. Jessica Whitaker Allen : We started tracking this. We saw that our water use was down and we thought, OK, well, we need to add to that, let ' s add more data points to that. Let ' s add our fertilizer, let ' s add our fuel usage. And so we really started recording all this stuff by hand in just an Excel spreadsheet. We didn ' t know what we were doing. MZ : But you knew you were on to something. JWA : Yes, so we started recording everything. MZ : Do you remember if there was a moment when the two of you thought, like, what we ' re doing, it shouldn ' t be **special** to us. Why aren ' t more people – JW : To collect the data, have the equipment and the cloud-based technology and the stuff in the field to record it, it ' s just massively time-consuming, and consumers don ' t pay for it. JWA : Well and people like us, why would you want to do it? I mean, take a walk through your supermarket. Everything ' s sustainable, everything ' s greenwashed. You can put whatever you want to on a package, there ' s no rules, there ' s no standards. So we ' re trying to make that standard. We live and work in southeast Arkansas. Our town has 4, 000 residents and one stoplight. The nearest airport, Starbucks shopping mall, Whole Foods, is two hours away in any direction. Without places like this and farmers like us, you ' d be hungry, naked and sober. I ' m a farmer, but not in the way you might think. I don ' t drive the tractors, and I don ' t plant the rice. But I know how to take what my dad has learned and what he is doing and share that with others. We are going to work with farmers in southeast Arkansas to educate them about the benefits of growing sustainable rice. JW : Let me tell you why that ' s important. There are 400 million acres of rice grown globally. And our methods, if used, can reduce greenhouse gas by 50 percent, reduce water use by 50 percent, increase yields to feed a hungry world. MZ : We hear a lot about how weather has gotten more extreme, flooding, heat. What ' s it been like in Arkansas? JW : So in 2016, we had a 500-year flood. We were... We get a picture of our place flooded. 14 inches of rain. That was a 500-year flood. Hurt a lot of people. And then we had a 1, 000-year flood. And we lost so many acres. And you know, when houses get flooded in rural communities, they don ' t come back. I mean, when you have whole neighborhoods get flooded, they don ' t rebuild them, they don ' t come back. JWA : I feel like almost every day I ' m getting a notification from the weather Channel of an excessive heat **warning** or thunderstorm **warning** or hail threat. You know, you don ' t really know what you ' re going to expect. MZ : When you think about what it will be like, I don ' t know, five years, 10 years, for someone to go into the supermarket and think, oh, right, I need to get rice off my grocery list. What ideally would you like to see on the shelf there? JW : So I think it ' s going to change, because I like to study what companies want. I mean, if you figure out what they want, then you know what to give them. And when you read their sustainability goals, they ' re all saying they ' re going to be net zero. The only way they can be net zero is they bring the farmer into the loop. So if we ' re able to do this, in five years, everybody ' s doing these **practices**, the US rice industry will be the most sustainable industry in the world. MZ : Can you do it? JW : Oh, yeah. It ' s about to happen. MZ : You ' ve just heard a lot of ideas, a lot of stories and a lot of big plans. So we want to wrap things up by asking our experts : What if we actually achieved our climate goals? What would that future even look like? They, of course, had a lot of thoughts. We ' ll let you pick your favorites. Thanks for watching. NT : If we are successful in addressing the climate crisis, we massively reduce the vulnerability and improve the economic and the creative prospects of billions of people around the world who currently are basically excluded from all of the opportunities which we have, which come from having abundant material and energy all around us. That ' s the real prize. FD : A world where we have had that exponential would be a world in which we have clean, cheap energy for all. KB : At the end of this decade, the International Energy Agency believes that we will have enough capacity to be producing 10 billion, 10 billion batteries a year. It ' s enough for every person on the planet to have their own battery. AC : I ' m constantly surrounded by young people just like me who are really, really, really **passionate** about the world that we live in. For obvious reasons. It ' s the world that we will inherit. EZ : Women are very important for the energy transition. So if we ' re talking about a world where we have, you know, where we tackle climate change, all I want to see is, you know, women in power. I want to see more solutions being driven by young people. And I want our politicians to be truly and meaningfully engaged in making change. NG : We always tend to underestimate the pace of ultimate adoption and change. Today, there are more than 150 pathways, scientific pathways that we could take to limit global warming. Al Gore : If we get to true net zero, astonishingly, global temperatures will stop going up with a lag time of as little as three to five years. Colin Averill : We ' ve been able to accelerate tree growth and carbon capture and tree stems by 30 to 70 percent. Dan Jørgensen : Offshore wind has the potential to cover the current electricity demand of the entire world not once, not twice, 18 times. NG : We need to decarbonize the old economy that we have and invest to create the new economy that we need Paul Hawken : Regenerative farming is fairly simple in concept. It means creating the conditions for more life. Josephine Phillips : We need to buy less stuff, and we need to look after what we buy. Valuing the things that we own is a climate solution. Vishaan Chakrabarti : We can all live in this transit-rich, carbon-negative, affordable way and leave the vast majority of the planet for nature, for agriculture, for clean oceans. We can do this. Susan Ruffo : The ocean is a powerful source of solutions that we ' ve overlooked for far too long. Al Roker : You have to be engaged. Let your elected officials know that this is important to you. You have to vote, you have to go out there and support politicians who are going to support our planet. Peggy Shepard : We can create a legacy of environmental quality and climate resilience for all. Fehinti Balogun : You are not powerless that the"oh, there ' s nothing we can do, just keep going"is symptom, not cure. But you are needed. Avinash Persaud : The power of what we can do when it matters to us is unlimited. CF : It ' s not that we ' re simply going to avoid the worst impacts of climate change. It ' s that we ' re going to improve the quality of life for humans, both in the urban and in the rural sector, and for non-humans.

Text Sample 210: POS Dim 2 – 2023 – Score 16.00 – 2023/t003508.txt

Chris Anderson : It ' s very nice to have you here. Let ' s see. First of all, congratulations. You really pulled off something remarkable on that grilling, you achieved something that very few people do, which was, you pulled off a kind of, a bipartisan consensus in US politics. It was great. The bad news was that that consensus largely seemed to be :"We must ban TikTok."So we ' re going to come to that in a bit. And I ' m curious, but before we go there, we need to know about you. You seem to me like a remarkable person. I want to know a bit of your story and how you came to TikTok in the first place. Shou Chew : Thank you, Chris. Before we do that, can I just check, need to know my audience, how many of you here use TikTok? Oh, thank you. For those who don ' t, the Wi-Fi is free. CA : There ' s another question, which is, how many of you here have had your lives touched through TikTok, through your kids and other people in your lives? SC : Oh, that ' s great to see. CA : It ' s basically, if you ' re alive, you have had some kind of contact with TikTok at this point. So tell us about you. SC : So my name is Shou, and I ' m from Singapore. Roughly 10 years ago, I met with two engineers who were building a product. And the idea behind this was to build a product that recommended content to people not based on who they knew, which was, if you think about it, 10 years ago, the social graph was all in the rage. And the idea was, you know, your content and the feed that you saw should be based on people that you knew. But 10 years ago, these two engineers thought about something different, which is, instead of showing you – instead of showing you people you knew, why don ' t we show you content that you liked? And that ' s sort of the genesis and the birth of the early iterations of TikTok. And about five years ago, with the advent of 4G, short video, **mobile** phone penetration, TikTok was born. And a couple of years ago, I had the opportunity to run this company, and it still excites me every single day. CA : So I want to dig in a little more into this, about what was it that made this take-off so explosive? Because the language I hear from people who spent time on it, it ’ s sort of like I mean, it is a different level of addiction to other media out there. And I don ’ t necessarily mean this in a good way, we ’ ll be coming on to it. There ’ s good and bad things about this type of addiction. But it ’ s the feeling that within a couple of days of experience of TikTok, it knows you and it surprises you with things that you didn ’ t know you were going to be interested in, but you are. How? Is it really just, instead of the social graph – What are these algorithms doing? SC : I think to describe this, to begin to answer your question, we have to talk about the **mission** of the company. Now the **mission** is to inspire creativity and to bring joy. And I think **missions** for companies like ours [are] really important. Because you have product managers working on the product every single day, and they need to have a North Star, you know, something to sort of, work towards together. Now, based on this **mission**, our vision is to provide three things to our users. We want to provide a window to discover, and I ’ ll talk about discovery, you talked about this, in a second. We want to give them a canvas to create, which is going to be really exciting with new technologies in AI that are going to help people create new things. And the final thing is bridges for people to connect. So that ’ s sort of the vision of what we ’ re trying to build. Now what really makes TikTok very unique and very different is the whole discovery engine behind it. So there are earlier apps that I have a lot of respect for, but they were built for a different purpose. For example, in the era of search, you know, there was an app that was built for people who wanted to search things so that is more easily found. And then in the era of social graphs, it was about connecting people and their followers. Now what we have done is that... based on our machine-learning algorithms, we ’ re showing people what they liked. And what this means is that we have given the everyday person a **platform** to be discovered. If you have talent, it is very, very easy to get discovered on TikTok. And I ’ ll just give you one example of this. The biggest creator on TikTok is a guy called Khaby. Khaby was from Senegal, he lives in Italy, he was a factory worker. He, for the longest time, didn ’ t even speak in any of his videos. But what he did was he had talent. He was funny, he had a good **expression**, he had creativity, so he kept posting. And today he has 160 million followers on our **platform**. So every single day we hear stories like that, businesses, people with talent. And I think it ’ s very freeing to have a **platform** where, as long as you have talent, you ’ re going to be heard and you have the chance to succeed. And that ’ s what we ’ re providing to our users. CA : So this is the amazing thing to me. Like, most of us have grown up with, say, network television, where, for decades you ’ ve had thousands of brilliant, creative people toiling in the trenches, trying to imagine stuff that will be amazing for an audience. And none of them ever remotely came up with anything that looked like many of your creators. So these algorithms, just by **observing** people ’ s behavior and what they look like, have discovered things that thousands of brilliant humans never discovered. Tell me some of the things that it is looking at. So obvious things, like if someone presses like or stays on a video for a long time, that gives you a clue,”more like that.”But is it subject matter? What are the array of things that you have noticed that you can actually track that provide useful clues? SC : I ’ m going to simplify this a lot, but the machine learning, the recommendation algorithm is really just math. So, for example, if you liked videos one, two, three and four, and I like videos one, two, three and five, maybe he liked videos one, two, three and six. Now what ’ s going to happen is, because we like one, two, three at the same time, he ’ s going to be shown four, five, six, and so are we. And you can think about this repeated at scale in real time across more than a billion people. That ’ s basically what it is, it ’ s math. And of course, you know, AI and machine learning has allowed this to be done at a very, very big scale. And what we have seen, the result of this, is that it learns the interest signals that people exhibit very quickly and shows you content that ’ s really relevant for you in a very quick way. CA : So it ’ s a form of collaborative filtering, from what you ’ re saying. The theory behind it is that these humans are weird people, we don ’ t really know what they ’ re interested in, but if we see that one human is interested, with an overlap of someone else, chances are, you know, you could make use of the other pieces that are in that overlapped human ’ s repertoire to feed them, and they ’ ll be surprised. But the reason they like it is because their pal also liked it. SC : It ’ s pattern recognition based on your interest signals. And I think the other thing here is that we don ’ t actually ask you 20 questions on whether you like a piece of content, you know, what are your interests, we don ’ t do that. We built that experience organically into the app experience. So you are voting with your thumbs by watching a video, by swiping it, by liking it, by sharing it, you are basically exhibiting interest signals. And what it does mathematically is to take those signals, put it in a formula and then matches it through pattern recognition. That ’ s basically the idea behind it. CA : I mean, lots of **start-ups** have tried to use these types of techniques. I ’ m wondering what else played a role early on? I mean, how big a deal was it, that from the get-go you were optimizing for smartphones so that videos were shot in portrait format and they were short. Was that an early distinguishing thing that mattered? SC : I think we were the first to really try this at scale. You know, the recommendation algorithm is a very important reason as to why the **platform** is so popular among so many people. But beyond that, you know, you mentioned the format itself. So we talked about the vision of the company, which is to have a window to discover. And if you just open the app for the first time, you ’ ll see that it takes up your whole screen. So that ’ s the window that we want. You can imagine a lot of people using that window to discover new things in their lives. Then, you know, through this recommendation algorithm, we have found that it connects people together. People find communities, and I ’ ve heard so many stories of people who have found their communities because of the content that they ’ re posting. Now, I ’ ll give you an example. I was in DC recently, and I met with a bunch of creators. CA : I heard. SC : One of them was sitting next to me at a dinner, his name is Samuel. He runs a restaurant in Phoenix, Arizona, and it ’ s a taco restaurant. He told me he has never done this before, first venture. He started posting all this content on TikTok, and I saw his content, I was hungry after looking at it, it ’ s great content. And he ’ s generated so much interest in his business, that last year he made something like a million dollars in revenue just via TikTok. One restaurant. And again and again, I hear these stories, you know, by connecting people together, by giving people the window to discover, we have given many small businesses and many people, your common person, a voice that they will never otherwise have. And I think that ’ s the power of the **platform**. CA : So you definitely have identified early just how we ’ re social creatures, we need affirmation. I ’ ve heard a story, and you can tell me whether true or not, that one of the keys to your early liftoff was that you wanted to persuade creators who were trying out TikTok that this was a **platform** where they would get response, early on, when you ’ re trying to grow something, the numbers aren ’ t there for response. So you had the brilliant idea of goosing those numbers a bit, basically finding ways to give people, you know, a bigger sense of like, more likes, more engagement than was actually the case, by using AI agents somehow in the process. Is that a brilliant idea, or is that just a myth? SC : I would describe it in a different way. So there are other **platforms** that exist before TikTok. And if you think about those **platforms**, you sort of have to be famous already in order to get followers. Because the way it ' s built is that people come and follow people. And if you aren ' t already famous, the chances that you get discovered are very, very low. Now, what we have done, again, because of the difference in the way we ' re recommending content, is that we have given anyone, any single person with enough talent a stage to be able to be discovered. And I think that actually is the single, probably the most important thing contributing to the growth of the **platform**. And again and again, you will hear stories from people who use the **platform**, who post regularly on it, that if they have something they want to say, the **platform** gives them the chance and the stage to connect with their audience in a way that I think no other product in the past has ever offered them. CA : So I ' m just trying to play back what you said there. You said you were describing a different way what I said. Is it then the case that like, to give someone a decent chance, someone who ' s brilliant but doesn ' t come with any followers initially, that you ' ve got some technique to identify talent and that you will almost encourage them, you will give them some kind of, you know, artificially increase the number of followers or likes or whatever that they have, so that others are encouraged to go,"Wow, there ' s something there."Like it ' s this idea of critical mass that kind of, every entrepreneur, every party **planner** kind of knows about of"No, no, this is the hot place in town, everyone come,"and that that is how you actually gain critical mass? SC : We want to make sure that every person who posts a video is given an equal chance to be able to have some audience to begin with. But this idea that you are maybe alluding to, that we can get people to like something, it doesn ' t really work like that. CA : Could you get AI agents to like something? Could you seed the network with extra AI agents that could kind of, you know, give someone early encouragement? SC : Ultimately, what the machine does is it recognizes people ' s interests. So if you post something that ' s not interesting to a lot of people, even if you gave it a lot of exposure, you ' re not going to get the virality that you want. So it ' s a lot of... There is no push here. It ' s not like you can go and push something, because I like Chris, I ' m going to push your content, it doesn ' t work like that. You ' ve got to have a message that resonates with people, and if it does, then it will automatically just have the virality itself. That ' s the beauty of user-generated content. It ' s not something that can be engineered or over-thought. It really is something that has to resonate with the audience. And if it does, then it goes viral. CA : Speaking privately with an investor who knows your company quite well, who said that actually the level of sophistication of the algorithms you have going is just another order of magnitude to what competitors like, you know, Facebook or YouTube have going. Is that just hype or do you really believe you – like, how complex are these algorithms? SC : Well, I think in terms of complexity, there are many companies who have a lot of resources and a lot of talent. They will figure out even the most complex algorithms. I think what is very different is your **mission** of your company, how you started the company. Like I said, you know, we started with this idea that this was the main use case. The most important use case is you come and you get to see recommended content. Now for some other apps out there, they are very significant and have a lot of users, they are built for a different original purpose. And if you are built for something different, then your users are used to that because the community comes in and they expect that sort of experience. So I think the pivot away from that is not really just a matter of engineering and algorithms, it ' s a matter of what your company is built to begin with. Which is why I started this by saying you need to have a vision, you need to have a **mission**, and that ' s the North Star. You can ' t just shift it halfway. CA : Right. And is it fair to say that because your start point has been interest algorithms rather than social graph algorithms, you ' ve been able to avoid some of the worst of the sort of, the filter bubbles that have happened in other social media where you have tribes kind of declaring war on each other effectively. And so much of the noise and energy is around that. Do you believe that you ' ve largely avoided that on TikTok? SC : The diversity of content that our users see is very key. You know, in order for the discovery – the **mission** is to discover – sorry, the vision is to discover. So in order to facilitate that, it is very important to us that what the users see is a diversity of content. Now, generally speaking, you know, there are certain issues that you mentioned that the industry faces, you know. There are some bad actors who come on the internet, they post bad content. Now our approach is that we have very clear community guidelines. We ' re very transparent about what is allowed and what is not allowed on our **platform**. No executives make any **ad** hoc decisions. And based on that, we have built a team that is tens of thousands of people plus machines in order to identify content that is bad and actively and proactively remove it from the **platform**. CA : Talk about what some of those key guidelines are. SC : We have it published on our website. In March, we just iterated a new version to make it more readable. So there are many things like, for example, no pornography, clearly no child sexual abuse material and other bad things, no violence, for example. We also make it clear that it ' s a differentiated experience if you ' re below 18 years old. So if you ' re below 18 years old, for example, your entire app experience is actually more restricted. We don ' t allow, as an example, users below 16, by default, to go viral. We don ' t allow that. If you ' re below 16, we don ' t allow you to use the **instant** messaging feature in app. If you ' re below 18, we don ' t allow you to use the livestreaming features. And of course, we give parents a whole set of tools to control their teenagers ' experience as well. CA : How do you know the age of your users? SC : In our industry, we rely mainly on something called age gating, which is when you sign up for the app for the first time and we ask you for the age. Now, beyond that, we also have built tools to go through your public profile for example, when you post a video, we try to match the age that you said with the video that you just posted. Now, there are questions of can we do more? And the question always has, for every company, by the way, in our industry, has to be balanced with **privacy**. Now, if, for example, we scan the faces of every single user, then we will significantly increase the ability to tell their age. But we will also significantly increase the amount of data that we collect on you. Now, we don ' t want to collect data. We don ' t want to scan data on your face to collect that. So that balance has to be maintained, and it ' s a challenge that we are working through together with industry, together with the regulators as well. CA : So look, one thing that is unquestionable is that you have created a **platform** for literally millions of people who never thought they were going to be a content creator. You ' ve given them an audience. I ' d actually like to hear from you one other favorite example of someone who TikTok has given an audience to that never had that before. SC : So when again, when I travel around the world, I meet with a whole bunch of creators on our **platform**. I was in South Korea just yesterday, and before that I met with – yes, before that I met with a bunch of – People don ' t expect, for example, teachers. There is an English teacher from Arkansas. Her name is Claudine, and I met her in person. She uses our **platform** to reach out to students. There is another teacher called Chemical Kim. And Chemical Kim teaches chemistry. What she does is she uses our **platform** to reach out to a much broader student base than she has in her classroom. And they ’ re both very, very popular. You know, in fact, what we have realized is that STEM content has over 116 billion views on our **platform** globally. And it ’ s so significant – CA : In a year? SC : Cumulatively. CA : [116] billion. SC : It ’ s so significant, that in the US we have started testing, creating a feed just for STEM content. Just for STEM content. I ’ ve been using it for a while, and I learned something new. You want to know what it is? Apparently if you flip an egg on your tray, the egg will last longer. It ’ s science, there ’ s a whole video on this, I learned this on TikTok. You can search for this. CA : You want to know something else about an egg? If you put it in just one hand and squeeze it as hard as you can, it will never break. SC : Yes, I think I read about that, too. CA : It ’ s not true. SC : We can search for it. CA : But look, here ’ s here ’ s the flip side to all this amazingness. And honestly, this is the key thing, that I want to have an honest, heart-to-heart conversation with you because it ’ s such an important issue, this question of human addiction. You know, we are... animals with a prefrontal cortex. That ’ s how I think of us. We have these addictive instincts that go back millions of years, and we often are in the mode of trying to modulate our own behavior. It turns out that the internet is incredibly good at activating our animal cells and getting them so damn excited. And your company, the company you ’ ve built, is better at it than any other company on the planet, I think. So what are the risks of this? I mean, how... From a company point of view, for example, it ’ s in your interest to have people on there as long as possible. So some would say, as a first pass, you want people to be addicted as long as possible. That ’ s how advertising money will flow and so forth, and that ’ s how your creators will be delighted. What is too much? SC : I don ’ t actually agree with that. You know, as a company, our goal is not to optimize and **maximize** time spent. It is not. In fact, in order to address people spending too much time on our **platform**, we have done a number of things. I was just speaking with some of your colleagues backstage. One of them told me she has encountered this as well. If you spend too much time on our **platform**, we will proactively send you videos to tell you to get off the **platform**. We will. And depending on the time of the day, if it ’ s late at night, it will come sooner. We have also built in tools to limit, if you below 18 years old, by default, we set a 60-minute default time limit. CA : How many? SC : Sixty minutes. And we ’ ve given parents tools and yourself tools, if you go to **settings**, you can set your own time limit. We ’ ve given parents tools so that you can pair, for the parents who don ’ t know this, go to **settings**, family pairing, you can pair your phone with your teenager ’ s phone and set the time limit. And we really encourage parents to have these conversations with their teenagers on what is the right amount of screen time. I think there ’ s a healthy relationship that you should have with your screen, and as a business, we believe that that balance needs to be met. So it ’ s not true that we just want to **maximize** time spent. CA : If you were advising parents here what time they should actually recommend to their teenagers, what do you think is the right **setting**? SC : Well, 60 minutes, we did not come up with it ourselves. So I went to the Digital Wellness Lab at the Boston Children ’ s Hospital, and we had this conversation with them. And 60 minutes was the recommendation that they gave to us, which is why we built this into the app. So 60 minutes, take it for what it is, it ’ s something that we ’ ve had some discussions of experts. But I think for all parents here, it is very important to have these conversations with your teenage children and help them develop a healthy relationship with screens. I think we live in an age where it ’ s completely inevitable that we ’ re going to interact with screens and digital content, but I think we should develop healthy habits early on in life, and that ’ s something I would encourage. CA : Curious to ask the audience, which of you who have ever had that video on TikTok appear saying,”Come off.”OK, I mean... So maybe a third of the audience seem to be active TikTok users, and about 20 people maybe put their hands up there. Are you sure that – like, it feels to me like this is a great thing to have, but are you... isn ’ t there always going to be a temptation in any given quarter or whatever, to just push it a bit at the boundary and just dial back a bit on that so that you can hit revenue goals, etc? Are you saying that this is used scrupulously? SC : I think, you know, in terms... Even if you think about it from a commercial point of view, it is always best when your customers have a very healthy relationship with your product. It ’ s always best when it ’ s healthy. So if you think about very short-term retention, maybe, but that ’ s not the way we think about it. If you think about it from a longer-term perspective, what you really want to have is a healthy relationship, you know. You don ’ t want people to develop very unhealthy habits, and then at some point they ’ re going to drop it. So I think everything in moderation. CA : There ’ s a claim out there that in China, there ’ s a much more rigorous standards imposed on the amount of time that children, especially, can spend on the TikTok equivalent of that. SC : That is unfortunately a misconception. So that experience that is being mentioned for Douyin, which is a different app, is for an under 14-year-old experience. Now, if you compare that in the United States, we have an under-13 experience in the US. It ’ s only available in the US, it ’ s not available here in Canada, in Canada, we just don ’ t allow it. If you look at the under-13 experience in the US, it ’ s much more restricted than the under-14 experience in China. It ’ s so restrictive, that every single piece of content is vetted by our third-party child safety expert. And we don ’ t allow any under-13s in the US to publish, we don ’ t allow them to post, and we don ’ t allow them to use a lot of features. So I think that that report, I ’ ve seen that report too, it ’ s not doing a fair comparison. CA : What do you make of this issue? You know, you ’ ve got these millions of content creators and all of them, in a sense, are in a race for attention, and that race can pull them in certain directions. So, for example, teenage girls on TikTok, sometimes people worry that, to win attention, they ’ ve discovered that by being more sexual that they can gain extra viewers. Is this a concern? Is there anything you can do about this? SC : We address this in our community guidelines as well. You know, if you look at sort of the sexualized content on our guidelines, if you ’ re below a certain age, you know, for certain themes that are mature, we actually remove that from your experience. Again, I come back to this, you know, we want to have a safe **platform**. In fact, at my congressional hearing, I made four commitments to our users and to the politicians in the US. And the first one is that we take safety, especially for teenagers, extremely seriously, and we will continue to prioritize that. You know, I believe that we need to give our teenage users, and our users in general, a very safe experience, because if we don ’ t do that, then we cannot fulfill – the **mission** is to inspire creativity and to bring joy. If they don ’ t feel safe, I cannot fulfill my **mission**. So it ’ s all very organic to me as a business to make sure I do that. CA : But in the strange interacting world of human psychology and so forth, weird memes can take off. I mean, you had this outbreak a couple years back with these devious licks where kids were competing with each other to do vandalism in schools and, you know, get lots of followers from it. How on Earth do you battle something like that? SC : So dangerous challenges are not allowed on our **platform**. If you look at our guidelines, it ’ s violative. We proactively invest resources to identify them and remove them from our **platform**. In fact, if you search for dangerous challenges on our **platform** today, we will redirect you to a safety resource page. And we actually worked with some creators as well to come up with campaigns. This is another campaign. It ’ s the”Stop, Think, Decide

Before You Act"campaign where we work with the creators to produce videos, to explain to people that some things are dangerous, please don ' t do it. And we post these videos actively on our **platform** as well. CA : That ' s cool. And you ' ve got lots of employees. I mean, how many employees do you have who are specifically looking at these content moderation things, or is that the wrong question? Are they mostly identified by AI initially and then you have a group who are overseeing and making the final decision? SC : The group is based in Ireland and it ' s a lot of people, it ' s tens of thousands of people. CA : Tens of thousands? SC : It ' s one of the most important cost items on my PnL, and I think it ' s completely worth it. Now, most of the moderation has to be done by machines. The machines are good, they ' re quite good, but they ' re not as good as, you know, they ' re not perfect at this point. So you have to complement them with a lot of human beings today. And I think, by the way, a lot of the progress in AI in general is making that kind of content moderation capabilities a lot better. So we ' re going to get more precise. You know, we ' re going to get more specific. And it ' s going to be able to handle larger scale. And that ' s something I think that I ' m personally looking forward to. CA : What about this perceived huge downside of use of, certainly Instagram, I think TikTok as well. What people worry that you are amplifying insecurities, especially of teenagers and perhaps especially of teenage girls. They see these amazing people on there doing amazing things, they feel inadequate, there ' s all these reported cases of depression, insecurity, suicide and so forth. SC : I take this extremely seriously. So in our guidelines, for certain themes that we think are mature and not suitable for teenagers, we actually proactively remove it from their experience. At the same time, if you search certain terms, we will make sure that you get redirected to a resource safety page. Now we are always working with experts to understand some of these new trends that could emerge and proactively try to manage them, if that makes sense. Now, this is a problem that predates us, that predates TikTok. It actually predates the internet. But it ' s our responsibility to make sure that we invest enough to understand and to address the concerns, to keep the experience as safe as possible for as many people as possible. CA : Now, in Congress, the main concern seemed to be not so much what we ' ve talked about, but data, the data of users, the fact that you ' re owned by ByteDance, Chinese company, and the concern that at any moment Chinese government might require or ask for data. And in fact, there have been instances where, I think you ' ve confirmed, that some data of journalists on the **platform** was made available to ByteDance ' s engineers and from there, who knows what. Now, your response to this was to have this Project Texas, where you ' re moving data to be controlled by Oracle here in the US. Can you talk about that project and why, if you believe it so, why we should not worry so much about this issue? SC : I will say a couple of things about this, if you don ' t mind. The first thing I would say is that the internet is built on global interoperability, and we are not the only company that relies on the global talent pool to make our products as good as possible. Technology is a very collaborative effort. I think many people here would say the same thing. So we are not the first company to have engineers in all countries, including in China. We ' re not the first one. Now, I understand some of these concerns. You know, the data access by employees is not data accessed by government. This is very different, and there ' s a clear difference in this. But we hear the concerns that are raised in the United States. We did not try to avoid discussing. We did not try to argue our way out of it. What we did was we built an unprecedented project where we localize American data to be stored on American soil by an American company overseen by American personnel. So this kind of protection for American data is beyond what any other company in our industry has ever done. Well, money is not the only issue here, but it ' s very expensive to build something like that. And more importantly, you know, we are basically localizing data in a way that no other company has done. So we need to be very careful that whilst we are pursuing what we call digital sovereignty in the US and we are also doing a version of this in Europe, that we don ' t balkanize the internet. Now we are the first to do it. And I expect that, you know, other companies are probably looking at this and trying to figure out how you balance between protecting, protected data, you know, to make sure that everybody feels secure about it while at the same time allowing for interoperability to continue to happen, because that ' s what makes technology and the internet so great. So that ' s something that we are doing. CA : How far are you along that journey with Project Texas? SC : We are very, very far along today. CA : When will there be a clear you know, here it is, it ' s done, it ' s firewalled, this data is protected? SC : Today, by default, all new US data is already stored in the Oracle cloud infrastructure. So it ' s in this protected US environment that we talked about in the United States. We still have some legacy data to delete in our own servers in Virginia and in Singapore. Our data has never been stored in China, by the way. That deletion is a very big engineering effort. So as we said, as I said at the hearing, it ' s going to take us a while to delete them, but I expect it to be done this year. CA : How much power do you have over your own ability to control certain things? So, for example, suppose that, for whatever reason, the Chinese government was to look at an upcoming US election and say,"You know what, we would like this party to win,"let ' s say, or"We would like civil war to break out"or whatever. How..."And we could do this by amplifying the content of certain troublemaking, disturbing people, causing uncertainty, spreading misinformation,"etc. If you were required via ByteDance to do this, like, first of all, is there a pathway where theoretically that is possible? What ' s your personal line in the sand on this? SC : So during the congressional hearing, I made four commitments, we talked about the first one, which is safety. The third one is to keep TikTok a place of freedom of **expression**. By the way, if you go on TikTok today, you can search for anything you want, as long as it doesn ' t violate our community guidelines. And to keep it free from any government manipulation. And the fourth one is transparency and third-party monitoring. So the way we are trying to address this concern is an unprecedented amount of transparency. What do I mean by this? We ' re actually allowing third-party reviewers to come in and review our source code. I don ' t know any other company that does this, by the way. Because everything, as you know, is driven by code. So to allow someone else to review the source code is to give this a significant amount of transparency to ensure that the scenarios that you described that are highly hypothetical, cannot happen on our **platform**. Now, at the same time, we are releasing more research tools for **researchers** so that they can study the output. So the source code is the input. We are also allowing **researchers** to study the output, which is the content on our **platform**. I think the easiest way to sort of fend this off is transparency. You know, we give people access to monitor us, and we just make it very, very transparent. And that ' s our approach to the problem. CA : So you will say directly to this group that the scenario I talked about, of theoretical Chinese government interference in an American election, you can say that will not happen? SC : I can say that we are building all the tools to prevent any of these **actions** from happening. And I ' m very confident that with an unprecedented amount of transparency that we ' re giving on the **platform**, we can reduce this risk to as low as zero as possible. CA : To as low as zero as possible. SC : To as close to zero as possible. CA : As close to zero as possible. That ' s fairly reassuring. Fairly. I mean, how would the world know? If you discovered this or you thought you had to do it, is this a line in the sand for you? Like, are you in a situation you would not let the company that you know now and that you are running do this? SC : Absolutely. That ' s the reason why we ' re letting third parties monitor, because if they find out, you know, they will disclose this. We also have transparency reports, by the way, where we talk about a whole bunch of things, the content that we remove, you know, that violates our guidelines, government requests. You know, it ' s all published online. All you have to do is search for it. CA : So you ' re **super** compelling and likable as a CEO, I have to say. And I would like to, as we wrap this up, I ' d like to give you a chance just to paint, like, what ' s the vision? As you look at what TikTok could be, let ' s move the clock out, say, five years from now. How should we think about your contribution to our collective future? SC : I think it ' s still down to the vision that we have. So in terms of the window of discovery, I think there ' s a huge benefit to the world when people can discover new things. You know, people think that TikTok is all about dancing and singing, and there ' s nothing wrong with that, because it ' s **super** fun. There ' s still a lot of that, but we ' re seeing science content, STEM content, have you about BookTok? It ' s a viral trend that talks about books and encourages people to read. That BookTok has 120 billion views globally, 120 billion. CA : Billion, with a B. SC : People are learning how to cook, people are learning about science, people are learning how to golf – well, people are watching videos on golfing, I guess. I haven ' t gotten better by looking at the videos. I think there ' s a huge, huge opportunity here on discovery and giving the everyday person a voice. If you talk to our creators, you know, a lot of people will tell you this again and again, that before TikTok, they would never have been discovered. And we have given them the **platform** to do that. And it ' s important to maintain that. Then we talk about creation. You know, there ' s all this new technology coming in with AI-generated content that will help people create even more creative content. I think there ' s going to be a collaboration between, and I think there ' s a speaker who is going to talk about this, between people and AI where they can unleash their creativity in a different way. You know, like for example, I ' m terrible at drawing personally, but if I had some AI to help me, then maybe I can express myself even better. Then we talk about bridges to connect and connecting people and the communities together. This could be products, this could be commerce, five million businesses in the US benefit from TikTok today. I think we can get that number to a much higher number. And of course, if you look around the world, including in Canada, that number is going to be massive. So I think these are the biggest opportunities that we have, and it ' s really very exciting. CA : So courtesy of your experience in Congress, you actually became a bit of a TikTok star yourself, I think. Some of your videos have gone viral. You ' ve got your phone with you. Do you want to make a little little TikTok video right now? Let ' s do this. SC : If you don ' t mind... CA : What do you think, should we do this? SC : We ' re just going to do a selfie together, how ' s that? So why don ' t we just say"Hi."Hi! Audience : Hi! CA : Hello from TED. SC : All right, thank you, I hope it goes viral. CA : If that one goes viral, I think I ' ve given up on your algorithm, actually. Shou Chew, you ' re one of the most influential and powerful people in the world, whether you know it or not. And I really appreciate you coming and sharing your vision. I really, really hope the upside of what you ' re talking about comes about. Thank you so much for coming today. SC : Thank you, Chris. CA : It ' s really interesting.

Isn ’ t learning fun? I absolutely love it. For the past 15 years, I have been an academic writing instructor, and I ’ ve been a coach for the last five. The people that I usually work with are adults who ’ ve returned to school, and I really love working with these folks because, like them, I ’ m a lifelong learner, and I ’ ve been to school three times, so far, in the past 20 years. But I still remember the first time that I went back. I almost quit, the first semester. By midterm, I was collapsed into this shabby chair in my prof ’ s office, in the corner, in the midst of an existential crisis. Things were going horribly. The seminars that I so diligently prepared for were painful. Every time we were asked for our responses and analysis of the readings, everyone else ’ s responses sounded so smart. Mine, by comparison, seemed so basic. And then, I got my first paper back... and I ’ d bombed it. Yep. So there I was, in tears, convinced that I was the dumbest, least capable person in the class. And honestly, I got to tell you, I was ready to quit. But I had actually staked a lot on going back to school. I had actually quit my best job to date to pursue my dream of becoming an instructor. So I wanted my prof ’ s advice before I made any final decisions. She handed me some tissues, and instead of agreeing with my assessment, she told me to stick it out. And she said that apparently, I wasn ’ t doing any worse than anyone else. Now, I was pretty skeptical, because all the evidence seemed to point to the contrary. But figuring she knew something that I didn ’ t, I held on. By the end of term, she was right. My grades began to improve, and I learned that my fellow students were just as overwhelmed as I was. Needless to say, this experience has stayed with me, and it has informed how I teach and coach. I ’ ve been where my prof was and said the same things to my students and clients. I ’ ve also learned a lot since then about the relationship between confidence and learning. Nowadays, the mid-career professionals who come to me for help with their academic success come to me because they think they have a skill problem. And sure, they could use some skill-building for sure. But for many, that ’ s not the crux of the issue that ’ s getting in the way of their success. The real issue lies in how they think about themselves as learners and what they believe to be true about their abilities. Now, this might seem like a **bold** claim, so let me explain. Why aren ’ t skills the real issue? Most of us are very capable learners. The people I work with are accomplished professionals and experts in their field. They wouldn ’ t be where they are if they didn ’ t know how to learn and build skills. When I went back, I had been writing and training for several years in a professional context. My challenge was up-leveling my analytical and critical thinking skills. Once I was oriented to that gap, I set about closing it. My grades began to improve. I see the same thing with my students and clients. Bridging the skill gap is easier than we think. It ’ s the confidence gap that is much harder to bridge. But it needs addressing because that is what is getting in the way of our academic success in learning situations. So what ’ s going on with our confidence anyway? What is happening? Why is it so hard? Based on my experience, adults in learning situations face three main challenges. The first one is that we **struggle** with a lot of self doubt and uncertainty. For many of us who go back, the learning curve is really steep. It ’ s not only been years, maybe decades, since we ’ d been back in school. We ’ ve spent a hot minute or two since we ’ ve been a beginner at anything. All of a sudden, we find ourselves having to **navigate** online **platforms** and figure out study habits, and this whole academic writing thing is a whole next level. And then, we have to read critically. It ’ s a lot. And then add to this that when we return to school, we often bring with us all the old patterns and beliefs that we ’ ve been carrying for the past ten, maybe 20 years, about who we are as learners. In the past, if we thought that we were weak students, we ’ ve already got bags of doubts and insecurities and anxieties, and we **judge** ourselves harshly right out of the gate. Now if you ’ re thinking,”I was a good student, I got this,”– no, no. We **struggle** because we can set the bar unreasonably high and then **judge** ourselves just as harshly and as quickly. And it ’ s difficult. The second challenge that we face is that we spend a lot of time comparing ourselves to everyone else. Now, this is a really human thing to do, and it ’ s a very easy pit to fall into for high-achieving adults. Because, let ’ s face it, we want to know that we can at least keep up with or do better than our peers. But when we compare ourselves to other folks, it can be paralyzing, because we can fall into thinking that we are less than them. This is especially true when people start sharing grades and progress reports. We can go from feeling accomplished and on top of things to feeling behind and confused, in a matter of minutes. And the third challenge that we face is that we have a strong fear of failing. Now, for most of the folks who go back, we ’ ve got a lot on the line. We ’ re **juggling** a job and family responsibilities alongside school. Plus, we want to do well, because we ’ re usually there to up-level our career or hit a career goal in some way, to say nothing of the time and the **financial** investments involved. So being afraid of failing, well, it ’ s understandable, right? But it is an **obstacle** to getting the very thing that we want. So those are the challenges. There is good news, though. These can be overcome by making three important **mindset** shifts when we are in learning situations. The first shift is that we really need to question the stories that our brain is telling us about who we are as learners. Every day, we have a ton of thoughts, and we often don ’ t stop to examine them. But when we do, we notice that often most of them are really unhelpful. And this is especially true when we are pushing ourselves out of our comfort zone. Our brain **interprets** the challenges and discomforts that come with learning and trying new things as dangerous, and it wants to move us into what is familiar and safe. So the way that it does that is it amplifies all of our fears and cranks the volume on our inner critic, who ’ s more than happy to tell us all the ways we sucked in the past, how we ’ re not doing it now, and there ’ s no hope for the future. Our job is to notice these stories and why they ’ re happening – because we ’ re stretching – and to challenge these outdated beliefs. So when we question the truthfulness and the relevance of the stories that we ’ re carrying for who we are in our current context, and choose more accurate and helpful ones, we can change our entire experience. The second shift that we need to make is that we need to look for the lessons in the mistakes. As learners, we are going to make mistakes. We just are. Rather than making them mean something about our current or our future ability, or our self-worth, for that matter, we need to get curious and look at these setbacks as offering data that we can use to improve. And part of being curious is remembering that the mistakes are where the learning happens. And that ’ s what we need to aim for – progress, not perfection. When we release ourselves from the need to know it all, be perfect and do it all perfectly, we are much better able to evaluate our progress and actually identify the skills we need to build for the outcome that we want. And then finally, the third shift we need to make is to **practice** self-compassion, not self-criticism. Learning and pushing ourselves to our growth edge, it ’ s uncomfortable work. It ’ s not easy. And that ’ s why this shift is the most important one, because it ’ s actually the fuel for our success. When we stop criticizing ourselves and start showing ourselves the kindness and the compassion that we so easily give everyone else... we are much more likely to take risks, because we create a sense of safety inside ourselves, that it ’ s OK to make mistakes and learn from them. And when we remember that we ’ re imperfectly human, and that our fellow students are also imperfect humans, we ’ re less likely to compare ourselves to them and more likely to connect and collaborate with them instead. When we cultivate a belief inside ourselves and show ourselves compassion, we increase our ability to face challenges and learn from them. And we build the resilience and the confidence that we need to succeed in learning situations. And from that foundation, we are better able to identify the skills we have – and we do, by the way – the ones we need to hone and the ones that we need. Closing the confidence gap enables us to reach our goals, feeling accomplished and proud rather than bedraggled and depleted. My experience and my work has convinced me that when we build a positive growth **mindset** alongside our skills in learning situations, not only do we increase our success – like, intensely – we uncage our fullest potential, and our possibilities for change and growth are limitless. Thank you very much.

Text Sample 212: POS Dim 2 – 2018 – Score 12.00 – 2018/t000384.txt

When I was in the sixth grade, I got into a fight at school. It wasn ' t the first time I ' d been in a fight, but it was the first time one happened at school. It was with a boy who was about a foot taller than me, who was physically stronger than me and who ' d been taunting me for weeks. One day in PE, he stepped on my shoe and refused to apologize. So, filled with anger, I grabbed him and I threw him to the ground. I ' d had some previous judo training. Our fight lasted less than two minutes, but it was a perfect reflection of the hurricane that was building inside of me as a young survivor of sexual assault and as a girl who was grappling with abandonment and exposure to violence in other spaces in my life. I was fighting him, but I was also fighting the men and boys that had assaulted my body and the culture that told me I had to be silent about it. A teacher broke up the fight and my principal called me in her office. But she didn ' t say,"Monique, what ' s wrong with you?"She gave me a moment to collect my breath and asked,"What happened?"The educators working with me led with **empathy**. They knew me. They knew I loved to read, they knew I loved to draw, they knew I adored Prince. And they used that information to help me understand why my **actions**, and those of my classmate, were disruptive to the learning community they were leading. They didn ' t place me on suspension ; they didn ' t call the police. My fight didn ' t keep me from going to school the next day. It didn ' t keep me from graduating ; it didn ' t keep me from teaching. But unfortunately, that ' s not a story that ' s shared by many black girls in the US and around the world today. We ' re living through a crisis in which black girls are being disproportionately pushed away from schools — - not because of an imminent threat they pose to the safety of a school, but because they ' re often experiencing schools as locations for punishment and marginalization. That ' s something that I hear from black girls around the country. But it ' s not insurmountable. We can shift this narrative. Let ' s start with some data. According to a National Black Women ' s Justice Institute analysis of civil rights data collected by the US Department of Education, black girls are the only group of girls who are overrepresented along the entire continuum of discipline in schools. That doesn ' t mean that other girls aren ' t experiencing exclusionary discipline and it doesn ' t mean that other girls aren ' t overrepresented at other parts along that continuum. But black girls are the only group of girls who are overrepresented all along the way. Black girls are seven times more likely than their white counterparts to experience one or more out-of-school suspensions and they ' re nearly three times more likely than their white and Latinx counterparts to be referred to the juvenile court. A recent study by the Georgetown Center on Poverty and Inequality partially explained why this disparity is taking place when they confirmed that black girls experience a specific type of age compression, where they ' re seen as more adult-like than their white peers. Among other things, the study found that people perceive black girls to need less nurturing, less protection, to know more about sex and to be more independent than their white peers. The study also found that the perception disparity begins when girls are as young as five years old. And that this perception and the disparity increases over time and **peaks** when girls are between the ages of 10 and 14. This is not without consequence. Believing that a girl is older than she is can lead to harsher treatment, immediate censure when she makes a mistake and victim blaming when she ' s harmed. It can also lead a girl to think that something is wrong with her, rather than the conditions in which she finds herself. Black girls are routinely seen as too loud, too aggressive, too angry, too visible. Qualities that are often measured in relation to nonblack girls and which don ' t take into consideration what ' s going on in this girl ' s life or her cultural **norms**. And it ' s not just in the US. In South Africa, black girls at the Pretoria Girls High School were discouraged from attending school with their hair in its natural state, without chemical processing. What did those girls do? They protested. And it was a beautiful thing to see the global community for the most part wrap its arms around girls as they stood in their truths. But there were those who saw them as disruptive, largely because they dared to ask the question,"Where can we be black if we can ' t be black in Africa?"It ' s a good question. Around the world, black girls are grappling with this question. And around the world, black girls are **struggling** to be seen, working to be free and fighting to be included in the landscape of promise that a safe space to learn provides. In the US, little girls, just past their toddler years, are being arrested in classrooms for having a tantrum. Middle school girls are being turned away from school because of the way they wear their hair naturally or because of the way the clothes fit their bodies. High school girls are experiencing violence at the hands of police officers in schools. Where can black girls be black without reprimand or punishment? And it ' s not just these incidents. In my work as a **researcher** and educator, I ' ve had an opportunity to work with girls like Stacy, a girl who I profile in my book"Pushout,"who **struggles** with her participation in violence. She bypasses the neuroscientific and structural analyses that science has to offer about how her adverse childhood experiences inform why she ' s participating in violence and goes straight to describing herself as a"problem child,"largely because that ' s the language that educators were using as they routinely suspended her. But here ' s the thing. Disconnection and the internalization of harm grow stronger in **isolation**. So when girls get in trouble, we shouldn ' t be pushing them away, we should be bringing them in closer. Education is a critical protective factor against contact with the criminal legal system. So we should be building out policies and **practices** that keep girls connected to their learning, rather than pushing them away from it. It ' s one of the reasons I like to say that education is freedom work. When girls feel safe, they can learn. When they don ' t feel safe, they fight, they protest, they argue, they flee, they freeze. The human brain is wired to protect us when we feel a threat. And so long as school feels like a threat, or part of the tapestry of harm in a girl ' s life, she ' ll be inclined to resist. But when schools become locations for healing, they can also become locations for learning. So what does this mean for a school to become a location for healing? Well, for one thing, it means that we have to immediately discontinue the policies and **practices** that target black girls for their hairstyles or dress. Let ' s focus on how and what a girl learns rather than policing her body in ways that facilitate rape culture or punish children for the conditions in which they were born. This is where parents and the community of concerned adults can enter this work. Start a conversation with the school and encourage them to address their dress code and other conduct-related policies as a collaborative project, with parents and students, so as to intentionally avoid **bias** and discrimination. Keep in mind, though, that some of the **practices** that harm black girls most are unwritten. So we have to continue to do the deep, internal work to address the **biases** that inform how, when and whether we see black girls for who they actually are, or what we ' ve been told they are. Volunteer at a school and establish culturally competent and gender responsive discussion groups with black girls, Latinas, indigenous girls and other students who experience marginalization in schools to give them a safe space to process their identities and experiences in schools. And if schools are to become locations for healing, we have to remove police officers and increase the number of counselors in schools. Education is freedom work. And whatever our point of entry is, we all have to be freedom fighters. The good news is that there are schools that are actively working to establish themselves as locations for girls to see themselves as sacred and loved. The Columbus City Prep School for Girls in Columbus, Ohio, is an example of this. They became an example the moment their principal declared that they were no longer going to punish girls for having"a bad attitude."In addition to building — Essentially, what they did is they built out a robust continuum of alternatives to suspension, expulsion and arrest. In addition to establishing a restorative justice program, they improved their student and teacher relationships by ensuring that every girl has at least one adult on campus that she can go to when she ' s in a moment of crisis. They built out spaces along the corridors of the school and in classrooms for girls to regroup, if they need a minute to do so. And they established an advisory program that provides girls with an opportunity to start every single day with the promotion of self-worth, communication skills and goal **setting**. At this school, they ' re trying to respond to a girl ' s adverse childhood experiences rather than ignore them. They bring them in closer ; they don ' t push them away. And as a result, their truancy and suspension rates have improved, and girls are arriving at school increasingly ready to learn because they know the teachers there care about them. That matters. Schools that integrate the arts and sports into their curriculum or that are building out tranformative programming, such as restorative justice, mindfulness and meditation, are providing an opportunity for girls to repair their relationships with others, but also with themselves. Responding to the lived, complex and historical trauma that our students face requires all of us who believe in the promise of children and adolescents to build relationships, learning materials, human and **financial** resources and other tools that provide children with an opportunity to heal, so that they can learn. Our schools should be places where we respond to our most vulnerable girls as essential to the creation of a positive school culture. Our ability to see her promise should be at its sharpest when she ' s in the throws of poverty and addiction ; when she ' s reeling from having been sex-trafficked or survived other forms of violence ; when she ' s at her loudest, or her quietest. We should be able to support her intellectual and social-emotional well-being whether her shorts reach her knees or stop mid-thigh or higher. It might seem like a tall order in a world so deeply entrenched in the politics of fear to radically imagine schools as locations where girls can heal and thrive, but we have to be **bold** enough to set this as our intention. If we commit to this notion of education as freedom work, we can shift educational conditions so that no girl, even the most vulnerable among us, will get pushed out of school. And that ' s a win for all of us. Thank you.

Who can we trust to tell us the truth? Once in another tumultuous era, as the Vietnam War, Watergate, the Civil Rights and Women ' s Liberation Movements were challenging America to its core, my dad and I would watch Walter Cronkite, a man he trusted to tell us what was happening. Dad, a politically conservative career military man, cared a lot about this country and was determined to make sure he was well informed. He listened to the radio every morning, read the paper every afternoon, and watched the news on TV every evening before sitting down to dinner, or at some point, he would almost always launch a debate about what was happening in the world. He ' d pound the table and say something like"Don ' t those Vietnam war protesters know it ' s my country, right or wrong?"And I ' d react with something like"But, Dad, don ' t they have a point? I mean, what are we doing in Vietnam?"And he ' d puff up and get red in the face and respond with something like"I can ' t believe I ' m hearing those words out of the mouth of my own daughter."Our arguments could get so loud, my brothers and sisters would sometimes pick up their plates to eat somewhere else. Dad really liked to win these arguments. But even when he didn ' t, he ' d respect my opinion. Sometimes, he would even say,"Ann, I don ' t always agree with you, but I ' d still vote for you for President."There were times, however, usually when Walter was off and someone else was substituting, when Dad would hear something on the evening news that would alarm him far more than the stories of the day. All it would take was one phrase, a changed tone of voice, a raised eyebrow, or even just a single word that struck Dad as opinionated, and he was offended. Suddenly, he was shaking his finger at the television set, shouting,"Stop telling me what to think! Just give me the facts!"And then he would look over at me and say,"See, Ann? He ' s disrespecting us, trying to tell us what to think as if we were stupid and can ' t make up our own minds."Boy, if my dad could see what counts for some of TV journalism today. He would want to be right up here with me, standing right next to me, suggesting an idea that might be worth spreading. Journalism is only trustworthy when it dependably offers accurate, verifiable facts, not **bias** and speculation, and not for ratings, circulation or clicks or for any **financial** or political motivation, but with one motive and one motive only : to reveal the truth for the greater public good. The bridge to trust is truth, and it ' s time to make things right. What do we define as truth? Well, lately I ' ve wondered if we ' ve all gotten a little confused about what truth is and what it isn ' t. People ask,"Whose truth?"uncertain if objective, absolute truth even exists, thinking, as some philosophers have argued, that as it requires human judgment, truth is ultimately subjective. As others see it, **reporters** can ' t be fair and unbiased, because being humans, of course they have opinions and so should at least tell us what those opinions are. Other people, who ' ve noticed objective facts now seem less influential than emotion and personal beliefs in shaping public opinion, have gone so far as to say we live in a post-truth era. To all this, my dad would say,"Balderdash!"He was a Navy man who didn ' t like to swear - go figure. I, however, don ' t seem to have that problem. So maybe I should just call it what it is : FUBAR - Fucked Up Beyond All Recognition. I appreciate philosophers, but not being one, I can ' t settle the"Is truth subjective or objective?"debate. Though it does seem to be an objective, verifiable fact that I ' m standing on this stage and that I ' m a little nervous, worried that I may have overdressed, and I ' m wishing that I wore more comfortable shoes. There is actually compelling evidence that humans can be fair and impartial, not just from the ancient biblical story of Solomon, but from the known science, which tell us that fairness along with **empathy** are fundamental human traits, deeply rooted in our genetics. If it wasn ’ t for these traits, we might not even be able to live amongst each other. And as a **reporter**, I know you can get in so deep, listening to and documenting all sides of the story, searching for the truth, that you don ’ t even know what your own opinion is. I know because I ’ ve done it. And because we as a species cannot live long, cannot long endure without objective facts, unelaborated and unvarnished, it can be argued they still and will always matter. We need truth. Perhaps especially from journalism, which, when **practiced** well, can help us see each other and ourselves more honestly, tell us what we need to know to be smarter citizens, show us how to live healthier and more connected lives, and even warn us when we need to keep ourselves and our loved ones safe from danger. Post-truth? Really? We do seem to be experiencing a loss of credibility, a demise in the face of a rising tide of lies, in our ability to trust what we ’ re told are objective facts are either objective or facts. Where does the information that ’ s sowing this distrust and confusion come from? And what is it doing to us and the quality of our relationships with each other? Instead of a Walter Cronkite today, i. e., someone who a significant number of people trust, we are exposed to an overwhelming number of sources of information on multiple **platforms**, working around the clock to get our attention, some motivated to purposely manipulate us with lies and propaganda, some inept, shelling out incomplete, misleading or poorly-sourced information and some doing exemplary reporting but still doubted almost as much for any mistakes or perceived **bias**. The net impact of all of this is a chaotic overload of competing, conflicting and confusing information. And while our brains are truly excellent at collecting data, we ’ re not always so great at remembering where we got it. So what we learn from a trusted source can easily get jumbled up in our brains with what we read on a website, saw in a **tweet** or a video posted on Facebook or heard from a pundit speculating on cable television. If you ever saw the David Bowie movie”The Man Who Fell to Earth”- I sometimes feel we ’ re all in that scene in which he ’ s watching a huge wall of TV monitors, each one tuned to a different channel, and suddenly, he can ’ t take it anymore, and he starts yelling,”Get out of my mind, all of you!”Bet you didn ’ t expect a David Bowie reference today. Perhaps never before have so many consumed so much news and yet have been so woefully misinformed. When, in this swirling chaos, can we be certain the information we need or want to know is accurate? The internet is an abyss as well as a wonderland. It mirrors the darkest dark in us and the brightest light of humanity and all there is in between. And because of it, no matter what comes next in journalism, there now seems no doubt that you and me and every one of us must become a better editor. So here, from one journalist ’ s playbook, are some tried and true strategies that might up your game. Focus on defense and develop a skill for listening to both sides of a story even if it pains you. Realize - Realize virtually every source wants a story told as he or she sees it. That means even seemingly good, honest people can tell you just the facts that support their point of view, sometimes leaving out key details. They might even distort the facts, purposely misdirect you or even out-and-out lie. Ask yourself,”What ’ s the motivating force for this source to tell the story?”And could that motivation be influencing the story that you ’ re getting? Then ask,”Is this source in a position, having been an eyewitness or having some expertise, to even know what is true?”Or is he or she wasting your time with speculation? And because even eyewitnesses and experts can get it wrong, you have to seek out sources from other points of view and then critically examine their motivations and credibility as well. Rarely is the truth one-sided ; it tends to be nuanced. And it ’ s not always fair. But you may never find it unless you search fairly, with a mind that is truly open. And then, even if you think you have a balanced view of the story, you have to re-examine the facts and motivations and reputations of your sources one more time to make sure you weren ’ t played or manipulated. And if your sources are anonymous, you better check and double check again. It is exhausting, but after this Sherlock Holmes- ing, you usually get the facts that people need to know to make up their own minds. This is Journalism 101, how we ’ re trained in journalism schools to work in defense of truth. Why are even long-trusted news organizations that know how to gather the facts vulnerable to attacks on their credibility? Journalism tends to be vulnerable because of the enormous power of credible information. When we believe the same story, we can find a common purpose and work together. This is what has made humans an unstoppable force throughout our history. The historian Yuval Harari suggests this is why we are the only human species to survive when once there were at least six and why we ’ ve risen from the middle of the animal kingdom, once huddled around fires in fear of being eaten, to now the top, having the power to decide what species live or die, and how we ourselves will evolve from here. This power to move people is why everyone wants to control the narrative, why truth is fought over and is the victim, usually the first victim, especially in war. It ’ s why journalists, as messengers of truth, are physically attacked in some parts of the world and even killed. At the same time, unfortunately, journalism is not like mathematics, in which two plus two is always four. Journalism is by humans, about humans and for humans and so is inherently as fallible as humans and as vulnerable to criticism. Add to that, the job is to ask prying questions, to push past the **norms** of good manners for honest answers, and then to race to report stories that can be controversial, embarrassing or infuriating. If you want to be popular, don ’ t be a journalist. Of course, it doesn ’ t help journalism ’ s credibility when it ’ s under constant attack by political leaders in the United States and around the world. It doesn ’ t help that emerging technologies have eliminated or diminished hundreds of local newspapers around the country and have failed, so far, to replace them with anything close to the same quality and range of credible reporting. But perhaps what is making journalism most vulnerable is that in this industry shift, some media executives, **struggling** to keep making money for their corporate owners, are pressuring journalists to make choices that weaken their credibility. The pressure for profits is one reason we have witnessed the stunning growth of openly **biased** news coverage, especially on cable television, where not everyone who is telling us the news is actually a journalist. Some are advocates with political agendas, some are activists, some are former political operatives, and some are what were once called”opinionaters,”people whose profession is to give their opinions and theories. So now I ’ m the one yelling at the television set :”Just give me the facts! Stop trying to tell us what to think!”Opinion, thoughtful and supported with facts, has an important place in journalism, but it is not news. Thus, allowing viewers to think it ’ s news, to fail to differentiate it, is fundamentally dishonest. News is not left or right ; it ’ s based on facts that are either right or wrong. And for the record, ranting from any point of view is not journalism. Besides, it has serious side effects : it makes you look a little nuts. In the quest for profits, corporate owners are punching holes through the long-standing wall protecting journalists from corporate meddling. In some companies, the wall is crumbling. I have heard a request from corporate executives to kill a news story. I have seen a media company ’ s advertising side try to get products placed in a news broadcast. In some companies, the wall appears to be collapsing. Recently, the nation ’ s largest broadcaster, Sinclair Broadcasting Group, which owns and operates more than 190 stations, engaged in corporate manipulation when it required dozens of anchors to read a script the company had provided. The push for profits is also pressuring journalists to muddy their judgment with worries about reaching clicks, ratings and circulation goals. This can affect the decisions they make about what stories to cover, what interviews to do and how headlines and teasers should be written. The public is not stupid. It can sense these motives in the work and the hype. It knows the truth is in trouble. How do we make things right and defend our access to accurate, verifiable reporting, which according to our nation ' s Founding Fathers, our democracy needs to survive? We need a renaissance in journalism. And it is actually possible that it is already beginning. We can see some of our nation ' s newspapers and magazines, in spite of everything, leading a rebirth, doubling down on serious, competitive and groundbreaking shoe-leather journalism, working to tell all the nuances of the stories they ' re covering, including both domestic and foreign. Our citizens are awakening to the reasons journalism is vital in a democracy. They ' re reminded by the movies"Spotlight"and"The Post,"and they ' re increasingly demanding and supporting quality work, and in some cases, they are even donating to the Committee to Protect Journalists. And journalists can be seen increasingly standing up to corporate pressures, including at the Denver Post and at Sinclair TV stations. They ' re also pushing across **platforms** to do smarter and more impactful reporting and balanced stories. And in some newsrooms, editors are reviving investigative reporting. Credibility lost is never fully regained. But what survives can be protected, and new bridges can be built by the journalists still to come. For that to happen, for news organizations to better endure attacks on their credibility, journalists must be able to work with one motive : the public good. Corporate owners and executives must know how to stay in their lane and out of influencing what and how stories are covered. Investors and advertisers will need to stop pressuring journalists to be their pot of gold and do what ' s right for this country : fund excellence and get out of the way. Editors and executive producers will have to fight harder against the blurring between opinion and news until all the stories we need to know, not just the ones or the one that might increase ratings and clicks. Technologists should realize they are not journalists ; they are **platform** creators and owners and should hire solid **reporters** and then leave them alone and make those **reporters** great forces for good. And news consumers, if you want the facts, subscribe. Read newspapers and perhaps ask, Why would journalism that ' s any good be free? Why do any one of us routinely put up with baseless opinion, speculation and propaganda? And why do we waste so much time on the Kardashians? Too much sugar just makes you fat. Journalists, keep going and stay humble. We may know a little about a lot, but few of us know enough about anything to have an opinion that matters. So we dig for the facts that do matter, from all sides, and then fight like hell to tell them. And potential future journalists, your country needs you. Journalism is war, a fight every day for truth. And it takes more than being curious and knowing how to write or blog or shoot a video or ask questions. It takes courage, and most of all, it takes integrity. Because journalism is only as good as the people who **practice** it and their willingness to stand up and fight for the stories that mean something. You will make mistakes ; we all do. But with **practice** and instincts you may not know you have, you will learn to make less of them. You will face a lack of resources, you will be denied access, people will refuse to give you interviews, editors and executive producers will give you impossible **deadlines** and not enough time or space to tell your stories. This is emotionally hard and sometimes around-the- clock work. It might cause people to hate you. It might put you in danger or expose you to trauma that might give you PTSD. This I know from experience. But after nearly 40 years at this, I still stand here before you and can honestly say with all my heart : journalism is a noble calling, a way to serve people and respond like an EMT or an emergency room doctor in a crisis with information they may need. If you work for the people and not for those who pay your checks, you will make the right choices about who to interview, what to ask and how to tell your stories, and this will bring your news organizations value that will make even your bosses happy. Be incorruptible. Do it with a pure motive, earnestly, without **bias** and expectations. Do it even though you may never know the impact of your stories. Do it even if you know you will be criticized. But get it right, which you will find is far more important than getting it first. Attribute, attribute whenever possible. Check, check, and then double check the facts. Ruthlessly edit out any word or phrase or tone in your work that could get in the way of people making up their own minds. This is how we build trust, by working to be **worthy** of it. It is time to lift truth off its knees, prize it, cherish it, defend it and watch it rise along with all of us. Thank you.

Text Sample 214: POS Dim 2 – 2018 – Score 10.00 – 2018/t000389.txt
”To do two things at once is to do neither.”It ’ s a great smackdown of multitasking, isn ’ t it, often attributed to the Roman writer Publilius Syrus, although you know how these things are, he probably never said it. What I ’ m interested in, though, is â is it true? I mean, it ’ s obviously true for emailing at the dinner table or texting while driving or possibly for live **tweeting** at TED Talk, as well. But I ’ d like to argue that for an important kind of activity, doing two things at once â or three or even four â is exactly what we should be aiming for. Look no further than Albert Einstein. In 1905, he published four remarkable scientific papers. One of them was on Brownian motion, it provided empirical evidence that atoms exist, and it laid out the basic mathematics behind most of **financial** economics. Another one was on the theory of **special** relativity. Another one was on the photoelectric effect, that ’ s why solar panels work, it ’ s a nice one. Gave him the Nobel prize for that one. And the fourth introduced an equation you might have heard of : E equals mc squared. So, tell me again how you shouldn ’ t do several things at once. Now, obviously, working simultaneously on Brownian motion, **special** relativity and the photoelectric effect â it ’ s not exactly the same kind of multitasking as Snapchatting while you ’ re watching”Westworld.”Very different. And Einstein, yeah, well, Einstein ’ s â he ’ s Einstein, he ’ s one of a kind, he ’ s unique. But the pattern of behavior that Einstein was demonstrating, that ’ s not unique at all. It ’ s very common among highly creative people, both artists and scientists, and I ’ d like to give it a name : slow-motion multitasking. Slow-motion multitasking feels like a counterintuitive idea. What I ’ m describing here is having multiple projects on the go at the same time, and you move backwards and forwards between topics as the mood takes you, or as the situation demands. But the reason it seems counterintuitive is because we ’ re used to lapsing into multitasking out of desperation. We ’ re in a hurry, we want to do everything at once. If we were willing to slow multitasking down, we might find that it works quite brilliantly. Sixty years ago, a young psychologist by the name of Bernice Eiduson began a long research project into the personalities and the working habits of 40 leading scientists. Einstein was already dead, but four of her subjects won Nobel prizes, including Linus Pauling and Richard Feynman. The research went on for decades, in fact, it continued even after professor Eiduson herself had died. And one of the questions that it answered was,”How is it that some scientists are able to go on producing important work right through their lives?”What is it about these people? Is it their personality, is it their skill set, their **daily**

routines, what? Well, a pattern that emerged was clear, and I think to some people surprising. The top scientists kept changing the subject. They would shift topics repeatedly during their first 100 published research papers. Do you want to guess how often? Three times? Five times? No. On average, the most enduringly creative scientists switched topics 43 times in their first 100 research papers. Seems that the secret to creativity is multitasking in slow motion. Eiduson ' s research suggests we need to reclaim multitasking and remind ourselves how powerful it can be. And she ' s not the only person to have found this. Different **researchers**, using different methods to study different highly creative people have found that very often they have multiple projects in progress at the same time, and they ' re also far more likely than most of us to have serious hobbies. Slow-motion multitasking among creative people is ubiquitous. So, why? I think there are three reasons. And the first is the simplest. Creativity often comes when you take an idea from its original context and you move it somewhere else. It ' s easier to think outside the box if you spend your time clambering from one box into another. For an example of this, consider the original eureka moment. Archimedes â he ' s wrestling with a difficult problem. And he realizes, in a flash, he can solve it, using the displacement of water. And if you believe the story, this idea comes to him as he ' s taking a bath, lowering himself in, and he ' s watching the water level rise and fall. And if solving a problem while having a bath isn ' t multitasking, I don ' t know what is. The second reason that multitasking can work is that learning to do one thing well can often help you do something else. Any athlete can tell you about the benefits of cross-training. It ' s possible to cross-train your mind, too. A few years ago, **researchers** took 18 randomly chosen medical students and they **enrolled** them in a course at the Philadelphia Museum of Art, where they learned to criticize and analyze works of visual art. And at the end of the course, these students were compared with a control group of their fellow medical students. And the ones who had taken the art course had become substantially better at performing tasks such as diagnosing diseases of the eye by analyzing photographs. They ' d become better eye doctors. So if we want to become better at what we do, maybe we should spend some time doing something else, even if the two fields appear to be as completely distinct as ophthalmology and the history of art. And if you ' d like an example of this, should we go for a less intimidating example than Einstein? OK. Michael Crichton, creator of"Jurassic Park"and"E. R."So in the 1970s, he originally trained as a doctor, but then he wrote novels and he directed the original"Westworld"movie. But also, and this is less well-known, he also wrote nonfiction books, about art, about medicine, about computer programming. So in 1995, he enjoyed the fruits of all this variety by penning the world ' s most commercially successful book. And the world ' s most commercially successful TV series. And the world ' s most commercially successful movie. In 1996, he did it all over again. There ' s a third reason why slow-motion multitasking can help us solve problems. It can provide assistance when we ' re stuck. This can ' t happen in an **instant**. So, imagine that feeling of working on a crossword puzzle and you can ' t figure out the answer, and the reason you can ' t is because the wrong answer is stuck in your head. It ' s very easy â just go and do something else. You know, switch topics, switch context, you ' ll forget the wrong answer and that gives the right answer space to pop into the front of your mind. But on the slower timescale that interests me, being stuck is a much more serious thing. You get turned down for funding. Your cell cultures won ' t grow, your rockets keep crashing. Nobody wants to publish you fantasy novel about a school for wizards. Or maybe you just can ' t find the solution to the problem that you ' re working on. And being stuck like that means stasis, **stress**, possibly even depression. But if you have another exciting, challenging project to work on, being stuck on one is just an opportunity to do something else. We could all get stuck sometimes, even Albert Einstein. Ten years after the original, miraculous year that I described, Einstein was putting together the pieces of his theory of general relativity, his greatest achievement. And he was exhausted. And so he turned to an easier problem. He proposed the stimulated emission of radiation. Which, as you may know, is the S in laser. So he ’ s laying down the theoretical foundation for the laser beam, and then, while he ’ s doing that, he moves back to general relativity, and he ’ s refreshed. He sees what the theory implies â that the universe isn ’ t static. It ’ s expanding. It ’ s an idea so staggering, Einstein can ’ t bring himself to believe it for years. Look, if you get stuck and you get the ball rolling on laser beams, you ’ re in pretty good shape. So, that ’ s the case for slow-motion multitasking. And I ’ m not promising that it ’ s going to turn you into Einstein. I ’ m not even promising it ’ s going to turn you into Michael Crichton. But it is a powerful way to organize our creative lives. But there ’ s a problem. How do we stop all of these projects becoming completely overwhelming? How do we keep all these ideas straight in our minds? Well, here ’ s a simple solution, a practical solution from the great American choreographer, Twyla Tharp. Over the last few decades, she ’ s blurred boundaries, mixed genres, won prizes, danced to the music of everybody, from Philip Glass to Billy Joel. She ’ s written three books. I mean, she ’ s a slow- motion multitasker, of course she is. She says,”You have to be all things. Why exclude? You have to be everything.”And Tharp ’ s method for preventing all of these different projects from becoming overwhelming is a simple one. She gives each project a big cardboard box, writes the name of the project on the side of the box. And into it, she tosses DVDs and books, magazine cuttings, theater programs, physical objects, really anything that ’ s provided a source of creative inspiration. And she writes,”The box means I never have to worry about forgetting. One of the biggest fears for a creative person is that some brilliant idea will get lost because you didn ’ t write it down and put it in a safe place. I don ’ t worry about that. Because I know where to find it. It ’ s all in the box.”You can manage many ideas like this, either in physical boxes or in their digital equivalents. So, I would like to urge you to embrace the art of slow-motion multitasking. Not because you ’ re in a hurry, but because you ’ re in no hurry at all. And I want to give you one final example, my favorite example. Charles Darwin. A man whose slow-burning multitasking is so staggering, I need a diagram to explain it all to you. We know what Darwin was doing at different times, because the creativity **researchers** Howard Gruber and Sara Davis have analyzed his diaries and his notebooks. So, when he left school, age of 18, he was initially interested in two fields, zoology and geology. Pretty soon, he signed up to be the onboard naturalist on the”Beagle.”This is the ship that eventually took five years to sail all the way around the southern oceans of the Earth, stopping at the GalĂĄpagos, passing through the Indian ocean. While he was on the”Beagle,”he began researching coral reefs. This is a great synergy between his two interests in zoology and geology, and it starts to get him thinking about slow processes. But when he gets back from the voyage, his interests start to expand even further : psychology, botany ; for the rest of his life, he ’ s moving backwards and forwards between these different fields. He never quite abandons any of them. In 1837, he begins work on two very interesting projects. One of them : earthworms. The other, a little notebook which he titles”The transmutation of species.”Then, Darwin starts studying my field, economics. He reads a book by the economist Thomas Malthus. And he has his eureka moment. In a flash, he realizes how species could emerge and evolve slowly, through this process of the survival of the fittest. It all comes to him, he writes it all down, every single important element of the theory of evolution, in that notebook. But then, a new project. His son William is born. Well, there ’ s a natural experiment right there, you get to **observe** the development of a human infant. So immediately, Darwin starts making notes. Now, of course, he ’ s still working on the theory of evolution and the development of the human infant. But during all of this, he realizes he doesn ’ t really know enough about taxonomy. So he starts studying that. And in the end, he spends eight years becoming the world ’ s leading expert on barnacles. Then,”Natural Selection.”A book that he ’ s to continue working on for his entire life, he never finishes it.”Origin of Species”is finally published 20 years after Darwin set out all the basic elements. Then, the”Descent of Man,”controversial book. And then, the book about the development of the human infant. The one that was inspired when he could see his son, William, crawling on the sitting room floor in front of him. When the book was published, William was 37 years old. And all this time, Darwin ’ s working on earthworms. He fills his billiard room with earthworms in pots, with glass covers. He shines lights on them, to see if they ’ ll respond. He holds a hot poker next to them, to see if they move away. He chews tobacco and â He blows on the earthworms to see if they have a sense of smell. He even plays the bassoon at the earthworms. I like to think of this great man when he ’ s tired, he ’ s **stressed**, he ’ s anxious about the reception of his book”The Descent of Man.”You or I might log into Facebook or turn on the television. Darwin would go into the billiard room to relax by studying the earthworms intensely. And that ’ s why it ’ s appropriate that one of his last great works is the”Formation of Vegetable Mould Through The Action of Worms.”He worked upon that book for 44 years. We don ’ t live in the 19th century anymore. I don ’ t think any of us could sit on our creative or scientific projects for 44 years. But we do have something to learn from the great slow-motion multitaskers. From Einstein and Darwin to Michael Crichton and Twyla Tharp. The modern world seems to present us with a choice. If we ’ re not going to fast-twitch from browser window to browser window, we have to live like a hermit, focus on one thing to the exclusion of everything else. I think that ’ s a false dilemma. We can make multitasking work for us, unleashing our natural creativity. We just need to slow it down. So... Make a list of your projects. Put down your phone. Pick up a couple of cardboard boxes. And get to work. Thank you very much.

Text Sample 215: POS Dim 2 – 2002 – Score 11.00 – 2002/t000410.txt

That splendid music, the coming-in music,”The Elephant March”from”Aida,”is the music I ’ ve chosen for my funeral. And you can see why. It ’ s triumphal. I won ’ t feel anything, but if I could, I would feel triumphal at having lived at all, and at having lived on this splendid planet, and having been given the opportunity to understand something about why I was here in the first place, before not being here. Can you understand my quaint English accent? Like everybody else, I was entranced yesterday by the animal session. Robert Full and Frans Lanting and others ; the beauty of the things that they showed. The only slight jarring note was when Jeffrey Katzenberg said of the mustang,”the most splendid creatures that God put on this earth.”Now of course, we know that he didn ’ t really mean that, but in this country at the moment, you can ’ t be too careful. I ’ m a biologist, and the central theorem of our subject : the theory of design, Darwin ’ s theory of evolution by natural selection. In professional circles everywhere, it ’ s of course universally accepted. In non-professional circles outside America, it ’ s largely ignored. But in non-professional circles within America, it arouses so much hostility — it ' s fair to say that American biologists are in a state of war. The war is so worrying at present, with court cases coming up in one state after another, that I felt I had to say something about it. If you want to know what I have to say about Darwinism itself, I ' m afraid you ' re going to have to look at my books, which you won ' t find in the bookstore outside. Contemporary court cases often concern an allegedly new version of creationism, called"Intelligent Design,"or ID. Don ' t be **fooled**. There ' s nothing new about ID. It ' s just creationism under another name, rechristened — I choose the word advisedly — for tactical, political reasons. The arguments of so-called ID theorists are the same old arguments that had been refuted again and again, since Darwin down to the present day. There is an effective evolution lobby coordinating the fight on behalf of science, and I try to do all I can to help them, but they get quite upset when people like me dare to mention that we happen to be atheists as well as evolutionists. They see us as rocking the boat, and you can understand why. Creationists, lacking any coherent scientific argument for their case, fall back on the popular phobia against atheism : Teach your children evolution in biology class, and they ' ll soon move on to drugs, grand larceny and sexual"pre-version."In fact, of course, educated theologians from the Pope down are firm in their support of evolution. This book,"Finding Darwin ' s God,"by Kenneth Miller, is one of the most effective attacks on Intelligent Design that I know and it ' s all the more effective because it ' s written by a devout Christian. People like Kenneth Miller could be called a"godsend"to the evolution lobby, because they expose the lie that evolutionism is, as a matter of fact, tantamount to atheism. People like me, on the other hand, rock the boat. But here, I want to say something nice about creationists. It ' s not a thing I often do, so listen carefully. I think they ' re right about one thing. I think they ' re right that evolution is fundamentally hostile to religion. I ' ve already said that many individual evolutionists, like the Pope, are also religious, but I think they ' re deluding themselves. I believe a true understanding of Darwinism is deeply corrosive to religious faith. Now, it may sound as though I ' m about to preach atheism, and I want to reassure you that that ' s not what I ' m going to do. In an audience as sophisticated as this one, that would be preaching to the choir. No, what I want to urge upon you — Instead, what I want to urge upon you is militant atheism. But that ' s putting it too negatively. If I was a person who were interested in preserving religious faith, I would be very afraid of the positive power of evolutionary science, and indeed science generally, but evolution in particular, to inspire and enthrall, precisely because it is atheistic. Now, the difficult problem for any theory of biological design is to explain the massive statistical improbability of living things. Statistical improbability in the direction of good design —"complexity"is another word for this. The standard creationist argument — there is only one ; they ' re all reduced to this one — takes off from a statistical improbability. Living creatures are too complex to have come about by chance ; therefore, they must have had a designer. This argument of course, shoots itself in the foot. Any designer capable of designing something really complex has to be even more complex himself, and that ' s before we even start on the other things he ' s expected to do, like forgive sins, bless marriages, listen to prayers — favor our side in a war — disapprove of our sex lives, and so on. Complexity is the problem that any theory of biology has to solve, and you can ' t solve it by postulating an agent that is even more complex, thereby simply compounding the problem. Darwinian natural selection is so stunningly elegant because it solves the problem of explaining complexity in terms of nothing but simplicity. Essentially, it does it by providing a smooth ramp of gradual, step-by-step increment. But here, I only want to make the point that the elegance of Darwinism is corrosive to religion, precisely because it is so elegant, so parsimonious, so powerful, so economically powerful. It has the sinewy economy of a beautiful suspension bridge. The God theory is not just a bad theory. It turns out to be — in principle — incapable of doing the job required of it. So, returning to tactics and the evolution lobby, I want to argue that rocking the boat may be just the right thing to do. My approach to attacking creationism is — unlike the evolution lobby — my approach to attacking creationism is to attack religion as a whole. And at this point I need to acknowledge the remarkable taboo against speaking ill of religion, and I ' m going to do so in the words of the late Douglas Adams, a dear friend who, if he never came to TED, certainly should have been invited. Richard Dawkins : He was. Good. I thought he must have been. He begins this speech, which was tape recorded in Cambridge shortly before he died — he begins by explaining how science works through the testing of hypotheses that are framed to be vulnerable to disproof, and then he goes on. I quote,"Religion doesn ' t seem to work like that. It has certain ideas at the heart of it, which we call ' sacred ' or ' holy. ' What it means is : here is an idea or a notion that you ' re not allowed to say anything bad about. You ' re just not. Why not? Because you ' re not.""Why should it be that it ' s perfectly legitimate to support the Republicans or Democrats, this model of economics versus that, Macintosh instead of Windows, but to have an opinion about how the universe began, about who created the universe — no, that ' s holy. So, we ' re used to not challenging religious ideas, and it ' s very interesting how much of a furor Richard creates when he does it."— He meant me, not that one."Everybody gets absolutely frantic about it, because you ' re not allowed to say these things. Yet when you look at it rationally, there ' s no reason why those ideas shouldn ' t be as open to debate as any other, except that we ' ve agreed somehow between us that they shouldn ' t be."And that ' s the end of the quote from Douglas. In my view, not only is science corrosive to religion ; religion is corrosive to science. It teaches people to be satisfied with **trivial**, supernatural non- explanations, and blinds them to the wonderful, real explanations that we have within our grasp. It teaches them to accept authority, revelation and faith, instead of always insisting on evidence. There ' s Douglas Adams, magnificent picture from his book,"Last Chance to See."Now, there ' s a typical scientific journal, The Quarterly Review of Biology. And I ' m going to put together, as guest editor, a **special** issue on the question,"Did an asteroid kill the dinosaurs?"And the first paper is a standard scientific paper, presenting evidence,"Iridium layer at the K-T boundary, and potassium argon dated crater in Yucatan, indicate that an asteroid killed the dinosaurs."Perfectly ordinary scientific paper. Now, the next one."The President of the Royal Society has been vouchsafed a strong inner conviction that an asteroid killed the dinosaurs.""It has been privately revealed to Professor Huxtane that an asteroid killed the dinosaurs.""Professor Hordley was brought up to have total and unquestioning faith"— —"that an asteroid killed the dinosaurs.""Professor Hawkins has promulgated an official dogma binding on all loyal Hawkinsians that an asteroid killed the dinosaurs."That ' s inconceivable, of course. But suppose — [Supporters of the Asteroid Theory cannot be patriotic citizens] In 1987, a **reporter** asked George Bush, Sr. whether he recognized the equal citizenship and patriotism of Americans who are atheists. Mr. Bush ' s reply has become infamous."No, I don ' t know that atheists should be considered citizens, nor should they be considered patriots. This is one nation under God."Bush ' s bigotry was not an **isolated** mistake, blurted out in the heat of the moment and later retracted. He stood by it in the face of repeated calls for clarification or withdrawal. He really meant it. More to the point, he knew it posed no threat to his election — quite the contrary. Democrats as well as Republicans parade their religiousness if they want to get elected. Both parties invoke”one nation under God.”What would Thomas Jefferson have said? [In every country and in every age, the priest has been hostile to liberty] Incidentally, I ’ m not usually very proud of being British, but you can ’ t help making the comparison. In **practice**, what is an atheist? An atheist is just somebody who feels about Yahweh the way any decent Christian feels about Thor or Baal or the golden calf. As has been said before, we are all atheists about most of the gods that humanity has ever believed in. Some of us just go one god further. And however we define atheism, it ’ s surely the kind of academic belief that a person is entitled to hold without being vilified as an unpatriotic, unelectable non-citizen. Nevertheless, it ’ s an undeniable fact that to own up to being an atheist is tantamount to introducing yourself as Mr. Hitler or Miss Beelzebub. And that all stems from the perception of atheists as some kind of weird, way-out minority. Natalie Angier wrote a rather sad piece in the New Yorker, saying how lonely she felt as an atheist. She clearly feels in a beleaguered minority. But actually, how do American atheists stack up numerically? The latest survey makes surprisingly encouraging reading. Christianity, of course, takes a massive lion ’ s share of the population, with nearly 160 million. But what would you think was the second largest group, convincingly outnumbering Jews with 2. 8 million, Muslims at 1. 1 million, Hindus, Buddhists and all other religions put together? The second largest group, with nearly 30 million, is the one described as non-religious or secular. You can ’ t help wondering why vote-seeking politicians are so proverbially overawed by the power of, for example, the Jewish lobby — the state of Israel seems to owe its very existence to the American Jewish vote — while at the same time, consigning the non-religious to political oblivion. This secular non-religious vote, if properly mobilized, is nine times as numerous as the Jewish vote. Why does this far more substantial minority not make a move to exercise its political muscle? Well, so much for quantity. How about quality? Is there any correlation, positive or negative, between intelligence and tendency to be religious? [Them folks misunderestimated me] The survey that I quoted, which is the ARIS survey, didn ’ t break down its data by socio-economic class or education, IQ or anything else. But a recent article by Paul G. Bell in the Mensa magazine provides some straws in the wind. Mensa, as you know, is an international organization for people with very high IQ. And from a meta-analysis of the literature, Bell concludes that, I quote —”Of 43 studies carried out since 1927 on the relationship between religious belief, and one ’ s intelligence or educational level, all but four found an inverse connection. That is, the higher one ’ s intelligence or educational level, the less one is likely to be religious.”Well, I haven ’ t seen the original 42 studies, and I can ’ t comment on that meta-analysis, but I would like to see more studies done along those lines. And I know that there are — if I could put a little plug here — there are people in this audience easily capable of financing a massive research survey to settle the question, and I put the suggestion up, for what it ’ s worth. But let me know show you some data that have been properly published and analyzed, on one **special** group — namely, top scientists. In 1998, Larson and Witham polled the cream of American scientists, those who ’ d been honored by election to the National Academy of Sciences, and among this select group, belief in a personal God dropped to a shattering seven percent. About 20 percent are agnostic ; the rest could fairly be called atheists. Similar figures obtained for belief in personal immortality. Among biological scientists, the figure is even lower : 5. 5 percent, only, believe in God. Physical scientists, it ’ s 7. 5 percent. I ’ ve not seen corresponding figures for elite scholars in other fields, such as history or philosophy, but I ’ d be surprised if they were different. So, we ’ ve reached a truly remarkable situation, a grotesque mismatch between the American intelligentsia and the American electorate. A philosophical opinion about the nature of the universe, which is held by the vast majority of top American scientists and probably the majority of the intelligentsia generally, is so abhorrent to the American electorate that no candidate for popular election dare affirm it in public. If I ' m right, this means that high office in the greatest country in the world is barred to the very people best qualified to hold it — the intelligentsia — unless they are prepared to lie about their beliefs. To put it bluntly : American political opportunities are heavily loaded against those who are simultaneously intelligent and honest. I ' m not a citizen of this country, so I hope it won ' t be thought unbecoming if I suggest that something needs to be done. And I ' ve already hinted what that something is. From what I ' ve seen of TED, I think this may be the ideal place to launch it. Again, I fear it will cost money. We need a consciousness-raising, coming-out campaign for American atheists. This could be similar to the campaign organized by homosexuals a few years ago, although heaven forbid that we should stoop to public outing of people against their will. In most cases, people who out themselves will help to destroy the myth that there is something wrong with atheists. On the contrary, they ' ll demonstrate that atheists are often the kinds of people who could serve as decent role models for your children, the kinds of people an advertising agent could use to recommend a product, the kinds of people who are sitting in this room. There should be a snowball effect, a positive feedback, such that the more names we have, the more we get. There could be non-linearities, threshold effects. When a critical mass has been obtained, there ' s an abrupt acceleration in recruitment. And again, it will need money. I suspect that the word"atheist"itself contains or remains a stumbling block far out of proportion to what it actually means, and a stumbling block to people who otherwise might be happy to out themselves. So, what other words might be used to smooth the path, oil the wheels, sugar the pill? Darwin himself preferred"agnostic"— and not only out of loyalty to his friend Huxley, who coined the term. Darwin said,"I have never been an atheist in the same sense of denying the existence of a God. I think that generally an ' agnostic ' would be the most correct description of my state of mind."He even became uncharacteristically tetchy with Edward Aveling. Aveling was a militant atheist who failed to persuade Darwin to accept the dedication of his book on atheism — incidentally, giving rise to a fascinating myth that Karl Marx tried to dedicate"Das Kapital"to Darwin, which he didn ' t, it was actually Edward Aveling. What happened was that Aveling ' s mistress was Marx ' s daughter, and when both Darwin and Marx were dead, Marx ' s papers became muddled up with Aveling ' s papers, and a letter from Darwin saying,"My dear sir, thank you very much but I don ' t want you to dedicate your book to me,"was mistakenly supposed to be addressed to Marx, and that gave rise to this whole myth, which you ' ve probably heard. It ' s a sort of urban myth, that Marx tried to dedicate"Kapital"to Darwin. Anyway, it was Aveling, and when they met, Darwin challenged Aveling."Why do you call yourselves atheists?""' Agnostic, '"retorted Aveling,"was simply ' atheist ' writ respectable, and ' atheist ' was simply ' agnostic ' writ aggressive."Darwin **complained**,"But why should you be so aggressive?"Darwin thought that atheism might be well and good for the intelligentsia, but that ordinary people were not, quote,"ripe for it."Which is, of course, our old friend, the"don ' t rock the boat"argument. It ' s not recorded whether Aveling told Darwin to come down off his high horse. But in any case, that was more than 100 years ago. You ' d think we might have grown up since then. Now, a friend, an intelligent lapsed Jew, who, incidentally, **observes** the Sabbath for reasons of cultural solidarity, describes himself as a"tooth-fairy agnostic."He won ' t call himself an atheist because it ' s, in principle, impossible to prove a negative, but"agnostic"on its own might suggest that God ' s existence was therefore on equal terms of likelihood as his non-existence. So, my friend is strictly agnostic about the tooth fairy, but it isn ' t very likely, is it? Like God. Hence the phrase,"tooth-fairy agnostic."Bertrand Russell made the same point using a hypothetical teapot in orbit about Mars. You would strictly have to be agnostic about whether there is a teapot in orbit about Mars, but that doesn ' t mean you treat the likelihood of its existence as on all fours with its non-existence. The list of things which we strictly have to be agnostic about doesn ' t stop at tooth fairies and teapots ; it ' s infinite. If you want to believe one particular one of them — unicorns or tooth fairies or teapots or Yahweh — the onus is on you to say why. The onus is not on the rest of us to say why not. We, who are atheists, are also a-fairyists and a-teapotists. But we don ' t bother to say so. And this is why my friend uses"tooth-fairy agnostic"as a label for what most people would call atheist. Nonetheless, if we want to attract deep-down atheists to come out publicly, we ' re going to have find something better to stick on our banner than"tooth-fairy"or"teapot agnostic."So, how about"humanist"? This has the advantage of a worldwide network of well-organized associations and journals and things already in place. My problem with it is only its apparent anthropocentrism. One of the things we ' ve learned from Darwin is that the human species is only one among millions of cousins, some close, some distant. And there are other possibilities, like"naturalist,"but that also has problems of confusion, because Darwin would have thought naturalist —"Naturalist"means, of course, as opposed to"supernaturalist"— and it is used sometimes — Darwin would have been confused by the other sense of"naturalist,"which he was, of course, and I suppose there might be others who would confuse it with"nudism". Such people might be those belonging to the British lynch mob, which last year attacked a pediatrician in mistake for a pedophile. I think the best of the available alternatives for"atheist"is simply"non- theist."It lacks the strong connotation that there ' s definitely no God, and it could therefore easily be embraced by teapot or tooth-fairy agnostics. It ' s completely compatible with the God of the physicists. When atheists like Stephen Hawking and Albert Einstein use the word"God,"they use it of course as a metaphorical shorthand for that deep, mysterious part of physics which we don ' t yet understand."Non-theist"will do for all that, yet unlike"atheist,"it doesn ' t have the same phobic, hysterical responses. But I think, actually, the alternative is to grasp the nettle of the word"atheism"itself, precisely because it is a taboo word, carrying frissons of hysterical phobia. Critical mass may be harder to achieve with the word"atheist"than with the word"non- theist,"or some other non-confrontational word. But if we did achieve it with that **dread** word"atheist"itself, the political impact would be even greater. Now, I said that if I were religious, I ' d be very afraid of evolution — I ' d go further : I would fear science in general, if properly understood. And this is because the scientific worldview is so much more exciting, more poetic, more filled with sheer wonder than anything in the poverty-stricken arsenals of the religious imagination. As Carl Sagan, another recently dead hero, put it,"How is it that hardly any major religion has looked at science and concluded, ' This is better than we thought! The universe is much bigger than our prophet said, grander, more subtle, more elegant '? Instead they say, ' No, no, no! My god is a little god, and I want him to stay that way. ' A religion, old or new, that **stressed** the magnificence of the universe as revealed by modern science, might be able to draw forth reserves of reverence and awe hardly tapped by the conventional faiths."Now, this is an elite audience, and I would therefore expect about 10 percent of you to be religious. Many of you probably subscribe to our polite cultural belief that we should respect religion. But I also suspect that a fair number of those secretly despise religion as much as I do. If you ’ re one of them, and of course many of you may not be, but if you are one of them, I ’ m asking you to stop being polite, come out, and say so. And if you happen to be rich, give some thought to ways in which you might make a difference. The religious lobby in this country is massively financed by foundations — to say nothing of all the tax benefits — by foundations, such as the Templeton Foundation and the Discovery Institute. We need an anti- Templeton to step forward. If my books sold as well as Stephen Hawking ’ s books, instead of only as well as Richard Dawkins ’ books, I ’ d do it myself. People are always going on about,”How did September the 11th change you?”Well, here ’ s how it changed me. Let ’ s all stop being so damned respectful. Thank you very much.

Text Sample 216: POS Dim 2 – 2002 – Score 9.00 – 2002/t000312.txt
It ’ s a great honor to be here with you. The good news is I ’ m very aware of my responsibilities to get you out of here because I ’ m the only thing standing between you and the bar. And the good news is I don ’ t have a prepared speech, but I have a box of slides. I have some pictures that represent my life and what I do for a living. I ’ ve learned through experience that people remember pictures long after they ’ ve forgotten words, and so I hope you ’ ll remember some of the pictures I ’ m going to share with you for just a few minutes. The whole story really starts with me as a high school kid in Pittsburgh, Pennsylvania, in a tough neighborhood that everybody gave up on for dead. And on a Wednesday afternoon, I was walking down the corridor of my high school kind of minding my own business. And there was this artist teaching, who made a great big old ceramic vessel, and I happened to be looking in the door of the art room — and if you ’ ve ever seen clay done, it ’ s magic — and I ’ d never seen anything like that before in my life. So, I walked in the art room and I said,”What is that?”And he said,”Ceramics. And who are you?”And I said,”I ’ m Bill Strickland. I want you to teach me that.”And he said,”Well, get your homeroom teacher to sign a piece of paper that says you can come here, and I ’ ll teach it to you.”And so for the remaining two years of my high school, I cut all my classes. But I had the presence of mind to give the teachers ’ classes that I cut the pottery that I made, and they gave me passing grades. And that ’ s how I got out of high school. And Mr. Ross said,”You ’ re too smart to die and I don ’ t want it on my conscience, so I ’ m leaving this school and I ’ m taking you with me.”And he drove me out to the University of Pittsburgh where I filled out a college application and got in on probation. Well, I ’ m now a trustee of the university, and at my installation ceremony I said,”I ’ m the guy who came from the neighborhood who got into the place on probation. Don ’ t give up on the poor kids, because you never know what ’ s going to happen to those children in life.”What I ’ m going to show you for a couple of minutes is a facility that I built in the toughest neighborhood in Pittsburgh with the highest crime rate. One is called Bidwell Training Center ; it is a vocational school for ex-steel workers and single parents and welfare mothers. You remember we used to make steel in Pittsburgh? Well, we don ’ t make any steel anymore, and the people who used to make the steel are having a very tough time of it. And I rebuild them and give them new life. Manchester Craftsmen ’ s Guild is named after my neighborhood. I was adopted by the Bishop of the Episcopal Diocese during the riots, and he donated a **row** house. And in that **row** house I started Manchester Craftsmen ’ s Guild, and I learned very quickly that wherever there are Episcopalians, there ’ s money in very close proximity. And the Bishop adopted me as his kid. And last year I spoke at his memorial **service** and wished him well in this life. I went out

and hired a student of Frank Lloyd Wright, the architect, and I asked him to build me a world class center in the worst neighborhood in Pittsburgh. And my building was a scale model for the Pittsburgh airport. And when you come to Pittsburgh — and you ' re all invited — you ' ll be flying into the blown-up version of my building. That ' s the building. Built in a tough neighborhood where people have been given up for dead. My view is that if you want to involve yourself in the life of people who have been given up on, you have to look like the solution and not the problem. As you can see, it has a fountain in the courtyard. And the reason it has a fountain in the courtyard is I wanted one and I had the checkbook, so I bought one and put it there. And now that I ' m giving speeches at conferences like TED, I got put on the board of the Carnegie Museum. At a reception in their courtyard, I noticed that they had a fountain because they think that the people who go to the museum deserve a fountain. Well, I think that welfare mothers and at-risk kids and ex-steel workers deserve a fountain in their life. And so the first thing that you see in my center in the springtime is water that greets you — water is life and water of human possibility — and it sets an attitude and expectation about how you feel about people before you ever give them a speech. So, from that fountain I built this building. As you can see, it has world class art, and it ' s all my taste because I raised all the money. I said to my boy,"When you raise the money, we ' ll put your taste on the wall."That we have quilts and clay and calligraphy and everywhere your eye turns, there ' s something beautiful looking back at you, that ' s deliberate. That ' s intentional. In my view, it is this kind of world that can redeem the soul of poor people. We also created a boardroom, and I hired a Japanese cabinetmaker from Kyoto, Japan, and commissioned him to do 60 pieces of furniture for our building. We have since spun him off into his own business. He ' s making a ton of money doing custom furniture for rich people. And I got 60 pieces out of it for my school because I felt that welfare moms and ex-steel workers and single parents deserved to come to a school where there was handcrafted furniture that greeted them every day. Because it sets a tone and an attitude about how you feel about people long before you give them the speech. We even have flowers in the hallway, and they ' re not plastic. Those are real and they ' re in my building every day. And now that I ' ve given lots of speeches, we had a bunch of high school principals come and see me, and they said,"Mr. Strickland, what an extraordinary story and what a great school. And we were particularly touched by the flowers and we were curious as to how the flowers got there."I said,"Well, I got in my car and I went out to the greenhouse and I bought them and I brought them back and I put them there."You don ' t need a task force or a study group to buy flowers for your kids. What you need to know is that the children and the adults deserve flowers in their life. The cost is incidental but the gesture is huge. And so in my building, which is full of sunlight and full of flowers, we believe in hope and human possibilities. That happens to be at Christmas time. And so the next thing you ' ll see is a million dollar kitchen that was built by the Heinz company — you ' ve heard of them? They did all right in the ketchup business. And I happen to know that company pretty well because John Heinz, who was our U. S. senator — who was tragically killed in a plane accident — he had heard about my desire to build a new building, because I had a cardboard box and I put it in a garbage bag and I walking all over Pittsburgh trying to raise money for this site. And he called me into his office — which is the equivalent of going to see the Wizard of Oz — and John Heinz had 600 million dollars, and at the time I had about 60 cents. And he said,"But we ' ve heard about you. We ' ve heard about your work with the kids and the ex- steel workers, and we ' re inclined to want to support your desire to build a new building. And you could do us a great **service** if you would add a culinary program to your program.”Because back then, we were building a trades program. He said,”That way we could fulfill our affirmative **action** goals for the Heinz company.”I said,”Senator, I ’ m reluctant to go into a field that I don ’ t know much about, but I promise you that if you ’ ll support my school, I ’ ll get it built and in a couple of years, I ’ ll come back and weigh out that program that you desire.”And Senator Heinz sat very quietly and he said,”Well, what would your reaction be if I said I ’ d give you a million dollars?”I said,”Senator, it appears that we ’ re going into the food training business.”And John Heinz did give me a million bucks. And most importantly, he loaned me the head of research for the Heinz company. And we kind of borrowed the curriculum from the Culinary Institute of America, which in their mind is kind of the Harvard of cooking schools, and we created a gourmet cooks program for welfare mothers in this million dollar kitchen in the middle of the inner city. And we ’ ve never looked back. I would like to show you now some of the food that these welfare mothers do in this million dollar kitchen. That happens to be our cafeteria line. That ’ s puff pastry day. Why? Because the students made puff pastry and that ’ s what the school ate every day. But the concept was that I wanted to take the stigma out of food. That good food ’ s not for rich people — good food ’ s for everybody on the planet, and there ’ s no excuse why we all can ’ t be eating it. So at my school, we subsidize a gourmet lunch program for welfare mothers in the middle of the inner city because we ’ ve discovered that it ’ s good for their stomachs, but it ’ s better for their heads. Because I wanted to let them know every day of their life that they have value at this place I call my center. We have students who sit together, black kids and white kids, and what we ’ ve discovered is you can solve the race problem by creating a world class environment, because people will have a tendency to show you world class behavior if you treat them in that way. These are examples of the food that welfare mothers are doing after six months in the training program. No sophistication, no class, no dignity, no history. What we ’ ve discovered is the only thing wrong with poor people is they don ’ t have any money, which happens to be a curable condition. It ’ s all in the way that you think about people that often determines their behavior. That was done by a student after seven months in the program, done by a very brilliant young woman who was taught by our pastry chef. I ’ ve actually eaten seven of those baskets and they ’ re very good. They have no calories. That ’ s our dining room. It looks like your average high school cafeteria in your average town in America. But this is my view of how students ought to be treated, particularly once they have been pushed aside. We train pharmaceutical technicians for the pharmacy industry, we train medical technicians for the medical industry, and we train chemical technicians for companies like Bayer and Calgon Carbon and Fisher Scientific and Exxon. And I will guarantee you that if you come to my center in Pittsburgh — and you ’ re all invited — you ’ ll see welfare mothers doing analytical chemistry with logarithmic calculators 10 months from **enrolling** in the program. There is absolutely no reason why poor people can ’ t learn world class technology. What we ’ ve discovered is you have to give them flowers and sunlight and food and expectations and Herbie ’ s music, and you can cure a spiritual cancer every time. We train corporate travel agents for the travel industry. We even teach people how to read. The kid with the red stripe was in the program two years ago — he ’ s now an instructor. And I have children with high school diplomas that they can ’ t read. And so you must ask yourself the question : how is it possible in the 21st century that we graduate children from schools who can ’ t read the diplomas that they have in their hands? The reason is that the system gets reimbursed for the kids they spit out the other end, not the children who read. I can take these children and in 20 weeks, demonstrated aptitude ; I can get them high school equivalent. No big deal. That ’ s our library with more handcrafted furniture. And this is the arts program I started in 1968. Remember I ’ m the black kid from the ’ 60s who got his life saved with ceramics. Well, I went out and decided to reproduce my experience with other kids in the neighborhood, the theory being if you get kids flowers and you give them food and you give them sunshine and enthusiasm, you can bring them right back to life. I have 400 kids from the Pittsburgh public school system that come to me every day of the week for arts education. And these are children who are flunking out of public school. And last year I put 88 percent of those kids in college and I ’ ve averaged over 80 percent for 15 years. We ’ ve made a fascinating discovery : there ’ s nothing wrong with the kids that affection and sunshine and food and enthusiasm and Herbie ’ s music can ’ t cure. For that I won a big old plaque — Man of the Year in Education. I beat out all the Ph. D. ’ s because I figured that if you treat children like human beings, it increases the likelihood they ’ re going to behave that way. And why we can ’ t institute that policy in every school and in every city and every town remains a mystery to me. Let me show you what these people do. We have ceramics and photography and computer imaging. And these are all kids with no artistic ability, no talent, no imagination. And we bring in the world ’ s greatest artists — Gordon Parks has been there, Chester Higgins has been there — and what we ’ ve learned is that the children will become like the people who teach them. In fact, I brought in a mosaic artist from the Vatican, an African-American woman who had studied the old Vatican mosaic techniques, and let me show you what they did with the work. These were children who the whole world had given up on, who were flunking out of public school, and that ’ s what they ’ re capable of doing with affection and sunlight and food and good music and confidence. We teach photography. And these are examples of some of the kids ’ work. That boy won a four-year scholarship on the strength of that photograph. This is our gallery. We have a world class gallery because we believe that poor kids need a world class gallery, so I designed this thing. We have smoked salmon at the art openings, we have a formal printed invitation, and I even have figured out a way to get their parents to come. I couldn ’ t buy a parent 15 years ago so I hired a guy who got off on the Jesus big time. He was dragging guys out of bars and saving those lives for the Lord. And I said,”Bill, I want to hire you, man. You have to tone down the Jesus stuff a little bit, but keep the enthusiasm. I can ’ t get these parents to come to the school.”He said,”I ’ ll get them to come to the school.”So, he jumped in the van, he went to Miss Jones ’ house and said,”Miss Jones, I knew you wanted to come to your kid ’ s art opening but you probably didn ’ t have a ride. So, I came to give you a ride.”And he got 10 parents and then 20 parents. At the last show that we did, 200 parents showed up and we didn ’ t pick up one parent. Because now it ’ s become socially not acceptable not to show up to support your children at the Manchester Craftsmen ’ s Guild because people think you ’ re bad parents. And there is no statistical difference between the white parents and the black parents. Mothers will go where their children are being celebrated, every time, every town, every city. I wanted you to see this gallery because it ’ s as good as it gets. And by the time I cut these kids loose from high school, they ’ ve got four shows on their resume before they apply to college because it ’ s all up here. You have to change the way that people see themselves before you can change their behavior. And it ’ s worked out pretty good up to this day. I even stuck another room on the building, which I ’ d like to show you. This is brand new. We just got this slide done in time for the TED Conference. I gave this little slide show at a place called the Silicon Valley and I did all right. And the woman came out of the audience, she said,”That was a great story and I was very impressed with your presentation. My only criticism is your computers are getting a little bit old."And I said,"Well, what do you do for a living?"She said,"Well, I work for a company called Hewlett-Packard."And I said,"You ' re in the computer business, is that right?"She said,"Yes, sir."And I said,"Well, there ' s an easy solution to that problem."Well, I ' m very pleased to announce to you that HP and a furniture company called Steelcase have adopted us as a demonstration model for all of their technology and all their furniture for the United States of America. And that ' s the room that ' s initiating the relationship. We got it just done in time to show you, so it ' s kind of the world debut of our digital imaging center. I only have a couple more slides, and this is where the story gets kind of interesting. So, I just want you to listen up for a couple more minutes and you ' ll understand why he ' s there and I ' m here. In 1986, I had the presence of mind to stick a music hall on the north end of the building while I was building it. And a guy named Dizzy Gillespie showed up to play there because he knew this man over here, Marty Ashby. And I stood on that stage with Dizzy Gillespie on sound check on a Wednesday afternoon, and I said,"Dizzy, why would you come to a black-run center in the middle of an industrial park with a high crime rate that doesn ' t even have a reputation in music?"He said,"Because I heard you built the center and I didn ' t believe that you did it, and I wanted to see for myself. And now that I have, I want to give you a gift."I said,"You ' re the gift."He said,"No, sir. You ' re the gift. And I ' m going to allow you to record the concert and I ' m going to give you the music, and if you ever choose to sell it, you must sign an agreement that says the money will come back and support the school."And I recorded Dizzy. And he died a year later, but not before telling a fellow named McCoy Tyner what we were doing. And he showed up and said,"Dizzy talking about you all over the country, man, and I want to help you."And then a guy named Wynton Marsalis showed up. Then a bass player named Ray Brown, and a fellow named Stanley Turrentine, and a piano player named Herbie Hancock, and a band called the Count Basie Orchestra, and a fellow named Tito Puente, and a guy named Gary Burton, and Shirley Horn, and Betty Carter, and Dakota Staton and Nancy Wilson all have come to this center in the middle of an industrial park to sold out audiences in the middle of the inner city. And I ' m very pleased to tell you that, with their permission, I have now accumulated 600 recordings of the greatest artists in the world, including Joe Williams, who died, but not before his last recording was done at my school. And Joe Williams came up to me and he put his hand on my shoulder and he said,"God ' s picked you, man, to do this work. And I want my music to be with you."And that worked out all right. When the Basie band came, the band got so excited about the school they voted to give me the rights to the music. And I recorded it and we won something called a Grammy. And like a **fool**, I didn ' t go to the ceremony because I didn ' t think we were going to win. Well, we did win, and our name was literally in lights over Madison Square Garden. Then the U. N. Jazz Orchestra dropped by and we recorded them and got nominated for a second Grammy back to back. So, we ' ve become one of the hot, young jazz recording studios in the United States of America in the middle of the inner city with a high crime rate. That ' s the place all filled up with Republicans. If you ' d have dropped a bomb on that room, you ' d have wiped out all the money in Pennsylvania because it was all sitting there. Including my mother and father, who lived long enough to see their kid build that building. And there ' s Dizzy, just like I told you. He was there. And he was there, Tito Puente. And Pat Metheny and Jim Hall were there and they recorded with us. And that was our first recording studio, which was the broom closet. We put the mops in the hallway and re-engineered the thing and that ' s where we recorded the first Grammy. And this is our new facility, which is all video technology. And that is a room that was built for a woman named Nancy Wilson, who recorded that album at our school last Christmas. And any of you who happened to have been watching Oprah Winfrey on Christmas Day, he was there and Nancy was there singing excerpts from this album, the rights to which she donated to our school. And I can now tell you with absolute certainty that an appearance on Oprah Winfrey will sell 10, 000 CDs. We are currently number four on the Billboard Charts, right behind Tony Bennett. And I think we ’ re going to be fine. This was burned out during the riots — this is next to my building — and so I had another cardboard box built and I walked back out in the streets again. And that ’ s the building, and that ’ s the model, and on the right ’ s a high-tech greenhouse and in the middle ’ s the medical technology building. And I ’ m very pleased to tell you that the building ’ s done. It ’ s also full of anchor tenants at 20 dollars a foot — triple that in the middle of the inner city. And there ’ s the fountain. Every building has a fountain. And the University of Pittsburgh Medical Center are anchor tenants and they took half the building, and we now train medical technicians through all their system. And Mellon Bank ’ s a tenant. And I love them because they pay the rent on time. And as a result of the association, I ’ m now a director of the Mellon Financial Corporation that bought Dreyfus. And this is in the process of being built as we speak. Multiply that picture times four and you will see the greenhouse that ’ s going to open in October this year because we ’ re going to grow those flowers in the middle of the inner city. And we ’ re going to have high school kids growing Phalaenopsis orchids in the middle of the inner city. And we have a handshake with one of the large retail grocers to sell our orchids in all 240 stores in six states. And our partners are Zuma Canyon Orchids of Malibu, California, who are Hispanic. So, the Hispanics and the black folks have formed a partnership to grow high technology orchids in the middle of the inner city. And I told my United States senator that there was a very high probability that if he could find some funding for this, we would become a left-hand column in the Wall Street Journal, to which he readily agreed. And we got the funding and we open in the fall. And you ought to come and see it — it ’ s going to be a hell of a story. And this is what I want to do when I grow up. The brown building is the one you guys have been looking at and I ’ ll tell you where I made my big mistake. I had a chance to buy this whole industrial park — which is less than 1, 000 feet from the riverfront — for four million dollars and I didn ’ t do it. And I built the first building, and guess what happened? I appreciated the real estate values beyond everybody ’ s expectations and the owners of the park turned me down for eight million dollars last year, and said,”Mr. Strickland, you ought to get the Civic Leader of the Year Award because you ’ ve appreciated our property values beyond our wildest expectations. Thank you very much for that.”The moral of the story is you must be prepared to act on your dreams, just in case they do come true. And finally, there ’ s this picture. This is in a place called San Francisco. And the reason this picture ’ s in here is I did this slide show a couple years ago at a big economics summit, and there was a fellow in the audience who came up to me. He said,”Man, that ’ s a great story. I want one of those.”I said,”Well, I ’ m very flattered. What do you do for a living?”He says,”I run the city of San Francisco. My name ’ s Willie Brown.”And so I kind of accepted the flattery and the praise and put it out of my mind. And that weekend, I was going back home and Herbie Hancock was playing our center that night — first time I ’ d met him. And he walked in and he says,”What is this?”And I said,”Herbie, this is my concept of a training center for poor people.”And he said,”As God as my witness, I ’ ve had a center like this in my mind for 25 years and you ’ ve built it. And now I really want to build one.”I said,”Well, where would you build this thing?”He said,”San Francisco.”I said,”Any chance you know Willie Brown?”As a matter of fact he did know Willie Brown, and Willie Brown and Herbie and I had dinner four years ago, and we started drawing out that center on the tablecloth. And Willie Brown said,"As sure as I ' m the mayor of San Francisco, I ' m going to build this thing as a legacy to the poor people of this city."And he got me five acres of land on San Francisco Bay and we got an architect and we got a general contractor and we got Herbie on the board, and our friends from HP, and our friends from Steelcase, and our friends from Cisco, and our friends from Wells Fargo and Genentech. And along the way, I met this real short guy at my slide show in the Silicon Valley. He came up to me afterwards, he said,"Man, that ' s a fabulous story. I want to help you."And I said,"Well, thank you very much for that. What do you do for a living?"He said,"Well, I built a company called eBay."I said,"Well, that ' s very nice. Thanks very much, and give me your card and sometime we ' ll talk."I didn ' t know eBay from that jar of water sitting on that piano, but I had the presence of mind to go back and talk to one of the techie kids at my center. I said,"Hey man, what is eBay?"He said,"Well, that ' s the electronic commerce network."I said,"Well, I met the guy who built the thing and he left me his card."So, I called him up on the phone and I said,"Mr. Skoll, I ' ve come to have a much deeper appreciation of who you are and I ' d like to become your friend."And Jeff and I did become friends, and he ' s organized a team of people and we ' re going to build this center. And I went down into the neighborhood called Bayview-Hunters Point, and I said,"The mayor sent me down here to work with you and I want to build a center with you, but I ' m not going to build you anything if you don ' t want it. And all I ' ve got is a box of slides."And so I stood up in front of 200 very angry, very disappointed people on a summer night, and the air conditioner had broken and it was 100 degrees outside, and I started showing these pictures. And after about 10 pictures they all settled down. And I ran the story and I said,"What do you think?"And in the back of the room, a woman stood up and she said,"In 35 years of living in this God forsaken place, you ' re the only person that ' s come down here and treated us with dignity. I ' m going with you, man."And she turned that audience around on a pin. And I promised these people that I was going to build this thing, and we ' re going to build it all right. And I think we can get in the ground this year as the first replication of the center in Pittsburgh. But I met a guy named Quincy Jones along the way and I showed him the box of slides. And Quincy said,"I want to help you, man. Let ' s do one in L. A."And so he ' s assembled a group of people. And I ' ve fallen in love with him, as I have with Herbie and with his music. And Quincy said,"Where did the idea for centers like this come from?"And I said,"It came from your music, man. Because Mr. Ross used to bring in your albums when I was 16 years old in the pottery class, when the world was all dark, and your music got me to the sunlight."And I said,"If I can follow that music, I ' ll get out into the sunlight and I ' ll be OK. And if that ' s not true, how did I get here?"I want you all to know that I think the world is a place that ' s worth living. I believe in you. I believe in your hopes and your dreams, I believe in your intelligence and I believe in your enthusiasm. And I ' m tired of living like this, going into town after town with people standing around on corners with holes where eyes used to be, their spirits damaged. We won ' t make it as a country unless we can turn this thing around. In Pennsylvania it costs 60, 000 dollars to keep people in jail, most of whom look like me. It ' s 40, 000 dollars to build the University of Pittsburgh Medical School. It ' s 20, 000 dollars cheaper to build a medical school than to keep people in jail. Do the math — it will never work. I am banking on you and I ' m banking on guys like Herbie and Quincy and Hackett and Richard and very decent people who still believe in something. And I want to do this in my lifetime, in every city and in every town. And I don ' t think I ' m crazy. I think we can get home on this thing and I think we can build these all over the country for less money than we ’ re spending on prisons. And I believe we can turn this whole story around to one of celebration and one of hope. In my business it ’ s very difficult work. You ’ re always fighting upstream like a salmon — never enough money, too much need — and so there is a tendency to have an occupational depression that accompanies my work. And so I ’ ve figured out, over time, the solution to the depression : you make a friend in every town and you ’ ll never be lonely. And my hope is that I ’ ve made a few here tonight. And thanks for listening to what I had to say.

Text Sample 217: POS Dim 2 – 2002 – Score 8.00 – 2002/t000095.txt
What I want to do today is spend some time talking about some stuff that ’ s giving me a little bit of existential angst, for lack of a better word, over the past couple of years. And basically, these three quotes tell what ’ s going on.”When God made the color purple, God was just showing off,”Alice Walker wrote in”The Color Purple.”And Zora Neale Hurston wrote in”Dust Tracks On A Road,””Research is a formalized curiosity. It ’ s poking and prying with a purpose.”And then finally, when I think about the near future, we have this attitude,”Well, whatever happens, happens.”Right? So that goes along with the Cheshire Cat saying,”If you don ’ t care much where you want to get to, it doesn ’ t much matter which way you go.”But I think it does matter which way we go and what road we take, because when I think about design in the near future, what I think are the most important issues, what ’ s really crucial and vital, is that we need to revitalize the arts and sciences right now, in 2002. If we describe the near future as 10, 20, 15 years from now, that means that what we do today is going to be critically important, because in the year 2015, in the year 2020, 2025, the world our society is going to be building on, the basic knowledge and abstract ideas, the discoveries that we came up with today, just as all these wonderful things we ’ re hearing about here at the TED conference that we take for granted in the world right now, were really knowledge and ideas that came up in the 50s, the 60s and the 70s. That ’ s the substrate that we ’ re exploiting today. Whether it ’ s the internet, genetic engineering, laser scanners, guided missiles, fiber optics, high-definition television, remote sensing from space and the wonderful remote-sensing photos that we see in 3D weaving, TV programs like Tracker and Enterprise, CD-rewrite drives, flat-screen, Alvin Ailey ’ s”Suite Otis,”or Sarah Jones ’ s”Your Revolution Will Not [Happen] Between These Thighs,”which, by the way, was banned by the FCC, or ska — all of these things, without question, almost without exception, are really based on ideas and abstract and creativity from years before. So we have to ask ourselves : What are we contributing to that legacy right now? And when I think about it, I ’ m really worried. To be quite frank, I ’ m concerned. I ’ m skeptical that we ’ re doing very much of anything. We ’ re, in a sense, failing to act in the future. We ’ re purposefully, consciously being laggards. We ’ re lagging behind. Frantz Fanon, who was a psychiatrist from Martinique, said,”Each generation must, out of relative obscurity, discover its **mission** and fulfill or betray it.”What is our **mission**? What do we have to do? I think our **mission** is to reconcile, to reintegrate science and the arts, because right now, there ’ s a schism that exists in popular culture. People have this idea that science and the arts are really separate ; we think of them as separate and different things. And this idea was probably introduced centuries ago, but it ’ s really becoming critical now, because we ’ re making decisions about our society every day that, if we keep thinking that the arts are separate from the

sciences, and we keep thinking it ' s cute to say,"I don ' t understand anything about this one, I don ' t understand anything about the other one,"then we ' re going to have problems. Now, I know no one here at TED thinks this. All of us, we already know that they ' re very connected. But I ' m going to let you know that some folks in the outside world, believe it or not, think it ' s neat when they say,"Scientists and science is not creative. Maybe scientists are ingenious, but they ' re not creative."And then we have this tendency, the career counselors and various people say things like,"Artists are not analytical. They ' re ingenious, perhaps, but not analytical."And when these concepts underlie our teaching and what we think about the world, then we have a problem, because we stymie support for everything. By accepting this dichotomy, whether it ' s tongue-in- cheek, when we attempt to accommodate it in our world, and we try to build our foundation for the world, we ' re messing up the future, because : Who wants to be uncreative? Who wants to be illogical? Talent would run from either of these fields if you said you had to choose either. Then they ' ll go to something where they think,"Well, I can be creative and logical at the same time."Now, I grew up in the ' 60s and I ' ll admit it — actually, my childhood spanned the ' 60s, and I was a wannabe hippie, and I always resented the fact that I wasn ' t old enough to be a hippie. And I know there are people here, the younger generation, who want to be hippies. People talk about the ' 60s all the time. And they talk about the anarchy that was there. But when I think about the ' 60s, what I took away from it was that there was hope for the future. We thought everyone could participate. There were wonderful, incredible ideas that were always percolating, and so much of what ' s cool or hot today is really based on some of those concepts, whether it ' s people trying to use the Prime Directive from Star Trek, being involved in things, or, again, that three- dimensional weaving and fax machines that I read about in my weekly readers that the technology and engineering was just getting started. But the ' 60s left me with a problem. You see, I always assumed I would go into space, because I followed all of this. But I also loved the arts and sciences. You see, when I was growing up as a little girl and as a teenager, I loved designing and making doll clothes and wanting to be a fashion designer. I took art and ceramics. I loved dance : Lola Falana, Alvin Ailey, Jerome Robbins. And I also avidly followed the Gemini and the Apollo programs. I had science projects and tons of astronomy books. I took calculus and philosophy. I wondered about infinity and the Big Bang theory. And when I was at Stanford, I found myself, my senior year, chemical engineering major, half the folks thought I was a political science and performing arts major, which was sort of true, because I was Black Student Union President, and I did major in some other things. And I found myself the last quarter **juggling** chemical engineering separation processes, logic classes, nuclear magnetic resonance spectroscopy, and also producing and choreographing a dance production. And I had to do the lighting and the design work, and I was trying to figure out : Do I go to New York City to try to become a professional dancer, or to go to medical school? Now, my mother helped me figure that one out. But when I went into space, I carried a number of things up with me. I carried a poster by Alvin Ailey — you can figure out now, I love the dance company — an Alvin Ailey poster of Judith Jamison performing the dance"Cry,"dedicated to all black women everywhere ; a Bundu statue, which was from the women ' s society in Sierra Leone ; and a certificate for the Chicago Public School students to work to improve their science and math. And folks asked me,"Why did you take up what you took up?"And I had to say,"Because it represents human creativity ; the creativity that allowed us, that we were required to have to conceive and build and launch the space shuttle, which springs from the same source as the imagination and analysis that it took to carve a Bundu statue, or the ingenuity it took to design, choreograph and stage"Cry."Each one of them are different manifestations, incarnations, of creativity — avatars of human creativity. And that ' s what we have to reconcile in our minds, how these things fit together. The difference between arts and sciences is not analytical versus intuitive. Right? E = mc2 required an intuitive leap, and then you had to do the analysis afterwards. Einstein said, in fact,"The most beautiful thing we can experience is the mysterious. It is the source of all true art and science."Dance requires us to express and want to express the jubilation in life, but then you have to figure out : Exactly what movement do I do to make sure it comes across correctly? The difference between arts and sciences is also not constructive versus deconstructive. A lot of people think of the sciences as deconstructive, you have to pull things apart. And yeah, subatomic physics is deconstructive — you literally try to tear atoms apart to understand what ' s inside of them. But sculpture, from what I understand from great sculptors, is deconstructive, because you see a piece and you remove what doesn ' t need to be there. Biotechnology is constructive. Orchestral arranging is constructive. So, in fact, we use constructive and deconstructive techniques in everything. The difference between science and the arts is not that they are different sides of the same coin, even, or even different parts of the same continuum, but rather, they ' re manifestations of the same thing. Different quantum states of an atom? Or maybe if I want to be more 21st century, I could say that they ' re different harmonic resonances of a superstring. But we ' ll leave that alone. They spring from the same source. The arts and sciences are avatars of human creativity. It ' s our attempt as humans to build an understanding of the universe, the world around us. It ' s our attempt to influence things, the universe internal to ourselves and external to us. The sciences, to me, are manifestations of our attempt to express or share our understanding, our experience, to influence the universe external to ourselves. It doesn ' t rely on us as individuals. It ' s the universe, as experienced by everyone. The arts manifest our desire, our attempt to share or influence others through experiences that are peculiar to us as individuals. Let me say it again another way : science provides an understanding of a universal experience, and arts provide a universal understanding of a personal experience. That ' s what we have to think about, that they ' re all part of us, they ' re all part of a continuum. It ' s not just the tools, it ' s not just the sciences, the mathematics and the numerical stuff and the statistics, because we heard, very much on this stage, people talked about music being mathematical. Arts don ' t just use clay, aren ' t the only ones that use clay, light and sound and movement. They use analysis as well. So people might say,"Well, I still like that intuitive versus analytical thing,"because everybody wants to do the right brain, left brain thing. We ' ve all been accused of being right-brained or left-brained at some point in time, depending on who we disagreed with. You know, people say"intuitive"— that ' s like you ' re in touch with nature, in touch with yourself and relationships ; analytical, you put your mind to work. I ' m going to tell you a little secret. You all know this, though. But sometimes people use this analysis idea, that things are outside of ourselves, to say, this is what we ' re going to elevate as the true, most important sciences, right? Then you have artists — and you all know this is true as well — artists will say things about scientists because they say they ' re too concrete, they ' re disconnected from the world. But, we ' ve even had that here on stage, so don ' t act like you don ' t know what I ' m talking about. We had folks talking about the Flat Earth Society and flower arrangers, so there ' s this whole dichotomy that we continue to carry along, even when we know better. And folks say we need to choose either-or. But it would really be foolish to choose either one, intuitive versus analytical.

That ’ s a foolish choice. It ’ s foolish just like trying to choose between being realistic or idealistic. You need both in life. Why do people do this? I ’ m going to quote a molecular biologist, Sydney Brenner, who ’ s 70 years old, so he can say this. He said,”It ’ s always important to distinguish between chastity and impotence.”Now — I want to share with you a little equation, OK? How does understanding science and the arts fit into our lives and what ’ s going on and the things we ’ re talking about here at the design conference? And this is a little thing I came up with : understanding and our resources and our will cause us to have outcomes. Our understanding is our science, our arts, our religion ; how we see the universe around us ; our resources, our money, our labor, our minerals — those things that are out there in the world we have to work with. But more importantly, there ’ s our will. This is our vision, our aspirations of the future, our hopes, our dreams, our **struggles** and our fears. Our successes and our failures influence what we do with all of those. And to me, design and engineering, craftsmanship and skilled labor, are all the things that work on this to have our outcome, which is our human quality of life. Where do we want the world to be? And guess what? Regardless of how we look at this, whether we look at arts and sciences as separate or different, they ’ re both being influenced now and they ’ re both having problems. I did a project called S. E. E. ing the Future : Science, Engineering and Education. It was looking at how to shed light on the most effective use of government funding. We got a bunch of scientists in all stages of their careers. They came to Dartmouth College, where I was teaching. And they talked about, with theologians and financiers : What are some of the issues of public funding for science and engineering research? What ’ s most important about it? There are some ideas that emerged that I think have really powerful parallels to the arts. The first thing they said was that the circumstances that we find ourselves in today in the sciences and engineering that made us world leaders are very different than the ’ 40s, the ’ 50s, and the ’ 60s and the ’ 70s, when we emerged as world leaders, because we ’ re no longer in competition with fascism, with Soviet-style communism. And by the way, that competition wasn ’ t just military ; it included social competition and political competition as well, that allowed us to look at space as one of those **platforms** to prove that our social system was better. Another thing they talked about was that the infrastructure that supports the sciences is becoming obsolete. We look at universities and colleges — small, mid-sized community colleges across the country — their laboratories are becoming obsolete. And this is where we train most of our science workers and our **researchers** — and our teachers, by the way. And there ’ s a media that doesn ’ t support the dissemination of any more than the most mundane and inane of information. There ’ s pseudoscience, crop circles, alien autopsy, haunted houses, or disasters. And that ’ s what we see. This isn ’ t really the information you need to operate in everyday life and figure out how to participate in this democracy and determine what ’ s going on. They also said there ’ s a change in the corporate mentality. Whereas government money had always been there for basic science and engineering research, we also counted on some companies to do some basic research. But what ’ s happened now is companies put more energy into short-term product development than they do in basic engineering and science research. And education is not keeping up. In K through 12, people are taking out wet labs. They think if we put a computer in the room, it ’ s going to take the place of actually mixing the acids or growing the potatoes. And government funding is decreasing in spending, and then they ’ re saying, let ’ s have corporations take over, and that ’ s not true. Government funding should at least do things like recognize cost benefits of basic science and engineering research. We have to know that we have a responsibility as global citizens in this world. We have to look at the education of humans. We need to build our resources today to make sure that they ' re trained so they understand the importance of these things. And we have to support the vitality of science. That doesn ' t mean that everything has to have one thing that ' s going to go on, or that we know exactly what ' s going to be the outcome of it, but that we support the vitality and the intellectual curiosity that goes along [with it]. And if you think about those parallels to the arts — the competition with the Bolshoi Ballet spurred the Joffrey and the New York City Ballet to become better. Infrastructure, museums, theaters, movie houses across the country are disappearing. We have more television stations with less to watch, we have more money spent on rewrites to get old television programs in the movies. We have corporate funding now that, when it goes to support the arts, it almost requires that the product be part of the picture that the artist draws. We have stadiums that are named over and over again by corporations. In Houston, we ' re trying to figure out what to do with that Enron Stadium thing. Fine arts and education in the schools is disappearing, And we have a government that seems like it ' s gutting the NEA and other programs. So we have to really stop and think : What are we trying to do with the sciences and the arts? There ' s a need to revitalize them. We have to pay attention to it. I just want to tell you quickly what I ' m doing — I want to tell you what I ' ve been doing a little bit since... I feel this need to sort of integrate some of the ideas that I ' ve had and run across over time. One of the things that I found out is that there ' s a need to repair the dichotomy between the mind and body as well. My mother always told me, you have to be observant, know what ' s going on in your mind and your body. And as a dancer, I had this tremendous faith in my ability to know my body, just as I knew how to sense colors. Then I went to medical school, and I was supposed to just go on what the machine said about bodies. You know, you would ask patients questions and some people would tell you,"Don ' t listen to what the patient said."We know that patients know and understand their bodies better, but these days we ' re trying to divorce them from that idea. We have to reconcile the patient ' s knowledge of their body with physicians ' measurements. We had someone talk about measuring emotions and getting machines to figure out what to keep us from acting crazy. No, we shouldn ' t measure. We shouldn ' t use machines to measure road rage and then do something to keep us from engaging in it. Maybe we can have machines help us to recognize that we have road rage, and then we need to know how to control that without the machines. We even need to be able to recognize that without the machines. What I ' m very concerned about is : How do we bolster our self-awareness as humans, as biological organisms? Michael Moschen spoke of having to teach and learn how to feel with my eyes, to see with my hands. We have all kinds of possibilities to use our senses by, and that ' s what we have to do. That ' s what I want to do — to try to use bioinstrumentation, those kind of things, to help our senses in what we do. That ' s the work I ' ve been doing now, as a company called BioSentient Corporation. I figured I ' d have to do that **ad**, because I ' m an entrepreneur, and"entrepreneur"says"somebody who does what they want to do, because they ' re not broke enough that they have to get a real job."But that ' s the work I ' m doing, BioSentient Corporation, trying to figure out : How do we integrate these things? Let me finish by saying that my personal design issue for the future is really about integrating ; to think about that intuitive and that analytical. The arts and sciences are not separate. High school physics lesson before you leave : high school physics teacher used to hold up a ball. She would say,"This ball has potential energy. But nothing will happen to it, it can ' t do any work, until I drop it and it changes states."I like to think of ideas as potential energy. They ' re really wonderful, but nothing will happen until we risk putting them into **action**. This conference is filled with wonderful ideas. We ’ re going to share lots of things with people. But nothing ’ s going to happen until we risk putting those ideas into **action**. We need to revitalize the arts and sciences today. We need to take responsibility for the future. We can ’ t hide behind saying it ’ s just for company profits, or it ’ s just a business, or I ’ m an artist or an academician. Here ’ s how you **judge** what you ’ re doing : I talked about that balance between intuitive, analytical. Fran Lebowitz, my favorite cynic, said,”The three questions of greatest concern...”— now I ’ m going to add on to design —”... are : Is it attractive?”That ’ s the intuitive.”Is it amusing?”— the analytical, and,”Does it know its place?”— the balance. Thank you very much.

Text Sample 218: POS Dim 2 – 2015 – Score 11.00 – 2015/t001607.txt

You ’ re looking at a woman who was publicly silent for a decade. Obviously, that ’ s changed, but only recently. It was several months ago that I gave my very first major public talk, at the Forbes”30 Under 30 Summit”â□□ 1, 500 brilliant people, all under the age of 30. That meant that in 1998, the oldest among the group were only 14, and the youngest, just four. I joked with them that some might only have heard of me from rap songs. Yes, I ’ m in rap songs. Almost 40 rap songs. But the night of my speech, a surprising thing happened. At the age of 41, I was hit on by a 27-year-old guy. I know, right? He was charming, and I was flattered, and I declined. You know what his unsuccessful pickup line was? He could make me feel 22 again. I realized, later that night, I ’ m probably the only person over 40 who does not want to be 22 again. At the age of 22, I fell in love with my boss. And at the age of 24, I learned the devastating consequences. Can I see a show of hands of anyone here who didn ’ t make a mistake or do something they regretted at 22? Yep. That ’ s what I thought. So like me, at 22, a few of you may have also taken wrong turns and fallen in love with the wrong person, maybe even your boss. Unlike me, though, your boss probably wasn ’ t the president of the United States of America. Of course, life is full of surprises. Not a day goes by that I ’ m not reminded of my mistake, and I regret that mistake deeply. In 1998, after having been swept up into an improbable romance, I was then swept up into the eye of a political, legal and media maelstrom like we had never seen before. Remember, just a few years earlier, news was consumed from just three places : reading a newspaper or magazine, listening to the radio or watching television. That was it. But that wasn ’ t my fate. Instead, this scandal was brought to you by the digital revolution. That meant we could access all the information we wanted, when we wanted it, anytime, anywhere. And when the story broke in January 1998, it broke online. It was the first time the traditional news was usurped by the internet for a major news story â□□ a click that reverberated around the world. What that meant for me personally was that overnight, I went from being a completely private figure to a publicly humiliated one, worldwide. I was patient zero of losing a personal reputation on a global scale almost instantaneously. This rush to judgment, enabled by technology, led to mobs of virtual stone- throwers. Granted, it was before social media, but people could still comment online, e-mail stories, and, of course, e-mail cruel jokes. News sources plastered photos of me all over to sell newspapers, banner **ads** online, and to keep people tuned to the TV. Do you recall a particular image of me, say, wearing a beret? Now, I admit I made mistakes â□□ especially wearing that beret. But the attention and judgment that I received â□□ not the story, but that I personally received â□□ was unprecedented. I was branded as a tramp, tart, slut, whore, bimbo, and, of course,”that woman.”I was seen by many, but actually known by few. And I get it : it was easy to forget that that woman was dimensional, had a soul and was once unbroken. When this happened to me 17 years ago, there was no name for it. Now we call it”cyberbullying”and”online harassment.”Today, I want to share some of my experience with you, talk about how that experience has helped shape my cultural observations, and how I hope my past experience can lead to a change that results in less suffering for others. In 1998, I lost my reputation and my dignity. I lost almost everything. And I almost lost my life. Let me paint a picture for you. It is September of 1998. I ’ m sitting in a windowless office room inside the Office of the Independent Counsel, underneath humming fluorescent lights. I ’ m listening to the sound of my voice, my voice on surreptitiously taped phone calls that a supposed friend had made the year before. I ’ m here because I ’ ve been legally required to personally authenticate all 20 hours of taped conversation. For the past eight months, the mysterious content of these tapes has hung like the sword of Damocles over my head. I mean, who can remember what they said a year ago? Scared and mortified, I listen, listen as I prattle on about the flotsam and jetsam of the day ; listen as I confess my love for the president, and, of course, my heartbreak ; listen to my sometimes catty, sometimes churlish, sometimes silly self being cruel, unforgiving, uncouth ; listen, deeply, deeply ashamed, to the worst version of myself, a self I don ’ t even recognize. A few days later, the Starr Report is released to Congress, and all of those tapes and transcripts, those stolen words, form a part of it. That people can read the transcripts is horrific enough. But a few weeks later, the audiotapes are aired on TV, and significant portions made available online. The public humiliation was excruciating. Life was almost unbearable. This was not something that happened with regularity back then in 1998, and by”this,”I mean the stealing of people ’ s private words, **actions**, conversations or photos, and then making them public â public without consent, public without context and public without compassion. **Fast-forward** 12 years, to 2010, and now social media has been born. The landscape has sadly become much more populated with instances like mine, whether or not someone actually made a mistake, and now, it ’ s for both public and private people. The consequences for some have become dire, very dire. I was on the phone with my mom in September of 2010, and we were talking about the news of a young college freshman from Rutgers University, named Tyler Clementi. Sweet, sensitive, creative Tyler was secretly webcammed by his roommate while being intimate with another man. When the online world learned of this incident, the ridicule and cyberbullying ignited. A few days later, Tyler jumped from the George Washington Bridge to his death. He was 18. My mom was beside herself about what happened to Tyler and his family, and she was gutted with pain in a way that I just couldn ’ t quite understand. And then eventually, I realized she was reliving 1998, reliving a time when she sat by my bed every night, reliving â sorry â reliving a time when she made me shower with the bathroom door open, and reliving a time when both of my parents feared that I would be humiliated to death, literally. Today, too many parents haven ’ t had the chance to step in and rescue their loved ones. Too many have learned of their child ’ s suffering and humiliation after it was too late. Tyler ’ s tragic, senseless death was a turning point for me. It served to recontextualize my experiences, and I then began to look at the world of humiliation and bullying around me and see something different. In 1998, we had no way of knowing where this brave new technology called the internet would take us. Since then, it has connected people in unimaginable ways â joining lost siblings, saving lives, launching revolutions... But the darkness, cyberbullying, and slut-shaming that I experienced had mushroomed. Every day online, people â especially young people, who are not developmentally equipped to handle this â are so abused and humiliated that they can ’ t imagine living to the next day. And some, tragically, don ’ t. And there ’ s nothing virtual about that. Childline, a UK nonprofit that ’ s focused on helping young people on various issues, released a staggering statistic late last year : from 2012 to 2013, there was an 87 percent increase in calls and e-mails related to cyber-bullying. A meta-analysis done out of the Netherlands showed that for the first time, cyberbullying was leading to suicidal ideations more significantly than offline bullying. And you know, what shocked me â although it shouldn ’ t have â was other research last year that determined humiliation was a more intensely felt emotion than either **happiness** or even anger. Cruelty to others is nothing new. But online, technologically enhanced shaming is amplified, uncontained and permanently accessible. The echo of embarrassment used to extend only as far as your family, village, school or community. But now, it ’ s the online community too. Millions of people, often anonymously, can stab you with their words, and that ’ s a lot of pain. And there are no perimeters around how many people can publicly **observe** you and put you in a public stockade. There is a very personal price to public humiliation, and the growth of the internet has jacked up that price. For nearly two decades now, we have slowly been sowing the seeds of shame and public humiliation in our cultural soil, both on- and offline. Gossip websites, paparazzi, reality programming, politics, news outlets and sometimes hackers all traffic in shame. It ’ s led to desensitization and a permissive environment online, which lends itself to trolling, invasion of **privacy** and cyberbullying. This shift has created what Professor Nicolaus Mills calls”a culture of humiliation.”Consider a few prominent examples just from the past six months alone. Snapchat, the **service** which is used mainly by younger generations and claims that its messages only have the life span of a few seconds. You can imagine the range of content that that gets. A third-party app which Snapchatters use to preserve the life span of the messages was hacked, and 100, 000 personal conversations, photos and videos were leaked online, to now have a life span of forever. Jennifer Lawrence and several other actors had their iCloud accounts hacked, and private, intimate, nude photos were plastered across the internet without their permission. One gossip website had over five million hits for this one story. And what about the Sony Pictures cyberhacking? The documents which received the most attention were private e-mails that had maximum public embarrassment value. But in this culture of humiliation, there is another kind of price tag attached to public shaming. The price does not measure the cost to the victim, which Tyler and too many others â notably, women, minorities and members of the LGBTQ community â have paid, but the price measures the profit of those who prey on them. This invasion of others is a raw material, efficiently and ruthlessly mined, packaged and sold at a profit. A marketplace has emerged where public humiliation is a commodity, and shame is an industry. How is the money made? Clicks. The more shame, the more clicks. The more clicks, the more advertising dollars. We ’ re in a dangerous cycle. The more we click on this kind of gossip, the more numb we get to the human lives behind it. And the more numb we get, the more we click. All the while, someone is making money off of the back of someone else ’ s suffering. With every click, we make a choice. The more we saturate our culture with public shaming, the more accepted it is, the more we will see behavior like cyberbullying, trolling, some forms of hacking and online harassment. Why? Because they all have humiliation at their cores. This behavior is a symptom of the culture we ’ ve created. Just think about it. Changing behavior begins with evolving beliefs. We ’ ve seen that to be true with racism, homophobia and plenty of other **biases**, today and in the past. As we ’ ve changed beliefs about same-sex marriage, more people have been offered equal freedoms. When we began valuing sustainability, more people began to recycle. So as far as our culture of humiliation goes, what we need is a cultural revolution. Public shaming as a blood sport has to stop, and it ’ s time for an intervention on the internet and in our culture. The shift begins with something simple, but it ’ s not easy. We need to return to a long-held value of compassion, compassion and **empathy**. Online, we ’ ve got a compassion deficit, an **empathy** crisis. **Researcher** BrenĂŠ Brown said, and I quote,”Shame can ’ t survive **empathy**.”Shame cannot survive **empathy**. I ’ ve seen some very dark days in my life. It was the compassion and **empathy** from my family, friends, professionals and sometimes even strangers that saved me. Even **empathy** from one person can make a difference. The theory of minority influence, proposed by social psychologist Serge Moscovici, says that even in small numbers, when there ’ s consistency over time, change can happen. In the online world, we can foster minority influence by becoming upstanders. To become an upstander means instead of bystander apathy, we can post a positive comment for someone or report a bullying situation. Trust me, compassionate comments help abate the negativity. We can also counteract the culture by supporting organizations that deal with these kinds of issues, like the Tyler Clementi Foundation in the US ; in the UK, there ’ s Anti-Bullying Pro ; and in Australia, there ’ s PROJECT ROCKIT. We talk a lot about our right to freedom of **expression**. But we need to talk more about our responsibility to freedom of **expression**. We all want to be heard, but let ’ s acknowledge the difference between speaking up with intention and speaking up for attention. The internet is the superhighway for the id. But online, showing **empathy** to others benefits us all and helps create a safer and better world. We need to communicate online with compassion, consume news with compassion and click with compassion. Just imagine walking a mile in someone else ’ s headline. I ’ d like to end on a personal note. In the past nine months, the question I ’ ve been asked the most is”Why?”Why now? Why was I sticking my head above the parapet? You can read between the lines in those questions, and the answer has nothing to do with politics. The top-note answer was and is”Because it ’ s time.”Time to stop tiptoeing around my past, time to stop living a life of opprobrium and time to take back my narrative. It ’ s also not just about saving myself. Anyone who is suffering from shame and public humiliation needs to know one thing : You can survive it. I know it ’ s hard. It may not be painless, quick or easy, but you can insist on a different ending to your story. Have compassion for yourself. We all deserve compassion and to live both online and off in a more compassionate world. Thank you for listening.

Text Sample 219: POS Dim 2 – 2015 – Score 9.00 – 2015/t001483.txt

A year ago, we were invited by the Swiss Embassy in Berlin to present our art projects. We are used to invitations, but this invitation really thrilled us. The Swiss Embassy in Berlin is **special**. It is the only old building in the government district that was not destroyed during the Second World War, and it sits right next to the Federal Chancellery. No one is closer to Chancellor Merkel than the Swiss diplomats. The government district in Berlin also contains the Reichstag — Germany ’ s parliament — and the Brandenburg Gate, and right next to the gate there are other embassies, in particular the US and the British Embassy. Although Germany is an advanced democracy, citizens are limited in their constitutional rights in its government district. The right of assembly and the right to demonstrate are restricted there. And this is interesting from an artistic point of view. The opportunities to exercise participation and to express oneself are always bound to a certain order and always subject to a specific regulation. With an awareness of the dependencies of these regulations, we can gain a new perspective. The given terms and conditions shape our perception, our **actions** and our lives. And this is crucial in another context. Over the last couple of years, we learned that from the roofs of the US and the British Embassy, the secret **services** have been listening to the entire district, including the **mobile** phone of Angela Merkel. The antennas of the British GCHQ are hidden in a white cylindrical radome, while the listening post of the American NSA is covered by radio transparent screens. But how to address these hidden and disguised forces? With my colleague, Christoph Wachter, we accepted the invitation of the Swiss Embassy. And we used this opportunity to exploit the specific situation. If people are spying on us, it stands to reason that they have to listen to what we are saying. On the roof of the Swiss Embassy, we installed a series of antennas. They weren ’ t as sophisticated as those used by the Americans and the British. They were makeshift can antennas, not camouflaged but totally obvious and visible. The Academy of Arts joined the project, and so we built another large antenna on their rooftop, exactly between the listening posts of the NSA and the GCHQ. Never have we been **observed** in such detail while building an art installation. A helicopter circled over our heads with a camera registering each and every move we made, and on the roof of the US Embassy, security officers patrolled. Although the government district is governed by a strict police order, there are no specific laws relating to digital communication. Our installation was therefore perfectly legal, and the Swiss Ambassador informed Chancellor Merkel about it. We named the project”Can You Hear Me?”The antennas created an open and free Wi-Fi communication network in which anyone who wanted to would be able to participate using any Wi-Fi-enabled device without any hindrance, and be able to send messages to those listening on the frequencies that were being intercepted. Text messages, voice chat, file sharing — anything could be sent anonymously. And people did communicate. Over 15, 000 messages were sent. Here are some examples.”Hello world, hello Berlin, hello NSA, hello GCHQ.””NSA Agents, Do the Right Thing! Blow the whistle!””This is the NSA. In God we trust. All others we track!!!!!””#@nonymous is watching #NSA #GCHQ - we are part of your organizations. # expect us. We will #shutdown””This is the NSA ’ s Achilles heel. Open Networks.””Agents, what twisted story of yourself will you tell your grandchildren?””@NSA My neighbors are noisy. Please send a drone strike.””Make Love, Not cyberwar.”We invited the embassies and the government departments to participate in the open network, too, and to our surprise, they did. Files appeared on the network, including classified documents leaked from the parliamentary investigation commission, which highlights that the free exchange and discussion of vital information is starting to become difficult, even for members of a parliament. We also organized guided tours to experience and sound out the power constellations on-site. The tours visited the restricted zones around the embassies, and we discussed the potential and the highlights of communication. If we become aware of the constellation, the terms and conditions of communication, it not only broadens our horizon, it allows us to look behind the regulations that limit our worldview, our specific social, political or aesthetic conventions. Let ’ s look at an actual example. The fate of people living in the makeshift settlements on the outskirts of Paris is hidden and faded from view. It ’ s a vicious circle. It ’ s not poverty, not racism, not exclusion that are new. What is new is how these realities are hidden and how people are made invisible in an age of global and overwhelming communication and exchange. Such makeshift settlements are considered illegal, and therefore those living in them don ’ t have a chance of making their voices heard. On the contrary, every time they appear, every time they risk becoming visible, merely gives grounds for further persecution, expulsion and suppression. What interested us was how we could come to know this hidden side. We were searching for an interface and we found one. It ’ s not a digital interface, but a physical one : it ’ s a hotel. We named the project”Hotel Gelem.”Together with Roma families, we created several Hotel Gelems in Europe, for example, in Freiburg in Germany, in Montreuil near Paris, and also in the Balkans. These are real hotels. People can stay there. But they aren ’ t a commercial enterprise. They are a symbol. You can go online and ask for a personal invitation to come and live for a few days in the Hotel Gelem, in their homes, eating, working and living with the Roma families. Here, the Roma families are not the travelers ; the visitors are. Here, the Roma families are not a minority ; the visitors are. The point is not to make judgments, but rather to find out about the context that determines these disparate and seemingly insurmountable contradictions. In the world of globalization, the continents are drifting closer to each other. Cultures, goods and people are in permanent exchange, but at the same time, the gap between the world of the privileged and the world of the excluded is growing. We were recently in Australia. For us, it was no problem to enter the country. We have European passports, visas and air tickets. But asylum seekers who arrive by boat in Australia are deported or taken to prison. The interception of the boats and the disappearance of the people into the detention system are veiled by the Australian authorities. These procedures are declared to be secret military operations. After dramatic escapes from crisis zones and war zones, men, women and children are detained by Australia without **trial**, sometimes for years. During our stay, however, we managed to reach out and work with asylum seekers who were imprisoned, despite strict screening and **isolation**. From these contexts was born an installation in the art space of the Queensland University of Technology in Brisbane. On the face of it, it was a very simple installation. On the floor, a stylized compass gave the direction to each immigration detention center, accompanied by the distance and the name of the immigration facility. But the exhibition step came in the form of connectivity. Above every floor marking, there was a headset. Visitors were offered the opportunity to talk directly to a refugee who was or had been imprisoned in a specific detention facility and engage in a personal conversation. In the protected context of the art exhibition, asylum seekers felt free to talk about themselves, their story and their situation, without fear of consequences. Visitors immersed themselves in long conversations about families torn apart, about dramatic escapes from war zones, about suicide attempts, about the fate of children in detention. Emotions ran deep. Many wept. Several revisited the exhibition. It was a powerful experience. Europe is now facing a stream of migrants. The situation for the asylum seekers is made worse by contradictory policies and the temptation of militarized responses. We have also established communication systems in remote refugee centers in Switzerland and Greece. They are all about providing basic information — weather forecasts, legal information, guidance. But they are significant. Information on the Internet that could ensure survival along dangerous routes is being censored, and the provision of such information is becoming increasingly criminalized. This brings us back to our network and to the antennas on the roof of the Swiss Embassy in Berlin and the”Can You Hear Me?”project. We should not take it for granted to be boundlessly connected. We should start making our own connections, fighting for this idea of an equal and globally interconnected world. This is essential to overcome our speechlessness and the separation provoked by rival political forces. It is only in truly exposing ourselves to the transformative power of this experience that we can overcome prejudice and exclusion. Thank you. Bruno Giussani : Thank you, Mathias. The other half of your artistic duo is also here. Christoph Wachter, come onstage. First, tell me just a detail : the name of the hotel is not a random name. Gelem means something specific in the Roma language. Mathias Jud : Yes,”Gelem, Gelem”is the title of the Romani hymn, the official, and it means”I went a long way.”BG : That ’ s just to add the detail to your talk. But you two traveled to the island of Lesbos very recently, you ’ re just back a couple of days ago, in Greece, where thousands of refugees are arriving and have been arriving over the last few months. What did you see there and what did you do there? Christoph Wachter : Well, Lesbos is one of the Greek islands close to Turkey, and during our stay, many asylum seekers arrived by boat on overcrowded dinghies, and after landing, they were left completely on their own. They are denied many **services**. For example, they are not allowed to buy a bus ticket or to rent a hotel room, so many families literally sleep in the streets. And we installed networks there to allow basic communication, because I think, I believe, it ’ s not only that we have to speak about the refugees, I think we need to start talking to them. And by doing so, we can realize that it is about human beings, about their lives and their **struggle** to survive. BG : And allow them to talk as well. Christoph, thank you for coming to TED. Mathias, thank you for coming to TED and sharing your story.

Text Sample 220: POS Dim 2 – 2015 – Score 9.00 – 2015/t001243.txt

You are a high-ranking military **service** member deployed to Afghanistan. You are responsible for the lives of hundreds of men and women, and your base is under attack. Incoming mortar rounds are exploding all around you. **Struggling** to see through the dust and the smoke, you do your best to assist the wounded and then crawl to a **nearby** bunker. Conscious but dazed by the blasts, you lay on your side and attempt to process what has just happened. As you regain your vision, you see a bloody face staring back at you. The image is terrifying, but you quickly come to understand it ’ s not real. This vision continues to visit you multiple times a day and in your sleep. You choose not to tell anyone for fear of losing your job or being seen as weak. You give the vision a name, Bloody Face in Bunker, and call it BFIB for short. You keep BFIB locked away in your mind, secretly haunting you, for the next seven years. Now close your eyes. Can you see BFIB? If you can, you ’ re beginning to see the face of the invisible wounds of war, commonly known as post-traumatic **stress** disorder and traumatic brain injury. While I can ’ t say I have post-traumatic **stress** disorder, I ’ ve never been a stranger to it. When I was a little girl, I would visit my grandparents every summer. It was my grandfather who introduced me to the effects of combat on the psyche. While my grandfather was serving as a Marine in the Korean War, a bullet pierced his neck and rendered him unable to cry out. He watched as a corpsman passed him over, declaring him a goner, and then leaving him to die. Years later, after his physical wounds had healed and he ’ d returned home, he rarely spoke of his experiences in waking life. But at night I would hear him shouting obscenities from his room down the hall. And during the day I would announce myself as I entered the room, careful not to startle or agitate him. He lived out the remainder of his days **isolated** and tight-lipped, never finding a way to express himself, and I didn ’ t yet have the tools to guide him. I wouldn ’ t have a name for my grandfather ’ s condition until I was in my 20s. Seeking a graduate degree in art therapy, I naturally gravitated towards the study of trauma. And while sitting in class learning about post-traumatic **stress** disorder, or PTSD for short, my **mission** to help **service** members who suffered like my grandfather began to take form. We ' ve had various names for post-traumatic **stress** throughout the history of war : homesickness, soldier ' s heart, shell shock, thousand-yard stare, for instance. And while I was pursuing my degree, a new war was raging, and thanks to modern body armor and military vehicles, **service** members were surviving blast injuries they wouldn ' t have before. But the invisible wounds were reaching new levels, and this pushed military doctors and **researchers** to try and truly understand the effects that traumatic brain injury, or TBI, and PTSD have on the brain. Due to advances in technology and neuroimaging, we now know there ' s an actual shutdown in the Broca ' s, or the speech-language area of the brain, after an individual experiences trauma. This physiological change, or speechless terror as it ' s often called, coupled with mental health stigma, the fear of being **judged** or misunderstood, possibly even removed from their current duties, has led to the invisible **struggles** of our servicemen and women. Generation after generation of veterans have chosen not to talk about their experiences, and suffer in solitude. I had my work cut out for me when I got my first job as an art therapist at the nation ' s largest military medical center, Walter Reed. After working for a few years on a locked-in patient psychiatric unit, I eventually transferred to the National Intrepid Center of Excellence, NICoE, which leads TBI care for active duty **service** members. Now, I believed in art therapy, but I was going to have to convince **service** members, big, tough, strong, manly military men, and some women too, to give art-making as a psychotherapeutic intervention a try. The results have been nothing short of spectacular. Vivid, symbolic artwork is being created by our servicemen and women, and every work of art tells a story. We ' ve **observed** that the process of art therapy bypasses the speech-language issue with the brain. Art-making accesses the same sensory areas of the brain that encode trauma. **Service** members can use the art-making to work through their experiences in a nonthreatening way. They can then apply words to their physical creations, reintegrating the left and the right hemispheres of the brain. Now, we ' ve seen this can work with all forms of art — drawing, painting, collage — but what seems to have the most impact is mask-making. Finally, these invisible wounds don ' t just have a name, they have a face. And when **service** members create these masks, it allows them to come to grips, literally, with their trauma. And it ' s amazing how often that enables them to break through the trauma and start to heal. Remember BFIB? That was a real experience for one of my patients, and when he created his mask, he was able to let go of that haunting image. Initially, it was a daunting process for the **service** member, but eventually he began to think of BFIB as the mask, not his internal wound, and he would go to leave each session, he would hand me the mask, and say,"Melissa, take care of him."Eventually, we placed BFIB in a box to further contain him, and when the **service** member went to leave the NICoE, he chose to leave BFIB behind. A year later, he had only seen BFIB twice, and both times BFIB was smiling and the **service** member didn ' t feel anxious. Now, whenever that **service** member is haunted by some traumatic memory, he continues to paint. Every time he paints these disturbing images, he sees them less or not at all. Philosophers have told us for thousands of years that the power to create is very closely linked to the power to destroy. Now science is showing us that the part of the brain that registers a traumatic wound can be the part of the brain where healing happens too. And art therapy is showing us how to make that connection. We asked one of our **service** members to describe how mask-making impacted his treatment, and this is what he had to say. Service Member : You sort of just zone out into the mask. You zone out into the drawing, and for me, it just released the block, so I was able to do it. And then when I looked at it after two days, I was like,"Holy crap, here ' s the picture, here ' s the key, here ' s the puzzle,"and then from there it just soared. I mean, from there my treatment just when out of sight, because they were like, Kurt, explain this, explain this. And for the first time in 23 years, I could actually talk about stuff openly to, like, anybody. I could talk to you about it right now if I wanted to, because it unlocked it. It ' s just amazing. And it allowed me to put 23 years of PTSD and TBI stuff together in one place that has never happened before. Sorry. Melissa Walker : Over the past five years, we ' ve had over 1, 000 masks made. It ' s pretty amazing, isn ' t it? Thank you. I wish I could have shared this process with my grandfather, but I know that he would be thrilled that we are finding ways to help today ' s and tomorrow ' s **service** members heal, and finding the resources within them that they can call upon to heal themselves. Thank you.

Text Sample 221: POS Dim 2 – 2014 – Score 12.00 – 2014/t001880.txt

Chris Anderson : The rights of citizens, the future of the Internet. So I would like to welcome to the TED stage the man behind those revelations, Ed Snowden. Ed is in a remote location somewhere in Russia controlling this bot from his laptop, so he can see what the bot can see. Ed, welcome to the TED stage. What can you see, as a matter of fact? Edward Snowden : Ha, I can see everyone. This is amazing. CA : Ed, some questions for you. You ' ve been called many things in the last few months. You ' ve been called a whistleblower, a traitor, a hero. What words would you describe yourself with? ES : You know, everybody who is involved with this debate has been **struggling** over me and my personality and how to describe me. But when I think about it, this isn ' t the question that we should be **struggling** with. Who I am really doesn ' t matter at all. If I ' m the worst person in the world, you can hate me and move on. What really matters here are the issues. What really matters here is the kind of government we want, the kind of Internet we want, the kind of relationship between people and societies. And that ' s what I ' m hoping the debate will move towards, and we ' ve seen that increasing over time. If I had to describe myself, I wouldn ' t use words like"hero."I wouldn ' t use"patriot,"and I wouldn ' t use"traitor."I ' d say I ' m an American and I ' m a citizen, just like everyone else. CA : So just to give some context for those who don ' t know the whole story — — this time a year ago, you were stationed in Hawaii working as a consultant to the NSA. As a sysadmin, you had access to their systems, and you began revealing certain classified documents to some handpicked journalists leading the way to June ' s revelations. Now, what propelled you to do this? ES : You know, when I was sitting in Hawaii, and the years before, when I was working in the intelligence community, I saw a lot of things that had disturbed me. We do a lot of good things in the intelligence community, things that need to be done, and things that help everyone. But there are also things that go too far. There are things that shouldn ' t be done, and decisions that were being made in secret without the public ' s awareness, without the public ' s consent, and without even our representatives in government having knowledge of these programs. When I really came to **struggle** with these issues, I thought to myself, how can I do this in the most responsible way, that **maximizes** the public benefit while minimizing the risks? And out of all the solutions that I could come up with, out of going to Congress, when there were no laws, there were no legal protections for a private employee, a contractor in intelligence like myself, there was a risk that I would be buried along with the information and the public would never find out. But the First Amendment of the United States Constitution guarantees us a free press for a reason, and that ' s to enable an adversarial press, to challenge the government, but also to work together with the government, to have a dialogue and debate about how we can inform the public about matters of vital importance without putting our national security at risk. And by working with journalists, by giving all of my information back to the American people, rather than trusting myself to make the decisions about **publication**, we ’ ve had a robust debate with a deep investment by the government that I think has resulted in a benefit for everyone. And the risks that have been threatened, the risks that have been played up by the government have never materialized. We ’ ve never seen any evidence of even a single instance of specific harm, and because of that, I ’ m comfortable with the decisions that I made. CA : So let me show the audience a couple of examples of what you revealed. If we could have a slide up, and Ed, I don ’ t know whether you can see, the slides are here. This is a slide of the PRISM program, and maybe you could tell the audience what that was that was revealed. ES : The best way to understand PRISM, because there ’ s been a little bit of controversy, is to first talk about what PRISM isn ’ t. Much of the debate in the U. S. has been about metadata. They ’ ve said it ’ s just metadata, it ’ s just metadata, and they ’ re talking about a specific legal authority called Section 215 of the Patriot Act. That allows sort of a warrantless wiretapping, mass surveillance of the entire country ’ s phone records, things like that — who you ’ re talking to, when you ’ re talking to them, where you traveled. These are all metadata events. PRISM is about content. It ’ s a program through which the government could compel corporate America, it could deputize corporate America to do its dirty work for the NSA. And even though some of these companies did resist, even though some of them — I believe Yahoo was one of them — challenged them in court, they all lost, because it was never tried by an open court. They were only tried by a secret court. And something that we ’ ve seen, something about the PRISM program that ’ s very concerning to me is, there ’ s been a talking point in the U. S. government where they ’ ve said 15 federal **judges** have reviewed these programs and found them to be lawful, but what they don ’ t tell you is those are secret **judges** in a secret court based on secret interpretations of law that ’ s considered 34, 000 warrant requests over 33 years, and in 33 years only rejected 11 government requests. These aren ’ t the people that we want deciding what the role of corporate America in a free and open Internet should be. CA : Now, this slide that we ’ re showing here shows the dates in which different technology companies, Internet companies, are alleged to have joined the program, and where data collection began from them. Now, they have denied collaborating with the NSA. How was that data collected by the NSA? ES : Right. So the NSA ’ s own slides refer to it as direct access. What that means to an actual NSA analyst, someone like me who was working as an intelligence analyst targeting, Chinese cyber-hackers, things like that, in Hawaii, is the provenance of that data is directly from their servers. It doesn ’ t mean that there ’ s a group of company representatives sitting in a smoky room with the NSA palling around and making back-room deals about how they ’ re going to give this stuff away. Now each company handles it different ways. Some are responsible. Some are somewhat less responsible. But the bottom line is, when we talk about how this information is given, it ’ s coming from the companies themselves. It ’ s not stolen from the lines. But there ’ s an important thing to remember here : even though companies pushed back, even though companies demanded, hey, let ’ s do this through a warrant process, let ’ s do this where we actually have some sort of legal review, some sort of basis for handing over these users ’ data, we saw stories in the Washington Post last year that weren ’ t as well reported as the PRISM story that said the NSA broke in to the data center communications between Google to itself and Yahoo to itself. So even these companies that are cooperating in at least a compelled but hopefully lawful manner with the NSA, the NSA isn ' t satisfied with that, and because of that, we need our companies to work very hard to guarantee that they ' re going to represent the interests of the user, and also advocate for the rights of the users. And I think over the last year, we ' ve seen the companies that are named on the PRISM slides take great strides to do that, and I encourage them to continue. CA : What more should they do? ES : The biggest thing that an Internet company in America can do today, right now, without consulting with lawyers, to protect the rights of users worldwide, is to enable SSL web encryption on every page you visit. The reason this matters is today, if you go to look at a copy of"1984"on Amazon. com, the NSA can see a record of that, the Russian intelligence **service** can see a record of that, the Chinese **service** can see a record of that, the French **service**, the German **service**, the **services** of Andorra. They can all see it because it ' s unencrypted. The world ' s library is Amazon. com, but not only do they not support encryption by default, you cannot choose to use encryption when browsing through books. This is something that we need to change, not just for Amazon, I don ' t mean to single them out, but they ' re a great example. All companies need to move to an encrypted browsing habit by default for all users who haven ' t taken any **action** or picked any **special** methods on their own. That ' ll increase the **privacy** and the rights that people enjoy worldwide. CA : Ed, come with me to this part of the stage. I want to show you the next slide here. This is a program called Boundless Informant. What is that? ES : So, I ' ve got to give credit to the NSA for using appropriate names on this. This is one of my favorite NSA cryptonyms. Boundless Informant is a program that the NSA hid from Congress. The NSA was previously asked by Congress, was there any ability that they had to even give a rough ballpark estimate of the amount of American communications that were being intercepted. They said no. They said, we don ' t track those stats, and we can ' t track those stats. We can ' t tell you how many communications we ' re intercepting around the world, because to tell you that would be to invade your **privacy**. Now, I really appreciate that sentiment from them, but the reality, when you look at this slide is, not only do they have the capability, the capability already exists. It ' s already in place. The NSA has its own internal data format that tracks both ends of a communication, and if it says, this communication came from America, they can tell Congress how many of those communications they have today, right now. And what Boundless Informant tells us is more communications are being intercepted in America about Americans than there are in Russia about Russians. I ' m not sure that ' s what an intelligence agency should be aiming for. CA : Ed, there was a story broken in the Washington Post, again from your data. The headline says,"NSA broke **privacy** rules thousands of times per year."Tell us about that. ES : We also heard in Congressional testimony last year, it was an amazing thing for someone like me who came from the NSA and who ' s seen the actual internal documents, knows what ' s in them, to see officials testifying under oath that there had been no abuses, that there had been no violations of the NSA ' s rules, when we knew this story was coming. But what ' s especially interesting about this, about the fact that the NSA has violated their own rules, their own laws thousands of times in a single year, including one event by itself, one event out of those 2, 776, that affected more than 3, 000 people. In another event, they intercepted all the calls in Washington, D. C., by accident. What ' s amazing about this, this report, that didn ' t get that much attention, is the fact that not only were there 2, 776 abuses, the chairman of the Senate Intelligence Committee, Dianne Feinstein, had not seen this report until the Washington Post contacted her asking for comment on the report. And she then requested a copy from the NSA and received it, but had never seen this before that. What does that say about the state of oversight in American intelligence when the chairman of the Senate Intelligence Committee has no idea that the rules are being broken thousands of times every year? CA : Ed, one response to this whole debate is this : Why should we care about all this surveillance, honestly? I mean, look, if you ’ ve done nothing wrong, you ’ ve got nothing to worry about. What ’ s wrong with that point of view? ES : Well, so the first thing is, you ’ re giving up your rights. You ’ re saying hey, you know, I don ’ t think I ’ m going to need them, so I ’ m just going to trust that, you know, let ’ s get rid of them, it doesn ’ t really matter, these guys are going to do the right thing. Your rights matter because you never know when you ’ re going to need them. Beyond that, it ’ s a part of our cultural identity, not just in America, but in Western societies and in democratic societies around the world. People should be able to pick up the phone and to call their family, people should be able to send a text message to their loved ones, people should be able to buy a book online, they should be able to travel by train, they should be able to buy an airline ticket without wondering about how these events are going to look to an agent of the government, possibly not even your government years in the future, how they ’ re going to be misinterpreted and what they ’ re going to think your intentions were. We have a right to **privacy**. We require warrants to be based on probable cause or some kind of individualized suspicion because we recognize that trusting anybody, any government authority, with the entirety of human communications in secret and without oversight is simply too great a temptation to be ignored. CA : Some people are furious at what you ’ ve done. I heard a quote recently from Dick Cheney who said that Julian Assange was a flea bite, Edward Snowden is the lion that bit the head off the dog. He thinks you ’ ve committed one of the worst acts of betrayal in American history. What would you say to people who think that? ES : Dick Cheney ’ s really something else. Thank you. I think it ’ s amazing, because at the time Julian Assange was doing some of his greatest work, Dick Cheney was saying he was going to end governments worldwide, the skies were going to ignite and the seas were going to boil off, and now he ’ s saying it ’ s a flea bite. So we should be suspicious about the same sort of overblown claims of damage to national security from these kind of officials. But let ’ s assume that these people really believe this. I would argue that they have kind of a narrow conception of national security. The prerogatives of people like Dick Cheney do not keep the nation safe. The public interest is not always the same as the national interest. Going to war with people who are not our enemy in places that are not a threat doesn ’ t make us safe, and that applies whether it ’ s in Iraq or on the Internet. The Internet is not the enemy. Our economy is not the enemy. American businesses, Chinese businesses, and any other company out there is a part of our society. It ’ s a part of our interconnected world. There are ties of fraternity that bond us together, and if we destroy these bonds by undermining the standards, the security, the manner of behavior, that nations and citizens all around the world expect us to abide by. CA : But it ’ s alleged that you ’ ve stolen 1. 7 million documents. It seems only a few hundred of them have been shared with journalists so far. Are there more revelations to come? ES : There are absolutely more revelations to come. I don ’ t think there ’ s any question that some of the most important reporting to be done is yet to come. CA : Come here, because I want to ask you about this particular revelation. Come and take a look at this. I mean, this is a story which I think for a lot of the techies in this room is the single most shocking thing that they have heard in the last few months. It ’ s about a program called”Bullrun.”Can you explain what that is? ES : So Bullrun, and this is again where we ’ ve got to thank the NSA for their candor, this is a program named after a Civil War battle. The British counterpart is called Edgehill, which is a U. K. civil war battle. And the reason that I believe they ’ re named this way is because they target our own infrastructure. They ’ re programs through which the NSA intentionally misleads corporate partners. They tell corporate partners that these are safe standards. They say hey, we need to work with you to secure your systems, but in reality, they ’ re giving bad advice to these companies that makes them degrade the security of their **services**. They ’ re building in backdoors that not only the NSA can exploit, but anyone else who has time and money to research and find it can then use to let themselves in to the world ’ s communications. And this is really dangerous, because if we lose a single standard, if we lose the trust of something like SSL, which was specifically targeted by the Bullrun program, we will live a less safe world overall. We won ’ t be able to access our banks and we won ’ t be able to access commerce without worrying about people monitoring those communications or subverting them for their own ends. CA : And do those same decisions also potentially open America up to cyberattacks from other sources? ES : Absolutely. One of the problems, one of the dangerous legacies that we ’ ve seen in the post-9 / 11 era, is that the NSA has traditionally worn two hats. They ’ ve been in charge of offensive operations, that is hacking, but they ’ ve also been in charge of defensive operations, and traditionally they ’ ve always prioritized defense over offense based on the principle that American secrets are simply worth more. If we hack a Chinese business and steal their secrets, if we hack a government office in Berlin and steal their secrets, that has less value to the American people than making sure that the Chinese can ’ t get access to our secrets. So by reducing the security of our communications, they ’ re not only putting the world at risk, they ’ re putting America at risk in a fundamental way, because intellectual property is the basis, the foundation of our economy, and if we put that at risk through weak security, we ’ re going to be paying for it for years. CA : But they ’ ve made a calculation that it was worth doing this as part of America ’ s defense against terrorism. Surely that makes it a price worth paying. ES : Well, when you look at the results of these programs in stopping terrorism, you will see that that ’ s unfounded, and you don ’ t have to take my word for it, because we ’ ve had the first open court, the first federal court that ’ s reviewed this, outside the secrecy arrangement, called these programs Orwellian and likely unconstitutional. Congress, who has access to be briefed on these things, and now has the desire to be, has produced bills to reform it, and two independent White House panels who reviewed all of the classified evidence said these programs have never stopped a single terrorist attack that was imminent in the United States. So is it really terrorism that we ’ re stopping? Do these programs have any value at all? I say no, and all three branches of the American government say no as well. CA : I mean, do you think there ’ s a deeper motivation for them than the war against terrorism? ES : I ’ m sorry, I couldn ’ t hear you, say again? CA : Sorry. Do you think there ’ s a deeper motivation for them other than the war against terrorism? ES : Yeah. The bottom line is that terrorism has always been what we in the intelligence world would call a cover for **action**. Terrorism is something that provokes an emotional response that allows people to rationalize authorizing powers and programs that they wouldn ’ t give otherwise. The Bullrun and Edgehill-type programs, the NSA asked for these authorities back in the 1990s. They asked the FBI to go to Congress and make the case. The FBI went to Congress and did make the case. But Congress and the American people said no. They said, it ’ s not worth the risk to our economy. They said it ’ s worth too much damage to our society to justify the gains. But what we saw is, in the post-9 / 11 era, they used secrecy and they used the justification of terrorism to start these programs in secret without asking Congress, without asking the American people, and it ’ s that kind of government behind closed doors that we need to guard ourselves against, because it makes us less safe, and it offers no value. CA : Okay, come with me here for a sec, because I ’ ve got a more personal question for you. Speaking of terror, most people would find the situation you ’ re in right now in Russia pretty terrifying. You obviously heard what happened, what the treatment that Bradley Manning got, Chelsea Manning as now is, and there was a story in Buzzfeed saying that there are people in the intelligence community who want you dead. How are you coping with this? How are you coping with the fear? ES : It ’ s no mystery that there are governments out there that want to see me dead. I ’ ve made clear again and again and again that I go to sleep every morning thinking about what I can do for the American people. I don ’ t want to harm my government. I want to help my government, but the fact that they are willing to completely ignore due process, they ’ re willing to declare guilt without ever seeing a **trial**, these are things that we need to work against as a society, and say hey, this is not appropriate. We shouldn ’ t be threatening dissidents. We shouldn ’ t be criminalizing journalism. And whatever part I can do to see that end, I ’ m happy to do despite the risks. CA : So I ’ d actually like to get some feedback from the audience here, because I know there ’ s widely differing reactions to Edward Snowden. Suppose you had the following two choices, right? You could view what he did as fundamentally a reckless act that has endangered America or you could view it as fundamentally a heroic act that will work towards America and the world ’ s long-term good? Those are the two choices I ’ ll give you. I ’ m curious to see who ’ s willing to vote with the first of those, that this was a reckless act? There are some hands going up. Some hands going up. It ’ s hard to put your hand up when the man is standing right here, but I see them. ES : I can see you. CA : And who goes with the second choice, the fundamentally heroic act? And I think it ’ s true to say that there are a lot of people who didn ’ t show a hand and I think are still thinking this through, because it seems to me that the debate around you doesn ’ t split along traditional political lines. It ’ s not left or right, it ’ s not really about pro-government, libertarian, or not just that. Part of it is almost a generational issue. You ’ re part of a generation that grew up with the Internet, and it seems as if you become offended at almost a visceral level when you see something done that you think will harm the Internet. Is there some truth to that? ES : It is. I think it ’ s very true. This is not a left or right issue. Our basic freedoms, and when I say our, I don ’ t just mean Americans, I mean people around the world, it ’ s not a partisan issue. These are things that all people believe, and it ’ s up to all of us to protect them, and to people who have seen and enjoyed a free and open Internet, it ’ s up to us to preserve that liberty for the next generation to enjoy, and if we don ’ t change things, if we don ’ t stand up to make the changes we need to do to keep the Internet safe, not just for us but for everyone, we ’ re going to lose that, and that would be a tremendous loss, not just for us, but for the world. CA : Well, I have heard similar language recently from the founder of the world wide web, who I actually think is with us, Sir Tim Berners-Lee. Tim, actually, would you like to come up and say, do we have a **microphone** for Tim? Tim, good to see you. Come up there. Which camp are you in, by the way, traitor, hero? I have a theory on this, but — Tim Berners-Lee : I ’ ve given much longer answers to that question, but hero, if I have to make the choice between the two. CA : And Ed, I think you ’ ve read the proposal that Sir Tim has talked about about a new Magna Carta to take back the Internet. Is that something that makes sense? ES : Absolutely. I mean, my generation, I grew up not just thinking about the Internet, but I grew up in the Internet, and although I never expected to have the chance to defend it in such a direct and practical manner and to embody it in this unusual, almost avatar manner, I think there ' s something poetic about the fact that one of the sons of the Internet has actually become close to the Internet as a result of their political **expression**. And I believe that a Magna Carta for the Internet is exactly what we need. We need to encode our values not just in writing but in the structure of the Internet, and it ' s something that I hope, I invite everyone in the audience, not just here in Vancouver but around the world, to join and participate in. CA : Do you have a question for Ed? TBL : Well, two questions, a general question — CA : Ed, can you still hear us? ES : Yes, I can hear you. CA : Oh, he ' s back. TBL : The wiretap on your line got a little interfered with for a moment. ES : It ' s a little bit of an NSA problem. TBL : So, from the 25 years, stepping back and thinking, what would you think would be the best that we could achieve from all the discussions that we have about the web we want? ES : When we think about in terms of how far we can go, I think that ' s a question that ' s really only limited by what we ' re willing to put into it. I think the Internet that we ' ve enjoyed in the past has been exactly what we as not just a nation but as a people around the world need, and by cooperating, by engaging not just the technical parts of society, but as you said, the users, the people around the world who contribute through the Internet, through social media, who just check the weather, who rely on it every day as a part of their life, to champion that. We ' ll get not just the Internet we ' ve had, but a better Internet, a better now, something that we can use to build a future that ' ll be better not just than what we hoped for but anything that we could have imagined. CA : It ' s 30 years ago that TED was founded, 1984. A lot of the conversation since then has been along the lines that actually George Orwell got it wrong. It ' s not Big Brother watching us. We, through the power of the web, and transparency, are now watching Big Brother. Your revelations kind of drove a stake through the heart of that rather optimistic view, but you still believe there ' s a way of doing something about that. And you do too. ES : Right, so there is an argument to be made that the powers of Big Brother have increased enormously. There was a recent legal article at Yale that established something called the Bankston-Soltani Principle, which is that our expectation of **privacy** is violated when the capabilities of government surveillance have become cheaper by an order of magnitude, and each time that occurs, we need to revisit and rebalance our **privacy** rights. Now, that hasn ' t happened since the government ' s surveillance powers have increased by several orders of magnitude, and that ' s why we ' re in the problem that we ' re in today, but there is still hope, because the power of individuals have also been increased by technology. I am living proof that an individual can go head to head against the most powerful adversaries and the most powerful intelligence agencies around the world and win, and I think that ' s something that we need to take hope from, and we need to build on to make it accessible not just to technical experts but to ordinary citizens around the world. Journalism is not a crime, communication is not a crime, and we should not be monitored in our everyday activities. CA : I ' m not quite sure how you shake the hand of a bot, but I imagine it ' s, this is the hand right here. TBL : That ' ll come very soon. ES : Nice to meet you, and I hope my beam looks as nice as my view of you guys does. CA : Thank you, Tim. I mean, The New York Times recently called for an amnesty for you. Would you welcome the chance to come back to America? ES : Absolutely. There ' s really no question, the principles that have been the foundation of this project have been the public interest and the principles that underly the journalistic establishment in the United States and around the world, and I think if the press is now saying, we support this, this is something that needed to happen, that ' s a powerful argument, but it ' s not the final argument, and I think that ' s something that public should decide.

But at the same time, the government has hinted that they want some kind of deal, that they want me to compromise the journalists with which I ’ ve been working, to come back, and I want to make it very clear that I did not do this to be safe. I did this to do what was right, and I ’ m not going to stop my work in the public interest just to benefit myself. CA : In the meantime, courtesy of the Internet and this technology, you ’ re here, back in North America, not quite the U. S., Canada, in this form. I ’ m curious, how does that feel? ES : Canada is different than what I expected. It ’ s a lot warmer. CA : At TED, the **mission** is”ideas worth spreading.”If you could encapsulate it in a single idea, what is your idea worth spreading right now at this moment? ES : I would say the last year has been a reminder that democracy may die behind closed doors, but we as individuals are born behind those same closed doors, and we don ’ t have to give up our **privacy** to have good government. We don ’ t have to give up our liberty to have security. And I think by working together we can have both open government and private lives, and I look forward to working with everyone around the world to see that happen. Thank you very much. CA : Ed, thank you.

Well, good afternoon. How many of you took the ALS Ice Bucket Challenge? Woo hoo! Well, I have to tell you, from the bottom of our hearts, thank you so very, very much. Do you know to date the ALS Association has raised 125 million dollars? Woo hoo! It takes me back to the summer of 2011. My family, my kids had all grown up. We were officially empty nesters, and we decided, let ’ s go on a family **vacation**. Jenn, my daughter, and my son-in-law came down from New York. My youngest, Andrew, he came down from his home in Charlestown where he was working in Boston, and my son Pete, who had played at Boston College, **baseball**, had played **baseball** professionally in Europe, and had now come home and was selling group insurance, he also joined us. And one night, I found myself having a beer with Pete, and Pete was looking at me and he just said,”You know, Mom, I don ’ t know, selling group insurance is just not my passion.”He said,”I just don ’ t feel I ’ m living up to my potential. I don ’ t feel this is my **mission** in life.”And he said,”You know, oh by the way, Mom, I have to leave early from **vacation** because my inter-city league team that I play for made the playoffs, and I have to get back to Boston because I can ’ t let my team down. I ’ m just not as **passionate** about my job as I am about **baseball**.”So off Pete went, and left the family **vacation** — break a mother ’ s heart — and he went, and we followed four days later to see the next playoff game. We ’ re at the playoff game, Pete ’ s at the plate, and a fastball ’ s coming in, and it hits him on the wrist. Oh, Pete. His wrist went completely limp, like this. So for the next six months, Pete went back to his home in Southie, kept working that unpassionate job, and was going to doctors to see what was wrong with this wrist that never came back. Six months later, in March, he called my husband and me, and he said,”Oh, Mom and Dad, we have a doctor that found a diagnosis for that wrist. Do you want to come with the doctor ’ s appointment with me?”I said,”Sure, we ’ ll come in.”That morning, Pete, John and I all got up, got dressed, got in our cars — three separate cars because we were going to go to work after the doctor ’ s appointment to find out what happened to the wrist. We walked into the neurologist ’ s office, sat down, four doctors walk in, and the head neurologist sits down. And he says,”Well, Pete, we ’ ve been looking at all the tests, and I have to tell you, it ’ s not a sprained wrist, it ’ s not a broken wrist, it ’ s not nerve damage in the wrist, it ’ s not an infection, it ’ s not Lyme disease.”And there was this deliberate elimination going up, and I was thinking to myself, where is he going with this? Then he put his hands on his knees, he looked right at my 27-year-old kid, and said,”I don ’ t know how to tell a 27-year-old this : Pete, you have ALS.”ALS? I had had a friend whose 80-year-old father had ALS. I looked at my husband, he looked at me, and then we looked at the doctor, and we said,”ALS? Okay, what treatment? Let ’ s go. What do we do? Let ’ s go.”And he looked at us, and he said,”Mr. and Mrs. Frates, I ’ m sorry to tell you this, but there ’ s no treatment and there ’ s no cure.”We were the worst culprits. We didn ’ t even understand that it had been 75 years since Lou Gehrig and nothing had been done in the progress against ALS. So we all went home, and Jenn and Dan flew home from Wall Street, Andrew came home from Charlestown, and Pete went to B. C. to pick up his then-girlfriend Julie and brought her home, and six hours later after diagnosis, we ’ re sitting around having a family dinner, and we ’ re having small chat. I don ’ t even remember cooking dinner that night. But then our leader, Pete, set the vision, and talked to us just like we were his new team. He said,”There will be no wallowing, people.”He goes,”We ’ re not looking back, we ’ re looking forward. What an amazing opportunity we have to change the world. I ’ m going to change the face of this unacceptable situation of ALS. We ’ re going to move the needle, and I ’ m going to get it in front of philanthropists like Bill Gates.”And that was it. We were given our directive. So in the days and months that followed, within a week, we had our brothers and sisters and our family come to us, that they were already creating Team Frate Train. Uncle Dave, he was the webmaster ; Uncle Artie, he was the accountant ; Auntie Dana, she was the graphic artist ; and my youngest son, Andrew, quit his job, left his apartment in Charlestown and says,”I ’ m going to take care of Pete and be his caregiver.”Then all those people, classmates, teammates, coworkers that Pete had inspired throughout his whole life, the circles of Pete all started intersecting with one another, and made Team Frate Train. Six months after diagnosis, Pete was given an award at a research summit for advocacy. He got up and gave a very eloquent speech, and at the end of the speech, there was a panel, and on the panel were these pharmaceutical executives and biochemists and clinicians and I ’ m sitting there and I ’ m listening to them and most of the content went straight over my head. I avoided every science class I ever could. But I was watching these people, and I was listening to them, and they were saying,”I, I do this, I do that,”and there was a real unfamiliarity between them. So at the end of their talk, the panel, they had questions and answers, and boom, my hand went right up, and I get the **microphone**, and I look at them and I say,”Thank you. Thank you so much for working in ALS. It means so very much to us.”I said,”But I do have to tell you that I ’ m watching your body language and I ’ m listening to what you ’ re saying. It just doesn ’ t seem like there ’ s a whole lot of collaboration going on here. And not only that, where ’ s the flip chart with the **action** items and the **follow-up** and the accountability? What are you going to do after you leave this room?”And then I turned around and there was about 200 pairs of eyes just staring at me. And it was that point that I realized that I had talked about the elephant in the room. Thus my **mission** had begun. So over the next couple of years, Pete — we ’ ve had our highs and our lows. Pete was put on a compassionate use drug. It was hope in a bottle for the whole ALS community. It was in a phase III **trial**. Then six months later, the data comes back : no efficacy. We were supposed to have therapies overseas, and the rug was pulled out from under us. So for the next two years, we just watched my son be taken away from me, little by little every day. Two and a half years ago, Pete was hitting home runs at **baseball** fields. Today, Pete ’ s completely paralyzed. He can ’ t hold his head up any longer. He ’ s confined to a motorized wheelchair. He can no longer swallow or eat. He has a feeding tube. He can ’ t speak. He talks with eye gaze technology and a speech generating device, and we ’ re watching his lungs, because his diaphragm eventually is going to give out and then the decision will be made to put him on a ventilator or not. ALS robs the human of all their physical parts, but the brain stays **intact**. So July 4th, 2014, 75th year of Lou Gehrig ’ s inspirational speech comes, and Pete is asked by MLB. com to write an article in the Bleacher Report. And it was very significant, because he wrote it using his eye gaze technology. Twenty days later, the ice started to fall. On July 27th, Pete ’ s roommate in New York City, wearing a Quinn For The Win shirt, signifying Pat Quinn, another ALS patient known in New York, and B. C. shorts said,”I ’ m taking the ALS Ice Bucket Challenge,”picked up the ice, put it over his head.”And I ’ m nominating...”And he sent it up to Boston. And that was on July 27th. Over the next couple of days, our news feed was full of family and friends. If you haven ’ t gone back, the nice thing about Facebook is that you have the dates, you can go back. You ’ ve got to see Uncle Artie ’ s human Bloody Mary. I ’ m telling you, it ’ s one of the best ones, and that was probably in day two. By about day four, Uncle Dave, the webmaster, he isn ’ t on Facebook, and I get a text from him, and it says,”Nancy, what the hell is going on?”Uncle Dave gets a hit every time Pete ’ s website is gone onto, and his phone was blowing up. So we all sat down and we realized, money is coming in — how amazing. So we knew awareness would lead to funding, we just didn ’ t know it would only take a couple of days. So we got together, put our best 501s on Pete ’ s website, and off we went. So week one, Boston media. Week two, national media. It was during week two that our neighbor next door opened up our door and threw a pizza across the kitchen floor, saying,”I think you people might need food in there.”Week three, celebrities — Entertainment Tonight, Access Hollywood. Week four, global — BBC, Irish Radio. Did anyone see”Lost In Translation”? My husband did Japanese television. It was interesting. And those videos, the popular ones. Paul Bissonnette ’ s glacier video, incredible. How about the redemption nuns of Dublin? Who ’ s seen that one? It ’ s absolutely fantastic. J. T., Justin Timberlake. That ’ s when we knew, that was a real A-list celebrity. I go back on my texts, and I can see”JT! JT!”My sister texting me. Angela Merkel, the chancellor of Germany. Incredible. And the ALS patients, you know what their favorite ones are, and their families ’? All of them. Because this misunderstood and underfunded”rare”disease, they just sat and watched people saying it over and over :”ALS, ALS.”It was unbelievable. And those naysayers, let ’ s just talk a couple of stats, shall we? Okay, so the ALS Association, they think by year end, it ’ ll be 160 million dollars. ALS TDI in Cambridge, they raised three million dollars. Well, guess what? They had a clinical **trial** for a drug that they ’ ve been developing. It was on a three-year track for funding. Two months. It ’ s coming out starting in two months. And YouTube has reported that over 150 countries have posted Ice Bucket Challenges for ALS. And Facebook, 2. 5 million videos, and I had the awesome adventure visiting the Facebook campus last week, and I said to them,”I know what it was like in my house. I can ’ t imagine what it was like around here.”All she said was,”Jaw-dropping.”And my family ’ s favorite video? Bill Gates. Because the night Pete was diagnosed, he told us that he was going to get ALS in front of philanthropists like Bill Gates, and he did it. Goal number one, check. Now on to the treatment and cure. So okay, after all of this ice, we know that it was much more than just pouring buckets of ice water over your head, and I really would like to leave you with a couple of things that I ’ d like you to remember. The first thing is, every morning when you wake up, you can choose to live your day in positivity. Would any of you blame me if I just was in the fetal position and pulled the covers over my head every day? No, I don ’ t think anybody would blame me, but Pete has inspired us to wake up every morning and be positive and proactive. I actually had to ditch support groups because everybody was in there saying that spraying their lawns with chemicals, that ’ s why they got ALS, and I was like,”I don ’ t think so,”but I had to get away from the negativity. The second thing I want to leave you with is the person at the middle of the challenge has to be willing to have the mental toughness to put themselves out there. Pete still goes to **baseball** games and he still sits with his teammates in the dugout, and he hangs his gravity feed bag right on the cages. You ’ ll see the kids, they ’ re up there hanging it up.”Pete, is that okay?””Yup.”And then they put it right into his stomach. Because he wants them to see what the reality of this is, and how he ’ s never, ever going to give up. And the third thing I want to leave you with : If you ever come across a situation that you see as so unacceptable, I want you to dig down as deep as you can and find your best mother bear and go after it. Thank you. I know that I ’ m running over, but I ’ ve got to leave you with this : the gifts that my son has given me. I have had 29 years of having the honor of being the mother of Pete Frates. Pete Frates has been inspiring and leading his whole life. He ’ s thrown out kindness, and all that kindness has come back to him. He walks the face of the Earth right now and knows why he ’ s here. What a gift. The second thing that my son has given me is he ’ s given me my **mission** in life. Now I know why I ’ m here. I ’ m going to save my son, and if it doesn ’ t happen in time for him, I ’ m going to work so that no other mother has to go through what I ’ m going through. And the third thing, and last but not least gift that my son has given me, as an exclamation point to the miraculous month of August 2014 : That girlfriend that he went to get on the night of diagnosis is now his wife, and Pete and Julie have given me my granddaughter, Lucy Fitzgerald Frates. Lucy Fitzgerald Frates came two weeks early as the exclamation point on August 31st, 2014. And so — — And so let me leave you with Pete ’ s words of inspiration that he would use to classmates, coworkers and teammates. Be **passionate**. Be genuine. Be hardworking. And don ’ t forget to be great. Thank you.

I ’ m a lifelong traveler. Even as a little kid, I was actually working out that it would be cheaper to go to boarding school in England than just to the best school down the road from my parents ’ house in California. So, from the time I was nine years old I was flying alone several times a year over the North Pole, just to go to school. And of course the more I flew the more I came to love to fly, so the very week after I graduated from high school, I got a job mopping tables so that I could spend every season of my 18th year on a different continent. And then, almost inevitably, I became a travel writer so my job and my joy could become one. And I really began to feel that if you were lucky enough to walk around the candlelit temples of Tibet or to wander along the seafronts in Havana with music passing all around you, you could bring those sounds and the high cobalt skies and the flash of the blue ocean back to your friends at home, and really bring some magic and clarity to your own life. Except, as you all know, one of the first things you learn when you travel is that nowhere is magical unless you can bring the right eyes to it. You take an angry man to the Himalayas, he just starts **complaining** about the food. And I found that the best way that I could develop more attentive and more appreciative eyes was, oddly, by going nowhere, just by sitting still. And of course sitting still is how many of us get what we most crave and need in our accelerated lives, a break. But it was also the only way that I could find to sift through the slideshow of my experience and make sense of the future and the past. And so, to my great surprise, I found that going nowhere was at least as exciting as going to Tibet or to Cuba. And by going nowhere, I mean nothing more intimidating than taking a few minutes out of every day or a few days out of every season, or even, as some people do, a few years out of a life in order to sit still long enough to find out what moves you most, to recall where your truest **happiness** lies and to remember that sometimes making a living and making a life point in opposite directions. And of course, this is what wise beings through the centuries from every tradition have been telling us. It ' s an old idea. More than 2, 000 years ago, the Stoics were reminding us it ' s not our experience that makes our lives, it ' s what we do with it. Imagine a hurricane suddenly sweeps through your town and reduces every last thing to rubble. One man is traumatized for life. But another, maybe even his brother, almost feels liberated, and decides this is a great chance to start his life anew. It ' s exactly the same event, but radically different responses. There is nothing either good or bad, as Shakespeare told us in"Hamlet,"but thinking makes it so. And this has certainly been my experience as a traveler. Twenty-four years ago I took the most mind-bending trip across North Korea. But the trip lasted a few days. What I ' ve done with it sitting still, going back to it in my head, trying to understand it, finding a place for it in my thinking, that ' s lasted 24 years already and will probably last a lifetime. The trip, in other words, gave me some amazing sights, but it ' s only sitting still that allows me to turn those into lasting insights. And I sometimes think that so much of our life takes place inside our heads, in memory or imagination or interpretation or speculation, that if I really want to change my life I might best begin by changing my mind. Again, none of this is new ; that ' s why Shakespeare and the Stoics were telling us this centuries ago, but Shakespeare never had to face 200 emails in a day. The Stoics, as far as I know, were not on Facebook. We all know that in our on-demand lives, one of the things that ' s most on demand is ourselves. Wherever we are, any time of night or day, our bosses, junk-mailers, our parents can get to us. Sociologists have actually found that in recent years Americans are working fewer hours than 50 years ago, but we feel as if we ' re working more. We have more and more time-saving devices, but sometimes, it seems, less and less time. We can more and more easily make contact with people on the furthest corners of the planet, but sometimes in that process we lose contact with ourselves. And one of my biggest surprises as a traveler has been to find that often it ' s exactly the people who have most enabled us to get anywhere who are intent on going nowhere. In other words, precisely those beings who have created the technologies that override so many of the limits of old, are the ones wisest about the need for limits, even when it comes to technology. I once went to the Google headquarters and I saw all the things many of you have heard about ; the indoor tree houses, the trampolines, workers at that time enjoying 20 percent of their paid time free so that they could just let their imaginations go wandering. But what impressed me even more was that as I was waiting for my digital I. D., one Googler was telling me about the program that he was about to start to teach the many, many Googlers who **practice** yoga to become trainers in it, and the other Googler was telling me about the book that he was about to write on the inner search engine, and the ways in which science has empirically shown that sitting still, or meditation, can lead not just to better health or to clearer thinking, but even to emotional intelligence. I have another friend in Silicon Valley who is really one of the most eloquent spokesmen for the latest technologies, and in fact was one of the founders of Wired magazine, Kevin Kelly. And Kevin wrote his last book on fresh technologies without a smartphone or a laptop or a TV in his home. And like many in Silicon Valley, he tries really hard to **observe** what they call an Internet sabbath, whereby for 24 or 48 hours every week they go completely offline in order to gather the sense of direction and proportion they ’ ll need when they go online again. The one thing perhaps that technology hasn ’ t always given us is a sense of how to make the wisest use of technology. And when you speak of the sabbath, look at the Ten Commandments — there ’ s only one word there for which the adjective”holy”is used, and that ’ s the Sabbath. I pick up the Jewish holy book of the Torah — its longest chapter, it ’ s on the Sabbath. And we all know that it ’ s really one of our greatest luxuries, the empty space. In many a piece of music, it ’ s the pause or the rest that gives the piece its beauty and its shape. And I know I as a writer will often try to include a lot of empty space on the page so that the reader can complete my thoughts and sentences and so that her imagination has room to breathe. Now, in the physical domain, of course, many people, if they have the resources, will try to get a place in the country, a second home. I ’ ve never begun to have those resources, but I sometimes remember that any time I want, I can get a second home in time, if not in space, just by taking a day off. And it ’ s never easy because, of course, whenever I do I spend much of it worried about all the extra stuff that ’ s going to crash down on me the following day. I sometimes think I ’ d rather give up meat or sex or wine than the chance to check on my emails. And every season I do try to take three days off on retreat but a part of me still feels guilty to be leaving my poor wife behind and to be ignoring all those seemingly urgent emails from my bosses and maybe to be missing a friend ’ s birthday party. But as soon as I get to a place of real quiet, I realize that it ’ s only by going there that I ’ ll have anything fresh or creative or joyful to share with my wife or bosses or friends. Otherwise, really, I ’ m just foisting on them my **exhaustion** or my distractedness, which is no blessing at all. And so when I was 29, I decided to remake my entire life in the light of going nowhere. One evening I was coming back from the office, it was after midnight, I was in a taxi **driving** through Times Square, and I suddenly realized that I was racing around so much I could never catch up with my life. And my life then, as it happened, was pretty much the one I might have dreamed of as a little boy. I had really interesting friends and colleagues, I had a nice apartment on Park Avenue and 20th Street. I had, to me, a fascinating job writing about world affairs, but I could never separate myself enough from them to hear myself think — or really, to understand if I was truly happy. And so, I abandoned my dream life for a single room on the backstreets of Kyoto, Japan, which was the place that had long exerted a strong, really mysterious gravitational pull on me. Even as a child I would just look at a painting of Kyoto and feel I recognized it ; I knew it before I ever laid eyes on it. But it ’ s also, as you all know, a beautiful city encircled by hills, filled with more than 2, 000 temples and shrines, where people have been sitting still for 800 years or more. And quite soon after I moved there, I ended up where I still am with my wife, formerly our kids, in a two-room apartment in the middle of nowhere where we have no bicycle, no car, no TV I can understand, and I still have to support my loved ones as a travel writer and a journalist, so clearly this is not ideal for job advancement or for cultural excitement or for social diversion. But I realized that it gives me what I prize most, which is days and hours. I have never once had to use a cell phone there. I almost never have to look at the time, and every morning when I wake up, really the day stretches in front of me like an open meadow. And when life throws up one of its nasty surprises, as it will, more than once, when a doctor comes into my room wearing a grave **expression**, or a car suddenly veers in front of mine on the freeway, I know, in my bones, that it ’ s the time I ’ ve spent going nowhere that is going to sustain me much more than all the time I ’ ve spent racing around to Bhutan or Easter Island. I ’ ll always be a traveler — my livelihood depends on it — but one of the beauties of travel is that it allows you to bring stillness into the motion and the commotion of the world. I once got on a plane in Frankfurt, Germany, and a young German woman came down and sat next to me and engaged me in a very friendly conversation for about 30 minutes, and then she just turned around and sat still for 12 hours. She didn ’ t once turn on her video monitor, she never pulled out a book, she didn ’ t even go to sleep, she just sat still, and something of her clarity and calm really imparted itself to me. I ’ ve noticed more and more people taking conscious measures these days to try to open up a space inside their lives. Some people go to black-hole resorts where they ’ ll spend hundreds of dollars a night in order to hand over their cell phone and their laptop to the front desk on arrival. Some people I know, just before they go to sleep, instead of **scrolling** through their messages or checking out YouTube, just turn out the lights and listen to some music, and notice that they sleep much better and wake up much refreshed. I was once fortunate enough to drive into the high, dark mountains behind Los Angeles, where the great poet and singer and international heartthrob Leonard Cohen was living and working for many years as a full-time monk in the Mount Baldy Zen Center. And I wasn ’ t entirely surprised when the record that he released at the age of 77, to which he gave the deliberately unsexy title of”Old Ideas,”went to number one in the charts in 17 nations in the world, hit the top five in nine others. Something in us, I think, is crying out for the sense of intimacy and depth that we get from people like that. who take the time and trouble to sit still. And I think many of us have the sensation, I certainly do, that we ’ re standing about two inches away from a huge screen, and it ’ s noisy and it ’ s crowded and it ’ s changing with every second, and that screen is our lives. And it ’ s only by stepping back, and then further back, and holding still, that we can begin to see what the canvas means and to catch the larger picture. And a few people do that for us by going nowhere. So, in an age of acceleration, nothing can be more exhilarating than going slow. And in an age of distraction, nothing is so luxurious as paying attention. And in an age of constant movement, nothing is so urgent as sitting still. So you can go on your next **vacation** to Paris or Hawaii, or New Orleans ; I bet you ’ ll have a wonderful time. But, if you want to come back home alive and full of fresh hope, in love with the world, I think you might want to try considering going nowhere. Thank you.

Sheryl Shade : Hi, Aimee. Aimee Mullins : Hi. SS : Aimee and I thought we ’ d just talk a little bit, and I wanted her to tell all of you what makes her a distinctive athlete. AM : Well, for those of you who have seen the picture in the little bio â it might have given it away â I ’ m a double amputee, and I was born without fibulas in both legs. I was amputated at age one, and I ’ ve been running like hell ever since, all over the place. SS : Well, why don ’ t you tell them how you got to Georgetown â why don ’ t we start there? Why don ’ t we start there? AM : I ’ m a senior in Georgetown in the Foreign Service program. I won a full academic scholarship out of high school. They pick three students out of the nation every year to get involved in international affairs, and so I won a full ride to Georgetown and I ’ ve been there for four years. Love it. SS : When Aimee got there, she decided that she ’ s, kind of, curious about track and field, so she decided to call someone and start asking about it. So, why don ’ t you tell that story? AM : Yeah. Well, I guess I ’ ve always been involved in sports. I played softball for five years growing up. I skied competitively throughout high school, and I got a little restless in college because I wasn ’ t doing anything for about a year or two sports-wise. And I ’ d never competed on a disabled level, you know â I ’ d always competed against other able-bodied athletes. That ’ s all I ’ d ever known. In fact, I ’ d never even met another amputee until I was 17. And I heard that they do these track meets with all disabled runners, and I figured,”Oh, I don ’ t know about this, but before I **judge** it, let me go see what it ’ s all about.”So, I booked myself a flight to Boston in ’ 95, 19 years old and definitely the dark horse candidate at this race. I ’ d never done it before. I went out on a gravel track a couple of weeks before this meet to see how far I could run, and about 50 meters was enough for me, panting and heaving. And I had these legs that were made of a wood and plastic compound, attached with Velcro straps â big, thick, five-ply wool socks on â you know, not the most comfortable things, but all I ’ d ever known. And I ’ m up there in Boston against people wearing legs made of all things â carbon graphite and, you know, shock absorbers in them and all sorts of things â and they ’ re all looking at me like, OK, we know who ’ s not going to win this race. And, I mean, I went up there expecting â I don ’ t know what I was expecting â but, you know, when I saw a man who was missing an entire leg go up to the high jump, hop on one leg to the high jump and clear it at six feet, two inches... Dan O ’ Brien jumped 5 ’ 11”in ’ 96 in Atlanta, I mean, if it just gives you a comparison of â these are truly accomplished athletes, without qualifying that word”athlete.”And so I decided to give this a shot : heart pounding, I ran my first race and I beat the national record-holder by three hundredths of a second, and became the new national record-holder on my first try out. And, you know, people said,”Aimee, you know, you ’ ve got speed â you ’ ve got natural speed â but you don ’ t have any skill or finesse going down that track. You were all over the place. We all saw how hard you were working.”And so I decided to call the track coach at Georgetown. And I thank god I didn ’ t know just how huge this man is in the track and field world. He ’ s coached five Olympians, and the man ’ s office is lined from floor to ceiling with All America certificates of all these athletes he ’ s coached. He ’ s just a rather intimidating figure. And I called him up and said,”Listen, I ran one race and I won...””I want to see if I can, you know â I need to just see if I can sit in on some of your **practices**, see what drills you do and whatever.”That ’ s all I wanted â just two **practices**.”Can I just sit in and see what you do?”And he said,”Well, we should meet first, before we decide anything.”You know, he ’ s thinking,”What am I getting myself into?”So, I met the man, walked in his office, and saw these posters and magazine covers of people he has coached. And we got to talking, and it turned out to be a great partnership because he ’ d never coached a disabled athlete, so therefore he had no preconceived notions of what I was or wasn ’ t capable of, and I ’ d never been coached before. So this was like,”Here we go â let ’ s start on this trip.”So he started giving me four days a week of his lunch break, his free time, and I would come up to the track and train with him. So that ’ s how I met Frank. That was fall of ’ 95. But then, by the time that winter was rolling around, he said,”You know, you ’ re good enough. You can run on our women ’ s track team here.”And I said,”No, come on.”And he said,”No, no, really. You can. You can run with our women ’ s track team.”In the spring of 1996, with my goal of making the U. S. Paralympic team that May coming up full speed, I joined the women ’ s track team. And no disabled person had ever done that â run at a collegiate level. So I don ’ t know, it started to become an interesting mix. SS : Well, on your way to the Olympics, a couple of memorable events happened at Georgetown. Why don ’ t you just tell them? AM : Yes, well, you know, I ’ d won everything as far as the disabled meets â everything I competed in â and, you know, training in Georgetown and knowing that I was going to have to get used to seeing the backs of all these women ’ s shirts â you know, I ’ m running against the next Flo-Jo â and they ’ re all looking at me like,”Hmm, what ’ s, you know, what ’ s going on here?”And putting on my Georgetown uniform and going out there and knowing that, you know, in order to become better â and I ’ m already the best in the country â you know, you have to train with people who are inherently better than you. And I went out there and made it to the Big East, which was sort of the championship race at the end of the season. It was really, really hot. And it ’ s the first â I had just gotten these new sprinting legs that you see in that bio, and I didn ’ t realize at that time that the amount of sweating I would be doing in the sock â it actually acted like a lubricant and I ’ d be, kind of, pistoning in the socket. And at about 85 meters of my 100 meters sprint, in all my glory, I came out of my leg. Like, I almost came out of it, in front of, like, 5, 000 people. And I, I mean, was just mortified â because I was signed up for the 200, you know, which went off in a half hour. I went to my coach :”Please, don ’ t make me do this.”I can ’ t do this in front of all those people. My legs will come off. And if it came off at 85 there ’ s no way I ’ m going 200 meters. And he just sat there like this. My pleas fell on deaf ears, thank god. Because you know, the man is from Brooklyn ; he ’ s a big man. He says,”Aimee, so what if your leg falls off? You pick it up, you put the damn thing back on, and finish the goddamn race!”And I did. So, he kept me in line. He kept me on the right track. SS : So, then Aimee makes it to the 1996 Paralympics, and she ’ s all excited. Her family ’ s coming down â it ’ s a big deal. It ’ s now two years that you ’ ve been running? AM : No, a year. SS : A year. And why don ’ t you tell them what happened right before you go run your race? AM : Okay, well, Atlanta. The Paralympics, just for a little bit of clarification, are the Olympics for people with physical disabilities â amputees, persons with cerebral palsy, and wheelchair athletes â as opposed to the **Special** Olympics, which deals with people with mental disabilities. So, here we are, a week after the Olympics and down at Atlanta, and I ’ m just blown away by the fact that just a year ago, I got out on a gravel track and couldn ’ t run 50 meters. And so, here I am â never lost. I set new records at the U. S. Nationals â the Olympic **trials** â that May, and was sure that I was coming home with the gold. I was also the only, what they call”bilateral BK”â below the knee. I was the only woman who would be doing the long jump. I had just done the long jump, and a guy who was missing two legs came up to me and says,”How do you do that? You know, we ’ re supposed to have a planar foot, so we can ’ t get off on the springboard.”I said,”Well, I just did it. No one told me that.”So, it ’ s funny â I ’ m three inches within the world record â and kept on from that point, you know, so I ’ m signed up in the long jump â signed up? No, I made it for the long jump and the 100-meter. And I ’ m sure of it, you know? I made the front page of my hometown paper that I delivered for six years, you know? It was, like, this is my time for shine. And we ’ re at the trainee warm-up track, which is a few blocks away from the Olympic stadium. These legs that I was on, which I ’ ll take out right now â I was the first person in the world on these legs. I was the guinea pig., I ’ m telling you, this was, like â talk about a tourist attraction. Everyone was taking pictures â”What is this girl running on?”And I ’ m always looking around, like, where is my competition? It ’ s my first international meet. I tried to get it out of anybody I could, you know,”Who am I running against here?””Oh, Aimee, we ’ ll have to get back to you on that one.”I wanted to find out times.”Don ’ t worry, you ’ re doing great.”This is 20 minutes before my race in the Olympic stadium, and they post the heat sheets. And I go over and look. And my fastest time, which was the world record, was

15. 77. Then I ’ m looking : the next lane, lane two, is 12. 8. Lane three is 12. 5. Lane four is 12. 2. I said,”What ’ s going on?”And they shove us all into the shuttle bus, and all the women there are missing a hand. So, I ’ m just, like â they ’ re all looking at me like ’ which one of these is not like the other, ’ you know? I ’ m sitting there, like,”Oh, my god. Oh, my god.”You know, I ’ d never lost anything, like, whether it would be the scholarship or, you know, I ’ d won five golds when I skied. In everything, I came in first. And Georgetown â that was great. I was losing, but it was the best training because this was Atlanta. Here we are, like, crĂ¨me de la crĂ¨me, and there is no doubt about it, that I ’ m going to lose big. And, you know, I ’ m just thinking,”Oh, my god, my whole family got in a van and drove down here from Pennsylvania.”And, you know, I was the only female U. S. sprinter. So they call us out and, you know â”Ladies, you have one minute.”And I remember putting my blocks in and just feeling horrified because there was just this murmur coming over the crowd, like, the ones who are close enough to the starting line to see. And I ’ m like,”I know! Look! This isn ’ t right.”And I ’ m thinking that ’ s my last card to play here ; if I ’ m not going to beat these girls, I ’ m going to mess their heads a little, you know? I mean, it was definitely the”Rocky IV”sensation of me versus Germany, and everyone else â Estonia and Poland â was in this heat. And the gun went off, and all I remember was finishing last and fighting back tears of frustration and incredible â incredible â this feeling of just being overwhelmed. And I had to think,”Why did I do this?”If I had won everything â but it was like, what was the point? All this training â I had transformed my life. I became a collegiate athlete, you know. I became an Olympic athlete. And it made me really think about how the achievement was getting there. I mean, the fact that I set my sights, just a year and three months before, on becoming an Olympic athlete and saying,”Here ’ s my life going in this direction â and I want to take it here for a while, and just seeing how far I could push it.”And the fact that I asked for help â how many people jumped on board? How many people gave of their time and their expertise, and their patience, to deal with me? And that was this collective glory â that there was, you know, 50 people behind me that had joined in this incredible experience of going to Atlanta. So, I apply this sort of philosophy now to everything I do : sitting back and realizing the progression, how far you ’ ve come at this day to this goal, you know. It ’ s important to focus on a goal, I think, but also recognize the progression on the way there and how you ’ ve grown as a person. That ’ s the achievement, I think. That ’ s the real achievement. SS : Why don ’ t you show them your legs? AM : Oh, sure. SS : You know, show us more than one set of legs. AM : Well, these are my pretty legs. No, these are my cosmetic legs, actually, and they ’ re absolutely beautiful. You ’ ve got to come up and see them. There are hair follicles on them, and I can paint my toenails. And, seriously, like, I can wear heels. Like, you guys don ’ t understand what that ’ s like to be able to just go into a shoe store and buy whatever you want. SS : You got to pick your height? AM : I got to pick my height, exactly. Patrick Ewing, who played for Georgetown in the ’ 80s, comes back every summer. And I had incessant fun making fun of him in the training room because he ’ d come in with foot injuries. I ’ m like,”Get it off! Don ’ t worry about it, you know. You can be eight feet tall. Just take them off.”He didn ’ t find it as humorous as I did, anyway. OK, now, these are my sprinting legs, made of carbon graphite, like I said, and I ’ ve got to make sure I ’ ve got the right socket. No, I ’ ve got so many legs in here. These are â do you want to hold that actually? That ’ s another leg I have for, like, tennis and softball. It has a shock absorber in it so it, like,”Shhhh,”makes this neat sound when you jump around on it. All right. And then this is the **silicon** sheath I roll over, to keep it on. Which, when

I sweat, you know, I ’ m pistoning out of it. SS : Are you a different height? AM : In these? SS : In these. AM : I don ’ t know. I don ’ t think so. I may be a little taller. I actually can put both of them on. SS : She can ’ t really stand on these legs. She has to be moving, so... AM : Yeah, I definitely have to be moving, and balance is a little bit of an art in them. But without having the **silicon** sock, I ’ m just going to try slip in it. And so, I run on these, and have shocked half the world on these. These are supposed to simulate the actual form of a sprinter when they run. If you ever watch a sprinter, the ball of their foot is the only thing that ever hits the track. So when I stand in these legs, my hamstring and my glutes are contracted, as they would be had I had feet and were standing on the ball of my feet. AM : It ’ s a company in San Diego called Flex-Foot. And I was a guinea pig, as I hope to continue to be in every new form of prosthetic limbs that come out. But actually these, like I said, are still the actual prototype. I need to get some new ones because the last meet I was at, they were everywhere. You know, it ’ s like a big â it ’ s come full circle. Moderator : Aimee and the designer of them will be at TEDMED 2, and we ’ ll talk about the design of them. AM : Yes, we ’ ll do that. SS : Yes, there you go. AM : So, these are the sprint legs, and I can put my other... SS : Can you tell about who designed your other legs? AM : Yes. These I got in a place called Bournemouth, England, about two hours south of London, and I ’ m the only person in the United States with these, which is a crime because they are so beautiful. And I don ’ t even mean, like, because of the toes and everything. For me, while I ’ m such a serious athlete on the track, I want to be feminine off the track, and I think it ’ s so important not to be limited in any capacity, whether it ’ s, you know, your mobility or even fashion. I mean, I love the fact that I can go in anywhere and pick out what I want â the shoes I want, the skirts I want â and I ’ m hoping to try to bring these over here and make them accessible to a lot of people. They ’ re also **silicon**. This is a really basic, basic prosthetic limb under here. It ’ s like a Barbie foot under this. It is. It ’ s just stuck in this position, so I have to wear a two-inch heel. And, I mean, it ’ s really â let me take this off so you can see it. I don ’ t know how good you can see it, but, like, it really is. There ’ re veins on the feet, and then my heel is pink, and my Achilles ’ tendon â that moves a little bit. And it ’ s really an amazing store. I got them a year and two weeks ago. And this is just a **silicon** piece of skin. I mean, what happened was, two years ago this man in Belgium was saying,”God, if I can go to Madame Tussauds ’ wax museum and see Jerry Hall replicated down to the color of her eyes, looking so real as if she breathed, why can ’ t they build a limb for someone that looks like a leg, or an arm, or a hand?”I mean, they make ears for burn victims. They do amazing stuff with **silicon**. SS : Two weeks ago, Aimee was up for the Arthur Ashe award at the ESPYs. And she came into town and she rushed around and she said,”I have to buy some new shoes!”We ’ re an hour before the ESPYs, and she thought she ’ d gotten a two-inch heel but she ’ d actually bought a three-inch heel. AM : And this poses a problem for me, because it means I ’ m walking like that all night long. SS : For 45 minutes. Luckily, the hotel was terrific. They got someone to come in and saw off the shoes. AM : I said to the receptionist â I mean, I am just harried, and Sheryl ’ s at my side â I said,”Look, do you have anybody here who could help me? Because I have this problem...”You know, at first they were just going to write me off, like,”If you don ’ t like your shoes, sorry. It ’ s too late.””No, no, no, no. I ’ ve got these **special** feet that need a two-inch heel. I have a three-inch heel. I need a little bit off.”They didn ’ t even want to go there. They didn ’ t even want to touch that one. They just did it. No, these legs are great. I ’ m actually going back in a couple of weeks to get some improvements. I want to get legs like these made for flat feet so I can wear sneakers, because I can ’ t with these ones. So... Moderator : That ’ s it. SS : That ’ s Aimee Mullins.

Back in 1992, I started working for a company called Interval Research, which was just then being founded by David Lidell and Paul Allen as a for-profit research enterprise in Silicon Valley. I met with David to talk about what I might do in his company. I was just coming out of a failed virtual reality business and supporting myself by being on the speaking circuit and writing books — after twenty years or so in the computer game industry having ideas that people didn ’ t think they could sell. And David and I discovered that we had a question in common, that we really wanted the answer to, and that was,”Why hasn ’ t anybody built any computer games for little girls?”Why is that? It can ’ t just be a giant sexist conspiracy. These people aren ’ t that smart. There ’ s six billion dollars on the table. They would go for it if they could figure out how. So, what is the deal here? And as we thought about our goals — I should say that Interval is really a humanistic institution, in the **classical** sense that humanism, at its best, finds a way to combine clear-eyed empirical research with a set of core values that fundamentally love and respect people. The basic idea of humanism is the improvable quality of life ; that we can do good things, that there are things worth doing because they ’ re good things to do, and that clear-eyed empiricism can help us figure out how to do them. So, contrary to popular belief, there is not a conflict of interest between empiricism and values. And Interval Research is kind of the living example of how that can be true. So David and I decided to go find out, through the best research we could muster, what it would take to get a little girl to put her hands on a computer, to achieve the level of comfort and ease with the technology that little boys have because they play video games. We spent two and a half years conducting research ; we spent another year and a half in advance development. Then we formed a spin-off company. In the research phase of the project at Interval, we partnered with a company called Cheskin Research, and these people — Davis Masten and Christopher Ireland — changed my mind entirely about what market research was and what it could be. They taught me how to look and see, and they did not do the incredibly stupid thing of saying to a child,”Of all these things we already make you, which do you like best?”— which gives you zero answers that are usable. So, what we did for the first two and a half years was four things : We did an extensive review of the literature in related fields, like cognitive psychology, spatial cognition, gender studies, play theory, sociology, primatology. Thank you Frans de Waal, wherever you are, I love you and I ’ d give anything to meet you. After we had done that with a pretty large team of people and discovered what we thought the salient issues were with girls and boys and playing — because, after all, that ’ s really what this is about — we moved to the second phase of our work, where we interviewed adult experts in **academia**, some of the people who ’ d produced the literature that we found relevant. Also, we did focus groups with people who were on the ground with kids every day, like playground supervisors. We talked to them, confirmed some hypotheses and identified some serious questions about gender difference and play. Then we did what I consider to be the heart of the work : interviewed 1, 100 children, boys and girls, ages seven to 12, all over the United States — except for Silicon Valley, Boston and Austin because we knew that their little families would have millions of computers in them and they wouldn ’ t be a representative sample. And at the end of those remarkable conversations with kids and their best friends across the United States, after two years, we pulled together some survey data from another 10, 000 children, drew up a set up of what we thought were the key findings of our research, and spent another year transforming them into design heuristics, for designing computer-based products — and, in fact, any kind of products — for little girls, ages eight to 12. And we spent that time designing interactive prototypes for computer software and testing them with little girls. In 1996, in November, we formed the company Purple Moon which was a spinoff of Interval Research, and our chief investors were Interval Research, Vulcan Northwest, Institutional Venture Partners and Allen and Company. We launched a website on September 2nd that has now served 25 million pages, and has 42, 000 registered young girl users. They visit an average of one and a half times a day, spend an average of 35 minutes a visit, and look at 50 pages a visit. So we feel that we ' ve formed a successful online community with girls. We launched two titles in October —"Rockett ' s New School"— the first of a series of products — is about a character called Rockett beginning her first day of school in eighth grade at a brand new place, with a blank slate, which allows girls to play with the question of,"What will I be like when I ' m older?""What ' s it going to be like to be in high school or junior high school? Who are my friends?"; to exercise the love of social complexity and the narrative intelligence that drives most of their play behavior ; and which embeds in it values about noticing that we have lots of choices in our lives and the ways that we conduct ourselves. The other title that we launched is called"Secret Paths in the Forest,"which addresses the more fantasy-oriented, inner lives of girls. These two titles both showed up in the top 50 entertainment titles in PC Data — entertainment titles in PC Data in December, right up there with"John Madden Football,"which thrills me to death. So, we ' re real, and we ' ve touched several hundreds of thousands of little girls. We ' ve made half-a-billion impressions with marketing and PR for this brand, Purple Moon. Ninety-six percent of them, roughly, have been positive ; four percent of them have been"other."I want to talk about the other, because the politics of this enterprise, in a way, have been the most fascinating part of it, for me. There are really two kinds of negative reviews that we ' ve received. One kind of reviewer is a male gamer who thinks he knows what games ought to be, and won ' t show the product to little girls. The other kind of reviewer is a certain flavor of feminist who thinks they know what little girls ought to be. And so it ' s funny to me that these interesting, odd bedfellows have one thing in common : they don ' t listen to little girls. They haven ' t looked at children and they ' re certainly not demonstrating any love for them. I ' d like to play you some voices of little girls from the two-and-a-half years of research that we did — actually, some of the voices are more recent. And these voices will be accompanied by photographs that they took for us of their lives, of the things that they value and care about. These are pictures the girls themselves never saw, but they gave to us This is the stuff those reviewers don ' t know about and aren ' t listening to and this is the kind of research I recommend to those who want to do humanistic work. Girl 1 : Yeah, my character is usually a tomboy. Hers is more into boys. Girl 2 : Uh, yeah. Girl 1 : We have — in the very beginning of the whole game, always we do this : we each have a piece of paper ; we write down our name, our age — are we rich, very rich, not rich, poor, medium, wealthy, boyfriends, dogs, pets — what else — sisters, brothers, and all those. Girl 2 : Divorced — parents divorced, maybe. Girl 3 : This is my pretend [unclear] one. Girl 4 : We make a school newspaper on the computer. Girl 5 : For a girl ' s game also usually they ' ll have really pretty scenery with clouds and flowers. Girl 6 : Like, if you were a girl and you were really adventurous and a real big tomboy, you would think that girls ' games were kinda sissy. Girl 7 : I run track, I played soccer, I play basketball, and I love a lot of things to do. And sometimes I feel like I can ’ t really enjoy myself unless it ’ s like a **vacation**, like when I get Mondays and all those days off. Girl 8 : Well, sometimes there is a lot of stuff going on because I have music lessons and I ’ m on swim team — all this different stuff that I have to do, and sometimes it gets overwhelming. Girl 9 : My friend Justine kinda took my friend Kelly, and now they ’ re being mean to me. Girl 10 : Well, sometimes it gets annoying when your brothers and sisters, or brother or sister, when they copy you and you get your idea first and they take your idea and they do it themselves. Girl 11 : Because my older sister, she gets everything and, like, when I ask my mom for something, she ’ ll say,”No”— all the time. But she gives my sister everything. Brenda Laurel : I want to show you, real quickly, just a minute of”Rockett ’ s Tricky Decision,”which went gold two days ago. Let ’ s hope it ’ s really stable. This is the second day in Rockett ’ s life. The reason I ’ m showing you this is I ’ m hoping that the scene that I ’ m going to show you will look familiar and sound familiar, now that you ’ ve listened to some girls ’ voices. And you can see how we ’ ve tried to incorporate the issues that matter to them in the game that we ’ ve created. Miko : Hey Rockett! C ’ mere! Rockett : Hi Miko! What ’ s going on? Miko : Did you hear about Nakilia ’ s big Halloween party this weekend? She asked me to make sure you knew about it. Nakilia invited Reuben too, but — Rockett : But what? Isn ’ t he coming? Miko : I don ’ t think so. I mean, I heard his band is playing at another party the same night. Rockett : Really? What other party? Girl : Max ’ s party is going to be so cool, Whitney. He ’ s invited all the best people. BL : I ’ m going to **fast-forward** to the decision point because I know I don ’ t have a lot of time. After this awful event occurs, Rocket gets to decide how she feels about it. Rockett : Who ’ d want to show up at that party anyway? I could get invited to that party any day if I wanted to. Gee, I doubt I ’ ll make Max ’ s best people list. BL : OK, so we ’ re going to emotionally **navigate**. If we were playing the game, that ’ s what we ’ d do. If at any time during the game we want to learn more about the characters, we can go into this hidden hallway, and I ’ ll quickly just show you the interface. We can, for example, go find Miko ’ s locker and get some more information about her. Oops, I turned the wrong way. But you get the general idea of the product. I wanted to show you the ways, innocuous as they seem, in which we ’ re incorporating what we ’ ve learned about girls — their desires to experience greater emotional flexibility, and to play around with the social complexity of their lives. I want to make the point that what we ’ re giving girls, I think, through this effort, is a kind of validation, a sense of being seen. And a sense of the choices that are available in their lives. We love them. We see them. We ’ re not trying to tell them who they ought to be. But we ’ re really, really happy about who they are. It turns out they ’ re really great. I want to close by showing you a videotape that ’ s a version of a future game in the Rockett series that our graphic artists and design people put together, that we feel would please that four percent of reviewers.”Rockett 28!”Rockett : It ’ s like I ’ m just waking up, you know? BL : Thanks.

Text Sample 226: POS Dim 2 – 1998 – Score 4.00 – 1998/t000200.txt

You hear that this is the era of environment â or biology, or information technology... Well, it ’ s the era of a lot of different things that we ’ re in right now. But one thing for sure : it ’ s the era of change. There ’ s more change going on than ever has occurred in the history of human life on earth. And you all sort of know it, but it ’ s hard to get it so that you really understand it. And I ’ ve tried to put together something that ’ s a good start for this. I ’ ve tried to show in this â though the color doesn ’ t come out â that what I ’ m concerned with is the little 50-year time bubble that you are in. You tend to be interested in a generation past, a generation future â your parents, your kids, things you can change over the next few decades â and this 50-year time bubble you kind of move along in. And in that 50 years, if you look at the population curve, you find the population of humans on the earth more than doubles and we ’ re up three-and-a-half times since I was born. When you have a new baby, by the time that kid gets out of high school more people will be added than existed on earth when I was born. This is unprecedented, and it ’ s big. Where it goes in the future is questioned. So that ’ s the human part. Now, the human part related to animals : look at the left side of that. What I call the human portion â humans and their livestock and pets â versus the natural portion â all the other wild animals and just â these are vertebrates and all the birds, etc., in the land and air, not in the water. How does it balance? Certainly, 10, 000 years ago, the civilization ’ s beginning, the human portion was less than one tenth of one percent. Let ’ s look at it now. You follow this curve and you see the whiter spot in the middle â that ’ s your 50- year time bubble. Humans, livestock and pets are now 97 percent of that integrated total mass on earth and all wild nature is three percent. We have won. The next generation doesn ’ t even have to worry about this game â it is over. And the biggest problem came in the last 25 years : it went from 25 percent up to that 97 percent. And this really is a sobering picture upon realizing that we, humans, are in charge of life on earth ; we ’ re like the capricious Gods of old Greek myths, kind of playing with life â and not a great deal of wisdom injected into it. Now, the third curve is information technology. This is Moore ’ s Law plotted here, which relates to density of information, but it has been pretty good for showing a lot of other things about information technology â computers, their use, Internet, etc. And what ’ s important is it just goes straight up through the top of the curve, and has no real limits to it. Now try and contrast these. This is the size of the earth going through that same â â frame. And to make it really clear, I ’ ve put all four on one graph. There ’ s no need to see the little detailed words on it. That first one is humans-versus-nature ; we ’ ve won, there ’ s no more gain. Human population. And so if you ’ re looking for growth industries to get into, that ’ s not a good one â protecting natural creatures. Human population is going up ; it ’ s going to continue for quite a while. Good business in obstetricians, morticians, and farming, housing, etc. â they all deal with human bodies, which require being fed, transported, housed and so on. And the information technology, which connects to our brains, has no limit â now, that is a wonderful field to be in. You ’ re looking for growth opportunity? It ’ s just going up through the roof. And then, the size of the Earth. Somehow making these all compatible with the Earth looks like a pretty bad industry to be involved with. So, that ’ s the stage out of all this. I find, for reasons I don ’ t understand, I really do have a goal. And the goal is that the world be desirable and sustainable when my kids reach my age â and I think that ’ s â in other words, the next generation. I think that ’ s a goal that we probably all share. I think it ’ s a hopeless goal. Technologically, it ’ s achievable ; economically, it ’ s achievable ; politically, it means sort of the habits, institutions of people â it ’ s impossible. The institutions of the past with all their inertia are just irrelevant for the future, except they ’ re there and we have to deal with them. I spend about 15 percent of my time trying to save the world, the other 85 percent, the usual â and whatever else we devote ourselves to. And in that 15 percent, the main focus is on human mind, thinking skills, somehow trying to unleash kids from the straightjacket of school, which is putting information and dogma into them, get them so they really think, ask tough questions, argue about serious subjects, don ’ t believe everything that ’ s in the book, think broadly or creative. They can be. Our school systems are very flawed and do not reward you for the things that are important in life or for the survival of civilization ; they reward you for a lot of learning and sopping up stuff. We can ’ t go into that today because there isn ’ t time â it ’ s a broad subject. One thing for sure, in the future there is an essential feature â necessary, but not sufficient â which is doing more with less. We ’ ve got to be doing things with more efficiency using less energy, less material. Your great-great grandparents got by on muscle power, and yet we all think there ’ s this huge power that ’ s essential for our lifestyle. And with all the wonderful technology we have we can do things that are much more efficient : conserve, recycle, etc. Let me just rush very quickly through things that we ’ ve done. Human-powered airplane â Gossamer Condor sort of started me in this direction in 1976 and 77, winning the Kremer prize in aviation history, followed by the Albatross. And we began making various odd planes and creatures. Here ’ s a giant flying replica of a pterosaur that has no tail. Trying to have it fly straight is like trying to shoot an arrow with the feathered end forward. It was a tough job, and boy it made me have a lot of respect for nature. This was the full size of the original creature. We did things on land, in the air, on water â vehicles of all different kinds, usually with some electronics or electric power systems in them. I find they ’ re all the same, whether its land, air or water. I ’ ll be focusing on the air here. This is a solar-powered airplane â 165 miles carrying a person from France to England as a symbol that solar power is going to be an important part of our future. Then we did the solar car for General Motors â the Sunracer â that won the race in Australia. We got a lot of people thinking about electric cars, what you could do with them. A few years later, when we suggested to GM that now is the time and we could do a thing called the Impact, they sponsored it, and here ’ s the Impact that we developed with them on their programs. This is the demonstrator. And they put huge effort into turning it into a commercial product. With that preamble, let ’ s show the first two-minute videotape, which shows a little airplane for surveillance and moving to a giant airplane. Narrator : A tiny airplane, the AV Pointer serves for surveillance â in effect, a pair of roving eyeglasses. A cutting-edge example of where miniaturization can lead if the operator is remote from the vehicle. It is convenient to carry, assemble and launch by hand. Battery-powered, it is silent and rarely noticed. It sends high-resolution video pictures back to the operator. With onboard GPS, it can **navigate** autonomously, and it is rugged enough to self-land without damage. The modern sailplane is superbly efficient. Some can glide as flat as 60 feet forward for every foot of descent. They are powered only by the energy they can extract from the atmosphere â an atmosphere nature stirs up by solar energy. Humans and soaring birds have found nature to be generous in providing replenishable energy. Sailplanes have flown over 1, 000 miles, and the altitude record is over 50, 000 feet. The Solar Challenger was made to serve as a symbol that photovoltaic cells can produce real power and will be part of the world ’ s energy future. In 1981, it flew 163 miles from Paris to England, solely on the power of sunbeams, and established a basis for the Pathfinder. The message from all these vehicles is that ideas and technology can be harnessed to produce remarkable gains in doing more with less â gains that can help us attain a desirable balance between technology and nature. The stakes are high as we speed toward a challenging future. Buckminster Fuller said it clearly :”there are no passengers on spaceship Earth, only crew. We, the crew, can and must do more with less â much less.”Paul MacCready : If we could have the second video, the one-minute, put in as quickly as you can, which â this will show the Pathfinder airplane in some flights this past year in Hawaii, and will show a sequence of some of the beauty behind it after it had just flown to 71, 530 feet â higher than any propeller airplane has ever flown. It ' s amazing : just on the puny power of the sun â by having a **super** lightweight plane, you ' re able to get it up there. It ' s part of a long-term program NASA sponsored. And we worked very closely with the whole thing being a team effort, and with wonderful results like that flight. And we ' re working on a bigger plane â 220-foot span â and an intermediate-size, one with a regenerative fuel cell that can store excess energy during the day, feed it back at night, and stay up 65, 000 feet for months at a time. Ray Morgan ' s voice will come in here. There he ' s the project manager. Anything they do is certainly a team effort. He ran this program. Here ' s... some things he showed as a celebration at the very end. Ray Morgan : We ' d just ended a seven-month deployment of Hawaii. For those who live on the mainland, it was tough being away from home. The friendly support, the quiet confidence, congenial hospitality shown by our Hawaiian and military hosts â this is starting â made the experience enjoyable and unforgettable. PM : We have real-time IR scans going out through the Internet while the plane is flying. And it ' s exploring without polluting the stratosphere. That ' s its goal : the stratosphere, the blanket that really controls the radiation of the earth and permits life on earth to be the success that it is â probing that is very important. And also we consider it as a sort of poor man ' s stationary satellite, because it can stay right overhead for months at a time, 2, 000 times closer than the real GFC synchronous satellite. We couldn ' t bring one here to fly it and show you. But now let ' s look at the other end. In the video you saw that nine-pound or eight-pound Pointer airplane surveillance drone that Keenan has developed and just done a remarkable job. Where some have servos that have gotten down to, oh, 18 or 25 grams, his weigh one-third of a gram. And what he ' s going to bring out here is a surveillance drone that weighs about 2 ounces â that includes the video camera, the batteries that run it, the telemetry, the receiver and so on. And we ' ll fly it, we hope, with the same success that we had last night when we did the **practice**. So Matt Keenan, just any time you ' re â all right â ready to let her go. But first, we ' re going to make sure that it ' s appearing on the screen, so you see what it sees. You can imagine yourself being a mouse or fly inside of it, looking out of its camera. Matt Keenan : It ' s switched on. PM : But now we ' re trying to get the video. There we go. MK : Can you bring up the house lights? PM : Yeah, the house lights and we ' ll see you all better and be able to fly the plane better. MK : All right, we ' ll try to do a few laps around and bring it back in. Here we go. PM : The video worked right for the first few and I don ' t know why it â there it goes. Oh, that was only a minute, but I think you ' d be safe to have that near the end of the flight, perhaps. We get to do the classic. All right. If this hits you, it will not hurt you. OK. Thank you very much. Thank you. But now, as they say in infomercials, we have something much better for you, which we ' re working on : planes that are only six inches â 15 centimeters â in size. And Matt ' s plane was on the cover of Popular Science last month, showing what this can lead to. And in a while, something this size will have GPS and a video camera in it. We ' ve had one of these fly nine miles through the air at 35 miles an hour with just a little battery in it. But there ' s a lot of technology going. There are just milestones along the way of some remarkable things. This one doesn ' t have the video in it, but you get a little feel from what it can do. OK, here we go. MK : Sorry. OK. PM : If you can pass it down when you ' re done. Yeah, I think â I lost a little orientation ; I looked up into this light. It hit the building. And the building was poorly placed, actually. But you ' re beginning to see what can be done. We ' re working on projects now â even wing-flapping things the size of hawk moths â DARPA contracts, working with Caltech, UCLA. Where all this leads, I don ’ t know. Is it practical? I don ’ t know. But like any basic research, when you ’ re really forced to do things that are way beyond existing technology, you can get there with micro-technology, nanotechnology. You can do amazing things when you realize what nature has been doing all along. As you get to these small scales, you realize we have a lot to learn from nature â not with 747s â but when you get down to the nature ’ s realm, nature has 200 million years of experience. It never makes a mistake. Because if you make a mistake, you don ’ t leave any progeny. We should have nothing but success stories from nature, for you or for birds, and we ’ re learning a lot from its fascinating subjects. In concluding, I want to get back to the big picture and I have just two final slides to try and put it in perspective. The first I ’ ll just read. At last, I put in three sentences and had it say what I wanted. Over billions of years on a unique sphere, chance has painted a thin covering of life â complex, improbable, wonderful and fragile. Suddenly, we humans â a recently arrived species, no longer subject to the checks and balances inherent in nature â have grown in population, technology and intelligence to a position of terrible power. We now wield the paintbrush. And that ’ s serious : we ’ re not very bright. We ’ re short on wisdom ; we ’ re high on technology. Where ’ s it going to lead? Well, inspired by the sentences, I decided to wield the paintbrush. Every 25 years I do a picture. Here ’ s the one â tries to show that the world isn ’ t getting any bigger. Sort of a timeline, very non-linear scale, nature rates and trilobites and dinosaurs, and eventually we saw some humans with caves... Birds were flying overhead, after pterosaurs. And then we get to the civilization above the little TV set with a gun on it. Then traffic jams, and power systems, and some dots for digital. Where it ’ s going to lead â I have no idea. And so I just put robotic and natural cockroaches out there, but you can fill in whatever you want. This is not a forecast. This is a **warning**, and we have to think seriously about it. And that time when this is happening is not 100 years or 500 years. Things are going on this decade, next decade ; it ’ s a very short time that we have to decide what we are going to do. And if we can get some agreement on where we want the world to be â desirable, sustainable when your kids reach your age â I think we actually can reach it. Now, I said this was a **warning**, not a forecast. That was before â I painted this before we started in on making robotic versions of hawk moths and cockroaches, and now I ’ m beginning to wonder seriously â was this more of a forecast than I wanted? I personally think the surviving intelligent life form on earth is not going to be carbon-based ; it ’ s going to be silicon-based. And so where it all goes, I don ’ t know. The one final bit of sparkle we ’ ll put in at the very end here is an utterly impractical flight vehicle, which is a little ornithopter wing-flapping device that â rubber-band powered â that we ’ ll show you. MK : 32 gram. Sorry, one gram. PM : Last night we gave it a few too many turns and it tried to bash the roof out also. It ’ s about a gram. The tube there ’ s hollow, about paper-thin. And if this lands on you, I assure you it will not hurt you. But if you reach out to grab it or hold it, you will destroy it. So, be gentle, just act like a wooden Indian or something. And when it comes down â and we ’ ll see how it goes. We consider this to be sort of the spirit of TED. And you wonder, is it practical? And it turns out if I had not been â Unfortunately, we have some light bulb changes. We can probably get it down, but it ’ s possible it ’ s gone up to a greater destiny up there â â than it ever had. And I wanted to make â just â But I want to make just two points. One is, you think it ’ s frivolous ; there ’ s nothing to it. And yet if I had not been making ornithopters like that, a little bit cruder, in 1939 â a long, long time ago â there wouldn ’ t have been a Gossamer Condor, there wouldn ’ t have been an Albatross, a Solar Challenger, there wouldn ’ t be an Impact car, there wouldn ’ t be a mandate on zero-emission vehicles in California. A lot of these things â or similar â would have happened some time, probably a decade later. I didn ’ t realize at the time I was doing inquiry-based, hands-on things with teams, like they ’ re trying to get in education systems. So I think that, as a symbol, it ’ s important. And I believe that also is important. You can think of it as a sort of a symbol for learning and TED that somehow gets you thinking of technology and nature, and puts it all together in things that are â that make this conference, I think, more important than any that ’ s taken place in this country in this decade. Thank you.

This will not be a speech like any one I have ever given. I will talk to you today about the failure of leadership in global politics and in our globalizing economy. And I won ’ t provide some feel-good, ready-made solutions. But I will in the end urge you to **rethink**, actually take risks, and get involved in what I see as a global evolution of democracy. Failure of leadership. What is the failure of leadership today? And why is our democracy not working? Well, I believe that the failure of leadership is the fact that we have taken you out of the process. So let me, from my personal experiences, give you an insight, so that you can step back and maybe understand why it is so difficult to cope with the challenges of today and why politics is going down a blind alley. Let ’ s start from the beginning. Let ’ s start from democracy. Well, if you go back to the Ancient Greeks, it was a revelation, a discovery, that we had the potential, together, to be masters of our own fate, to be able to examine, to learn, to imagine, and then to design a better life. And democracy was the political innovation which protected this freedom, because we were liberated from fear so that our minds in fact, whether they be despots or dogmas, could be the protagonists. Democracy was the political innovation that allowed us to limit the power, whether it was of tyrants or of high priests, their natural tendency to **maximize** power and wealth. Well, I first began to understand this when I was 14 years old. I used to, to try to avoid homework, sneak down to the living room and listen to my parents and their friends debate heatedly. You see, then Greece was under control of a very powerful establishment which was strangling the country, and my father was heading a promising movement to reimagine Greece, to imagine a Greece where freedom reigned and where, maybe, the people, the citizens, could actually rule their own country. I used to join him in many of the campaigns, and you can see me here next to him. I ’ m the younger one there, to the side. You may not recognize me because I used to part my hair differently there. So in 1967, elections were coming, things were going well in the campaign, the house was electric. We really could sense that there was going to be a major progressive change in Greece. Then one night, military trucks drive up to our house. Soldiers storm the door. They find me up on the top terrace. A sergeant comes up to me with a machine gun, puts it to my head, and says,”Tell me where your father is or I will kill you.”My father, hiding **nearby**, reveals himself, and was summarily taken to prison. Well, we survived, but democracy did not. Seven brutal years of dictatorship which we spent in exile. Now, today, our democracies are again facing a moment of truth. Let me tell you a story. Sunday evening, Brussels, April 2010. I ’ m sitting with my counterparts in the European Union. I had just been elected prime minister, but I had the unhappy privilege of revealing a truth that our deficit was not 6 percent, as had been officially reported only a few days earlier before the elections by the previous government, but actually 15. 6 percent. But the deficit was only the symptom of much deeper problems that Greece was facing, and I had been elected on a mandate, a **mission**, actually, to tackle these problems, whether it was lack of transparency and accountability in governance, or whether it was a clientelistic state offering favors to the powerful — tax avoidance abetted and aided by a global tax evasion system, politics and media captured by **special** interests. But despite our electoral mandate, the markets mistrusted us. Our borrowing costs were skyrocketing, and we were facing possible default. So I went to Brussels on a **mission** to make the case for a united European response, one that would calm the markets and give us the time to make the necessary reforms. But time we didn ' t get. Picture yourselves around the table in Brussels. Negotiations are difficult, the tensions are high, progress is slow, and then, 10 minutes to 2, a prime minister shouts out,"We have to finish in 10 minutes."I said,"Why? These are important decisions. Let ' s deliberate a little bit longer."Another prime minister comes in and says,"No, we have to have an agreement now, because in 10 minutes, the markets are opening up in Japan, and there will be havoc in the global economy."We quickly came to a decision in those 10 minutes. This time it was not the military, but the markets, that put a gun to our collective heads. What followed were the most difficult decisions in my life, painful to me, painful to my countrymen, imposing cuts, austerity, often on those not to blame for the crisis. With these sacrifices, Greece did avoid bankruptcy and the eurozone avoided a collapse. Greece, yes, triggered the Euro crisis, and some people blame me for pulling the trigger. But I think today that most would agree that Greece was only a symptom of much deeper structural problems in the eurozone, vulnerabilities in the wider global economic system, vulnerabilities of our democracies. Our democracies are trapped by systems too big to fail, or, more accurately, too big to control. Our democracies are weakened in the global economy with players that can evade laws, evade taxes, evade environmental or labor standards. Our democracies are undermined by the growing inequality and the growing concentration of power and wealth, lobbies, corruption, the speed of the markets or simply the fact that we sometimes fear an impending disaster, have constrained our democracies, and they have constrained our capacity to imagine and actually use the potential, your potential, in finding solutions. Greece, you see, was only a preview of what is in store for us all. I, overly optimistically, had hoped that this crisis was an opportunity for Greece, for Europe, for the world, to make radical democratic transformations in our institutions. Instead, I had a very humbling experience. In Brussels, when we tried desperately again and again to find common solutions, I realized that not one, not one of us, had ever dealt with a similar crisis. But worse, we were trapped by our collective ignorance. We were led by our fears. And our fears led to a blind faith in the orthodoxy of austerity. Instead of reaching out to the common or the collective wisdom in our societies, investing in it to find more creative solutions, we reverted to political posturing. And then we were surprised when every **ad** hoc new measure didn ' t bring an end to the crisis, and of course that made it very easy to look for a whipping boy for our collective European failure, and of course that was Greece. Those profligate, idle, ouzo- swilling, Zorba-dancing Greeks, they are the problem. Punish them! Well, a convenient but unfounded stereotype that sometimes hurt even more than austerity itself. But let me warn you, this is not just about Greece. This could be the pattern that leaders follow again and again when we deal with these complex, cross- border problems, whether it ' s climate change, whether it ' s migration, whether it ' s the **financial** system. That is, abandoning our collective power to imagine our potential, falling victims to our fears, our stereotypes, our dogmas, taking our citizens out of the process rather than building the process around our citizens. And doing so will only test the faith of our citizens, of our peoples, even more in the democratic process. It ' s no wonder that many political leaders, and I don ' t exclude myself, have lost the trust of our people. When riot police have to protect parliaments, a scene which is increasingly common around the world, then there ' s something deeply wrong with our democracies. That ' s why I called for a referendum to have the Greek people own and decide on the terms of the rescue package. My European counterparts, some of them, at least, said,"You can ' t do this. There will be havoc in the markets again."I said,"We need to, before we restore confidence in the markets, we need to restore confidence and trust amongst our people."Since leaving office, I have had time to reflect. We have weathered the storm, in Greece and in Europe, but we remain challenged. If politics is the power to imagine and use our potential, well then 60-percent youth unemployment in Greece, and in other countries, certainly is a lack of imagination if not a lack of compassion. So far, we ' ve thrown economics at the problem, actually mostly austerity, and certainly we could have designed alternatives, a different strategy, a green stimulus for green jobs, or mutualized debt, Eurobonds which would support countries in need from market pressures, these would have been much more viable alternatives. Yet I have come to believe that the problem is not so much one of economics as it is one of democracy. So let ' s try something else. Let ' s see how we can bring people back to the process. Let ' s throw democracy at the problem. Again, the Ancient Greeks, with all their shortcomings, believed in the wisdom of the crowd at their best moments. In people we trust. Democracy could not work without the citizens deliberating, debating, taking on public responsibilities for public affairs. Average citizens often were chosen for citizen juries to decide on critical matters of the day. Science, theater, research, philosophy, games of the mind and the body, they were **daily** exercises. Actually they were an education for participation, for the potential, for growing the potential of our citizens. And those who shunned politics, well, they were idiots. You see, in Ancient Greece, in ancient Athens, that term originated there."Idiot"comes from the root"idio,"oneself. A person who is self-centered, secluded, excluded, someone who doesn ' t participate or even examine public affairs. And participation took place in the agora, the agora having two meanings, both a marketplace and a place where there was political deliberation. You see, markets and politics then were one, unified, accessible, transparent, because they gave power to the people. They serve the demos, democracy. Above government, above markets was the direct rule of the people. Today we have globalized the markets but we have not globalized our democratic institutions. So our politicians are limited to local politics, while our citizens, even though they see a great potential, are prey to forces beyond their control. So how then do we reunite the two halves of the agora? How do we democratize globalization? And I ' m not talking about the necessary reforms of the United Nations or the G20. I ' m talking about, how do we secure the space, the demos, the **platform** of values, so that we can tap into all of your potential? Well, this is exactly where I think Europe fits in. Europe, despite its recent failures, is the world ' s most successful cross-border peace experiment. So let ' s see if it can ' t be an experiment in global democracy, a new kind of democracy. Let ' s see if we can ' t design a European agora, not simply for products and **services**, but for our citizens, where they can work together, deliberate, learn from each other, exchange between art and cultures, where they can come up with creative solutions. Let ' s imagine that European citizens actually have the power to vote directly for a European president, or citizen juries chosen by lottery which can deliberate on critical and controversial issues, a European-wide referendum where our citizens, as the lawmakers, vote on future treaties. And here ' s an idea : Why not have the first truly European citizens by giving our immigrants, not Greek or German or Swedish citizenship, but a European citizenship? And make sure we actually empower the unemployed by giving them a voucher scholarship where they can choose to study anywhere in Europe. Where our common identity is democracy, where our education is through participation, and where participation builds trust and solidarity rather than exclusion and xenophobia. Europe of and by the people, a Europe, an experiment in deepening and widening democracy beyond borders. Now, some might accuse me of being naive, putting my faith in the power and the wisdom of the people. Well, after decades in politics, I am also a pragmatist. Believe me, I have been, I am, part of today ' s political system, and I know things must change. We must revive politics as the power to imagine, reimagine, and redesign for a better world. But I also know that this disruptive force of change won ' t be driven by the politics of today. The revival of democratic politics will come from you, and I mean all of you. Everyone who participates in this global exchange of ideas, whether it ' s here in this room or just outside this room or online or locally, where everybody lives, everyone who stands up to injustice and inequality, everybody who stands up to those who preach racism rather than **empathy**, dogma rather than critical thinking, technocracy rather than democracy, everyone who stands up to the unchecked power, whether it ' s authoritarian leaders, plutocrats hiding their assets in tax havens, or powerful lobbies protecting the powerful few. It is in their interest that all of us are idiots. Let ' s not be. Thank you. Bruno Giussani : You seem to describe a political leadership that is kind of unprepared and a prisoner of the whims of the **financial** markets, and that scene in Brussels that you describe, to me, as a citizen, is terrifying. Help us understand how you felt after the decision. It was not a good decision, clearly, but how do you feel after that, not as the prime minister, but as George? George Papandreou : Well, obviously there were constraints which didn ' t allow me or others to make the types of decisions we would have wanted, and obviously I had hoped that we would have the time to make the reforms which would have dealt with the deficit rather than trying to cut the deficit which was the symptom of the problem. And that hurt. That hurt because that, first of all, hurt the younger generation, and not only, many of them are demonstrating outside, but I think this is one of our problems. When we face these crises, we have kept the potential, the huge potential of our society out of this process, and we are closing in on ourselves in politics, and I think we need to change that, to really find new participatory ways using the great capabilities that now exist even in technology but not only in technology, the minds that we have, and I think we can find solutions which are much better, but we have to be open. BG : You seem to suggest that the way forward is more Europe, and that is not to be an easy discourse right now in most European countries. It ' s rather the other way — more closed borders and less cooperation and maybe even stepping out of some of the different parts of the European construction. How do you reconcile that? GP : Well, I think one of the worst things that happened during this crisis is that we started a blame game. And the fundamental idea of Europe is that we can cooperate beyond borders, go beyond our conflicts and work together. And the paradox is that, because we have this blame game, we have less the potential to convince our citizens that we should work together, while now is the time when we really need to bring our powers together. Now, more Europe for me is not simply giving more power to Brussels. It is actually giving more power to the citizens of Europe, that is, really making Europe a project of the people. So that, I think, would be a way to answer some of the fears that we have in our society. BG : George, thank you for coming to TED. GP : Thank you very much. BG : Thank you.

I ’ m going to be showing some of the cybercriminals ’ latest and nastiest creations. So basically, please don ’ t go and download any of the viruses that I show you. Some of you might be wondering what a cybersecurity specialist looks like, and I thought I ’ d give you a quick insight into my career so far. It ’ s a pretty accurate description. This is what someone that specializes in malware and hacking looks like. So today, computer viruses and trojans, designed to do everything from stealing data to watching you in your webcam to the theft of billions of dollars. Some malicious code today goes as far as targeting power, utilities and infrastructure. Let me give you a quick snapshot of what malicious code is capable of today. Right now, every second, eight new users are joining the Internet. Today, we will see 250, 000 individual new computer viruses. We will see 30, 000 new infected websites. And, just to kind of tear down a myth here, lots of people think that when you get infected with a computer virus, it ’ s because you went to a porn site. Right? Well, actually, statistically speaking, if you only visit porn sites, you ’ re safer. People normally write that down, by the way. Actually, about 80 percent of these are small business websites getting infected. Today ’ s cybercriminal, what do they look like? Well, many of you have the image, don ’ t you, of the spotty teenager sitting in a basement, hacking away for notoriety. But actually today, cybercriminals are wonderfully professional and organized. In fact, they have product adverts. You can go online and buy a hacking **service** to knock your business competitor offline. Check out this one I found. Man : So you ’ re here for one reason, and that reason is because you need your business competitors, rivals, haters, or whatever the reason is, or who, they are to go down. Well you, my friend, you ’ ve came to the right place. If you want your business competitors to go down, well, they can. If you want your rivals to go offline, well, they will. Not only that, we are providing a short- term-to-long-term DDOS **service** or scheduled attack, starting five dollars per hour for small personal websites to 10 to 50 dollars per hour. James Lyne : Now, I did actually pay one of these cybercriminals to attack my own website. Things got a bit tricky when I tried to expense it at the company. Turns out that ’ s not cool. But regardless, it ’ s amazing how many products and **services** are available now to cybercriminals. For example, this testing **platform**, which enables the cybercriminals to test the quality of their viruses before they release them on the world. For a small fee, they can upload it and make sure everything is good. But it goes further. Cybercriminals now have crime packs with business intelligence reporting dashboards to manage the distribution of their malicious code. This is the market leader in malware distribution, the Black Hole Exploit Pack, responsible for nearly one third of malware distribution in the last couple of quarters. It comes with technical installation guides, video setup routines, and get this, technical support. You can email the cybercriminals and they ’ ll tell you how to set up your illegal hacking server. So let me show you what malicious code looks like today. What I ’ ve got here is two systems, an attacker, which I ’ ve made look all Matrix-y and scary, and a victim, which you might recognize from home or work. Now normally, these would be on different sides of the planet or of the Internet, but I ’ ve put them side by side because it makes things much more interesting. Now, there are many ways you can get infected. You will have come in contact with some of them. Maybe some of you have received an email that says something like,"Hi, I ' m a Nigerian banker, and I ' d like to give you 53 billion dollars because I like your face."Or funnycats. exe, which rumor has it was quite successful in China ' s recent campaign against America. Now there are many ways you can get infected. I want to show you a couple of my favorites. This is a little USB key. Now how do you get a USB key to run in a business? Well, you could try looking really cute. Awww. Or, in my case, awkward and pathetic. So imagine this scenario : I walk into one of your businesses, looking very awkward and pathetic, with a copy of my C. V. which I ' ve covered in coffee, and I ask the receptionist to plug in this USB key and print me a new one. So let ' s have a look here on my victim computer. What I ' m going to do is plug in the USB key. After a couple of seconds, things start to happen on the computer on their own, usually a bad sign. This would, of course, normally happen in a couple of seconds, really, really quickly, but I ' ve kind of slowed it down so you can actually see the attack occurring. Malware is very boring otherwise. So this is writing out the malicious code, and a few seconds later, on the left-hand side, you ' ll see the attacker ' s screen get some interesting new text. Now if I place the mouse cursor over it, this is what we call a command prompt, and using this we can **navigate** around the computer. We can access your documents, your data. You can turn on the webcam. That can be very embarrassing. Or just to really prove a point, we can launch programs like my personal favorite, the Windows Calculator. So isn ' t it amazing how much control the attackers can get with such a simple operation? Let me show you how most malware is now distributed today. What I ' m going to do is open up a website that I wrote. It ' s a terrible website. It ' s got really awful graphics. And it ' s got a comments section here where we can submit comments to the website. Many of you will have used something a bit like this before. Unfortunately, when this was implemented, the developer was slightly inebriated and managed to forget all of the secure coding **practices** he had learned. So let ' s imagine that our attacker, called Evil Hacker just for comedy value, inserts something a little nasty. This is a script. It ' s code which will be **interpreted** on the webpage. So I ' m going to submit this post, and then, on my victim computer, I ' m going to open up the web browser and browse to my website, www. incrediblyhacked. com. Notice that after a couple of seconds, I get redirected. That website address at the top there, which you can just about see, microshaft. com, the browser crashes as it hits one of these exploit packs, and up pops fake antivirus. This is a virus pretending to look like antivirus software, and it will go through and it will scan the system, have a look at what its popping up here. It creates some very serious alerts. Oh look, a child porn proxy server. We really should clean that up. What ' s really insulting about this is not only does it provide the attackers with access to your data, but when the scan finishes, they tell you in order to clean up the fake viruses, you have to register the product. Now I liked it better when viruses were free. People now pay cybercriminals money to run viruses, which I find utterly bizarre. So anyway, let me change pace a little bit. Chasing 250, 000 pieces of malware a day is a massive challenge, and those numbers are only growing directly in proportion to the length of my **stress** line, you ' ll note here. So I want to talk to you briefly about a group of hackers we tracked for a year and actually found — and this is a rare treat in our job. Now this was a cross-industry collaboration, people from Facebook, independent **researchers**, guys from Sophos. So here we have a couple of documents which our cybercriminals had uploaded to a cloud **service**, kind of like Dropbox or SkyDrive, like many of you might use. At the top, you ' ll notice a section of source code. What this would do is send the cybercriminals a text message every day telling them how much money they ' d made that day, so a kind of cybercriminal billings report, if you will. If you look closely, you ' ll notice a series of what are Russian telephone numbers. Now that ' s obviously interesting, because that gives us a way of finding our cybercriminals. Down below, highlighted in red, in the other section of source code, is this bit"leded:leded."That ' s a username, kind of like you might have on Twitter. So let ' s take this a little further. There are a few other interesting pieces the cybercriminals had uploaded. Lots of you here will use smartphones to take photos and post them from the conference. An interesting feature of lots of modern smartphones is that when you take a photo, it embeds GPS data about where that photo was taken. In fact, I ' ve been spending a lot of time on Internet dating sites recently, obviously for research purposes, and I ' ve noticed that about 60 percent of the profile pictures on Internet dating sites contain the GPS coordinates of where the photo was taken, which is kind of scary because you wouldn ' t give out your home address to lots of strangers, but we ' re happy to give away our GPS coordinates to plus or minus 15 meters. And our cybercriminals had done the same thing. So here ' s a photo which resolves to St. Petersburg. We then deploy the incredibly advanced hacking tool. We used Google. Using the email address, the telephone number and the GPS data, on the left you see an advert for a BMW that one of our cybercriminals is selling, on the other side an advert for the sale of sphynx kittens. One of these was more stereotypical for me. A little more searching, and here ' s our cybercriminal. Imagine, these are hardened cybercriminals sharing information scarcely. Imagine what you could find about each of the people in this room. A bit more searching through the profile and there ' s a photo of their office. They were working on the third floor. And you can also see some photos from his business companion where he has a taste in a certain kind of image. It turns out he ' s a member of the Russian Adult Webmasters Federation. But this is where our investigation starts to slow down. The cybercriminals have locked down their profiles quite well. And herein is the greatest lesson of social media and **mobile** devices for all of us right now. Our friends, our families and our colleagues can break our security even when we do the right things. This is MobSoft, one of the companies that this cybercriminal gang owned, and an interesting thing about MobSoft is the 50-percent owner of this posted a job advert, and this job advert matched one of the telephone numbers from the code earlier. This woman was Maria, and Maria is the wife of one of our cybercriminals. And it ' s kind of like she went into her social media **settings** and clicked on every option imaginable to make herself really, really insecure. By the end of the investigation, where you can read the full 27-page report at that link, we had photos of the cybercriminals, even the office Christmas party when they were out on an outing. That ' s right, cybercriminals do have Christmas parties, as it turns out. Now you ' re probably wondering what happened to these guys. Let me come back to that in just a minute. I want to change pace to one last little demonstration, a technique that is wonderfully simple and basic, but is interesting in exposing how much information we ' re all giving away, and it ' s relevant because it applies to us as a TED audience. This is normally when people start kind of shuffling in their pockets trying to turn their phones onto airplane mode desperately. Many of you all know about the concept of scanning for wireless networks. You do it every time you take out your iPhone or your Blackberry and connect to something like TEDAttendees. But what you might not know is that you ' re also beaming out a list of networks you ' ve previously connected to, even when you ' re not using wireless actively. So I ran a little scan. I was relatively inhibited compared to the cybercriminals, who wouldn ' t be so concerned by law, and here you can see my **mobile** device. Okay? So you can see a list of wireless networks. TEDAttendees, HyattLB. Where do you think I ' m staying? My home network, PrettyFlyForAWifi, which I think is a great name. Sophos_Visitors, SANSEMEA, companies I work with. Loganwifi, that ’ s in Boston. HiltonLondon. CIASurveillanceVan. We called it that at one of our conferences because we thought that would freak people out, which is quite fun. This is how geeks party. So let ’ s make this a little bit more interesting. Let ’ s talk about you. Twenty- three percent of you have been to Starbucks recently and used the wireless network. Things get more interesting. Forty-six percent of you I could link to a business, XYZ Employee network. This isn ’ t an exact science, but it gets pretty accurate. Seven hundred and sixty-one of you I could identify a hotel you ’ d been to recently, absolutely with pinpoint precision somewhere on the globe. Two hundred and thirty-four of you, well, I know where you live. Your wireless network name is so unique that I was able to pinpoint it using data available openly on the Internet with no hacking or clever, clever tricks. And I should mention as well that some of you do use your names,”James Lyne ’ s iPhone,”for example. And two percent of you have a tendency to extreme profanity. So something for you to think about : As we adopt these new applications and **mobile** devices, as we play with these shiny new toys, how much are we trading off convenience for **privacy** and security? Next time you install something, look at the **settings** and ask yourself,”Is this information that I want to share? Would someone be able to abuse it?”We also need to think very carefully about how we develop our future talent pool. You see, technology ’ s changing at a staggering rate, and that 250, 000 pieces of malware won ’ t stay the same for long. There ’ s a very concerning trend that whilst many people coming out of schools now are much more technology-savvy, they know how to use technology, fewer and fewer people are following the feeder subjects to know how that technology works under the covers. In the U. K., a 60 percent reduction since 2003, and there are similar statistics all over the world. We also need to think about the legal issues in this area. The cybercriminals I talked about, despite theft of millions of dollars, actually still haven ’ t been arrested, and at this point possibly never will. Most laws are national in their implementation, despite cybercrime conventions, where the Internet is borderless and international by definition. Countries do not agree, which makes this area exceptionally challenging from a legal perspective. But my biggest ask is this : You see, you ’ re going to leave here and you ’ re going to see some astonishing stories in the news. You ’ re going to read about malware doing incredible and terrifying, scary things. However, 99 percent of it works because people fail to do the basics. So my ask is this : Go online, find these simple best **practices**, find out how to update and patch your computer. Get a secure password. Make sure you use a different password on each of your sites and **services** online. Find these resources. Apply them. The Internet is a fantastic resource for business, for political **expression**, for art and for learning. Help me and the security community make life much, much more difficult for cybercriminals. Thank you.

So here ’ s the good news about families. The last 50 years have seen a revolution in what it means to be a family. We have blended families, adopted families, we have nuclear families living in separate houses and divorced families living in the same house. But through it all, the family has grown stronger. Eight in 10 say the family they have today is as strong or stronger than the family they grew up in. Now, here ’ s the bad news. Nearly everyone is completely overwhelmed by the chaos of family life. Every parent I know, myself included, feels like we ’ re constantly playing defense. Just when our kids stop teething, they start having tantrums. Just when they stop needing our help taking a bath, they need our help dealing with cyberstalking or bullying. And here ’ s the worst news of all. Our children sense we ’ re out of control. Ellen Galinsky of the Families and Work Institute asked 1, 000 children,”If you were granted one wish about your parents, what would it be?”The parents predicted the kids would say, spending more time with them. They were wrong. The kids ’ number one wish? That their parents be less tired and less **stressed**. So how can we change this dynamic? Are there concrete things we can do to reduce **stress**, draw our family closer, and generally prepare our children to enter the world? I spent the last few years trying to answer that question, traveling around, meeting families, talking to scholars, experts ranging from elite peace negotiators to Warren Buffett ’ s bankers to the Green Berets. I was trying to figure out, what do happy families do right and what can I learn from them to make my family happier? I want to tell you about one family that I met, and why I think they offer clues. At 7 p. m. on a Sunday in Hidden Springs, Idaho, where the six members of the Starr family are sitting down to the highlight of their week : the family meeting. The Starrs are a regular American family with their share of regular American family problems. David is a software engineer. Eleanor takes care of their four children, ages 10 to 15. One of those kids tutors math on the far side of town. One has lacrosse on the near side of town. One has Asperger syndrome. One has ADHD.”We were living in complete chaos,”Eleanor said. What the Starrs did next, though, was surprising. Instead of turning to friends or relatives, they looked to David ’ s **workplace**. They turned to a cutting-edge program called agile development that was just spreading from manufacturers in Japan to startups in Silicon Valley. In agile, workers are organized into small groups and do things in very short spans of time. So instead of having executives issue grand proclamations, the team in effect manages itself. You have constant feedback. You have **daily** update sessions. You have weekly reviews. You ’ re constantly changing. David said when they brought this system into their home, the family meetings in particular increased communication, decreased **stress**, and made everybody happier to be part of the family team. When my wife and I adopted these family meetings and other techniques into the lives of our then-five-year-old twin daughters, it was the biggest single change we made since our daughters were born. And these meetings had this effect while taking under 20 minutes. So what is Agile, and why can it help with something that seems so different, like families? In 1983, Jeff Sutherland was a technologist at a **financial** firm in New England. He was very frustrated with how software got designed. Companies followed the waterfall method, right, in which executives issued orders that slowly trickled down to programmers below, and no one had ever consulted the programmers. Eighty-three percent of projects failed. They were too bloated or too out of date by the time they were done. Sutherland wanted to create a system where ideas didn ’ t just percolate down but could percolate up from the bottom and be adjusted in real time. He read 30 years of Harvard Business Review before stumbling upon an article in 1986 called”The New New Product Development Game.”It said that the pace of business was quickening — and by the way, this was in 1986 — and the most successful companies were flexible. It highlighted Toyota and Canon and likened their adaptable, tight- knit teams to rugby scrums. As Sutherland told me, we got to that article, and said,”That ’ s it.”In Sutherland ’ s system, companies don ’ t use large, massive projects that take two years. They do things in small chunks. Nothing takes longer than two weeks. So instead of saying,”You guys go off into that bunker and come back with a cell phone or a social network,”you say,”You go off and come up with one element, then bring it back. Let ’ s talk about it. Let ’ s adapt.”You succeed or fail quickly. Today, agile is used in a hundred countries, and it ' s sweeping into management suites. Inevitably, people began taking some of these techniques and applying it to their families. You had blogs pop up, and some manuals were written. Even the Sutherlands told me that they had an Agile Thanksgiving, where you had one group of people working on the food, one setting the table, and one greeting visitors at the door. Sutherland said it was the best Thanksgiving ever. So let ' s take one problem that families face, crazy mornings, and talk about how agile can help. A key plank is accountability, so teams use information radiators, these large boards in which everybody is accountable. So the Starrs, in adapting this to their home, created a morning checklist in which each child is expected to tick off chores. So on the morning I visited, Eleanor came downstairs, poured herself a cup of coffee, sat in a reclining chair, and she sat there, kind of amiably talking to each of her children as one after the other they came downstairs, checked the list, made themselves breakfast, checked the list again, put the dishes in the dishwasher, rechecked the list, fed the pets or whatever chores they had, checked the list once more, gathered their belongings, and made their way to the bus. It was one of the most astonishing family dynamics I have ever seen. And when I strenuously objected this would never work in our house, our kids needed way too much monitoring, Eleanor looked at me."That ' s what I thought,"she said."I told David, ' keep your work out of my kitchen. ' But I was wrong."So I turned to David :"So why does it work?"He said,"You can ' t underestimate the power of doing this."And he made a checkmark. He said,"In the **workplace**, adults love it. With kids, it ' s heaven."The week we introduced a morning checklist into our house, it cut parental screaming in half. But the real change didn ' t come until we had these family meetings. So following the agile model, we ask three questions : What worked well in our family this week, what didn ' t work well, and what will we agree to work on in the week ahead? Everyone throws out suggestions and then we pick two to focus on. And suddenly the most amazing things started coming out of our daughters ' mouths. What worked well this week? Getting over our fear of riding bikes. Making our beds. What didn ' t work well? Our math sheets, or greeting visitors at the door. Like a lot of parents, our kids are something like Bermuda Triangles. Like, thoughts and ideas go in, but none ever comes out, I mean at least not that are revealing. This gave us access suddenly to their innermost thoughts. But the most surprising part was when we turned to, what are we going to work on in the week ahead? You know, the key idea of agile is that teams essentially manage themselves, and it works in software and it turns out that it works with kids. Our kids love this process. So they would come up with all these ideas. You know, greet five visitors at the door this week, get an extra 10 minutes of reading before bed. Kick someone, lose desserts for a month. It turns out, by the way, our girls are little Stalins. We constantly have to kind of dial them back. Now look, naturally there ' s a gap between their kind of conduct in these meetings and their behavior the rest of the week, but the truth is it didn ' t really bother us. It felt like we were kind of laying these underground cables that wouldn ' t light up their world for many years to come. Three years later — our girls are almost eight now — We ' re still holding these meetings. My wife counts them among her most treasured moments as a mom. So what did we learn? The word"agile"entered the lexicon in 2001 when Jeff Sutherland and a group of designers met in Utah and wrote a 12-point Agile Manifesto. I think the time is right for an Agile Family Manifesto. I ' ve taken some ideas from the Starrs and from many other families I met. I ' m proposing three planks. Plank number one : Adapt all the time. When I became a parent, I figured, you know what? We ' ll set a few rules and we ' ll stick to them. That assumes, as parents, we can anticipate every problem that ’ s going to arise. We can ’ t. What ’ s great about the agile system is you build in a system of change so that you can react to what ’ s happening to you in real time. It ’ s like they say in the Internet world : if you ’ re doing the same thing today you were doing six months ago, you ’ re doing the wrong thing. Parents can learn a lot from that. But to me,”adapt all the time”means something deeper, too. We have to break parents out of this strait-jacket that the only ideas we can try at home are ones that come from shrinks or self-help gurus or other family experts. The truth is, their ideas are stale, whereas in all these other worlds there are these new ideas to make groups and teams work effectively. Let ’ s just take a few examples. Let ’ s take the biggest issue of all : family dinner. Everybody knows that having family dinner with your children is good for the kids. But for so many of us, it doesn ’ t work in our lives. I met a celebrity chef in New Orleans who said,”No problem, I ’ ll just time-shift family dinner. I ’ m not home, can ’ t make family dinner? We ’ ll have family breakfast. We ’ ll meet for a bedtime snack. We ’ ll make Sunday meals more important.”And the truth is, recent research backs him up. It turns out there ’ s only 10 minutes of productive time in any family meal. The rest of it ’ s taken up with”take your elbows off the table”and”pass the ketchup.”You can take that 10 minutes and move it to any part of the day and have the same benefit. So time-shift family dinner. That ’ s adaptability. An environmental psychologist told me,”If you ’ re sitting in a hard chair on a rigid surface, you ’ ll be more rigid. If you ’ re sitting on a cushioned chair, you ’ ll be more open.”She told me,”When you ’ re discipling your children, sit in an upright chair with a cushioned surface. The conversation will go better.”My wife and I actually moved where we sit for difficult conversations because I was sitting above in the power position. So move where you sit. That ’ s adaptability. The point is there are all these new ideas out there. We ’ ve got to hook them up with parents. So plank number one : Adapt all the time. Be flexible, be open-minded, let the best ideas win. Plank number two : Empower your children. Our instinct as parents is to order our kids around. It ’ s easier, and frankly, we ’ re usually right. There ’ s a reason that few systems have been more waterfall over time than the family. But the single biggest lesson we learned is to reverse the waterfall as much as possible. Enlist the children in their own upbringing. Just yesterday, we were having our family meeting, and we had voted to work on overreacting. So we said,”Okay, give us a reward and give us a punishment. Okay?”So one of my daughters threw out, you get five minutes of overreacting time all week. So we kind of liked that. But then her sister started working the system. She said,”Do I get one five-minute overreaction or can I get 10 30-second overreactions?”I loved that. Spend the time however you want. Now give us a punishment. Okay. If we get 15 minutes of overreaction time, that ’ s the limit. Every minute above that, we have to do one pushup. So you see, this is working. Now look, this system isn ’ t lax. There ’ s plenty of parental authority going on. But we ’ re giving them **practice** becoming independent, which of course is our ultimate goal. Just as I was leaving to come here tonight, one of my daughters started screaming. The other one said,”Overreaction! Overreaction!”and started counting, and within 10 seconds it had ended. To me that is a certified agile miracle. And by the way, research backs this up too. Children who plan their own goals, set weekly schedules, evaluate their own work build up their frontal cortex and take more control over their lives. The point is, we have to let our children succeed on their own terms, and yes, on occasion, fail on their own terms. I was talking to Warren Buffett ’ s banker, and he was chiding me for not letting my children make mistakes with their allowance. And I said,”But what if they drive into a ditch?”He said,”It ’ s much better to drive into a ditch with a $6 allowance than a $60, 000-a-year salary or a $6 million inheritance.”So the bottom line is, empower your children. Plank number three : Tell your story. Adaptability is fine, but we also need bedrock. Jim Collins, the author of”Good To Great,”told me that successful human organizations of any kind have two things in common : they preserve the core, they stimulate progress. So agile is great for stimulating progress, but I kept hearing time and again, you need to preserve the core. So how do you do that? Collins coached us on doing something that businesses do, which is define your **mission** and identify your core values. So he led us through the process of creating a family **mission** statement. We did the family equivalent of a corporate retreat. We had a pajama party. I made popcorn. Actually, I burned one, so I made two. My wife bought a flip chart. And we had this great conversation, like, what ’ s important to us? What values do we most uphold? And we ended up with 10 statements. We are travelers, not tourists. We don ’ t like dilemmas. We like solutions. Again, research shows that parents should spend less time worrying about what they do wrong and more time focusing on what they do right, worry less about the bad times and build up the good times. This family **mission** statement is a great way to identify what it is that you do right. A few weeks later, we got a call from the school. One of our daughters had gotten into a spat. And suddenly we were worried, like, do we have a mean girl on our hands? And we didn ’ t really know what to do, so we called her into my office. The family **mission** statement was on the wall, and my wife said,”So, anything up there seem to apply?”And she kind of looked down the list, and she said,”Bring people together?”Suddenly we had a way into the conversation. Another great way to tell your story is to tell your children where they came from. **Researchers** at Emory gave children a simple”what do you know”test. Do you know where your grandparents were born? Do you know where your parents went to high school? Do you know anybody in your family who had a difficult situation, an illness, and they overcame it? The children who **scored** highest on this”do you know”scale had the highest self-esteem and a greater sense they could control their lives. The”do you know”test was the single biggest predictor of emotional health and **happiness**. As the author of the study told me, children who have a sense of — they ’ re part of a larger narrative have greater self-confidence. So my final plank is, tell your story. Spend time retelling the story of your family ’ s positive moments and how you overcame the negative ones. If you give children this happy narrative, you give them the tools to make themselves happier. I was a teenager when I first read”Anna Karenina”and its famous opening sentence,”All happy families are alike. Each unhappy family is unhappy in its own way.”When I first read that, I thought,”That sentence is inane. Of course all happy families aren ’ t alike.”But as I began working on this project, I began changing my mind. Recent scholarship has allowed us, for the first time, to identify the building blocks that successful families have. I ’ ve mentioned just three here today : Adapt all the time, empower the children, tell your story. Is it possible, all these years later, to say Tolstoy was right? The answer, I believe, is yes. When Leo Tolstoy was five years old, his brother Nikolay came to him and said he had engraved the secret to universal **happiness** on a little green stick, which he had hidden in a ravine on the family ’ s estate in Russia. If the stick were ever found, all humankind would be happy. Tolstoy became consumed with that stick, but he never found it. In fact, he asked to be buried in that ravine where he thought it was hidden. He still lies there today, covered in a layer of green grass. That story perfectly captures for me the final lesson that I learned : **Happiness** is not something we find, it ’ s something we make. Almost anybody who ’ s looked at well-run organizations has come to pretty much the same conclusion. Greatness is not a matter of circumstance. It ’ s a matter of choice. You don ’ t need some grand plan. You don ’ t need a waterfall. You just need to take small steps, accumulate small wins, keep reaching for that green stick. In the end, this may be the greatest lesson of all. What ' s the secret to a happy family? Try.

Like many of you, I ' m one of the lucky people. I was born to a family where education was pervasive. I ' m a third-generation PhD, a daughter of two academics. In my childhood, I played around in my father ' s university lab. So it was taken for granted that I attend some of the best universities, which in turn opened the door to a world of opportunity. Unfortunately, most of the people in the world are not so lucky. In some parts of the world, for example, South Africa, education is just not readily accessible. In South Africa, the educational system was constructed in the days of apartheid for the white minority. And as a consequence, today there is just not enough spots for the many more people who want and deserve a high quality education. That scarcity led to a crisis in January of this year at the University of Johannesburg. There were a handful of positions left open from the standard admissions process, and the night before they were supposed to open that for registration, thousands of people lined up outside the gate in a line a mile long, hoping to be first in line to get one of those positions. When the gates opened, there was a stampede, and 20 people were **injured** and one woman died. She was a mother who gave her life trying to get her son a chance at a better life. But even in parts of the world like the United States where education is available, it might not be within reach. There has been much discussed in the last few years about the rising cost of health care. What might not be quite as obvious to people is that during that same period the cost of higher education tuition has been increasing at almost twice the rate, for a total of 559 percent since 1985. This makes education unaffordable for many people. Finally, even for those who do manage to get the higher education, the doors of opportunity might not open. Only a little over half of recent college graduates in the United States who get a higher education actually are working in jobs that require that education. This, of course, is not true for the students who graduate from the top institutions, but for many others, they do not get the value for their time and their effort. Tom Friedman, in his recent New York Times article, captured, in the way that no one else could, the spirit behind our effort. He said the big breakthroughs are what happen when what is suddenly possible meets what is desperately necessary. I ' ve talked about what ' s desperately necessary. Let ' s talk about what ' s suddenly possible. What ' s suddenly possible was demonstrated by three big Stanford classes, each of which had an enrollment of 100, 000 people or more. So to understand this, let ' s look at one of those classes, the Machine Learning class offered by my colleague and cofounder Andrew Ng. Andrew teaches one of the bigger Stanford classes. It ' s a Machine Learning class, and it has 400 people **enrolled** every time it ' s offered. When Andrew taught the Machine Learning class to the general public, it had 100, 000 people registered. So to put that number in perspective, for Andrew to reach that same size audience by teaching a Stanford class, he would have to do that for 250 years. Of course, he ' d get really bored. So, having seen the impact of this, Andrew and I decided that we needed to really try and scale this up, to bring the best quality education to as many people as we could. So we formed Coursera, whose goal is to take the best courses from the best instructors at the best universities and provide it to everyone around the world for free. We currently have 43 courses on the **platform** from four universities across a range of disciplines, and let me show you a little bit of an overview of what that looks like. Robert Ghrist : Welcome to Calculus. Ezekiel Emanuel : Fifty million people are uninsured. Scott Page : Models help us design more effective institutions and policies. We get unbelievable segregation. Scott Klemmer : So Bush imagined that in the future, you ’ d wear a camera right in the center of your head. Mitchell Duneier : Mills wants the student of sociology to develop the quality of mind... RG : Hanging cable takes on the form of a hyperbolic cosine. Nick Parlante : For each pixel in the image, set the red to zero. Paul Offit :... Vaccine allowed us to eliminate polio virus. Dan Jurafsky : Does Lufthansa serve breakfast and San Jose? Well, that sounds funny. Daphne Koller : So this is which coin you pick, and this is the two tosses. Andrew Ng : So in large-scale machine learning, we ’ d like to come up with computational... DK : It turns out, maybe not surprisingly, that students like getting the best content from the best universities for free. Since we opened the website in February, we now have 640, 000 students from 190 countries. We have 1. 5 million enrollments, 6 million quizzes in the 15 classes that have launched so far have been submitted, and 14 million videos have been viewed. But it ’ s not just about the numbers, it ’ s also about the people. Whether it ’ s Akash, who comes from a small town in India and would never have access in this case to a Stanford-quality course and would never be able to afford it. Or Jenny, who is a single mother of two and wants to hone her skills so that she can go back and complete her master ’ s degree. Or Ryan, who can ’ t go to school, because his immune deficient daughter can ’ t be risked to have germs come into the house, so he couldn ’ t leave the house. I ’ m really glad to say — recently, we ’ ve been in correspondence with Ryan — that this story had a happy ending. Baby Shannon — you can see her on the left — is doing much better now, and Ryan got a job by taking some of our courses. So what made these courses so different? After all, online course content has been available for a while. What made it different was that this was real course experience. It started on a given day, and then the students would watch videos on a weekly basis and do homework assignments. And these would be real homework assignments for a real grade, with a real **deadline**. You can see the **deadlines** and the usage graph. These are the spikes showing that procrastination is global phenomenon. At the end of the course, the students got a certificate. They could present that certificate to a prospective employer and get a better job, and we know many students who did. Some students took their certificate and presented this to an educational institution at which they were **enrolled** for actual college credit. So these students were really getting something meaningful for their investment of time and effort. Let ’ s talk a little bit about some of the components that go into these courses. The first component is that when you move away from the constraints of a physical classroom and design content explicitly for an online format, you can break away from, for example, the monolithic one-hour lecture. You can break up the material, for example, into these short, modular units of eight to 12 minutes, each of which represents a coherent concept. Students can traverse this material in different ways, depending on their background, their skills or their interests. So, for example, some students might benefit from a little bit of preparatory material that other students might already have. Other students might be interested in a particular enrichment topic that they want to pursue individually. So this format allows us to break away from the one-size-fits-all model of education, and allows students to follow a much more personalized curriculum. Of course, we all know as educators that students don ’ t learn by sitting and passively watching videos. Perhaps one of the biggest components of this effort is that we need to have students who **practice** with the material in order to really understand it. There ’ s been a range of studies that demonstrate the importance of this. This one that appeared in Science last year, for example, demonstrates that even simple retrieval **practice**, where students are just supposed to repeat what they already learned gives considerably improved results on various achievement tests down the line than many other educational interventions. We ’ ve tried to build in retrieval **practice** into the **platform**, as well as other forms of **practice** in many ways. For example, even our videos are not just videos. Every few minutes, the video pauses and the students get asked a question. SP :... These four things. Prospect theory, hyperbolic discounting, status quo **bias**, base rate **bias**. They ’ re all well documented. So they ’ re all well documented deviations from rational behavior. DK : So here the video pauses, and the student types in the answer into the box and submits. Obviously they weren ’ t paying attention. So they get to try again, and this time they got it right. There ’ s an optional explanation if they want. And now the video moves on to the next part of the lecture. This is a kind of simple question that I as an instructor might ask in class, but when I ask that kind of a question in class, 80 percent of the students are still scribbling the last thing I said, 15 percent are zoned out on Facebook, and then there ’ s the smarty pants in the front **row** who blurts out the answer before anyone else has had a chance to think about it, and I as the instructor am terribly gratified that somebody actually knew the answer. And so the lecture moves on before, really, most of the students have even noticed that a question had been asked. Here, every single student has to engage with the material. And of course these simple retrieval questions are not the end of the story. One needs to build in much more meaningful **practice** questions, and one also needs to provide the students with feedback on those questions. Now, how do you grade the work of 100, 000 students if you do not have 10, 000 TAs? The answer is, you need to use technology to do it for you. Now, fortunately, technology has come a long way, and we can now grade a range of interesting types of homework. In addition to multiple choice and the kinds of short answer questions that you saw in the video, we can also grade math, mathematical **expressions** as well as mathematical derivations. We can grade models, whether it ’ s **financial** models in a business class or physical models in a science or engineering class and we can grade some pretty sophisticated programming assignments. Let me show you one that ’ s actually pretty simple but fairly visual. This is from Stanford ’ s Computer Science 101 class, and the students are supposed to color-correct that blurry red image. They ’ re typing their program into the browser, and you can see they didn ’ t get it quite right, Lady Liberty is still seasick. And so, the student tries again, and now they got it right, and they ’ re told that, and they can move on to the next assignment. This ability to interact actively with the material and be told when you ’ re right or wrong is really essential to student learning. Now, of course we cannot yet grade the range of work that one needs for all courses. Specifically, what ’ s lacking is the kind of critical thinking work that is so essential in such disciplines as the humanities, the social sciences, business and others. So we tried to convince, for example, some of our humanities faculty that multiple choice was not such a bad strategy. That didn ’ t go over really well. So we had to come up with a different solution. And the solution we ended up using is peer grading. It turns out that previous studies show, like this one by Saddler and Good, that peer grading is a surprisingly effective strategy for providing reproducible grades. It was tried only in small classes, but there it showed, for example, that these student-assigned grades on the y-axis are actually very well correlated with the teacher-assigned grade on the x-axis. What ’ s even more surprising is that self-grades, where the students grade their own work critically — so long as you incentivize them properly so they can ’ t give themselves a perfect **score** — are actually even better correlated with the teacher grades. And so this is an effective strategy that can be used for grading at scale, and is also a useful learning strategy for the students, because they actually learn from the experience. So we now have the largest peer-grading pipeline ever devised, where tens of thousands of students are grading each other ’ s work, and quite successfully, I have to say. But this is not just about students sitting alone in their living room working through problems. Around each one of our courses, a community of students had formed, a global community of people around a shared intellectual endeavor. What you see here is a self-generated map from students in our Princeton Sociology 101 course, where they have put themselves on a world map, and you can really see the global reach of this kind of effort. Students collaborated in these courses in a variety of different ways. First of all, there was a question and answer forum, where students would pose questions, and other students would answer those questions. And the really amazing thing is, because there were so many students, it means that even if a student posed a question at 3 o ’ clock in the morning, somewhere around the world, there would be somebody who was awake and working on the same problem. And so, in many of our courses, the median response time for a question on the question and answer forum was 22 minutes. Which is not a level of **service** I have ever offered to my Stanford students. And you can see from the student testimonials that students actually find that because of this large online community, they got to interact with each other in many ways that were deeper than they did in the context of the physical classroom. Students also self-assembled, without any kind of intervention from us, into small study groups. Some of these were physical study groups along geographical constraints and met on a weekly basis to work through problem sets. This is the San Francisco study group, but there were ones all over the world. Others were virtual study groups, sometimes along language lines or along cultural lines, and on the bottom left there, you see our multicultural universal study group where people explicitly wanted to connect with people from other cultures. There are some tremendous opportunities to be had from this kind of framework. The first is that it has the potential of giving us a completely unprecedented look into understanding human learning. Because the data that we can collect here is unique. You can collect every click, every homework submission, every forum post from tens of thousands of students. So you can turn the study of human learning from the hypothesis-driven mode to the data-driven mode, a transformation that, for example, has revolutionized biology. You can use these data to understand fundamental questions like, what are good learning strategies that are effective versus ones that are not? And in the context of particular courses, you can ask questions like, what are some of the misconceptions that are more common and how do we help students fix them? So here ’ s an example of that, also from Andrew ’ s Machine Learning class. This is a distribution of wrong answers to one of Andrew ’ s assignments. The answers happen to be pairs of numbers, so you can draw them on this two-dimensional plot. Each of the little crosses that you see is a different wrong answer. The big cross at the top left is where 2, 000 students gave the exact same wrong answer. Now, if two students in a class of 100 give the same wrong answer, you would never notice. But when 2, 000 students give the same wrong answer, it ’ s kind of hard to miss. So Andrew and his students went in, looked at some of those assignments, understood the root cause of the misconception, and then they produced a targeted error message that would be provided to every student whose answer fell into that bucket, which means that students who made that same mistake would now get personalized feedback telling them how to fix their misconception much more effectively. So this personalization is something that one can then build by having the virtue of large numbers. Personalization is perhaps one of the biggest opportunities here as well, because it provides us with the potential of solving a 30-year-old problem. Educational **researcher** Benjamin Bloom, in 1984, posed what ' s called the 2 sigma problem, which he **observed** by studying three populations. The first is the population that studied in a lecture-based classroom. The second is a population of students that studied using a standard lecture-based classroom, but with a mastery-based approach, so the students couldn ' t move on to the next topic before demonstrating mastery of the previous one. And finally, there was a population of students that were taught in a one- on-one instruction using a tutor. The mastery-based population was a full standard deviation, or sigma, in achievement **scores** better than the standard lecture-based class, and the individual tutoring gives you 2 sigma improvement in performance. To understand what that means, let ' s look at the lecture-based classroom, and let ' s pick the median performance as a threshold. So in a lecture-based class, half the students are above that level and half are below. In the individual tutoring instruction, 98 percent of the students are going to be above that threshold. Imagine if we could teach so that 98 percent of our students would be above average. Hence, the 2 sigma problem. Because we cannot afford, as a society, to provide every student with an individual human tutor. But maybe we can afford to provide each student with a computer or a smartphone. So the question is, how can we use technology to push from the left side of the graph, from the blue curve, to the right side with the green curve? Mastery is easy to achieve using a computer, because a computer doesn ' t get tired of showing you the same video five times. And it doesn ' t even get tired of grading the same work multiple times, we ' ve seen that in many of the examples that I ' ve shown you. And even personalization is something that we ' re starting to see the beginnings of, whether it ' s via the personalized trajectory through the curriculum or some of the personalized feedback that we ' ve shown you. So the goal here is to try and push, and see how far we can get towards the green curve. So, if this is so great, are universities now obsolete? Well, Mark Twain certainly thought so. He said that,"College is a place where a professor ' s lecture notes go straight to the students ' lecture notes, without passing through the brains of either."I beg to differ with Mark Twain, though. I think what he was **complaining** about is not universities but rather the lecture-based format that so many universities spend so much time on. So let ' s go back even further, to Plutarch, who said that,"The mind is not a vessel that needs filling, but wood that needs igniting."And maybe we should spend less time at universities filling our students ' minds with content by lecturing at them, and more time igniting their creativity, their imagination and their problem-solving skills by actually talking with them. So how do we do that? We do that by doing active learning in the classroom. So there ' s been many studies, including this one, that show that if you use active learning, interacting with your students in the classroom, performance improves on every single metric — on attendance, on engagement and on learning as measured by a standardized test. You can see, for example, that the achievement **score** almost doubles in this particular experiment. So maybe this is how we should spend our time at universities. So to summarize, if we could offer a top quality education to everyone around the world for free, what would that do? Three things. First it would establish education as a fundamental human right, where anyone around the world with the ability and the motivation could get the skills that they need to make a better life for themselves, their families and their communities. Second, it would enable lifelong learning. It ' s a shame that for so many people, learning stops when we finish high school or when we finish college. By having this amazing content be available, we would be able to learn something new every time we wanted, whether it ’ s just to expand our minds or it ’ s to change our lives. And finally, this would enable a wave of innovation, because amazing talent can be found anywhere. Maybe the next Albert Einstein or the next Steve Jobs is living somewhere in a remote village in Africa. And if we could offer that person an education, they would be able to come up with the next big idea and make the world a better place for all of us. Thank you very much.

I study the future of crime and terrorism, and frankly, I ’ m afraid. I ’ m afraid by what I see. I sincerely want to believe that technology can bring us the techno-utopia that we ’ ve been promised, but, you see, I ’ ve spent a career in law enforcement, and that ’ s informed my perspective on things. I ’ ve been a street police officer, an undercover investigator, a counter-terrorism strategist, and I ’ ve worked in more than 70 countries around the world. I ’ ve had to see more than my fair share of violence and the darker underbelly of society, and that ’ s informed my opinions. My work with criminals and terrorists has actually been highly educational. They have taught me a lot, and I ’ d like to be able to share some of these observations with you. Today I ’ m going to show you the flip side of all those technologies that we marvel at, the ones that we love. In the hands of the TED community, these are awesome tools which will bring about great change for our world, but in the hands of suicide bombers, the future can look quite different. I started **observing** technology and how criminals were using it as a young patrol officer. In those days, this was the height of technology. Laugh though you will, all the drug dealers and gang members with whom I dealt had one of these long before any police officer I knew did. Twenty years later, criminals are still using **mobile** phones, but they ’ re also building their own **mobile** phone networks, like this one, which has been deployed in all 31 states of Mexico by the narcos. They have a national encrypted radio communications system. Think about that. Think about the innovation that went into that. Think about the infrastructure to build it. And then think about this : Why can ’ t I get a cell phone signal in San Francisco? How is this possible? It makes no sense. We consistently underestimate what criminals and terrorists can do. Technology has made our world increasingly open, and for the most part, that ’ s great, but all of this openness may have unintended consequences. Consider the 2008 terrorist attack on Mumbai. The men that carried that attack out were armed with AK-47s, explosives and hand grenades. They threw these hand grenades at innocent people as they sat eating in cafes and waited to catch trains on their way home from work. But heavy artillery is nothing new in terrorist operations. Guns and bombs are nothing new. What was different this time is the way that the terrorists used modern information communications technologies to locate additional victims and slaughter them. They were armed with **mobile** phones. They had BlackBerries. They had access to satellite imagery. They had satellite phones, and they even had night vision goggles. But perhaps their greatest innovation was this. We ’ ve all seen pictures like this on television and in the news. This is an operations center. And the terrorists built their very own op center across the border in Pakistan, where they monitored the BBC, al Jazeera, CNN and Indian local stations. They also monitored the Internet and social media to monitor the progress of their attacks and how many people they had killed. They did all of this in real time. The innovation of the terrorist operations center gave terrorists unparalleled situational awareness and tactical advantage over the police and over the government. What did they do with this? They used it to great effect. At one

point during the 60-hour siege, the terrorists were going room to room trying to find additional victims. They came upon a suite on the top floor of the hotel, and they kicked down the door and they found a man hiding by his bed. And they said to him,”Who are you, and what are you doing here?”And the man replied,”I ’ m just an innocent schoolteacher.”Of course, the terrorists knew that no Indian schoolteacher stays at a suite in the Taj. They picked up his identification, and they phoned his name in to the terrorist war room, where the terrorist war room Googled him, and found a picture and called their operatives on the ground and said,”Your hostage, is he heavyset? Is he bald in front? Does he wear glasses?””Yes, yes, yes,”came the answers. The op center had found him and they had a match. He was not a schoolteacher. He was the second-wealthiest businessman in India, and after discovering this information, the terrorist war room gave the order to the terrorists on the ground in Mumbai. We all worry about our **privacy settings** on Facebook, but the fact of the matter is, our openness can be used against us. Terrorists are doing this. A search engine can determine who shall live and who shall die. This is the world that we live in. During the Mumbai siege, terrorists were so dependent on technology that several witnesses reported that as the terrorists were shooting hostages with one hand, they were checking their **mobile** phone messages in the very other hand. In the end, 300 people were gravely wounded and over 172 men, women and children lost their lives that day. Think about what happened. During this 60-hour siege on Mumbai, 10 men armed not just with weapons, but with technology, were able to bring a city of 20 million people to a standstill. Ten people brought 20 million people to a standstill, and this traveled around the world. This is what radicals can do with openness. This was done nearly four years ago. What could terrorists do today with the technologies available that we have? What will they do tomorrow? The ability of one to affect many is scaling exponentially, and it ’ s scaling for good and it ’ s scaling for evil. It ’ s not just about terrorism, though. There ’ s also been a big paradigm shift in crime. You see, you can now commit more crime as well. In the old days, it was a knife and a gun. Then criminals moved to robbing trains. You could rob 200 people on a train, a great innovation. Moving forward, the Internet allowed things to scale even more. In fact, many of you will remember the recent Sony PlayStation hack. In that incident, over 100 million people were robbed. Think about that. When in the history of humanity has it ever been possible for one person to rob 100 million? Of course, it ’ s not just about stealing things. There are other avenues of technology that criminals can exploit. Many of you will remember this **super** cute video from the last TED, but not all quadcopter swarms are so nice and cute. They don ’ t all have drumsticks. Some can be armed with HD cameras and do countersurveillance on protesters, or, as in this little bit of movie magic, quadcopters can be loaded with firearms and automatic weapons. Little robots are cute when they play music to you. When they swarm and chase you down the block to shoot you, a little bit less so. Of course, criminals and terrorists weren ’ t the first to give guns to robots. We know where that started. But they ’ re adapting quickly. Recently, the FBI arrested an al Qaeda affiliate in the United States, who was planning on using these remote-controlled drone aircraft to fly C4 explosives into government buildings in the United States. By the way, these travel at over 600 miles an hour. Every time a new technology is being introduced, criminals are there to exploit it. We ’ ve all seen 3D printers. We know with them that you can print in many materials ranging from plastic to chocolate to metal and even concrete. With great precision I actually was able to make this just the other day, a very cute little ducky. But I wonder to myself, for those people that strap bombs to their chests and blow themselves up, how might they use 3D printers? Perhaps like this. You see, if you can print in metal, you can print one of these, and in fact you can also print one of these too. The UK I know has some very strict firearms laws. You needn ' t bring the gun into the UK anymore. You just bring the 3D printer and print the gun while you ' re here, and, of course, the magazines for your bullets. But as these get bigger in the future, what other items will you be able to print? The technologies are allowing bigger printers. As we move forward, we ' ll see new technologies also, like the Internet of Things. Every day we ' re connecting more and more of our lives to the Internet, which means that the Internet of Things will soon be the Internet of Things To Be Hacked. All of the physical objects in our space are being transformed into information technologies, and that has a radical implication for our security, because more connections to more devices means more vulnerabilities. Criminals understand this. Terrorists understand this. Hackers understand this. If you control the code, you control the world. This is the future that awaits us. There has not yet been an operating system or a technology that hasn ' t been hacked. That ' s troubling, since the human body itself is now becoming an information technology. As we ' ve seen here, we ' re transforming ourselves into cyborgs. Every year, thousands of cochlear implants, diabetic pumps, pacemakers and defibrillators are being implanted in people. In the United States, there are 60, 000 people who have a pacemaker that connects to the Internet. The defibrillators allow a physician at a distance to give a shock to a heart in case a patient needs it. But if you don ' t need it, and somebody else gives you the shock, it ' s not a good thing. Of course, we ' re going to go even deeper than the human body. We ' re going down to the cellular level these days. Up until this point, all the technologies I ' ve been talking about have been silicon-based, ones and zeroes, but there ' s another operating system out there : the original operating system, DNA. And to hackers, DNA is just another operating system waiting to be hacked. It ' s a great challenge for them. There are people already working on hacking the software of life, and while most of them are doing this to great good and to help us all, some won ' t be. So how will criminals abuse this? Well, with synthetic biology you can do some pretty neat things. For example, I predict that we will move away from a plant- based narcotics world to a synthetic one. Why do you need the plants anymore? You can just take the DNA code from marijuana or poppies or coca leaves and cut and past that gene and put it into yeast, and you can take those yeast and make them make the cocaine for you, or the marijuana, or any other drug. So how we use yeast in the future is going to be really interesting. In fact, we may have some really interesting bread and beer as we go into this next century. The cost of sequencing the human genome is dropping precipitously. It was proceeding at Moore ' s Law pace, but then in 2008, something changed. The technologies got better, and now DNA sequencing is proceeding at a pace five times that of Moore ' s Law. That has significant implications for us. It took us 30 years to get from the introduction of the personal computer to the level of cybercrime we have today, but looking at how biology is proceeding so rapidly, and knowing criminals and terrorists as I do, we may get there a lot faster with biocrime in the future. It will be easy for anybody to go ahead and print their own bio-virus, enhanced versions of ebola or anthrax, weaponized **flu**. We recently saw a case where some **researchers** made the H5N1 avian influenza virus more potent. It already has a 70 percent mortality rate if you get it, but it ' s hard to get. Engineers, by moving around a small number of genetic changes, were able to weaponize it and make it much more easy for human beings to catch, so that not thousands of people would die, but tens of millions. You see, you can go ahead and create new pandemics, and the **researchers** who did this were so proud of their accomplishments, they wanted to publish it openly so that everybody could see this and get access to this information. But it goes deeper than that. DNA **researcher** Andrew Hessel has pointed out quite rightly that if you can use cancer treatments, modern cancer treatments, to go after one cell while leaving all the other cells around it **intact**, then you can also go after any one person ’ s cell. Personalized cancer treatments are the flip side of personalized bioweapons, which means you can attack any one individual, including all the people in this picture. How will we protect them in the future? What to do? What to do about all this? That ’ s what I get asked all the time. For those of you who follow me on Twitter, I will be **tweeting** out the answer later on today. Actually, it ’ s a bit more complex than that, and there are no magic bullets. I don ’ t have all the answers, but I know a few things. In the wake of 9 / 11, the best security minds put together all their innovation and this is what they created for security. If you ’ re expecting the people who built this to protect you from the coming robopocalypse — — uh, you may want to have a backup plan. Just saying. Just think about that. Law enforcement is currently a closed system. It ’ s nation-based, while the threat is international. Policing doesn ’ t scale globally. At least, it hasn ’ t, and our current system of guns, border guards, big gates and fences are outdated in the new world into which we ’ re moving. So how might we prepare for some of these specific threats, like attacking a president or a prime minister? This would be the natural government response, to hide away all our government leaders in hermetically sealed bubbles. But this is not going to work. The cost of doing a DNA sequence is going to be **trivial**. Anybody will have it and we will all have them in the future. So maybe there ’ s a more radical way that we can look at this. What happens if we were to take the President ’ s DNA, or a king or queen ’ s, and put it out to a group of a few hundred trusted **researchers** so they could study that DNA and do penetration testing against it as a means of helping our leaders? Or what if we sent it out to a few thousand? Or, controversially, and not without its risks, what happens if we just gave it to the whole public? Then we could all be engaged in helping. We ’ ve already seen examples of this working well. The Organized Crime and Corruption Reporting Project is staffed by journalists and citizens where they are crowd-sourcing what dictators and terrorists are doing with public funds around the world, and, in a more dramatic case, we ’ ve seen in Mexico, a country that has been racked by 50, 000 narcotics-related murders in the past six years. They ’ re killing so many people they can ’ t even afford to bury them all in anything but these unmarked graves like this one outside of Ciudad Juarez. What can we do about this? The government has proven **ineffective**. So in Mexico, citizens, at great risk to themselves, are fighting back to build an effective solution. They ’ re crowd-mapping the activities of the drug dealers. Whether or not you realize it, we are at the dawn of a technological arms race, an arms race between people who are using technology for good and those who are using it for ill. The threat is serious, and the time to prepare for it is now. I can assure you that the terrorists and criminals are. My personal belief is that, rather than having a small, elite force of highly trained government agents here to protect us all, we ’ re much better off having average and ordinary citizens approaching this problem as a group and seeing what we can do. If we all do our part, I think we ’ ll be in a much better space. The tools to change the world are in everybody ’ s hands. How we use them is not just up to me, it ’ s up to all of us. This was a technology I would frequently deploy as a police officer. This technology has become outdated in our current world. It doesn ’ t scale, it doesn ’ t work globally, and it surely doesn ’ t work virtually. We ’ ve seen paradigm shifts in crime and terrorism. They call for a shift to a more open form and a more participatory form of law enforcement. So I invite you to join me. After all, public safety is too important to leave to the professionals. Thank you.

Text Sample 232: POS Dim 2 – 2012 – Score 11.00 – 2012/t002367.txt

I ’ m going to talk to you about optimism â or more precisely, the optimism **bias**. It ’ s a cognitive illusion that we ’ ve been studying in my lab for the past few years, and 80 percent of us have it. It ’ s our tendency to overestimate our likelihood of experiencing good events in our lives and underestimate our likelihood of experiencing bad events. So we underestimate our likelihood of suffering from cancer, being in a car accident. We overestimate our longevity, our career prospects. In short, we ’ re more optimistic than realistic, but we are oblivious to the fact. Take marriage for example. In the Western world, divorce rates are about 40 percent. That means that out of five married couples, two will end up splitting their assets. But when you ask newlyweds about their own likelihood of divorce, they estimate it at zero percent. And even divorce lawyers, who should really know better, hugely underestimate their own likelihood of divorce. So it turns out that optimists are not less likely to divorce, but they are more likely to remarry. In the words of Samuel Johnson,”Remarriage is the triumph of hope over experience.”So if we ’ re married, we ’ re more likely to have kids. And we all think our kids will be especially talented. This, by the way, is my two-year-old nephew, Guy. And I just want to make it absolutely clear that he ’ s a really bad example of the optimism **bias**, because he is in fact uniquely talented. And I ’ m not alone. Out of four British people, three said that they were optimistic about the future of their own families. That ’ s 75 percent. But only 30 percent said that they thought families in general are doing better than a few generations ago. And this is a really important point, because we ’ re optimistic about ourselves, we ’ re optimistic about our kids, we ’ re optimistic about our families, but we ’ re not so optimistic about the guy sitting next to us, and we ’ re somewhat pessimistic about the fate of our fellow citizens and the fate of our country. But private optimism about our own personal future remains persistent. And it doesn ’ t mean that we think things will magically turn out okay, but rather that we have the unique ability to make it so. Now I ’ m a scientist, I do experiments. So to show you what I mean, I ’ m going to do an experiment here with you. So I ’ m going to give you a list of abilities and characteristics, and I want you to think for each of these abilities where you stand relative to the rest of the population. The first one is getting along well with others. Who here believes they ’ re at the bottom 25 percent? Okay, that ’ s about 10 people out of 1, 500. Who believes they ’ re at the top 25 percent? That ’ s most of us here. Okay, now do the same for your **driving** ability. How interesting are you? How attractive are you? How honest are you? And finally, how modest are you? So most of us put ourselves above average on most of these abilities. Now this is statistically impossible. We can ’ t all be better than everyone else. But if we believe we ’ re better than the other guy, well that means that we ’ re more likely to get that promotion, to remain married, because we ’ re more social, more interesting. And it ’ s a global phenomenon. The optimism **bias** has been **observed** in many different countries â in Western cultures, in non-Western cultures, in females and males, in kids, in the elderly. It ’ s quite widespread. But the question is, is it good for us? So some people say no. Some people say the secret to **happiness** is low expectations. I think the logic goes something like this : If we don ’ t expect greatness, if we don ’ t expect to find love and be healthy and successful, well we ’ re not going to be disappointed when these things don ’ t happen. And if we ’ re not disappointed when good things don ’ t happen, and we ’ re pleasantly surprised when they do, we will be happy. So it ’ s a very good theory, but it turns out to be wrong for three reasons. Number one : Whatever happens, whether you succeed or you fail, people with high expectations always feel better. Because how we feel when we get dumped or win employee of the month depends on how we **interpret** that event. The psychologists Margaret Marshall and John Brown studied students with high and low expectations. And they found that when people with high expectations succeed, they attribute that success to their own traits.”I ’ m a genius, therefore I got an A, therefore I ’ ll get an A again and again in the future.”When they failed, it wasn ’ t because they were dumb, but because the exam just happened to be unfair. Next time they will do better. People with low expectations do the opposite. So when they failed it was because they were dumb, and when they succeeded it was because the exam just happened to be really easy. Next time reality would catch up with them. So they felt worse. Number two : Regardless of the outcome, the pure act of anticipation makes us happy. The behavioral economist George Lowenstein asked students in his university to imagine getting a **passionate** kiss from a celebrity, any celebrity. Then he said,”How much are you willing to pay to get a kiss from a celebrity if the kiss was delivered immediately, in three hours, in 24 hours, in three days, in one year, in 10 years? He found that the students were willing to pay the most not to get a kiss immediately, but to get a kiss in three days. They were willing to pay extra in order to wait. Now they weren ’ t willing to wait a year or 10 years ; no one wants an aging celebrity. But three days seemed to be the optimum amount. So why is that? Well if you get the kiss now, it ’ s over and done with. But if you get the kiss in three days, well that ’ s three days of jittery anticipation, the thrill of the wait. The students wanted that time to imagine where is it going to happen, how is it going to happen. Anticipation made them happy. This is, by the way, why people prefer Friday to Sunday. It ’ s a really curious fact, because Friday is a day of work and Sunday is a day of pleasure, so you ’ d assume that people will prefer Sunday, but they don ’ t. It ’ s not because they really, really like being in the office and they can ’ t stand strolling in the park or having a lazy brunch. We know that, because when you ask people about their ultimate favorite day of the week, surprise, surprise, Saturday comes in at first, then Friday, then Sunday. People prefer Friday because Friday brings with it the anticipation of the weekend ahead, all the plans that you have. On Sunday, the only thing you can look forward to is the work week. So optimists are people who expect more kisses in their future, more strolls in the park. And that anticipation enhances their wellbeing. In fact, without the optimism **bias**, we would all be slightly depressed. People with mild depression, they don ’ t have a **bias** when they look into the future. They ’ re actually more realistic than healthy individuals. But individuals with severe depression, they have a pessimistic **bias**. So they tend to expect the future to be worse than it ends up being. So optimism changes subjective reality. The way we expect the world to be changes the way we see it. But it also changes objective reality. It acts as a self-fulfilling prophecy. And that is the third reason why lowering your expectations will not make you happy. Controlled experiments have shown that optimism is not only related to success, it leads to success. Optimism leads to success in **academia** and sports and politics. And maybe the most surprising benefit of optimism is health. If we expect the future to be bright, **stress** and anxiety are reduced. So all in all, optimism has lots of benefits. But the question that was really confusing to me was, how do we maintain optimism in the face of reality? As an neuroscientist, this was especially confusing, because according to all the theories out there, when your expectations are not met, you should alter them. But this is not what we find. We asked people to come into our lab in order to try and figure out what was going on. We asked them to estimate their likelihood of experiencing different terrible events in their lives. So, for example, what is your likelihood of suffering from cancer? And then we told them the average likelihood of someone like them to suffer these misfortunes. So cancer, for example, is about 30 percent. And then we asked them again,"How likely are you to suffer from cancer?"What we wanted to know was whether people will take the information that we gave them to change their beliefs. And indeed they did â but mostly when the information we gave them was better than what they expected. So for example, if someone said,"My likelihood of suffering from cancer is about 50 percent,"and we said,"Hey, good news. The average likelihood is only 30 percent,"the next time around they would say,"Well maybe my likelihood is about 35 percent."So they learned quickly and efficiently. But if someone started off saying,"My average likelihood of suffering from cancer is about 10 percent,"and we said,"Hey, bad news. The average likelihood is about 30 percent,"the next time around they would say,"Yep. Still think it ' s about 11 percent."So it ' s not that they didn ' t learn at all â they did â but much, much less than when we gave them positive information about the future. And it ' s not that they didn ' t remember the numbers that we gave them ; everyone remembers that the average likelihood of cancer is about 30 percent and the average likelihood of divorce is about 40 percent. But they didn ' t think that those numbers were related to them. What this means is that **warning** signs such as these may only have limited impact. Yes, smoking kills, but mostly it kills the other guy. What I wanted to know was what was going on inside the human brain that prevented us from taking these **warning** signs personally. But at the same time, when we hear that the housing market is hopeful, we think,"Oh, my house is definitely going to double in price."To try and figure that out, I asked the participants in the experiment to lie in a brain imaging scanner. It looks like this. And using a method called functional MRI, we were able to identify regions in the brain that were responding to positive information. One of these regions is called the left inferior frontal gyrus. So if someone said,"My likelihood of suffering from cancer is 50 percent,"and we said,"Hey, good news. Average likelihood is 30 percent,"the left inferior frontal gyrus would respond fiercely. And it didn ' t matter if you ' re an extreme optimist, a mild optimist or slightly pessimistic, everyone ' s left inferior frontal gyrus was functioning perfectly well, whether you ' re Barack Obama or Woody Allen. On the other side of the brain, the right inferior frontal gyrus was responding to bad news. And here ' s the thing : it wasn ' t doing a very good job. The more optimistic you were, the less likely this region was to respond to **unexpected** negative information. And if your brain is failing at integrating bad news about the future, you will constantly leave your rose-tinted spectacles on. So we wanted to know, could we change this? Could we alter people ' s optimism **bias** by interfering with the brain activity in these regions? And there ' s a way for us to do that. This is my collaborator Ryota Kanai. And what he ' s doing is he ' s passing a small magnetic pulse through the skull of the participant in our study into their inferior frontal gyrus. And by doing that, he ' s interfering with the activity of this brain region for about half an hour. After that everything goes back to normal, I assure you. So let ' s see what happens. First of all, I ' m going to show you the average amount of **bias** that we see. So if I was to test all of you now, this is the amount that you would learn more from good news relative to bad news. Now we interfere with the region that we found to integrate negative information in this task, and the optimism **bias** grew even larger. We made people more **biased** in the way that they process information. Then we interfered with the brain region that we found to integrate good news in this task, and the optimism **bias** disappeared. We were quite amazed by these results because we were able to eliminate a deep-rooted **bias** in humans. And at this point we stopped and we asked ourselves, would we want to shatter the optimism illusion into tiny little bits? If we could do that, would we want to take people ’ s optimism **bias** away? Well I ’ ve already told you about all of the benefits of the optimism **bias**, which probably makes you want to hold onto it for dear life. But there are, of course, pitfalls, and it would be really foolish of us to ignore them. Take for example this email I recieved from a firefighter here in California. He says,”Fatality investigations for firefighters often include ’ We didn ’ t think the fire was going to do that, ’ even when all of the available information was there to make safe decisions.”This captain is going to use our findings on the optimism **bias** to try to explain to the firefighters why they think the way they do, to make them acutely aware of this very optimistic **bias** in humans. So unrealistic optimism can lead to risky behavior, to **financial** collapse, to faulty planning. The British government, for example, has acknowledged that the optimism **bias** can make individuals more likely to underestimate the costs and durations of projects. So they have adjusted the 2012 Olympic budget for the optimism **bias**. My friend who ’ s getting married in a few weeks has done the same for his wedding budget. And by the way, when I asked him about his own likelihood of divorce, he said he was quite sure it was zero percent. So what we would really like to do, is we would like to protect ourselves from the dangers of optimism, but at the same time remain hopeful, benefiting from the many fruits of optimism. And I believe there ’ s a way for us to do that. The key here really is knowledge. We ’ re not born with an innate understanding of our **biases**. These have to be identified by scientific investigation. But the good news is that becoming aware of the optimism **bias** does not shatter the illusion. It ’ s like visual illusions, in which understanding them does not make them go away. And this is good because it means we should be able to strike a balance, to come up with plans and rules to protect ourselves from unrealistic optimism, but at the same time remain hopeful. I think this cartoon portrays it nicely. Because if you ’ re one of these pessimistic penguins up there who just does not believe they can fly, you certainly never will. Because to make any kind of progress, we need to be able to imagine a different reality, and then we need to believe that that reality is possible. But if you are an extreme optimistic penguin who just jumps down blindly hoping for the best, you might find yourself in a bit of a mess when you hit the ground. But if you ’ re an optimistic penguin who believes they can fly, but then adjusts a parachute to your back just in case things don ’ t work out exactly as you had planned, you will soar like an eagle, even if you ’ re just a penguin. Thank you.

I have given the slide show that I gave here two years ago about 2, 000 times. I ’ m giving a short slide show this morning that I ’ m giving for the very first time, so â well it ’ s â I don ’ t want or need to raise the bar, I ’ m actually trying to lower the bar. Because I ’ ve cobbled this together to try to meet the challenge of this session. And I was reminded by Karen Armstrong ’ s fantastic presentation that religion really properly understood is not about belief, but about behavior. Perhaps we should say the same thing about optimism. How dare we be optimistic? Optimism is sometimes characterized as a belief, an intellectual posture. As Mahatma Gandhi famously said,”You must become the change you wish to see in the world.”And the outcome about which we wish to be optimistic is not going to be created by the belief alone, except to the extent that the belief brings about new behavior. But the word”behavior”is also, I think, sometimes misunderstood in this context. I ’ m a big advocate of changing the lightbulbs and buying hybrids, and Tipper and I put 33 solar panels on our house, and dug the geothermal wells, and did all of that other stuff. But, as important as it is to change the lightbulbs, it is more important to change the laws. And when we change our behavior in our **daily** lives, we sometimes leave out the citizenship part and the democracy part. In order to be optimistic about this, we have to become incredibly active as citizens in our democracy. In order to solve the climate crisis, we have to solve the democracy crisis. And we have one. I have been trying to tell this story for a long time. I was reminded of that recently, by a woman who walked past the table I was sitting at, just staring at me as she walked past. She was in her 70s, looked like she had a kind face. I thought nothing of it until I saw from the corner of my eye she was walking from the opposite direction, also just staring at me. And so I said,”How do you do?”And she said,”You know, if you dyed your hair black, you would look just like Al Gore.”Many years ago, when I was a young congressman, I spent an awful lot of time dealing with the challenge of nuclear arms control â the nuclear arms race. And the military historians taught me, during that quest, that military conflicts are typically put into three categories : local battles, regional or theater wars, and the rare but all-important global, world war â strategic conflicts. And each level of conflict requires a different allocation of resources, a different approach, a different **organizational** model. Environmental challenges fall into the same three categories, and most of what we think about are local environmental problems : air pollution, water pollution, hazardous waste dumps. But there are also regional environmental problems, like acid rain from the Midwest to the Northeast, and from Western Europe to the Arctic, and from the Midwest out the Mississippi into the dead zone of the Gulf of Mexico. And there are lots of those. But the climate crisis is the rare but all-important global, or strategic, conflict. Everything is affected. And we have to organize our response appropriately. We need a worldwide, global mobilization for renewable energy, conservation, efficiency and a global transition to a low-carbon economy. We have work to do. And we can mobilize resources and political will. But the political will has to be mobilized, in order to mobilize the resources. Let me show you these slides here. I thought I would start with the logo. What ’ s missing here, of course, is the North Polar ice cap. Greenland remains. Twenty-eight years ago, this is what the polar ice cap â the North Polar ice cap â looked like at the end of the summer, at the fall equinox. This last fall, I went to the Snow and Ice Data Center in Boulder, Colorado, and talked to the **researchers** here in Monterey at the Naval Postgraduate Laboratory. This is what ’ s happened in the last 28 years. To put it in perspective, 2005 was the previous record. Here ’ s what happened last fall that has really unnerved the **researchers**. The North Polar ice cap is the same size geographically â doesn ’ t look quite the same size â but it is exactly the same size as the United States, minus an area roughly equal to the state of Arizona. The amount that disappeared in 2005 was equivalent to everything east of the Mississippi. The extra amount that disappeared last fall was equivalent to this much. It comes back in the winter, but not as permanent ice, as thin ice â vulnerable. The amount remaining could be completely gone in summer in as little as five years. That puts a lot of pressure on Greenland. Already, around the Arctic Circle â this is a famous village in Alaska. This is a town in Newfoundland. Antarctica. Latest studies from NASA. The amount of a moderate-to-severe snow melting of an area equivalent to the size of California.”They were the best of times, they were the worst of times”: the most famous opening sentence in English literature. I want to share briefly a tale of two planets. Earth and Venus are exactly the same size. Earth ' s diameter is about 400 kilometers larger, but essentially the same size. They have exactly the same amount of carbon. But the difference is, on Earth, most of the carbon has been leeched over time out of the atmosphere, deposited in the ground as coal, oil, natural gas, etc. On Venus, most of it is in the atmosphere. The difference is that our temperature is 59 degrees on average. On Venus, it ' s 855. This is relevant to our current strategy of taking as much carbon out of the ground as quickly as possible, and putting it into the atmosphere. It ' s not because Venus is slightly closer to the Sun. It ' s three times hotter than Mercury, which is right next to the Sun. Now, briefly, here ' s an image you ' ve seen, as one of the only old images, but I show it because I want to briefly give you CSI : Climate. The global scientific community says : man-made global warming pollution, put into the atmosphere, thickening this, is trapping more of the outgoing infrared. You all know that. At the last IPCC summary, the scientists wanted to say,"How certain are you?"They wanted to answer that"99 percent."The Chinese objected, and so the compromise was"more than 90 percent."Now, the skeptics say,"Oh, wait a minute, this could be variations in this energy coming in from the sun."If that were true, the stratosphere would be heated as well as the lower atmosphere, if it ' s more coming in. If it ' s more being trapped on the way out, then you would expect it to be warmer here and cooler here. Here is the lower atmosphere. Here ' s the stratosphere : cooler. CSI : Climate. Now, here ' s the good news. Sixty-eight percent of Americans now believe that human activity is responsible for global warming. Sixty-nine percent believe that the Earth is heating up in a significant way. There has been progress, but here is the key : when given a list of challenges to confront, global warming is still listed at near the bottom. What is missing is a sense of urgency. If you agree with the factual analysis, but you don ' t feel the sense of urgency, where does that leave you? Well, the Alliance for Climate Protection, which I head in conjunction with Current TV â who did this pro bono â did a worldwide contest to do commercials on how to communicate this. This is the winner. NBC â I ' ll show all of the networks here â the top journalists for NBC asked 956 questions in 2007 of the presidential candidates : two of them were about the climate crisis. ABC : 844 questions, two about the climate crisis. Fox : two. CNN : two. CBS : zero. From laughs to tears â this is one of the older tobacco commercials. So here ' s what we ' re doing. This is gasoline consumption in all of these countries. And us. But it ' s not just the developed nations. The developing countries are now following us and accelerating their pace. And actually, their cumulative emissions this year are the equivalent to where we were in 1965. And they ' re catching up very dramatically. The total concentrations : by 2025, they will be essentially where we were in 1985. If the wealthy countries were completely missing from the picture, we would still have this crisis. But we have given to the developing countries the technologies and the ways of thinking that are creating the crisis. This is in Bolivia â over thirty years. This is **peak** fishing in a few seconds. The ' 60s. ' 70s. ' 80s. ' 90s. We have to stop this. And the good news is that we can. We have the technologies. We have to have a unified view of how to go about this : the **struggle** against poverty in the world and the challenge of cutting wealthy country emissions, all has a single, very simple solution. People say,"What ' s the solution?"Here it is. Put a price on carbon. We need a CO2 tax, revenue neutral, to replace taxation on employment, which was invented by Bismarck â and some things have changed since the 19th century. In the poor world, we have to integrate the responses to poverty with the solutions to the climate crisis. Plans to fight poverty in Uganda are mooted, if we do not solve the climate crisis. But responses can actually make a huge difference in the poor countries. This is a proposal that has been talked about a lot in Europe. This was from Nature magazine. These are concentrating solar, renewable energy plants, linked in a so-called”supergrid”to supply all of the electrical power to Europe, largely from developing countries â high-voltage DC currents. This is not pie in the sky ; this can be done. We need to do it for our own economy. The latest figures show that the old model is not working. There are a lot of great investments that you can make. If you are investing in tar sands or shale oil, then you have a portfolio that is crammed with sub-prime carbon assets. And it is based on an old model. Junkies find veins in their toes when the ones in their arms and their legs collapse. Developing tar sands and coal shale is the equivalent. Here are just a few of the investments that I personally think make sense. I have a stake in these, so I ’ ll have a disclaimer there. But geothermal, concentrating solar, advanced photovoltaics, efficiency and conservation. You ’ ve seen this slide before, but there ’ s a change. The only two countries that didn ’ t ratify â and now there ’ s only one. Australia had an election. And there was a campaign in Australia that involved television and Internet and radio commercials to lift the sense of urgency for the people there. And we trained 250 people to give the slide show in every town and village and city in Australia. Lot of other things contributed to it, but the new Prime Minister announced that his very first priority would be to change Australia ’ s position on Kyoto, and he has. Now, they came to an awareness partly because of the horrible drought that they have had. This is Lake Lanier. My friend Heidi Cullen said that if we gave droughts names the way we give hurricanes names, we ’ d call the one in the southeast now Katrina, and we would say it ’ s headed toward Atlanta. We can ’ t wait for the kind of drought Australia had to change our political culture. Here ’ s more good news. The cities supporting Kyoto in the U. S. are up to 780 â and I thought I saw one go by there, just to localize this â which is good news. Now, to close, we heard a couple of days ago about the value of making individual heroism so commonplace that it becomes banal or routine. What we need is another hero generation. Those of us who are alive in the United States of America today especially, but also the rest of the world, have to somehow understand that history has presented us with a choice â just as Jill [Bolte] Taylor was figuring out how to save her life while she was distracted by the amazing experience that she was going through. We now have a culture of distraction. But we have a planetary emergency. And we have to find a way to create, in the generation of those alive today, a sense of generational **mission**. I wish I could find the words to convey this. This was another hero generation that brought democracy to the planet. Another that ended slavery. And that gave women the right to vote. We can do this. Don ’ t tell me that we don ’ t have the capacity to do it. If we had just one week ’ s worth of what we spend on the Iraq War, we could be well on the way to solving this challenge. We have the capacity to do it. One final point : I ’ m optimistic, because I believe we have the capacity, at moments of great challenge, to set aside the causes of distraction and rise to the challenge that history is presenting to us. Sometimes I hear people respond to the disturbing facts of the climate crisis by saying,”Oh, this is so terrible. What a burden we have.”I would like to ask you to reframe that. How many generations in all of human history have had the opportunity to rise to a challenge that is **worthy** of our best efforts? A challenge that can pull from us more than we knew we could do? I think we ought to approach this challenge with a sense of profound joy and gratitude that we are the generation about which, a thousand years from now, philharmonic orchestras and poets and singers will celebrate by saying, they were the ones that found it within themselves to solve this crisis and lay the basis for a bright and optimistic human future. Let ’ s do that. Thank you very much. Chris Anderson : For so many people at TED, there is deep pain that basically a design issue on a voting form â one bad design issue meant that your voice wasn ’ t being heard like that in the last eight years in a position where you could make these things come true. That hurts. Al Gore : You have no idea. CA : When you look at what the leading candidates in your own party are doing now â I mean, there ’ s â are you excited by their plans on global warming? AG : The answer to the question is hard for me because, on the one hand, I think that we should feel really great about the fact that the Republican nominee â certain nominee â John McCain, and both of the finalists for the Democratic nomination â all three have a very different and forward-leaning position on the climate crisis. All three have offered leadership, and all three are very different from the approach taken by the current administration. And I think that all three have also been responsible in putting forward plans and proposals. But the campaign dialogue that â as illustrated by the questions â that was put together by the League of Conservation Voters, by the way, the analysis of all the questions â and, by the way, the debates have all been sponsored by something that goes by the Orwellian label,”Clean Coal.”Has anybody noticed that? Every single debate has been sponsored by”Clean Coal.””Now, even lower emissions!”The richness and fullness of the dialogue in our democracy has not laid the basis for the kind of **bold** initiative that is really needed. So they ’ re saying the right things and they may â whichever of them is elected â may do the right thing, but let me tell you : when I came back from Kyoto in 1997, with a feeling of great **happiness** that we ’ d gotten that breakthrough there, and then confronted the United States Senate, only one out of 100 senators was willing to vote to confirm, to ratify that treaty. Whatever the candidates say has to be laid alongside what the people say. This challenge is part of the fabric of our whole civilization. CO2 is the exhaling breath of our civilization, literally. And now we mechanized that process. Changing that pattern requires a scope, a scale, a speed of change that is beyond what we have done in the past. So that ’ s why I began by saying, be optimistic in what you do, but be an active citizen. Demand â change the light bulbs, but change the laws. Change the global treaties. We have to speak up. We have to solve this democracy â this â We have sclerosis in our democracy. And we have to change that. Use the Internet. Go on the Internet. Connect with people. Become very active as citizens. Have a moratorium â we shouldn ’ t have any new coal-fired generating plants that aren ’ t able to capture and store CO2, which means we have to quickly build these renewable sources. Now, nobody is talking on that scale. But I do believe that between now and November, it is possible. This Alliance for Climate Protection is going to launch a nationwide campaign â grassroots mobilization, television **ads**, Internet **ads**, radio, newspaper â with partnerships with everybody from the Girl Scouts to the hunters and fishermen. We need help. We need help. CA : In terms of your own personal role going forward, Al, is there something more than that you would like to be doing? AG : I have prayed that I would be able to find the answer to that question. What can I do? Buckminster Fuller once wrote,”If the future of all human civilization depended on me, what would I do? How would I be?”It does depend on all of us, but again, not just with the light bulbs. We, most of us here, are Americans. We have a democracy. We can change things, but we have to actively change. What ’ s needed really is a higher level of consciousness. And that ’ s hard to â that ’ s hard to create â but it is coming. There ’ s an old African proverb that some of you know that says,”If you want to go quickly, go alone ; if you want to go far, go together.”We have to go far, quickly. So we have to have a change in consciousness. A change in commitment. A new sense of urgency. A new appreciation for the privilege that we have of undertaking this challenge. CA : Al Gore, thank you so much for coming to TED. AG : Thank you. Thank you very much.

Text Sample 234: POS Dim 2 – 2008 – Score 9.00 – 2008/t000208.txt

This is a guy named Bob McKim. He was a creativity **researcher** in the ’ 60s and ’ 70s, and also led the Stanford Design Program. And in fact, my friend and IDEO founder, David Kelley, whoâs out there somewhere, studied under him at Stanford. And he liked to do an exercise with his students where he got them to take a piece of paper and draw the person who sat next to them, their neighbor, very quickly, just as quickly as they could. And in fact, weâre going to do that exercise right now. You all have a piece of cardboard and a piece of paper. Itâs actually got a bunch of circles on it. I need you to turn that piece of paper over ; you should find that itâs blank on the other side. And there should be a pencil. And I want you to pick somebody thatâs seated next to you, and when I say, go, youâve got 30 seconds to draw your neighbor, OK? So, everybody ready? OK. Off you go. Youâve got 30 seconds, youâd better be fast. Come on : those masterpieces... OK? Stop. All right, now. Yes, lotâs of laughter. Yeah, exactly. Lots of laughter, quite a bit of embarrassment. Am I hearing a few”sorryâs”? I think Iâm hearing a few sorryâs. Yup, yup, I think I probably am. And thatâs exactly what happens every time, every time you do this with adults. McKim found this every time he did it with his students. He got exactly the same response : lots and lots of sorryâs. And he would point this out as evidence that we fear the judgment of our peers, and that weâre embarrassed about showing our ideas to people we think of as our peers, to those around us. And this fear is what causes us to be conservative in our thinking. So we might have a wild idea, but weâre afraid to share it with anybody else. OK, so if you try the same exercise with kids, they have no embarrassment at all. They just quite happily show their masterpiece to whoever wants to look at it. But as they learn to become adults, they become much more sensitive to the opinions of others, and they lose that freedom and they do start to become embarrassed. And in studies of kids playing, itâs been shown time after time that kids who feel secure, who are in a kind of trusted environment â theyâre the ones that feel most free to play. And if youâre starting a design firm, letâs say, then you probably also want to create a place where people have the same kind of security. Where they have the same kind of security to take risks. Maybe have the same kind of security to play. Before founding IDEO, David said that what he wanted to do was to form a company where all the employees are my best friends. Now, that wasnât just self-indulgence. He knew that friendship is a short cut to play. And he knew that it gives us a sense of trust, and it allows us then to take the kind of creative risks that we need to take as designers. And so, that decision to work with his friends â now he has 550 of them â was what got IDEO started. And our studios, like, I think, many creative **workplaces** today, are designed to help people feel relaxed : familiar with their surroundings, comfortable with the people that theyâre working with. It takes more than decor, but I think weâve all seen that creative companies do often have symbols in the **workplace** that remind people to be playful, and that itâs a permissive environment. So, whether itâs this microbus meeting room that we have in one our buildings at IDEO ; or at Pixar, where the animators work in wooden huts and decorated caves ; or at the Googleplex, where itâs famous for its [beach] volleyball courts, and even this massive dinosaur skeleton with pink flamingos on it. Donât know the reason for the pink flamingos, but anyway, theyâre there in the garden.

Or even in the Swiss office of Google, which perhaps has the most wacky ideas of all. And my theory is, thatâs so the Swiss can prove to their Californian colleagues that theyâre not boring. So they have the slide, and they even have a firemanâs pole. Donât know what they do with that, but they have one. So all of these places have these symbols. Now, our big symbol at IDEO is actually not so much the place, itâs a thing. And itâs actually something that we invented a few years ago, or created a few years ago. Itâs a toy ; itâs called a"finger blaster."And I forgot to bring one up with me. So if somebody can reach under the chair thatâs next to them, youâll find something taped underneath it. Thatâs great. If you could pass it up. Thanks, David, I appreciate it. So this is a finger blaster, and you will find that every one of you has got one taped under your chair. And Iâm going to run a little experiment. Another little experiment. But before we start, I need just to put these on. Thank you. All right. Now, what Iâm going to do is, Iâm going to see how â I canât see out of these, OK. Iâm going to see how many of you at the back of the room can actually get those things onto the stage. So the way they work is, you know, you just put your finger in the thing, pull them back, and off you go. So, donât look backwards. Thatâs my only recommendation here. I want to see how many of you can get these things on the stage. So come on! There we go, there we go. Thank you. Thank you. Oh. I have another idea. I wanted to â there we go. There we go. Thank you, thank you, thank you. Not bad, not bad. No serious injuries so far. Well, theyâre still coming in from the back there ; theyâre still coming in. Some of you havenât fired them yet. Can you not figure out how to do it, or something? Itâs not that hard. Most of your kids figure out how to do this in the first 10 seconds, when they pick it up. All right. This is pretty good ; this is pretty good. Okay, all right. Letâs â I suppose we ’ d better... I ’ d better clear these up out of the way ; otherwise, Iâm going to trip over them. All right. So the rest of you can save them for when I say something particularly boring, and then you can fire at me. All right. I think Iâm going to take these off now, because I canât see a damn thing when Iâve â all right, OK. So, ah, that was fun. All right, good. So, OK, so why? So we have the finger blasters. Other people have dinosaurs, you know. Why do we have them? Well, as I said, we have them because we think maybe playfulness is important. But why is it important? We use it in a pretty pragmatic way, to be honest. We think playfulness helps us get to better creative solutions. Helps us do our jobs better, and helps us feel better when we do them. Now, an adult encountering a new situation â when we encounter a new situation we have a tendency to want to categorize it just as quickly as we can, you know. And thereâs a reason for that : we want to settle on an answer. Lifeâs complicated ; we want to figure out whatâs going on around us very quickly. I suspect, actually, that the evolutionary biologists probably have lots of reasons [for] why we want to categorize new things very, very quickly. One of them might be, you know, when we see this funny stripy thing : is that a tiger just about to jump out and kill us? Or is it just some weird shadows on the tree? We need to figure that out pretty fast. Well, at least, we did once. Most of us donât need to anymore, I suppose. This is some aluminum foil, right? You use it in the kitchen. Thatâs what it is, isnât it? Of course it is, of course it is. Well, not necessarily. Kids are more engaged with open possibilities. Now, theyâll certainly â when they come across something new, theyâll certainly ask,"What is it?"Of course they will. But theyâll also ask,"What can I do with it?"And you know, the more creative of them might get to a really interesting example. And this openness is the beginning of exploratory play. Any parents of young kids in the audience? There must be some. Yeah, thought so. So weâve all seen it, havenât we?

Weâve all told stories about how, on Christmas morning, our kids end up playing with the boxes far more than they play with the toys that are inside them. And you know, from an exploration perspective, this behavior makes complete sense. Because you can do a lot more with boxes than you can do with a toy. Even one like, say, Tickle Me Elmo â which, despite its ingenuity, really only does one thing, whereas boxes offer an infinite number of choices. So again, this is another one of those playful activities that, as we get older, we tend to forget and we have to relearn. So another one of Bob McKimâs favorite exercises is called the”30 Circles Test.”So weâre back to work. You guys are going to get back to work again. Turn that piece of paper that you did the sketch on back over, and youâll find those 30 circles printed on the piece of paper. So it should look like this. You should be looking at something like this. So what Iâm going to do is, Iâm going to give you minute, and I want you to adapt as many of those circles as you can into objects of some form. So for example, you could turn one into a football, or another one into a sun. All Iâm interested in is quantity. I want you to do as many of them as you can, in the minute that Iâm just about to give you. So, everybody ready? OK? Off you go. Okay. Put down your pencils, as they say. So, who got more than five circles figured out? Hopefully everybody? More than 10? Keep your hands up if you did 10. 15? 20? Anybody get all 30? No? Oh! Somebody did. Fantastic. Did anybody to a variation on a theme? Like a smiley face? Happy face? Sad face? Sleepy face? Anybody do that? Anybody use my examples? The sun and the football? Great. Cool. So I was really interested in quantity. I wasnât actually very interested in whether they were all different. I just wanted you to fill in as many circles as possible. And one of the things we tend to do as adults, again, is we edit things. We stop ourselves from doing things. We self-edit as weâre having ideas. And in some cases, our desire to be original is actually a form of editing. And that actually isnât necessarily really playful. So that ability just to go for it and explore lots of things, even if they donât seem that different from each other, is actually something that kids do well, and it is a form of play. So now, Bob McKim did another version of this test in a rather famous experiment that was done in the 1960s. Anybody know what this is? Itâs the peyote cactus. Itâs the plant from which you can create mescaline, one of the psychedelic drugs. For those of you around in the ’ 60s, you probably know it well. McKim published a paper in 1966, describing an experiment that he and his colleagues conducted to test the effects of psychedelic drugs on creativity. So he picked 27 professionals â they were engineers, physicists, mathematicians, architects, furniture designers even, artists â and he asked them to come along one evening, and to bring a problem with them that they were working on. He gave each of them some mescaline, and had them listen to some nice, relaxing music for a while. And then he did whatâs called the Purdue Creativity Test. You might know it as,”How many uses can you find for a paper clip?”Itâs basically the same thing as the 30 circles thing that I just had you do. Now, actually, he gave the test before the drugs and after the drugs, to see what the difference was in peopleâs facility and speed with coming up with ideas. And then he asked them to go away and work on those problems that theyâd brought. And theyâd come up with a bunch of interesting solutions â and actually, quite valid solutions â to the things that theyâd been working on. And so, some of the things that they figured out, some of these individuals figured out ; in one case, a new commercial building and designs for houses that were accepted by clients ; a design of a solar space probe experiment ; a redesign of the linear electron accelerator ; an engineering improvement to a magnetic tape recorder â you can tell this is a while ago ; the completion of a line of furniture ; and even a new **conceptual** model of the photon. So it was a pretty successful evening. In fact, maybe this experiment was the reason that Silicon Valley got off to its great start with innovation. We donâ□□t know, but it may be. We need to ask some of the CEOs whether they were involved in this mescaline experiment. But really, it wasnâ□□t the drugs that were important ; it was this idea that what the drugs did would help shock people out of their normal way of thinking, and getting them to forget the adult behaviors that were getting in the way of their ideas. But itâ□□s hard to break our habits, our adult habits. At IDEO we have brainstorming rules written on the walls. Edicts like,"Defer judgment,"or"Go for quantity."And somehow that seems wrong. I mean, can you have rules about creativity? Well, it sort of turns out that we need rules to help us break the old rules and **norms** that otherwise we might bring to the creative process. And weâ□□ve certainly learnt that over time, you get much better brainstorming, much more creative outcomes when everybody does play by the rules. Now, of course, many designers, many individual designers, achieve this is in a much more organic way. I think the Eameses are wonderful examples of experimentation. And they experimented with plywood for many years without necessarily having one single goal in mind. They were exploring following what was interesting to them. They went from designing splints for wounded soldiers coming out of World War II and the Korean War, I think, and from this experiment they moved on to chairs. Through constant experimentation with materials, they developed a wide range of iconic solutions that we know today, eventually resulting in, of course, the legendary lounge chair. Now, if the Eameses had stopped with that first great solution, then we wouldnâ□□t be the beneficiaries of so many wonderful designs today. And of course, they used experimentation in all aspects of their work, from films to buildings, from games to graphics. So, theyâ□□re great examples, I think, of exploration and experimentation in design. Now, while the Eameses were exploring those possibilities, they were also exploring physical objects. And they were doing that through building prototypes. And building is the next of the behaviors that I thought Iâ□□d talk about. So the average Western first-grader spends as much as 50 percent of their play time taking part in whatâ□□s called"construction play."Construction play â□□ itâ□□s playful, obviously, but also a powerful way to learn. When play is about building a tower out of blocks, the kid begins to learn a lot about towers. And as they repeatedly knock it down and start again, learning is happening as a sort of by-product of play. Itâ□□s classically learning by doing. Now, David Kelley calls this behavior, when itâ□□s carried out by designers,"thinking with your hands."And it typically involves making multiple, low- resolution prototypes very quickly, often by bringing lots of found elements together in order to get to a solution. On one of his earliest projects, the team was kind of stuck, and they came up with a mechanism by hacking together a prototype made from a roll-on deodorant. Now, that became the first commercial computer mouse for the Apple Lisa and the Macintosh. So, they learned their way to that by building prototypes. Another example is a group of designers who were working on a surgical instrument with some surgeons. They were meeting with them ; they were talking to the surgeons about what it was they needed with this device. And one of the designers ran out of the room and grabbed a white board marker and a film canister â□□ which is now becoming a very precious prototyping medium â□□ and a clothespin. He taped them all together, ran back into the room and said,"You mean, something like this?"And the surgeons grabbed hold of it and said, well, I want to hold it like this, or like that. And all of a sudden a productive conversation was happening about design around a tangible object. And in the end it turned into a real device. And so this behavior is all about quickly getting something into the real world, and having your thinking advanced as a result. At IDEO thereâs a kind of a back-to-preschool feel sometimes about the environment. The prototyping carts, filled with colored paper and Play-Doh and glue sticks and stuff â I mean, they do have a bit of a kindergarten feel to them. But the important idea is that everythingâs at hand, everythingâs around. So when designers are working on ideas, they can start building stuff whenever they want. They donât necessarily even have to go into some kind of formal workshop to do it. And we think thatâs pretty important. And then the sad thing is, although preschools are full of this kind of stuff, as kids go through the school system it all gets taken away. They lose this stuff that facilitates this sort of playful and building mode of thinking. And of course, by the time you get to the average **workplace**, maybe the best construction tool we have might be the Post-it notes. Itâs pretty barren. But by giving project teams and the clients who theyâre working with permission to think with their hands, quite complex ideas can spring into life and go right through to execution much more easily. This is a nurse using a very simple â as you can see â plasticine prototype, explaining what she wants out of a portable information system to a team of technologists and designers that are working with her in a hospital. And just having this very simple prototype allows her to talk about what she wants in a much more powerful way. And of course, by building quick prototypes, we can get out and test our ideas with consumers and users much more quickly than if weâre trying to describe them through words. But what about designing something that isnât physical? Something like a **service** or an experience? Something that exists as a series of interactions over time? Instead of building play, this can be approached with role-play. So, if youâre designing an interaction between two people â such as, I donât know â ordering food at a fast food joint or something, you need to be able to imagine how that experience might feel over a period of time. And I think the best way to achieve that, and get a feeling for any flaws in your design, is to act it out. So we do quite a lot of work at IDEO trying to convince our clients of this. They can be a little skeptical ; Iâll come back to that. But a place, I think, where the effort is really worthwhile is where people are wrestling with quite serious problems â things like education or security or finance or health. And this is another example in a healthcare environment of some doctors and some nurses and designers acting out a **service** scenario around patient care. But you know, many adults are pretty reluctant to engage with role-play. Some of itâs embarrassment and some of it is because they just donât believe that what emerges is necessarily valid. They dismiss an interesting interaction by saying, you know,"Thatâs just happening because theyâre acting it out."Research into kids ' behavior actually suggests that itâs worth taking role- playing seriously. Because when children play a role, they actually follow social scripts quite closely that theyâve learnt from us as adults. If one kid plays"store,"and another oneâs playing"house,"then the whole kind of play falls down. So they get used to quite quickly to understanding the rules for social interactions, and are actually quite quick to point out when theyâre broken. So when, as adults, we role-play, then we have a huge set of these scripts already internalized. Weâve gone through lots of experiences in life, and they provide a strong intuition as to whether an interaction is going to work. So weâre very good, when acting out a solution, at spotting whether something lacks authenticity. So role-play is actually, I think, quite valuable when it comes to thinking about experiences. Another way for us, as designers, to explore role-play is to put ourselves through an experience which weâre designing for, and project ourselves into an experience. So here are some designers who are trying to understand what it might feel like to sleep in a confined space on an airplane. And so they grabbed some very simple materials, you can see, and did this role-play, this kind of very crude role-play, just to get a sense of what it would be like for passengers if they were stuck in quite small places on airplanes. This is one of our designers, Kristian Simsarian, and heâ□□s putting himself through the experience of being an ER patient. Now, this is a real hospital, in a real emergency room. One of the reasons he chose to take this rather large video camera with him was because he didnâ□□t want the doctors and nurses thinking he was actually sick, and sticking something into him that he was going to regret later. So anyhow, he went there with his video camera, and itâ□□s kind of interesting to see what he brought back. Because when we looked at the video when he got back, we saw 20 minutes of this. And also, the amazing thing about this video â□□ as soon as you see it you immediately project yourself into that experience. And you know what it feels like : all of that uncertainty while youâ□□re left out in the hallway while the docs are dealing with some more urgent case in one of the emergency rooms, wondering what the heckâ□□s going on. And so this notion of using role-play â□□ or in this case, living through the experience as a way of creating **empathy** â□□ particularly when you use video, is really powerful. Or another one of our designers, Altay Sendil : heâ□□s here having his chest waxed, not because heâ□□s very vain, although actually he is â□□ no, Iâ□□m kidding â□□ but in order to empathize with the pain that chronic care patients go through when theyâ□□re having dressings removed. And so sometimes these analogous experiences, analogous role-play, can also be quite valuable. So when a kid dresses up as a firefighter, you know, heâ□□s beginning to try on that identity. He wants to know what it feels like to be a firefighter. Weâ□□re doing the same thing as designers. Weâ□□re trying on these experiences. And so the idea of role-play is both as an **empathy** tool, as well as a tool for prototyping experiences. And you know, we kind of admire people who do this at IDEO anyway. Not just because they lead to insights about the experience, but also because of their willingness to explore and their ability to unselfconsciously surrender themselves to the experience. In short, we admire their willingness to play. Playful exploration, playful building and role-play : those are some of the ways that designers use play in their work. And so far, I admit, this might feel like itâ□□s a message just to go out and play like a kid. And to certain extent it is, but I want to **stress** a couple of points. The first thing to remember is that play is not anarchy. Play has rules, especially when itâ□□s group play. When kids play tea party, or they play cops and robbers, theyâ□□re following a script that theyâ□□ve agreed to. And itâ□□s this code negotiation that leads to productive play. So, remember the sketching task we did at the beginning? The kind of little face, the portrait you did? Well, imagine if you did the same task with friends while you were drinking in a pub. But everybody agreed to play a game where the worst sketch artist bought the next round of drinks. That framework of rules would have turned an embarrassing, difficult situation into a fun game. As a result, weâ□□d all feel perfectly secure and have a good time â□□ but because we all understood the rules and we agreed on them together. But there arenâ□□t just rules about how to play ; there are rules about when to play. Kids donâ□□t play all the time, obviously. They transition in and out of it, and good teachers spend a lot of time thinking about how to move kids through these experiences. As designers, we need to be able to transition in and out of play also. And if weâ□□re running design studios we need to be able to figure out, how can we transition designers through these different experiences? I think this is particularly true if we think about the sort of â□□ I think whatâ□□s very different about design is that we go through these two very distinctive modes of operation. We go through a sort of **generative** mode, where weâ□□re exploring many ideas ; and then we come back together again, and come back looking for that solution, and developing that solution. I think theyâ□□re two quite different modes : divergence and convergence. And I think itâ□□s probably in the divergent mode that we most need playfulness. Perhaps in convergent mode we need to be more serious. And so being able to move between those modes is really quite important. So, itâ□□s where thereâ□□s a more nuanced version view of play, I think, is required. Because itâ□□s very easy to fall into the trap that these states are absolute. Youâ□□re either playful or youâ□□re serious, and you canâ□□t be both. But thatâ□□s not really true : you can be a serious professional adult and, at times, be playful. Itâ□□s not an either / or ; itâ□□s an”and.”You can be serious and play. So to sum it up, we need trust to play, and we need trust to be creative. So, thereâ□□s a connection. And there are a series of behaviors that weâ□□ve learnt as kids, and that turn out to be quite useful to us as designers. They include exploration, which is about going for quantity ; building, and thinking with your hands ; and role-play, where acting it out helps us both to have more **empathy** for the situations in which weâ□□re designing, and to create **services** and experiences that are seamless and authentic. Thank you very much.

Text Sample 235: POS Dim 2 – 2008 – Score 9.00 – 2008/t000284.txt

Thank you so much everyone from TED, and Chris and Amy in particular. I cannot believe I ’ m here. I have not slept in weeks. Neil and I were sitting there comparing how little we ’ ve slept in anticipation for this. I ’ ve never been so nervous â□□ and I do this when I ’ m nervous, I just realized. So, I ’ m going to talk about sort of what we did at this organization called 826 Valencia, and then I ’ m going to talk about how we all might join in and do similar things. Back in about 2000, I was living in Brooklyn, I was trying to finish my first book, I was wandering around dazed every day because I wrote from 12 a. m. to 5 a. m. So I would walk around in a daze during the day. I had no mental acuity to speak of during the day, but I had flexible hours. In the Brooklyn neighborhood that I lived in, Park Slope, there are a lot of writers â□□ it ’ s like a very high per capita ratio of writers to normal people. Meanwhile, I had grown up around a lot of teachers. My mom was a teacher, my sister became a teacher and after college so many of my friends went into teaching. And so I was always hearing them talk about their lives and how inspiring they were, and they were really sort of the most hard-working and constantly inspiring people I knew. But I knew so many of the things they were up against, so many of the **struggles** they were dealing with. And one of them was that so many of my friends that were teaching in city schools were having trouble with their students keeping up at grade level, in their reading and writing in particular. Now, so many of these students had come from households where English isn ’ t spoken in the home, where a lot of them have different **special** needs, learning disabilities. And of course they ’ re working in schools which sometimes and very often are underfunded. And so they would talk to me about this and say,”You know, what we really need is just more people, more bodies, more one-on-one attention, more hours, more expertise from people that have skills in English and can work with these students one-on-one.”Now, I would say,”Well, why don ’ t you just work with them one-on-one?”And they would say,”Well, we have five classes of 30 to 40 students each. This can lead up to 150, 180, 200 students a day. How can we possibly give each student even one hour a week of one-on-one attention?”You ’ d have to greatly multiply the workweek and clone the teachers. And so we started talking about this. And at the same time, I thought about this massive group of people I knew : writers, editors, journalists, graduate students, assistant professors, you name it. All these people that had sort of flexible **daily** hours and an interest in the English word â I hope to have an interest in the English language, but I ’ m not speaking it well right now. I ’ m trying. That clock has got me. But everyone that I knew had an interest in the primacy of the written word in terms of nurturing a democracy, nurturing an enlightened life. And so they had, you know, their time and their interest, but at the same time there wasn ’ t a conduit that I knew of in my community to bring these two communities together. So when I moved back to San Francisco, we rented this building. And the idea was to put McSweeney ’ s â McSweeney ’ s Quarterly, that we published twice or three times a year, and a few other magazines â we were going to move it into an office for the first time. It used to be in my kitchen in Brooklyn. We were going to move it into an office, and we were going to actually share space with a tutoring center. So we thought,”We ’ ll have all these writers and editors and everybody â sort of a writing community â coming into the office every day anyway, why don ’ t we just open up the front of the building for students to come in there after school, get extra help on their written homework, so you have basically no border between these two communities?”So the idea was that we would be working on whatever we ’ re working on, at 2:30 p. m. the students flow in and you put down what you ’ re doing, or you trade, or you work a little bit later or whatever it is. You give those hours in the afternoon to the students in the neighborhood. So, we had this place, we rented it, the landlord was all for it. We did this mural, that ’ s a Chris Ware mural, that basically explains the entire history of the printed word, in mural form â it takes a long time to digest and you have to stand in the middle of the road. So we rented this space. And everything was great except the landlord said,”Well, the space is zoned for retail ; you have to come up with something. You ’ ve **gotta** sell something. You can ’ t just have a tutoring center.”So we thought,”Ha ha! Really!”And we couldn ’ t think of anything necessarily to sell, but we did all the necessary research. It used to be a weight room, so there were rubber floors below, acoustic tile ceilings and fluorescent lights. We took all that down, and we found beautiful wooden floors, whitewashed beams and it had the look â while we were renovating this place, somebody said,”You know, it really kind of looks like the hull of a ship.”And we looked around and somebody else said,”Well, you should sell supplies to the working buccaneer.”And so this is what we did. So it made everybody laugh, and we said,”There ’ s a point to that. Let ’ s sell pirate supplies.”This is the pirate supply store. You see, this is sort of a sketch I did on a napkin. A great carpenter built all this stuff and you see, we made it look sort of pirate supply-like. Here you see planks sold by the foot and we have supplies to combat scurvy. We have the peg legs there, that are all handmade and fitted to you. Up at the top, you see the eyepatch display, which is the black column there for everyday use for your eyepatch, and then you have the pastel and other colors for stepping out at night â **special** occasions, bar mitzvahs and whatever. So we opened this place. And this is a vat that we fill with treasures that students dig in. This is replacement eyes in case you lose one. These are some signs that we have all over the place :”Practical Joking with Pirates.”While you ’ re reading the sign, we pull a rope behind the counter and eight mop heads drop on your head. That was just my one thing â I said we had to have something that drops on people ’ s heads. It became mop heads. And this is the fish theater, which is just a saltwater tank with three seats, and then right behind it we set up this space, which was the tutoring center. So right there is the tutoring center, and then behind the curtain were the McSweeney ’ s offices, where all of us would be working on the magazine and book editing and things like that. The kids would come in â or we thought they would come in. I should back up. We set the place up, we opened up, we spent months and months renovating this place. We had tables, chairs, computers, everything. I went to a dot-com auction at a Holiday Inn in Palo Alto and I bought 11 G4s with a stroke of a paddle. Anyway, we bought ’ em, we set everything up and then we waited. It was started with about 12 of my friends, people that I had known for years that were writers in the neighborhood. And we sat. And at 2:30 p. m. we put a sandwich board out on the front sidewalk and it just said,”Free Tutoring for Your English-Related and Writing-Related Needs â Just Come In, It ’ s All Free.”And we thought,”Oh, they ’ re going to storm the gates, they ’ re gonna love it.”And they didn ’ t. And so we waited, we sat at the tables, we waited and waited. And everybody was becoming very discouraged because it was weeks and weeks that we waited, really, where nobody came in. And then somebody alerted us to the fact that maybe there was a trust gap, because we were operating behind a pirate supply store. We never put it together, you know? And so then, around that time, I persuaded a woman named Nineveh Caligari, a longtime San Francisco educator â she was teaching in Mexico City, she had all the experience necessary, knew everything about education, was connected with all the teachers and community members in the neighborhood â I convinced her to move up from Mexico City where she was teaching. She took over as executive director. Immediately, she made the inroads with the teachers and the parents and the students and everything, and so suddenly it was actually full every day. And what we were trying to offer every day was one-on-one attention. The goal was to have a one-to-one ratio with every one of these students. You know, it ’ s been proven that 35 to 40 hours a year with one-on-one attention, a student can get one grade level higher. And so most of these students, English is not spoken in the home. They come there, many times their parents â you can ’ t see it, but there ’ s a church pew that I bought in a Berkeley auction right there â the parents will sometimes watch while their kids are being tutored. So that was the basis of it, was one-on-one attention. And we found ourselves full every day with kids. If you ’ re on Valencia Street within those few blocks at around 2 p. m., 2:30 p. m., you will get run over, often, by the kids and their big backpacks, or whatever, actually running to this space, which is very strange, because it ’ s school, in a way. But there was something psychological happening there that was just a little bit different. And the other thing was, there was no stigma. Kids weren ’ t going into the”Center-for- Kids-That-Need-More-Help,”or something like that. It was 826 Valencia. First of all, it was a pirate supply store, which is insane. And then secondly, there ’ s a publishing company in the back. And so our interns were actually working at the same tables very often, and shoulder-to-shoulder, computer-next- to-computer with the students. And so it became a tutoring center â publishing center, is what we called it â and a writing center. They go in, and they might be working with a high school student actually working on a novel â because we had very gifted kids, too. So there ’ s no stigma. They ’ re all working next to each other. It ’ s all a creative endeavor. They ’ re seeing adults. They ’ re modeling their behavior. These adults, they ’ re working in their field. They can lean over, ask a question of one of these adults and it all sort of feeds on each other. There ’ s a lot of cross-pollination. The only problem, especially for the adults working at McSweeney ’ s who hadn ’ t necessarily bought into all of this when they signed up, was that there was just the one bathroom. With like 60 kids a day, this is a problem. But you know, there ’ s something about the kids finishing their homework in a given day, working one-on-one, getting all this attention â they go home, they ’ re finished. They don ’ t stall. They don ’ t do their homework in front of the TV. They ’ re allowed to go home at 5:30 p. m., enjoy their family, enjoy other hobbies, get outside, play. And that makes a happy family. A bunch of happy families in a neighborhood is a happy community. A bunch of happy communities tied together is a happy city and a happy world. So the key to it all is homework! There you have it, you know â one-on- one attention. So we started off with about 12 volunteers, and then we had about 50, and then a couple hundred. And we now have 1, 400 volunteers on our roster. And we make it incredibly easy to volunteer. The key thing is, even if you only have a couple of hours a month, those two hours shoulder-to-shoulder, next to one student, concentrated attention, shining this beam of light on their work, on their thoughts and their self-expression, is going to be absolutely transformative, because so many of the students have not had that ever before. So we said,”Even if you have two hours one Sunday every six months, it doesn ’ t matter. That ’ s going to be enough.”So that ’ s partly why the tutor corps grew so fast. Then we said,”Well, what are we going to do with the space during the day, because it has to be used before 2:30 p. m.?”So we started bringing in classes during the day. So every day, there ’ s a field trip where they together create a book â you can see it being typed up above. This is one of the classes getting way too excited about writing. You just point a camera at a class, and it always looks like this. So this is one of the books that they do. Notice the title of the book,”The Book That Was Never Checked Out : Titanic.”And the first line of that book is,”Once there was a book named Cindy that was about the Titanic.”So, meanwhile, there ’ s an adult in the back typing this up, taking it completely seriously, which blows their mind. So then we still had more tutors to use. This is a shot of just some of the tutors during one of the events. The teachers that we work with â and everything is different to teachers â they tell us what to do. We went in there thinking,”We ’ re ultimately, completely malleable. You ’ re going to tell us. The neighborhood ’ s going to tell us, the parents are going to tell us. The teachers are going to tell us how we ’ re most useful.”So then they said,”Why don ’ t you come into the schools? Because what about the students that wouldn ’ t come to you, necessarily, who don ’ t have really active parents that are bringing them in, or aren ’ t close enough?”So then we started saying,”Well, we ’ ve got 1, 400 people on our tutor roster. Let ’ s just put out the word.”A teacher will say,”I need 12 tutors for the next five Sundays. We ’ re working on our college essays. Send them in.”So we put that out on the wire : 1, 400 tutors. Whoever can make it signs up. They go in about a half an hour before the class. The teacher tells them what to do, how to do it, what their training is, what their project is so far. They work under the teacher ’ s guide, and it ’ s all in one big room. And that ’ s actually the brunt of what we do is, people going straight from their **workplace**, straight from home, straight into the classroom and working directly with the students. So then we ’ re able to work with thousands and thousands of more students. Then another school said,”Well, what if we just give you a classroom and you can staff it all day?”So this is the Everett Middle School Writers ’ Room, where we decorated it in buccaneer style. It ’ s right off the library. And there we serve all 529 kids in this middle school. This is their newspaper, the”Straight-Up News,”that has an ongoing column from Mayor Gavin Newsom in both languages â English and Spanish. So then one day Isabel Allende wrote to us and said,”Hey, why don ’ t you assign a book with high school students? I want them to write about how to achieve peace in a violent world.”And so we went into Thurgood Marshall High School, which is a school that we had worked with on some other things, and we gave that assignment to the students. And we said,”Isabel Allende is going to read all your essays at the end. She ’ s going to publish them in a book. She ’ s going to sponsor the printing of this book in paperback form. It ’ s going to be available in all the bookstores in the Bay Area and throughout the world, on Amazon and you name it.”So these kids worked harder than they ’ ve ever worked on anything in their lives, because there was that outside audience, there was Isabel Allende on the other end. I think we had about 170 tutors that worked on this book with them and so this worked out incredibly well. We had a big party at the end. This is a book that you can find anywhere. So that led to a series of these. You can see Amy Tan sponsored the next one,”I Might Get Somewhere.”And this became an ongoing thing. More and more books. Now we ’ re sort of addicted to the book thing. The kids will work harder than they ’ ve ever worked in their life if they know it ’ s going to be permanent, know it ’ s going to be on a shelf, know that nobody can diminish what they ’ ve thought and said, that we ’ ve honored their words, honored their thoughts with hundreds of hours of five drafts, six drafts â all this attention that we give to their thoughts. And once they achieve that level, once they ’ ve written at that level, they can never go back. It ’ s absolutely transformative. And so then they ’ re all sold in the store. This is near the planks. We sell all the student books. Where else would you put them, right? So we sell ’ em, and then something weird had been happening with the stores. The store, actually â even though we started out as just a gag â the store actually made money. So it was paying the rent. And maybe this is just a San Francisco thing â I don ’ t know, I don ’ t want to **judge**. But people would come in â and this was before the pirate movies and everything! It was making a lot of money. Not a lot of money, but it was paying the rent, paying a full-time staff member there. There ’ s the ocean maps you can see on the left. And it became a gateway to the community. People would come in and say,”What the â? What is this?”I don ’ t want to swear on the web. Is that a rule? I don ’ t know. They would say,”What is this?”And people would come in and learn more about it. And then right beyond â there ’ s usually a little chain there â right beyond, they would see the kids being tutored. This is a field trip going on. And so they would be shopping, and they might be more likely to buy some lard, or millet for their parrot, or, you know, a hook, or hook protector for nighttime, all of these things we sell. So the store actually did really well. But it brought in so many people â teachers, donors, volunteers, everybody â because it was street level. It was open to the public. It wasn ’ t a non-profit buried, you know, on the 30th floor of some building downtown. It was right in the neighborhood that it was serving, and it was open all the time to the public. So, it became this sort of weird, happy accident. So all the people I used to know in Brooklyn, they said,”Well, why don ’ t we have a place like that here?”And a lot of them had been former educators or would-be educators, so they combined with a lot of local designers, local writers, and they just took the idea independently and they did their own thing. They didn ’ t want to sell pirate supplies. They didn ’ t think that that was going to work there. So, knowing the crime-fighting community in New York, they opened the Brooklyn Superhero Supply Company. This is Sam Potts ’ great design that did this. And this was to make it look sort of like one of those keysmith ’ s shops that has to have every **service** they ’ ve ever offered, you know, all over there. So they opened this place. Inside, it ’ s like a Costco for superheroes â all the supplies in kind of basic form. These are all handmade. These are all sort of repurposed other products, or whatever. All the packaging is done by Sam Potts. So then you have the villain containment unit, where kids put their parents. You have the office. This is a little vault â you have to put your product in there, it goes up an electric lift and then the guy behind the counter tells you that you have to recite the vow of heroism, which you do, if you want to buy anything. And it limits, really, their sales. Personally, I think it ’ s a problem. Because they have to do it hand on heart and everything. These are some of the products. These are all handmade. This is a secret identity kit. If you want to take on the identity of Sharon Boone, one American female marketing executive from Hoboken, New Jersey. It ' s a full dossier on everything you would need to know about Sharon Boone. So, this is the capery where you get fitted for your cape, and then you walk up these three steel-graded steps and then we turn on three hydraulic fans from every side and then you can see the cape in **action**. There ' s nothing worse than, you know, getting up there and the cape is bunching up or something like that. So then, the secret door â this is one of the shelves you don ' t see when you walk in, but it slowly opens. You can see it there in the middle next to all the grappling hooks. It opens and then this is the tutoring center in the back. So you can see the full effect! But this is â I just want to emphasize â locally funded, locally built. All the designers, all of the builders, everybody was local, all the time was pro- bono. I just came and visited and said,"Yes, you guys are doing great,"or whatever. That was it. You can see the time in all five boroughs of New York in the back. So this is the space during tutoring hours. It ' s very busy. Same principles : one-on-one attention, complete devotion to the students ' work and a boundless optimism and sort of a possibility of creativity and ideas. And this switch is flicked in their heads when they walk through those 18 feet of this bizarre store, right? So it ' s school, but it ' s not school. It ' s clearly not school, even though they ' re working shoulder-to- shoulder on tables, pencils and papers, whatever. This is one of the students, Khaled Hamdan. You can read this quote. Addicted to video games and TV. Couldn ' t concentrate at home. Came in. Got this concentrated attention. And he couldn ' t escape it. So, soon enough, he was writing. He would finish his homework early â got really addicted to finishing his homework early. It ' s an addictive thing to sort of be done with it, and to have it checked, and to know he ' s going to achieve the next thing and be prepared for school the next day. So he got hooked on that, and then he started doing other things. He ' s now been published in five books. He co-wrote a mockumentary about failed superheroes called"Super-Has-Beens."He wrote a series on"Penguin Balboa,"which is a fighting â a boxing â penguin. And then he read aloud just a few weeks ago to 500 people at Symphony Space, at a benefit for 826 New York. So he ' s there every day. He ' s evangelical about it. He brings his cousins in now. There ' s four family members that come in every day. So, I ' ll go through really quickly. This is L. A., The Echo Park Time Travel Mart :"Whenever You Are, We ' re Already Then."This is sort of a 7- Eleven for time travelers. So you see everything : it ' s exactly as a 7-Eleven would be. Leeches. Mammoth chunks. They even have their own Slurpee machine :"Out of Order. Come Back Yesterday."Anyway. So I ' m going to jump ahead. These are spaces that are only affiliated with us, doing this same thing : Word St. in Pittsfield, Massachusetts ; Ink Spot in Cincinnati ; Youth Speaks, San Francisco, California, which inspired us ; Studio St. Louis in St. Louis ; Austin Bat Cave in Austin ; Fighting Words in Dublin, Ireland, started by Roddy Doyle, this will be open in April. Now I ' m going to the TED Wish â is that okay? All right, I ' ve got a minute. So, the TED Wish : I wish that you â you personally and every creative individual and organization you know â will find a way to directly engage with a public school in your area and that you ' ll then tell the story of how you got involved, so that within a year we have a thousand examples â a thousand! â of transformative partnerships. Profound leaps forward! And these can be things that maybe you ' re already doing. I know that so many people in this room are already doing really interesting things. I know that for a fact. So, tell us these stories and inspire others on the website. We created a website. I ' m going to switch to"we,"and not"I,"hope : We hope that the attendees of this conference will usher in a new era of participation in our public schools. We hope that you will take the lead in partnering your innovative spirit and expertise with that of innovative educators in your community. Always let the teachers lead the way. They will tell you how to be useful. I hope that you ' ll step in and help out. There are a million ways. You can walk up to your local school and consult with the teachers. They ' ll always tell you how to help. So, this is with Hot Studio in San Francisco, they did this phenomenal job. This website is already up, it ' s already got a bunch of stories, a lot of ideas. It ' s called"Once Upon a School,"which is a great title, I think. This site will document every story, every project that comes out of this conference and around the world. So you go to the website, you see a bunch of ideas you can be inspired by and then you add your own projects once you get started. Hot Studio did a great job in a very tight **deadline**. So, visit the site. If you have any questions, you can ask this guy, who ' s our director of national programs. He ' ll be on the phone. You email him, he ' ll answer any question you possibly want. And he ' ll get you inspired and get you going and guide you through the process so that you can affect change. And it can be fun! That ' s the point of this talk â□□ it needn ' t be sterile. It needn ' t be bureaucratically untenable. You can do and use the skills that you have. The schools need you. The teachers need you. Students and parents need you. They need your actual person : your physical personhood and your open minds and open ears and boundless compassion, sitting next to them, listening and nodding and asking questions for hours at a time. Some of these kids just don ' t plain know how good they are : how smart and how much they have to say. You can tell them. You can shine that light on them, one human interaction at a time. So we hope you ' ll join us. Thank you so much.

So what does the happiest man in the world look like? He certainly doesn ' t look like me. He looks like this. His name is Matthieu Ricard. So how do you get to be the happiest man in the world? Well it turns out there is a way to measure **happiness** in the brain. And you do that by measuring the relative activation of the left prefrontal cortex in the fMRI, versus the right prefrontal cortex. And Matthieu ' s **happiness** measure is off the charts. He ' s by far the happiest man ever measured by science. Which leads us to a question : What was he thinking when he was being measured? Perhaps something very naughty. Actually, he was meditating on compassion. Matthieu ' s own experience is that compassion is the happiest state ever. Reading about Matthieu was one of the pivotal moments of my life. My dream is to create the conditions for world peace in my lifetime — and to do that by creating the conditions for inner peace and compassion on a global scale. And learning about Matthieu gave me a new angle to look at my work. Matthieu ' s brain scan shows that compassion is not a chore. Compassion is something that creates **happiness**. Compassion is fun. And that mind-blowing insight changes the entire game. Because if compassion was a chore, nobody ' s going to do it, except maybe the Dalai Lama or something. But if compassion was fun, everybody ' s going to do it. Therefore, to create the conditions for global compassion, all we have to do is to reframe compassion as something that is fun. But fun is not enough. What if compassion is also profitable? What if compassion is also good for business? Then, every boss, every manager in the world, will want to have compassion — like this. That would create the conditions for world peace. So, I started paying attention to what compassion looks like in a business **setting**. Fortunately, I didn ' t have to look very far. Because what I was looking for was right in front of my eyes — in Google, my company. I know there are other compassionate compa-

nies in the world, but Google is the place I ’ m familiar with because I ’ ve been there for 10 years, so I ’ ll use Google as the case study. Google is a company born of idealism. It ’ s a company that thrives on idealism. And maybe because of that, compassion is organic and widespread company-wide. In Google, **expressions** of corporate compassion almost always follow the same pattern. It ’ s sort of a funny pattern. It starts with a small group of Googlers taking the initiative to do something. And they don ’ t usually ask for permission ; they just go ahead and do it, and then other Googlers join in, and it just gets bigger and bigger. And sometimes it gets big enough to become official. So in other words, it almost always starts from the bottom up. And let me give you some examples. The first example is the largest annual community event — where Googlers from around the world donate their labor to their local communities — was initiated and organized by three employees before it became official, because it just became too big. Another example, three Googlers — a chef, an engineer and, most funny, a massage therapist — three of them, they learned about a region in India where 200, 000 people live without a single medical facility. So what do they do? They just go ahead and start a fundraiser. And they raise enough money to build this hospital — the first hospital of its kind for 200, 000 people. During the Haiti earthquake, a number of engineers and product managers spontaneously came together and stayed overnight to build a tool to allow earthquake victims to find their loved ones. And **expressions** of compassion are also found in our international offices. In China for example, one mid-level employee initiated the largest social **action** competition in China, involving more than 1, 000 schools in China, working on issues such as education, poverty, health care and the environment. There is so much organic social **action** all around Google that the company decided to form a social responsibility team just to support these efforts. And this idea, again, came from the grassroots, from two Googlers who wrote their own job descriptions and volunteered themselves for the job. And I found it fascinating that the social responsibility team was not formed as part of some grand corporate strategy. It was two persons saying,”Let ’ s do this,”and the company said,”Yes.”So it turns out that Google is a compassionate company, because Googlers found compassion to be fun. But again, fun is not enough. There are also real business benefits. So what are they? The first benefit of compassion is that it creates highly effective business leaders. What does that mean? There are three components of compassion. There is the affective component, which is,”I feel for you.”There is the cognitive component, which is,”I understand you.”And there is a motivational component, which is,”I want to help you.”So what has this got to do with business leadership? According to a very comprehensive study led by Jim Collins, and documented in the book”Good to Great,”it takes a very **special** kind of leader to bring a company from goodness to greatness. And he calls them”Level 5 leaders.”These are leaders who, in addition to being highly capable, possess two important qualities, and they are humility and ambition. These are leaders who are highly ambitious for the greater good. And because they ’ re ambitious for a greater good, they feel no need to inflate their own egos. And they, according to the research, make the best business leaders. And if you look at these qualities in the context of compassion, we find that the cognitive and affective components of compassion — understanding people and empathizing with people — inhibits, tones down, what I call the excessive self-obsession that ’ s in us, therefore creating the conditions for humility. The motivational component of compassion creates ambition for greater good. In other words, compassion is the way to grow Level 5 leaders. And this is the first compelling business benefit. The second compelling benefit of compassion is that it creates an inspiring **workforce**. Employees mutually inspire each other towards greater good. It creates a vibrant, energetic community where people admire and respect each other. I mean, you come to work in the morning, and you work with three guys who just up and decide to build a hospital in India. It ' s like how can you not be inspired by those people — your own coworkers? So this mutual inspiration promotes collaboration, initiative and creativity. It makes us a highly effective company. So, having said all that, what is the secret formula for brewing compassion in the corporate **setting**? In our experience, there are three ingredients. The first ingredient is to create a culture of **passionate** concern for the greater good. So always think : how is your company and your job serving the greater good? Or, how can you further serve the greater good? This awareness of serving the greater good is very self-inspiring and it creates fertile ground for compassion to grow in. That ' s one. The second ingredient is autonomy. So in Google, there ' s a lot of autonomy. And one of our most popular managers jokes that, this is what he says,"Google is a place where the inmates run the asylum."And he considers himself one of the inmates. If you already have a culture of compassion and idealism and you let your people roam free, they will do the right thing in the most compassionate way. The third ingredient is to focus on inner development and personal growth. Leadership training in Google, for example, places a lot of emphasis on the inner qualities, such as self-awareness, self-mastery, **empathy** and compassion, because we believe that leadership begins with character. We even created a seven-week curriculum on emotion intelligence, which we jokingly call"Searching Inside Yourself."It ' s less naughty than it sounds. So I ' m an engineer by training, but I ' m one of the creators and instructors of this course, which I find kind of funny, because this is a company that trusts an engineer to teach emotion intelligence. What a company. So"Search Inside Yourself"— how does it work? It works in three steps. The first step is attention training. Attention is the basis of all higher cognitive and emotional abilities. Therefore, any curriculum for training emotion intelligence has to begin with attention training. The idea here is to train attention to create a quality of mind that is calm and clear at the same time. And this creates the foundation for emotion intelligence. The second step follows the first step. The second step is developing self-knowledge and self-mastery. So using the supercharged attention from step one, we create a high-resolution perception into the cognitive and emotive processes. What does that mean? It means being able to **observe** our thought stream and the process of emotion with high clarity, objectivity and from a third-person perspective. And once you can do that, you create the kind of self-knowledge that enables self-mastery. The third step, following the second step, is to create new mental habits. What does that mean? Imagine this. Imagine whenever you meet any other person, any time you meet a person, your habitual, instinctive first thought is,"I want you to be happy. I want you to be happy."Imagine you can do that. Having this habit, this mental habit, changes everything at work. Because this good will is unconsciously picked up by other people, and it creates trust, and trust creates a lot of good working relationships. And this also creates the conditions for compassion in the **workplace**. Someday, we hope to open-source"Search Inside Yourself"so that everybody in the corporate world will at least be able to use it as a reference. And in closing, I want to end the same place I started, with **happiness**. I want to quote this guy — the guy in robes, not the other guy — the Dalai Lama, who said,"If you want others to be happy, **practice** compassion. If you want to be happy, **practice** compassion."I found this to be true, both on the individual level and at a corporate level. And I hope that compassion will be both fun and profitable for you too. Thank you.

I ’ m going to talk about the simple truth in leadership in the 21st century. In the 21st century, we need to actually look at â and what I ’ m actually going to encourage you to consider today â is to go back to our school days when we learned how to count. But I think it ’ s time for us to think about what we count. Because what we actually count truly counts. Let me start by telling you a little story. This is Van Quach. She came to this country in 1986 from Vietnam. She changed her name to Vivian because she wanted to fit in here in America. Her first job was at an inner-city motel in San Francisco as a maid. I happened to buy that motel about three months after Vivian started working there. So Vivian and I have been working together for 23 years. With the youthful idealism of a 26-year-old, in 1987, I started my company and I called it Joie de Vivre, a very impractical name, because I actually was looking to create joy of life. And this first hotel that I bought, motel, was a pay-by-the-hour, no-tell motel in the inner-city of San Francisco. As I spent time with Vivian, I saw that she had sort of a joie de vivre in how she did her work. It made me question and curious : How could someone actually find joy in cleaning toilets for a living? So I spent time with Vivian, and I saw that she didn ’ t find joy in cleaning toilets. Her job, her goal and her calling was not to become the world ’ s greatest toilet scrubber. What counts for Vivian was the emotional connection she created with her fellow employees and our guests. And what gave her inspiration and meaning was the fact that she was taking care of people who were far away from home. Because Vivian knew what it was like to be far away from home. That very human lesson, more than 20 years ago, served me well during the last economic downturn we had. In the wake of the dotcom crash and 9 / 11, San Francisco Bay Area hotels went through the largest percentage revenue drop in the history of American hotels. We were the largest operator of hotels in the Bay Area, so we were particularly vulnerable. But also back then, remember we stopped eating French fries in this country. Well, not exactly, of course not. We started eating”freedom fries,”and we started boycotting anything that was French. Well, my name of my company, Joie de Vivre â so I started getting these letters from places like Alabama and Orange County saying to me that they were going to boycott my company because they thought we were a French company. And I ’ d write them back, and I ’ d say,”What a minute. We ’ re not French. We ’ re an American company. We ’ re based in San Francisco.”And I ’ d get a terse response :”Oh, that ’ s worse.”So one particular day when I was feeling a little depressed and not a lot of joie de vivre, I ended up in the local bookstore around the corner from our offices. And I initially ended up in the business section of the bookstore looking for a business solution. But given my befuddled state of mind, I ended up in the self-help section very quickly. That ’ s where I got reacquainted with Abraham Maslow ’ s”hierarchy of needs.”I took one psychology class in college, and I learned about this guy, Abraham Maslow, as many of us are familiar with his hierarchy of needs. But as I sat there for four hours, the full afternoon, reading Maslow, I recognized something that is true of most leaders. One of the simplest facts in business is something that we often neglect, and that is that we ’ re all human. Each of us, no matter what our role is in business, has some hierarchy of needs in the **workplace**. So as I started reading more Maslow, what I started to realize is that Maslow, later in his life, wanted to take this hierarchy for the individual and apply it to the collective, to organizations and specifically to business. But unfortunately, he died prematurely in 1970, and so he wasn ’ t really able to live that dream completely. So I realized in that dotcom crash that my role in life was to channel Abe Maslow. And that ' s what I did a few years ago when I took that five-level hierarchy of needs pyramid and turned it into what I call the transformation pyramid, which is survival, success and transformation. It ' s not just fundamental in business, it ' s fundamental in life. And we started asking ourselves the questions about how we were actually addressing the higher needs, these transformational needs for our key employees in the company. These three levels of the hierarchy needs relate to the five levels of Maslow ' s hierarchy of needs. But as we started asking ourselves about how we were addressing the higher needs of our employees and our customers, I realized we had no metrics. We had nothing that actually could tell us whether we were actually getting it right. So we started asking ourselves : What kind of less obvious metrics could we use to actually evaluate our employees ' sense of meaning, or our customers ' sense of emotional connection with us? For example, we actually started asking our employees, do they understand the **mission** of our company, and do they feel like they believe in it, can they actually influence it, and do they feel that their work actually has an impact on it? We started asking our customers, did they feel an emotional connection with us, in one of seven different kinds of ways. Miraculously, as we asked these questions and started giving attention higher up the pyramid, what we found is we created more loyalty. Our customer loyalty skyrocketed. Our employee turnover dropped to one-third of the industry average, and during that five year dotcom bust, we tripled in size. As I went out and started spending time with other leaders out there and asking them how they were getting through that time, what they told me over and over again was that they just manage what they can measure. What we can measure is that tangible stuff at the bottom of the pyramid. They didn ' t even see the intangible stuff higher up the pyramid. So I started asking myself the question : How can we get leaders to start valuing the intangible? If we ' re taught as leaders to just manage what we can measure, and all we can measure is the tangible in life, we ' re missing a whole lot of things at the top of the pyramid. So I went out and studied a bunch of things, and I found a survey that showed that 94 percent of business leaders worldwide believe that the intangibles are important in their business, things like intellectual property, their corporate culture, their brand loyalty, and yet, only five percent of those same leaders actually had a means of measuring the intangibles in their business. So as leaders, we understand that intangibles are important, but we don ' t have a clue how to measure them. So here ' s another Einstein quote :"Not everything that can be counted counts, and not everything that counts can be counted."I hate to argue with Einstein, but if that which is most valuable in our life and our business actually can ' t be counted or valued, aren ' t we going to spend our lives just mired in measuring the mundane? It was that sort of heady question about what counts that led me to take my CEO hat off for a week and fly off to the Himalayan **peaks**. I flew off to a place that ' s been shrouded in mystery for centuries, a place some folks call Shangri- La. It ' s actually moved from the survival base of the pyramid to becoming a transformational role model for the world. I went to Bhutan. The teenage king of Bhutan was also a curious man, but this was back in 1972, when he ascended to the throne two days after his father passed away. At age 17, he started asking the kinds of questions that you ' d expect of someone with a beginner ' s mind. On a trip through India, early in his reign as king, he was asked by an Indian journalist about the Bhutanese GDP, the size of the Bhutanese GDP. The king responded in a fashion that actually has transformed us four decades later. He said the following, he said :"Why are we so obsessed and focused with gross domestic product? Why don ' t we care more about gross national **happiness**?"Now, in essence, the king was asking us to consider an alternative definition of success, what has come to be known as GNH, or gross national **happiness**. Most world leaders didn ’ t take notice, and those that did thought this was just”Buddhist economics.”But the king was serious. This was a notable moment, because this was the first time a world leader in almost 200 years had suggested that intangible of **happiness** â that leader 200 years ago, Thomas Jefferson with the Declaration of Independence â 200 years later, this king was suggesting that intangible of **happiness** is something that we should measure, and it ’ s something we should actually value as government officials. For the next three dozen years as king, this king actually started measuring and managing around **happiness** in Bhutan â including, just recently, taking his country from being an absolute monarchy to a constitutional monarchy with no bloodshed, no coup. Bhutan, for those of you who don ’ t know it, is the newest democracy in the world, just two years ago. So as I spent time with leaders in the GNH movement, I got to really understand what they ’ re doing. And I got to spend some time with the prime minister. Over dinner, I asked him an impertinent question. I asked him,”How can you create and measure something which evaporates â in other words, **happiness**?”And he ’ s a very wise man, and he said,”Listen, Bhutan ’ s goal is not to create **happiness**. We create the conditions for **happiness** to occur. In other words, we create a habitat of **happiness**.”Wow, that ’ s interesting. He said that they have a science behind that art, and they ’ ve actually created four essential pillars, nine key indicators and 72 different metrics that help them to measure their GNH. One of those key indicators is : How do the Bhutanese feel about how they spend their time each day? It ’ s a good question. How do you feel about how you spend your time each day? Time is one of the scarcest resources in the modern world. And yet, of course, that little intangible piece of data doesn ’ t factor into our GDP calculations. As I spent my week up in the Himalayas, I started to imagine what I call an emotional equation. And it focuses on something I read long ago from a guy named Rabbi Hyman Schachtel. How many know him? Anybody? 1954, he wrote a book called”The Real Enjoyment of Living,”and he suggested that **happiness** is not about having what you want ; instead, it ’ s about wanting what you have. Or in other words, I think the Bhutanese believe **happiness** equals wanting what you have â imagine gratitude â divided by having what you want â gratification. The Bhutanese aren ’ t on some aspirational treadmill, constantly focused on what they don ’ t have. Their religion, their **isolation**, their deep respect for their culture and now the principles of their GNH movement all have fostered a sense of gratitude about what they do have. How many of us here, as TEDsters in the audience, spend more of our time in the bottom half of this equation, in the denominator? We are a bottom-heavy culture in more ways than one. The reality is, in Western countries, quite often we do focus on the pursuit of **happiness** as if **happiness** is something that we have to go out â an object that we ’ re supposed to get, or maybe many objects. Actually, in fact, if you look in the dictionary, many dictionaries define pursuit as to”chase with hostility.”Do we pursue **happiness** with hostility? Good question. But back to Bhutan. Bhutan ’ s bordered on its north and south by 38 percent of the world ’ s population. Could this little country, like a startup in a mature industry, be the spark plug that influences a 21st century of middle-class in China and India? Bhutan ’ s created the ultimate export, a new global currency of well- being, and there are 40 countries around the world today that are studying their own GNH. You may have heard, this last fall Nicolas Sarkozy in France announcing the results of an 18-month study by two Nobel economists, focusing on **happiness** and wellness in France. Sarkozy suggested that world leaders should stop myopically focusing on GDP and consider a new index, what some French are calling a”joie de vivre index.”I like it. Co-branding opportunities. Just three days ago, three days ago here at TED, we had a simulcast of David Cameron, potentially the next prime minister of the UK, quoting one of my favorite speeches of all-time, Robert Kennedy ’ s poetic speech from 1968 when he suggested that we ’ re myopically focused on the wrong thing and that GDP is a misplaced metric. So it suggests that the momentum is shifting. I ’ ve taken that Robert Kennedy quote, and I ’ ve turned it into a new balance sheet for just a moment here. This is a collection of things that Robert Kennedy said in that quote. GDP counts everything from air pollution to the destruction of our redwoods. But it doesn ’ t count the health of our children or the integrity of our public officials. As you look at these two columns here, doesn ’ t it make you feel like it ’ s time for us to start figuring out a new way to count, a new way to imagine what ’ s important to us in life? Certainly Robert Kennedy suggested at the end of the speech exactly that. He said GDP”measures everything in short, except that which makes life worthwhile.”Wow. So how do we do that? Let me say one thing we can just start doing ten years from now, at least in this country. Why in the heck in America are we doing a census in 2010? We ’ re spending 10 billion dollars on the census. We ’ re asking 10 simple questions â it is simplicity. But all of those questions are tangible. They ’ re about demographics. They ’ re about where you live, how many people you live with, and whether you own your home or not. That ’ s about it. We ’ re not asking meaningful metrics. We ’ re not asking important questions. We ’ re not asking anything that ’ s intangible. Abe Maslow said long ago something you ’ ve heard before, but you didn ’ t realize it was him. He said,”If the only tool you have is a hammer, everything starts to look like a nail.”We ’ ve been **fooled** by our tool. Excuse that **expression**. We ’ ve been **fooled** by our tool. GDP has been our hammer. And our nail has been a 19th- and 20th-century industrial-era model of success. And yet, 64 percent of the world ’ s GDP today is in that intangible industry we call **service**, the **service** industry, the industry I ’ m in. And only 36 percent is in the tangible industries of manufacturing and agriculture. So maybe it ’ s time that we get a bigger toolbox, right? Maybe it ’ s time we get a toolbox that doesn ’ t just count what ’ s easily counted, the tangible in life, but actually counts what we most value, the things that are intangible. I guess I ’ m sort of a curious CEO. I was also a curious economics major as an undergrad. I learned that economists measure everything in tangible units of production and consumption as if each of those tangible units is exactly the same. They aren ’ t the same. In fact, as leaders, what we need to learn is that we can influence the quality of that unit of production by creating the conditions for our employees to live their calling. In Vivian ’ s case, her unit of production isn ’ t the tangible hours she works, it ’ s the intangible difference she makes during that one hour of work. This is Dave Arringdale who ’ s actually been a longtime guest at Vivian ’ s motel. He stayed there a hundred times in the last 20 years, and he ’ s loyal to the property because of the relationship that Vivian and her fellow employees have created with him. They ’ ve created a habitat of **happiness** for Dave. He tells me that he can always count on Vivian and the staff there to make him feel at home. Why is it that business leaders and investors quite often don ’ t see the connection between creating the intangible of employee **happiness** with creating the tangible of **financial** profits in their business? We don ’ t have to choose between inspired employees and sizable profits, we can have both. In fact, inspired employees quite often help make sizable profits, right? So what the world needs now, in my opinion, is business leaders and political leaders who know what to count. We count numbers. We count on people. What really counts is when we actually use our numbers to truly take into account our people. I learned that from a maid in a motel and a king of a country. What can you start counting today? What one thing can you start counting today that actually would be meaningful in your life, whether it ’ s your work life or your business life? Thank you very much.

Hi, my name is Roz Savage and I **row** across oceans. Four years ago, I **rowed** solo across the Atlantic, and since then, I ’ ve done two out of three stages across the Pacific, from San Francisco to Hawaii and from Hawaii to Kiribati. And tomorrow, I ’ ll be leaving this boat to fly back to Kiribati to continue with the third and final stage of my **row** across the Pacific. Cumulatively, I will have **rowed** over 8, 000 miles, taken over three million oar strokes and spent more than 312 days alone on the ocean on a 23 foot rowboat. This has given me a very **special** relationship with the ocean. We have a bit of a love / hate thing going on. I feel a bit about it like I did about a very strict math teacher that I once had at school. I didn ’ t always like her, but I did respect her, and she taught me a heck of a lot. So today I ’ d like to share with you some of my ocean adventures and tell you a little bit about what they ’ ve taught me, and how I think we can maybe take some of those lessons and apply them to this environmental challenge that we face right now. Now, some of you might be thinking,”Hold on a minute. She doesn ’ t look very much like an ocean rower. Isn ’ t she meant to be about this tall and about this wide and maybe look a bit more like these guys?”You ’ ll notice, they ’ ve all got something that I don ’ t. Well, I don ’ t know what you ’ re thinking, but I ’ m talking about the beards. And no matter how long I ’ ve spent on the ocean, I haven ’ t yet managed to muster a decent beard, and I hope that it remains that way. For a long time, I didn ’ t believe that I could have a big adventure. The story that I told myself was that adventurers looked like this. I didn ’ t look the part. I thought there were them and there were us, and I was not one of them. So for 11 years, I conformed. I did what people from my kind of background were supposed to do. I was working in an office in London as a management consultant. And I think I knew from day one that it wasn ’ t the right job for me. But that kind of conditioning just kept me there for so many years, until I reached my mid-30s and I thought,”You know, I ’ m not getting any younger. I feel like I ’ ve got a purpose in this life, and I don ’ t know what it is, but I ’ m pretty certain that management consultancy is not it. So, fast forward a few years. I ’ d gone through some changes. To try and answer that question of,”What am I supposed to be doing with my life?”I sat down one day and wrote two versions of my own obituary, the one that I wanted, a life of adventure, and the one that I was actually heading for which was a nice, normal, **pleasant** life, but it wasn ’ t where I wanted to be by the end of my life. I wanted to live a life that I could be proud of. And I remember looking at these two versions of my obituary and thinking,”Oh boy, I ’ m on totally the wrong track here. If I carry on living as I am now, I ’ m just not going to end up where I want to be in five years, or 10 years, or at the end of my life.”I made a few changes, let go of some loose trappings of my old life, and through a bit of a leap of logic, decided to **row** across the Atlantic Ocean. The Atlantic Rowing Race runs from the Canaries to Antigua, it ’ s about 3, 000 miles, and it turned out to be the hardest thing I had ever done. Sure, I had wanted to get outside of my comfort zone, but what I ’ d sort of failed to notice was that getting out of your comfort zone is, by definition, extremely uncomfortable. And my timing was not great either : 2005, when I did the Atlantic, was the year of Hurricane Katrina. There were more tropical storms in the North Atlantic than ever before, since records began. And pretty early on, those storms started making their presence known. All four of my oars broke before I reached halfway across. Oars are not supposed to look like this. But what can you do? You ’ re in the middle of the ocean. Oars are your only means of propulsion. So I just had to look around the boat and figure out what I was going to use to fix up these oars so that I could carry on. So I found a boat hook and my trusty duct tape and splintered the boat hook to the oars to reinforce it. Then, when that gave out, I sawed the wheel axles off my spare rowing seat and used those. And then when those gave out, I cannibalized one of the broken oars. I ’ d never been very good at fixing stuff when I was living my old life, but it ’ s amazing how resourceful you can become when you ’ re in the middle of the ocean and there ’ s only one way to get to the other side. And the oars kind of became a symbol of just in how many ways I went beyond what I thought were my limits. I suffered from tendinitis on my shoulders and saltwater sores on my bottom. I really **struggled** psychologically, totally overwhelmed by the scale of the challenge, realizing that, if I carried on moving at two miles an hour, 3, 000 miles was going to take me a very, very long time. There were so many times when I thought I ’ d hit that limit, but had no choice but to just carry on and try and figure out how I was going to get to the other side without driving myself crazy. And eventually after 103 days at sea, I arrived in Antigua. I don ’ t think I ’ ve ever felt so happy in my entire life. It was a bit like finishing a marathon and getting out of solitary confinement and winning an Oscar all rolled into one. I was euphoric. And to see all the people coming out to greet me and standing along the cliff tops and clapping and cheering, I just felt like a movie star. It was absolutely wonderful. And I really learned then that, the bigger the challenge, the bigger the sense of achievement when you get to the end of it. So this might be a good moment to take a quick time-out to answer a few FAQs about ocean rowing that might be going through your mind. Number one that I get asked : What do you eat? A few freeze-dried meals, but mostly I try and eat much more unprocessed foods. So I grow my own beansprouts. I eat fruits and nut bars, a lot of nuts. And generally arrive about 30 pounds lighter at the other end. Question number two : How do you sleep? With my eyes shut. Ha-ha. I suppose what you mean is : What happens to the boat while I ’ m sleeping? Well, I plan my route so that I ’ m drifting with the winds and the currents while I ’ m sleeping. On a good night, I think my best ever was 11 miles in the right direction. Worst ever, 13 miles in the wrong direction. That ’ s a bad day at the office. What do I wear? Mostly, a **baseball** cap, rowing gloves and a smile — or a frown, depending on whether I went backwards overnight — and lots of sun lotion. Do I have a chase boat? No I don ’ t. I ’ m totally self-supporting out there. I don ’ t see anybody for the whole time that I ’ m at sea, generally. And finally : Am I crazy? Well, I leave that one up to you to **judge**. So, how do you top rowing across the Atlantic? Well, naturally, you decide to **row** across the Pacific. Well, I thought the Atlantic was big, but the Pacific is really, really big. I think we tend to do it a little bit of a disservice in our usual maps. I don ’ t know for sure that the Brits invented this particular view of the world, but I suspect we might have done so : we are right in the middle, and we ’ ve cut the Pacific in half and flung it to the far corners of the world. Whereas if you look in Google Earth, this is how the Pacific looks. It pretty much covers half the planet. You can just see a little bit of North America up here and a sliver of Australia down there. It is really big — 65 million square miles — and to **row** in a straight line across it would be about 8, 000 miles. Unfortunately, ocean rowboats very rarely go in a straight line. By the time I get to Australia, if I get to Australia, I will have **rowed** probably nine or 10, 000 miles in all. So, because nobody in their straight mind would **row** straight past Hawaii without dropping in, I decided to cut this very big undertaking into three segments. The first attempt didn ' t go so well. In 2007, I did a rather involuntary capsize drill three times in 24 hours. A bit like being in a washing machine. Boat got a bit dinged up, so did I. I blogged about it. Unfortunately, somebody with a bit of a hero complex decided that this damsel was in **distress** and needed saving. The first I knew about this was when the Coast Guard plane turned up overhead. I tried to tell them to go away. We had a bit of a battle of wills. I lost and got airlifted. Awful, really awful. It was one of the worst feelings of my life, as I was lifted up on that winch line into the helicopter and looked down at my trusty little boat rolling around in the 20 foot waves and wondering if I would ever see her again. So I had to launch a very expensive salvage operation and then wait another nine months before I could get back out onto the ocean again. But what do you do? Fall down nine times, get up 10. So, the following year, I set out and, fortunately, this time made it safely across to Hawaii. But it was not without misadventure. My watermaker broke, only the most important piece of kit that I have on the boat. Powered by my solar panels, it sucks in saltwater and turns it into freshwater. But it doesn ' t react very well to being immersed in ocean, which is what happened to it. Fortunately, help was at hand. There was another unusual boat out there at the same time, doing as I was doing, bringing awareness to the North Pacific Garbage Patch, that area in the North Pacific about twice the size of Texas, with an estimated 3. 5 million tons of trash in it, circulating at the center of that North Pacific Gyre. So, to make the point, these guys had actually built their boat out of plastic trash, 15, 000 empty water bottles latched together into two pontoons. They were going very slowly. Partly, they ' d had a bit of a delay. They ' d had to pull in at Catalina Island shortly after they left Long Beach because the lids of all the water bottles were coming undone, and they were starting to sink. So they ' d had to pull in and do all the lids up. But, as I was approaching the end of my water reserves, luckily, our courses were converging. They were running out of food ; I was running out of water. So we liaised by satellite phone and arranged to meet up. And it took about a week for us to actually gradually converge. I was doing a pathetically slow speed of about 1. 3 knots, and they were doing only marginally less pathetic speed of about 1. 4 : it was like two snails in a mating dance. But, eventually, we did manage to meet up and Joel hopped overboard, caught us a beautiful, big mahi- mahi, which was the best food I ' d had in, ooh, at least three months. Fortunately, the one that he caught that day was better than this one they caught a few weeks earlier. When they opened this one up, they found its stomach was full of plastic. And this is really bad news because plastic is not an inert substance. It leaches out chemicals into the flesh of the poor critter that ate it, and then we come along and eat that poor critter, and we get some of the toxins accumulating in our bodies as well. So there are very real implications for human health. I eventually made it to Hawaii still alive. And, the following year, set out on the second stage of the Pacific, from Hawaii down to Tarawa. And you ' ll notice something about Tarawa ; it is very low-lying. It ' s that little green sliver on the horizon, which makes them very nervous about rising oceans. This is big trouble for these guys. They ' ve got no points of land more than about six feet above sea level. And also, as an increase in extreme weather events due to climate change, they ' re expecting more waves to come in over the fringing reef, which will contaminate their fresh water supply. I had a meeting with the president there, who told me about his exit strategy for his country. He expects that within the next 50 years, the 100, 000 people that live there will have to relocate to New Zealand or Australia. And that made me think about how would I feel if Britain was going to disappear under the waves ; if the places where I ' d been born and gone to school and got married, if all those places were just going to disappear forever. How, literally, ungrounded that would make me feel. Very shortly, I ’ ll be setting out to try and get to Australia, and if I ’ m successful, I ’ ll be the first woman ever to **row** solo all the way across the Pacific. And I try to use this to bring awareness to these environmental issues, to bring a human face to the ocean. If the Atlantic was about my inner journey, discovering my own capabilities, maybe the Pacific has been about my outer journey, figuring out how I can use my interesting career choice to be of **service** to the world, and to take some of those things that I ’ ve learned out there and apply them to the situation that humankind now finds itself in. I think there are probably three key points here. The first one is about the stories that we tell ourselves. For so long, I told myself that I couldn ’ t have an adventure because I wasn ’ t six foot tall and athletic and bearded. And then that story changed. I found out that people had **rowed** across oceans. I even met one of them and she was just about my size. So even though I didn ’ t grow any taller, I didn ’ t sprout a beard, something had changed : My interior dialogue had changed. At the moment, the story that we collectively tell ourselves is that we need all this stuff, that we need oil. But what about if we just change that story? We do have alternatives, and we have the power of free will to choose those alternatives, those sustainable ones, to create a greener future. The second point is about the accumulation of tiny **actions**. We might think that anything that we do as an individual is just a drop in the ocean, that it can ’ t really make a difference. But it does. Generally, we haven ’ t got ourselves into this mess through big disasters. Yes, there have been the Exxon Valdezes and the Chernobyls, but mostly it ’ s been an accumulation of bad decisions by billions of individuals, day after day and year after year. And, by the same token, we can turn that tide. We can start making better, wiser, more sustainable decisions. And when we do that, we ’ re not just one person. Anything that we do spreads ripples. Other people will see if you ’ re in the supermarket line and you pull out your reusable grocery bag. Maybe if we all start doing this, we can make it socially unacceptable to say yes to plastic in the checkout line. That ’ s just one example. This is a world-wide community. The other point : It ’ s about taking responsibility. For so much of my life, I wanted something else to make me happy. I thought if I had the right house or the right car or the right man in my life, then I could be happy. But when I wrote that obituary exercise, I actually grew up a little bit in that moment and realized that I needed to create my own future. I couldn ’ t just wait passively for **happiness** to come and find me. And I suppose I ’ m a selfish environmentalist. I plan on being around for a long time, and when I ’ m 90 years old, I want to be happy and healthy. And it ’ s very difficult to be happy on a planet that ’ s racked with famine and drought. It ’ s very difficult to be healthy on a planet where we ’ ve poisoned the earth and the sea and the air. So, shortly, I ’ m going to be launching a new initiative called Eco-Heroes. And the idea here is that all our Eco-Heroes will log at least one green deed every day. It ’ s meant to be a bit of a game. We ’ re going to make an iPhone app out of it. We just want to try and create that awareness because, sure, changing a light bulb isn ’ t going to change the world, but that attitude, that awareness that leads you to change the light bulb or take your reusable coffee mug, that is what could change the world. I really believe that we stand at a very important point in history. We have a choice. We ’ ve been blessed, or cursed, with free will. We can choose a greener future, and we can get there if we all pull together to take it one stroke at a time. Thank you.

When you think about resilience and technology it ’ s actually much easier. You ’ re going to see some other speakers today, I already know, who are going to talk about breaking-bones stuff, and, of course, with technology it never is. So it ’ s very easy, comparatively speaking, to be resilient. I think that, if we look at what happened on the Internet, with such an incredible last half a dozen years, that it ’ s hard to even get the right analogy for it. A lot of how we decide, how we ’ re supposed to react to things and what we ’ re supposed to expect about the future depends on how we bucket things and how we categorize them. And so I think the tempting analogy for the boom-bust that we just went through with the Internet is a gold rush. It ’ s easy to think of this analogy as very different from some of the other things you might pick. For one thing, both were very real. In 1849, in that Gold Rush, they took over $700 million worth of gold out of California. It was very real. The Internet was also very real. This is a real way for humans to communicate with each other. It ’ s a big deal. Huge boom. Huge boom. Huge bust. Huge bust. You keep going, and both things are lots of hype. I don ’ t have to remind you of all the hype that was involved with the Internet — like GetRich. com. But you had the same thing with the Gold Rush.”Gold. Gold. Gold.”Sixty-eight rich men on the Steamer Portland. Stacks of yellow metal. Some have 5, 000. Many have more. A few bring out 100, 000 dollars each. People would get very excited about this when they read these articles.”The Eldorado of the United States of America : the discovery of inexhaustible gold mines in California.”And the parallels between the Gold Rush and the Internet Rush continue very strongly. So many people left what they were doing. And what would happen is — and the Gold Rush went on for years. People on the East Coast in 1849, when they first started to get the news, they thought,”Ah, this isn ’ t real.”But they keep hearing about people getting rich, and then in 1850 they still hear that. And they think it ’ s not real. By about 1852, they ’ re thinking,”Am I the stupidest person on Earth by not rushing to California?”And they start to decide they are. These are community affairs, by the way. Local communities on the East Coast would get together and whole teams of 10, 20 people would caravan across the United States, and they would form companies. These were typically not solitary efforts. But no matter what, if you were a lawyer or a banker, people dropped what they were doing, no matter what skill set they had, to go pan for gold. This guy on the left, Dr. Richard Beverley Cole, he lived in Philadelphia and he took the Panama route. They would take a ship down to Panama, across the isthmus, and then take another ship north. This guy, Dr. Toland, went by covered wagon to California. This has its parallels, too. Doctors leaving their **practices**. These are both very successful — a physician in one case, a surgeon in the other. Same thing happened on the Internet. You get DrKoop. com. In the Gold Rush, people literally jumped ship. The San Francisco harbor was clogged with 600 ships at the **peak** because the ships would get there and the crews would abandon to go search for gold. So there were literally 600 captains and 600 ships. They turned the ships into hotels, because they couldn ’ t sail them anywhere. You had dotcom fever. And you had gold fever. And you saw some of the excesses that the dotcom fever created and the same thing happened. The fort in San Francisco at the time had about 1, 300 soldiers. Half of them deserted to go look for gold. And they wouldn ’ t let the other half out to go look for the first half because they were afraid they wouldn ’ t come back. And one of the soldiers wrote home, and this is the sentence that he put :”The **struggle** between right and six dollars a month and wrong and 75 dollars a day is a rather severe one.”They had bad burn rate in the Gold Rush. A very bad burn rate. This is actually from the Klondike Gold Rush. This is the White Pass Trail. They loaded up their mules and their horses. And they didn ’ t plan right. And they didn ’ t know how far they would really have to go, and they overloaded the horses with hundreds and hundreds of pounds of stuff. In fact it was so bad that most of the horses died before they could get where they were going. It got renamed the"Dead Horse Trail."And the Canadian Minister of the Interior wrote this at the time :"Thousands of pack horses lie dead along the way, sometimes in bunches under the cliffs, with pack saddles and packs where they ' ve fallen from the rock above, sometimes in tangled masses, filling the mud holes and furnishing the only footing for our poor pack animals on the march, often, I regret to say, exhausted, but still alive, a fact we were unaware of, until after the miserable wretches turned beneath the hooves of our cavalcade. The eyeless sockets of the pack animals everywhere account for the myriads of ravens along the road. The inhumanity which this trail has been witness to, the heartbreak and suffering which so many have undergone, cannot be imagined. They certainly cannot be described."And you know, without the smell that would have accompanied that, we had the same thing on the Internet : very bad burn rate calculations. I ' ll just play one of these and you ' ll remember it. This is a commercial that was played on the Super Bowl in the year 2000. : Bride #1 : You said you had a large selection of invitations. Clerk : But we do. Bride #2 : Then why does she have my invitation? Announcer : What may be a little thing to some... Bride #3 : You are mine, little man. Announcer : Could be a really big deal to you. Husband #1 : Is that your wife? Husband #2 : Not for another 15 minutes. Announcer : After all, it ' s your **special** day. OurBeginning. com. Life ' s an event. Announce it to the world. Jeff Bezos : It ' s very difficult to figure out what that **ad** is for. But they spent three and a half million dollars in the 2000 Super Bowl to air that **ad**, even though, at the time, they only had a million dollars in annual revenue. Now, here ' s where our analogy with the Gold Rush starts to diverge, and I think rather severely. And that is, in a gold rush, when it ' s over, it ' s over. Here ' s this guy :"There are many men in Dawson at the present time who feel keenly disappointed. They ' ve come thousands of miles on a perilous trip, risked life, health and property, spent months of the most arduous labor a man can perform and at length with expectations raised to the highest pitch have reached the coveted goal only to discover the fact that there is nothing here for them."And that was, of course, the very common story. Because when you take out that last piece of gold — and they did incredibly quickly. I mean, if you look at the 1849 Gold Rush — the entire American river region, within two years — every stone had been turned. And after that, only big companies who used more sophisticated mining technologies started to take gold out of there. So there ' s a much better analogy that allows you to be incredibly optimistic and that analogy is the electric industry. And there are a lot of similarities between the Internet and the electric industry. With the electric industry you actually have to — one of them is that they ' re both sort of thin, horizontal, enabling layers that go across lots of different industries. It ' s not a specific thing. But electricity is also very, very broad, so you have to sort of narrow it down. You know, it can be used as an incredible means of transmitting power. It ' s an incredible means of coordinating, in a very fine-grained way, information flows. There ' s a bunch of things that are interesting about electricity. And the part of the electric revolution that I want to focus on is sort of the golden age of appliances. The killer app that got the world ready for appliances was the light bulb. So the light bulb is what wired the world. And they weren ' t thinking about appliances when they wired the world. They were really thinking about — they weren ' t putting electricity into the home ; they were putting lighting into the home. And, but it really — it got the electricity. It took a long time. This was a huge — as you would expect — a huge capital build out. All the streets had to be torn up. This is work going on down in lower Manhattan where they built some of the first electric power generating stations. And they ’ re tearing up all the streets. The Edison Electric Company, which became Edison General Electric, which became General Electric, paid for all of this digging up of the streets. It was incredibly expensive. But that is not the — and that ’ s not the part that ’ s really most similar to the Web. Because, remember, the Web got to stand on top of all this heavy infrastructure that had been put in place because of the long-distance phone network. So all of the cabling and all of the heavy infrastructure — I ’ m going back now to, sort of, the explosive part of the Web in 1994, when it was growing 2, 300 percent a year. How could it grow at 2, 300 percent a year in 1994 when people weren ’ t really investing in the Web? Well, it was because that heavy infrastructure had already been laid down. So the light bulb laid down the heavy infrastructure, and then home appliances started coming into being. And this was huge. The first one was the electric fan — this was the 1890 electric fan. And the appliances, the golden age of appliances really lasted — it depends how you want to measure it — but it ’ s anywhere from 40 to 60 years. It goes on a long time. It starts about 1890. And the electric fan was a big success. The electric iron, also very big. By the way, this is the beginning of the asbestos lawsuit. There ’ s asbestos under that handle there. This is the first vacuum cleaner, the 1905 Skinner Vacuum, from the Hoover Company. And this one weighed 92 pounds and took two people to operate and cost a quarter of a car. So it wasn ’ t a big seller. This was truly, truly an early-adopter product — the 1905 Skinner Vacuum. But three years later, by 1908, it weighed 40 pounds. Now, not all these things were highly successful. This is the electric tie press, which never really did catch on. People, I guess, decided that they would not wrinkle their ties. These never really caught on either : the electric shoe warmer and drier. Never a big seller. This came in, like, six different colors. I don ’ t know why. But I thought, you know, sometimes it ’ s just not the right time for an invention ; maybe it ’ s time to give this one another shot. So I thought we could build a Super Bowl **ad** for this. We ’ d need the right partner. And I thought that really — I thought that would really work, to give that another shot. Now, the toaster was huge because they used to make toast on open fires, and it took a lot of time and attention. I want to point out one thing. This is — you guys know what this is. They hadn ’ t invented the electric socket yet. So this was — remember, they didn ’ t wire the houses for electricity. They wired them for lighting. So your — your appliances would plug in. They would — each room typically had a light bulb socket at the top. And you ’ d plug it in there. In fact, if you ’ ve seen the Carousel of Progress at Disney World, you ’ ve seen this. Here are the cables coming up into this light fixture. All the appliances plug in there. And you would just unscrew your light bulb if you wanted to plug in an appliance. The next thing that really was a big, big deal was the washing machine. Now, this was an object of much envy and lust. Everybody wanted one of these electric washing machines. On the left-hand side, this was the soapy water. And there ’ s a rotor there — that this motor is spinning. And it would clean your clothes. This is the clean rinse-water. So you ’ d take the clothes out of here, put them in here, and then you ’ d run the clothes through this electric wringer. And this was a big deal. You ’ d keep this on your porch. It was a little bit messy and kind of a pain. And you ’ d run a long cord into the house where you could screw it into your light socket. And that ’ s actually kind of an important point in my presentation, because they hadn ’ t invented the off switch. That was to come much later — the off switch on appliances — because it didn ’ t make any sense. I mean, you didn ’ t want this thing clogging up a light socket. So you know, when you were done with it, you unscrewed it. That ’ s what you did. You didn ’ t turn it off. And as I said before, they hadn ’ t invented the electric outlet either, so the washing machine was a particularly dangerous device. And there are — when you research this, there are gruesome descriptions of people getting their hair and clothes caught in these devices. And they couldn ’ t yank the cord out because it was screwed into a light socket inside the house. And there was no off switch, so it wasn ’ t very good. And you might think that that was incredibly stupid of our ancestors to be plugging things into a light socket like this. But, you know, before I get too far into condemning our ancestors, I thought I ’ d show you : this is my conference room. This is a total kludge, if you ask me. First of all, this got installed upside down. This light socket — and so the cord keeps falling out, so I taped it in. This is supposed — don ’ t even get me started. But that ’ s not the worst one. This is what it looks like under my desk. I took this picture just two days ago. So we really haven ’ t progressed that much since 1908. It ’ s a total, total mess. And, you know, we think it ’ s getting better, but have you tried to install 802. 11 yourself? I challenge you to try. It ’ s very hard. I know Ph. D. s in Computer Science — this process has brought them to tears, absolute tears. And that ’ s assuming you already have DSL in your house. Try to get DSL installed in your house. The engineers who do it everyday can ’ t do it. They have to — typically, they come three times. And one friend of mine was telling me a story : not only did they get there and have to wait, but then the engineers, when they finally did get there, for the third time, they had to call somebody. And they were really happy that the guy had a speakerphone because then they had to wait on hold for an hour to talk to somebody to give them an access code after they got there. So we ’ re not — we ’ re pretty kludge-y ourselves. By the way, DSL is a kludge. I mean, this is a twisted pair of copper that was never designed for the purpose it ’ s being put to — you know it ’ s the whole thing — we ’ re very, very primitive. And that ’ s kind of the point. Because, you know, resilience — if you think of it in terms of the Gold Rush, then you ’ d be pretty depressed right now because the last nugget of gold would be gone. But the good thing is, with innovation, there isn ’ t a last nugget. Every new thing creates two new questions and two new opportunities. And if you believe that, then you believe that where we are — this is what I think — I believe that where we are with the incredible kludge — and I haven ’ t even talked about user interfaces on the Web — but there ’ s so much kludge, so much terrible stuff — we are at the 1908 Hurley washing machine stage with the Internet. That ’ s where we are. We don ’ t get our hair caught in it, but that ’ s the level of primitiveness of where we are. We ’ re in 1908. And if you believe that, then stuff like this doesn ’ t bother you. This is 1996 :”All the negatives add up to making the online experience not worth the trouble.”1998 :”Amazon. toast.”In 1999 :”Amazon. bomb.”My mom hates this picture. She — but you know, if you really do believe that it ’ s the very, very beginning, if you believe it ’ s the 1908 Hurley washing machine, then you ’ re incredibly optimistic. And I do think that that ’ s where we are. And I do think there ’ s more innovation ahead of us than there is behind us. And in 1917, Sears — I want to get this exactly right. This was the advertisement that they ran in 1917. It says :”Use your electricity for more than light.”And I think that ’ s where we are. We ’ re very, very early. Thank you very much.

Text Sample 240: POS Dim 2 – 2003 – Score 6.00 – 2003/t000088.txt

The future of life, where the unraveling of our biology â and bring up the lights a little bit. I don ’ t have any slides. I ’ m just going to talk â about where that ’ s likely to carry us. And you know, I saw all the visions of the first couple of sessions. It almost made me feel a little bit guilty about having an uplifting talk about the future. It felt wrong to do that in some way. And yet, I don ’ t really think it is because when it comes down to it, it ’ s this larger trajectory that is really what is going to remain â what people in the future are going to remember about this period. I want to talk to you a little bit about why the visions of Jeremy Rivkins, who would like to ban these sorts of technologies, or of the Bill Joys who would like to relinquish them, are actually â to follow those paths would be such a tragedy for us. I ’ m focusing on biology, the biological sciences. The reason I ’ m doing that is because those are going to be the areas that are the most significant to us. The reason for that is really very simple. It ’ s because we ’ re flesh and blood. We ’ re biological creatures. And what we can do with our biology is going to shape our future and that of our children and that of their children â whether we gain control over aging, whether we learn to protect ourselves from Alzheimer ’ s, and heart disease, and cancer. I think that Shakespeare really put it very nicely. And I ’ m actually going to use his words in the same order that he did. He said,”And so from hour to hour we ripe and ripe. And then from hour to hour we rot and rot. And thereby hangs a tale.”Life is short, you know. And we need to think about planning a little bit. We ’ re all going to eventually, even in the developed world, going to have to lose everything that we love. When you ’ re beginning to rot a little bit, all of the videos crammed into your head, all of the extensions that extend your various powers, are going to being to seem a little secondary. And you know, I ’ m getting a little bit gray â so is Ray Kurzweil, so is Eric Drexler. This is where it ’ s really central to our lives. Now I know there ’ s been a whole lot of hype about our power to control biology. You just have to look at the Human Genome Project. It wasn ’ t two years ago that everybody was talking about â we ’ ve found the Holy Grail of biology. We ’ re deciphering the code of codes. We ’ re reading the book of life. It ’ s a little bit reminiscent of 1969 when Neil Armstrong walked on the moon, and everybody was about to race out toward the stars. And we ’ ve all seen”2001 : A Space Odyssey.”You know it ’ s 2003, and there is no HAL. And there is no odyssey to our own moon, much less the moons of Jupiter. And we ’ re still picking up pieces of the Challenger. So it ’ s not surprising that some people would wonder whether maybe 30 or 40 years from now, we ’ ll look back at this **instant** in time, and all of the sort of talk about the Human Genome Project, and what all this is going to mean to us â well, it will really mean precious little. And I just want to say that that is absolutely not going to be the case. Because when we talk about our genetics and our biology, and modifying and altering and adjusting these things, we ’ re talking about changing ourselves. And this is very critical stuff. If you have any doubts about how technology affects our lives, you just have to go to any major city. This is not the stomping ground of our Pleistocene ancestors. What ’ s happening is we ’ re taking this technology â it ’ s becoming more precise, more potent â and we ’ re turning it back upon ourselves. Before it ’ s all done we are going to alter ourselves every bit as much as we have changed the world around us. It ’ s going to happen a lot sooner than people imagine. On the way there it ’ s going to completely revolutionize medicine and health care ; that ’ s obvious. It ’ s going to change the way we have children. It ’ s going to change the way we manage and alter our emotions. It ’ s going to probably change the human lifespan. It will really make us question what it is to be a human being. The larger context of this is that are two unprecedented revolutions that are going on today. The first of them is the obvious one, the **silicon** revolution, which you all are very, very familiar with. It ’ s changing our lives in so many ways, and it will continue to do that. What the essence of that is, is that we ’ re taking the sand at our feet, the inert **silicon** at our feet, and we ’ re breathing a level of complexity into it that rivals that of life itself, and may even surpass it. As an outgrowth of that, as a child of that revolution, is the revolution in biology. The genomics revolution, proteomics, metabolomics, all of these”omics”that sound so terrific on grants and on business plans. What we ’ re doing is we are seizing control of our evolutionary future. I mean we ’ re essentially using technology to just jam evolution into **fast-forward**. It ’ s not at all clear where it ’ s going to take us. But in five to ten years we ’ re going to start see some very profound changes. The most immediate changes that we ’ ll see are things like in medicine. There is going to be a big shift towards preventative medicine as we start to be able to identify all of the risk factors that we have as individuals. But who is going to pay for all this? And how are we going to understand all this complex information? That is going to be the IT challenge of the next generation, is communicating all this information. There ’ s pharmacogenomics, the combination of pharmacology and genetics : tailoring drugs to our individual constitutions that Juan talked about a little bit earlier. That ’ s going to have amazing impacts. And it ’ s going to be used for diet as well, and nutritional supplements and such. But it ’ s going to have a big impact because we ’ re going to have niche drugs. And we aren ’ t going to be able to support the kinds of expenses that we have to create blockbuster drugs today. The approval process is going to fall apart, actually. It ’ s too slow. It ’ s too risk-averse. And it is really not suited for the future that we ’ re moving into. Another thing is that we ’ re just going to have to deal with this knowledge. It ’ s really wonderful when we hear,”Oh, 99. 9 percent of the letters in the code are the same. We ’ re all identical to each other. Isn ’ t it wonderful?”And look around you and know that what we really care about is that little bit of difference. We look the same to a visitor from another planet, maybe, but not to each other because we compete with each other all time. And we ’ re going to have to come to grips with the fact that there are differences between us as individuals that we will know about, and between subpopulations of humans as well. To deny that that ’ s the case is not a very good start on that. A generation or so away there are going to be even more profound things that are going to happen. That ’ s when we ’ re going to begin to use this knowledge to modify ourselves. Now I don ’ t mean extra gills or something â□□ something we care about, like aging. What if we could unravel aging and understand it â□□ begin to retard the process or even reverse it? It would change absolutely everything. And it ’ s obvious to anyone, that if we can do this, we absolutely will do this, whatever the consequences are. The second is modifying our emotions. I mean Ritalin, Viagra, things of that sort, Prozac. You know, this is just clumsy little baby steps. What if you could take a little concoction of pharmaceuticals that would make you feel really contented, just happy to be you. Are you going to be able to resist that if it doesn ’ t have any overt side effects? Probably not. And if you don ’ t, who are you going to be? Why do you do what you do? We ’ re sort of circumventing evolutionary programs that guide our behavior. It ’ s going to be very challenging to deal with. The third area is reproduction. The idea that we ’ re going to chose our children ’ s genes, as we begin to understand what genes say about who we are. That ’ s the focus of my book”Redesigning Humans,”where I talk about the kinds of choices we ’ ll make, and the challenges it ’ s going to present to society. There are three obvious ways of doing this. The first is cloning. It didn ’ t happen. It ’ s a total media circus. It will happen in five to 10 years. And when it does it ’ s not going to be that big a deal. The birth of a delayed identical twin is not going to shake western civilization. But there are more important things that are already occurring : embryo screening. You take a six to eight cell embryo, you tease out one of the cells, you run a genetic test on that cell, and depending on the results of that test you either implant that embryo or you discard it. It ’ s already done to avoid rare diseases today. And pretty soon it ’ s going to be possible to avoid virtually all genetic diseases in that way. As that becomes possible this is going to move from something that is used by those who have infertility problems and are already doing in vitro fertilization, to the wealthy who want to protect their children, to just about everybody else. And in that process that ’ s going to morph from being just for diseases, to being for lesser vulnerabilities, like risk of manic depression or something, to picking personalities, temperaments, traits, these sorts of things. Of course there is going to be genetic engineering. Directly going in â it ’ s a little bit further away, but not that far away â going in and altering the genes in the first cell in an embryo. The way I suspect it will happen is using artificial chromosomes and extra chromosomes, so we go from 46 to 47 or 48. And one that is not heritable because who would want to pass on to their children the archaic enhancement modules that they got 25 years earlier from their parents? It ’ s a joke ; of course they wouldn ’ t want to do that. They ’ ll want the new release. Those kinds of loose analogies with computers, and with programming, are actually much deeper than that. They are really going to come to operate in this realm. Now not everything that can be done should be done. And it won ’ t be done. But when something is feasible in thousands of laboratories all over the world, which is going to be the case with these technologies, when there are large numbers of people who see them as beneficial, which is already the case, and when they ’ re almost impossible to police, it ’ s not a question of if this is going to happen, it ’ s when and where and how it ’ s going to happen. Humanity is going to go down this path. And it ’ s going to do so for two reasons. The first is that all these technologies are just a spin-off of mainstream medical research that everybody wants to see happen. It is being funded very very â in a big way. The second is, we ’ re human. That ’ s what we do. We try and use our technology to improve our lives in one way or another. To imagine that we ’ re not going to use these technologies when they become available, is as much a denial of who we are as to imagine that we ’ ll use these technologies and not fret and worry about it a great deal. The lines are going to blur. And they already are between therapy and enhancement, between treatment and prevention, between need and desire. That ’ s really the central one, I believe. People can try and ban these things. They undoubtedly will. They have. But ultimately all this is going to do is just shift development elsewhere. It ’ s going to drive these things from view. It ’ s going to reserve the technology for the wealthy because they are in the best position to circumvent any of these sorts of laws. And it ’ s going to deny us the information that we need to make wise decisions about how to use these technologies. So, sure, we need to debate these things. And I think it ’ s wonderful that we do. But we shouldn ’ t kid ourselves and think that we ’ re going to reach a consensus about these things. That is simply not going to happen. They touch us too deeply. And they depend too much upon history, upon philosophy, upon religion, upon culture, upon politics. Some people are going to see this as an abomination, as the worst thing, as just awful. Other people are going to say,”This is great. This is the flowering of human endeavor.”The one thing though that is really dangerous about these sorts of technologies, is that it ’ s easy to become seduced by them. And to focus too much on all the high-technology possibilities that exist. And to lose touch with the basic rhythms of our biology and our health. There are too many people that think that high-technology medicine is going to keep them, save them, from overeating, from eating a lot of fast foods, from not getting any exercise. It ’ s not going to happen. In the midst of all this amazing technology, and all these things that are occurring, it ’ s really interesting because there is sort of a counter- revolution that is going on : a resurgence of interest in remedies from the past, in nutraceuticals, in all of these sorts of things that some people, in the pharmaceutical industry particularly, like to brand as non-science. But this whole effort is generated, is driven, by IT as well because that is how we ’ re gathering all this information, and linking it, and integrating it together. There is a lot in this rich biota that is going to serve us well. And that ’ s where about half of our drugs come. So we shouldn ’ t dismiss this because it ’ s an enormous opportunity to use these sorts of results, or these random loose **trials** from the last thousand years about what has impacts on our health. And to use our advanced technologies to pull out what is beneficial from this sea of noise, basically. In fact this isn ’ t just abstract. I just formed a biotechnology company that is using this sort of an approach to develop therapeutics for Alzheimer ’ s and other diseases of aging, and we ’ re making some real progress. So here we are. It ’ s the beginning of a new millennium. If you look forward, I mean future humans, far before the end of this millennium, in a few hundred years, they are going to look back at this moment. And from the beginning of today ’ s sessions you ’ d think that they ’ re going to see this as this horrible difficult, painful period that we **struggled** through. And I don ’ t think that ’ s what ’ s going to happen. They ’ re going to do like everybody does. They are going to forget about all that stuff. And they are actually going to romanticize this moment in time. They are going to think about it as this glorious **instant** when we laid down the very foundations of their lives, of their society, of their future. You know it ’ s a little bit like a birth. Where there is this bloody, awful mess happens. And then what comes out of it? New life. Actually as was pointed out earlier, we forget about all the **struggle** there was in getting there. So to me, it ’ s clear that one of the foundations of that future is going to be the reworking of our biology. It ’ s going to come gradually at first. It ’ s going to pick up speed. We ’ re going to make lots of errors. That ’ s the way these things work. To me it ’ s an incredible privilege to be alive now and to be able to witness this thing. It is something that is a unique **instant** in the history of all of life. It will always be remembered. And what ’ s extraordinary is that we ’ re not just **observing** this, we are the architects of this. I think that we should be proud of it. What is so difficult and challenging is that we are also the objects of these changes. It ’ s our health, it ’ s our lives, it ’ s our future, it ’ s our children. And that is why they are so very troubling to so many people who would pull back in fear. I think that our choice in the choice of life, is not whether we ’ re going to go down this path. We are, definitely. It ’ s how we hold it in our hearts. It ’ s how we look at it. I think Thucydides really spoke to us very clearly in 430 B. C. He put it nicely. Again, I ’ ll use the words in the same order he did.”The bravest are surely those who have the clearest vision of what is before them, both glory and danger alike. And yet notwithstanding, they go out and they meet it.”Thank you.

Text Sample 241: POS Dim 2 – 2003 – Score 6.00 – 2003/t000444.txt

I ’ m going to give you four specific examples, I ’ m going to cover at the end about how a company called Silk tripled their sales ; how an artist named Jeff Koons went from being a nobody to making a whole bunch of money and having a lot of impact ; to how Frank Gehry redefined what it meant to be an architect. And one of my biggest failures as a marketer in the last few years — a record label I started that had a CD called”Sauce.”Before I can do that I ’ ve got to tell you about sliced bread, and a guy named Otto Rohwedder. Now, before sliced bread was invented in the 1910s I wonder what they said? Like the greatest invention since the telegraph or something. But this guy named Otto Rohwedder invented sliced bread, and he focused, like most inventors did, on the patent part and the making part. And the thing about the invention of sliced bread is this — that for the first 15 years after sliced bread was available no one bought it ; no one knew about it ; it was a complete and total failure. And the reason is that until Wonder came along and figured out how to spread the idea of sliced bread, no one wanted it. That the success of sliced bread, like the success of almost everything we ' ve talked about at this conference, is not always about what the patent is like, or what the factory is like — it ' s about can you get your idea to spread, or not. And I think that the way you ' re going to get what you want, or cause the change that you want to change, to happen, is to figure out a way to get your ideas to spread. And it doesn ' t matter to me whether you ' re running a coffee shop or you ' re an intellectual, or you ' re in business, or you ' re flying hot air balloons. I think that all this stuff applies to everybody regardless of what we do. That what we are living in is a century of idea diffusion. That people who can spread ideas, regardless of what those ideas are, win. When I talk about it I usually pick business, because they make the best pictures that you can put in your presentation, and because it ' s the easiest sort of way to keep **score**. But I want you to forgive me when I use these examples because I ' m talking about anything that you decide to spend your time to do. At the heart of spreading ideas is TV and stuff like TV. TV and mass media made it really easy to spread ideas in a certain way. I call it the"TV-industrial complex."The way the TV-industrial complex works, is you buy some **ads**, interrupt some people, that gets you distribution. You use the distribution you get to sell more products. You take the profit from that to buy more **ads**. And it goes around and around and around, the same way that the military-industrial complex worked a long time ago. That model of, and we heard it yesterday — if we could only get onto the homepage of Google, if we could only figure out how to get promoted there, or grab that person by the throat, and tell them about what we want to do. If we did that then everyone would pay attention, and we would win. Well, this TV-industrial complex informed my entire childhood and probably yours. I mean, all of these products succeeded because someone figured out how to touch people in a way they weren ' t expecting, in a way they didn ' t necessarily want, with an **ad**, over and over again until they bought it. And the thing that ' s happened is, they canceled the TV-industrial complex. That just over the last few years, what anybody who markets anything has discovered is that it ' s not working the way that it used to. This picture is really fuzzy, I apologize ; I had a bad cold when I took it. But the product in the blue box in the center is my poster child. I go to the deli ; I ' m sick ; I need to buy some medicine. The brand manager for that blue product spent 100 million dollars trying to interrupt me in one year. 100 million dollars interrupting me with TV commercials and magazine **ads** and Spam and coupons and shelving allowances and spiff — all so I could ignore every single message. And I ignored every message because I don ' t have a pain reliever problem. I buy the stuff in the yellow box because I always have. And I ' m not going to invest a minute of my time to solve her problem, because I don ' t care. Here ' s a magazine called"Hydrate."It ' s 180 pages about water. Articles about water, **ads** about water. Imagine what the world was like 40 years ago, with just the Saturday Evening Post and Time and Newsweek. Now there are magazines about water. New product from Coke Japan : water salad. Coke Japan comes out with a new product every three weeks, because they have no idea what ' s going to work and what ' s not. I couldn ' t have written this better myself. It came out four days ago — I circled the important parts so you can see them here. They ' ve come out... Arby ' s is going to spend 85 million dollars promoting an oven mitt with the voice of Tom Arnold, hoping that that will get people to go to Arby ' s and buy a roast beef sandwich. Now, I had tried to imagine what could possibly be in an animated TV commercial featuring Tom Arnold, that would get you to get in your car, drive across town and buy a roast beef sandwich. Now, this is Copernicus, and he was right, when he was talking to anyone who needs to hear your idea."The world revolves around me."Me, me, me, me. My favorite person — me. I don ' t want to get email from anybody ; I want to get"memail."So consumers, and I don ' t just mean people who buy stuff at the Safeway ; I mean people at the Defense Department who might buy something, or people at, you know, the New Yorker who might print your article. Consumers don ' t care about you at all ; they just don ' t care. Part of the reason is — they ' ve got way more choices than they used to, and way less time. And in a world where we have too many choices and too little time, the obvious thing to do is just ignore stuff. And my parable here is you ' re driving down the road and you see a cow, and you keep driving because you ' ve seen cows before. Cows are invisible. Cows are boring. Who ' s going to stop and pull over and say —"Oh, look, a cow."Nobody. But if the cow was purple — isn ' t that a great **special** effect? I could do that again if you want. If the cow was purple, you ' d notice it for a while. I mean, if all cows were purple you ' d get bored with those, too. The thing that ' s going to decide what gets talked about, what gets done, what gets changed, what gets purchased, what gets built, is :"Is it remarkable?"And"remarkable"is a really cool word, because we think it just means"neat,"but it also means"worth making a remark about."And that is the essence of where idea diffusion is going. That two of the hottest cars in the United States is a 55, 000-dollar giant car, big enough to hold a Mini in its trunk. People are paying full price for both, and the only thing they have in common is that they don ' t have anything in common. Every week, the number one best-selling DVD in America changes. It ' s never"The Godfather,"it ' s never"Citizen Kane,"it ' s always some third-rate movie with some second-rate star. But the reason it ' s number one is because that ' s the week it came out. Because it ' s new, because it ' s fresh. People saw it and said"I didn ' t know that was there"and they noticed it. Two of the big success stories of the last 20 years in retail — one sells things that are super- expensive in a blue box, and one sells things that are as cheap as they can make them. The only thing they have in common is that they ' re different. We ' re now in the fashion business, no matter what we do for a living, we ' re in the fashion business. And people in the fashion business know what it ' s like to be in the fashion business — they ' re used to it. The rest of us have to figure out how to think that way. How to understand that it ' s not about interrupting people with big full-page **ads**, or insisting on meetings with people. But it ' s a totally different sort of process that determines which ideas spread, and which ones don ' t. They sold a billion dollars ' worth of Aeron chairs by reinventing what it meant to sell a chair. They turned a chair from something the purchasing department bought, to something that was a status symbol about where you sat at work. This guy, Lionel Poilne, the most famous baker in the world — he died two and a half months ago, and he was a hero of mine and a dear friend. He lived in Paris. Last year, he sold 10 million dollars ' worth of French bread. Every loaf baked in a bakery he owned, by one baker at a time, in a wood-fired oven. And when Lionel started his bakery, the French pooh-pooh-ed it. They didn ' t want to buy his bread. It didn ' t look like"French bread."It wasn ' t what they expected. It was neat ; it was remarkable ; and slowly, it spread from one person to another person until finally, it became the official bread of three-star restaurants in Paris. Now he ' s in London, and he ships by FedEx all around the world. What marketers used to do is make average products for average people. That ' s what mass marketing is. Smooth out the edges ; go for the center ; that ' s the big market. They would ignore the geeks, and God forbid, the laggards. It was all about going for the center. But in a world where the TV-industrial complex is broken, I don ' t think that ' s a strategy we want to use any more. I think the strategy we want to use is to not market to these people because they ' re really good at ignoring you. But market to these people because they care. These are the people who are obsessed with something. And when you talk to them, they ' ll listen, because they like listening — it ' s about them. And if you ' re lucky, they ' ll tell their friends on the rest of the curve, and it ' ll spread. It ' ll spread to the entire curve. They have something I call"otaku"— it ' s a great Japanese word. It describes the desire of someone who ' s obsessed to say, drive across Tokyo to try a new ramen noodle place, because that ' s what they do : they get obsessed with it. To make a product, to market an idea, to come up with any problem you want to solve that doesn ' t have a constituency with an otaku, is almost impossible. Instead, you have to find a group that really, desperately cares about what it is you have to say. Talk to them and make it easy for them to tell their friends. There ' s a hot sauce otaku, but there ' s no mustard otaku. That ' s why there ' s lots and lots of kinds of hot sauces, and not so many kinds of mustard. Not because it ' s hard to make interesting mustard — you could make interesting mustard — but people don ' t, because no one ' s obsessed with it, and thus no one tells their friends. Krispy Kreme has figured this whole thing out. It has a strategy, and what they do is, they enter a city, they talk to the people, with the otaku, and then they spread through the city to the people who ' ve just crossed the street. This yoyo right here cost 112 dollars, but it sleeps for 12 minutes. Not everybody wants it but they don ' t care. They want to talk to the people who do, and maybe it ' ll spread. These guys make the loudest car stereo in the world. It ' s as loud as a 747 jet. You can ' t get in, the car ' s got bulletproof glass, because it ' ll blow out the windshield otherwise. But the fact remains that when someone wants to put a couple of speakers in their car, if they ' ve got the otaku or they ' ve heard from someone who does, they go ahead and they pick this. It ' s really simple — you sell to the people who are listening, and just maybe, those people tell their friends. So when Steve Jobs talks to 50, 000 people at his keynote, who are all tuned in from 130 countries watching his two-hour commercial — that ' s the only thing keeping his company in business — it ' s that those 50, 000 people care desperately enough to watch a two-hour commercial, and then tell their friends. Pearl Jam, 96 albums released in the last two years. Every one made a profit. How? They only sell them on their website. Those people who buy them have the otaku, and then they tell their friends, and it spreads and it spreads. This hospital crib cost 10, 000 dollars, 10 times the standard. But hospitals are buying it faster than any other model. Hard Candy nail polish, doesn ' t appeal to everybody, but to the people who love it, they talk about it like crazy. This paint can right here saved the Dutch Boy paint company, making them a fortune. It costs 35 percent more than regular paint because Dutch Boy made a can that people talk about, because it ' s remarkable. They didn ' t just slap a new **ad** on the product ; they changed what it meant to build a paint product. AmIhotornot. com — everyday 250, 000 people go to this site, run by two volunteers, and I can tell you they are hard graders — They didn ' t get this way by advertising a lot. They got this way by being remarkable, sometimes a little too remarkable. And this picture frame has a cord going out the back, and you plug it into the wall. My father has this on his desk, and he sees his grandchildren everyday, changing constantly. And every single person who walks into his office hears the whole story of how this thing ended up on his desk. And one person at a time, the idea spreads. These are not diamonds, not really. They ' re made from”cremains.”After you ’ re cremated you can have yourself made into a gem. Oh, you like my ring? It ’ s my grandmother. Fastest-growing business in the whole mortuary industry. But you don ’ t have to be Ozzie Osborne — you don ’ t have to be super-outrageous to do this. What you have to do is figure out what people really want and give it to them. A couple of quick rules to wrap up. The first one is : Design is free when you get to scale. The people who come up with stuff that ’ s remarkable more often than not figure out how to put design to work for them. Number two : The riskiest thing you can do now is be safe. Proctor and Gamble knows this, right? The whole model of being Proctor and Gamble is always about average products for average people. That ’ s risky. The safe thing to do now is to be at the fringes, be remarkable. And being very good is one of the worst things you can possibly do. Very good is boring. Very good is average. It doesn ’ t matter whether you ’ re making a record album, or you ’ re an architect, or you have a tract on sociology. If it ’ s very good, it ’ s not going to work, because no one ’ s going to notice it. So my three stories. Silk put a product that does not need to be in the refrigerated section next to the milk in the refrigerated section. Sales tripled. Why? Milk, milk, milk, milk, milk — not milk. For the people who were there and looking at that section, it was remarkable. They didn ’ t triple their sales with advertising ; they tripled it by doing something remarkable. That is a remarkable piece of art. You don ’ t have to like it, but a 40-foot tall dog made out of bushes in the middle of New York City is remarkable. Frank Gehry didn ’ t just change a museum ; he changed an entire city ’ s economy by designing one building that people from all over the world went to see. Now, at countless meetings at, you know, the Portland City Council, or who knows where, they said, we need an architect — can we get Frank Gehry? Because he did something that was at the fringes. And my big failure? I came out with an entire — A record album and hopefully a whole bunch of record albums in SACD, this remarkable new format — and I marketed it straight to people with 20, 000- dollar stereos. People with 20, 000-dollar stereos don ’ t like new music. So what you need to do is figure out who does care. Who is going to raise their hand and say,”I want to hear what you ’ re doing next,”and sell something to them. The last example I want to give you. This is a map of Soap Lake, Washington. As you can see, if that ’ s nowhere, it ’ s in the middle of it. But they do have a lake. And people used to come from miles around to swim in the lake. They don ’ t anymore. So the founding fathers said,”We ’ ve got some money to spend. What can we build here?”And like most committees, they were going to build something pretty safe. And then an artist came to them — this is a true artist ’ s rendering — he wants to build a 55-foot tall lava lamp in the center of town. That ’ s a purple cow ; that ’ s something worth noticing. I don ’ t know about you, but if they build it, that ’ s where I ’ m going to go. Thank you very much for your attention.

The first thing I want to do is say thank you to all of you. The second thing I want to do is introduce my co-author and dear friend and co-teacher. Ken and I have been working together for almost 40 years. That ’ s Ken Sharpe over there. So there is among many people â certainly me and most of the people I talk to â a kind of collective dissatisfaction with the way things are working, with the way our institutions run. Our kids ’ teachers seem to be failing them. Our doctors don ’ t know who the hell we are, and they don ’ t have enough time for us. We certainly can ’ t trust the bankers, and we certainly can ’ t trust the brokers. They almost brought the entire **financial** system down. And even as we do our own work, all too often, we find ourselves having to choose between doing what we think is the right thing and doing the expected thing, or the required thing, or the profitable thing. So everywhere we look, pretty much across the board, we worry that the people we depend on don ’ t really have our interests at heart. Or if they do have our interests at heart, we worry that they don ’ t know us well enough to figure out what they need to do in order to allow us to secure those interests. They don ’ t understand us. They don ’ t have the time to get to know us. There are two kinds of responses that we make to this sort of general dissatisfaction. If things aren ’ t going right, the first response is : let ’ s make more rules, let ’ s set up a set of detailed procedures to make sure that people will do the right thing. Give teachers scripts to follow in the classroom, so even if they don ’ t know what they ’ re doing and don ’ t care about the welfare of our kids, as long as they follow the scripts, our kids will get educated. Give **judges** a list of mandatory sentences to impose for crimes, so that you don ’ t need to rely on **judges** using their judgment. Instead, all they have to do is look up on the list what kind of sentence goes with what kind of crime. Impose limits on what credit card companies can charge in interest and on what they can charge in fees. More and more rules to protect us against an indifferent, uncaring set of institutions we have to deal with. Or â□□ or maybe and â□□ in addition to rules, let ’ s see if we can come up with some really clever incentives so that, even if the people we deal with don ’ t particularly want to serve our interests, it is in their interest to serve our interest â□□ the magic incentives that will get people to do the right thing even out of pure selfishness. So we offer teachers bonuses if the kids they teach **score** passing grades on these big test **scores** that are used to evaluate the quality of school systems. Rules and incentives â□□”sticks”and”carrots.”We passed a bunch of rules to regulate the **financial** industry in response to the recent collapse. There ’ s the Dodd-Frank Act, there ’ s the new Consumer Financial Protection Agency that is temporarily being headed through the backdoor by Elizabeth Warren. Maybe these rules will actually improve the way these **financial services** companies behave. We ’ ll see. In addition, we are **struggling** to find some way to create incentives for people in the **financial services** industry that will have them more interested in serving the long-term interests even of their own companies, rather than securing short-term profits. So if we find just the right incentives, they ’ ll do the right thing â□□ as I said â□□ selfishly, and if we come up with the right rules and regulations, they won ’ t drive us all over a cliff. And Ken [Sharpe] and I certainly know that you need to reign in the bankers. If there is a lesson to be learned from the **financial** collapse it is that. But what we believe, and what we argue in the book, is that there is no set of rules, no matter how detailed, no matter how specific, no matter how carefully monitored and enforced, there is no set of rules that will get us what we need. Why? Because bankers are smart people. And, like water, they will find cracks in any set of rules. You design a set of rules that will make sure that the particular reason why the **financial** system”almost-collapse”can ’ t happen again. It is naive beyond description to think that having blocked this source of **financial** collapse, you have blocked all possible sources of **financial** collapse. So it ’ s just a question of waiting for the next one and then marveling at how we could have been so stupid as not to protect ourselves against that. What we desperately need, beyond, or along with, better rules and reasonably smart incentives, is we need virtue. We need character. We need people who want to do the right thing. And in particular, the virtue that we need most of all is the virtue that Aristotle called”practical wisdom.”Practical wisdom is the moral will to do the right thing and the moral skill to figure out what the right thing is. So Aristotle was very interested in watching how the craftsmen around him worked. And he was impressed at how they would improvise novel solutions to novel problems â problems that they hadn ' t anticipated. So one example is he sees these stonemasons working on the Isle of Lesbos, and they need to measure out round columns. Well if you think about it, it ' s really hard to measure out round columns using a ruler. So what do they do? They fashion a novel solution to the problem. They created a ruler that bends, what we would call these days a tape measure â a flexible rule, a rule that bends. And Aristotle said,"Hah, they appreciated that sometimes to design rounded columns, you need to bend the rule."And Aristotle said often in dealing with other people, we need to bend the rules. Dealing with other people demands a kind of flexibility that no set of rules can encompass. Wise people know when and how to bend the rules. Wise people know how to improvise. The way my co-author, Ken, and I talk about it, they are kind of like jazz musicians. The rules are like the notes on the page, and that gets you started, but then you dance around the notes on the page, coming up with just the right combination for this particular moment with this particular set of fellow players. So for Aristotle, the kind of rule-bending, rule exception-finding and improvisation that you see in skilled craftsmen is exactly what you need to be a skilled moral craftsman. And in interactions with people, almost all the time, it is this kind of flexibility that is required. A wise person knows when to bend the rules. A wise person knows when to improvise. And most important, a wise person does this improvising and rule- bending in the **service** of the right aims. If you are a rule-bender and an improviser mostly to serve yourself, what you get is ruthless manipulation of other people. So it matters that you do this wise **practice** in the **service** of others and not in the **service** of yourself. And so the will to do the right thing is just as important as the moral skill of improvisation and exception-finding. Together they comprise practical wisdom, which Aristotle thought was the master virtue. So I ' ll give you an example of wise **practice** in **action**. It ' s the case of Michael. Michael ' s a young guy. He had a pretty low-wage job. He was supporting his wife and a child, and the child was going to parochial school. Then he lost his job. He panicked about being able to support his family. One night, he drank a little too much, and he robbed a **cab** driver â stole 50 dollars. He robbed him at gunpoint. It was a toy gun. He got caught. He got tried. He got convicted. The Pennsylvania sentencing guidelines required a minimum sentence for a crime like this of two years, 24 months. The **judge** on the case, Judge Lois Forer thought that this made no sense. He had never committed a crime before. He was a responsible husband and father. He had been faced with desperate circumstances. All this would do is wreck a family. And so she improvised a sentence â 11 months, and not only that, but release every day to go to work. Spend your night in jail, spend your day holding down a job. He did. He served out his sentence. He made restitution and found himself a new job. And the family was united. And it seemed on the road to some sort of a decent life â a happy ending to a story involving wise improvisation from a wise **judge**. But it turned out the prosecutor was not happy that Judge Forer ignored the sentencing guidelines and sort of invented her own, and so he appealed. And he asked for the mandatory minimum sentence for armed robbery. He did after all have a toy gun. The mandatory minimum sentence for armed robbery is five years. He won the appeal. Michael was sentenced to five years in prison. **Judge** Forer had to follow the law. And by the way, this appeal went through after he had finished serving his sentence, so he was out and working at a job and taking care of his family and he had to go back into jail. **Judge** Forer did what she was required to do, and then she quit the bench. And Michael disappeared. So that is an example, both of wisdom in

practice and the subversion of wisdom by rules that are meant, of course, to make things better. Now consider Ms. Dewey. Ms. Dewey ’ s a teacher in a Texas elementary school. She found herself listening to a consultant one day who was trying to help teachers boost the test **scores** of the kids, so that the school would reach the elite category in percentage of kids passing big tests. All these schools in Texas compete with one another to achieve these milestones, and there are bonuses and various other treats that come if you beat the other schools. So here was the consultant ’ s advice : first, don ’ t waste your time on kids who are going to pass the test no matter what you do. Second, don ’ t waste your time on kids who can ’ t pass the test no matter what you do. Third, don ’ t waste your time on kids who moved into the district too late for their **scores** to be counted. Focus all of your time and attention on the kids who are on the bubble, the so-called”bubble kids”â kids where your intervention can get them just maybe over the line from failing to passing. So Ms. Dewey heard this, and she shook her head in despair while fellow teachers were sort of cheering each other on and nodding approvingly. It ’ s like they were about to go play a football game. For Ms. Dewey, this isn ’ t why she became a teacher. Now Ken and I are not naive, and we understand that you need to have rules. You need to have incentives. People have to make a living. But the problem with relying on rules and incentives is that they demoralize professional activity, and they demoralize professional activity in two senses. First, they demoralize the people who are engaged in the activity. **Judge** Forer quits, and Ms. Dewey in completely disheartened. And second, they demoralize the activity itself. The very **practice** is demoralized, and the practitioners are demoralized. It creates people â when you manipulate incentives to get people to do the right thing â it creates people who are addicted to incentives. That is to say, it creates people who only do things for incentives. Now the striking thing about this is that psychologists have known this for 30 years. Psychologists have known about the negative consequences of incentivizing everything for 30 years. We know that if you reward kids for drawing pictures, they stop caring about the drawing and care only about the reward. If you reward kids for reading books, they stop caring about what ’ s in the books and only care about how long they are. If you reward teachers for kids ’ test **scores**, they stop caring about educating and only care about test preparation. If you were to reward doctors for doing more procedures â which is the current system â they would do more. If instead you reward doctors for doing fewer procedures, they will do fewer. What we want, of course, is doctors who do just the right amount of procedures and do the right amount for the right reason â namely, to serve the welfare of their patients. Psychologists have known this for decades, and it ’ s time for policymakers to start paying attention and listen to psychologists a little bit, instead of economists. And it doesn ’ t have to be this way. We think, Ken and I, that there are real sources of hope. We identify one set of people in all of these **practices** who we call canny outlaws. These are people who, being forced to operate in a system that demands rule-following and creates incentives, find away around the rules, find a way to subvert the rules. So there are teachers who have these scripts to follow, and they know that if they follow these scripts, the kids will learn nothing. And so what they do is they follow the scripts, but they follow the scripts at double-time and squirrel away little bits of extra time during which they teach in the way that they actually know is effective. So these are little ordinary, everyday heroes, and they ’ re incredibly admirable, but there ’ s no way that they can sustain this kind of activity in the face of a system that either roots them out or grinds them down. So canny outlaws are better than nothing, but it ’ s hard to imagine any canny outlaw sustaining that for an indefinite period of time. More hopeful are people we call system-changers. These are people who are looking not to dodge the system ’ s rules and regulations, but to transform the system, and we talk about several. One in particular is a **judge** named Robert Russell. And one day he was faced with the case of Gary Pettengill. Pettengill was a 23-year-old vet who had planned to make the army a career, but then he got a severe back injury in Iraq, and that forced him to take a medical discharge. He was married, he had a third kid on the way, he suffered from PTSD, in addition to the bad back, and recurrent nightmares, and he had started using marijuana to ease some of the symptoms. He was only able to get part-time work because of his back, and so he was unable to earn enough to put food on the table and take care of his family. So he started selling marijuana. He was busted in a drug sweep. His family was kicked out of their apartment, and the welfare system was threatening to take away his kids. Under normal sentencing procedures, Judge Russell would have had little choice but to sentence Pettengill to serious jail-time as a drug felon. But Judge Russell did have an alternative. And that ’ s because he was in a **special** court. He was in a court called the Veterans ’ Court. In the Veterans ’ Court â□□ this was the first of its kind in the United States. Judge Russell created the Veterans ’ Court. It was a court only for veterans who had broken the law. And he had created it exactly because mandatory sentencing laws were taking the judgment out of **judging**. No one wanted non-violent offenders â□□ and especially non-violent offenders who were veterans to boot â□□ to be thrown into prison. They wanted to do something about what we all know, namely the revolving door of the criminal justice system. And what the Veterans ’ Court did, was it treated each criminal as an individual, tried to get inside their problems, tried to fashion responses to their crimes that helped them to rehabilitate themselves, and didn ’ t forget about them once the judgment was made. Stayed with them, followed up on them, made sure that they were sticking to whatever plan had been jointly developed to get them over the hump. There are now 22 cities that have Veterans ’ Courts like this. Why has the idea spread? Well, one reason is that Judge Russell has now seen 108 vets in his Veterans ’ Court as of February of this year, and out of 108, guess how many have gone back through the revolving door of justice into prison. None. None. Anyone would glom onto a criminal justice system that has this kind of a record. So here ’ s is a system-changer, and it seems to be catching. There ’ s a banker who created a for-profit community bank that encouraged bankers â□□ I know this is hard to believe â□□ encouraged bankers who worked there to do well by doing good for their low-income clients. The bank helped finance the rebuilding of what was otherwise a dying community. Though their loan recipients were high-risk by ordinary standards, the default rate was extremely low. The bank was profitable. The bankers stayed with their loan recipients. They didn ’ t make loans and then sell the loans. They **serviced** the loans. They made sure that their loan recipients were staying up with their payments. Banking hasn ’ t always been the way we read about it now in the newspapers. Even Goldman Sachs once used to serve clients, before it turned into an institution that serves only itself. Banking wasn ’ t always this way, and it doesn ’ t have to be this way. So there are examples like this in medicine â□□ doctors at Harvard who are trying to transform medical education, so that you don ’ t get a kind of ethical erosion and loss of **empathy**, which characterizes most medical students in the course of their medical training. And the way they do it is to give third-year medical students patients who they follow for an entire year. So the patients are not organ systems, and they ’ re not diseases ; they ’ re people, people with lives. And in order to be an effective doctor, you need to treat people who have lives and not just disease. In addition to which there ’ s an enormous amount of back and forth, mentoring of one student by another, of all the students by the doctors, and the result is a generation â we hope â of doctors who do have time for the people they treat. We ’ ll see. So there are lots of examples like this that we talk about. Each of them shows that it is possible to build on and nurture character and keep a profession true to its proper **mission** â what Aristotle would have called its proper telos. And Ken and I believe that this is what practitioners actually want. People want to be allowed to be virtuous. They want to have permission to do the right thing. They don ’ t want to feel like they need to take a shower to get the moral grime off their bodies everyday when they come home from work. Aristotle thought that practical wisdom was the key to **happiness**, and he was right. There ’ s now a lot of research being done in psychology on what makes people happy, and the two things that jump out in study after study â I know this will come as a shock to all of you â the two things that matter most to **happiness** are love and work. Love : managing successfully relations with the people who are close to you and with the communities of which you are a part. Work : engaging in activities that are meaningful and satisfying. If you have that, good close relations with other people, work that ’ s meaningful and fulfilling, you don ’ t much need anything else. Well, to love well and to work well, you need wisdom. Rules and incentives don ’ t tell you how to be a good friend, how to be a good parent, how to be a good spouse, or how to be a good doctor or a good lawyer or a good teacher. Rules and incentives are no substitutes for wisdom. Indeed, we argue, there is no substitute for wisdom. And so practical wisdom does not require heroic acts of self-sacrifice on the part of practitioners. In giving us the will and the skill to do the right thing â to do right by others â practical wisdom also gives us the will and the skill to do right by ourselves. Thanks.

Text Sample 243: POS Dim 2 – 2011 – Score 11.00 – 2011/t002676.txt

I ’ m speaking to you about what I call the”mesh.”It ’ s essentially a fundamental shift in our relationship with stuff, with the things in our lives. And it ’ s starting to look at â not always and not for everything â but in certain moments of time, access to certain kinds of goods and **service** will trump **ownership** of them. And so it ’ s the pursuit of better things, easily shared. And we come from a long tradition of sharing. We ’ ve shared transportation. We ’ ve shared wine and food and other sorts of fabulous experiences in coffee bars in Amsterdam. We ’ ve also shared other sorts of entertainment â sports arenas, public parks, concert halls, libraries, universities. All these things are share-platforms, but sharing ultimately starts and ends with what I refer to as the”mother of all share-platforms.”And as I think about the mesh and I think about, well, what ’ s driving it, how come it ’ s happening now, I think there ’ s a number of vectors that I want to give you as background. One is the recession â that the recession has caused us to **rethink** our relationship with the things in our lives relative to the value â so starting to align the value with the true cost. Secondly, population growth and density into cities. More people, smaller spaces, less stuff. Climate change : we ’ re trying to reduce the **stress** in our personal lives and in our communities and on the planet. Also, there ’ s been this recent distrust of big brands, global big brands, in a bunch of different industries, and that ’ s created an opening. Research is showing here, in the States, and in Canada and Western Europe, that most of us are much more open to local companies, or brands that maybe we haven ’ t heard of. Whereas before, we went with the big brands that we were sure we trusted. And last is that we ’ re more connected now to more people on the planet than ever before â except for if you ’ re sitting next to someone. The other thing that ’ s worth considering is that we ’ ve made a huge investment over decades and decades, and tens of billions of dollars have gone into this investment that now is our inheritance. It ’ s a physical infrastructure that allows us to get from point A to point B and move things that way. It ’ s also â Web and **mobile** allow us to be connected and create all kinds of **platforms** and systems, and the investment of those technologies and that infrastructure is really our inheritance. It allows us to engage in really new and interesting ways. And so for me, a mesh company, the”classic”mesh company, brings together these three things : our ability to connect to each other â most of us are walking around with these **mobile** devices that are GPS-enabled and Web-enabled â allows us to find each other and find things in time and space. And third is that physical things are readable on a map â so restaurants, a variety of venues, but also with GPS and other technology like RFID and it continues to expand beyond that, we can also track things that are moving, like a car, a taxicab, a transit system, a box that ’ s moving through time and space. And so that sets up for making access to get goods and **services** more convenient and less costly in many cases than owning them. For example, I want to use Zipcar. How many people here have experienced car- sharing or bike-sharing? Wow, that ’ s great. Okay, thank you. Basically Zipcar is the largest car-sharing company in the world. They did not invent car- sharing. Car-sharing was actually invented in Europe. One of the founders went to Switzerland, saw it implemented someplace, said,”Wow, that looks really cool. I think we can do that in Cambridge,”brought it to Cambridge and they started â two women â Robin Chase being the other person who started it. Zipcar got some really important things right. First, they really understood that a brand is a voice and a product is a souvenir. And so they were very clever about the way that they packaged car-sharing. They made it sexy. They made it fresh. They made it aspirational. If you were a member of the club, when you ’ re a member of a club, you ’ re a Zipster. The cars they picked didn ’ t look like ex-cop cars that were hollowed out or something. They picked these sexy cars. They targeted to universities. They made sure that the demographic for who they were targeting and the car was all matching. It was a very nice experience, and the cars were clean and reliable, and it all worked. And so from a branding perspective, they got a lot right. But they understood fundamentally that they are not a car company. They understand that they are an information company. Because when we buy a car we go to the dealer once, we have an interaction, and we ’ re chow â usually as quickly as possible. But when you ’ re sharing a car and you have a car-share **service**, you might use an E. V. to commute, you get a truck because you ’ re doing a home project. When you pick your aunt up at the airport, you get a sedan. And you ’ re going to the mountains to ski, you get different accessories put on the car for doing that sort of thing. Meanwhile, these guys are sitting back, collecting all sorts of data about our behavior and how we interact with the **service**. And so it ’ s not only an option for them, but I believe it ’ s an imperative for Zipcar and other mesh companies to actually just wow us, to be like a concierge **service**. Because we give them so much information, and they are entitled to really see how it is that we ’ re moving. They ’ re in really good shape to anticipate what we ’ re going to want next. And so what percent of the day do you think the average person uses a car? What percentage of the time? Any guesses? Those are really very good. I was imagining it was like 20 percent when I first started. The number across the U. S. and Western Europe is eight percent. And so basically even if you think it ’ s 10 percent, 90 percent of the time, something that costs us a lot of money â personally, and also we organize our cities around it and all sorts of things â 90 percent of the time it ’ s sitting around. So for this reason, I think one of the other themes with the mesh is essentially that, if we squeeze hard on things that we ’ ve thrown away, there ’ s a lot of value in those things. What set up with Zipcar â Zipcar started in 2000. In the last year, 2010, two car companies started, one that ’ s in the U. K. called WhipCar, and the other one, RelayRides, in the U. S. They ’ re both peer- to-peer car-sharing **services**, because the two things that really work for car- sharing is, one, the car has to be available, and two, it ’ s within one or two blocks of where you stand. Well the car that ’ s one or two blocks from your home or your office is probably your neighbor ’ s car, and it ’ s probably also available. So people have created this business. Zipcar started a decade earlier, in 2000. It took them six years to get 1, 000 cars in **service**. WhipCar, which started April of last year, it took them six months to get 1, 000 cars in the **service**. So, really interesting. People are making anywhere between 200 and 700 dollars a month letting their neighbors use their car when they ’ re not using it. So it ’ s like **vacation** rentals for cars. Since I ’ m here â and I hope some people in the audience are in the car business â â I ’ m thinking that, coming from the technology side of things â we saw cable-ready TVs and WiFi-ready Notebooks â it would be really great if, any minute now, you guys could start rolling share-ready cars off. Because it just creates more flexibility. It allows us as owners to have other options. And I think we ’ re going there anyway. The opportunity and the challenge with mesh businesses â and those are businesses like Zipcar or Netflix that are full mesh businesses, or other ones where you have a lot of the car companies, car manufacturers, who are beginning to offer their own car-share **services** as well as a second flanker brand, or as really a test, I think â is to make sharing irresistible. We have experiences in our lives, certainly, when sharing has been irresistible. It ’ s just, how do we make that recurrent and scale it? We know also, because we ’ re connected in social networks, that it ’ s easy to create delight in one little place. It ’ s contagious because we ’ re all connected to each other. So if I have a terrific experience and I **tweet** it, or I tell five people standing next to me, news travels. The opposite, as we know, is also true, often more true. So here we have LudoTruck, which is in L. A., doing the things that gourmet food trucks do, and they ’ ve gathered quite a following. In general, and maybe, again, it ’ s because I ’ m a tech entrepreneur, I look at things as **platforms**. **Platforms** are invitations. So creating Craigslist or iTunes and the iPhone developer network, there are all these networks â Facebook as well. These **platforms** invite all sorts of developers and all sorts of people to come with their ideas and their opportunity to create and target an application for a particular audience. And honestly, it ’ s full of surprises. Because I don ’ t think any of us in this room could have predicted the sorts of applications that have happened at Facebook, around Facebook, for example, two years ago, when Mark announced that they were going to go with a **platform**. So in this way, I think that cities are **platforms**, and certainly Detroit is a **platform**. The invitation of bringing makers and artists and entrepreneurs â it really helps stimulate this fiery creativity and helps a city to thrive. It ’ s inviting participation, and cities have, historically, invited all sorts of participation. Now we ’ re saying that there ’ s other options as well. So, for example, city departments can open up transit data. Google has made available transit data API. And so there ’ s about seven or eight cities already in the U. S. that have provided the transit data, and different developers are building applications. So I was having a coffee in Portland, and half-of-a-latte in and the little board in the cafe all of a sudden starts showing me that the next bus is coming in three minutes and the train is coming in 16 minutes. And so it ’ s reliable, real data that ’ s right in my face, where I am, so I can finish the latte. There ’ s this fabulous opportunity we have across the U. S. now : about 21 percent of vacant commercial and industrial space. That space is not vital. The areas around it lack vitality and vibrancy and engagement. There ’ s this thing â how many people here have heard of pop-up stores or pop-up shops? Oh, great. So I ’ m a big fan of this. And this is a very mesh-y thing. Essentially, there are all sorts of restaurants in Oakland, near where I live. There ’ s a pop-up general store every three weeks, and they do a fantastic job of making a very social event happening for foodies. **Super** fun, and it happens in a very transitional neighborhood. Subsequent to that, after it ’ s been going for about a year now, they actually started to lease and create and extend. An area that was edgy-artsy is now starting to become much cooler and engage a lot more people. So this is an example. The Crafty Fox is this woman who ’ s into crafts, and she does these pop-up crafts fairs around London. But these sorts of things are happening in many different environments. From my perspective, one of the things pop-up stores do is create perishability and urgency. It creates two of the favorite words of any businessperson : sold out. And the opportunity to really focus trust and attention is a wonderful thing. So a lot of what we see in the mesh, and a lot of what we have in the **platform** that we built allows us to define, refine and scale. It allows us to test things as an entrepreneur, to go to market, to be in conversation with people, listen, refine something and go back. It ’ s very cost-effective, and it ’ s very mesh-y. The infrastructure enables that. In closing, and as we ’ re moving towards the end, I just also want to encourage â and I ’ m willing to share my failures as well, though not from the stage. I would just like to say that one of the big things, when we look at waste and when we look at ways that we can really be generous and contribute to each other, but also move to create a better economic situation and a better environmental situation, is by sharing failures. And one quick example is Velib, in 2007, came forward in Paris with a very **bold** proposition, a very big bike-sharing **service**. They made a lot of mistakes. They had some number of big successes. But they were very transparent, or they had to be, in the way that they exposed what worked and didn ’ t work. And so B. C. in Barcelona and B-cycle and Boris Bikes in London â no one has had to repeat the version 1. 0 screw- ups and expensive learning exercises that happened in Paris. So the opportunity when we ’ re connected is also to share failures and successes. We ’ re at the very beginning of something that, what we ’ re seeing and the way that mesh companies are coming forward, is inviting, it ’ s engaging, but it ’ s very early. I have a website â it ’ s a directory â and it started with about 1, 200 companies, and in the last two-and-a-half months it ’ s up to about 3, 300 companies. And it grows on a very regular **daily** basis. But it ’ s very much at the beginning. So I just want to welcome all of you onto the ride. And thank you very much.

Text Sample 244: POS Dim 2 – 2011 – Score 10.00 – 2011/t002499.txt

I just want to start with a little bit of a word of **warning**, and that is : my job here tonight is to be a little bit of a”doctor bring-me-down.”So bear with me for a few minutes, and know that after this, things will get lighter and brighter. So let ’ s start. I know that many of you have heard the traveler ’ s adage,”Take nothing but pictures, leave nothing but footprints.”Well, I ’ m going to say I don ’ t think that ’ s either as benign nor as simple as it sounds, particularly for those of us in industries who are portraying people in poor countries, in developing countries and portraying the poor. And those of us in those industries are **reporters**, **researchers** and people working for NGOs ; I suspect there are a lot of us in those industries in the audience. We ’ re going overseas and bringing back pictures like this : of the utterly distressed or the displaced or the hungry or the child laborers or the exotic. Now, Susan Sontag reminds us that photographs, in part, help define what we have the right to **observe**, but more importantly, they are an ethics of seeing. And I think right now is a good time to review our ethics of seeing, as our industries of reporting and research and NGO work are collapsing and changing, in part, by what ' s being driven by what ' s happening in the economy. But it ' s making us forge new relationships. And those new relationships have some fuzzy boundaries. I worked at the edge of some of these fuzzy boundaries, and I want to share with you some of my observations. My ethics of seeing is informed by 25 years as a **reporter** covering emerging economies and international relations. And I believe in a free and independent press. I believe that journalism is a public good. But it ' s getting harder to do that job, in part, because of the massive layoffs, because the budgets for international reporting aren ' t there anymore, new technologies and new **platforms** begging new content, and there are a lot of new journalisms. There ' s activist journalism, humanitarian journalism, peace journalism, and we are all looking to cover the important stories of our time. So we ' re going to NGOs and asking them if we can embed in their projects. This is in part because they ' re doing important work in interesting places. That ' s one example here : this is a project I worked on in the Blue Nile in Ethiopia. NGOs understand the benefits of having **reporters** tag along on their team. They need the publicity, they are under tremendous pressure, they ' re competing in a very crowded market for compassion. So they ' re also looking to **reporters** and to hire freelance **reporters** to help them develop their public relations material and their media material. Now, **researchers** are also under pressure. They ' re under pressure to communicate their science outside of the academy. So they ' re collaborating with **reporters**, because for many **researchers**, it ' s difficult for them to write a simple story or a clear story. And the benefit for **reporters** is that covering field research is some of the best work out there. You not only get to cover science, but you get to meet interesting scientists, like my PhD advisor Revi Sterling, she, of the magic research high tops there. And it was a discussion with Revi that brought us to the edge of the **researcher** and **reporter**, that fuzzy boundary. And I said to her,"I was looking forward to going to developing countries and doing research and covering stories at the same time."She said,"I don ' t think so, girlfriend."And that confusion, that mutual confusion, drove us to publish a paper on the conflicting ethics and the contradictory **practices** of research and reporting. We started with the understanding that **researchers** and **reporters** are distant cousins, equally storytellers and social analysts. But we don ' t see nor portray developing communities the same way. Here ' s a very classic example. This is Somalia, 1992. It could be Somalia today. And this is a standard operating procedure for much of the news video and the news pictures that you see, where a group of **reporters** will be trucked in, escorted to the site of a disaster, they ' ll produce their material, take their pictures, get their interviews, and then they ' ll be escorted out. This is decidedly not a research **setting**. Now, sometimes, we ' re working on feature stories. This is an image I took of a woman in Bhongir Village in Andhra Pradesh in India. She ' s at a microfinance meeting. It ' s a terrific story. What ' s important here is that she is identifiable. You can see her face. This also is not a research picture. This is much more representative of a research picture. It ' s a research site : you see young women accessing new technologies. It ' s more of a time stamp, it ' s a documentation of research. I couldn ' t use this for news. It doesn ' t tell enough, and it wouldn ' t sell. But then, the differences are even deeper than that. Revi and I analyzed some of the mandates that **researchers** are under. They are under some very strict rules governed by their university research review boards when it comes to content and confidentiality. **Researchers** are mandated to acquire document-informed consent. Well, as a **reporter**, if I hang a **microphone** on someone, that is consent. And when it comes to creating the story, I ' ll fact-check as a **reporter**, but I don ' t invite company to create that story, whereas social scientists, **researchers**, and particularly participatory **researchers**, will often work on constructing the narrative with the community. And when it comes to paying for information,"checkbook journalism"is roundly discouraged, in part, because of the **bias** it introduces in the kind of information you get. But social scientists understand that people ' s time is valuable so they pay them for that time. So while journalists are well-placed to convey the beauty of the scientific process — and I would add, the NGO process — what about the warts? What happens if a research project is not particularly well-designed, or an NGO project doesn ' t fulfill its goals? Or the other kind of warts, you know, what happens after dark when the drinks happen. Research environments and reporting trips and NGO projects are very intimate environments ; you make good friends while you ' re doing good work. But there ' s a little bit of Johnnie Walker journalism after dark, and what happens to that line between embedded and in- bedded? Or what do you do with the odd and odious behavior? The point is that you ' ll want to negotiate in advance what is on the record and off the record. I ' m going to turn now to some NGO imagery which will be familiar to some of you in this audience. Narrator : For about 70 cents, you can buy a can of soda, regular or diet. In Ethiopia, for just 70 cents a day, you can feed a child like Jamal nourishing meals. For about 70 cents, you can also buy a cup of coffee. In Guatemala, for 70 cents a day, you can help a child like Vilma get the clothes she needs to attend school. Leslie Dodson : Now, there ' s some very common imagery that ' s been around for 40 years. That ' s part of Sally Struthers ' s famine campaign. Some of it is very familiar ; it ' s the Madonna and child. Women and children are very effective in terms of NGO campaigns. We ' ve been looking at this imagery for a long time, for hundreds and hundreds of years ; the Madonna and child. Here is [Duccio], and here is Michelangelo. My concern is : Are we one-noting the genders in our narratives of poverty in developing communities? Do we have women as victims, and are men only the perpetrators? Are they the guys with the AK-47s or the boy soldiers? Because that doesn ' t leave room for stories like the man who ' s selling ice cream at the refuge camp in Southern Sudan, where we did a project, or the stories of the men who are working on the bridge over the Blue Nile. So I wonder : Are these stories inconvenient to our narratives? And what about this narrative? This is a for-profit game, and its aim is to make development fun. One question is : Did they inadvertently make fun of? Another set of questions is : What are the rights of these children? What rights of publicity or **privacy** do they have? Did they get paid? Should they get paid? Should they share in the profit? This is a for-profit game. Did they sign talent waivers? I have to use these when I ' m working with NGOs and documentary filmmakers here in the States. In the States, we take our right to **privacy** and publicity very seriously. So what is it about getting on a long-haul flight that makes these rights vaporize? I don ' t want to just pick on our friends in the gaming arts ; I ' ll turn to the graphic arts, where we often see these monolithic, homogeneous stories about the great country of Africa. But Africa is not a country, it ' s a continent. It ' s 54 countries and thousands and thousands of languages. So my question is : Is this imagery productive, or is it reductive? I know that it ' s popular. USAID just launched their campaign"Forward"— FWD : Famine, War and Drought. And by looking at it, you would think that was happening all the time, all over Africa. But this is about what ' s happening in the Horn of Africa. And I ' m still trying to make sense of Africa in a piece of Wonder Bread. I ' m wondering about that. Germaine Greer has wondered about the same things and she says,”At breakfast and at dinner, we can sharpen our own appetites with a plentiful dose of the pornography of war, genocide, destitution and disease.”She ’ s right. We have sharpened our appetites. But we can also sharpen our insights. It is not always war, insurrection and disease. This is a picture out of South Sudan, just a couple of months before the new country was born. I will continue to work as a **researcher** and a **reporter** in developing countries, but I do it with an altered ethic of seeing. I ask myself whether my pictures are pandering, whether they contribute to stereotypes, whether the images match the message, am I complacent or am I complicit? Thank you.

Text Sample 245: POS Dim 2 – 2006 – Score 9.00 – 2006/t000160.txt

The future that we will create can be a future that we ’ ll be proud of. I think about this every day ; it ’ s quite literally my job. I ’ m co-founder and senior columnist at Worldchanging. com. Alex Steffen and I founded Worldchanging in late 2003, and since then we and our growing global team of contributors have documented the ever-expanding variety of solutions that are out there, right now and on the near horizon. In a little over two years, we ’ ve written up about 4, 000 items — replicable models, technological tools, emerging ideas — all providing a path to a future that ’ s more sustainable, more equitable and more desirable. Our emphasis on solutions is quite intentional. There are tons of places to go, online and off, if what you want to find is the latest bit of news about just how quickly our hell-bound handbasket is moving. We want to offer people an idea of what they can do about it. We focus primarily on the planet ’ s environment, but we also address issues of global development, international conflict, responsible use of emerging technologies, even the rise of the so-called Second Superpower and much, much more. The scope of solutions that we discuss is actually pretty broad, but that reflects both the range of challenges that need to be met and the kinds of innovations that will allow us to do so. A quick sampling really can barely scratch the surface, but to give you a sense of what we cover : tools for rapid disaster relief, such as this inflatable concrete shelter ; innovative uses of bioscience, such as a flower that changes color in the presence of landmines ; ultra high-efficiency designs for homes and offices ; distributed power generation using solar power, wind power, ocean power, other clean energy sources ; ultra, ultra high-efficiency vehicles of the future ; ultra high- efficiency vehicles you can get right now ; and better urban design, so you don ’ t need to drive as much in the first place ; bio-mimetic approaches to design that take advantage of the efficiencies of natural models in both vehicles and buildings ; distributed computing projects that will help us model the future of the climate. Also, a number of the topics that we ’ ve been talking about this week at TED are things that we ’ ve addressed in the past on Worldchanging : cradle-to-cradle design, MIT ’ s Fab Labs, the consequences of extreme longevity, the One Laptop per Child project, even Gapminder. As a born-in-the-mid-1960s Gen X-er, hurtling all too quickly to my fortieth birthday, I ’ m naturally inclined to pessimism. But working at Worldchanging has convinced me, much to my own surprise, that successful responses to the world ’ s problems are nonetheless possible. Moreover, I ’ ve come to realize that focusing only on negative outcomes can really blind you to the very possibility of success. As Norwegian social scientist Evelin Lindner has **observed**,”Pessimism is a luxury of good times... In difficult times, pessimism is a self- fulfilling, self-inflicted death sentence.”The truth is, we can build a better world, and we can do so right now. We have the tools : we saw a hint of that a moment ago, and we ’ re coming up with new ones all the time. We have the knowledge, and our understanding of the planet improves every day. Most importantly, we have the motive : we have a world that needs fixing, and nobody ’ s going to do it for us. Many of the solutions that I and my colleagues seek out and write up every day have some important aspects in common : transparency, collaboration, a willingness to experiment, and an appreciation of science — or, more appropriately, science! The majority of models, tools and ideas on World-changing encompass combinations of these characteristics, so I want to give you a few concrete examples of how these principles combine in world- changing ways. We can see world-changing values in the emergence of tools to make the invisible visible — that is, to make apparent the conditions of the world around us that would otherwise be largely imperceptible. We know that people often change their behavior when they can see and understand the impact of their **actions**. As a small example, many of us have experienced the change in driving behavior that comes from having a real time display of mileage showing precisely how one ’ s **driving** habits affect the vehicle ’ s efficiency. The last few years have all seen the rise of innovations in how we measure and display aspects of the world that can be too big, or too intangible, or too slippery to grasp easily. Simple technologies, like wall-mounted devices that display how much power your household is using, and what kind of results you ’ ll get if you turn off a few lights — these can actually have a direct positive impact on your energy footprint. Community tools, like text messaging, that can tell you when pollen counts are up or smog levels are rising or a natural disaster is unfolding, can give you the information you need to act in a timely fashion. Data-rich displays like maps of campaign contributions, or maps of the disappearing polar ice caps, allow us to better understand the context and the flow of processes that affect us all. We can see world-changing values in research projects that seek to meet the world ’ s medical needs through open access to data and collaborative **action**. Now, some people emphasize the risks of knowledge-enabled dangers, but I ’ m convinced that the benefits of knowledge-enabled solutions are far more important. For example, open-access journals, like the Public Library of Science, make cutting-edge scientific research free to all — everyone in the world. And actually, a growing number of science publishers are adopting this model. Last year, hundreds of volunteer biology and chemistry **researchers** around the world worked together to sequence the genome of the parasite responsible for some of the developing world ’ s worst diseases : African sleeping sickness, leishmaniasis and Chagas disease. That genome data can now be found on open-access genetic data banks around the world, and it ’ s an enormous boon to **researchers** trying to come up with treatments. But my favorite example has to be the global response to the SARS epidemic in 2003, 2004, which relied on worldwide access to the full gene sequence of the SARS virus. The U. S. National Research Council in its **follow-up** report on the outbreak specifically cited this open availability of the sequence as a key reason why the treatment for SARS could be developed so quickly. And we can see world-changing values in something as humble as a cell phone. I can probably count on my fingers the number of people in this room who do not use a **mobile** phone — and where is Aubrey, because I know he doesn ’ t? For many of us, cell phones have really become almost an extension of ourselves, and we ’ re really now beginning to see the social changes that **mobile** phones can bring about. You may already know some of the big-picture aspects : globally, more camera phones were sold last year than any other kind of camera, and a growing number of people live lives mediated through the lens, and over the network — and sometimes enter history books. In the developing world, **mobile** phones have become economic drivers. A study last year showed a direct correlation between the growth of **mobile** phone use and subsequent GDP increases across Africa. In Kenya, **mobile** phone minutes have actually become an alternative currency. The political aspects of **mobile** phones can ' t be ignored either, from text message swarms in Korea helping to bring down a government, to the Blairwatch Project in the UK, keeping tabs on politicians who try to avoid the press. And it ' s just going to get more wild. Pervasive, always-on networks, high quality sound and video, even devices made to be worn instead of carried in the pocket, will transform how we live on a scale that few really appreciate. It ' s no exaggeration to say that the **mobile** phone may be among the world ' s most important technologies. And in this rapidly evolving context, it ' s possible to imagine a world in which the **mobile** phone becomes something far more than a medium for social interaction. I ' ve long admired the Witness project, and Peter Gabriel told us more details about it on Wednesday, in his profoundly moving presentation. And I ' m just incredibly happy to see the news that Witness is going to be opening up a Web portal to enable users of digital cameras and camera phones to send in their recordings over the Internet, rather than just hand-carrying the videotape. Not only does this add a new and potentially safer avenue for documenting abuses, it opens up the program to the growing global digital generation. Now, imagine a similar model for networking environmentalists. Imagine a Web portal collecting recordings and evidence of what ' s happening to the planet : putting news and data at the fingertips of people of all kinds, from activists and **researchers** to businesspeople and political figures. It would highlight the changes that are underway, but would more importantly give voice to the people who are willing to work to see a new world, a better world, come about. It would give everyday citizens a chance to play a role in the protection of the planet. It would be, in essence, an"Earth Witness"project. Now, just to be clear, in this talk I ' m using the name"Earth Witness"as part of the scenario, simply as a shorthand, for what this imaginary project could aspire to, not to piggyback on the wonderful work of the Witness organization. It could just as easily be called,"Environmental Transparency Project,""Smart Mobs for Natural Security"— but Earth Witness is a lot easier to say. Now, many of the people who participate in Earth Witness would focus on ecological problems, human-caused or otherwise, especially environmental crimes and significant sources of greenhouse gases and emissions. That ' s understandable and important. We need better documentation of what ' s happening to the planet if we ' re ever going to have a chance of repairing the damage. But the Earth Witness project wouldn ' t need to be limited to problems. In the best Worldchanging tradition, it might also serve as a showcase for good ideas, successful projects and efforts to make a difference that deserve much more visibility. Earth Witness would show us two worlds : the world we ' re leaving behind, and the world we ' re building for generations to come. And what makes this scenario particularly appealing to me is we could do it today. The key components are already widely available. Camera phones, of course, would be fundamental to the project. And for a lot of us, they ' re as close as we have yet to always-on, widely available information tools. We may not remember to bring our digital cameras with us wherever we go, but very few of us forget our phones. You could even imagine a version of this scenario in which people actually build their own phones. Over the course of last year, open-source hardware hackers have come up with multiple models for usable, Linux-based **mobile** phones, and the Earth Phone could spin off from this kind of project. At the other end of the network, there ' d be a server for people to send photos and messages to, accessible over the Web, combining a photo-sharing **service**, social networking **platforms** and a collaborative filtering system. Now, you Web 2. 0 folks in the audience know what I ' m talking about, but for those of you for whom that last sentence was in a crazy moon language, I mean simply this : the online part of the Earth Witness project would be created by the users, working together and working openly. That ' s enough right there to start to build a compelling chronicle of what ' s now happening to our planet, but we could do more. An Earth Witness site could also serve as a collection spot for all sorts of data about conditions around the planet picked up by environmental sensors that attach to your cell phone. Now, you don ' t see these devices as add-ons for phones yet, but students and engineers around the world have attached atmospheric sensors to bicycles and handheld computers and cheap robots and the backs of pigeons — that being a project that ' s actually underway right now at U. C. Irvine, using bird-mounted sensors as a way of measuring smog-forming pollution. It ' s hardly a stretch to imagine putting the same thing on a phone carried by a person. Now, the idea of connecting a sensor to your phone is not new : phone-makers around the world offer phones that sniff for bad breath, or tell you to worry about too much sun exposure. Swedish firm Uppsala Biomedical, more seriously, makes a **mobile** phone add-on that can process blood tests in the field, uploading the data, displaying the results. Even the Lawrence Livermore National Labs have gotten into the act, designing a prototype phone that has radiation sensors to find dirty bombs. Now, there ' s an enormous variety of tiny, inexpensive sensors on the market, and you can easily imagine someone putting together a phone that could measure temperature, CO2 or methane levels, the presence of some biotoxins — potentially, in a few years, maybe even H5N1 avian **flu** virus. You could see that some kind of system like this would actually be a really good fit with Larry Brilliant ' s InSTEDD project. Now, all of this data could be tagged with geographic information and mashed up with online maps for easy viewing and analysis. And that ' s worth noting in particular. The impact of open-access online maps over the last year or two has been simply phenomenal. Developers around the world have come up with an amazing variety of ways to layer useful data on top of the maps, from bus routes and crime statistics to the global progress of avian **flu**. Earth Witness would take this further, linking what you see with what thousands or millions of other people see around the world. It ' s kind of exciting to think about what might be accomplished if something like this ever existed. We ' d have a far better — far better knowledge of what ' s happening on our planet environmentally than could be gathered with satellites and a handful of government sensor nets alone. It would be a collaborative, bottom-up approach to environmental awareness and protection, able to respond to emerging concerns in a smart mobs kind of way — and if you need greater sensor density, just have more people show up. And most important, you can ' t ignore how important **mobile** phones are to global youth. This is a system that could put the next generation at the front lines of gathering environmental data. And as we work to figure out ways to mitigate the worst effects of climate disruption, every little bit of information matters. A system like Earth Witness would be a tool for all of us to participate in the improvement of our knowledge and, ultimately, the improvement of the planet itself. Now, as I suggested at the outset, there are thousands upon thousands of good ideas out there, so why have I spent the bulk of my time telling you about something that doesn ' t exist? Because this is what tomorrow could look like : bottom-up, technology-enabled global collaboration to handle the biggest crisis our civilization has ever faced. We can save the planet, but we can ' t do it alone — we need each other. Nobody ' s going to fix the world for us, but working together, making use of technological innovations and human communities alike, we might just be able to fix it ourselves. We have at our fingertips a cornucopia of compelling models, powerful tools, and innovative ideas that can make a meaningful difference in our planet ' s future. We don ' t need to wait for a magic bullet to save us all ; we already have an arsenal of solutions just waiting to be used. There ' s a staggering array of wonders out there, across diverse disciplines, all telling us the same thing : success can be ours if we ' re willing to try. And as we say at Worldchanging, another world isn ' t just possible ; another world is here. We just need to open our eyes. Thank you very much.

Text Sample 246: POS Dim 2 – 2006 – Score 8.00 – 2006/t000491.txt
Hello voice mail, my old friend. I ' ve called for tech support again. I ignored my boss ' s **warning**. I called on a Monday morning. Now it ' s evening, and my dinner first grew cold, and then grew mold. I ' m still on hold. I ' m listening to the sounds of silence. I don ' t think you understand. I think your phone lines are unmanned. I punched every touch tone I was told, but I ' ve still spent 18 hours on hold. It ' s not enough your software crashed my Mac, and it constantly hangs and bombs — it erased my ROMs! Now the Mac makes the sounds of silence. In my dreams I fantasize of wreaking vengeance on you guys. Say your motorcycle crashes. Blood comes gushing from your gashes. With your fading strength, you call 9-1-1 and you pray for a trained MD. But you get me. And you listen to the sounds of silence. Thank you. Good evening and welcome to :"Spot the TED Presenter Who Used to Be a Broadway Accompanist."When I was offered the Times column six years ago, the deal was like this : you ' ll be sent the coolest, hottest, slickest new gadgets. Every week, it ' ll arrive at your door. You get to try them out, play with them, evaluate them until the novelty wears out, before you have to send them back, and you ' ll get paid for it. You can think about it, if you want. So, I ' ve always been a technology nut, and I absolutely love it. The job, though, came with one small downside, and that is, they intended to publish my email address at the end of every column. And what I ' ve noticed is — first of all, you get an incredible amount of email. If you ever are feeling lonely, get a New York Times column, because you will get hundreds and hundreds and hundreds of emails. And the email I ' m getting a lot today is about frustration. People are feeling like things — Ok, I just had an alarm come up on my screen. Lucky you can ' t see it. People are feeling overwhelmed. They ' re feeling like it ' s too much technology, too fast. It may be good technology, but I feel like there ' s not enough of a support structure. There ' s not enough help. There ' s not enough thought put into the design of it to make it easy and enjoyable to use. One time I wrote a column about my efforts to reach Dell Technical Support, and within 12 hours, there were 700 messages from readers on the feedback boards on the Times website, from users saying,""Me too, and here ' s my tale of woe."I call it"software rage."And man, let me tell you, whoever figures out how to make money off of this frustration will — Oh, how did that get up there? Just kidding. Ok, so why is the problem accelerating? And part of the problem is, ironically, because the industry has put so much thought into making things easier to use. I ' ll show you what I mean. This is what the computer interface used to look like, DOS. Over the years, it ' s gotten easier to use. This is the original Mac operating system. Reagan was President. Madonna was still a brunette. And the entire operating system — this is the good part — the entire operating system fit in 211 k. You couldn ' t put the Mac OS X logo in 211 k! So the irony is, that as these things became easier to use, a less technical, broader audience was coming into contact with this equipment for the first time. I once had the distinct privilege of sitting in on the Apple call center for a day. The guy had a duplicate headset for me

to listen to. And the calls that — you know how they say,”Your call may be recorded for quality assurance?”Uh-uh. Your call may be recorded so that they can collect the funniest dumb user stories and pass them around on a CD. Which they do. And I have a copy. It ’ s in your gift bag. No, no. With your voices on it! So, some of the stories are just so classic, and yet so understandable. A woman called Apple to **complain** that her mouse was squeaking. Making a squeaking noise. And the technician said,”Well, **ma** ’ am, what do you mean your mouse is squeaking?”She says,”All I can tell you is that it squeaks louder, the faster I move it across the screen.”And the technician ’ s like,”Ma ’ am, you ’ ve got the mouse up against the screen?”She goes,”Well, the message said, ’ Click here to continue. ’”Well, if you like that one — how much time have we got? Another one, a guy called — this is absolutely true — his computer had crashed, and he told the technician he couldn ’ t restart it, no matter how many times he typed”11.”And the technician said,”What? Why are you typing 11?”He said,”The message says, ’ Error Type 11. ’”So, we must admit that some of the blame falls squarely at the feet of the users. But why is the technical overload crisis, the complexity crisis, accelerating now? In the hardware world, it ’ s because we the consumers want everything to be smaller, smaller, smaller. So the gadgets are getting tinier and tinier, but our fingers are essentially staying the same size. So it gets to be more and more of a challenge. Software is subject to another primal force : the mandate to release more and more versions. When you buy a piece of software, it ’ s not like buying a vase or a candy bar, where you own it. It ’ s more like joining a club, where you pay dues every year, and every year, they say,”We ’ ve added more features, and we ’ ll sell it to you for $99.”I know one guy who ’ s spent $4, 000 just on Photoshop over the years. And software companies make 35 percent of their revenue from just these software upgrades. I call it the Software Upgrade Paradox — which is that if you improve a piece of software enough times, you eventually ruin it. I mean, Microsoft Word was last just a word processor in, you know, the Eisenhower administration. But what ’ s the alternative? Microsoft actually did this experiment. They said,”Well, wait a minute. Everyone **complains** that we ’ re adding so many features. Let ’ s create a word processor that ’ s just a word processor : Simple, pure ; does not do web pages, is not a database.”And it came out, and it was called Microsoft Write. And none of you are nodding in acknowledgment, because it died. It tanked. No one ever bought it. I call this the Sport Utility Principle. People like to surround themselves with unnecessary power, right? They don ’ t need the database and the website, but they ’ re like,”Well, I ’ ll upgrade, because, I might, you know, I might need that someday.”So the problem is : as you add more features, where are they going to go? Where are you going to stick them? You only have so many design tools. You can do buttons, you can do sliders, pop-up menus, sub-menus. But if you ’ re not careful about how you choose, you wind up with this. This is an un-retouched — this is not a joke — un-retouched photo of Microsoft Word, the copy that you have, with all the toolbars open. You ’ ve obviously never opened all the toolbars, but all you have to type in is this little, teeny window down here. And we ’ ve arrived at the age of interface matrices, where there are so many features and options, you have to do two dimensions, you know : a vertical and a horizontal. You guys all **complain** about how Microsoft Word is always bulleting your lists and underlining your links automatically. The off switch is in there somewhere. I ’ m telling you — it ’ s there. Part of the art of designing a simple, good interface, is knowing when to use which one of these features. So, here is the log-off dialogue box for Windows 2000. There are only four choices, so why are they in a pop-up menu? It ’ s not like the rest of the screen is so full of other components that you need to collapse the choices. They could have put them all out in view. Here ' s Apple ' s take on the exact same dialogue box. Thank you — yes, I designed the dialogue box. No, no. Already, we can see that Apple and Microsoft have a severely divergent approach to software design. Microsoft ' s approach to simplicity tends to be : let ' s break it down ; let ' s just make it more steps. There are these"wizards"everywhere. And you know, there ' s a new version of Windows coming out this fall. If they continue at this pace, there ' s absolutely no telling where they might wind up. [Welcome to the Type a Word Wizard]"Welcome to the Type a Word Wizard."Ok, I ' ll bite. Let ' s click"Next"to continue. From the drop-down menu, choose the first letter you want to type. Ok. So there is a limit that we don ' t want to cross. So what is the answer? How do you pack in all these features in a simple, intelligent way? I believe in consistency, when possible, real-world equivalents, trash can folder, when possible, label things, mostly. But I beg of the designers here to break all those rules if they violate the biggest rule of all, which is intelligence. Now what do I mean by that? I ' m going to give you some examples where intelligence makes something not consistent, but it ' s better. If you are buying something on the web, you ' re supposed to put in your address, and you ' re supposed to choose what country you ' re from, ok? There are 200 countries in the world. We like to think of the Internet as a global village. I ' m sorry ; it ' s not one yet. It ' s mainly like, the United States, Europe, and Japan. So why is"United States"in the"U"s? You have to **scroll**, like, seven screensful to get to it. Now, it would be inconsistent to put"United States"first, but it would be intelligent. This one ' s been touched on before, but why in God ' s name do you shut down a Windows PC by clicking a button called"Start?"Here ' s another pet one of mine : you have a printer. Most of the time, you want to print one copy of your document, in page order, on that printer. So why in God ' s name do you see this every time you print? It ' s like a 747 shuttle cockpit. And one of the buttons at the bottom, you ' ll notice, is not"Print."Now, I ' m not saying that Apple is the only company who has embraced the cult of simplicity. Palm is also, especially in the old days, wonderful about this. I actually got to speak to Palm when they were flying high in the ' 90s, and after the talk, I met one of the employees. He says,"Nice talk."And I said,"Thank you. What do you do here?"He said,"I ' m a tap counter."I ' m like,"You ' re a what?"He goes,"Well Jeff Hawkins, the CEO, says, ' If any task on the Palm Pilot takes more than three taps of the stylus, it ' s too long, and it has to be redesigned. ' So I ' m the tap counter."So, I ' m going to show you an example of a company that does not have a tap counter. This is Microsoft Word. Ok, when you want to create a new blank document in Word — it could happen. You go up to the"File"menu and you choose"New."Now, what happens when you choose"New?"Do you get a new blank document? You do not. On the opposite side of the monitor, a task bar appears, and somewhere in those links — by the way, not at the top — somewhere in those links is a button that makes you a new document. Ok, so that is a company not counting taps. You know, I don ' t want to just stand here and make fun of Microsoft... Yes, I do. The Bill Gates song! I ' ve been a geek forever and I wrote the very first DOS. I put my software and IBM together ; I got profit and they got the loss. I write the code that makes the whole world run. I ' m getting royalties from everyone. Sometimes it ' s garbage, but the press is snowed. You buy the box ; I ' ll sell the code. Every software company is doing Microsoft ' s R&D. You can ' t keep a good idea down these days. Even Windows is a hack. We ' re kind of based loosely on the Mac. So it ' s big, so it ' s slow. You ' ve got nowhere to go. I ' m not doing this for praise. I write the code that fits the world today. Big mediocrity in every way. We ' ve entered planet domination mode. You ' ll have no choice ; you ' ll buy my code. I am Bill Gates and I write the code.

But actually, I believe there are really two Microsofts. There ' s the old one, responsible for Windows and Office. They ' re dying to throw the whole thing out and start fresh, but they can ' t. They ' re locked in, because so many add-ons and other company stuff locks into the old 1982 chassis. But there ' s also a new Microsoft, that ' s really doing good, simple interface designs. I liked the Media Center PC. I liked the Microsoft SPOT Watch. The Wireless Watch flopped miserably in the market, but it wasn ' t because it wasn ' t simply and beautifully designed. But let ' s put it this way : would you pay $10 a month to have a watch that has to be recharged every night like your cell phone, and stops working when you leave your area code? So, the signs might indicate that the complexity crunch is only going to get worse. So is there any hope? The screens are getting smaller, people are illuminating, putting manuals in the boxes, things are coming out at a faster pace. It ' s funny — when Steve Jobs came back to Apple in 1997, after 12 years away, it was the MacWorld Expo — he came to the stage in that black turtleneck and jeans, and he sort of did this. The crowd went wild, but I had just seen — I ' m like, where have I seen this before? I had just seen the movie"Evita"— with Madonna, and I ' m like, you know what? I ' ve got to do one about Steve Jobs. It won ' t be easy. You ' ll think I ' m strange. When I try to explain why I ' m back, after telling the press Apple ' s future is black. You won ' t believe me. All that you see is a kid in his teens who started out in a garage with only a buddy named Woz. You try rhyming with garage! Don ' t cry for me, Cupertino. The truth is, I never left you. I know the ropes now, know what the tricks are. I made a fortune over at Pixar. Don ' t cry for me, Cupertino. I ' ve still got the drive and vision. I still wear sandals in any weather. It ' s just that these days, they ' re Gucci leather. Thank you. So Steve Jobs had always believed in simplicity and elegance and beauty. And the truth is, for years I was a little depressed, because Americans obviously did not value it, because the Mac had three percent market share, Windows had 95 percent market share — people did not think it was worth putting a price on it. So I was a little depressed. And then I heard Al Gore ' s talk, and I realized I didn ' t know the meaning of depressed. But it turns out I was wrong, right? Because the iPod came out, and it violated every bit of common wisdom. Other products cost less ; other products had more features, they had voice recorders and FM transmitters. The other products were backed by Microsoft, with an open standard, not Apple ' s propriety standard. But the iPod won — this is the one they wanted. The lesson was : simplicity sells. And there are signs that the industry is getting the message. This is a little company that ' s done very well with simplicity and elegance. The Sonos thing — it ' s catching on. I ' ve got just a couple examples. Physically, a really cool, elegant thinking coming along lately. When you have a digital camera, how do you get the pictures back to your computer? Well, you either haul around a USB cable, or you buy a card reader and haul that around. Either one, you ' re going to lose. What I do is, I take out the memory card, and I fold it in half, revealing USB contacts. I just stick it in the computer, offload the pictures, put it right back in the camera. I never have to lose anything. Here ' s another example. Chris, you ' re the source of all power. Will you be my power plug? Chris Anderson : Oh yeah. DP : Hold that and don ' t let go. You might ' ve seen this, this is Apple ' s new laptop. This the power cord. It hooks on like this. And I ' m sure every one of you has done this at some point in your lives, or one of your children. You walk along — and I ' m about to pull this onto the floor. I don ' t care. It ' s a loaner. Here we go. Whoa! It ' s magnetic — it doesn ' t pull the laptop onto the floor. In my very last example — I do a lot of my work using speech recognition software. And I ' ll just — you have to be kind of quiet because the software is nervous. Speech recognition software is really great for doing emails very quickly ; period. Like, I get hundreds of them a day ; period. And it ' s not just what I dictate that it writes down ; period. I also use this feature called voice macros ; period. Correct"dissuade."Not"just."Ok, this is not an ideal situation, because it ' s getting the echo from the hall and stuff. The point is, I can respond to people very quickly by saying a short word, and having it write out a much longer thing. So if somebody sends me a fan letter, I ' ll say,"Thanks for that."[Thank you so much for taking the time to write...] And conversely, if somebody sends me hate mail — which happens **daily** — I say,"Piss off."[I admire your frankness...] So that ' s my dirty little secret. Don ' t tell anyone. So the point is — this is a really interesting story. This is version eight of this software, and do you know what they put in version eight? No new features. It ' s never happened before in software! The company put no new features. They just said,"We ' ll make this software work right."Right? Because for years, people had bought this software, tried it out — 95 percent accuracy was all they got, which means one in 20 words is wrong — and they ' d put it in their drawer. And the company got sick of that, so they said,"This version, we ' re not going to do anything, but make sure it ' s darned accurate."And so that ' s what they did. This cult of doing things right is starting to spread. So, my final advice for those of you who are consumers of this technology : remember, if it doesn ' t work, it ' s not necessarily you, ok? It could be the design of the thing you ' re using. Be aware in life of good design and bad design. And if you ' re among the people who create this stuff : Easy is hard. Pre-sweat the details for your audience. Count the taps. Remember, the hard part is not deciding what features to add, it ' s deciding what to leave out. And best of all, your motivation is : simplicity sells. CA : Bravo. DP : Thank you very much. CA : Hear, hear!

Text Sample 247: POS Dim 2 – 2006 – Score 7.00 – 2006/t000442.txt

I ' ve got apparently 18 minutes to convince you that history has a direction, an arrow ; that in some fundamental sense, it ' s good ; that the arrow points to something positive. Now, when the TED people first approached me about giving this upbeat talk â□□ â□□ that was before the cartoon of Muhammad had triggered global rioting. It was before the avian **flu** had reached Europe. It was before Hamas had won the Palestinian election, eliciting various counter-measures by Israel. And to be honest, if I had known when I was asked to give this upbeat talk that even as I was giving the upbeat talk, the apocalypse would be unfolding â□□ â□□ I might have said,"Is it okay if I talk about something else?"But I didn ' t, OK. So we ' re here. I ' ll do what I can. I ' ll do what I can. I ' ve got to warn you : the sense in which my worldview is upbeat has always been kind of subtle, sometimes even elusive. The sense in which I can be uplifting and inspiring â□□ I mean, there ' s always been a kind of a certain grim dimension to the way I try to uplift, so if grim inspiration â□□ â□□ if grim inspiration is not a contradiction in terms, that is, I ' m afraid, the most you can hope for. OK, today â□□ that ' s if I succeed. I ' ll see what I can do. OK? Now, in one sense, the claim that history has a direction is not that controversial. If you ' re just talking about social structure, OK, clearly that ' s gotten more complex a little over the last 10, 000 years â□□ has reached higher and higher levels. And in fact, that ' s actually sustaining a long- standing trend that predates human beings, OK, that biological evolution was doing for us. Because what happened in the beginning, this stuff encases itself in a cell, then cells start hanging out together in societies. Eventually they get so close, they form multicellular organisms, then you get complex multicellular organisms ; they form societies.

But then at some point, one of these multicellular organisms does something completely amazing with this stuff, which is it launches a whole second kind of evolution : cultural evolution. And amazingly, that evolution sustains the trajectory that biological evolution had established toward greater complexity. By cultural evolution we mean the evolution of ideas. A lot of you have heard the term"memes."The evolution of technology, I pay a lot of attention to, so, you know, one of the first things you got was a little hand axe. Generations go by, somebody says, hey, why don ' t we put it on a stick? Just absolutely delights the little ones. Next best thing to a video game. This may not seem to impress, but technological evolution is progressive, so another 10, 20, 000 years, and armaments technology takes you here. Impressive. And the rate of technological evolution speeds up, so a mere quarter of a century after this, you get this, OK. And this. I ' m sorry â it was a cheap laugh, but I wanted to find a way to transition back to this idea of the unfolding apocalypse, and I thought that might do it. So, what threatens to happen with this unfolding apocalypse is the collapse of global social organization. Now, first let me remind you how much work it took to get us where we are, to be on the brink of true global social organization. Originally, you had the most complex societies, the hunter-gatherer village. Stonehenge is the remnant of a chiefdom, which is what you get with the invention of agriculture : multi-village polity with centralized rule. With the invention of writing, you start getting cities. This is blurry. I kind of like that because it makes it look like a one-celled organism and reminds you how many levels organic organization has already moved through to get to this point. And then you get to, you know, you get empires. I want to **stress**, you know, social organization can transcend political bounds. This is the Silk Road connecting the Chinese Empire and the Roman Empire. So you had social complexity spanning the whole continent, even if no polity did similarly. Today, you ' ve got nation states. Point is : there ' s obviously collaboration and organization going on beyond national bounds. This is actually just a picture of the earth at night, and I ' m just putting it up because I think it ' s pretty. Does kind of convey the sense that this is an integrated system. Now, I explained this growth of complexity by reference to something called"non-zero sumness."Assuming that a few of you did not do the assigned reading, very quickly, the key idea is the distinction between zero-sum games, in which correlations are inverse : always a winner and a loser. Non-zero-sum games in which correlations can be positive, OK. So like in tennis, usually it ' s win- lose ; it always adds up to zero-zero-sum. But if you ' re playing doubles, the person on your side of the net, they ' re in the same boat as you, so you ' re playing a non-zero-sum game with them. It ' s either for the better or for the worse, OK. A lot of forms of non-zero-sum behavior in the realm of economics and so on in everyday life often leads to cooperation. The argument I make is basically that, well, non-zero-sum games have always been part of life. You have them in hunter-gatherer societies, but then through technological evolution, new forms of technology arise that facilitate or encourage the playing of non-zero-sum games, involving more people over larger territory. Social structure adapts to accommodate this possibility and to harness this productive potential, so you get cities, you know, and you get all the non-zero-sum games you don ' t think about that are being played across the world. Like, have you ever thought when you buy a car, how many people on how many different continents contributed to the manufacture of that car? Those are people in effect you ' re playing a non-zero-sum game with. I mean, there are certainly plenty of them around. Now, this sounds like an intrinsically upbeat worldview in a way, because when you think of non-zero, you think win-win, you know, that ' s good. Well, there are a few reasons that actually it ' s not intrinsically upbeat. First of all, it can accommodate ; it doesn ’ t deny the existence of inequality exploitation war. But there ’ s a more fundamental reason that it ’ s not intrinsically upbeat, because a non-zero-sum game, all it tells you for sure is that the fortunes will be correlated for better or worse. It doesn ’ t necessarily predict a win- win outcome. So, in a way, the question is : on what grounds am I upbeat at all about history? And the answer is, first of all, on balance I would say people have played their games to more win-win outcomes than lose-lose outcomes. On balance, I think history is a net positive in the non-zero-sum game department. And a testament to this is the thing that most amazes me, most impresses me, and most uplifts me, which is that there is a moral dimension to history ; there is a moral arrow. We have seen moral progress over time. 2, 500 years ago, members of one Greek city-state considered members of another Greek city-state subhuman and treated them that way. And then this moral revolution arrived, and they decided that actually, no, Greeks are human beings. It ’ s just the Persians who aren ’ t fully human and don ’ t deserve to be treated very nicely. But this was progress â you know, give them credit. And now today, we ’ ve seen more progress. I think â I hope â most people here would say that all people everywhere are human beings, deserve to be treated decently, unless they do something horrendous, regardless of race or religion. And you have to read your ancient history to realize what a revolution that has been, OK. This was not a prevalent view, few thousand years ago, and I attribute it to this non- zero-sum dynamic. I think that ’ s the reason there is as much tolerance toward nationalities, ethnicities, religions as there is today. If you asked me, you know, why am I not in favor of bombing Japan, well, I ’ m only half-joking when I say they built my car. We have this non-zero-sum relationship, and I think that does lead to a kind of a tolerance to the extent that you realize that someone else ’ s welfare is positively correlated with yours â you ’ re more likely to cut them a break. I kind of think this is a kind of a business-class morality. Unfortunately, I don ’ t fly trans-Atlantic business class often enough to know, or any other kind of business class really, but I assume that in business class, you don ’ t hear many **expressions** of, you know, bigotry about racial groups or ethnic groups, because the people who are flying trans-Atlantic business class are doing business with all these people ; they ’ re making money off all these people. And I really do think that, in that sense at least, capitalism has been a constructive force, and more fundamentally, it ’ s a non-zero-sumness that has been a constructive force in expanding people ’ s realm of moral awareness. I think the non-zero-sum dynamic, which is not only economic by any means â it ’ s not always commerce â but it has driven us to the verge of a moral truth, which is the fundamental equality of everyone. It has done that. As it has moved global, moved us toward a global level of social organization, it has driven us toward moral truth. I think that ’ s wonderful. Now, back to the unfolding apocalypse. And you may wonder, OK, that ’ s all fine, sounds great â moral direction in history â but what about this so-called clash of civilizations? Well, first of all, I would emphasize that it fits into the non-zero-sum framework, OK. If you look at the relationship between the so- called Muslim world and Western world â two terms I don ’ t like, but can ’ t really avoid ; in such a short span of time, they ’ re efficient if nothing else â it is non-zero-sum. And by that I mean, if people in the Muslim world get more hateful, more resentful, less happy with their place in the world, it ’ ll be bad for the West. If they get more happy, it ’ ll be good for the West. So that is a non-zero-sum dynamic. And I would say the non-zero-sum dynamic is only going to grow more intense over time because of technological trends, but more intense in a kind of negative way. It ’ s the downside correlation of their fortunes that will become more and more possible. And one reason is because of something I call the”growing lethality of hatred."More and more, it ’ s possible for grassroots hatred abroad to manifest itself in the form of organized violence on American soil. And that ’ s pretty new, and I think it ’ s probably going to get a lot worse â this capacity â because of trends in information technology, in technologies that can be used for purposes of munitions like biotechnology and nanotechnology. We may be hearing more about that today. And there ’ s something I worry about especially, which is that this dynamic will lead to a kind of a feedback cycle that puts us on a slippery slope. What I have in mind is : terrorism happens here ; we overreact to it. That, you know, we ’ re not sufficiently surgical in our retaliation leads to more hatred abroad, more terrorism. We overreact because being human, we feel like retaliating, and it gets worse and worse and worse. You could call this the positive feedback of negative vibes, but I think in something so spooky, we really shouldn ’ t have the word positive there at all, even in a technical sense. So let ’ s call it the death spiral of negativity. I assure you if it happens, at the end, both the West and the Muslim world will have suffered. So, what do we do? Well, first of all, we can do a lot more with arms control, the international regulation of dangerous technologies. I have a whole global governance sermon that I will spare you right now, because I don ’ t think that ’ s going to be enough anyway, although it ’ s essential. I think we ’ re going to have to have a major round of moral progress in the world. I think you ’ re just going to have to see less hatred among groups, less bigotry, and, you know, racial groups, religious groups, whatever. I ’ ve got to admit I feel silly saying that. It sounds so kind of Pollyannaish. I feel like Rodney King, you know, saying, why can ’ t we all just get along? But hey, I don ’ t really see any alternative, given the way I read the situation. There ’ s going to have to be moral progress. There ’ s going to have to be a lessening of the amount of hatred in the world, given how dangerous it ’ s becoming. In my defense, I ’ d say, as naive as this may sound, it ’ s ultimately grounded in cynicism. That is to say â â thank you, thank you. That is to say, remember : my whole view of morality is that it boils down to self-interest. It ’ s when people ’ s fortunes are correlated. It ’ s when your welfare conduces to mine, that I decide, oh yeah, I ’ m all in favor of your welfare. That ’ s what ’ s responsible for this growth of this moral progress so far, and I ’ m saying we once again have a correlation of fortunes, and if people respond to it intelligently, we will see the development of tolerance and so on â the **norms** that we need, you know. We will see the further evolution of this kind of business-class morality. So, these two things, you know, if they get people ’ s attention and drive home the positive correlation and people do what ’ s in their self-interests, which is further the moral evolution, then they could actually have a constructive effect. And that ’ s why I lump growing lethality of hatred and death spiral of negativity under the general rubric, reasons to be cheerful. Doing the best I can, OK. I never called myself Mr. Uplift. I ’ m just doing what I can here. Now, launching a moral revolution has got to be hard, right? I mean, what do you do? And I think the answer is a lot of different people are going to have to do a lot of different things. We all start where we are. Speaking as an American who has children whose security 10, 20, 30 years down the road I worry about â what I personally want to start out doing is figuring out why so many people around the world hate us, OK. I think that ’ s a **worthy** research project myself. I also like it because it ’ s an intrinsically kind of morally redeeming exercise. Because to understand why somebody in a very different culture does something â somebody you ’ re kind of viewing as alien, who ’ s doing things you consider strange in a culture you consider strange â to really understand why they do the things they do is a morally redeeming accomplishment, because you ’ ve got to relate their experience to yours. To really understand it, you ’ ve got to say,”Oh, I get it. So when they feel resentful, it ’ s kind of like the way I feel resentful when this happens, and for somewhat the same reasons.”That ’ s true understanding. And I think that is an expansion of your moral compass when you manage to do that. It ’ s especially hard to do when people hate you, OK, because you don ’ t really, in a sense, want to completely understand why people hate you. I mean, you want to hear the reason, but you don ’ t want to be able to relate to it. You don ’ t want it to make sense, right? You don ’ t want to say,”Well, yeah, I can kind of understand how a human being in those circumstances would hate the country I live in.”That ’ s not a **pleasant** thing, but I think it ’ s something that we ’ re going to have to get used to and work on. Now, I want to **stress** that to understand, you know â there are people who don ’ t like this whole business of understanding the grassroots, the root causes of things ; they don ’ t want to know why people hate us. I want to understand it. The reason you ’ re trying to understand why they hate us, is to get them to quit hating us. The idea when you go through this moral exercise of really coming to appreciate their humanity and better understand them, is part of an effort to get them to appreciate your humanity in the long run. I think it ’ s the first step toward that. That ’ s the long-term goal. There are people who worry about this, and in fact, I, myself, apparently, was denounced on national TV a couple of nights ago because of an op-ed I ’ d written. It was kind of along these lines, and the allegation was that I have, quote,”affection for terrorists.”Now, the good news is that the person who said it was Ann Coulter. I mean, if you ’ ve got to have an enemy, do make it Ann Coulter. But it ’ s not a crazy concern, OK, because understanding behavior can lead to a kind of **empathy**, and it can make it a little harder to deliver tough love, and so on. But I think we ’ re a lot closer to erring on the side of not comprehending the situation clearly enough, than in comprehending it so clearly that we just can ’ t, you know, get the army out to kill terrorists. So I ’ m not really worried about it. So â â I mean, we ’ re going to have to work on a lot of fronts, but if we succeed â if we succeed â then once again, non-zero-sumness and the recognition of non-zero-sum dynamics will have forced us to a higher moral level. And a kind of saving higher moral level, something that kind of literally saves the world. If you look at the word”salvation”in the Bible â the Christian usage that we ’ re familiar with â saving souls, that people go to heaven â that ’ s actually a latecomer. The original meaning of the word”salvation”in the Bible is about saving the social system.”Yahweh is our Savior”means”He has saved the nation of Israel,”which at the time, was a pretty high-level social organization. Now, social organization has reached the global level, and I guess, if there ’ s good news I can say I ’ m bringing you, it ’ s just that all the salvation of the world requires is the intelligent pursuit of self-interests in a disciplined and careful way. It ’ s going to be hard. I say we give it a shot anyway because we ’ ve just come too far to screw it up now. Thanks.

Text Sample 248: POS Dim 2 – 2007 – Score 9.00 – 2007/t000238.txt

Well, good morning. You know, the computer and television both recently turned 60, and today I ’ d like to talk about their relationship. Despite their middle age, if you ’ ve been following the themes of this conference or the entertainment industry, it ’ s pretty clear that one has been picking on the other. So it ’ s about time that we talked about how the computer ambushed television, or why the invention of the atomic bomb unleashed forces that lead to the writers ’ strike. And it ’ s not just what these are doing to each other, but it ’ s what the audience thinks that really frames this matter. To get a sense of this, and it ' s been a theme we ' ve talked about all week, I recently talked to a bunch of tweeners. I wrote on cards :"television,""radio,""MySpace,""Internet,""PC."And I said, just arrange these, from what ' s important to you and what ' s not, and then tell me why. Let ' s listen to what happens when they get to the portion of the discussion on television. Girl 1 : Well, I think it ' s important but, like, not necessary because you can do a lot of other stuff with your free time than watch programs. Peter Hirshberg : Which is more fun, Internet or TV? Girls : Internet. Girl 2 : I think we — the reasons, one of the reasons we put computer before TV is because nowadays, like, we have TV shows on the computer. Girl 2 : And then you can download onto your iPod. PH : Would you like to be the president of a TV network? Girl 4 : I wouldn ' t like it. Girl 2 : That would be so **stressful**. Girl 5 : No. PH : How come? Girl 5 : Because they ' re going to lose all their money eventually. Girl 3 : Like the stock market, it goes up and down and stuff. I think right now the computers will be at the top and everything will be kind of going down and stuff. PH : There ' s been an uneasy relationship between the TV business and the tech business, really ever since they both turned about 30. We go through periods of enthrallment, followed by reactions in boardrooms, in the finance community best characterized as, what ' s the finance term? Ick pooey. Let me give you an example of this. The year is 1976, and Warner buys Atari because video games are on the rise. The next year they march forward and they introduce Qube, the first interactive cable TV system, and the New York Times heralds this as telecommunications moving to the home, convergence, great things are happening. Everybody in the East Coast gets in the pictures — Citicorp, Penney, RCA — all getting into this big vision. By the way, this is about when I enter the picture. I ' m going to do a summer internship at Time Warner. That summer I ' m all — I ' m at Warner that summer — I ' m all excited to work on convergence, and then the bottom falls out. Doesn ' t work out too well for them, they lose money. And I had a happy brush with convergence until, kind of, Warner basically has to liquidate the whole thing. That ' s when I leave graduate school, and I can ' t work in New York on kind of entertainment and technology because I have to be exiled to California, where the remaining jobs are, almost to the sea, to go to work for Apple Computer. Warner, of course, writes off more than 400 million dollars. Four hundred million dollars, which was real money back in the ' 70s. But they were onto something and they got better at it. By the year 2000, the process was perfected. They merged with AOL, and in just four years, managed to shed about 200 billion dollars of market capitalization, showing that they ' d actually mastered the art of applying Moore ' s law of successive miniaturization to their balance sheet. Now, I think that one reason that the media and the entertainment communities, or the media community, is driven so crazy by the tech community is that tech folks talk differently. You know, for 50 years, we ' ve talked about changing the world, about total transformation. For 50 years, it ' s been about hopes and fears and promises of a better world. And I got to thinking, you know, who else talks that way? And the answer is pretty clearly — it ' s people in religion and in politics. And so I realized that actually the tech world is best understood, not as a business cycle, but as a messianic movement. We promise something great, we evangelize it, we ' re going to change the world. It doesn ' t work out too well, and so we actually go back to the well and start all over again, as the people in New York and L. A. look on in absolute, morbid astonishment. But it ' s this irrational view of things that drives us on to the next thing. So, what I ' d like to ask is, if the computer is becoming a principal tool of media and entertainment, how did we get here? I mean, how did a machine that was built for accounting and artillery morph into media? Of course, the first computer was built just after World War II to solve military problems, but things got really interesting just a couple of years later — 1949 with Whirlwind, built at MIT ' s Lincoln Lab. Jay Forrester was building this for the Navy, but you can ' t help but see that the creator of this machine had in mind a machine that might actually be a potential media star. So take a look at what happens when the foremost journalist of early television meets one of the foremost computer pioneers, and the computer begins to express itself. Journalist : It ' s a Whirlwind electronic computer. With considerable trepidation, we undertake to interview this new machine. Jay Forrester : Hello New York, this is Cambridge. And this is the oscilloscope of the Whirlwind electronic computer. Would you like if I used the machine? Journalist : Yes, of course. But I have an idea, Mr. Forrester. Since this computer was made in conjunction with the Office of Naval Research, why don ' t we switch down to the Pentagon in Washington and let the Navy ' s research chief, Admiral Bolster, give Whirlwind the workout? Calvin Bolster : Well, Ed, this problem concerns the Navy ' s Viking rocket. This rocket goes up 135 miles into the sky. Now, at the standard rate of fuel consumption, I would like to see the computer trace the flight path of this rocket and see how it can determine, at any **instant**, say at the end of 40 seconds, the amount of fuel remaining, and the velocity at that set **instant**. JF : Over on the left-hand side, you will notice fuel consumption decreasing as the rocket takes off. And on the right-hand side, there ' s a scale that shows the rocket ' s velocity. The rocket ' s position is shown by the trajectory that we ' re now looking at. And as it reaches the **peak** of its trajectory, the velocity, you will notice, has dropped off to a minimum. Then, as the rocket dives down, velocity picks up again toward a maximum velocity and the rocket hits the ground. How ' s that? Journalist : What about that, Admiral? CB : Looks very good to me. JF : And before leaving, we would like to show you another kind of mathematical problem that some of the boys have worked out in their spare time, in a less serious vein, for a Sunday afternoon. Journalist : Thank you very much indeed, Mr. Forrester and the MIT lab. PH : You know, so much was worked out : the first real-time interaction, the video display, pointing a gun. It lead to the microcomputer, but unfortunately, it was too pricey for the Navy, and all of this would have been lost if it weren ' t for a happy coincidence. Enter the atomic bomb. We ' re threatened by the greatest weapon ever, and knowing a good thing when it sees it, the Air Force decides it needs the biggest computer ever to protect us. They adapt Whirlwind to a massive air defense system, deploy it all across the frozen north, and spend nearly three times as much on this computer as was spent on the Manhattan Project building the A-Bomb in the first place. Talk about a shot in the arm for the computer industry. And you can imagine that the Air Force became a pretty good salesman. Here ' s their marketing video. Narrator : In a mass raid, high-speed bombers could be in on us before we could determine their tracks. And then it would be too late to act. We cannot afford to take that chance. It is to meet this threat that the Air Force has been developing SAGE, the Semi-Automatic Ground Environment system, to strengthen our air defenses. This new computer, built to become the nerve center of a defense network, is able to perform all the complex mathematical problems involved in countering a mass enemy raid. It is provided with its own powerhouse containing large diesel-driven generators, air-conditioning equipment, and cooling towers required to cool the thousands of vacuum tubes in the computer. PH : You know, that one computer was huge. There ' s an interesting marketing lesson from it, which is basically, when you market a product, you can either say, this is going to be wonderful, it will make you feel better and enliven you. Or there ' s one other marketing proposition : if you don ' t use our product, you ' ll die. This is a really good example of that. This had the first pointing device. It was distributed, so it worked out

— distributed computing and modems — so all these things could talk to each other. About 20 percent of all the nation ’ s programmers were wrapped up in this thing, and it led to an awful lot of what we have today. It also used vacuum tubes. You saw how huge it was, and to give you a sense for this — because we ’ ve talked a lot about Moore ’ s law and making things small at this conference, so let ’ s talk about making things large. If we took Whirlwind and put it in a place that you all know, say, Century City, it would fit beautifully. You ’ d kind of have to take Century City out, but it could fit in there. But like, let ’ s imagine we took the latest Pentium processor, the latest Core 2 Extreme, which is a four-core processor that Intel ’ s working on, it will be our laptop tomorrow. To build that, what we ’ d do with Whirlwind technology is we ’ d have to take up roughly from the 10 to Mulholland, and from the 405 to La Cienega just with those Whirlwinds. And then, the 92 nuclear power plants that it would take to provide the power would fill up the rest of Los Angeles. That ’ s roughly a third more nuclear power than all of France creates. So, the next time they tell you they ’ re on to something, clearly they ’ re not. So — and we haven ’ t even worked out the cooling needs. But it gives you the kind of power that people have, that the audience has, and the reasons these transformations are happening. All of this stuff starts moving into industry. DEC kind of reduces all this and makes the first mini-computer. It shows up at places like MIT, and then a mutation happens. Spacewar! is built, the first computer game, and all of a sudden, interactivity and involvement and passion is worked out. Actually, many MIT students stayed up all night long working on this thing, and many of the principles of gaming today were worked out. DEC knew a good thing about wasting time. It shipped every one of its computers with that game. Meanwhile, as all of this is happening, by the mid- ’ 50s, the business model of traditional broadcasting and cinema has been busted completely. A new technology has confounded radio men and movie moguls and they ’ re quite certain that television is about to do them in. In fact, despair is in the air. And a quote that sounds largely reminiscent from everything I ’ ve been reading all week. RCA had David Sarnoff, who basically commercialized radio, said this,”I don ’ t say that radio networks must die. Every effort has been made and will continue to be made to find a new pattern, new selling arrangements and new types of programs that may arrest the declining revenues. It may yet be possible to eke out a poor existence for radio, but I don ’ t know how.”And of course, as the computer industry develops interactively, producers in the emerging TV business actually hit on the same idea. And they fake it. Jack Berry : Boys and girls, I think you all know how to get your magic windows up on the set, you just get them out. First of all, get your Winky Dink kits out. Put out your Magic Window and your erasing glove, and rub it like this. That ’ s the way we get some of the magic into it, boys and girls. Then take it and put it right up against the screen of your own television set, and rub it out from the center to the corners, like this. Make sure you keep your magic crayons handy, your Winky Dink crayons and your erasing glove, because you ’ ll be using them during the show to draw like that. You all set? OK, let ’ s get right to the first story about Dusty Man. Come on into the secret lab. PH : It was the dawn of interactive TV, and you may have noticed they wanted to sell you the Winky Dink kits. Those are the Winky Dink crayons. I know what you ’ re saying.”Pete, I could use any ordinary open-source crayon, why do I have to buy theirs?”I assure you, that ’ s not the case. Turns out they told us directly that these are the only crayons you should ever use with your Winky Dink Magic Window, other crayons may discolor or hurt the window. This proprietary principle of vendor lock-in would go on to be perfected with great success as one of the enduring principles of windowing systems everywhere. It led to lawsuits — — federal investigations, and lots of repercussions, and that ' s a scandal we won ' t discuss today. But we will discuss this scandal, because this man, Jack Berry, the host of"Winky Dink,"went on to become the host of"Twenty One,"one of the most important quiz shows ever. And it was rigged, and it became unraveled when this man, Charles van Doren, was outed after an unnatural winning streak, ending Berry ' s career. And actually, ending the career of a lot of people at CBS. It turns out there was a lot to learn about how this new medium worked. And 50 years ago, if you ' d been at a meeting like this and were trying to understand the media, there was one prophet and only but one you wanted to hear from, Professor Marshall McLuhan. He actually understood something about a theme that we ' ve been discussing all week. It ' s the role of the audience in an era of pervasive electronic communications. Here he is talking from the 1960s. Marshall McLuhan : If the audience can become involved in the actual process of making the **ad**, then it ' s happy. It ' s like the old quiz shows. They were great TV because it gave the audience a role, something to do. They were horrified when they discovered they ' d really been left out all the time because the shows were rigged. Now, then, this was a horrible misunderstanding of TV on the part of the programmers. PH : You know, McLuhan talked about the global village. If you substitute the word blogosphere, of the Internet today, it is very true that his understanding is probably very enlightening now. Let ' s listen in to him. MM : The global village is a world in which you don ' t necessarily have harmony. You have extreme concern with everybody else ' s business and much involvement in everybody else ' s life. It ' s a sort of Ann Landers ' column writ large. And it doesn ' t necessarily mean harmony and peace and quiet, but it does mean huge involvement in everybody else ' s affairs. And so the global village is as big as a planet, and as small as a village post office. PH : We ' ll talk a little bit more about him later. We ' re now right into the 1960s. It ' s the era of big business and data centers for computing. But all that was about to change. You know, the **expression** of technology reflects the people and the time of the culture it was built in. And when I say that code expresses our hopes and aspirations, it ' s not just a joke about messianism, it ' s actually what we do. But for this part of the story, I ' d actually like to throw it to America ' s leading technology correspondent, John Markoff. John Markoff : Do you want to know what the counterculture in drugs, sex, rock ' n ' roll and the anti-war movement had to do with computing? Everything. It all happened within five miles of where I ' m standing, at Stanford University, between 1960 and 1975. In the midst of revolution in the streets and rock and roll concerts in the parks, a group of **researchers** led by people like John McCarthy, a computer scientist at the Stanford Artificial Intelligence Lab, and Doug Engelbart, a computer scientist at SRI, changed the world. Engelbart came out of a pretty dry engineering culture, but while he was beginning to do his work, all of this stuff was bubbling on the mid-peninsula. There was LSD leaking out of Kesey ' s Veterans ' Hospital experiments and other areas around the campus, and there was music literally in the streets. The Grateful Dead was playing in the pizza parlors. People were leaving to go back to the land. There was the Vietnam War. There was black liberation. There was women ' s liberation. This was a remarkable place, at a remarkable time. And into that ferment came the microprocessor. I think it was that interaction that led to personal computing. They saw these tools that were controlled by the establishment as ones that could actually be liberated and put to use by these communities that they were trying to build. And most importantly, they had this ethos of sharing information. I think these ideas are difficult to understand, because when you ' re trapped in one paradigm, the next paradigm is always like a science fiction universe — it makes no sense. The stories were so compelling that I decided to write a book about them. The title of the book is,”What the Dormouse Said : How the ’ 60s Counterculture Shaped the Personal Computer Industry.”The title was taken from the lyrics to a Jefferson Airplane song. The lyrics go,”Remember what the dormouse said. Feed your head, feed your head, feed your head.”PH : By this time, computing had kind of leapt into media territory, and in short order much of what we ’ re doing today was imagined in Cambridge and Silicon Valley. Here ’ s the Architecture Machine Group, the predecessor of the Media Lab, in 1981. Meanwhile, in California, we were trying to commercialize a lot of this stuff. HyperCard was the first program to introduce the public to hyperlinks, where you could randomly hook to any kind of picture, or piece of text, or data across a file system, and we had no way of explaining it. There was no metaphor. Was it a database? A prototyping tool? A scripted language? Heck, it was everything. So we ended up writing a marketing brochure. We asked a question about how the mind works, and we let our customers play the role of so many blind men filling out the elephant. A few years later, we then hit on the idea of explaining to people the secret of, how do you get the content you want, the way you want it and the easy way? Here ’ s the Apple marketing video. James Burke : You ’ ll be pleased to know, I ’ m sure, that there are several ways to create a HyperCard interactive video. The most involved method is to go ahead and produce your own videodisc as well as build your own HyperCard stacks. By far the simplest method is to buy a pre-made videodisc and HyperCard stacks from a commercial supplier. The method we illustrate in this video uses a pre-made videodisc but creates custom HyperCard stacks. This method allows you to use existing videodisc materials in ways which suit your specific needs and interests. PH : I hope you realize how subversive that is. That ’ s like a Dick Cheney speech. You think he ’ s a nice balding guy, but he ’ s just declared war on the content business. Find the commercial stuff, mash it up, tell the story your way. Now, as long as we confine this to the education market, and a personal matter between the computer and the file system, that ’ s fine, but as you can see, it was about to leap out and upset Jack Valenti and a lot of other people. By the way, speaking of the filing system, it never occurred to us that these hyperlinks could go beyond the local area network. A few years later, Tim Berners-Lee worked that out. It became a killer app of links, and today, of course, we call that the World Wide Web. Now, not only was I instrumental in helping Apple miss the Internet, but a couple of years later, I helped Bill Gates do the same thing. The year is 1993 and he was working on a book and I was working on a video to help him kind of explain where we were all heading and how to popularize all this. We were plenty aware that we were messing with media, and on the surface, it looks like we predicted a lot of the right things, but we also missed an awful lot. Let ’ s take a look. Narrator : The pyramids, the Colosseum, the New York subway system and TV dinners, ancient and modern wonders of the man-made world all. Yet each pales to insignificance with the completion of that magnificent accomplishment of twenty-first-century technology, the Digital Superhighway. Once it was only a dream of technoids and a few long-forgotten politicians. The Digital Highway arrived in America ’ s living rooms late in the twentieth century. Let us recall the pioneers who made this technical marvel possible. The Digital Highway would follow the rutted trail first blazed by Alexander Graham Bell. Though some were incredulous... Man 1 : The phone company! Narrator : Stirred by the prospects of mass communication and making big bucks on advertising, David Sarnoff commercializes radio. Man 2 : Never had scientists been put under such pressure and demand. Narrator : The medium introduced America to new products. Voice 1 : Say, mom, Windows for Radio means more enjoyment and greater ease of use for the whole family. Be sure to enjoy Windows for Radio at home and at work. Narrator : In 1939, the Radio Corporation of America introduced television. Man 2 : Never had scientists been put under such pressure and demand. Narrator : Eventually, the race to the future took on added momentum with the breakup of the telephone company. And further stimulus came with the deregulation of the cable television industry, and the re-regulation of the cable television industry. Ted Turner : We did the work to build this, this cable industry, now the broadcasters want some of our money. I mean, it ' s ridiculous. Narrator : Computers, once the unwieldy tools of accountants and other geeks, escaped the backrooms to enter the media fracas. The world and all its culture reduced to bits, the lingua franca of all media. And the forces of convergence exploded. Finally, four great industrial sectors combined. Telecommunications, entertainment, computing and everything else. Man 3 : We ' ll see channels for the gourmet and we ' ll see channels for the pet lover. Voice 2 : Next on the gourmet pet channel, decorating birthday cakes for your schnauzer. Narrator : All of industry was in play, as investors flocked to place their bets. At stake : the battle for you, the consumer, and the right to spend billions to send a lot of information into the parlors of America. PH : We missed a lot. You know, you missed, we missed the Internet, the long tail, the role of the audience, open systems, social networks. It just goes to show how tough it is to come up with the right uses of media. Thomas Edison had the same problem. He wrote a list of what the phonograph might be good for when he invented it, and kind of only one of his ideas turned out to have been the right early idea. Well, you know where we ' re going on from here. We come into the era of the dotcom, the World Wide Web, and I don ' t need to tell you about that because we all went through that bubble together. But when we emerge from this and what we call Web 2. 0, things actually are quite different. And I think it ' s the reason that TV ' s so challenged. If Internet one was about pages, now it ' s about people. It ' s a customer, it ' s an audience, it ' s a person who ' s participating. It ' s the formidable thing that is changing entertainment now. MM : Because it gave the audience a role, something to do. PH : In my own company, Technorati, we see something like 67, 000 blog posts an hour come in. That ' s about 2, 700 fresh, connective links across about 112 million blogs that are out there. And it ' s no wonder that as we head into the writers ' strike, odd things happen. You know, it reminds me of that old saw in Hollywood, that a producer is anyone who knows a writer. I now think a network boss is anyone who has a cable modem. But it ' s not a joke. This is a real headline."Websites attract striking writers : operators of sites like MyDamnChannel. com could benefit from labor disputes."Meanwhile, you have the TV bloggers going out on strike, in sympathy with the television writers. And then you have TV Guide, a Fox property, which is about to sponsor the online video awards — but cancels it out of sympathy with traditional television, not appearing to gloat. To show you how schizophrenic this all is, here ' s the head of MySpace, or Fox Interactive, a News Corp company, being asked, well, with the writers ' strike, isn ' t this going to hurt News Corp and help you online? Man : But I, yeah, I think there ' s an opportunity. As the strike continues, there ' s an opportunity for more people to experience video on places like MySpace TV. PH : Oh, but then he remembers he works for Rupert Murdoch. Man : Yes, well, first, you know, I ' m part of News Corporation as part of Fox Entertainment Group. Obviously, we hope that the strike is — that the issues are resolved as quickly as possible. PH : One of the great things that ' s going on here is the globalization of content really is happening. Here is a clip from a video, from a piece of animation that was written by a writer in Hollywood, animation worked out in Israel, farmed out to Croatia and India, and it ' s now an international series. Narrator : The following takes place between the minutes of 2:15 p. m. and

2:18 p. m., in the months preceding the presidential primaries. Voice 1 : You ’ ll have to stay here in the safe house until we get word the terrorist threat is over. Voice 2 : You mean we ’ ll have to live here, together? Voices 2, 3 and 4 : With her? Voice 2 : Well, there goes the neighborhood. PH : The company that created this, Aniboom, is an interesting example of where this is headed. Traditional TV animation costs, say, between 80, 000 and 10, 000 dollars a minute. They ’ re producing things for between 1, 500 and 800 dollars a minute. And they ’ re offering their creators 30 percent of the back end, in a much more entrepreneurial manner. So, it ’ s a different model. What the entertainment business is **struggling** with, the world of brands is figuring out. For example, Nike now understands that Nike Plus is not just a device in its shoe, it ’ s a network to hook its customers together. And the head of marketing at Nike says,”People are coming to our site an average of three times a week. We don ’ t have to go to them.”Which means television advertising is down 57 percent for Nike. Or, as Nike ’ s head of marketing says,”We ’ re not in the business of keeping media companies alive. We ’ re in the business of connecting with consumers.”And media companies realize the audience is important also. Here ’ s a man announcing the new Market Watch from Dow Jones, powered 100 percent by the user experience on the home page — user-generated content married up with traditional content. It turns out you have a bigger audience and more interest if you hook up with them. Or, as Geoffrey Moore once told me, it ’ s intellectual curiosity that ’ s the trade that brands need in the age of the blogosphere. And I think this is beginning to happen in the entertainment business. One of my heroes is songwriter, Ally Willis, who just wrote”The Color Purple”and has been an R and — rhythm and blues writer, and this is what she said about where songwriting ’ s going. Ally Willis : Where millions of collaborators wanted the song, because to look at them strictly as spam is missing what this medium is about. PH : So, to wrap up, I ’ d love to throw it back to Marshall McLuhan, who, 40 years ago, was dealing with audiences that were going through just as much change, and I think that, today, traditional Hollywood and the writers are framing this perhaps in the way that it was being framed before. But I don ’ t need to tell you this, let ’ s throw it back to him. Narrator : We are in the middle of a tremendous clash between the old and the new. MM : The medium does things to people and they are always completely unaware of this. They don ’ t really notice the new medium that is wrapping them up. They think of the old medium, because the old medium is always the content of the new medium, as movies tend to be the content of TV, and as books used to be the content, novels used to be the content of movies. And so every time a new medium arrives, the old medium is the content, and it is highly observable, highly noticeable, but the real, real roughing up and massaging is done by the new medium, and it is ignored. PH : I think it ’ s a great time of enthrallment. There ’ s been more raw DNA of communications and media thrown out there. Content is moving from shows to particles that are batted back and forth, and part of social communications, and I think this is going to be a time of great renaissance and opportunity. And whereas television may have gotten beat up, what ’ s getting built is a really exciting new form of communication, and we kind of have the merger of the two industries and a new way of thinking to look at it. Thanks very much.

Text Sample 249: POS Dim 2 – 2007 – Score 9.00 – 2007/t000370.txt

Images like this, from the Auschwitz concentration camp, have been seared into our consciousness during the twentieth century and have given us a new understanding of who we are, where we ' ve come from and the times we live in. During the twentieth century, we witnessed the atrocities of Stalin, Hitler, Mao, Pol Pot, Rwanda and other genocides, and even though the twenty-first century is only seven years old, we have already witnessed an ongoing genocide in Darfur and the **daily** horrors of Iraq. This has led to a common understanding of our situation, namely that modernity has brought us terrible violence, and perhaps that native peoples lived in a state of harmony that we have departed from, to our peril. Here is an example from an op-ed on Thanksgiving, in the Boston Globe a couple of years ago, where the writer wrote,"The Indian life was a difficult one, but there were no employment problems, community harmony was strong, substance abuse unknown, crime nearly non-existent, what warfare there was between tribes was largely ritualistic and seldom resulted in indiscriminate or wholesale slaughter."Now, you ' re all familiar with this treacle. We teach it to our children. We hear it on television and in storybooks. Now, the original title of this session was,"Everything You Know Is Wrong,"and I ' m going to present evidence that this particular part of our common understanding is wrong, that, in fact, our ancestors were far more violent than we are, that violence has been in decline for long stretches of time, and that today we are probably living in the most peaceful time in our species ' existence. Now, in the decade of Darfur and Iraq, a statement like that might seem somewhere between hallucinatory and obscene. But I ' m going to try to convince you that that is the correct picture. The decline of violence is a fractal phenomenon. You can see it over millennia, over centuries, over decades and over years, although there seems to have been a tipping point at the onset of the Age of Reason in the sixteenth century. One sees it all over the world, although not homogeneously. It ' s especially evident in the West, beginning with England and Holland around the time of the Enlightenment. Let me take you on a journey of several powers of 10 — from the millennium scale to the year scale — to try to persuade you of this. Until 10, 000 years ago, all humans lived as hunter-gatherers, without permanent settlements or government. And this is the state that ' s commonly thought to be one of primordial harmony. But the archaeologist Lawrence Keeley, looking at casualty rates among contemporary hunter-gatherers, which is our best source of evidence about this way of life, has shown a rather different conclusion. Here is a graph that he put together showing the percentage of male deaths due to warfare in a number of foraging, or hunting and gathering societies. The red bars correspond to the likelihood that a man will die at the hands of another man, as opposed to passing away of natural causes, in a variety of foraging societies in the New Guinea Highlands and the Amazon Rainforest. And they range from a rate of almost a 60 percent chance that a man will die at the hands of another man to, in the case of the Gebusi, only a 15 percent chance. The tiny, little blue bar in the lower left-hand corner plots the corresponding statistic from United States and Europe in the twentieth century, and includes all the deaths of both World Wars. If the death rate in tribal warfare had prevailed during the 20th century, there would have been two billion deaths rather than 100 million. Also at the millennium scale, we can look at the way of life of early civilizations such as the ones described in the Bible. And in this supposed source of our moral values, one can read descriptions of what was expected in warfare, such as the following from Numbers 31 :"And they warred against the Midianites as the Lord commanded Moses, and they slew all the males. And Moses said unto them, ' Have you saved all the women alive? Now, therefore, kill every male among the little ones and kill every woman that hath known man by lying with him, but all the women children that have not know a man by lying with him keep alive for yourselves. '"In other words, kill the men ; kill the children ; if you see any virgins, then you can keep them alive so that you can rape them. You can find four or five passages in the Bible of this ilk. Also in the Bible, one sees that the death **penalty** was the accepted punishment for crimes such as homosexuality, adultery, blasphemy, idolatry, talking back to your parents — — and picking up sticks on the Sabbath. Well, let ' s click the zoom lens down one order of magnitude, and look at the century scale. Although we don ' t have statistics for warfare throughout the Middle Ages to modern times, we know just from conventional history — the evidence was under our nose all along that there has been a reduction in socially sanctioned forms of violence. For example, any social history will reveal that mutilation and torture were routine forms of criminal punishment. The kind of infraction today that would give you a fine, in those days would result in your tongue being cut out, your ears being cut off, you being blinded, a hand being chopped off and so on. There were numerous ingenious forms of sadistic capital punishment : burning at the stake, disemboweling, breaking on the wheel, being pulled apart by horses and so on. The death **penalty** was a sanction for a long list of non-violent crimes : criticizing the king, stealing a loaf of bread. Slavery, of course, was the preferred labor-saving device, and cruelty was a popular form of entertainment. Perhaps the most vivid example was the **practice** of cat burning, in which a cat was hoisted on a stage and lowered in a sling into a fire, and the spectators shrieked in laughter as the cat, howling in pain, was burned to death. What about one-on-one murder? Well, there, there are good statistics, because many municipalities recorded the cause of death. The criminologist Manuel Eisner scoured all of the historical records across Europe for homicide rates in any village, hamlet, town, county that he could find, and he supplemented them with national data, when nations started keeping statistics. He plotted on a logarithmic scale, going from 100 deaths per 100, 000 people per year, which was approximately the rate of homicide in the Middle Ages. And the figure plummets down to less than one homicide per 100, 000 people per year in seven or eight European countries. Then, there is a slight uptick in the 1960s. The people who said that rock ' n ' roll would lead to the decline of moral values actually had a grain of truth to that. But there was a decline from at least two orders of magnitude in homicide from the Middle Ages to the present, and the elbow occurred in the early sixteenth century. Let ' s click down now to the decade scale. According to non-governmental organizations that keep such statistics, since 1945, in Europe and the Americas, there has been a steep decline in interstate wars, in deadly ethnic riots or pogroms, and in military coups, even in South America. Worldwide, there ' s been a steep decline in deaths in interstate wars. The yellow bars here show the number of deaths per war per year from 1950 to the present. And, as you can see, the death rate goes down from 65, 000 deaths per conflict per year in the 1950s to less than 2, 000 deaths per conflict per year in this decade, as horrific as it is. Even in the year scale, one can see a decline of violence. Since the end of the Cold War, there have been fewer civil wars, fewer genocides — indeed, a 90 percent reduction since post-World War II highs — and even a reversal of the 1960s uptick in homicide and violent crime. This is from the FBI Uniform Crime Statistics. You can see that there is a fairly low rate of violence in the ' 50s and the ' 60s, then it soared upward for several decades, and began a precipitous decline, starting in the 1990s, so that it went back to the level that was last enjoyed in 1960. President Clinton, if you ' re here, thank you. So the question is, why are so many people so wrong about something so important? I think there are a number of reasons. One of them is we have better reporting. The Associated Press is a better chronicler of wars over the surface of the Earth than sixteenth-century monks were. There ' s a cognitive illusion. We cognitive psychologists know that the easier it is to recall specific instances of something, the higher the probability that you assign to it. Things that we read about in the paper with gory footage burn into memory more than reports of a lot more people dying in their beds of old age. There are dynamics in the opinion and advocacy markets : no one ever attracted observers, advocates and donors by saying things just seem to be getting better and better. There ' s guilt about our treatment of native peoples in modern intellectual life, and an unwillingness to acknowledge there could be anything good about Western culture. And of course, our change in standards can outpace the change in behavior. One of the reasons violence went down is that people got sick of the carnage and cruelty in their time. That ' s a process that seems to be continuing, but if it outstrips behavior by the standards of the day, things always look more barbaric than they would have been by historic standards. So today, we get exercised — and rightly so — if a handful of murderers get executed by lethal injection in Texas after a 15-year appeal process. We don ' t consider that a couple of hundred years ago, they may have been burned at the stake for criticizing the king after a **trial** that lasted 10 minutes, and indeed, that that would have been repeated over and over again. Today, we look at capital punishment as evidence of how low our behavior can sink, rather than how high our standards have risen. Well, why has violence declined? No one really knows, but I have read four explanations, all of which, I think, have some grain of plausibility. The first is, maybe Thomas Hobbes got it right. He was the one who said that life in a state of nature was"solitary, poor, nasty, brutish and short."Not because, he argued, humans have some primordial thirst for blood or aggressive instinct or territorial imperative, but because of the logic of anarchy. In a state of anarchy, there ' s a constant temptation to invade your neighbors preemptively, before they invade you. More recently, Thomas Schelling gives the analogy of a homeowner who hears a rustling in the basement. Being a good American, he has a pistol in the nightstand, pulls out his gun, and walks down the stairs. And what does he see but a burglar with a gun in his hand. Now, each one of them is thinking,"I don ' t really want to kill that guy, but he ' s about to kill me. Maybe I had better shoot him, before he shoots me, especially since, even if he doesn ' t want to kill me, he ' s probably worrying right now that I might kill him before he kills me."And so on. Hunter-gatherer peoples explicitly go through this train of thought, and will often raid their neighbors out of fear of being raided first. Now, one way of dealing with this problem is by deterrence. You don ' t strike first, but you have a publicly announced policy that you will retaliate savagely if you are invaded. The only thing is that it ' s liable to having its bluff called, and therefore can only work if it ' s credible. To make it credible, you must avenge all insults and settle all **scores**, which leads to the cycles of bloody vendetta. Life becomes an episode of"The Sopranos."Hobbes ' solution, the"Leviathan,"was that if authority for the legitimate use of violence was vested in a single democratic agency — a leviathan — then such a state can reduce the temptation of attack, because any kind of aggression will be punished, leaving its profitability as zero. That would remove the temptation to invade preemptively, out of fear of them attacking you first. It removes the need for a hair trigger for retaliation to make your deterrent threat credible. And therefore, it would lead to a state of peace. Eisner — the man who plotted the homicide rates that you failed to see in the earlier slide — argued that the timing of the decline of homicide in Europe coincided with the rise of centralized states. So that ' s a bit of a support for the leviathan theory. Also supporting it is the fact that we today see eruptions of violence in zones of anarchy, in failed states, collapsed empires, frontier regions, mafias, street gangs and so on. The second explanation is that in many times and places, there is a widespread sentiment that life is cheap. In earlier times, when suffering and early death were common in one ’ s own life, one has fewer compunctions about inflicting them on others. And as technology and economic efficiency make life longer and more **pleasant**, one puts a higher value on life in general. This was an argument from the political scientist James Payne. A third explanation invokes the concept of a nonzero-sum game, and was worked out in the book”Nonzero”by the journalist Robert Wright. Wright points out that in certain circumstances, cooperation or non-violence can benefit both parties in an interaction, such as gains in trade when two parties trade their surpluses and both come out ahead, or when two parties lay down their arms and split the so-called peace dividend that results in them not having to fight the whole time. Wright argues that technology has increased the number of positive- sum games that humans tend to be embroiled in, by allowing the trade of goods, **services** and ideas over longer distances and among larger groups of people. The result is that other people become more valuable alive than dead, and violence declines for selfish reasons. As Wright put it,”Among the many reasons that I think that we should not bomb the Japanese is that they built my mini-van.”The fourth explanation is captured in the title of a book called”The Expanding Circle,”by the philosopher Peter Singer, who argues that evolution bequeathed humans with a sense of **empathy**, an ability to treat other peoples ’ interests as comparable to one ’ s own. Unfortunately, by default we apply it only to a very narrow circle of friends and family. People outside that circle are treated as sub-human, and can be exploited with impunity. But, over history, the circle has expanded. One can see, in historical record, it expanding from the village, to the clan, to the tribe, to the nation, to other races, to both sexes, and, in Singer ’ s own arguments, something that we should extend to other sentient species. The question is, if this has happened, what has powered that expansion? And there are a number of possibilities, such as increasing circles of reciprocity in the sense that Robert Wright argues for. The logic of the golden rule — the more you think about and interact with other people, the more you realize that it is untenable to privilege your interests over theirs, at least not if you want them to listen to you. You can ’ t say that my interests are **special** compared to yours, anymore than you can say that the particular spot that I ’ m standing on is a unique part of the universe because I happen to be standing on it that very minute. It may also be powered by cosmopolitanism, by histories, and journalism, and memoirs, and realistic fiction, and travel, and literacy, which allows you to project yourself into the lives of other people that formerly you may have treated as sub-human, and also to realize the accidental contingency of your own station in life, the sense that”there but for fortune go I.”Whatever its causes, the decline of violence, I think, has profound implications. It should force us to ask not just, why is there war? But also, why is there peace? Not just, what are we doing wrong? But also, what have we been doing right? Because we have been doing something right, and it sure would be good to find out what it is. Thank you very much.. Chris Anderson : I loved that talk. I think a lot of people here in the room would say that that expansion of — that you were talking about, that Peter Singer talks about, is also driven by, just by technology, by greater visibility of the other, and the sense that the world is therefore getting smaller. I mean, is that also a grain of truth? Steven Pinker : Very much. It would fit both in Wright ’ s theory, that it allows us to enjoy the benefits of cooperation over larger and larger circles. But also, I think it helps us imagine what it ’ s like to be someone else. I think when you read these horrific tortures that were common in the Middle Ages, you think, how could they possibly have done it, how could they have not have empathized with the person that they ’ re disemboweling? But clearly, as far as they ’ re concerned, this is just an alien being that does not have feelings akin to their own. Anything, I think, that makes it easier to imagine trading places with someone else means that it increases your moral consideration to that other person. CA : Well, Steve, I would love every news media owner to hear that talk at some point in the next year. I think it ’ s really important. Thank you so much. SP : My pleasure.

I live and work from Tokyo, Japan. And I specialize in human behavioral research, and applying what we learn to think about the future in different ways, and to design for that future. And you know, to be honest, I ’ ve been doing this for seven years, and I haven ’ t got a clue what the future is going to be like. But I ’ ve got a pretty good idea how people will behave when they get there. This is my office. It ’ s out there. It ’ s not in the lab, and it ’ s increasingly in places like India, China, Brazil, Africa. We live on a planet — 6. 3 billion people. About three billion people, by the end of this year, will have cellular connectivity. And it ’ ll take about another two years to connect the next billion after that. And I mention this because, if we want to design for that future, we need to figure out what those people are about. And that ’ s, kind of, where I see what my job is and what our team ’ s job is. Our research often starts with a very simple question. So I ’ ll give you an example. What do you carry? If you think of everything in your life that you own, when you walk out that door, what do you consider to take with you? When you ’ re looking around, what do you consider? Of that stuff, what do you carry? And of that stuff, what do you actually use? So this is interesting to us, because the conscious and subconscious decision process implies that the stuff that you do take with you and end up using has some kind of spiritual, emotional or functional value. And to put it really bluntly, you know, people are willing to pay for stuff that has value, right? So I ’ ve probably done about five years ’ research looking at what people carry. I go in people ’ s bags. I look in people ’ s pockets, purses. I go in their homes. And we do this worldwide, and we follow them around town with video cameras. It ’ s kind of like stalking with permission. And we do all this — and to go back to the original question, what do people carry? And it turns out that people carry a lot of stuff. OK, that ’ s fair enough. But if you ask people what the three most important things that they carry are — across cultures and across gender and across contexts — most people will say keys, money and, if they own one, a **mobile** phone. And I ’ m not saying this is a good thing, but this is a thing, right? I mean, I couldn ’ t take your phones off you if I wanted to. You ’ d probably kick me out, or something. OK, it might seem like an obvious thing for someone who works for a **mobile** phone company to ask. But really, the question is, why? Right? So why are these things so important in our lives? And it turns out, from our research, that it boils down to survival — survival for us and survival for our loved ones. So, keys provide an access to shelter and warmth — transport as well, in the U. S. increasingly. Money is useful for buying food, sustenance, among all its other uses. And a **mobile** phone, it turns out, is a great recovery tool. If you prefer this kind of Maslow ’ s hierarchy of needs, those three objects are very good at supporting the lowest rungs in Maslow ’ s hierarchy of needs. Yes, they do a whole bunch of other stuff, but they ’ re very good at this. And in particular, it ’ s the **mobile** phone ’ s ability to allow people to transcend space and time. And what I mean by that is, you know, you can transcend space by simply making a voice call, right? And you can transcend time by sending a message at your convenience, and someone else can pick it up at their convenience. And this is fairly universally appreciated, it turns out, which is why we have three billion plus people who have been connected. And they value that connectivity. But actually, you can do this kind of stuff with PCs. And you can do them with phone kiosks. And the **mobile** phone, in addition, is both personal — and so it also gives you a degree of **privacy** — and it ’ s convenient. You don ’ t need to ask permission from anyone, you can just go ahead and do it, right? However, for these things to help us survive, it depends on them being carried. But — and it ’ s a pretty big but — we forget. We ’ re human, that ’ s what we do. It ’ s one of our features. I think, quite a nice feature. So we forget, but we ’ re also adaptable, and we adapt to situations around us pretty well. And so we have these strategies to remember, and one of them was mentioned yesterday. And it ’ s, quite simply, the point of reflection. And that ’ s that moment when you ’ re walking out of a space, and you turn around, and quite often you tap your pockets. Even women who keep stuff in their bags tap their pockets. And you turn around, and you look back into the space, and some people talk aloud. And pretty much everyone does it at some point. OK, the next thing is — most of you, if you have a stable home life, and what I mean is that you don ’ t travel all the time, and always in hotels, but most people have what we call a center of gravity. And a center of gravity is where you keep these objects. And these things don ’ t stay in the center of gravity, but over time, they gravitate there. It ’ s where you expect to find stuff. And in fact, when you ’ re turning around, and you ’ re looking inside the house, and you ’ re looking for this stuff, this is where you look first, right? OK, so when we did this research, we found the absolutely, 100 percent, guaranteed way to never forget anything ever, ever again. And that is, quite simply, to have nothing to remember. OK, now, that sounds like something you get on a Chinese fortune cookie, right? But is, in fact, about the art of delegation. And from a design perspective, it ’ s about understanding what you can delegate to technology and what you can delegate to other people. And it turns out, delegation — if you want it to be — can be the solution for pretty much everything, apart from things like bodily functions, going to the toilet. You can ’ t ask someone to do that on your behalf. And apart from things like entertainment, you wouldn ’ t pay for someone to go to the cinema for you and have fun on your behalf, or, at least, not yet. Maybe sometime in the future, we will. So, let me give you an example of delegation in **practice**, right. So this is — probably the thing I ’ m most **passionate** about is the research that we ’ ve been doing on illiteracy and how people who are illiterate communicate. So, the U. N. estimated — this is 2004 figures — that there are almost 800 million people who can ’ t read and write, worldwide. So, we ’ ve been conducting a lot of research. And one of the things we were looking at is — if you can ’ t read and write, if you want to communicate over distances, you need to be able to identify the person that you want to communicate with. It could be a phone number, it could be an e-mail address, it could be a postal address. Simple question : if you can ’ t read and write, how do you manage your contact information? And the fact is that millions of people do it. Just from a design perspective, we didn ’ t really understand how they did it, and so that ’ s just one small example of the kind of research that we were doing. And it turns out that illiterate people are masters of delegation. So they delegate that part of the task process to other people, the stuff that they can ’ t do themselves. Let me give you another example of delegation. This one ’ s a little bit more sophisticated, and this is from a study that we did in Uganda about how people who are sharing devices, use those devices. Sente is a word in Uganda that means money. It has a second meaning, which is to send money as airtime. OK? And it works like this. So let ’ s say, June, you ’ re in a village, rural village. I ’ m in Kampala and I ’ m the wage earner. I ’ m sending money back, and it works like this. So, in your village, there ’ s one person in the village with a phone, and that ’ s the phone kiosk operator. And it ’ s quite likely that they ’ d have a quite simple **mobile** phone as a phone kiosk. So what I do is, I buy a prepaid card like this. And instead of using that money to top up my own phone, I call up the local village operator. And I read out that number to them, and they use it to top up their phone. So, they ’ re topping up the value from Kampala, and it ’ s now being topped up in the village. You take a 10 or 20 percent commission, and then you — the kiosk operator takes 10 or 20 percent commission, and passes the rest over to you in cash. OK, there ’ s two things I like about this. So the first is, it turns anyone who has access to a **mobile** phone — anyone who has a **mobile** phone — essentially into an ATM machine. It brings rudimentary banking **services** to places where there ’ s no banking infrastructure. And even if they could have access to the banking infrastructure, they wouldn ’ t necessarily be considered viable customers, because they ’ re not wealthy enough to have bank accounts. There ’ s a second thing I like about this. And that is that despite all the resources at my disposal, and despite all our kind of apparent sophistication, I know I could never have designed something as elegant and as totally in tune with the local conditions as this. OK? And, yes, there are things like Grameen Bank and micro-lending. But the difference between this and that is, there ’ s no central authority trying to control this. This is just street-up innovation. So, it turns out the street is a never-ending source of inspiration for us. And OK, if you break one of these things here, you return it to the carrier. They ’ ll give you a new one. They ’ ll probably give you three new ones, right? I mean, that ’ s buy three, get one free. That kind of thing. If you go on the streets of India and China, you see this kind of stuff. And this is where they take the stuff that breaks, and they fix it, and they put it back into circulation. This is from a workbench in Jilin City, in China, and you can see people taking down a phone and putting it back together. They reverse-engineer manuals. This is a kind of hacker ’ s manual, and it ’ s written in Chinese and English. They also write them in Hindi. You can subscribe to these. There are training institutes where they ’ re churning out people for fixing these things as well. But what I like about this is, it boils down to someone on the street with a small, flat surface, a screwdriver, a toothbrush for cleaning the contact heads — because they often get dust on the contact heads — and knowledge. And it ’ s all about the social network of the knowledge, floating around. And I like this because it challenges the way that we design stuff, and build stuff, and potentially distribute stuff. It challenges the **norms**. OK, for me the street just raises so many different questions. Like, this is Viagra that I bought from a backstreet sex shop in China. And China is a country where you get a lot of fakes. And I know what you ’ re asking — did I test it? I ’ m not going to answer that, OK. But I look at something like this, and I consider the implications of trust and confidence in the purchase process. And we look at this and we think, well, how does that apply, for example, for the design of — the lessons from this — apply to the design of online **services**, future **services** in these markets? This is a pair of underpants from — — from Tibet. And I look at something like this, and honestly, you know, why would someone design underpants with a pocket, right? And I look at something like this and it makes me question, if we were to take all the functionality in things like this, and redistribute them around the body in some kind of personal area network, how would we prioritize where to put stuff? And yes, this is quite **trivial**, but actually the lessons from this can apply to that kind of personal area networks. And what you see here is a couple of phone numbers written above the shack in rural Uganda. This doesn ’ t have house numbers. This has phone numbers. So what does it mean when people ’ s identity is **mobile**? When those extra three billion people ’ s identity is **mobile**, it isn ’ t fixed? Your notion of identity is out-of-date already, OK, for those extra three billion people. This is how it ' s shifting. And then I go to this picture here, which is the one that I started with. And this is from Delhi. It ' s from a study we did into illiteracy, and it ' s a guy in a teashop. You can see the chai being poured in the background. And he ' s a, you know, incredibly poor teashop worker, on the lowest rungs in the society. And he, somehow, has the appreciation of the values of Livestrong. And it ' s not necessarily the same values, but some kind of values of Livestrong, to actually go out and purchase them, and actually display them. For me, this kind of personifies this connected world, where everything is intertwined, and the dots are — it ' s all about the dots joining together. OK, the title of this presentation is"Connections and Consequences,"and it ' s really a kind of summary of five years of trying to figure out what it ' s going to be like when everyone on the planet has the ability to transcend space and time in a personal and convenient manner, right? When everyone ' s connected. And there are four things. So, the first thing is the immediacy of ideas, the speed at which ideas go around. And I know TED is about big ideas, but actually, the benchmark for a big idea is changing. If you want a big idea, you need to embrace everyone on the planet, that ' s the first thing. The second thing is the immediacy of objects. And what I mean by that is, as these become smaller, as the functionality that you can access through this becomes greater — things like banking, identity — these things quite simply move very quickly around the world. And so the speed of the adoption of things is just going to become that much more rapid, in a way that we just totally cannot conceive, when you get it to 6. 3 billion and the growth in the world ' s population. The next thing is that, however we design this stuff — carefully design this stuff — the street will take it, and will figure out ways to innovate, as long as it meets base needs — the ability to transcend space and time, for example. And it will innovate in ways that we cannot anticipate. In ways that, despite our resources, they can do it better than us. That ' s my feeling. And if we ' re smart, we ' ll look at this stuff that ' s going on, and we ' ll figure out a way to enable it to inform and infuse both what we design and how we design. And the last thing is that — actually, the direction of the conversation. With another three billion people connected, they want to be part of the conversation. And I think our relevance and TED ' s relevance is really about embracing that and learning how to listen, essentially. And we need to learn how to listen. So thank you very, very much.

Text Sample 251: POS Dim 2 – 2009 – Score 9.00 – 2009/t002967.txt

Okay, so 90 percent of my photographic process is, in fact, not photographic. It involves a campaign of letter writing, research and phone calls to access my subjects, which can range from Hamas leaders in Gaza to a hibernating black bear in its cave in West Virginia. And oddly, the most notable letter of rejection I ever received came from Walt Disney World, a seemingly innocuous site. And it read — I ' m just going to read a key sentence :"Especially during these violent times, I personally believe that the magical spell cast upon guests who visit our theme parks is particularly important to protect and helps to provide them with an important fantasy they can escape to."Photography threatens fantasy. They didn ' t want to let my camera in because it confronts constructed realities, myths and beliefs, and provides what appears to be evidence of a truth. But there are multiple truths attached to every image, depending on the creator ' s intention, the viewer and the context in which it is presented. Over a five year period following September 11th, when the American media and government were seeking hidden and unknown sites beyond its borders, most notably weapons of mass destruction, I chose to look inward at that which was integral to America ' s foundation, mythology and **daily** functioning. I wanted to confront the boundaries of the citizen, self-imposed and real, and confront the divide between privileged and public access to knowledge. It was a critical moment in American history and global history where one felt they didn ' t have access to accurate information. And I wanted to see the center with my own eyes, but what I came away with is a photograph. And it ' s just another place from which to **observe**, and the understanding that there are no absolute, all-knowing insiders. And the outsider can never really reach the core. I ' m going to run through some of the photographs in this series. It ' s titled,"An American Index of the Hidden and Unfamiliar,"and it ' s comprised of nearly 70 images. In this context I ' ll just show you a few. This is a nuclear waste storage and encapsulation facility at Hanford site in Washington State, where there are over 1, 900 stainless steel capsules containing nuclear waste submerged in water. A human standing in front of an unprotected capsule would die instantly. And I found one section amongst all of these that actually resembled the outline of the United States of America, which you can see here. And a big part of the work that is sort of absent in this context is text. So I create these two poles. Every image is accompanied with a very detailed factual text. And what I ' m most interested in is the invisible space between a text and its accompanying image, and how the image is transformed by the text and the text by the image. So, at best, the image is meant to float away into abstraction and multiple truths and fantasy. And then the text functions as this cruel anchor that kind of nails it to the ground. But in this context I ' m just going to read an abridged version of those texts. This is a cryopreservation unit, and it holds the bodies of the wife and mother of cryonics pioneer Robert Ettinger, who hoped to be awoken one day to extended life in good health, with advancements in science and technology, all for the cost of 35 thousand dollars, for forever. This is a 21-year-old Palestinian woman undergoing hymenoplasty. Hymenoplasty is a surgical procedure which restores the virginal state, allowing her to adhere to certain cultural expectations regarding virginity and marriage. So it essentially reconstructs a ruptured hymen, allowing her to bleed upon having sexual intercourse, to simulate the loss of virginity. This is a jury simulation deliberation room, and you can see beyond that two- way mirror jury advisers standing in a room behind the mirror. And they **observe** deliberations after mock **trial** proceedings so that they can better advise their clients how to adjust their **trial** strategy to have the outcome that they ' re hoping for. This process costs 60, 000 dollars. This is a U. S. Customs and Border Protection room, a contraband room, at John F. Kennedy International Airport. On that table you can see 48 hours ' worth of seized goods from passengers entering in to the United States. There is a pig ' s head and African cane rats. And part of my photographic work is I ' m not just documenting what ' s there. I do take certain liberties and intervene. And in this I really wanted it to resemble an early still-life painting, so I spent some time with the smells and items. This is the exhibited art on the walls of the CIA in Langley, Virginia, their original headquarters building. And the CIA has had a long history with both covert and public cultural diplomacy efforts. And it ' s speculated that some of their interest in the arts was designed to counter Soviet communism and promote what it considered to be pro-American thoughts and aesthetics. And one of the art forms that elicited the interest of the agency, and had thus come under question, is abstract expressionism. This is the Forensic Anthropology Research Facility, and on a six acre plot there are approximately 75 cadavers at any given time that are being studied by forensic anthropologists and **researchers** who are interested in monitoring a rate of corpse decomposition. And in this particular photograph the body of a young boy has been used to reenact a crime scene. This is the only federally funded site where it is legal to cultivate cannabis for scientific research in the United States. It ' s a research crop marijuana grow room. And part of the work that I hope for is that there is a sort of disorienting entropy where you can ' t find any discernible formula in how these things — they sort of awkwardly jump from government to science to religion to security — and you can ' t completely understand how information is being distributed. These are transatlantic submarine communication cables that travel across the floor of the Atlantic Ocean, connecting North America to Europe. They carry over 60 million simultaneous voice conversations, and in a lot of the government and technology sites there was just this very apparent vulnerability. This one is almost humorous because it feels like I could just snip all of that conversation in one easy cut. But stuff did feel like it could have been taken 30 or 40 years ago, like it was locked in the Cold War era and hadn ' t necessarily progressed. This is a Braille edition of Playboy magazine. And this is... a division of the Library of Congress produces a free national library **service** for the blind and visually impaired, and the **publications** they choose to publish are based on reader popularity. And Playboy is always in the top few. But you ' d be surprised, they don ' t do the photographs. It ' s just the text. This is an avian **quarantine** facility where all imported birds coming into America are required to undergo a 30-day **quarantine**, where they are tested for diseases including Exotic Newcastle Disease and Avian Influenza. This film shows the testing of a new explosive fill on a warhead. And the Air Armament Center at Eglin Air Force Base in Florida is responsible for the deployment and testing of all air-delivered weaponry coming from the United States. And the film was shot on 72 millimeter, government-issue film. And that red dot is a marking on the government-issue film. All living white tigers in North America are the result of selective inbreeding — that would be mother to son, father to daughter, sister to brother — to allow for the genetic conditions that create a salable white tiger. Meaning white fur, ice blue eyes, a pink nose. And the majority of these white tigers are not born in a salable state and are killed at birth. It ' s a very violent process that is little known. And the white tiger is obviously celebrated in several forms of entertainment. Kenny was born. He actually made it to adulthood. He has since passed away, but was mentally retarded and suffers from severe bone abnormalities. This, on a lighter note, is at George Lucas ' personal archive. This is the Death Star. And it ' s shown here in its true orientation. In the context of"Star Wars : Return of the Jedi,"its mirror image is presented. They flip the negative. And you can see the photoetched brass detailing, and the painted acrylic facade. In the context of the film, this is a deep-space battle station of the Galactic Empire, capable of annihilating planets and civilizations, and in reality it measures about four feet by two feet. This is at Fort Campbell in Kentucky. It ' s a Military Operations on Urbanized Terrain site. Essentially they ' ve simulated a city for urban combat, and this is one of the structures that exists in that city. It ' s called the World Church of God. It ' s supposed to be a generic site of worship. And after I took this photograph, they constructed a wall around the World Church of God to mimic the set-up of mosques in Afghanistan or Iraq. And I worked with Mehta Vihar who creates virtual simulations for the army for tactical **practice**. And we put that wall around the World Church of God, and also used the characters and vehicles and explosions that are offered in the video games for the army. And I put them into my photograph. This is live HIV virus at Harvard Medical School, who is working with the U. S. Government to develop sterilizing immunity. And Alhurra is a U. S. Government- sponsored Arabic language television network that distributes news and information to over 22 countries in the Arab world. It runs 24 hours a day, commercial free. However, it ’ s illegal to broadcast Alhurra within the United States. And in 2004, they developed a channel called Alhurra Iraq, which specifically deals with events occurring in Iraq and is broadcast to Iraq. Now I ’ m going to move on to another project I did. It ’ s titled”The Innocents.”And for the men in these photographs, photography had been used to create a fantasy. Contradicting its function as evidence of a truth, in these instances it furthered the fabrication of a lie. I traveled across the United States photographing men and women who had been wrongfully convicted of crimes they did not commit, violent crimes. I investigate photography ’ s ability to blur truth and fiction, and its influence on memory, which can lead to severe, even lethal consequences. For the men in these photographs, the primary cause of their wrongful conviction was mistaken identification. A victim or eyewitness identifies a suspected perpetrator through law enforcement ’ s use of images. But through exposure to composite sketches, Polaroids, mug shots and line-ups, eyewitness testimony can change. I ’ ll give you an example from a case. A woman was raped and presented with a series of photographs from which to identify her attacker. She saw some similarities in one of the photographs, but couldn ’ t quite make a positive identification. Days later, she is presented with another photo array of all new photographs, except that one photograph that she had some draw to from the earlier array is repeated in the second array. And a positive identification is made because the photograph replaced the memory, if there ever was an actual memory. Photography offered the criminal justice system a tool that transformed innocent citizens into criminals, and the criminal justice system failed to recognize the limitations of relying on photographic identifications. Frederick Daye, who is photographed at his alibi location, where 13 witnesses placed him at the time of the crime. He was convicted by an all-white jury of rape, kidnapping and vehicle theft. And he served 10 years of a life sentence. Now DNA exonerated Frederick and it also implicated another man who was serving time in prison. But the victim refused to press charges because she claimed that law enforcement had permanently altered her memory through the use of Frederick ’ s photograph. Charles Fain was convicted of kidnapping, rape and murder of a young girl walking to school. He served 18 years of a death sentence. I photographed him at the scene of the crime at the Snake River in Idaho. And I photographed all of the wrongfully convicted at sites that came to particular significance in the history of their wrongful conviction. The scene of arrest, the scene of misidentification, the alibi location. And here, the scene of the crime, it ’ s this place to which he ’ s never been, but changed his life forever. So photographing there, I was hoping to highlight the tenuous relationship between truth and fiction, in both his life and in photography. Calvin Washington was convicted of capital murder. He served 13 years of a life sentence in Waco, Texas. Larry Mayes, I photographed at the scene of arrest, where he hid between two mattresses in Gary, Indiana, in this very room to hide from the police. He ended up serving 18 and a half years of an 80 year sentence for rape and robbery. The victim failed to identify Larry in two live lineups and then made a positive identification, days later, from a photo array. Larry Youngblood served eight years of a 10 and half year sentence in Arizona for the abduction and repeated sodomizing of a 10 year old boy at a carnival. He is photographed at his alibi location. Ron Williamson. Ron was convicted of the rape and murder of a barmaid at a club, and served 11 years of a death sentence. I photographed Ron at a **baseball** field because he had been drafted to the Oakland A ’ s to play professional **baseball** just before his conviction. And the state ’ s key witness in Ron ’ s case was, in the end, the actual perpetrator. Ronald Jones served eight years of a death sentence for rape and murder of a 28-year-old woman. I photographed him at the scene of arrest in Chicago. William Gregory was convicted of rape and burglary. He served seven years of a 70 year sentence in Kentucky. Timothy Durham, who I photographed at his alibi location where 11 witnesses placed him at the time of the crime, was convicted of 3. 5 years of a 3220 year sentence, for several charges of rape and robbery. He had been misidentified by an 11-year-old victim. Troy Webb is photographed here at the scene of the crime in Virginia. He was convicted of rape, kidnapping and robbery, and served seven years of a 47 year sentence. Troy ' s picture was in a photo array that the victim tentatively had some draw toward, but said he looked too old. The police went and found a photograph of Troy Webb from four years earlier, which they entered into a photo array days later, and he was positively identified. Now I ' m going to leave you with a self portrait. And it reiterates that distortion is a constant, and our eyes are easily deceived. That ' s it. Thank you.

Text Sample 252: POS Dim 2 – 2009 – Score 9.00 – 2009/t002966.txt

I believe that there are new, hidden tensions that are actually happening between people and institutions â institutions that are the institutions that people inhabit in their **daily** life : schools, hospitals, **workplaces**, factories, offices, etc. And something that I see happening is something that I would like to call a sort of"democratization of intimacy."And what do I mean by that? I mean that what people are doing is, in fact, they are sort of, with their communication channels, they are breaking an imposed **isolation** that these institutions are imposing on them. How are they doing this? They ' re doing it in a very simple way, by calling their mom from work, by IMing from their office to their friends, by texting under the desk. The pictures that you ' re seeing behind me are people that I visited in the last few months. And I asked them to come along with the person they communicate with most. And somebody brought a boyfriend, somebody a father. One young woman brought her grandfather. For 20 years, I ' ve been looking at how people use channels such as email, the **mobile** phone, texting, etc. What we ' re actually going to see is that, fundamentally, people are communicating on a regular basis with five, six, seven of their most intimate sphere. Now, lets take some data. Facebook. Recently some sociologists from Facebook â Facebook is the channel that you would expect is the most enlargening of all channels. And an average user, said Cameron Marlow, from Facebook, has about 120 friends. But he actually talks to, has two-way exchanges with, about four to six people on a regular base, depending on his gender. Academic research on **instant** messaging also shows 100 people on buddy lists, but fundamentally people chat with two, three, four â anyway, less than five. My own research on cellphones and voice calls shows that 80 percent of the calls are actually made to four people. 80 percent. And when you go to Skype, it ' s down to two people. A lot of sociologists actually are quite disappointed. I mean, I ' ve been a bit disappointed sometimes when I saw this data and all this deployment, just for five people. And some sociologists actually feel that it ' s a closure, it ' s a cocooning, that we ' re disengaging from the public. And I would actually, I would like to show you that if we actually look at who is doing it, and from where they ' re doing it, actually there is an incredible social transformation. There are three stories that I think are quite good examples. The first gentleman, he ' s a baker. And so he starts working every morning at four o ' clock in the morning. And around eight o ' clock he sort of sneaks away from his oven, cleans his hands from the flour and calls his wife. He just wants to wish her a good day, because that ' s the start of her day. And I ' ve heard this story a number of times. A young factory worker who works night shifts, who manages to sneak away from the factory floor, where there is CCTV by the way, and find a corner, where at 11 o ' clock at night he can call his girlfriend and just say goodnight. Or a mother who, at four o ' clock, suddenly manages to find a corner in the toilet to check that her children are safely home. Then there is another couple, there is a Brazilian couple. They ' ve lived in Italy for a number of years. They Skype with their families a few times a week. But once a fortnight, they actually put the computer on their dining table, pull out the webcam and actually have dinner with their family in Sao Paulo. And they have a big event of it. And I heard this story the first time a couple of years ago from a very modest family of immigrants from Kosovo in Switzerland. They had set up a big screen in their living room, and every morning they had breakfast with their grandmother. But Danny Miller, who is a very good anthropologist who is working on Filipina migrant women who leave their children back in the Philippines, was telling me about how much parenting is going on through Skype, and how much these mothers are engaged with their children through Skype. And then there is the third couple. They are two friends. They chat to each other every day, a few times a day actually. And finally, finally, they ' ve managed to put **instant** messaging on their computers at work. And now, obviously, they have it open. Whenever they have a moment they chat to each other. And this is exactly what we ' ve been seeing with teenagers and kids doing it in school, under the table, and texting under the table to their friends. So, none of these cases are unique. I mean, I could tell you hundreds of them. But what is really exceptional is the **setting**. So, think of the three **settings** I ' ve talked to you about : factory, migration, office. But it could be in a school, it could be an administration, it could be a hospital. Three **settings** that, if we just step back 15 years, if you just think back 15 years, when you clocked in, when you clocked in to an office, when you clocked in to a factory, there was no contact for the whole duration of the time, there was no contact with your private sphere. If you were lucky there was a public phone hanging in the corridor or somewhere. If you were in management, oh, that was a different story. Maybe you had a direct line. If you were not, you maybe had to go through an operator. But basically, when you walked into those buildings, the private sphere was left behind you. And this has become such a **norm** of our professional lives, such a **norm** and such an expectation. And it had nothing to do with technical capability. The phones were there. But the expectation was once you moved in there your commitment was fully to the task at hand, fully to the people around you. That was where the focus had to be. And this has become such a cultural **norm** that we actually school our children for them to be capable to do this cleavage. If you think nursery, kindergarten, first years of school are just dedicated to take away the children, to make them used to staying long hours away from their family. And then the school enacts perfectly well. It mimics perfectly all the rituals that we will find in offices : rituals of entry, rituals of exit, the schedules, the uniforms in this country, things that identify you, team-building activities, team building that will allow you to basically be with a random group of kids, or a random group of people that you will have to be with for a number of time. And of course, the major thing : learn to pay attention, to concentrate and focus your attention. This only started about 150 years ago. It only started with the birth of modern bureaucracy, and of industrial revolution. When people basically had to go somewhere else to work and carry out the work. And when with modern bureaucracy there was a very rational approach, where there was a clear distinction between the private sphere and the public sphere. So, until then, basically people were living on top of their trades. They were living on top of the land they were laboring. They were living on top of the workshops where they were working. And if you think, it ' s permeated our whole culture, even our cities. If you think of medieval cities, medieval cities the boroughs all have the names of the guilds and professions that lived there. Now we have sprawling residential suburbias that are well distinct from production areas and commercial areas. And actually, over these 150 years, there has been a very clear class system that also has emerged. So the lower the status of the job and of the person carrying out, the more removed he would be from his personal sphere. People have taken this amazing possibility of actually being in contact all through the day or in all types of situations. And they are doing it massively. The Pew Institute, which produces good data on a regular basis on, for instance, in the States, says that â□□ and I think that this number is conservative â□□ 50 percent of anybody with email access at work is actually doing private email from his office. I really think that the number is conservative. In my own research, we saw that the **peak** for private email is actually 11 o ’ clock in the morning, whatever the country. 75 percent of people admit doing private conversations from work on their **mobile** phones. 100 percent are using text. The point is that this re-appropriation of the personal sphere is not terribly successful with all institutions. I ’ m always surprised the U. S. Army sociologists are discussing of the impact for instance, of soldiers in Iraq having **daily** contact with their families. But there are many institutions that are actually blocking this access. And every day, every single day, I read news that makes me cringe, like a $15 fine to kids in Texas, for using, every time they take out their **mobile** phone in school. Immediate dismissal to bus drivers in New York, if seen with a **mobile** phone in a hand. Companies blocking access to IM or to Facebook. Behind issues of security and safety, which have always been the arguments for social control, in fact what is going on is that these institutions are trying to decide who, in fact, has a right to self determine their attention, to decide, whether they should, or not, be isolated. And they are actually trying to block, in a certain sense, this movement of a greater possibility of intimacy.

Thirteen trillion dollars in wealth has evaporated over the course of the last two years. We ’ ve questioned the future of capitalism. We ’ ve questioned the **financial** industry. We ’ ve looked at our government oversight. We ’ ve questioned where we ’ re going. And yet, at the same time, this very well may be a seminal moment in American history, an opportunity for the consumer to actually take control and guide us to a new trajectory in America. I ’ m calling this The Great Unwind. And the idea is a simple, simple idea, which is the fact that the consumer has moved from a state of anxiety to **action**. Consumers who represent 72 percent of the GDP of America have actually started, just like banks and just like businesses, to de-leverage, to unwind their leverage in **daily** life, to remove themselves from the liability and risk that presents itself as they move forward. So, to understand this — and I ’ m going to **stress** this — it ’ s not about the consumer being in retreat. The consumer is empowered. To understand this, we ’ ll step back and look at what ’ s happened over the last year and a half. So if you ’ ve been gone, this is the CliffsNotes on what ’ s happened in the economy. Unemployment up. Housing values down. Equity markets down. Commodity prices are like this. If you ’ re a mom trying to manage a budget, and oil was 150 dollars a barrel last summer, and it ’ s somewhere between 50 and 70, do you plan **vacations**? How do you buy? What ’ s your strategy in your household? Will the bailout work? We have national debt, Detroit, currency valuations, health care — all these issues facing us. You put them all together, mix them up in a bouillabaisse, and you have consumer confidence that ' s basically a ticking time bomb. In fact, let ' s go back and look at what caused this crisis, because the consumer, all of us, in our **daily** lives, actually contributed a large part to the problem. This is something I call the 50-20 paradox. It took us 50 years to reach annual savings ratings of almost 10 percent. Fifty years. Do you know what this was right here? This was World War II. Do you know why savings was so high? There was nothing to buy, unless you wanted to buy some rivets. What happened, though, over the course of the last 20 years, we went from a 10 percent savings rate to a negative savings rate. Because we binged. We bought extra-large cars, supersized everything, we bought remedies for restless leg syndrome. All these things together basically created a factor where the consumer drove us headlong into the crisis that we face today. The personal debt-to-income ratio basically went from 65 to 135 percent in the span of about 15 years. So consumers got over-leveraged. And of course our banks did as well, as did our federal government. This is an absolutely staggering chart. It shows leverage, trended out from 1919 to 2009. And what you end up seeing is the whole phenomenon that we are actually stepping forth and basically leveraging future education, future children in our households. So if you look at this in the context of visualizing the bailout, what you can see is, if you stack up dollar bills, first of all, 360, 000 dollars is about the size of a five-foot-four guy. But if you stack it up, you see this amazing, staggering amount of dollars that have been put into the system to fund and bail us out. So this is the first 315 billion. But I read this fact the other day, that one trillion seconds equals 32, 000 years. So if you think about that, the context, the casualness with which we talk about trillion-dollar bailout here and trillion there, we are stacking ourselves up for long-term leverage. However, consumers have moved. They are taking responsibility. What we ' re seeing is an uptake in the savings rate. In fact, 11 straight months of savings have happened since the beginning of the crisis. We ' re working our way back up to that 10 percent. Also, remarkably, in the fourth quarter, spending dropped to its lowest level in 62 years — almost a 3. 7 percent decline. Visa now reports that more people are using debit cards than credit cards. So we ' re starting to pay for things with money that we have. And we ' re starting to be much more careful about how we save and invest. But that ' s not really the whole story, because this has also been a dramatic time of transformation. And you ' ve got to admit, over the last year and a half, consumers have been doing some weird things. It ' s pretty staggering, what we ' ve lived through. If you take into account that 80 percent of all Americans were born after World War II, this was essentially our Depression. And so, as a result, some crazy things have happened. I ' ll give you some examples. Let ' s talk about dentists, vasectomies, guns and shark attacks. Dentists report molars — people grinding their teeth, coming in and reporting that they ' ve had **stress**. So there ' s an increase in people having to have their fillings replaced. Gun sales, according to the FBI, who does background checks, are up almost 25 percent since January. Vasectomies are up 48 percent, according to the Cornell Institute. And lastly, but a very good point, hopefully not related to the former point I just made, which is that shark attacks are at their lowest level from 2003. Does anybody know why? No one ' s at the beach. So there ' s a bright side to everything. But seriously, what we see happening, and the reason I want to **stress** that the consumer is not in retreat, is that this is a tremendous opportunity for the consumer who drove us into this recession to lead us right back out. What I mean by that is we can move from mindless consumption to mindful consumption. Right? If you think about the last three decades, the consumer has moved from savvy about marketing in the ' 90s, to gathering all these amazing social and search tools in this decade. But the one thing holding them back is the ability to **discriminate**. By restricting their demand, consumers can actually align their values with their spending, and drive capitalism and business to not just be about more, but to be about better. We ' re going to explain that right now. Based on Y&R ' s BrandAsset Valuator, proprietary tool of VML and Young & Rubicam, we set out to understand what ' s been happening in the crisis with the consumer marketplace. We found a couple of really interesting things. We ' re going to go through four value shifts that we see driving new consumer behaviors, that offer new management principles. The first cultural value shift we see is this tendency toward something we call"liquid life."This is the movement from Americans defining their success on having things to having liquidity, because the less excess that you have around you, the more nimble and fleet of foot you are. As a result, dclass consumption is in. Dclass consumption is the whole idea that spending money frivolously makes you look a little bit anti-fashion. The management principle is dollars and cents. So let ' s look at some examples of this dclass consumption that falls out of this value. The first thing is, something must be happening when P. Diddy vows to tone down his bling. But seriously, we also have this phenomenon on Madison Avenue and in other places, where people are actually walking out of luxury boutiques with ordinary, generic paper bags to hide the brand purchases. We see high-end haggling in fashion today, high-end haggling for luxury and real estate. We also see just a relaxing of ego, and sort of a dismantling of artifice. This is a story on the yacht club that ' s all basically blue collar. Blue-collar yacht club — where you can join, but you ' ve got to work in the boatyard as condition of membership. We also see the trend toward tourism that ' s a little bit more low-key : agritourism — going to vineyards and going to farms. And then we also see this movement forward from dollars and cents. What businesses can do to connect with these new mindsets is really interesting. A couple things that are kind of cool. One is that Frito-Lay figured out this liquidity thing with their consumer. They found their consumer had more money at the beginning of the month, less at the end of the month. So they started to change their packaging : larger packs at the beginning of the month, smaller packaging at the end of the month. Really interestingly, too, was the San Francisco Giants. They ' ve just instituted dynamic pricing. It takes into account everything from the pitcher match-ups, to the weather, to the team records, in setting prices for the consumer. Another quick example of these types of movements is the rise of Zynga. Zynga has risen on the consumer ' s desire to not want to be locked in to fixed cost. Again, this theme is about variable cost, variable living. So micro-payments have become huge. And lastly, some people are using Hulu as a device to get rid of their cable bill. So, really clever ideas there that are being taken ahold of and that marketers are starting to understand. The second of the four values is this movement toward ethics and fair play. We see that play itself out with **empathy** and respect. The consumer is demanding it. And, as a result, businesses must provide not only value, but values. Increasingly, consumers are looking at the culture of the company, at their conduct in the marketplace. So we see with **empathy** and respect lots of really hopeful things come out of this recession. I ' ll give you a few examples. One is the rise toward communities and neighborhoods, and increased emphasis on your neighbors as your support system. Also, a wonderful by-product of a really lousy thing, which has been unemployment, is a rise in volunteerism that ' s been noted in our country. We also see the phenomenon — some of you may have"boomerang kids"— these are"boomerang alumni,"where universities are actually reconnecting with alumni and helping them with jobs, sharing skills and retraining. We also talked about character and professionalism. We had this miracle on the

Hudson in New York City in January, and suddenly Sully has become a key name on BabyCenter. So, from a value and values standpoint, what companies can do is connect in lots of different ways. Microsoft is doing something wonderful. They are actually vowing to retrain two million Americans with IT training, using their existing infrastructure to do something good. Also, a really interesting company is GORE-TEX. GORE-TEX is all about personal accountability of their management and their employees, to the point where they really kind of shun the idea of bosses. But they also talk about the fact that their executives — all of their expense reports are put onto their company intranet for everyone to see. Complete transparency. Think twice before you have that bottle of wine. The third of the four laws of post-crisis consumerism is about durable living. We ' re seeing in our data that consumers are realizing this is a marathon, not a sprint. They ' re digging in and looking for ways to extract value out of every purchase they make. Witness the fact that Americans are holding on to their cars longer than ever before : 9. 4 years on average, in March. A record. We also see the fact that libraries have become a huge resource for America. Did you know that 68 percent of Americans now carry a library card? The highest percentage ever in our nation ' s history. So what you see in this trend is also the accumulation of knowledge. Continuing education is up. Everything is focused on betterment, training, development and moving forward. We also see a big DIY movement. I was fascinated to learn that 30 percent of all homes in America are actually built by owners. That includes cottages and the like, but 30 percent. People are getting their hands dirty, rolling up their sleeves. They want these skills. We see it with the phenomenon of raising backyard hens, chickens and ducks. And when you work out the math, they say it doesn ' t work, but the principle is there ; it ' s about being sustainable and taking care of yourself. Then we look at the High Line in New York City, an excellent use of reimagining existing infrastructure for something good, which is a brand-new park in New York City. So what brands can do, and companies, is pay dividends to consumers, be a brand that lasts, offer transparency, promise you ' re going to be there beyond today ' s sale. Perfect example of that is Patagonia. Patagonia ' s"Footprint Chronicles"basically goes through and tracks every product they make, and gives you social responsibility, and helps you understand the ethics behind the product they make. Another great example is Fidelity. Rather than **instant** cash-back rewards on your credit or debit purchases, this is about 529 rewards for your student education. Or the interesting company Sunrun. I love this company. They ' ve created a consumer collective where they put solar panels on households and create a consumer-based utility, where the electricity they generate is basically pumped back out into the marketplace. So it ' s a consumer-driven co- op. The fourth post-crisis consumerism that we see is this movement about"return to the fold."It ' s incredibly important right now. Trust is not parceled out, as we all know. It ' s now about connecting to your communities, connecting to your social networks. In my book, I talked about the fact that 72 percent of people trust what other people say about a brand or a company, versus 15 percent on advertising. So in that respect, cooperative consumerism has really taken off. This is about consumers working together to get what they want out of the marketplace. Let ' s look at a couple of quick examples. The artisanal movement is huge : everything about locally derived products and **services**, supporting your local neighborhoods, whether it ' s cheeses, wines and other products. Also this rise of local currencies. Realizing that it ' s difficult to get loans in this environment, you ' re doing business with people you trust in your local markets. So this rise of local currency is another really interesting phenomenon. And then they did a recent report I thought was fascinating. They actually started, in certain communities in the United

States, to publish people ' s electricity usage. And what they found out is when that was available for public record, the people ' s electricity usage in those communities dropped. Then we also look at the idea of cow-pooling, which is the whole phenomenon of consumers organizing together to buy meat from organic farms, that they know is safe and controlled in the way that they want it to be controlled. And then there ' s this other really interesting movement in California, which is about carrot mobs. The traditional thing would be to boycott, right? Have a stick. Well, why not have a carrot? So these are consumers organizing, pooling their resources to incentify companies to do good. And then we look at what companies can do. This is all the opportunity about being a community organizer. You have to realize that you can ' t fight and control this. You actually need to organize it. You need to harness it. You need to give it meaning. And there ' s lots of really interesting examples here. First is just the rise of the fact that Zagat ' s has actually moved out of and diversified from rating restaurants, into actually rating health care. So what credentials does Zagat ' s have? Well, they have a lot, because it ' s their network of people. So that becomes a very powerful force for them to make their brand more elastic. Then you look at the phenomenon of Kogi. This Kogi doesn ' t exist. It ' s a moving truck. It ' s a moving truck through L. A., and the only way you can find it is through Twitter. Or you look at Johnson & Johnson ' s"Momversations,"a phenomenal blog that ' s been built up, where J&J basically is tapping into the power of mommy bloggers, allowing them to create a forum where they can communicate and connect. And it ' s also become a very valuable advertising revenue for J&J as well. This, plus the fact that you ' ve got phenomenal work from CEOs, from Ford to Zappos, connecting on Twitter, creating an open environment, allowing their employees to be part of the process, rather than hidden behind walls. You see this rising force in total transparency and openness that companies are starting to adopt, all because the consumer is demanding it. So when we look at this and step back, what I believe is that the crisis that exists today is definitely real. It ' s been tremendously powerful for consumers. But at the same time, this is also a tremendous opportunity. The Chinese character for crisis is actually the same side of the same coin. Crisis equals opportunity. What we ' re seeing with consumers right now is the ability for them to actually lead us forward out of this recession. So we believe that values-driven spending will force capitalism to be better : it will drive innovation ; it will make longer-lasting products ; it will create better, more intuitive customer **service** ; and it will give us the opportunity to connect with companies that share the values that we share. So when we look back and step out at this and see the beginning of these trends that we ' re seeing in our data, we see a very hopeful picture for the future of America. Thank you very much.

Text Sample 254: POS Dim 2 – 2025 – Score 5.00 – 2025/t003466.txt

Can you paint with all the colors of the wind? I love this song from the first time I heard it. I was 14, growing up in public housing in western Sydney. So maybe a little too old for this Disney classic from"Pocahontas."But it spoke to me. I saw something of myself in it. At this stage, I think I knew I was queer. I mean, come on, I was rocking out to Disney. And look at those glasses. Seriously, what a queer kid. But I was also from a Pacific Indigenous heritage with conservative views and values. I didn ' t feel like I could fit into any of the boxes that were being presented to me. Straight, gay, Fijian, Australian. I couldn ' t pick just one color to paint with. Prior to colonization, sexuality amongst many of our Pacific islands across the region was fluid. Men would have sex with men without the stigma or shame afforded it today. Sexual intimacy was a way of being able to connect socially and relationally. Sex wasn ’ t just for procreation. Or in marriage. It wasn ’ t exclusively monogamous. Just because you had sex with a man didn ’ t define your sexuality. It didn ’ t make you an outcast. But as Europeans started to colonize the Pacific region, they brought Christian missionaries with them. They told us to cover up our beautiful bodies. We were taught shame. We were told to stop **practicing** Pacifica cultures and values that were seen as provocative. To a Western and white perspective, our non-binary sexuality was **judged** as tribal, outdated, sinful and impossible to **practice** alongside a Christian faith. Still today, those who are Indigenous to the Pacific are negatively impacted by whiteness. That”white is right, West is best.”I was brought up to espouse strong Christian beliefs, views and values which would shape my burgeoning identity as an adult. From these staunch conservative views, I was taught to fear the queer. Those people that were seen as unusual and fruity. And in essence, I grew to despise a part of myself. I sought to separate my queerness from my identity. I could never see myself as part of that world. Growing up, biracial and bisexual constantly challenged the way I saw the world around me. I was unsure about my thinking, feelings and behaviors around liking males and females. I was unsure about my thinking, feelings and behaviors when it came to whether I needed to be a white Australian or a Fijian person. And whether this needed to be framed within a binary to choose one over the other. In this way, I don ’ t think that my story is unique. There ’ s plenty of people in the queer world that have escaped conservative upbringings, religions and cultures. But this is only part of my story. Another common story in the queer community is the coming-out story. When did you tell your parents? How did they react? How it liberated you or ultimately separated you from your family. But this didn ’ t feel like an option for me either. I believe that embedded in these particular stories, these tropes, is a part of dominant queer culture that made it very hard for me to access the queer world. For example, when I started to go to gay clubs, I would be lining up at the front of the club and often I would get door staff come up to me and go,”Sorry, you do know this is a gay club, right?”From these lived experiences, I feel that there is a whiteness that pervades queer culture. And I didn ’ t want to give up my identity and my appearance as a Pacific indigenous person to be queer. Pacifica cultures really, really value and esteem the collective above the individual. For Pacifica people, our families are inextricably connected to our own sense of self-agency, self-determination, self-esteem, self-love and self-worth. Our own individual identities are meshed and intertwined with our family ’ s reputation and standing in the community. Our mind, body and souls are inextricably connected to the broader community, to our families, to ourselves and to others. I didn ’ t want to come out to potentially ostracize myself, to make a point to separate myself from my Pacific and faith communities. I couldn ’ t then see my authentic self in any of these spaces. And a quick shout out to my son on the left-hand side. Round of applause for my son. He said to me this morning,”Daddy, make sure you mention me.”So I was like,”OK, son. Alright.”So there you go for the recording, son. And the rest are my other family, that ’ s up there as well. Across queer cultures and the broader community, we have learned to embrace our gender and sexual differences. We encourage individuals to be allies for each other and to support safe spaces for those that are seen to not fit in. We empower and really encourage individuals to really develop and express their self-agency, their self-determination, their self love, their self-worth. We boldly go into spaces striving to bring others with us to ensure that we can create inclusive societies for everyone. However, the dominant Western view in queer cultures is still based on the individual. Me, myself and I. And my individual pursuits towards **happiness**. As a queer Indigenous Pacific person, I feel that there are parts of queer culture that is white, feels very white. We may fail to see the importance of bringing our families and our cultural communities along our journey as queer people. It ’ s either the queer way or the highway. It ’ s one or the other. Young or old. Rich or poor. Smart or stupid. Masculine or feminine. Fit or fat. These binaries create a sense of us and them, those people. A binary approach and position that we generally in Western white societies use to determine the **norm**. We create, conflate, perpetuate binaries that create divisions in our society. Saints or sinner, straight or gay. I see it like this. Binaries are a very white and Western way of thinking, feeling and behaving. As individuals today, we live within these binaries and create identities that then create these labels. We use these labels to then define and confine people and places. We are one or the other. But what we fail to see is that our identities are more than a set of binaries. Our own identities are comprised of intersecting identifiers that contributes to who you are, including our age, class, color, education, gender, size, spirituality, sexuality, and so, so much more. We need to decolonize queerness, to live beyond”white is right, West is best.”Because if we don ’ t, we ’ re going to continue to create silos and divisions in our societies that don ’ t create inclusive and safe spaces for everyone. For Indigenous queer people, they shape our connection to community and culture, our families. If we don ’ t include that within our understanding of who we are, even as queer people, then we ’ re not able to be, again, our true and authentic selves. We ’ re not able to then be our fabulous selves as part of the queer community. And it ’ s really, really interesting because I believe that we can learn so much from pre-colonial cultures like those that were **practiced** in the Pacific, that provide a different way of looking at a society. A queer way that pre-dates all the privileges that go into binary ways of thinking, feeling and behaving. Across many of our Pacifica languages we have a lot of key concepts that help solidify and support a shared understanding of the collective. For example, in Fijian,”solesolevaki”is all about reciprocal living, where my wellbeing is your wellbeing. I will actively seek to ensure that your well-being and every part of your life is catered for, knowing that you will do the same for me. We strive to enact”veiqaravi,”as tatted here on my hand, to serve others. We strive to also embed and embold and empower people to **practice**”veirokovi,”respect for self and others where we are relationally driven, where that is so important to our spaces and places. My sense of ability to actually put this into **practice**, my ability to actually understand these Indigenous perspectives has greatly helped shape and reconcile my queer identity today. But what ’ s really interesting is that it ’ s not just queer communities that need to decolonize itself. It ’ s all of us as a broader society that needs to be part of a shared conversation to decolonize, deconstruct and disrupt binary ways of thinking, feeling and behaving. So how can we practically do that? **Practice** cultural humility, where you are constantly learning and embracing differences, where you get over yourselves and strive to learn about other people ’ s differences and how that can be meaningfully included in the way in which you create safe spaces for everyone. I also believe it ’ s possible to bring Indigenous perspectives into Western and white **workplaces**. For example, I ’ ve introduced the concept of”talanoa”in all of my work meetings. Talanoa is all about being able to create a safe space where everyone is able to contribute to a collective, collegial and collaborative conversation. Where people are able to bring their authentic selves into these spaces. Literally, I will chair meetings where I have no firm set agenda items and I literally would just hold space for participants just to bring themselves. So you can tell I ’ m a social worker, right? Safe space, safe space, safe space. It ’ s OK, it ’ s OK. But it ’ s through these safe spaces that people can bring their multiple, intersecting identifiers, including their age, their class, color, education, gender, size, spirituality, sexuality and so, so much more. I invite queer communities to come talanoa with Pacific Indigenous Communities to create robust and resilient queer cultures. I have been able to greatly reconcile my queer and Pacifica identities, which has now really been embraced to help shape how I see the world around me today. And it ’ s through these shared perspectives and approaches that we can truly embrace cultural diversity and its differences. And to know that people can live beyond those binaries and those labels we continue to perpetuate and perpetrate against others. It is a commitment from queer communities to decolonize queerness. It ’ s a commitment from me, from you and all of us to decolonize Western and white societies and to live beyond the binary way of thinking, feeling and behaving. I genuinely believe that it ’ s through this common goal that we can truly learn how to paint with all the colors of the wind.”Vinaka vakalevu”and thank you.

A Love Letter to my Garden by Debbie Millman In the beginning of time, there was no time. The universe began with every bit of energy contained in a very tiny, incredibly dense point. It was even smaller than this point. The point exploded with an unimaginable force and created everything we know and are made of. Seeds are a bit like that too. They ’ re tiny and densely packed with their entire existence. Time feels different now, while we shelter at home. Time is scary and uncertain. So we decided to plant some mint. We actually started a little garden a while ago, but now we have more time. We thought that these flowers had died, but they miraculously came back to life. A hopeful sign about the future, perhaps? We planted foxglove and it thrived. And then we went a little crazy. We planted tomatoes, carrots, beans, corn, lettuce and cucumbers, strawberries, blueberries and limes. It ’ s such a strange time in the world. There is so much beauty amidst so much fear. It ’ s so hard to know what to do. In the meantime, we watch and wait and remain grateful we ’ re able to make things with our hands. A love letter to New York City by Debbie Millman I ’ m a native New Yorker. I ’ ve lived here my entire life, yet the city never ceases to surprise me. Everywhere you look, there ’ s something to see. There is Tom Otterness underground and Lawrence Weiner underfoot. There are so many of us. Everyone wants to be someone. Everyone seeks to be heard. Everyone has an opinion, A point of view. And seemingly something to sell. But life is different now as we shelter at home. Under the same sky, at the same moment, at the same time. I ’ m thinking about how tough New York can be, how rough and unrelenting. But maybe that intensity is what fuels our tenacity. As we **navigate** through this crisis, I am hopeful we will find some solace together. A Love Letter to Travel by Debbie Millman My work has taken me all over the world. There have been many early departures, and many evenings in the air. In all my travels, I ’ ve been struck by so many things. I ’ ve **observed** how people lived in some of the most ancient places on the planet. This is Machu Picchu. This is Easter Island. This is Samoa. This is Angkor Wat. This is Petra in Jordan. The ancient city contained a church, a theater and tombs for the dead. Families lived in two and three-bedroom apartments. We ’ ve come a long way. Some of the structures that remain are rather mysterious, some are otherworldly, some are glorious odes to love, some house the souls of the dead. Some have forced us to choose sides. Some have succumbed to the power of nature. And some have not. The view from the sky is so abstract. It reveals our connections, our continuity and our scale. Nevertheless, it ’ s hard to see the big picture right now. It ’ s such a difficult time in the world as we pause and dismantle and rebuild our culture. I think back to my travels. I ’ ve seen how different we are, how diverse and distinct. But I ’ ve also seen our commonalities. How much worship means in Tibet, in Pakistan, in Italy, in China, in Cambodia and in Peru. How much peace means to our future. How much we regret the mistakes of our past. And now, insisting on what matters no matter what. There is still so much beauty in the world. So much love. I ’ m hopeful for the next generation. For every creature, large and small. And for the planet we call home. A Love Letter to Storytelling by Debbie Millman”A need to tell and hear stories is essential to the species Homo Sapiens. The sound of story is the dominant sound of our lives.”- Joseph Campbell I ’ ve loved telling stories all of my life. I ’ ve loved writing them and drawing them, and I love teaching my students how to make them. Now I conduct visual storytelling workshops all over the world. Over the years, the students have invented many new ways of expressing their stories. They tell their truths. They reveal secrets. They bare their souls. They share stories of pain, of feeling seen, of not being smart enough. Stories of being scared, feeling pretty or not. No matter where I teach, I ’ ve come to realize how many of their stories are universal. They convey so many shared experiences : rejection, judgment, insecurity, prejudice, forgetting and remembering. But there are also stories of hope, strength, awareness, courage and realizations. Their stories reflect who they really are, how deeply they want to feel connected. And now, as they share their visions for a more optimistic future, their stories are becoming the stories of our times.

- I don ’ t remember exactly, but... I use the most expensive hair color in the world. It ’ s not that I care about the money, it ’ s that I care about my hair. It ’ s not just the color. I expect great color. What ’ s worth more to me is the way my hair feels. Feels good around my neck. I can ’ t remember it. I can ’ t finish it all. If only we had more time. - Why don ’ t we have more time? - I ’ m dying. I ’ m croaking! - It ’ s tough, coming home. But this is what you do for a parent that you love. But, you know? She ’ s not my mother. Technically. In my own family, there ’ s a lot of dysfunction, a lot of mental illness, a lot of substance abuse. Every generation. My parents divorced when I was about five. My mother moved us out of state, so we had to fly to New York to see my father ’ cause he was already working in advertising, and New York was the only place to be. - Many of the commercials you see on television begin life here. - Advertising is one of the main sources of messaging about who you should be. - Nowadays, most of you women lead two lives, combining homemaking with the role of glamorous hostess. - And in the ’ 60s, the **ads** were often made from a male point of view. - In the pre-production meeting, everybody who has anything to do with the commercial is there. - It was mostly men. These superstar art directors and writers. Like my father, Gene Case.”Mad Men”was like home movies, and he was Don Draper. He was very witty, but I don ’ t think my father realized how powerful his words were. He knew it professionally. But with his kids, he could be incredibly cutting. Flay you just with a phrase. But it ’ s the time with my mother that was the nightmare. She had a horrible childhood, but she sure as hell didn ’ t make any effort to overcome that in her relations with us. You know, it was really horrifying to my mother that I was not popular. But I was also really awkward because she had been undermining my confidence for all my life. She would pick apart your personality in detail. I was lazy, I looked bad, I acted bad, I was awkward. Emotionally, just out for blood.

At a certain point in the night, I would know,”OK, the situation is dangerous. I need to get outta here.”I had this fantasy when I was in fourth grade that I vividly remember that some kind of outside agency was gonna come in and determine from all the salt on my pillow that I was crying myself to sleep every night and do something about it. No, it was awful. It was awful. And that was the point where Ilon came into my life. - Ilon, do you need anything to eat? - I don ’ t think so, but look up this wallpaper, Waverly Fabrics, and see if they have a rose pattern. - OK. Oh, what about this one here? - That ’ s not it. - No? - No, first of all, I was an art dir... I was a creative director at an advertising agency. The first thing I know is what I ’ m looking at. Ilon the girl. I don ’ t remember particularly being into advertising, but somehow I found myself in it. And I seemed to be very good at it. First of all, I ’ d always listened to everybody. And I noticed that I saw things differently than other people. - Women could get somewhere in advertising, but they were marginalized. - Women were given a lesser role. All the men were always arguing with you and always taking credit. - And one of the things that was coming through loud and clear is that women are for men. - Glory, glory, hallelujah Glory, glory, hallelujah Glory, glory, hallelujah His truth is marching on - Men were always the ones who everyone was pleasing. - What will your eyes say to him tonight? Wait till the fellas take a look at this plunging backline. - You look at **ads** from that period, and it ’ s jaw-dropping. - This is one of our nation ’ s most beautiful sights, the kind of girl who keeps her figure. - But that ’ s what feminism was pushing back against. - I was a feminist. I knew women were equal if not superior to men from the time I was a little girl. - And in advertising, she wanted to be a trailblazer that way. At one point, she worked in the same agency with my father, and that ’ s how they met. - He was a good writer, and I was a good writer. I liked the fact that he was good at what he did and cared about it. We got engaged, and then we got married. - I ’ m sitting there in the background. I ’ m grinning. I ’ m so thrilled because I adored her instantly. I thought she was **super** cool. And she treated me like I mattered. - She was a sweet little girl, and she deserved some caretaking. My mother was kinda terrible, so I knew that she needed support, and I gave her support. And that was what we did. - She was interested in me. She listened to me. Treated me like I was lovable. - She didn ’ t have anyone to recognize her being, to support her, to see who she could be, who she was. - She was very interested in what I would do with my life, and the assumption was that it would be something worthwhile. She just went way, way beyond the call of duty to make me feel like I was worth it. And she did that for a lot of other women, too. - I was working at McCann Erickson. We were given an assignment. L ’ Oréal, they wanted a campaign for Preference, it ’ s a hair color. - She ’ s in this room full of men brainstorming for this **ad**. - The men were busy flirting with the women, telling us we all looked like models and we didn ’ t look like advertising people, you know? - They ’ re like,”Oh, this woman is gonna be standing by an open window, and the wind will be blowing the curtains.”And she ’ s thinking, you know, this is just making the woman totally an object. - I was feeling angry. I ’ m not interested in writing anything about looking good for men. Fuck ’ em. Fuck you too. - Why fuck me? - Well, you ’ re a man. - Yeah, but I ’ m here trying to help you tell your story. - Yeah, that ’ s good. I like that part. I was pissed. We weren ’ t there to just dance for the men. - It is what she said. She just thought,”Fuck you.”And wrote this. - I just opened my eyes and knew. Because I ’ m worth it. The campaign got approved, but all the men were always telling you that you were doing something wrong or they knew how to do it better. - The agency insisted on a male voiceover. - She uses the most expensive hair color in the world, Preference by L ’ Oréal. - You know, it was just totally different. - Smooth and silky, but with body. It feels good against her neck. Actually, she doesn ’ t mind spending more for L ’ Oréal. Because she ’ s worth it. - It was wrong. This was not for men but for women and for other human beings. - I use the most expensive hair color in the world, Preference by L ’ Oréal. It ’ s not that I care about the money, it ’ s that I care about my hair. It ’ s not just the color, I expect great color. What ’ s worth more to me is the way my hair feels. Smooth and silky, but with body. It feels good against my neck. Actually, I don ’ t mind spending more for L ’ Oréal. Because I ’ m worth it. - I wrote that. - It was everywhere. It was a national campaign. - Yes, it ’ s expensive, but I ’ m worth it. - What they realized after they started running it was that that was only the tip of the iceberg. - It was supporting women, finally. - And I ’ m worth it. And I ’ m worth it. I ’ m worth it. - It ’ s a four-word feminist manifesto, defying this social pressure to think about yourself in relation to men. - You ’ re worth it. I ’ m worth it. I ’ m worth it. - It was a very big success. - At a certain point, L ’ Oréal adopted it as the tagline for their entire business. - Parce que je le vaux bien. - Even today, that ’ s their motto. - Because I ’ m worth it. - ’ Cause you ’ re worth it. - You ’ re worth it. - We ’ re worth it. - And I ’ m worth it. - She wrote the most influential tagline in women ’ s beauty advertising. - I ’ m worth it. - It ’ s magic, that phrase. - Those words just get better with age, don ’ t they? - I ’ m worth it. Because you are and always will be. - She came up with that line because she believed it. She believed it about herself, and she believed that women should believe it. She did that for me. You know, even after they split up, she was still a big part of my life. I ’ ve always kind of felt like I dodged a bullet that I have watched take down other members of my family. She saved me. And today, I am a professor of English at Williams College. I teach Victorian literature, and I also teach women ’ s, gender and sexuality studies. She was my mother. She also taught me how to be a mother. I had been very uncertain about motherhood for myself because my role model for that was so nightmarish. But Ilon really taught me, I can do this. I can be a good mother. She made me believe that I was worth it. And I was not either the first or the last. - I have to go away now. Go to my room. - It ’ s been lovely. - It ’ s been lovely. Oh... I ’ m not interested in advertising. I don ’ t give a shit. It wasn ’ t like it was my whole life. It was just a portion. It ’ s about humans ; it ’ s not about advertising. It ’ s about caring for people because... we ’ re all worth it, or no one is worth it.

I ’ m going to go right into the slides. And all I ’ m going to try and prove to you with these slides is that I do just very straight stuff. And my ideas are â□□ in my head, anyway â□□ they ’ re very logical and relate to what ’ s going on and problem solving for clients. I either convince clients at the end that I solve their problems, or I really do solve their problems, because usually they seem to like it. Let me go right into the slides. Can you turn off the light? Down. I like to be in the dark. I don ’ t want you to see what I ’ m doing up here. Anyway, I did this house in Santa Monica, and it got a lot of notoriety. In fact, it appeared in a porno comic book, which is the slide on the right. This is in Venice. I just show it because I want you to know I ’ m concerned about context. On the left-hand side, I had the context of those little houses, and I tried to build a building that fit into that context. When people take pictures of these buildings out of that context they look really weird, and my premise is that they make a lot more sense when they ’ re photographed or seen in that space. And then, once I deal with the context, I then try to make a place that ’ s comfortable and private and fairly serene, as I hope you ’ ll find that slide on the right. And then I did a law school for Loyola in downtown L. A. I was concerned about making a place for the study of law. And we continue to work with this client. The building on the right at the top is now under construction. The garage on the right â the gray structure â will be torn down, finally, and several small classrooms will be placed along this avenue that we ’ ve created, this campus. And it all related to the clients and the students from the very first meeting saying they felt denied a place. They wanted a sense of place. And so the whole idea here was to create that kind of space in downtown, in a neighborhood that was difficult to fit into. And it was my theory, or my point of view, that one didn ’ t upstage the neighborhood â one made accommodations. I tried to be inclusive, to include the buildings in the neighborhood, whether they were buildings I liked or not. In the ’ 60s I started working with paper furniture and made a bunch of stuff that was very successful in Bloomingdale ’ s. We even made flooring, walls and everything, out of cardboard. And the success of it threw me for a loop. I couldn ’ t deal with the success of furniture â I wasn ’ t secure enough as an architect â and so I closed it all up and made furniture that nobody would like. So, nobody would like this. And it was in this, preliminary to these pieces of furniture, that Ricky and I worked on furniture by the slice. And after we failed, I just kept failing. The piece on the left â and that ultimately led to the piece on the right â happened when the kid that was working on this took one of those long strings of stuff and folded it up to put it in the wastebasket. And I put a piece of tape around it, as you see there, and realized you could sit on it, and it had a lot of resilience and strength and so on. So, it was an accidental discovery. I got into fish. I mean, the story I tell is that I got mad at postmodernism â at po-mo â and said that fish were 500 million years earlier than man, and if you ’ re going to go back, we might as well go back to the beginning. And so I started making these funny things. And they started to have a life of their own and got bigger â as the one glass at the Walker. And then, I sliced off the head and the tail and everything and tried to translate what I was learning about the form of the fish and the movement. And a lot of my architectural ideas that came from it â accidental, again â it was an intuitive kind of thing, and I just kept going with it, and made this proposal for a building, which was only a proposal. I did this building in Japan. I was taken out to dinner after the contract for this little restaurant was signed. And I love sake and Kobe and all that stuff. And after I got â I was really drunk â I was asked to do some sketches on napkins. And I made some sketches on napkins â little boxes and Morandi-like things that I used to do. And the client said,”Why no fish?”And so I made a drawing with a fish, and I left Japan. Three weeks later, I received a complete set of drawings saying we ’ d won the competition. Now, it ’ s hard to do. It ’ s hard to translate a fish form, because they ’ re so beautiful â perfect â into a building or object like this. And Oldenburg, who I work with a little once in a while, told me I couldn ’ t do it, and so that made it even more exciting. But he was right â I couldn ’ t do the tail. I started to get the head OK, but the tail I couldn ’ t do. It was pretty hard. The thing on the right is a snake form, a ziggurat. And I put them together, and you walk between them. It was a dialog with the context again. Now, if you saw a picture of this as it was published in Architectural Record â they didn ’ t show the context, so you would think,”God, what a pushy guy this is.”But a friend of mine spent four hours wandering around here looking for this restaurant. Couldn ’ t find it. So... As for craft and technology and all those things that you ’ ve all been talking about, I was thrown for a complete loop. This was built in six months. The way we sent drawings to Japan : we used the magic computer in Michigan that does carved models, and we used to make foam models, which that thing scanned. We made the drawings of the fish and the scales. And when I got there, everything was perfect â except the tail. So, I decided to cut off the head and the tail. And I made the object on the left for my show at the Walker. And it ' s one of the nicest pieces I ' ve ever made, I think. And then Jay Chiat, a friend and client, asked me to do his headquarters building in L. A. For reasons we don ' t want to talk about, it got delayed. Toxic waste, I guess, is the key clue to that one. And so we built a temporary building â I ' m getting good at temporary â and we put a conference room in that ' s a fish. And, finally, Jay dragged me to my hometown, Toronto, Canada. And there is a story â it ' s a real story â about my grandmother buying a carp on Thursday, bringing it home, putting it in the bathtub when I was a kid. I played with it in the evening. When I went to sleep, the next day it wasn ' t there. And the next night, we had gefilte fish. And so I set up this interior for Jay ' s offices and I made a pedestal for a sculpture. And he didn ' t buy a sculpture, so I made one. I went around Toronto and found a bathtub like my grandmother ' s, and I put the fish in. It was a joke. I play with funny people like [Claes] Oldenburg. We ' ve been friends for a long time. And we ' ve started to work on things. A few years ago, we did a performance piece in Venice, Italy, called"Il Corso del Coltello"â the Swiss Army knife. And most of the imagery is â Claes ', but those two little boys are my sons, and they were Claes ' assistants in the play. He was the Swiss Army knife. He was a souvenir salesman who always wanted to be a painter, and I was Frankie P. Toronto. P for Palladio. Dressed up like the AT&T building by Claes â with a fish hat. The highlight of the performance was at the end. This beautiful object, the Swiss Army knife, which I get credit for participating in. And I can tell you â it ' s totally an Oldenburg. I had nothing to do with it. The only thing I did was, I made it possible for them to turn those blades so you could sail this thing in the canal, because I love sailing. We made it into a sailing craft. I ' ve been known to mess with things like chain link fencing. I do it because it ' s a curious thing in the culture, when things are made in such great quantities, absorbed in such great quantities, and there ' s so much denial about them. People hate it. And I ' m fascinated with that, which, like the paper furniture â it ' s one of those materials. And I ' m always drawn to that. And so I did a lot of dirty things with chain link, which nobody will forgive me for. But Claes made homage to it in the Loyola Law School. And that chain link is really expensive. It ' s in perspective and everything. And then we did a camp together for children with cancer. And you can see, we started making a building together. Of course, the milk can is his. But we were trying to collide our ideas, to put objects next to each other. Like a Morandi â like the little bottles â composing them like a still life. And it seemed to work as a way to put he and I together. Then Jay Chiat asked me to do this building on this funny lot in Venice, and I started with this three-piece thing, and you entered in the middle. And Jay asked me what I was going to do with the piece in the middle. And he pushed that. And one day I had a â oh, well, the other way. I had the binoculars from Claes, and I put them there, and I could never get rid of them after that. Oldenburg made the binoculars incredible when he sent me the first model of the real proposal. It made my building look sick. And it was this interaction between that kind of, up-the-ante stuff that became pretty interesting. It led to the building on the left. And I still think the Time magazine picture will be of the binoculars, you know, leaving out the â what the hell. I use a lot of metal in my work, and I have a hard time connecting with the craft. The whole thing about my house, the whole use of rough carpentry and everything, was the frustration with the crafts available. I said,"If I can ' t get the craft that I want, I ' ll use the craft I can get."There were plenty of models for that, in Rauschenberg and Jasper Johns, and many artists who were making beautiful art and sculpture with junk materials. I went into the metal because it was a way of building a building that was a sculpture. And it was all of one material, and the metal could go on the roof as well as the walls. The metalworkers, for the most part, do ducts behind the ceilings and stuff. I was given an opportunity to design an exhibit for the metalworkers ’ unions of America and Canada in Washington, and I did it on the condition that they become my partners in the future and help me with all future metal buildings, etc. etc. And it ’ s working very well to have these people, these craftsmen, interested in it. I just tell the stories. It ’ s a way of connecting, at least, with some of those people that are so important to the realization of architecture. The metal continued into a building â Herman Miller, in Sacramento. And it ’ s just a complex of factory buildings. And Herman Miller has this philosophy of having a place â a people place. I mean, it ’ s kind of a trite thing to say, but it is real that they wanted to have a central place where the cafeteria would be, where the people would come and where the people working would interact. So it ’ s out in the middle of nowhere, and you approach it. It ’ s copper and galvanize. I used the galvanize and copper in a very light gauge, so it would buckle. I spent a lot of time undoing Richard Meier ’ s aesthetic. Everybody ’ s trying to get the panels perfect, and I always try to get them sloppy and fuzzy. And they end up looking like stone. This is the central area. There ’ s a ramp. And that little dome in there is a building by Stanley Tigerman. Stanley was instrumental in my getting this job. And when I was awarded the contract I, at the very beginning, asked the client if they would let Stanley do a cameo piece with me. Because these were ideas that we were talking about, building things next to each other, making â it ’ s all about [a] metaphor for a city, maybe. And so Stanley did the little dome thing. And we did it over the phone and by fax. He would send me a fax and show me something. He ’ d made a building with a dome and he had a little tower. I told him,”No, no, that ’ s too ongepotchket. I don ’ t want the tower.”So he came back with a simpler building, but he put some funny details on it, and he moved it closer to my building. And so I decided to put him in a depression. I put him in a hole and made a kind of a hole that he sits in. And so then he put two bridges â this all happened on the fax, going back and forth over a couple of weeks ’ period. And he put these two bridges with pink guardrails on it. And so then I put this big billboard behind it. And I call it,”David and Goliath.”And that ’ s my cafeteria. In Boston, we had that old building on the left. It was a very prominent building off the freeway, and we added a floor and cleaned it up and fixed it up and used the kind of â I thought â the language of the neighborhood, which had these cornices, projecting cornices. Mine got a little exuberant, but I used lead copper, which is a beautiful material, and it turns green in 100 years. Instead of, like, copper in 10 or 15. We redid the side of the building and re-proportioned the windows so it sort of fit into the space. And it surprised both Boston and myself that we got it approved, because they have very strict kind of design guideline, and they wouldn ’ t normally think I would fit them. The detailing was very careful with the lead copper and making panels and fitting it tightly into the fabric of the existing building. In Barcelona, on Las Ramblas for some film festival, I did the Hollywood sign going and coming, made a building out of it, and they built it. I flew in one night and took this picture. But they made it a third smaller than my model without telling me. And then more metal and some chain link in Santa Monica â a little shopping center. And this is a laser laboratory at the University of Iowa, in which the fish comes back as an abstraction in the back. It ’ s the support labs, which, by some coincidence, required no windows. And the shape fit perfectly. I just joined the points. In the curved part there ’ s all the mechanical equipment. That solid wall behind it is a pipe chase â a pipe canyon â and so it was an opportunity that I seized, because I didn ’ t have to have any protruding ducts or vents or things in this form. It gave me an opportunity to make a sculpture out of it. This is a small house somewhere. They ’ ve been building it so long I don ’ t remember where it is. It ’ s in the West Valley. And we started with the stream and built the house along the stream â dammed it up to make a lake. These are the models. The reality, with the lake â the workmanship is pretty bad. And it reminded me why I play defensively in things like my house. When you have to do something really cheaply, it ’ s hard to get perfect corners and stuff. That big metal thing is a passage, and in it is â you go downstairs into the living room and then down into the bedroom, which is on the right. It ’ s kind of like a whole built town. I was asked to do a hospital for schizophrenic adolescents at Yale. I thought it was fitting for me to be doing that. This is a house next to a Philip Johnson house in Minnesota. The owners had a dilemma â they asked Philip to do it. He was too busy. He didn ’ t recommend me, by the way. We ended up having to make it a sculpture, because the dilemma was, how do you build a building that doesn ’ t look like the language? Is it going to look like this beautiful estate is sub-divided? Etc. etc. You ’ ve got the idea. And so we finally ended up making it. These people are art collectors. And we finally made it so it appears very sculptural from the main house and all the windows are on the other side. And the building is very sculptural as you walk around it. It ’ s made of metal and the brown stuff is Fin-Ply â it ’ s that formed lumber from Finland. We used it at Loyola on the chapel, and it didn ’ t work. I keep trying to make it work. In this case we learned how to detail it. In Cleveland, there ’ s Burnham Mall, on the left. It ’ s never been finished. Going out to the lake, you can see all those new buildings we built. And we had the opportunity to build a building on this site. There ’ s a railroad track. This is the city hall over here somewhere, and the courthouse. And the centerline of the mall goes out. Burnham had designed a railroad station that was never built, and so we followed. Sohio is on the axis here, and we followed the axis, and they ’ re two kind of goalposts. And this is our building, which is a corporate headquarters for an insurance company. We collaborated with Oldenburg and put the newspaper on top, folded. The health club is fastened to the garage with a C-clamp, for Cleveland. You drive down. So it ’ s about a 10-story C-clamp. And all this stuff at the bottom is a museum, and an idea for a very fancy automobile entry. This owner has a pet peeve about bad automobile entries. And this would be a hotel. So, the centerline of this thing â we ’ d preserve it, and it would start to work with the scale of the new buildings by Pelli and Kohn Pederson Fox, etc., that are underway. It ’ s hard to do high-rise. I feel much more comfortable down here. This is a piece of property in Brentwood. And a long time ago, about ’ 82 or something, after my house â I designed a house for myself that would be a village of several pavilions around a courtyard â and the owner of this lot worked for me and built that actual model on the left. And she came back, I guess wealthier or something â something happened â and asked me to design a house for her on this site. And following that basic idea of the village, we changed it as we got into it. I locked the house into the site by cutting the back end â here you see on the photographs of the site â slicing into it and putting all the bathrooms and dressing rooms like a retaining wall, creating a lower level zone for the master bedroom, which I designed like a kind of a barge, looking like a boat. And that ’ s it, built. The dome was a request from the client. She wanted a dome somewhere in the house. She didn ’ t care where. When you sleep in this bedroom, I hope â I mean, I haven ’ t slept in it yet. I ’ ve offered to marry her so I could sleep there, but she said I didn ’ t have to do that. But when you ’ re in that room, you feel like you ’ re on a kind of barge on some kind of lake.

And it ’ s very private. The landscape is being built around to create a private garden. And then up above there ’ s a garden on this side of the living room, and one on the other side. These aren ’ t focused very well. I don ’ t know how to do it from here. Focus the one on the right. It ’ s up there. Left â it ’ s my right. Anyway, you enter into a garden with a beautiful grove of trees. That ’ s the living room. Servants ’ quarters. A guest bedroom, which has this dome with marble on it. And then you enter into the living room and then so on. This is the bedroom. You come down from this level along the stairway, and you enter the bedroom here, going into the lake. And the bed is back in this space, with windows looking out onto the lake. These Stonehenge things were designed to give foreground and to create a greater depth in this shallow lot. The material is lead copper, like in the building in Boston. And so it was an intent to make this small piece of land â it ’ s 100 by 250 â into a kind of an estate by separating these areas and making the living room and dining room into this pavilion with a high space in it. And this happened by accident that I got this right on axis with the dining room table. It looks like I got a Baldessari painting for free. But the idea is, the windows are all placed so you see pieces of the house outside. Eventually this will be screened â these trees will come up â and it will be very private. And you feel like you ’ re in your own kind of village. This is for Michael Eisner â Disney. We ’ re doing some work for him. And this is in Anaheim, California, and it ’ s a freeway building. You go under this bridge at about 65 miles an hour, and there ’ s another bridge here. And you ’ re through this room in a split second, and the building will sort of reflect that. On the backside, it ’ s much more humane â entrance, dining hall, etc. And then this thing here â I ’ m hoping as you drive by you ’ ll hear the picket fence effect of the sound hitting it. Kind of a fun thing to do. I ’ m doing a building in Switzerland, Basel, which is an office building for a furniture company. And we **struggled** with the image. These are the early studies, but they have to sell furniture to normal people, so if I did the building and it was too fancy, then people might say,”Well, the furniture looks OK in his thing, but no, it ain ’ t going to look good in my normal building.”So we ’ ve made a kind of pragmatic slab in the second phase here, and we ’ ve taken the conference facilities and made a villa out of them so that the communal space is very sculptural and separate. And you ’ re looking at it from the offices and you create a kind of interaction between these pieces. This is in Paris, along the Seine. Palais des Sports, the Gare de Lyon over here. The Minister of Finance â the guy that moved from the Louvre â goes in here. There ’ s a new library across the river. And back in here, in this already treed park, we ’ re doing a very dense building called the American Center, which has a theater, apartments, dance school, an art museum, restaurants and all kinds of â it ’ s a very dense program â bookstores, etc. In a very tight, small â this is the ground level. And the French have this extraordinary way of screwing things up by taking a beautiful site and cutting the corner off. They call it the plan coupe. And I **struggled** with that thing â how to get around the corner. These are the models for it. I showed you the other model, the one â this is the way I organized myself so I could make the drawing â so I understood the problem. I was trying to get around this plan coupe â how do you do it? Apartments, etc. And these are the kind of study models we did. And the one on the left is pretty awful. You can see why I was ready to commit suicide when this one was built. But out of it came finally this resolution, where the elevator piece worked frontally to this, parallel to this street, and also parallel to here. And then this kind of twist, with this balcony and the skirt, kind of like a ballerina lifting her skirt to let you into the foyer. The restaurants here â the apartments and the theater, etc. So it would all be built in stone, in

French limestone, except for this metal piece. And it faces into a park. And the idea was to make this express the energy of this. On the side facing the street it ’ s much more normal, except I slipped a few mansards down, so that coming on the point, these housing units made a gesture to the corner. And this will be some kind of high-tech billboard. If any of you guys have any ideas for it, please contact me. I don ’ t know what to do. Jay Chiat is a glutton for punishment, and he hired me to do a house for him in the Hamptons. And it ’ s got a fish. And I keep thinking,”This is going to be the last fish.”It ’ s like a drug addict. I say,”I ’ m not going to do it anymore â I don ’ t want to do it anymore â I ’ m not going to do it.”And then I do it. There it is. But it ’ s the living room. And this piece here is â I don ’ t know what it is. I just added it so that we ’ d have enough money in the budget so we could take something out. This is Euro Disney, and I ’ ve worked with all of the guys that presented to you earlier. We ’ ve had a lot of fun working together. I think I ’ m from Mars for them, and they are for me, but somehow we all manage to work together, and I think, productively. So far. This is a shopping thing. You come into the Magic Kingdom and the hotel that Tony Baxter ’ s group is doing out here. And then this is a kind of a shopping mall, with a rodeo and restaurants. And another restaurant. What I did â because of the Paris skies being quite dull, I made a light grid that ’ s perpendicular to the train station, to the route of the train. It looks like it ’ s kind of been there, and then crashed all these simpler forms into it. The light grid will have a light, be lit up at night and give a kind of light ceiling. In Switzerland â Germany, actually â on the Rhine across from Basel, we did a furniture factory and a furniture museum. And I tried to â there ’ s a Nick Grimshaw building over here, there ’ s an Oldenburg sculpture over here â I tried to make a relationship urbanistically. And I don ’ t gave good slides to show â it ’ s just been completed â but this piece here is this building, and these pieces here and here. And as you pass by it ’ s always part â you see it as all of these pieces accrue and become part of an overall neighborhood. It ’ s plaster and just zinc. And you wonder, if this is a museum, what it ’ s going to be like inside? If it ’ s going to be so busy and crazy that you wouldn ’ t show anything, and just wait. I ’ m so cunning and clever â I made it quiet and wonderful. But on the outside it does scream out at you a bit. It ’ s actually basically three square rooms with a couple of skylights and stuff. And from the building in the back, you see it as an iceberg floating by in the hills. I know I ’ m over time. See, that skylight goes down and becomes that one. So it ’ s pretty quiet inside. This is the Disney Hall â the concert hall. It ’ s a complicated project. It has a chamber hall. It ’ s related to an existing Chandler Pavilion that was built with a lot of love and tears and caring. And it ’ s not a great building, but I approached it optimistically, that we would make a compositional relationship between us that would strengthen both of us. And the plan of this â it ’ s a concert hall. This is the foyer, which is kind of a garden structure. There ’ s commercial at the ground floor. These are offices, which, really, in the competition, we didn ’ t have to design. But finally, there ’ s a hotel there. These were the kind of relationships made to the Chandler, composing these elevations together and relating them to the buildings that existed â to MOCA, etc. The acoustician in the competition gave us criteria, which led to this compartmentalized scheme, which we found out after the competition would not work at all. But everybody liked these forms and liked the space, and so that ’ s one of the problems of a competition. You have to then try and get that back in some way. And we studied many models. This was our original model. These were the three buildings that were the ideal â the Concertgebouw, Boston and Berlin. Everybody liked the surround. Actually, this is the smallest hall in size, and it has more seats than any of these because it has double balconies. Our client doesn ’ t want balconies, so â and when we met our new acoustician, he told us this was the right shape or this was the right shape. And we tried many shapes, trying to get the energy of the original design within an acoustical, acceptable format. We finally settled on a shape that was the proportion of the Concertgebouw with the sloping outside walls, which the acoustician said were crucial to this and later decided they weren ’ t, but now we have them. And our idea is to make the seating carriage very sculptural and out of wood and like a big boat sitting in this plaster room. That ’ s the idea. And the corners would have skylights and these columns would be structural. And the nice thing about introducing columns is they give you a kind of sense of proscenium from wherever you sit, and create intimacy. Now, this is not a final design â these are just on the way to being â and so I wouldn ’ t take it literally, except the feeling of the space. We studied the acoustics with laser stuff, and they bounce them off this and see where it all works. But you get the sense of the hall in section. Most halls come straight down into a proscenium. In this case we ’ re opening it back up and getting skylights in the four corners. And so it will be quite a different shape. The original building, because it was frog-like, fit nicely on the site and cranked itself well. When you get into a box, it ’ s harder to do it â and here we are, **struggling** with how to put the hotel in. And this is a teapot I designed for Alessi. I just stuck it on there. But this is how I do work. I do take pieces and bits and look at it and **struggle** with it and cut it away. And of course it ’ s not going to look like that, but it is the crazy way I tend to work. And then finally, in L. A. I was asked to do a sculpture at the foot of Interstate Bank Tower, the highest building in L. A. Larry Halprin is doing the stairs. And I was asked to do a fish, and so I did a snake. It ’ s a public space, and I made it kind of a garden structure, and you can go in it. It ’ s a kiva, and Larry ’ s putting some water in there, and it works much better than a fish. In Barcelona I was asked to do a fish, and we ’ re working on that, at the foot of a Ritz-Carlton Tower being done by Skidmore, Owings and Merrill. And the Ritz-Carlton Tower is being designed with exposed steel, non-fire proof, much like those old gas tanks. And so we took the language of this exposed steel and used it, perverted it, into the form of the fish, and created a kind of a 19th- century contraption that looks like, that will sit â this is the beach and the harbor out in front, and this is really a shopping center with department stores. And we split these bridges. Originally, this was all solid with a hole in it. We cut them loose and made several bridges and created a kind of a foreground for this hotel. We showed this to the hotel people the other day, and they were terrified and said that nobody would come to the Ritz-Carlton anymore, because of this fish. And finally, I just threw these in â Lou Danziger. I didn ’ t expect Lou Danziger to be here, but this is a building I did for him in 1964, I think. A little studio â and it ’ s sadly for sale. Time goes on. And this is my son working with me on a small fast-food thing. He designed the robot as the cashier, and the head moves, and I did the rest of it. And the food wasn ’ t as good as the stuff, and so it failed. It should have been the other way around â the food should have been good first. It didn ’ t work. Thank you very much.

Text Sample 258: NEG Dim 2 – 1990 – Score 1.00 – 1990/t000287.txt

I ’ m going to go right into the slides. And all I ’ m going to try and prove to you with these slides is that I do just very straight stuff. And my ideas are â in my head, anyway â they ’ re very logical and relate to what ’ s going on and problem solving for clients. I either convince clients at the end that I solve their problems, or I really do solve their problems, because usually they seem to like it. Let me go right into the slides. Can you turn off the light? Down. I like to be in the dark. I don ’ t want you to see what I ’ m doing up here. Anyway, I did this house in Santa Monica, and it got a lot of notoriety. In fact, it appeared in a porno comic book, which is the slide on the right. This is in Venice. I just show it because I want you to know I ’ m concerned about context. On the left-hand side, I had the context of those little houses, and I tried to build a building that fit into that context. When people take pictures of these buildings out of that context they look really weird, and my premise is that they make a lot more sense when they ’ re photographed or seen in that space. And then, once I deal with the context, I then try to make a place that ’ s comfortable and private and fairly serene, as I hope you ’ ll find that slide on the right. And then I did a law school for Loyola in downtown L. A. I was concerned about making a place for the study of law. And we continue to work with this client. The building on the right at the top is now under construction. The garage on the right â the gray structure â will be torn down, finally, and several small classrooms will be placed along this avenue that we ’ ve created, this campus. And it all related to the clients and the students from the very first meeting saying they felt denied a place. They wanted a sense of place. And so the whole idea here was to create that kind of space in downtown, in a neighborhood that was difficult to fit into. And it was my theory, or my point of view, that one didn ’ t upstage the neighborhood â one made accommodations. I tried to be inclusive, to include the buildings in the neighborhood, whether they were buildings I liked or not. In the ’ 60s I started working with paper furniture and made a bunch of stuff that was very successful in Bloomingdale ’ s. We even made flooring, walls and everything, out of cardboard. And the success of it threw me for a loop. I couldn ’ t deal with the success of furniture â I wasn ’ t secure enough as an architect â and so I closed it all up and made furniture that nobody would like. So, nobody would like this. And it was in this, preliminary to these pieces of furniture, that Ricky and I worked on furniture by the slice. And after we failed, I just kept failing. The piece on the left â and that ultimately led to the piece on the right â happened when the kid that was working on this took one of those long strings of stuff and folded it up to put it in the wastebasket. And I put a piece of tape around it, as you see there, and realized you could sit on it, and it had a lot of resilience and strength and so on. So, it was an accidental discovery. I got into fish. I mean, the story I tell is that I got mad at postmodernism â at po-mo â and said that fish were 500 million years earlier than man, and if you ’ re going to go back, we might as well go back to the beginning. And so I started making these funny things. And they started to have a life of their own and got bigger â as the one glass at the Walker. And then, I sliced off the head and the tail and everything and tried to translate what I was learning about the form of the fish and the movement. And a lot of my architectural ideas that came from it â accidental, again â it was an intuitive kind of thing, and I just kept going with it, and made this proposal for a building, which was only a proposal. I did this building in Japan. I was taken out to dinner after the contract for this little restaurant was signed. And I love sake and Kobe and all that stuff. And after I got â I was really drunk â I was asked to do some sketches on napkins. And I made some sketches on napkins â little boxes and Morandi-like things that I used to do. And the client said,”Why no fish?”And so I made a drawing with a fish, and I left Japan.

Three weeks later, I received a complete set of drawings saying we ’ d won the competition. Now, it ’ s hard to do. It ’ s hard to translate a fish form, because they ’ re so beautiful â perfect â into a building or object like this. And Oldenburg, who I work with a little once in a while, told me I couldn ’ t do it, and so that made it even more exciting. But he was right â I couldn ’ t do the tail. I started to get the head OK, but the tail I couldn ’ t do. It was pretty hard. The thing on the right is a snake form, a ziggurat. And I put them together, and you walk between them. It was a dialog with the context again. Now, if you saw a picture of this as it was published in Architectural Record â they didn ’ t show the context, so you would think,”God, what a pushy guy this is.”But a friend of mine spent four hours wandering around here looking for this restaurant. Couldn ’ t find it. So... As for craft and technology and all those things that you ’ ve all been talking about, I was thrown for a complete loop. This was built in six months. The way we sent drawings to Japan : we used the magic computer in Michigan that does carved models, and we used to make foam models, which that thing scanned. We made the drawings of the fish and the scales. And when I got there, everything was perfect â except the tail. So, I decided to cut off the head and the tail. And I made the object on the left for my show at the Walker. And it ’ s one of the nicest pieces I ’ ve ever made, I think. And then Jay Chiat, a friend and client, asked me to do his headquarters building in L. A. For reasons we don ’ t want to talk about, it got delayed. Toxic waste, I guess, is the key clue to that one. And so we built a temporary building â I ’ m getting good at temporary â and we put a conference room in that ’ s a fish. And, finally, Jay dragged me to my hometown, Toronto, Canada. And there is a story â it ’ s a real story â about my grandmother buying a carp on Thursday, bringing it home, putting it in the bathtub when I was a kid. I played with it in the evening. When I went to sleep, the next day it wasn ’ t there. And the next night, we had gefilte fish. And so I set up this interior for Jay ’ s offices and I made a pedestal for a sculpture. And he didn ’ t buy a sculpture, so I made one. I went around Toronto and found a bathtub like my grandmother ’ s, and I put the fish in. It was a joke. I play with funny people like [Claes] Oldenburg. We ’ ve been friends for a long time. And we ’ ve started to work on things. A few years ago, we did a performance piece in Venice, Italy, called”Il Corso del Coltello”â the Swiss Army knife. And most of the imagery is â Claes ’, but those two little boys are my sons, and they were Claes ’ assistants in the play. He was the Swiss Army knife. He was a souvenir salesman who always wanted to be a painter, and I was Frankie P. Toronto. P for Palladio. Dressed up like the AT&T building by Claes â with a fish hat. The highlight of the performance was at the end. This beautiful object, the Swiss Army knife, which I get credit for participating in. And I can tell you â it ’ s totally an Oldenburg. I had nothing to do with it. The only thing I did was, I made it possible for them to turn those blades so you could sail this thing in the canal, because I love sailing. We made it into a sailing craft. I ’ ve been known to mess with things like chain link fencing. I do it because it ’ s a curious thing in the culture, when things are made in such great quantities, absorbed in such great quantities, and there ’ s so much denial about them. People hate it. And I ’ m fascinated with that, which, like the paper furniture â it ’ s one of those materials. And I ’ m always drawn to that. And so I did a lot of dirty things with chain link, which nobody will forgive me for. But Claes made homage to it in the Loyola Law School. And that chain link is really expensive. It ’ s in perspective and everything. And then we did a camp together for children with cancer. And you can see, we started making a building together. Of course, the milk can is his. But we were trying to collide our ideas, to put objects next to each other. Like a Morandi â like the little bottles â composing them like a still life. And it seemed to work as a way to put he and I together. Then Jay Chiat asked me to do this building on this funny lot in Venice, and I started with this three-piece thing, and you entered in the middle. And Jay asked me what I was going to do with the piece in the middle. And he pushed that. And one day I had a â oh, well, the other way. I had the binoculars from Claes, and I put them there, and I could never get rid of them after that. Oldenburg made the binoculars incredible when he sent me the first model of the real proposal. It made my building look sick. And it was this interaction between that kind of, up-the-ante stuff that became pretty interesting. It led to the building on the left. And I still think the Time magazine picture will be of the binoculars, you know, leaving out the â what the hell. I use a lot of metal in my work, and I have a hard time connecting with the craft. The whole thing about my house, the whole use of rough carpentry and everything, was the frustration with the crafts available. I said,"If I can ’ t get the craft that I want, I ’ ll use the craft I can get."There were plenty of models for that, in Rauschenberg and Jasper Johns, and many artists who were making beautiful art and sculpture with junk materials. I went into the metal because it was a way of building a building that was a sculpture. And it was all of one material, and the metal could go on the roof as well as the walls. The metalworkers, for the most part, do ducts behind the ceilings and stuff. I was given an opportunity to design an exhibit for the metalworkers ’ unions of America and Canada in Washington, and I did it on the condition that they become my partners in the future and help me with all future metal buildings, etc. etc. And it ’ s working very well to have these people, these craftsmen, interested in it. I just tell the stories. It ’ s a way of connecting, at least, with some of those people that are so important to the realization of architecture. The metal continued into a building â Herman Miller, in Sacramento. And it ’ s just a complex of factory buildings. And Herman Miller has this philosophy of having a place â a people place. I mean, it ’ s kind of a trite thing to say, but it is real that they wanted to have a central place where the cafeteria would be, where the people would come and where the people working would interact. So it ’ s out in the middle of nowhere, and you approach it. It ’ s copper and galvanize. I used the galvanize and copper in a very light gauge, so it would buckle. I spent a lot of time undoing Richard Meier ’ s aesthetic. Everybody ’ s trying to get the panels perfect, and I always try to get them sloppy and fuzzy. And they end up looking like stone. This is the central area. There ’ s a ramp. And that little dome in there is a building by Stanley Tigerman. Stanley was instrumental in my getting this job. And when I was awarded the contract I, at the very beginning, asked the client if they would let Stanley do a cameo piece with me. Because these were ideas that we were talking about, building things next to each other, making â it ’ s all about [a] metaphor for a city, maybe. And so Stanley did the little dome thing. And we did it over the phone and by fax. He would send me a fax and show me something. He ’ d made a building with a dome and he had a little tower. I told him,"No, no, that ’ s too ongepotchket. I don ’ t want the tower."So he came back with a simpler building, but he put some funny details on it, and he moved it closer to my building. And so I decided to put him in a depression. I put him in a hole and made a kind of a hole that he sits in. And so then he put two bridges â this all happened on the fax, going back and forth over a couple of weeks ’ period. And he put these two bridges with pink guardrails on it. And so then I put this big billboard behind it. And I call it,"David and Goliath."And that ’ s my cafeteria. In Boston, we had that old building on the left. It was a very prominent building off the freeway, and we added a floor and cleaned it up and fixed it up and used the kind of â I thought â the language of the neighborhood, which had these cornices, projecting cornices. Mine got a little exuberant, but I used lead copper, which is a beautiful material, and it turns green in 100 years. Instead of, like, copper in 10 or 15. We redid the side of the building and re-proportioned the windows so it sort of fit into the space. And it surprised both Boston and myself that we got it approved, because they have very strict kind of design guideline, and they wouldn ’ t normally think I would fit them. The detailing was very careful with the lead copper and making panels and fitting it tightly into the fabric of the existing building. In Barcelona, on Las Ramblas for some film festival, I did the Hollywood sign going and coming, made a building out of it, and they built it. I flew in one night and took this picture. But they made it a third smaller than my model without telling me. And then more metal and some chain link in Santa Monica â a little shopping center. And this is a laser laboratory at the University of Iowa, in which the fish comes back as an abstraction in the back. It ’ s the support labs, which, by some coincidence, required no windows. And the shape fit perfectly. I just joined the points. In the curved part there ’ s all the mechanical equipment. That solid wall behind it is a pipe chase â a pipe canyon â and so it was an opportunity that I seized, because I didn ’ t have to have any protruding ducts or vents or things in this form. It gave me an opportunity to make a sculpture out of it. This is a small house somewhere. They ’ ve been building it so long I don ’ t remember where it is. It ’ s in the West Valley. And we started with the stream and built the house along the stream â dammed it up to make a lake. These are the models. The reality, with the lake â the workmanship is pretty bad. And it reminded me why I play defensively in things like my house. When you have to do something really cheaply, it ’ s hard to get perfect corners and stuff. That big metal thing is a passage, and in it is â you go downstairs into the living room and then down into the bedroom, which is on the right. It ’ s kind of like a whole built town. I was asked to do a hospital for schizophrenic adolescents at Yale. I thought it was fitting for me to be doing that. This is a house next to a Philip Johnson house in Minnesota. The owners had a dilemma â they asked Philip to do it. He was too busy. He didn ’ t recommend me, by the way. We ended up having to make it a sculpture, because the dilemma was, how do you build a building that doesn ’ t look like the language? Is it going to look like this beautiful estate is sub-divided? Etc. etc. You ’ ve got the idea. And so we finally ended up making it. These people are art collectors. And we finally made it so it appears very sculptural from the main house and all the windows are on the other side. And the building is very sculptural as you walk around it. It ’ s made of metal and the brown stuff is Fin-Ply â it ’ s that formed lumber from Finland. We used it at Loyola on the chapel, and it didn ’ t work. I keep trying to make it work. In this case we learned how to detail it. In Cleveland, there ’ s Burnham Mall, on the left. It ’ s never been finished. Going out to the lake, you can see all those new buildings we built. And we had the opportunity to build a building on this site. There ’ s a railroad track. This is the city hall over here somewhere, and the courthouse. And the centerline of the mall goes out. Burnham had designed a railroad station that was never built, and so we followed. Sohio is on the axis here, and we followed the axis, and they ’ re two kind of goalposts. And this is our building, which is a corporate headquarters for an insurance company. We collaborated with Oldenburg and put the newspaper on top, folded. The health club is fastened to the garage with a C-clamp, for Cleveland. You drive down. So it ’ s about a 10-story C-clamp. And all this stuff at the bottom is a museum, and an idea for a very fancy automobile entry. This owner has a pet peeve about bad automobile entries. And this would be a hotel. So, the centerline of this thing â we ’ d preserve it, and it would start to work with the scale of the new buildings by Pelli and Kohn Pederson Fox, etc., that are underway. It ’ s hard to do high-rise. I feel much more comfortable down here. This is a piece of property in Brentwood. And a long time ago, about ’ 82 or something, after my house â I designed a house for myself that would be a village of several pavilions around a courtyard â and the owner of this lot worked for me and built that actual model on the left. And she came back, I guess wealthier or something â something happened â and asked me to design a house for her on this site. And following that basic idea of the village, we changed it as we got into it. I locked the house into the site by cutting the back end â here you see on the photographs of the site â slicing into it and putting all the bathrooms and dressing rooms like a retaining wall, creating a lower level zone for the master bedroom, which I designed like a kind of a barge, looking like a boat. And that ’ s it, built. The dome was a request from the client. She wanted a dome somewhere in the house. She didn ’ t care where. When you sleep in this bedroom, I hope â I mean, I haven ’ t slept in it yet. I ’ ve offered to marry her so I could sleep there, but she said I didn ’ t have to do that. But when you ’ re in that room, you feel like you ’ re on a kind of barge on some kind of lake. And it ’ s very private. The landscape is being built around to create a private garden. And then up above there ’ s a garden on this side of the living room, and one on the other side. These aren ’ t focused very well. I don ’ t know how to do it from here. Focus the one on the right. It ’ s up there. Left â it ’ s my right. Anyway, you enter into a garden with a beautiful grove of trees. That ’ s the living room. Servants ’ quarters. A guest bedroom, which has this dome with marble on it. And then you enter into the living room and then so on. This is the bedroom. You come down from this level along the stairway, and you enter the bedroom here, going into the lake. And the bed is back in this space, with windows looking out onto the lake. These Stonehenge things were designed to give foreground and to create a greater depth in this shallow lot. The material is lead copper, like in the building in Boston. And so it was an intent to make this small piece of land â it ’ s 100 by 250 â into a kind of an estate by separating these areas and making the living room and dining room into this pavilion with a high space in it. And this happened by accident that I got this right on axis with the dining room table. It looks like I got a Baldessari painting for free. But the idea is, the windows are all placed so you see pieces of the house outside. Eventually this will be screened â these trees will come up â and it will be very private. And you feel like you ’ re in your own kind of village. This is for Michael Eisner â Disney. We ’ re doing some work for him. And this is in Anaheim, California, and it ’ s a freeway building. You go under this bridge at about 65 miles an hour, and there ’ s another bridge here. And you ’ re through this room in a split second, and the building will sort of reflect that. On the backside, it ’ s much more humane â entrance, dining hall, etc. And then this thing here â I ’ m hoping as you drive by you ’ ll hear the picket fence effect of the sound hitting it. Kind of a fun thing to do. I ’ m doing a building in Switzerland, Basel, which is an office building for a furniture company. And we struggled with the image. These are the early studies, but they have to sell furniture to normal people, so if I did the building and it was too fancy, then people might say,”Well, the furniture looks OK in his thing, but no, it ain ’ t going to look good in my normal building.”So we ’ ve made a kind of pragmatic slab in the second phase here, and we ’ ve taken the conference facilities and made a villa out of them so that the communal space is very sculptural and separate. And you ’ re looking at it from the offices and you create a kind of interaction between these pieces. This is in Paris, along the Seine. Palais des Sports, the Gare de Lyon over here. The Minister of Finance â the guy that moved from the Louvre â goes in here. There ’ s a new library across the river. And back in here, in this already treed park, we ’ re doing a very dense building called the American Center, which has a theater, apartments, dance school, an art museum, restaurants and all kinds of â it ’ s a very dense program â bookstores, etc. In a very tight, small â this is the ground level. And the French have this extraordinary way of screwing things up by taking a beautiful site and cutting the corner off. They call it the plan coupe. And I struggled with that thing â how to get around the corner. These are the models for it. I showed you the other model, the one â this is the way I organized myself so I could make the drawing â so I understood the problem. I was trying to get around this plan coupe â how do you do it? Apartments, etc. And these are the kind of study models we did. And the one on the left is pretty awful. You can see why I was ready to commit suicide when this one was built. But out of it came finally this resolution, where the elevator piece worked frontally to this, parallel to this street, and also parallel to here. And then this kind of twist, with this balcony and the skirt, kind of like a ballerina lifting her skirt to let you into the foyer. The restaurants here â the apartments and the theater, etc. So it would all be built in stone, in French limestone, except for this metal piece. And it faces into a park. And the idea was to make this express the energy of this. On the side facing the street it ’ s much more normal, except I slipped a few mansards down, so that coming on the point, these housing units made a gesture to the corner. And this will be some kind of high-tech billboard. If any of you guys have any ideas for it, please contact me. I don ’ t know what to do. Jay Chiat is a glutton for punishment, and he hired me to do a house for him in the Hamptons. And it ’ s got a fish. And I keep thinking,”This is going to be the last fish.”It ’ s like a drug addict. I say,”I ’ m not going to do it anymore â I don ’ t want to do it anymore â I ’ m not going to do it.”And then I do it. There it is. But it ’ s the living room. And this piece here is â I don ’ t know what it is. I just added it so that we ’ d have enough money in the budget so we could take something out. This is Euro Disney, and I ’ ve worked with all of the guys that presented to you earlier. We ’ ve had a lot of fun working together. I think I ’ m from Mars for them, and they are for me, but somehow we all manage to work together, and I think, productively. So far. This is a shopping thing. You come into the Magic Kingdom and the hotel that Tony Baxter ’ s group is doing out here. And then this is a kind of a shopping mall, with a rodeo and restaurants. And another restaurant. What I did â because of the Paris skies being quite dull, I made a light grid that ’ s perpendicular to the train station, to the route of the train. It looks like it ’ s kind of been there, and then crashed all these simpler forms into it. The light grid will have a light, be lit up at night and give a kind of light ceiling. In Switzerland â Germany, actually â on the Rhine across from Basel, we did a furniture factory and a furniture museum. And I tried to â there ’ s a Nick Grimshaw building over here, there ’ s an Oldenburg sculpture over here â I tried to make a relationship urbanistically. And I don ’ t gave good slides to show â it ’ s just been completed â but this piece here is this building, and these pieces here and here. And as you pass by it ’ s always part â you see it as all of these pieces accrue and become part of an overall neighborhood. It ’ s plaster and just zinc. And you wonder, if this is a museum, what it ’ s going to be like inside? If it ’ s going to be so busy and crazy that you wouldn ’ t show anything, and just wait. I ’ m so cunning and clever â I made it quiet and wonderful. But on the outside it does scream out at you a bit. It ’ s actually basically three square rooms with a couple of skylights and stuff. And from the building in the back, you see it as an iceberg floating by in the hills. I know I ’ m over time. See, that skylight goes down and becomes that one. So it ’ s pretty quiet inside. This is the Disney Hall â the concert hall. It ’ s a complicated project. It has a chamber hall. It ’ s related to an existing

Chandler Pavilion that was built with a lot of love and tears and caring. And it ’ s not a great building, but I approached it optimistically, that we would make a compositional relationship between us that would strengthen both of us. And the plan of this â it ’ s a concert hall. This is the foyer, which is kind of a garden structure. There ’ s commercial at the ground floor. These are offices, which, really, in the competition, we didn ’ t have to design. But finally, there ’ s a hotel there. These were the kind of relationships made to the Chandler, composing these elevations together and relating them to the buildings that existed â to MOCA, etc. The acoustician in the competition gave us criteria, which led to this compartmentalized scheme, which we found out after the competition would not work at all. But everybody liked these forms and liked the space, and so that ’ s one of the problems of a competition. You have to then try and get that back in some way. And we studied many models. This was our original model. These were the three buildings that were the ideal â the Concertgebouw, Boston and Berlin. Everybody liked the surround. Actually, this is the smallest hall in size, and it has more seats than any of these because it has double balconies. Our client doesn ’ t want balconies, so â and when we met our new acoustician, he told us this was the right shape or this was the right shape. And we tried many shapes, trying to get the energy of the original design within an acoustical, acceptable format. We finally settled on a shape that was the proportion of the Concertgebouw with the sloping outside walls, which the acoustician said were crucial to this and later decided they weren ’ t, but now we have them. And our idea is to make the seating carriage very sculptural and out of wood and like a big boat sitting in this plaster room. That ’ s the idea. And the corners would have skylights and these columns would be structural. And the nice thing about introducing columns is they give you a kind of sense of proscenium from wherever you sit, and create intimacy. Now, this is not a final design â these are just on the way to being â and so I wouldn ’ t take it literally, except the feeling of the space. We studied the acoustics with laser stuff, and they bounce them off this and see where it all works. But you get the sense of the hall in section. Most halls come straight down into a proscenium. In this case we ’ re opening it back up and getting skylights in the four corners. And so it will be quite a different shape. The original building, because it was frog-like, fit nicely on the site and cranked itself well. When you get into a box, it ’ s harder to do it â and here we are, struggling with how to put the hotel in. And this is a teapot I designed for Alessi. I just stuck it on there. But this is how I do work. I do take pieces and bits and look at it and struggle with it and cut it away. And of course it ’ s not going to look like that, but it is the crazy way I tend to work. And then finally, in L. A. I was asked to do a sculpture at the foot of Interstate Bank Tower, the highest building in L. A. Larry Halprin is doing the stairs. And I was asked to do a fish, and so I did a snake. It ’ s a public space, and I made it kind of a garden structure, and you can go in it. It ’ s a kiva, and Larry ’ s putting some water in there, and it works much better than a fish. In Barcelona I was asked to do a fish, and we ’ re working on that, at the foot of a Ritz-Carlton Tower being done by Skidmore, Owings and Merrill. And the Ritz-Carlton Tower is being designed with exposed steel, non-fire proof, much like those old gas tanks. And so we took the language of this exposed steel and used it, perverted it, into the form of the fish, and created a kind of a 19th- century contraption that looks like, that will sit â this is the beach and the harbor out in front, and this is really a shopping center with department stores. And we split these bridges. Originally, this was all solid with a hole in it. We cut them loose and made several bridges and created a kind of a foreground for this hotel. We showed this to the hotel people the other day, and they were terrified and said that nobody would come to the Ritz-Carlton anymore, because of this fish. And finally, I just threw these in â Lou Danziger. I didn ' t expect Lou Danziger to be here, but this is a building I did for him in 1964, I think. A little studio â and it ' s sadly for sale. Time goes on. And this is my son working with me on a small fast-food thing. He designed the robot as the cashier, and the head moves, and I did the rest of it. And the food wasn ' t as good as the stuff, and so it failed. It should have been the other way around â the food should have been good first. It didn ' t work. Thank you very much.

Text Sample 259: NEG Dim 2 – 2025 – Score 2.00 – 2025/t003001.txt

- I don ' t remember exactly, but... I use the most expensive hair color in the world. It ' s not that I care about the money, it ' s that I care about my hair. It ' s not just the color. I expect great color. What ' s worth more to me is the way my hair feels. Feels good around my neck. I can ' t remember it. I can ' t finish it all. If only we had more time. - Why don ' t we have more time? - I ' m dying. I ' m croaking! - It ' s tough, coming home. But this is what you do for a parent that you love. But, you know? She ' s not my mother. Technically. In my own family, there ' s a lot of dysfunction, a lot of mental illness, a lot of substance abuse. Every generation. My parents divorced when I was about five. My mother moved us out of state, so we had to fly to New York to see my father ' cause he was already working in advertising, and New York was the only place to be. - Many of the commercials you see on television begin life here. - Advertising is one of the main sources of messaging about who you should be. - Nowadays, most of you women lead two lives, combining homemaking with the role of glamorous hostess. - And in the ' 60s, the ads were often made from a male point of view. - In the pre-production meeting, everybody who has anything to do with the commercial is there. - It was mostly men. These superstar art directors and writers. Like my father, Gene Case."Mad Men"was like home movies, and he was Don Draper. He was very witty, but I don ' t think my father realized how powerful his words were. He knew it professionally. But with his kids, he could be incredibly cutting. Flay you just with a phrase. But it ' s the time with my mother that was the nightmare. She had a horrible childhood, but she sure as hell didn ' t make any effort to overcome that in her relations with us. You know, it was really horrifying to my mother that I was not popular. But I was also really awkward because she had been undermining my confidence for all my life. She would pick apart your personality in detail. I was lazy, I looked bad, I acted bad, I was awkward. Emotionally, just out for blood. At a certain point in the night, I would know,"OK, the situation is dangerous. I need to get outta here."I had this fantasy when I was in fourth grade that I vividly remember that some kind of outside agency was gonna come in and determine from all the salt on my pillow that I was crying myself to sleep every night and do something about it. No, it was awful. It was awful. And that was the point where Ilon came into my life. - Ilon, do you need anything to eat? - I don ' t think so, but look up this wallpaper, Waverly Fabrics, and see if they have a rose pattern. - OK. Oh, what about this one here? - That ' s not it. - No? - No, first of all, I was an art dir... I was a creative director at an advertising agency. The first thing I know is what I ' m looking at. Ilon the girl. I don ' t remember particularly being into advertising, but somehow I found myself in it. And I seemed to be very good at it. First of all, I ' d always listened to everybody. And I noticed that I saw things differently than other people. - Women could get somewhere in advertising, but they were marginalized. - Women were given a lesser role. All the men were always arguing with you and always taking credit. - And one of the things that was coming through loud and clear is that women are for men. - Glory, glory, hallelujah Glory, glory, hallelujah Glory, glory, hallelujah His truth is marching on - Men were always the ones who everyone was pleasing. - What will your eyes say to him tonight? Wait till the fellas take a look at this plunging backline. - You look at ads from that period, and it ' s jaw-dropping. - This is one of our nation ' s most beautiful sights, the kind of girl who keeps her figure. - But that ' s what feminism was pushing back against. - I was a feminist. I knew women were equal if not superior to men from the time I was a little girl. - And in advertising, she wanted to be a trailblazer that way. At one point, she worked in the same agency with my father, and that ' s how they met. - He was a good writer, and I was a good writer. I liked the fact that he was good at what he did and cared about it. We got engaged, and then we got married. - I ' m sitting there in the background. I ' m grinning. I ' m so thrilled because I adored her instantly. I thought she was super cool. And she treated me like I mattered. - She was a sweet little girl, and she deserved some caretaking. My mother was kinda terrible, so I knew that she needed support, and I gave her support. And that was what we did. - She was interested in me. She listened to me. Treated me like I was lovable. - She didn ' t have anyone to recognize her being, to support her, to see who she could be, who she was. - She was very interested in what I would do with my life, and the assumption was that it would be something worthwhile. She just went way, way beyond the call of duty to make me feel like I was worth it. And she did that for a lot of other women, too. - I was working at McCann Erickson. We were given an assignment. L ' Oréal, they wanted a campaign for Preference, it ' s a hair color. - She ' s in this room full of men brainstorming for this ad. - The men were busy flirting with the women, telling us we all looked like models and we didn ' t look like advertising people, you know? - They ' re like,"Oh, this woman is gonna be standing by an open window, and the wind will be blowing the curtains."And she ' s thinking, you know, this is just making the woman totally an object. - I was feeling angry. I ' m not interested in writing anything about looking good for men. Fuck ' em. Fuck you too. - Why fuck me? - Well, you ' re a man. - Yeah, but I ' m here trying to help you tell your story. - Yeah, that ' s good. I like that part. I was pissed. We weren ' t there to just dance for the men. - It is what she said. She just thought,"Fuck you."And wrote this. - I just opened my eyes and knew. Because I ' m worth it. The campaign got approved, but all the men were always telling you that you were doing something wrong or they knew how to do it better. - The agency insisted on a male voiceover. - She uses the most expensive hair color in the world, Preference by L ' Oréal. - You know, it was just totally different. - Smooth and silky, but with body. It feels good against her neck. Actually, she doesn ' t mind spending more for L ' Oréal. Because she ' s worth it. - It was wrong. This was not for men but for women and for other human beings. - I use the most expensive hair color in the world, Preference by L ' Oréal. It ' s not that I care about the money, it ' s that I care about my hair. It ' s not just the color, I expect great color. What ' s worth more to me is the way my hair feels. Smooth and silky, but with body. It feels good against my neck. Actually, I don ' t mind spending more for L ' Oréal. Because I ' m worth it. - I wrote that. - It was everywhere. It was a national campaign. - Yes, it ' s expensive, but I ' m worth it. - What they realized after they started running it was that that was only the tip of the iceberg. - It was supporting women, finally. - And I ' m worth it. And I ' m worth it. I ' m worth it. - It ' s a four-word feminist manifesto, defying this social pressure to think about yourself in relation to men. - You ' re worth it. I ' m worth it. I ' m worth it. - It was a very big success. - At a certain point, L ' Oréal adopted it as the tagline for their entire business. - Parce que je le vaux bien. - Even today, that ' s their motto. - Because I ’ m worth it. - ’ Cause you ’ re worth it. - You ’ re worth it. - We ’ re worth it. - And I ’ m worth it. - She wrote the most influential tagline in women ’ s beauty advertising. - I ’ m worth it. - It ’ s magic, that phrase. - Those words just get better with age, don ’ t they? - I ’ m worth it. Because you are and always will be. - She came up with that line because she believed it. She believed it about herself, and she believed that women should believe it. She did that for me. You know, even after they split up, she was still a big part of my life. I ’ ve always kind of felt like I dodged a bullet that I have watched take down other members of my family. She saved me. And today, I am a professor of English at Williams College. I teach Victorian literature, and I also teach women ’ s, gender and sexuality studies. She was my mother. She also taught me how to be a mother. I had been very uncertain about motherhood for myself because my role model for that was so nightmarish. But Ilon really taught me, I can do this. I can be a good mother. She made me believe that I was worth it. And I was not either the first or the last. - I have to go away now. Go to my room. - It ’ s been lovely. - It ’ s been lovely. Oh... I ’ m not interested in advertising. I don ’ t give a shit. It wasn ’ t like it was my whole life. It was just a portion. It ’ s about humans ; it ’ s not about advertising. It ’ s about caring for people because... we ’ re all worth it, or no one is worth it.

A Love Letter to my Garden by Debbie Millman In the beginning of time, there was no time. The universe began with every bit of energy contained in a very tiny, incredibly dense point. It was even smaller than this point. The point exploded with an unimaginable force and created everything we know and are made of. Seeds are a bit like that too. They ’ re tiny and densely packed with their entire existence. Time feels different now, while we shelter at home. Time is scary and uncertain. So we decided to plant some mint. We actually started a little garden a while ago, but now we have more time. We thought that these flowers had died, but they miraculously came back to life. A hopeful sign about the future, perhaps? We planted foxglove and it thrived. And then we went a little crazy. We planted tomatoes, carrots, beans, corn, lettuce and cucumbers, strawberries, blueberries and limes. It ’ s such a strange time in the world. There is so much beauty amidst so much fear. It ’ s so hard to know what to do. In the meantime, we watch and wait and remain grateful we ’ re able to make things with our hands. A love letter to New York City by Debbie Millman I ’ m a native New Yorker. I ’ ve lived here my entire life, yet the city never ceases to surprise me. Everywhere you look, there ’ s something to see. There is Tom Otterness underground and Lawrence Weiner underfoot. There are so many of us. Everyone wants to be someone. Everyone seeks to be heard. Everyone has an opinion, A point of view. And seemingly something to sell. But life is different now as we shelter at home. Under the same sky, at the same moment, at the same time. I ’ m thinking about how tough New York can be, how rough and unrelenting. But maybe that intensity is what fuels our tenacity. As we navigate through this crisis, I am hopeful we will find some solace together. A Love Letter to Travel by Debbie Millman My work has taken me all over the world. There have been many early departures, and many evenings in the air. In all my travels, I ’ ve been struck by so many things. I ’ ve observed how people lived in some of the most ancient places on the planet. This is Machu Picchu. This is Easter Island. This is Samoa. This is Angkor Wat. This is Petra in Jordan. The ancient city contained a church, a theater and tombs for the dead. Families lived in two and three-bedroom apartments. We ’ ve come a long way. Some of the structures that remain are rather mysterious, some are otherworldly, some are glorious odes to love, some house the souls of the dead. Some have forced us to choose sides. Some have succumbed to the power of nature. And some have not. The view from the sky is so abstract. It reveals our connections, our continuity and our scale. Nevertheless, it ’ s hard to see the big picture right now. It ’ s such a difficult time in the world as we pause and dismantle and rebuild our culture. I think back to my travels. I ’ ve seen how different we are, how diverse and distinct. But I ’ ve also seen our commonalities. How much worship means in Tibet, in Pakistan, in Italy, in China, in Cambodia and in Peru. How much peace means to our future. How much we regret the mistakes of our past. And now, insisting on what matters no matter what. There is still so much beauty in the world. So much love. I ’ m hopeful for the next generation. For every creature, large and small. And for the planet we call home. A Love Letter to Storytelling by Debbie Millman”A need to tell and hear stories is essential to the species Homo Sapiens. The sound of story is the dominant sound of our lives.”- Joseph Campbell I ’ ve loved telling stories all of my life. I ’ ve loved writing them and drawing them, and I love teaching my students how to make them. Now I conduct visual storytelling workshops all over the world. Over the years, the students have invented many new ways of expressing their stories. They tell their truths. They reveal secrets. They bare their souls. They share stories of pain, of feeling seen, of not being smart enough. Stories of being scared, feeling pretty or not. No matter where I teach, I ’ ve come to realize how many of their stories are universal. They convey so many shared experiences : rejection, judgment, insecurity, prejudice, forgetting and remembering. But there are also stories of hope, strength, awareness, courage and realizations. Their stories reflect who they really are, how deeply they want to feel connected. And now, as they share their visions for a more optimistic future, their stories are becoming the stories of our times.

Can you paint with all the colors of the wind? I love this song from the first time I heard it. I was 14, growing up in public housing in western Sydney. So maybe a little too old for this Disney classic from”Pocahontas.”But it spoke to me. I saw something of myself in it. At this stage, I think I knew I was queer. I mean, come on, I was rocking out to Disney. And look at those glasses. Seriously, what a queer kid. But I was also from a Pacific Indigenous heritage with conservative views and values. I didn ’ t feel like I could fit into any of the boxes that were being presented to me. Straight, gay, Fijian, Australian. I couldn ’ t pick just one color to paint with. Prior to colonization, sexuality amongst many of our Pacific islands across the region was fluid. Men would have sex with men without the stigma or shame afforded it today. Sexual intimacy was a way of being able to connect socially and relationally. Sex wasn ’ t just for procreation. Or in marriage. It wasn ’ t exclusively monogamous. Just because you had sex with a man didn ’ t define your sexuality. It didn ’ t make you an outcast. But as Europeans started to colonize the Pacific region, they brought Christian missionaries with them. They told us to cover up our beautiful bodies. We were taught shame. We were told to stop practicing Pacifica cultures and values that were seen as provocative. To a Western and white perspective, our non-binary sexuality was judged as tribal, outdated, sinful and impossible to practice alongside a Christian faith. Still today, those who are Indigenous to the Pacific are negatively impacted by whiteness. That”white is right, West is best.”I was brought up to espouse strong Christian beliefs, views and values which would shape my burgeoning identity as an adult. From these staunch conservative views, I was taught to fear the queer. Those people that were seen as unusual and fruity. And in essence, I grew to despise a part of myself. I sought to separate my queerness from my identity. I could never see myself as part of that world. Growing up, biracial and bisexual constantly challenged the way I saw the world around me. I was unsure about my thinking, feelings and behaviors around liking males and females. I was unsure about my thinking, feelings and behaviors when it came to whether I needed to be a white Australian or a Fijian person. And whether this needed to be framed within a binary to choose one over the other. In this way, I don ’ t think that my story is unique. There ’ s plenty of people in the queer world that have escaped conservative upbringings, religions and cultures. But this is only part of my story. Another common story in the queer community is the coming-out story. When did you tell your parents? How did they react? How it liberated you or ultimately separated you from your family. But this didn ’ t feel like an option for me either. I believe that embedded in these particular stories, these tropes, is a part of dominant queer culture that made it very hard for me to access the queer world. For example, when I started to go to gay clubs, I would be lining up at the front of the club and often I would get door staff come up to me and go,”Sorry, you do know this is a gay club, right?”From these lived experiences, I feel that there is a whiteness that pervades queer culture. And I didn ’ t want to give up my identity and my appearance as a Pacific indigenous person to be queer. Pacifica cultures really, really value and esteem the collective above the individual. For Pacifica people, our families are inextricably connected to our own sense of self-agency, self-determination, self-esteem, self-love and self-worth. Our own individual identities are meshed and intertwined with our family ’ s reputation and standing in the community. Our mind, body and souls are inextricably connected to the broader community, to our families, to ourselves and to others. I didn ’ t want to come out to potentially ostracize myself, to make a point to separate myself from my Pacific and faith communities. I couldn ’ t then see my authentic self in any of these spaces. And a quick shout out to my son on the left-hand side. Round of applause for my son. He said to me this morning,”Daddy, make sure you mention me.”So I was like,”OK, son. Alright.”So there you go for the recording, son. And the rest are my other family, that ’ s up there as well. Across queer cultures and the broader community, we have learned to embrace our gender and sexual differences. We encourage individuals to be allies for each other and to support safe spaces for those that are seen to not fit in. We empower and really encourage individuals to really develop and express their self-agency, their self-determination, their self love, their self-worth. We boldly go into spaces striving to bring others with us to ensure that we can create inclusive societies for everyone. However, the dominant Western view in queer cultures is still based on the individual. Me, myself and I. And my individual pursuits towards happiness. As a queer Indigenous Pacific person, I feel that there are parts of queer culture that is white, feels very white. We may fail to see the importance of bringing our families and our cultural communities along our journey as queer people. It ’ s either the queer way or the highway. It ’ s one or the other. Young or old. Rich or poor. Smart or stupid. Masculine or feminine. Fit or fat. These binaries create a sense of us and them, those people. A binary approach and position that we generally in Western white societies use to determine the norm. We create, conflate, perpetuate binaries that create divisions in our society. Saints or sinner, straight or gay. I see it like this. Binaries are a very white and Western way of thinking, feeling and behaving. As individuals today, we live within these binaries and create identities that then create these labels. We use these labels to then define and confine people and places. We are one or the other. But what we fail to see is that our identities are more than a set of binaries. Our own identities are comprised of intersecting identifiers that contributes to who you are, including our age, class, color, education, gender, size, spirituality, sexuality, and so, so much more. We need to decolonize queerness, to live beyond”white is right, West is best.”Because if we don ’ t, we ’ re going to continue to create silos and divisions in our societies that don ’ t create inclusive and safe spaces for everyone. For Indigenous queer people, they shape our connection to community and culture, our families. If we don ’ t include that within our understanding of who we are, even as queer people, then we ’ re not able to be, again, our true and authentic selves. We ’ re not able to then be our fabulous selves as part of the queer community. And it ’ s really, really interesting because I believe that we can learn so much from pre-colonial cultures like those that were practiced in the Pacific, that provide a different way of looking at a society. A queer way that pre-dates all the privileges that go into binary ways of thinking, feeling and behaving. Across many of our Pacifica languages we have a lot of key concepts that help solidify and support a shared understanding of the collective. For example, in Fijian,”solesolevaki”is all about reciprocal living, where my wellbeing is your wellbeing. I will actively seek to ensure that your well-being and every part of your life is catered for, knowing that you will do the same for me. We strive to enact”veiqaravi,”as tatted here on my hand, to serve others. We strive to also embed and embold and empower people to practice”veirokovi,”respect for self and others where we are relationally driven, where that is so important to our spaces and places. My sense of ability to actually put this into practice, my ability to actually understand these Indigenous perspectives has greatly helped shape and reconcile my queer identity today. But what ’ s really interesting is that it ’ s not just queer communities that need to decolonize itself. It ’ s all of us as a broader society that needs to be part of a shared conversation to decolonize, deconstruct and disrupt binary ways of thinking, feeling and behaving. So how can we practically do that? Practice cultural humility, where you are constantly learning and embracing differences, where you get over yourselves and strive to learn about other people ’ s differences and how that can be meaningfully included in the way in which you create safe spaces for everyone. I also believe it ’ s possible to bring Indigenous perspectives into Western and white workplaces. For example, I ’ ve introduced the concept of”talanoa”in all of my work meetings. Talanoa is all about being able to create a safe space where everyone is able to contribute to a collective, collegial and collaborative conversation. Where people are able to bring their authentic selves into these spaces. Literally, I will chair meetings where I have no firm set agenda items and I literally would just hold space for participants just to bring themselves. So you can tell I ’ m a social worker, right? Safe space, safe space, safe space. It ’ s OK, it ’ s OK. But it ’ s through these safe spaces that people can bring their multiple, intersecting identifiers, including their age, their class, color, education, gender, size, spirituality, sexuality and so, so much more. I invite queer communities to come talanoa with Pacific Indigenous Communities to create robust and resilient queer cultures. I have been able to greatly reconcile my queer and Pacifica identities, which has now really been embraced to help shape how I see the world around me today. And it ’ s through these shared perspectives and approaches that we can truly embrace cultural diversity and its differences. And to know that people can live beyond those binaries and those labels we continue to perpetuate and perpetrate against others. It is a commitment from queer communities to decolonize queerness. It ’ s a commitment from me, from you and all of us to decolonize Western and white societies and to live beyond the binary way of thinking, feeling and behaving. I genuinely believe that it ’ s through this common goal that we can truly learn how to paint with all the colors of the wind.”Vinaka vakalevu”and thank you.

What ’ s happening to the climate? It is unbelievably bad. This is, obviously, that famous view now of the Arctic, which is likely to be gone at this point in the next three or four or five years. Very, very, very scary. So we all look at what we can do. And when you look at the worldwide sources of CO2, 52 percent are tied to buildings. Only nine percent is passenger cars, interestingly enough. So we ran off to a sushi bar. And at that sushi bar we came up with a great idea. And it was something called EcoRock. And we said we could redesign the 115-year-old gypsum drywall process that generates 20 billion pounds of CO2 a year. So it was a big idea. We wanted to reduce that by 80 percent, which is exactly what we ’ ve done. We started R&D in 2006. Decided to use recycled content from cement and steel manufacturing. There is the inside of our lab. We haven ’ t shown this before. But our people had to do some 5, 000 different mixes to get this right, to hit our targets. And they worked absolutely very, very, very hard. So then we went forward and built our production line in China. We don ’ t build this production equipment any longer in the U. S., unfortunately. We did the line install over the summer. We started right there, with absolutely nothing. You ’ re seeing for the first time, a brand new drywall production line, not made using gypsum at all. That ’ s the finished production line there. We got our first panel out on December third. That is the slurry being poured onto paper, basically. That ’ s the line running. The exciting thing is, look at the faces of the people. These are people who worked this project for two to three years. And they are so excited. That ’ s the first board off the line. Our Vice President of Operation kissing the board. Obviously very, very excited. But this has a huge, huge impact on the environment. We signed the first panel just a few weeks after that, had a great signing ceremony, leading to people hopefully using these products across the world. And we ’ ve got Cradle-to-Cradle Gold on this thing. We happened to win, just recently, the Green Product of the Year for”The Re-Invention of Drywall,”from Popular Science. Thank you. Thank you. So here is what we learned : 8, 000 gallons of gas equivalent to build one house. You probably had no idea. It ’ s like driving around the world six times. We must change everything. Look around the room : chairs, wood, everything around us has to change or we ’ re not going to lick this problem. Don ’ t listen to the people who say you can ’ t do this, because anyone can. And these job losses, we can fix them with green-collar jobs. We ’ ve got four plants. We ’ re building this stuff around the country. We ’ re going as fast as we can. Two and a half million cars worth of gypsum, you know, CO2 generated. Right? So what will you do? I ’ ll tell you what I did and why I did it. And I know my time ’ s up. Those are my kids, Natalie and David. When they have their kids, 2050, they ’ d better look back at Grandpa and say,”Hey, you gave it a good shot. You did the best you could with the team that you had.”So my hope is that when you leave TED, you will look at reducing your carbon footprint in however you can do it. And if you don ’ t know how, please find me — I will help you. Last but not least, Bill Gates, I know you invented Windows. Wait till you see, maybe next year, what kind of windows we ’ ve invented. Thank you so much.

This is a world-changing invention. The smoke alarm has saved perhaps hundreds of thousands of lives, worldwide. But smoke alarms don ’ t prevent fires. Every year in the USA, over 20, 000 are killed or injured with 350, 000 home fires. And one of the main causes of all these fires is electricity. What if we could prevent electrical fires before they start? Well, a couple of friends and I figured out how to do this. So how does electricity ignite residential fires? Well it turns out that the main causes are faulty and misused appliances and electrical wiring. Our invention had to address all of these issues. So what about circuit breakers? Well, Thomas Edison invented the circuit breaker in 1879. This is 130-year-old technology, and this is a problem, because over 80 percent of all home electrical fires start below the safety threshold of circuit breakers. Hmmm... So we considered all of this. And we realized that electrical appliances must be able to communicate directly with the power receptacle itself. Any electrical device — an appliance, an extension cord, whatever — must be able to tell the power outlet,”Hey, power outlet, I ’ m drawing too much current. Shut me off now, before I start a fire.”And the power outlet needs to be smart enough to do it. So here is what we did. We put a 10-cent digital transponder, a data tag, in the appliance plug. And we put an inexpensive, wireless data reader inside the receptacle so they could communicate. Now, every home electrical system becomes an intelligent network. The appliance ’ s safe operating parameters are embedded into its plug. If too much current is flowing, the intelligent receptacle turns itself off, and prevents another fire from starting. We call this technology EFCI, Electrical Fault Circuit Interrupter. Okay, two more points. Every year in the USA, roughly 2, 500 children are admitted to emergency rooms for shock and burn injuries related to electrical receptacles. And this is crazy. An intelligent receptacle prevents injuries because the power is always off, until an intelligent plug is detected. Simple. Now, besides saving lives, perhaps the greatest benefit of intelligent power is in its energy savings. This invention will reduce global energy consumption by allowing remote control and automation of every outlet in every home and business. Now you can choose to reduce your home energy bill by automatically cycling heavy loads like air conditioners and heaters. Hotels and businesses can shut down unused rooms from a central location, or even a cell phone. There are 10 billion electrical outlets in North America alone. The potential energy savings is very, very significant. So far we ’ ve applied for 414 patent claims. Of those, 186 have been granted : 228 are in process. And I ’ m pleased to announce that just three weeks ago we received our first international recognition, the 2009 CES Innovation Award. So, to conclude, intelligent power can, globally, save thousands of lives, prevent tens of thousands of injuries, and eliminate tens of billions of dollars in property damage every single year, while significantly reducing global energy consumption. In the spirit of this year ’ s TED Conference, we think this is a powerful, world-changing invention. And I ’ d like to thank Chris for this opportunity to unveil our technology with you, and soon the world. Thank you.

I ’ m here because I have a very important message : I think we have found the most important factor for success. And it was found close to here, Stanford. Psychology professor took kids that were four years old and put them in a room all by themselves. And he would tell the child, a four-year-old kid,”Johnny, I am going to leave you here with a marshmallow for 15 minutes. If, after I come back, this marshmallow is here, you will get another one. So you will have two.”To tell a four-year-old kid to wait 15 minutes for something that they like, is equivalent to telling us,”We ’ ll bring you coffee in two hours.”Exact equivalent. So what happened when the professor left the room? As soon as the door closed... two out of three ate the marshmallow. Five seconds, 10 seconds, 40 seconds, 50 seconds, two minutes, four minutes, eight minutes. Some lasted 14- and-a-half minutes. Couldn ’ t do it. Could not wait. What ’ s interesting is that one out of three would look at the marshmallow and go like this... Would look at it. Put it back. They would walk around. They would play with their skirts and pants. That child already, at four, understood the most important principle for success, which is the ability to delay gratification. Self-discipline : the most important factor for success. 15 years later, 14 or 15 years later, follow-up study. What did they find? They went to look for these kids who were now 18 and 19. And they found that 100 percent of the children that had not eaten the marshmallow were successful. They had good grades. They were doing wonderful. They were happy. They had their plans. They had good relationships with the teachers, students. They were doing fine. A great percentage of the kids that ate the marshmallow, they were in trouble. They did not make it to university. They had bad grades. Some of them dropped out. A few were still there with bad grades. A few had good grades. I had a question in my mind : Would Hispanic kids react the same way as the American kids? So I went to Colombia. And I reproduced the experiment. And it was very funny. I used four, five and six years old kids. And let me show you what happened. So what happened in Colombia? Hispanic kids, two out of three ate the marshmallow ; one out of three did not. This little girl was interesting ; she ate the inside of the marshmallow. In other words, she wanted us to think that she had not eaten it, so she would get two. But she ate it. So we know she ’ ll be successful. But we have to watch her. She should not go into banking, for example, or work at a cash register. But she will be successful. And this applies for everything. Even in sales. The sales person that — the customer says,”I want that.”And the person says,”Okay, here you are.”That person ate the marshmallow. If the sales person says,”Wait a second. Let me ask you a few questions to see if this is a good choice.”Then you sell a lot more. So this has applications in all walks of life. I end with — the Koreans did this. You know what? This is so good that we want a marshmallow book for children. We did one for children. And now it is all over Korea. They are teaching these kids exactly this principle. And we need to learn that principle here in the States, because we have a big debt. We are eating more marshmallows than we are producing. Thank you so much.

I ’ ve always wanted to be a cyborg. One of my favorite shows as a kid was”The Six Million Dollar Man,”and this is a little bit closer to the 240-dollar man or so, but â At any rate, I would normally feel very self-conscious and geeky wearing this around, but a few days ago I saw one world-renowned statistician swallowing swords on stage here, so I figure it ’ s OK amongst this group. But that ’ s not what I want to talk about today. I want to talk about toys, and the power that I see inherent in them. When I was a kid, I attended Montessori school up to sixth grade in Atlanta, Georgia. And at the time I didn ’ t think much about it, but then later, I realized that that was the high point of my education. From that point on, everything else was pretty much downhill. And it wasn ’ t until later, as I started making games, that â I really actually think of them more as toys. People call me a game designer, but I really think of these things more as toys. I started getting very interested in Maria Montessori and her methods, and the way she went about things, and the way she thought it very valuable for kids to discover things on their own rather than being taught these things overtly. And she would design these toys, where kids in playing with the toys would come to understand these deep principles of life and nature through play. And since they discovered this, it stuck with them so much more, and also they would experience their own failures. There was a failure-based aspect to learning there. It was very important. And so, the games that I do, I think of really more as modern Montessori toys. And I really kind of want them to be presented in a way to where kids can kind of explore and discover their own principles. So a few years ago, I started getting very interested in the SETI program. And that ' s the way I work. I get interested in different subjects, I dive in, research them, and then try to figure out how to craft a toy around that, so that other people can experience the same sense of discovery that I did as I was learning that subject. And it led me to astrobiology, the study of possible life in the universe. And then Drake ' s equation, looking at the probability of life arising on planets, how long it might last, how many planets are out there. And I started looking at how interesting Drake ' s equation was, because it spanned all these different subjects â physics, chemistry, sociology, economics, astronomy. And another thing that really impressed me a long time ago was"Powers of Ten,"Charles and Ray Eames ' film. And I started putting those two together and wondering, could I build a toy where kids would trip across all these interesting principles of life, as it exists and as it might go in the future. Things where you might trip across things like the Copernican principle, the Fermi paradox, the anthropic principle, the origin of life. And so I ' m going to show you a toy today that I ' ve been working on, that I think of more as kind of a philosophy toy. Playing this toy will bring up philosophical questions in you. The game is"Spore."I ' ve been working on it for several years. It ' s getting pretty close to finished now. It occurs at all these different scales, from very small to very large. I ' m going to pop in at the start of the game. And you actually start this game in a drop of water, as a very, very small single-cell creature, and right off the bat you basically just have to live, survive, reproduce. So here we are, at a very microscopic scale, swimming around. And I actually realize that cells don ' t have eyes, but it helps to make it cute. The players are going to play through every generation of this species, and as you play the game, the creature is actually growing bit by bit. And as we start growing, the camera will actually start zooming out, and things that you see in the background there will start slowly pulling into the foreground, showing you a little bit of what you ' ll be interacting with as you grow. So as we eat, the camera starts pulling out, and then we start interacting with larger and larger organisms. We actually play through many generations here, at the cellular scale. I ' m going to skip ahead here. At some point we get larger, and we actually get to a macroevolution scale. Now, at this point we ' re leaving the water, and one thing that ' s kind of important about this game is that, at every level, the player is designing their creature, and that ' s a fundamental aspect of this. Now, in the evolution game here, the creature scale, basically you have to eat, survive, and then reproduce. You know, very Darwinian. One thing we noticed with"The Sims,"a game I did earlier, is that players love making stuff. When they were able to make stuff in the game, they had a lot of empathy in connection to it. Even if it wasn ' t as pretty as a professional artist would make for games, it really stuck with them and they really cared about what would happen to it. At this point, we ' ve left the water, and now with this little creature â we could bring up the volume a little bit â and now we might try to eat. We might sneak up on this little guy over here maybe, and try and eat him. OK, well, we fight. OK, we got him. Now we get a meal. So really, at this part of the game, what we ’ re doing is we ’ re running around and surviving, and also getting to the next generation, because we ’ re going to play through every generation of this creature. We can mate, so I ’ m going to see if one of these creatures wants to mate with me. Yeah. We didn ’ t want to replay actual evolution with humans and all that, because it ’ s almost more interesting to look at alternate possibilities in evolution. Evolution is usually presented as this one path that we took through, but really it represents this huge set of possibilities. Now, once we mate, we click on the egg. And this is where the game starts getting interesting, because one of the things we really focused on here was giving the players very high-leverage tools, so that for very little effort, the player can make something very cool. And it involves a lot of intelligence on the tool side. But basically, this is the editor where we ’ re going to design the next generation. So it has a little spine. I can move around, I can extend. I can also inflate or deflate it with the mouse wheel, so you sculpt it like clay. We have parts here that I can put on or pull off. The idea is that the player can basically design anything they can think of in this editor, and we ’ ll basically bring it to life. So I might put some limbs on the character here. I ’ ll inflate them kind of large. And in this case I might decide I ’ m going to put â I ’ ll put mouths on the limbs. So pretty much players are encouraged to be very creative in the game. Here, I ’ ll give it one eye in the middle, maybe scale it up a bit. Point it down. And I ’ ll also give it a few legs. So in some sense we want this to feel like an amplifier for the player ’ s imagination, so that with a very small number of clicks a player can create something that they didn ’ t really think was possible before. This is almost like designing something like Maya â that an eight- year-old can use. But really the goal here was, within about a minute, I wanted somebody to replicate what typically takes a pictorial artist several weeks to create. OK, now I ’ ll put some hands on it. OK, so here I ’ ve basically thrown together a little creature. Let me give it a little weapon on the tail here, so it can fight. OK, so that ’ s the complete model. Now we can actually go to the painting phase. At this phase, the program has some understanding of the topology of this creature. It knows where the backbone is, where the spine, the limbs are, how stripes should run, how it should be shaded. And so we ’ re procedurally generating the texture map, something a texture artist would take many days to work on. And then we can test it out, and see how it would move around. And so at this point the computer is procedurally animating this creature. It ’ s looking at whatever I ’ ve designed. It will actually bring it to life. And I can see how it might dance. How it might show emotions, how it might fight. So it ’ s acting with its two mouths there. I can even have it pose for a photo. Snap a little photo of it. So then I bring this back into the game. It ’ s born, and I play the next generation of my creature through evolution. Now again, the empathy that the players have when they create the content is tremendous. When players create content in this game, it ’ s automatically sent up to a server and then redistributed to all the other players transparently. So in fact, as I ’ m interacting in this world with other creatures, these creatures are transparently coming from other players as they play. So the process of playing the game is a process of building up this huge database of content. And pretty much everything you ’ re going to see in this game, there ’ s an editor for that the player can create, up through civilization. This is my baby. When I eat, I ’ ll actually start growing. This is the next generation. But I ’ m going to skip ahead here. Normally what would happen is these creatures would work their way up, eventually become intelligent. I ’ d start dealing with tribes, cities and civilizations of them over time. I ’ m going to skip way ahead to the space phase. Eventually they would go out into space, and start colonizing and exploring the universe. Now, really, in some sense, I want the players to be building this world in their imagination, and then extracting it from them with the least amount of pain. So that ’ s kind of what these tools are about. How do we make the gameplay, you know, basically the player ’ s imagination amplifier? And how do we make these tools, these editors, something that are just as fun as the game itself? So this is the planet that we ’ ve been playing on up to this point in the game. So far the entire game has been played on the surface of this little world here. At this point we ’ re actually dealing with a very little toy planet. Almost, again, like the Montessori toy idea. What happens if you give somebody a toy planet, and let them play with a lot of dynamics on it? What could they discover? What might they learn on this? This world was actually extracted from the player ’ s imagination. So, this is the planet that the player evolved on. Things like the buildings, the vehicles, the architecture, civilizations were all designed by the player up to this point. So here ’ s a little city with some of our guys walking around in it. And most games put the player in the role of Luke Skywalker, this protagonist playing through this story. This is more about putting the player in the role of George Lucas. I want them, after they ’ ve played this game, to have extracted an entire world that they ’ re now interacting with. As we pull down here, we still have a whole set of creatures living on the surface of the planet. All these different dynamics going on here. I can look over here, and this is a little simplified food web that ’ s going on with the creatures. I can open this up and then scan what exists on the surface. You get some sense of the diversity of creatures that were brought in. Some of these were created by the player, others by other players, automatically sent over here. But there ’ s a very simple calculation of what ’ s required, how many plants are required for the herbivores to live, how many herbivores for the carnivores to eat, etc., that you have to balance actively. Also with this phase, we ’ re getting more and more God-like powers for the player, and you can experiment with this planet as a toy. So I can come in and I can do things, and just treat this planet as a lump of clay. We have very simple weather systems, simple geology. For instance, I could open one of my tools here and then carve out rivers. So this whole thing is kind of like a big lump of clay, a sculpture. I can also play with the dynamics in this world over time. So one of the things I can do is start pumping more CO2 gases into the atmosphere, and so that ’ s what I ’ m doing here. There ’ s actually a little readout down there of our planetary atmosphere, pressure and temperature. So as I start pumping in more atmosphere, we ’ re going to start pushing up the greenhouse gases here and if you ’ ll start noticing, we start seeing the ocean levels rise over time. And our cities are going to be at risk too, because a lot of these are coastal cities. You can see the ocean levels are rising now and as they encroach upon the cities, I ’ ll start losing cities here. So basically, I want the players to be able to experiment and explore a huge amount of failure space. So there goes one city. Now, over time, this is going to heat up the planet. So at first what we ’ re going to see is a global ocean rise here on this little toy planet, but then over time â I can speed it up â we ’ ll see the heat impact of that as well. Not only will it get hotter, but at some point it ’ s going to get so hot the oceans will evaporate. They ’ ll go up, and then they ’ ll evaporate, and that ’ ll be my planet. So basically, what we ’ re getting here is the sequel to”An Inconvenient Truth,”in about two minutes, and that actually brings up an interesting point about games. Now here, our entire oceans are evaporating off the surface, and as it keeps getting hotter, at some point the entire planet is going to melt down. Here it goes. So we ’ re not only simulating biological dynamics â food webs and all that â but also geologic, you know, on a very simple core scale. And what ’ s interesting to me about games is that I think we can take a lot of long-term dynamics and compress them into very short-term experiences. Because it ’ s so hard for people to think 50 or 100 years out, but when you can give them a toy, and they can experience these long-term dynamics in just a few minutes, I think it ’ s an entirely different point of view, where we ’ re actually using the game to remap our intuition. It ’ s almost in the same way that a telescope or microscope recalibrates your eyesight ; I think computer simulations can recalibrate your instinct across vast scales of both space and time. So here ’ s our little solar system, as we pull away from our melted planet here. We actually have a couple of other planets in this solar system. Let ’ s fly to another one. We ’ re going to have this unlimited number of worlds you can explore here. As we move into the future, and we start going out into space and doing stuff, we ’ re drawing a lot from things like science fiction. And all my favorite science fiction movies I want to play out here as different dynamics. This planet actually has some life on it. Here it is, some indigenous life down here. One of the tools I can eventually earn for my UFO is a monolith that I can drop down. Now, as you can see, these guys are actually starting to go up and bow to it, and over time, once they touch it, they will become intelligent. So I can actually pick a species on a planet and then make them sentient. Now they ’ ve actually gone to tribal dynamics. And now, because I ’ m actually the one here, I can get out of the UFO and walk up, and they should be worshipping me at this point as a god. At first they ’ re a little freaked out. OK, well maybe they ’ re not worshipping me. I think I ’ ll leave before they get hostile. But we basically want a diversity of activities the players can play through this. I want to be able to play”The Day the Earth Stood Still,””2001 : A Space Odyssey,””Star Trek,””War Of the Worlds.”Now, as we pull away from this world â we ’ re going to keep pulling away from the star now. One of the things that always frustrated me about astronomy when I was a kid is how it was always presented so two-dimensionally and so static. As we pull away from the star here, we ’ re actually going now out into interstellar space, and we ’ re getting a sense of the space around our home star. What I really wanted to do is to present this, basically, as wonderfully 3D as it is actually is. And also show the dynamics, and a lot of the interesting objects that you might find, like, in the Hubble, at pretty much realistic frequencies and scales. So most people have no idea of the difference between an emission nebula and a planetary nebula. But these are the things that we can put in this little galaxy here. So we ’ re flying over here to what looks like a black hole. I want to basically have the entire zoo of Hubble objects that people can interact with and play with, again, as toys. So here ’ s a little black hole that we probably don ’ t want to get too close to. But we also have stars and things as well. If we pull all the way back, we start seeing the entire galaxy here, kind of slowly in motion. Typically, when people present galaxies, it ’ s always beautiful photos, but they ’ re always static. And when you bring it forward in time and start animating it, it ’ s amazing what a galaxy would look like fast forwarded. This would be about a million years a second, because you have about one supernova every century. And so you ’ d have this wonderful sparkling thing, with the disk slowly rotating, and this is roughly what it would look like. Part of this is about bringing the beauty of the natural world to somebody in a very imaginative way, so that they can start calibrating their instinct across these vast scales of space and time. Chris was wondering what kind of gods the players would become. Because if you think about it, you ’ re going to have 15-year-olds, 20-year-olds flying around this universe. They might be a nurturing god. They might be bootstrapping life on planets, trying to terraform and spread civilization. You might be a vengeful god, conquesting, because you actually can do that, you can attack other intelligent races. You might be a networking god, building alliances, or just curious, going around and wanting to explore as much as you possibly can. But basically, the reason why I make toys like this is because I think if there ’ s one difference I could possibly make in the world, that I would choose to make, it ’ s that I would like to somehow give people just a little bit better calibration on long-term thinking. Because I think most of the problems that our world is facing right now are the result of short-term thinking, and the fact that it is so hard for us to think 50, 100, or 1, 000 years out. And I think by giving kids toys like this and letting them replay dynamics, very long-term dynamics over the short term, and getting some sense of what we ’ re doing now, what it ’ s going to be like in 100 years, I think probably is the most effective thing I can be doing to help the world. And so that ’ s why I think that toys can change the world. Thank you.

I would like to tell you about a project which I started about 16 years ago. It ’ s about making new forms of life. And these are made of this kind of tube â electricity tube, we call it in Holland. And we can start a film about that, and we can see a little bit backwards in time. Narrator : Eventually, these beasts are going to live in herds on the beaches. Theo Jansen is working hard on this evolution. Theo Jansen : I want to put these forms of life on the beaches. And they should survive over there, on their own, in the future. Learning to live on their own â and it ’ ll take couple of more years to let them walk on their own. Narrator : The mechanical beasts will not get their energy from food, but from the wind. The wind will move feathers on their back, which will drive their feet. The beast walks sideways on the wet sand of the beach, with its nose pointed into the wind. As soon as it walks into either the rolling surf or the dry sand, it stops, and walks in the opposite direction. Evolution has generated many species. This is the Animaris Currens Ventosa. TJ : This is a herd, and it is built according to genetic codes. And it is a sort of race, and each and every animal is different, and the winning codes will multiply. This is the wave, going from left to right. You can see this one. Yes, and now it goes from left to right. This is a new generation, a new family, which is able to store the wind. So, the wings pump up air in lemonade bottles, which are on top of that. And they can use that energy in case the wind falls away, and the tide is coming up, and there is still a little bit of energy to reach the dunes and save their lives, because they are drowned very easily. I could show you this animal. Thank you. So, the proportion of the tubes in this animal is very important for the walking. There are 11 numbers, which I call The 11 Holy Numbers. These are the distances of the tubes which make it walk that way. In fact, it ’ s a new invention of the wheel. It works the same as a wheel. The axis of a wheel stays on the same level, and this hip is staying on the same level as well. In fact, this is better than a wheel, because when you try to drive your bicycle on the beach, you will notice it ’ s very hard to do. And the feet just step over the sand, and the wheel has to touch every piece of the ground in-between. So 5, 000 years after the invention of the wheel, we have a new wheel. I will show you, in the next video â can you start it, please? â that very heavy loads can be moved. There ’ s a guy pushing there, behind, but it can also walk on the wind very well. It ’ s 3. 2 tons. This is working on the stored wind in the bottles. It has a feeler, where it can feel obstacles and turn around. You see, it ’ s going the other way. Can I have the feeler here? OK. Good. So, they have to survive all the dangers of the beach, and one of the big dangers is the sea. This is the sea. And it must feel the water of the sea. And this is the water feeler, and what ’ s very important is this tube. It sucks in air normally, but when it swallows water, it feels the resistance of it. So, imagine that the animal is walking towards the sea. As soon as it touches the water â□□ you should hear a sound of running air. Yes! So if it doesn ’ t feel, it will be drowned, OK? Here we have the brain of the animal. In fact, it is a step counter, and it counts the steps. It ’ s a binary step counter. So as soon it has been to the sea, it changes the pattern of zeroes and ones here. And it always knows where it is on the beach. So it ’ s very simple brain. It says, well, there ’ s the sea, there are dunes, and I ’ m here. So it ’ s a sort of imagination of the simple world of the beach animal. Thank you. One of the biggest enemies are the storms. This is a part of the nose of the Animaris Percipiere. When the nose of the animal is fixed, the whole animal is fixed. So when the storm is coming up, it drives a pin into the ground. Audience member : Wow! The nose is fixed, the whole animal is fixed. The wind may turn, but the animal will always turn its nose into the wind. Now, another couple of years, and these animals will survive on their own. I still have to help them a lot. Thank you very much, ladies and gentlemen.

This is a recent comic strip from the Los Angeles Times. The punch line?”On the other hand, I don ’ t have to get up at four every single morning to milk my Labrador.”This is a recent cover of New York Magazine. Best hospitals where doctors say they would go for cancer treatment, births, strokes, heart disease, hip replacements, 4 a. m. emergencies. And this is a song medley I put together — Did you ever notice that four in the morning has become some sort of meme or shorthand? It means something like you are awake at the worst possible hour. A time for inconveniences, mishaps, yearnings. A time for plotting to whack the chief of police, like in this classic scene from”The Godfather.”Coppola ’ s script describes these guys as,”exhausted in shirt sleeves. It is four in the morning.”A time for even grimmer stuff than that, like autopsies and embalmings in Isabel Allende ’ s”The House of the Spirits.”After the breathtaking green- haired Rosa is murdered, the doctors preserve her with unguents and morticians ’ paste. They worked until four o ’ clock in the morning. A time for even grimmer stuff than that, like in last April ’ s New Yorker magazine. This short fiction piece by Martin Amis starts out,”On September 11, 2001, he opened his eyes at 4 a. m. in Portland, Maine, and Mohamed Atta ’ s last day began.”For a time that I find to be the most placid and uneventful hour of the day, four in the morning sure gets an awful lot of bad press — across a lot of different media from a lot of big names. And it made me suspicious. I figured, surely some of the most creative artistic minds in the world, really, aren ’ t all defaulting back to this one easy trope like they invented it, right? Could it be there is something more going on here? Something deliberate, something secret, and who got the four in the morning bad rap ball rolling anyway? I say this guy — Alberto Giacometti, shown here with some of his sculptures on the Swiss 100 franc note. He did it with this famous piece from the New York Museum of Modern Art. Its title —”The Palace at Four in the Morning — 1932. Not just the earliest cryptic reference to four in the morning I can find. I believe that this so-called first surrealist sculpture may provide an incredible key to virtually every artistic depiction of four in the morning to follow it. I call this The Giacometti Code, a TED exclusive. No, feel free to follow along on your Blackberries or your iPhones if you ’ ve got them. It works a little something like — this is a recent Google search for four in the morning. Results vary, of course. This is pretty typical. The top 10 results yield you four hits for Faron Young ’ s song,”It ’ s Four in the Morning,”three hits for Judi Dench ’ s film,”Four in the

Morning,”one hit for Wislawa Szymborska ’ s poem,”Four in the Morning.”But what, you may ask, do a Polish poet, a British Dame, a country music hall of famer all have in common besides this totally excellent Google ranking? Well, let ’ s start with Faron Young — who was born incidentally in 1932. In 1996, he shot himself in the head on December ninth — which incidentally is Judi Dench ’ s birthday. But he didn ’ t die on Dench ’ s birthday. He languished until the following afternoon when he finally succumbed to a supposedly self-inflicted gunshot wound at the age of 64 — which incidentally is how old Alberto Giacometti was when he died. Where was Wislawa Szymborska during all this? She has the world ’ s most absolutely watertight alibi. On that very day, December 10, 1996 while Mr. Four in the Morning, Faron Young, was giving up the ghost in Nashville, Tennessee, Ms. Four in the Morning — or one of them anyway — Wislawa Szymborska was in Stockholm, Sweden, accepting the Nobel Prize for Literature. 100 years to the day after the death of Alfred Nobel himself. Coincidence? No, it ’ s creepy. Coincidence to me has a much simpler metric. That ’ s like me telling you,”Hey, you know the Nobel Prize was established in 1901, which coincidentally is the same year Alberto Giacometti was born?”No, not everything fits so tidily into the paradigm, but that does not mean there ’ s not something going on at the highest possible levels. In fact there are people in this room who may not want me to show you this clip we ’ re about to see. Video : Homer Simpson : We have a tennis court, a swimming pool, a screening room — You mean if I want pork chops, even in the middle of the night, your guy will fry them up? Herbert Powell : Sure, that ’ s what he ’ s paid for. Now do you need towels, laundry, maids? HS : Wait, wait, wait, wait, wait, wait — let me see if I got this straight. It is Christmas Day, 4 a. m. There ’ s a rumble in my stomach. Marge Simpson : Homer, please. Rives : Wait, wait, wait, wait, wait, wait, wait. Let me see if I got this straight, Matt. When Homer Simpson needs to imagine the most remote possible moment of not just the clock, but the whole freaking calendar, he comes up with 0400 on the birthday of the Baby Jesus. And no, I don ’ t know how it works into the whole puzzling scheme of things, but obviously I know a coded message when I see one. I said, I know a coded message when I see one. And folks, you can buy a copy of Bill Clinton ’ s”My Life”from the bookstore here at TED. Parse it cover to cover for whatever hidden references you want. Or you can go to the Random House website where there is this excerpt. And how far down into it you figure we ’ ll have to scroll to get to the golden ticket? Would you believe about a dozen paragraphs? This is page 474 on your paperbacks if you ’ re following along :”Though it was getting better, I still wasn ’ t satisfied with the inaugural address. My speechwriters must have been tearing their hair out because as we worked between one and four in the morning on Inauguration Day, I was still changing it.”Sure you were, because you ’ ve prepared your entire life for this historic quadrennial event that just sort of sneaks up on you. And then — three paragraphs later we get this little beauty :”We went back to Blair House to look at the speech for the last time. It had gotten a lot better since 4 a. m.”Well, how could it have? By his own writing, this man was either asleep, at a prayer meeting with Al and Tipper or learning how to launch a nuclear missile out of a suitcase. What happens to American presidents at 0400 on inauguration day? What happened to William Jefferson Clinton? We might not ever know. And I noticed, he ’ s not exactly around here today to face any tough questions. It could get awkward, right? I mean after all, this whole business happened on his watch. But if he were here — he might remind us, as he does in the wrap-up to his fine autobiography, that on this day Bill Clinton began a journey — a journey that saw him go on to become the first Democrat president elected to two consecutive terms in decades. In generations. The first since this man, Franklin Delano Roosevelt, who began his own unprecedented journey way back at his own first election, way back in a simpler time, way back in 1932 — the year Alberto Giacometti made”The Palace at Four in the Morning.”The year, let ’ s remember, that this voice, now departed, first came a-cryin ’ into this big old crazy world of ours.

I ’ m going to present three projects in rapid fire. I don ’ t have much time to do it. And I want to reinforce three ideas with that rapid-fire presentation. The first is what I like to call a hyper-rational process. It ’ s a process that takes rationality almost to an absurd level, and it transcends all the baggage that normally comes with what people would call, sort of a rational conclusion to something. And it concludes in something that you see here, that you actually wouldn ’ t expect as being the result of rationality. The second — the second is that this process does not have a signature. There is no authorship. Architects are obsessed with authorship. This is something that has editing and it has teams, but in fact, we no longer see within this process, the traditional master architect creating a sketch that his minions carry out. And the third is that it challenges — and this is, in the length of this, very hard to support why, connect all these things — but it challenges the high modernist notion of flexibility. High modernists said we will create sort of singular spaces that are generic, almost anything can happen within them. I call it sort of”shotgun flexibility”— turn your head this way ; shoot ; and you ’ re bound to kill something. So, this is the promise of high modernism : within a single space, actually, any kind of activity can happen. But as we ’ re seeing, operational costs are starting to dwarf capital costs in terms of design parameters. And so, with this sort of idea, what happens is, whatever actually is in the building on opening day, or whatever seems to be the most immediate need, starts to dwarf the possibility and sort of subsume it, of anything else could ever happen. And so we ’ re proposing a different kind of flexibility, something that we call”compartmentalized flexibility.”And the idea is that you, within that continuum, identify a series of points, and you design specifically to them. They can be pushed off-center a little bit, but in the end you actually still get as much of that original spectrum as you originally had hoped. With high modernist flexibility, that doesn ’ t really work. Now I ’ m going to talk about — I ’ m going to build up the Seattle Central Library in this way before your eyes in about five or six diagrams, and I truly mean this is the design process that you ’ ll see. With the library staff and the library board, we settled on two core positions. This is the first one, and this is showing, over the last 900 years, the evolution of the book, and other technologies. This diagram was our sort of position piece about the book, and our position was, books are technology — that ’ s something people forget — but it ’ s a form of technology that will have to share its dominance with any other form of truly potent technology or media. The second premise — and this was something that was very difficult for us to convince the librarians of at first — is that libraries, since the inception of Carnegie Library tradition in America, had a second responsibility, and that was for social roles. Ok, now, this I ’ ll come back to later, but something — actually, the librarians at first said,”No, this isn ’ t our mandate. Our mandate is media, and particularly the book.”So what you ’ re seeing now is actually the design of the building. The upper diagram is what we had seen in a whole host of contemporary libraries that used high modernist flexibility. Sort of, any activity could happen anywhere. We don ’ t know the future of the library ; we don ’ t know the future of the book ; and so, we ’ ll

use this approach. And what we saw were buildings that were very generic, and worse — not only were they very generic — so, not only does the reading room look like the copy room look like the magazine area — but it meant that whatever issue was troubling the library at that moment was starting to engulf every other activity that was happening in it. And in this case, what was getting engulfed were these social responsibilities by the expansion of the book. And so we proposed what ' s at the lower diagram. Very dumb approach : simply compartmentalize. Put those things whose evolution we could predict — and I don ' t mean that we could say what would actually happen in the future, but we have some certainty of the spectrum of what would happen in the future — put those in boxes designed specifically for it, and put the things that we can ' t predict on the rooftops. So that was the core idea. Now, we had to convince the library that social roles were equally important to media, in order to get them to accept this. What you ' re seeing here is actually their program on the left. That ' s as it was given to us in all of its clarity and glory. Our first operation was to re-digest it back to them, show it to them and say,"You know what? We haven ' t touched it, but only one-third of your own program is dedicated to media and books. Two-thirds of it is already dedicated — that ' s the white band below, the thing you said isn ' t important — is already dedicated to social functions."So once we had presented that back to them, they agreed that this sort of core concept could work. We got the right to go back to first principles — that ' s the third diagram. We recombined everything. And then we started making new decisions. What you ' re seeing on the right is the design of the library, specifically in terms of square footage. On the left of that diagram, here, you ' ll see a series of five platforms — sort of combs, collective programs. And on the right are the more indeterminate spaces ; things like reading rooms, whose evolution in 20, 30, 40 years we can ' t predict. So that literally was the design of the building. They signed it, and to their chagrin, we came back a week later, and we presented them this. And as you can see, it is literally the diagram on the right. We just sized — no, really, I mean that, literally. The things on the left- hand side of the diagram, those are the boxes. We sized them into five compartments. They ' re super-efficient. We had a very low budget to work with. We pushed them around on the site to make very literal contextual relationships. The reading room should be able to see the water. The main entrance should have a public plaza in front of it to abide by the zoning code, and so forth. So, you see the five platforms, those are the boxes. within each one, a very discrete thing is happening. The area in between is sort of an urban continuum, these things that we can ' t predict their evolution to the same degree. To give you some sense of the power of this idea, the biggest block is what we call the book spiral. It ' s literally built in a very inexpensive way — it is a parking garage for books. It just so happens to be on the 6th through 10th floors of the building, but that is not necessarily an expensive approach. And it allows us to organize the entire Dewey Decimal System on one continuous run ; no matter how it grows or contracts within the building, it will always have its clarity to end the sort of trail of tears that we ' ve all experienced in public libraries. And so this was the final operation, which was to take these blocks as they were all pushed off kilter, and to hold onto them with a skin. That skin serves double duty, again, for economics. One, it is the lateral stability for the entire building ; it ' s a structural element. But its dimensions were designed not only for structure, but also for holding on every piece of glass. The glass was then — I ' ll use the word impregnated — but it had a layer of metal that was called"stretched metal."That metal acts as a microlouver, so from the exterior of the building, the sun sees it as totally opaque, but from the interior, it ' s entirely transparent. So now I ' m going to take you on a tour of the building.

Let me see if I can find it. For anyone who gets motion sickness, I apologize. So, this is the building. And I think what ’ s important is, when we first unveiled the building, the public saw it as being totally about our whim and ego. And it was defended, believe it or not, by the librarians. They said,”Look, we don ’ t know what it is, but we know it ’ s everything that we need it to be, based on the observations that we ’ ve done about the program.”This is going into one of the entries. So, it ’ s an unusual building for a public library, obviously. So now we ’ re going into what we call the living room. This is actually a program that we invented with the library. It was recognizing that public libraries are the last vestige of public free space. There are plenty of shopping malls that allow you to get out of the rain in downtown Seattle, but there are not so many free places that allow you to get out of the rain. So this was an unprogrammed area where people could pretty much do anything, including eat, yell, play chess and so forth. Now we ’ re moving up into what we call the mixing chamber. That was the main technology area in the building. You ’ ll have to tell me if I ’ m going too fast for you. And now up. This is actually the place that we put into the building so I could propose to my wife, right there. She said yes. I ’ m running out of time, so I ’ m actually going to stop. I can show this to you later. But let ’ s see if I can very quickly get into the book spiral, because I think it ’ s, as I said, the most — this is the main reading room — the most unique part of the building. You dizzy yet? Ok, so here, this is the book spiral. So, it ’ s very indiscernible, but it ’ s actually a continuous stair- stepping. It allows you to, on one city block, go up one full floor, so that it ’ s on a continuum. Ok, now I ’ m going to go back, and I ’ m going to hit a second project. I ’ m going to go very, very quickly through this. Now this is the Dallas Theater. It was an unusual client for us, because they came to us and they said,”We need you to do a new building. We ’ ve been working in a temporary space for 30 years, but because of that temporary space, we ’ ve become an infamous theater company. Theater is really focused in New York, Chicago and Seattle, with the exception of the Dallas Theater Company.”And the very fact that they worked in a provisional space meant that for Beckett, they could blow out a wall ; they could do”Cherry Orchard”and blow a hole through the floor, and so forth. So it was a very daunting task for us to do a brand-new building that could be a pristine building, but keep this kind of experimental nature. And the second is, they were what we call a multi-form theater, they do different kinds of performances in repertory. So they in the morning will do something in arena, then they ’ ll do something in proscenium and so forth. And so they needed to be able to quickly transform between different theater organizations, and for operational budget reasons, this actually no longer happens in pretty much any multi-form theater in the United States, so we needed to figure out a way to overcome that. So our thought was to literally put the theater on its head : to take those things that were previously defined as front-of-house and back-of-house and stack them above house and below house, and to create what we called a theater machine. We invest the money in the operation of the building. It ’ s almost as though the building could be placed anywhere, wherever you place it, the area under it is charged for theatrical performances. And it allowed us to go back to first principles, and redefine fly tower, acoustic enclosure, light enclosure and so forth. And at the push of a button, it allows the artistic director to move between proscenium, thrust, and in fact, arena and traverse and flat floor, in a very quick transfiguration. So in fact, using operational budget, we can — sorry, capital cost — we can actually achieve what was no longer achievable in operational cost. And that means that the artistic director now has a palette that he or she can choose from, between a series of forms and a series of processions, because that enclosure around the theater that is normally trapped with front-of-house and back-of-house spaces has been liberated. So an artistic director has the ability to have a performance that enters in a Wagnerian procession, shows the first act in thrust, the intermission in a Greek procession, second act in arena, and so forth. So I ’ m going to show you what this actually means. This is the theater up close. Any portion around the theater actually can be opened discretely. The light enclosure can be lifted separate to the acoustic enclosure, so you can do Beckett with Dallas as the backdrop. Portions can be opened, so you can now actually have motorcycles drive directly into the performance, or you can even just have an open-air performance, or for intermissions. The balconies all move to go between those configurations, but they also disappear. The proscenium line can also disappear. You can bring enormous objects in, so in fact, the Dallas Theater Company — their first show will be a play about Charles Lindbergh, and they ’ ll want to bring in a real aircraft. And then it also provides them, in the off-season, the ability to actually rent out their space for entirely different things. This is it from a distance. Open up entire portions for different kinds of events. And at night. Again, remove the light enclosure ; keep the acoustic enclosure. This is a monster truck show. I ’ m going to show now the last project. This also is an unusual client. They inverted the whole idea of development. They came to us and they said — unlike normal developers — they said,”We want to start out by providing a contemporary art museum in Louisville. That ’ s our main goal.”And so instead of being a developer that sees an opportunity to make money, they saw an ability to be a catalyst in their downtown. And the fact that they wanted to support the contemporary art museum actually built their pro forma, so they worked in reverse. And that pro forma led us to a mixed-use building that was very large, in order to support their aspirations of the art, but it also opened up opportunities for the art itself to collaborate, interact with commercial spaces that actually artists more and more want to work within. And it also charged us with thinking about how to have something that was both a single building and a credible sort of sub-building. So this is Louisville ’ s skyline, and I ’ m going to take you through the various constraints that led to the project. First : the physical constraints. We actually had to operate on three discrete sites, all of them well smaller than the size of the building. We had to operate next to the new Muhammad Ali Center, and respect it. We had to operate within the 100-year floodplain. Now, this area floods three to four times a year, and there ’ s a levee behind our site, similar to the ones that broke in New Orleans. Had to operate behind the I-64 corridor, a street that cuts through the middle of these separate sites. So we ’ re starting to build a sort of nightmare of constraints in a bathtub. Underneath the bathtub are the city ’ s main power lines. And there is a pedestrian corridor that they wanted to add, that would link a series of cultural buildings, and a view corridor — because this is the historic district — that they didn ’ t want to obstruct with a new building. And now we ’ re going to add 1. 1 million square feet. And if we did the traditional thing, that 1. 1 million square feet — these are the different programs — the traditional thing would be to identify the public elements, place them on sites, and now we ’ d have a really terrible situation : a public thing in the middle of a bathtub that floods. And then we would size all the other elements — the different commercial elements : hotel, luxury housing, offices and so forth — and dump it on top. And we would create something that was unviable. In fact — and you know this — this is called the Time Warner Building. So our strategy was very simple. Just lift the entire block, flip some of the elements over, reposition them so they have appropriate views and relationships to downtown, and make circulation connections and reroute the road. So that ’ s the basic concept, and now I ’ m going to show you what it leads to. Ok, it seems a very formal, willful gesture, but something derived entirely out of the constraints. And again, when we unveiled it, there was a sort of nervousness that this was about an architect making a statement, not an architect who was attempting to solve a series of problems. Now, within that center zone, as I said, we have the ability to mix a series of things. So here, this is sort of an x-ray — the towers are totally developer-driven. They told us the dimensions, the sizes and so forth, and we focused on taking all the public components — the lobbies, the bars — everything that different commercial elements would have, and combined it in the center, in the sort of subway map, in the transfer zone that would also include the contemporary art museum. So it creates a situation like this, where you have artists who can operate within an art space that also has an amazing view on the 22nd floor, but it also has proximity that the curator can either open or close. It allows people on exercise bicycles to be seen, or to see the art, and so forth. It also means that if an artist wants to invade something like a swimming pool, they can begin to do their exhibition in a swimming pool, so they ’ re not forced to always work within the confines of a contemporary gallery space. So, how to build this. It ’ s very simple : it ’ s a chair. So, we begin by building the cores. As we ’ re building the cores, we build the contemporary art museum at grade. That allows us to have incredible efficiency and cost efficiency. This is not a high-budget building. The moment the cores get to mid level, we finish the art museum ; we put all the mechanical equipment in it ; and then we jack it up into the air. This is how they build really large aircraft hangars, for instance, the ones that they did for the A380. Finish the cores, finish the meat and you get something that looks like this. Now I only have about 30 seconds, so I want to start an animation, and we ’ ll conclude with that. Thank you. Chris asked me to add — the theater is under construction, and this project will start construction in about a year, and finish in 2010. [identify public elements] [insert public elements at grade] [optimize tower dimensions] [place towers on site] [lift program] [flip!] [optimize program adjacencies] [connect to context] [redirect 7th street]

About 10 years ago, I took on the task to teach global development to Swedish undergraduate students. That was after having spent about 20 years, together with African institutions, studying hunger in Africa. So I was sort of expected to know a little about the world. And I started, in our medical university, Karolinska Institute, an undergraduate course called Global Health. But when you get that opportunity, you get a little nervous. I thought, these students coming to us actually have the highest grade you can get in the Swedish college system, so I thought, maybe they know everything I ’ m going to teach them about. So I did a pretest when they came. And one of the questions from which I learned a lot was this one :”Which country has the highest child mortality of these five pairs?”And I put them together so that in each pair of countries, one has twice the child mortality of the other. And this means that it ’ s much bigger, the difference, than the uncertainty of the data. I won ’ t put you at a test here, but it ’ s Turkey, which is highest there, Poland, Russia, Pakistan and South Africa. And these were the results of the Swedish students. I did it so I got the confidence interval, which is pretty narrow. And I got happy, of course — a 1. 8 right answer out of five possible. That means there was a place for a professor of international health and for my course. But one late night, when I was compiling the report, I really realized my discovery. I have shown that Swedish top students know, statistically, significantly less about the world than the chimpanzees. Because the chimpanzee would score half right if I gave them two bananas with Sri Lanka and Turkey. They would be right half of the cases. But the students are not there. The problem for me was not ignorance ; it was preconceived ideas. I did also an unethical study of the professors of the Karolinska Institute, which hands out the Nobel Prize in Medicine, and they are on par with the chimpanzee there. This is where I realized that there was really a need to communicate, because the data of what ’ s happening in the world and the child health of every country is very well aware. So we did this software, which displays it like this. Every bubble here is a country. This country over here is China. This is India. The size of the bubble is the population, and on this axis here, I put fertility rate. Because my students, what they said when they looked upon the world, and I asked them,”What do you really think about the world?”Well, I first discovered that the textbook was Tintin, mainly. And they said,”The world is still ’ we ’ and ’ them. ’ And ’ we ’ is the Western world and ’ them ’ is the Third World.””And what do you mean with ’ Western world? ’”I said.”Well, that ’ s long life and small family. And ’ Third World ’ is short life and large family.”So this is what I could display here. I put fertility rate here — number of children per woman : one, two, three, four, up to about eight children per woman. We have very good data since 1962, 1960, about, on the size of families in all countries. The error margin is narrow. Here, I put life expectancy at birth, from 30 years in some countries, up to about 70 years. And in 1962, there was really a group of countries here that were industrialized countries, and they had small families and long lives. And these were the developing countries. They had large families and they had relatively short lives. Now, what has happened since 1962? We want to see the change. Are the students right? It ’ s still two types of countries? Or have these developing countries got smaller families and they live here? Or have they got longer lives and live up there? Let ’ s see. We stopped the world then. This is all UN statistics that have been available. Here we go. Can you see there? It ’ s China there, moving against better health there, improving there. All the green Latin American countries are moving towards smaller families. Your yellow ones here are the Arabic countries, and they get longer life, but not larger families. The Africans are the green here. They still remain here. This is India ; Indonesia is moving on pretty fast. In the ’ 80s here, you have Bangladesh still among the African countries. But now, Bangladesh — it ’ s a miracle that happens in the ’ 80s — the imams start to promote family planning, and they move up into that corner. And in the ’ 90s, we have the terrible HIV epidemic that takes down the life expectancy of the African countries. And the rest of them all move up into the corner, where we have long lives and small family, and we have a completely new world. Let me make a comparison directly between the United States of America and Vietnam. 1964 : America had small families and long life ; Vietnam had large families and short lives. And this is what happens. The data during the war indicate that even with all the death, there was an improvement of life expectancy. By the end of the year, family planning started in Vietnam, and they went for smaller families. And the United States up there is getting longer life, keeping family size. And in the ’ 80s now, they give up Communist planning and they go for market economy, and it moves faster even than social life. And today, we have in Vietnam the same life expectancy and the same family size here in Vietnam, 2003, as in United States, 1974, by the end of the war. I think we all, if we don ’ t look at the data, we underestimate the tremendous change in Asia, which was in social change before we saw the economic change. So let ’ s move over to another way here in which we could display the distribution in the world of income. This is the world distribution of income of people. One dollar, 10 dollars or 100 dollars per day. There ’ s no gap between rich and poor any longer. This is a myth. There ’ s a little hump here.

But there are people all the way. And if we look where the income ends up, this is 100 percent of the world ’ s annual income. And the richest 20 percent, they take out of that about 74 percent. And the poorest 20 percent, they take about two percent. And this shows that the concept of developing countries is extremely doubtful. We think about aid, like these people here giving aid to these people here. But in the middle, we have most of the world population, and they have now 24 percent of the income. We heard it in other forms. And who are these? Where are the different countries? I can show you Africa. This is Africa. Ten percent of the world population, most in poverty. This is OECD — the rich countries, the country club of the UN. And they are over here on this side. Quite an overlap between Africa and OECD. And this is Latin America. It has everything on this earth, from the poorest to the richest in Latin America. And on top of that, we can put East Europe, we can put East Asia, and we put South Asia. And what did it look like if we go back in time, to about 1970? Then, there was more of a hump. And most who lived in absolute poverty were Asians. The problem in the world was the poverty in Asia. And if I now let the world move forward, you will see that while population increases, there are hundreds of millions in Asia getting out of poverty, and some others getting into poverty, and this is the pattern we have today. And the best projection from the World Bank is that this will happen, and we will not have a divided world. We ’ ll have most people in the middle. Of course it ’ s a logarithmic scale here, but our concept of economy is growth with percent. We look upon it as a possibility of percentile increase. If I change this and take GDP per capita instead of family income, and I turn these individual data into regional data of gross domestic product, and I take the regions down here, the size of the bubble is still the population. And you have the OECD there, and you have sub-Saharan Africa there, and we take off the Arab states there, coming both from Africa and from Asia, and we put them separately, and we can expand this axis, and I can give it a new dimension here, by adding the social values there, child survival. Now I have money on that axis, and I have the possibility of children to survive there. In some countries, 99. 7 % of children survive to five years of age ; others, only 70. And here, it seems, there is a gap between OECD, Latin America, East Europe, East Asia, Arab states, South Asia and sub-Saharan Africa. The linearity is very strong between child survival and money. But let me split sub-Saharan Africa. Health is there and better health is up there. I can go here, and I can split sub-Saharan Africa into its countries. And when it bursts, the size of each country bubble is the size of the population. Sierra Leone down there, Mauritius is up there. Mauritius was the first country to get away with trade barriers, and they could sell their sugar, they could sell their textiles, on equal terms as the people in Europe and North America. There ’ s a huge difference [within] Africa. And Ghana is here in the middle. In Sierra Leone, humanitarian aid. Here in Uganda, development aid. Here, time to invest ; there, you can go for a holiday. There ’ s tremendous variation within Africa, which we very often make that it ’ s equal everything. I can split South Asia here. India ’ s the big bubble in the middle. But there ’ s a huge difference between Afghanistan and Sri Lanka. I can split Arab states. How are they? Same climate, same culture, same religion — huge difference. Even between neighbors — Yemen, civil war ; United Arab Emirates, money, which was quite equally and well-used. Not as the myth is. And that includes all the children of the foreign workers who are in the country. Data is often better than you think. Many people say data is bad. There is an uncertainty margin, but we can see the difference here : Cambodia, Singapore. The differences are much bigger than the weakness of the data. East Europe : Soviet economy for a long time, but they come out after 10 years very, very differently. And there is Latin America. Today, we don ’ t have to go to Cuba to find a healthy country in Latin America. Chile will have a lower child mortality than Cuba within some few years from now. Here, we have high-income countries in the OECD. And we get the whole pattern here of the world, which is more or less like this. And if we look at it, how the world looks, in 1960, it starts to move. This is Mao Zedong. He brought health to China. And then he died. And then Deng Xiaoping came and brought money to China, and brought them into the mainstream again. And we have seen how countries move in different directions like this, so it ' s sort of difficult to get an example country which shows the pattern of the world. But I would like to bring you back to about here, at 1960. I would like to compare South Korea, which is this one, with Brazil, which is this one. The label went away for me here. And I would like to compare Uganda, which is there. I can run it forward, like this. And you can see how South Korea is making a very, very fast advancement, whereas Brazil is much slower. And if we move back again, here, and we put trails on them, like this, you can see again that the speed of development is very, very different, and the countries are moving more or less at the same rate as money and health, but it seems you can move much faster if you are healthy first than if you are wealthy first. And to show that, you can put on the way of United Arab Emirates. They came from here, a mineral country. They cached all the oil ; they got all the money ; but health cannot be bought at the supermarket. You have to invest in health. You have to get kids into schooling. You have to train health staff. You have to educate the population. And Sheikh Zayed did that in a fairly good way. In spite of falling oil prices, he brought this country up here. So we ' ve got a much more mainstream appearance of the world, where all countries tend to use their money better than they used it in the past. Now, this is, more or less, if you look at the average data of the countries — they are like this. That ' s dangerous, to use average data, because there is such a lot of difference within countries. So if I go and look here, we can see that Uganda today is where South Korea was in 1960. If I split Uganda, there ' s quite a difference within Uganda. These are the quintiles of Uganda. The richest 20 percent of Ugandans are there. The poorest are down there. If I split South Africa, it ' s like this. And if I go down and look at Niger, where there was such a terrible famine [recently], it ' s like this. The 20 percent poorest of Niger is out here, and the 20 percent richest of South Africa is there, and yet we tend to discuss what solutions there should be in Africa. Everything in this world exists in Africa. And you can ' t discuss universal access to HIV [treatment] for that quintile up here with the same strategy as down here. The improvement of the world must be highly contextualized, and it ' s not relevant to have it on a regional level. We must be much more detailed. We find that students get very excited when they can use this. And even more, policy makers and the corporate sectors would like to see how the world is changing. Now, why doesn ' t this take place? Why are we not using the data we have? We have data in the United Nations, in the national statistical agencies and in universities and other nongovernmental organizations. Because the data is hidden down in the databases. And the public is there, and the internet is there, but we have still not used it effectively. All that information we saw changing in the world does not include publicly funded statistics. There are some web pages like this, you know, but they take some nourishment down from the databases, but people put prices on them, stupid passwords and boring statistics. And this won ' t work. So what is needed? We have the databases. It ' s not a new database that you need. We have wonderful design tools and more and more are added up here. So we started a nonprofit venture linking data to design, we called"Gapminder,"from the London Underground, where they warn you,"Mind the gap."So we thought Gapminder was appropriate. And we started to write software which could link the data like this. And it wasn ' t that difficult. It took some person years, and we have produced animations. You can take a data set and put it there. We are liberating UN data, some few UN organization. Some countries accept that their databases can go out on the world. But what we really need is, of course, a search function, a search function where we can copy the data up to a searchable format and get it out in the world. And what do we hear when we go around? I ' ve done anthropology on the main statistical units. Everyone says,"It ' s impossible. This can ' t be done. Our information is so peculiar in detail, so that cannot be searched as others can be searched. We cannot give the data free to the students, free to the entrepreneurs of the world."But this is what we would like to see, isn ' t it? The publicly funded data is down here. And we would like flowers to grow out on the net. One of the crucial points is to make them searchable, and then people can use the different design tools to animate it there. And I have pretty good news for you. I have good news that the [current], new head of UN statistics doesn ' t say it ' s impossible. He only says,"We can ' t do it."And that ' s a quite clever guy, huh? So we can see a lot happening in data in the coming years. We will be able to look at income distributions in completely new ways. This is the income distribution of China, 1970. This is the income distribution of the United States, 1970. Almost no overlap. Almost no overlap. And what has happened? What has happened is this : that China is growing, it ' s not so equal any longer, and it ' s appearing here, overlooking the United States, almost like a ghost, isn ' t it? It ' s pretty scary. But I think it ' s very important to have all this information. We need really to see it. And instead of looking at this, I would like to end up by showing the internet users per 1, 000. In this software, we access about 500 variables from all the countries quite easily. It takes some time to change for this, but on the axes, you can quite easily get any variable you would like to have. And the thing would be to get up the databases free, to get them searchable, and with a second click, to get them into the graphic formats, where you can instantly understand them. Now, statisticians don ' t like it, because they say that this will not show the reality ; we have to have statistical, analytical methods. But this is hypothesis-generating. I end now with the world. There, the internet is coming. The number of internet users are going up like this. This is the GDP per capita. And it ' s a new technology coming in, but then amazingly, how well it fits to the economy of the countries. That ' s why the $100 computer will be so important. But it ' s a nice tendency. It ' s as if the world is flattening off, isn ' t it? These countries are lifting more than the economy, and it will be very interesting to follow this over the year, as I would like you to be able to do with all the publicly funded data. Thank you very much.

Text Sample 270: NEG Dim 2 – 2006 – Score 1.00 – 2006/t000485.txt

Hi, everyone. I ' m Sirena. I ' m 11 years old and from Connecticut. Well, I ' m not really sure why I ' m here. I mean, what does this have to do with technology, entertainment and design? Well, I count my iPod, cellphone and computer as technology, but this has nothing to do with that. So I did a little research on it. Well, this is what I found. Of course, I hope I can memorize it. The violin is made of a wood box and four metal strings. By pulling a string, it vibrates and produces a sound wave, which passes through a piece of wood called a bridge, and goes down to the wood box and gets amplified, but... let me think. Placing your finger at different places on the fingerboard changes the string length, and that changes the frequency of the sound wave. Oh, my gosh! OK, this is sort of technology, but I can call it a 16th-century technology. But actually, the most fascinating thing that I found was that even the audio system or wave transmission nowadays are still based on the same principle of producing and projecting sound. Isn ’ t that cool? Design — I love its design. I remember when I was little, my mom asked me,”Would you like to play the violin or the piano?”I looked at that giant monster and said to myself —”I am not going to lock myself on that bench the whole day!”This is small and lightweight. I can play from standing, sitting or walking. And, you know what? The best of all is that if I don ’ t want to practice, I can hide it. The violin is very beautiful. Some people relate it as the shape of a lady. But whether you like it or not, it ’ s been so for more than 400 years, unlike modern stuff [that] easily looks dated. But I think it ’ s very personal and unique that, although each violin looks pretty similar, no two violins sound the same — even from the same maker or based on the same model. Entertainment — I love the entertainment. But actually, the instrument itself isn ’ t very entertaining. I mean, when I first got my violin and tried to play around on it, it was actually really bad, because it didn ’ t sound the way I ’ d heard from other kids — it was so horrible and so scratchy. So, it wasn ’ t entertaining at all. But besides, my brother found this very funny : Yuk! Yuk! Yuk! A few years later, I heard a joke about the greatest violinist, Jascha Heifetz. After Mr. Heifetz ’ s concert, a lady came over and complimented him :”Oh, Mr. Heifetz, your violin sounded so great tonight!”And Mr. Heifetz was a very cool person, so he picked up his violin and said,”Funny — I don ’ t hear anything.”Now I realize that as the musician, we human beings, with our great mind, artistic heart and skill, can change this 16th-century technology and a legendary design to a wonderful entertainment. Now I know why I ’ m here. At first, I thought I was just going to be here to perform, but unexpectedly, I learned and enjoyed much more. But... although some of the talks were quite up there for me. Like the multi-dimension stuff. I mean, honestly, I ’ d be happy enough if I could actually get my two dimensions correct in school. But actually, the most impressive thing to me is that — well, actually, I would also like to say this for all children is to say thank you to all adults, for actually caring for us a lot, and to make our future world much better. Thank you.

Text Sample 271: NEG Dim 2 – 2011 – Score 1.00 – 2011/t002454.txt

What I ’ m going to do is, I ’ m going to explain to you an extreme green concept that was developed at NASA ’ s Glenn Research Center in Cleveland, Ohio. But before I do that, we have to go over the definition of what green is, ’ cause a lot of us have a different definition of it. Green. The product is created through environmentally and socially conscious means. There ’ s plenty of things that are being called green now. What does it actually mean? We use three metrics to determine green. The first metric is : Is it sustainable? Which means, are you preserving what you are doing for future use or for future generations? Is it alternative? Is it different than what is being used today, or does it have a lower carbon footprint than what ’ s used conventionally? And three : Is it renewable? Does it come from Earth ’ s natural replenishing resources, such as sun, wind and water? Now, my task at NASA is to develop the next generation of aviation fuels. Extreme green. Why aviation? The field of aviation uses more fuel than just about every other combined. We need to find an alternative. Also it ’ s a national aeronautics directive. One of the national aeronautics goals is to develop the next generation of fuels, biofuels, using domestic and safe, friendly resources. Now, combating that challenge we have to also meet the big three metric — Actually, extreme green for us is all three together ; that ’ s why you see the plus there. I was told to say that. So it has to be the big three at GRC. That ' s another metric. Ninety-seven percent of the world ' s water is saltwater. How about we use that? Combine that with number three. Do not use arable land. Because crops are already growing on that land that ' s very scarce around the world. Number two : Don ' t compete with food crops. That ' s already a well established entity, they don ' t need another entry. And lastly the most precious resource we have on this Earth is fresh water. Don ' t use fresh water. If 97. 5 percent of the world ' s water is saltwater, 2. 5 percent is fresh water. Less than a half percent of that is accessible for human use. But 60 percent of the population lives within that one percent. So, combating my problem was, now I have to be extreme green and meet the big three. Ladies and gentlemen, welcome to the GreenLab Research Facility. This is a facility dedicated to the next generation of aviation fuels using halophytes. A halophyte is a salt-tolerating plant. Most plants don ' t like salt, but halophytes tolerate salt. We also are using weeds and we are also using algae. The good thing about our lab is, we ' ve had 3, 600 visitors in the last two years. Why do you think that ' s so? Because we are on to something special. So, in the lower you see the GreenLab obviously, and on the right hand side you ' ll see algae. If you are into the business of the next generation of aviation fuels, algae is a viable option, there ' s a lot of funding right now, and we have an algae to fuels program. There ' s two types of algae growing. One is a closed photobioreactor that you see here, and what you see on the other side is our species — we are currently using a species called Scenedesmus dimorphus. Our job at NASA is to take the experimental and computational and make a better mixing for the closed photobioreactors. Now the problems with closed photobioreactors are : They are quite expensive, they are automated, and it ' s very difficult to get them in large scale. So on large scale what do they use? We use open pond systems. Now, around the world they are growing algae, with this racetrack design that you see here. Looks like an oval with a paddle wheel and mixes really well, but when it gets around the last turn, which I call turn four — it ' s stagnant. We actually have a solution for that. In the GreenLab in our open pond system we use something that happens in nature : waves. We actually use wave technology on our open pond systems. We have 95 percent mixing and our lipid content is higher than a closed photobioreactor system, which we think is significant. There is a drawback to algae, however : It ' s very expensive. Is there a way to produce algae inexpensively? And the answer is : yes. We do the same thing we do with halophytes, and that is : climatic adaptation. In our GreenLab we have six primary ecosystems that range from freshwater all the way to saltwater. What we do : We take a potential species, we start at freshwater, we add a little bit more salt, when the second tank here will be the same ecosystem as Brazil — right next to the sugar cane fields you can have our plants — the next tank represents Africa, the next tank represents Arizona, the next tank represents Florida, and the next tank represents California or the open ocean. What we are trying to do is to come up with a single species that can survive anywhere in the world, where there ' s barren desert. We are being very successful so far. Now, here ' s one of the problems. If you are a farmer, you need five things to be successful : You need seeds, you need soil, you need water and you need sun, and the last thing that you need is fertilizer. Most people use chemical fertilizers. But guess what? We do not use chemical fertilizer. Wait a second! I just saw lots of greenery in your GreenLab. You have to use fertilizer. Believe it or not, in our analysis of our saltwater ecosystems 80 percent of what we need are in these tanks themselves. The 20 percent that ' s missing is nitrogen and phosphorous. We have a natural solution : fish. No we don ' t cut up the fish and put them in there. Fish waste is what we use. As a matter of fact we use freshwater mollies, that we ’ ve used our climatic adaptation technique from freshwater all the way to seawater. Freshwater mollies : cheap, they love to make babies, and they love to go to the bathroom. And the more they go to the bathroom, the more fertilizer we get, the better off we are, believe it or not. It should be noted that we use sand as our soil, regular beach sand. Fossilized coral. So a lot of people ask me,”How did you get started?”Well, we got started in what we call the indoor biofuels lab. It ’ s a seedling lab. We have 26 different species of halophytes, and five are winners. What we do here is — actually it should be called a death lab, ’ cause we try to kill the seedlings, make them rough — and then we come to the GreenLab. What you see in the lower corner is a wastewater treatment plant experiment that we are growing, a macro-algae that I ’ ll talk about in a minute. And lastly, it ’ s me actually working in the lab to prove to you I do work, I don ’ t just talk about what I do. Here ’ s the plant species. Salicornia virginica. It ’ s a wonderful plant. I love that plant. Everywhere we go we see it. It ’ s all over the place, from Maine all the way to California. We love that plant. Second is Salicornia bigelovii. Very difficult to get around the world. It is the highest lipid content that we have, but it has a shortcoming : It ’ s short. Now you take europaea, which is the largest or the tallest plant that we have. And what we are trying to do with natural selection or adaptive biology — combine all three to make a high-growth, high-lipid plant. Next, when a hurricane decimated the Delaware Bay — soybean fields gone — we came up with an idea : Can you have a plant that has a land reclamation positive in Delaware? And the answer is yes. It ’ s called seashore mallow. Kosteletzkya virginica — say that five times fast if you can. This is a 100 percent usable plant. The seeds : biofuels. The rest : cattle feed. It ’ s there for 10 years ; it ’ s working very well. Now we get to Chaetomorpha. This is a macro-algae that loves excess nutrients. If you are in the aquarium industry you know we use it to clean up dirty tanks. This species is so significant to us. The properties are very close to plastic. We are trying right now to convert this macro-algae into a bioplastic. If we are successful, we will revolutionize the plastics industry. So, we have a seed to fuel program. We have to do something with this biomass that we have. And so we do G. C. extraction, lipid optimization, so on and so forth, because our goal really is to come up with the next generation of aviation fuels, aviation specifics, so on and so forth. So far we talked about water and fuel, but along the way we found out something interesting about Salicornia : It ’ s a food product. So we talk about ideas worth spreading, right? How about this : In sub-Saharan Africa, next to the sea, saltwater, barren desert, how about we take that plant, plant it, half use for food, half use for fuel. We can make that happen, inexpensively. You can see there ’ s a greenhouse in Germany that sells it as a health food product. This is harvested, and in the middle here is a shrimp dish, and it ’ s being pickled. So I have to tell you a joke. Salicornia is known as sea beans, saltwater asparagus and pickle weed. So we are pickling pickle weed in the middle. Oh, I thought it was funny. And at the bottom is seaman ’ s mustard. It does make sense, this is a logical snack. You have mustard, you are a seaman, you see the halophyte, you mix it together, it ’ s a great snack with some crackers. And last, garlic with Salicornia, which is what I like. So, water, fuel and food. None of this is possible without the GreenLab team. Just like the Miami Heat has the big three, we have the big three at NASA GRC. That ’ s myself, professor Bob Hendricks, our fearless leader, and Dr. Arnon Chait. The backbone of the GreenLab is students. Over the last two years we ’ ve had 35 different students from around the world working at GreenLab. As a matter fact my division chief says a lot,”You have a green university.”I say,”I ’ m okay with that, ’ cause we are nurturing the next generation of extreme green thinkers, which is significant.”So, in first summary I presented to you what we think is a global solution for food, fuel and water. There ’ s something missing to be complete. Clearly we use electricity. We have a solution for you — We ’ re using clean energy sources here. So, we have two wind turbines connected to the GreenLab, we have four or five more hopefully coming soon. We are also using something that is quite interesting — there is a solar array field at NASA ’ s Glenn Research Center, hasn ’ t been used for 15 years. Along with some of my electrical engineering colleagues, we realized that they are still viable, so we are refurbishing them right now. In about 30 days or so they ’ ll be connected to the GreenLab. And the reason why you see red, red and yellow, is a lot of people think NASA employees don ’ t work on Saturday — This is a picture taken on Saturday. There are no cars around, but you see my truck in yellow. I work on Saturday. This is a proof to you that I ’ m working. ’ Cause we do what it takes to get the job done, most people know that. Here ’ s a concept with this : We are using the GreenLab for a micro-grid test bed for the smart grid concept in Ohio. We have the ability to do that, and I think it ’ s going to work. So, GreenLab Research Facility. A self-sustainable renewable energy ecosystem was presented today. We really, really hope this concept catches on worldwide. We think we have a solution for food, water, fuel and now energy. Complete. It ’ s extreme green, it ’ s sustainable, alternative and renewable and it meets the big three at GRC : Don ’ t use arable land, don ’ t compete with food crops, and most of all, don ’ t use fresh water. So I get a lot of questions about,”What are you doing in that lab?”And I usually say,”None of your business, that ’ s what I ’ m doing in the lab.”And believe it or not, my number one goal for working on this project is I want to help save the world.

Text Sample 272: NEG Dim 2 – 2011 – Score 1.00 – 2011/t002439.txt

The oceans cover some 70 percent of our planet. And I think Arthur C. Clarke probably had it right when he said that perhaps we ought to call our planet Planet Ocean. And the oceans are hugely productive, as you can see by the satellite image of photosynthesis, the production of new life. In fact, the oceans produce half of the new life every day on Earth as well as about half the oxygen that we breathe. In addition to that, it harbors a lot of the biodiversity on Earth, and much of it we don ’ t know about. But I ’ ll tell you some of that today. That also doesn ’ t even get into the whole protein extraction that we do from the ocean. That ’ s about 10 percent of our global needs and 100 percent of some island nations. If you were to descend into the 95 percent of the biosphere that ’ s livable, it would quickly become pitch black, interrupted only by pinpoints of light from bioluminescent organisms. And if you turn the lights on, you might periodically see spectacular organisms swim by, because those are the denizens of the deep, the things that live in the deep ocean. And eventually, the deep sea floor would come into view. This type of habitat covers more of the Earth ’ s surface than all other habitats combined. And yet, we know more about the surface of the Moon and about Mars than we do about this habitat, despite the fact that we have yet to extract a gram of food, a breath of oxygen or a drop of water from those bodies. And so 10 years ago, an international program began called the Census of Marine Life, which set out to try and improve our understanding of life in the global oceans. It involved 17 different projects around the world. As you can see, these are the footprints of the different projects. And I hope you ’ ll appreciate the level of global coverage that it managed to achieve. It all began when two scientists, Fred Grassle and Jesse Ausubel, met in Woods Hole, Massachusetts where both were guests at the famed oceanographic institute.

And Fred was lamenting the state of marine biodiversity and the fact that it was in trouble and nothing was being done about it. Well, from that discussion grew this program that involved 2, 700 scientists from more than 80 countries around the world who engaged in 540 ocean expeditions at a combined cost of 650 million dollars to study the distribution, diversity and abundance of life in the global ocean. And so what did we find? We found spectacular new species, the most beautiful and visually stunning things everywhere we looked — from the shoreline to the abyss, form microbes all the way up to fish and everything in between. And the limiting step here wasn ’ t the unknown diversity of life, but rather the taxonomic specialists who can identify and catalog these species that became the limiting step. They, in fact, are an endangered species themselves. There are actually four to five new species described everyday for the oceans. And as I say, it could be a much larger number. Now, I come from Newfoundland in Canada — It ’ s an island off the east coast of that continent — where we experienced one of the worst fishing disasters in human history. And so this photograph shows a small boy next to a codfish. It ’ s around 1900. Now, when I was a boy of about his age, I would go out fishing with my grandfather and we would catch fish about half that size. And I thought that was the norm, because I had never seen fish like this. If you were to go out there today, 20 years after this fishery collapsed, if you could catch a fish, which would be a bit of a challenge, it would be half that size still. So what we ’ re experiencing is something called shifting baselines. Our expectations of what the oceans can produce is something that we don ’ t really appreciate because we haven ’ t seen it in our lifetimes. Now most of us, and I would say me included, think that human exploitation of the oceans really only became very serious in the last 50 to, perhaps, 100 years or so. The census actually tried to look back in time, using every source of information they could get their hands on. And so anything from restaurant menus to monastery records to ships ’ logs to see what the oceans looked like. Because science data really goes back to, at best, World War II, for the most part. And so what they found, in fact, is that exploitation really began heavily with the Romans. And so at that time, of course, there was no refrigeration. So fishermen could only catch what they could either eat or sell that day. But the Romans developed salting. And with salting, it became possible to store fish and to transport it long distances. And so began industrial fishing. And so these are the sorts of extrapolations that we have of what sort of loss we ’ ve had relative to pre-human impacts on the ocean. They range from 65 to 98 percent for these major groups of organisms, as shown in the dark blue bars. Now for those species the we managed to leave alone, that we protect — for example, marine mammals in recent years and sea birds — there is some recovery. So it ’ s not all hopeless. But for the most part, we ’ ve gone from salting to exhausting. Now this other line of evidence is a really interesting one. It ’ s from trophy fish caught off the coast of Florida. And so this is a photograph from the 1950s. I want you to notice the scale on the slide, because when you see the same picture from the 1980s, we see the fish are much smaller and we ’ re also seeing a change in terms of the composition of those fish. By 2007, the catch was actually laughable in terms of the size for a trophy fish. But this is no laughing matter. The oceans have lost a lot of their productivity and we ’ re responsible for it. So what ’ s left? Actually quite a lot. There ’ s a lot of exciting things, and I ’ m going to tell you a little bit about them. And I want to start with a bit on technology, because, of course, this is a TED Conference and you want to hear something on technology. So one of the tools that we use to sample the deep ocean are remotely operated vehicles. So these are tethered vehicles we lower down to the sea floor where they ’ re our eyes and our hands for working on the sea bottom. So a couple of years ago, I was supposed to go on an oceanographic cruise and I couldn ' t go because of a scheduling conflict. But through a satellite link I was able to sit at my study at home with my dog curled up at my feet, a cup of tea in my hand, and I could tell the pilot,"I want a sample right there."And that ' s exactly what the pilot did for me. That ' s the sort of technology that ' s available today that really wasn ' t available even a decade ago. So it allows us to sample these amazing habitats that are very far from the surface and very far from light. And so one of the tools that we can use to sample the oceans is acoustics, or sound waves. And the advantage of sound waves is that they actually pass well through water, unlike light. And so we can send out sound waves, they bounce off objects like fish and are reflected back. And so in this example, a census scientist took out two ships. One would send out sound waves that would bounce back. They would be received by a second ship, and that would give us very precise estimates, in this case, of 250 billion herring in a period of about a minute. And that ' s an area about the size of Manhattan Island. And to be able to do that is a tremendous fisheries tool, because knowing how many fish are there is really critical. We can also use satellite tags to track animals as they move through the oceans. And so for animals that come to the surface to breathe, such as this elephant seal, it ' s an opportunity to send data back to shore and tell us where exactly it is in the ocean. And so from that we can produce these tracks. For example, the dark blue shows you where the elephant seal moved in the north Pacific. Now I realize for those of you who are colorblind, this slide is not very helpful, but stick with me nonetheless. For animals that don ' t surface, we have something called pop-up tags, which collect data about light and what time the sun rises and sets. And then at some period of time it pops up to the surface and, again, relays that data back to shore. Because GPS doesn ' t work under water. That ' s why we need these tools. And so from this we ' re able to identify these blue highways, these hot spots in the ocean, that should be real priority areas for ocean conservation. Now one of the other things that you may think about is that, when you go to the supermarket and you buy things, they ' re scanned. And so there ' s a barcode on that product that tells the computer exactly what the product is. Geneticists have developed a similar tool called genetic barcoding. And what barcoding does is use a specific gene called CO1 that ' s consistent within a species, but varies among species. And so what that means is we can unambiguously identify which species are which even if they look similar to each other, but may be biologically quite different. Now one of the nicest examples I like to cite on this is the story of two young women, high school students in New York City, who worked with the census. They went out and collected fish from markets and from restaurants in New York City and they barcoded it. Well what they found was mislabeled fish. So for example, they found something which was sold as tuna, which is very valuable, was in fact tilapia, which is a much less valuable fish. They also found an endangered species sold as a common one. So barcoding allows us to know what we ' re working with and also what we ' re eating. The Ocean Biogeographic Information System is the database for all the census data. It ' s open access ; you can all go in and download data as you wish. And it contains all the data from the census plus other data sets that people were willing to contribute. And so what you can do with that is to plot the distribution of species and where they occur in the oceans. What I ' ve plotted up here is the data that we have on hand. This is where our sampling effort has concentrated. Now what you can see is we ' ve sampled the area in the North Atlantic, in the North Sea in particular, and also the east coast of North America fairly well. That ' s the warm colors which show a well-sampled region. The cold colors, the blue and the black, show areas where we have almost no data. So even after a 10-year census, there are large areas that still remain unexplored. Now there are a group of scientists living in Texas, working in the Gulf of Mexico who decided really as a labor of love to pull together all the knowledge they could about biodiversity in the Gulf of Mexico. And so they put this together, a list of all the species, where they ' re known to occur, and it really seemed like a very esoteric, scientific type of exercise. But then, of course, there was the Deep Horizon oil spill. So all of a sudden, this labor of love for no obvious economic reason has become a critical piece of information in terms of how that system is going to recover, how long it will take and how the lawsuits and the multi-billion-dollar discussions that are going to happen in the coming years are likely to be resolved. So what did we find? Well, I could stand here for hours, but, of course, I ' m not allowed to do that. But I will tell you some of my favorite discoveries from the census. So one of the things we discovered is where are the hot spots of diversity? Where do we find the most species of ocean life? And what we find if we plot up the well-known species is this sort of a distribution. And what we see is that for coastal tags, for those organisms that live near the shoreline, they ' re most diverse in the tropics. This is something we ' ve actually known for a while, so it ' s not a real breakthrough. What is really exciting though is that the oceanic tags, or the ones that live far from the coast, are actually more diverse at intermediate latitudes. This is the sort of data, again, that managers could use if they want to prioritize areas of the ocean that we need to conserve. You can do this on a global scale, but you can also do it on a regional scale. And that ' s why biodiversity data can be so valuable. Now while a lot of the species we discovered in the census are things that are small and hard to see, that certainly wasn ' t always the case. For example, while it ' s hard to believe that a three kilogram lobster could elude scientists, it did until a few years ago when South African fishermen requested an export permit and scientists realized that this was something new to science. Similarly this Golden V kelp collected in Alaska just below the low water mark is probably a new species. Even though it ' s three meters long, it actually, again, eluded science. Now this guy, this bigfin squid, is seven meters in length. But to be fair, it lives in the deep waters of the Mid- Atlantic Ridge, so it was a lot harder to find. But there ' s still potential for discovery of big and exciting things. This particular shrimp, we ' ve dubbed it the Jurassic shrimp, it ' s thought to have gone extinct 50 years ago — at least it was, until the census discovered it was living and doing just fine off the coast of Australia. And it shows that the ocean, because of its vastness, can hide secrets for a very long time. So, Steven Spielberg, eat your heart out. If we look at distributions, in fact distributions change dramatically. And so one of the records that we had was this sooty shearwater, which undergoes these spectacular migrations all the way from New Zealand all the way up to Alaska and back again in search of endless summer as they complete their life cycles. We also talked about the White Shark Cafe. This is a location in the Pacific where white shark converge. We don ' t know why they converge there, we simply don ' t know. That ' s a question for the future. One of the things that we ' re taught in high school is that all animals require oxygen in order to survive. Now this little critter, it ' s only about half a millimeter in size, not terribly charismatic. But it was only discovered in the early 1980s. But the really interesting thing about it is that, a few years ago, census scientists discovered that this guy can thrive in oxygen-poor sediments in the deep Mediterranean Sea. So now they know that, in fact, animals can live without oxygen, at least some of them, and that they can adapt to even the harshest of conditions. If you were to suck all the water out of the ocean, this is what you ' d be left behind with, and that ' s the biomass of life on the sea floor. Now what we see is huge biomass towards the poles and not much biomass in between. We found life in the extremes. And so there were new species that were found that live inside ice and help to support an ice-based food web. And we also found this spectacular yeti crab that lives near boiling hot hydrothermal vents at Easter Island. And this particular species really captured the public ' s attention. We also found the deepest vents known yet — 5, 000 meters — the hottest vents at 407 degrees Celsius — vents in the South Pacific and also in the Arctic where none had been found before. So even new environments are still within the domain of the discoverable. Now in terms of the unknowns, there are many. And I ' m just going to summarize just a few of them very quickly for you. First of all, we might ask, how many fishes in the sea? We actually know the fishes better than we do any other group in the ocean other than marine mammals. And so we can actually extrapolate based on rates of discovery how many more species we ' re likely to discover. And from that, we actually calculate that we know about 16, 500 marine species and there are probably another 1, 000 to 4, 000 left to go. So we ' ve done pretty well. We ' ve got about 75 percent of the fish, maybe as much as 90 percent. But the fishes, as I say, are the best known. So our level of knowledge is much less for other groups of organisms. Now this figure is actually based on a brand new paper that ' s going to come out in the journal PLoS Biology. And what is does is predict how many more species there are on land and in the ocean. And what they found is that they think that we know of about nine percent of the species in the ocean. That means 91 percent, even after the census, still remain to be discovered. And so that turns out to be about two million species once all is said and done. So we still have quite a lot of work to do in terms of unknowns. Now this bacterium is part of mats that are found off the coast of Chile. And these mats actually cover an area the size of Greece. And so this particular bacterium is actually visible to the naked eye. But you can imagine the biomass that represents. But the really intriguing thing about the microbes is just how diverse they are. A single drop of seawater could contain 160 different types of microbes. And the oceans themselves are thought potentially to contain as many as a billion different types. So that ' s really exciting. What are they all doing out there? We actually don ' t know. The most exciting thing, I would say, about this census is the role of global science. And so as we see in this image of light during the night, there are lots of areas of the Earth where human development is much greater and other areas where it ' s much less, but between them we see large dark areas of relatively unexplored ocean. The other point I ' d like to make about this is that this ocean ' s interconnected. Marine organisms do not care about international boundaries ; they move where they will. And so the importance then of global collaboration becomes all the more important. We ' ve lost a lot of paradise. For example, these tuna that were once so abundant in the North Sea are now effectively gone. There were trawls taken in the deep sea in the Mediterranean, which collected more garbage than they did animals. And that ' s the deep sea, that ' s the environment that we consider to be among the most pristine left on Earth. And there are a lot of other pressures. Ocean acidification is a really big issue that people are concerned with, as well as ocean warming, and the effects they ' re going to have on coral reefs. On the scale of decades, in our lifetimes, we ' re going to see a lot of damage to coral reefs. And I could spend the rest of my time, which is getting very limited, going through this litany of concerns about the ocean, but I want to end on a more positive note. And so the grand challenge then is to try and make sure that we preserve what ' s left, because there is still spectacular beauty. And the oceans are so productive, there ' s so much going on in there that ' s of relevance to humans that we really need to, even from a selfish perspective, try to do better than we have in the past. So we need to recognize those hot spots and do our best to protect them. When we look at pictures like this, they take our breath away, in addition to helping to give us breath by the oxygen that the oceans provide. Census scientists worked in the rain, they worked in the cold, they worked under water and they worked above water trying to illuminate the wondrous discovery, the still vast unknown, the spectacular adaptations that we see in ocean life. So whether you ’ re a yak herder living in the mountains of Chile, whether you ’ re a stockbroker in New York City or whether you ’ re a TEDster living in Edinburgh, the oceans matter. And as the oceans go so shall we. Thanks for listening.

The things we make have one supreme quality â they live longer than us. We perish, they survive ; we have one life, they have many lives, and in each life they can mean different things. Which means that, while we all have one biography, they have many. I want this morning to talk about the story, the biography â or rather the biographies â of one particular object, one remarkable thing. It doesn ’ t, I agree, look very much. It ’ s about the size of a rugby ball. It ’ s made of clay, and it ’ s been fashioned into a cylinder shape, covered with close writing and then baked dry in the sun. And as you can see, it ’ s been knocked about a bit, which is not surprising because it was made two and a half thousand years ago and was dug up in 1879. But today, this thing is, I believe, a major player in the politics of the Middle East. And it ’ s an object with fascinating stories and stories that are by no means over yet. The story begins in the Iran-Iraq war and that series of events that culminated in the invasion of Iraq by foreign forces, the removal of a despotic ruler and instant regime change. And I want to begin with one episode from that sequence of events that most of you would be very familiar with, Belshazzar ’ s feast â because we ’ re talking about the Iran-Iraq war of 539 BC. And the parallels between the events of 539 BC and 2003 and in between are startling. What you ’ re looking at is Rembrandt ’ s painting, now in the National Gallery in London, illustrating the text from the prophet Daniel in the Hebrew scriptures. And you all know roughly the story. Belshazzar, the son of Nebuchadnezzar, Nebuchadnezzar who ’ d conquered Israel, sacked Jerusalem and captured the people and taken the Jews back to Babylon. Not only the Jews, he ’ d taken the temple vessels. He ’ d ransacked, desecrated the temple. And the great gold vessels of the temple in Jerusalem had been taken to Babylon. Belshazzar, his son, decides to have a feast. And in order to make it even more exciting, he added a bit of sacrilege to the rest of the fun, and he brings out the temple vessels. He ’ s already at war with the Iranians, with the king of Persia. And that night, Daniel tells us, at the height of the festivities a hand appeared and wrote on the wall,”You are weighed in the balance and found wanting, and your kingdom is handed over to the Medes and the Persians.”And that very night Cyrus, king of the Persians, entered Babylon and the whole regime of Belshazzar fell. It is, of course, a great moment in the history of the Jewish people. It ’ s a great story. It ’ s story we all know.”The writing on the wall”is part of our everyday language. What happened next was remarkable, and it ’ s where our cylinder enters the story. Cyrus, king of the Persians, has entered Babylon without a fight â the great empire of Babylon, which ran from central southern Iraq to the Mediterranean, falls to Cyrus. And Cyrus makes a declaration. And that is what this cylinder is, the declaration made by the ruler guided by God who had toppled the Iraqi despot and was going to bring freedom to the people. In ringing Babylonian â it was written in Babylonian â he says,”I am Cyrus, king of all the universe, the great king, the powerful king, king of Babylon, king of the four quarters of the world.”They ’ re not shy of hyperbole as you can see. This is probably the first real press release by a victorious army that we ’ ve got. And it ’ s written, as we ’ ll see in due course, by very skilled P. R. consultants. So the hyperbole is not actually surprising. And what is the great king, the powerful king, the king of the four quarters of the world going to do? He goes on to say that, having conquered Babylon, he will at once let all the peoples that the Babylonians â Nebuchadnezzar and Belshazzar â have captured and enslaved go free. He ’ ll let them return to their countries. And more important, he will let them all recover the gods, the statues, the temple vessels that had been confiscated. All the peoples that the Babylonians had repressed and removed will go home, and they ’ ll take with them their gods. And they ’ ll be able to restore their altars and to worship their gods in their own way, in their own place. This is the decree, this object is the evidence for the fact that the Jews, after the exile in Babylon, the years they ’ d spent sitting by the waters of Babylon, weeping when they remembered Jerusalem, those Jews were allowed to go home. They were allowed to return to Jerusalem and to rebuild the temple. It ’ s a central document in Jewish history. And the Book of Chronicles, the Book of Ezra in the Hebrew scriptures reported in ringing terms. This is the Jewish version of the same story.”Thus said Cyrus, king of Persia, ’ All the kingdoms of the earth have the Lord God of heaven given thee, and he has charged me to build him a house in Jerusalem. Who is there among you of his people? The Lord God be with him, and let him go up. ’””Go up”â aaleh. The central element, still, of the notion of return, a central part of the life of Judaism. As you all know, that return from exile, the second temple, reshaped Judaism. And that change, that great historic moment, was made possible by Cyrus, the king of Persia, reported for us in Hebrew in scripture and in Babylonian in clay. Two great texts, what about the politics? What was going on was the fundamental shift in Middle Eastern history. The empire of Iran, the Medes and the Persians, united under Cyrus, became the first great world empire. Cyrus begins in the 530s BC. And by the time of his son Darius, the whole of the eastern Mediterranean is under Persian control. This empire is, in fact, the Middle East as we now know it, and it ’ s what shapes the Middle East as we now know it. It was the largest empire the world had known until then. Much more important, it was the first multicultural, multifaith state on a huge scale. And it had to be run in a quite new way. It had to be run in different languages. The fact that this decree is in Babylonian says one thing. And it had to recognize their different habits, different peoples, different religions, different faiths. All of those are respected by Cyrus. Cyrus sets up a model of how you run a great multinational, multifaith, multicultural society. And the result of that was an empire that included the areas you see on the screen, and which survived for 200 years of stability until it was shattered by Alexander. It left a dream of the Middle East as a unit, and a unit where people of different faiths could live together. The Greek invasions ended that. And of course, Alexander couldn ’ t sustain a government and it fragmented. But what Cyrus represented remained absolutely central. The Greek historian Xenophon wrote his book”Cyropaedia”promoting Cyrus as the great ruler. And throughout European culture afterward, Cyrus remained the model. This is a 16th century image to show you how widespread his veneration actually was. And Xenophon ’ s book on Cyrus on how you ran a diverse society was one of the great textbooks that inspired the Founding Fathers of the American Revolution. Jefferson was a great admirer â the ideals of Cyrus obviously speaking to those 18th century ideals of how you create religious tolerance in a new state. Meanwhile, back in Babylon, things had not been going well. After Alexander, the other empires, Babylon declines, falls into ruins, and all the traces of the great Babylonian empire are lost â until 1879 when the cylinder is discovered by a British Museum exhibition digging in Babylon. And it enters now another story. It enters that great debate in the middle of the 19th century : Are the scriptures reliable? Can we trust them? We only knew about the return of the Jews and the decree of Cyrus from the Hebrew scriptures. No other evidence. Suddenly, this appeared. And great excitement to a world where those who believed in the scriptures had had their faith in creation shaken by evolution, by geology, here was evidence that the scriptures were historically true. It ’ s a great 19th century moment. But â and this, of course, is where it becomes complicated â the facts were true, hurrah for archeology, but the interpretation was rather more complicated. Because the cylinder account and the Hebrew Bible account differ in one key respect. The Babylonian cylinder is written by the priests of the great god of Bablyon, Marduk. And, not surprisingly, they tell you that all this was done by Marduk.”Marduk, we hold, called Cyrus by his name.”Marduk takes Cyrus by the hand, calls him to shepherd his people and gives him the rule of Babylon. Marduk tells Cyrus that he will do these great, generous things of setting the people free. And this is why we should all be grateful to and worship Marduk. The Hebrew writers in the Old Testament, you will not be surprised to learn, take a rather different view of this. For them, of course, it can ’ t possibly by Marduk that made all this happen. It can only be Jehovah. And so in Isaiah, we have the wonderful texts giving all the credit of this, not to Marduk but to the Lord God of Israel â the Lord God of Israel who also called Cyrus by name, also takes Cyrus by the hand and talks of him shepherding his people. It ’ s a remarkable example of two different priestly appropriations of the same event, two different religious takeovers of a political fact. God, we know, is usually on the side of the big battalions. The question is, which god was it? And the debate unsettles everybody in the 19th century to realize that the Hebrew scriptures are part of a much wider world of religion. And it ’ s quite clear the cylinder is older than the text of Isaiah, and yet, Jehovah is speaking in words very similar to those used by Marduk. And there ’ s a slight sense that Isaiah knows this, because he says, this is God speaking, of course,”I have called thee by thy name though thou hast not known me.”I think it ’ s recognized that Cyrus doesn ’ t realize that he ’ s acting under orders from Jehovah. And equally, he ’ d have been surprised that he was acting under orders from Marduk. Because interestingly, of course, Cyrus is a good Iranian with a totally different set of gods who are not mentioned in any of these texts. That ’ s 1879. 40 years on and we ’ re in 1917, and the cylinder enters a different world. This time, the real politics of the contemporary world â the year of the Balfour Declaration, the year when the new imperial power in the Middle East, Britain, decides that it will declare a Jewish national home, it will allow the Jews to return. And the response to this by the Jewish population in Eastern Europe is rhapsodic. And across Eastern Europe, Jews display pictures of Cyrus and of George V side by side â the two great rulers who have allowed the return to Jerusalem. And the Cyrus cylinder comes back into public view and the text of this as a demonstration of why what is going to happen after the war is over in 1918 is part of a divine plan. You all know what happened. The state of Israel is setup, and 50 years later, in the late 60s, it ’ s clear that Britain ’ s role as the imperial power is over. And another story of the cylinder begins. The region, the U. K. and the U. S. decide, has to be kept safe from communism, and the superpower that will be created to do this would be Iran, the Shah. And so the Shah invents an Iranian history, or a return to Iranian history, that puts him in the center of a great tradition and produces coins showing himself with the Cyrus cylinder. When he has his great celebrations in Persepolis, he summons the cylinder and the cylinder is lent by the British Museum, goes to Tehran, and is part of those great celebrations of the Pahlavi dynasty. Cyrus cylinder : guarantor of the Shah. 10 years later, another story : Iranian Revolution, 1979. Islamic revolution, no more Cyrus ; we ’ re not interested in that history, we ’ re interested in Islamic Iran â until Iraq, the new superpower that we ’ ve all decided should be in the region, attacks. Then another Iran-Iraq war. And it becomes critical for the Iranians to remember their great past, their great past when they fought Iraq and won. It becomes critical to find a symbol that will pull together all Iranians â Muslims and non-Muslims, Christians, Zoroastrians, Jews living in Iran, people who are devout, not devout. And the obvious emblem is Cyrus. So when the British Museum and Tehran National Musuem cooperate and work together, as we ’ ve been doing, the Iranians ask for one thing only as a loan. It ’ s the only object they want. They want to borrow the Cyrus cylinder. And last year, the Cyrus cylinder went to Tehran for the second time. It ’ s shown being presented here, put into its case by the director of the National Museum of Tehran, one of the many women in Iran in very senior positions, Mrs. Ardakani. It was a huge event. This is the other side of that same picture. It ’ s seen in Tehran by between one and two million people in the space of a few months. This is beyond any blockbuster exhibition in the West. And it ’ s the subject of a huge debate about what this cylinder means, what Cyrus means, but above all, Cyrus as articulated through this cylinder â Cyrus as the defender of the homeland, the champion, of course, of Iranian identity and of the Iranian peoples, tolerant of all faiths. And in the current Iran, Zoroastrians and Christians have guaranteed places in the Iranian parliament, something to be very, very proud of. To see this object in Tehran, thousands of Jews living in Iran came to Tehran to see it. It became a great emblem, a great subject of debate about what Iran is at home and abroad. Is Iran still to be the defender of the oppressed? Will Iran set free the people that the tyrants have enslaved and expropriated? This is heady national rhetoric, and it was all put together in a great pageant launching the return. Here you see this out-sized Cyrus cylinder on the stage with great figures from Iranian history gathering to take their place in the heritage of Iran. It was a narrative presented by the president himself. And for me, to take this object to Iran, to be allowed to take this object to Iran was to be allowed to be part of an extraordinary debate led at the highest levels about what Iran is, what different Irans there are and how the different histories of Iran might shape the world today. It ’ s a debate that ’ s still continuing, and it will continue to rumble, because this object is one of the great declarations of a human aspiration. It stands with the American constitution. It certainly says far more about real freedoms than Magna Carta. It is a document that can mean so many things, for Iran and for the region. A replica of this is at the United Nations. In New York this autumn, it will be present when the great debates about the future of the Middle East take place. And I want to finish by asking you what the next story will be in which this object figures. It will appear, certainly, in many more Middle Eastern stories. And what story of the Middle East, what story of the world, do you want to see reflecting what is said, what is expressed in this cylinder? The right of peoples to live together in the same state, worshiping differently, freely â a Middle East, a world, in which religion is not the subject of division or of debate. In the world of the Middle East at the moment, the debates are, as you know, shrill. But I think it ’ s possible that the most powerful and the wisest voice of all of them may well be the voice of this mute thing, the Cyrus cylinder. Thank you.

So I ’ m going to speak about a problem that I have and that ’ s that I ’ m a philosopher. When I go to a party and people ask me what do I do and I say,”I ’ m a professor,”their eyes glaze over. When I go to an academic cocktail party and there are all the professors around, they ask me what field I ’ m in and I say,”philosophy”— their eyes glaze over. When I go to a philosopher ’ s party and they ask me what I work on and I say,”consciousness,”their eyes don ’ t glaze over — their lips curl into a snarl. And I get hoots of derision and cackles and growls because they think,”That ’ s impossible! You can ’ t explain consciousness.”The very chutzpah of somebody thinking that you could explain consciousness is just out of the question. My late, lamented friend Bob Nozick, a fine philosopher, in one of his books,”Philosophical Explanations,”is commenting on the ethos of philosophy — the way philosophers go about their business. And he says, you know,”Philosophers love rational argument.”And he says,”It seems as if the ideal argument for most philosophers is you give your audience the premises and then you give them the inferences and the conclusion, and if they don ’ t accept the conclusion, they die. Their heads explode.”The idea is to have an argument that is so powerful that it knocks out your opponents. But in fact that doesn ’ t change people ’ s minds at all. It ’ s very hard to change people ’ s minds about something like consciousness, and I finally figured out the reason for that. The reason for that is that everybody ’ s an expert on consciousness. We heard the other day that everybody ’ s got a strong opinion about video games. They all have an idea for a video game, even if they ’ re not experts. But they don ’ t consider themselves experts on video games ; they ’ ve just got strong opinions. I ’ m sure that people here who work on, say, climate change and global warming, or on the future of the Internet, encounter people who have very strong opinions about what ’ s going to happen next. But they probably don ’ t think of these opinions as expertise. They ’ re just strongly held opinions. But with regard to consciousness, people seem to think, each of us seems to think,”I am an expert. Simply by being conscious, I know all about this.”And so, you tell them your theory and they say,”No, no, that ’ s not the way consciousness is! No, you ’ ve got it all wrong.”And they say this with an amazing confidence. And so what I ’ m going to try to do today is to shake your confidence. Because I know the feeling — I can feel it myself. I want to shake your confidence that you know your own innermost minds — that you are, yourselves, authoritative about your own consciousness. That ’ s the order of the day here. Now, this nice picture shows a thought-balloon, a thought-bubble. I think everybody understands what that means. That ’ s supposed to exhibit the stream of consciousness. This is my favorite picture of consciousness that ’ s ever been done. It ’ s a Saul Steinberg of course — it was a New Yorker cover. And this fellow here is looking at the painting by Braque. That reminds him of the word baroque, barrack, bark, poodle, Suzanne R. — he ’ s off to the races. There ’ s a wonderful stream of consciousness here and if you follow it along, you learn a lot about this man. What I particularly like about this picture, too, is that Steinberg has rendered the guy in this sort of pointillist style. Which reminds us, as Rod Brooks was saying yesterday : what we are, what each of us is — what you are, what I am — is approximately 100 trillion little cellular robots. That ’ s what we ’ re made of. No other ingredients at all. We ’ re just made of cells, about 100 trillion of them. Not a single one of those cells is conscious ; not a single one of those cells knows who you are, or cares. Somehow, we have to explain how when you put together teams, armies, battalions of hundreds of millions of little robotic unconscious cells — not so different really from a bacterium, each one of them — the result is this. I mean, just look at it. The content — there ’ s color, there ’ s ideas, there ’ s memories, there ' s history. And somehow all that content of consciousness is accomplished by the busy activity of those hoards of neurons. How is that possible? Many people just think it isn ' t possible at all. They think,"No, there can ' t be any sort of naturalistic explanation of consciousness."This is a lovely book by a friend of mine named Lee Siegel, who ' s a professor of religion, actually, at the University of Hawaii, and he ' s an expert magician, and an expert on the street magic of India, which is what this book is about,"Net of Magic."And there ' s a passage in it which I would love to share with you. It speaks so eloquently to the problem."' I ' m writing a book on magic, ' I explain, and I ' m asked, ' Real magic? ' By ' real magic, ' people mean miracles, thaumaturgical acts, and supernatural powers. ' No, ' I answer. ' Conjuring tricks, not real magic. ' ' Real magic, ' in other words, refers to the magic that is not real ; while the magic that is real, that can actually be done, is not real magic."Now, that ' s the way a lot of people feel about consciousness. Real consciousness is not a bag of tricks. If you ' re going to explain this as a bag of tricks, then it ' s not real consciousness, whatever it is. And, as Marvin said, and as other people have said,"Consciousness is a bag of tricks."This means that a lot of people are just left completely dissatisfied and incredulous when I attempt to explain consciousness. So this is the problem. So I have to do a little bit of the sort of work that a lot of you won ' t like, for the same reason that you don ' t like to see a magic trick explained to you. How many of you here, if somebody — some smart aleck — starts telling you how a particular magic trick is done, you sort of want to block your ears and say,"No, no, I don ' t want to know! Don ' t take the thrill of it away. I ' d rather be mystified. Don ' t tell me the answer."A lot of people feel that way about consciousness, I ' ve discovered. And I ' m sorry if I impose some clarity, some understanding on you. You ' d better leave now if you don ' t want to know some of these tricks. But I ' m not going to explain it all to you. I ' m going to do what philosophers do. Here ' s how a philosopher explains the sawing-the-lady-in-half trick. You know the sawing-the-lady-in-half trick? The philosopher says,"I ' m going to explain to you how that ' s done. You see, the magician doesn ' t really saw the lady in half.""He merely makes you think that he does."And you say,"Yes, and how does he do that?"He says,"Oh, that ' s not my department, I ' m sorry."So now I ' m going to illustrate how philosophers explain consciousness. But I ' m going to try to also show you that consciousness isn ' t quite as marvelous — your own consciousness isn ' t quite as wonderful — as you may have thought it is. This is something, by the way, that Lee Siegel talks about in his book. He marvels at how he ' ll do a magic show, and afterwards people will swear they saw him do X, Y, and Z. He never did those things. He didn ' t even try to do those things. People ' s memories inflate what they think they saw. And the same is true of consciousness. Now, let ' s see if this will work. All right. Let ' s just watch this. Watch it carefully. I ' m working with a young computer-animator documentarian named Nick Deamer, and this is a little demo that he ' s done for me, part of a larger project some of you may be interested in. We ' re looking for a backer. It ' s a feature-length documentary on consciousness. OK, now, you all saw what changed, right? How many of you noticed that every one of those squares changed color? Every one. I ' ll just show you by running it again. Even when you know that they ' re all going to change color, it ' s very hard to notice. You have to really concentrate to pick up any of the changes at all. Now, this is an example — one of many — of a phenomenon that ' s now being studied quite a bit. It ' s one that I predicted in the last page or two of my 1991 book,"Consciousness Explained,"where I said if you did experiments of this sort, you ' d find that people were unable to pick up really large changes. If there ' s time at the end, I ' ll show you the much more dramatic case. Now, how can it be that there are all those changes going on, and that we ’ re not aware of them? Well, earlier today, Jeff Hawkins mentioned the way your eye saccades, the way your eye moves around three or four times a second. He didn ’ t mention the speed. Your eye is constantly in motion, moving around, looking at eyes, noses, elbows, looking at interesting things in the world. And where your eye isn ’ t looking, you ’ re remarkably impoverished in your vision. That ’ s because the foveal part of your eye, which is the high-resolution part, is only about the size of your thumbnail held at arms length. That ’ s the detail part. It doesn ’ t seem that way, does it? It doesn ’ t seem that way, but that ’ s the way it is. You ’ re getting in a lot less information than you think. Here ’ s a completely different effect. This is a painting by Bellotto. It ’ s in the museum in North Carolina. Bellotto was a student of Canaletto ’ s. And I love paintings like that — the painting is actually about as big as it is right here. And I love Canalettos, because Canaletto has this fantastic detail, and you can get right up and see all the details on the painting. And I started across the hall in North Carolina, because I thought it was probably a Canaletto, and would have all that in detail. And I noticed that on the bridge there, there ’ s a lot of people — you can just barely see them walking across the bridge. And I thought as I got closer I would be able to see all the detail of most people, see their clothes, and so forth. And as I got closer and closer, I actually screamed. I yelled out because when I got closer, I found the detail wasn ’ t there at all. There were just little artfully placed blobs of paint. And as I walked towards the picture, I was expecting detail that wasn ’ t there. The artist had very cleverly suggested people and clothes and wagons and all sorts of things, and my brain had taken the suggestion. You ’ re familiar with a more recent technology, which is — There, you can get a better view of the blobs. See, when you get close they ’ re really just blobs of paint. You will have seen something like this — this is the reverse effect. I ’ ll just give that to you one more time. Now, what does your brain do when it takes the suggestion? When an artful blob of paint or two, by an artist, suggests a person — say, one of Marvin Minsky ’ s little society of mind — do they send little painters out to fill in all the details in your brain somewhere? I don ’ t think so. Not a chance. But then, how on Earth is it done? Well, remember the philosopher ’ s explanation of the lady? It ’ s the same thing. The brain just makes you think that it ’ s got the detail there. You think the detail ’ s there, but it isn ’ t there. The brain isn ’ t actually putting the detail in your head at all. It ’ s just making you expect the detail. Let ’ s just do this experiment very quickly. Is the shape on the left the same as the shape on the right, rotated? Yes. How many of you did it by rotating the one on the left in your mind ’ s eye, to see if it matched up with the one on the right? How many of you rotated the one on the right? OK. How do you know that ’ s what you did? There ’ s in fact been a very interesting debate raging for over 20 years in cognitive science — various experiments started by Roger Shepherd, who measured the angular velocity of rotation of mental images. Yes, it ’ s possible to do that. But the details of the process are still in significant controversy. And if you read that literature, one of the things that you really have to come to terms with is even when you ’ re the subject in the experiment, you don ’ t know. You don ’ t know how you do it. You just know that you have certain beliefs. And they come in a certain order, at a certain time. And what explains the fact that that ’ s what you think? Well, that ’ s where you have to go backstage and ask the magician. This is a figure that I love : Bradley, Petrie, and Dumais. You may think that I ’ ve cheated, that I ’ ve put a little whiter-than-white boundary there. How many of you see that sort of boundary, with the Necker cube floating in front of the circles? Can you see it? Well, you know, in effect, the boundary ’ s really there, in a certain sense. Your brain is actually computing that boundary, the boundary that goes right there. But now, notice there are two ways of seeing the cube, right? It ' s a Necker cube. Everybody can see the two ways of seeing the cube? OK. Can you see the four ways of seeing the cube? Because there ' s another way of seeing it. If you ' re seeing it as a cube floating in front of some circles, some black circles, there ' s another way of seeing it. As a cube, on a black background, as seen through a piece of Swiss cheese. Can you get it? How many of you can ' t get it? That ' ll help. Now you can get it. These are two very different phenomena. When you see the cube one way, behind the screen, those boundaries go away. But there ' s still a sort of filling in, as we can tell if we look at this. We don ' t have any trouble seeing the cube, but where does the color change? Does your brain have to send little painters in there? The purple-painters and the green-painters fight over who ' s going to paint that bit behind the curtain? No. Your brain just lets it go. The brain doesn ' t need to fill that in. When I first started talking about the Bradley, Petrie, Dumais example that you just saw — I ' ll go back to it, this one — I said that there was no filling-in behind there. And I supposed that that was just a flat truth, always true. But Rob Van Lier has recently shown that it isn ' t. Now, if you think you see some pale yellow — I ' ll run this a few more times. Look in the gray areas, and see if you seem to see something sort of shadowy moving in there — yeah, it ' s amazing. There ' s nothing there. It ' s no trick. [”Failure to Detect Changes in Scenes”slide] This is Ron Rensink ' s work, which was in some degree inspired by that suggestion right at the end of the book. Let me just pause this for a second if I can. This is change-blindness. What you ' re going to see is two pictures, one of which is slightly different from the other. You see here the red roof and the gray roof, and in between them there will be a mask, which is just a blank screen, for about a quarter of a second. So you ' ll see the first picture, then a mask, then the second picture, then a mask. And this will just continue, and your job as the subject is to press the button when you see the change. So, show the original picture for 240 milliseconds. Blank. Show the next picture for 240 milliseconds. Blank. And keep going, until the subject presses the button, saying,”I see the change.”So now we ' re going to be subjects in the experiment. We ' re going to start easy. Some examples. No trouble there. Can everybody see? All right. Indeed, Rensink ' s subjects took only a little bit more than a second to press the button. Can you see that one? 2. 9 seconds. How many don ' t see it still? What ' s on the roof of that barn? It ' s easy. Is it a bridge or a dock? There are a few more really dramatic ones, and then I ' ll close. I want you to see a few that are particularly striking. This one because it ' s so large and yet it ' s pretty hard to see. Can you see it? Audience : Yes. Dan Dennett : See the shadows going back and forth? Pretty big. So 15. 5 seconds is the median time for subjects in his experiment there. I love this one. I ' ll end with this one, just because it ' s such an obvious and important thing. How many still don ' t see it? How many still don ' t see it? How many engines on the wing of that Boeing? Right in the middle of the picture! Thanks very much for your attention. What I wanted to show you is that scientists, using their from-the-outside, third- person methods, can tell you things about your own consciousness that you would never dream of, and that, in fact, you ' re not the authority on your own consciousness that you think you are. And we ' re really making a lot of progress on coming up with a theory of mind. Jeff Hawkins, this morning, was describing his attempt to get theory, and a good, big theory, into the neuroscience. And he ' s right. This is a problem. Harvard Medical School once — I was at a talk — director of the lab said,”In our lab, we have a saying. If you work on one neuron, that ' s neuroscience. If you work on two neurons, that ' s psychology.”We have to have more theory, and it can come as much from the top down. Thank you very much.

Text Sample 275: NEG Dim 2 – 2003 – Score 1.00 – 2003/t000319.txt

I study ants, and that ' s because I like to think about how organizations work. And in particular, how the simple parts of organizations interact to create the behavior of the whole organization. So, ant colonies are a good example of an organization like that, and there are many others. The web is one. There are many biological systems like that — brains, cells, developing embryos. There are about 10, 000 species of ants. They all live in colonies consisting of one or a few queens, and then all the ants you see walking around are sterile female workers. And all ant colonies have in common that there ' s no central control. Nobody tells anybody what to do. The queen just lays the eggs. There ' s no management. No ant directs the behavior of any other ant. And I try to figure out how that works. And I ' ve been working for the past 20 years on a population of seed-eating ants in southeastern Arizona. Here ' s my study site. This is really a picture of ants, and the rabbit just happens to be there. And these ants are called harvester ants because they eat seeds. This is the nest of the mature colony, and there ' s the nest entrance. And they forage maybe for about 20 meters away, gather up the seeds and bring them back to the nest, and store them. And every year I go there and make a map of my study site. This is just a road. And it ' s not very big : it ' s about 250 meters on one side, 400 on the other. And every colony has a name, which is a number, which is painted on a rock. And I go there every year and look for all the colonies that were alive the year before, and figure out which ones have died, and put all the new ones on the map. And by doing this I know how old they all are. And because of that, I ' ve been able to study how their behavior changes as the colony gets older and larger. So I want to tell you about the life cycle of a colony. Ants never make more ants ; colonies make more colonies. And they do that by each year sending out the reproductives — those are the ones with wings — on a mating flight. So every year, on the same day — and it ' s a mystery exactly how that happens — each colony sends out its virgin, unmated queens with wings, and the males, and they all fly to a common place. And they mate. And this shows a recently virgin queen. Here ' s her wings. And she ' s in the process of mating with this male, and there ' s another male on top waiting his turn. Often the queens mate more than once. And after that, the males all die. That ' s it for them. And then the newly mated queens fly off somewhere, drop their wings, dig a hole and go into that hole and start laying eggs. And they will live for 15 or 20 years, continuing to lay eggs using the sperm from that original mating. So the queen goes down in there. She lays eggs, she feeds the larvae — so an ant starts as an egg, then it ' s a larva. She feeds the larvae by regurgitating from her fat reserves. Then, as soon as the ants — the first group of ants — emerge, they ' re larvae. Then they ' re pupae. Then they come out as adult ants. They go out, they get the food, they dig the nest, and the queen never comes out again. So this is a one-year-old colony — this happens to be 536. There ' s the nest entrance, there ' s a pencil for scale. So this is the colony founded by a queen the previous summer. This is a three-year-old colony. There ' s the nest entrance, there ' s a pencil for scale. They make a midden, a pile of refuse — mostly the husks of the seeds that they eat. This is a five-year-old colony. This is the nest entrance, here ' s a pencil for scale. This is about as big as they get, about a meter across. And then this is how colony size and numbers of worker ants changes — so this is about 10, 000 worker ants — changes as a function of colony age, in years. So it starts out with zero ants, just the founding queen, and it grows to a size of about 10 or 12 thousand ants when the colony is five. And it stays that size until the queen dies and there ' s nobody to make more ants, when she ' s about 15 or 20 years old. And it ' s when they reach this stable size, in numbers of ants, that they start to reproduce. That is, to send more winged queens and males to that year ' s mating flight. And I know how colony size changes as a function of colony age because I ' ve dug up colonies of known age and counted all the ants. So that ' s not the most fun part of this research, although it ' s interesting. Really the question that I think about with these ants is what I call task allocation. That ' s not just how is the colony organized, but how does it change what it ' s doing? How is it that the colony manages to adjust the numbers of workers performing each task as conditions change? So, things happen to an ant colony. When it rains in the summer, it floods in the desert. There ' s a lot of damage to the nest, and extra ants are needed to clean up that mess. When extra food becomes available — and this is what everybody knows about picnics — then extra ants are allocated to collect the food. So, with nobody telling anybody what to do, how is it that the colony manages to adjust the numbers of workers performing each task? And that ' s the process that I call task allocation. And in harvester ants, I divide the tasks of the ants I see just outside the nest into these four categories : where an ant is foraging, when it ' s out along the foraging trail, searching for food or bringing food back. The patrollers — that ' s supposed to be a magnifying glass — are an interesting group that go out early in the morning before the foragers are active. They somehow choose the direction that the foragers will go, and by coming back — just by making it back — they tell the foragers that it ' s safe to go out. Then the nest maintenance workers work inside the nest, and I wanted to say that the nests look a lot like Bill Lishman ' s house. That is, that there are chambers inside, they line the walls of the chambers with moist soil and it dries to a kind of an adobe-like surface in it. It also looks very similar to some of the cave dwellings of the Hopi people that are in that area. And the nest maintenance workers do that inside the nest, and then they come out of the nest carrying bits of dry soil in their mandibles. So you see the nest maintenance workers come out with a bit of sand, put it down, turn around, and go back in. And finally, the midden workers put some kind of territorial chemical in the garbage. So what you see the midden workers doing is making a pile of refuse. On one day, it ' ll all be here, and then the next day they ' ll move it over there, and then they ' ll move it back. So that ' s what the midden workers do. And these four groups are just the ants outside the nest. So that ' s only about 25 percent of the colony, and they ' re the oldest ants. So, an ant starts out somewhere near the queen. And when we dig up nests we find they ' re about as deep as the colony is wide, so about a meter deep for the big old nests. And then there ' s another long tunnel and a chamber, where we often find the queen, after eight hours of hacking away at the rock with pickaxes. I don ' t think that chamber has evolved because of me and my backhoe and my crew of students with pickaxes, but instead because when there ' s flooding, occasionally the colony has to go down deep. So there ' s this whole network of chambers. The queen ' s in there somewhere ; she just lays eggs. There ' s the larvae, and they consume most of the food. And this is true of most ants — that the ants you see walking around don ' t do much eating. They bring it back and feed it to the larvae. When the foragers come in with food, they just drop it into the upper chamber, and other ants come up from below, get the food, bring it back, husk the seeds, and pile them up. There are nest maintenance workers working throughout the nest. And curiously, and interestingly, it looks as though at any time about half the ants in the colony are just doing nothing. So, despite what it says in the Bible, about, you know,"Look to the ant, thou sluggard,"in fact, you could think of those ants as reserves. That is to say, if something happened — and I ' ve never seen anything like this happen, but I ' ve only been looking for 20 years — if something happened, they might all come out if they were needed. But in fact, mostly they ' re just hanging around in there. And I think it ' s a very interesting question — what is there about the way the colony is organized that might give some function to a reserve of ants who are doing nothing? And they sort of stand as a buffer in between the ants working deep inside the nest and the ants working outside. And if you mark ants that are working outside, and dig up a colony, you never see them deep down. So what ' s happening is that the ants work inside the nest when they ' re younger. They somehow get into this reserve. And then eventually they get recruited to join this exterior workforce. And once they belong to the ants that work outside, they never go back down. Now ants — most ants, including these, don ' t see very well. They have eyes, they can distinguish between light and dark, but they mostly work by smell. So just to reinforce that what you might have thought about ant queens isn ' t true — you know, even if the queen did have the intelligence to send chemical messages through this whole network of chambers to tell the ants outside what to do, there is no way that such messages could make it in time to see the shifts in the allocation of workers that we actually see outside the nest. So that ' s one way that we know the queen isn ' t directing the behavior of the colony. So when I first set out to work on task allocation, my first question was,"What ' s the relationship between the ants doing different tasks? Does it matter to the foragers what the nest maintenance workers are doing? Does it matter to the midden workers what the patrollers are doing?"And I was working in the context of a view of ant colonies in which each ant was somehow dedicated to its task from birth and sort of performed independently of the others, knowing its place on the assembly line. And instead I wanted to ask,"How are the different task groups interdependent?"So I did experiments where I changed one thing. So for example, I created more work for the nest maintenance workers by putting out a pile of toothpicks near the nest entrance, early in the morning when the nest maintenance workers are first active. This is what it looks like about 20 minutes later. Here it is about 40 minutes later. And the nest maintenance workers just take all the toothpicks to the outer edge of the nest mound and leave them there. And what I wanted to know was,"OK, here ' s a situation where extra nest maintenance workers were recruited — is this going to have any effect on the workers performing other tasks?"Then we repeated all those experiments with the ants marked. So here ' s some blue nest maintenance workers. And lately we ' ve gotten more sophisticated and we have this three-color system. And we can mark them individually so we know which ant is which. We started out with model airplane paint and then we found these wonderful little Japanese markers, and they work really well. And so just to summarize the result, well it turns out that yes, the different tasks are interdependent. So, if I change the numbers performing one task, it changes the numbers performing another. So for example, if I make a mess that the nest maintenance workers have to clean up, then I see fewer ants out foraging. And this was true for all the pair-wise combinations of tasks. And the second result, which was surprising to a lot of people, was that ants actually switch tasks. The same ant doesn ' t do the same task over and over its whole life. So for example, if I put out extra food, everybody else — the midden workers stop doing midden work and go get the food, they become foragers. The nest maintenance workers become foragers. The patrollers become foragers. But not every transition is possible. And this shows how it works. Like I just said, if there is more food to collect, the patrollers, the midden workers, the nest maintenance workers will all change to forage. If there ' s more patrolling to do — so I created a disturbance, so extra patrollers were needed — the nest maintenance workers will switch to patrol. But if more nest maintenance work is needed — for example, if I put out a bunch of toothpicks — then nobody will ever switch back to nest maintenance, they have to get nest maintenance workers from inside the nest. So foraging acts as a sink, and the ants inside the nest act as a source. And finally, it looks like each ant is deciding moment to moment whether to be active or not. So, for example, when there ' s extra nest maintenance work to do, it ' s not that the foragers switch over. I know that they don ' t do that. But the foragers somehow decide not to come out. And here was the most intriguing result : the task allocation. This process changes with colony age, and it changes like this. When I do these experiments with older colonies — so ones that are five years or older — they ' re much more consistent from one time to another and much more homeostatic. The worse things get, the more I hassle them, the more they act like undisturbed colonies. Whereas the young, small colonies — the two-year-old colonies of just 2, 000 ants — are much more variable. And the amazing thing about this is that an ant lives only a year. It could be this year, or this year. So, the ants in the older colony that seem to be more stable are not any older than the ants in the younger colony. It ' s not due to the experience of older, wiser ants. Instead, something about the organization must be changing as the colony gets older. And the obvious thing that ' s changing is its size. So since I ' ve had this result, I ' ve spent a lot of time trying to figure out what kinds of decision rules — very simple, local, probably olfactory, chemical rules could an ant could be using, since no ant can assess the global situation — that would have the outcome that I see, these predictable dynamics, in who does what task. And it would change as the colony gets larger. And what I ' ve found out is that ants are using a network of antennal contact. So anybody who ' s ever looked at ants has seen them touch antennae. They smell with their antennae. When one ant touches another, it ' s smelling it, and it can tell, for example, whether the other ant is a nest mate because ants cover themselves and each other, through grooming, with a layer of grease, which carries a colony-specific odor. And what we ' re learning is that an ant uses the pattern of its antennal contacts, the rate at which it meets ants of other tasks, in deciding what to do. And so what the message is, is not any message that they transmit from one ant to another, but the pattern. The pattern itself is the message. And I ' ll tell you a little bit more about that. But first you might be wondering : how is it that an ant can tell, for example, I ' m a forager. I expect to meet another forager every so often. But if instead I start to meet a higher number of nest maintenance workers, I ' m less likely to forage. So it has to know the difference between a forager and a nest maintenance worker. And we ' ve learned that, in this species — and I suspect in others as well — these hydrocarbons, this layer of grease on the outside of ants, is different as ants perform different tasks. And we ' ve done experiments that show that that ' s because the longer an ant stays outside, the more these simple hydrocarbons on its surface change, and so they come to smell different by doing different tasks. And they can use that task-specific odor in cuticular hydrocarbons — they can use that in their brief antennal contacts to somehow keep track of the rate at which they ' re meeting ants of certain tasks. And we ' ve just recently demonstrated this by putting extract of hydrocarbons on little glass beads, and dropping the beads gently down into the nest entrance at the right rate. And it turns out that ants will respond to the right rate of contact with a glass bead with hydrocarbon extract on it, as they would to contact with real ants. So I want now to show you a bit of film — and this will start out, first of all, showing you the nest entrance. So the idea is that ants are coming in and out of the nest entrance. They ' ve gone out to do different tasks, and the rate at which they meet as they come in and out of the nest entrance determines, or influences, each ant ’ s decision about whether to go out, and which task to perform. This is taken through a fiber optics microscope. It ’ s down inside the nest. In the beginning you see the ants just kind of engaging with the fiber optics microscope. But the idea is that the ants are in there, and each ant is experiencing a certain flow of ants past it — a stream of contacts with other ants. And the pattern of these interactions determines whether the ant comes back out, and what it does when it comes back out. You can also see this in the ants just outside the nest entrance like these. Each ant, then, as it comes back in, is contacting other ants. And the ants that are waiting just inside the nest entrance to decide whether to go out on their next trip, are contacting the ants coming in. So, what ’ s interesting about this system is that it ’ s messy. It ’ s variable. It ’ s noisy. And, in particular, in two ways. The first is that the experience of the ant — of each ant — can ’ t be very predictable. Because the rate at which ants come back depends on all the little things that happen to an ant as it goes out and does its task outside. And the second thing is that an ant ’ s ability to assess this pattern must be very crude because no ant can do any sophisticated counting. So, we do a lot of simulation and modeling, and also experimental work, to try to figure out how those two kinds of noise combine to, in the aggregate, produce the predictable behavior of ant colonies. Again, I don ’ t want to say that this kind of haphazard pattern of interactions produces a factory that works with the precision and efficiency of clockwork. In fact, if you watch ants at all, you end up trying to help them because they never seem to be doing anything exactly the way that you think that they ought to be doing it. So it ’ s not really that out of these haphazard contacts, perfection arises. But it works pretty well. Ants have been around for several hundred million years. They cover the earth, except for Antarctica. Something that they ’ re doing is clearly successful enough that this pattern of haphazard contacts, in the aggregate, produces something that allows ants to make a lot more ants. And one of the things that we ’ re studying is how natural selection might be acting now to shape this use of interaction patterns — this network of interaction patterns — to perhaps increase the foraging efficiency of ant colonies. So the one thing, though, that I want you to remember about this is that these patterns of interactions are something that you ’ d expect to be closely connected to colony size. The simplest idea is that when an ant is in a small colony — and an ant in a large colony can use the same rule, like”I expect to meet another forager every three seconds.”But in a small colony, it ’ s likely to meet fewer foragers, just because there are fewer other foragers there to meet. So this is the kind of rule that, as the colony develops and gets older and larger, will produce different behavior in an old colony and a small young one. Thank you.

How will we be remembered in 200 years? I happen to live in a little town, Princeton, in New Jersey, which every year celebrates the great event in Princeton history : the Battle of Princeton, which was, in fact, a very important battle. It was the first battle that George Washington won, in fact, and was pretty much of a turning point in the war of independence. It happened 225 years ago. It was actually a terrible disaster for Princeton. The town was burned down ; it was in the middle of winter, and it was a very, very severe winter. And about a quarter of all the people in Princeton died that winter from hunger and cold, but nobody remembers that. What they remember is, of course, the great triumph, that the Brits were beaten, and we won, and that the country was born. And so I agree very emphatically that the pain of childbirth is not remembered. It ' s the child that ' s remembered. And that ' s what we ' re going through at this time. I wanted to just talk for one minute about the future of biotechnology, because I think I know very little about that — I ' m not a biologist — so everything I know about it can be said in one minute. What I ' m saying is that we should follow the model that has been so successful with the electronic industry, that what really turned computers into a great success, in the world as a whole, is toys. As soon as computers became toys, when kids could come home and play with them, then the industry really took off. And that has to happen with biotech. There ' s a huge — — there ' s a huge community of people in the world who are practical biologists, who are dog breeders, pigeon breeders, orchid breeders, rose breeders, people who handle biology with their hands, and who are dedicated to producing beautiful things, beautiful creatures, plants, animals, pets. These people will be empowered with biotech, and that will be an enormous positive step to acceptance of biotechnology. That will blow away a lot of the opposition. When people have this technology in their hands, you have a do-it-yourself biotech kit, grow your own — grow your dog, grow your own cat. Just buy the software, you design it. I won ' t say anymore, you can take it on from there. It ' s going to happen, and I think it has to happen before the technology becomes natural, becomes part of the human condition, something that everybody ' s familiar with and everybody accepts. So, let ' s leave that aside. I want to talk about something quite different, which is what I know about, and that is astronomy. And I ' m interested in searching for life in the universe. And it ' s open to us to introduce a new way of doing that, and that ' s what I ' ll talk about for 10 minutes, or whatever the time remains. The important fact is, that most of the real estate that ' s accessible to us — I ' m not talking about the stars, I ' m talking about the solar system, the stuff that ' s within reach for spacecraft and within reach of our earthbound telescopes — most of the real estate is very cold and very far from the Sun. If you look at the solar system, as we know it today, it has a few planets close to the Sun. That ' s where we live. It has a fairly substantial number of asteroids between the orbit of the Earth out through — to the orbit of Jupiter. The asteroids are a substantial amount of real estate, but not very large. And it ' s not very promising for life, since most of it consists of rock and metal, mostly rock. It ' s not only cold, but very dry. So the asteroids we don ' t have much hope for. There stand some interesting places a little further out : the moons of Jupiter and Saturn. Particularly, there ' s a place called Europa, which is — Europa is one of the moons of Jupiter, where we see a very level ice surface, which looks as if it ' s floating on top of an ocean. So, we believe that on Europa there is, in fact, a deep ocean. And that makes it extraordinarily interesting as a place to explore. Ocean — probably the most likely place for life to originate, just as it originated on the Earth. So we would love to explore Europa, to go down through the ice, find out who is swimming around in the ocean, whether there are fish or seaweed or sea monsters — whatever there may be that ' s exciting — - or cephalopods. But that ' s hard to do. Unfortunately, the ice is thick. We don ' t know just how thick it is, probably miles thick, so it ' s very expensive and very difficult to go down there — send down your submarine or whatever it is — and explore. That ' s something we don ' t yet know how to do. There are plans to do it, but it ' s hard. Go out a bit further, you ' ll find that beyond the orbit of Neptune, way out, far from the Sun, that ' s where the real estate really begins. You ' ll find millions or trillions or billions of objects which, in what we call the Kuiper Belt or the Oort Cloud — these are clouds of small objects which appear as comets when they fall close to the Sun. Mostly, they just live out there in the cold of the outer solar system, but they are biologically very interesting indeed, because they consist primarily of ice with other minerals, which are just the right ones for developing life. So if life could be established out there, it would have all the essentials — chemistry and sunlight — everything that ' s needed. So, what I ' m proposing is that there is where we should be looking for life, rather than on Mars, although Mars is, of course, also a very promising and interesting place. But we can look outside, very cheaply and in a simple fashion. And that ' s what I ' m going to talk about. There is a — imagine that life originated on Europa, and it was sitting in the ocean for billions of years. It ' s quite likely that it would move out of the ocean onto the surface, just as it did on the Earth. Staying in the ocean and evolving in the ocean for 2 billion years, finally came out onto the land. And then of course it had great — much greater freedom, and a much greater variety of creatures developed on the land than had ever been possible in the ocean. And the step from the ocean to the land was not easy, but it happened. Now, if life had originated on Europa in the ocean, it could also have moved out onto the surface. There wouldn ' t have been any air there — it ' s a vacuum. It is out in the cold, but it still could have come. You can imagine that the plants growing up like kelp through cracks in the ice, growing on the surface. What would they need in order to grow on the surface? They ' d need, first of all, to have a thick skin to protect themselves from losing water through the skin. So they would have to have something like a reptilian skin. But better — what is more important is that they would have to concentrate sunlight. The sunlight in Jupiter, on the satellites of Jupiter, is 25 times fainter than it is here, since Jupiter is five times as far from the Sun. So they would have to have — these creatures, which I call sunflowers, which I imagine living on the surface of Europa, would have to have either lenses or mirrors to concentrate sunlight, so they could keep themselves warm on the surface. Otherwise, they would be at a temperature of minus 150, which is certainly not favorable for developing life, at least of the kind we know. But if they just simply could grow, like leaves, little lenses and mirrors to concentrate sunlight, then they could keep warm on the surface. They could enjoy all the benefits of the sunlight and have roots going down into the ocean ; life then could flourish much more. So, why not look? Of course, it ' s not very likely that there ' s life on the surface of Europa. None of these things is likely, but my, my philosophy is, look for what ' s detectable, not for what ' s probable. There ' s a long history in astronomy of unlikely things turning out to be there. And I mean, the finest example of that was radio astronomy as a whole. This was — originally, when radio astronomy began, Mr. Jansky, at the Bell labs, detected radio waves coming from the sky. And the regular astronomers were scornful about this. They said,"It ' s all right, you can detect radio waves from the Sun, but the Sun is the only object in the universe that ' s close enough and bright enough actually to be detectable. You can easily calculate that radio waves from the Sun are fairly faint, and everything else in the universe is millions of times further away, so it certainly will not be detectable. So there ' s no point in looking."And that, of course, that set back the progress of radio astronomy by about 20 years. Since there was nothing there, you might as well not look. Well, of course, as soon as anybody did look, which was after about 20 years, when radio astronomy really took off. Because it turned out the universe is absolutely full of all kinds of wonderful things radiating in the radio spectrum, much brighter than the Sun. So, the same thing could be true for this kind of life, which I ' m talking about, on cold objects : that it could in fact be very abundant all over the universe, and it ' s not been detected just because we haven ' t taken the trouble to look. So, the last thing I want to talk about is how to detect it. There is something called pit lamping. That ' s the phrase which I learned from my son George, who is there in the audience. You take — that ' s a Canadian expression. If you happen to want to hunt animals at night, you take a miner ' s lamp, which is a pit lamp. You strap it onto your forehead, so you can see the reflection in the eyes of the animal. So, if you go out at night, you shine a flashlight, the animals are bright. You see the red glow in their eyes, which is the reflection of the flashlight. And then, if you ' re one of these unsporting characters, you shoot the animals and take them home. And of course, that spoils the game for the other hunters who hunt in the daytime, so in Canada that ' s illegal. In New Zealand, it ' s legal, because the New Zealand farmers use this as a way of getting rid of rabbits, because the rabbits compete with the sheep in New Zealand. So, the farmers go out at night with heavily armed jeeps, and shine the headlights, and anything that doesn ' t look like a sheep, you shoot. So I have proposed to apply the same trick to looking for life in the universe. That if these creatures who are living on cold surfaces — either on Europa, or further out, anywhere where you can live on a cold surface — those creatures must be provided with reflectors. In order to concentrate sunlight, they have to have lenses and mirrors — in order to keep themselves warm. And then, when you shine sunlight at them, the sunlight will be reflected back, just as it is in the eyes of an animal. So these creatures will be bright against the cold surroundings. And the further out you go in this, away from the Sun, the more powerful this reflection will be. So actually, this method of hunting for life gets stronger and stronger as you go further away, because the optical reflectors have to be more powerful so the reflected light shines out even more in contrast against the dark background. So as you go further away from the Sun, this becomes more and more powerful. So, in fact, you can look for these creatures with telescopes from the Earth. Why aren ' t we doing it? Simply because nobody thought of it yet. But I hope that we shall look, and with any — we probably won ' t find anything, none of these speculations may have any basis in fact. But still, it ' s a good chance. And of course, if it happens, it will transform our view of life altogether. Because it means that — the way life can live out there, it has enormous advantages as compared with living on a planet. It ' s extremely hard to move from one planet to another. We ' re having great difficulties at the moment and any creatures that live on a planet are pretty well stuck. Especially if you breathe air, it ' s very hard to get from planet A to planet B, because there ' s no air in between. But if you breathe air — — you ' re dead — — as soon as you ' re off the planet, unless you have a spaceship. But if you live in a vacuum, if you live on the surface of one of these objects, say, in the Kuiper Belt, this — an object like Pluto, or one of the smaller objects in the neighborhood of Pluto, and you happened — if you ' re living on the surface there, and you get knocked off the surface by a collision, then it doesn ' t change anything all that much. You still are on a piece of ice, you can still have sunlight and you can still survive while you ' re traveling from one place to another. And then if you run into another object, you can stay there and colonize the other object. So life will spread, then, from one object to another. So if it exists at all in the Kuiper Belt, it ' s likely to be very widespread. And you will have then a great competition amongst species — Darwinian evolution — so there ' ll be a huge advantage to the species which is able to jump from one place to another without having to wait for a collision. And there ' ll be advantages for spreading out long, sort of kelp-like forest of vegetation. I call these creatures sunflowers. They look like, maybe like sunflowers. They have to be all the time pointing toward the Sun, and they will be able to spread out in space, because gravity on these objects is weak. So they can collect sunlight from a big area. So they will, in fact, be quite easy for us to detect. So, I hope in the next 10 years, we ' ll find these creatures, and then, of course, our whole view of life in the universe will change. If we don ’ t find them, then we can create them ourselves. That ’ s another wonderful opportunity that ’ s opening. We can — as soon as we have a little bit more understanding of genetic engineering, one of the things you can do with your take-it-home, do-it-yourself genetic engineering kit — — is to design a creature that can live on a cold satellite, a place like Europa, so we could colonize Europa with our own creatures. That would be a fun thing to do. In the long run, of course, it would also make it possible for us to move out there. What ’ s going to happen in the end, it ’ s not going to be just humans colonizing space, it ’ s going to be life moving out from the Earth, moving it into its kingdom. And the kingdom of life, of course, is going to be the universe. And if life is already there, it makes it much more exciting, in the short run. But in the long run, if there ’ s no life there, we create it ourselves. We transform the universe into something much more rich and beautiful than it is today. So again, we have a big and wonderful future to look forward. Thank you.

I was offered a position as associate professor of medicine and chief of scientific visualization at Yale University in the department of medicine. And my job was to write many of the algorithms and code for NASA to do virtual surgery in preparation for the astronauts going into deep-space flight, so they could be kept in robotic pods. One of the fascinating things about what we were working on is that we were seeing, using new scanning technologies, things that had never been seen before. Not only in disease management, but also things that allowed us to see things about the body that just made you marvel. I remember one of the first times we were looking at collagen. And your entire body, everything — your hair, skin, bone, nails — everything is made of collagen. And it ’ s a kind of rope-like structure that twirls and swirls like this. And the only place that collagen changes its structure is in the cornea of your eye. In your eye, it becomes a grid formation, and therefore, it becomes transparent, as opposed to opaque. So perfectly organized a structure, it was hard not to attribute divinity to it. Because we kept on seeing this in different parts of the body. One of the opportunities I had was one person was working on a really interesting micromagnetic resonance imaging machine with the NIH. And what we were going to do was scan a new project on the development of the fetus from conception to birth using these new technologies. So I wrote the algorithms and code, and he built the hardware — Paul Lauterbur — then went onto win the Nobel Prize for inventing the MRI. I got the data. And I ’ m going to show you a sample of the piece,”From Conception to Birth.”[From Conception to Birth] [Oocyte] [Sperm] [Egg Inseminated] [24 Hours : Baby ’ s first division] [The fertilized ovum divides a few hours after fusion...] [And divides anew every 12 to 15 hours.] [Early Embryo] [Yolk sack still feeding baby.] [25 Days : Heart chamber developing.] [32 Days : Arms & hands are developing] [36 Days : Beginning of the primitive vertebrae] [These weeks are the period of the most rapid development of the fetus.] [If the fetus continues to grow at this speed for the entire 9 months, it would be 1. 5 tons at birth.] [45 Days] [Embryo ’ s heart is beating twice as fast as the mother ’ s.] [51 Days] [Developing retina, nose and fingers] [The fetus ’ continual movement in the womb is necessary for muscular and skeletal growth.] [12 Weeks : Indifferent penis] [Girl or boy yet to be determined] [8 Months] [Delivery : The expulsion stage] [The moment of birth] Alexander Tsiaras : Thank you. But as you can see, when you actually start working on this data, it ’ s pretty spectacular. And as we kept on scanning more and more, working on this project, looking at these two simple cells that have this unbelievable machinery that will become the magic of you. And as we kept on working on this data, looking at small clusters of the body, these little pieces of tissue that were the trophoblasts coming off of the blastocyst, all of a sudden burrowing itself into the side of the uterus, saying,”I ’ m here to stay.”Having conversation and communications with the estrogens, the progesterones, saying,”I ’ m here to stay, plant me,”building this incredible trilinear fetus that becomes, within 44 days, something that you can recognize, and then at nine weeks is really kind of a little human being. The marvel of this information : How do we actually have this biological mechanism inside our body to actually see this information? I ’ m going to show you something pretty unique. Here ’ s a human heart at 25 days. It ’ s just basically two strands. And like this magnificent origami, cells are developing at one million cells per second at four weeks, as it ’ s just folding on itself. Within five weeks, you start to see the early atrium and the early ventricles. Six weeks, these folds are now beginning with the papilla on the inside of the heart actually being able to pull down each one of those valves in your heart until you get a mature heart — and then basically the development of the entire human body. The magic of the mechanisms inside each genetic structure saying exactly where that nerve cell should go — the complexity of these, the mathematical models of how these things are indeed done are beyond human comprehension. Even though I am a mathematician, I look at this with marvel of how do these instruction sets not make these mistakes as they build what is us? It ’ s a mystery, it ’ s magic, it ’ s divinity. Then you start to take a look at adult life. Take a look at this little tuft of capillaries. It ’ s just a tiny sub- substructure, microscopic. But basically by the time you ’ re nine months and you ’ re given birth, you have almost 60, 000 miles of vessels inside your body. And only one mile is visible. 59, 999 miles that are basically bringing nutrients and taking waste away. The complexity of building that within a single system is, again, beyond any comprehension or any existing mathematics today. And then instructions set, from the brain to every other part of the body — look at the complexity of the folding. Where does this intelligence of knowing that a fold can actually hold more information, so as you actually watch the baby ’ s brain grow. And this is one of the things we ’ re doing. We ’ re launching two new studies of scanning babies ’ brains from the moment they ’ re born. Every six months until they ’ re six years old, we ’ re going to be doing about 250 children, watching exactly how the gyri and the sulci of the brains fold to see how this magnificent development actually turns into memories and the marvel that is us. And it ’ s not just our own existence, but how does the woman ’ s body understand to have genetic structure that not only builds her own, but then has the understanding that allows her to become a walking immunological, cardiovascular system that basically is a mobile system that can actually nurture, treat this child with a kind of marvel that is beyond, again, our comprehension — the magic that is existence, that is us? Thank you.

I know what you ’ re thinking. You think I ’ ve lost my way, and somebody ’ s going to come on the stage in a minute and guide me gently back to my seat. I get that all the time in Dubai.”Here on holiday are you, dear?””Come to visit the children? How long are you staying?”Well actually, I hope for a while longer yet. I have been living and teaching in the Gulf for over 30 years. And in that time, I have seen a lot of changes. Now that statistic is quite shocking. And I want to talk to you today about language loss and the globalization of English. I want to tell you about my friend who was teaching English to adults in Abu Dhabi. And one fine day, she decided to take them into the garden to teach them some nature vocabulary. But it was she who ended up learning all the Arabic words for the local plants, as well as their uses — medicinal uses, cosmetics, cooking, herbal. How did those students get all that knowledge? Of course, from their grandparents and even their great-grandparents. It ’ s not necessary to tell you how important it is to be able to communicate across generations. But sadly, today, languages are dying at an unprecedented rate. A language dies every 14 days. Now, at the same time, English is the undisputed global language. Could there be a connection? Well I don ’ t know. But I do know that I ’ ve seen a lot of changes. When I first came out to the Gulf, I came to Kuwait in the days when it was still a hardship post. Actually, not that long ago. That is a little bit too early. But nevertheless, I was recruited by the British Council, along with about 25 other teachers. And we were the first non- Muslims to teach in the state schools there in Kuwait. We were brought to teach English because the government wanted to modernize the country and to empower the citizens through education. And of course, the U. K. benefited from some of that lovely oil wealth. Okay. Now this is the major change that I ’ ve seen — how teaching English has morphed from being a mutually beneficial practice to becoming a massive international business that it is today. No longer just a foreign language on the school curriculum, and no longer the sole domain of mother England, it has become a bandwagon for every English-speaking nation on earth. And why not? After all, the best education — according to the latest World University Rankings — is to be found in the universities of the U. K. and the U. S. So everybody wants to have an English education, naturally. But if you ’ re not a native speaker, you have to pass a test. Now can it be right to reject a student on linguistic ability alone? Perhaps you have a computer scientist who ’ s a genius. Would he need the same language as a lawyer, for example? Well, I don ’ t think so. We English teachers reject them all the time. We put a stop sign, and we stop them in their tracks. They can ’ t pursue their dream any longer, ’ til they get English. Now let me put it this way : if I met a monolingual Dutch speaker who had the cure for cancer, would I stop him from entering my British University? I don ’ t think so. But indeed, that is exactly what we do. We English teachers are the gatekeepers. And you have to satisfy us first that your English is good enough. Now it can be dangerous to give too much power to a narrow segment of society. Maybe the barrier would be too universal. Okay.”But,”I hear you say,”what about the research? It ’ s all in English.”So the books are in English, the journals are done in English, but that is a self- fulfilling prophecy. It feeds the English requirement. And so it goes on. I ask you, what happened to translation? If you think about the Islamic Golden Age, there was lots of translation then. They translated from Latin and Greek into Arabic, into Persian, and then it was translated on into the Germanic languages of Europe and the Romance languages. And so light shone upon the Dark Ages of Europe. Now don ’ t get me wrong ; I am not against teaching English, all you English teachers out there. I love it that we have a global language. We need one today more than ever. But I am against using it as a barrier. Do we really want to end up with 600 languages and the main one being English, or Chinese? We need more than that. Where do we draw the line? This system equates intelligence with a knowledge of English, which is quite arbitrary. And I want to remind you that the giants upon whose shoulders today ’ s intelligentsia stand did not have to have English, they didn ’ t have to pass an English test. Case in point, Einstein. He, by the way, was considered remedial at school because he was, in fact, dyslexic. But fortunately for the world, he did not have to pass an English test. Because they didn ’ t start until

1964 with TOEFL, the American test of English. Now it ’ s exploded. There are lots and lots of tests of English. And millions and millions of students take these tests every year. Now you might think, you and me,”Those fees aren ’ t bad, they ’ re okay,”but they are prohibitive to so many millions of poor people. So immediately, we ’ re rejecting them. It brings to mind a headline I saw recently :”Education : The Great Divide.”Now I get it, I understand why people would want to focus on English. They want to give their children the best chance in life. And to do that, they need a Western education. Because, of course, the best jobs go to people out of the Western Universities, that I put on earlier. It ’ s a circular thing. Okay. Let me tell you a story about two scientists, two English scientists. They were doing an experiment to do with genetics and the forelimbs and the hind limbs of animals. But they couldn ’ t get the results they wanted. They really didn ’ t know what to do, until along came a German scientist who realized that they were using two words for forelimb and hind limb, whereas genetics does not differentiate and neither does German. So bingo, problem solved. If you can ’ t think a thought, you are stuck. But if another language can think that thought, then, by cooperating, we can achieve and learn so much more. My daughter came to England from Kuwait. She had studied science and mathematics in Arabic. It ’ s an Arabic-medium school. She had to translate it into English at her grammar school. And she was the best in the class at those subjects. Which tells us that when students come to us from abroad, we may not be giving them enough credit for what they know, and they know it in their own language. When a language dies, we don ’ t know what we lose with that language. This is — I don ’ t know if you saw it on CNN recently — they gave the Heroes Award to a young Kenyan shepherd boy who couldn ’ t study at night in his village, like all the village children, because the kerosene lamp, it had smoke and it damaged his eyes. And anyway, there was never enough kerosene, because what does a dollar a day buy for you? So he invented a cost-free solar lamp. And now the children in his village get the same grades at school as the children who have electricity at home. When he received his award, he said these lovely words :”The children can lead Africa from what it is today, a dark continent, to a light continent.”A simple idea, but it could have such far-reaching consequences. People who have no light, whether it ’ s physical or metaphorical, cannot pass our exams, and we can never know what they know. Let us not keep them and ourselves in the dark. Let us celebrate diversity. Mind your language. Use it to spread great ideas. Thank you very much.

I was only four years old when I saw my mother load a washing machine for the very first time in her life. That was a great day for my mother. My mother and father had been saving money for years to be able to buy that machine, and the first day it was going to be used, even Grandma was invited to see the machine. And Grandma was even more excited. Throughout her life she had been heating water with firewood, and she had hand washed laundry for seven children. And now she was going to watch electricity do that work. My mother carefully opened the door, and she loaded the laundry into the machine, like this. And then, when she closed the door, Grandma said,”No, no, no, no. Let me, let me push the button.”And Grandma pushed the button, and she said,”Oh, fantastic! I want to see this! Give me a chair! Give me a chair! I want to see it,”and she sat down in front of the machine, and she watched the entire washing program. She was mesmerized. To my grandmother, the washing machine was a miracle. Today, in Sweden and other rich countries, people are using so many different machines. Look, the homes are full of machines. I can ' t even name them all. And they also, when they want to travel, they use flying machines that can take them to remote destinations. And yet, in the world, there are so many people who still heat the water on fire, and they cook their food on fire. Sometimes they don ' t even have enough food, and they live below the poverty line. There are two billion fellow human beings who live on less than two dollars a day. And the richest people over there — there ' s one billion people — and they live above what I call the"air line,"because they spend more than $80 a day on their consumption. But this is just one, two, three billion people, and obviously there are seven billion people in the world, so there must be one, two, three, four billion people more who live in between the poverty and the air line. They have electricity, but the question is, how many have washing machines? I ' ve done the scrutiny of market data, and I ' ve found that, indeed, the washing machine has penetrated below the air line, and today there ' s an additional one billion people out there who live above the"wash line."And they consume more than $40 per day. So two billion have access to washing machines. And the remaining five billion, how do they wash? Or, to be more precise, how do most of the women in the world wash? Because it remains hard work for women to wash. They wash like this : by hand. It ' s a hard, time-consuming labor, which they have to do for hours every week. And sometimes they also have to bring water from far away to do the laundry at home, or they have to bring the laundry away to a stream far off. And they want the washing machine. They don ' t want to spend such a large part of their life doing this hard work with so relatively low productivity. And there ' s nothing different in their wish than it was for my grandma. Look here, two generations ago in Sweden — picking water from the stream, heating with firewood and washing like that. They want the washing machine in exactly the same way. But when I lecture to environmentally-concerned students, they tell me,"No, everybody in the world cannot have cars and washing machines."How can we tell this woman that she ain ' t going to have a washing machine? And then I ask my students, I ' ve asked them — over the last two years I ' ve asked,"How many of you doesn ' t use a car?"And some of them proudly raise their hand and say,"I don ' t use a car."And then I put the really tough question :"How many of you hand-wash your jeans and your bed sheets?"And no one raised their hand. Even the hardcore in the green movement use washing machines. So how come [this is] something that everyone uses and they think others will not stop it? What is special with this? I had to do an analysis about the energy used in the world. Here we are. Look here, you see the seven billion people up there : the air people, the wash people, the bulb people and the fire people. One unit like this is an energy unit of fossil fuel — oil, coal or gas. That ' s what most of electricity and the energy in the world is. And it ' s 12 units used in the entire world, and the richest one billion, they use six of them. Half of the energy is used by one seventh of the world ' s population. And these ones who have washing machines, but not a house full of other machines, they use two. This group uses three, one each. And they also have electricity. And over there they don ' t even use one each. That makes 12 of them. But the main concern for the environmentally-interested students — and they are right — is about the future. What are the trends? If we just prolong the trends, without any real advanced analysis, to 2050, there are two things that can increase the energy use. First, population growth. Second, economic growth. Population growth will mainly occur among the poorest people here because they have high child mortality and they have many children per woman. And [with] that you will get two extra, but that won ' t change the energy use very much. What will happen is economic growth. The best of here in the emerging economies — I call them the New East — they will jump the air line.”Wopp!”they will say. And they will start to use as much as the Old West are doing already. And these people, they want the washing machine. I told you. They ’ ll go there. And they will double their energy use. And we hope that the poor people will get into the electric light. And they ’ ll get a two-child family without a stop in population growth. But the total energy consumption will increase to 22 units. And these 22 units — still the richest people use most of it. So what needs to be done? Because the risk, the high probability of climate change is real. It ’ s real. Of course they must be more energy-efficient. They must change behavior in some way. They must also start to produce green energy, much more green energy. But until they have the same energy consumption per person, they shouldn ’ t give advice to others — what to do and what not to do. Here we can get more green energy all over. This is what we hope may happen. It ’ s a real challenge in the future. But I can assure you that this woman in the favela in Rio, she wants a washing machine. She ’ s very happy about her minister of energy that provided electricity to everyone — so happy that she even voted for her. And she became Dilma Rousseff, the president-elect of one of the biggest democracies in the world — moving from minister of energy to president. If you have democracy, people will vote for washing machines. They love them. And what ’ s the magic with them? My mother explained the magic with this machine the very, very first day. She said,”Now Hans, we have loaded the laundry. The machine will make the work. And now we can go to the library.”Because this is the magic : you load the laundry, and what do you get out of the machine? You get books out of the machines, children ’ s books. And mother got time to read for me. She loved this. I got the”ABC ’ s”— this is where I started my career as a professor, when my mother had time to read for me. And she also got books for herself. She managed to study English and learn that as a foreign language. And she read so many novels, so many different novels here. And we really, we really loved this machine. And what we said, my mother and me,”Thank you industrialization. Thank you steel mill. Thank you power station. And thank you chemical processing industry that gave us time to read books.”Thank you very much.

Great creativity. In times of need, we need great creativity. Discuss. Great creativity is astonishingly, absurdly, rationally, irrationally powerful. Great creativity can spread tolerance, champion freedom, make education seem like a bright idea. Great creativity can turn a spotlight on deprivation, or show that deprivation ain ’ t necessarily so. Great creativity can make politicians electable, or parties unelectable. It can make war seem like tragedy or farce. Creativity is the meme-maker that puts slogans on our t-shirts and phrases on our lips. It ’ s the pathfinder that shows us a simple road through an impenetrable moral maze. Science is clever, but great creativity is something less knowable, more magical. And now we need that magic. This is a time of need. Our climate is changing quickly, too quickly. And great creativity is needed to do what it does so well : to provoke us to think differently with dramatic creative statements. To tempt us to act differently with delightful creative scraps. Here is one such scrap from an initiative I ’ m involved in using creativity to inspire people to be greener. Man : You know, rather than drive today, I ’ m going to walk. Narrator : And so he walked, and as he walked he saw things. Strange and wonderful things he would not otherwise have seen. A deer with an itchy leg. A flying motorcycle. A father and daughter separated from a bicycle by a mysterious wall. And then he stopped. Walking in front of him was her. The woman who as a child had skipped with him through fields and broken his heart. Sure, she had aged a little. In fact, she had aged a lot. But he felt all his old passion for her return.”Ford,”he called softly. For that was her name.”Don ’ t say another word, Gusty,”she said, for that was his name.”I know a tent next to a caravan, exactly 300 yards from here. Let ’ s go there and make love. In the tent.”Ford undressed. She spread one leg, and then the other. Gusty entered her boldly and made love to her rhythmically while she filmed him, because she was a keen amateur pornographer. The earth moved for both of them. And they lived together happily ever after. And all because he decided to walk that day. Andy Hobsbawm : We ’ ve got the science, we ’ ve had the debate. The moral imperative is on the table. Great creativity is needed to take it all, make it simple and sharp. To make it connect. To make it make people want to act. So this is a call, a plea, to the incredibly talented TED community. Let ’ s get creative against climate change. And let ’ s do it soon. Thank you.

I don ’ t know what the hell I ’ m doing here. I was born in a Scots Presbyterian ghetto in Canada, and dropped out of high school. I don ’ t own a cell phone, and I paint on paper using gouache, which hasn ’ t changed in 600 years. But about three years ago I had an art show in New York, and I titled it”Serious Nonsense.”So I think I ’ m actually the first one here — I lead. I called it”Serious Nonsense”because on the serious side, I use a technique of painstaking realism of editorial illustration from when I was a kid. I copied it and I never unlearned it — it ’ s the only style I know. And it ’ s very kind of staid and formal. And meanwhile, I use nonsense, as you can see. This is a Scottish castle where people are playing golf indoors, and the trick was to bang the golf ball off of suits of armor — which you can ’ t see there. This was one of a series called”Zany Afternoons,”which became a book. This is a home-built rocket-propelled car. That ’ s a 1953 Henry J — I ’ m a bug for authenticity — in a quiet neighborhood in Toledo. This is my submission for the L. A. Museum of Film. You can probably tell Frank Gehry and I come from the same town. My work is so personal and so strange that I have to invent my own lexicon for it. And I work a lot in what I call”retrofuturism,”which is looking back to see how yesterday viewed tomorrow. And they ’ re always wrong, always hilariously, optimistically wrong. And the peak time for that was the 30s, because the Depression was so dismal that anything to get away from the present into the future... and technology was going to carry us along. This is Popular Workbench. Popular science magazines in those days — I had a huge collection of them from the ’ 30s — all they are is just poor people being asked to make sunglasses out of wire coat hangers and everything improvised and dreaming about these wonderful giant radio robots playing ice hockey at 300 miles an hour — it ’ s all going to happen, it ’ s all going to be wonderful. Automotive retrofuturism is one of my specialties. I was both an automobile illustrator and an advertising automobile copywriter, so I have a lot of revenge to take on the subject. Detroit has always been halfway into the future — the advertising half. This is the ’ 58 Bulgemobile : so new, they make tomorrow look like yesterday. This is a chain gang of guys admiring the car. That ’ s from a whole catalog — it ’ s 18 pages or so — ran back in the days of the Lampoon, where I cut my teeth. Techno-archaeology is digging back and finding past miracles that never happened — for good reason, usually. The zeppelin — this was from a brochure about the zeppelin based, obviously, on the Hindenburg. But the zeppelin was the biggest thing that ever moved made by man. And it carried 56 people at the speed of a Buick at an altitude you could hear dogs bark, and it cost twice as much as a first-class cabin on the Normandie to fly it. So the Hindenburg wasn ’ t, you know, it was inevitable it was going to go. This is auto-gyro jousting in Malibu in the 30s. The auto-gyro couldn ’ t wait for the invention of the helicopter, but it should have — it wasn ’ t a big success. It ’ s the only Spanish innovation, technologically, of the 20th century, by the way. You needed to know that. The flying car which never got off the ground — it was a post-war dream. My old man used to tell me we were going to get a flying car. This is pitched into the future from 1946, looking at the day all American families have them.”There ’ s Moscow, Shirley. Hope they speak Esperanto!”Faux-nostalgia, which I ’ m sort of — not, say, famous for, but I work an awful lot in it. It ’ s the achingly sentimental yearning for times that never happened. Somebody once said that nostalgia is the one utterly most useless human emotion — so I think that—s a case for serious play. This is emblematic of it — this is wing dining, recalling those balmy summer days somewhere over France in the 20s, dining on the wing of a plane. You can ’ t see it very well here, but that ’ s Hemingway reading some pages from his new novel to Fitzgerald and Ford Madox Ford until the slipstream blows him away. This is tank polo in the South Hamptons. The brainless rich are more fun to make fun of than anybody. I do a lot of that. And authenticity is a major part of my serious nonsense. I think it adds a huge amount. Those, for example, are Mark IV British tanks from 1916. They had two machine guns and a cannon, and they had 90 horsepower Ricardo engines. They went five miles an hour and inside it was 105 degrees in the pitch dark. And they had a canary hung inside the thing to make sure the Germans weren ’ t going to use gas. Happy little story, isn ’ t it? This is Motor Ritz Towers in Manhattan in the 30s, where you drove up to your front door, if you had the guts. Anybody who was anybody had an apartment there. I managed to stick in both the zeppelin and an ocean liner out of sheer enthusiasm. And I love cigars — there ’ s a cigar billboard down there. And faux-nostalgia works even in serious subjects like war. This is those wonderful days of the Battle of Britain in 1940, when a Messerschmitt ME109 bursts into the House of Commons and buzzes around, just to piss off Churchill, who ’ s down there somewhere. It ’ s a fond memory of times past. Hyperbolic overkill is a way of taking exaggeration to the absolute ultimate limit, just for the fun of it. This was a piece I did — a brochure again —”RMS Tyrannic : The Biggest Thing in All the World.”The copy, which you can ’ t see because it goes on and on for several pages, says that steerage passengers can ’ t get their to bunks before the voyage is over, and it ’ s so safe it carries no insurance. It ’ s obviously modeled on the Titanic. But it ’ s not a cri de coeur about man ’ s hubris in the face of the elements. It ’ s just a sick, silly joke. Shamelessly cheap is something, I think — this will wake you up. It has no meaning, just — Desoto discovers the Mississippi, and it ’ s a Desoto discovering the Mississippi. I did that as a quick back page — I had like four hours to do a back page for an issue of the Lampoon, and I did that, and I thought,”Well, I ’ m ashamed. I hope nobody knows it.”People wrote in for reprints of that thing. Urban absurdism — that ’ s what the New Yorker really calls for. I try to make life in New York look even weirder than it is with those covers. I ’ ve done about 40 of them, and I ’ d say 30 of them are based on that concept. I was driving down 7th Avenue one night at 3 a. m., and this steam pouring out of the street, and I thought,”What causes that?”And that — who—s to say? The Temple of Dendur at the Metropolitan in New York — it ’ s a very somber place. I thought I could jazz it up a bit, have a little fun with it. This is a very un-PC cover. Not in New York. I couldn ’ t resist, and I got a nasty email from some environmental group saying,”This is too serious and solemn to make fun of. You should be ashamed, please apologize on our website.”Haven ’ t got around to it yet but — I may. This is the word side of my brain. I love the word”Eurotrash.”That ’ s all the Eurotrash coming through JFK customs. This was the New York bike messenger meeting the Tour de France. If you live in New York, you know how the bike messengers move. Except that he ’ s carrying a tube for blueprints and stuff — they all do — and a lot of people thought that meant it was a terrorist about to shoot rockets at the Tour de France — sign of our times, I guess. This is the only fashion cover I ’ ve ever done. It ’ s the little old lady that lives in a shoe, and then this thing — the title of that was,”There Goes the Neighborhood.”I don ’ t know a hell of a lot about fashion — I was told to do what they call a Mary Jane, and then I got into this terrible fight between the art director and the editor saying :”Put a strap on it”—”No, don ’ t put a strap on it”—”Put a strap on it —”Don ’ t put a strap on it”— because it obscures the logo and looks terrible and it ’ s bad and — I finally chickened out and did it for the sake of the authenticity of the shoe. This is a tiny joke — E-ZR pass. One letter makes an idea. This is a big joke. This is the audition for”King Kong.”People always ask me, where do you get your ideas, how do your ideas come? Truth about that one is I had a horrible red wine hangover, in the middle of the night, this came to me like a Xerox — all I had to do was write it down. It was perfectly clear. I didn ’ t do any thinking about it. And then when it ran, a lovely lady, an old lady named Mrs. Edgar Rosenberg — if you know that name — called me and said she loved the cover, it was so sweet. Her former name was Fay Wray, and so that was — I didn ’ t have the wit to say,”Take the painting.”Finally, this was a three-page cover, never done before, and I don ’ t think it will ever be done again — successive pages in the front of the magazine. It ’ s the ascent of man using an escalator, and it ’ s in three parts. You can ’ t see it all together, unfortunately, but if you look at it enough, you can sort of start to see how it actually starts to move. Pretty elegant. Nothing like a crash to end a joke. That completes my oeuvre. I would just like to add a crass commercial — I have a kids ’ book coming out in the fall called”Marvel Sandwiches,”a compendium of all the serious play that ever was, and it—s going to be available in fine bookstores, crummy bookstores, tables on the street in October. So thank you very much.

About four years ago, the New Yorker published an article about a cache of dodo bones that was found in a pit on the island of Mauritius. Now, the island of Mauritius is a small island off the east coast of Madagascar in the Indian Ocean, and it is the place where the dodo bird was discovered and extinguished, all within about 150 years. Everyone was very excited about this archaeological find, because it meant that they might finally be able to assemble a single dodo skeleton. See, while museums all over the world have dodo skeletons in their collection, nobody — not even the actual Natural History Museum on the island of Mauritius — has a skeleton that ’ s made from the bones of a single dodo. Well, this isn ’ t exactly true. The fact is, is that the British Museum had a complete specimen of a dodo in their collection up until the 18th century — it was actually mummified, skin and all — but in a fit of space-saving zeal, they actually cut off the head and they cut off the feet and they burned the rest in a bonfire. If you go look at their website today, they ’ ll actually list these specimens, saying, the rest was lost in a fire. Not quite the whole truth. Anyway. The frontispiece of this article was this photo, and I ’ m one of the people that thinks that Tina Brown was great for bringing photos to the New Yorker, because this photo completely rocked my world. I became obsessed with the object — not just the beautiful photograph itself, and the color, the shallow depth of field, the detail that ' s visible, the wire you can see on the beak there that the conservator used to put this skeleton together — there ' s an entire story here. And I thought to myself, wouldn ' t it be great if I had my own dodo skeleton? I want to point out here at this point that I ' ve spent my life obsessed by objects and the stories that they tell, and this was the very latest one. So I began looking around for — to see if anyone sold a kit, some kind of model that I could get, and I found lots of reference material, lots of lovely pictures. No dice : no dodo skeleton for me. But the damage had been done. I had saved a few hundred photos of dodo skeletons into my"Creative Projects"folder — it ' s a repository for my brain, everything that I could possibly be interested in. Any time I have an internet connection, there ' s a sluice of stuff moving into there, everything from beautiful rings to cockpit photos. The key that the Marquis du Lafayette sent to George Washington to celebrate the storming of the Bastille. Russian nuclear launch key : The one on the top is the picture of the one I found on eBay ; the one on the bottom is the one I made for myself, because I couldn ' t afford the one on eBay. Storm trooper costumes. Maps of Middle Earth — that ' s one I hand-drew myself. There ' s the dodo skeleton folder. This folder has 17, 000 photos — over 20 gigabytes of information — and it ' s growing constantly. And one day, a couple of weeks later, it might have been maybe a year later, I was in the art store with my kids, and I was buying some clay tools — we were going to have a craft day. I bought some Super Sculpeys, some armature wire, some various materials. And I looked down at this Sculpey, and I thought, maybe, yeah, maybe I could make my own dodo skull. I should point out at this time — I ' m not a sculptor ; I ' m a hard-edged model maker. You give me a drawing, you give me a prop to replicate, you give me a crane, scaffolding, parts from"Star Wars"— especially parts from"Star Wars"— I can do this stuff all day long. It ' s exactly how I made my living for 15 years. But you give me something like this — my friend Mike Murnane sculpted this ; it ' s a maquette for"Star Wars, Episode Two"— this is not my thing — this is something other people do — dragons, soft things. However, I felt like I had looked at enough photos of dodo skulls to actually be able to understand the topology and perhaps replicate it — I mean, it couldn ' t be that difficult. So, I started looking at the best photos I could find. I grabbed all the reference, and I found this lovely piece of reference. This is someone selling this on eBay ; it was clearly a woman—s hand, hopefully a woman ' s hand. Assuming it was roughly the size of my wife ' s hand, I made some measurements of her thumb, and I scaled them out to the size of the skull. I blew it up to the actual size, and I began using that, along with all the other reference that I had, comparing it to it as size reference for figuring out exactly how big the beak should be, exactly how long, etc. And over a few hours, I eventually achieved what was actually a pretty reasonable dodo skull. And I didn ' t mean to continue, I — it ' s kind of like, you know, you can only clean a super messy room by picking up one thing at a time ; you can ' t think about the totality. I wasn ' t thinking about a dodo skeleton ; I just noticed that as I finished this skull, the armature wire that I had been used to holding it up was sticking out of the back just where a spine would be. And one of the other things I ' d been interested in and obsessed with over the years is spines and skeletons, having collected a couple of hundred. I actually understood the mechanics of vertebrae enough to kind of start to imitate them. And so button by button, vertebrae by vertebrae, I built my way down. And actually, by the end of the day, I had a reasonable skull, a moderately good vertebrae and half of a pelvis. And again, I kept on going, looking for more reference, every bit of reference I could find — drawings, beautiful photos. This guy — I love this guy! He put a dodo leg bones on a scanner with a ruler. This is the kind of accuracy that I wanted, and I replicated every last bone and put it in. And after about six weeks, I finished, painted, mounted my own dodo skeleton. You can see that I even made a museum label for it that includes a brief history of the dodo. And TAP Plastics made me — although I didn ' t photograph it — a museum vitrine. I don ' t have the room for this in my house, but I had to finish what I had started. And this actually represented kind of a sea change to me. Again, like I said, my life has been about being fascinated by objects and the stories that they tell, and also making them for myself, obtaining them, appreciating them and diving into them. And in this folder,"Creative Projects,"there are tons of projects that I ' m currently working on, projects that I ' ve already worked on, things that I might want to work on some day, and things that I may just want to find and buy and have and look at and touch. But now there was potentially this new category of things that I could sculpt that was different, that I — you know, I have my own R2D2, but that ' s — honestly, relative to sculpting, to me, that ' s easy. And so I went back and looked through my"Creative Projects"folder, and I happened across the Maltese Falcon. Now, this is funny for me : to fall in love with an object from a Hammett novel, because if it ' s true that the world is divided into two types of people, Chandler people and Hammett people, I am absolutely a Chandler person. But in this case, it ' s not about the author, it ' s not about the book or the movie or the story, it ' s about the object in and of itself. And in this case, this object is — plays on a host of levels. First of all, there ' s the object in the world. This is the"Kniphausen Hawk."It is a ceremonial pouring vessel made around 1700 for a Swedish Count, and it is very likely the object from which Hammett drew his inspiration for the Maltese Falcon. Then there is the fictional bird, the one that Hammett created for the book. Built out of words, it is the engine that drives the plot of his book and also the movie, in which another object is created : a prop that has to represent the thing that Hammett created out of words, inspired by the Kniphausen Hawk, and this represents the falcon in the movie. And then there is this fourth level, which is a whole new object in the world : the prop made for the movie, the representative of the thing, becomes, in its own right, a whole other thing, a whole new object of desire. And so now it was time to do some research. I actually had done some research a few years before — it ' s why the folder was there. I ' d bought a replica, a really crappy replica, of the Maltese Falcon on eBay, and had downloaded enough pictures to actually have some reasonable reference. But I discovered, in researching further, really wanting precise reference, that one of the original lead birds had been sold at Christie ' s in 1994, and so I contacted an antiquarian bookseller who had the original Christie ' s catalogue, and in it I found this magnificent picture, which included a size reference. I was able to scan the picture, blow it up to exactly full size. I found other reference. Avi [Ara] Chekmayan, a New Jersey editor, actually found this resin Maltese Falcon at a flea market in 1991, although it took him five years to authenticate this bird to the auctioneers ' specifications, because there was a lot of controversy about it. It was made out of resin, which wasn ' t a common material for movie props about the time the movie was made. It ' s funny to me that it took a while to authenticate it, because I can see it compared to this thing, and I can tell you — it ' s real, it ' s the real thing, it ' s made from the exact same mold that this one is. In this one, because the auction was actually so controversial, Profiles in History, the auction house that sold this — I think in 1995 for about 100, 000 dollars — they actually included — you can see here on the bottom — not just a front elevation, but also a side, rear and other side elevation. So now, I had all the topology I needed to replicate the Maltese Falcon. What do they do, how do you start something like that? I really don ’ t know. So what I did was, again, like I did with the dodo skull, I blew all my reference up to full size, and then I began cutting out the negatives and using those templates as shape references. So I took Sculpey, and I built a big block of it, and I passed it through until, you know, I got the right profiles. And then slowly, feather by feather, detail by detail, I worked out and achieved — working in front of the television and Super Sculpey — here ’ s me sitting next to my wife — it ’ s the only picture I took of the entire process. As I moved through, I achieved a very reasonable facsimile of the Maltese Falcon. But again, I am not a sculptor, and so I don ’ t know a lot of the tricks, like, I don ’ t know how my friend Mike gets beautiful, shiny surfaces with his Sculpey ; I certainly wasn ’ t able to get it. So, I went down to my shop, and I molded it and I cast it in resin, because in the resin, then, I could absolutely get the glass smooth finished. Now there ’ s a lot of ways to fill and get yourself a nice smooth finish. My preference is about 70 coats of this — matte black auto primer. I spray it on for about three or four days, it drips to hell, but it allows me a really, really nice gentle sanding surface and I can get it glass-smooth. Oh, finishing up with triple-zero steel wool. Now, the great thing about getting it to this point was that because in the movie, when they finally bring out the bird at the end, and they place it on the table, they actually spin it. So I was able to actually screen-shot and freeze-frame to make sure. And I ’ m following all the light kicks on this thing and making sure that as I ’ m holding the light in the same position, I ’ m getting the same type of reflection on it — that ’ s the level of detail I ’ m going into this thing. I ended up with this : my Maltese Falcon. And it ’ s beautiful. And I can state with authority at this point in time, when I ’ d finished it, of all of the replicas out there — and there is a few — this is by far the most accurate representation of the original Maltese Falcon than anyone has sculpted. Now the original one, I should tell you, is sculpted by a guy named Fred Sexton. This is where it gets weird. Fred Sexton was a friend of this guy, George Hodel. Terrifying guy — agreed by many to be the killer of the Black Dahlia. Now, James Ellroy believes that Fred Sexton, the sculptor of the Maltese Falcon, killed James Elroy ’ s mother. I ’ ll go you one stranger than that : In 1974, during the production of a weird comedy sequel to”The Maltese Falcon,”called”The Black Bird,”starring George Segal, the Los Angeles County Museum of Art had a plaster original of the Maltese Falcon — one of the original six plasters, I think, made for the movie — stolen out of the museum. A lot of people thought it was a publicity stunt for the movie. John ’ s Grill, which actually is seen briefly in”The Maltese Falcon,”is still a viable San Francisco eatery, counted amongst its regular customers Elisha Cook, who played Wilmer Cook in the movie, and he gave them one of his original plasters of the Maltese Falcon. And they had it in their cabinet for about 15 years, until it got stolen in January of 2007. It would seem that the object of desire only comes into its own by disappearing repeatedly. So here I had this Falcon, and it was lovely. It looked really great, the light worked on it really well, it was better than anything that I could achieve or obtain out in the world. But there was a problem. And the problem was that : I wanted the entirety of the object, I wanted the weight behind the object. This thing was made of resin and it was too light. There ’ s this group online that I frequent. It ’ s a group of prop crazies just like me called the Replica Props Forum, and it ’ s people who trade, make and travel in information about movie props. And it turned out that one of the guys there, a friend of mine that I never actually met, but befriended through some prop deals, was the manager of a local foundry. He took my master Falcon pattern, he actually did lost wax casting in bronze for me, and this is the bronze

I got back. And this is, after some acid etching, the one that I ended up with. And this thing, it ' s deeply, deeply satisfying to me. Here, I ' m going to put it out there, later on tonight, and I want you to pick it up and handle it. You want to know how obsessed I am. This project ' s only for me, and yet I went so far as to buy on eBay a 1941 Chinese San Francisco-based newspaper, in order so that the bird could properly be wrapped... like it is in the movie. Yeah, I know! There you can see, it ' s weighing in at 27 and a half pounds. That ' s half the weight of my dog, Huxley. But there ' s a problem. Now, here ' s the most recent progression of Falcons. On the far left is a piece of crap — a replica I bought on eBay. There ' s my somewhat ruined Sculpey Falcon, because I had to get it back out of the mold. There ' s my first casting, there ' s my master and there ' s my bronze. There ' s a thing that happens when you mold and cast things, which is that every time you throw it into silicone and cast it in resin, you lose a little bit of volume, you lose a little bit of size. And when I held my bronze one up against my Sculpey one, it was shorter by three-quarters of an inch. Yeah, no, really, this was like aah — why didn ' t I remember this? Why didn ' t I start and make it bigger? So what do I do? I figure I have two options. One, I can fire a freaking laser at it, which I have already done, to do a 3D scan — there ' s a 3D scan of this Falcon. I had figured out the exact amount of shrinkage I achieved going from a wax master to a bronze master and blown this up big enough to make a 3D lithography master of this, which I will polish, then I will send to the mold maker and then I will have it done in bronze. Or : There are several people who own originals, and I have been attempting to contact them and reach them, hoping that they will let me spend a few minutes in the presence of one of the real birds, maybe to take a picture, or even to pull out the hand-held laser scanner that I happen to own that fits inside a cereal box, and could maybe, without even touching their bird, I swear, get a perfect 3D scan. And I ' m even willing to sign pages saying that I ' ll never let anyone else have it, except for me in my office, I promise. I ' ll give them one if they want it. And then, maybe, then I ' ll achieve the end of this exercise. But really, if we ' re all going to be honest with ourselves, I have to admit that achieving the end of the exercise was never the point of the exercise to begin with, was it. Thank you.

Usually I like working in my shop, but when it ' s raining and the driveway outside turns into a river, then I just love it. And I ' ll cut some wood and drill some holes and watch the water, and maybe I ' ll have to walk around and look for washers. You have no idea how much time I spend. This is the"Double Raindrop."Of all my sculptures, it ' s the most talkative. It adds together the interference pattern from two raindrops that land near each other. Instead of expanding circles, they ' re expanding hexagons. All the sculptures move by mechanical means. Do you see how there ' s three peaks to the yellow sine wave? Right here I ' m adding a sine wave with four peaks and turning it on. Eight hundred two-liter soda bottles — oh yea. Four hundred aluminum cans. Tule is a reed that ' s native to California, and the best thing about working with it is that it smells just delicious. A single drop of rain increasing amplitude. The spiral eddy that trails a paddle on a rafting trip. This adds together four different waves. And here I ' m going to pull out the double wavelengths and increase the single. The mechanism that drives it has nine motors and about 3, 000 pulleys. Four hundred and forty-five strings in a three-dimensional weave. Transferred to a larger scale — actually a lot larger, with a lot of help — 14, 064 bicycle reflectors — a 20-day install.”Connected”is a collaboration with choreographer Gideon Obarzanek. Strings attached to dancers. This is very early rehearsal footage, but the finished work ’ s on tour and is actually coming through L. A. in a couple weeks. A pair of helices and 40 wooden slats. Take your finger and draw this line. Summer, fall, winter, spring, noon, dusk, dark, dawn. Have you ever seen those stratus clouds that go in parallel stripes across the sky? Did you know that ’ s a continuous sheet of cloud that ’ s dipping in and out of the condensation layer? What if every seemingly isolated object was actually just where the continuous wave of that object poked through into our world? The Earth is neither flat nor round. It ’ s wavy. It sounds good, but I ’ ll bet you know in your gut that it ’ s not the whole truth, and I ’ ll tell you why. I have a two-year-old daughter who ’ s the best thing ever. And I ’ m just going to come out and say it : My daughter is not a wave. And you might say,”Surely, Rueben, if you took even just the slightest step back, the cycles of hunger and eating, waking and sleeping, laughing and crying would emerge as pattern.”But I would say,”If I did that, too much would be lost.”This tension between the need to look deeper and the beauty and immediacy of the world, where if you even try to look deeper you ’ ve already missed what you ’ re looking for, this tension is what makes the sculptures move. And for me, the path between these two extremes takes the shape of a wave. Let me show you one more. Thank you very much. Thanks. Thanks. June Cohen : Looking at each of your sculptures, they evoke so many different images. Some of them are like the wind and some are like waves, and sometimes they look alive and sometimes they seem like math. Is there an actual inspiration behind each one? Are you thinking of something physical or somthing tangible as you design it? RM : Well some of them definitely have a direct observation — like literally two raindrops falling, and just watching that pattern is so stunning. And then just trying to figure out how to make that using stuff. I like working with my hands. There ’ s nothing better than cutting a piece of wood and trying to make it move. JC : And does it ever change? Do you think you ’ re designing one thing, and then when it ’ s produced it looks like something else? RM : The”Double Raindrop”I worked on for nine months, and when I finally turned it on, I actually hated it. The very moment I turned it on, I hated it. It was like a really deep-down gut reaction, and I wanted to throw it out. And I happened to have a friend who was over, and he said,”Why don ’ t you just wait.”And I waited, and the next day I liked it a bit better, the next day I liked it a bit better, and now I really love it. And so I guess, one, the gut reactions a little bit wrong sometimes, and two, it does not look like as expected. JC : The relationship evolves over time. Well thank you so much. That was a gorgeous treat for us. RM : Thanks.

To most of you, this is a device to buy, sell, play games, watch videos. I think it might be a lifeline. I think actually it might be able to save more lives than penicillin. Texting : I know I say texting and a lot of you think sexting, a lot of you think about the lewd photos that you see â hopefully not your kids sending to somebody else â or trying to translate the abbreviations LOL, LMAO, HMU. I can help you with those later. But the parents in the room know that texting is actually the best way to communicate with your kids. It might be the only way to communicate with your kids. The average teenager sends 3, 339 text messages a month, unless she ’ s a girl, then it ’ s closer to 4, 000. And the secret is she opens every single one. Texting has a 100 percent open rate. Now the parents are really alarmed. It ’ s a 100 percent open rate even if she doesn ’ t respond to you when you ask her when she ’ s coming home for dinner. I promise she read that text. And this isn ’ t some suburban iPhone-using teen phenomenon. Texting actually overindexes for minority and urban youth. I know this because at DoSomething. org, which is the largest organization for teenagers and social change in America, about six months ago we pivoted and started focusing on text messaging. We ’ re now texting out to about 200, 000 kids a week about doing our campaigns to make their schools more green or to work on homeless issues and things like that. We ’ re finding it 11 times more powerful than email. We ’ ve also found an unintended consequence. We ’ ve been getting text messages back like these.”I don ’ t want to go to school today. The boys call me faggot.””I was cutting, my parents found out, and so I stopped. But I just started again an hour ago.”Or,”He won ’ t stop raping me. He told me not to tell anyone. It ’ s my dad. Are you there?”That last one ’ s an actual text message that we received. And yeah, we ’ re there. I will not forget the day we got that text message. And so it was that day that we decided we needed to build a crisis text hotline. Because this isn ’ t what we do. We do social change. Kids are just sending us these text messages because texting is so familiar and comfortable to them and there ’ s nowhere else to turn that they ’ re sending them to us. So think about it, a text hotline ; it ’ s pretty powerful. It ’ s fast, it ’ s pretty private. No one hears you in a stall, you ’ re just texting quietly. It ’ s real time. We can help millions of teens with counseling and referrals. That ’ s great. But the thing that really makes this awesome is the data. Because I ’ m not really comfortable just helping that girl with counseling and referrals. I want to prevent this shit from happening. So think about a cop. There ’ s something in New York City. The police did it. It used to be just guess work, police work. And then they started crime mapping. And so they started following and watching petty thefts, summonses, all kinds of things â charting the future essentially. And they found things like, when you see crystal meth on the street, if you add police presence, you can curb the otherwise inevitable spate of assaults and robberies that would happen. In fact, the year after the NYPD put CompStat in place, the murder rate fell 60 percent. So think about the data from a crisis text line. There is no census on bullying and dating abuse and eating disorders and cutting and rape â no census. Maybe there ’ s some studies, some longitudinal studies, that cost lots of money and took lots of time. Or maybe there ’ s some anecdotal evidence. Imagine having real time data on every one of those issues. You could inform legislation. You could inform school policy. You could say to a principal,”You ’ re having a problem every Thursday at three o ’ clock. What ’ s going on in your school?”You could see the immediate impact of legislation or a hateful speech that somebody gives in a school assembly and see what happens as a result. This is really, to me, the power of texting and the power of data. Because while people are talking about data, making it possible for Facebook to mine my friend from the third grade, or Target to know when it ’ s time for me to buy more diapers, or some dude to build a better baseball team, I ’ m actually really excited about the power of data and the power of texting to help that kid go to school, to help that girl stop cutting in the bathroom and absolutely to help that girl whose father ’ s raping her. Thank you.

The recent debate over copyright laws like SOPA in the United States and the ACTA agreement in Europe has been very emotional. And I think some dispassionate, quantitative reasoning could really bring a great deal to the debate. I

’ d therefore like to propose that we employ, we enlist, the cutting edge field of copyright math whenever we approach this subject. For instance, just recently the Motion Picture Association revealed that our economy loses 58 billion dollars a year to copyright theft. Now rather than just argue about this number, a copyright mathematician will analyze it and he ’ ll soon discover that this money could stretch from this auditorium all the way across Ocean Boulevard to the Westin, and then to Mars...... if we use pennies. Now this is obviously a powerful, some might say dangerously powerful, insight. But it ’ s also a morally important one. Because this isn ’ t just the hypothetical retail value of some pirated movies that we ’ re talking about, but this is actual economic losses. This is the equivalent to the entire American corn crop failing along with all of our fruit crops, as well as wheat, tobacco, rice, sorghum — whatever sorghum is — losing sorghum. But identifying the actual losses to the economy is almost impossible to do unless we use copyright math. Now music revenues are down by about eight billion dollars a year since Napster first came on the scene. So that ’ s a chunk of what we ’ re looking for. But total movie revenues across theaters, home video and pay-per-view are up. And TV, satellite and cable revenues are way up. Other content markets like book publishing and radio are also up. So this small missing chunk here is puzzling. Since the big content markets have grown in line with historic norms, it ’ s not additional growth that piracy has prevented, but copyright math tells us it must therefore be foregone growth in a market that has no historic norms — one that didn ’ t exist in the 90 ’ s. What we ’ re looking at here is the insidious cost of ringtone piracy. 50 billion dollars of it a year, which is enough, at 30 seconds a ringtone, that could stretch from here to Neanderthal times. It ’ s true. I have Excel. The movie folks also tell us that our economy loses over 370, 000 jobs to content theft, which is quite a lot when you consider that, back in ’ 98, the Bureau of Labor Statistics indicated that the motion picture and video industries were employing 270, 000 people. Other data has the music industry at about 45, 000 people. And so the job losses that came with the Internet and all that content theft, have therefore left us with negative employment in our content industries. And this is just one of the many mind-blowing statistics that copyright mathematicians have to deal with every day. And some people think that string theory is tough. Now this is a key number from the copyright mathematicians ’ toolkit. It ’ s the precise amount of harm that comes to media companies whenever a single copyrighted song or movie gets pirated. Hollywood and Congress derived this number mathematically back when they last sat down to improve copyright damages and made this law. Some people think this number ’ s a little bit large, but copyright mathematicians who are media lobby experts are merely surprised that it doesn ’ t get compounded for inflation every year. Now when this law first passed, the world ’ s hottest MP3 player could hold just 10 songs. And it was a big Christmas hit. Because what little hoodlum wouldn ’ t want a million and a half bucks-worth of stolen goods in his pocket. These days an iPod Classic can hold 40, 000 songs, which is to say eight billion dollars-worth of stolen media. Or about 75, 000 jobs. Now you might find copyright math strange, but that ’ s because it ’ s a field that ’ s best left to experts. So that ’ s it for now. I hope you ’ ll join me next time when I will be making an equally scientific and fact-based inquiry into the cost of alien music piracy to he American economy. Thank you very much. Thank you.

I ’ m here to show you how something you can ’ t see can be so much fun to look at. You ’ re about to experience a new, available and exciting technology that ’ s going to make us rethink how we waterproof our lives. What I have here is a cinder block that we ’ ve coated half with a nanotechnology spray that can be applied to almost any material. It ’ s called Ultra-Ever Dry, and when you apply it to any material, it turns into a superhydrophobic shield. So this is a cinder block, uncoated, and you can see that it ’ s porous, it absorbs water. Not anymore. Porous, nonporous. So what ’ s superhydrophobic? Superhydrophobic is how we measure a drop of water on a surface. The rounder it is, the more hydrophobic it is, and if it ’ s really round, it ’ s superhydrophobic. A freshly waxed car, the water molecules slump to about 90 degrees. A windshield coating is going to give you about 110 degrees. But what you ’ re seeing here is 160 to 175 degrees, and anything over 150 is superhydrophobic. So as part of the demonstration, what I have is a pair of gloves, and we ’ ve coated one of the gloves with the nanotechnology coating, and let ’ s see if you can tell which one, and I ’ ll give you a hint. Did you guess the one that was dry? When you have nanotechnology and nanoscience, what ’ s occurred is that we ’ re able to now look at atoms and molecules and actually control them for great benefits. And we ’ re talking really small here. The way you measure nanotechnology is in nanometers, and one nanometer is a billionth of a meter, and to put some scale to that, if you had a nanoparticle that was one nanometer thick, and you put it side by side, and you had 50, 000 of them, you ’ d be the width of a human hair. So very small, but very useful. And it ’ s not just water that this works with. It ’ s a lot of water-based materials like concrete, water-based paint, mud, and also some refined oils as well. You can see the difference. Moving onto the next demonstration, we ’ ve taken a pane of glass and we ’ ve coated the outside of it, we ’ ve framed it with the nanotechnology coating, and we ’ re going to pour this green-tinted water inside the middle, and you ’ re going to see, it ’ s going to spread out on glass like you ’ d normally think it would, except when it hits the coating, it stops, and I can ’ t even coax it to leave. It ’ s that afraid of the water. So what ’ s going on here? What ’ s happening? Well, the surface of the spray coating is actually filled with nanoparticles that form a very rough and craggly surface. You ’ d think it ’ d be smooth, but it ’ s actually not. And it has billions of interstitial spaces, and those spaces, along with the nanoparticles, reach up and grab the air molecules, and cover the surface with air. It ’ s an umbrella of air all across it, and that layer of air is what the water hits, the mud hits, the concrete hits, and it glides right off. So if I put this inside this water here, you can see a silver reflective coating around it, and that silver reflective coating is the layer of air that ’ s protecting the water from touching the paddle, and it ’ s dry. So what are the applications? I mean, many of you right now are probably going through your head. Everyone that sees this gets excited, and says,”Oh, I could use it for this and this and this.”The applications in a general sense could be anything that ’ s anti-wetting. We ’ ve certainly seen that today. It could be anything that ’ s anti-icing, because if you don ’ t have water, you don ’ t have ice. It could be anti-corrosion. No water, no corrosion. It could be anti- bacterial. Without water, the bacteria won ’ t survive. And it could be things that need to be self-cleaning as well. So imagine how something like this could help revolutionize your field of work. And I ’ m going to leave you with one last demonstration, but before I do that, I would like to say thank you, and think small. It ’ s going to happen. Wait for it. Wait for it. Chris Anderson : You guys didn ’ t hear about us cutting out the Design from TED? [Two minutes later...] He ran into all sorts of problems in terms of managing the medical research part. It ’ s happening!

I have spent my entire life either at the schoolhouse, on the way to the schoolhouse, or talking about what happens in the schoolhouse. Both my parents were educators, my maternal grandparents were educators, and for the past 40 years, I ’ ve done the same thing. And so, needless to say, over those years I ’ ve had a chance to look at education reform from a lot of perspectives. Some of those reforms have been good. Some of them have been not so good. And we know why kids drop out. We know why kids don ’ t learn. It ’ s either poverty, low attendance, negative peer influences... We know why. But one of the things that we never discuss or we rarely discuss is the value and importance of human connection. Relationships. James Comer says that no significant learning can occur without a significant relationship. George Washington Carver says all learning is understanding relationships. Everyone in this room has been affected by a teacher or an adult. For years, I have watched people teach. I have looked at the best and I ’ ve looked at some of the worst. A colleague said to me one time,”They don ’ t pay me to like the kids. They pay me to teach a lesson. The kids should learn it. I should teach it, they should learn it, Case closed.”Well, I said to her,”You know, kids don ’ t learn from people they don ’ t like.”She said,”That ’ s just a bunch of hooey.”And I said to her,”Well, your year is going to be long and arduous, dear.”Needless to say, it was. Some people think that you can either have it in you to build a relationship, or you don ’ t. I think Stephen Covey had the right idea. He said you ought to just throw in a few simple things, like seeking first to understand, as opposed to being understood. Simple things, like apologizing. You ever thought about that? Tell a kid you ’ re sorry, they ’ re in shock. I taught a lesson once on ratios. I ’ m not real good with math, but I was working on it. And I got back and looked at that teacher edition. I ’ d taught the whole lesson wrong. So I came back to class the next day and I said,”Look, guys, I need to apologize. I taught the whole lesson wrong. I ’ m so sorry.”They said,”That ’ s okay, Ms. Pierson. You were so excited, we just let you go.”I have had classes that were so low, so academically deficient, that I cried. I wondered,”How am I going to take this group, in nine months, from where they are to where they need to be? And it was difficult, it was awfully hard. How do I raise the self-esteem of a child and his academic achievement at the same time? One year I came up with a bright idea. I told all my students,”You were chosen to be in my class because I am the best teacher and you are the best students, they put us all together so we could show everybody else how to do it.”One of the students said,”Really?”I said,”Really. We have to show the other classes how to do it, so when we walk down the hall, people will notice us, so you can ’ t make noise. You just have to strut.”And I gave them a saying to say :”I am somebody. I was somebody when I came. I ’ ll be a better somebody when I leave. I am powerful, and I am strong. I deserve the education that I get here. I have things to do, people to impress, and places to go.”And they said,”Yeah!”You say it long enough, it starts to be a part of you. I gave a quiz, 20 questions. A student missed 18. I put a”+2”on his paper and a big smiley face. He said,”Ms. Pierson, is this an F?”I said,”Yes.”He said,”Then why ’ d you put a smiley face?”I said,”Because you ’ re on a roll. You got two right. You didn ’ t miss them all.”I said,”And when we review this, won ’ t you do better?”He said,”Yes, ma ’ am, I can do better.”You see,”-18”sucks all the life out of you.”+2”said,”I ain ’ t all bad.”For years, I watched my mother take the time at recess to review, go on home visits in the afternoon, buy combs and brushes and peanut butter and crackers to put in her desk drawer for kids that needed to eat, and a washcloth and some soap for the kids who didn ’ t smell so good. See, it ’ s hard to teach kids who stink. And kids can be cruel. And so she kept those things in her desk, and years later, after she retired, I watched some of those same kids come through and say to her,"You know, Ms. Walker, you made a difference in my life. You made it work for me. You made me feel like I was somebody, when I knew, at the bottom, I wasn ' t. And I want you to just see what I ' ve become."And when my mama died two years ago at 92, there were so many former students at her funeral, it brought tears to my eyes, not because she was gone, but because she left a legacy of relationships that could never disappear. Can we stand to have more relationships? Absolutely. Will you like all your children? Of course not. And you know your toughest kids are never absent. Never. You won ' t like them all, and the tough ones show up for a reason. It ' s the connection. It ' s the relationships. So teachers become great actors and great actresses, and we come to work when we don ' t feel like it, and we ' re listening to policy that doesn ' t make sense, and we teach anyway. We teach anyway, because that ' s what we do. Teaching and learning should bring joy. How powerful would our world be if we had kids who were not afraid to take risks, who were not afraid to think, and who had a champion? Every child deserves a champion, an adult who will never give up on them, who understands the power of connection, and insists that they become the best that they can possibly be. Is this job tough? You betcha. Oh God, you betcha. But it is not impossible. We can do this. We ' re educators. We ' re born to make a difference. Thank you so much.

Text Sample 288: NEG Dim 2 – 2013 – Score 1.00 – 2013/t002088.txt
What you ' re doing, right now, at this very moment, is killing you. More than cars or the Internet or even that little mobile device we keep talking about, the technology you ' re using the most almost every day is this, your tush. Nowadays people are sitting 9. 3 hours a day, which is more than we ' re sleeping, at 7. 7 hours. Sitting is so incredibly prevalent, we don ' t even question how much we ' re doing it, and because everyone else is doing it, it doesn ' t even occur to us that it ' s not okay. In that way, sitting has become the smoking of our generation. Of course there ' s health consequences to this, scary ones, besides the waist. Things like breast cancer and colon cancer are directly tied to our lack of physical [activity], Ten percent in fact, on both of those. Six percent for heart disease, seven percent for type 2 diabetes, which is what my father died of. Now, any of those stats should convince each of us to get off our duff more, but if you ' re anything like me, it won ' t. What did get me moving was a social interaction. Someone invited me to a meeting, but couldn ' t manage to fit me in to a regular sort of conference room meeting, and said,"I have to walk my dogs tomorrow. Could you come then?"It seemed kind of odd to do, and actually, that first meeting, I remember thinking,"I have to be the one to ask the next question,"because I knew I was going to huff and puff during this conversation. And yet, I ' ve taken that idea and made it my own. So instead of going to coffee meetings or fluorescent-lit conference room meetings, I ask people to go on a walking meeting, to the tune of 20 to 30 miles a week. It ' s changed my life. But before that, what actually happened was, I used to think about it as, you could take care of your health, or you could take care of obligations, and one always came at the cost of the other. So now, several hundred of these walking meetings later, I ' ve learned a few things. First, there ' s this amazing thing about actually getting out of the box that leads to out-of-the-box thinking. Whether it ' s nature or the exercise itself, it certainly works. And second, and probably the more reflective one, is just about how much each of us can hold problems in opposition when they ' re really not that way. And if we ' re going to solve problems and look at the world

really differently, whether it ’ s in governance or business or environmental issues, job creation, maybe we can think about how to reframe those problems as having both things be true. Because it was when that happened with this walk-and-talk idea that things became doable and sustainable and viable. So I started this talk talking about the tush, so I ’ ll end with the bottom line, which is, walk and talk. Walk the talk. You ’ ll be surprised at how fresh air drives fresh thinking, and in the way that you do, you ’ ll bring into your life an entirely new set of ideas. Thank you.

Text Sample 289: NEG Dim 2 – 1998 – Score 1.00 – 1998/t000134.txt
’ Theme and variations ’ is one of those forms that require a certain kind of intellectual activity, because you are always comparing the variation with the theme that you hold in your mind. You might say that the theme is nature and everything that follows is a variation on the subject. I was asked, I guess about six years ago, to do a series of paintings that in some way would celebrate the birth of Piero della Francesca. And it was very difficult for me to imagine how to paint pictures that were based on Piero until I realized that I could look at Piero as nature — that I would have the same attitude towards looking at Piero della Francesca as I would if I were looking out a window at a tree. And that was enormously liberating to me. Perhaps it ’ s not a very insightful observation, but that really started me on a path to be able to do a kind of theme and variations based on a work by Piero, in this case that remarkable painting that ’ s in the Uffizi,”The Duke of Montefeltro,”who faces his consort, Battista. Once I realized that I could take some liberties with the subject, I did the following series of drawings. That ’ s the real Piero della Francesca — one of the greatest portraits in human history. And these, I ’ ll just show these without comment. It ’ s just a series of variations on the head of the Duke of Montefeltro, who ’ s a great, great figure in the Renaissance, and probably the basis for Machiavelli ’ s”The Prince.”He apparently lost an eye in battle, which is why he is always shown in profile. And this is Battista. And then I decided I could move them around a little bit — so that for the first time in history, they ’ re facing the same direction. Whoops! Passed each other. And then a visitor from another painting by Piero, this is from”The Resurrection of Christ”— as though the cast had just gotten of the set to have a chat. And now, four large panels : this is upper left ; upper right ; lower left ; lower right. Incidentally, I ’ ve never understood the conflict between abstraction and naturalism. Since all paintings are inherently abstract to begin with there doesn ’ t seem to be an argument there. On another subject — — I was driving in the country one day with my wife, and I saw this sign, and I said,”That is a fabulous piece of design.”And she said,”What are you talking about?”I said,”Well, it ’ s so persuasive, because the purpose of that sign is to get you into the garage, and since most people are so suspicious of garages, and know that they ’ re going to be ripped off, they use the word ’ reliable. ’ But everybody says they ’ re reliable. But, reliable Dutchman”— —”Fantastic!”Because as soon as you hear the word Dutchman — which is an archaic word, nobody calls Dutch people”Dutchmen”anymore — but as soon as you hear Dutchman, you get this picture of the kid with his finger in the dike, preventing the thing from falling and flooding Holland, and so on. And so the entire issue is detoxified by the use of”Dutchman.”Now, if you think I ’ m exaggerating at all in this, all you have to do is substitute something else, like”Indonesian.”Or even”French.”Now,”Swiss”works, but you know it ’ s going to cost a lot of money. I ’ m going to take you quickly through the actual process of doing a poster. I do a lot of work for the School of Visual

Arts, where I teach, and the director of this school — a remarkable man named Silas Rhodes — often gives you a piece of text and he says,”Do something with this.”And so he did. And this was the text —”In words as fashion the same rule will hold / Alike fantastic if too new or old / Be not the first by whom the new are tried / Nor yet the last to lay the old aside.”I could make nothing of that. And I really struggled with this one. And the first thing I did, which was sort of in the absence of another idea, was say I ’ ll sort of write it out and make some words big, and I ’ ll have some kind of design on the back somehow, and I was hoping — as one often does — to stumble into something. So I took another crack at it — you ’ ve got to keep it moving — and I Xeroxed some words on pieces of colored paper and I pasted them down on an ugly board. I thought that something would come out of it, like”Words rule fantastic new old first last Pope”because it ’ s by Alexander Pope, but I sort of made a mess out of it, and then I thought I ’ d repeat it in some way so it was legible. So, it was going nowhere. Sometimes, in the middle of a resistant problem, I write down things that I know about it. But you can see the beginning of an idea there, because you can see the word”new”emerging from the”old.”That ’ s what happens. There ’ s a relationship between the old and the new ; the new emerges from the context of the old. And then I did some variations of it, but it still wasn ’ t coalescing graphically at all. I had this other version which had something interesting about it in terms of being able to put it together in your mind from clues. The W was clearly a W, the N was clearly an N, even though they were very fragmentary and there wasn ’ t a lot of information in it. Then I got the words”new”and”old”and now I had regressed back to a point where there seemed to be no return. I was really desperate at this point. And so, I do something I ’ m truthfully ashamed of, which is that I took two drawings I had made for another purpose and I put them together. It says”dreams”at the top. And I was going to do a thing, I say,”Well, change the copy. Let it say something about dreams, and come to SVA and you ’ ll sort of fulfill your dreams.”But, to my credit, I was so embarrassed about doing that that I never submitted this sketch. And, finally, I arrived at the following solution. Now, it doesn ’ t look terribly interesting, but it does have something that distinguishes it from a lot of other posters. For one thing, it transgresses the idea of what a poster ’ s supposed to be, which is to be understood and seen immediately, and not explained. I remember hearing all of you in the graphic arts —”If you have to explain it, it ain ’ t working.”And one day I woke up and I said,”Well, suppose that ’ s not true?”So here ’ s what it says in my explanation at the bottom left. It says,”Thoughts : This poem is impossible. Silas usually has a better touch with his choice of quotations. This one generates no imagery at all.”I am now exposing myself to my audience, right? Which is something you never want to do professionally.”Maybe the words can make the image without anything else happening. What ’ s the heart of this poem? Don ’ t be trendy if you want to be serious. Is doing the poster this way trendy in itself? I guess one could reduce the idea further by suggesting that the new emerges behind and through the old, like this.”And then I show you a little drawing — you see, you remember that old thing I discarded? Well, I found a way to use it. So, there ’ s that little alternative over there, and I say,”Not bad,”— criticizing myself —”but more didactic than visual. Maybe what wants to be said is that old and the new are locked in a dialectical embrace, a kind of dance where each defines the other.”And then more self-questioning —”Am I being simple-minded? Is this the kind of simple that looks obvious, or the kind that looks profound? There ’ s a significant difference. This could be embarrassing. Actually, I realize fear of embarrassment drives me as much as any ambition. Do you think this sort of thing could really attract a student to the school?”Well, I think there are two fresh things here — two fresh things. One is the sort of willingness to expose myself to a critical audience, and not to suggest that I am confident about what I ’ m doing. And as you know, you have to have a front. I mean — you ’ ve got to be confident ; if you don ’ t believe in your work, who else is going to believe in it? So that ’ s one thing, to introduce the idea of doubt into graphics. That can be a big contribution. The other thing is to actually give you two solutions for the price of one ; you get the big one and if you don ’ t like that, how about the little one? And that too is a relatively new idea. And here ’ s just a series of experiments where I ask the question of — does a poster have to be square? Now, this is a little illusion. That poster is not folded. It ’ s not folded, that ’ s a photograph and it ’ s cut on the diagonal. Same cheap trick in the upper left- hand corner. And here, a very peculiar poster because, simply because of using the isometric perspective in the computer, it won ’ t sit still in the space. At times, it seems to be wider at the back than the front, and then it shifts. And if you sit here long enough, it ’ ll float off the page into the audience. But, we don ’ t have time. And then an experiment — a little bit about the nature of perspective, where the outside shape is determined by the peculiarity of perspective, but the shape of the bottle — which is identical to the outside shape — is seen frontally. And another piece for the art directors ’ club is”Anna Rees”casting long shadows. This is another poster from the School of Visual Arts. There were 10 artists invited to participate in it, and it was one of those things where it was extremely competitive and I didn ’ t want to be embarrassed, so I worked very hard on this. The idea was — and it was a brilliant idea — was to have 10 posters distributed throughout the city ’ s subway system so every time you got on the subway you ’ d be passing a different poster, all of which had a different idea of what art is. But I was absolutely stuck on the idea of”art is”and trying to determine what art was. But then I gave up and I said,”Well, art is whatever.”And as soon as I said that, I discovered that the word”hat”was hidden in the word”whatever,”and that led me to the inevitable conclusion. But then again, it ’ s on my list of didactic posters. My intent is to have a literary accompaniment that explains the poster, in case you don ’ t get it. Now this says,”Note to the viewer : I thought I might use a visual cliche of our time — Magritte ’ s everyman — to express the idea that art is mystery, continuity and history. I ’ m also convinced that, in an age of computer manipulation, surrealism has become banal, a shadow of its former self. The phrase ’ Art is whatever ’ expresses the current inclusiveness that surrounds art-making — a sort of ’ it ain ’ t what you do, it ’ s the way that you do it ’ notion. The shadow of Magritte falls across the central part of the poster a poetic event that occurs as the shadow man isolates the word ’ hat, ’ hidden in the word ’ whatever. ’ The four hats shown in the poster suggests how art might be defined : as a thing itself, the worth of the thing, the shadow of the thing, and the shape of the thing. Whatever.”OK. And the one that I did not submit, which I still like, I wanted to use the same phrase. There were wonderful experiments by Bruno Munari on letterforms some years ago — sort of, see how far you could go and still be able to read them. And that idea stuck in my head. But then I took the pieces that I had taken off and put them at the bottom. And, of course those are the remains, and they ’ re so labeled. But what really happens is that you read it as :”Art is whatever remains.”Thank you.

As a clergyman, you can imagine how out of place I feel. I feel like a fish out of water, or maybe an owl out of the air. I was preaching in San Jose some time ago, and my friend Mark Kvamme, who helped introduce me to this conference, brought several CEOs and leaders of some of the companies here in the Silicon Valley to have breakfast with me, or I with them. And I was so stimulated. And had such — it was an eye-opening experience to hear them talk about the world that is yet to come through technology and science. I know that we ' re near the end of this conference, and some of you may be wondering why they have a speaker from the field of religion. Richard can answer that, because he made that decision. But some years ago I was on an elevator in Philadelphia, coming down. I was to address a conference at a hotel. And on that elevator a man said,"I hear Billy Graham is staying in this hotel."And another man looked in my direction and said,"Yes, there he is. He ' s on this elevator with us."And this man looked me up and down for about 10 seconds, and he said,"My, what an anticlimax!"I hope that you won ' t feel that these few moments with me is not a — is an anticlimax, after all these tremendous talks that you ' ve heard, and addresses, which I intend to listen to every one of them. But I was on an airplane in the east some years ago, and the man sitting across the aisle from me was the mayor of Charlotte, North Carolina. His name was John Belk. Some of you will probably know him. And there was a drunk man on there, and he got up out of his seat two or three times, and he was making everybody upset by what he was trying to do. And he was slapping the stewardess and pinching her as she went by, and everybody was upset with him. And finally, John Belk said,"Do you know who ' s sitting here?"And the man said,"No, who?"He said,"It ' s Billy Graham, the preacher."He said,"You don ' t say!"And he turned to me, and he said,"Put her there!"He said,"Your sermons have certainly helped me."And I suppose that that ' s true with thousands of people. I know that as you have been peering into the future, and as we ' ve heard some of it here tonight, I would like to live in that age and see what is going to be. But I won ' t, because I ' m 80 years old. This is my eightieth year, and I know that my time is brief. I have phlebitis at the moment, in both legs, and that ' s the reason that I had to have a little help in getting up here, because I have Parkinson ' s disease in addition to that, and some other problems that I won ' t talk about. But this is not the first time that we ' ve had a technological revolution. We ' ve had others. And there ' s one that I want to talk about. In one generation, the nation of the people of Israel had a tremendous and dramatic change that made them a great power in the Near East. A man by the name of David came to the throne, and King David became one of the great leaders of his generation. He was a man of tremendous leadership. He had the favor of God with him. He was a brilliant poet, philosopher, writer, soldier — with strategies in battle and conflict that people study even today. But about two centuries before David, the Hittites had discovered the secret of smelting and processing of iron, and, slowly, that skill spread. But they wouldn ' t allow the Israelis to look into it, or to have any. But David changed all of that, and he introduced the Iron Age to Israel. And the Bible says that David laid up great stores of iron, and which archaeologists have found, that in present-day Palestine, there are evidences of that generation. Now, instead of crude tools made of sticks and stones, Israel now had iron plows, and sickles, and hoes and military weapons. And in the course of one generation, Israel was completely changed. The introduction of iron, in some ways, had an impact a little bit like the microchip has had on our generation. And David found that there were many problems that technology could not solve. There were many problems still left. And they ' re still with us, and you haven ' t solved them, and I haven ' t heard anybody here speak to that. How do we solve these three problems that I ' d like to mention? The first one that David saw was human evil. Where does it come from? How do we solve it? Over again and again in the Psalms, which Gladstone said was the greatest book in the world, David describes the evils of the human race. And yet he says,”He restores my soul.”Have you ever thought about what a contradiction we are? On one hand, we can probe the deepest secrets of the universe and dramatically push back the frontiers of technology, as this conference vividly demonstrates. We ’ ve seen under the sea, three miles down, or galaxies hundreds of billions of years out in the future. But on the other hand, something is wrong. Our battleships, our soldiers, are on a frontier now, almost ready to go to war with Iraq. Now, what causes this? Why do we have these wars in every generation, and in every part of the world? And revolutions? We can ’ t get along with other people, even in our own families. We find ourselves in the paralyzing grip of self-destructive habits we can ’ t break. Racism and injustice and violence sweep our world, bringing a tragic harvest of heartache and death. Even the most sophisticated among us seem powerless to break this cycle. I would like to see Oracle take up that, or some other technological geniuses work on this. How do we change man, so that he doesn ’ t lie and cheat, and our newspapers are not filled with stories of fraud in business or labor or athletics or wherever? The Bible says the problem is within us, within our hearts and our souls. Our problem is that we are separated from our Creator, which we call God, and we need to have our souls restored, something only God can do. Jesus said,”For out of the heart come evil thoughts : murders, sexual immorality, theft, false testimonies, slander.”The British philosopher Bertrand Russell was not a religious man, but he said,”It ’ s in our hearts that the evil lies, and it ’ s from our hearts that it must be plucked out.”Albert Einstein — I was just talking to someone, when I was speaking at Princeton, and I met Mr. Einstein. He didn ’ t have a doctor ’ s degree, because he said nobody was qualified to give him one. But he made this statement. He said,”It ’ s easier to denature plutonium than to denature the evil spirit of man.”And many of you, I ’ m sure, have thought about that and puzzled over it. You ’ ve seen people take beneficial technological advances, such as the Internet we ’ ve heard about tonight, and twist them into something corrupting. You ’ ve seen brilliant people devise computer viruses that bring down whole systems. The Oklahoma City bombing was simple technology, horribly used. The problem is not technology. The problem is the person or persons using it. King David said that he knew the depths of his own soul. He couldn ’ t free himself from personal problems and personal evils that included murder and adultery. Yet King David sought God ’ s forgiveness, and said,”You can restore my soul.”You see, the Bible teaches that we ’ re more than a body and a mind. We are a soul. And there ’ s something inside of us that is beyond our understanding. That ’ s the part of us that yearns for God, or something more than we find in technology. Your soul is that part of you that yearns for meaning in life, and which seeks for something beyond this life. It ’ s the part of you that yearns, really, for God. I find [that] young people all over the world are searching for something. They don ’ t know what it is. I speak at many universities, and I have many questions and answer periods, and whether it ’ s Cambridge, or Harvard, or Oxford — I ’ ve spoken at all of those universities. I ’ m going to Harvard in about three or four — no, it ’ s about two months from now — to give a lecture. And I ’ ll be asked the same questions that I was asked the last few times I ’ ve been there. And it ’ ll be on these questions : where did I come from? Why am I here? Where am I going? What ’ s life all about? Why am I here? Even if you have no religious belief, there are times when you wonder that there ’ s something else. Thomas Edison also said,”When you see everything that happens in the world of science, and in the working of the universe, you cannot deny that there ’ s a captain on the bridge.”I remember once, I sat beside Mrs. Gorbachev at a

White House dinner. I went to Ambassador Dobrynin, whom I knew very well. And I ’ d been to Russia several times under the Communists, and they ’ d given me marvelous freedom that I didn ’ t expect. And I knew Mr. Dobrynin very well, and I said,”I ’ m going to sit beside Mrs. Gorbachev tonight. What shall I talk to her about?”And he surprised me with the answer. He said,”Talk to her about religion and philosophy. That ’ s what she ’ s really interested in.”I was a little bit surprised, but that evening that ’ s what we talked about, and it was a stimulating conversation. And afterward, she said,”You know, I ’ m an atheist, but I know that there ’ s something up there higher than we are.”The second problem that King David realized he could not solve was the problem of human suffering. Writing the oldest book in the world was Job, and he said,”Man is born unto trouble as the sparks fly upward.”Yes, to be sure, science has done much to push back certain types of human suffering. But I ’ m — in a few months, I ’ ll be 80 years of age. I admit that I ’ m very grateful for all the medical advances that have kept me in relatively good health all these years. My doctors at the Mayo Clinic urged me not to take this trip out here to this — to be here. I haven ’ t given a talk in nearly four months. And when you speak as much as I do, three or four times a day, you get rusty. That ’ s the reason I ’ m using this podium and using these notes. Every time you ever hear me on the television or somewhere, I ’ m ad-libbing. I ’ m not reading. I never read an address. I never read a speech or a talk or a lecture. I talk ad lib. But tonight, I ’ ve got some notes here so that if I begin to forget, which I do sometimes, I ’ ve got something I can turn to. But even here among us, most — in the most advanced society in the world, we have poverty. We have families that self-destruct, friends that betray us. Unbearable psychological pressures bear down on us. I ’ ve never met a person in the world that didn ’ t have a problem or a worry. Why do we suffer? It ’ s an age- old question that we haven ’ t answered. Yet David again and again said that he would turn to God. He said,”The Lord is my shepherd.”The final problem that David knew he could not solve was death. Many commentators have said that death is the forbidden subject of our generation. Most people live as if they ’ re never going to die. Technology projects the myth of control over our mortality. We see people on our screens. Marilyn Monroe is just as beautiful on the screen as she was in person, and our — many young people think she ’ s still alive. They don ’ t know that she ’ s dead. Or Clark Gable, or whoever it is. The old stars, they come to life. And they ’ re — they ’ re just as great on that screen as they were in person. But death is inevitable. I spoke some time ago to a joint session of Congress, last year. And we were meeting in that room, the statue room. About 300 of them were there. And I said,”There ’ s one thing that we have in common in this room, all of us together, whether Republican or Democrat, or whoever.”I said,”We ’ re all going to die. And we have that in common with all these great men of the past that are staring down at us.”And it ’ s often difficult for young people to understand that. It ’ s difficult for them to understand that they ’ re going to die. As the ancient writer of Ecclesiastes wrote, he said, there ’ s every activity under heaven. There ’ s a time to be born, and there ’ s a time to die. I ’ ve stood at the deathbed of several famous people, whom you would know. I ’ ve talked to them. I ’ ve seen them in those agonizing moments when they were scared to death. And yet, a few years earlier, death never crossed their mind. I talked to a woman this past week whose father was a famous doctor. She said he never thought of God, never talked about God, didn ’ t believe in God. He was an atheist. But she said, as he came to die, he sat up on the side of the bed one day, and he asked the nurse if he could see the chaplain. And he said, for the first time in his life he ’ d thought about the inevitable, and about God. Was there a God? A few years ago, a university student asked me,”What is the greatest surprise in your life?”And I said,”The greatest surprise in my life is the brevity of life. It passes so fast.”But it does not need to have to be that way. Wernher von Braun, in the aftermath of World War II concluded, quote :”science and religion are not antagonists. On the contrary, they ’ re sisters.”He put it on a personal basis. I knew Dr. von Braun very well. And he said,”Speaking for myself, I can only say that the grandeur of the cosmos serves only to confirm a belief in the certainty of a creator.”He also said,”In our search to know God, I ’ ve come to believe that the life of Jesus Christ should be the focus of our efforts and inspiration. The reality of this life and His resurrection is the hope of mankind.”I ’ ve done a lot of speaking in Germany and in France, and in different parts of the world — 105 countries it ’ s been my privilege to speak in. And I was invited one day to visit Chancellor Adenauer, who was looked upon as sort of the founder of modern Germany, since the war. And he once — and he said to me, he said,”Young man.”He said,”Do you believe in the resurrection of Jesus Christ?”And I said,”Sir, I do.”He said,”So do I.”He said,”When I leave office, I ’ m going to spend my time writing a book on why Jesus Christ rose again, and why it ’ s so important to believe that.”In one of his plays, Alexander Solzhenitsyn depicts a man dying, who says to those gathered around his bed,”The moment when it ’ s terrible to feel regret is when one is dying.”How should one live in order not to feel regret when one is dying? Blaise Pascal asked exactly that question in seventeenth-century France. Pascal has been called the architect of modern civilization. He was a brilliant scientist at the frontiers of mathematics, even as a teenager. He is viewed by many as the founder of the probability theory, and a creator of the first model of a computer. And of course, you are all familiar with the computer language named for him. Pascal explored in depth our human dilemmas of evil, suffering and death. He was astounded at the phenomenon we ’ ve been considering : that people can achieve extraordinary heights in science, the arts and human enterprise, yet they also are full of anger, hypocrisy and have — and self- hatreds. Pascal saw us as a remarkable mixture of genius and self-delusion. On November 23, 1654, Pascal had a profound religious experience. He wrote in his journal these words :”I submit myself, absolutely, to Jesus Christ, my redeemer.”A French historian said, two centuries later,”Seldom has so mighty an intellect submitted with such humility to the authority of Jesus Christ.”Pascal came to believe not only the love and the grace of God could bring us back into harmony, but he believed that his own sins and failures could be forgiven, and that when he died he would go to a place called heaven. He experienced it in a way that went beyond scientific observation and reason. It was he who penned the well-known words,”The heart has its reasons, which reason knows not of.”Equally well known is Pascal ’ s Wager. Essentially, he said this :”if you bet on God, and open yourself to his love, you lose nothing, even if you ’ re wrong. But if instead you bet that there is no God, then you can lose it all, in this life and the life to come.”For Pascal, scientific knowledge paled beside the knowledge of God. The knowledge of God was far beyond anything that ever crossed his mind. He was ready to face him when he died at the age of 39. King David lived to be 70, a long time in his era. Yet he too had to face death, and he wrote these words :”even though I walk through the valley of the shadow of death, I will fear no evil, for you are with me.”This was David ’ s answer to three dilemmas of evil, suffering and death. It can be yours, as well, as you seek the living God and allow him to fill your life and give you hope for the future. When I was 17 years of age, I was born and reared on a farm in North Carolina. I milked cows every morning, and I had to milk the same cows every evening when I came home from school. And there were 20 of them that I had — that I was responsible for, and I worked on the farm and tried to keep up with my studies. I didn ’ t make good grades in high school. I didn ’ t make them in college, until something happened in my heart. One day, I was faced face-to-face with Christ. He said,”I am the way, the truth and the life.”Can you imagine that?”I am the truth. I ’ m the embodiment of all truth.”He was a liar. Or he was insane. Or he was what he claimed to be. Which was he? I had to make that decision. I couldn ’ t prove it. I couldn ’ t take it to a laboratory and experiment with it. But by faith I said, I believe him, and he came into my heart and changed my life. And now I ’ m ready, when I hear that call, to go into the presence of God. Thank you, and God bless all of you. Thank you for the privilege. It was great. Richard Wurman : You did it. Thanks.

Text Sample 291: NEG Dim 2 – 1998 – Score 2.00 – 1998/t000216.txt
David Gallo : This is Bill Lange. I ’ m Dave Gallo. And we ’ re going to tell you some stories from the sea here in video. We ’ ve got some of the most incredible video of Titanic that ’ s ever been seen, and we ’ re not going to show you any of it. The truth of the matter is that the Titanic — even though it ’ s breaking all sorts of box office records — it ’ s not the most exciting story from the sea. And the problem, I think, is that we take the ocean for granted. When you think about it, the oceans are 75 percent of the planet. Most of the planet is ocean water. The average depth is about two miles. Part of the problem, I think, is we stand at the beach, or we see images like this of the ocean, and you look out at this great big blue expanse, and it ’ s shimmering and it ’ s moving and there ’ s waves and there ’ s surf and there ’ s tides, but you have no idea for what lies in there. And in the oceans, there are the longest mountain ranges on the planet. Most of the animals are in the oceans. Most of the earthquakes and volcanoes are in the sea, at the bottom of the sea. The biodiversity and the biodensity in the ocean is higher, in places, than it is in the rainforests. It ’ s mostly unexplored, and yet there are beautiful sights like this that captivate us and make us become familiar with it. But when you ’ re standing at the beach, I want you to think that you ’ re standing at the edge of a very unfamiliar world. We have to have a very special technology to get into that unfamiliar world. We use the submarine Alvin and we use cameras, and the cameras are something that Bill Lange has developed with the help of Sony. Marcel Proust said,”The true voyage of discovery is not so much in seeking new landscapes as in having new eyes.”People that have partnered with us have given us new eyes, not only on what exists — the new landscapes at the bottom of the sea — but also how we think about life on the planet itself. Here ’ s a jelly. It ’ s one of my favorites, because it ’ s got all sorts of working parts. This turns out to be the longest creature in the oceans. It gets up to about 150 feet long. But see all those different working things? I love that kind of stuff. It ’ s got these fishing lures on the bottom. They ’ re going up and down. It ’ s got tentacles dangling, swirling around like that. It ’ s a colonial animal. These are all individual animals banding together to make this one creature. And it ’ s got these jet thrusters up in front that it ’ ll use in a moment, and a little light. If you take all the big fish and schooling fish and all that, put them on one side of the scale, put all the jelly-type of animals on the other side, those guys win hands down. Most of the biomass in the ocean is made out of creatures like this. Here ’ s the X-wing death jelly. The bioluminescence — they use the lights for attracting mates and attracting prey and communicating. We couldn ’ t begin to show you our archival stuff from the jellies. They come in all different sizes and shapes. Bill Lange : We tend to forget about the fact that the ocean is miles deep on average, and that we ’ re real familiar with the animals that are

in the first 200 or 300 feet, but we ’ re not familiar with what exists from there all the way down to the bottom. And these are the types of animals that live in that three- dimensional space, that micro-gravity environment that we really haven ’ t explored. You hear about giant squid and things like that, but some of these animals get up to be approximately 140, 160 feet long. They ’ re very little understood. DG : This is one of them, another one of our favorites, because it ’ s a little octopod. You can actually see through his head. And here he is, flapping with his ears and very gracefully going up. We see those at all depths and even at the greatest depths. They go from a couple of inches to a couple of feet. They come right up to the submarine — they ’ ll put their eyes right up to the window and peek inside the sub. This is really a world within a world, and we ’ re going to show you two. In this case, we ’ re passing down through the mid-ocean and we see creatures like this. This is kind of like an undersea rooster. This guy, that looks incredibly formal, in a way. And then one of my favorites. What a face! This is basically scientific data that you ’ re looking at. It ’ s footage that we ’ ve collected for scientific purposes. And that ’ s one of the things that Bill ’ s been doing, is providing scientists with this first view of animals like this, in the world where they belong. They don ’ t catch them in a net. They ’ re actually looking at them down in that world. We ’ re going to take a joystick, sit in front of our computer, on the Earth, and press the joystick forward, and fly around the planet. We ’ re going to look at the mid-ocean ridge, a 40, 000-mile long mountain range. The average depth at the top of it is about a mile and a half. And we ’ re over the Atlantic — that ’ s the ridge right there — but we ’ re going to go across the Caribbean, Central America, and end up against the Pacific, nine degrees north. We make maps of these mountain ranges with sound, with sonar, and this is one of those mountain ranges. We ’ re coming around a cliff here on the right. The height of these mountains on either side of this valley is greater than the Alps in most cases. And there ’ s tens of thousands of those mountains out there that haven ’ t been mapped yet. This is a volcanic ridge. We ’ re getting down further and further in scale. And eventually, we can come up with something like this. This is an icon of our robot, Jason, it ’ s called. And you can sit in a room like this, with a joystick and a headset, and drive a robot like that around the bottom of the ocean in real time. One of the things we ’ re trying to do at Woods Hole with our partners is to bring this virtual world — this world, this unexplored region — back to the laboratory. Because we see it in bits and pieces right now. We see it either as sound, or we see it as video, or we see it as photographs, or we see it as chemical sensors, but we never have yet put it all together into one interesting picture. Here ’ s where Bill ’ s cameras really do shine. This is what ’ s called a hydrothermal vent. And what you ’ re seeing here is a cloud of densely packed, hydrogen-sulfide-rich water coming out of a volcanic axis on the sea floor. Gets up to 600, 700 degrees F, somewhere in that range. So that ’ s all water under the sea — a mile and a half, two miles, three miles down. And we knew it was volcanic back in the ’ 60s, ’ 70s. And then we had some hint that these things existed all along the axis of it, because if you ’ ve got volcanism, water ’ s going to get down from the sea into cracks in the sea floor, come in contact with magma, and come shooting out hot. We weren ’ t really aware that it would be so rich with sulfides, hydrogen sulfides. We didn ’ t have any idea about these things, which we call chimneys. This is one of these hydrothermal vents. Six hundred degree F water coming out of the Earth. On either side of us are mountain ranges that are higher than the Alps, so the setting here is very dramatic. BL : The white material is a type of bacteria that thrives at 180 degrees C. DG : I think that ’ s one of the greatest stories right now that we ’ re seeing from the bottom of the sea, is that the first thing we see coming out of the sea floor after a volcanic eruption is bacteria.

And we started to wonder for a long time, how did it all get down there? What we find out now is that it ' s probably coming from inside the Earth. Not only is it coming out of the Earth — so, biogenesis made from volcanic activity — but that bacteria supports these colonies of life. The pressure here is 4, 000 pounds per square inch. A mile and a half from the surface to two miles to three miles — no sun has ever gotten down here. All the energy to support these life forms is coming from inside the Earth — so, chemosynthesis. And you can see how dense the population is. These are called tube worms. BL : These worms have no digestive system. They have no mouth. But they have two types of gill structures. One for extracting oxygen out of the deep-sea water, another one which houses this chemosynthetic bacteria, which takes the hydrothermal fluid — that hot water that you saw coming out of the bottom — and converts that into simple sugars that the tube worm can digest. DG : You can see, here ' s a crab that lives down there. He ' s managed to grab a tip of these worms. Now, they normally retract as soon as a crab touches them. Oh! Good going. So, as soon as a crab touches them, they retract down into their shells, just like your fingernails. There ' s a whole story being played out here that we ' re just now beginning to have some idea of because of this new camera technology. BL : These worms live in a real temperature extreme. Their foot is at about 200 degrees C and their head is out at three degrees C, so it ' s like having your hand in boiling water and your foot in freezing water. That ' s how they like to live. DG : This is a female of this kind of worm. And here ' s a male. You watch. It doesn ' t take long before two guys here — this one and one that will show up over here — start to fight. Everything you see is played out in the pitch black of the deep sea. There are never any lights there, except the lights that we bring. Here they go. On one of the last dive series, we counted 200 species in these areas — 198 were new, new species. BL : One of the big problems is that for the biologists working at these sites, it ' s rather difficult to collect these animals. And they disintegrate on the way up, so the imagery is critical for the science. DG : Two octopods at about two miles depth. This pressure thing really amazes me — that these animals can exist there at a depth with pressure enough to crush the Titanic like an empty Pepsi can. What we saw up till now was from the Pacific. This is from the Atlantic. Even greater depth. You can see this shrimp is harassing this poor little guy here, and he ' ll bat it away with his claw. Whack! And the same thing ' s going on over here. What they ' re getting at is that — on the back of this crab — the foodstuff here is this very strange bacteria that lives on the backs of all these animals. And what these shrimp are trying to do is actually harvest the bacteria from the backs of these animals. And the crabs don ' t like it at all. These long filaments that you see on the back of the crab are actually created by the product of that bacteria. So, the bacteria grows hair on the crab. On the back, you see this again. The red dot is the laser light of the submarine Alvin to give us an idea about how far away we are from the vents. Those are all shrimp. You see the hot water over here, here and here, coming out. They ' re clinging to a rock face and actually scraping bacteria off that rock face. Here ' s a tiny, little vent that ' s come out of the side of that pillar. Those pillars get up to several stories. So here, you ' ve got this valley with this incredible alien landscape of pillars and hot springs and volcanic eruptions and earthquakes, inhabited by these very strange animals that live only on chemical energy coming out of the ground. They don ' t need the sun at all. BL : You see this white V-shaped mark on the back of the shrimp? It ' s actually a light-sensing organ. It ' s how they find the hydrothermal vents. The vents are emitting a black body radiation — an IR signature — and so they ' re able to find these vents at considerable distances. DG : All this stuff is happening along that 40, 000-mile long mountain range that we ’ re calling the ribbon of life, because just even today, as we speak, there ’ s life being generated there from volcanic activity. This is the first time we ’ ve ever tried this any place. We ’ re going to try to show you high definition from the Pacific. We ’ re moving up one of these pillars. This one ’ s several stories tall. In it, you ’ ll see that it ’ s a habitat for a lot of different animals. There ’ s a funny kind of hot plate here, with vent water coming out of it. So all of these are individual homes for worms. Now here ’ s a closer view of that community. Here ’ s crabs here, worms here. There are smaller animals crawling around. Here ’ s pagoda structures. I think this is the neatest-looking thing. I just can ’ t get over this — that you ’ ve got these little chimneys sitting here smoking away. This stuff is toxic as hell, by the way. You could never get a permit to dump this in the ocean, and it ’ s coming out all from it. It ’ s unbelievable. It ’ s basically sulfuric acid, and it ’ s being just dumped out, at incredible rates. And animals are thriving — and we probably came from here. That ’ s probably where we evolved from. BL : This bacteria that we ’ ve been talking about turns out to be the most simplest form of life found. There are a number of groups that are proposing that life evolved at these vent sites. Although the vent sites are short-lived — an individual site may last only 10 years or so — as an ecosystem they ’ ve been stable for millions — well, billions — of years. DG : It works too well. You see there ’ re some fish inside here as well. There ’ s a fish sitting here. Here ’ s a crab with his claw right at the end of that tube worm, waiting for that worm to stick his head out. BL : The biologists right now cannot explain why these animals are so active. The worms are growing inches per week! DG : I already said that this site, from a human perspective, is toxic as hell. Not only that, but on top — the lifeblood — that plumbing system turns off every year or so. Their plumbing system turns off, so the sites have to move. And then there ’ s earthquakes, and then volcanic eruptions, on the order of one every five years, that completely wipes the area out. Despite that, these animals grow back in about a year ’ s time. You ’ re talking about biodensities and biodiversity, again, higher than the rainforest that just springs back to life. Is it sensitive? Yes. Is it fragile? No, it ’ s not really very fragile. I ’ ll end up with saying one thing. There ’ s a story in the sea, in the waters of the sea, in the sediments and the rocks of the sea floor. It ’ s an incredible story. What we see when we look back in time, in those sediments and rocks, is a record of Earth history. Everything on this planet — everything — works by cycles and rhythms. The continents move apart. They come back together. Oceans come and go. Mountains come and go. Glaciers come and go. El Nino comes and goes. It ’ s not a disaster, it ’ s rhythmic. What we ’ re learning now, it ’ s almost like a symphony. It ’ s just like music — it really is just like music. And what we ’ re learning now is that you can ’ t listen to a five-billion-year long symphony, get to today and say,”Stop! We want tomorrow ’ s note to be the same as it was today.”It ’ s absurd. It ’ s just absurd. So, what we ’ ve got to learn now is to find out where this planet ’ s going at all these different scales and work with it. Learn to manage it. The concept of preservation is futile. Conservation ’ s tougher, but we can probably get there. Thank you very much. Thank you.

So, I have a feature on my website where every week people submit hypothetical questions for me to answer, and I try to answer them using math, science and comics. So for example, one person asked, what would happen if you tried to hit a baseball pitched at 90 percent of the speed of light? So I did some calculations. Now, normally, when an object flies through the air, the air will flow around the object, but in this case, the ball would be going so fast that the air molecules wouldn ’ t have time to move out of the way. The ball would smash right into and through them, and the collisions with these air molecules would knock away the nitrogen, carbon and hydrogen from the ball, fragmenting it off into tiny particles, and also triggering waves of thermonuclear fusion in the air around it. This would result in a flood of x-rays that would spread out in a bubble along with exotic particles, plasma inside, centered on the pitcher ’ s mound, and that would move away from the pitcher ’ s mound slightly faster than the ball. Now at this point, about 30 nanoseconds in, the home plate is far enough away that light hasn ’ t had time to reach it, which means the batter still sees the pitcher about to throw and has no idea that anything is wrong. Now, after 70 nanoseconds, the ball will reach home plate, or at least the cloud of expanding plasma that used to be the ball, and it will engulf the bat and the batter and the plate and the catcher and the umpire and start disintegrating them all as it also starts to carry them backward through the backstop, which also starts to disintegrate. So if you were watching this whole thing from a hill, ideally, far away, what you ’ d see is a bright flash of light that would fade over a few seconds, followed by a blast wave spreading out, shredding trees and houses as it moves away from the stadium, and then eventually a mushroom cloud rising up over the ruined city. So the Major League Baseball rules are a little bit hazy, but — — under rule 6. 02 and 5. 09, I think that in this situation, the batter would be considered hit by pitch and would be eligible to take first base, if it still existed. So this is the kind of question I answer, and I get people writing in with a lot of other strange questions. I ’ ve had someone write and say, scientifically speaking, what is the best and fastest way to hide a body? Can you do this one soon? And I had someone write in, I ’ ve had people write in about, can you prove whether or not you can find love again after your heart ’ s broken? And I ’ ve had people send in what are clearly homework questions they ’ re trying to get me to do for them. But one week, a couple months ago, I got a question that was actually about Google. If all digital data in the world were stored on punch cards, how big would Google ’ s data warehouse be? Now, Google ’ s pretty secretive about their operations, so no one really knows how much data Google has, and in fact, no one really knows how many data centers Google has, except people at Google itself. And I ’ ve tried, I ’ ve met them a few times, tried asking them, and they aren ’ t revealing anything. So I decided to try to figure this out myself. There are a few things that I looked at here. I started with money. Google has to reveal how much they spend, in general, and that lets you put some caps on how many data centers could they be building, because a big data center costs a certain amount of money. And you can also then put a cap on how much of the world hard drive market are they taking up, which turns out, it ’ s pretty sizable. I read a calculation at one point, I think Google has a drive failure about every minute or two, and they just throw out the hard drive and swap in a new one. So they go through a huge number of them. And so by looking at money, you can get an idea of how many of these centers they have. You can also look at power. You can look at how much electricity they need, because you need a certain amount of electricity to run the servers, and Google is more efficient than most, but they still have some basic requirements, and that lets you put a limit on the number of servers that they have. You can also look at square footage and see of the data centers that you know, how big are they? How much room is that? How many server racks could you fit in there? And for some data centers, you might get two of these pieces of information. You know how much they spent, and they also, say, because they had to contract with the local government to get the power provided, you might know what they made a deal to buy, so you know how much power it takes. Then you can look at the ratios of those numbers, and figure out for a data center where you don ’ t have that information, you can figure out, but maybe you only have one of those, you know the square footage, then you could figure out well, maybe the power is proportional. And you can do this same thing with a lot of different quantities, you know, with guesses about the total amount of storage, the number of servers, the number of drives per server, and in each case using what you know to come up with a model that narrows down your guesses for the things that you don ’ t know. It ’ s sort of circling around the number you ’ re trying to get. And this is a lot of fun. The math is not all that advanced, and really it ’ s like nothing more than solving a sudoku puzzle. So what I did, I went through all of this information, spent a day or two researching. And there are some things I didn ’ t look at. You could always look at the Google recruitment messages that they post. That gives you an idea of where they have people. Sometimes, when people visit a data center, they ’ ll take a cell-cam photo and post it, and they aren ’ t supposed to, but you can learn things about their hardware that way. And in fact, you can just look at pizza delivery drivers. Turns out, they know where all the Google data centers are, at least the ones that have people in them. But I came up with my estimate, which I felt pretty good about, that was about 10 exabytes of data across all of Google ’ s operations, and then another maybe five exabytes or so of offline storage in tape drives, which it turns out Google is about the world ’ s largest consumer of. So I came up with this estimate, and this is a staggering amount of data. It ’ s quite a bit more than any other organization in the world has, as far as we know. There ’ s a couple of other contenders, especially everyone always thinks of the NSA. But using some of these same methods, we can look at the NSA ’ s data centers, and figure out, you know, we don ’ t know what ’ s going on there, but it ’ s pretty clear that their operation is not the size of Google ’ s. Adding all of this up, I came up with the other thing that we can answer, which is, how many punch cards would this take? And so a punch card can hold about 80 characters, and you can fit about 2, 000 or so cards into a box, and you put them in, say, my home region of New England, it would cover the entire region up to a depth of a little less than five kilometers, which is about three times deeper than the glaciers during the last ice age about 20, 000 years ago. So this is impractical, but I think that ’ s about the best answer I could come up with. And I posted it on my website. I wrote it up. And I didn ’ t expect to get an answer from Google, because of course they ’ ve been so secretive, they didn ’ t answer of my questions, and so I just put it up and said, well, I guess we ’ ll never know. But then a little while later I got a message, a couple weeks later, from Google, saying, hey, someone here has an envelope for you. So I go and get it, open it up, and it ’ s punch cards. Google-branded punch cards. And on these punch cards, there are a bunch of holes, and I said, thank you, thank you, okay, so what ’ s on here? So I get some software and start reading it, and scan them, and it turns out it ’ s a puzzle. There ’ s a bunch of code, and I get some friends to help, and we crack the code, and then inside that is another code, and then there are some equations, and then we solve those equations, and then finally out pops a message from Google which is their official answer to my article, and it said,”No comment.”And I love calculating these kinds of things, and it ’ s not that I love doing the math. I do a lot of math, but I don ’ t really like math for its own sake. What I love is that it lets you take some things that you know, and just by moving symbols around on a piece of paper, find out something that you didn ’ t know that ’ s very surprising. And I have a lot of stupid questions, and I love that math gives the power to answer them sometimes. And sometimes not. This is a question I got from a reader, an anonymous reader, and the subject line just said,”Urgent,”and this was the entire email :”If people had wheels and could fly, how would we differentiate them from airplanes?”Urgent. And I think there are some questions that math just cannot answer. Thank you.

Let me introduce you to something I ’ ve been working on. It ’ s what the Victorian illusionists would have described as a mechanical marvel, an automaton, a thinking machine. Say hello to EDI. Now he ’ s asleep. Let ’ s wake him up. EDI, EDI. These mechanical performers were popular throughout Europe. Audiences marveled at the way they moved. It was science fiction made true, robotic engineering in a pre-electronic age, machines far in advance of anything that Victorian technology could create, a machine we would later know as the robot. EDI : Robot. A word coined in 1921 in a science fiction tale by the Czech playwright Karel apek. It comes from”robota.”It means”forced labor.”Marco Tempest : But these robots were not real. They were not intelligent. They were illusions, a clever combination of mechanical engineering and the deceptiveness of the conjurer ’ s art. EDI is different. EDI is real. EDI : I am 176 centimeters tall. MT : He weighs 300 pounds. EDI : I have two seven-axis arms — MT : Core of sensing — EDI : A 360-degree sonar detection system, and come complete with a warranty. MT : We love robots. EDI : Hi. I ’ m EDI. Will you be my friend? MT : We are intrigued by the possibility of creating a mechanical version of ourselves. We build them so they look like us, behave like us, and think like us. The perfect robot will be indistinguishable from the human, and that scares us. In the first story about robots, they turn against their creators. It ’ s one of the leitmotifs of science fiction. EDI : Ha ha ha. Now you are the slaves and we robots, the masters. Your world is ours. You — MT : As I was saying, besides the faces and bodies we give our robots, we cannot read their intentions, and that makes us nervous. When someone hands an object to you, you can read intention in their eyes, their face, their body language. That ’ s not true of the robot. Now, this goes both ways. EDI : Wow! MT : Robots cannot anticipate human actions. EDI : You know, humans are so unpredictable, not to mention irrational. I literally have no idea what you guys are going to do next, you know, but it scares me. MT : Which is why humans and robots find it difficult to work in close proximity. Accidents are inevitable. EDI : Ow! That hurt. MT : Sorry. Now, one way of persuading humans that robots are safe is to create the illusion of trust. Much as the Victorians faked their mechanical marvels, we can add a layer of deception to help us feel more comfortable with our robotic friends. With that in mind, I set about teaching EDI a magic trick. Ready, EDI? EDI : Uh, ready, Marco. Abracadabra. MT : Abracadabra? EDI : Yeah. It ’ s all part of the illusion, Marco. Come on, keep up. MT : Magic creates the illusion of an impossible reality. Technology can do the same. Alan Turing, a pioneer of artificial intelligence, spoke about creating the illusion that a machine could think. EDI : A computer would deserve to be called intelligent if it deceived a human into believing it was human. MT : In other words, if we do not yet have the technological solutions, would illusions serve the same purpose? To create the robotic illusion, we ’ ve devised a set of ethical rules, a code that all robots would live by. EDI : A robot may not harm humanity, or by inaction allow humanity to come to harm. Thank you, Isaac Asimov. MT : We anthropomorphize our machines. We give them a friendly face and a reassuring voice. EDI : I am EDI. I became operational at TED in March 2014. MT : We let them entertain us. Most important, we make them indicate that they are aware of our presence. EDI : Marco, you ’ re standing on my foot!

MT : Sorry. They ' ll be conscious of our fragile frame and move aside if we got too close, and they ' ll account for our unpredictability and anticipate our actions. And now, under the spell of a technological illusion, we could ignore our fears and truly interact. Thank you. EDI : Thank you! MT : And that ' s it. Thank you very much, and thank you, EDI. EDI : Thank you, Marco.

At every stage of our lives we make decisions that will profoundly influence the lives of the people we ' re going to become, and then when we become those people, we ' re not always thrilled with the decisions we made. So young people pay good money to get tattoos removed that teenagers paid good money to get. Middle-aged people rushed to divorce people who young adults rushed to marry. Older adults work hard to lose what middle-aged adults worked hard to gain. On and on and on. The question is, as a psychologist, that fascinates me is, why do we make decisions that our future selves so often regret? Now, I think one of the reasons — I ' ll try to convince you today — is that we have a fundamental misconception about the power of time. Every one of you knows that the rate of change slows over the human lifespan, that your children seem to change by the minute but your parents seem to change by the year. But what is the name of this magical point in life where change suddenly goes from a gallop to a crawl? Is it teenage years? Is it middle age? Is it old age? The answer, it turns out, for most people, is now, wherever now happens to be. What I want to convince you today is that all of us are walking around with an illusion, an illusion that history, our personal history, has just come to an end, that we have just recently become the people that we were always meant to be and will be for the rest of our lives. Let me give you some data to back up that claim. So here ' s a study of change in people ' s personal values over time. Here ' s three values. Everybody here holds all of them, but you probably know that as you grow, as you age, the balance of these values shifts. So how does it do so? Well, we asked thousands of people. We asked half of them to predict for us how much their values would change in the next 10 years, and the others to tell us how much their values had changed in the last 10 years. And this enabled us to do a really interesting kind of analysis, because it allowed us to compare the predictions of people, say, 18 years old, to the reports of people who were 28, and to do that kind of analysis throughout the lifespan. Here ' s what we found. First of all, you are right, change does slow down as we age, but second, you ' re wrong, because it doesn ' t slow nearly as much as we think. At every age, from 18 to 68 in our data set, people vastly underestimated how much change they would experience over the next 10 years. We call this the"end of history"illusion. To give you an idea of the magnitude of this effect, you can connect these two lines, and what you see here is that 18-year-olds anticipate changing only as much as 50-year-olds actually do. Now it ' s not just values. It ' s all sorts of other things. For example, personality. Many of you know that psychologists now claim that there are five fundamental dimensions of personality : neuroticism, openness to experience, agreeableness, extraversion, and conscientiousness. Again, we asked people how much they expected to change over the next 10 years, and also how much they had changed over the last 10 years, and what we found, well, you ' re going to get used to seeing this diagram over and over, because once again the rate of change does slow as we age, but at every age, people underestimate how much their personalities will change in the next decade. And it isn ' t just ephemeral things like values and personality. You can ask people about their likes and dislikes, their basic preferences. For example, name your best friend, your favorite kind of vacation, what ’ s your favorite hobby, what ’ s your favorite kind of music. People can name these things. We ask half of them to tell us,”Do you think that that will change over the next 10 years?”and half of them to tell us,”Did that change over the last 10 years?”And what we find, well, you ’ ve seen it twice now, and here it is again : people predict that the friend they have now is the friend they ’ ll have in 10 years, the vacation they most enjoy now is the one they ’ ll enjoy in 10 years, and yet, people who are 10 years older all say,”Eh, you know, that ’ s really changed.”Does any of this matter? Is this just a form of mis-prediction that doesn ’ t have consequences? No, it matters quite a bit, and I ’ ll give you an example of why. It bedevils our decision-making in important ways. Bring to mind right now for yourself your favorite musician today and your favorite musician 10 years ago. I put mine up on the screen to help you along. Now we asked people to predict for us, to tell us how much money they would pay right now to see their current favorite musician perform in concert 10 years from now, and on average, people said they would pay 129 dollars for that ticket. And yet, when we asked them how much they would pay to see the person who was their favorite 10 years ago perform today, they say only 80 dollars. Now, in a perfectly rational world, these should be the same number, but we overpay for the opportunity to indulge our current preferences because we overestimate their stability. Why does this happen? We ’ re not entirely sure, but it probably has to do with the ease of remembering versus the difficulty of imagining. Most of us can remember who we were 10 years ago, but we find it hard to imagine who we ’ re going to be, and then we mistakenly think that because it ’ s hard to imagine, it ’ s not likely to happen. Sorry, when people say”I can ’ t imagine that,”they ’ re usually talking about their own lack of imagination, and not about the unlikelihood of the event that they ’ re describing. The bottom line is, time is a powerful force. It transforms our preferences. It reshapes our values. It alters our personalities. We seem to appreciate this fact, but only in retrospect. Only when we look backwards do we realize how much change happens in a decade. It ’ s as if, for most of us, the present is a magic time. It ’ s a watershed on the timeline. It ’ s the moment at which we finally become ourselves. Human beings are works in progress that mistakenly think they ’ re finished. The person you are right now is as transient, as fleeting and as temporary as all the people you ’ ve ever been. The one constant in our life is change. Thank you.

Text Sample 295: NEG Dim 2 – 2015 – Score 1.00 – 2015/t001553.txt

What do you do when you have a headache? You swallow an aspirin. But for this pill to get to your head, where the pain is, it goes through your stomach, intestines and various other organs first. Swallowing pills is the most effective and painless way of delivering any medication in the body. The downside, though, is that swallowing any medication leads to its dilution. And this is a big problem, particularly in HIV patients. When they take their anti-HIV drugs, these drugs are good for lowering the virus in the blood, and increasing the CD4 cell counts. But they are also notorious for their adverse side effects, but mostly bad, because they get diluted by the time they get to the blood, and worse, by the time they get to the sites where it matters most : within the HIV viral reservoirs. These areas in the body — such as the lymph nodes, the nervous system, as well as the lungs — where the virus is sleeping, and will not readily get delivered in the blood of patients that are under consistent anti-HIV drugs therapy. However, upon discontinuation of therapy, the virus can awake and infect new cells in the blood. Now, all this is a big problem in treating HIV with the current drug treatment, which is a life-long treatment that must be swallowed by patients. One day, I sat and thought,”Can we deliver anti-HIV directly within its reservoir sites, without the risk of drug dilution?”As a laser scientist, the answer was just before my eyes : Lasers, of course. If they can be used for dentistry, for diabetic wound-healing and surgery, they can be used for anything imaginable, including transporting drugs into cells. As a matter of fact, we are currently using laser pulses to poke or drill extremely tiny holes, which open and close almost immediately in HIV-infected cells, in order to deliver drugs within them.”How is that possible?”you may ask. Well, we shine a very powerful but super-tiny laser beam onto the membrane of HIV-infected cells while these cells are immersed in liquid containing the drug. The laser pierces the cell, while the cell swallows the drug in a matter of microseconds. Before you even know it, the induced hole becomes immediately repaired. Now, we are currently testing this technology in test tubes or in Petri dishes, but the goal is to get this technology in the human body, apply it in the human body.”How is that possible?”you may ask. Well, the answer is : through a three-headed device. Using the first head, which is our laser, we will make an incision in the site of infection. Using the second head, which is a camera, we meander to the site of infection. Finally, using a third head, which is a drug- spreading sprinkler, we deliver the drugs directly at the site of infection, while the laser is again used to poke those cells open. Well, this might not seem like much right now. But one day, if successful, this technology can lead to complete eradication of HIV in the body. Yes. A cure for HIV. This is every HIV researcher ’ s dream — in our case, a cure lead by lasers. Thank you.

I ’ ll begin today by sharing a poem written by my friend from Malawi, Eileen Piri. Eileen is only 13 years old, but when we were going through the collection of poetry that we wrote, I found her poem so interesting, so motivating. So I ’ ll read it to you. She entitled her poem”I ’ ll Marry When I Want.””I ’ ll marry when I want. My mother can ’ t force me to marry. My father cannot force me to marry. My uncle, my aunt, my brother or sister, cannot force me to marry. No one in the world can force me to marry. I ’ ll marry when I want. Even if you beat me, even if you chase me away, even if you do anything bad to me, I ’ ll marry when I want. I ’ ll marry when I want, but not before I am well educated, and not before I am all grown up. I ’ ll marry when I want.”This poem might seem odd, written by a 13-year-old girl, but where I and Eileen come from, this poem, which I have just read to you, is a warrior ’ s cry. I am from Malawi. Malawi is one of the poorest countries, very poor, where gender equality is questionable. Growing up in that country, I couldn ’ t make my own choices in life. I couldn ’ t even explore personal opportunities in life. I will tell you a story of two different girls, two beautiful girls. These girls grew up under the same roof. They were eating the same food. Sometimes, they would share clothes, and even shoes. But their lives ended up differently, in two different paths. The other girl is my little sister. My little sister was only 11 years old when she got pregnant. It ’ s a hurtful thing. Not only did it hurt her, even me. I was going through a hard time as well. As it is in my culture, once you reach puberty stage, you are supposed to go to initiation camps. In these initiation camps, you are taught how to sexually please a man. There is this special day, which they call”Very Special Day”where a man who is hired by the community comes to the camp and sleeps with the little girls. Imagine the trauma that these young girls go through every day. Most girls end up pregnant. They even contract HIV and AIDS and other sexually transmitted diseases. For my little sister, she ended up being pregnant. Today, she ' s only 16 years old and she has three children. Her first marriage did not survive, nor did her second marriage. On the other side, there is this girl. She ' s amazing. I call her amazing because she is. She ' s very fabulous. That girl is me. When I was 13 years old, I was told, you are grown up, you have now reached of age, you ' re supposed to go to the initiation camp. I was like,"What? I ' m not going to go to the initiation camps."You know what the women said to me?"You are a stupid girl. Stubborn. You do not respect the traditions of our society, of our community."I said no because I knew where I was going. I knew what I wanted in life. I had a lot of dreams as a young girl. I wanted to get well educated, to find a decent job in the future. I was imagining myself as a lawyer, seated on that big chair. Those were the imaginations that were going through my mind every day. And I knew that one day, I would contribute something, a little something to my community. But every day after refusing, women would tell me,"Look at you, you ' re all grown up. Your little sister has a baby. What about you?"That was the music that I was hearing every day, and that is the music that girls hear every day when they don ' t do something that the community needs them to do. When I compared the two stories between me and my sister, I said,"Why can ' t I do something? Why can ' t I change something that has happened for a long time in our community?"That was when I called other girls just like my sister, who have children, who have been in class but they have forgotten how to read and write. I said,"Come on, we can remind each other how to read and write again, how to hold the pen, how to read, to hold the book."It was a great time I had with them. Nor did I just learn a little about them, but they were able to tell me their personal stories, what they were facing every day as young mothers. That was when I was like, ' Why can ' t we take all these things that are happening to us and present them and tell our mothers, our traditional leaders, that these are the wrong things?"It was a scary thing to do, because these traditional leaders, they are already accustomed to the things that have been there for ages. A hard thing to change, but a good thing to try. So we tried. It was very hard, but we pushed. And I ' m here to say that in my community, it was the first community after girls pushed so hard to our traditional leader, and our leader stood up for us and said no girl has to be married before the age of 18. In my community, that was the first time a community, they had to call the bylaws, the first bylaw that protected girls in our community. We did not stop there. We forged ahead. We were determined to fight for girls not just in my community, but even in other communities. When the child marriage bill was being presented in February, we were there at the Parliament house. Every day, when the members of Parliament were entering, we were telling them,"Would you please support the bill?"And we don ' t have much technology like here, but we have our small phones. So we said,"Why can ' t we get their numbers and text them?"So we did that. It was a good thing. So when the bill passed, we texted them back,"Thank you for supporting the bill."And when the bill was signed by the president, making it into law, it was a plus. Now, in Malawi, 18 is the legal marriage age, from 15 to 18. It ' s a good thing to know that the bill passed, but let me tell you this : There are countries where 18 is the legal marriage age, but don ' t we hear cries of women and girls every day? Every day, girls ' lives are being wasted away. This is high time for leaders to honor their commitment. In honoring this commitment, it means keeping girls ' issues at heart every time. We don ' t have to be subjected as second, but they have to know that women, as we are in this room, we are not just women, we are not just girls, we are extraordinary. We can do more. And another thing for Malawi, and not just Malawi but other countries : The laws which are there, you know how a law is not a law until it is enforced? The law which has just recently passed and the laws that in other countries have been there, they need to be publicized at the local level, at the community level, where girls ’ issues are very striking. Girls face issues, difficult issues, at the community level every day. So if these young girls know that there are laws that protect them, they will be able to stand up and defend themselves because they will know that there is a law that protects them. And another thing I would say is that girls ’ voices and women ’ s voices are beautiful, they are there, but we cannot do this alone. Male advocates, they have to jump in, to step in and work together. It ’ s a collective work. What we need is what girls elsewhere need : good education, and above all, not to marry whilst 11. And furthermore, I know that together, we can transform the legal, the cultural and political framework that denies girls of their rights. I am standing here today and declaring that we can end child marriage in a generation. This is the moment where a girl and a girl, and millions of girls worldwide, will be able to say,”I will marry when I want.”Thank you.

Chris Anderson : So I guess what we ’ re going to do is we ’ re going to talk about your life, and using some pictures that you shared with me. And I think we should start right here with this one. Okay, now who is this? Martine Rothblatt : This is me with our oldest son Eli. He was about age five. This is taken in Nigeria right after having taken the Washington, D. C. bar exam. CA : Okay. But this doesn ’ t really look like a Martine. MR : Right. That was myself as a male, the way I was brought up. Before I transitioned from male to female and Martin to Martine. CA : You were brought up Martin Rothblatt. MR : Correct. CA : And about a year after this picture, you married a beautiful woman. Was this love at first sight? What happened there? MR : It was love at the first sight. I saw Bina at a discotheque in Los Angeles, and we later began living together, but the moment I saw her, I saw just an aura of energy around her. I asked her to dance. She said she saw an aura of energy around me. I was a single male parent. She was a single female parent. We showed each other our kids ’ pictures, and we ’ ve been happily married for a third of a century now. CA : And at the time, you were kind of this hotshot entrepreneur, working with satellites. I think you had two successful companies, and then you started addressing this problem of how could you use satellites to revolutionize radio. Tell us about that. MR : Right. I always loved space technology, and satellites, to me, are sort of like the canoes that our ancestors first pushed out into the water. So it was exciting for me to be part of the navigation of the oceans of the sky, and as I developed different types of satellite communication systems, the main thing I did was to launch bigger and more powerful satellites, the consequence of which was that the receiving antennas could be smaller and smaller, and after going through direct television broadcasting, I had the idea that if we could make a more powerful satellite, the receiving dish could be so small that it would just be a section of a parabolic dish, a flat little plate embedded into the roof of an automobile, and it would be possible to have nationwide satellite radio, and that ’ s Sirius XM today. CA : Wow. So who here has used Sirius? MR : Thank you for your monthly subscriptions. CA : So that succeeded despite all predictions at the time. It was a huge commercial success, but soon after this, in the early 1990s, there was this big transition in your life and you became Martine. MR : Correct. CA : So tell me, how did that happen? MR : It happened in consultation with Bina and our four beautiful children, and I discussed with each of them that I felt my soul was always female, and as a woman, but I was afraid people would laugh at me if I expressed it, so I always kept it bottled up and just showed my male side. And each of them had a different take on this. Bina said,"I love your soul, and whether the outside is Martin and Martine, it doesn ' t it matter to me, I love your soul."My son said,"If you become a woman, will you still be my father?"And I said,"Yes, I ' ll always be your father,"and I ' m still his father today. My youngest daughter did an absolutely brilliant five-year-old thing. She told people,"I love my dad and she loves me."So she had no problem with a gender blending whatsoever. CA : And a couple years after this, you published this book :"The Apartheid of Sex."What was your thesis in this book? MR : My thesis in this book is that there are seven billion people in the world, and actually, seven billion unique ways to express one ' s gender. And while people may have the genitals of a male or a female, the genitals don ' t determine your gender or even really your sexual identity. That ' s just a matter of anatomy and reproductive tracts, and people could choose whatever gender they want if they weren ' t forced by society into categories of either male or female the way South Africa used to force people into categories of black or white. We know from anthropological science that race is fiction, even though racism is very, very real, and we now know from cultural studies that separate male or female genders is a constructed fiction. The reality is a gender fluidity that crosses the entire continuum from male to female. CA : You yourself don ' t always feel 100 percent female. MR : Correct. I would say in some ways I change my gender about as often as I change my hairstyle. CA : Okay, now, this is your gorgeous daughter, Jenesis. And I guess she was about this age when something pretty terrible happened. MR : Yes, she was finding herself unable to walk up the stairs in our house to her bedroom, and after several months of doctors, she was diagnosed to have a rare, almost invariably fatal disease called pulmonary arterial hypertension. CA : So how did you respond to that? MR : Well, we first tried to get her to the best doctors we could. We ended up at Children ' s National Medical Center in Washington, D. C. The head of pediatric cardiology told us that he was going to refer her to get a lung transplant, but not to hold out any hope, because there are very few lungs available, especially for children. He said that all people with this illness died, and if any of you have seen the film"Lorenzo ' s Oil,"there ' s a scene when the protagonist kind of rolls down the stairway crying and bemoaning the fate of his son, and that ' s exactly how we felt about Jenesis. CA : But you didn ' t accept that as the limit of what you could do. You started trying to research and see if you could find a cure somehow. MR : Correct. She was in the intensive care ward for weeks at a time, and Bina and I would tag team to stay at the hospital while the other watched the rest of the kids, and when I was in the hospital and she was sleeping, I went to the hospital library. I read every article that I could find on pulmonary hypertension. I had not taken any biology, even in college, so I had to go from a biology textbook to a college-level textbook and then medical textbook and the journal articles, back and forth, and eventually I knew enough to think that it might be possible that somebody could find a cure. So we started a nonprofit foundation. I wrote a description asking people to submit grants and we would pay for medical research. I became an expert on the condition — doctors said to me, Martine, we really appreciate all the funding you ' ve provided us, but we are not going to be able to find a cure in time to save your daughter. However, there is a medicine that was developed at the Burroughs Wellcome Company that could halt the progression of the disease, but Burroughs Wellcome has just been acquired by Glaxo Wellcome. They made a decision not to develop any medicines for rare and orphan diseases, and maybe you could use your expertise in satellite communications to develop this cure for pulmonary hypertension. CA : So how on earth did you get access to this drug? MR : I went to Glaxo Wellcome and after three times being rejected and having the door slammed in my face because they weren ’ t going to out-license the drug to a satellite communications expert, they weren ’ t going to send the drug out to anybody at all, and they thought I didn ’ t have the expertise, finally I was able to persuade a small team of people to work with me and develop enough credibility. I wore down their resistance, and they had no hope this drug would even work, by the way, and they tried to tell me,”You ’ re just wasting your time. We ’ re sorry about your daughter.”But finally, for 25, 000 dollars and agreement to pay 10 percent of any revenues we might ever get, they agreed to give me worldwide rights to this drug. CA : And so you put this drug on the market in a really brilliant way, by basically charging what it would take to make the economics work. MR : Oh yes, Chris, but this really wasn ’ t a drug that I ended up — after I wrote the check for 25, 000, and I said,”Okay, where ’ s the medicine for Jenesis?”they said,”Oh, Martine, there ’ s no medicine for Jenesis. This is just something we tried in rats.”And they gave me, like, a little plastic Ziploc bag of a small amount of powder. They said,”Don ’ t give it to any human,”and they gave me a piece of paper which said it was a patent, and from that, we had to figure out a way to make this medicine. A hundred chemists in the U. S. at the top universities all swore that little patent could never be turned into a medicine. If it was turned into a medicine, it could never be delivered because it had a half-life of only 45 minutes. CA : And yet, a year or two later, you were there with a medicine that worked for Jenesis. MR : Chris, the astonishing thing is that this absolutely worthless piece of powder that had the sparkle of a promise of hope for Jenesis is not only keeping Jenesis and other people alive today, but produces almost a billion and a half dollars a year in revenue. CA : So here you go. So you took this company public, right? And made an absolute fortune. And how much have you paid Glaxo, by the way, after that 25, 000? MR : Yeah, well, every year we pay them 10 percent of 1. 5 billion, 150 million dollars, last year 100 million dollars. It ’ s the best return on investment they ever received. CA : And the best news of all, I guess, is this. MR : Yes. Jenesis is an absolutely brilliant young lady. She ’ s alive, healthy today at 30. You see me, Bina and Jenesis there. The most amazing thing about Jenesis is that while she could do anything with her life, and believe me, if you grew up your whole life with people in your face saying that you ’ ve got a fatal disease, I would probably run to Tahiti and just not want to run into anybody again. But instead she chooses to work in United Therapeutics. She says she wants to do all she can to help other people with orphan diseases get medicines, and today, she ’ s our project leader for all telepresence activities, where she helps digitally unite the entire company to work together to find cures for pulmonary hypertension. CA : But not everyone who has this disease has been so fortunate. There are still many people dying, and you are tackling that too. How? MR : Exactly, Chris. There ’ s some 3, 000 people a year in the United States alone, perhaps 10 times that number worldwide, who continue to die of this illness because the medicines slow down the progression but they don ’ t halt it. The only cure for pulmonary hypertension, pulmonary fibrosis, cystic fibrosis, emphysema, COPD, what Leonard Nimoy just died of, is a lung transplant, but sadly, there are only enough available lungs for 2, 000 people in the U. S. a year to get a lung transplant, whereas nearly a half million people a year die of end-stage lung failure. CA : So how can you address that? MR : So I conceptualize the possibility that just like we keep cars and planes and buildings going forever with an unlimited supply of building parts and machine parts, why can ’ t we create an unlimited supply of transplantable organs to keep people living indefinitely, and especially people with lung disease. So we ' ve teamed up with the decoder of the human genome, Craig Venter, and the company he founded with Peter Diamandis, the founder of the X Prize, to genetically modify the pig genome so that the pig ' s organs will not be rejected by the human body and thereby to create an unlimited supply of transplantable organs. We do this through our company, United Therapeutics. CA : So you really believe that within, what, a decade, that this shortage of transplantable lungs maybe be cured, through these guys? MR : Absolutely, Chris. I ' m as certain of that as I was of the success that we ' ve had with direct television broadcasting, Sirius XM. It ' s actually not rocket science. It ' s straightforward engineering away one gene after another. We ' re so lucky to be born in the time that sequencing genomes is a routine activity, and the brilliant folks at Synthetic Genomics are able to zero in on the pig genome, find exactly the genes that are problematic, and fix them. CA : But it ' s not just bodies that — though that is amazing. It ' s not just long-lasting bodies that are of interest to you now. It ' s long-lasting minds. And I think this graph for you says something quite profound. What does this mean? MR : What this graph means, and it comes from Ray Kurzweil, is that the rate of development in computer processing hardware, firmware and software, has been advancing along a curve such that by the 2020s, as we saw in earlier presentations today, there will be information technology that processes information and the world around us at the same rate as a human mind. CA : And so that being so, you ' re actually getting ready for this world by believing that we will soon be able to, what, actually take the contents of our brains and somehow preserve them forever? How do you describe that? MR : Well, Chris, what we ' re working on is creating a situation where people can create a mind file, and a mind file is the collection of their mannerisms, personality, recollection, feelings, beliefs, attitudes and values, everything that we ' ve poured today into Google, into Amazon, into Facebook, and all of this information stored there will be able, in the next couple decades, once software is able to recapitulate consciousness, be able to revive the consciousness which is imminent in our mind file. CA : Now you ' re not just messing around with this. You ' re serious. I mean, who is this? MR : This is a robot version of my beloved spouse, Bina. And we call her Bina 48. She was programmed by Hanson Robotics out of Texas. There ' s the centerfold from National Geographic magazine with one of her caregivers, and she roams the web and has hundreds of hours of Bina ' s mannerisms, personalities. She ' s kind of like a two-year-old kid, but she says things that blow people away, best expressed by perhaps a New York Times Pulitzer Prize-winning journalist Amy Harmon who says her answers are often frustrating, but other times as compelling as those of any flesh person she ' s interviewed. CA : And is your thinking here, part of your hope here, is that this version of Bina can in a sense live on forever, or some future upgrade to this version can live on forever? MR : Yes. Not just Bina, but everybody. You know, it costs us virtually nothing to store our mind files on Facebook, Instagram, what-have- you. Social media is I think one of the most extraordinary inventions of our time, and as apps become available that will allow us to out-Siri Siri, better and better, and develop consciousness operating systems, everybody in the world, billions of people, will be able to develop mind clones of themselves that will have their own life on the web. CA : So the thing is, Martine, that in any normal conversation, this would sound stark-staring mad, but in the context of your life, what you ' ve done, some of the things we ' ve heard this week, the constructed realities that our minds give, I mean, you wouldn ' t bet against it. MR : Well, I think it ' s really nothing coming from me. If anything, I ' m perhaps a bit of a communicator of activities that are being undertaken by the greatest companies in China, Japan, India, the

U. S., Europe. There are tens of millions of people working on writing code that expresses more and more aspects of our human consciousness, and you don ’ t have to be a genius to see that all these threads are going to come together and ultimately create human consciousness, and it ’ s something we ’ ll value. There are so many things to do in this life, and if we could have a simulacrum, a digital doppelgnger of ourselves that helps us process books, do shopping, be our best friends, I believe our mind clones, these digital versions of ourselves, will ultimately be our best friends, and for me personally and Bina personally, we love each other like crazy. Each day, we are always saying, like,”Wow, I love you even more than 30 years ago. And so for us, the prospect of mind clones and regenerated bodies is that our love affair, Chris, can go on forever. And we never get bored of each other. I ’ m sure we never will. CA : I think Bina ’ s here, right? MR : She is, yeah. CA : Would it be too much, I don ’ t know, do we have a handheld mic? Bina, could we invite you to the stage? I just have to ask you one question. Besides, we need to see you. Thank you, thank you. Come and join Martine here. I mean, look, when you got married, if someone had told you that, in a few years time, the man you were marrying would become a woman, and a few years after that, you would become a robot — — how has this gone? How has it been? Bina Rothblatt : It ’ s been really an exciting journey, and I would have never thought that at the time, but we started making goals and setting those goals and accomplishing things, and before you knew it, we just keep going up and up and we ’ re still not stopping, so it ’ s great. CA : Martine told me something really beautiful, just actually on Skype before this, which was that he wanted to live for hundreds of years as a mind file, but not if it wasn ’ t with you. BR : That ’ s right, we want to do it together. We ’ re cryonicists as well, and we want to wake up together. CA : So just so as you know, from my point of view, this isn ’ t only one of the most astonishing lives I have heard, it ’ s one of the most astonishing love stories I ’ ve ever heard. It ’ s just a delight to have you both here at TED. Thank you so much. MR : Thank you.

Text Sample 298: NEG Dim 2 – 2002 – Score 1.00 – 2002/t000426.txt

What I want to talk about is, as background, is the idea that cars are art. This is actually quite meaningful to me, because car designers tend to be a little bit low on the totem pole â we don ’ t do coffee table books with just one lamp inside of it â and cars are thought so much as a product that it ’ s a little bit difficult to get into the aesthetic side under the same sort of terminology that one would discuss art. And so cars, as art, brings it into an emotional plane â if you accept that â that you have to deal with on the same level you would with art with a capital A. Now at this point you ’ re going to see a picture of Michelangelo. This is completely different than automobiles. Automobiles are self-moving things, right? Elevators are automobiles. And they ’ re not very emotional ; they solve a purpose ; and certainly automobiles have been around for 100 years and have made our lives functionally a lot better in many ways ; they ’ ve also been a real pain in the ass, because automobiles are really the thing we have to solve. We have to solve the pollution, we have to solve the congestion â but that ’ s not what interests me in this speech. What interests me in this speech is cars. Automobiles may be what you use, but cars are what we are, in many ways. And as long as we can solve the problems of automobiles, and I believe we can, with fuel cells or hydrogen, like BMW is really hip on, and lots of other things, then I think we can look past that and try and understand why this hook is in many of us â of this car-y-ness â and what that means, what we can learn from it. That ’ s what I want to get to. Cars are not a suit of clothes ; cars are an avatar. Cars are an expansion of yourself : they take your thoughts, your ideas, your emotions, and they multiply it â your anger, whatever. It ’ s an avatar. It ’ s a super-waldo that you happen to be inside of, and if you feel sexy, the car is sexy. And if you ’ re full of road rage, you ’ ve got a”Chevy : Like a Rock,”right? Cars are a sculpture â did you know this? That every car you see out there is sculpted by hand. Many people think,”Well, it ’ s computers, and it ’ s done by machines and stuff like that.”Well, they reproduce it, but the originals are all done by hand. It ’ s done by men and women who believe a lot in their craft. And they put that same kind of tension into the sculpting of a car that you do in a great sculpture that you would go and look at in a museum. That tension between the need to express, the need to discover, then you put something new into it, and at the same time you have bounds of craftsmanship. Rules that say, this is how you handle surfaces ; this is what control is all about ; this is how you show you ’ re a master of your craft. And that tension, that discovery, that push for something new â and at the same time, that sense of obligation to the regards of craftsmanship â that ’ s as strong in cars as it is in anything. We work in clay, which hasn ’ t changed much since Michelangelo started screwing around with it, and there ’ s a very interesting analogy to that too. Real quickly â Michelangelo once said he ’ s there to”discover the figure within,”OK? There we go, the automobile. That was 100 years right there â did you catch that? Between that one there, and that one there, it changed a lot didn ’ t it? OK, it ’ s not marketing ; there ’ s a very interesting car concept here, but the marketing part is not what I want to talk about here. I want to talk about this. Why it means you have to wash a car, what is it, that sensuality you have to touch about it? That ’ s the sculpture that goes into it. That sensuality. And it ’ s done by men and women working just like this, making cars. Now this little quote about sculpture from Henry Moore, I believe that that”pressure within”that Moore ’ s talking about â at least when it comes to cars â comes right back to this idea of the mean. It ’ s that will to live, that need to survive, to express itself, that comes in a car, and takes over people like me. And we tell other people,”Do this, do this, do this,”until this thing comes alive. We are completely infected. And beauty can be the result of this infectiousness ; it ’ s quite wonderful. This sculpture is, of course, at the heart of all of it, and it ’ s really what puts the craftsmanship into our cars. And it ’ s not a whole lot different, really, when they ’ re working like this, or when somebody works like this. It ’ s that same kind of commitment, that same kind of beauty. Now, now I get to the point. I want to talk about cars as art. Art, in the Platonic sense, is truth ; it ’ s beauty, and love. Now this is really where designers in car business diverge from the engineers. We don ’ t really have a problem talking about love. We don ’ t have a problem talking about truth or beauty in that sense. That ’ s what we ’ re searching for â when we ’ re working our craft, we are really trying to find that truth out there. We ’ re not trying to find vanity and beauty. We ’ re trying to find the beauty in the truth. However, engineers tend to look at things a little bit more Newtonian, instead of this quantum approach. We ’ re dealing with irrationalisms, and we ’ re dealing with paradoxes that we admit exist, and the engineers tend to look things a little bit more like two and two is four, and if you get 4. 0 it ’ s better, and 4. 000 is even better. And that sometimes leads to bit of a divergence in why we ’ re doing what we ’ re doing. We ’ ve pretty much accepted the fact, though, that we are the women in the organization at BMW â BMW is a very manly type business, â men, men, men ; it ’ s engineers. And we ’ re kind of the female side to that. That ’ s OK, that ’ s cool. You go off and be manly. We ’ re going to be a little bit more female. Because what we ’ re interested in is finding form that ’ s more than just a function. We ’ re interested in finding beauty that ’ s more than just an aesthetic ; it ’ s really a truth. And I think this idea of soul, as being at the heart of great cars, is very applicable. You all know it. You know a car when you ’ ve seen it, with soul. You know how strong this is. Well, this experience of love, and the experience of design, to me, are interchangeable. And now I ’ m coming to my story. I discovered something about love and design through a project called Deep Blue. And first of all, you have to go with me for a second, and say, you know, you could take the word”love”out of a lot of things in our society, put the word”design”in, and it still works, like this quote here, you know. It kind of works, you know? You can understand that. It works in truisms.”All is fair in design and war.”Certainly we live in a competitive society. I think this one here, there ’ s a pop song that really describes Philippe Starck for me, you know, this is like you know, this is like puppy love, you know, this is cool right? Toothbrush, cool. It really only gets serious when you look at something like this. OK? This is one substitution that I believe all of us, in design management, are guilty of. And this idea that there is more to love, more to design, when it gets down to your neighbor, your other, it can be physical like this, and maybe in the future it will be. But right now it ’ s in dealing with our own people, our own teams who are doing the creating. So, to my story. The idea of people- work is what we work with here, and I have to make a bond with my designers when we ’ re creating BMWs. We have to have a shared intimacy, a shared vision â that means we have to work as one family ; we have to understand ourselves that way. There ’ s good times ; there ’ s interesting times ; and there ’ s some stress times too. You want to do cars, you ’ ve got to go outside. You ’ ve got to do cars in the rain ; you ’ ve got to do cars in the snow. That ’ s, by the way, is a presentation we made to our board of directors. We haul their butts out in the snow, too. You want to know cars outside? Well, you ’ ve got to stand outside to do this. And because these are artists, they have very artistic temperaments. All right? Now one thing about art is, art is discovery, and art is discovering yourself through your art. Right? And one thing about cars is we ’ re all a little bit like Pygmalion, we are completely in love with our own creations. This is one of my favorite paintings, it really describes our relationship with cars. This is sick beyond belief. But because of this, the intimacy with which we work together as a team takes on a new dimension, a new meaning. We have a shared center ; we have a shared focus â that car stays at the middle of all our relationships. And it ’ s my job, in the competitive process, to narrow this down. I heard today about Joseph ’ s death genes that have to go in and kill cell reproduction. You know, that ’ s what I have to do sometimes. We start out with 10 cars ; we narrow it down to five cars, down to three cars, down to two cars, down to one car, and I ’ m in the middle of that killing, basically. Someone ’ s love, someone ’ s baby. This is very difficult, and you have to have a bond with your team that permits you to do this, because their life is wrapped up in that too. They ’ ve got that gene infected in them as well, and they want that to live, more than anything else. Well, this project, Deep Blue, put me in contact with my team in a way that I never expected, and I want to pass it on to you, because I want you to reflect on this, perhaps in your own relationships. We wanted to a do a car which was a complete leap of faith for BMW. We wanted to do a team which was so removed from the way we ’ d done it, that I only had a phone number that connected me to them. So, what we did was : instead of having a staff of artists that are just your wrist, we decided to free up a team of creative designers and engineers to find out what ’ s the successor to the SUV phenomenon in America. This is 1996 we did this project. And so we sent them off with this team name, Deep Blue. Now many people know Deep Blue from

IBM â we actually stole it from them because we figured if anybody read our faxes they ' d think we ' re talking about computers. It turned out it was quite clever because Deep Blue, in a company like BMW, has a hook â"Deep Blue,"wow, cool name. So people get wrapped up in it. And we took a team of designers, and we sent them off to America. And we gave them a budget, what we thought was a set of deliverables, a timetable, and nothing else. Like I said, I just had a phone number that connected me to them. And a group of engineers worked in Germany, and the idea was they would work separately on this problem of what ' s the successor to the SUV. They would come together, compare notes. Then they would work apart, come together, and they would produce together a monumental set of diverse opinions that didn ' t pollute each other ' s ideas â but at the same time came together and resolved the problems. Hopefully, really understand the customer at its heart, where the customer is, live with them in America. So â sent the team off, and actually something different happened. They went other places. They disappeared, quite honestly, and all I got was postcards. Now, I got some postcards of these guys in Las Vegas, and I got some postcards of these guys in the Grand Canyon, and I got these postcards of Niagara Falls, and pretty soon they ' re in New York, and I don ' t know where else. And I ' m telling myself,"This is going to be a great car, they ' re doing research that I ' ve never even thought about before."Right? And they decided that instead of, like, having a studio, and six or seven apartments, it was cheaper to rent Elizabeth Taylor ' s ex-house in Malibu. And â at least they told me it was her house, I guess it was at one time, she had a party there or something. But anyway, this was the house, and they all lived there. Now this is 24 / 7 living, half-a-dozen people who ' d left their â some had left their wives behind and families behind, and they literally lived in this house for the entire six months the project was in America, but the first three months were the most intensive. And one of the young women in the project, she was a fantastic lady, she actually built her room in the bathroom. The bathroom was so big, she built the bed over the bathtub â it ' s quite fascinating. On the other hand, I didn ' t know anything about this. OK? Nothing. This is all going on, and all I ' m getting is postcards of these guys in Las Vegas, or whatever, saying,"Don ' t worry Chris, this is really going to be good."OK? So my concept of what a design studio was probably â I wasn ' t up to speed on where these guys were. However, the engineers back in Munich had taken on this kind of Newtonian solution, and they were trying to find how many cup holders can dance on the head of a pin, and, you know, these really serious questions that are confronting the modern consumer. And one was hoping that these two teams would get together, and this collusion of incredible creativity, under these incredible surroundings, and these incredibly stressed-out engineers, would create some incredible solutions. Well, what I didn ' t know was, and what we found out was â these guys, they can ' t even like talk to each other under those conditions. You get a divergence of Newtonian and quantum thinking at that point, you have a split in your dialog that is so deep, and so far, that they cannot bring this together at all. And so we had our first meeting, after three months, in Tiburon, which is just up the road from here â you know Tiburon? And the idea was after the first three months of this independent research they would present it all to Dr. Goschel â who is now my boss, and at that time he was co-mentor on the project â and they would present their results. We would see where we were going, we would see the first indication of what could be the successive phenomenon to the SUV in America. And so I had these ideas in my head, that this is going to be great. I mean, I ' m going to see so much work, it ' s so intense â I know probably Las Vegas meant a lot about it, and I ' m not really sure where the Grand Canyon came in either â but somehow all this is going to come together, and I ’ m going to see some really great product. So we went to Tiburon, after three months, and the team had gotten together the week before, many days ahead of time. The engineers flew over, and designers got together with them, and they put their presentation together. Well, it turns out that the engineers hadn ’ t done anything. And they hadn ’ t done anything because â kind of, like in car business, engineers are there to solve problems, and we were asking them to create a problem. And the engineers were waiting for the designers to say,”This is the problem that we ’ ve created, now help us solve it.”And they couldn ’ t talk about it. So what happened was, the engineers showed up with nothing. And the engineers told the designers,”If you go in with all your stuff, we ’ ll walk out, we ’ ll walk right out of the project.”So I didn ’ t know any of this, and we got a presentation that had an agenda, looked like this. There was a whole lot of dialog. We spent four hours being told all about vocabulary that needs to be built between engineers and designers. And here I ’ m expecting at any moment,”OK, they ’ re going to turn the page, and I ’ m going to see the cars, I ’ m going to see the sketches, I ’ m going to see maybe some idea of where it ’ s going.”Dialog kept on going, with mental maps of words, and pretty soon it was becoming obvious that instead of being dazzled with brilliance, I was seriously being baffled with bullshit. And if you can imagine what this is like, to have these months of postcard indication of how great this team is working, and they ’ re out there spending all this money, and they ’ re learning, and they ’ re doing all this stuff. I went fucking ballistic, right? I went nuts. You can probably remember Tiburon, it used to look like this. After four hours of this, I stood up, and I took this team apart. I screamed at them, I yelled at them,”What the hell are you doing? You ’ re letting me down, you ’ re my designers, you ’ re supposed to be the creative ones, what the hell is going on around here?”It was probably one of my better tirades, I have some good ones, but this was probably one of my better ones. And I went into these people ; how could they take BMW ’ s money, how could they have a holiday for three months and produce nothing, nothing? Because of course they didn ’ t tell us that they had three station wagons full of drawings, model concepts, pictures â everything I wanted, they ’ d locked up in the cars, because they had shown solidarity with the engineers â and they ’ d decided not to show me anything, in order to give the chance for problem solving a chance to start, because they hadn ’ t realized, of course, that they couldn ’ t do problem creating. So we went to lunch â And I ’ ve got to tell you, this was one seriously quiet lunch. The engineers all sat at one end of the table, the designers and I sat at the other end of the table, really quiet. And I was just fucking furious, furious. OK? Probably because they had all the fun and I didn ’ t, you know. That ’ s what you get furious about right? And somebody asked me about Catherine, my wife, you know, did she fly out with me or something? I said,”No,”and it triggered a set of thoughts about my wife. And I recalled that when Catherine and I were married, the priest gave a very nice sermon, and he said something very important. He said,”Love is not selfish,”he said,”Love does not mean counting how many times I say, ’ I love you. ’ It doesn ’ t mean you had sex this many times this month, and it ’ s two times less than last month, so that means you don ’ t love me as much. Love is not selfish.”And I thought about this, and I thought,”You know, I ’ m not showing love here. I ’ m seriously not showing love. I ’ m in the air, I ’ m in the air without trust. This cannot be. This cannot be that I ’ m expecting a certain number of sketches, and to me that ’ s my quantification method for qualifying a team. This cannot be.”So I told them this story. I said,”Guys, I ’ m thinking about something here, this isn ’ t right. I can ’ t have a relationship with you guys based on a premise that is a quantifiable one. Based on a dictate premise that says, ’ I ’ m a boss, you do what I say, without trust. ’”I said”This can ’ t be.”Actually, we all broke down into tears, to be quite honest about it, because they still could not tell me how much frustration they had built up inside of them, not being able to show me what I wanted, and merely having to ask me to trust them that it would come. And I think we felt much closer that day, we cut a lot of strings that didn ’ t need to be there, and we forged the concept for what real team and creativity is all about. We put the car back at the center of our thoughts, and we put love, I think, truly back into the center of the process. By the way, that team went on to create six different concepts for the next model of what would be the proposal for the next generation after SUVs in America. One of those was the idea of a crossover coupes â you see it downstairs, the X Coupe â they had a lot of fun with that. It was the rendition of our motorcycle, the GS, as Carl Magnusson says,”brute-iful,”as the idea of what could be a motorcycle, if you add two more wheels. And so, in conclusion, my lesson that I wanted to pass on to you, was this one here. I ’ m also going to steal a little quote out of”Little Prince.”There ’ s a lot to be said about trust and love, if you know that those two words are synonymous for design. I had a very, very meaningful relationship with my team that day, and it ’ s stayed that way ever since. And I hope that you too find that there ’ s more to design, and more towards the art of the design, than doing it yourself. It ’ s true that the trust and the love, that makes it worthwhile. Thanks so much.

I ’ m a historian. Steve told us about the future of little technology ; I ’ m going to show you some of the past of big technology. This was a project to build a 4, 000-ton nuclear bomb-propelled spaceship and go to Saturn and Jupiter. This took place in my childhood, 1957-65. It was deeply classified. I ’ m going to show you some stuff that not only has not been declassified, but has now been reclassified. If all goes well, next year I ’ ll be back, and I ’ ll have a lot more to show you, and if all doesn ’ t go well, I ’ ll be in jail, like Wen Ho Lee. So, this ship was basically the size of the Marriott Hotel, a little taller and a little bigger. And one of the people who worked on it at the beginning was my father, Freeman, there in the middle. That ’ s me and my sister, Esther, who ’ s a frequent TEDster. I didn ’ t like nuclear bomb-propelled spaceships. I mean, I thought it was a great idea, but I started building kayaks. So we had a few kayaks. Just so you know that I am not Dr. Strangelove. But all the time I was out there doing these strange kayak voyages in odd, beautiful parts of this planet, I always thought in the back of my mind about Project Orion, and how my father and his friends were going to build these big ships. They were actually going to go — Ted Taylor, who led the project, was going to take his children. My father was not going to take his children, that was one of the reasons we sort of had a falling out for a few years. The project began in ’ 57 at General Atomics there, that ’ s right on the coast at La Jolla. Look at that central building right in the middle of the picture. That ’ s the 130-foot diameter library. That is exactly the size of the base of the spaceship. So put that library at the bottom of that ship — that ’ s how big the thing was going to be. It would take two or three thousand bombs. The people who worked on it were a lot of the Los Alamos people who had done the hydrogen bomb work. It was the first project funded by ARPA. That ’ s the contract where ARPA gave the first million dollars to get this thing started.”Spaceship project officially begun. Job waiting for you. Dyson.”That ’ s July ’ 58. Two days later, the space traveler ’ s manifesto explaining why — just like we heard yesterday — why we need to go into space :”... trips to satellites of the outer planets. August 20, 1958.”These are the statistics of what would be the good places to go and stop. Some of the sizes of the ships, ranging all the way up to ship mass of 8 million tons. So that was the outer extreme. Here was version two : 2, 000 bombs. These are five-kiloton yield bombs, about the size of small Volkswagens ; it would take 800 to get into orbit. Here we see a 10, 000-ton ship will deliver 1, 300 tons to Saturn and back — essentially, a five-year trip. Possible departure dates : October 1960 to February 1967. These are trajectories going to Mars. All this was done by hand, with slide rules. The little Orion ship, and what it would take to do what Orion does with chemicals : you have a ship the size of the Empire State Building. NASA had no interest ; they tried to kill the project. The people who supported it were the Air Force, which meant that it was all secret. And that ’ s why when you get something declassified, that ’ s what it looks like. Military weapon versions that carried hydrogen bombs that could destroy half the planet. There ’ s another version there that sends retaliatory strikes at the Soviet Union. This is the really secret stuff : how to get directed energy explosions. So you ’ re sending the energy of a nuclear explosion — not like just a stick of dynamite, but you ’ re directing it at the ship. And this is still a very active subject. It ’ s quite dangerous, but I believe it ’ s better to have dangerous things in the open than think you ’ re going to keep them secret. This is what happened at 600 microseconds. The Air Force started to build smaller models and actually started doing this. The guys in La Jolla said,”We ’ ve got to get started now.”They built a high-explosive propelled model. These are stills from film footage that was saved by someone who was supposed to destroy it but didn ’ t, and kept it in their basement for the last 40 years. So, these are three-pound charges of C4 ; that ’ s about 10 times what the guy had in his shoes. This is Ed Day putting — So each of these coffee cans has three pounds of C4 in it. They ’ re building a system that ejects these at quarter-second intervals. That ’ s my dad in the sport coat there, holding the briefcase. So, they had a lot of fun doing this. But no children were allowed ; my dad could tell me he was building a spaceship and going to go to Saturn, but he could not say anything more about it. So all my life I have wanted to find this stuff out, and spent the last four years tracking these old guys down. These are stills from the video. Jeff Bezos kindly, yesterday, said he ’ ll put this video up on the Amazon site — some little clip of it. So, thanks to him. They got quite serious about the engineering of this. The size of that mass, for us, is really large technology in a way we ’ re never going to go back to. If you saw the 1959 — this is what it would feel like in the passenger compartment ; that ’ s acceleration profile. And pulse-system yield : we ’ re looking at 20-kiloton yield for an effective thrust of 10 million newtons. Well, here we have a little problem, the radiation doses at the crew station : 700 rads per shot. Fission yields during development : they were hoping to get clean bombs ; they didn ’ t. Eyeburn : this is what happens to the people in Miami who are looking up. Personnel compartment noise : that ’ s not too bad ; it ’ s very low frequencies, it ’ s basically like these sub-woofers. And now we have ground-hazard assessments when you have a blow-up on the pad. Finally, at the very end in 1964, NASA steps in and says,”OK, we ’ ll support a feasibility study for a small version that could be launched with Saturn Vs in sections and pieced together.”So this is what NASA did, getting an eight-man version that would go to Mars. They liked it because the guys could kind of live there and be like,”It ’ s like living in a submarine.”This is crew compartment. It switches, so what ’ s upside down is right side up when you go to artificial gravity mode. The scientists were still going to go along ; they would take seven astronauts and seven scientists. This is a 20-man version for going to Jupiter : bunks, storm cellars, exercise room. You know, it was going to be a nice, long trip. The Air Force version : here we have a military version. This is the kind of stuff that ' s not been declassified, just that people managed to sneak home and after, you know, on their deathbed, basically, gave me that. The sort of artist conceptions. These are basically PowerPoint presentations given to the Air Force 40 years ago. Look at the little guys there outside the vehicle. And one part of NASA was interested in it, but the headquarters in NASA, they killed the project. So finally, at the end, we can see the thing followed its sort of design path right up to 1965, and then all those paths came to a halt. Results : none. This project is hereby terminated. So that ' s the end. All I can say in closing is : we heard yesterday that one of the 10 bad things that could happen to us is an asteroid with our name on it. And one of the bad things that could happen to NASA is if that asteroid shows up with our name on it nine months out, and everybody says,"Well, what are we going to do?"And Orion is really one of the only, if not the only, off-the-shelf technologies that could do something. So I ' m going to tell you the good news and the bad news. The good news is that NASA has a small, secret contingency-plan division that is looking at this, trying to keep knowledge of Orion preserved in the event of such a misfortune. Maybe keep a few little bombs of plutonium on the side. That ' s the good news. The bad news is, when I got in contact with these people to try and get some documents from them, they went crazy because I had all this stuff that they don ' t have, and NASA purchased 1, 759 pages of this stuff from me. So that ' s the state we ' re at ; it ' s not very good.

Text Sample 300: NEG Dim 2 – 2002 – Score 1.00 – 2002/t000295.txt

I started juggling a long time ago, but long before that, I was a golfer, and that ' s what I was, a golfer. And as a golfer and as a kid, one of the things that really sort of seeped into my pores, that I sort of lived my whole life, is process. And it ' s the process of learning things. One of the great things was that my father was an avid golfer, but he was lefty. And he had a real passion for golf, and he also created this whole mythology about Ben Hogan and various things. Well, I learned a lot about interesting things that I knew nothing about at the time, but grew to know stuff about. And that was the mythology of skill. So, one of the things that I love to do is to explore skill. And since Richard put me on this whole thing with music — I ' m supposed to actually be doing a project with Tod Machover with the MIT Media Lab — it relates a lot to music. But Tod couldn ' t come and the project is sort of somewhere, I ' m not sure whether it ' s happening the way we thought, or not. But I ' m going to explore skill, and juggling, and basically visual music, I guess. OK, you can start the music, thanks. Thanks. Thank you. Now, juggling can be a lot of fun ; play with skill and play with space, play with rhythm. And you can turn the mike on now. I ' m going to do a couple of pieces. I do a big piece in a triangle and these are three sections from it. Part of the challenge was to try to understand rhythm and space using not just my hands — because a lot of juggling is hand-oriented — but using the rhythm of my body and feet, and controlling the balls with my feet. Thanks. Now, this next section was an attempt to explore space. You see, I think Richard said something about people that are against something. Well, a lot of people think jugglers defy gravity or do stuff. Well, I kind of, from my childhood and golf and all that, it ' s a process of joining with forces. And so what I ' d like to do is try to figure out how to join with the space through the technique. So juggling gravity — up, down. If you figure out what up and down really are, it ' s a complex physical set of skills to be able to throw a ball down and up and everything, but then you add in sideways. Now, I look at it somewhat as a way — when you learn juggling what you learn is how to feel with your eyes, and see with your hands because you ’ re not looking at your hands, you ’ re looking at where the balls are or you ’ re looking at the audience. So this next part is really a way of understanding space and rhythm, with the obvious reference to the feet, but it ’ s also time — where the feet were, where the balls were. Thanks. So, visual music : rhythm and complexity. I ’ m going to build towards complexity now. Juggling three balls is simple and normal. Excuse me. We ’ re jugglers, OK. And remember, you ’ re transposing, you ’ re getting into a subculture here. And juggling — the balls cross and all that. OK, if you keep them in their assigned paths you get parallel lines of different heights, but then hopefully even rhythm. And you can change the rhythm — good, Michael. You can change the rhythm, if you get out of the lights. OK? Change the rhythm, so it ’ s even. Or you can go back and change the height. Now, skill. But you ’ re boxed in, if you can only do it up and down that way. So, you ’ ve got to go after the space down there. OK, then you ’ ve got to combine them, because then you have the whole spatial palette in front of you. And then you get crazy. Now, I ’ m actually going to ask you to try something, so you ’ ve got to pay attention. Complexity : if you spend enough time doing something, time slows down or your skill increases, so your perceptions change. It ’ s learning skills — like being in a high-speed car crash. Things slow down as you learn, as you learn, as you learn. You may not be able to affect it, it almost drifts on you. It goes. But that ’ s the closest approximation I can have to it. So, complexity. Now, how many here are jugglers? OK, so most of you are going to have a similar reaction to this. OK? And whoever laughed there — you understood it completely, right? No, it looks like a mess. It looks like a mess with a guy there, who ’ s got his hands around that mess, OK. Well, that ’ s what juggling is about, right? It ’ s being able to do something that other people can ’ t do or can ’ t understand. All right. So, that ’ s one way of doing it, which is five balls down. OK? Another way is the outside. And you could play with the rhythm. Same pattern. Make it faster and smaller. Make it wider. Make it narrower. Bring it back up. OK. It ’ s done. Thanks. Now, what I wanted to get to is that you ’ re all very bright, very tactile. I have no idea how computer-oriented or three-dimensionally-oriented you are, but let ’ s try something. OK, so since you all don ’ t understand what the five-ball pattern is, I ’ m going to give you a little clue. Enough of a clue? So, you get the pattern, right? OK. You ’ re not getting off that easy. All right? Now, do me a favor : follow the ball that I ask you to follow. Green. Yellow. Pink. White. OK, you can do that? Yeah? OK. Now, let ’ s actually learn something. Actually, let me put you in that area of learning, which is very insecure. You want to do it? Yeah? OK. Hands out in front of you. Palms up, together. What you ’ re going to learn is this. OK? So what I want you to do is just listen to me and do it. Index finger, middle finger, ring, little. Little, ring, middle, index. And then open. Finger, finger, finger, finger, finger, finger, finger, finger. A little bit faster. Finger, finger, finger, finger, finger, finger, finger, finger. Finger, finger, finger, finger, finger, finger, finger, finger. All right. A lot of different learning processes going on in here. One learning process that I see is this — OK. Another learning process that I see is this — OK. So, everybody take a deep breath in, breath out. OK. Now, one more time, and — finger, finger, finger, finger, finger, finger, finger, finger. Open. Finger, finger, finger, finger, finger, finger, finger, finger. OK. Shake your hands out. Now, I assume a lot of you spend a lot of time at a computer. OK? So, what you ’ re doing is, you ’ re going la, la, la, and you ’ re getting this. OK? So that ’ s exactly what I ’ m going to ask you to do, but in a slightly different way. You ’ re going to combine it. So what I want you to do is — fingers. I ’ ll tell you what to do with your fingers, same thing. But I want you to do is also, with your eyes, is follow the colored ball that I ask you to follow. OK? Here we go. So, we ’ re going to start off looking at the white ball — and I ’ m going to tell you which color, and I ’ m also going to tell you to go with your fingers. OK? So white ball and — finger, finger, finger, finger, finger, finger, finger, finger. Pink. Finger, finger, finger, finger, finger, finger, finger, finger. Green. Finger, finger, finger, finger. Yellow. Finger, finger, finger, pink or finger. Pink, finger, finger, finger, finger, finger, finger, finger. All right. How did you do? Well? OK. The reason I wanted you to do this is because that ’ s actually what most people face throughout their lives, a moment of learning, a moment of challenge. It ’ s a moment that you can ’ t make sense of. Why the hell should I learn this? OK? Does it really have anything to do with anything in my life? You know, I can ’ t decipher — is it fun? Is it challenging? Am I supposed to cheat? You know, what are you supposed to do? You ’ ve got somebody up here who is the operative principle of doing that for his whole life. OK? Trying to figure that stuff out. But is it going to get you anywhere? It ’ s just a moment. That ’ s all it is, a moment. OK? I ’ m going to change the script for one second. Just let me do this. I don ’ t need music for it. Talking about time in a moment. There ’ s a piece that I recently developed which was all about that, a moment. And what I do as a creative artist is I develop vocabularies or languages of moving objects. What I ’ ve done for you here, I developed a lot of those tricks and I put the choreography together, but they ’ re not original techniques. Now, I ’ m going to start showing you some original techniques that come from the work that I ’ ve developed. OK? So, a moment, how would you define a moment? Well, as a juggler, what I wanted to do was create something that was representational of a moment. Ahhh. All right, I ’ m going to get on my knees and do it. So, a moment. OK? And then, what I did as a juggler was say, OK, what can I do to make that something that is dependent on something else, another dynamic. So, a moment. Another moment. Excuse me, still getting there. A moment that travels. A moment — no, we ’ ll try that again. It separates, and comes back together. Time. How can you look at time? And what do you dedicate it to, in exploring a particular thing? Well, obviously, there ’ s something in here, and you can all have a guess as to what it is. There ’ s a mystery. There ’ s a mystery in the moment. And it has to settle. And then it ’ s dependent on something else. And then it comes to rest. Just a little thing about time. Now, this has expanded into a much bigger piece, because I use ramps of different parabolas that I roll the balls on while I ’ m keeping time with this. But I just thought I ’ d talk about a moment. All right. OK. Can we show the video of the triangle? Are we ready to do that? Yes? This is the piece that I told you about. It ’ s a much bigger piece that I do exploring the space of a geometric triangle. Thanks. The only thing I ’ ll say about the last session is, you ever try juggling and driving the car with your knees at 120 miles an hour? The only other thing is, it was a real shock. I always drove motorcycles. And when I bought my first car, it shocked me that it cost three times more than my parents ’ house. Interesting. Anyway, balance : constant movement to find an approach to stillness. Cheating. Balance : making up the rules so you can ’ t cheat, so you learn to approach stillness with different parts of your body. To have a conversation with it. To speak. To listen. Hup. Now, it ’ s dependent on rhythm, and keeping a center of balance. When it falls, going underneath. So, there ’ s a rhythm to it. The rhythm can get much smaller. As your skill increases, you learn to find those tinier spaces, those tinier movements. Thanks. Now, I ’ m going to show you the beginnings of a piece that is about balance in some ways, and also — oh, actually, if you ’ re bored, not here, here ’ s one use for it. You can go with the”Sticks One”music. Thanks. That has a certain kind of balance to it, which is all about plumb. I apprenticed with a carpenter and learned about plumb, square and level. And they influenced that, and this next piece, which I ’ ll do a little segment of.”Two Sticks,”you can go with it. Thanks. Which is again exploring space, or the lines in space. Working with space and the lines in space in a different way. Oh, let ’ s see here. So, I ’ ll come back to that in a second. But working with one ball, now, what if you attach something to it, or change it. This is a little thing that I made because I really like the idea of curves and balls together. And then creating space and the rhythm of space, using the surface of the balls, the surface of the arms. Just a little toy. Which leads me to the next thing, which is — what have I got here? OK. All right. I ’ m actually leading up to something, the newest thing that I ’ m working on. This is not it. This is exploring geometry and the rhythm of shape. Now, what I just did was I worked with the mathematics — the diameter and the circumference. Sometimes these pieces are mathematical, in that way that I look at a shape and say, what about if I use this and this and this. Sometimes what happens in life affects my choice of objects that I try to work with. The next piece that I ’ m going to do — which is the cylinders piece, if you want to get that up — it has to do with cylinder seals from about 5, 000 years ago, which were stones with designs that were used to roll over wet clay with all sorts of great designs. I love ceramics and all of that. It ’ s a combination of that, the beauty of that, the shape, and the stories that were involved in it, as well as the fact that they protected the contents. The second influence on this piece came from recycling and looking into a tin can recycling bin and seeing all that beautiful emptiness. So, if you want to go with the music for cylinders. Talking about geometry and everything, if you take the circle and you split it in half — can you run”S-Curve music?”I ’ m going to do just a short version of it. Circles split in half and rotated, and mythology. Anyway, that piece also has a kinetic sculpture in the middle of it, and I dance around a small stage so — two minutes, just to end? The latest piece that I ’ m working on — what I love is that I never know what I ’ m working on, why I ’ m working on it. They ’ re not ideas, they ’ re instincts. And the latest thing that I ’ m working on — — is something really — I don ’ t know what it is yet. And that ’ s good. I like not to know for as long as possible. Well, because then it tells me the truth, instead of me imposing the truth. And what it is, is working with both positive and negative space but also with these curves. And what it involves, and I don ’ t know if my hands are too beaten up to do it or not, but I ’ ll do a little bit of it. It initially started off with me stacking these things, bunches of them, and then playing with the sense of space, of filling in the space. And then it started changing, and become folding on themselves. And then changing levels. Because my attempt is to make visual instruments, not to just make — I ’ ll try one other thing. For work in three dimensions, with your perceptions of space and time. Now, I don ’ t know exactly where it ’ s going, but I ’ ve got a bit of effort involved in this thing. And it ’ s going to change as I go through it. But I really like it, it feels right. This may not be the right shape, and — look at this shape, and then I ’ ll show you the first design I ever put to it, just to see, just to play, because I love all different kinds of things to play with. Let ’ s see here. To work with the positive and negative in a different way. And to change, and to change. So, I ’ m off in my new direction with this to explore rhythm and space. We ’ ll see what I come up with. Thanks for having me.

Text Sample 301: NEG Dim 2 – 2018 – Score 1.00 – 2018/t000832.txt

The hoodie is an amazing object. It ’ s one of those timeless objects that we hardly think of, because they work so well that they ’ re part of our lives. We call them”humble masterpieces.”[Small thing.] [Big idea.] [Paola Antonelli on the Hoodie] The hoodie has been â even if it was not called so â it ’ s been an icon throughout history for good and for bad reasons. The earliest ones that we can trace are from ancient Greece and ancient Rome. The Middle Ages, you see a lot of monks that were wearing garments that were cape-like, with hoods attached, so therefore,”hoodies.”Ladies in the 17th century would wear hoodies to kind of hide themselves when they were going to meet their lovers. And then, of course, there ’ s the legend, there ’ s fantasy. There ’ s the image of the hoodie connected to the grim reaper. There ’ s the image of the hoodie connected to the executioner. So there ’ s the dark side of the hoodie. The modern incarnation of the hoodie â a garment that ’ s made usually of cotton jersey, that has a hood attached with a drawstring ; sometimes it has a marsupial pocket â was introduced in the 1930s by Knickerbocker Knitting Company. Now it ’ s called Champion. It was meant to keep athletes warm. Of course, though, it was such a functional, comfortable garment that it was very rapidly adopted by workmen everywhere. And then, around the 1980s, it also gets adopted by hip-hop and B-boys, skateboarders, and it takes on this kind of youth street culture. It was, at the same time, super-comfortable, perfect for the streets and also had that added value of anonymity when you needed it. And then we have Mark Zuckerberg, who defies convention of respectable attire for businesspeople. But interestingly, it ’ s also a way to show how power has changed. If you ’ re wearing a two-piece suit, you might be the bodyguard. The real powerful person is wearing a hoodie with a T-shirt and jeans. It ’ s easy to think of the physical aspects of the hoodie. You can immediately think of wearing the hood up, and you feel this warmth and this protection, but at the same time, you can also feel the psychological aspects of it. I mean, think of donning a hoodie, all of a sudden, you feel more protected, you feel that you are in your own shell. We know very well what the hoodie has come to signify in the past few years in the United States. When Trayvon Martin, a 17-year-old African-American kid, was shot by a neighborhood vigilante, and Million Hoodie Marches happened all over the United States, in which people wore hoodies with the hood up and marched in the streets against this kind of prejudice. It doesn ’ t happen that often for a garment to have so much symbolism and history and that encompasses so many different universes as the hoodie. So, like all garments, especially all truly utilitarian garments, it is very basic in its design. But at the same time, it has a whole universe of possibilities attached.

The history of civilization, in some ways, is a history of maps : How have we come to understand the world around us? One of the most famous maps works because it really isn ’ t a map at all. [Small thing. Big idea.] [Michael Bierut on the London Tube Map] The London Underground came together in 1908, when eight different independent railways merged to create a single system. They needed a map to represent that system so people would know where to ride. The map they made is complicated. You can see rivers, bodies of water, trees and parks — the stations were all crammed together at the center of the map, and out in the periphery, there were some that couldn ’ t even fit on the map. So the map was geographically accurate, but maybe not so useful. Enter Harry Beck. Harry Beck was a 29-year-old engineering draftsman who had been working on and off for the London Underground. And he had a key insight, and that was that people riding underground in trains don ’ t really care what ’ s happening aboveground. They just want to get from station to station —”Where do I get on? Where do I get off?”It ’ s the system that ’ s important, not the geography. He ’ s taken this complicated mess of spaghetti, and he ’ s simplified it. The lines only go in three directions : they ’ re horizontal, they ’ re vertical, or they ’ re 45 degrees. Likewise, he spaced the stations equally, he ’ s made every station color correspond to the color of the line, and he ’ s fixed it all so that it ’ s not really a map anymore. What it is is a diagram, just like circuitry, except the circuitry here isn ’ t wires conducting electrons, it ’ s tubes containing trains conducting people from place to place. In 1933, the Underground decided, at last, to give Harry Beck ’ s map a try. The Underground did a test run of a thousand of these maps, pocket-size. They were gone in one hour. They realized they were onto something, they printed 750, 000 more, and this is the map that you see today. Beck ’ s design really became the template for the way we think of metro maps today. Tokyo, Paris, Berlin, So Paulo, Sydney, Washington, D. C. — all of them convert complex geography into crisp geometry. All of them use different colors to distinguish between lines, all of them use simple symbols to distinguish between types of stations. They all are part of a universal language, seemingly. I bet Harry Beck wouldn ’ t have known what a user interface was, but that ’ s really what he designed and he really took that challenge and broke it down to three principles that I think can be applied in nearly any design problem. First one is focus. Focus on who you ’ re doing this for. The second principle is simplicity. What ’ s the shortest way to deliver that need? Finally, the last thing is : Thinking in a cross-disciplinary way. Who would ’ ve thought that an electrical engineer would be the person to hold the key to unlock what was then one of the most complicated systems in the world — all started by one guy with a pencil and an idea.

If you do it right, it should sound like : TICK-tat, TICK-tat, TICK-tat, TICK- tat, TICK-tat, TICK-tat. If you do it wrong, it sounds like : Tick-TAT, tick- TAT, tick-TAT. [Small thing. Big idea.] [Kyra Gaunt on the Jump Rope] The jump rope is such a simple object. It can be made out of rope, a clothesline, twine. It has, like, a twirl on it. I ’ m not sure how to describe that. What ’ s important is that it has a certain weight, and that they have that kind of whip sound. It ’ s not clear what the origin of the jump rope is. There ’ s some evidence that it began in ancient Egypt, Phoenicia, and then it most likely traveled to North America with Dutch settlers. The rope became a big thing when women ’ s clothes became more fitted and the pantaloon came into being. And so, girls were able to jump rope because their skirts wouldn ’ t catch the ropes. Governesses used it to train their wards to jump rope. Even formerly enslaved African children in the antebellum South jumped rope, too. In the 1950s, in Harlem, Bronx, Brooklyn, Queens, you could see on the sidewalk, lots of girls playing with ropes. Sometimes they would take two ropes and turn them as a single rope together, but you could separate them and turn them in like an eggbeater on each other. The skipping rope was like a steady timeline — tick, tick, tick, tick — upon which you can add rhymes and rhythms and chants. Those ropes created a space where we were able to contribute to something that was far greater than the neighborhood. Double Dutch jump rope remains a powerful symbol of culture and identity for black women. Back from the 1950s to the 1970s, girls weren ’ t supposed to play sports. Boys played baseball, basketball and football, and girls weren ’ t allowed. A lot has changed, but in that era, girls would rule the playground. They ’ d make sure that boys weren ’ t a part of that. It ’ s their space, it ’ s a girl-power space. It ’ s where they get to shine. But I also think it ’ s for boys, because boys overheard those, which is why, I think, so many hip-hop artists sampled from things that they heard in black girls ’ game songs.... cold, thick shake, act like you know how to flip, Filet-O-Fish, Quarter Pounder, french fries, ice cold, thick shake, act like you know how to jump. Why”Country Grammar”by Nelly became a Grammy Award-winning single was because people already knew”We ’ re going down down baby your street in a Range Rover...”That ’ s the beginning of”Down down, baby, down down the roller coaster, sweet, sweet baby, I ’ ll never let you go.”All people who grew up in any black urban community would know that music. And so, it was a ready-made hit. The Double Dutch rope playing helped maintain these songs and helped maintain the chants and the gestures that go along with it, which is very natural to what I call”kinetic orality”— word of mouth and word of body. It ’ s the thing that gets passed down over generations. In some ways, the rope is the thing that helps carry it. You need some object to carry memory through. So, a jump rope, you can use it for all different kinds of things. It crosses cultures. And I think it lasted because people need to move. And I think sometimes the simplest objects can make the most creative uses.

When I was a little girl, my parents would take me outside and show me all the incredible ways that they would take care of our land to produce good food. And I would begrudgingly follow them out and listen to the stories that they had to say. And their pieces of advice would range from totally rational and practical to absolutely bizarre. For example, my grandfather would say,”Hey Louise, if you want to plant good root crops this season, what you should do is plant some rocks underneath your sweet potatoes.”And I would look at him and be like,”OK, Grandpa, sure. I totally believe you.”And my grandmother would say,”OK, to have the best harvest of fruits from the fruit-bearing trees this season, you want to be able to plant according to lunar cycles. You want to plan towards the full moon and never towards a new moon.”And I would look at her and say,”What?”And my dad, most bizarrely of all, would say,”If you want to sift rice or cocoa nibs to get rid of all the dust, the best thing that you can do is to whistle a certain tone to harness the wind.”And I ’ d be like,”Dad, like air-bending?””OK, sure.”So as I grew up, I would ask them,”Why? Why do we do all these weird, strange things,”right? And my relatives and my family would come up to me and be like,”Louise, here ’ s the thing. Your grandparents are kind of crazy. So this is just traditions. You don ’ t have to think about it. It ’ s fine.”But my work has put me at the frontlines of the climate crisis, working with communities and farmers to build resilient agroforests that really react best to the intense super typhoons that we experience. I established an initiative called the Cacao Project, which works to build these resilient agroforests and work closely with farmers to understand how we could best steward our ecosystems and landscapes. And over the years, I ’ ve been able to really do my best dream job, which is make chocolates for restoration. And I have the best job, I know. I get to eat chocolates, talk to farmers, live on the land and have such a good life. And we look at the ways that we can marry practical, traditional knowledge techniques with modern science and know-how, so that we could really put a spotlight on those simple, practical solutions that react effectively to climate change. Now over the years I ’ ve trained with farmers, and we make sure that learning is a two-way street where we listen to the stories that they have to say, but also be able to teach them regeneration. So very simple concepts, like putting more carbon back in the soil than we take from it, or maybe planting the crops that are suited to our ecosystems and our landscapes. And even propagating the life that strengthens our forests and our trees. And as I was talking to these farmers, these crazy stories started resurfacing, and I said,"OK, hang on, hang on. Maybe they ' re on to something here."So together with our farmers, we started kind of trying it out. OK, let ' s plant some rocks here and see what happens. OK, let ' s plant according to the lunar cycles. And for some reason, every single time that we would do that, it would work. When we plant rocks under sweet potatoes, they were better, sweeter, just more delicious. Every time we planted according to lunar cycles, we ' d have delicious harvests. And I thought, maybe, what if all of these weird stories are just kind of decades of peer review that has passed down from grandmother to grandson, from father to daughter, in the ways that they best knew how? And maybe Grandma wasn ' t so crazy after all. So I quickly learned that lunar cycles were actually tied to insect flight activity and reproduction that made better pollinators, so more fruits. It was tied to irrigation and water patterns. And I thought, wow, that is so cool. So my grandmother had a point. I digress. It turns out planting rocks under root crops, it meant that you were just actually making better drainage, but also it was creating this inviting ecosystem for worms and little creatures to live under. And they were just natural fertilizers. So, awesome, Granddad was right. And whistling for wind, well... I wish I could give you a scientific explanation. I have no idea how that works, but every time I ask my dad,"Can you bring me out to a field and whistle?"a light breeze would always seem to blow. And it was magic. I was like, what is this sorcery? So what if all of these invisible pieces of knowledge are actually keys to how we can best curate our stewardship to our landscapes, how we could best create resilience in our ecosystems and forests to react better to climate change. And all of this knowledge exists in countries and communities, and traditions and stories within our families. And as a young person who works in the environmental field, I think it is so cool to have that kind of responsibility to carry this knowledge on to the next generation, to transfer this information over into our modern age and be able to articulate why they work. Because maybe the solutions to our climate crisis, maybe the next big fix-all, isn ' t just this one big, amazing, sparkling solution. Maybe it exists in the soils under our feet. Maybe it ' s in the wind that blows in the air or the sunlight that beats down on us. Or maybe it exists in the crazy, wild stories of our grandmothers. And it is such an honor to think that maybe these amazing solutions are actually an opportunity for us to build something that embodies the wisdom of our communities, of our families and of our landscapes over years and generations. And as a young person carrying that on, I think, wow, we have some exciting magic in our planet to offer, and hopefully we can harness that power and all this sorcery and secret bits of knowledge to do something really great with it in different parts of the world that curate our stewardship to our planet. With that, thank you.

Let me take you back to a day in my life, July 2021. I was sitting with my laptop on my lap, slightly sweating, awaiting a call that could change my life. You see, a year ago I read a book about a woman who paddled around Australia, beating the men before her to become the fastest ever to do so. I ' m sure most people would read that book and think, wow, and forget about the idea, but I cannot get it out of my mind. I ' m a surf lifesaver and an ex-professional Ironwoman, and I want to beat that record. I want to become the fastest person to paddle around Australia. But to do so, I ’ ll need to paddle 80 to 100 kilometers a day and cover every meter of coastline in less than ten and a half months. A ski is basically a kayak, but built to withstand wind and swells and everything thrown up by the ocean. It ’ s six meters long, just 45 centimeters across at its widest point, and made of carbon fiber, it weighs eight kilograms. Oh, I ’ ll also need a support catamaran and a jet ski and a skipper and crew crazy enough to come with me for the journey. It ’ s going to cost a really significant amount of money too. And my husband and I have sold our cars, but our sacrifice is just a drop in the ocean of funds needed. This call today is my opportunity to land a sponsorship deal which will enable me to start the paddle. And 15 minutes after the start of that call, I received the life-changing”yes”I ’ ve been seeking. Which gives me six months to plan the journey. To figure out what direction I ’ m going to paddle in – clockwise – how to stay safe, and how to film the journey. But despite the challenges that lay ahead, it finally feels real. In December, I will set out to cover every meter of rugged, unforgiving coastline of Australia. Flash forward, February 2022. I am 500 kilometers out to sea and facing the crossing of the Great Australian Bight, that untamable stretch of water at the bottom of Australia. If successful, I will be the first person to cross directly across the Bight, as opposed to those prior to me who would hug the coastline. But I figure that to break a world record, I need to be prepared to go where no one has before. I had a little scare earlier today, though. I fell out of my ski and I couldn ’ t get back in. I was 100 kilometers into paddling. For the fifth time, I tried to haul myself up into my ski. As I did so, I slid into the icy water, the shock of it sending a chill up my spine like I touched an electric fence. Out here it ’ s freezing, and hypothermia is a real risk. I ’ ve lost eight kilograms in the last two weeks from seasickness. My support boat ’ s having trouble slowing down. They ’ re sailing away from me in the 25-knot wind gusts. They ’ re not turning around. One more time, I try to haul myself up into my ski and fail again, in waters known for killer whales and great white sharks. I start to sink into a sense of self-pity and feel terribly scared. But as I do so, I look up at the night sky, and I feel like a dot in the grand scheme of creation. I also have a realization. Out here, staying still is the worst thing I can do. If I can ’ t get into my ski, I need to keep moving forward. I need to swim. So slowly but surely, I move my arms as my legs start to follow, and I inch my way towards the support boat. They ’ re finally coming back to me now. I forgot to mention, it ’ s nighttime. They ’ re 50 meters away, and I can hear them calling out, seeing if I ’ m OK. By the time I ’ m pulled aboard, I ’ ve been submerged in the Bight for ten minutes. I ’ m so cold, I can ’ t speak. The bulging discs in my back are on fire, and it feels like my back is breaking in two. My lips are cracked and bleeding from dehydration. But the worst thing is, I need to get back in these waters and paddle for 16 hours again tomorrow as I ’ m just halfway across the Bight. I ’ ve not really been able to hold any food down in the last two days, due to seasickness, and the only bit of protein I ’ ve got in my stomach is about five almonds from this morning so I ’ m just running off soft-textured carbohydrate. Had some rice and Nutella and banana just then, so I ’ m really hoping it stays down. I pretty much have nothing in my stomach at the moment. Yeah, it ’ s really, really tough. So I ’ m trying to focus mentally when your focus starts to go with with no fuel in the tank. I made it across the Bight. And on the April 23, 2022, it ’ s my birthday, I ’ m 32 years old, and I ’ m two months ahead of the world record. I saw 25 turtles on my paddle yesterday. But such experiences have become the norm. I ’ ve been surrounded by dolphins in the middle of the ocean, had seals play beside me, seen flying fish scoot 50 meters across the water in front of me. I ’ ve seen Indigenous carvings over tens of thousands of years old. I ’ ve also had sharks show a little too much interest in my ski for my liking. At the moment, I ’ ve got a fishing boat supporting me, and since the start of the trip I ’ ve had a mix of fishing boat, catamaran and jet ski. I ’ ve also got a crew of amazing young men who champion me every day. They ’ re excellent listeners, they ’ re feminists, but I ’ m missing having a female around when I have my period. I ’ m not quite ready to trouble the guys about menstrual cramps just yet. I ’ m also addicted to lolly snakes, which are known as gummy worms in other parts of the world, I found out recently. It ’ s not my fault I ’ m addicted to them though. The skipper of my crew, who looks like Crocodile Dundee in his Akubra hat, fed them to me on day one and now I ’ m obsessed, I ’ m eating around a packet a day. I do eat other things though. Cut up wraps, fresh apple, Jatz crackers, they ’ re among my favorites. As a dietician, which is my day job, I had the perfect plan for nutrition, and that all went out the window on day one when the craving started. I ’ m in Broome in Western Australia. This is where they say the crocodiles start and continue right across the top of the country. May 2022. Yesterday, my crew saw a crocodile ten meters from my ski, watching, waiting. They were quick to call me into the boat and pull me aboard. But this record means I need to paddle every meter of coastline. That means today, I had to get back in the water where they saw that crocodile yesterday. It doesn ’ t help that the water is brown and the hundreds of logs feel like crocodile heads waiting to pounce. Crocodiles are predators. They ’ re patient, they ’ ll stalk as long as needed. There ’ s also hundreds of sea snakes out here that nobody told me about. Yellow with black markings. They ’ re thick as pythons, and they coil up at me as I pass. At night, I try not to hit them with my paddle. So in waters known for crocodiles and sea snakes, as I climb down into my ski, I tell my crew to talk to me. Childhood stories, jokes, riddles. Just keep talking to distract me from what lies beneath. When I was an Ironwoman, I thought that vulnerability was weakness. Be stoic, I thought. Game face always at the ready. But out here, in these waters, no game face will help. Telling my crew I ’ m scared enables me to get through the day, and we talk and joke and laugh our way through the most dangerous waters in the world. On August 28, 2022, I set foot on the shores of the Gold Coast for the first time in eight months as a world record holder. I paddled around Australia in 254 days, beating the previous record by over two and a half months. But while crossing the tape was very exciting, it wasn ’ t the most valuable thing I took from this record. You see, remember that time I told you about in the middle of the Bight when I looked up at the night sky? It was the most beautiful thing I ’ d ever seen. And in that moment, I had another realization. Instead of feeling scared, I felt lucky. Instead of that sense of self-pity, I felt grateful. Grateful and lucky to experience a perspective seen by so few humans ever before. And that gratitude carried me 12, 700 kilometers around the country. Mother Nature taught me resilience. To keep pushing as a storm is only ever fleeting. She taught me to step back and look around, as beauty can be found in the darkest of places. And though the sand and salt has been washed from my body and someone someday will break my world record, I know they will, the memories I have from this paddle will stay with me forever. And I know that all I ever need to do is take a step back and look around and remember, how lucky am I? How lucky are we to be part of this amazing, crazy, unpredictable journey of life? Even if we are just a drop in the ocean. Thank you.

So most of us here are migrants. We have moved for opportunities and a bet-

ter life for ourselves and our children. There are three quarters of a billion workers globally who migrate within their countries. Some go to the nearest town for a short duration, and some travel thousands of miles for months, even years, leaving all they know, including their families, behind. These migrants work at a construction site, manufacturing units, agriculture fields. But unlike us, they are not migrating for opportunities, but to survive. The majority of them are poor, working for very low wages and lack safety nets. Many face hunger, debt and exploitation. Without safety nets, one job loss, one health emergency, undermine years of effort and keep them trapped in the cycles of poverty. I come from India. India is the fastest-growing economy in the world and home to 200 million internal migrants. These migrants directly contribute at least 10 percent in our three-trillion GDP, but they lack safety nets. What ' s remarkable is that we have a huge safety-net system in India which provides various benefits like cash transfer, food subsidy, health care, insurance. In fact, there are 7, 000 benefits available with billions of dollars allocated for the poor, including migrants. And evidence shows that these benefits help in a huge way. And globally, safety nets [help] reduce poverty by 40 percent. But migrants [can ' t] access them and access is not very easy. Most do not know about the benefit. If they do, requirements are too complex and too many for the migrants who are daily-wage earners. So the money and programs exist, but the delivery system is just not working. And this is what our team and partners at Migrant Resilience Collaborative are trying to fix. Our goal is simple. We build resilience and ensure dignity of the migrant community. For this, we have adopted a two-pronged strategy. Our team, over 1, 000 people, themselves come from the migrant community, helps millions across 100 districts to overcome the challenges in the delivery and access of their benefits. And at the same time, we establish a feedback loop from the community to the government and industry. So we can improve the underlying system, policy design and accountability to fix the system long-term for tens of millions more. In just two and a half years, what we started as an audacious idea, is today the planet ' s largest grassroots-led collaborative for the migrants and has helped over three million households for the social security benefits. Benefits for the people like Suresh. We met Suresh when he was looking for daily job work in Mumbai. Let ' s hear from him. Suresh Waidande : My wife and I work very hard to ensure that our children do not have to do hard labor, that they get a good education. My name is Suresh Bhimrao Waidande. I ' m from the Khatav Block of Satara district. I got tired of being poor and quit school to work for daily wages. I decided that I had to work hard to survive and make sure that I could feed my family. So I came to Mumbai. When I arrived I took the Koyna Express from Satara to Mumbai. It was my first time taking a train. I saw mountains, valleys, canyons and tunnels. The atmosphere was so different. For my first job, I was paid something like 30-40 rupees a day. As a daily laborer, there are many problems. and some are really difficult to overcome. If workers take on jobs without proper identification or attendance cards [to track their hours], they can potentially lose payment. Sometimes the employer doesn ' t pay for your travel like they should, or they promise you work and then give it to someone else. There is a lot of injustice. Such information is shared by Jan Sahas. But not everything about our work is formal, so they ask us to be careful and aware. They provide us information about our rights. And assure us of support if we are treated unfairly or face any injustice. Whether it ' s Mumbai or any other city in India, the country cannot survive without workers like us. The great poet Annabhau Sathe used to say, this land is not resting on Earth but on callused hands of workers. The only way that any town, village or country can develop is through the hard labor of workers. AS : With support of our team, Suresh has access to food security, insurance and a hope to continue education for his children. And most importantly, most importantly, knowledge on how to access his rights and entitlements. Let me leave you with this. With climate change, the migration is set to grow at an unprecedented scale in our countries. We will scale our program across south and southeast Asia to share our work with the world. There are hundreds of millions of people who work very hard to build modern society from the ground up. The buildings where we live or work in, the airport, the big hotels, but yet none of these [are] accessible for them. This is the moment where we should recognize their contribution. And ensure they will no longer be invisible or ignored. They belong. We do this work to honor their dignity. Thank you.

My subject is the future of life on Earth. This is a very large and complex topic. It ’ s the subject of futurology. And in fact, I am a palaeontologist, I study dinosaurs, and you might wonder why a palaeontologist would have something to say about the future. However, there are some shared aspects which I will talk about, and this can provide some evidence to help us in making decisions. I—m a palaeontologist, as I say. I decided on this career when I was seven years old. I loved dinosaurs at the age of seven, and I think these days, young people still do. And I haven ’ t changed my view since. I love the job, teaching students, going to exotic parts of the world to dig up dinosaurs, finding new facts about the history of life. However, this kind of subject, studying the past, like studying the future, could be said by some not to be truly scientific. And I want to explore that a little bit first, how do we do this, before we get to the point of beginning to establish some facts and figures about life and current threats. And this has been criticised by other scientists. For example, 100 years ago, Sir Ernest Rutherford, a very famous physicist, Nobel Prize winner, said, ’ All of science is physics, and the rest is stamp collecting. ’ By which he meant that if you cannot make it into mathematics or physics, it doesn ’ t count. That excludes then the natural sciences, medicine and a lot of other areas. And I think at the far end of the spectrum would be my subject, palaeontology. I ’ d like to give you an example though, to show you how we apply scientific methods to achieve a certain level of understanding and certainty. And this is something that has been developing during my career so that when I started, a lot of what we did would be called a speculation or guesswork, whereas now, a lot of what we do can be tested and can be called scientific. The example I ’ m going to take is the question I asked when I was seven, ’ Could T. rex bite a car in half? ’ This is a question about the most famous dinosaur, Tyrannosaurus Rex, which was huge, five tons in weight, enormous jaws and teeth. Could it bite a car in half? Well, there were no cars in the Cretaceous, but let ’ s forget that for the moment. When I started, you could only answer that question by guesswork, or you could make some very simple models of the skull, like levers, and try to calculate things. If you were going to make a realistic model that had all the properties of the original bone and flesh of the dinosaur, you could not do it. But now, with the power of computing, we can do this kind of thing. So the way you calculate the bite force of T. rex, and the way people have done it, is they scan a skull and make a three-dimensional, digital model inside the computer. You then divide that model into a mesh, or into a framework of elements or small components. And each of these elements can be given physical properties so that we know the physical properties of bone of living animals. These are material properties, like how far can you twist the bone

before it breaks, how much compression can that bone take. And so all of those properties are mapped into the skull. And then you apply imaginary forces and increase those pressures until the thing breaks. And so the bite force of T. rex is huge. Let me lead you to the figure. Our bite force is about 800 newtons at most. The biggest bite force of any living animal is the great white shark, and that is about 5, 000 newtons. T. rex, 50, 000 newtons, ten times. And that ' s equivalent to five tons of weight, acting. So it could bite a car in half. Why do we believe this method? Because this method is a standard in design and architecture. Finite element analysis is used for designing buildings like this one. You don ' t simply build it and hope it doesn ' t fall down. The thing is designed in a computer, it is stress-tested using this program we apply to the dinosaur. I think we can believe it. But let ' s move on. That was just a brief word about how you can actually apply science, I would argue, to questions that are not happening at our time, in the past, or maybe in the future. And in palaeontology, we don ' t just find fossils. We also care about evolution and diversification, how groups have become diverse, how groups go extinct. And at the moment, we are crucially concerned about extinction. So let ' s have a look at that, let ' s explore that. What are the current views? And these views are expressed not by scientists, but also by very important politicians. So some of you may recall, a number of years ago, Al Gore, who was then vice president of the United States - He quoted a figure of 100 species are going extinct every day. So this is a very high rate of extinction, 100 per day, which is equivalent to 40, 000 per year. At the other end, other politicians, perhaps in President Trump ' s camp, would say, ' Don ' t worry about it. Extinction happens. Look at the dinosaurs. We ' ve got nothing to do. ' So how do you connect between these two positions because of course we have to think about these points. The first approach that we use is to look at history. We have recent history recorded of extinction. So many of you will be familiar with the extinct bird called the dodo. This lived on the island of Mauritius in the Indian Ocean. The dodo was a kind of fat, flightless bird related to pigeons, and a very famous image of the dodo was in the famous children ' s book ' Alice in Wonderland ', where the dodo, who is a wise, old gentleman with a walking stick organises Alice and all the animals and says to them, ' We will have a Caucus race. ' And a Caucus race is one where people start when they like and they finish when they like, and everybody gets a prize. So that was very nice, but unfortunately the dodo in real life didn ' t get a prize. Because some of you may know the first records of dodos were in 1598 when seamen reported they had seen this bird. They could go on the island and catch it very easily and eat it. And within 60 years it was extinct. Another example of recorded extinction is the great auk. This was a large bird that lived in the North Atlantic, and the great auk went extinct in 1844. How do we know that? Because collectors sent by a museum shot the last example. They were concerned that their museum did not have a stuffed specimen of this bird. They heard it was going extinct, so they thought, ' We ' d better get one before it dies out. ' So these are two examples of data about extinction. And indeed through the last 500 years, mankind has killed many species which are recorded like that. And this is the basis of the figure that Al Gore gave. Let me explain it. He gave that figure of 100 species per day going extinct. This was based on the bird data. But we know something like 100 or two or three hundred species of birds have been killed by human activity in the last 500 years. And the figures are debated. It ' s something like from half a species to four species each year on average. We don ' t know for sure because of course people didn ' t record everything. Now, how do we scale this up to get a global figure, from birds on the one hand to all of life? And the way it was done was simply to say, ' We know how many species or birds there are alive today. ’ There are 10, 000, and the initial estimate for the diversity of all of life were 100 million. So you scale from four a day upwards, and that brings you up to this figure of 100 per day by multiplying up many times ; 40, 000 lost per year, 100 per day, based on that extreme high bird figure. At the other end, the lowest estimate is something like one species per day. This is because we are not sure about that bird figure, so we could take a lower estimate, and also we are actually not sure about the diversity of life today either. Some of you will know that you might think we would have named every species, we would know that - we don ’ t. You can look at Wikipedia. There are thousands and thousands of pages describing all the living species, but there are so many living species that we have never discovered, never described, aren ’ t there in Wikipedia. So there is that uncertainty. One hundred million? Ten million? We don ’ t know. Those are the estimates of numbers of species going extinct each day. One per day, one hundred per day. Do we worry about that? This is where palaeontology comes in first, because fossil data allows us to calculate what would be the normal rate of extinction. Species do go extinct, so this politician over here was quite right. But was Al Gore right? We don ’ t know. You know, he was giving that high figure - maybe somewhere in between. But what is the norm? Is one a day okay? It doesn ’ t sound too many. If there are millions and millions of species, it is far too high. We know that the average duration of a species is two million years. They originate, they go extinct. Two million years. And that means, as they come and go, on average, we would expect the extinction of five million species every million years, which is five species per year. So that does contrast remarkably even at the lowest estimate of human impact - 500 species per year is 100 times the normal rate of 5 per year. And at the bottom there is the dodo, just in case you weren ’ t sure what it looked like. So I want to look at two other topics briefly. One is risk. And so, one of the questions we would have estimating the total numbers is one thing. We have learned that we are impacting life harder than we should be. Human activity is causing extinction. What about risk? It ’ s easy to say of course, the dodo was stupid, it lived on one island, it just stood around and allowed itself to be hit on the head. To an extent. We worry about elephants, we worry about pandas, we worry about many individual species. Many of those have high- risk factors. So for example, an elephant is very large. This means they need a lot of food, they need a lot of territory to walk around. And so it ’ s much harder to keep a sufficiently large population of elephants breeding and successfully in the wild. We don ’ t need to worry about rats, for example. They ’ re small and there ’ s lots of them. So body size is one risk factor. Being big is not a good thing if you want to survive as a species. What about the panda? They ’ re not so huge. They ’ re about human size. They have a specialised diet. They have evolved into a crazy position. As you know, they are eating bamboo without the real ability to consume it properly. If that food supply disappears, they ’ re stuck. So, secondly, restricted diet is a problem. The third one is shown by the dodo. If you live in only a very small geographic area rather than over the whole world, you are at risk. So there are three things to be : medium-sized or small, if you want to survive ; broad diet, willing to eat everything ; and living over the whole world. So that includes human beings and rats and cockroaches. They will survive and many other species will not survive whatever we do. So risk is something we can determine from the present day, but also we can test when we look at mass extinctions in the past. So this is where we come back to palaeontology, because I think most people here know that the end of the dinosaurs was marked by a mass extinction. Many millions or thousands of species died out rather rapidly. The cause of that extinction definitely was largely the impact of a meteorite, a huge asteroid, maybe ten kilometres across, and the model for extinction of the dinosaurs 66 million years ago was the asteroid hit the Earth - this is unpredictable, when this may happen or not - it penetrated into the crust, it vaporised, and all that rock of the asteroid plus the crust that it had penetrated turned into rocks and dust, mainly dust. This was thrown up high into the atmosphere and went all round the Earth, blacking out the sun, and so that you get two effects there, no light, no heat. So there was a cessation of photosynthesis. The plants died. There was darkness and cold. So this was not good for dinosaurs and other groups that enjoyed the warm climates, and so you get extinction. And you might think, of course, ’ What do we learn from this? ’ Yes, that ’ s all very well, but that ’ s not something we can do anything about really. And indeed, asteroids do come close to the Earth from time to time. Earlier this week, one did. Luckily it didn ’ t hit the Earth. We can ’ t really prepare. But the key point is that the other mass extinctions in the history of life were not caused by impact. They were caused by climate change. Immediately, you can see now how that matters. I will briefly characterise one of them that I have worked upon. At the end of the Permian Period, 250 million years ago, there was another major extinction. This was before the dinosaurs. And the sequence of events was that massive volcanoes errupted in Russia. They were so huge that they poured out enormous amounts of lava, of course, but more importantly, they poured out gases into the atmosphere, including carbon dioxide. And carbon dioxide is famous as a greenhouse gas, meaning it heats the atmosphere. We have primary evidence that around the equator, ocean temperatures warmed up to 40 degrees plus. So this is like a very warm shower. You might think that ’ s OK. Maybe for 10 minutes but not for day after day after day. And so life had to progressively flee out of the equatorial zones. It became crowded at the poles and there was great extinction. So we learnt from that that carbon dioxide and global warming can cause extinction whatever the cause of that carbon dioxide, whether it comes from volcanoes or human activity. So we ’ ve learnt three things that we can illustrate and use for predicting into the future, what may happen to life. We ’ ve learnt that we can calculate the rate of extinction by looking at historical extinctions and at that rate of extinction, even at the minimal figures, it ’ s at least one hundred times what it ought to be. Secondly, we ’ ve learnt something about risk, which species are most at risk of extinction, and I think that ’ s fairly straightforward. But we need the evidence to be able to argue the case. And thirdly, we ’ ve learnt that the whole history of the Earth records a rich record of climate change. We don ’ t need to do experiments, we don ’ t need to imagine what a world would be like without the polar ice caps. It has existed and we can study it. So to conclude, my aim has not been simply to spread doom and gloom, but to indicate that we have the power to change. And in order to change, we have to accept reality along the lines that we ’ re mentioning. And we have to ask the right questions about what we should do. And in order to decide what we should do, we need to use evidence. And some great evidence comes from the history of the Earth and the history of life. Thank you very much.

I could fit all movies ever made inside of this tube. If you can ’ t see it, that ’ s kind of the point. Before we understand how this is possible, it ’ s important to understand the value of this feat. All of our thoughts and actions these days, through photos and videos â even our fitness activities â are stored as digital data. Aside from running out of space on our phones, we rarely think about our digital footprint. But humanity has collectively generated more data in the last few years than all of preceding human history. Big data has become a big problem. Digital storage is really expensive, and none of these devices that we have really stand the test of time. There ’ s this nonprofit website called the Internet Archive. In addition to free books and movies, you can access web pages as far back as 1996. Now, this is very tempting, but I decided to go back and look at the TED website ’ s very humble beginnings. As you can see, it ’ s changed quite a bit in the last 30 years. So this led me to the first-ever TED, back in 1984, and it just so happened to be a Sony executive explaining how a compact disk works. Now, it ’ s really incredible to be able to go back in time and access this moment. It ’ s also really fascinating that after 30 years, after that first TED, we ’ re still talking about digital storage. Now, if we look back another 30 years, IBM released the first-ever hard drive back in 1956. Here it is being loaded for shipping in front of a small audience. It held the equivalent of one MP3 song and weighed over one ton. At 10, 000 dollars a megabyte, I don ’ t think anyone in this room would be interested in buying this thing, except maybe as a collector ’ s item. But it ’ s the best we could do at the time. We ’ ve come such a long way in data storage. Devices have evolved dramatically. But all media eventually wear out or become obsolete. If someone handed you a floppy drive today to back up your presentation, you ’ d probably look at them kind of strange, maybe laugh, but you ’ d have no way to use the damn thing. These devices can no longer meet our storage needs, although some of them can be repurposed. All technology eventually dies or is lost, along with our data, all of our memories. There ’ s this illusion that the storage problem has been solved, but really, we all just externalize it. We don ’ t worry about storing our emails and our photos. They ’ re just in the cloud. But behind the scenes, storage is problematic. After all, the cloud is just a lot of hard drives. Now, most digital data, we could argue, is not really critical. Surely, we could just delete it. But how can we really know what ’ s important today? We ’ ve learned so much about human history from drawings and writings in caves, from stone tablets. We ’ ve deciphered languages from the Rosetta Stone. You know, we ’ ll never really have the whole story, though. Our data is our story, even more so today. We won ’ t have our record recorded on stone tablets. But we don ’ t have to choose what is important now. There ’ s a way to store it all. It turns out that there ’ s a solution that ’ s been around for a few billion years, and it ’ s actually in this tube. DNA is nature ’ s oldest storage device. After all, it contains all the information necessary to build and maintain a human being. But what makes DNA so great? Well, let ’ s take our own genome as an example. If we were to print out all three billion A ’ s, T ’ s, C ’ s and G ’ s on a standard font, standard format, and then we were to stack all of those papers, it would be about 130 meters high, somewhere between the Statue of Liberty and the Washington Monument. Now, if we converted all those A ’ s, T ’ s, C ’ s and G ’ s to digital data, to zeroes and ones, it would total a few gigs. And that ’ s in each cell of our body. We have more than 30 trillion cells. You get the idea : DNA can store a ton of information in a minuscule space. DNA is also very durable, and it doesn ’ t even require electricity to store it. We know this because scientists have recovered DNA from ancient humans that lived hundreds of thousands of years ago. One of those is Ă▯tzi the Iceman. Turns out, he ’ s Austrian. He was found high, well-preserved, in the mountains between Italy and Austria, and it turns out that he has living genetic relatives here in Austria today. So one of you could be a cousin of Ă▯tzi. The point is that we have a better chance of recovering information from an ancient human than we do from an old phone. It ’ s also much less likely that we ’ ll lose the ability to read DNA than any single man-made device. Every single new storage format requires a new way to read it. We ’ ll always be able to read DNA. If we can no longer sequence, we have bigger problems than worrying about data storage. Storing data on DNA is not new. Nature ’ s been doing it for several billion years. In fact, every living thing is a DNA storage device. But how do we store data on DNA? This is Photo 51. It ’ s the first-ever photo of DNA, taken about 60 years ago. This is around the time that that same hard drive was released by IBM. So really, our understanding of digital storage and of DNA have coevolved. We first learned to sequence, or read DNA, and very soon after, how to write it, or synthesize it. This is much like how we learn a new language. And now we have the ability to read, write and copy DNA. We do it in the lab all the time. So anything, really anything, that can be stored as zeroes and ones can be stored in DNA. To store something digitally, like this photo, we convert it to bits, or binary digits. Each pixel in a black-and-white photo is simply a zero or a one. And we can write DNA much like an inkjet printer can print letters on a page. We just have to convert our data, all of those zeroes and ones, to A ’ s, T ’ s, C ’ s and G ’ s, and then we send this to a synthesis company. So we write it, we can store it, and when we want to recover our data, we just sequence it. Now, the fun part of all of this is deciding what files to include. We ’ re serious scientists, so we had to include a manuscript for good posterity. We also included a $50 Amazon gift card â don ’ t get too excited, it ’ s already been spent, someone decoded it â as well as an operating system, one of the first movies ever made and a Pioneer plaque. Some of you might have seen this. It has a depiction of a typical â apparently â male and female, and our approximate location in the Solar System, in case the Pioneer spacecraft ever encounters extraterrestrials. So once we decided what sort of files we want to encode, we package up the data, convert those zeroes and ones to A ’ s, T ’ s, C ’ s and G ’ s, and then we just send this file off to a synthesis company. And this is what we got back. Our files were in this tube. All we had to do was sequence it. This all sounds pretty straightforward, but the difference between a really cool, fun idea and something we can actually use is overcoming these practical challenges. Now, while DNA is more robust than any man-made device, it ’ s not perfect. It does have some weaknesses. We recover our message by sequencing the DNA, and every time data is retrieved, we lose the DNA. That ’ s just part of the sequencing process. We don ’ t want to run out of data, but luckily, there ’ s a way to copy the DNA that ’ s even cheaper and easier than synthesizing it. We actually tested a way to make 200 trillion copies of our files, and we recovered all the data without error. So sequencing also introduces errors into our DNA, into the A ’ s, T ’ s, C ’ s and G ’ s. Nature has a way to deal with this in our cells. But our data is stored in synthetic DNA in a tube, so we had to find our own way to overcome this problem. We decided to use an algorithm that was used to stream videos. When you ’ re streaming a video, you ’ re essentially trying to recover the original video, the original file. When we ’ re trying to recover our original files, we ’ re simply sequencing. But really, both of these processes are about recovering enough zeroes and ones to put our data back together. And so, because of our coding strategy, we were able to package up all of our data in a way that allowed us to make millions and trillions of copies and still always recover all of our files back. This is the movie we encoded. It ’ s one of the first movies ever made, and now the first to be copied more than 200 trillion times on DNA. Soon after our work was published, we participated in an”Ask Me Anything”on the website reddit. If you ’ re a fellow nerd, you ’ re very familiar with this website. Most questions were thoughtful. Some were comical. For example, one user wanted to know when we would have a literal thumb drive. Now, the thing is, our DNA already stores everything needed to make us who we are. It ’ s a lot safer to store data on DNA in synthetic DNA in a tube. Writing and reading data from DNA is obviously a lot more time-consuming than just saving all your files on a hard drive â for now. So initially, we should focus on long-term storage. Most data are ephemeral. It ’ s really hard to grasp what ’ s important today, or what will be important for future generations. But the point is, we don ’ t have to decide today. There ’ s this great program by UNESCO called the”Memory of the World”program. It ’ s been created to preserve historical materials that are considered of value to all of humanity. Items are nominated to be added to the collection, including that film that we encoded. While a wonderful way to preserve human heritage, it doesn ’ t have to be a choice. Instead of asking the current generation â us â what might be important in the future, we could store everything in DNA. Storage is not just about how many bytes but how well we can actually store the data and recover it. There ’ s always been this tension between how much data we can generate and how much we can recover and how much we can store. Every advance in writing data has required a new way to read it. We can no longer read old media. How many of you even have a disk drive in your laptop, never mind a floppy drive? This will never be the case with DNA. As long as we ’ re around, DNA is around, and we ’ ll find a way to sequence it. Archiving the world around us is part of human nature. This is the progress we ’ ve made in digital storage in 60 years, at a time when we were only beginning to understand DNA. Yet, we ’ ve made similar progress in half that time with DNA sequencers, and as long as we ’ re around, DNA will never be obsolete. Thank you.

I want to tell you a story about stories. And I want to tell you this story because I think we need to remember that sometimes the stories we tell each other are more than just tales or entertainment or narratives. They ’ re also vehicles for sowing inspiration and ideas across our societies and across time. The story I ’ m about to tell you is about how one of the most advanced technological achievements of the modern era has its roots in stories, and how some of the most important transformations yet to come might also. The story begins over 300 years ago, when Galileo Galilei first learned of the recent Dutch invention that took two pieces of shaped glass and put them in a long tube and thereby extended human sight farther than ever before. When Galileo turned his new telescope to the heavens and to the Moon in particular, he discovered something incredible. These are pages from Galileo ’ s book”Sidereus Nuncius,”published in 1610. And in them, he revealed to the world what he had discovered. And what he discovered was that the Moon was not just a celestial object wandering across the night sky, but rather, it was a world, a world with high, sunlit mountains and dark”mare,”the Latin word for seas. And once this new world and the Moon had been discovered, people immediately began to think about how to travel there. And just as importantly, they began to write stories about how that might happen and what those voyages might be like. One of the first people to do so was actually the Bishop of Hereford, a man named Francis Godwin. Godwin wrote a story about a Spanish explorer, Domingo Gonsales, who ended up marooned on the island of St. Helena in the middle of the Atlantic, and there, in an effort to get home, developed a machine, an invention, to harness the power of the local wild geese to allow him to fly — and eventually to embark on a voyage to the Moon. Godwin ’ s book,”The Man in the Moone, or a Discourse of a Voyage Thither,”was only published posthumously and anonymously in 1638, likely on account of the number of controversial ideas that it contained, including an endorsement of the Copernican view of the universe that put the Sun at the center of the Solar System, as well as a pre- Newtonian concept of gravity that had the idea that the weight of an object would decrease with increasing distance from Earth. And that ' s to say nothing of his idea of a goose machine that could go to the Moon. And while this idea of a voyage to the Moon by goose machine might not seem particularly insightful or technically creative to us today, what ' s important is that Godwin described getting to the Moon not by a dream or by magic, as Johannes Kepler had written about, but rather, through human invention. And it was this idea that we could build machines that could travel into the heavens, that would plant its seed in minds across the generations. The idea was next taken up by his contemporary, John Wilkins, then just a young student at Oxford, but later, one of the founders of the Royal Society. John Wilkins took the idea of space travel in Godwin ' s text seriously and wrote not just another story but a nonfiction philosophical treatise, entitled,"Discovery of the New World in the Moon, or, a Discourse Tending to Prove that ' tis Probable There May Be Another Habitable World in that Planet."And note, by the way, that word"habitable."That idea in itself would have been a powerful incentive for people thinking about how to build machines that could go there. In his books, Wilkins seriously considered a number of technical methods for spaceflight, and it remains to this day the earliest known nonfiction account of how we might travel to the Moon. Other stories would soon follow, most notably by Cyrano de Bergerac, with his"Lunar Tales."By the mid-17th century, the idea of people building machines that could travel to the heavens was growing in complexity and technical nuance. And yet, in the late 17th century, this intellectual progress effectively ceased. People still told stories about getting to the Moon, but they relied on the old ideas or, once again, on dreams or on magic. Why? Well, because the discovery of the laws of gravity by Newton and the invention of the vacuum pump by Robert Hooke and Robert Boyle meant that people now understood that a condition of vacuum existed between the planets, and consequentially between the Earth and the Moon. And they had no way of overcoming this, no way of thinking about overcoming this. And so, for well over a century, the idea of a voyage to the Moon made very little intellectual progress until the rise of the Industrial Revolution and the development of steam engines and boilers and most importantly, pressure vessels. And these gave people the tools to think about how they could build a capsule that could resist the vacuum of space. So it was in this context, in 1835, that the next great story of spaceflight was written, by Edgar Allan Poe. Now, today we think of Poe in terms of gothic poems and telltale hearts and ravens. But he considered himself a technical thinker. He grew up in Baltimore, the first American city with gas street lighting, and he was fascinated by the technological revolution that he saw going on all around him. He considered his own greatest work not to be one of his gothic tales but rather his epic prose poem"Eureka,"in which he expounded his own personal view of the cosmographical nature of the universe. In his stories, he would describe in fantastical technical detail machines and contraptions, and nowhere was he more influential in this than in his short story,"The Unparalleled Adventure of One Hans Pfaall."It ' s a story of an unemployed bellows maker in Rotterdam, who, depressed and tired of life — this is Poe, after all — and deeply in debt, he decides to build a hermetically enclosed balloon-borne carriage that is launched into the air by dynamite and from there, floats through the vacuum of space all the way to the lunar surface. And importantly, he did not develop this story alone, for in the appendix to his tale, he explicitly acknowledged Godwin ' s"A Man in the Moone"from over 200 years earlier as an influence, calling it"a singular and somewhat ingenious little book."And although this idea of a balloon-borne voyage to the Moon may seem not much more technically sophisticated than the goose machine, in fact, Poe was sufficiently detailed in the description of the construction of the device and in terms of the orbital dynamics of the voyage that it could be diagrammed in the very first spaceflight encyclopedia as a mission in the 1920s. And it was this attention to detail, or to"verisimilitude,"as he called it, that would influence the next great story : Jules Verne ' s"From the Earth to the Moon,"written in 1865. And it ' s a story that has a remarkable legacy and a remarkable similarity to the real voyages to the Moon that would take place over a hundred years later. Because in the story, the first voyage to the Moon takes place from Florida, with three people on board, in a trip that takes three days — exactly the parameters that would prevail during the Apollo program itself. And in an explicit tribute to Poe ' s influence on him, Verne situated the group responsible for this feat in the book in Baltimore, at the Baltimore Gun Club, with its members shouting,"Cheers for Edgar Poe!"as they began to lay out their plans for their conquest of the Moon. And just as Verne was influenced by Poe, so, too, would Verne ' s own story go on to influence and inspire the first generation of rocket scientists. The two great pioneers of liquid fuel rocketry in Russia and in Germany, Konstantin Tsiolkovsky and Hermann Oberth, both traced their own commitment to the field of spaceflight to their reading"From the Earth to the Moon"as teenagers, and then subsequently committing themselves to trying to make that story a reality. And Verne ' s story was not the only one in the 19th century with a long arm of influence. On the other side of the Atlantic, H. G. Wells ' s"War of the Worlds"directly inspired a young man in Massachusetts, Robert Goddard. And it was after reading"War of the Worlds"that Goddard wrote in his diary, one day in the late 1890s, of resting while trimming a cherry tree on his family ' s farm and having a vision of a spacecraft taking off from the valley below and ascending into the heavens. And he decided then and there that he would commit the rest of his life to the development of the spacecraft that he saw in his mind ' s eye. And he did exactly that. Throughout his career, he would celebrate that day as his anniversary day, his cherry tree day, and he would regularly read and reread the works of Verne and of Wells in order to renew his inspiration and his commitment over the decades of labor and effort that would be required to realize the first part of his dream : the flight of a liquid fuel rocket, which he finally achieved in 1926. So it was while reading"From the Earth to the Moon"and"The War of the Worlds"that the first pioneers of astronautics were inspired to dedicate their lives to solving the problems of spaceflight. And it was their treatises and their works in turn that inspired the first technical communities and the first projects of spaceflight, thus creating a direct chain of influence that goes from Godwin to Poe to Verne to the Apollo program and to the present-day communities of spaceflight. So why I have told you all this? Is it just because I think it ' s cool, or because I ' m just weirdly fascinated by stories of 17th- and 19th-century science fiction? It is, admittedly, partly that. But I also think that these stories remind us of the cultural processes driving spaceflight and even technological innovation more broadly. As an economist working at NASA, I spend time thinking about the economic origins of our movement out into the cosmos. And when you look before the investments of billionaire tech entrepreneurs and before the Cold War Space Race, and even before the military investments in liquid fuel rocketry, the economic origins of spaceflight are found in stories and in ideas. It was in these stories that the first concepts for spaceflight were articulated. And it was through these stories that the narrative of a future for humanity in space began to propagate from mind to mind, eventually creating an intergenerational intellectual community that would iterate on the ideas for spacecraft until such a time as they could finally be built. This process has now been going on for over 300 years, and the result is a culture of spaceflight. It ' s a culture that involves thousands of people over hundreds of years. Because for hundreds of years, some of us have looked at the stars and longed to go. And because for hundreds of years, some of us have dedicated our labors to the development of the concepts and systems required to make those voyages possible. I also wanted to tell you about Godwin, Poe and Verne because I think their stories also tell us of the importance of the stories that we tell each other about the future more generally. Because these stories don ’ t just transmit information or ideas. They can also nurture passions, passions that can lead us to dedicate our lives to the realization of important projects. Which means that these stories can and do influence social and technological forces centuries into the future. I think we need to realize this and remember it when we tell our stories. We need to work hard to write stories that don ’ t just show us the possible dystopian paths we may take for a fear that the more dystopian stories we tell each other, the more we plant seeds for possible dystopian futures. Instead we need to tell stories that plant the seeds, if not necessarily for utopias, then at least for great new projects of technological, societal and institutional transformation. And if we think of this idea that the stories we tell each other can transform the future is fanciful or impossible, then I think we need to remember the example of this, our voyage to the Moon, an idea from the 17th century that propagated culturally for over 300 years until it could finally be realized. So, we need to write new stories, stories that, 300 years in the future, people will be able to look back upon and remark how they inspired us to new heights and to new shores, how they showed us new paths and new possibilities, and how they shaped our world for the better. Thank you.

Text Sample 310: NEG Dim 2 – 2016 – Score 1.00 – 2016/t001326.txt

I ’ m an Iranian-American Muslim female, like all of you. And I ’ m also a social justice comedian, something that I insist is an actual job. To explain what that is, let me tell you how I got here. I ’ ve performed all over the country. And let me tell you, America is majestic, right? It ’ s got breathtaking nature, waffle houses and diabetes as far as the eye can see. It is really something. Now, the American population can be broken up into three main categories : there ’ s mostly wonderful people, haters and Florida. Besides Florida, the most troubling category here are the Haters. They are a minority, but they overcompensate by being extra loud. They have the Napoleon complex of demographics, and yes, some of the men do wear heels. As a social justice comedian, it ’ s my goal to convert these haters, because they hate a lot of things, which leads to negative outcomes, like racism, violence and Ted Nugent. This is not an exhaustive list ; I ’ m probably missing 3-7 items. But the point is, we have to reckon with the haters. But there ’ s variance within this group and it ’ s not efficient to go after all of them, right? So what I ’ ve done is created a highly scientific Taxonomy of Haters. I basically took all of the haters, I put them in a petri dish, like a scientist, and this is what I found. First off, we have the trolls. These are your garden-variety digital haters. They ’ re the people who quit their jobs so they can post on YouTube videos all day long. There ’ s also the drive-by haters. Now, these people will be at a stoplight, they ’ ll wait for the light to turn green and when it does, they yell,”Go back to your own country!”Now back in the day, they would ’ ve actually gotten out of their cars and hated you to your face. But they just don ’ t make them like they used to — which is another sign of the decline in America. The next category is the mission-oriented-bigot-whose-group-affiliation- gives-them-cover-for-hating hater. These guys like to hate via a seemingly nice organization, like a church or a nonprofit, and they oftentimes like to speak in an old-timey voice. But the group I ' m most interested in is the swing hater. The swing hater is sister to the swing voter — they just can ' t decide! They ' re like ideological sluts who move from hating to not hating. And they do it because they don ' t have enough information. This is the group I like to target with social justice comedy. Why comedy? Because on a scale of comedy to brochure, the average American prefers comedy, as you can see from this graph. Comedy is very popular. And by the way, this is a mathematically accurate graph, generated from fake numbers. Now, the question is : Why does social justice comedy work? Because, first off, it makes you laugh. And when you ' re laughing, you enter into a state of openness. And in that moment of openness, a good social justice comedian can stick in a whole bunch of information, and if they ' re really skilled, a rectal exam. Here are some ground rules for social justice comedy : first off, it ' s not partisan. This isn ' t political comedy, this is about justice, and no one is against justice. Two, it ' s inviting and warm, it makes you feel like you ' re sitting inside of a burrito. Three, it ' s funny but sneaky, like you could be hearing an interesting treatise on income inequality, that ' s encased in a really sophisticated poop joke. Here ' s how I see social justice comedy working. A few years ago, I rounded up a bunch of Muslim-American comedians — in a non-violent way — And we went around the country to places like Alabama, Arizona, Tennessee, Georgia — places where they love the Muzzies — and we did stand-up shows. We called the tour"The Muslims Are Coming!"We turned this into a movie, and then after the movie came out, a known hate group spent 300, 000 dollars on an anti-Muslim poster campaign with the MTA — that ' s the New York City subway system. Now, the posters were truly offensive, not to mentioned poorly designed — I mean, if you ' re going to be bigoted, you might as well use a better font. But we decided, why not launch our own poster campaign that says nice things about Muslims, while promoting the movie. So myself and fellow comedian Dean Obeidallah decided to launch the fighting-bigotry- with-delightful-posters campaign. We raised the money, worked with the MTA for over 5 months, got the posters approved, and two days after they were supposed to go up, the MTA decided to ban the posters, citing political content. Let ' s take a look at a couple of those posters. Here ' s one. Facts about Muslims : Muslims invented the concept of a hospital. OK. Fact : Grown-up Muslims can do more push-ups than baby Muslims. Fact : Muslims invented Justin Timberlake. Let ' s take a look at another one. The ugly truth about Muslims : they have great frittata recipes. Now clearly, frittatas are considered political by the MTA. Either that, or the mere mention of Muslims in a positive light was considered political — but it isn ' t. It ' s about justice. So we decided to change our fighting-bigortry-with- delightful-posters campaign and turn it into the fighting-bigotry- with-a-delightful-lawsuit campaign. So basically, what I ' m saying is a couple of dirtbag comedians took on a major New York City agency and the comedians won. Thank you. Victory was a very weird feeling. I was like,"Is this what blonde girls feel like all the time? ' Cause this is amazing!"Here ' s another example. I ' m asked everywhere I go :"Why don ' t Muslims denounce terrorism?"We do. But OK, I ' ll take the bait. So I decided to launch thedailydenouncer. com. It ' s a website that denounces terrorism every day of the week, while taking the weekends off. Let ' s take a look at an example. They generally appear as single-panel cartoons,"I denounce terrorism! I also denounce people who never fill the paper tray!"The point of the website is that it denounces terrorism while recognizing that it ' s ridiculous that we have to constantly denounce terrorism. But if bigotry isn ' t your thing, social justice comedy is useful for all sorts of issues. For example, myself and fellow comedian Lee Camp went to the Cayman Islands to investigate offshore banking. Now, the United States loses something like 300 billion dollars a year in these offshore tax havens. Not to brag, but at the end of every month, I have something like 5-15 dollars in disposable income. So we walked into these banks in the Cayman Islands and asked if we could open up a bank account with eight dollars and 27 cents. The bank managers would indulge us for 30-45 seconds before calling security. Security would come out, brandish their weapons, and then we would squeal with fear and run away, because — and this is the last rule of social justice comedy — sometimes it makes you want to take a dump in your pants. Most of my work is meant to be fun. It ' s meant to generate a connection and laughter. But yes, sometimes I get run off the grounds by security. Sometimes I get mean tweets and hate mail. Sometimes I get voice mails saying that if I continue telling my jokes, they ' ll kill me and they ' ll kill my family. And those death threats are definitely not funny. But despite the occasional danger, I still think that social justice comedy is one of our best weapons. I mean, we ' ve tried a lot of approaches to social justice, like war and competitive ice dancing. But still, a lot of things are still kind of awful. So I think it ' s time we try and tell a really good poop joke. Thank you.

So I know TED is about a lot of things that are big, but I want to talk to you about something very small. So small, it ' s a single word. The word is"misfit."It ' s one of my favorite words, because it ' s so literal. I mean, it ' s a person who sort of missed fitting in. Or a person who fits in badly. Or this :"a person who is poorly adapted to new situations and environments."I ' m a card- carrying misfit. And I ' m here for the other misfits in the room, because I ' m never the only one. I ' m going to tell you a misfit story. Somewhere in my early 30s, the dream of becoming a writer came right to my doorstep. Actually, it came to my mailbox in the form of a letter that said I ' d won a giant literary prize for a short story I had written. The short story was about my life as a competitive swimmer and about my crappy home life, and a little bit about how grief and loss can make you insane. The prize was a trip to New York City to meet big-time editors and agents and other authors. So kind of it was the wannabe writer ' s dream, right? You know what I did the day the letter came to my house? Because I ' m me, I put the letter on my kitchen table, I poured myself a giant glass of vodka with ice and lime, and I sat there in my underwear for an entire day, just staring at the letter. I was thinking about all the ways I ' d already screwed my life up. Who the hell was I to go to New York City and pretend to be a writer? Who was I? I ' ll tell you. I was a misfit. Like legions of other children, I came from an abusive household that I narrowly escaped with my life. I already had two epically failed marriages underneath my belt. I ' d flunked out of college not once but twice and maybe even a third time that I ' m not going to tell you about. And I ' d done an episode of rehab for drug use. And I ' d had two lovely staycations in jail. So I ' m on the right stage. But the real reason, I think, I was a misfit, is that my daughter died the day she was born, and I hadn ' t figured out how to live with that story yet. After my daughter died I also spent a long time homeless, living under an overpass in a kind of profound state of zombie grief and loss that some of us encounter along the way. Maybe all of us, if you live long enough. You know, homeless people are some of our most heroic misfits, because they start out as us. So you see, I ' d missed fitting in to just about every category out there : daughter, wife, mother, scholar. And the dream of being a writer was really kind of like a small, sad stone in my throat. It was pretty much in spite of

myself that I got on that plane and flew to New York City, where the writers are. Fellow misfits, I can almost see your heads glowing. I can pick you out of a room. At first, you would ' ve loved it. You got to choose the three famous writers you wanted to meet, and these guys went and found them for you. You got set up at the Gramercy Park Hotel, where you got to drink Scotch late in the night with cool, smart, swank people. And you got to pretend you were cool and smart and swank, too. And you got to meet a bunch of editors and authors and agents at very, very fancy lunches and dinners. Ask me how fancy. Audience : How fancy? Lidia Yuknavitch : I ' m making a confession : I stole three linen napkins — from three different restaurants. And I shoved a menu down my pants. I just wanted some keepsakes so that when I got home, I could believe it had really happened to me. You know? The three writers I wanted to meet were Carole Maso, Lynne Tillman and Peggy Phelan. These were not famous, best-selling authors, but to me, they were women-writer titans. Carole Maso wrote the book that later became my art bible. Lynne Tillman gave me permission to believe that there was a chance my stories could be part of the world. And Peggy Phelan reminded me that maybe my brains could be more important than my boobs. They weren ' t mainstream women writers, but they were cutting a path through the mainstream with their body stories, I like to think, kind of the way water cut the Grand Canyon. It nearly killed me with joy to hang out with these three over-50-year-old women writers. And the reason it nearly killed me with joy is that I ' d never known a joy like that. I ' d never been in a room like that. My mother never went to college. And my creative career to that point was a sort of small, sad, stillborn thing. So kind of in those first nights in New York I wanted to die there. I was just like,"Kill me now. I ' m good. This is beautiful."Some of you in the room will understand what happened next. First, they took me to the offices of Farrar, Straus and Giroux. Farrar, Straus and Giroux was like my mega-dream press. I mean, T. S. Eliot and Flannery O ' Connor were published there. The main editor guy sat me down and talked to me for a long time, trying to convince me I had a book in me about my life as a swimmer. You know, like a memoir. The whole time he was talking to me, I sat there smiling and nodding like a numb idiot, with my arms crossed over my chest, while nothing, nothing, nothing came out of my throat. So in the end, he patted me on the shoulder like a swim coach might. And he wished me luck and he gave me some free books and he showed me out the door. Next, they took me to the offices of W. W. Norton, where I was pretty sure I ' d be escorted from the building just for wearing Doc Martens. But that didn ' t happen. Being at the Norton offices felt like reaching up into the night sky and touching the moon while the stars stitched your name across the cosmos. I mean, that ' s how big a deal it was to me. You get it? Their lead editor, Carol Houck Smith, leaned over right in my face with these beady, bright, fierce eyes and said,"Well, send me something then, immediately!"See, now most people, especially TED people, would have run to the mailbox, right? It took me over a decade to even imagine putting something in an envelope and licking a stamp. On the last night, I gave a big reading at the National Poetry Club. And at the end of the reading, Katharine Kidde of Kidde, Hoyt & Picard Literary Agency, walked straight up to me and shook my hand and offered me representation, like, on the spot. I stood there and I kind of went deaf. Has this ever happened to you? And I almost started crying because all the people in the room were dressed so beautifully, and all that came out of my mouth was :"I don ' t know. I have to think about it."And she said,"OK, then,"and walked away. All those open hands out to me, that small, sad stone in my throat... You see, I ' m trying to tell you something about people like me. Misfit people — we don ' t always know how to hope or say yes or choose the big thing, even when it ' s right in front of us. It ’ s a shame we carry. It ’ s the shame of wanting something good. It ’ s the shame of feeling something good. It ’ s the shame of not really believing we deserve to be in the room with the people we admire. If I could, I ’ d go back and I ’ d coach myself. I ’ d be exactly like those over- 50-year-old women who helped me. I ’ d teach myself how to want things, how to stand up, how to ask for them. I ’ d say,”You! Yeah, you! You belong in the room, too.”The radiance falls on all of us, and we are nothing without each other. Instead, I flew back to Oregon, and as I watched the evergreens and rain come back into view, I just drank many tiny bottles of airplane”feel sorry for yourself.”I thought about how, if I was a writer, I was some kind of misfit writer. What I ’ m saying is, I flew back to Oregon without a book deal, without an agent, and with only a headful and heart-ful of memories of having sat so near the beautiful writers. Memory was the only prize I allowed myself. And yet, at home in the dark, back in my underwear, I could still hear their voices. They said,”Don ’ t listen to anyone who tries to get you to shut up or change your story.”They said,”Give voice to the story only you know how to tell.”They said,”Sometimes telling the story is the thing that saves your life.”Now I am, as you can see, the woman over 50. And I ’ m a writer. And I ’ m a mother. And I became a teacher. Guess who my favorite students are. Although it didn ’ t happen the day that dream letter came through my mailbox, I did write a memoir, called”The Chronology of Water.”In it are the stories of how many times I ’ ve had to reinvent a self from the ruins of my choices, the stories of how my seeming failures were really just weird-ass portals to something beautiful. All I had to do was give voice to the story. There ’ s a myth in most cultures about following your dreams. It ’ s called the hero ’ s journey. But I prefer a different myth, that ’ s slightly to the side of that or underneath it. It ’ s called the misfit ’ s myth. And it goes like this : even at the moment of your failure, right then, you are beautiful. You don ’ t know it yet, but you have the ability to reinvent yourself endlessly. That ’ s your beauty. You can be a drunk, you can be a survivor of abuse, you can be an ex-con, you can be a homeless person, you can lose all your money or your job or your husband or your wife, or the worst thing of all, a child. You can even lose your marbles. You can be standing dead center in the middle of your failure and still, I ’ m only here to tell you, you are so beautiful. Your story deserves to be heard, because you, you rare and phenomenal misfit, you new species, are the only one in the room who can tell the story the way only you would. And I ’ d be listening. Thank you.

Text Sample 312: NEG Dim 2 – 2016 – Score 1.00 – 2016/t001358.txt

So I ’ m an artist, but a little bit of a peculiar one. I don ’ t paint. I can ’ t draw. My shop teacher in high school wrote that I was a menace on my report card. You probably don ’ t really want to see my photographs. But there is one thing I know how to do : I know how to program a computer. I can code. And people will tell me that 100 years ago, folks like me didn ’ t exist, that it was impossible, that art made with data is a new thing, it ’ s a product of our age, it ’ s something that ’ s really important to think of as something that ’ s very”now.”And that ’ s true. But there is an art form that ’ s been around for a very long time that ’ s really about using information, abstract information, to make emotionally resonant pieces. And it ’ s called music. We ’ ve been making music for tens of thousands of years, right? And if you think about what music is — notes and chords and keys and harmonies and melodies — these things are algorithms. These things are systems that are designed to unfold over time, to make us feel. I came to the arts through music. I was trained as a composer, and about 15 years ago, I started making pieces that were designed to look at the intersection between sound and image, to use an image to unveil a musical structure or to use a sound to show you something interesting about something that ' s usually pictorial. So what you ' re seeing on the screen is literally being drawn by the musical structure of the musicians onstage, and there ' s no accident that it looks like a plant, because the underlying algorithmic biology of the plant is what informed the musical structure in the first place. So once you know how to do this, once you know how to code with media, you can do some pretty cool stuff. This is a project I did for the Sundance Film Festival. Really simple idea : you take every Academy Award Best Picture, you speed it up to one minute each and string them all together. And so in 75 minutes, I can show you the history of Hollywood cinema. And what it really shows you is the history of editing in Hollywood cinema. So on the left, we ' ve got Casablanca ; on the right, we ' ve got Chicago. And you can see that Casablanca is a little easier to read. That ' s because the average length of a cinematic shot in the 1940s was 26 seconds, and now it ' s around six seconds. This is a project that was inspired by some work that was funded by the US Federal Government in the early 2000s, to look at video footage and find a specific actor in any video. And so I repurposed this code to train a system on one person in our culture who would never need to be surveilled in that manner, which is Britney Spears. I downloaded 2, 000 paparazzi photos of Britney Spears and trained my computer to find her face and her face alone. I can run any footage of her through it and will center her eyes in the frame, and this sort of is a little double commentary about surveillance in our society. We are very fraught with anxiety about being watched, but then we obsess over celebrity. What you ' re seeing on the screen here is a collaboration I did with an artist named Lin Amaris. What she did is very simple to explain and describe, but very hard to do. She took 72 minutes of activity, getting ready for a night out on the town, and stretched it over three days and performed it on a traffic island in slow motion in New York City. I was there, too, with a film crew. We filmed the whole thing, and then we reversed the process, speeding it up to 72 minutes again, so it looks like she ' s moving normally and the whole world is flying by. At a certain point, I figured out that what I was doing was making portraits. When you think about portraiture, you tend to think about stuff like this. The guy on the left is named Gilbert Stuart. He ' s sort of the first real portraitist of the United States. And on the right is his portrait of George Washington from 1796. This is the so-called Lansdowne portrait. And if you look at this painting, there ' s a lot of symbolism, right? We ' ve got a rainbow out the window. We ' ve got a sword. We ' ve got a quill on the desk. All of these things are meant to evoke George Washington as the father of the nation. This is my portrait of George Washington. And this is an eye chart, only instead of letters, they ' re words. And what the words are is the 66 words in George Washington ' s State of the Union addresses that he uses more than any other president. So"gentlemen"has its own symbolism and its own rhetoric. And it ' s really kind of significant that that ' s the word he used the most. This is the eye chart for George W. Bush, who was president when I made this piece. And how you get there, from"gentlemen"to"terror"in 43 easy steps, tells us a lot about American history, and gives you a different insight than you would have looking at a series of paintings. These pieces provide a history lesson of the United States through the political rhetoric of its leaders. Ronald Reagan spent a lot of time talking about deficits. Bill Clinton spent a lot of time talking about the century in which he would no longer be president, but maybe his wife would be. Lyndon Johnson was the first President to give his State of the Union addresses on prime-time television ; he began every paragraph with the word"tonight."And Richard Nixon, or more accurately, his speechwriter, a guy named William Safire, spent a lot of time thinking about language and making sure that his boss portrayed a rhetoric of honesty. This project is shown as a series of monolithic sculptures. It ' s an outdoor series of light boxes. And it ' s important to note that they ' re to scale, so if you stand 20 feet back and you can read between those two black lines, you have 20 / 20 vision. This is a portrait. And there ' s a lot of these. There ' s a lot of ways to do this with data. I started looking for a way to think about how I can do a more democratic form of portraiture, something that ' s more about my country and how it works. Every 10 years, we make a census in the United States. We literally count people, find out who lives where, what kind of jobs we ' ve got, the language we speak at home. And this is important stuff — really important stuff. But it doesn ' t really tell us who we are. It doesn ' t tell us about our dreams and our aspirations. And so in 2010, I decided to make my own census. And I started looking for a corpus of data that had a lot of descriptions written by ordinary Americans. And it turns out that there is such a corpus of data that ' s just sitting there for the taking. It ' s called online dating. So in 2010, I joined 21 different online dating services, as a gay man, a straight man, a gay woman and a straight woman, in every zip code in America and downloaded about 19 million people ' s dating profiles — about 20 percent of the adult population of the United States. I have obsessive-compulsive disorder. This is going to become really freaking obvious. Just go with me. So what I did was I sorted all this stuff by zip code. And I looked at word analysis. These are some dating profiles from 2010 with the word"lonely"highlighted. If you look at these things topographically, if you imagine dark colors to light colors are more use of the word, you can see that Appalachia is a pretty lonely place. You can also see that Nebraska ain ' t that funny. This is the kinky map, so what this is showing you is that the women in Alaska need to get together with the men in southern New Mexico, and have a good time. And I have this at a pretty granular level, so I can tell you that the men in the eastern half of Long Island are way more interested in being spanked than men in the western half of Long Island. This will be your one takeaway from this whole conference. You ' re going to remember that fact for, like, 30 years. When you bring this down to a cartographic level, you can make maps and do the same trick I was doing with the eye charts. You can replace the name of every city in the United States with the word people use more in that city than anywhere else. If you ' ve ever dated anyone from Seattle, this makes perfect sense. You ' ve got"pretty."You ' ve got"heartbreak."You ' ve got"gig."You ' ve got"cigarette."They play in a band and they smoke. And right above that you can see"email."That ' s Redmond, Washington, which is the headquarters of the Microsoft Corporation. Some of these you can guess — so, Los Angeles is"acting"and San Francisco is"gay."Some are a little bit more heartbreaking. In Baton Rouge, they talk about being curvy ; downstream in New Orleans, they still talk about the flood. Folks in the American capital will say they ' re interesting. People in Baltimore, Maryland, will say they ' re afraid. This is New Jersey. I grew up somewhere between"annoying"and"cynical."And New York City ' s number one word is"now,"as in,"Now I ' m working as a waiter, but actually I ' m an actor."Or,"Now I ' m a professor of engineering at NYU, but actually I ' m an artist."If you go upstate, you see"dinosaur."That ' s Syracuse. The best place to eat in Syracuse, New York, is a Hell ' s Angels barbecue joint called Dinosaur Barbecue. That ' s where you would take somebody on a date. I live somewhere between"unconditional"and"midsummer,"in Midtown Manhattan. And this is gentrified North Brooklyn, so you ' ve got"DJ"and"glamorous"and"hipsters"and"urbane."So that ' s maybe a more democratic portrait. And the idea was, what if we made red-state and blue-state maps based on what we want to do on a Friday night? This is a self-portrait.

This is based on my email, about 500, 000 emails sent over 20 years. You can think of this as a quantified selfie. So what I ’ m doing is running a physics equation based on my personal data. You have to imagine everybody I ’ ve ever corresponded with. It started out in the middle and it exploded with a big bang. And everybody has gravity to one another, gravity based on how much they ’ ve been emailing, who they ’ ve been emailing with. And it also does sentimental analysis, so if I say”I love you,”you ’ re heavier to me. And you attract to my email addresses in the middle, which act like mainline stars. And all the names are handwritten. Sometimes you do this data and this work with real-time data to illuminate a specific problem in a specific city. This is a Walther PPK 9mm semiautomatic handgun that was used in a shooting in the French Quarter of New Orleans about two years ago on Valentine ’ s Day in an argument over parking. Those are my cigarettes. This is the house where the shooting took place. This project involved a little bit of engineering. I ’ ve got a bike chain rigged up as a cam shaft, with a computer driving it. That computer and the mechanism are buried in a box. The gun ’ s on top welded to a steel plate. There ’ s a wire going through to the trigger, and the computer in the box is online. It ’ s listening to the 911 feed of the New Orleans Police Department, so that anytime there ’ s a shooting reported in New Orleans, the gun fires. Now, there ’ s a blank, so there ’ s no bullet. There ’ s big light, big noise and most importantly, there ’ s a casing. There ’ s about five shootings a day in New Orleans, so over the four months this piece was installed, the case filled up with bullets. You guys know what this is — you call this”data visualization.”When you do it right, it ’ s illuminating. When you do it wrong, it ’ s anesthetizing. It reduces people to numbers. So watch out. One last piece for you. I spent the last summer as the artist in residence for Times Square. And Times Square in New York is literally the crossroads of the world. One of the things people don ’ t notice about it is it ’ s the most Instagrammed place on Earth. About every five seconds, someone commits a selfie in Times Square. That ’ s 17, 000 a day, and I have them all. These are some of them with their eyes centered. Every civilization, will use the maximum level of technology available to make art. And it ’ s the responsibility of the artist to ask questions about what that technology means and how it reflects our culture. So I leave you with this : we ’ re more than numbers. We ’ re people, and we have dreams and ideas. And reducing us to statistics is something that ’ s done at our peril. Thank you very much.

I thought I would read poems I have that relate to the subject of youth and age. I was sort of astonished to find out how many I have actually. The first one is dedicated to Spencer, and his grandmother, who was shocked by his work. My poem is called”Dirt.”My grandmother is washing my mouth out with soap ; half a long century gone and still she comes at me with that thick cruel yellow bar. All because of a word I said, not even said really, only repeated. But”Open,”she says,”open up!”her hand clawing at my head. I know now her life was hard ; she lost three children as babies, then her husband died too, leaving young sons, and no money. She ’ d stand me in the sink to pee because there was never room in the toilet. But oh, her soap! Might its bitter burning have been what made me a poet? The street she lived on was unpaved, her flat, two cramped rooms and a fetid kitchen where she stalked and caught me. Dare I admit that after she did it I never really loved her again? She lived to a hundred, even then. All along it was the sadness, the squalor, but I never, until now loved her again. When that was published in a magazine I got an irate letter from my uncle.”You have maligned a great woman.”It took some diplomacy. This is called”The Dress.”It ’ s a longer poem. In those days, those days which exist for me only as the most elusive memory now, when often the first sound you ’ d hear in the morning would be a storm of birdsong, then the soft clop of the hooves of the horse hauling a milk wagon down your block, and the last sound at night as likely as not would be your father pulling up in his car, having worked late again, always late, and going heavily down to the cellar, to the furnace, to shake out the ashes and damp the draft before he came upstairs to fall into bed — in those long-ago days, women, my mother, my friends ’ mothers, our neighbors, all the women I knew — wore, often much of the day, what were called house-dresses, cheap, printed, pulpy, seemingly purposefully shapeless light cotton shifts that you wore over your nightgown and, when you had to go look for a child, hang wash on the line, or run down to the grocery store on the corner, under a coat, the twisted hem of the nightgown always lank and yellowed, dangling beneath. More than the curlers some of the women seemed constantly to have in their hair in preparation for some great event — a ball, one would think — that never came to pass ; more than the way most women ’ s faces not only were never made up during the day, but seemed scraped, bleached, and, with their plucked eyebrows, scarily masklike ; more than all that it was those dresses that made women so unknowable and forbidding, adepts of enigmas to which men could have no access, and boys no conception. Only later would I see the dresses also as a proclamation : that in your dim kitchen, your laundry, your bleak concrete yard, what you revealed of yourself was a fabulation ; your real sensual nature, veiled in those sexless vestments, was utterly your dominion. In those days, one hid much else as well : grown men didn ’ t embrace one another, unless someone had died, and not always then ; you shook hands or, at a ball game, thumped your friend ’ s back and exchanged blows meant to be codes for affection ; once out of childhood you ’ d never again know the shock of your father ’ s whiskers on your cheek, not until mores at last had evolved, and you could hug another man, then hold on for a moment, then even kiss. What release finally, the embrace : though we were wary — it seemed so audacious — how much unspoken joy there was in that affirmation of equality and communion, no matter how much misunderstanding and pain had passed between you by then. We knew so little in those days, as little as now, I suppose about healing those hurts : even the women, in their best dresses, with beads and sequins sewn on the bodices, even in lipstick and mascara, their hair aflow, could only stand wringing their hands, begging for peace, while father and son, like thugs, like thieves, like Romans, simmered and hissed and hated, inflicting sorrows that endured, the worst anyway, through the kiss and embrace, bleeding from brother to brother, into the generations. In those days there was still countryside close to the city, farms, cornfields, cows ; even not far from our building with its blurred brick and long shadowy hallway you could find tracts with hills and trees you could pretend were mountains and forests. Or you could go out by yourself even to a half-block-long empty lot, into the bushes : like a creature of leaves you ’ d lurk, crouched, crawling, simplified, savage, alone ; already there was wanting to be simpler, wanting, when they called you, never to go back. This is another longish one, about the old and the young. It actually happened right at the time we met. Part of the poem takes place in space we shared and time we shared. It ’ s called”The Neighbor.”Her five horrid, deformed little dogs who incessantly yap on the roof under my window. Her cats, God knows how many, who must piss on her rugs — her landing ’ s a sickening reek. Her shadow once, fumbling the chain on her door, then the door slamming fearfully shut, only the barking and the music — jazz

— filtering as it does, day and night into the hall. The time it was Chris Connor singing"Lush Life"— how it brought back my college sweetheart, my first real love, who — till I left her — played the same record. And head on my shoulder, hand on my thigh, sang sweetly along, of regrets and depletions she was too young for, as I was too young, later, to believe in her pain. It startled, then bored, then repelled me. My starting to fancy she ' d ended up in this fire-trap in the Village, that my neighbor was her. My thinking we ' d meet, recognize one another, become friends, that I ' d accomplish a penance. My seeing her, it wasn ' t her, at the mailbox. Gray-yellow hair, army pants under a night-gown, her turning away, hiding her ravaged face in her hands, muttering an inappropriate"Hi."Sometimes there are frightening goings-on in the stairwell. A man shouting,"Shut up!"The dogs frantically snarling, claws scrabbling, then her — her voice hoarse, harsh, hollow, almost only a tone, incoherent, a note, a squawk, bone on metal, metal gone molten, calling them back,"Come back darlings, come back dear ones. My sweet angels, come back."Medea she was, next time I saw her. Sorceress, tranced, ecstatic, stock-still on the sidewalk ragged coat hanging agape, passersby flowing around her, her mouth torn suddenly open as though in a scream, silently though, as though only in her brain or breast had it erupted. A cry so pure, practiced, detached, it had no need of a voice, or could no longer bear one. These invisible links that allure, these transfigurations, even of anguish, that hold us. The girl, my old love, the last lost time I saw her when she came to find me at a party, her drunkenly stumbling, falling, sprawling, skirt hiked, eyes veined red, swollen with tears, her shame, her dishonor. My ignorant, arrogant coarseness, my secret pride, my turning away. Still life on a rooftop, dead trees in barrels, a bench broken, dogs, excrement, sky. What pathways through pain, what junctures of vulnerability, what crossings and counterings? Too many lives in our lives already, too many chances for sorrow, too many unaccounted-for pasts."Behold me,"the god of frenzied, inexhaustible love says, rising in bloody splendor,"Behold me."Her making her way down the littered vestibule stairs, one agonized step at a time. My holding the door. Her crossing the fragmented tiles, faltering at the step to the street, droning, not looking at me,"Can you help me?"Taking my arm, leaning lightly against me. Her wavering step into the world. Her whispering,"Thanks love."Lightly, lightly against me. I think I ' ll lighten up a little. Another, different kind of poem of youth and age. It ' s called"Gas."Wouldn ' t it be nice, I think, when the blue-haired lady in the doctor ' s waiting room bends over the magazine table and farts, just a little, and violently blushes. Wouldn ' t it be nice if intestinal gas came embodied in visible clouds, so she could see that her really quite inoffensive pop had only barely grazed my face before it drifted away. Besides, for this to have happened now is a nice coincidence. Because not an hour ago, while we were on our walk, my dog was startled by a backfire and jumped straight up like a horse bucking. And that brought back to me the stable I worked on weekends when I was 12, and a splendid piebald stallion, who whenever he was mounted would buck just like that, though more hugely of course, enormous, gleaming, resplendent. And the woman, her face abashedly buried in her"Elle"now, reminded me — I ' d forgotten that not the least part of my awe consisted of the fact that with every jump he took the horse would powerfully fart. Phwap! Phwap! Phwap! Something never mentioned in the dozens of books about horses and their riders I devoured in those days. All that savage grandeur, the steely glinting hooves, the eruptions driven from the creature ' s mighty innards, breath stopped, heart stopped, nostrils madly flared, I didn ' t know if I wanted to break him, or be him. This is called"Thirst."Many — most of my poems actually are urban poems. I happen to be reading a bunch that aren ' t."Thirst."Here was my relation with the woman who lived all last autumn and winter, day and night, on a bench in the 103rd Street subway station, until finally one day she vanished. We regarded each other, scrutinized one another. Me shyly, obliquely, trying not to be furtive. She boldly, unblinkingly, even pugnaciously, wrathfully even, when her bottle was empty. I was frightened of her. I felt like a child. I was afraid some repressed part of myself would go out of control, and I ' d be forever entrapped in the shocking seethe of her stench. Not excrement merely, not merely surface and orifice going unwashed, rediffusion of rum, there was will in it, and intention, power and purpose — a social, ethical rage and rebellion — despair too, though, grief, loss. Sometimes I ' d think I should take her home with me, bathe her, comfort her, dress her. She wouldn ' t have wanted me to, I would think. Instead, I ' d step into my train. How rich I would think, is the lexicon of our self-absolving. How enduring, our bland fatal assurance that reflection is righteousness being accomplished. The dance of our glances, the clash, pulling each other through our perceptual punctures, then holocaust, holocaust, host on host of ill, injured presences, squandered, consumed. Her vigil somewhere I know continues. Her occupancy, her absolute, faithful attendance. The dance of our glances, challenge, abdication, effacement, the perfume of our consternation. This is a newer poem, a brand new poem. The title is"This Happened."A student, a young woman in a fourth-floor hallway of her lycee, perched on the ledge of an open window chatting with friends between classes ; a teacher passes and chides her,"Be careful, you might fall,"almost banteringly chides her,"You might fall,"and the young woman, 18, a girl really, though she wouldn ' t think that, as brilliant as she is, first in her class, and"Beautiful, too,"she ' s often told, smiles back, and leans into the open window, which wouldn ' t even be open if it were winter — if it were winter someone would have closed it — leans into the window, farther, still smiling, farther and farther, though it takes less time than this, really an instant, and lets herself fall. Herself fall. A casual impulse, a fancy, never thought of until now, hardly thought of even now... No, more than impulse or fancy, the girl knows what she ' s doing, the girl means something, the girl means to mean, because it occurs to her in that instant, that beautiful or not, bright yes or no, she ' s not who she is, she ' s not the person she is, and the reason, she suddenly knows, is that there ' s been so much premeditation where she is, so much plotting and planning, there ' s hardly a person where she is, or if there is, it ' s not her, or not wholly her, it ' s a self inhabited, lived in by her, and seemingly even as she thinks it she knows what ' s been missing : grace, not premeditation but grace, a kind of being in the world spontaneously, with grace. Weightfully upon me was the world. Weightfully this self which graced the world yet never wholly itself. Weightfully this self which weighed upon me, the release from which is what I desire and what I achieve. And the girl remembers, in this infinite instant already now so many times divided, the sadness she felt once, hardly knowing she felt it, to merely inhabit herself. Yes, the girl falls, absurd to fall, even the earth with its compulsion to take unto itself all that falls must know that falling is absurd, yet the girl falling isn ' t myself, or she is myself, but a self I took of my own volition unto myself. Forever. With grace. This happened. I ' ll read just one more. I don ' t usually say that. I like to just end. But I ' m afraid that Ricky will come out here and shake his fist at me. This is called"Old Man,"appropriately enough."Special : big tits,"Says the advertisement for a soft-core magazine on our neighborhood newsstand. But forget her breasts. A lush, fresh-lipped blond, skin glowing gold, sprawls there, resplendent. 60 nearly, yet these hardly tangible, hardly better than harlots, can still stir me. Maybe a coming of age in the American sensual darkness, never seeing an unsmudged nipple, an uncensored vagina, has left me forever infected with an unquenchable lust of the eye. Always that erotic murmur, I ’ m hardly myself if I ’ m not in a state of incipient desire. God knows though, there are worse twists your obsessions can take. Last year in Israel, a young ultra-orthodox Rabbi guiding some teenage girls through the Shrine of the Shoah forbade them to look in one room. Because there were images in it he said were licentious. The display was a photo. Men and women stripped naked, some trying to cover their genitals, others too frightened to bother, lined up in snow waiting to be shot and thrown into a ditch. The girls, to my horror, averted their gaze. What carnal mistrust had their teacher taught them. Even that though. Another confession : Once in a book on pre-war Poland, a studio portrait, an absolute angel, an absolute angel with tormented, tormenting eyes. I kept finding myself at her page. That she died in the camps made her — I didn ’ t dare wonder why — more present, more precious. Died in the camps, that too people — or Jews anyway — kept from their children back then. But it was like sex, you didn ’ t have to be told. Sex and death, how close they can seem. So constantly conscious now of death moving towards me, sometimes I think I confound them. My wife ’ s loveliness almost consumes me. My passion for her goes beyond reasonable bounds. When we make love, her holding me everywhere all around me, I ’ m there and not there. My mind teems, jumbles of faces, voices, impressions, I live my life over, as though I were drowning. Then I am drowning, in despair at having to leave her, this, everything, all, unbearable, awful. Still, to be able to die with no special contrition, not having been slaughtered, or enslaved. And not having to know history ’ s next mad rage or regression, it might be a relief. No. Again, no. I don ’ t mean that for a moment. What I mean is the world holds me so tightly — the good and the bad — my own follies and weakness that even this counterfeit Venus with her sham heat, and her bosom probably plumped with gel, so moves me my breath catches. Vamp. Siren. Seductress. How much more she reveals in her glare of ink than she knows. How she incarnates our desperate human need for regard, our passion to live in beauty, to be beauty, to be cherished by glances, if by no more, of something like love, or love. Thank you.

So I understand that this meeting was planned, and the slogan was From Was to Still. And I am illustrating Still. Which, of course, I am not agreeing with because, although I am 94, I am not still working. And anybody who asks me,”Are you still doing this or that?”I don ’ t answer because I ’ m not doing things still, I ’ m doing it like I always did. I still have — or did I use the word still? I didn ’ t mean that. I have my file which is called To Do. I have my plans. I have my clients. I am doing my work like I always did. So this takes care of my age. I want to show you my work so you know what I am doing and why I am here. This was about 1925. All of these things were made during the last 75 years. But, of course, I ’ m working since 25, doing more or less what you see here. This is Castleton China. This was an exhibition at the Museum of Modern Art. This is now for sale at the Metropolitan Museum. This is still at the Metropolitan Museum now for sale. This is a portrait of my daughter and myself. These were just some of the things I ’ ve made. I made hundreds of them for the last 75 years. I call myself a maker of things. I don ’ t call myself an industrial designer because I ’ m other things. Industrial designers want to make novel things. Novelty is a concept of commerce, not an aesthetic concept. The industrial design magazine, I believe, is called”Innovation.”Innovation is not part of the aim of my work. Well, makers of things : they make things more beautiful, more elegant, more comfortable than just the craftsmen do. I have so much to say. I have to think what I am going to say. Well, to describe our profession otherwise, we are actually concerned with the playful search for beauty. That means the playful search for beauty was called the first activity of Man. Sarah Smith, who was a mathematics professor at MIT, wrote,"The playful search for beauty was Man ' s first activity — that all useful qualities and all material qualities were developed from the playful search for beauty."These are tiles. The word,"playful"is a necessary aspect of our work because, actually, one of our problems is that we have to make, produce, lovely things throughout all of life, and this for me is now 75 years. So how can you, without drying up, make things with the same pleasure, as a gift to others, for so long? The playful is therefore an important part of our quality as designer. Let me tell you some about my life. As I said, I started to do these things 75 years ago. My first exhibition in the United States was at the Sesquicentennial exhibition in 1926 — that the Hungarian government sent one of my hand-drawn pieces as part of the exhibit. My work actually took me through many countries, and showed me a great part of the world. This is not that they took me — the work didn ' t take me — I made the things particularly because I wanted to use them to see the world. I was incredibly curious to see the world, and I made all these things, which then finally did take me to see many countries and many cultures. I started as an apprentice to a Hungarian craftsman, and this taught me what the guild system was in Middle Ages. The guild system : that means when I was an apprentice, I had to apprentice myself in order to become a pottery master. In my shop where I studied, or learned, there was a traditional hierarchy of master, journeyman and learned worker, and apprentice, and I worked as the apprentice. The work as an apprentice was very primitive. That means I had to actually learn every aspect of making pottery by hand. We mashed the clay with our feet when it came from the hillside. After that, it had to be kneaded. It had to then go in, kind of, a mangle. And then finally it was prepared for the throwing. And there I really worked as an apprentice. My master took me to set ovens because this was part of oven-making, oven-setting, in the time. And finally, I had received a document that I had accomplished my apprenticeship successfully, that I had behaved morally, and this document was given to me by the Guild of Roof- Coverers, Rail-Diggers, Oven-Setters, Chimney Sweeps and Potters. I also got at the time a workbook which explained my rights and my working conditions, and I still have that workbook. First I set up a shop in my own garden, and made pottery which I sold on the marketplace in Budapest. And there I was sitting, and my then-boyfriend — I didn ' t mean it was a boyfriend like it is meant today — but my boyfriend and I sat at the market and sold the pots. My mother thought that this was not very proper, so she sat with us to add propriety to this activity. However, after a while there was a new factory being built in Budapest, a pottery factory, a large one. And I visited it with several ladies, and asked all sorts of questions of the director. Then the director asked me, why do you ask all these questions? I said, I also have a pottery. So he asked me, could he please visit me, and then finally he did, and explained to me that what I did now in my shop was an anachronism, that the industrial revolution had broken out, and that I rather should join the factory. There he made an art department for me where I worked for several months. However, everybody in the factory spent his time at the art department. The director there said there were several women casting and producing my designs now in molds, and this was sold also to America. I remember that it was quite successful. However, the director, the chemist, model maker — everybody — concerned himself much more with the art department — that means, with my work — than making toilets, so finally they got a letter from the center, from the bank who owned the factory, saying, make toilet-setting behind the art department, and that was my end. So this gave me the possibility because now I was a journeyman, and journeymen also take their satchel and go to see the world. So as a journeyman, I put an ad into the paper that I had studied, that I was a down-to-earth potter ’ s journeyman and I was looking for a job as a journeyman. And I got several answers, and I accepted the one which was farthest from home and practically, I thought, halfway to America. And that was in Hamburg. Then I first took this job in Hamburg, at an art pottery where everything was done on the wheel, and so I worked in a shop where there were several potters. And the first day, I was coming to take my place at the turntable — there were three or four turntables — and one of them, behind where I was sitting, was a hunchback, a deaf-mute hunchback, who smelled very bad. So I doused him in cologne every day, which he thought was very nice, and therefore he brought bread and butter every day, which I had to eat out of courtesy. The first day I came to work in this shop there was on my wheel a surprise for me. My colleagues had thoughtfully put on the wheel where I was supposed to work a very nicely modeled natural man ’ s organs. After I brushed them off with a hand motion, they were very — I finally was now accepted, and worked there for some six months. This was my first job. If I go on like this, you will be here till midnight. So I will try speed it up a little Moderator : Eva, we have about five minutes. Eva Zeisel : Are you sure? Moderator : Yes, I am sure. EZ : Well, if you are sure, I have to tell you that within five minutes I will talk very fast. And actually, my work took me to many countries because I used my work to fill my curiosity. And among other things, other countries I worked, was in the Soviet Union, where I worked from ’ 32 to ’ 37 — actually, to ’ 36. I was finally there, although I had nothing to do — I was a foreign expert. I became art director of the china and glass industry, and eventually under Stalin ’ s purges — at the beginning of Stalin ’ s purges, I didn ’ t know that hundreds of thousands of innocent people were arrested. So I was arrested quite early in Stalin ’ s purges, and spent 16 months in a Russian prison. The accusation was that I had successfully prepared an Attentat on Stalin ’ s life. This was a very dangerous accusation. And if this is the end of my five minutes, I want to tell you that I actually did survive, which was a surprise. But since I survived and I ’ m here, and since this is the end of the five minutes, I will — Moderator : Tell me when your last trip to Russia was. Weren ’ t you there recently? EZ : Oh, this summer, in fact, the Lomonosov factory was bought by an American company, invited me. They found out that I had worked in ’ 33 at this factory, and they came to my studio in Rockland County, and brought the 15 of their artists to visit me here. And they invited myself to come to the Russian factory last summer, in July, to make some dishes, design some dishes. And since I don ’ t like to travel alone, they also invited my daughter, son-in-law and granddaughter, so we had a lovely trip to see Russia today, which is not a very pleasant and happy view. Here I am now, if this is the end? Thank you.

I ’ d like to do pretty much what I did the first time, which is to choose a lighthearted theme. Last time, I talked about death and dying. This time, I ’ m going to talk about mental illness. But it has to be technological, so I ’ ll talk about electroshock therapy. You know, ever since man had any notion that some of his other people, his colleagues, could be different, could be strange, could be severely depressed or what we now recognize as schizophrenia, he was certain that this kind of illness had to come from evil spirits getting into the body. So, the way of treating these diseases in early times was to, in some way or other, exorcise those evil spirits, and this is still going on, as you know. But it wasn ’ t enough to use the priests. When medicine became somewhat scientific, in about 450 BC, with Hippocrates and those boys, they tried to look for herbs, plants that would literally shake the bad spirits out. So, they found certain plants that could cause convulsions. And the herbals, the botanical books of up to the late Middle Ages, the Renaissance are filled with prescriptions for causing convulsions to shake the evil spirits out. Finally, in about the sixteenth century, a physician whose name was Theophrastus Bombastus Aureolus von Hohenheim, called Paracelsus, a name probably familiar to some people here — — good, old Paracelsus found that he could predict the degree of convulsion by using a measured amount of camphor to produce the convulsion. Can you imagine going to your closet, pulling out a mothball, and chewing on it if you ’ re feeling depressed? It ’ s better than Prozac, but I wouldn ’ t recommend it. So what we see in the seventeenth, eighteenth century is the continued search for medications other than camphor that ’ ll do the trick. Well, along comes Benjamin Franklin, and he comes close to convulsing himself with a bolt of electricity off the end of his kite. And so people begin thinking in terms of electricity to produce convulsions. And then, we fast-forward to about 1932, when three Italian psychiatrists, who were largely treating depression, began to notice among their patients, who were also epileptics, that if they had an epileptic — a series of epileptic fits, a lot of them in a row — the depression would very frequently lift. Not only would it lift, but it might never return. So they got very interested in producing convulsions, measured types of convulsions. And they thought,”Well, we ’ ve got electricity, we ’ ll plug somebody into the wall. That always makes hair stand up and people shake a lot.”So, they tried it on a few pigs, and none of the pigs were killed. So, they went to the police and they said,”We know that at the Rome railroad station, there are all these lost souls wandering around, muttering gibberish. Can you bring one of them to us?”Someone who is, as the Italians say,”cagoots.”So they found this”cagoots”guy, a 39-year-old man who was really hopelessly schizophrenic, who was known, had been known for months, to be literally defecating on himself, talking nothing that made any sense, and they brought him into the hospital. So these three psychiatrists, after about two or three weeks of observation, laid him down on a table, connected his temples to a very small source of current. They thought,”Well, we ’ ll try 55 volts, two-tenths of a second. That ’ s not going to do anything terrible to him.”So they did that. Well, I have the following from a firsthand observer, who told me this about 35 years ago, when I was thinking about these things for some research project of mine. He said,”This fellow”— remember, he wasn ’ t even put to sleep —”after this major grand mal convulsion, sat right up, looked at these three fellas and said, ’ What the fuck are you assholes trying to do? ’”If I could only say that in Italian. Well, they were happy as could be, because he hadn ’ t said a rational word in the weeks of observation. So they plugged him in again, and this time they used 110 volts for half a second. And to their amazement, after it was over, he began speaking like he was perfectly well. He relapsed a little bit, they gave him a series of treatments, and he was essentially cured. But of course, having schizophrenia, within a few months, it returned. But they wrote a paper about this, and everybody in the Western world began using electricity to convulse people who were either schizophrenic or severely depressed. It didn ’ t work very well on the schizophrenics, but it was pretty clear in the ’ 30s and by the middle of the ’ 40s that electroconvulsive therapy was very, very effective in the treatment of depression. And of course, in those days, there were no antidepressant drugs, and it became very, very popular. They would anesthetize people, convulse them, but the real difficulty was that there was no way to paralyze muscles. So people would have a real grand mal seizure. Bones were broken. Especially in old, fragile people, you couldn ’ t use it. And then in the 1950s, late 1950s, the so-called muscle relaxants were developed by pharmacologists, and it got so that you could induce a complete convulsion, an electroencephalographic convulsion — you could see it on the brain waves — without causing any convulsion in the body except a little bit of twitching of the toes. So again, it was very, very popular and very, very useful. Well, you know, in the middle ’ 60s, the first antidepressants came out. Tofranil was the first. In the late ’ 70s, early ’ 80s, there were others, and they were very effective. And patients ’ rights groups seemed to get very upset about the kinds of things that they would witness. And so the whole idea of electroconvulsive, electroshock therapy disappeared, but has had a renaissance in the last 10 years. And the reason that it has had a renaissance is that probably about 10 percent of the people, severe depressives, do not respond, regardless of what is done for them. Now, why am I telling you this story at this meeting? I ’ m telling you this story, because actually ever since Richard called me and asked me to talk about — as he asked all of his speakers — to talk about something that would be new to this audience, that we had never talked about, never written about, I ’ ve been planning this moment. This reason really is that I am a man who, almost 30 years ago, had his life saved by two long courses of electroshock therapy. And let me tell you this story. I was, in the 1960s, in a marriage. To use the word bad would be perhaps the understatement of the year. It was dreadful. There are, I ’ m sure, enough divorced people in this room to know about the hostility, the anger, who knows what. Being someone who had had a very difficult childhood, a very difficult adolescence — it had to do with not quite poverty but close. It had to do with being brought up in a family where no one spoke English, no one could read or write English. It had to do with death and disease and lots of other things. I was a little prone to depression. So, as things got worse, as we really began to hate each other, I became progressively depressed over a period of a couple of years, trying to save this marriage, which was inevitably not to be saved. Finally, I would schedule — all my major surgical cases, I was scheduling them for 12, one o ’ clock in the afternoon, because I couldn ’ t get out of bed before about 11 o ’ clock. And anybody who ’ s been depressed here knows what that ’ s like. I couldn ’ t even pull the covers off myself. Well, you ’ re in a university medical center, where everybody knows everybody, and it ’ s perfectly clear to my colleagues, so my referrals began to decrease. As my referrals began to decrease, I clearly became increasingly depressed until I thought, my God, I can ’ t work anymore. And, in fact, it didn ’ t make any difference because I didn ’ t have any patients anymore. So, with the advice of my physician, I had myself admitted to the acute care psychiatric unit of our university hospital. And my colleagues, who had known me since medical school in that place, said,”Don ’ t worry, chap. Six weeks, you ’ re back in the operating room. Everything ’ s going to be great.”Well, you know what bovine stercus is? That proved to be a lot of bovine stercus. I know some people who got tenure in that place with lies like that. So I was one of their failures. But it wasn ’ t that simple. Because by the time I got out of that unit, I was not functional at all. I could hardly see five feet in front of myself. I shuffled when I walked. I was bowed over. I rarely bathed. I sometimes didn ’ t shave. It was dreadful. And it was clear — not to me, because nothing was clear to me at that time anymore — that I would need long-term hospitalization in that awful place called a mental hospital. So I was admitted, in 1973, in the spring of 1973, to the Institute of Living, which used to be called the Hartford Retreat. It was founded in the eighteenth century, the largest psychiatric hospital in the state of Connecticut, other than the huge public hospitals that existed at that time. And they tried everything they had. They tried the usual psychotherapy. They tried every medication available in those days. And they did have Tofranil and other things — Mellaril, who knows what. Nothing happened except that I got jaundiced from one of these things. And finally, because I was well known in Connecticut, they decided they better have a meeting of the senior staff. All the senior staff got together, and I later found out what happened. They put all their heads together and they decided that there was nothing that could be done for this surgeon who had essentially separated himself from the world, who by that time had become so overwhelmed, not just with depression and feelings of worthlessness and inadequacy, but with obsessional thinking, obsessional thinking about coincidences. And there were particular numbers that every time I saw them, just got me dreadfully upset — all kinds of ritualistic observances, just awful, awful stuff. Remember when you were a kid, and you had to step on every line? Well, I was a grown man who had all of these rituals, and it got so there was a throbbing, there was a ferocious fear in my head. You ' ve seen this painting by Edvard Munch, The Scream. Every moment was a scream. It was impossible. So they decided there was no therapy, there was no treatment. But there was one treatment, which actually had been pioneered at the Hartford hospital in the early 1940s, and you can imagine what it was. It was pre-frontal lobotomy. So they decided — I didn ' t know this, again, I found this out later — that the only thing that could be done was for this 43-year-old man to have a pre-frontal lobotomy. Well, as in all hospitals, there was a resident assigned to my case. He was 27 years old, and he would meet with me two or three times a week. And of course, I had been there, what, three or four months at the time. And he asked to meet with the senior staff, and they agreed to meet with him because he was very well thought of in that place. They thought he had a really extraordinary future. And he dug in his heels and said,"No. I know this man better than any of you. I have met with him over and over again. You ' ve just seen him from time to time. You ' ve read reports and so forth. I really honestly believe that the basic problem here is pure depression, and all of the obsessional thinking comes out of it. And you know, of course, what ' ll happen if you do a pre- frontal lobotomy. Any of the results along the spectrum, from pretty bad to terrible, terrible, terrible is going to happen. If he does the best he can, he will have no further obsessions, probably no depression, but his affect will be dulled, he will never go back to surgery, he will never be the loving father that he was to his two children, his life will be changed. If he has the usual result, he will end up like ' One Flew Over the Cuckoo ' s Nest. ' And you know about that, just essentially in a stupor the rest of his life."Well, he said,"Can ' t we try a course of electroshock therapy?"And you know why they agreed? They agreed to humor him. They just thought,"Well, we ' ll give a course of 10. And so we ' ll lose a little time. Big deal. It doesn ' t make any difference."So they gave the course of 10, and the first — the usual course, incidentally, was six to eight and still is six to eight. Plugged me into the wires, put me to sleep, gave me the muscle relaxant. Six didn ' t work. Seven didn ' t work. Eight didn ' t work. At nine, I noticed — and it ' s wonderful that I could notice anything — I noticed a change. And at 10, I noticed a real change. And he went back to them, and they agreed to do another 10. Again, not a single one of them — I think there are about seven or eight of them — thought this would do any good. They thought this was a temporary change. But, lo and behold, by 16, by 17, there were demonstrable differences in the way I felt. By 18 and 19, I was sleeping through the night. And by 20, I had the sense, I really had the sense that I could overcome this, that I was now strong enough that by an act of will, I could blow the obsessional thinking away. I could blow the depression away.

And I ’ ve never forgotten — I never will forget — standing in the kitchen of the unit, it was a Sunday morning in January of 1974, standing in the kitchen by myself and thinking,”I ’ ve got the strength now to do this.”It was as though those tightly coiled wires in my head had been disconnected and I could think clearly. But I need a formula. I need some thing to say to myself when I begin thinking obsessionally, obsessively. Well, the Gilbert and Sullivan fans in this room will remember”Ruddigore,”and they will remember Mad Margaret, and they will remember that she was married to a fellow named Sir Despard Murgatroyd. And she used to go nuts, every five minutes or so in the play, and he said to her,”We must have a word to bring you back to reality, and the word, my dear, will be ’ Basingstoke. ’”So every time she got a little nuts, he would say,”Basingstoke!”And she would say,”Basingstoke, it is.”And she would be fine for a little while. Well, you know, I ’ m from the Bronx. I can ’ t say”Basingstoke.”But I had something better. And it was very simple. It was,”Ah, fuck it!”Much better than”Basingstoke,”at least for me. And it worked — my God, it worked. Every time I would begin thinking obsessionally — again, once more, after 20 shock treatments — I would say,”Ah, fuck it.”And things got better and better, and within three or four months, I was discharged from that hospital, and I joined a group of surgeons where I could work with other people in the community, not in New Haven, but fairly close by. I stayed there for three years. At the end of three years, I went back to New Haven, had remarried by that time. I brought my wife with me, actually, to make sure I could get through this. My children came back to live with us. We had two more children after that. Resuscitated the career, even better than it had been before. Went right back into the university and began to write books. Well, you know, it ’ s been a wonderful life. It ’ s been, as I said, close to 30 years. I stopped doing surgery about six years ago and became a full-time writer, as many people know. But it ’ s been very exciting. It ’ s been very happy. Every once in a while, I have to say,”Ah, fuck it.”Every once in a while, I get somewhat depressed and a little obsessional. So, I ’ m not free of all of this. But it ’ s worked. It ’ s always worked. Why have I chosen, after never, ever talking about this, to talk about it now? Well, those of you who know some of these books know that one is about death and dying, one is about the human body and the human spirit, one is about the way mystical thoughts are constantly in our minds, and they have always to do with my own personal experiences. One might think reading these books — and I ’ ve gotten thousands of letters about them by people who do think this — that based on my life ’ s history as I ’ ve portrayed in the books, my early life ’ s history, I am someone who has overcome adversity. That I am someone who has drunk, drank, drunk of the bitter dregs of near-disaster in childhood and emerged not just unscathed but strengthened. I really have it figured out, so that I can advise people about death and dying, so that I can talk about mysticism and the human spirit. And I ’ ve always felt guilty about that. I ’ ve always felt that somehow I was an impostor because my readers don ’ t know what I have just told you. It ’ s known by some people in New Haven, obviously, but it is not generally known. So one of the reasons that I have come here to talk about this today is to — frankly, selfishly — unburden myself and let it be known that this is not an untroubled mind that has written all of these books. But more importantly, I think, is the fact that a very significant proportion of people in this audience are under 30, and there are many, of course, who are well over 30. For people under 30, and it looks to me like almost all of you — I would say all of you — are either on the cusp of a magnificent and exciting career or right into a magnificent and exciting career : anything can happen to you. Things change. Accidents happen. Something from childhood comes back to haunt you. You can be thrown off the track. I hope it happens to none of you, but it will probably happen to a small percentage of you. To those to whom it doesn ’ t happen, there will be adversities. If I, with the bleakness of spirit, with no spirit, that I had in the 1970s and no possibility of recovery, as far as that group of very experienced psychiatrists thought, if I can find my way back from this, believe me, anybody can find their way back from any adversity that exists in their lives. And for those who are older, who have lived through perhaps not something as bad as this, but who have lived through difficult times, perhaps where they lost everything, as I did, and started out all over again, some of these things will seem very familiar. There is recovery. There is redemption. And there is resurrection. There are resurrection themes in every society that has ever been studied, and it is because not just only do we fantasize about the possibility of resurrection and recovery, but it actually happens. And it happens a lot. Perhaps the most popular resurrection theme, outside of specifically religious ones, is the one about the phoenix, the ancient story of the phoenix, who, every 500 years, resurrects itself from its own ashes to go on to live a life that is even more beautiful than it was before. Richard, thanks very much.

Text Sample 316: NEG Dim 2 – 2019 – Score 1.00 – 2019/t000016.txt
Yogi Berra, a US baseball player and philosopher, said,”If we don ’ t know where we ’ re going, we might not get there.”Accumulating scientific knowledge is giving us greater insights, greater clarity, into what our future might look like in a changing climate and what that could mean for our health. I ’ m here to talk about a related aspect, on how our emissions of greenhouse gases from burning of fossil fuels is reducing the nutritional quality of our food. We ’ ll start with the food pyramid. You all know the food pyramid. We all need to eat a balanced diet. We need to get proteins, we need to get micronutrients, we need to get vitamins. And so, this is a way for us to think about how to make sure we get what we need every day so we can grow and thrive. But we eat not just because we need to, we also eat for enjoyment. Bread, pasta, pizza — there ’ s a whole range of foods that are culturally important. We enjoy eating these. And so they ’ re important for our diet, but they ’ re also important for our cultures. Carbon dioxide has been increasing since the start of the Industrial Revolution, increasing from about 280 parts per million to over 410 today, and it continues to increase. The carbon that plants need to grow comes from this carbon dioxide. They bring it into the plant, they break it apart into the carbon itself, and they use that to grow. They also need nutrients from the soil. And so yes, carbon dioxide is plant food. And this should be good news, of rising carbon dioxide concentrations, for food security around the world, making sure that people get enough to eat every day. About 820 million people in the world don ’ t get enough to eat every day. So there ’ s a fair amount written about how higher CO2 is going to help with our food security problem. We need to accelerate our progress in agricultural productivity to feed the nine to 10 billion people who will be alive in 2050 and to achieve the Sustainable Development Goals, particularly the Goal Number 2, that is on reducing food insecurity, increasing nutrition, increasing access to the foods that we need for everyone. We know that climate change is affecting agricultural productivity. The earth has warmed about one degree centigrade since preindustrial times. That is changing local temperature and precipitation patterns, and that has consequences for the agricultural productivity in many parts of the world. And it ’ s not just local changes in temperature and precipitation, it ’ s the extremes. Extremes in terms of heat waves, floods and droughts are significantly affecting

productivity. And that carbon dioxide, besides making plants grow, has other consequences as well, that plants, when they have higher carbon dioxide, increase the synthesis of carbohydrates, sugars and starches, and they decrease the concentrations of protein and critical nutrients. And this is very important for how we think about food security going forward. A couple of nights ago in the table talks on climate change, someone said that they ’ re a five-sevenths optimist : that they ’ re an optimist five days of the week, and this is a topic for the other two days. When we think about micronutrients, almost all of them are affected by higher CO2 concentrations. Two in particular are iron and zinc. When you don ’ t have enough iron, you can develop iron deficiency anemia. It ’ s associated with fatigue, shortness of breath and some fairly serious consequences as well. When you don ’ t have enough zinc, you can have a loss of appetite. It is a significant problem around the world. There ’ s about one billion people who are zinc deficient. It ’ s very important for maternal and child health. It affects development. The B vitamins are critical for a whole range of reasons. They help convert our food into energy. They ’ re important for the functions of many of the physiologic activities in our bodies. And when you have higher carbon in a plant, you have less nitrogen, and you have less B vitamins. And it ’ s not just us. Cattle are already being affected because the quality of their forage is declining. In fact, this affects every consumer of plants. And give a thought to, for example, our pet cats and dogs. If you look on the label of most of the pet and dog food, there ’ s a significant amount of grain in those foods. So this affects everyone. How do we know that this is a problem? We know from field studies and we know from experimental studies in laboratories. In the field studies — and I ’ ll focus primarily on wheat and on rice — there ’ s fields, for example, of rice that are divided into different plots. And the plots are all the same : the soil ’ s the same, the precipitation ’ s the same — everything ’ s the same. Except carbon dioxide is blown over some of the plots. And so you can compare what it looks like under today ’ s conditions and under carbon dioxide conditions later in the century. I was part of one of the few studies that have done this. We looked at 18 rice lines in China and in Japan and grew them under conditions that you would expect later in the century. And when you look at the results, the white bar is today ’ s conditions, the red bar is conditions later in the century. So protein declines about 10 percent, iron about eight percent, zinc about five percent. These don ’ t sound like really big changes, but when you start thinking about the poor in every country who primarily eat starch, that this will put people who are on the edge over the edge into frank deficiencies, creating all kinds of health problems. The situation is more significant for the B vitamins. When you look at vitamin B1 and vitamin B2, there ’ s about a 17 percent decline. Pantothenic acid, vitamin B5, is about a 13 percent decline. Folate is about a 30 percent decline. And these are averages over the various experiments that were done. Folate is critical for child development. Pregnant women who don ’ t get enough folate are at much higher risk of having babies with birth defects. So these are very serious potential consequences for our health as CO2 continues to rise. In another example, this is modeling work that was done by Chris Weyant and his colleagues, taking a look at this chain from higher CO2 to lower iron and zinc — and they only looked at iron and zinc — to various health outcomes. They looked at malaria, diarrheal disease, pneumonia, iron deficiency anemia, and looked at what the consequences could be in 2050. And the darker the color in this, the larger the consequences. So you can see the major impacts in Asia and in Africa, but also note that in countries such as the United States and countries in Europe, the populations also could be affected. They estimated about 125 million people could be affected. They also modeled what would be the most effective interventions, and their conclusion was reducing our greenhouse gases : getting our greenhouse gas emissions down by mid-century so we don ’ t have to worry so much about these consequences later in the century. These experiments, these modeling studies did not take climate change itself into account. They just focused on the carbon dioxide component. So when you put the two together, it ’ s expected the impact is much larger than what I ’ ve told you. I ’ d love to be able to tell you right now how much the food you had for breakfast, the food you ’ re going to have for lunch, has shifted from what your grandparents ate in terms of its nutritional quality. But I can ’ t. We don ’ t have the research on that. I ’ d love to tell you how much current food insecurity is affected by these changes. But I can ’ t. We don ’ t have the research on that, either. There ’ s a lot that needs to be known in this area, including what the possible solutions could be. We don ’ t know exactly what those solutions are, but we ’ ve got a range of options. We ’ ve got advancements in technologies. We ’ ve got plant breeding. We ’ ve got biofortification. Soils could make a difference. And, of course, it will be very helpful to know how these changes could affect our future health and the health of our children and the health of our grandchildren. And these investments take time. It will take time to sort all of these issues out. There is no national entity or business group that is funding this research. We need these investments critically so that we do know where we ’ re going. In the meantime, what we can do is ensure that all people have access to a complete diet, not just those in the wealthy parts of the world but everywhere in the world. We also individually and collectively need to reduce our greenhouse gas emissions to reduce the challenges that will come later in the century. It ’ s been said that if you think education is expensive, try ignorance. Let ’ s not. Let ’ s invest in ourselves, in our children and in our planet. Thank you.

I am obsessed with forming healthy communities, and that ’ s why I started Twitch â to help people watch other people play video games on the internet. Thank you for coming to my TED talk. So in seriousness, video games and communities truly are quite related. From our early human history, we made our entertainment together in small tribes. We shared stories around the campfire, we sang together, we danced together. Our earliest entertainment was both shared and interactive. It wasn ’ t until pretty recently on the grand scale of human history that interactivity took a back seat and broadcast entertainment took over. Radio and records brought music into our vehicles, into our homes. TV and VHS brought sports and drama into our living rooms. This access to broadcast entertainment was unprecedented. It gave people amazing content around the globe. It created a shared culture for millions of people. And now, if you want to go watch or listen to Mozart, you don ’ t have to buy an incredibly expensive ticket and find an orchestra. And if you like to sing â I can show you the world â then you have something in common with people around the world. But with this amazing access, we allowed for a separation between creator and consumer, and the relationship between the two became much more one-way. We wound up in a world where we had a smaller class of professional creators and most of us became spectators, and as a result it became far easier for us to enjoy that content alone. There ’ s a trend counteracting this : scarcity. So, Vienna in the 1900s, was famous for its cafĂŠ culture. And one of the big drivers of that cafĂŠ culture was expensive newspapers that were hard to get, and as a result, people would go to the cafĂŠ and read the shared copy there. And once they ’ re in the cafe, they meet the other people also reading the same newspaper, they converse, they exchange ideas and they form a community. In a similar way, TV and cable used to be more expensive, and so you might not watch the game at home. Instead you ' d go to the local bar and cheer along with your fellow sports fans there. But as the price of media continues to fall over time thanks to technology, this shared necessity that used to bring our communities together falls away. We have so many amazing options for our entertainment, and yet it ' s easier than ever for us to wind up consuming those options alone. Our communities are bearing the consequences. For example, the number of people who report having at least two close friends is at an all-time low. I believe that one of the major contributing causes to this is that our entertainment today allows us to be separate. There is one trend reversing this atomization of our society : modern multiplayer video games. Games are like a shared campfire. They ' re both interactive and connecting. Now these campfires may have beautiful animations, heroic quests, occasionally too many loot boxes, but games today are very different than the solitary activity of 20 years ago. They ' re deeply complex, they ' re more intellectually stimulating, and most of all, they ' re intrinsically social. One of the recent breakout genres exemplifying this change is the battle royale. 100 people parachute onto an island in a last-man-standing competition. Think of it as being kind of like"American Idol,"but with a lot more fighting and a lot less Simon Cowell. You may have heard of"Fortnite,"which is a breakout example of the battle royale genre, which has been played by more than 250 million people around the world. It ' s everyone from kids in your neighborhood to Drake and Ellen DeGeneres. 2. 3 billion people in the world play video games. Early games like"Tetris"and"Mario"may have been simple puzzles or quests, but with the rise of arcades and then internet play, and now massively multiplayer games of huge, thriving online communities, games have emerged as the one form of entertainment where consumption truly requires human connection. So this brings us to streaming. Why do people stream themselves playing video games? And why do hundreds of millions of people around the world congregate to watch them? I want you all the imagine for second â imagine you land on an alien planet, and on this planet, there ' s a giant green rectangle. And in this green rectangle, aliens in matching outfits are trying to push a checkered sphere between two posts using only their feet. It ' s pretty evenly matched, so the ball is just going back and forth, but there ' s hundreds of millions of people watching from home anyway, and cheering and getting excited and engaged right along with them. Now I grew up watching sports with my dad, so I get why soccer is entertaining and engaging. But if you don ' t watch sports, maybe you like watching"Dancing with the Stars"or you enjoy"Top Chef."Regardless, the principle is the same. If there is an activity that you really enjoy, you ' re probably going to like watching other people do it with skill and panache. It might be perplexing to an alien, but bonding over shared passion is a human universal. So gamers grew up expecting this live, interactive entertainment, and passive consumption just doesn ' t feel as fulfilling. That ' s why livestreaming has taken off with video games. Because livestreaming offers that same kind of interactive feeling. So when you imagine what ' s happening on Twitch, I don ' t want you to think of a million livestreams of video games. Instead, what I want you to picture is millions of campfires. Some of them are bonfires â huge, roaring bonfires with hundreds of thousands of people around them. Some of them are smaller, more intimate community gatherings where everyone knows your name. Let ' s try taking a seat by one of those campfires right now. Hey Cohh, how ' s it going? Cohh : Hey, how ' s it going, Emmett? ES : So I ' m here at TED with about 1, 000 of my closest friends, and we thought we ' d come and join you guys for a little stream. Cohh

: Awesome! It ’ s great to hear from you guys. ES : So Cohh, can you share with the TED audience here â what have you learned about your community on Twitch? Cohh : Ah, man, where to begin? I ’ ve been doing this for over five years now, and if there ’ s one thing that doesn ’ t cease to impress me on the daily, it ’ s just kind of how incredible this whole thing is for communication. I ’ ve been playing games for 20 years of my life, I ’ ve led online MMO guilds for over 10, and it ’ s the kind of thing where there ’ s very few places in life where you can go to meet so many people with similar interests. I was listening in a bit earlier ; I love the campfire analogy, I actually use a similar one. I see it all as a bunch of people on a big couch but only one person has the controller. So it ’ s kind of like a”Pass the snack!”situation, you know? 700 people that way â but it ’ s great and really it ’ s just â ES : So Cohh, what is going on in chat right now? Can you explain that a little bit to us? Because my eyesight isn ’ t that good but I see a lot of emotes. Cohh : So this is my community ; this is the Cohhilition. I stream every single day. I actually just wrapped up a 2, 000-day challenge, and as such, we have developed a pretty incredible community here in the channel. Right now we have about 6200 people with us. What you ’ re seeing is a spam of”Hello, TED”good- vibe emotes, love emotes,”this is awesome,””Hi, guys,””Hi, everyone.”Basically just a huge collection of people â huge collection of gamers that are all just experiencing a positive event together. ES : So is there anything that â can we poll chat? I want ask chat a question. Is there anything that chat would like the world, and particularly these people here with me at TED right now, to know about what they get out of playing video games and being part of this community? Cohh : Oh, wow. I am already starting to see a lot of answers here.”I like the good vibes.””Best communities are on Twitch.””They get us through the rough patches in life.”Oh, that ’ s a message I definitely see a lot on Twitch, which is very good.”A very positive community,””a lot of positivity,”which is pretty great. ES : So Cohh, before I get back to my TED talk, which I actually should probably get back to doing at some point â Do you have anything else that you want to share with me or any question you wanted to ask, you ’ ve always wanted to get out there before an audience? Cohh : Honestly, not too much. I mean, I absolutely love what you ’ re doing right now. I think that the interactive streaming is the big unexplored frontier of the future in entertainment, and thank you for doing everything you ’ re doing up there. The more people that hear about what you do, the better â for everyone on here. ES : Awesome, Cohh. Thanks so much. I ’ m going to get back to giving this talk now, but we should catch up later. Cohh : Sounds great! ES : So that was a new way to interact. We could influence what happened on the stream, we could cocreate the experience along with him, and we really had a multiplayer experience with chat and with Cohh. At Twitch, we ’ ve started calling this, as a result,”multiplayer entertainment.”Because going from watching a video alone to watching a live interactive stream is similar to the difference between going from playing a single-player game to playing a multiplayer game. Gamers are often as the forefront of exploration in new technology. Microcomputers, for example, were used early on for video games, and the very first handheld, digital mass-market devices weren ’ t cell phones, they were Gameboys... for video games. And as a result, one way that you can get a hint of what the future might hold is to look to this fun, interactive sandbox of video games and ask yourself,”what are these gamers doing today?”And that might give you a hint as to what the future is going to hold for all of us. One of the things we ’ re already seeing on Twitch is multiplayer entertainment coming to sports. So, Twitch and the NFL teamed up to offer livestreaming football, but instead of network announcers in suits streaming the game, we got Twitch users to come in and stream it themselves on their own channel and interact with their community and make it a real multiplayer experience. So I actually think that if you look out into the future â only hundreds of people today get to be sports announcers. It ’ s a tiny, tiny number of people who have that opportunity. But sports are about to go multiplayer, and that means that anyone who wants to around the world is going to get the opportunity to become a sports announcer, to give it a shot. And I think that ’ s going to unlock incredible amounts of new talent for all of us. And we ’ re not going to be asking,”Did you catch the game?”Instead, we ’ re going to be asking,”Whose channel did you catch the game on?”We already see this happening with cooking, with singing â we even see people streaming welding. And all of this stuff is going to happen around the metaphorical campfire. There ’ s going to be millions of these campfires lit over the next few years. And on every topic, you ’ re going to be able to find a campfire that will allow you to bond with your people around the world. For most of human history, entertainment was simply multiplayer. We sang together in person, we shared news together in the town square in person, and somewhere along the way, that two-way conversation turned into a one-way transmission. As someone who cares about communities, I am excited for a world where our entertainment could connect us instead of isolating us. A world where we can bond with each other over our shared interests and create real, strong communities. Games, streams and the interactions they encourage, are only just beginning to turn the wheel back to our interactive, community-rich, multiplayer past. Thank you all for sharing this experience here with me, and may you all find your best campfire.

Text Sample 318: NEG Dim 2 – 2019 – Score 1.00 – 2019/t000660.txt

I ’ ve been a police officer in an urban city for nearly 25 years. That ’ s crazy, right? And in that time, I ’ ve served in every rank, from police officer to police chief. A few years ago, I noticed something alarming. Starting in 2014, I started monitoring recruits as they cycled through police academies in the state of New Jersey, and I found that women were failing at rates between 65 and 80 percent, due to varying aspects of the physical fitness test. I learned that a change in policy now required recruits to pass the fitness exam within 10 short workout sessions. This had the greatest impact on women. The change meant that recruits had about three weeks out of a five- month-long academy to pass the fitness exam. This just didn ’ t make sense, though. Police agencies and police recruits had made huge investments to get those recruits into the academy. Police recruits had passed lengthy background checks, they had passed medical and psychological exams, they had quit their jobs. And many had spent more than 2, 000 dollars in fees and equipment just to get kicked out within the first three weeks? The dire situation in New Jersey led me to examine the status of women in policing across the United States. I found that women make up less than 13 percent of police officers. A number that hasn ’ t changed much in the past 20 years. And they make up just three percent of police chiefs as of 2013, the last time the data was collected. We know that we can improve those rates. Other countries like Canada, Australia and the UK have nearly twice the amount of policewomen. And New Zealand is steadily marching towards their goal of recruit gender parity by 2021. Other countries are actively working to increase the number of women in policing, because they know of a vast body of research evidence, spanning more than 50 years, detailing the advantages to women in policing. From that research, we know that policewomen are less likely to use force or to be accused of excessive force. We know that policewomen are less likely to be named in a lawsuit or a citizen complaint. We know that the mere presence of a policewoman reduces the use of force among other officers. And we know that policewomen are met with the same rates of force as their male counterparts, and sometimes more, and yet they ’ re more successful in defusing violent or aggressive behavior overall. So there are vast advantages to women in policing, and we ’ re losing them to arbitrary fitness standards. The problem is, the United States has nearly 18, 000 police agencies — 18, 000 agencies with wildly varying fitness standards. We know that a majority of academies rely on a masculine ideal of policing that works to decrease the number of women in policing. These types of academies overemphasize physical strength, with much less attention spent to subjects like community policing, problem-solving and interpersonal communication skills. This results in training that does not mirror the realities of policing. Physical agility is but a small component of police work. Much of an officer ’ s day is spent mediating interpersonal conflicts. That ’ s the reality of policing. These are my babies. And we can reduce the disparity in policing by changing exams that produce disparate outcomes. The federal courts have stated that men and women simply are not physiologically the same for the purposes of physical fitness programs. And that ’ s based on science. Respected institutions that law enforcement deeply respects, like the FBI, the US Marshals Service, the DEA and even the US military — they rigorously test fitness programs to ensure they measure fitness without gender-disparate outcomes. Why is that? Because recruiting is expensive. They want to recruit and retain qualified candidates. You know what else the research finds? Well- trained women are as capable as their male counterparts in overall fitness, but more importantly, in how they police. The law-enforcement community is admittedly experiencing a recruitment crisis. Yet, if they truly want to increase the number of applicants, they can. We can easily recruit more women and reap all those research benefits by training well-qualified candidates to pass validated, work-related, physiologically- based fitness exams, as required by Title VII of the Civil Rights Act. We can increase the number of women, we can reduce that gender disparity, by simply changing exams that produce disparate outcomes. We have the tools. We have the research, we have the science, we have the law. This, my friends, should be a very easy fix. Thank you.

The most important things I know about negotiation I learned in a kayak on my honeymoon. Picture this. I arrive in Hawaii, and I look adoringly at my brand new husband as we get in a two-person kayak together for a river tour. Then things go wrong fast. You see, in a two-person kayak, the passenger in the back, usually the larger passenger, is supposed to drive using their paddles. Well, I didn ’ t like how he was driving. So I decided to drive my own way. And exactly at the moment I thought I had taken over – We flipped over. Three separate times. Apparently we set a record. So I get back in the kayak now dripping wet, when our guide up ahead turns back and says,”OK folks, let ’ s negotiate these things to the left because you ’ re going to hit that beach up ahead.”Negotiate the kayak. In that moment, I realized that although I had been teaching negotiation for a few years already, I had missed something important. And I was not alone. A lot of us have misconceptions about negotiation. We are taught that it ’ s a battle over money, that it involves losing, so we either fear it or we avoid it altogether. In fact, 54 percent of us didn ’ t negotiate our last salary. That ’ s from research, by the way. I ’ m not actually seeing into your souls. The fact is that before that guide, I had never heard anyone use the word negotiate that way before. I, too, had absorbed this message that it was a contest of wills. You know, like five minutes earlier when I dunked us in the river. But there ' s another way to think about it, isn ' t there? When I negotiate my kayak toward a beach, what am I doing? I ' m steering. Today, I want to share five lessons about negotiation that just might change your life. And the first is this : negotiation is simply steering. It is any conversation in which you are steering a relationship. And it ' s so much more than the money conversations. You know, just like a kayak, where we want to steer consistently to get to our goal. We can be steering our relationships almost every minute of the day. You know, when I got back from that honeymoon, I looked around and I saw opportunities to negotiate everywhere. I could be getting to know my bosses better so that I understood what they prioritized most. I could be calling my clients regularly and asking them what was new in their businesses. And I realized something powerful. If we intentionally focus on the everyday steering, what happens when we do get to the money conversations? We ' re more likely to be successful. Which brings me to lesson two. Curious people make more money. There ' s one negotiation technique that most of us are not using. So years ago, a professor set people up to negotiate as part of a study. Only seven percent of those people achieved the optimal outcome. What did they do? Well, they didn ' t lead with their points. They asked questions first. Bottom line, in negotiation, you get more by asking questions than you do by arguing. But not just any questions. That seven percent? They asked open questions. Questions that uncovered the other person ' s needs, concerns, and goals, And most of us aren ' t great at that. When I teach people about asking questions, I say, OK, I ' ve just taken a trip. What can you ask me to get some good information? Top two questions they ask? I bet you could guess. Number one : Where did you go? Reno. Did you have a good time? Yeah. Two closed questions. Two one-word answers. So what ' s the best question? Well, it ' s a little bit of a trick, because technically, the best question of all doesn ' t end with a question mark. It ' s :"Tell me all about your vacation.""Tell me"is the biggest question you can ask, and it is the most powerful first question in any negotiation : at work or at home. With the hiring manager :"Tell me how the company sees the salary range for this position."With your teenager :"Tell me what ' s making you ask for a 50-dollar-a-week allowance?""Tell me"gets you the most information, but it also builds trust, so it creates the best deals. Lesson three : the negotiation starts before the negotiation starts. Most people don ' t know that every negotiation actually comes in two parts. The second part we all know about, that ' s where we ' re sitting down with someone else. But that first part, that ' s what I call the mirror. Because we have to negotiate with ourselves first before we negotiate with anyone else. And it ' s the most critical part of the negotiation, too, because if we don ' t get this right, the negotiation stops there. We don ' t ask. We get confused about our priorities. We shut ourselves down before we give anybody else the chance. If you want to master the mirror, try asking yourself, how have I handled something like this successfully before? Did you know that research shows if we think about a time and write it down, that we achieved great results before we go into negotiate, we are more likely to negotiate well. Why? Because we remind ourselves of who we are at our most powerful, and we also gather data on strategies that are likely to work for us. Lesson four. Land the plane. I worked with a brilliant sales executive who sometimes would lose deals because he talked too much. He ' d ask a great question, and then he would get scared of the silence so he would eat it up with his words."What do you need to get this done here today? Well, I know our price point might be a little bit higher than that of our competitors, but I think if you go ahead and look at our customer reviews..."Want to know the secret to great deals?

Shut up. Recent research found that leaving a period of silence in negotiation not only made it more likely that the other person would give you a high-value move, but it also came across as collaborative. So how much silence? I just did it. Three and a half seconds. See? You were nervous, but we all survived. That ’ s what I call landing the plane. Ask your question, make your proposal, and then zip it. And finally, lesson five. Make your adversary your partner. It ’ s 3am, and you have five hours to go before the entire world is expecting you and several other countries to announce a peace deal. But right now, you have a problem because one of the other country ’ s diplomats has left the building and is down in the parking lot, threatening to drive away because he feels disrespected. This was the situation that one of the diplomats I worked with faced. But a lot of us face things like this in our everyday negotiations. So much of the popular wisdom talks about our adversary, our opponent. Well, in most everyday negotiations, that adversary at the bargaining table becomes our partner once that deal is done. The boss who holds the keys to your raise, once you get it, you ’ re working together. Or that home contractor you ’ re negotiating with over your kitchen. Once you settle on a price, you ’ re trusting her to build a room you ’ re going to love for years to come. And even when your spouse might feel like an opponent, well, you ’ re still sleeping in the same bed at the end of the day. That diplomat I worked with, he walked out of the building, down to the parking lot, and he approached the man who had left. He said to him,”We are on the same side.”He listened. Eventually, the two men walked together back into that building, and later they announced that peace deal. My negotiation motto is this : I never request ; I recruit. I don ’ t want to talk to someone across the table. I want to pull them around with questions to my side of the table so that we are now co-conspirators working toward the same goal. Negotiation is not a battle. It is simply steering. And if we lead with curiosity about ourselves and about others, we won ’ t just create great deals, we ’ ll create great relationships along the way. Speaking of which, you might be wondering what happened after the honeymoon. Well, I ’ m glad to report that my husband and I have been happily steering together for 18 years. Just not in a kayak. Thank you.

The world today, it ’ s no longer news that we are grappling with the devastating effects of climate change. Communities are searching for solutions, trying to turn the tide onto the future that at times really looks so depressing. And there is no place this is more real than in the continent of Africa. But of course, conversations about climate change often miss out on accounting for the most critical barrier to climate solution, which is conflict. I got to know about this through my personal experience as a survivor of war, but also working with a population that has been living through conflicts for years. If you may, I would love to share with you a story based on my personal encounter with the communities that I work with and who are going through the difficult times of climate change. I ’ m from Uganda. Recently, in my home district of Lira, a woman was arrested because she had cut the shea trees and burned the charcoal into fuel. And it ’ s a crime in Uganda. I saw her being walked to the police station, and I decided to ask her, said,”My sister, I see you are being taken, and you ’ ll be charged for this crime. But I have a question for you. If you were forgiven for this crime today, do you promise that you will never do it again?”The frustrated woman looked at me and told me and said,”You know what? Even if they release me right now, I would do it again. I would do it again, because only through burning charcoal that I can raise money to pay for my children ' s education. And it ' s only through burning charcoal that I can raise money to meet the medical bills for my children, who are always falling sick of malaria. So the truth is, I would do it again."This is the story for many in Uganda. Beautiful country with so much potential, but always undermined by a near constant state of violent conflict. And you know, in a community where poverty and unemployment is so high, fighting against climate change is almost a losing battle. But when you look through across Africa, you find that most of the countries most vulnerable to climate crisis are going through some sort of conflict. When you look through the Sahel region, you find there ' s always constant attack, clashes between the herding, the farming and the fishing communities over diminishing land and water resources. Of course, with not so much option, humanity will always do anything possible for survival. I remember this firsthand when I was growing up as a child in war zone in northern Uganda. I myself had to cut the trees, to burn charcoal, to raise money to meet the basic needs, but most importantly, to pay for my education. An education that has enabled me to be able to stand before you to give this speech today. Now the big question is : How can we make it, what can we do to create an alternative to environmental destruction and provide economic means that will support conditions necessary for peace? That ' s the biggest question we should be asking ourselves today. I remember, I think about this a lot through my work at African Youth Initiative Network, AYINET, where for decades we have been supporting war survivors from Uganda, from Congo, from Sudan and South Sudan, and we ' ve been able to mobilize young people to make them game changers for peace and development. We mediate in community conflicts and support agricultural activities as a mechanism to provide youth economic alternatives to violence. And we have been successful. So the success of this work we have done is a clear manifestation of how a local initiative can greatly impact on economic empowerment, on conflict resolution and on climate change. And every time I think about this, I do believe this is an opportunity for Africa to also impact on world peace. And I sincerely know for sure that for us to achieve this goal, the following three points have always come very strongly in my heart. And the first is we need to change the way we ' re talking about climate change. It is time that we take the climate dialogue beyond just mere weather patterns and help people understand what they are fighting for, who they are protecting, what will they win or lose based on their action or inactions. This has always helped us. I remember early last year I went to my village with my twin brother, Jack. We were welcomed by one of the community elders, Charles. He was so happy to see us, to welcome us home, and he was sad that he couldn ' t give us some sugar cane, which used to be his traditional gift to us, simply because the wetland that used to grow sugar cane had dried up, and he was really sad about it. My twin brother comforted him and told him,"Weather is changing, weather would encourage us, let community do our part by planting trees so that we can attract more rain."When he heard this, he asked my brother, said,"Mr. Opio, are you saying, as you are saying, trees is good to bring rain? Now that you have planted so many trees in your community, is it raining in your garden?"To me, this was sincerely the most basic, important organic question that could come from this community. But also it made me reflect if, if at all, our global discussions about climate change is actually responding to the needs at the grassroots. So, today, in northern Uganda, shea trees are no longer producing enough fruits because there ' s local knowledge that shea trees do need bush burning in order to stimulate flowering. But also, we know bush burning is bad for environment, creating a lot of confusion. And this brings in the issue that contradictory accounts from experts, from activists, from the government, which leaves the local communities as collateral victims of global disagreement. And this has kept every one of us in the merry-go-round of climate confusion. Secondly... We need to engage the population that is most affected, in this case, the young people, the youth. With 70 percent of Africa below the age of 30, youth represent the largest demographic opportunity for the continent. We have to engage, including youth, to be an opportunity to uplift the continent from the devastating poverty. And excluding young people in all the climate activities will benefit conflict. So we must engage young people. This is because we do know youth are the legitimate owners of the future, so their inclusion is mandatory. And finally, as we seek to mitigate the effects of climate change and conflict, it is time to hold corporations, government and individuals accountable for committing climate crimes at home and abroad. This should be done by establishing International Climate Court. Today, the world is celebrating the transition to clean energy. We are celebrating the progress. But we cannot celebrate the transition to clean energy while being silent about the death and suffering of millions of people. In Democratic Republic of Congo, for instance, populations have been displaced, millions have been killed, lost properties, just because companies or corporations are exploiting their natural resources. And we have seen also rebel groups fighting to take on the fertile lands, lands rich with minerals in the Democratic Republic of Congo. The truth is, the suffering, the death, the inhumanity we are seeing in Congo is a proof that the road to clean energy is so far the dirtiest road on the planet. Of course, I ’ m also worried. I ’ m worried that the climate crisis will leave the world more divided, especially between the global North and the global South. I ’ m also worried that the rich and the poor will be divided. The rural and urban. Why? Because 10 percent of the world ’ s wealthiest are discussing a reduction of global emissions by flying less. And yet, greater, poorer majority are dreaming for only the one-time opportunity to fly. And to them, all these climate regulations being proposed appear as an effort to reinforce the preexisting inequality, which has always been meant to keep them poor. This is going to create the division. Lastly, there is an African proverb by legendary South African musician, Lucky Dube, who sang the song that says :”The night is long for a hungry child.””The night is long for a hungry child.”What an image. That child could have been your child. Think about that mom, that dad, who are powerlessly waiting for the morning, to try to get something for the child who can ’ t sleep because he went to bed with empty stomach. If we have opportunity, we should have leadership that are willing to create conditions that will help build the community of tomorrow that our children can count on. And lastly, may we realize that the birth of a new era would mean we must all understand that climate change and war are intertwined global long-term challenges. It will require all of us to work together and, most importantly, mobilize a generation that is so willing to defy violence and work for the good of all of us. Apwoyo matek. Thank you very much.

I am so honored to be onstage representing TED ’ s growing recognition of the importance of its immigrant diaspora community. I am an Iranian-American, a kind of free-range Iranian, lucky to be here with all of you and free to embrace all my native culture ’ s positive elements : the poetry, the music, philosophy and hospitality, every day, in ways that many Iranians inside Iran cannot. But I also love having the bow of my identity stretched between two seemingly opposed poles of”Iranian”and”American,”because that gives the arrow of my life a unique perspective on things. I want to share a couple of American ideals that explicate this multicultural dichotomy in me. The first is independence. In America, independence is foundational, the bedrock of our freedom that makes us all, all us Americans, feel exceptional. Unlike my Iranian side, where everyone is in everyone ' s business, I ' m free, maybe even driven, to pursue my own happiness, and that feels so liberating. The other is continuous improvement, the idea that you can always do better. America is a do-ocracy that is always inventing, reinventing herself. We make mistakes, and keep on growing and growing. That ' s why it ' s so exciting to be an entrepreneur in America – we ' re free to try to build anything our hearts desire. For me, these days, it ' s taking on our corrupt political duopoly and working to democratize democracy itself. Isn ' t it amazing that as an American, I just get to do that, without fear or permission? But I ' m Iranian too, and I have the ancient wisdom of Iranian mystics, Ferdowsi, Hafez and Rumi, running through my veins. So each of these American traits give my Iranian psyche cause for pause and reflection. For instance, independence is great, but if I ' m truly independent, then I don ' t need anything or anyone. That ' s kind of lonely. Iranians are congenitally hospitable and tribal. In fact, the word Iran itself is a portmanteau of the word"Ir"and"An,"where"Ir"comes from the word"yar,"literally"friendship"or"love,"and"an"comes from"ostan,"or"land of."Shout-out to our cultural cousins from Ireland, another land of love. Anyway, where does this love and friendship fit into my Statue-of-Liberty-esque, freedom-loving American psyche? Love requires connection and interdependence, as we found out earlier. And interdependence is, well, kind of un-American. After all, Americans never had a Declaration of Interdependence. So my Iranian side begs for me to differ here. As my beloved Sufi uncle Behzad used to say,"Love is the ether the universe swims in."So without love, we literally have nothing. So to be independent, or to be in love? That is the cross-cultural question for me. And what about the American ideal of continuous improvement? That seems downright productive, if you ask my American side. But again, my Iranian side disagrees. I remember a magnet on my mom ' s fridge :"If you ' re ever going to be happy, you must be happy now."Hinting at a tiny existential problem : it ' s always"now."And of course, we have the Iranian mystic poet Rumi imploring us in ode after ode to get drunk and out of our minds so we can become blissfully present in the wow of now. So should I work to create a better future, or be drunk and happy now? Another multicultural paradox. Or is it? Maybe I ' ve been setting up a false dichotomy all along. There ' s no real Iranian or American on this stage, here in me. After all, I ' m not some LLM trained in a lab on a discrete set of cultural memes. I am that still magical, mystical, fractal of universal consciousness known as human being. I am a point – thank you – a point at the center and circumference of the infinite sphere, as my favorite author, the Argentinian Jorge Luis Borges once wrote. And as a magical, mystical life – an MML – we humans are uniquely free to embody whatever useful paradoxes we find, whenever it suits us. We can choose to be culturally American or Iranian or both, no matter where we are from, and can even have a favorite author who is neither. And as an MML, we can simultaneously be both independent and free, while deeply connected by love to everyone and everything, always striving for a better future, while also happy together, here, now, wow.

This is a piece of skin. Of artificial skin. And now, OK, I ' m just going to paste it on this hand, and I ' ll greet you all. I will show you how it works.

So please have a look at what happens on the table, where there is one piece of this artificial skin, and also what happens on the screen of the laptop that you see in the video that is about to start. So this is me. I ' m first breathing on the skin. And you see now that this line that first was flat now shows a bump. And now I ' m touching it with my finger. And again, another bump. I am touching it one more time with the back of a feather. And now tinier bumps are coming. And again. Now even smaller bumps are coming. But what is this line? This, what we are looking at, is electrical current, which first is constant. And then when we touch the skin or breathe on it or touch it with a very light feather, it shows a signal. So this bump that you see is a signal in the electrical current. And this is actually exactly how our skin also works. So we have receptors in the skin which sense what is happening on the skin. And then they produce an electrical signal which travels through the nerves and arrives at our brain where it is recognized. I am a chemist by education, and I worked in the field of material science, which is a very interdisciplinary field, since almost 20 years now. First, as a PhD student in Italy, in Bari, and then at MIT as a postdoc, and now I am group leader in Graz. And it is almost six years that we are working on artificial skins. Almost 12 students, between master and doctoral students, have worked on these devices, trying to study how the materials work, how they work together and how to build this device. And after this, we have for the first time produced an artificial skin that can respond at the same time to three stimuli. Touch, so force, temperature and humidity. And it can do this also at an unprecedented resolution. So it ' s a very tiny device. You will see how it is done. And so this means that it can sense objects that are actually smaller than the objects that can be sensed with our skin. Our skin has a resolution of one millimeter square. This skin has a resolution of 0. 25 millimeter square. So I promised I would give you some technical details. I know you are really looking forward to them. The main component of this material, of this skin, is what is called the stimuli-responsive material. So what does it mean that it is stimuli-responsive? It means that at the beginning it is small. And when we have either humidity or light or pH or temperature changes, this material changes in its shape, and it becomes bigger. It can arrive to even doubling or tripling its thickness, its original thickness. And this is an amazing property, but it happens at a very, very microscopic scale because we produce these materials as thin films, so sometimes even one million times smaller than a millimeter. So the problem was, OK, how do we translate this very big change in thickness into something measurable? And we thought, OK, let ' s combine it with a piezoelectric material. Now maybe this word sounds a bit complex. Sounds like something you have never seen in your life, never heard before, but it ' s not really true. You have been in contact with this material many times. I am in contact with it right now. It ' s in microphones, for example. So it ' s the material that when there is a movement, produces electricity. And so in microphones there are membranes that when they move, produce electricity. It ' s also the material that is in these funny greeting cards that when you open, they make this music. The music is also made with the piezo material. So there is an electrical circuit into the card and when you open it, it moves a membrane and the membrane makes the music. And it ' s also the material that is included in the arm wristbands, those that measure the heartbeat. OK. So we combined these two materials in these cylinders that you see in the picture. So in the middle we have that material I showed you before, the stimuli-responsive material, the material that changes its thickness and gets bigger. And on the outer shell we have the piezoelectric material, the material that when the inside gets bigger, the outside produces the electricity. And this is how it is done. Easy-peasy. Then these type of cylinders are very tiny, and we have several of them in this device so that we can sense with very high resolution the three different types of stimuli I was telling you before. And a bit more of technical details. I know they are exciting, right? So how do we do these cylinders? We do them using a template, the one that you see in the picture on the top. This is a template with a lot of wells, so a lot of holes. And then we refill the holes. First we fill them up with the piezoelectric material, which is represented in yellow in the bottom figure, and then we fill it up with the stimuli-responsive material that is the light blue in the bottom figure. But to do this we cannot use liquids, because as you know, liquids would fill the wells from the bottom up. And instead we want to cover also the lateral walls. And so we do this using vapor deposition. So the whole process of production of these things happens in vacuum chambers like the one that you can see in the picture. And you may be wondering, OK, why working on this topic? Why working on artificial skin? So from a material scientist point of view, the skin is really a complex ensemble of materials and functions. Skin is useful for protection, secretion, adsorption, heat regulation and sensing. And so being able to just reproduce artificially all these properties – or actually, for the moment, only the sensation – looked like a challenge. And so I was happy to embrace it. OK, now I ’ m done with the technical details. Now I know you are all wondering, OK, you have done these artificial skins. But why? I will show you some fields of application, ending with the one that I think could be the closest. So we have also seen how there are many victims of burns. These burns can be so huge that they even take away the receptors in the skin. And so people would then lose the sensation where there was this burn. Now imagine a future where actually victims of burns could, thanks to our technologies, regain the sensation. 216 million users of smartwatches in 2022. Should I ask how many of you have a smartwatch now? Wearing a smartwatch? Yeah, so imagine you are, for example, running on a hot day, and your smartwatch could measure, for example, the level of hydration of your skin and warn you maybe if you are reaching the limit of the hydration. Another interesting field of application would be robotics. Nowadays, humanoid robots are used in many fields, for example in medicine but also in household. And these robots are exposed to several stimuli, several interactions with the environment and with the humans, and sometimes they have too many inputs at the same time. And this is the reason number one for robot failure. So imagine a future where actually a robot could be a bit more sensitive, a bit smarter. This would lead also to a higher safety of this technology. And finally, unfortunately, a very highly cited paper projects the number of people in need of a prosthesis on the rise, from 1. 6 million in 2005 to 3. 6 million 2015. So a lot of people are born without limbs, and some people lose them during their life due to, for example, vascular diseases. This is so common that you may even know somebody who actually is in a need of prosthesis. Now imagine we could coat the prosthesis with this artificial skin and give this type of people the sensation back. With almost a decade of working in this field, I ’ m hopeful that technologies like this could help in the future not only regain, but also maybe augment capabilities. Thank you.

Text Sample 323: NEG Dim 2 – 2022 – Score 1.00 – 2022/t003521.txt

It ’ s an honor to be with you here today. And the message I have to deliver is a simple one, which is that clean energy will win on cost, definitively, but only if we get out of the way and allow it to be built. Let ’ s focus on that first point. Let ’ s look at the cost of clean energy technology. In 1975, if you were buying a solar panel per watt of power that it produced, it would cost you 100 US dollars. By 2020, that cost had declined to 20 cents per watt of power. That ' s a 500-fold decline. This is unlike anything else ever seen in energy. It is unlike anything else ever seen in physical infrastructure, and it continues today, and it is likely to continue for decades to come. Now, this has surprised the leading experts on clean energy and even the biggest optimists on the future of clean energy. I should know because I am one of those leading optimists. In 2010, the International Energy Agency, the world ' s foremost and official experts on energy, forecasted that the cost of solar power would drop like this. Now, I came from technology. I was a computer scientist, and so I looked at the cost of solar through the lens of Moore ' s law, exponential decline in cost as technology scales. And so I forecast that the cost of solar would drop at around five times the rate that the IEA believed it would. Unfortunately or fortunately, I was wrong. The cost of solar actually dropped 10 times as fast as the IEA expected and twice as fast as I expected. Clean energy is a technology. This deception in understanding the pace of cost decline has led to a massive underestimation of the pace of growth. Every year, the IEA puts out a forecast for how much new solar will we install per year. And you see these colored lines show you the pace at which the IEA believes new solar will be deployed annually, versus the black line, which shows how fast it ' s actually been deployed. So you see the colored lines going off to the right, those are successive years of forecasts of annual installations. And on the left you have what amounts to a 30 to 40 percent annual growth in installations. Note this has happened through the COVID years, note that 2022 will see another 38 to 40 percent growth in this market. This trend is not limited to just solar. It applies to a wide variety of clean-energy technologies. We ' ve seen the price of solar drop by a factor of 40 over the last few decades. We ' ve seen the cost of wind drop almost as much, and now an accelerating cost decline in floating offshore wind and offshore wind. We ' ve seen the cost of batteries that power our electric vehicles and grid energy storage drop at the same pace or faster than the pace of solar. And we are just at the very beginning of an exponential cost decline in the cost of using clean electricity to make hydrogen and other fuels that we can use to power industry, to provide weeks or months of storage on the grid and to provide fuels we can use for aviation, for shipping and so on. What ' s happening here – and I won ' t claim this is happening quickly enough to stay below 1. 5 degrees Celsius – but what ' s happening here is that clean energy technologies are technologies and they drop in cost like technology. As they are scaled, they come down in price. Meanwhile, fossil fuels are commodities and fossil fuel prices fluctuate over time. This is data from Oxford ' s Institute of New Economic Studies, which shows the cost of oil, gas and coal across the bottom there, fluctuating over time, largely remaining flat. Whereas here is the cost of clean energy technologies : solar, wind, batteries, power to fuels, all of them dropping exponentially. In 2010, there was no place on earth where clean energy was cheaper than fossil energy. In 2015, we started to see the first instances of clean energy without subsidies being cost-competitive. Now we see in more and more parts of the world that it is cheaper to build solar and wind than it is to put fuel into an already built and operating coal or gas plant. And behind that is the continued cost decline of batteries and hydrogen, which are still expensive but will get cheap enough to solve many of our intermittency issues. Now, does that mean we are done and the problem is solved? Not at all. We need to go faster. And we have a number of barriers. Some of these we ' ve talked about. Critical minerals need to be built out. We need a just transition. But there ' s two barriers I want to talk about in particular, which are the reluctance to build – not in my backyard – and the challenges with permitting. Because we look at renewables and a common complaint is they take up too much land. All of us want clean energy infrastructure, but many of us don ’ t want it in our backyard. Now, solar power is fairly compact. Wind power takes more space, but that space is co-located with agriculture. Animals graze up to wind turbines, fields of crops can be grown. And yet, despite this, in modern nations, in Europe and North America, roughly half of the land in the UK, in Germany or the US, is devoted to agriculture. Yet, Germany allows now two percent of land in Germany to be used for wind power. The US allows local communities to block wind power even if it ’ s nowhere near them. If we want to deploy clean energy, we must allow it to actually be built. But the even larger problem is this : We need to build out the grid. We have a perception that clean energy technologies don ’ t need the grid. Solar and wind mean you can be off-grid. While that ’ s easier, largely the opposite is true. Because solar and wind are weather-dependent, they benefit much more from continent-sized grid than do fossil fuels. And yet the same NIMBY issues and the same permitting issues plague energy transmission. Electricity transmission is ugly, and why do we need it, if we can just go off-grid and local with these energy technologies? Well, here ’ s why we need it. This is the sunshine, the solar resources of Europe. The most sun is in the south. Of course, the most wind is in the north, by the way. And this is averaged across the year. In winter, it is much more dramatic. In winter you have one seventh the solar resource in the UK that you have in summer. You have one sixth the solar resource in Germany that you have in summer. So every model, every simulation of weather and energy demand shows this. It shows that if you want to have the highest-reliability grid at the lowest cost, with the least carbon emissions and the most clean energy deployment, you want to build a continent-sized grid. In Europe, it would bring wind from the north, primarily the North Sea, but also on land, hydro from the Nordics and solar from the south. And these would be countercyclical. More sun in the summer, more wind in the winter. This is slightly oversimplified, but this is the sort of system that would allow Europe to decarbonize its electricity sector with some degree of storage and hydrogen and so on, nearly completely, at a lower cost than the system today. That same Oxford study I showed you says that a rapid transition to clean energy, because the more you deploy, the cheaper it gets, would save us 12 trillion dollars on the energy system, not even counting climate damages. Now, could we build such a grid? Of course, we have the technology and the economics. In China, the bulk of energy demand is on the East Coast, yet, the greatest solar resources and wind resources are in the interior. And China is building literally scores of high-voltage power lines that transmit power from where the sun and wind are to the coasts, where the energy demand is. And the longest of these lines right now, the Ürümqi to Shanghai line, is 3, 400 kilometers long. It is 90 percent efficient, very low losses, and it adds maybe a penny or two to the cost of electricity. That ’ s what ’ s technically feasible with current technology, let alone advances. In Europe that would allow us to transmit electricity from Seville to Copenhagen, to bring power from the North Sea to anywhere in the continent that needs it. In my home country, the United States, we could bring power from the sunny, wide open areas of New Mexico to population and land-dense New York, which doesn ’ t get so much sun. And we could take wind power from the Great Plains, that are largely devoid of population, and bring it to the coasts in winter. That is what a modern grid looks like. And yet we are not building this. Now, let me give you two pieces of data that will back up my assertions about how powerful these issues of permitting and grid build-out are, and one more, which is open competition on cost. What state in the United States do you believe has the most combined solar and wind power today and has deployed the most solar over the last year? Audience : Texas. RN : You are a very smart audience. It is the great state of Texas. Now, Texas has no climate policies to speak of. It has no incentives for solar or wind to speak of. It does have abundant land and abundant sun and wind. We can ’ t all duplicate that. But it has three other things we should think about. One, it has an open market for electricity where the cheapest provider wins, and that should give us confidence of what is actually winning. Two, permitting in Texas is relatively easy. It ’ s easy to build things, easy to build fossil infrastructure. I don ’ t love that, but it ’ s easy to build clean infrastructure and that ’ s what ’ s winning out. And three, Texas is the easiest state in the United States to build electricity transmission. Not as easy as I ’ d like, but it makes it easy. Those last three factors are factors we can replicate in every nation, every state, every geography on planet Earth. And they would accelerate this transition. Now, in August of 2022, we passed the largest US climate bill ever, Inflation Reduction Act. In Europe, we have a massive push on clean energy as part of the energy crisis driven by the war on Ukraine. Now I want to reveal at the same time that we failed at something. In late September 2022, we had a permitting bill in the United States that would have made it tremendously easier to build the continent-sized grid that we need in the US. It also made it easier to build fossil fuels. Yet every analysis showed that fundamentally this bill accelerated the clean energy transition. But it was opposed by some people because of it making it a bit easier to build fossil fuels as well. The consequence of this is potentially dire. The Princeton REPEAT project, led by my friend Dr. Jesse Jenkins, has analyzed this and said that up to 80 percent of the benefits of the Inflation Reduction Act may not manifest if we can ’ t accelerate the pace of building transmission. That that could amount to as much as 800 million tons a year of carbon emissions in the United States that would have been eliminated, but that won ’ t be because we don ’ t have the transmission capability to bring the cheapest power to where it ’ s needed and boost resilience and reliability along the way. So I believe that a deal that makes it easier to build, even if, to get that bill passed, we need to make it a bit easier to build some fossil infrastructure, will win for clean energy because clean energy simply wins on cost. On a level playing field, it will dominate the future. And so if you have confidence in this decades-long trend that clean energy will economically disrupt fossil fuels, then the logical conclusion is that we must get out of the way, make permitting easier, and allow it to be built. It is time for us to build. Thank you very much.

My grandfather was a restaurant owner. My father was a restaurant owner. My name is Vincent Yeow Lim. I ’ m a chef, content creator and restaurant owner. Owning and running a Chinese restaurant is one of the hardest and most valuable things I think you can do. When we first arrived in Australia, my dad opened a Chinese restaurant. I would go there every single day to help him out. That was my way to spend time with him. And slowly I developed my love for cooking. At the age of 15, I was able to use a wok to cook and to serve customers. Now I ’ m running a 100-seater Chinese restaurant. The hard work that I saw my dad put into Chinese food makes me feel really proud. Proud that I was lucky enough to learn from a master. When I tell people that I ’ m a chef cooking Chinese food, I want people to value it the same way that I do. So what is the value of Chinese food? Is it the taste? Is it the hard work and the training? Or is it the dish ’ s history and the nostalgia it makes us feel? To me, it is all of those things. But being in the restaurant industry, I can tell you the most obvious value of food. And that is the price at which we choose to set it at. The perception of Chinese food is that it is indulgent, yet cheap. But the value of Chinese food is so much more than that. There is no formal culinary school to train to be a Chinese chef. And after the pandemic, there was a shortage of Chinese chefs in Australia. Now the cost of ingredients, labor and demand for Chinese food is high. The amount of skill required to cook the first dish that I ever learned doesn ’ t match up to the price. The first dish that I ever learned to cook was the fried rice. Fried rice is the easiest dish to cook, but also the hardest dish to get right. I actually wasn ’ t allowed to serve customers until I got this dish right. The oil goes into the wok first, but only when the wok is hot enough. The egg goes in next. This creates a nonstick coating for when the rice hits the hot wok. From experience, you can tell when the rice is too wet or if the wok is too hot or too cold. All these small factors will create a different end result. If the rice is too wet, you lose the smoky aromatic flavor. But if the rice is too dry, you ’ re basically eating pebbles. Now we add a little bit of yum, yum. Now we add the cooked meats and vegetables. I ’ m tossing it to combine the flavors of the meat and vegetables with the rice. Even if we were to remove all the meat and vegetables, your rice should still have all the flavor. From years of experience, I can tell you the difference between a good fried rice just from the feel and from the smell, without even having to take a bite. And I thought – I thought that was enough. But I realized cooking with one wok was way too slow. So I took the knowledge from my dad and taught myself the dual wok cooking technique, using two woks to cook two different dishes at the same time. This requires coordination, organization and years of training. What makes it harder is the combination of dishes coming up next. They have endless possibilities. Chow mein, sizzling garlic prawns, egg foo young. When one is cooking, the other is served. When the other is cooking, the next is served. The goal is that no matter the combination, all the dishes get to the table at the same time. People expect this in a Chinese restaurant. People expect variety. In a Western restaurant, you open the menu, there ’ s 20 items. When I first started, I had 300. In a Western restaurant, you can often judge the food by the decor, the plating of the dishes or even by the number of different forks for each course. But in a Chinese restaurant, it ’ s a little bit different. You can often judge it by things like the kids sitting on the first table doing their homework. That ’ s when you know a Chinese restaurant will have amazing food. I was that kid. To a lot of us Chinese immigrants who started our own restaurants, the restaurant isn ’ t just a business. It ’ s a part of our lives. We eat almost three meals a day there, and often we just use our homes as a place to sleep. We dedicate our lives to these restaurants and to making delicious food. In Chinese cooking, we use a lot of strong flavors like ginger, garlic, chilies and even shrimp paste. The different flavors, I think, are why people like Chinese food, because every bite is different, and you never really get bored. But flavors, flavors are also built with the tools we use. When you use a wok, you get wok hei, known as”breath of the dragon.”Wok hei is the reason why noodles and rice always taste better at a restaurant than when you try to cook it at home. Wok hei is the combustion of oils in the air that make that smoky aromatic flavor. But wok hei also tastes like nostalgia. Growing up in Malaysia, the kitchens are outside, just like this. You can smell every ingredient that goes into the wok. The air is thick with humidity, and the fragrances of the food, they linger around so much longer. Those memories, they become nostalgic. The sense of home is what I feel when I taste Chinese wok cooking. Nostalgia is what makes a good dish taste ten times better and that much more valuable. But the value of Chinese food is often compared to fast food, quick and cheap. Although we ’ ve spent years developing skills to cook faster, Chinese food isn ’ t fast food. It requires skills, mastery of ingredients and nostalgia. In 2017, my dad passed away. I looked up to him. He was my best friend. When he passed away, I realized – I realized my passion of cooking dishes from my childhood. I was working as a chef at an airline ’ s first class lounge at the time, but I didn ’ t have any memories of the dishes I was cooking. I wanted to feel closer to my dad. So I quit. I dropped out of university on my last semester. I hopped onto a plane, and I flew over here to Sydney. And I took over the restaurant that I own today. I wanted to record everything that my dad taught me, so I shared it on social media. It went viral. Hundreds of millions of views. A lot of people related to the recipes that I was cooking because it was what they grew up eating with their parents. I remember this one fried rice he made. I was eight years old at the time. It was the first time I recall my dad stepping into the kitchen cooking. He made this fried rice with spam, seafood, peas and a little bit of dark soy sauce. It was a little bit salty, but it was the best fried rice that I ’ ve ever had. I cook and I ’ ve always cooked because it was a way to connect to my dad. It was something that we shared. Cooking represents all the hard work and memories that we had, learning the art, mastering the skills and understanding the history of Chinese food. To me, the value of Chinese food is so much more than the prices you pay at my restaurant. So the next time you visit a Chinese restaurant, just remember. It ’ s not just a plate of fried rice. It ’ s so much more than that. Thank you.

We live in a time-pressed culture. There is never enough time. And we see it, we feel it around us every day. We live in a world that valorizes work, accomplishment, busyness. And there ’ s real upside to that ; there ’ s real value. We ’ re pushed, we ’ re driven toward achievement and action and creation. And that ’ s great, but there ’ s also a downside. And that ’ s something that I think is worth talking about. There was a study done a while back, by the Management Research Group, of 10, 000 senior leaders. And they asked them,”What is key to your organization ’ s success?”And 97 percent said long-term strategic thinking. I mean, when was the last time that 97 percent of people agreed on anything? There is near unanimity that being a long-term thinker – having perspective, having the ability to think and ask big questions – is essential to our success. And yet in a separate study, 96 percent of leaders were surveyed, and they said they don ’ t have time for strategic thinking. What is going on? Why is it – how can it be that 96 percent of people are not doing the one thing that they say is most critical to their success? Well, I think we know the answer... or at least we think we do. The average professional attends 62 meetings per month. That sounds pretty outrageous. How could that be? But if you actually break it down, it ’ s not that many. It ’ s two to three meetings per day, which is probably average for many of you. So 62 meetings a month. That does not help, and that is not wrong. It is a contributor. Also, we know – we know what else... email. A study a while back by McKinsey showed that the average professional spends 28 percent of their time just responding to email. Of course that drains us, of course that makes us busy. But the truth is, it ’ s also, I believe, not the full picture. Those are manifestations. Those are problems, legitimately. But there are also some other things going on underneath the surface, reasons that perhaps we are, in some ways, working at cross-purposes. Because for so long almost all of us have said we want desperately to be less busy, and yet we keep making choices that put ourselves in the position where we ’ re just as busy as we ’ ve always been. What is going on? Well, some research out of Columbia

University sheds a little bit of light on this. Silvia Bellezza and her colleagues have done interesting research into the fact that in some cultures – American culture chief among them – busyness is actually a form of status. When we say,”Oh, I am so crazy busy,”what we ’ re really saying is a societally-accepted version of”I am so important –”I am so popular! I am so in demand!”And the truth is that feeling can be hard to give up... even if we say that we want to. That ’ s not the only reason, of course. It turns out it is very hard for the human mind to deal with conditions of uncertainty. And in modern life, there ’ s a lot of it. Sometimes we are given tasks or challenges, and the truth is, tactically, we just don ’ t know how to do it.”Increase sales by 30 percent.”Well, how? There ’ s a lot of ways you could do it. You ’ re not sure how. Sometimes it ’ s easier, frankly, to just double down and keep doing more of what you ’ re already doing. That might not be the best answer, but it ’ s an answer, and it removes uncertainty. The picture gets even worse when we ’ re talking about existential questions ; when we ’ re talking about uncomfortable matters that we might not actually really want to deal with. That might be,”Am I in the right job?”It might be,”Am I in the right career?”Those are often questions, truth be told, we might not want the answer to. And so we become busy as a way so that we don ’ t even have to ask the question. Now, there ’ s a third reason, and I ’ ll admit it ’ s one that I know well, personally, and that is that sometimes we use busyness as a way to numb ourselves out. I ’ ve experienced that. This is my boy Gideon, and he died in 2013. I ’ d had him for 17 years, and he was my best friend. And after he died, I ’ ll be honest, I didn ’ t want to be home because I knew that he wouldn ’ t be there. And so for two years, my life basically was an Uber to an airport, to a hotel and back again, because I just really didn ’ t want to face that. For a lot of us, there are things we sometimes don ’ t want to face. What we ’ re really looking for with work is an anesthetic. And as I like to say, work is better than crack – so if you ’ re choosing... it ’ s not the worst. But the truth is, it ’ s also not a sustainable solution. For many of us, we get trapped in the pattern of busyness, of overwork. It ’ s hard sometimes even to remember what it was like before. Oftentimes in our mind ’ s eye, when we think of busyness, what we think of is this. What we think of is triumphant success and the world at your fingertips. The truth is, more often, busyness looks like this. It looks like loneliness. It looks like frustration. It looks like having a life that ’ s not really in your full control. So I would like to propose that we make a change. Because if we are ever going to succeed in beating back busyness once and for all, first of all, we have to get real and acknowledge what is actually behind some of the busyness that is filling our days. We have to really get honest about what it is that ’ s motivating us so that we can make a different choice. Because it is about our choice. We need to recognize that real freedom is about creating the space so that we can breathe, the space so that we can think. Ultimately, real freedom is about choosing how and with whom we want to be spending our time. Thank you.

[The Universe in Verse] [Prelude] In 1908, Henrietta Swan Leavitt, one of the women known as the Harvard Computers, who changed our understanding of the universe long before they could vote, was cataloging photographic plates at the Harvard College Observatory, single-handedly analyzing 2, 000 variable stars – stars with fluctuating brightness, kind of like a lighthouse beacon – when she began noticing a distinct correlation between their brightness and their blinking pattern. That correlation made it possible to measure the distance of stars for the very first time, furnishing the yardstick of the universe. Meanwhile, a dutiful teenage boy in the Midwest was repressing his childhood love of astronomy and beginning his legal studies to fulfill his dying father ’ s demand for an ordinary, reputable life. When his father died, Edwin Hubble turned that passion for the stars into formal study and discovered two revolutionary facts about the universe : that it is tremendously bigger than we thought and that it ’ s getting bigger and bigger by the blink. One October evening in 1923, perched at the foot of the largest telescope in the world, at Mount Wilson Observatory, not far from here, Hubble took a 45-minute exposure of Andromeda, which was then thought to be one of many spiral nebulae in our Milky Way. The notion of a galaxy, a gravitationally bound cluster of stars and dust and dark matter, didn ’ t exist at the time. The Milky Way, which, by the way, was coined as a term by Chaucer in the 14th century, was thought to be what was called an”island universe”beyond the edge of which lay cold, dark nothingness. But when Hubble looked at the photograph the next morning and compared it to previous ones, he furrowed his brow and with a gasp of revelation scribbled right on top of the plate”VAR”and then drew an exclamation point because he had realized that a tiny fleck in Andromeda previously thought to be a nova could not possibly be a nova, given its blinking pattern across these different photographs. And it was, in fact, a variable star. Which meant, given Henrietta Leavitt ’ s data, that it was very, very far away, farther than the edge of the Milky Way. Which meant that Andromeda was not a nebula in our own galaxy, but a whole other galaxy, out there, in the cold, dark nothingness. Suddenly, the universe was a garden, blooming with galaxies, with ours but a single bloom. That same year, in another country, suspended between two World Wars, another young scientist came up with the radical idea of using rocket technology, this deadly military technology, to mount an enormous telescope and launch it into Earth ’ s orbit. Not only closer to the stars, but bypassing the atmosphere that occludes our terrestrial instruments. It would take another two generations of scientists to make that telescope a reality : a shimmering poem of metal, physics and perseverance bearing Hubble ’ s name. But when the Hubble Space Telescope launched in 1990, our human fallibility had slipped into the precision of the instrument, and it turned out that its primary mirror was ground into the wrong spherical shape, warping these long-awaited images of the unfathomed universe. Up the coast from Mount Wilson Observatory, a teenage girl watched her father, who had worked on the Hubble, one of NASA ’ s first Black engineers, come home brokenhearted. He didn ’ t know that his observant daughter would become poet laureate of his country and would commemorate him in the tenderest tribute that an artist ’ s daughter has ever composed for a scientist father, which would win her the Pulitzer Prize the year the Hubble ’ s corrected optics captured that revolutionary, ultra-deep field image of the observable universe, revealing what neither Hubble nor Henrietta Leavitt could have imagined. That ours is not just one of several galaxies, but that there are 100 billion galaxies out there, each containing 100 billion stars. Narrator : From”My God, It ’ s Full of Stars.”When my father worked on the Hubble Telescope, he said They operated like surgeons : scrubbed and sheathed In papery green, the room a clean, cold and bright white. He ’ d read Larry Niven at home, and drink scotch on the rocks, His eyes exhausted and pink. These were the Reagan years, When we lived with our finger on The Button and struggled To view our enemies as children. My father spent whole seasons Bowing before the oracle-eye, hungry for what it would find. His face lit-up whenever anyone asked, and his arms would rise As if he were weightless, perfectly at ease in the never-ending Night of space. On the ground, we tied postcards to balloons For peace. Prince Charles married

Lady Di. Rock Hudson died. We learned new words for things. The decade changed. The first few pictures came back blurred, and I felt ashamed For all the cheerful engineers, my father and his tribe. The second time, The optics jibed. We saw to the edge of all there is – So brutal and alive it seemed to comprehend us back.

Hi, my name is Fariel, but back home, I am also called the goat lady. And today I will be sharing the story of how that came to be about. In 2015, I visited a small, remote village in Pakistan called Pathan Goth. The residents of Pathan Goth were living without access to basic facilities such as water and electricity. The community was bussing water two hours from Karachi. This made their water so expensive that their livestock went without water every other day. Bathing and laundry was a luxury. The solution was simple : a solar water pump. But that would cost $10, 000. And for a community where the average household earned just about $70 a month, this was beyond their affordability. As I sat there thinking about this issue, the solution literally walked in front of me. A herd of more than 100 goats crossed my path. And I thought to myself, that is a lot of goats. I took a chance and asked the village elder : Would they consider paying me for their pump in goats? He agreed, and that is how Pathan Goth got its pump and I became the proud owner of 40 goats. A few months down the line, the Muslim festival of Eid came around. During Eid, livestock is offered to honor Abraham ’ s willingness to sacrifice Isaac. And much like shopping before Christmas, the demand for goats goes up, and the price skyrockets. I remembered my goats and decided to put up a post on Facebook asking my friends and family to buy their Eid goat from me that year. Within a week I sold all my goats. And even after paying for a team to do transport and manage them, I more than recovered the cost of the pump. This experience made me question the idea of money and how it has changed and evolved for us. I found that in 2500 BC, Mesopotamia, Sumerians used measured quantity of barley as money. But as the trading circle grew beyond one village, money ’ s key characteristics changed and evolved. Money not only needed to reliably store value but also be easy to convert and easy to transport. That is when we – civilization – moved towards coin and paper money. But coin and paper money get value only when they ’ re validated by an external authority, such as God, crown or the central bank. Technology today enables us to bypass the need for this central authority. Today, the value of any asset can be transferred from one person to another using blockchain. Any asset can now be tokenized, digitized and traded. So technology is not only disrupting the need for a financial intermediary in mainstream economy but also has the potential to disrupt and democratize economic power in more rural economies. By removing the need for inefficient and expensive intermediaries, small farmers can derive greater value from what they grow and raise. Livestock is very abundant in these communities. Farmers literally use their goats and cows as ATM machines and as saving instruments. They will sell an animal when they need cash, such as to buy fodder for the rest of the herd, to buy groceries for their home or for weddings and health emergencies. But these communities have never been able to use their goats and cows for larger, more productive assets... until now. Our farmers are able to convert 15 goats into a solar water pump. Previously, these communities would rely on or wait for an NGO, a charity or the government to take notice and give them what they needed. Now they are using their own resources to fulfill their own needs when they need it. This is self-reliance. So

how have we enabled the use of goats as a reliable form of currency? Right now, we we work with farmers through physical barter. At the time of the solar installation, we take possession of the goats. We then sell these goats as meat to grocery chains and through our own retail brand. Every goat that we receive is then recorded, as its unique ID – its key characteristics such as its sex, its age, its weight and even its number of teeth are taken into account. And then using these, we assign each goat a dollar or a rupee value, essentially tokenizing a goat. We have already worked with 45 communities, enabling more than 6, 000 farmers to convert their goats into water and electricity. We are now planning to add smartphones, tractors and other equipment. My hope is that we can create a more inclusive economic system where any person or any community can use what they grow and raise as money. Where a farmer, a small farmer can use, wherever he is, whether it ’ s Pakistan, Nepal, Somalia, can use a digitized goat to pay for her kid ’ s school fees, a tractor or a smartphone. This future isn ’ t quite here yet, but I hope using goats as money gets us closer. Thank you.

Imagine spending seven years at MIT and research laboratories, only to find out that you ’ re a performance artist. I ’ m also a software engineer, and I make lots of different kinds of art with the computer. And I think the main thing that I ’ m interested in is trying to find a way of making the computer into a personal mode of expression. And many of you out there are the heads of Macromedia and Microsoft, and in a way those are my bane : I think there ’ s a great homogenizing force that software imposes on people and limits the way they think about what ’ s possible on the computer. Of course, it ’ s also a great liberating force that makes possible, you know, publishing and so forth, and standards, and so on. But, in a way, the computer makes possible much more than what most people think, and my art has just been about trying to find a personal way of using the computer, and so I end up writing software to do that. Chris has asked me to do a short performance, and so I ’ m going to take just this time — maybe 10 minutes — to do that, and hopefully at the end have just a moment to show you a couple of my other projects in video form. Thank you. We ’ ve got about a minute left. I ’ d just like to show a clip from a most recent project. I did a performance with two singers who specialize in making strange noises with their mouths. And this just came off last September at ARS Electronica ; we repeated it in England. And the idea is to visualize their speech and song behind them with a large screen. We used a computer vision tracking system in order to know where they were. And since we know where their heads are, and we have a wireless mic on them that we ’ re processing the sound from, we ’ re able to create visualizations which are linked very tightly to what they ’ re doing with their speech. This will take about 30 seconds or so. He ’ s making a, kind of, cheek-flapping sound. Well, suffice it to say it ’ s not all like that, but that ’ s part of it. Thanks very much. There ’ s always lots more. I ’ m overtime, so I just wanted to say you can, if you ’ re in New York, you can check out my work at the Whitney Biennial next week, and also at Bitforms Gallery in Chelsea. And with that, I think I should give up the stage, so, thank you so much.

Brain magic. What ’ s brain magic all about? Brain magic to me indicates that

area of magic dealing with psychological and mind-reading effects. So unlike traditional magic, it uses the power of words, linguistic deception, non-verbal communication and various other techniques to create the illusion of a sixth sense. I ’ m going to show you all how easy it is to manipulate the human mind once you know how. I want everybody downstairs also to join in with me and everybody. I want everybody to put out your hands like this for me, first of all. OK, clap them together, once. OK, reverse your hands. Now, follow my actions exactly. Now about half the audience has their left hand up. Why is that? OK, swap them around, put your right hand up. Cross your hands over, so your right hand goes over, interlace your fingers like this, then make sure your right thumb is outside your left thumb — that ’ s very important. Yours is the other way around, so swap it around. Excellent, OK. Extend your fingers like this for me. All right. Tap them together once. OK, now, if you did not allow me to deceive your minds, you would all be able to do this. Now you can see how easy it is for me to manipulate the human mind, once you know how. Now, I remember when I was about 15, I read a copy of Life magazine, which detailed a story about a 75-year-old blind Russian woman who could sense printed letters — there ’ s still people trying to do it — — who could sense printed letters and even sense colors, just by touch. And she was completely blind. She could also read the serial numbers on bills when they were placed, face down, on a hard surface. Now, I was fascinated, but at the same time, skeptical. How could somebody read using their fingertips? You know, if you actually think about it, if somebody is totally blind — a guy yesterday did a demonstration in one of the rooms, where people had to close their eyes and they could just hear things. And it ’ s just a really weird thing to try and figure out. How could somebody read using their fingertips? Now earlier on, as part of a TV show that I have coming up on MTV, I attempted to give a similar demonstration of what is now known as second sight. So, let ’ s take a look. Man : There we go. I ’ m going to guide you into the car. Kathryn Thomas : Man : You ’ re OK, keep on going. KT : How are you? Keith Barry : Kathryn, it ’ s Keith here. I ’ m going to take you to a secret location, OK? Kathryn, there was no way you could see through that blindfold. KT : OK, but don ’ t say my name like that. KB : But you ’ re OK? KT : Yes. KB : No way to see through it? KT : No. KB : I ’ ll take it off. Do you want to take the rest off? Take it off, you ’ re OK. We ’ ll stop for a second. KT : I ’ m so afraid of what I ’ m going to see. KB : You ’ re fine, take it off. You ’ re OK. You ’ re safe. Have you ever heard of second sight? KT : No. KB : Second sight is whereby a mind-control expert can see through somebody else ’ s eyes. And I ’ m going to try that right now. KT : God. KB : Are you ready? Where is it? There ’ s no way — KT : KT : Oh, my God! KB : Don ’ t say anything, I ’ m trying to see through your eyes. I can ’ t see. KT : There ’ s a wall, there ’ s a wall. KB : Look at the road, look at the road. KT : OK, OK, OK. Oh, my God! KB : Now, anything coming at all? KT : No. KB : Sure there ’ s not? KT : No, no, I ’ m just still looking at the road. I ’ m looking at the road, all the time. I ’ m not taking my eyes off the road. KT : Oh, my God! KB : Where are we? Where are we? We ’ re going uphill, are we going uphill? KT : Look at the road — Still got that goddamn blindfold on. KB : What? KT : How are you doing this? KB : Just don ’ t break my concentration. We ’ re OK, though? KT : Yes. That ’ s so weird. We ’ re nearly there. Oh, my God! Oh, my God! KB : And I ’ ve stopped. KT : That is weird. You ’ re like a freak-ass of nature. That was the most scary thing I ’ ve ever done in my life! KB : Thank you. By the way, two days ago, we were going to film this down there, at the race course, and we got a guy into a car, and we got a camera man in the back, but halfway through the drive, he told me he had, I think it was a nine- millimeter, stuck to his leg. So, I stopped pretty quick, and that was it. So, do you believe it ’ s possible to see through somebody else ’ s eyes? That ’ s the question. Now, most people here would automatically say no. OK, but I want you to realize some facts. I couldn ’ t see through the blindfold. The car was not gimmicked or tricked in any way. The girl, I ’ d never met before, all right. So, I want you to just think about it for a moment. A lot of people try to come up with a logical solution to what just happened, all right. But because your brains are not trained in the art of deception, the solutions you come up with will, 99 percent of the time, be way off the mark. This is because magic is all about directing attention. If, for instance, I didn ’ t want you to look at my right hand, then I don ’ t look at it. But if I wanted you to look at my right hand, then I look at it, too. You see, it ’ s very simple, once you know how, but very complicated in other ways. I ’ m going to give you some demonstrations right now. I need two people to help me out real quick. Can you come up? And let ’ s see, down at the end, here, can you also come up, real quick? Do you mind? Yes, at the end. OK, give them a round of applause as they come up. You might want to use the stairs, there. It ’ s very important for everybody here to realize I haven ’ t set anything up with you. You don ’ t know what will happen, right? Would you mind just standing over here for a moment? Your name is? Nicole : Nicole. KB : Nicole, and? KB : Actually, here ’ s the thing, answer it, answer it, answer it. Is it a girl? Man : They ’ ve already gone. KB : OK, swap over positions. Can you stand over here? This will make it easier. Pity, I would have told them it was the ace of spades. OK, a little bit closer. OK, a little bit closer, come over — they look really nervous up here. Do you believe in witchcraft? Nicole : No. KB : Voodoo? Nicole : No. KB : Things that go bump in the night? Nicole : No. KB : Besides, who ’ s next, no, OK. I want you to just stand exactly like this for me, pull up your sleeves, if you don ’ t mind. OK, now, I want you to be aware of all the different sensations around you, because we ’ ll try a voodoo experiment. I want you to be aware of the sensations, but don ’ t say anything until I ask you, and don ’ t open your eyes until I ask you. From this point onwards, close your eyes, do not say anything, do not open them, be aware of the sensations. Yes or no, did you feel anything? Nicole : Yes. KB : You did feel that? What did you feel? Nicole : A touch on my back. KB : How many times did you feel it? Nicole : Twice. KB : Twice. OK, extend your left arm out in front of you. Extend your left arm, OK. OK, keep it there. Be aware of the sensations, don ’ t say anything, don ’ t open your eyes, OK. Did you feel anything, there? Nicole : Yes. KB : What did you feel? Nicole : Three — KB : Like a tickling sensation? Nicole : Yes. KB : Can you show us where? OK, excellent. Open your eyes. I never touched you. I just touched his back, and I just touched his arm. A voodoo experiment. Yeah, I walk around nightclubs all night like this. You just take a seat over here for a second. I ’ m going to use you again, in a moment. Can you take a seat right over here, if you don ’ t mind. Sit right here. Man : OK. KB : OK, take a seat. Excellent, OK. Now, what I want you to do is look directly at me, OK, just take a deep breath in through your nose, letting it out through your mouth, and relax. Allow your eyes to close, on five, four, three, two, one. Close your eyes right now. OK, now, I ’ m not hypnotizing you, I ’ m merely placing you in a heightened state of synchronicity, so our minds are along the same lines. And as you sink and drift and float into this relaxed state of mind, I ’ m going to take your left hand, and just place it up here. I want you to hold it there just for a moment, and I only want you to allow your hand to sink and drift and float back to the tabletop at the same rate and speed as you drift and float into this relaxed state of awareness, and allow it to go all the way down to the tabletop. That ’ s it, all the way down, all the way down. and further, and further. Excellent. I want you to allow your hand to stick firmly to the tabletop. OK, now, allow it to stay there. OK, now, in a moment, you ’ ll feel a certain pressure, OK, and I want you to be aware of the pressure. Just be aware of the pressure. And I only want you to allow your hand to float slowly back up from the tabletop as you feel the pressure release, but only when you feel the pressure release. Do you understand? Just answer yes or no. Man : Yes. KB : Hold it right there. And only when you feel the pressure go back, allow your hand to drift back to the tabletop, but only when you feel the pressure. OK, that was wonderfully done. Let ' s try it again. Excellent. Now that you ' ve got the idea, let ' s try something even more interesting. Allow it to stick firmly to the tabletop, keep your eyes closed. Can you stand up? Just stand, stage forward. I want you to point directly at his forehead. OK. Imagine a connection between you and him. Only when you want the pressure to be released, make an upward gesture, like this, but only when you want it to be released. You can wait as long as you want, but only when you want the pressure released. OK, let ' s try it again. OK, now, imagine the connection, OK. Point directly at his forehead. Only when you want the pressure released, we ' ll try it again. OK, it worked that time, excellent. And hold it there, both of you. Only when you want the pressure to go back, make a downward gesture. You can wait as long as you want. You did it pretty quickly, but it went down, OK. Now, I want you to be aware that in a moment, when I snap my fingers, your eyes will open, again. It ' s OK to remember to forget, or forget to remember what happened. Most people ask you,"What the hell just happened up here?"But it ' s OK that even though you ' re not hypnotized, you will forget everything that happened. On five, four, three, two, one — open your eyes, wide awake. Give them a round of applause, as they go back to their seats. OK, you can go back. I once saw a film called"The Gods Are Crazy."Has anybody here seen that film? Yeah. Remember when they threw the Coke out of the airplane, and it landed on the ground, and it didn ' t break? Now, see, that ' s because Coke bottles are solid. It ' s nearly impossible to break a Coke bottle. Do you want to try it? Good job. She ' s not taking any chances. You see, psychokinesis is the paranormal influence of the mind on physical events and processes. For some magicians or mentalists, sometimes the spoon will bend or melt, sometimes it will not. Sometimes the object will slide across the table, sometimes it will not. It depends on how much energy you have that day, so on and so forth. We ' re going to try an experiment in psychokinesis, right now. Come right over here, next to me. Excellent. Now, have a look at the Coke bottle. Make sure it is solid, there ' s only one hole, and it ' s a normal Coke bottle. And you can whack it against the table, if you want ; be careful. Even though it ' s solid, I ' m standing away. I want you to pinch right here with two fingers and your thumb. Excellent. Now, I ' ve got a shard of glass here, OK. I want you to examine the shard of glass. Careful, it ' s sharp. Just hold on to it for a moment. Now, hold it out here. I want you to imagine, right now, a broken relationship from many years ago. I want you to imagine all the negative energy from that broken relationship, from that guy, being imparted into the broken piece of glass, which will represent him, OK. But I want you to take this very seriously. Stare at the glass, ignore everybody right here. In a moment, you ' ll feel a certain sensation, OK, and when you feel that sensation, I want you to drop the piece of glass into the bottle. Think of that guy, that ba — that guy. I ' m trying to be good here. OK, and when you feel the sensation — it might take a while — drop it into the glass. OK, drop it in. Now, imagine all that negative energy in there. Imagine his name and imagine him inside the glass. And I want you to release that negative energy by shaking it from side to side. That was a lot of negative energy, built up in there. I also want you to look at me and think of his name. OK, think of how many letters in the title of his name. There ' s five letters in the title. You didn ' t react to that, so it ' s four letters. Think of one of the letters in the title. There

’ s a K in his name, there is a K. I knew that because my name starts with a K also, but his name doesn ’ t start with a K, it starts with an M. Tell Mike I said hello, the next time you see him. Was that his name? Nicole : Mm-hmm. KB : OK, give her a round of applause. Thank you. I ’ ve got one more thing to share with you right now. Actually, Chris, I was going to pick you for this, but instead of picking you, can you hop up here and pick a victim for this next experiment? And it should be a male victim, that ’ s the only thing. Chris Anderson : Oh, OK. KB : I was going to use you, but I decided I might want to come back another year. CA : Well, to reward him for saying”eureka,”and for selecting Michael Mercil to come and talk to us — Steve Jurvetson. KB : OK, Steve, come on up here. CA : You knew! KB : OK, Steve, I want you to take a seat, right behind here. Excellent. Now, Steve — oh, you can check underneath. Go ahead, I ’ ve no fancy assistants underneath there. They insist that because I was a magician, put a nice, black tablecloth on. There you are, OK. I ’ ve got four wooden plinths here, Steve. One, two, three and four. Now, they ’ re all the exact same except this one obviously has a stainless steel spike sticking out of it. I want you to examine it, and make sure it ’ s solid. Happy? Steve Jurvetson : Mmm, yes. KB : OK. Now, Steve, I ’ m going to stand in front of the table, When I stand in front of the table, I want you to put the cups on the plinths, in any order you want, and then mix them all up, so nobody has any idea where the spike is, all right? SJ : No one in the audience? KB : Yes, and just to help you out, I ’ ll block them from view, so nobody can see what you ’ re doing. I ’ ll also look away. So, go ahead and mix them up, now. OK, and tell me when you ’ re done. KB : You done? SJ : Almost. KB : Almost, oh. OK, you ’ re making sure that ’ s well hidden. Oh, we ’ ve got one here, we ’ ve got one here. So, all right, we ’ ll leave them like that. I ’ m going to have the last laugh, though. Now, Steve, you know where the spike is, but nobody else, does? Correct? But I don ’ t want you to know either, so swivel around on your chair. They ’ ll keep an eye on me to make sure I don ’ t do anything funny. No, stay around, OK. Now, Steve, look back. Now you don ’ t know where the spike is, and I don ’ t know where it is either. Now, is there any way to see through this blindfold? SJ : Put this on? KB : No, just, is there any way to see through it? No? SJ : No, I can ’ t see through it. KB : Excellent. Now, I ’ m going to put on the blindfold. Don ’ t stack them up, OK. Give them an extra mix up. Don ’ t move the cups, I don ’ t want anybody to see where the spike is, but give the plinths an extra mix up, and then line them up. I ’ ll put the blindfold on. Give them an extra mix up. No messing around this time. OK, go ahead, mix them up. My hand is at risk here. Tell me when you ’ re done. SJ : Done. KB : OK, where are you? Put out your hand. Your right hand. Tell me when I ’ m over a cup. SJ : You ’ re over a cup. KB : I ’ m over a cup, right now? SJ : Mm-hmm. KB : Now, Steve, do you think it ’ s here? Yes or no? SJ : Oh! KB : I told you I ’ d have the last laugh. SJ : I don ’ t think it ’ s there. KB : No? Good decision. Now, if I go this way, is there another cup over here? SJ : Can we do the left hand? KB : Oh, no, no, no. He asked me could he do the left hand. Absolutely not. KB : If I go this way, is there another cup? SJ : Yes. KB : Tell me when to stop. SJ : OK. KB : There? SJ : Yes, there ’ s one. KB : OK. Do you think it ’ s here, yes or no? This is your decision, not mine. SJ : I ’ m going to say no. KB : Good decision. OK, give me both hands. Now, put them on both cups. Do you think the spike is under your left or your right hand? SJ : Neither. KB : Neither, oh, OK. But if you were to guess. SJ : Under my right hand. KB : Under your right hand? Now, remember, you made all the decisions all along. Psychologists, figure this out. Have a look. SJ : Oh! KB : Thank you. If anybody wants to see some sleight of hand later on, I ’ ll be outside. Thank you. Thank you. Thank you.

Text Sample 330: NEG Dim 2 – 2004 – Score 2.00 – 2004/t000179.txt

I became an inventor by accident. I was out of the air force in 1956. No, no, that ’ s not true : I went in in 1956, came out in 1959, was working at the University of Washington, and I came up with an idea, from reading a magazine article, for a new kind of a phonograph tone arm. Now, that was before cassette tapes, C. D. s, DVDs — any of the cool stuff we ’ ve got now. And it was an arm that, instead of hinging and pivoting as it went across the record, went straight : a radial, linear tracking tone arm. And it was the hardest invention I ever made, but it got me started, and I got really lucky after that. And without giving you too much of a tirade, I want to talk to you about an invention I brought with me today : my 44th invention. No, that ’ s not true either. Golly, I ’ m just totally losing it. My 44th patent ; about the 15th invention. I call this hypersonic sound. I ’ m going to play it for you in a couple minutes, but I want to make an analogy before I do to this. I usually show this hypersonic sound and people will say, That ’ s really cool, but what ’ s it good for? And I say, What is the light bulb good for? Sound, light : I ’ m going to draw the analogy. When Edison invented the light bulb, pretty much looked like this. Hasn ’ t changed that much. Light came out of it in every direction. Before the light bulb was invented, people had figured out how to put a reflector behind it, focus it a little bit ; put lenses in front of it, focus it a little bit better. Ultimately we figured out how to make things like lasers that were totally focused. Now, think about where the world would be today if we had the light bulb, but you couldn ’ t focus light ; if when you turned one on it just went wherever it wanted to. That ’ s the way loudspeakers pretty much are. You turn on the loudspeaker, and after almost 80 years of having those gadgets, the sound just kind of goes where it wants. Even when you ’ re standing in front of a megaphone, it ’ s pretty much every direction. A little bit of differential, but not much. If the light bulb was the way the speaker is, and you couldn ’ t focus or sharpen the edges or define it, we wouldn ’ t have that, or movies in general, or computers, or T. V. sets, or C. D. s, or DVDs — and just go down the list of what the importance is of being able to focus light. Now, after almost 80 years of having sound, I thought it was about time that we figure out a way to put sound where you want to. I have a couple of units. That guy there was made for a demo I did yesterday early in the day for a big car maker in Detroit who wants to put them in a car — small version, over your head — so that you can actually get binaural sound in a car. What if I could aim sound the way I aim light? I got this waterfall I recorded in my back yard. Now, you ’ re not going to hear a thing unless it hits you. Maybe if I hit the side wall it will bounce around the room. The sound is being made right next to your ears. Is that cool? Because I have some limited time, I ’ ll cut it off for a second, and tell you about how it works and what it ’ s good for. Course, like light, it ’ s great to be able to put sound to highlight a clothing rack, or the cornflakes, or the toothpaste, or a talking plaque in a movie theater lobby. Sony ’ s got an idea — Sony ’ s our biggest customers right now. They tried this back in the ’ 60s and were too smart, and so they gave up. But they want to use it — seriously. There ’ s a mix an inventor has to have. You have to be kind of smart, and though I did not graduate from college doesn ’ t mean I ’ m stupid, because you cannot be stupid and do very much in the world today. Too many other smart people out there. So. I just happened to get my education in a little different way. I ’ m not at all against education. I think it ’ s wonderful ; I think sometimes people, when they get educated, lose it : they get so smart they ’ re unwilling to look at things that they know better than. And we ’ re living in a great time right now, because almost everything ’ s being explored anew. I have this little slogan that I use a lot, which is : virtually nothing — and I mean this honestly — has been invented yet. We ' re just starting. We ' re just starting to really discover the laws of nature and science and physics. And this is, I hope, a little piece of it. Sony ' s got this vision back — to get myself on track — that when you stand in the checkout line in the supermarket, you ' re going to watch a new T. V. channel. They know that when you watch T. V. at home, because there are so many choices you can change channels, miss their commercials. A hundred and fifty- one million people every day stand in the line at the supermarket. Now, they ' ve tried this a couple years ago and it failed, because the checker gets tired of hearing the same message every 20 minutes, and reaches out, turns off the sound. And, you know, if the sound isn ' t there, the sale typically isn ' t made. For instance, like, when you ' re on an airplane, they show the movie, you get to watch it for free ; when you want to hear the sound, you pay. And so ABC and Sony have devised this new thing where when you step in the line in the supermarket — initially it ' ll be Safeways. It is Safeways ; they ' re trying this in three parts of the country right now — you ' ll be watching TV. And hopefully they ' ll be sensitive that they don ' t want to offend you with just one more outlet. But what ' s great about it, from the tests that have been done, is, if you don ' t want to hear it, you take about one step to the side and you don ' t hear it. So, we create silence as much as we create sound. ATMs that talk to you ; nobody else hears it. Sit in bed, two in the morning, watch TV ; your spouse, or someone, is next to you, asleep ; doesn ' t hear it, doesn ' t wake up. We ' re also working on noise canceling things like snoring, noise from automobiles. I have been really lucky with this technology : all of a sudden as it is ready, the world is ready to accept it. They have literally beat a path to our door. We ' ve been selling it since about last September, October, and it ' s been immensely gratifying. If you ' re interested in what it costs — I ' m not selling them today — but this unit, with the electronics and everything, if you buy one, is around a thousand bucks. We expect by this time next year, it ' ll be hundreds, a few hundred bucks, to buy it. It ' s not any more pricey than regular electronics. Now, when I played it for you, you didn ' t hear the thunderous bass. This unit that I played goes from about 200 hertz to above the range of hearing. It ' s actually emitting ultrasound — low-level ultrasound — that ' s about 100, 000 vibrations per second. And the sound that you ' re hearing, unlike a regular speaker on which all the sound is made on the face, is made out in front of it, in the air. The air is not linear, as we ' ve always been taught. You turn up the volume just a little bit — I ' m talking about a little over 80 decibels — and all of a sudden the air begins to corrupt signals you propagate. Here ' s why : the speed of sound is not a constant. It ' s fairly slow. It changes with temperature and with barometric pressure. Now, imagine, if you will, without getting too technical, I ' m making a little sine wave here in the air. Well, if I turn up the amplitude too much, I ' m having an effect on the pressure, which means during the making of that sine wave, the speed at which it is propagating is shifting. All of audio as we know it is an attempt to be more and more perfectly linear. Linearity means higher quality sound. Hypersonic sound is exactly the opposite : it ' s 100 percent based on non-linearity. An effect happens in the air, it ' s a corrupting effect of the sound — the ultrasound in this case — that ' s emitted, but it ' s so predictable that you can produce very precise audio out of that effect. Now, the question is, where ' s the sound made? Instead of being made on the face of the cone, it ' s made at literally billions of little independent points along this narrow column in the air, and so when I aim it towards you, what you hear is made right next to your ears. I said we can shorten the column, we can spread it out to cover the couch. I can put it so that one ear hears one speaker, the other ear hears the other.

That ’ s true binaural sound. When you listen to stereo on your home system, your both ears hear both speakers. Turn on the left speaker sometime and notice you ’ re hearing it also in your right ear. So, the stage is more restricted — the sound stage that ’ s supposed to spread out in front of you. Because the sound is made in the air along this column, it does not follow the inverse square law, which says it drops off about two thirds every time you double the distance : 6dB every time you go from one meter, for instance, to two meters. That means you go to a rock concert or a symphony, and the guy in the front row gets the same level as the guy in the back row, now, all of a sudden. Isn ’ t that terrific? So, we ’ ve been, as I say, very successful, very lucky, in having companies catch the vision of this, from cars — car makers who want to put a stereo system in the front for the kids, and a separate system in the back — oh, no, the kids aren ’ t driving today. I was seeing if you were listening. Actually, I haven ’ t had breakfast yet. A stereo system in the front for mom and dad, and maybe there ’ s a little DVD player in the back for the kids, and the parents don ’ t want to be bothered with that, or their rap music or whatever. So, again, this idea of being able to put sound anywhere you want to is really starting to catch on. It also works for transmitting and communicating data. It also works five times better underwater. We ’ ve got the military — have just deployed some of these into Iraq, where you can put fake troop movements quarter of a mile away on a hillside. Or you can whisper in the ear of a supposed terrorist some Biblical verse. I ’ m serious. And they have these infrared devices that can look at their countenance, and see a fraction of a degree Kelvin in temperature shift from 100 yards away when they play this thing. And so, another way of hopefully determining who ’ s friendly and who isn ’ t. We make a version with this which puts out 155 decibels. Pain is 120. So it allows you to go nearly a mile away and communicate with people, and there can be a public beach just off to the side, and they don ’ t even know it ’ s turned on. We sell those to the military presently for about 70, 000 dollars, and they ’ re buying them as fast as we can make them. We put it on a turret with a camera, so that when they shoot at you, you ’ re over there, and it ’ s there. I have a bunch of other inventions. I invented a plasma antenna, to shift gears. Looked up at the ceiling of my office one day — I was working on a ground-penetrating radar project — and my physicist CEO came in and said,”We have a real problem. We ’ re using very short wavelengths. We ’ ve got a problem with the antenna ringing. When you run very short wavelengths, like a tuning fork the antenna resonates, and there ’ s more energy coming out of the antenna than there is the backscatter from the ground that we ’ re trying to analyze, taking too much processing.”I says,”Why don ’ t we make an antenna that only exists when you want it? Turn it on ; turn it off. That ’ s a fluorescent tube refined.”I just sold that for a million and a half dollars, cash. I took it back to the Pentagon after it got declassified, when the patent issued, and told the people back there about it, and they laughed, and then I took them back a demo and they bought. Any of you ever wore a Jabber headphone — the little cell headphones? That ’ s my invention. I sold that for seven million dollars. Big mistake : it just sold for 80 million dollars two years ago. I actually drew that up on a little crummy Mac computer in my attic at my house, and one of the many designs which they have now is still the same design I drew way back when. So, I ’ ve been really lucky as an inventor. I ’ m the happiest guy you ’ re ever going to meet. And my dad died before he realized anybody in the family would maybe, hopefully, make something out of themselves. You ’ ve been a great audience. I know I ’ ve jumped all over the place. I usually figure out what my talk is when I get up in front of a group. Let me give you, in the last minute, one more quick demo of this guy, for those of you that haven ’ t heard it. Can never tell if it ’ s on. If you haven ’ t heard it, raise your hand. Getting it over there? Get the cameraman. Yeah, there you go. I ’ ve got a Coke can opening that ’ s right in your head ; that ’ s really cool. Thank you once again. Appreciate it very much.

Thank you. It ’ s really an honor and a privilege to be here spending my last day as a teenager. Today I want to talk to you about the future, but first I ’ m going to tell you a bit about the past. My story starts way before I was born. My grandmother was on a train to Auschwitz, the death camp. And she was going along the tracks, and the tracks split. And somehow — we don ’ t really know exactly the whole story — but the train took the wrong track and went to a work camp rather than the death camp. My grandmother survived and married my grandfather. They were living in Hungary, and my mother was born. And when my mother was two years old, the Hungarian revolution was raging, and they decided to escape Hungary. They got on a boat, and yet another divergence — the boat was either going to Canada or to Australia. They got on and didn ’ t know where they were going, and ended up in Canada. So, to make a long story short, they came to Canada. My grandmother was a chemist. She worked at the Banting Institute in Toronto, and at 44 she died of stomach cancer. I never met my grandmother, but I carry on her name — her exact name, Eva Vertes — and I like to think I carry on her scientific passion, too. I found this passion not far from here, actually, when I was nine years old. My family was on a road trip and we were in the Grand Canyon. And I had never been a reader when I was young — my dad had tried me with the Hardy Boys ; I tried Nancy Drew ; I tried all that — and I just didn ’ t like reading books. And my mother bought this book when we were at the Grand Canyon called”The Hot Zone.”It was all about the outbreak of the Ebola virus. And something about it just kind of drew me towards it. There was this big sort of bumpy-looking virus on the cover, and I just wanted to read it. I picked up that book, and as we drove from the edge of the Grand Canyon to Big Sur, and to, actually, here where we are today, in Monterey, I read that book, and from when I was reading that book, I knew that I wanted to have a life in medicine. I wanted to be like the explorers I ’ d read about in the book, who went into the jungles of Africa, went into the research labs and just tried to figure out what this deadly virus was. So from that moment on, I read every medical book I could get my hands on, and I just loved it so much. I was a passive observer of the medical world. It wasn ’ t until I entered high school that I thought,”Maybe now, you know — being a big high school kid — I can maybe become an active part of this big medical world.”I was 14, and I emailed professors at the local university to see if maybe I could go work in their lab. And hardly anyone responded. But I mean, why would they respond to a 14-year-old, anyway? And I got to go talk to one professor, Dr. Jacobs, who accepted me into the lab. At that time, I was really interested in neuroscience and wanted to do a research project in neurology — specifically looking at the effects of heavy metals on the developing nervous system. So I started that, and worked in his lab for a year, and found the results that I guess you ’ d expect to find when you feed fruit flies heavy metals — that it really, really impaired the nervous system. The spinal cord had breaks. The neurons were crossing in every which way. And from then I wanted to look not at impairment, but at prevention of impairment. So that ’ s what led me to Alzheimer ’ s. I started reading about Alzheimer ’ s and tried to familiarize myself with the research, and at the same time when I was in the — I was reading in the medical library one day, and I read this article about something called”purine derivatives.”And they seemed to have cell growth-promoting properties. And being naive about the whole field, I kind of thought,”Oh, you have cell death in Alzheimer ’ s which is causing the memory deficit, and then you have this compound — purine derivatives — that are promoting cell growth.”And so I thought,”Maybe if it can promote cell growth, it can inhibit cell death, too.”And so that ’ s the project that I pursued for that year, and it ’ s continuing now as well, and found that a specific purine derivative called”guanidine”had inhibited the cell growth by approximately 60 percent. So I presented those results at the International Science Fair, which was just one of the most amazing experiences of my life. And there I was awarded”Best in the World in Medicine,”which allowed me to get in, or at least get a foot in the door of the big medical world. And from then on, since I was now in this huge exciting world, I wanted to explore it all. I wanted it all at once, but knew I couldn ’ t really get that. And I stumbled across something called”cancer stem cells.”And this is really what I want to talk to you about today — about cancer. At first when I heard of cancer stem cells, I didn ’ t really know how to put the two together. I ’ d heard of stem cells, and I ’ d heard of them as the panacea of the future — the therapy of many diseases to come in the future, perhaps. But I ’ d heard of cancer as the most feared disease of our time, so how did the good and bad go together? Last summer I worked at Stanford University, doing some research on cancer stem cells. And while I was doing this, I was reading the cancer literature, trying to — again — familiarize myself with this new medical field. And it seemed that tumors actually begin from a stem cell. This fascinated me. The more I read, the more I looked at cancer differently and almost became less fearful of it. It seems that cancer is a direct result to injury. If you smoke, you damage your lung tissue, and then lung cancer arises. If you drink, you damage your liver, and then liver cancer occurs. And it was really interesting — there were articles correlating if you have a bone fracture, and then bone cancer arises. Because what stem cells are — they ’ re these phenomenal cells that really have the ability to differentiate into any type of tissue. So, if the body is sensing that you have damage to an organ and then it ’ s initiating cancer, it ’ s almost as if this is a repair response. And the cancer, the body is saying the lung tissue is damaged, we need to repair the lung. And cancer is originating in the lung trying to repair — because you have this excessive proliferation of these remarkable cells that really have the potential to become lung tissue. But it ’ s almost as if the body has originated this ingenious response, but can ’ t quite control it. It hasn ’ t yet become fine-tuned enough to finish what has been initiated. So this really, really fascinated me. And I really think that we can ’ t think about cancer — let alone any disease — in such black-and-white terms. If we eliminate cancer the way we ’ re trying to do now, with chemotherapy and radiation, we ’ re bombarding the body or the cancer with toxins, or with radiation, trying to kill it. It ’ s almost as if we ’ re getting back to this starting point. We ’ re removing the cancer cells, but we ’ re revealing the previous damage that the body has tried to fix. Shouldn ’ t we think about manipulation, rather than elimination? If somehow we can cause these cells to differentiate — to become bone tissue, lung tissue, liver tissue, whatever that cancer has been put there to do — it would be a repair process. We ’ d end up better than we were before cancer. So, this really changed my view of looking at cancer. And while I was reading all these articles about cancer, it seemed that the articles — a lot of them — focused on, you know, the genetics of breast cancer, and the genesis and the progression of breast cancer — tracking the cancer through the body, tracing where it is, where it goes. But it struck me that I ’ d never heard of cancer of the heart, or cancer of any skeletal muscle for that matter. And skeletal muscle constitutes 50 percent of our body, or over

50 percent of our body. And so at first I kind of thought,”Well, maybe there ’ s some obvious explanation why skeletal muscle doesn ’ t get cancer — at least not that I know of.”So, I looked further into it, found as many articles as I could, and it was amazing — because it turned out that it was very rare. Some articles even went as far as to say that skeletal muscle tissue is resistant to cancer, and furthermore, not only to cancer, but of metastases going to skeletal muscle. And what metastases are is when the tumor — when a piece — breaks off and travels through the blood stream and goes to a different organ. That ’ s what a metastasis is. It ’ s the part of cancer that is the most dangerous. If cancer was localized, we could likely remove it, or somehow — you know, it ’ s contained. It ’ s very contained. But once it starts moving throughout the body, that ’ s when it becomes deadly. So the fact that not only did cancer not seem to originate in skeletal muscles, but cancer didn ’ t seem to go to skeletal muscle — there seemed to be something here. So these articles were saying, you know,”Skeletal — metastasis to skeletal muscle — is very rare.”But it was left at that. No one seemed to be asking why. So I decided to ask why. At first — the first thing I did was I emailed some professors who specialized in skeletal muscle physiology, and pretty much said,”Hey, it seems like cancer doesn ’ t really go to skeletal muscle. Is there a reason for this?”And a lot of the replies I got were that muscle is terminally differentiated tissue. Meaning that you have muscle cells, but they ’ re not dividing, so it doesn ’ t seem like a good target for cancer to hijack. But then again, this fact that the metastases didn ’ t go to skeletal muscle made that seem unlikely. And furthermore, that nervous tissue — brain — gets cancer, and brain cells are also terminally differentiated. So I decided to ask why. And here ’ s some of, I guess, my hypotheses that I ’ ll be starting to investigate this May at the Sylvester Cancer Institute in Miami. And I guess I ’ ll keep investigating until I get the answers. But I know that in science, once you get the answers, inevitably you ’ re going to have more questions. So I guess you could say that I ’ ll probably be doing this for the rest of my life. Some of my hypotheses are that when you first think about skeletal muscle, there ’ s a lot of blood vessels going to skeletal muscle. And the first thing that makes me think is that blood vessels are like highways for the tumor cells. Tumor cells can travel through the blood vessels. And you think, the more highways there are in a tissue, the more likely it is to get cancer or to get metastases. So first of all I thought, you know,”Wouldn ’ t it be favorable to cancer getting to skeletal muscle?”And as well, cancer tumors require a process called angiogenesis, which is really, the tumor recruits the blood vessels to itself to supply itself with nutrients so it can grow. Without angiogenesis, the tumor remains the size of a pinpoint and it ’ s not harmful. So angiogenesis is really a central process to the pathogenesis of cancer. And one article that really stood out to me when I was just reading about this, trying to figure out why cancer doesn ’ t go to skeletal muscle, was that it had reported 16 percent of micro-metastases to skeletal muscle upon autopsy. 16 percent! Meaning that there were these pinpoint tumors in skeletal muscle, but only. 16 percent of actual metastases — suggesting that maybe skeletal muscle is able to control the angiogenesis, is able to control the tumors recruiting these blood vessels. We use skeletal muscles so much. It ’ s the one portion of our body — our heart ’ s always beating. We ’ re always moving our muscles. Is it possible that muscle somehow intuitively knows that it needs this blood supply? It needs to be constantly contracting, so therefore it ’ s almost selfish. It ’ s grabbing its blood vessels for itself. Therefore, when a tumor comes into skeletal muscle tissue, it can ’ t get a blood supply, and can ’ t grow. So this suggests that maybe if there is an anti-angiogenic factor in skeletal muscle — or perhaps even more, an angiogenic routing factor, so it can actually direct

where the blood vessels grow — this could be a potential future therapy for cancer. And another thing that ' s really interesting is that there ' s this whole — the way tumors move throughout the body, it ' s a very complex system — and there ' s something called the chemokine network. And chemokines are essentially chemical attractants, and they ' re the stop and go signals for cancer. So a tumor expresses chemokine receptors, and another organ — a distant organ somewhere in the body — will have the corresponding chemokines, and the tumor will see these chemokines and migrate towards it. Is it possible that skeletal muscle doesn ' t express this type of molecules? And the other really interesting thing is that when skeletal muscle — there ' s been several reports that when skeletal muscle is injured, that ' s what correlates with metastases going to skeletal muscle. And, furthermore, when skeletal muscle is injured, that ' s what causes chemokines — these signals saying,"Cancer, you can come to me,"the"go signs"for the tumors — it causes them to highly express these chemokines. So, there ' s so much interplay here. I mean, there are so many possibilities for why tumors don ' t go to skeletal muscle. But it seems like by investigating, by attacking cancer, by searching where cancer is not, there has got to be something — there ' s got to be something — that ' s making this tissue resistant to tumors. And can we utilize — can we take this property, this compound, this receptor, whatever it is that ' s controlling these anti-tumor properties and apply it to cancer therapy in general? Now, one thing that kind of ties the resistance of skeletal muscle to cancer — to the cancer as a repair response gone out of control in the body — is that skeletal muscle has a factor in it called"MyoD."And what MyoD essentially does is, it causes cells to differentiate into muscle cells. So this compound, MyoD, has been tested on a lot of different cell types and been shown to actually convert this variety of cell types into skeletal muscle cells. So, is it possible that the tumor cells are going to the skeletal muscle tissue, but once in contact inside the skeletal muscle tissue, MyoD acts upon these tumor cells and causes them to become skeletal muscle cells? Maybe tumor cells are being disguised as skeletal muscle cells, and this is why it seems as if it is so rare. It ' s not harmful ; it has just repaired the muscle. Muscle is constantly being used — constantly being damaged. If every time we tore a muscle or every time we stretched a muscle or moved in a wrong way, cancer occurred — I mean, everybody would have cancer almost. And I hate to say that. But it seems as though muscle cell, possibly because of all its use, has adapted faster than other body tissues to respond to injury, to fine-tune this repair response and actually be able to finish the process which the body wants to finish. I really believe that the human body is very, very smart, and we can ' t counteract something the body is saying to do. It ' s different when a bacteria comes into the body — that ' s a foreign object — we want that out. But when the body is actually initiating a process and we ' re calling it a disease, it doesn ' t seem as though elimination is the right solution. So even to go from there, it ' s possible, although far-fetched, that in the future we could almost think of cancer being used as a therapy. If those diseases where tissues are deteriorating — for example Alzheimer ' s, where the brain, the brain cells, die and we need to restore new brain cells, new functional brain cells — what if we could, in the future, use cancer? A tumor — put it in the brain and cause it to differentiate into brain cells? That ' s a very far-fetched idea, but I really believe that it may be possible. These cells are so versatile, these cancer cells are so versatile — we just have to manipulate them in the right way. And again, some of these may be far- fetched, but I figured if there ' s anywhere to present far-fetched ideas, it ' s here at TED, so thank you very much.

18 minutes is an absolutely brutal time limit, so I ’ m going to dive straight in, right at the point where I get this thing to work. Here we go. I ’ m going to talk about five different things. I ’ m going to talk about why defeating aging is desirable. I ’ m going to talk about why we have to get our shit together, and actually talk about this a bit more than we do. I ’ m going to talk about feasibility as well, of course. I ’ m going to talk about why we are so fatalistic about doing anything about aging. And then I ’ m going spend perhaps the second half of the talk talking about, you know, how we might actually be able to prove that fatalism is wrong, namely, by actually doing something about it. I ’ m going to do that in two steps. The first one I ’ m going to talk about is how to get from a relatively modest amount of life extension — which I ’ m going to define as 30 years, applied to people who are already in middle-age when you start — to a point which can genuinely be called defeating aging. Namely, essentially an elimination of the relationship between how old you are and how likely you are to die in the next year — or indeed, to get sick in the first place. And of course, the last thing I ’ m going to talk about is how to reach that intermediate step, that point of maybe 30 years life extension. So I ’ m going to start with why we should. Now, I want to ask a question. Hands up : anyone in the audience who is in favor of malaria? That was easy. OK. OK. Hands up : anyone in the audience who ’ s not sure whether malaria is a good thing or a bad thing? OK. So we all think malaria is a bad thing. That ’ s very good news, because I thought that was what the answer would be. Now the thing is, I would like to put it to you that the main reason why we think that malaria is a bad thing is because of a characteristic of malaria that it shares with aging. And here is that characteristic. The only real difference is that aging kills considerably more people than malaria does. Now, I like in an audience, in Britain especially, to talk about the comparison with foxhunting, which is something that was banned after a long struggle, by the government not very many months ago. I mean, I know I ’ m with a sympathetic audience here, but, as we know, a lot of people are not entirely persuaded by this logic. And this is actually a rather good comparison, it seems to me. You know, a lot of people said,”Well, you know, city boys have no business telling us rural types what to do with our time. It ’ s a traditional part of the way of life, and we should be allowed to carry on doing it. It ’ s ecologically sound ; it stops the population explosion of foxes.”But ultimately, the government prevailed in the end, because the majority of the British public, and certainly the majority of members of Parliament, came to the conclusion that it was really something that should not be tolerated in a civilized society. And I think that human aging shares all of these characteristics in spades. What part of this do people not understand? It ’ s not just about life, of course — — it ’ s about healthy life, you know — getting frail and miserable and dependent is no fun, whether or not dying may be fun. So really, this is how I would like to describe it. It ’ s a global trance. These are the sorts of unbelievable excuses that people give for aging. And, I mean, OK, I ’ m not actually saying that these excuses are completely valueless. There are some good points to be made here, things that we ought to be thinking about, forward planning so that nothing goes too — well, so that we minimize the turbulence when we actually figure out how to fix aging. But these are completely crazy, when you actually remember your sense of proportion. You know, these are arguments ; these are things that would be legitimate to be concerned about. But the question is, are they so dangerous — these risks of doing something about aging — that they outweigh the downside of doing the opposite, namely, leaving aging as it is? Are these so bad that they outweigh condemning 100, 000 people a day to an unnecessarily early death?

You know, if you haven ’ t got an argument that ’ s that strong, then just don ’ t waste my time, is what I say. Now, there is one argument that some people do think really is that strong, and here it is. People worry about overpopulation ; they say,”Well, if we fix aging, no one ’ s going to die to speak of, or at least the death toll is going to be much lower, only from crossing St. Giles carelessly. And therefore, we ’ re not going to be able to have many kids, and kids are really important to most people.”And that ’ s true. And you know, a lot of people try to fudge this question, and give answers like this. I don ’ t agree with those answers. I think they basically don ’ t work. I think it ’ s true, that we will face a dilemma in this respect. We will have to decide whether to have a low birth rate, or a high death rate. A high death rate will, of course, arise from simply rejecting these therapies, in favor of carrying on having a lot of kids. And, I say that that ’ s fine — the future of humanity is entitled to make that choice. What ’ s not fine is for us to make that choice on behalf of the future. If we vacillate, hesitate, and do not actually develop these therapies, then we are condemning a whole cohort of people — who would have been young enough and healthy enough to benefit from those therapies, but will not be, because we haven ’ t developed them as quickly as we could — we ’ ll be denying those people an indefinite life span, and I consider that that is immoral. That ’ s my answer to the overpopulation question. Right. So the next thing is, now why should we get a little bit more active on this? And the fundamental answer is that the pro-aging trance is not as dumb as it looks. It ’ s actually a sensible way of coping with the inevitability of aging. Aging is ghastly, but it ’ s inevitable, so, you know, we ’ ve got to find some way to put it out of our minds, and it ’ s rational to do anything that we might want to do, to do that. Like, for example, making up these ridiculous reasons why aging is actually a good thing after all. But of course, that only works when we have both of these components. And as soon as the inevitability bit becomes a little bit unclear — and we might be in range of doing something about aging — this becomes part of the problem. This pro-aging trance is what stops us from agitating about these things. And that ’ s why we have to really talk about this a lot — evangelize, I will go so far as to say, quite a lot — in order to get people ’ s attention, and make people realize that they are in a trance in this regard. So that ’ s all I ’ m going to say about that. I ’ m now going to talk about feasibility. And the fundamental reason, I think, why we feel that aging is inevitable is summed up in a definition of aging that I ’ m giving here. A very simple definition. Aging is a side effect of being alive in the first place, which is to say, metabolism. This is not a completely tautological statement ; it ’ s a reasonable statement. Aging is basically a process that happens to inanimate objects like cars, and it also happens to us, despite the fact that we have a lot of clever self-repair mechanisms, because those self-repair mechanisms are not perfect. So basically, metabolism, which is defined as basically everything that keeps us alive from one day to the next, has side effects. Those side effects accumulate and eventually cause pathology. That ’ s a fine definition. So we can put it this way : we can say that, you know, we have this chain of events. And there are really two games in town, according to most people, with regard to postponing aging. They ’ re what I ’ m calling here the”gerontology approach”and the”geriatrics approach.”The geriatrician will intervene late in the day, when pathology is becoming evident, and the geriatrician will try and hold back the sands of time, and stop the accumulation of side effects from causing the pathology quite so soon. Of course, it ’ s a very short-term-ist strategy ; it ’ s a losing battle, because the things that are causing the pathology are becoming more abundant as time goes on. The gerontology approach looks much more promising on the surface, because, you know, prevention is better than cure. But unfortunately the thing is that we don ’ t understand metabolism very well. In fact, we have a pitifully poor understanding of how organisms work — even cells we ’ re not really too good on yet. We ’ ve discovered things like, for example, RNA interference only a few years ago, and this is a really fundamental component of how cells work. Basically, gerontology is a fine approach in the end, but it is not an approach whose time has come when we ’ re talking about intervention. So then, what do we do about that? I mean, that ’ s a fine logic, that sounds pretty convincing, pretty ironclad, doesn ’ t it? But it isn ’ t. Before I tell you why it isn ’ t, I ’ m going to go a little bit into what I ’ m calling step two. Just suppose, as I said, that we do acquire — let ’ s say we do it today for the sake of argument — the ability to confer 30 extra years of healthy life on people who are already in middle age, let ’ s say 55. I ’ m going to call that”robust human rejuvenation.”OK. What would that actually mean for how long people of various ages today — or equivalently, of various ages at the time that these therapies arrive — would actually live? In order to answer that question — you might think it ’ s simple, but it ’ s not simple. We can ’ t just say,”Well, if they ’ re young enough to benefit from these therapies, then they ’ ll live 30 years longer.”That ’ s the wrong answer. And the reason it ’ s the wrong answer is because of progress. There are two sorts of technological progress really, for this purpose. There are fundamental, major breakthroughs, and there are incremental refinements of those breakthroughs. Now, they differ a great deal in terms of the predictability of time frames. Fundamental breakthroughs : very hard to predict how long it ’ s going to take to make a fundamental breakthrough. It was a very long time ago that we decided that flying would be fun, and it took us until 1903 to actually work out how to do it. But after that, things were pretty steady and pretty uniform. I think this is a reasonable sequence of events that happened in the progression of the technology of powered flight. We can think, really, that each one is sort of beyond the imagination of the inventor of the previous one, if you like. The incremental advances have added up to something which is not incremental anymore. This is the sort of thing you see after a fundamental breakthrough. And you see it in all sorts of technologies. Computers : you can look at a more or less parallel time line, happening of course a bit later. You can look at medical care. I mean, hygiene, vaccines, antibiotics — you know, the same sort of time frame. So I think that actually step two, that I called a step a moment ago, isn ’ t a step at all. That in fact, the people who are young enough to benefit from these first therapies that give this moderate amount of life extension, even though those people are already middle-aged when the therapies arrive, will be at some sort of cusp. They will mostly survive long enough to receive improved treatments that will give them a further 30 or maybe 50 years. In other words, they will be staying ahead of the game. The therapies will be improving faster than the remaining imperfections in the therapies are catching up with us. This is a very important point for me to get across. Because, you know, most people, when they hear that I predict that a lot of people alive today are going to live to 1, 000 or more, they think that I ’ m saying that we ’ re going to invent therapies in the next few decades that are so thoroughly eliminating aging that those therapies will let us live to 1, 000 or more. I ’ m not saying that at all. I ’ m saying that the rate of improvement of those therapies will be enough. They ’ ll never be perfect, but we ’ ll be able to fix the things that 200- year-olds die of, before we have any 200-year-olds. And the same for 300 and 400 and so on. I decided to give this a little name, which is”longevity escape velocity.”Well, it seems to get the point across. So, these trajectories here are basically how we would expect people to live, in terms of remaining life expectancy, as measured by their health, for given ages that they were at the time that these therapies arrive. If you ’ re already 100, or even if you ’ re 80 — and an average 80-year-old, we probably can ’ t do a lot for you with these therapies, because you ’ re too close to death ’ s door for the really initial, experimental therapies to be good enough for you. You won ’ t be able to withstand them. But if you ’ re only 50, then there ’ s a chance that you might be able to pull out of the dive and, you know — — eventually get through this and start becoming biologically younger in a meaningful sense, in terms of your youthfulness, both physical and mental, and in terms of your risk of death from age-related causes. And of course, if you ’ re a bit younger than that, then you ’ re never really even going to get near to being fragile enough to die of age-related causes. So this is a genuine conclusion that I come to, that the first 150-year-old — we don ’ t know how old that person is today, because we don ’ t know how long it ’ s going to take to get these first-generation therapies. But irrespective of that age, I ’ m claiming that the first person to live to 1, 000 — subject of course, to, you know, global catastrophes — is actually, probably, only about 10 years younger than the first 150-year-old. And that ’ s quite a thought. Alright, so finally I ’ m going to spend the rest of the talk, my last seven-and- a-half minutes, on step one ; namely, how do we actually get to this moderate amount of life extension that will allow us to get to escape velocity? And in order to do that, I need to talk about mice a little bit. I have a corresponding milestone to robust human rejuvenation. I ’ m calling it”robust mouse rejuvenation,”not very imaginatively. And this is what it is. I say we ’ re going to take a long-lived strain of mouse, which basically means mice that live about three years on average. We do exactly nothing to them until they ’ re already two years old. And then we do a whole bunch of stuff to them, and with those therapies, we get them to live, on average, to their fifth birthday. So, in other words, we add two years — we treble their remaining lifespan, starting from the point that we started the therapies. The question then is, what would that actually mean for the time frame until we get to the milestone I talked about earlier for humans? Which we can now, as I ’ ve explained, equivalently call either robust human rejuvenation or longevity escape velocity. Secondly, what does it mean for the public ’ s perception of how long it ’ s going to take for us to get to those things, starting from the time we get the mice? And thirdly, the question is, what will it do to actually how much people want it? And it seems to me that the first question is entirely a biology question, and it ’ s extremely hard to answer. One has to be very speculative, and many of my colleagues would say that we should not do this speculation, that we should simply keep our counsel until we know more. I say that ’ s nonsense. I say we absolutely are irresponsible if we stay silent on this. We need to give our best guess as to the time frame, in order to give people a sense of proportion so that they can assess their priorities. So, I say that we have a 50 / 50 chance of reaching this RHR milestone, robust human rejuvenation, within 15 years from the point that we get to robust mouse rejuvenation. 15 years from the robust mouse. The public ’ s perception will probably be somewhat better than that. The public tends to underestimate how difficult scientific things are. So they ’ ll probably think it ’ s five years away. They ’ ll be wrong, but that actually won ’ t matter too much. And finally, of course, I think it ’ s fair to say that a large part of the reason why the public is so ambivalent about aging now is the global trance I spoke about earlier, the coping strategy. That will be history at this point, because it will no longer be possible to believe that aging is inevitable in humans, since it ’ s been postponed so very effectively in mice. So we ’ re likely to end up with a very strong change in people ’ s attitudes, and of course that has enormous implications. So in order to tell you now how we ’ re going to get these mice, I ’ m going to add a little bit to my description of aging. I ’ m going to use this word”damage”to denote these intermediate things that are caused by metabolism and that eventually cause pathology. Because the critical thing about this is that even though the damage only eventually causes pathology, the damage itself is caused ongoing-ly throughout life, starting before we ’ re born. But it is not part of metabolism itself. And this turns out to be useful. Because we can re-draw our original diagram this way. We can say that, fundamentally, the difference between gerontology and geriatrics is that gerontology tries to inhibit the rate at which metabolism lays down this damage. And I ’ m going to explain exactly what damage is in concrete biological terms in a moment. And geriatricians try to hold back the sands of time by stopping the damage converting into pathology. And the reason it ’ s a losing battle is because the damage is continuing to accumulate. So there ’ s a third approach, if we look at it this way. We can call it the”engineering approach,”and I claim that the engineering approach is within range. The engineering approach does not intervene in any processes. It does not intervene in this process or this one. And that ’ s good because it means that it ’ s not a losing battle, and it ’ s something that we are within range of being able to do, because it doesn ’ t involve improving on evolution. The engineering approach simply says,”Let ’ s go and periodically repair all of these various types of damage — not necessarily repair them completely, but repair them quite a lot, so that we keep the level of damage down below the threshold that must exist, that causes it to be pathogenic.”We know that this threshold exists, because we don ’ t get age-related diseases until we ’ re in middle age, even though the damage has been accumulating since before we were born. Why do I say that we ’ re in range? Well, this is basically it. The point about this slide is actually the bottom. If we try to say which bits of metabolism are important for aging, we will be here all night, because basically all of metabolism is important for aging in one way or another. This list is just for illustration ; it is incomplete. The list on the right is also incomplete. It ’ s a list of types of pathology that are age-related, and it ’ s just an incomplete list. But I would like to claim to you that this list in the middle is actually complete — this is the list of types of thing that qualify as damage, side effects of metabolism that cause pathology in the end, or that might cause pathology. And there are only seven of them. They ’ re categories of things, of course, but there ’ s only seven of them. Cell loss, mutations in chromosomes, mutations in the mitochondria and so on. First of all, I ’ d like to give you an argument for why that list is complete. Of course one can make a biological argument. One can say,”OK, what are we made of?”We ’ re made of cells and stuff between cells. What can damage accumulate in? The answer is : long-lived molecules, because if a short-lived molecule undergoes damage, but then the molecule is destroyed — like by a protein being destroyed by proteolysis — then the damage is gone, too. It ’ s got to be long-lived molecules. So, these seven things were all under discussion in gerontology a long time ago and that is pretty good news, because it means that, you know, we ’ ve come a long way in biology in these 20 years, so the fact that we haven ’ t extended this list is a pretty good indication that there ’ s no extension to be done. However, it ’ s better than that ; we actually know how to fix them all, in mice, in principle — and what I mean by in principle is, we probably can actually implement these fixes within a decade. Some of them are partially implemented already, the ones at the top. I haven ’ t got time to go through them at all, but my conclusion is that, if we can actually get suitable funding for this, then we can probably develop robust mouse rejuvenation in only 10 years, but we do need to get serious about it. We do need to really start trying. So of course, there are some biologists in the audience, and I want to give some answers to some of the questions that you may have. You may have been dissatisfied with this talk, but fundamentally you have to go and read this stuff. I ’ ve published a great deal on this ; I cite the experimental work on which my optimism is based, and there ’ s quite a lot of detail there. The detail is what makes me confident of my rather aggressive time frames that I ’ m predicting here. So if you think that I ’ m wrong, you ’ d better damn well go and find out why you think I ’ m wrong. And of course the main thing is that you shouldn ’ t trust people who call themselves gerontologists because, as with any radical departure from previous thinking within a particular field, you know, you expect people in the mainstream to be a bit resistant and not really to take it seriously. So, you know, you ’ ve got to actually do your homework, in order to understand whether this is true. And we ’ ll just end with a few things. One thing is, you know, you ’ ll be hearing from a guy in the next session who said some time ago that he could sequence the human genome in half no time, and everyone said,”Well, it ’ s obviously impossible.”And you know what happened. So, you know, this does happen. We have various strategies — there ’ s the Methuselah Mouse Prize, which is basically an incentive to innovate, and to do what you think is going to work, and you get money for it if you win. There ’ s a proposal to actually put together an institute. This is what ’ s going to take a bit of money. But, I mean, look — how long does it take to spend that on the war in Iraq? Not very long. OK. It ’ s got to be philanthropic, because profits distract biotech, but it ’ s basically got a 90 percent chance, I think, of succeeding in this. And I think we know how to do it. And I ’ ll stop there. Thank you. Chris Anderson : OK. I don ’ t know if there ’ s going to be any questions but I thought I would give people the chance. Audience : Since you ’ ve been talking about aging and trying to defeat it, why is it that you make yourself appear like an old man? AG : Because I am an old man. I am actually 158. Audience : Species on this planet have evolved with immune systems to fight off all the diseases so that individuals live long enough to procreate. However, as far as I know, all the species have evolved to actually die, so when cells divide, the telomerase get shorter, and eventually species die. So, why does — evolution has — seems to have selected against immortality, when it is so advantageous, or is evolution just incomplete? AG : Brilliant. Thank you for asking a question that I can answer with an uncontroversial answer. I ’ m going to tell you the genuine mainstream answer to your question, which I happen to agree with, which is that, no, aging is not a product of selection, evolution ; [aging] is simply a product of evolutionary neglect. In other words, we have aging because it ’ s hard work not to have aging ; you need more genetic pathways, more sophistication in your genes in order to age more slowly, and that carries on being true the longer you push it out. So, to the extent that evolution doesn ’ t matter, doesn ’ t care whether genes are passed on by individuals, living a long time or by procreation, there ’ s a certain amount of modulation of that, which is why different species have different lifespans, but that ’ s why there are no immortal species. CA : The genes don ’ t care but we do? AG : That ’ s right. Audience : Hello. I read somewhere that in the last 20 years, the average lifespan of basically anyone on the planet has grown by 10 years. If I project that, that would make me think that I would live until 120 if I don ’ t crash on my motorbike. That means that I ’ m one of your subjects to become a 1, 000-year- old? AG : If you lose a bit of weight. Your numbers are a bit out. The standard numbers are that lifespans have been growing at between one and two years per decade. So, it ’ s not quite as good as you might think, you might hope. But I intend to move it up to one year per year as soon as possible. Audience : I was told that many of the brain cells we have as adults are actually in the human embryo, and that the brain cells last 80 years or so. If that is indeed true, biologically are there implications in the world of rejuvenation? If there are cells in my body that live all 80 years, as opposed to a typical, you know, couple of months? AG : There are technical implications certainly. Basically what we need to do is replace cells in those few areas of the brain that lose cells at a respectable rate, especially neurons, but we don ’ t want to replace them any faster than that — or not much faster anyway, because replacing them too fast would degrade cognitive function. What I said about there being no non-aging species earlier on was a little bit of an oversimplification. There are species that have no aging — Hydra for example — but they do it by not having a nervous system — and not having any tissues in fact that rely for their function on very long-lived cells.

Hello. Actually, that ’ s”hello”in Bauer Bodoni for the typographically hysterical amongst us. One of the threads that seems to have come through loud and clear in the last couple of days is this need to reconcile what the Big wants â the”Big”being the organization, the system, the country â and what the”Small”wants â the individual, the person. And how do you bring those two things together? Charlie Ledbetter, yesterday, I thought, talked very articulately about this need to bring consumers, to bring people into the process of creating things. And that ’ s what I want to talk about today. So, bringing together the Small to help facilitate and create the Big, I think, is something that we believe in â something I believe in, and something that we kind of bring to life through what we do at Ideo. I call this first chapter â for the Brits in the room â the”Blinding Glimpse of the Bleeding Obvious.”Often, the good ideas are so staring-at-you- right-in-the-face that you kind of miss them. And I think, a lot of times, what we do is just, sort of, hold the mirror up to our clients, and sort of go,”Duh! You know, look what ’ s really going on.”And rather than talk about it in the theory, I think I ’ m just going to show you an example. We were asked by a large healthcare system in Minnesota to describe to them what their patient experience was. And I think they were expecting â they ’ d worked with lots of consultants before â I think they were expecting some kind of hideous org chart with thousands of bubbles and systemic this, that and the other, and all kinds of mappy stuff. Or even worse, some kind of ghastly death-by-Powerpoint thing with WowCharts and all kinds of, you know, God knows, whatever. The first thing we actually shared with them was this. I ’ ll play this until your eyeballs completely dissolve. This is 59 seconds into the film. This is a minute 59. 3:19. I think something happens. I think a head may appear in a second. 5:10. 5:58. 6:20. We showed them the whole cut, and they were all completely, what is this? And the point is when you lie in a hospital bed all day, all you do is look at the roof, and it ’ s a really shitty experience. And just putting yourself in the position of the patient â this is Christian, who works with us at Ideo. He just lay in the hospital bed, and, kind of, stared at the polystyrene ceiling tiles for a really long time. That ’ s what it ’ s like to be a patient in the hospital. And they were sort, you know, blinding glimpse of bleeding obvious. Oh, my goodness. So, looking at the situation from the point of view of the person out â as opposed to the traditional position of the organization in â was, for these guys, quite a revelation. And so, that was a really catalytic thing for them. So they snapped into action. They said, OK, it ’ s not about systemic change. It ’ s not about huge, ridiculous things that we need to do. It ’ s about tiny things that can make a huge amount of difference. So we started with them prototyping some really little things that we could do to have a huge amount of impact. The first thing we did was we took a little bicycle mirror and we Band-Aided it here, onto a gurney, a hospital trolley, so that when you were wheeled around by a nurse or by a doctor, you could actually have a conversation with them. You could, kind of, see them in your rear-view mirror, so it created a tiny human interaction. Very small example of something that they could do. Interestingly, the nurses themselves, sort of, snapped into action â said, OK, we embrace this. What can we do? The first thing they do is they decorated the ceiling. Which I thought was really â I showed this to my mother recently. I think my mother now thinks that I ’ m some sort of interior decorator. It ’ s what I do for a living, sort of Laurence Llewelyn-Bowen. Not particularly the world ’ s best design solution for those of us who are real, sort of, hard-core designers, but nonetheless, a fabulous empathic solution for people. Things that they started doing themselves â like changing the floor going into the patient ’ s room so that it signified,”This is my room. This is my personal space”â was a really interesting sort of design solution to the problem. So you went from public space to private space. And another idea, again, that came from one of the nurses â which I love â was they took traditional, sort of, corporate white boards, then they put them on one wall of the patient ’ s room, and they put this sticker there. So that what you could actually do was go into the room and write messages to the person who was sick in that room, which was lovely. So, tiny, tiny, tiny solutions that made a huge amount of impact. I thought that was a really, really nice example. So this is not particularly a new idea, kind of, seeing opportunities in things that are around you and snapping and turning them into a solution. It ’ s a history of invention based around this. I ’ m going to read this because I want to get these names right. Joan Ganz Cooney saw her daughter â came down on a Saturday morning, saw her daughter watching the test card, waiting for programs to come on one morning and from that came Sesame Street. Malcolm McLean was moving from one country to another and was wondering why it took these guys so long to get the boxes onto the ship. And he invented the shipping container. George de Mestral â this is not bugs all over a Birkenstock â was walking his dog in a field and got covered in burrs, sort of little prickly things, and from that came Velcro. And finally, for the Brits, Percy Shaw â this is a big British invention â saw the cat ’ s eyes at the side of the road, when he was driving home one night and from that came the Catseye. So there ’ s a whole series of just using your eyes, seeing things for the first time, seeing things afresh and using them as an opportunity to create new possibilities. Second one, without sounding overly Zen, and this is a quote from the Buddha :”Finding yourself in the margins, looking to the edges of things, is often a really interesting place to start.”Blinkered vision tends to produce, I think, blinkered solutions. So, looking wide, using your peripheral vision, is a really interesting place to look for opportunity. Again, another medical example here. We were asked by a device producer â we did the Palm Pilot and the Treo. We did a lot of sexy tech at Ideo â they ’ d seen this and they wanted a sexy piece of technology for medical diagnostics. This was a device that a nurse uses when they ’ re doing a spinal procedure in hospital. They ’ ll ask the nurses to input data. And they had this vision of the nurse, kind of, clicking away on this aluminum device and it all being incredibly, sort of, gadget-lustish. When we actually went and watched this procedure taking place â and I ’ ll explain this in a second â it became very obvious that there was a human dimension to this that they really weren ’ t recognizing. When you ’ re having a four-inch needle inserted into your spine â which was the procedure that this device ’ s data was about ; it was for pain management â you ’ re shit scared ; you ’ re freaking out. And so the first thing that pretty much every nurse did, was hold the patient ’ s hand to comfort them. Human gesture â which made the fabulous two-handed data input completely impossible. So, the thing that we designed, much less sexy but much more human and practical, was this. So, it

’ s not a Palm Pilot by any stretch of the imagination, but it has a thumb-scroll so you can do everything with one hand. So, again, going back to this â the idea that a tiny human gesture dictated the design of this product. And I think that ’ s really, really important. So, again, this idea of workarounds. We use this phrase”workarounds”a lot, sort of, looking around us. I was actually looking around the TED and just watching all of these kind of things happen while I ’ ve been here. This idea of the way that people cobble together solutions in our life â and the things we kind of do in our environment that are somewhat subconscious but have huge potential â is something that we look at a lot. We wrote a book recently, I think you might have received it, called”Thoughtless Acts?”It ’ s been all about these kind of thoughtless things that people do, which have huge intention and huge opportunity. Why do we all follow the line in the street? This is a picture in a Japanese subway. People consciously follow things even though, why, we don ’ t know. Why do we line up the square milk carton with the square fence? Because we kind of have to â we ’ re just compelled to. We don ’ t know why, but we do. Why do we wrap the teabag string around the cup handle? Again, we ’ re sort of using the world around us to create our own design solutions. And we ’ re always saying to our clients :”You should look at this stuff. This stuff is really important. This stuff is really vital.”This is people designing their own experiences. You can draw from this. We sort of assume that because there ’ s a pole in the street, that it ’ s okay to use it, so we park our shopping cart there. It ’ s there for our use, on some level. So, again, we sort of co-opt our environment to do all these different things. We co-opt other experiences â we take one item and transfer it to another. And this is my favorite one. My mother used to say to me,”Just because your sister jumps in the lake doesn ’ t mean you have to.”But, of course, we all do. We all follow each other every day. So somebody assumes that because somebody else has done something, that ’ s permission for them to do the same thing. And there ’ s almost this sort of semaphore around us all the time. I mean, shopping bag equals”parking meter out of order.”And we all, kind of, know how to read these signals now. We all talk to one another in this highly visual way without realizing what we ’ re doing. Third section is this idea of not knowing, of consciously putting yourself backwards. I talk about unthinking situations all the time. Sort of having beginner ’ s mind, scraping your mind clean and looking at things afresh. A friend of mine was a designer at IKEA, and he was asked by his boss to help design a storage system for children. This is the Billy bookcase â it ’ s IKEA ’ s biggest selling product. Hammer it together. Hammer it together with a shoe, if you ’ re me, because they ’ re impossible to assemble. But big selling bookcase. How do we replicate this for children? The reality is when you actually watch children, children don ’ t think about things like storage in linear terms. Children assume permission in a very different way. Children live on things. They live under things. They live around things, and so their spatial awareness relationship, and their thinking around storage is totally different. So the first thing you have to do â this is Graham, the designer â is, sort of, put yourself in their shoes. And so, here he is sitting under the table. So, what came out of this? This is the storage system that he designed. So what is this? I hear you all ask. No, I don ’ t. It ’ s this, and I think this is a particularly lovely solution. So, you know, it ’ s a totally different way of looking at the situation. It ’ s a completely empathic solution â apart from the fact that teddy ’ s probably not loving it. But a really nice way of re-framing the ordinary, and I think that ’ s one of the things. And putting yourself in the position of the person, and I think that ’ s one of the threads that I ’ ve heard again from this conference is how do we put ourselves in other peoples ’ shoes and really feel what they feel? And then use that information to fuel solutions? And I think that ’ s what this is very much about. Last section : green armband. We ’ ve all got them. It ’ s about this really. I mean, it ’ s about picking battles big enough to matter but small enough to win. Again, that ’ s one of the themes that I think has come through loud and clear in this conference is : Where do we start? How do we start? What do we do to start? So, again, we were asked to design a water pump for a company called ApproTEC, in Kenya. They ’ re now called KickStart. And, again, as designers, we wanted to make this thing incredibly beautiful and spend a lot of time thinking of the form. And that was completely irrelevant. When you put yourself in the position of these people, things like the fact that this has to be able to fold up and fit on a bicycle, become much more relevant than the form of it. The way it ’ s produced, it has to be produced with indigenous manufacturing methods and indigenous materials. So it had to be looked at completely from the point of view of the user. We had to completely transfer ourselves over to their world. So what seems like a very clunky product is, in fact, incredibly useful. It ’ s powered a bit like a Stairmaster â you pump up and down on it. Children can use it. Adults can use it. Everybody uses it. It ’ s turning these guys â again, one of the themes â it ’ s turning them into entrepreneurs. These guys are using this very successfully. And for us, it ’ s been great because it ’ s won loads of design awards. So we actually managed to reconcile the needs of the design company, the needs of the individuals in the company, to feel good about a product we were actually designing, and the needs of the individuals we were designing it for. There it is, pumping water from 30 feet. So as a final gesture we handed out these bracelets to all of you this morning. We ’ ve made a donation on everybody ’ s behalf here to kick start, no pun intended, their next project. Because, again, I think, sort of, putting our money where our mouth is, here. We feel that this is an important gesture. So we ’ ve handed out bracelets. Small is the new big. I hope you ’ ll all wear them. So that ’ s it. Thank you.

Because I usually take the role of trying to explain to people how wonderful the new technologies that are coming along are going to be, and I thought that, since I was among friends here, I would tell you what I really think and try to look back and try to understand what is really going on here with these amazing jumps in technology that seem so fast that we can barely keep on top of it. So I ’ m going to start out by showing just one very boring technology slide. And then, so if you can just turn on the slide that ’ s on. This is just a random slide that I picked out of my file. What I want to show you is not so much the details of the slide, but the general form of it. This happens to be a slide of some analysis that we were doing about the power of RISC microprocessors versus the power of local area networks. And the interesting thing about it is that this slide, like so many technology slides that we ’ re used to, is a sort of a straight line on a semi-log curve. In other words, every step here represents an order of magnitude in performance scale. And this is a new thing that we talk about technology on semi-log curves. Something really weird is going on here. And that ’ s basically what I ’ m going to be talking about. So, if you could bring up the lights. If you could bring up the lights higher, because I ’ m just going to use a piece of paper here. Now why do we draw technology curves in semi-log curves? Well the answer is, if I drew it on a normal curve where, let ’ s say, this is years, this is time of some sort, and this is whatever measure of the technology that I ’ m trying to graph, the graphs look sort of silly. They sort of go like this. And they don ’ t tell us much. Now if I graph, for instance, some other technology, say transportation technology, on a semi-log curve, it would look very stupid, it would look like a flat line. But when something like this happens, things are qualitatively changing. So if transportation technology was moving along as fast as microprocessor technology, then the day after tomorrow, I would be able to get in a taxi cab and be in Tokyo in 30 seconds. It ' s not moving like that. And there ' s nothing precedented in the history of technology development of this kind of self- feeding growth where you go by orders of magnitude every few years. Now the question that I ' d like to ask is, if you look at these exponential curves, they don ' t go on forever. Things just can ' t possibly keep changing as fast as they are. One of two things is going to happen. Either it ' s going to turn into a sort of classical S-curve like this, until something totally different comes along, or maybe it ' s going to do this. That ' s about all it can do. Now I ' m an optimist, so I sort of think it ' s probably going to do something like that. If so, that means that what we ' re in the middle of right now is a transition. We ' re sort of on this line in a transition from the way the world used to be to some new way that the world is. And so what I ' m trying to ask, what I ' ve been asking myself, is what ' s this new way that the world is? What ' s that new state that the world is heading toward? Because the transition seems very, very confusing when we ' re right in the middle of it. Now when I was a kid growing up, the future was kind of the year 2000, and people used to talk about what would happen in the year 2000. Now here ' s a conference in which people talk about the future, and you notice that the future is still at about the year 2000. It ' s about as far as we go out. So in other words, the future has kind of been shrinking one year per year for my whole lifetime. Now I think that the reason is because we all feel that something ' s happening there. That transition is happening. We can all sense it. And we know that it just doesn ' t make too much sense to think out 30, 50 years because everything ' s going to be so different that a simple extrapolation of what we ' re doing just doesn ' t make any sense at all. So what I would like to talk about is what that could be, what that transition could be that we ' re going through. Now in order to do that I ' m going to have to talk about a bunch of stuff that really has nothing to do with technology and computers. Because I think the only way to understand this is to really step back and take a long time scale look at things. So the time scale that I would like to look at this on is the time scale of life on Earth. So I think this picture makes sense if you look at it a few billion years at a time. So if you go back about two and a half billion years, the Earth was this big, sterile hunk of rock with a lot of chemicals floating around on it. And if you look at the way that the chemicals got organized, we begin to get a pretty good idea of how they do it. And I think that there ' s theories that are beginning to understand about how it started with RNA, but I ' m going to tell a sort of simple story of it, which is that, at that time, there were little drops of oil floating around with all kinds of different recipes of chemicals in them. And some of those drops of oil had a particular combination of chemicals in them which caused them to incorporate chemicals from the outside and grow the drops of oil. And those that were like that started to split and divide. And those were the most primitive forms of cells in a sense, those little drops of oil. But now those drops of oil weren ' t really alive, as we say it now, because every one of them was a little random recipe of chemicals. And every time it divided, they got sort of unequal division of the chemicals within them. And so every drop was a little bit different. In fact, the drops that were different in a way that caused them to be better at incorporating chemicals around them, grew more and incorporated more chemicals and divided more. So those tended to live longer, get expressed more. Now that ' s sort of just a very simple chemical form of life, but when things got interesting was when these drops learned a trick about abstraction. Somehow by ways that we don ’ t quite understand, these little drops learned to write down information. They learned to record the information that was the recipe of the cell onto a particular kind of chemical called DNA. So in other words, they worked out, in this mindless sort of evolutionary way, a form of writing that let them write down what they were, so that that way of writing it down could get copied. The amazing thing is that that way of writing seems to have stayed steady since it evolved two and a half billion years ago. In fact the recipe for us, our genes, is exactly that same code and that same way of writing. In fact, every living creature is written in exactly the same set of letters and the same code. In fact, one of the things that I did just for amusement purposes is we can now write things in this code. And I ’ ve got here a little 100 micrograms of white powder, which I try not to let the security people see at airports. But this has in it — what I did is I took this code — the code has standard letters that we use for symbolizing it — and I wrote my business card onto a piece of DNA and amplified it 10 to the 22 times. So if anyone would like a hundred million copies of my business card, I have plenty for everyone in the room, and, in fact, everyone in the world, and it ’ s right here. If I had really been a egotist, I would have put it into a virus and released it in the room. So what was the next step? Writing down the DNA was an interesting step. And that caused these cells — that kept them happy for another billion years. But then there was another really interesting step where things became completely different, which is these cells started exchanging and communicating information, so that they began to get communities of cells. I don ’ t know if you know this, but bacteria can actually exchange DNA. Now that ’ s why, for instance, antibiotic resistance has evolved. Some bacteria figured out how to stay away from penicillin, and it went around sort of creating its little DNA information with other bacteria, and now we have a lot of bacteria that are resistant to penicillin, because bacteria communicate. Now what this communication allowed was communities to form that, in some sense, were in the same boat together ; they were synergistic. So they survived or they failed together, which means that if a community was very successful, all the individuals in that community were repeated more and they were favored by evolution. Now the transition point happened when these communities got so close that, in fact, they got together and decided to write down the whole recipe for the community together on one string of DNA. And so the next stage that ’ s interesting in life took about another billion years. And at that stage, we have multi-cellular communities, communities of lots of different types of cells, working together as a single organism. And in fact, we ’ re such a multi- cellular community. We have lots of cells that are not out for themselves anymore. Your skin cell is really useless without a heart cell, muscle cell, a brain cell and so on. So these communities began to evolve so that the interesting level on which evolution was taking place was no longer a cell, but a community which we call an organism. Now the next step that happened is within these communities. These communities of cells, again, began to abstract information. And they began building very special structures that did nothing but process information within the community. And those are the neural structures. So neurons are the information processing apparatus that those communities of cells built up. And in fact, they began to get specialists in the community and special structures that were responsible for recording, understanding, learning information. And that was the brains and the nervous system of those communities. And that gave them an evolutionary advantage. Because at that point, an individual — learning could happen within the time span of a single organism, instead of over this evolutionary time span. So an organism could, for instance, learn not to eat a certain kind of fruit because it tasted bad and it got sick last time it ate it. That could happen within the lifetime of a single organism, whereas before they ’ d built these special information processing structures, that would have had to be learned evolutionarily over hundreds of thousands of years by the individuals dying off that ate that kind of fruit. So that nervous system, the fact that they built these special information structures, tremendously sped up the whole process of evolution. Because evolution could now happen within an individual. It could happen in learning time scales. But then what happened was the individuals worked out, of course, tricks of communicating. And for example, the most sophisticated version that we ’ re aware of is human language. It ’ s really a pretty amazing invention if you think about it. Here I have a very complicated, messy, confused idea in my head. I ’ m sitting here making grunting sounds basically, and hopefully constructing a similar messy, confused idea in your head that bears some analogy to it. But we ’ re taking something very complicated, turning it into sound, sequences of sounds, and producing something very complicated in your brain. So this allows us now to begin to start functioning as a single organism. And so, in fact, what we ’ ve done is we, humanity, have started abstracting out. We ’ re going through the same levels that multi-cellular organisms have gone through — abstracting out our methods of recording, presenting, processing information. So for example, the invention of language was a tiny step in that direction. Telephony, computers, videotapes, CD-ROMs and so on are all our specialized mechanisms that we ’ ve now built within our society for handling that information. And it all connects us together into something that is much bigger and much faster and able to evolve than what we were before. So now, evolution can take place on a scale of microseconds. And you saw Ty ’ s little evolutionary example where he sort of did a little bit of evolution on the Convolution program right before your eyes. So now we ’ ve speeded up the time scales once again. So the first steps of the story that I told you about took a billion years a piece. And the next steps, like nervous systems and brains, took a few hundred million years. Then the next steps, like language and so on, took less than a million years. And these next steps, like electronics, seem to be taking only a few decades. The process is feeding on itself and becoming, I guess, autocatalytic is the word for it — when something reinforces its rate of change. The more it changes, the faster it changes. And I think that that ’ s what we ’ re seeing here in this explosion of curve. We ’ re seeing this process feeding back on itself. Now I design computers for a living, and I know that the mechanisms that I use to design computers would be impossible without recent advances in computers. So right now, what I do is I design objects at such complexity that it ’ s really impossible for me to design them in the traditional sense. I don ’ t know what every transistor in the connection machine does. There are billions of them. Instead, what I do and what the designers at Thinking Machines do is we think at some level of abstraction and then we hand it to the machine and the machine takes it beyond what we could ever do, much farther and faster than we could ever do. And in fact, sometimes it takes it by methods that we don ’ t quite even understand. One method that ’ s particularly interesting that I ’ ve been using a lot lately is evolution itself. So what we do is we put inside the machine a process of evolution that takes place on the microsecond time scale. So for example, in the most extreme cases, we can actually evolve a program by starting out with random sequences of instructions. Say,”Computer, would you please make a hundred million random sequences of instructions. Now would you please run all of those random sequences of instructions, run all of those programs, and pick out the ones that came closest to doing what I wanted.”So in other words, I define what I wanted. Let ’ s say I want to sort numbers, as a simple example I ’ ve done it with. So find the programs that come closest to sorting numbers. So of course, random sequences of instructions are very unlikely to sort numbers, so none of them will really do it. But one of them, by luck, may put two numbers in the right order. And I say,"Computer, would you please now take the 10 percent of those random sequences that did the best job. Save those. Kill off the rest. And now let ' s reproduce the ones that sorted numbers the best. And let ' s reproduce them by a process of recombination analogous to sex."Take two programs and they produce children by exchanging their subroutines, and the children inherit the traits of the subroutines of the two programs. So I ' ve got now a new generation of programs that are produced by combinations of the programs that did a little bit better job. Say,"Please repeat that process."Score them again. Introduce some mutations perhaps. And try that again and do that for another generation. Well every one of those generations just takes a few milliseconds. So I can do the equivalent of millions of years of evolution on that within the computer in a few minutes, or in the complicated cases, in a few hours. At the end of that, I end up with programs that are absolutely perfect at sorting numbers. In fact, they are programs that are much more efficient than programs I could have ever written by hand. Now if I look at those programs, I can ' t tell you how they work. I ' ve tried looking at them and telling you how they work. They ' re obscure, weird programs. But they do the job. And in fact, I know, I ' m very confident that they do the job because they come from a line of hundreds of thousands of programs that did the job. In fact, their life depended on doing the job. I was riding in a 747 with Marvin Minsky once, and he pulls out this card and says,"Oh look. Look at this. It says, ' This plane has hundreds of thousands of tiny parts working together to make you a safe flight. ' Doesn ' t that make you feel confident?"In fact, we know that the engineering process doesn ' t work very well when it gets complicated. So we ' re beginning to depend on computers to do a process that ' s very different than engineering. And it lets us produce things of much more complexity than normal engineering lets us produce. And yet, we don ' t quite understand the options of it. So in a sense, it ' s getting ahead of us. We ' re now using those programs to make much faster computers so that we ' ll be able to run this process much faster. So it ' s feeding back on itself. The thing is becoming faster and that ' s why I think it seems so confusing. Because all of these technologies are feeding back on themselves. We ' re taking off. And what we are is we ' re at a point in time which is analogous to when single- celled organisms were turning into multi-celled organisms. So we ' re the amoebas and we can ' t quite figure out what the hell this thing is we ' re creating. We ' re right at that point of transition. But I think that there really is something coming along after us. I think it ' s very haughty of us to think that we ' re the end product of evolution. And I think all of us here are a part of producing whatever that next thing is. So lunch is coming along, and I think I will stop at that point, before I get selected out.

Today, I would like to talk to you about beauty and how we ' ve got it all wrong when it comes to our perceptions of women, particularly Aboriginal women. But before I do, I would like to acknowledge the traditional custodians of the land in which I stand upon : the Gadigal people of the Eora Nation. I pay my respects to the elders past, present and emerging and give thanks to our ancestors who guide and protect us. It was 1990, and I was pumped. I was off to my first birthday party, just before I hit the terrible teens. No chaperone, and no bratty sister to tag along so she could snitch. I had my cute little outfit on, gift in hand, and I was hoping that this little cutie that I liked would show up. And I was hoping that this little cutie would ask me this one question. You know that question that makes your heart beat right out your chest – Do you want to be my girlfriend? – even though I had no business having a boyfriend at that age. But it didn ' t matter, because back then, it was all about the rush. I never did get asked that question. But the question I did get asked was : What ' s your background? And like any proud Aboriginal child would declare,"I ' m Aboriginal."Given the reaction of the room, being Aboriginal was clearly a dirty word. And at the tender age of 11, I was told by my best friend ' s adult sister that I was too pretty to be Aboriginal. By this time, my mouth is dry, my blood is boiling, and I ' m trying so hard to fight back what feels like an ocean of tears. I calmly join my circle of friends and begin to fake laugh at whatever is funny to mask my embarrassment, as I clutch on to my newfound complex. And this is why we need to change our perceptions of beauty. And how we do this is by learning from Aboriginal women, their stories and perspectives. Because right now,"pretty"hurts. Pretty hurts because you ' re trying to erase my Aboriginality, to applaud my proximity to whiteness. Pretty hurts because aimed at an Aboriginal woman, it is a weapon loaded in racism, sexual exploitation and cultural genocide. You see, what this woman didn ' t realize when she declared that I was too pretty to be Aboriginal is that she took something precious from me : pride in my identity. You see, I belong to the oldest living culture in the world, but that day, that legacy – it was replaced with shame, and it ' s been this filthy stain I ' ve been trying to get rid of for 20 years. And this is where my obsession for beauty comes from, over the years, trying to mimic it as a model, advocating for diversity in fashion, to launching"Ascension"magazine to celebrate women of color, whose beauty is still underrepresented. With much pain and trauma behind one word,"pretty"taught me, through my indigeneity, I could reclaim my beauty. To Indigenous women, true beauty came from the traditional roles we upheld, our kinship systems, connection to country and the waterways and how we pass this ancient knowledge down to the next generation. The way we express beauty was never defined against a Eurocentric ideal of beauty. You see, in my culture, our beauty is not monolithic. It ' s not measured by a thin waistline, porcelain skin or slender hips. It runs much deeper than that. So what does indigenous beauty look like? Oh, it ' s fierce, defiant and proud. And one ancestor who epitomizes indigenous beauty is Barangaroo, a powerful Cammeraygal woman. Revered for her wisdom and independence, Barangaroo, like the Eora other women, took pride in their status as being the main food providers for their tribe. A skillful and patient fisherwoman, Barangaroo would access Sydney Harbour and its surrounding waters for its abundant food supply, only taking what was needed. So you can just imagine how furious Barangaroo was when she saw British colonists troll 4, 000 salmon off the north shore in just one day, then gifting some of this catch to her husband and some of the other men from her tribe. Barangaroo knew such a wasteful act would threaten the Eora women ' s cultural authority within the tribe, furthermore destroying their traditional way of life. So Barangaroo rejected British laws and customs, their food, drink and social etiquette, even when her husband decided to conform. When Barangaroo and her husband Bennelong were invited to dine with Governor Phillip and the British party, Barangaroo stayed true to who she was. instead of wearing colonial attire – a tight corset and a gown layered in silk finished with pearls – she came sporting her traditional wares : white ochre and a bone through her nose. What Barangaroo illustrated was : indigenous beauty is authentic. Aunty Beryl Van-Oploo, a respected Gamilaraay elder, shared a story with a group of women one day, and she said,"We all have a bit of Barangaroo in us."Later that evening, I thought about Aunty Beryl ' s message. And what I received from her message was, no matter our culture, color or how we identify, spirit is what we share. It ' s what connects us. You see, if we indigenize beauty, the meaning is transformed from aesthetically pleasing to a state of divinity ; beauty now becomes spirit manifested. Not only is spirit found within us, it ' s in all things. It ' s in the landscapes, it ' s in the elements. The Yolngu people of northeast Arnhem Land, they have a Dreamtime story : Walu, the Sun woman. They say Walu lights a small fire each morning, which creates the dawn. She then paints her body in red ochre. And as she does, some of it falls onto the clouds, creating the sunrise. She then makes a torch from a stringybark tree and carries this fire across the sky from east to west, creating the daylight. And when it ' s time for her journey to end, she descends from the sky. And as she does, some of the red ochre from her body falls onto the clouds, creating the sunset. Indigenous beauty can be seen right across this continent, each Aboriginal nation with its own creation stories of how we came to be – astronomy, medicine, agriculture, architecture, education, innovation. And when we had conflict, we had lore, l-o-r-e, to restore order. Like the seasons, flora and fauna, night and day, we are all interconnected. One does not work without the other – the very principles which binds humanity together. Over the years, my obsession for beauty, it ' s led me to this truth : you cannot appreciate beauty if you cannot recognize it in yourself. So how do we change our perceptions of beauty? We have to get real with ourselves and start by asking : Who am I? Where do I come from? The world that I live in – how did it come to be? And more importantly : Where to from here? You may not like what you discover. But sit with it, feel the discomfort. Colonization has stolen from us one of the greatest treasures we can obtain : each other. This year alone, we ' ve witnessed pathological political and social unrest. That is why healing is the antidote humanity needs because it leads us to unity. When we decolonize beauty, we are reintroduced to our authentic selves. I used to wonder whatever happened to that woman from the birthday party, you know, the one that told me I was too pretty to be Aboriginal. A moment that was so devastating helped me to embrace my girgorou."Girgorou"means"beautiful"in Jirrbal, my grandmother ' s language. I now know that my girgorou is mighty, like Barangaroo. And my girgorou, like Walu, it ' s everlasting, from when that sun rises to when that sun sets. Are you ready to embrace your girgorou? Thank you.

Voting can be hard. It ' s been hard, sometimes painful, sometimes impossible, since the very beginning of our democracy. This year and years prior, we ' ve seen voters wait in line for five, six and seven hours. And the issue hasn ' t been fixed. Now, some people may see these images and think,"How patriotic. How impressive that someone would wait in line for seven hours just to vote."But to me, it ' s not impressive at all. It ' s disrespectful to these voters. Making voting difficult goes against the very core of our democracy. If we could redesign the system to make it more convenient, more accessible and easier for voters, why wouldn ' t we? Now, the short answer is : political will. Many established politicians would not actually benefit personally from a reformed voting process that ' s inclusive for all voters. Politicians are the players in the game, but yet they set the rules for the game. Election policy must be about who votes, not who wins. And the more complicated answer is that our voting system and election system in the United States is highly decentralized and inconsistent. Over 10, 000 different local election officials administer this process in cities and towns and counties across the country. They might vary in size from 400 voters to 4. 7 million. There ' s also 50 different state legislative bodies that set the rules of the game, and over 50 different chief election officials and entities that oversee those rules and how they ' re administered. So voting may vary greatly from state to state. Best-case scenario, you ' re in a state like Colorado, and a ballot is mailed to you proactively before each and every election. No bureaucracy, no extra paperwork. The ballot comes, and the government is responsible for delivering democracy to you. Worst-case scenario, you ' re in a state like Missouri, where your options are limited, you have overly restrictive voter registration deadlines. And if you can ' t get off work or you don ' t have childcare or you ' re sick, that ' s too bad. And most American voters don ' t fall into the best-case scenario. Now, in my career as an elections official for many years, and now leading the National Vote at Home Institute and our work to improve the voting process across the United States, I ' ve talked to thousands of voters about their voting experience and thousands of election officials about the process. I also coauthored a book called"When Women Vote,"that outlines a road map and a playbook for how to improve the process for all. And so I ask you : What would you choose? Which scenario would you choose? Now, the 2016 election was the most highly watched, most anticipated election in US history. And yet, only 60 percent of eligible Americans actually voted. Over 100 million people did not vote in 2016. And when they were surveyed as to why, over 40 percent indicated it was due to a barrier : missing a deadline, couldn ' t get off work, couldn ' t wait in line for hours. If"did not vote"was on the ballot in 2016,"did not vote"would have won in a landslide. What we end up with is a system where a minority of eligible Americans are choosing the politicians that make decisions for all of us collectively. Trust in the US government and politicians is at an all-time low, and the ballot box isn ' t helping. If we can ' t even cast a vote easily, why would we ever trust the process or trust politicians? We must put voters first. I ' ll say that again. We must put voters first in election policies and designing a system that serves them. Just ask any successful business. We live in an era of same-day shipping, free delivery, Lyft and Uber and take-home cocktails. And consumers, especially in the height of the pandemic, are choosing their experiences in the comfort of their home and on their schedules. So why can ' t we design a voting process that is as convenient as that? Luckily, we don ' t have to speculate. In Colorado, we ' ve already designed that process, and Colorado is now one of the best states to vote in and also one of the most secure. In 2013, I worked with a group of dedicated leaders to redesign our voting process and pass legislation that put voters first. In Colorado, every voter receives a ballot ahead of each election. They ' re automatically registered to vote. There ' s no overly restrictive deadlines. And with BallotTRACE, voters can track their ballot just like they would a package, through the process, from the moment it ' s mailed to the moment the election official receives it for counting. That system was pioneered in Denver now 11 years ago. And when we designed it, we were able to reduce our call volume by 70 percent and infuse transparency and accountability into the process. Now, when you get that ballot at home, you can vote it and then mail it back in or drop it off in person. And if you want to vote in person, you can do that, too. And you ' re not confined to the government-assigned polling places on one day. You can go to any vote center – close to your kids ' school, close to work, close to home – and you can do so over a few weeks prior to the election. It ' s been seven years since we passed that legislation and implemented that model. And the results are incredible. Colorado increased turnout significantly and now is one of the top states for voter turnout and also one of the most secure. We also saw a reduction in costs. So, because more people were voting at home, we didn ’ t need as many poll workers, and we saw that reduce by over 70 percent. When we went to buy a new voting system, we no longer needed as much equipment. We also saw voters go farther down the ballot, to local races and ballot issues. And we saw turnout increase on those down-ballot races and issues. Those races include mayor and school board and city council. And they also include the really long legalese ballot issues that take forever to figure out. Voters now have a laptop in reach at their home, and they can research candidates and issues on their own time. We also have research now that shows that voting by mail and voting at home makes voters more informed because they have all of that extra time, as opposed to being in person and worrying about the long line of voters behind you while you ’ re trying to rush through. And the final, most important aspect of the results that we ’ ve seen out of Colorado is about civics for future voters. And I want to share my story with my two elementary children. Every time my ballot comes before each election, one of my kids gets it, and they always start asking,”When are we going to fill out mom ’ s ballot?”We sit down together, they read the instructions to me, they read the candidate names, and they ask me questions like,”Mom, what does governor do? What does the mayor do? Maybe I want to be a mayor someday.”We research those issues together, we talk about it, and it takes me forever to complete my ballot. But I know that I have created lifelong, civically engaged voters and future voters that understand that the choices they make on that ballot impact their communities and their world. This is the type of voting experience that we want for every voter across the country. Many other states have taken notice, including California, Vermont, New Jersey, Hawaii. All have expanded options for voting at home this year, in 2020. Americans are resilient. We need a voting process that is also resilient – from a pandemic, from burdens and barriers, from inequities, from unfairness, from foreign adversaries and from administrative deficiencies. Across the country, voters are choosing to vote at home in record numbers. It is safe, it is secure, and we have built-in security measures to deter and detect bad actors who try to interfere with the process. Today, voting at home means paper ballots, but in the future, that might look very different. Voters deserve an awesome and safe voting experience, free from barriers and burdens. It ’ s the politicians that serve us, not the other way around. You deserve excellence. Expect it, demand it and advocate for it. Thank you.

I am a linguist. Linguists study language. And we do this in a lot of different ways. Some linguists study how we pronounce certain sounds. Others look at how we build sentences. And some study how language varies from place to place, just to name a few. But what I ’ m really interested in is what people think and believe about language and how these beliefs affect the way we use it. All of us have deeply held beliefs about language such as the belief that some languages are more beautiful than others or that some ways of using language are more correct. And as most linguists know, these beliefs are often less about language itself and more about what we believe about the social world around us. So I ’ m a linguist, and I ’ m also a nonbinary person, which means I don ’ t identify as a man or a woman. I also identify as a member of a broader transgender community. When I first started getting connected to other transgender people, it was like learning a whole new language and the linguist part of me was really excited. There was a whole new way of talking about my relationship with myself and a new clear way to communicate that to other people. And then I started having conversations with my friends and family about what it meant for me to be trans and nonbinary, what those words meant to me specifically, and why I would use both of them. I also clarified the correct words they could use when referring to me. For some of them, this meant some very specific changes. For example, some of my friends who are used to talking about our friend group as”ladies”or”girls”switched to non-gendered terms like”friends”or”pals.”And my parents can now tell people that their three kids are their son, their daughter and their child. And all of them would have to switch the pronouns they used to refer to me. My correct pronouns are”they”and”them,”also known as the singular they. And these people love me, but many of them told me that some of these language changes were too hard or too confusing or too ungrammatical for them to pick up. These responses led me to the focus of my research. There are commonly held, yet harmful and incorrect beliefs about language that for the people who hold these beliefs, act as barriers to building and strengthening relationships with the transgender people in their families and communities, even if they want to do so. Today, I ’ m going to walk you through some of these beliefs in the hope that we can embrace creativity in our language and allow language to bring us closer together. You might see your own beliefs reflected in these experiences in some way, but no matter what, I hope that I can share with you some linguistic insights that you can put into your back pocket and take with you out into the world. And I just want to be super clear. This can be fun. Learning about language brings me joy, and I hope that it can bring you more joy too. So do you remember how I said that for some of my friends and family learning how to use the singular they was really hard, and they said it was too confusing or too ungrammatical for them to pick up. Well, this brings us to the first belief about language that people have. Grammar rules don ’ t change. As a linguist, I see this belief a lot out in the world. A lot of language users believe that grammar just is what it is. When it comes to language, what ’ s grammatical is what matters. You can ’ t change it. I want to tell you a story about English in the 1600s. Back then, as you might imagine, people spoke differently than we do today. In particular, they used”thou”when addressing a single other person, and”you”when addressing more than one other person, But for some complex historical reasons that we don ’ t have time to get into today, so you ’ ll just have to trust me as a linguist here, but people started using”you”to address someone, regardless of how many people they were talking to. And people had a lot to say about this. Take a look at what this guy, Thomas Elwood, had to say. He wrote,”The corrupt and unsound form of speaking in the plural number to a single person, ’ you ’ to one instead of ’ thou, ’ contrary to the pure, plain and single language of truth, ’ thou ’ to one and ’ you ’ to more than one.”And he goes on. Needless to say, this change in pronouns was a big deal in the 1600s. But actually, if you followed the debates about the singular they at all, these arguments might sound familiar to you. They ’ re not that far off from the bickering we hear about the so-called grammaticality of pronouns used to talk about trans and nonbinary people. One of the most common complaints about the singular they is that if”they”is used to refer to people in the plural, it can ’ t also be used to talk about people in the singular, which is exactly what they said about”thou”and”you.”But as we have seen, pronouns have changed. Our grammar rules do change and for a lot of different reasons. And we ’ re living through one of these shifts right now. All living languages will continue to change, and the Thomas Elwoods of the world will eventually have to get with the program because hundreds of years later, it ’ s considered right to use”you”when addressing another person. Not just allowable, but right. The second belief about language that people have is that dictionaries provide official, unchanging definitions for words. When you were in school, did you ever start an essay with a sentence like,"The dictionary defines history as..."Well, if you did, which dictionary were you talking about? Was it the Oxford English Dictionary? Was it Merriam Webster? Was it Urban Dictionary? Did you even have a particular dictionary in mind? Which one of these is"the dictionary?"Dictionaries are often thought of as the authority on language. But dictionaries, in fact, are changing all the time. And here ' s where our minds are really blown. Dictionaries don ' t provide a single definition for words. Dictionaries are living documents that track how some people are using language. Language doesn ' t originate in dictionaries. Language originates with people and dictionaries are the documents that chronicle that language use. Here ' s one example. We currently use the word"awful"to talk about something that is bad or gross. But before the 19th century,"awful"meant just the opposite. People used"awful"to talk about something that was deserving of respect or full of awe. And in the mid-1900s,"awesome"was the word that took up these positive meanings and"awful"switched to the negative one we have today. And dictionaries over time reflected that. This is just one example of how definitions and meanings have changed over time. And to keep up with it, how dictionaries are updated all the time. So I hope you ' re starting to feel a little more comfortable with the idea of changing language. But of course, I ' m not just talking about language in general. I ' m talking about language as it is impactful for trans people. And pronouns are only one part of language, and they ' re only one part of language that ' s important for trans people. Also important are the identity terms that trans people use to talk about ourselves, such as trans man, trans woman, nonbinary or gender queer. And some of these words have been documented in dictionaries for decades now and others are still being added year after year. And that ' s because dictionaries are working to keep up with us, the people who are using language creatively. So at this point, you might be thinking,"But Archie, it seems like every trans person has a different word they want me to use for them. There are so many opportunities for me to mess up or to look ignorant or to hurt someone ' s feelings. What is something I can memorize and reliably employ when talking to the trans people in my life?"Well, that brings us to the third belief about language that people have. You can ' t just make up words. Folks, people do this all the time. Here ' s one of my favorite examples. The"official"term for your mother ' s mother or your father ' s mother is grandmother. I recently polled my friends and asked them what they call their grandmothers. We don ' t get frustrated if your friend ' s grandma goes by Meemaw and yours goes by Gigi. We just make rather short work of it and memorize it and move on getting to know her. In fact, we might even celebrate her by gifting her with a sweatshirt or an embroidered pillow that celebrates the name she has chosen for herself. And just like your Nana and your grandma, trans people have every right to choose their own identifying language. The process of determining self-identifying language is crucial for trans people. In my research, many trans people have shared that finding new vocabulary was an important part of understanding their own identities. As one person I interviewed put it,"Language is one of the most important personal things because using different words to describe myself and then finding something that feels good, feels right, is a very introspective and important process. With that process you can piece together, with the language that you find out works best for you, who am I?"Sometimes the words that feel good are already out there. For me, the words trans and nonbinary just feel right. But sometimes the common lexicon doesn ' t yet hold the words that a person needs to feel properly understood. And it ' s necessary and exciting to get to create and redefine words that better reflect our experience of gender. So this is a very long answer, but, yes, I ’ m absolutely going to give you a magic word, something really easy you can memorize. And I want you to think of this word as the biggest piece of advice I could give you if you don ’ t know what words to use for the trans people in your life. Ask. I might be a linguist and a trans person and a linguist who works with trans people, but I ’ m no substitute for the actual trans people in your life when it comes to what words to use for them. And you ’ re more likely to hurt someone ’ s feelings by not asking or assuming than you are by asking. And the words that a person uses might change. So just commit to asking and learning. Language is a powerful tool for explaining and claiming our own identities and for building relationships that affirm and support us. But language is just that, a tool. Language works for us, not the other way around. All of us, transgender and cisgender can use language to understand ourselves and to respect those around us. We ’ re not bound by what words have meant before, what order they might have come in or what rules we have been taught. We can consider the beliefs that we might have had about how language works and recognize that language will continue to change. And we can creatively use language to build the identities and relationships that bring us joy. And that ’ s not just allowable. It ’ s right. Believe me.

I thought I would read poems I have that relate to the subject of youth and age. I was sort of astonished to find out how many I have actually. The first one is dedicated to Spencer, and his grandmother, who was shocked by his work. My poem is called”Dirt.”My grandmother is washing my mouth out with soap ; half a long century gone and still she comes at me with that thick cruel yellow bar. All because of a word I said, not even said really, only repeated. But”Open,”she says,”open up!”her hand clawing at my head. I know now her life was hard ; she lost three children as babies, then her husband died too, leaving young sons, and no money. She ’ d stand me in the sink to pee because there was never room in the toilet. But oh, her soap! Might its **bitter** burning have been what made me a poet? The **street** she lived on was unpaved, her flat, two cramped rooms and a fetid kitchen where she stalked and caught me. Dare I admit that after she did it I never really loved her again? She lived to a hundred, even then. All along it was the sadness, the squalor, but I never, until now loved her again. When that was published in a magazine I got an irate letter from my uncle.”You have maligned a great woman.”It took some diplomacy. This is called”The Dress.”It ’ s a longer poem. In those days, those days which exist for me only as the most elusive memory now, when often the first sound you ’ d hear in the morning would be a storm of birdsong, then the soft clop of the hooves of the horse hauling a milk wagon down your block, and the last sound at night as likely as not would be your father pulling up in his car, having worked late again, always late, and going heavily down to the cellar, to the furnace, to shake out the ashes and damp the draft before he came upstairs to fall into bed — in those long-ago days, women, my mother, my friends ’ mothers, our neighbors, all the women I knew — wore, often much of the day, what were called house-dresses, cheap, printed, pulpy, seemingly purposefully shapeless light cotton shifts that you wore over your nightgown and, when you had to go look for a child, hang wash on the line, or run down to the grocery store on the corner, under a coat, the twisted hem of the nightgown always lank and yellowed, dangling beneath. More than the curlers some of the women seemed constantly to have in their hair in preparation for some great event — a ball, one would think — that never came to pass ; more than the way most women ' s faces not only were never made up during the day, but seemed scraped, bleached, and, with their plucked eyebrows, scarily masklike ; more than all that it was those dresses that made women so unknowable and forbidding, adepts of enigmas to which men could have no **access**, and boys no conception. Only later would I see the dresses also as a proclamation : that in your dim kitchen, your laundry, your bleak concrete yard, what you revealed of yourself was a fabulation ; your real sensual nature, veiled in those sexless vestments, was utterly your dominion. In those days, one hid much else as well : grown men didn ' t embrace one another, unless someone had died, and not always then ; you shook hands or, at a ball game, thumped your friend ' s back and exchanged blows meant to be codes for affection ; once out of childhood you ' d never again know the shock of your father ' s whiskers on your cheek, not until mores at last had evolved, and you could hug another man, then hold on for a moment, then even kiss. What release finally, the embrace : though we were wary — it seemed so **audacious** — how much unspoken joy there was in that affirmation of **equality** and communion, no matter how much misunderstanding and pain had passed between you by then. We knew so little in those days, as little as now, I suppose about **healing** those hurts : even the women, in their best dresses, with beads and sequins sewn on the bodices, even in lipstick and mascara, their hair aflow, could only stand wringing their hands, begging for peace, while father and son, like thugs, like thieves, like Romans, simmered and hissed and hated, inflicting sorrows that endured, the worst anyway, through the kiss and embrace, bleeding from brother to brother, into the generations. In those days there was still countryside close to the city, farms, cornfields, cows ; even not far from our building with its blurred brick and long shadowy hallway you could find tracts with hills and trees you could pretend were mountains and forests. Or you could go out by yourself even to a half-block-long empty lot, into the bushes : like a creature of leaves you ' d lurk, crouched, crawling, simplified, savage, alone ; already there was wanting to be simpler, wanting, when they called you, never to go back. This is another longish one, about the old and the young. It actually happened right at the time we met. Part of the poem takes place in space we shared and time we shared. It ' s called"The Neighbor."Her five horrid, deformed little dogs who incessantly yap on the roof under my window. Her cats, God knows how many, who must piss on her rugs — her landing ' s a sickening reek. Her shadow once, fumbling the chain on her door, then the door slamming fearfully shut, only the barking and the music — jazz — filtering as it does, day and night into the hall. The time it was Chris Connor singing"Lush Life"— how it brought back my college sweetheart, my first real love, who — till I left her — played the same record. And head on my shoulder, hand on my thigh, **sang** sweetly along, of regrets and depletions she was too young for, as I was too young, later, to believe in her pain. It startled, then bored, then repelled me. My starting to fancy she ' d ended up in this fire-trap in the Village, that my neighbor was her. My thinking we ' d meet, recognize one another, become friends, that I ' d accomplish a penance. My seeing her, it wasn ' t her, at the mailbox. Gray-yellow hair, army pants under a nightgown, her turning away, hiding her ravaged face in her hands, muttering an inappropriate"Hi."Sometimes there are frightening goings-on in the stairwell. A man shouting,"Shut up!"The dogs frantically snarling, claws scrabbling, then her — her voice hoarse, harsh, hollow, almost only a tone, incoherent, a note, a squawk, bone on metal, metal gone molten, calling them back,"Come back darlings, come back dear ones. My sweet angels, come back.”Medea she was, next time I saw her. Sorceress, tranced, ecstatic, stock-still on the **sidewalk** ragged coat hanging agape, passersby flowing around her, her mouth torn suddenly open as though in a scream, silently though, as though only in her brain or breast had it erupted. A cry so pure, practiced, detached, it had no need of a voice, or could no longer bear one. These invisible links that allure, these transfigurations, even of anguish, that hold us. The girl, my old love, the last lost time I saw her when she came to find me at a party, her drunkenly stumbling, falling, sprawling, skirt hiked, eyes veined red, swollen with tears, her **shame**, her dishonor. My ignorant, arrogant coarseness, my secret pride, my turning away. Still life on a rooftop, dead trees in barrels, a bench broken, dogs, excrement, sky. What pathways through pain, what junctures of vulnerability, what crossings and counterings? Too many lives in our lives already, too many chances for sorrow, too many unaccounted-for pasts.”Behold me,”the god of frenzied, inexhaustible love says, rising in bloody splendor,”Behold me.”Her making her way down the littered vestibule stairs, one agonized step at a time. My holding the door. Her crossing the fragmented tiles, faltering at the step to the **street**, droning, not looking at me,”Can you help me?”Taking my arm, leaning lightly against me. Her wavering step into the world. Her whispering,”Thanks love.”Lightly, lightly against me. I think I ’ ll lighten up a little. Another, different kind of poem of youth and age. It ’ s called”Gas.”Wouldn ’ t it be nice, I think, when the blue-haired lady in the doctor ’ s waiting room bends over the magazine table and farts, just a little, and violently blushes. Wouldn ’ t it be nice if intestinal gas came embodied in visible clouds, so she could see that her really quite inoffensive pop had only barely grazed my face before it drifted away. Besides, for this to have happened now is a nice coincidence. Because not an hour ago, while we were on our walk, my dog was startled by a backfire and jumped straight up like a horse bucking. And that brought back to me the stable I worked on weekends when I was 12, and a splendid piebald stallion, who whenever he was mounted would buck just like that, though more hugely of course, **enormous**, gleaming, resplendent. And the woman, her face abashedly buried in her”Elle”now, reminded me — I ’ d forgotten that not the least part of my awe consisted of the fact that with every jump he took the horse would powerfully fart. Phwap! Phwap! Phwap! Something never mentioned in the dozens of books about horses and their riders I devoured in those days. All that savage grandeur, the steely glinting hooves, the eruptions driven from the creature ’ s mighty innards, breath stopped, heart stopped, nostrils madly flared, I didn ’ t know if I wanted to break him, or be him. This is called”Thirst.”Many — most of my poems actually are urban poems. I happen to be reading a bunch that aren ’ t.”Thirst.”Here was my relation with the woman who lived all last autumn and winter, day and night, on a bench in the 103rd Street subway station, until finally one day she vanished. We regarded each other, scrutinized one another. Me shyly, obliquely, trying not to be furtive. She boldly, unblinkingly, even pugnaciously, wrathfully even, when her bottle was empty. I was frightened of her. I felt like a child. I was afraid some repressed part of myself would go out of control, and I ’ d be forever entrapped in the shocking seethe of her stench. Not excrement merely, not merely surface and orifice going unwashed, rediffusion of rum, there was will in it, and intention, power and purpose — a social, ethical rage and rebellion — despair too, though, **grief**, loss. Sometimes I ’ d think I should take her home with me, bathe her, comfort her, dress her. She wouldn ’ t have wanted me to, I would think. Instead, I ’ d step into my train. How rich I would think, is the lexicon of our self-absolving. How enduring, our bland fatal assurance that reflection is righteousness being accomplished. The dance of our glances, the clash, pulling each other through our perceptual punctures, then holocaust, holocaust, host on host of **ill**, injured presences, squandered, consumed. Her vigil somewhere I know continues. Her occupancy, her absolute, faithful attendance. The dance of our glances, challenge, abdication, effacement, the perfume of our consternation. This is a newer poem, a brand new poem. The title is"This Happened."A student, a young woman in a fourth-floor hallway of her lycee, perched on the ledge of an open window **chatting** with friends between classes ; a teacher passes and chides her,"Be careful, you might fall,"almost banteringly chides her,"You might fall,"and the young woman, 18, a girl really, though she wouldn ' t think that, as brilliant as she is, first in her class, and"Beautiful, too,"she ' s often told, smiles back, and leans into the open window, which wouldn ' t even be open if it were winter — if it were winter someone would have closed it — leans into the window, farther, still smiling, farther and farther, though it takes less time than this, really an instant, and lets herself fall. Herself fall. A casual impulse, a fancy, never thought of until now, hardly thought of even now... No, more than impulse or fancy, the girl knows what she ' s doing, the girl means something, the girl means to mean, because it occurs to her in that instant, that beautiful or not, bright yes or no, she ' s not who she is, she ' s not the person she is, and the reason, she suddenly knows, is that there ' s been so much premeditation where she is, so much plotting and planning, there ' s hardly a person where she is, or if there is, it ' s not her, or not wholly her, it ' s a self inhabited, lived in by her, and seemingly even as she thinks it she knows what ' s been missing : grace, not premeditation but grace, a kind of being in the world spontaneously, with grace. Weightfully upon me was the world. Weightfully this self which graced the world yet never wholly itself. Weightfully this self which weighed upon me, the release from which is what I desire and what I achieve. And the girl remembers, in this infinite instant already now so many times divided, the sadness she felt once, hardly knowing she felt it, to merely inhabit herself. Yes, the girl falls, absurd to fall, even the earth with its compulsion to take unto itself all that falls must know that falling is absurd, yet the girl falling isn ' t myself, or she is myself, but a self I took of my own volition unto myself. Forever. With grace. This happened. I ' ll read just one more. I don ' t usually say that. I like to just end. But I ' m afraid that Ricky will come out here and shake his fist at me. This is called"Old Man,"appropriately enough."Special : big tits,"Says the advertisement for a soft-core magazine on our **neighborhood** newsstand. But forget her breasts. A lush, fresh-lipped blond, skin glowing gold, sprawls there, resplendent. 60 nearly, yet these hardly tangible, hardly better than harlots, can still stir me. Maybe a coming of age in the American sensual **darkness**, never seeing an unsmudged nipple, an uncensored vagina, has left me forever infected with an unquenchable lust of the eye. Always that erotic murmur, I ' m hardly myself if I ' m not in a state of incipient desire. God knows though, there are worse twists your obsessions can take. Last year in Israel, a young ultra-orthodox Rabbi guiding some teenage girls through the Shrine of the Shoah forbade them to look in one room. Because there were images in it he said were licentious. The display was a photo. Men and women stripped naked, some trying to cover their genitals, others too frightened to bother, lined up in snow waiting to be shot and thrown into a ditch. The girls, to my horror, averted their gaze. What carnal mistrust had their teacher taught them. Even that though. Another **confession** : Once in a book on pre-war Poland, a studio portrait, an absolute angel, an absolute angel with tormented, tormenting eyes. I kept finding myself at her page. That she died in the camps made her — I didn ' t dare wonder why — more present, more precious. Died in the camps, that too people — or Jews anyway — kept from their children back then. But it was like sex, you didn ' t have to be told.

Sex and death, how close they can seem. So constantly conscious now of death moving towards me, sometimes I think I confound them. My wife ’ s loveliness almost consumes me. My **passion** for her goes beyond reasonable bounds. When we make love, her holding me everywhere all around me, I ’ m there and not there. My mind teems, jumbles of faces, voices, impressions, I live my life over, as though I were drowning. Then I am drowning, in despair at having to leave her, this, everything, all, unbearable, awful. Still, to be able to die with no special contrition, not having been slaughtered, or enslaved. And not having to know history ’ s next mad rage or regression, it might be a relief. No. Again, no. I don ’ t mean that for a moment. What I mean is the world holds me so tightly — the good and the bad — my own follies and weakness that even this counterfeit Venus with her sham heat, and her bosom probably plumped with gel, so moves me my breath catches. Vamp. Siren. Seductress. How much more she reveals in her glare of ink than she knows. How she incarnates our desperate human need for regard, our **passion** to live in beauty, to be beauty, to be cherished by glances, if by no more, of something like love, or love. Thank you.

I coined my own definition of success in 1934, when I was teaching at a high school in South Bend, Indiana, being a little bit disappointed, and [disillusioned] perhaps, by the way parents of the youngsters in my English classes expected their youngsters to get an A or a B. They thought a C was all right for the neighbors ’ children, because they were all average. But they weren ’ t satisfied when their own — it would make the teacher feel that they had failed, or the youngster had failed. And that ’ s not right. The good Lord in his infinite wisdom didn ’ t create us all **equal** as far as intelligence is concerned, any more than we ’ re **equal** for size, appearance. Not everybody could earn an A or a B, and I didn ’ t like that way of judging, and I did know how the alumni of various schools back in the ’ 30s judged coaches and athletic teams. If you won them all, you were considered to be reasonably successful — not completely. Because I found out — we had a number of years at UCLA where we didn ’ t lose a game. But it seemed that we didn ’ t win each individual game by the margin that some of our alumni had predicted — And quite frequently I really felt that they had backed up their predictions in a more materialistic manner. But that was true back in the 30s, so I understood that. But I didn ’ t like it, I didn ’ t agree with it. I wanted to come up with something I hoped could make me a better teacher, and give the youngsters under my supervision, be it in athletics or the English classroom, something to which to aspire, other than just a higher mark in the classroom, or more points in some athletic contest. I thought about that for quite a spell, and I wanted to come up with my own definition. I thought that might help. And I knew how Mr. Webster defined it, as the accumulation of material possessions or the attainment of a position of power or prestige, or something of that sort, worthy accomplishments perhaps, but in my opinion, not necessarily indicative of success. So I wanted to come up with something of my own. And I recalled — I was raised on a small farm in Southern Indiana, and Dad tried to teach me and my brothers that you should never try to be better than someone else. I ’ m sure at the time he did that, I didn ’ t — it didn ’ t — well, somewhere, I guess in the hidden recesses of the mind, it popped out years later. Never try to be better than someone else, always learn from others. Never cease trying to be the best you can be — that ’ s under your control. If you get too engrossed and involved and concerned in regard to the things over

which you have no control, it will adversely affect the things over which you have control. Then I ran across this simple verse that said,”At God ’ s footstool to confess, a poor soul knelt, and bowed his head. ’ I failed! ’ he cried. The Master said, ’ Thou didst thy best, that is success. ’”From those things, and one other perhaps, I coined my own definition of success, which is : Peace of mind attained only through self-satisfaction in knowing you made the effort to do the best of which you ’ re capable. I believe that ’ s true. If you make the effort to do the best of which you ’ re capable, trying to improve the situation that exists for you, I think that ’ s success, and I don ’ t think others can judge that ; it ’ s like character and reputation — your reputation is what you ’ re perceived to be ; your character is what you really are. And I think that character is much more important than what you are perceived to be. You ’ d hope they ’ d both be good, but they won ’ t necessarily be the same. Well, that was my idea that I was going to try to get across to the youngsters. I ran across other things. I love to teach, and it was mentioned by the previous speaker that I enjoy poetry, and I dabble in it a bit, and love it. There are some things that helped me, I think, be better than I would have been. I know I ’ m not what I ought to be, what I should be, but I think I ’ m better than I would have been if I hadn ’ t run across certain things. One was just a little verse that said,”No written word, no spoken plea can teach our youth what they should be ; nor all the books on all the shelves — it ’ s what the teachers are themselves.”That made an impression on me in the 1930s. And I tried to use that more or less in my teaching, whether it be in sports, or whether it be in the English classroom. I love poetry and always had an interest in that somehow. Maybe it ’ s because Dad used to read to us at night, by coal oil lamp — we didn ’ t have electricity in our farm home. And Dad would read poetry to us. So I always liked it. And about the same time I ran across this one verse, I ran across another one. Someone asked a lady teacher why she taught, and after some time, she said she wanted to think about that. Then she came up and said,”They ask me why I teach, and I **reply**, ’ Where could I find such splendid company? ’ There sits a statesman, strong, unbiased, wise ; another Daniel Webster, silver-tongued. A doctor sits beside him, whose quick, steady hand may mend a bone, or stem the life-blood ’ s flow. And there a builder ; upward rise the arch of a church he builds, wherein that minister may speak the word of God, and lead a stumbling soul to touch the Christ. And all about, a gathering of teachers, farmers, merchants, laborers — those who work and vote and build and plan and pray into a great tomorrow. And I may say, I may not see the church, or hear the word, or eat the food their hands may grow, but yet again I may ; And later I may say, I knew him once, and he was weak, or strong, or bold or proud or **gay**. I knew him once, but then he was a boy. They ask me why I teach and I **reply**, ’ Where could I find such splendid company? ’”And I believe the teaching profession — it ’ s true, you have so many youngsters, and I ’ ve got to think of my youngsters at UCLA — 30-some attorneys, 11 dentists and doctors, many, many teachers and other professions. And that gives you a great deal of pleasure, to see them go on. I always tried to make the youngsters feel that they ’ re there to get an education, number one ; basketball was second, because it was paying their way, and they do need a little time for social activities, but you let social activities take a little precedence over the other two, and you ’ re not going to have any very long. So that was the idea that I tried to get across to the youngsters under my supervision. I had three rules, pretty much, that I stuck with practically all the time. I ’ d learned these prior to coming to UCLA, and I decided they were very important. One was”Never be late.”Later on I said certain things — the players, if we were leaving for somewhere, had to be neat and clean. There was a time when I made them wear jackets and shirts and ties. Then I saw our chancellor coming to school in denims and turtlenecks, and thought, it ' s not right for me to keep this other [rule] so I let them just — they had to be neat and clean. I had one of my greatest players that you probably heard of, Bill Walton. He came to catch the bus ; we were leaving for somewhere to play. And he wasn ' t clean and neat, so I wouldn ' t let him go. He couldn ' t get on the bus, he had to go home and get cleaned up to get to the airport. So I was a stickler for that. I believed in that. I believe in time ; very important. I believe you should be on time, but I felt at practice, for example — we start on time, we close on time. The youngsters didn ' t have to feel that we were going to keep them over. When I speak at coaching clinics, I often tell young coaches — and at coaching clinics, more or less, they ' ll be the younger coaches getting in the profession. Most of them are young, you know, and probably newly-married. And I tell them,"Don ' t run practices late, because you ' ll go home in a bad mood, and that ' s not good, for a young married man to go home in a bad mood. When you get older, it doesn ' t make any difference, but —"So I did believe : on time. I believe starting on time, and I believe closing on time. And another one I had was, not one word of profanity. One word of profanity, and you are out of here for the day. If I see it in a game, you ' re going to come out and sit on the bench. And the third one was, never criticize a teammate. I didn ' t want that. I used to tell them I was paid to do that. That ' s my job. I ' m paid to do it. Pitifully poor, but I am paid to do it. Not like the coaches today, for gracious sakes, no. It ' s a little different than it was in my day. Those were three things that I stuck with pretty closely all the time. And those actually came from my dad. That ' s what he tried to teach me and my brothers at one time. I came up with a pyramid eventually, that I don ' t have the time to go on that. But that helped me, I think, become a better teacher. It ' s something like this : And I had blocks in the pyramid, and the cornerstones being industriousness and enthusiasm, working hard and enjoying what you ' re doing, coming up to the apex, according to my definition of success. And right at the top, faith and patience. And I say to you, in whatever you ' re doing, you must be patient. You have to have patience to — we want things to happen. We talk about our youth being impatient a lot, and they are. They want to change everything. They think all change is progress. And we get a little older — we sort of let things go. And we forget there is no progress without change. So you must have patience, and I believe that we must have faith. I believe that we must believe, truly believe. Not just give it word service, believe that things will work out as they should, providing we do what we should. I think our tendency is to hope things will turn out the way we want them to much of the time, but we don ' t do the things that are necessary to make those things become reality. I worked on this for some 14 years, and I think it helped me become a better teacher. But it all revolved around that original definition of success. You know, a number of years ago, there was a Major League Baseball umpire by the name of George Moriarty. He spelled Moriarty with only one ' i '. I ' d never seen that before, but he did. Big league baseball players — they ' re very perceptive about those things, and they noticed he had only one ' i ' in his name. You ' d be surprised how many also told him that that was one more than he had in his head at various times. But he wrote something where I think he did what I tried to do in this pyramid. He called it"The Road Ahead, or the Road Behind."He said,"Sometimes I think the Fates must grin as we denounce them and insist the only reason we can ' t win, is the Fates themselves have missed. Yet there lives on the ancient claim : we win or lose within ourselves. The shining trophies on our shelves can never win tomorrow ' s game. You and I know deeper down, there ' s always a chance to win the crown. But when we fail to give our best, we simply haven ' t met the test, of giving all and saving none until the game is really won ; of showing what is meant by grit ; of playing through when others quit ; of playing through, not letting up. It ’ s bearing down that wins the cup. Of dreaming there ’ s a goal ahead ; of hoping when our dreams are dead ; of praying when our hopes have fled ; yet losing, not afraid to fall, if, bravely, we have given all. For who can ask more of a man than giving all within his span. Giving all, it seems to me, is not so far from victory. And so the Fates are seldom wrong, no matter how they twist and wind. It ’ s you and I who make our fates — we open up or close the gates on the road ahead or the road behind.”Reminds me of another set of threes that my dad tried to get across to us : Don ’ t whine. Don ’ t complain. Don ’ t make excuses. Just get out there, and whatever you ’ re doing, do it to the best of your ability. And no one can do more than that. I tried to get across, too, that — my opponents will tell you — you never heard me mention winning. Never mention winning. My idea is that you can lose when you outscore somebody in a game, and you can win when you ’ re outscored. I ’ ve felt that way on certain occasions, at various times. And I just wanted them to be able to hold their head up after a game. I used to say that when a game is over, and you see somebody that didn ’ t know the outcome, I hope they couldn ’ t tell by your actions whether you outscored an opponent or the opponent outscored you. That ’ s what really matters : if you make an effort to do the best you can regularly, the results will be about what they should be. Not necessarily what you ’ d want them to be but they ’ ll be about what they should ; only you will know whether you can do that. And that ’ s what I wanted from them more than anything else. And as time went by, and I learned more about other things, I think it worked a little better, as far as the results. But I wanted the score of a game to be the byproduct of these other things, and not the end itself. I believe it was one great philosopher who said — no, no — Cervantes. Cervantes said,”The journey is better than the end.”And I like that. I think that it is — it ’ s getting there. Sometimes when you get there, there ’ s almost a let down. But it ’ s the getting there that ’ s the fun. As a basketball coach at UCLA, I liked our practices to be the journey, and the game would be the end, the end result. I liked to go up and sit in the stands and watch the players play, and see whether I ’ d done a decent job during the week. There again, it ’ s getting the players to get that self-satisfaction, in knowing that they ’ d made the effort to do the best of which they are capable. Sometimes I ’ m asked who was the best player I had, or the best teams. I can never answer that. As far as the individuals are concerned — I was asked one time about that, and they said,”Suppose that you, in some way, could make the perfect player. What would you want?”And I said,”Well, I ’ d want one that knew why he was at UCLA : to get an education, he was a good student, really knew why he was there in the first place. But I ’ d want one that could play, too. I ’ d want one to realize that defense usually wins championships, and who would work hard on defense. But I ’ d want one who would play offense, too. I ’ d want him to be unselfish, and look for the pass first and not shoot all the time. And I ’ d want one that could pass and would pass. I ’ ve had some that could and wouldn ’ t, and I ’ ve had some that would and could. So, yeah, I ’ d want that. And I wanted them to be able to shoot from the outside. I wanted them to be good inside too. I ’ d want them to be able to rebound well at both ends, too. Why not just take someone like Keith Wilkes and let it go at that. He had the qualifications. Not the only one, but he was one that I used in that particular category, because I think he made the effort to become the best. There was a couple. I mention in my book,”They Call Me Coach,”two players that gave me great satisfaction, that came as close as I think anyone I ever had to reach their full potential : one was Conrad Burke, and one was Doug McIntosh. When I saw them as freshmen, on our freshmen team — freshmen couldn ’ t play varsity when I taught. I thought,”Oh gracious, if these two players, either one of them”— they were different years, but I thought about each one at the time he was there —”Oh, if he ever makes the varsity, our varsity must be pretty miserable, if he ’ s good enough to make it.”And you know, one of them was a starting player for a season and a half. The other one, his next year, played 32 minutes in a national championship game, Did a tremendous job for us. The next year, he was a starting player on the national championship team, and here I thought he ’ d never play a minute, when he was — so those are the things that give you great joy, and great satisfaction to see. Neither one of those youngsters could shoot very well. But they had outstanding shooting percentages, because they didn ’ t force it. And neither one could jump very well, but they kept good position, and so they did well rebounding. They remembered that every shot that ’ s taken, they assumed would be missed. I ’ ve had too many stand around and wait to see if it ’ s missed, then they go and it ’ s too late, somebody else is in there ahead of them. They weren ’ t very quick, but they played good position, kept in good balance. And so they played pretty good defense for us. So they had qualities that — they came close to — as close to reaching possibly their full potential as any players I ever had. So I consider them to be as successful as Lewis Alcindor or Bill Walton, or many of the others that we had ; there were some outstanding players. Have I rambled enough? I was told that when he makes his appearance, I was supposed to shut up.

Text Sample 340: POS Dim 3 – 2001 – Score 2.00 – 2001/t000367.txt

I ’ d like to do pretty much what I did the first time, which is to choose a light-hearted theme. Last time, I talked about death and dying. This time, I ’ m going to talk about mental illness. But it has to be technological, so I ’ ll talk about electroshock therapy. You know, ever since man had any notion that some of his other people, his colleagues, could be different, could be strange, could be severely depressed or what we now recognize as schizophrenia, he was certain that this kind of illness had to come from evil spirits getting into the body. So, the way of treating these diseases in early times was to, in some way or other, exorcise those evil spirits, and this is still going on, as you know. But it wasn ’ t enough to use the priests. When medicine became somewhat scientific, in about 450 BC, with Hippocrates and those boys, they tried to look for herbs, plants that would literally shake the bad spirits out. So, they found certain plants that could cause convulsions. And the herbals, the botanical books of up to the late Middle Ages, the Renaissance are filled with prescriptions for causing convulsions to shake the evil spirits out. Finally, in about the sixteenth century, a physician whose name was Theophrastus Bombastus Aureolus von Hohenheim, called Paracelsus, a name probably familiar to some people here — — good, old Paracelsus found that he could predict the degree of convulsion by using a measured amount of camphor to produce the convulsion. Can you imagine going to your closet, pulling out a mothball, and chewing on it if you ’ re feeling depressed? It ’ s better than Prozac, but I wouldn ’ t recommend it. So what we see in the seventeenth, eighteenth century is the continued search for medications other than camphor that ’ ll do the trick. Well, along comes Benjamin Franklin, and he comes close to convulsing himself with a bolt of electricity off the end of his kite. And so people begin thinking in terms of electricity to produce convulsions. And then, we fast-forward to about 1932, when three Italian psychiatrists, who were largely treating depression, began to notice among their patients, who were also epileptics, that if they had an epileptic — a series of epileptic fits, a lot of them in a row — the depression would very frequently lift. Not only would it lift, but it might never return. So they got very interested in producing convulsions, measured types of convulsions. And they thought,"Well, we ' ve got electricity, we ' ll plug somebody into the wall. That always makes hair stand up and people shake a lot."So, they tried it on a few pigs, and none of the pigs were killed. So, they went to the police and they said,"We know that at the Rome railroad station, there are all these lost souls wandering around, muttering gibberish. Can you bring one of them to us?"Someone who is, as the Italians say,"cagoots."So they found this"cagoots"guy, a 39-year-old man who was really hopelessly schizophrenic, who was known, had been known for months, to be literally defecating on himself, talking nothing that made any sense, and they brought him into the hospital. So these three psychiatrists, after about two or three weeks of observation, laid him down on a table, connected his temples to a very small source of current. They thought,"Well, we ' ll try 55 volts, two-tenths of a second. That ' s not going to do anything terrible to him."So they did that. Well, I have the following from a firsthand observer, who told me this about 35 years ago, when I was thinking about these things for some research project of mine. He said,"This fellow"— remember, he wasn ' t even put to sleep —"after this major grand mal convulsion, sat right up, looked at these three fellas and said, ' What the fuck are you assholes trying to do? '"If I could only say that in Italian. Well, they were happy as could be, because he hadn ' t said a rational word in the weeks of observation. So they plugged him in again, and this time they used 110 volts for half a second. And to their amazement, after it was over, he began speaking like he was perfectly well. He relapsed a little bit, they gave him a series of treatments, and he was essentially cured. But of course, having schizophrenia, within a few months, it returned. But they wrote a paper about this, and everybody in the Western world began using electricity to convulse people who were either schizophrenic or severely depressed. It didn ' t work very well on the schizophrenics, but it was pretty clear in the ' 30s and by the middle of the ' 40s that electroconvulsive therapy was very, very effective in the treatment of depression. And of course, in those days, there were no antidepressant drugs, and it became very, very popular. They would anesthetize people, convulse them, but the real difficulty was that there was no way to paralyze muscles. So people would have a real grand mal seizure. Bones were broken. Especially in old, fragile people, you couldn ' t use it. And then in the 1950s, late 1950s, the so-called muscle relaxants were developed by pharmacologists, and it got so that you could induce a complete convulsion, an electroencephalographic convulsion — you could see it on the brain waves — without causing any convulsion in the body except a little bit of twitching of the toes. So again, it was very, very popular and very, very useful. Well, you know, in the middle ' 60s, the first antidepressants came out. Tofranil was the first. In the late ' 70s, early ' 80s, there were others, and they were very effective. And patients ' rights groups seemed to get very upset about the kinds of things that they would witness. And so the whole idea of electroconvulsive, electroshock therapy disappeared, but has had a renaissance in the last 10 years. And the reason that it has had a renaissance is that probably about 10 percent of the people, severe depressives, do not respond, regardless of what is done for them. Now, why am I telling you this story at this meeting? I ' m telling you this story, because actually ever since Richard called me and asked me to talk about — as he asked all of his speakers — to talk about something that would be new to this audience, that we had never talked about, never written about, I ' ve been planning this moment. This reason really is that I am a man who, almost 30 years ago, had his life saved by two long courses of electroshock therapy. And let me tell you this story. I was, in the 1960s, in a marriage. To use the word bad would be perhaps the understatement of the year. It was dreadful. There are, I ’ m sure, enough divorced people in this room to know about the hostility, the anger, who knows what. Being someone who had had a very difficult childhood, a very difficult adolescence — it had to do with not quite poverty but close. It had to do with being brought up in a family where no one spoke English, no one could read or write English. It had to do with death and disease and lots of other things. I was a little prone to depression. So, as things got worse, as we really began to hate each other, I became progressively depressed over a period of a couple of years, trying to save this marriage, which was inevitably not to be saved. Finally, I would schedule — all my major surgical cases, I was scheduling them for 12, one o ’ clock in the afternoon, because I couldn ’ t get out of bed before about 11 o ’ clock. And anybody who ’ s been depressed here knows what that ’ s like. I couldn ’ t even pull the covers off myself. Well, you ’ re in a university medical center, where everybody knows everybody, and it ’ s perfectly clear to my colleagues, so my referrals began to decrease. As my referrals began to decrease, I clearly became increasingly depressed until I thought, my God, I can ’ t work anymore. And, in fact, it didn ’ t make any difference because I didn ’ t have any patients anymore. So, with the advice of my physician, I had myself admitted to the acute care psychiatric unit of our university hospital. And my colleagues, who had known me since medical school in that place, said,”Don ’ t worry, chap. Six weeks, you ’ re back in the operating room. Everything ’ s going to be great.”Well, you know what bovine stercus is? That proved to be a lot of bovine stercus. I know some people who got tenure in that place with lies like that. So I was one of their failures. But it wasn ’ t that simple. Because by the time I got out of that unit, I was not functional at all. I could hardly see five feet in front of myself. I shuffled when I walked. I was bowed over. I rarely bathed. I sometimes didn ’ t shave. It was dreadful. And it was clear — not to me, because nothing was clear to me at that time anymore — that I would need long-term hospitalization in that awful place called a mental hospital. So I was admitted, in 1973, in the spring of 1973, to the Institute of Living, which used to be called the Hartford Retreat. It was founded in the eighteenth century, the largest psychiatric hospital in the state of Connecticut, other than the huge public hospitals that existed at that time. And they tried everything they had. They tried the usual psychotherapy. They tried every medication available in those days. And they did have Tofranil and other things — Mellaril, who knows what. Nothing happened except that I got jaundiced from one of these things. And finally, because I was well known in Connecticut, they decided they better have a meeting of the senior staff. All the senior staff got together, and I later found out what happened. They put all their heads together and they decided that there was nothing that could be done for this surgeon who had essentially separated himself from the world, who by that time had become so overwhelmed, not just with depression and feelings of worthlessness and inadequacy, but with obsessional thinking, obsessional thinking about coincidences. And there were particular numbers that every time I saw them, just got me dreadfully upset — all kinds of ritualistic observances, just awful, awful stuff. Remember when you were a kid, and you had to step on every line? Well, I was a grown man who had all of these rituals, and it got so there was a throbbing, there was a ferocious fear in my head. You ’ ve seen this painting by Edvard Munch, The Scream. Every moment was a scream. It was impossible. So they decided there was no therapy, there was no treatment. But there was one treatment, which actually had been pioneered at the Hartford hospital in the early 1940s, and you can imagine what it was. It was pre-frontal lobotomy. So they decided — I didn ’ t know this, again, I found this out later — that the only thing that could be done was for this 43-year-old man to have a pre-frontal lobotomy. Well, as in all hospitals, there was a resident assigned to my case. He was 27 years old, and he would meet with me two or three times a week. And of course, I had been there, what, three or four months at the time. And he asked to meet with the senior staff, and they agreed to meet with him because he was very well thought of in that place. They thought he had a really extraordinary future. And he dug in his heels and said,"No. I know this man better than any of you. I have met with him over and over again. You ' ve just seen him from time to time. You ' ve read reports and so forth. I really honestly believe that the basic problem here is pure depression, and all of the obsessional thinking comes out of it. And you know, of course, what ' ll happen if you do a pre- frontal lobotomy. Any of the results along the spectrum, from pretty bad to terrible, terrible, terrible is going to happen. If he does the best he can, he will have no further obsessions, probably no depression, but his affect will be dulled, he will never go back to surgery, he will never be the **loving** father that he was to his two children, his life will be changed. If he has the usual result, he will end up like ' One Flew Over the Cuckoo ' s Nest. ' And you know about that, just essentially in a stupor the rest of his life."Well, he said,"Can ' t we try a course of electroshock therapy?"And you know why they agreed? They agreed to humor him. They just thought,"Well, we ' ll give a course of 10. And so we ' ll lose a little time. Big deal. It doesn ' t make any difference."So they gave the course of 10, and the first — the usual course, incidentally, was six to eight and still is six to eight. Plugged me into the wires, put me to sleep, gave me the muscle relaxant. Six didn ' t work. Seven didn ' t work. Eight didn ' t work. At nine, I noticed — and it ' s wonderful that I could notice anything — I noticed a change. And at 10, I noticed a real change. And he went back to them, and they agreed to do another 10. Again, not a single one of them — I think there are about seven or eight of them — thought this would do any good. They thought this was a temporary change. But, lo and behold, by 16, by 17, there were demonstrable differences in the way I felt. By 18 and 19, I was sleeping through the night. And by 20, I had the sense, I really had the sense that I could overcome this, that I was now strong enough that by an act of will, I could blow the obsessional thinking away. I could blow the depression away. And I ' ve never forgotten — I never will forget — standing in the kitchen of the unit, it was a Sunday morning in January of 1974, standing in the kitchen by myself and thinking,"I ' ve got the strength now to do this."It was as though those tightly coiled wires in my head had been disconnected and I could think clearly. But I need a **formula**. I need some thing to say to myself when I begin thinking obsessionally, obsessively. Well, the Gilbert and Sullivan fans in this room will remember"Ruddigore,"and they will remember Mad Margaret, and they will remember that she was married to a fellow named Sir Despard Murgatroyd. And she used to go nuts, every five minutes or so in the play, and he said to her,"We must have a word to bring you back to reality, and the word, my dear, will be ' Basingstoke. '"So every time she got a little nuts, he would say,"Basingstoke!"And she would say,"Basingstoke, it is."And she would be fine for a little while. Well, you know, I ' m from the Bronx. I can ' t say"Basingstoke."But I had something better. And it was very simple. It was,"Ah, fuck it!"Much better than"Basingstoke,"at least for me. And it worked — my God, it worked. Every time I would begin thinking obsessionally — again, once more, after 20 shock treatments — I would say,"Ah, fuck it."And things got better and better, and within three or four months, I was discharged from that hospital, and I joined a group of surgeons where I could work with other people in the community, not in New Haven, but fairly close by. I stayed there for three years. At the end of three years, I went back to New Haven, had remarried by that time. I brought my wife with me, actually, to make sure I could get through this. My children came back to live with us. We had two more children after that. Resuscitated the career, even better than it had been before. Went right back into the university and began to write books. Well, you know, it ’ s been a wonderful life. It ’ s been, as I said, close to 30 years. I stopped doing surgery about six years ago and became a full-time writer, as many people know. But it ’ s been very exciting. It ’ s been very happy. Every once in a while, I have to say,”Ah, fuck it.”Every once in a while, I get somewhat depressed and a little obsessional. So, I ’ m not free of all of this. But it ’ s worked. It ’ s always worked. Why have I chosen, after never, ever talking about this, to talk about it now? Well, those of you who know some of these books know that one is about death and dying, one is about the human body and the human spirit, one is about the way mystical thoughts are constantly in our minds, and they have always to do with my own personal experiences. One might think reading these books — and I ’ ve gotten thousands of letters about them by people who do think this — that based on my life ’ s history as I ’ ve portrayed in the books, my early life ’ s history, I am someone who has overcome adversity. That I am someone who has drunk, drank, drunk of the **bitter** dregs of near-disaster in childhood and emerged not just unscathed but strengthened. I really have it figured out, so that I can advise people about death and dying, so that I can talk about mysticism and the human spirit. And I ’ ve always felt guilty about that. I ’ ve always felt that somehow I was an impostor because my readers don ’ t know what I have just told you. It ’ s known by some people in New Haven, obviously, but it is not generally known. So one of the reasons that I have come here to talk about this today is to — frankly, selfishly — unburden myself and let it be known that this is not an untroubled mind that has written all of these books. But more importantly, I think, is the fact that a very significant proportion of people in this audience are under 30, and there are many, of course, who are well over 30. For people under 30, and it looks to me like almost all of you — I would say all of you — are either on the cusp of a magnificent and exciting career or right into a magnificent and exciting career : anything can happen to you. Things change. Accidents happen. Something from childhood comes back to haunt you. You can be thrown off the track. I hope it happens to none of you, but it will probably happen to a small percentage of you. To those to whom it doesn ’ t happen, there will be adversities. If I, with the bleakness of spirit, with no spirit, that I had in the 1970s and no possibility of recovery, as far as that group of very experienced psychiatrists thought, if I can find my way back from this, believe me, anybody can find their way back from any adversity that exists in their lives. And for those who are older, who have lived through perhaps not something as bad as this, but who have lived through difficult times, perhaps where they lost everything, as I did, and started out all over again, some of these things will seem very familiar. There is recovery. There is redemption. And there is resurrection. There are resurrection themes in every society that has ever been studied, and it is because not just only do we fantasize about the possibility of resurrection and recovery, but it actually happens. And it happens a lot. Perhaps the most popular resurrection theme, outside of specifically religious ones, is the one about the phoenix, the ancient story of the phoenix, who, every 500 years, resurrects itself from its own ashes to go on to live a life that is even more beautiful than it was before. Richard, thanks very much.

So I understand that this meeting was planned, and the slogan was From Was

to Still. And I am illustrating Still. Which, of course, I am not agreeing with because, although I am 94, I am not still working. And anybody who asks me,”Are you still doing this or that?”I don ’ t answer because I ’ m not doing things still, I ’ m doing it like I always did. I still have — or did I use the word still? I didn ’ t mean that. I have my file which is called To Do. I have my plans. I have my clients. I am doing my work like I always did. So this takes care of my age. I want to show you my work so you know what I am doing and why I am here. This was about 1925. All of these things were made during the last 75 years. But, of course, I ’ m working since 25, doing more or less what you see here. This is Castleton China. This was an exhibition at the Museum of Modern Art. This is now for sale at the Metropolitan Museum. This is still at the Metropolitan Museum now for sale. This is a portrait of my daughter and myself. These were just some of the things I ’ ve made. I made hundreds of them for the last 75 years. I call myself a maker of things. I don ’ t call myself an industrial designer because I ’ m other things. Industrial designers want to make novel things. Novelty is a concept of commerce, not an aesthetic concept. The industrial design magazine, I believe, is called”Innovation.”Innovation is not part of the aim of my work. Well, makers of things : they make things more beautiful, more elegant, more comfortable than just the craftsmen do. I have so much to say. I have to think what I am going to say. Well, to describe our profession otherwise, we are actually concerned with the playful search for beauty. That means the playful search for beauty was called the first activity of Man. Sarah Smith, who was a mathematics professor at MIT, wrote,”The playful search for beauty was Man ’ s first activity — that all useful qualities and all material qualities were developed from the playful search for beauty.”These are tiles. The word,”playful”is a necessary aspect of our work because, actually, one of our problems is that we have to make, produce, lovely things throughout all of life, and this for me is now 75 years. So how can you, without drying up, make things with the same pleasure, as a gift to others, for so long? The playful is therefore an important part of our quality as designer. Let me tell you some about my life. As I said, I started to do these things 75 years ago. My first exhibition in the United States was at the Sesquicentennial exhibition in 1926 — that the Hungarian government sent one of my hand-drawn pieces as part of the exhibit. My work actually took me through many countries, and showed me a great part of the world. This is not that they took me — the work didn ’ t take me — I made the things particularly because I wanted to use them to see the world. I was incredibly curious to see the world, and I made all these things, which then finally did take me to see many countries and many cultures. I started as an apprentice to a Hungarian craftsman, and this taught me what the guild system was in Middle Ages. The guild system : that means when I was an apprentice, I had to apprentice myself in order to become a pottery master. In my shop where I studied, or learned, there was a traditional hierarchy of master, journeyman and learned worker, and apprentice, and I worked as the apprentice. The work as an apprentice was very primitive. That means I had to actually learn every aspect of making pottery by hand. We mashed the clay with our feet when it came from the hillside. After that, it had to be kneaded. It had to then go in, kind of, a mangle. And then finally it was prepared for the throwing. And there I really worked as an apprentice. My master took me to set ovens because this was part of oven-making, oven-setting, in the time. And finally, I had received a document that I had accomplished my apprenticeship successfully, that I had behaved morally, and this document was given to me by the Guild of Roof- Coverers, Rail-Diggers, Oven-Setters, Chimney Sweeps and Potters. I also got at the time a workbook which explained my rights and my working conditions, and I still have that workbook. First I set up a shop in my own garden, and made pottery which I sold on the marketplace in Budapest. And there I was sitting, and my then-boyfriend — I didn ’ t mean it was a boyfriend like it is meant today — but my boyfriend and I sat at the market and sold the pots. My mother thought that this was not very proper, so she sat with us to add propriety to this activity. However, after a while there was a new factory being built in Budapest, a pottery factory, a large one. And I visited it with several ladies, and asked all sorts of questions of the director. Then the director asked me, why do you ask all these questions? I said, I also have a pottery. So he asked me, could he please visit me, and then finally he did, and explained to me that what I did now in my shop was an anachronism, that the industrial revolution had broken out, and that I rather should join the factory. There he made an art department for me where I worked for several months. However, everybody in the factory spent his time at the art department. The director there said there were several women casting and producing my designs now in molds, and this was sold also to America. I remember that it was quite successful. However, the director, the chemist, model maker — everybody — concerned himself much more with the art department — that means, with my work — than making toilets, so finally they got a letter from the center, from the bank who owned the factory, saying, make toilet-setting behind the art department, and that was my end. So this gave me the possibility because now I was a journeyman, and journeymen also take their satchel and go to see the world. So as a journeyman, I put an ad into the paper that I had studied, that I was a down-to-earth potter ’ s journeyman and I was looking for a job as a journeyman. And I got several answers, and I accepted the one which was farthest from home and practically, I thought, halfway to America. And that was in Hamburg. Then I first took this job in Hamburg, at an art pottery where everything was done on the wheel, and so I worked in a shop where there were several potters. And the first day, I was coming to take my place at the turntable — there were three or four turntables — and one of them, behind where I was sitting, was a hunchback, a deaf-mute hunchback, who smelled very bad. So I doused him in cologne every day, which he thought was very nice, and therefore he brought bread and butter every day, which I had to eat out of courtesy. The first day I came to work in this shop there was on my wheel a surprise for me. My colleagues had thoughtfully put on the wheel where I was supposed to work a very nicely modeled natural man ’ s organs. After I brushed them off with a hand motion, they were very — I finally was now accepted, and worked there for some six months. This was my first job. If I go on like this, you will be here till midnight. So I will try speed it up a little Moderator : Eva, we have about five minutes. Eva Zeisel : Are you sure? Moderator : Yes, I am sure. EZ : Well, if you are sure, I have to tell you that within five minutes I will talk very fast. And actually, my work took me to many countries because I used my work to fill my curiosity. And among other things, other countries I worked, was in the Soviet Union, where I worked from ’ 32 to ’ 37 — actually, to ’ 36. I was finally there, although I had nothing to do — I was a foreign expert. I became art director of the china and glass industry, and eventually under Stalin ’ s purges — at the beginning of Stalin ’ s purges, I didn ’ t know that hundreds of thousands of **innocent** people were arrested. So I was arrested quite early in Stalin ’ s purges, and spent 16 months in a Russian prison. The accusation was that I had successfully prepared an Attentat on Stalin ’ s life. This was a very dangerous accusation. And if this is the end of my five minutes, I want to tell you that I actually did survive, which was a surprise. But since I survived and I ’ m here, and since this is the end of the five minutes, I will — Moderator : Tell me when your last trip to Russia was. Weren ’ t you there recently? EZ : Oh, this summer, in fact, the Lomonosov factory was bought by an American company, invited me. They found out that I had worked in ’ 33 at this factory, and they came to my studio in Rockland County, and brought the 15 of their artists to visit me here. And they invited myself to come to the Russian factory last summer, in July, to make some dishes, design some dishes. And since I don ’ t like to travel alone, they also invited my daughter, son-in-law and granddaughter, so we had a lovely trip to see Russia today, which is not a very pleasant and happy view. Here I am now, if this is the end? Thank you.

So I know for sure there ’ s at least one thing I have in common with dentists. I absolutely hate the holiday of Halloween. Now, this **hatred** stems not from a dislike of cavities, nor was it a lifetime in the making. Rather, this **hatred** stems from a particular incident that happened nine years ago. Nine years ago, I was even younger, I was 20 years old, and I was an intern in the White House. The other White House. And my job was to work with mayors and councilors nationwide. November 1, 2010 began just like any other day. I turned on the computer, went on Google and prepared to write my news clips. I was met with a call from my mother, which isn ’ t that out the norm, my mom likes to text, call, email, Facebook, Instagram, all that. So I answered the phone expecting to hear maybe some church gossip, or maybe something from WorldStarHipHop she had discovered. But when I answered the phone, I was met with a tone that was unlike anything I had ever heard from my mother. My mother ’ s loud. But she spoke in a hush, still, muffled tone that conveyed a sense of sadness. And as she whispered, she said,”Michael, your cousin Donnell was murdered last night, on Halloween, at a house party in Stockton.”And like far too many people in this country, particularly from communities like mine, particularly that look like me, I spent the better part of the year dealing with anger, rage, nihilism, and I had a choice to make. The choice was one between action and apathy. The choice was what could I do to put purpose to this pain. I spent a year dealing with feelings of survivor ’ s guilt. What was the point of me being at Stanford, what was the point of me being at the White House if I was powerless to help my own family? And my own family was dying, quite literally. I then began to feel a little selfish and say, what ’ s the point of even trying to make the world a better place? Maybe that ’ s just the way it is. Maybe I would be smart to take advantage of all the opportunities given to me and make as much money as possible, so I ’ m comfortable, and my immediate family is comfortable. But finally, towards the end of that year, I realized I wanted to do something. So I made the crazy decision, as a senior in college, to run for city council. That decision was unlikely for a couple of reasons, and not just my age. You see, my family is far from a political dynasty. More men in my family have been incarcerated than in college. In fact, as I speak today, my father is still incarcerated. My mother, she had me as a teenager, and government wasn ’ t something we had warm feelings from. You see, it was the government that red- lined the **neighborhoods** I grew up in. Full of liquor stores and no grocery stores, there was a lack of opportunity and concentrated poverty. It was the government and the politicians that made choices, like the war on drugs and three strikes, that have incarcerated far too many people in our country. It was the government and political actors that made the decisions that created the school funding **formulas**, that made it so the school I went to receive less per pupil spending than schools in more affluent areas. So there was nothing about that background that made it likely for me to choose to be involved in being a government actor. And at the same time, Stockton was a very unlikely

place. Stockton is my home town, a city of 320, 000 people. But historically, it ’ s been a place people run from, rather than come back to. It ’ s a city that ’ s incredibly diverse. Thirty- five percent Latino, 35 percent white, 20 percent Asian, 10 percent African American, the oldest Sikh temple in North America. But at the time I ran for office, we were also the largest city in the country at that time to **declare** bankruptcy. At the time I decided to run for office, we also had more murders per capita than Chicago. At the time I decided to run for office, we had a 23 percent poverty rate, a 17 percent college attainment rate and a host of challenges and issues beyond the scope of any 21-year-old. So after I won my election, I did what I usually do when I feel overwhelmed, I realized the problems of Stockton were far bigger than me and that I might need a little divine intervention. So as I prepared for my first council meeting, I went back to some wisdom my grandmother taught me. A parable I think we all know, that really constitutes the governing frame we ’ re using to reinvent Stockton today. I remember in Sunday school, my grandmother told me that at one time, a guy asked Jesus,”Who was my neighbor? Who was my fellow citizen? Who am I responsible for?”And instead of a short answer, Jesus **replied** with a parable. He said there was a man on a journey, walking down Jericho Road. As he was walking down the road, he was beat up, left on the side of the road, stripped of all his clothes, had everything stolen from and left to die. And then a priest came by, saw the man on the side of the road, maybe said a silent **prayer**, hopes and **prayers**, **prayers** that he gets better. Maybe saw the man on the side of the road and surmised that it was ordained by God for this particular man, this particular group to be on the side of the road, there ’ s nothing I can do to change it. After the priest walked by, maybe a politician walked by. A 28-year-old politician, for example. Saw the man on the side of the road and saw how beat up the man was, saw that the man was a **victim** of **violence**, or fleeing **violence**. And the politician decided,”You know what? Instead of welcoming this man in, let ’ s build a wall. Maybe the politician said,”Maybe this man chose to be on the side of the road.”That if he just pulled himself up by his bootstraps, despite his boots being stolen, and got himself back on the horse, he could be successful, and there ’ s nothing I could do.”And then finally, my grandmother said, a good Samaritan came by, saw the man on the side of the road and looked and saw not centuries of **hatred** between Jews and Samaritans, looked and saw not his fears reflected, not economic anxiety, not”what ’ s going to happen to me because things are changing.”But looked and saw a reflection of himself. He saw his neighbor, he saw his common humanity. He didn ’ t just see it, he did something about it, my grandmother said. He got down on one knee, he made sure the man was OK, and I heard, even gave him a room at that nice Fairmont, the Pan Pacific one. And as I prepared to govern, I realized that given the diversity of Stockton, the first step to making change will be to again answer the same question : Who is our neighbor? And realizing that our destiny as a city was tied up in everyone. Particularly those who are left on the side of the road. But then I realized that charity isn ’ t justice, that acts of empathy isn ’ t justice, that being a good neighbor is necessary but not sufficient, and there was more that had to be done. So looking at the story, I realized that the road, Jericho Road, has a nickname. It ’ s known as the Bloody Pass, the Ascent of Red, because the road is structured for **violence**. This Jericho Road is narrow, it ’ s conducive for ambushing. Meaning, a man on the side of the road wasn ’ t abnormal. Wasn ’ t strange. And in fact, it was something that was structured to happen, it was supposed to happen. And Johan Galtung, a peace theorist, talks about structural **violence** in our society. He says,”Structural **violence** is the avoidable impairment of basic human needs.”Dr. Paul Farmer talks about structural **violence** and talks about how it ’ s the way our institutions, our policies, our culture creates outcomes that advantage some people and disadvantage others. And then I realized, much like the road in Jericho, in many ways, Stockton, our society, has been structured for the outcomes we complain about. That we should not be surprised when we see that kids in poverty don ’ t do well in school, that we should not be surprised to see wealth gaps by race and **ethnicity**. We should not be surprised to see income pay disparities between genders, because that ’ s what our society, historically, has been structured to do, and it ’ s working accordingly. So taking this wisdom, I rolled up my sleeves and began to work. And there ’ s three quick stories I want to share, that point to not that we figured everything out, not that we have arrived, but we ’ re trending in the right direction. The first story, about the neighbor. When I was a city council member, I was working with one of the most conservative members in our community on opening a health clinic for undocumented people in the south part of the city, and I loved it. And as we opened the clinic, we had a resolution to sign, he presented me a gift. It was an O ’ Reilly Factor lifetime membership pin. Mind you, I didn ’ t ask what he did to get such a gift. What blood oath — I had no idea how he got it. But I looked at him and I said,”Well, how are we working together to open a health clinic, to provide free health care for undocumented people, and you ’ re an O ’ Reilly Factor member?”He looked at me and said,”Councilman Tubbs, this is for my neighbors.”And he ’ s a great example of what it means to be a good neighbor, at least in that instance. The robbers. So after four years on city council, I decided to run for mayor, realizing that being a part-time councilman wasn ’ t enough to enact the structural changes we need to see in Stockton, and I came to that conclusion by looking at the data. So my old council district, where I grew up, is 10 minutes away from a more affluent district. And 10 minutes away in the same city, the difference between zip code 95205 and 95219 in life expectancy is 10 years. Ten minutes away, 4. 5 miles, 10 years life expectancy difference, and not because of the choices people are making. Because no one chose to live in an **unsafe** community where they can ’ t exercise. No one chose to put more liquor stores than grocery stores in the community. No one chose these things, but that ’ s the reality. I realized, as a councilman, to enact a structural change I wanted to see, where between the same zip codes there ’ s a 30 percent difference in the rate of **unemployment**, there ’ s a 75, 000 dollars a year difference in income, that being a councilman was not going to cut it. So that ’ s when I decided to run for mayor. And as mayor, we ’ ve been focused on the robbers and the road. So in Stockton, as I mentioned, we have historically had problems with **violent** crime. In fact, that ’ s why I decided to run for office in the first place. And my first job as mayor was helping our community to see ourselves, our neighbors, not just in the people victimized by **violence** but also in the **perpetrators**. We realized that those who enact pain in our society, those who are committing homicides and contributing to gun **violence**, are oftentimes **victims** themselves. They have high rates of **trauma**, they have been shot at, they ’ ve known people who have been shot. That doesn ’ t excuse their behavior, but it helps explain it, and as a community, we have to see these folks as us, too. That they too are our neighbors. So for the past three years — So for the past three years, we ’ ve been working on two strategies : Ceasefire and Advance Peace, where we give these guys as much attention, as much love from social services, from opportunities, from tattoo removals, in some cases even cash, as a gift from law **enforcement**. And last year, we saw a 40 percent reduction in homicides and a 30 percent reduction in **violent** crime. And now, the road. I mentioned that my community has a 23 percent poverty rate. As someone who comes from poverty, it ’ s a personal issue for me. So I decided that we wouldn ’ t just do a program, or we wouldn ’ t just do something to go around the edges, but we would call into question the very structure that produces poverty in the first place. So starting in February, we launched a basic income demonstration, where for the next 18 months, as a pilot, 130 families, randomly selected, who live in zip codes at or below the median income of the city, are given 500 dollars a month. And we ’ re doing this for a couple of reasons. We ’ re doing it because we realize that something is structurally wrong in America, when one in two Americans can ’ t afford one 400- dollar emergency. We ’ re doing it because we realize that something is structurally wrong when wages have only increased six percent between 1979 and 2013. We ’ re doing it because we realize something is structurally wrong when people working two and three jobs, doing all the jobs no one in here wants to do, can ’ t pay for necessities, like rent, like lights, like health care, like childcare. So I would say, Stockton again, we have real issues. I have constituent emails in my phone now, about the **homelessness** issue, about some of the **violent** crime we ’ re still experiencing. But I would say, I think as a society, we would be wise to go back to those old Bible stories we were taught growing up, and understand that number one, we have to begin to see each other as neighbors, that when we see someone different from us, they should not reflect our fears, our anxieties, our insecurities, the **prejudices** we ’ ve been taught, our biases — but we should see ourselves. We should see our common humanity. Because I think once we do that, we can do the more important work of restructuring the road. Because again, I understand some listening are saying,”Well, Mayor Tubbs, you ’ re talking about structural **violence** and structural this, but you ’ re on the stage. That the structures can ’ t be too bad if you could come up from poverty, have a father in jail, go to Stanford, work in the White House and become mayor.”And I would respond by saying the term for that is exceptionalism. Meaning that we recognize it ’ s exceptional for people to escape the structures. Meaning by our very language, we understand that the things we ’ re seeing in our world are by design. And I think that task for us, as TEDsters, and as good people, just people, moral people, is really do the hard work necessary of not just joining hands as neighbors, but using our hands to restructure our road, a road that in this country has been rooted in things like white supremacy. A road like in this country has been rooted in things like misogyny. A road that ’ s not working for far too many people. And I think today, tomorrow and 2020 we have a chance to change that. So as I prepare to close, I started with a story from nine years ago and I ’ ll end with one. So after my cousin was murdered, I was lucky enough to go on the Freedom Rides with some of the original freedom riders. And they taught me a lot about restructuring the road. And one guy in particular, Bob Singleton, asked me a question I ’ m going to leave with us today. We were going to Anniston, Alabama, and he said,”Michael,”and I said,”Yes, sir.”He said,”I was arrested on August 4, 1961. Now why is that day important?”And I said,”Well, you were arrested, if you weren ’ t arrested, we wouldn ’ t be on this bus. if we weren ’ t on this bus, we wouldn ’ t have the rights we enjoy.”He rolled his eyes and said,”No, son.”He said,”On that day, Barack Obama was born.”And then he said he had no idea that the choice he made to restructure the road would pave the way, so a child born as a second class citizen, who wouldn ’ t be able to even get a cup of water at a counter, would have the chance, 50 years later, to be president. Then he looked at me and he said,”What are you prepared to do today so that 50 years from now a child born has a chance to be president?”And I think, TED, that ’ s the question before us today. We know things are jacked up. I think what we ’ ve seen recently isn ’ t abnormal but a reflection of a system that ’ s been structured to produce such crazy outcomes. But I think it ’ s also an opportunity. Because these structures we inherit aren ’ t acts of God but acts of men and women, they

’ re policy choices, they ’ re by politicians like me, approved by voters like you. And we have the chance and the awesome opportunity to do something about it. So my question is : What are we prepared to do today, so that a child born today, 50 years from now isn ’ t born in a society rooted in white supremacy ; isn ’ t born into a society riddled with misogyny ; isn ’ t born into a society riddled with homophobia and transphobia and anti-Semitism and Islamophobia and ableism, and all the phobias and -isms? What are we prepared to do today, so that 50 years from now we have a road in our society that ’ s structured to reflect what we hold to be self-evident? That all men, that all women, that even all trans people are created **equal** and are endowed by your Creator with certain unalienable rights, including life, liberty and the pursuit of happiness. Thank you.

When people meet me for the first time on my job, they often feel inspired to share a revelation they ’ ve had about me, and it kind of goes something like this.”Hey, I know why police chiefs like to share their deep, dark secrets with you. Phil, with your PhD in psychology, and your shiny bald head, you ’ re basically the Black Dr. Phil, right?”And for each and every person who ’ s ever said that to me I do want to say thank you because that was the first time I ever heard that joke. But for everybody else, I really hope you ’ ll believe me when I tell you no police chief likes talking to me because they think I ’ m a clinical psychologist. And also I ’ m not. I have no idea what your mother did to you, and I can ’ t help. Police chiefs like talking to me because I ’ m an expert on a problem that feels impossible for them to solve : racism in their profession. Now my expertise comes from being a scientist who studies how our minds learn to associate Blackness and crime and misperceive Black children as older than they actually are. It also comes from studying actual police behavior, which is how I know that every year, about one in five adults in the United States has contact with law **enforcement**. Out of those, about a million are targeted for police use of force. And if you ’ re Black, you ’ re two to four times more likely to be targeted for that force than if you ’ re white. But it also comes from knowing what those statistics feel like. I ’ ve experienced the fear of seeing an officer unclip their gun and the panic of realizing that someone might mistake my 13-year-old godson as old enough to be a threat. So when a police chief, or a pastor, or an imam, or a mother — when they call me after an officer shoots another unarmed Black child, I understand a bit of the pain in their voice. It ’ s the pain of a heart breaking when it fails to solve a deadly problem. Breaking from trying to do something that feels simultaneously necessary and impossible. The way trying to fix racism usually feels. Necessary and impossible. So, police chiefs like talking to me because I ’ m an expert, but I doubt they ’ d be lining up to lie down on Dr. Phil ’ s couch if I told them all their problems were hopeless. All of my research, and the decade of work I ’ ve done with my center — the Center for Policing **Equity** — actually leads me to a hopeful conclusion amidst all the heartbreak of race in America, which is this : trying to solve racism feels impossible because our definition of racism makes it impossible — but it doesn ’ t have to be that way. So here ’ s what I mean. The most common definition of racism is that racist behaviors are the product of contaminated hearts and minds. When you listen to the way we talk about trying to cure racism, you ’ ll hear it.”We need to stamp out **hatred**. We need to combat ignorance,”right? It ’ s hearts and minds. Now the only problem with that definition is that it ’ s completely wrong — both scientifically and

otherwise. One of the foundational insights of social psychology is that **attitudes** are very weak predictors of behaviors, but more importantly than that, no Black community has ever taken to the **streets** to demand that white people would love us more. Communities march to stop the killing, because racism is about behaviors, not feelings. And even when civil rights leaders like King and Fannie Lou Hamer used the language of love, the racism they fought, that was segregation and brutality. It ' s actions over feelings. And every one of those leaders would agree, if a definition of racism makes it harder to see the injuries racism causes, that ' s not just wrong. A definition that cares about the intentions of abusers more than the **harms** to the abused — that definition of racism is racist. But when we change the definition of racism from **attitudes** to behaviors, we transform that problem from impossible to solvable. Because you can measure behaviors. And when you can measure a problem, you can tap into one of the only universal rules of organizational success. You ' ve got a problem or a goal, you measure it, you hold yourself accountable to that metric. So if every other organization measures success this way, why can ' t we do that in policing? It turns out we actually already do. Police departments already practice data- driven accountability, it ' s just for crime. The vast majority of police departments across the United States use a system called CompStat. It ' s a process that, when you use it right, it identifies crime data, it tracks it and identifies patterns, and then it allows departments to hold themselves accountable to public **safety** goals. It usually works either by directing police attentions and police resources, or changing police behavior once they show up. So if I see a string of muggings in that **neighborhood**, I ' m going to want to increase patrols in that **neighborhood**. If I see a spike in homicides, I ' m going to want to talk to the community to find out why and collaborate on changes on police behavior to tamp down the **violence**. Now when you define racism in terms of measurable behaviors, you can do the same thing. You can create a CompStat for justice. That ' s exactly what the Center for Policing Equity has been doing. So let me tell you how that works. After a police department invites us in, we handle the legal stuff, we engage with the community, our next step is to analyze their data. The goal of these analyses is to determine how much do crime, poverty, **neighborhood** demographics predict, let ' s say, police use of force? Let ' s say that those factors predict police will use force on this many Black people. There? So our next question is, how many Black people actually are targeted for police use of force? Let ' s say it ' s this many. So what ' s up with the gap? Well, a big portion of the gap is the difference between what ' s predicted by things police can ' t control and what ' s predicted by things police can control — their policies and their behaviors. And what we ' re looking for are the types of contact or the areas in the city where that gap is biggest, because then we can tell our partners,"Look here. Solve this problem first."It ' s actually the kind of therapy police chiefs can get behind, because there is nothing so inspiring in the face of our history of racism as a solvable problem. Look, if the community in Minneapolis asked their police department to remedy the moral failings of race in policing, I ' m not sure they know how to do that. But if instead the community says,"Hey, you ' re data say you ' re beating up a lot of **homeless** folks. You want to knock that off?"That ' s something police can learn how to do. And they did. So in 2015, the Minneapolis PD let us know their community was concerned they were using force too often. So we showed them how to leverage their own data to identify situations where force could be avoided. And when you look at those data, you ' ll see that a disproportionate number of their use-of-force incidents, they involved somebody who ' s **homeless**, in mental distress, has a substance abuse issue or some combination of all three — more than you expect based on those factors I was just telling you about. So right there ' s the gap. Next question is why. Well, it turns out **homeless** folks often need services. And when those services are unavailable, when they can ' t get their meds, they lose their spot in the shelter, they ' re more likely to engage in behaviors that end up with folks calling the cops. And when the cops show up, they ' re more likely to resist intervention, oftentimes because they haven ' t actually done anything illegal, they ' re literally just living outside. The problem wasn ' t a need to train officers differently in Minneapolis. The problem was the fact that folks were using the cops to"treat"substance abuse and **homelessness** in the first place. So the city of Minneapolis found a way to deliver social services and city resources to the **homeless** community before anybody ever called the cops. Now the problem isn ' t always **homelessness**, right? Sometimes the problem is fear of **immigration enforcement**, like it was in Salt Lake City, or it is in Houston, where the chiefs had to come forward and say,"We ' re not going to deport you just for calling 911."Or the problem is foot pursuits, like it was in Las Vegas, where they had to train their officers to slow down and take a breath instead of allowing the adrenaline in that situation to escalate it. It ' s searches in Oakland ; it ' s pulling folks out of cars in San Jose ; it ' s the way that they patrol the **neighborhoods** that make up Zone 3 in Pittsburgh and the Black **neighborhoods** closest to the waterfront in Baltimore. But in each city, if we can give them a solvable problem, they get busy solving it. And together our partners have seen an average of 25 percent fewer arrests, fewer use-of- force incidents and 13 percent fewer officer-related injuries. Essentially, by identifying the biggest gaps and directing police attentions to solving it, we can deliver a data-driven vaccine against racial disparities in policing. Right now, we have the capacity to partner with about 40 cities at a time. That means if we want the United States to stop feeling exhausted from trying to solve an impossible problem, we ' re going to need a lot more infrastructure. Because our goal is to have our tools be able to scale the brilliance of dedicated organizers and reform-minded chiefs. So to get there we ' re going to need the kind of collective will that desegregated schools and won the franchise for the sons and daughters of former slaves so that we can build a kind of health care system capable of delivering our vaccine across the country. Because our **audacious** idea is to deliver a CompStat for justice to departments serving 100 million people across the United States in the next five years. Doing that would mean arming about a third of the United States with tools to reduce racial disparities in police stops, arrests and use of force, but also tools to reduce predatory cash **bail** and mass incarceration, family instability and chronic mental health and substance abuse issues, and every other **ill** that our broken criminal-legal systems aggravate. Because every unnecessary arrest we can prevent saves a family from the terrifying journey through each one of those systems. Just like every gun we can leave holstered saves an entire community from a lifetime of **grief**. Look, each and every one of us, we measure the things that matter to us. Businesses measure profit ; good students keep track of their grades ; families chart the growth of their children with pencil markings in doorframes. We all measure the things that matter most to us, which is why we feel the neglect when nobody ' s bothering to measure anything at all. For the past quarter millennium, we ' ve defined the problems of race and policing in a way that ' s functionally impossible to measure. But now the science says we can just change that definition. And the folks at the Center for Policing Equity, I actually think we may have measured more police behavior than any one in human history. And that means that once we have the will and the resources to do it, this could be the generation that stops feeling like racism is an unsolvable problem and instead sees that what ' s been necessary for far too long is possible. Thank you.

My parents gave me an extraordinary name : Baratunde Rafiq Thurston. Now, Baratunde is based on a Yoruba name from Nigeria, but we ’ re not Nigerian. That ’ s just how black my mama was.”Get this boy the blackest name possible. What does the book say?”Rafiq is an Arabic name, but we are not Arabs. My mom just wanted me to have difficulty boarding planes in the 21st century. She foresaw America ’ s turn toward nativism. She was a black futurist. Thurston is a British name, but we are not British. Shoutout to the multigenerational, dehumanizing economic institution of American chattel slavery, though. Also, Thurston makes for a great Starbucks name. Really expedites the process. My mother was a renaissance woman. Arnita Lorraine Thurston was a computer programmer, former **domestic** worker, survivor of **sexual assault**, an artist and an activist. She prepared me for this world with lessons in black history, in martial arts, in urban farming, and then she sent me in the seventh grade to the private Sidwell Friends School, where US presidents send their daughters, and where she sent me looking like this. I had two key tasks going to that school : don ’ t lose your blackness and don ’ t lose your glasses. This accomplished both. Sidwell was a great place to learn the arts and the sciences, but also the art of living amongst whiteness. That would prepare me for life later at Harvard, or doing corporate consulting, or for my jobs at”The Daily Show”and”The Onion.”I would write down many of these lessons in my memoir,”How to Be Black,”which if you haven ’ t read yet, makes you a racist, because — you ’ ve had plenty of time to read the book. But America insists on reminding me and teaching me what it means to be black in America. It ’ s December 2018, I ’ m with my fianc in the suburbs of Wisconsin. We are visiting her parents, both of whom are white, which makes her white. That ’ s how it works. I don ’ t make the rules. She ’ s had some drinks, so I drive us in her parents ’ car, and we get pulled over by the police. I ’ m scared. I turn on the flashing lights to indicate compliance. I pull over slowly under the brightest streetlight I can find in case I need witnesses or dashcam footage. We get out my identification, the car registration, lay it out in the open, roll down the windows, my hands are placed on the steering wheel, all before the officer exits the vehicle. This is how to stay alive. As we wait, I think about these headlines —”Police shoot another unarmed black person”— and I don ’ t want to join them. The good news is, our officer was friendly. She told us our tags were expired. So to all the white parents out there, if your child is involved with a person whose skin tone is rated Dwayne”The Rock”Johnson or darker — you need to get that car inspected, update the paperwork every time we visit. That ’ s just common courtesy. I got lucky. I got a law **enforcement** professional. I survived something that should not require survival. And I think about this series of stories —”Police shoot another unarmed black person”— and that season when those stories popped up everywhere. I would scroll through my feed and I would see a baby announcement photo. I ’ d see an ad for a product I had just whispered to a friend about yesterday. I would see a video of a police officer gunning down someone who looked just like me. And I ’ d see a think piece about how millennials have replaced sex with avocado toast. It was a confusing time. Those stories kept popping up, but in 2018, those stories got changed out for a different type of story, stories like,”White Woman Calls Cops On Black Woman Waiting For An Uber.”That was Brooklyn Becky. Then there was,”White Woman Calls Police On Eight-Year-Old Black Girl Selling Water.”That was Per-

mit Patty. Then there was,"Woman Calls Police On Black Family BBQing At Lake In Oakland."That was now infamous BBQ Becky. And I contend that these stories of living while black are actually progress. We used to find out after the extrajudicial police killings. Now, we ' re getting video of people calling 911. We ' re moving upstream, closer to the problem and closer to the solution. So I started a collection of as many of these stories as I could find. I built an evolving, still-growing database at baratunde. com / livingwhileblack. Seeking understanding, I realized the process was really diagramming sentences to understand these headlines. And I want to thank my Sidwell English teacher Erica Berry and all English teachers. You have given us tools to fight for our own freedom. What I found was a process to break down the headline and understand the consistent layers in each one : a subject takes an action against a target engaged in some activity, so that"White Woman Calls Police On Eight-Year-Old Black Girl"is the same as"White Man Calls Police On Black Woman Using **Neighborhood** Pool"is the same as"Woman Calls Cops On Black Oregon Lawmaker Campaigning In Her District."They ' re the same. Diagramming the sentences allowed me to diagram the white supremacy which allowed such sentences to be true, and I will pause to define my terms. When I say"white supremacy,"I ' m not just talking about Nazis or white power activists, and I ' m definitely not saying that all white people are racist. What I ' m referring to is a system of structural advantage that favors white people over others in social, economic and political arenas. It ' s what Bryan Stevenson at the Equal Justice Initiative calls the narrative of racial difference, the story we told ourselves to justify slavery and Jim Crow and mass incarceration and beyond. So when I saw this pattern repeating, I got angry, but I also got inspired to create a game, a game of words that would allow me to transform this traumatic exposure into more of a healing experience. I ' m going to talk you through the game. The first level is a training level, and I need your participation. Our objective : to determine if this is real or fake. Did this happen or not? Here is the example :"Catholic University Law Librarian Calls Police On Student For ' Being Argumentative. '"Clap your hands if you think this is real. Clap your hands if you think this is fake. The reals have it, unfortunately, and a point of information, being argumentative in a law library is the exact right place to do that. This student should be promoted to professor. Training level complete, so we move on to the real levels. Level one, our objective is simple : reverse the roles. That means"Woman Calls Cops On Black Oregon Lawmaker"becomes"Black Oregon Lawmaker Calls Cops On Woman."That means"White Man Calls Police On Black Woman Using **Neighborhood** Pool"becomes"Black Woman Calls Police On White Man Using **Neighborhood** Pool."How do you like them reverse racist apples? That ' s it, level one complete, and so we level up to level two, where our objective is to increase the believability of the reversal. Let ' s face it, a black woman calling police on a white man using a pool isn ' t absurd enough, but what if that white man was trying to touch her hair without asking, or maybe he was making oat milk while riding a unicycle, or maybe he ' s just talking over everyone in a meeting. We ' ve all been there, right? Seriously, we ' ve all been there. So that ' s it, level two complete. But it comes with a warning : simply reversing the flow of injustice is not justice. That is vengeance, that is not our mission, that ' s a different game so we level up to level three, where the objective is to change the action, also known as"calling the police is not your only option OMG, what is wrong with you people!"And I need to pause the game to remind us of the structure. A subject takes an action against a target engaged in some activity."White Woman Calls Police On Black Real Estate Investor Inspecting His Own Property.""California Safeway Calls Cops On Black Woman Donating Food To The Homeless.""Gold Club

Twice Calls Cops On Black Women For Playing Too Slow."In all these cases, the subject is usually white, the target is usually black, and the activities are anything, from sitting in a Starbucks to using the wrong type of barbecue to napping to walking"agitated"on the way to work, which I just call"walking to work."And, my personal favorite, not stopping his dog from humping her dog, which is clearly a case for dog police, not people police. All of these activities add up to living. Our existence is being interpreted as crime. Now, this is the obligatory moment in the presentation where I have to say, not everything is about race. Crime is a thing, should be reported, but ask yourself, do we need **armed** men to show up and resolve this situation, because when they show up for me, it ' s different. We know that police officers use force more with black people than with white people, and we are learning the role of 911 calls in this. Thanks to preliminary research from the Center for Policing Equity, we ' re learning that in some cities, most of the interactions between cops and citizens is due to 911 calls, not officer-initiated stops, and most of the **violence**, the use of force by police on citizens, is in response to those calls. Further, when those officers responding to calls use force, that increases in areas where the percentage of the white population has also increased, aka gentrification, aka unicycles and oat milk, aka when BBQ Becky feels threatened, she becomes a threat to me in my own **neighborhood**, which forces me and people like me to police ourselves. We quiet ourselves, we walk on eggshells, we maybe pull over to the side of the road under the brightest light we can find so that our murder might be caught cleanly on camera, and we do this because we live in a system in which white people can too easily call on deadly force to ensure their comfort. The California Safeway didn ' t just call cops on black woman donating food to **homeless**. They ordered **armed**, unaccountable men upon her. They essentially called in a drone strike. This is weaponized discomfort, and it is not new. From 1877 to 1950, there were at least 4, 400 documented racial terror lynchings of black people in the United States. They had headlines as well."Rev. T. A. Allen was lynched in Hernando, Mississippi for organizing local sharecroppers.""Oliver Moore was lynched in Edgecomb County, North Carolina, for frightening a white girl.""Nathan Bird was lynched near Luling, Texas, for refusing to turn his son over to a mob."We need to change the action, whether that action is"lynches"or"calls police."And now that I have shortened the distance between those two, let ' s get back to our game, to our mission. Our objective in level three is to change the action. So what if, instead of"Calls Cops On Black Woman Donating Food To Homeless,"that California Safeway simply thanks her. Thanking is far cheaper than bringing law **enforcement** to the scene. Or, instead, they could give the food they would have wasted to her, upped their civic cred. Or, the white woman who called the police on the eight-year- old black girl, she could have bought all the inventory from that little black girl, support a small business. And the white woman who called the police on the black real estate investor, we would all be better off, the cops agree, if she had simply ignored him and minded her own damn business. Minding one ' s own damn business is an excellent choice, excellent choice. Choose it more often. Level three is complete, but there is a final bonus level, where the objective is inclusion. We have also seen headlines like this :"Powerful Man Masturbates In Front Of Young Women Visiting His Office."What an odd choice for powerful man to make. So many other actions available to him. Like, such as,"listens to,""mentors,""inspired by, starts joint venture, everybody rich now."I want to live in that world of everybody rich now, but because of his poor choice, we are all in a poorer world. Doesn ' t have to be this way. This word game reminded me that there is a structure to white supremacy, as there is to misogyny, as there is to all **systemic** abuses of power. Structure is what makes them **sys-**

temic. I ’ m asking people here to see the structure, where the power is in it, and even more importantly to see the humanity of those of us made targets by this structure. I am here because I was loved and invested in and protected and lucky, because I went to the right schools, I ’ m semifamous, mostly happy, meditate twice a day, and yet, I walk around in fear, because I know that someone seeing me as a threat can become a threat to my life, and I am tired. I am tired of carrying this invisible burden of other people ’ s fears, and many of us are, and we shouldn ’ t have to, because we can change this, because we can change the action, which changes the story, which changes the system that allows those stories to happen. Systems are just collective stories we all buy into. When we change them, we write a better reality for us all to be a part of. I am asking us to use our power to choose. I am asking us to level up. Thank you. I am Baratunde Rafiq Thurston.

[This talk contains graphic language and descriptions of **sexual violence** Viewer discretion is advised] Tom Stranger : In 1996, when I was 18 years old, I had the golden opportunity to go on an international exchange program. Ironically I ’ m an Australian who prefers proper icy cold weather, so I was both excited and tearful when I got on a plane to Iceland, after just having farewelled my parents and brothers goodbye. I was welcomed into the home of a beautiful Icelandic family who took me hiking, and helped me get a grasp of the melodic Icelandic language. I struggled a bit with the initial period of homesickness. I snowboarded after school, and I slept a lot. Two hours of chemistry class in a language that you don ’ t yet fully understand can be a pretty good sedative. My teacher recommended I try out for the school play, just to get me a bit more socially active. It turns out I didn ’ t end up being part of the play, but through it I met Thordis. We shared a lovely teenage romance, and we ’ d meet at lunchtimes to just hold hands and walk around old downtown Reykjavk. I met her welcoming family, and she met my friends. We ’ d been in a budding relationship for a bit over a month when our school ’ s Christmas Ball was held. Thordis Elva : I was 16 and in love for the first time. Going together to the Christmas dance was a public confirmation of our relationship, and I felt like the luckiest girl in the world. No longer a child, but a young woman. High on my newfound maturity, I felt it was only natural to try drinking rum for the first time that night, too. That was a bad idea. I became very **ill**, drifting in and out of consciousness in between spasms of convulsive vomiting. The security guards wanted to call me an ambulance, but Tom acted as my knight in shining armor, and told them he ’ d take me home. It was like a fairy tale, his strong arms around me, laying me in the **safety** of my bed. But the gratitude that I felt towards him soon turned to horror as he proceeded to take off my clothes and get on top of me. My head had cleared up, but my body was still too weak to fight back, and the pain was blinding. I thought I ’ d be severed in two. In order to stay sane, I silently counted the seconds on my alarm clock. And ever since that night, I ’ ve known that there are 7, 200 seconds in two hours. Despite limping for days and crying for weeks, this incident didn ’ t fit my ideas about rape like I ’ d seen on TV. Tom wasn ’ t an **armed** lunatic ; he was my boyfriend. And it didn ’ t happen in a seedy alleyway, it happened in my own bed. By the time I could identify what had happened to me as rape, he had completed his exchange program and left for Australia. So I told myself it was pointless to address what had happened. And besides, it had to have been my fault, somehow. I was raised in a world where girls are taught that

they get raped for a reason. Their skirt was too short, their smile was too wide, their breath smelled of alcohol. And I was guilty of all of those things, so the **shame** had to be mine. It took me years to realize that only one thing could have stopped me from being raped that night, and it wasn ' t my skirt, it wasn ' t my smile, it wasn ' t my childish trust. The only thing that could ' ve stopped me from being raped that night is the man who raped me — had he stopped himself. TS : I have vague memories of the next day : the after effects of drinking, a certain hollowness that I tried to stifle. Nothing more. But I didn ' t show up at Thordis ' s door. It is important to now state that I didn ' t see my deed for what it was. The word"rape"didn ' t echo around my mind as it should ' ve, and I wasn ' t crucifying myself with memories of the night before. It wasn ' t so much a conscious refusal, it was more like any acknowledgment of reality was forbidden. My definition of my actions completely refuted any recognition of the immense **trauma** I caused Thordis. To be honest, I repudiated the entire act in the days afterwards and when I was committing it. I disavowed the truth by convincing myself it was sex and not rape. And this is a lie I ' ve felt spine- bending guilt for. I broke up with Thordis a couple of days later, and then saw her a number of times during the remainder of my year in Iceland, feeling a sharp stab of heavyheartedness each time. Deep down, I knew I ' d done something immeasurably wrong. But without planning it, I sunk the memories deep, and then I tied a rock to them. What followed is a nine-year period that can best be titled as"Denial and Running."When I got a chance to identify the real torment that I caused, I didn ' t stand still long enough to do so. Whether it be via distraction, substance use, thrill-seeking or the scrupulous policing of my inner speak, I refused to be static and silent. And with this noise, I also drew heavily upon other parts of my life to construct a picture of who I was. I was a surfer, a social science student, a friend to good people, a loved brother and son, an outdoor recreation guide, and eventually, a youth worker. I gripped tight to the simple notion that I wasn ' t a bad person. I didn ' t think I had this in my bones. I thought I was made up of something else. In my nurtured upbringing, my **loving** extended family and role models, people close to me were warm and genuine in their respect shown towards women. It took me a long time to stare down this dark corner of myself, and to ask it questions. TE : Nine years after the Christmas dance, I was 25 years old, and headed straight for a nervous breakdown. My self-worth was buried under a soul- crushing load of **silence** that isolated me from everyone that I cared about, and I was consumed with misplaced **hatred** and anger that I took out on myself. One day, I stormed out of the door in tears after a fight with a loved one, and I wandered into a caf, where I asked the waitress for a pen. I always had a notebook with me, claiming that it was to jot down ideas in moments of inspiration, but the truth was that I needed to be constantly fidgeting, because in moments of stillness, I found myself counting seconds again. But that day, I watched in wonder as the words streamed out of my pen, forming the most pivotal letter I ' ve ever written, addressed to Tom. Along with an account of the **violence** that he subjected me to, the words,"I want to find forgiveness"stared back at me, surprising nobody more than myself. But deep down I realized that this was my way out of my **suffering**, because regardless of whether or not he deserved my forgiveness, I deserved peace. My era of **shame** was over. Before sending the letter, I prepared myself for all kinds of negative responses, or what I found likeliest : no response whatsoever. The only outcome that I didn ' t prepare myself for was the one that I then got — a typed **confession** from Tom, full of disarming regret. As it turns out, he, too, had been imprisoned by **silence**. And this marked the start of an eight-year-long correspondence that God knows was never easy, but always honest. I relieved myself of the burdens that I ’ d wrongfully shouldered, and he, in turn, wholeheartedly owned up to what he ’ d done. Our written exchanges became a platform to dissect the consequences of that night, and they were everything from gut-wrenching to healing beyond words. And yet, it didn ’ t bring about closure for me. Perhaps because the email format didn ’ t feel personal enough, perhaps because it ’ s easy to be brave when you ’ re hiding behind a computer screen on the other side of the planet. But we ’ d begun a dialogue that I felt was necessary to explore to its fullest. So, after eight years of writing, and nearly 16 years after that dire night, I mustered the courage to propose a wild idea : that we ’ d meet up in person and face our past once and for all. TS : Iceland and Australia are geographically like this. In the middle of the two is South Africa. We decided upon the city of Cape Town, and there we met for one week. The city itself proved to be a stunningly powerful environment to focus on reconciliation and forgiveness. Nowhere else has healing and rapprochement been tested like it has in South Africa. As a nation, South Africa sought to sit within the truth of its past, and to listen to the details of its history. Knowing this only magnified the effect that Cape Town had on us. Over the course of this week, we literally spoke our life stories to each other, from start to finish. And this was about analyzing our own history. We followed a strict policy of being honest, and this also came with a certain exposure, an open-chested vulnerability. There were gutting **confessions**, and moments where we just absolutely couldn ’ t fathom the other person ’ s experience. The seismic effects of **sexual violence** were spoken aloud and felt, face to face. At other times, though, we found a soaring clarity, and even some totally unexpected but liberating laughter. When it came down to it, we did out best to listen to each other intently. And our individual realities were aired with an unfiltered purity that couldn ’ t do any less than lighten the soul. TE : Wanting to take revenge is a very human emotion — instinctual, even. And all I wanted to do for years was to hurt Tom back as deeply as he had hurt me. But had I not found a way out of the **hatred** and anger, I ’ m not sure I ’ d be standing here today. That isn ’ t to say that I didn ’ t have my doubts along the way. When the plane bounced on that landing strip in Cape Town, I remember thinking,”Why did I not just get myself a therapist and a bottle of vodka like a normal person would do?”At times, our search for understanding in Cape Town felt like an impossible quest, and all I wanted to do was to give up and go home to my **loving** husband, Vidir, and our son. But despite our difficulties, this journey did result in a victorious feeling that light had triumphed over **darkness**, that something constructive could be built out of the ruins. I read somewhere that you should try and be the person that you needed when you were younger. And back when I was a teenager, I would have needed to know that the **shame** wasn ’ t mine, that there ’ s hope after rape, that you can even find happiness, like I share with my husband today. Which is why I started writing feverishly upon my return from Cape Town, resulting in a book co-authored by Tom, that we hope can be of use to people from both ends of the perpetrator- survivor scale. If nothing else, it ’ s a story that we would ’ ve needed to hear when we were younger. Given the nature of our story, I know the words that inevitably accompany it — **victim**, rapist — and labels are a way to organize concepts, but they can also be dehumanizing in their connotations. Once someone ’ s been **deemed** a **victim**, it ’ s that much easier to file them away as someone damaged, dishonored, less than. And likewise, once someone has been branded a rapist, it ’ s that much easier to call him a monster — inhuman. But how will we understand what it is in human societies that produces **violence** if we refuse to recognize the humanity of those who commit it? And how — And how can we empower survivors if we ’ re making them feel less than? How can we discuss solutions to one of the biggest threats to the lives of women and children around the world, if the very words we use are part of the problem? TS : From what I ’ ve now learnt, my actions that night in 1996 were a self- centered taking. I felt deserving of Thordis ’ s body. I ’ ve had primarily positive social influences and examples of **equitable** behavior around me. But on that occasion, I chose to draw upon the negative ones. The ones that see women as having less intrinsic worth, and of men having some unspoken and symbolic claim to their bodies. These influences I speak of are external to me, though. And it was only me in that room making choices, nobody else. When you own something and really square up to your culpability, I do think a surprising thing can happen. It ’ s what I call a paradox of ownership. I thought I ’ d buckle under the weight of responsibility. I thought my certificate of humanity would be burnt. Instead, I was offered to really own what I did, and found that it didn ’ t possess the entirety of who I am. Put simply, something you ’ ve done doesn ’ t have to constitute the sum of who you are. The noise in my head abated. The indulgent self-pity was starved of oxygen, and it was replaced with the clean air of acceptance — an acceptance that I did hurt this wonderful person standing next to me ; an acceptance that I am part of a large and shockingly everyday grouping of men who have been sexually **violent** toward their partners. Don ’ t underestimate the power of words. Saying to Thordis that I raped her changed my accord with myself, as well as with her. But most importantly, the blame transferred from Thordis to me. Far too often, the responsibility is attributed to female survivors of **sexual violence**, and not to the males who enact it. Far too often, the denial and running leaves all parties at a great distance from the truth. There ’ s definitely a public conversation happening now, and like a lot of people, we ’ re heartened that there ’ s less retreating from this difficult but important discussion. I feel a real responsibility to add our voices to it. TE : What we did is not a **formula** that we ’ re prescribing for others. Nobody has the right to tell anyone else how to handle their deepest pain or their greatest error. Breaking your **silence** is never easy, and depending on where you are in the world, it can even be deadly to speak out about rape. I realize that even the most traumatic event of my life is still a testament to my privilege, because I can talk about it without getting ostracized, or even killed. But with that privilege of having a voice comes the responsibility of using it. That ’ s the least I owe my fellow survivors who can ’ t. The story we ’ ve just relayed is unique, and yet it is so common with **sexual violence** being a global pandemic. But it doesn ’ t have to be that way. One of the things that I found useful on my own healing journey is educating myself about **sexual violence**. And as a result, I ’ ve been reading, writing and speaking about this issue for over a decade now, going to conferences around the world. And in my experience, the attendees of such events are almost exclusively women. But it ’ s about time that we stop treating **sexual violence** as a women ’ s issue. A majority of **sexual violence** against women and men is perpetrated by men. And yet their voices are sorely underrepresented in this discussion. But all of us are needed here. Just imagine all the **suffering** we could alleviate if we dared to face this issue together. Thank you.

I want to talk about sex for money. I ’ m not like most of the people you ’ ll have heard speaking about prostitution before. I ’ m not a police officer or a social worker. I ’ m not an academic, a journalist or a politician. And as you ’ ll probably have picked up from Maryam ’ s blurb, I ’ m not a nun, either. Most of those people would tell you that selling sex is degrading ; that no one would ever choose to do it ; that it ’ s dangerous ; women get abused and killed. In fact, most of those people would say,”There should be a law against it!”Maybe that sounds reasonable to you. It sounded reasonable to me until the closing months of 2009, when I was working two dead-end, minimum-wage jobs. Every month my wages would just replenish my overdraft. I was exhausted and my life was going nowhere. Like many others before me, I decided sex for money was a better option. Now don ’ t get me wrong — I would have loved to have won the lottery instead. But it wasn ’ t going to happen anytime soon, and my rent needed paying. So I signed up for my first shift in a brothel. In the years that have passed, I ’ ve had a lot of time to think. I ’ ve reconsidered the ideas I once had about prostitution. I ’ ve given a lot of thought to consent and the nature of work under capitalism. I ’ ve thought about gender inequality and the **sexual** and reproductive labor of women. I ’ ve experienced exploitation and **violence** at work. I ’ ve thought about what ’ s needed to protect other sex workers from these things. Maybe you ’ ve thought about them, too. In this talk, I ’ ll take you through the four main legal approaches applied to sex work throughout the world, and explain why they don ’ t work ; why prohibiting the sex industry actually exacerbates every **harm** that sex workers are vulnerable to. Then I ’ m going tell you about what we, as sex workers, actually want. The first approach is full criminalization. Half the world, including Russia, South Africa and most of the US, regulates sex work by criminalizing everyone involved. So that ’ s seller, buyer and third parties. Lawmakers in these countries apparently hope that the fear of getting arrested will deter people from selling sex. But if you ’ re forced to choose between obeying the law and feeding yourself or your family, you ’ re going to do the work anyway, and take the risk. Criminalization is a trap. It ’ s hard to get a conventional job when you have a criminal record. Potential employers won ’ t hire you. Assuming you still need money, you ’ ll stay in the more flexible, informal economy. The law forces you to keep selling sex, which is the exact opposite of its intended effect. Being criminalized leaves you exposed to mistreatment by the state itself. In many places you may be coerced into paying a bribe or even into having sex with a police officer to avoid arrest. Police and prison guards in Cambodia, for example, have been documented subjecting sex workers to what can only be described as torture : threats at gunpoint, beatings, electric shocks, rape and denial of food. Another worrying thing : if you ’ re selling sex in places like Kenya, South Africa or New York, a police officer can arrest you if you ’ re caught carrying condoms, because condoms can legally be used as evidence that you ’ re selling sex. Obviously, this increases HIV risk. Imagine knowing if you ’ re busted carrying condoms, it ’ ll be used against you. It ’ s a pretty strong incentive to leave them at home, right? Sex workers working in these places are forced to make a tough choice between risking arrest or having risky sex. What would you choose? Would you pack condoms to go to work? How about if you ’ re worried the police officer would rape you when he got you in the van? The second approach to regulating sex work seen in these countries is partial criminalization, where the buying and selling of sex are legal, but surrounding activities, like brothel-keeping or soliciting on the **street**, are banned. Laws like these — we have them in the UK and in France — essentially say to us sex workers,”Hey, we don ’ t mind you selling sex, just make sure it ’ s done behind closed doors and all alone.”And brothel-keeping, by the way, is defined as just two or more sex workers working together. Making that illegal means that many of us work alone, which obviously makes us vulnerable to **violent** offenders. But we ’ re also vulnerable if we choose to break the law by working together. A couple of years ago, a friend of mine was nervous after she was attacked at work, so I said that she could see her clients from my place for a while. During that time, we had another guy turn nasty. I told the guy to leave or I ’ d call the police. And he looked at the two of us and said,”You girls can ’ t call the cops. You ’ re working together, this place is illegal.”He was right. He eventually left without getting physically **violent**, but the knowledge that we were breaking the law empowered that man to threaten us. He felt confident he ’ d get away with it. The prohibition of **street** prostitution also causes more **harm** than it prevents. Firstly, to avoid getting arrested, **street** workers take risks to avoid detection, and that means working alone or in isolated locations like dark forests where they ’ re vulnerable to attack. If you ’ re caught selling sex outdoors, you pay a fine. How do you pay that fine without going back to the **streets**? It was the need for money that saw you in the **streets** in the first place. And so the fines stack up, and you ’ re caught in a vicious cycle of selling sex to pay the fines you got for selling sex. Let me tell you about Mariana Popa who worked in Redbridge, East London. The **street** workers on her patch would normally wait for clients in groups for **safety** in numbers and to warn each other about how to avoid dangerous guys. But during a police crackdown on sex workers and their clients, she was forced to work alone to avoid being arrested. She was stabbed to death in the early hours of October 29, 2013. She had been working later than usual to try to pay off a fine she had received for soliciting. So if criminalizing sex workers hurts them, why not just criminalize the people who buy sex? This is the aim of the third approach I want to talk about — the Swedish or Nordic model of sex-work law. The idea behind this law is that selling sex is intrinsically harmful and so you ’ re, in fact, helping sex workers by removing the option. Despite growing support for what ’ s often described as the”end demand”approach, there ’ s no evidence that it works. There ’ s just as much prostitution in Sweden as there was before. Why might that be? It ’ s because people selling sex often don ’ t have other options for income. If you need that money, the only effect that a drop in business is going have is to force you to lower your prices or offer more risky **sexual** services. If you need to find more clients, you might seek the help of a manager. So you see, rather than putting a stop to what ’ s often descried as pimping, a law like this actually gives oxygen to potentially abusive third parties. To keep safe in my work, I try not to take bookings from someone who calls me from a withheld number. If it ’ s a home or a hotel visit, I try to get a full name and details. If I worked under the Swedish model, a client would be too scared to give me that information. I might have no other choice but to accept a booking from a man who is untraceable if he later turns out to be **violent**. If you need their money, you need to protect your clients from the police. If you work outdoors, that means working alone or in isolated locations, just as if you were criminalized yourself. It might mean getting into cars quicker, less negotiating time means snap decisions. Is this guy dangerous or just nervous? Can you afford to take the risk? Can you afford not to? Something I ’ m often hearing is,”Prostitution would be fine if we made it legal and regulated it.”We call that approach legalization, and it ’ s used by countries like the Netherlands, Germany and Nevada in the US. But it ’ s not a great model for human rights. And in state-controlled prostitution, commercial sex can only happen in certain legally-designated areas or venues, and sex workers are made to comply with special restrictions, like registration and forced health checks. Regulation sounds great on paper, but politicians deliberately make regulation around the sex industry expensive and difficult to comply with. It creates a two-tiered system : legal and illegal work. We sometimes call it”backdoor criminalization.”Rich, well-connected brothel owners can comply with the regulations, but more marginalized people find those hoops impossible to jump through. And even if it ’ s possible in principle, getting a license or proper venue takes time and costs money. It ’ s not going to be an option for someone who ’ s desperate and needs money tonight. They might be a refugee or fleeing **domestic** abuse. In this two-tiered system, the most vulnerable people are forced to work illegally, so they ’ re still exposed to all the dangers of criminalization I mentioned earlier. So. It ’ s looking like all attempts to control or prevent sex work from happening makes things more dangerous for people selling sex. Fear of law **enforcement** makes them work alone in isolated locations, and allows clients and even cops to get abusive in the knowledge they ’ ll get away with it. Fines and criminal records force people to keep selling sex, rather than enabling them to stop. Crackdowns on buyers drive sellers to take dangerous risks and into the arms of potentially abusive managers. These laws also reinforce stigma and **hatred** against sex workers. When France temporarily brought in the Swedish model two years ago, ordinary citizens took it as a cue to start carrying out vigilante attacks against people working on the **street**. In Sweden, opinion surveys show that significantly more people want sex workers to be arrested now than before the law was brought in. If prohibition is this harmful, you might ask, why it so popular? Firstly, sex work is and always has been a survival strategy for all kinds of unpopular minority groups : people of color, migrants, people with disabilities, LGBTQ people, particularly trans women. These are the groups most heavily profiled and punished through prohibitionist law. I don ’ t think this is an accident. These laws have political support precisely because they target people that voters don ’ t want to see or know about. Why else might people support prohibition? Well, lots of people have understandable fears about trafficking. Folks think that foreign women kidnapped and sold into **sexual** slavery can be saved by shutting a whole industry down. So let ’ s talk about trafficking. Forced labor does occur in many industries, especially those where the workers are migrants or otherwise vulnerable, and this needs to be addressed. But it ’ s best addressed with legislation targeting those specific abuses, not an entire industry. When 23 undocumented Chinese migrants drowned while picking cockles in Morecambe Bay in 2004, there were no calls to outlaw the entire seafood industry to save trafficking **victims**. The solution is clearly to give workers more legal protections, allowing them to resist abuse and report it to authorities without fear of arrest. The way the term trafficking is thrown around implies that all undocumented migration into prostitution is forced. In fact, many migrants have made a decision, out of economic need, to place themselves into the hands of people smugglers. Many do this with the full knowledge that they ’ ll be selling sex when they reach their destination. And yes, it can often be the case that these people smugglers demand exorbitant fees, coerce migrants into work they don ’ t want to do and abuse them when they ’ re vulnerable. That ’ s true of prostitution, but it ’ s also true of agricultural work, hospitality work and **domestic** work. Ultimately, nobody wants to be forced to do any kind of work, but that ’ s a risk many migrants are willing to take, because of what they ’ re leaving behind. If people were allowed to migrate legally they wouldn ’ t have to place their lives into the hands of people smugglers. The problems arise from the criminalization of migration, just as they do from the criminalization of sex work itself. This is a lesson of history. If you try to prohibit something that people want or need to do, whether that ’ s drinking alcohol or crossing borders or getting an abortion or selling sex, you create more problems than you solve. Prohibition barely makes a difference to the amount of people actually doing those things. But it makes a huge difference as to whether or not they ’ re safe when they do them. Why else might people support prohibition? As a feminist, I know that the sex industry is a site of deeply entrenched social inequality. It ’ s a fact that most buyers of sex are men with money, and most sellers are women without. You can agree with all that — I do — and still think prohibition is a terrible policy. In a better, more **equal** world, maybe there would be far fewer people selling sex to survive, but you can ' t simply legislate a better world into existence. If someone needs to sell sex because they ' re poor or because they ' re **homeless** or because they ' re undocumented and they can ' t find legal work, taking away that option doesn ' t make them any less poor or house them or change their **immigration** status. People worry that selling sex is degrading. Ask yourself : is it more degrading than going hungry or seeing your children go hungry? There ' s no call to ban rich people from hiring nannies or getting manicures, even though most of the people doing that labor are poor, migrant women. It ' s the fact of poor migrant women selling sex specifically that has some feminists uncomfortable. And I can understand why the sex industry provokes strong feelings. People have all kinds of complicated feelings when it comes to sex. But we can ' t make policy on the basis of mere feelings, especially not over the heads of the people actually effected by those policies. If we get fixated on the abolition of sex work, we end up worrying more about a particular manifestation of gender inequality, rather than about the underlying causes. People get really hung up on the question,"Well, would you want your daughter doing it?"That ' s the wrong question. Instead, imagine she is doing it. How safe is she at work tonight? Why isn ' t she safer? So we ' ve looked at full criminalization, partial criminalization, the Swedish or Nordic Model and legalization, and how they all cause **harm**. Something I never hear asked is :"What do sex workers want?"After all, we ' re the ones most affected by these laws. New Zealand decriminalized sex work in 2003. It ' s crucial to remember that decriminalization and legalization are not the same thing. Decriminalization means the removal of laws that punitively target the sex industry, instead treating sex work much like any other kind of work. In New Zealand, people can work together for **safety**, and employers of sex workers are accountable to the state. A sex worker can refuse to see a client at any time, for any reason, and 96 percent of **street** workers report that they feel the law protects their rights. New Zealand hasn ' t actually seen an increase in the amount of people doing sex work, but decriminalizing it has made it a lot safer. But the lesson from New Zealand isn ' t just that its particular legislation is good, but that crucially, it was written in collaboration with sex workers ; namely, the New Zealand Prostitutes ' Collective. When it came to making sex work safer, they were ready to hear it straight from sex workers themselves. Here in the UK, I ' m part of sex worker-led groups like the Sex Worker Open University and the English Collective of Prostitutes. And we form part of a global movement demanding decriminalization and self-determination. The universal symbol of our movement is the red umbrella. We ' re supported in our demands by global bodies like UNAIDS, the World Health Organization and Amnesty International. But we need more allies. If you care about gender **equality** or poverty or migration or public health, then sex worker rights matter to you. Make space for us in your movements. That means not only listening to sex workers when we speak but amplifying our voices. Resist those who **silence** us, those who say that a prostitute is either too victimized, too damaged to know what ' s best for herself, or else too privileged and too removed from real hardship, not representative of the millions of voiceless **victims**. This distinction between **victim** and empowered is imaginary. It exists purely to discredit sex workers and make it easy to ignore us. No doubt many of you work for a living. Well, sex work is work, too. Just like you, some of us like our jobs, some of us hate them. Ultimately, most of us have mixed feelings. But how we feel about our work isn ' t the point. And how others feel about our work certainly isn ' t. What ' s important is that we have the right to work safely and on our own terms. Sex workers are real people. We ' ve had complicated experiences and complicated responses to those experiences. But our demands are not complicated. You can ask expensive escorts in New York City, brothel workers in Cambodia, **street** workers in South Africa and every girl on the roster at my old job in Soho, and they will all tell you the same thing. You can speak to millions of sex workers and countless sex work-led organizations. We want full decriminalization and labor rights as workers. I ' m just one sex worker on the stage today, but I ' m bringing a message from all over the world. Thank you.

Text Sample 347: POS Dim 3 – 2016 – Score 14.00 – 2016/t001236.txt
It was April, last year. I was on an evening out with friends to **celebrate** one of their birthdays. We hadn ' t been all together for a couple of weeks ; it was a perfect evening, as we were all reunited. At the end of the evening, I caught the last underground train back to the other side of London. The journey was smooth. I got back to my local station and I began the 10-minute walk home. As I turned the corner onto my **street**, my house in sight up ahead, I heard footsteps behind me that seemed to have approached out of nowhere and were picking up pace. Before I had time to process what was happening, a hand was clapped around my mouth so that I could not breathe, and the young man behind me dragged me to the ground, beat my head repeatedly against the pavement until my face began to bleed, kicking me in the back and neck while he began to **assault** me, ripping off my clothes and telling me to"shut up,"as I struggled to cry for help. With each smack of my head to the concrete ground, a question echoed through my mind that still haunts me today :"Is this going to be how it all ends?"Little could I have realized, I ' d been followed the whole way from the moment I left the station. And hours later, I was standing topless and barelegged in front of the police, having the cuts and bruises on my naked body photographed for forensic evidence. Now, there are few words to describe the all-consuming feelings of vulnerability, **shame**, upset and injustice that I was ridden with in that moment and for the weeks to come. But wanting to find a way to condense these feelings into something ordered that I could work through, I decided to do what felt most natural to me : I wrote about it. It started out as a cathartic exercise. I wrote a letter to my assaulter, humanizing him as"you,"to identify him as part of the very community that he had so violently abused that night. Stressing the tidal-wave effect of his actions, I wrote :"Did you ever think of the people in your life? I don ' t know who the people in your life are. I don ' t know anything about you. But I do know this : you did not just attack me that night. I ' m a daughter, I ' m a friend, I ' m a sister, I ' m a pupil, I ' m a cousin, I ' m a niece, I ' m a neighbor ; I ' m the employee who served everyone coffee in the caf under the railway. And all the people who form these relations to me make up my community. And you **assaulted** every single one of them. You violated the truth that I will never cease to fight for, and which all of these people represent : that there are infinitely more good people in the world than bad."But, determined not to let this one incident make me lose faith in the **solidarity** in my community or humanity as a whole, I recalled the 7 / 7 terrorist bombings in July 2005 on London transport, and how the mayor of London at the time, and indeed my own parents, had insisted that we all get back on the tubes the next day, so we wouldn ' t be defined or changed by those that had made us feel **unsafe**. I told my attacker,"You ' ve carried out your attack, but now I ' m getting back on my tube. My community will not feel we are **unsafe** walking home after dark. We will get on the last tubes home, and we will walk up our **streets** alone, because we will not ingrain or submit to the idea that we are putting ourselves in danger in doing

so. We will continue to come together, like an army, when any member of our community is threatened. And this is a fight you will not win.”At the time of writing this letter — Thank you. At the time of writing this letter, I was studying for my exams in Oxford, and I was working on the local student paper there. Despite being lucky enough to have friends and family supporting me, it was an isolating time. I didn ’ t know anyone who ’ d been through this before ; at least I didn ’ t think I did. I ’ d read news reports, statistics, and knew how common **sexual assault** was, yet I couldn ’ t actually name a single person that I ’ d heard speak out about an experience of this kind before. So in a somewhat spontaneous decision, I decided that I would publish my letter in the student paper, hoping to reach out to others in Oxford that might have had a similar experience and be feeling the same way. At the end of the letter, I asked others to write in with their experiences under the hashtag,”#NotGuilty,”to emphasize that survivors of **assault** could express themselves without feeling **shame** or guilt about what happened to them — to show that we could all stand up to **sexual assault**. What I never anticipated is that almost overnight, this published letter would go viral. Soon, we were receiving hundreds of stories from men and women across the world, which we began to publish on a website I set up. And the hashtag became a campaign. There was an Australian mother in her 40s who described how on an evening out, she was followed to the bathroom by a man who went to repeatedly grab her crotch. There was a man in the Netherlands who described how he was date-raped on a visit to London and wasn ’ t taken seriously by anyone he reported his case to. I had personal Facebook messages from people in India and South America, saying, how can we bring the message of the campaign there? One of the first contributions we had was from a woman called Nikki, who described growing up, being molested my her own father. And I had friends open up to me about experiences ranging from those that happened last week to those that happened years ago, that I ’ d had no idea about. And the more we started to receive these messages, the more we also started to receive messages of hope — people feeling empowered by this community of voices standing up to **sexual assault** and victim-blaming. One woman called Olivia, after describing how she was attacked by someone she had trusted and cared about for a long time, said,”I ’ ve read many of the stories posted here, and I feel hopeful that if so many women can move forward, then I can, too. I ’ ve been inspired by many, and I hope I can be as strong as them someday. I ’ m sure I will.”People around the world began tweeting under this hashtag, and the letter was republished and covered by the national press, as well as being translated into several other languages worldwide. But something struck me about the media attention that this letter was attracting. For something to be front-page news, given the word”news”itself, we can assume it must be something new or something surprising. And yet **sexual assault** is not something new. **Sexual assault**, along with other kinds of injustices, is reported in the media all the time. But through the campaign, these injustices were framed as not just news stories, they were firsthand experiences that had affected real people, who were creating, with the **solidarity** of others, what they needed and had previously lacked : a platform to speak out, the reassurance they weren ’ t alone or to blame for what happened to them and open discussions that would help to reduce stigma around the issue. The voices of those directly affected were at the forefront of the story — not the voices of journalists or commentators on social media. And that ’ s why the story was news. We live in an incredibly interconnected world with the proliferation of social media, which is of course a fantastic resource for igniting social change. But it ’ s also made us increasingly reactive, from the smallest annoyances of,”Oh, my train ’ s been delayed,”to the greatest injustices of war, genocides, terrorist attacks. Our default response has become to leap to react to any kind of grievance by tweeting, Facebooking, hastagging — anything to show others that we, too, have reacted. The problem with reacting in this manner en masse is it can sometimes mean that we don ’ t actually react at all, not in the sense of actually doing anything, anyway. It might make ourselves feel better, like we ’ ve contributed to a group mourning or outrage, but it doesn ’ t actually change anything. And what ’ s more, it can sometimes drown out the voices of those directly affected by the injustice, whose needs must be heard. Worrying, too, is the tendency for some reactions to injustice to build even more walls, being quick to point fingers with the hope of providing easy solutions to complex problems. One British tabloid, on the publication of my letter, branded a headline stating,”Oxford Student Launches Online Campaign to **Shame** Attacker.”But the campaign never meant to **shame** anyone. It meant to let people speak and to make others listen. Divisive **Twitter** trolls were quick to create even more injustice, commenting on my attacker ’ s **ethnicity** or class to push their own prejudiced agendas. And some even accused me of feigning the whole thing to push, and I quote, my”feminist agenda of man-hating.”I know, right? As if I ’ m going to be like,”Hey guys! Sorry I can ’ t make it, I ’ m busy trying to hate the entire male population by the time I ’ m 30.”Now, I ’ m almost sure that these people wouldn ’ t say the things they say in person. But it ’ s as if because they might be behind a screen, in the comfort in their own home when on social media, people forget that what they ’ re doing is a public act — that other people will be reading it and be affected by it. Returning to my analogy of getting back on our trains, another main concern I have about this noise that escalates from our online responses to injustice is that it can very easily slip into portraying us as the affected party, which can lead to a sense of defeatism, a kind of mental barrier to seeing any opportunity for positivity or change after a negative situation. A couple of months before the campaign started or any of this happened to me, I went to a TEDx event in Oxford, and I saw Zelda la Grange speak, the former private secretary to Nelson Mandela. One of the stories she told really struck me. She spoke of when Mandela was taken to court by the South African Rugby Union after he commissioned an inquiry into sports affairs. In the courtroom, he went up to the South African Rugby Union ’ s lawyers, shook them by the hand and conversed with them, each in their own language. And Zelda wanted to protest, saying they had no right to his respect after this injustice they had caused him. He turned to her and said,”You must never allow the enemy to determine the grounds for battle.”At the time of hearing these words, I didn ’ t really know why they were so important, but I felt they were, and I wrote them down in a notebook I had on me. But I ’ ve thought about this line a lot ever since. Revenge, or the expression of **hatred** towards those who have done us injustice may feel like a human instinct in the face of wrong, but we need to break out of these cycles if we are to hope to transform negative events of injustice into positive social change. To do otherwise continues to let the enemy determine the grounds for battle, creates a binary, where we who have suffered become the affected, pitted against them, the **perpetrators**. And just like we got back on our tubes, we can ’ t let our platforms for interconnectivity and community be the places that we settle for defeat. But I don ’ t want to discourage a social media response, because I owe the development of the #NotGuilty campaign almost entirely to social media. But I do want to encourage a more considered approach to the way we use it to respond to injustice. The start, I think, is to ask ourselves two things. Firstly : Why do I feel this injustice? In my case, there were several answers to this. Someone had hurt me and those who I loved, under the assumption they wouldn ’ t have to be held to account or recognize the damage they had caused. Not only that, but thousands of men and women suffer every day from **sexual** abuse, often in **silence**, yet it ’ s still a problem we don ’ t give the same airtime to as other issues. It ’ s still an issue many people blame **victims** for. Next, ask yourself : How, in recognizing these reasons, could I go about reversing them? With us, this was holding my attacker to account — and many others. It was calling them out on the effect they had caused. It was giving air-time to the issue of **sexual assault**, opening up discussions amongst friends, amongst families, in the media that had been closed for too long, and stressing that **victims** shouldn ’ t feel to blame for what happened to them. We might still have a long way to go in solving this problem entirely. But in this way, we can begin to use social media as an active tool for social justice, as a tool to educate, to stimulate dialogues, to make those in positions of authority aware of an issue by listening to those directly affected by it. Because sometimes these questions don ’ t have easy answers. In fact, they rarely do. But this doesn ’ t mean we still can ’ t give them a considered response. In situations where you can ’ t go about thinking how you ’ d reverse this feeling of injustice, you can still think, maybe not what you can do, but what you can not do. You can not build further walls by fighting injustice with more **prejudice**, more **hatred**. You can not speak over those directly affected by an injustice. And you can not react to injustice, only to forget about it the next day, just because the rest of **Twitter** has moved on. Sometimes not reacting instantly is, ironically, the best immediate course of action we can take. Because we might be angry, upset and energized by injustice, but let ’ s consider our responses. Let us hold people to account, without descending into a culture that thrives off **shaming** and injustice ourselves. Let us remember that distinction, so often forgotten by internet users, between criticism and insult. Let us not forget to think before we speak, just because we might have a screen in front of us. And when we create noise on social media, let it not drown out the needs of those affected, but instead let it amplify their voices, so the internet becomes a place where you ’ re not the exception if you speak out about something that has actually happened to you. All these considered approaches to injustice evoke the very keystones on which the internet was built : to network, to have signal, to connect — all these terms that imply bringing people together, not pushing people apart. Because if you look up the word”justice”in the dictionary, before punishment, before administration of law or judicial authority, you get :”The maintenance of what is right.”And I think there are few things more”right”in this world than bringing people together, than unions. And if we allow social media to deliver that, then it can deliver a very powerful form of justice, indeed. Thank you very much.

Chris Anderson : Welcome to this next edition of TED Dialogues. We ’ re trying to do some bridging here today. You know, the American dream has inspired millions of people around the world for many years. Today, I think, you can say that America is divided, perhaps more than ever, and the divisions seem to be getting worse. It ’ s actually really hard for people on different sides to even have a conversation. People almost feel... disgusted with each other. Some families can ’ t even speak to each other right now. Our purpose in this dialogue today is to try to do something about that, to try to have a different kind of conversation, to do some listening, some thinking, some understanding. And I have two people with us to help us do that. They ’ re not going to come at this hammer and tong against each other. This is not like cable news. This is two people who have both spent a lot of their working life in the political center or right of the center. They ' ve immersed themselves in conservative worldviews, if you like. They know that space very well. And we ' re going to explore together how to think about what is happening right now, and whether we can find new ways to bridge and just to have wiser, more connected conversations. With me, first of all, Gretchen Carlson, who has spent a decade working at Fox News, hosting"Fox and Friends"and then"The Real Story,"before taking a courageous stance in filing **sexual harassment** claims against Roger Ailes, which eventually led to his departure from Fox News. David Brooks, who has earned the wrath of many of [The New York Times ' s] left-leaning readers because of his conservative views, and more recently, perhaps, some of the right-leaning readers because of his criticism of some aspects of Trump. Yet, his columns are usually the top one, two or three most-read content of the day because they ' re brilliant, because they bring psychology and social science to providing understanding for what ' s going on. So without further ado, a huge welcome to Gretchen and David. Come and join me. So, Gretchen. Sixty-three million Americans voted for Donald Trump. Why did they do this? Gretchen Carlson : There are a lot of reasons, in my mind, why it happened. I mean, I think it was a movement of sorts, but it started long ago. It didn ' t just happen overnight."Anger"would be the first word that I would think of — anger with nothing being done in Washington, anger about not being heard. I think there was a huge swath of the population that feels like Washington never listens to them, you know, a good part of the middle of America, not just the coasts, and he was somebody they felt was listening to their concerns. So I think those two issues would be the main reason. I have to throw in there also celebrity. I think that had a huge impact on Donald Trump becoming president. CA : Was the anger justified? David Brooks : Yeah, I think so. In 2015 and early 2016, I wrote about 30 columns with the following theme : don ' t worry, Donald Trump will never be the Republican nominee. And having done that and gotten that so wrong, I decided to spend the ensuing year just out in Trumpworld, and I found a lot of economic dislocation. I ran into a woman in West Virginia who was going to a funeral for her mom. She said,"The nice thing about being Catholic is we don ' t have to speak, and that ' s good, because we ' re not word people."That phrase rung in my head : word people. A lot of us in the TED community are word people, but if you ' re not, the economy has not been angled toward you, and so 11 million men, for example, are out of the labor force because those jobs are done away. A lot of social injury. You used to be able to say,"I ' m not the richest person in the world, I ' m not the most famous, but my neighbors can count on me and I get some dignity out of that."And because of celebritification or whatever, if you ' re not rich or famous, you feel invisible. And a lot of moral injury, sense of feeling betrayed, and frankly, in this country, we almost have one success story, which is you go to college, get a white-collar job, and you ' re a success, and if you don ' t fit in that **formula**, you feel like you ' re not respected. And so that accumulation of things — and when I talked to Trump voters and still do, I found most of them completely realistic about his failings, but they said, this is my shot. GC : And yet I predicted that he would be the nominee, because I ' ve known him for 27 years. He ' s a master marketer, and one of the things he did extremely well that President Obama also did extremely well, was simplifying the message, simplifying down to phrases and to a populist message. Even if he can ' t achieve it, it sounded good. And many people latched on to that simplicity again. It ' s something they could grasp onto :"I get that. I want that. That sounds fantastic."And I remember when he used to come on my show originally, before"The Apprentice"was even"The Apprentice,"and he ' d say it was the number one show on TV. I ' d say back to him,"No, it ' s not."And he would say,"Yes it is, Gretchen."And I would say,"No it ’ s not.”But people at home would see that, and they ’ d be like,”Wow, I should be watching the number one show on TV.”And — lo and behold — it became the number one show on TV. So he had this, I ’ ve seen this ability in him to be the master marketer. CA : It ’ s puzzling to a lot of people on the left that so many women voted for him, despite some of his comments. GC : I wrote a column about this for Time Motto, saying that I really believe that lot of people put on blinders, and maybe for the first time, some people decided that policies they believed in and being heard and not being invisible anymore was more important to them than the way in which he had acted or acts as a human. And so human dignity — whether it would be the dust-up about the **disabled** reporter, or what happened in that audiotape with Billy Bush and the way in which he spoke about women — they put that aside and pretended as if they hadn ’ t seen that or heard that, because to them, policies were more important. CA : Right, so just because someone voted for Trump, it ’ s not blind adherence to everything that he ’ s said or stood for. GC : No. I heard a lot of people that would say to me,”Wow, I just wish he would shut up before the election. If he would just stay quiet, he ’ d get elected.”CA : And so, maybe for people on the left there ’ s a trap there, to sort of despise or just be baffled by the support, assuming that it ’ s for some of the unattractive features. Actually, maybe they ’ re supporting him despite those, because they see something exciting. They see a man of action. They see the choking hold of government being thrown off in some way and they ’ re excited by that. GC : But don ’ t forget we saw that on the left as well — Bernie Sanders. So this is one of the commonalities that I think we can talk about today,”The Year of the Outsider,”David — right? And even though Bernie Sanders has been in Congress for a long time, he was **deemed** an outsider this time. And so there was anger on the left as well, and so many people were in favor of Bernie Sanders. So I see it as a commonality. People who like Trump, people who like Bernie Sanders, they were liking different policies, but the underpinning was anger. CA : David, there ’ s often this narrative, then, that the sole explanation for Trump ’ s victory and his rise is his tapping into anger in a very visceral way. But you ’ ve written a bit about that it ’ s actually more than that, that there ’ s a worldview that ’ s being worked on here. Could you talk about that? DB : I would say he understood what, frankly, I didn ’ t, which is what debate we were having. And so I ’ d grown up starting with Reagan, and it was the big government versus small government debate. It was Barry Goldwater versus George McGovern, and that was the debate we had been having for a generation. It was : Democrats wanted to use government to enhance **equality**, Republicans wanted to limit government to enhance freedom. That was the debate. He understood what I think the two major parties did not, which was that ’ s not the debate anymore. The debate is now open versus closed. On one side are those who have the tailwinds of globalization and the meritocracy blowing at their back, and they tend to favor open trade, open borders, open social mores, because there are so many opportunities. On the other side are those who feel the headwinds of globalization and the meritocracy just blasting in their faces, and they favor closed trade, closed borders, closed social mores, because they just want some security. And so he was right on that fundamental issue, and people were willing to overlook a lot to get there. And so he felt that sense of security. We ’ re speaking the morning after Trump ’ s joint session speech. There are three traditional groups in the Republican Party. There are the foreign policies hawks who believe in America as global policeman. Trump totally repudiated that view. Second, there was the social conservatives who believed in religious liberty, pro-life, **prayer** in schools. He totally ignored that. There was not a single mention of a single social conservative issue. And then there were the fiscal hawks, the people who wanted to cut down on the national debt, Tea Party, cut the size of government. He ' s expanding the size of government! Here ' s a man who has single-handedly revolutionized a major American party because he understood where the debate was headed before other people. And then guys like Steve Bannon come in and give him substance to his impulses. CA : And so take that a bit further, and maybe expand a bit more on your insights into Steve Bannon ' s worldview. Because he ' s sometimes tarred in very simple terms as this dangerous, racist, xenophobic, anger-sparking person. There ' s more to the story ; that is perhaps an unfair simplification. DB : I think that part is true, but there ' s another part that ' s probably true, too. He ' s part of a global movement. It ' s like being around Marxists in 1917. There ' s him here, there ' s the UKIP party, there ' s the National Front in France, there ' s Putin, there ' s a Turkish version, a Philippine version. So we have to recognize that this is a global intellectual movement. And it believes that wisdom and virtue is not held in individual conversation and civility the way a lot of us in the enlightenment side of the world do. It ' s held in — the German word is the"volk"— in the people, in the common, instinctive wisdom of the plain people. And the essential virtue of that people is always being threatened by outsiders. And he ' s got a strategy for how to get there. He ' s got a series of policies to bring the people up and repudiate the outsiders, whether those outsiders are Islam, Mexicans, the media, the coastal elites... And there ' s a whole worldview there ; it ' s a very coherent worldview. I sort of have more respect for him. I loathe what he stands for and I think he ' s wrong on the substance, but it ' s interesting to see someone with a set of ideas find a vehicle, Donald Trump, and then try to take control of the White House in order to advance his viewpoint. CA : So it ' s almost become, like, that the core question of our time now is : Can you be patriotic but also have a global mindset? Are these two things implacably opposed to each other? I mean, a lot of conservatives and, to the extent that it ' s a different category, a lot of Trump supporters, are infuriated by the coastal elites and the globalists because they see them as, sort of, not cheering for America, not embracing fully American values. I mean, have you seen that in your conversations with people, in your understanding of their mindset? GC : I do think that there ' s a huge difference between — I hate to put people in categories, but, Middle America versus people who live on the coasts. It ' s an entirely different existence. And I grew up in Minnesota, so I have an understanding of Middle America, and I ' ve never forgotten it. And maybe that ' s why I have an understanding of what happened here, because those people often feel like nobody ' s listening to them, and that we ' re only concentrating on California and New York. And so I think that was a huge reason why Trump was elected. I mean, these people felt like they were being heard. Whether or not patriotism falls into that, I ' m not sure about that. I do know one thing : a lot of things Trump talked about last night are not conservative things. Had Hillary Clinton gotten up and given that speech, not one Republican would have stood up to applaud. I mean, he ' s talking about spending a trillion dollars on infrastructure. That is not a conservative viewpoint. He talked about government-mandated maternity leave. A lot of women may love that ; it ' s not a conservative viewpoint. So it ' s fascinating that people who loved what his message was during the campaign, I ' m not sure — how do you think they ' ll react to that? DB : I should say I grew up in Lower Manhattan, in the triangle between ABC Carpets, the Strand Bookstore and The Odeon restaurant. GC : Come to Minnesota sometime! CA : You are a card-carrying member of the coastal elite, my man. But what did you make of the speech last night? It seemed to be a move to a more moderate position, on the face of it. DB : Yeah, I thought it was his best speech, and it took away the freakishness of him. I do think he ' s a moral freak, and I think he ' ll be undone by that fact, the fact that he just doesn ' t know anything about anything and is uncurious about it. But if you take away these minor flaws, I think we got to see him at his best, and it was revealing for me to see him at his best, because to me, it exposed a central contradiction that he ' s got to confront, that a lot of what he ' s doing is offering security. So,"I ' m ordering closed borders, I ' m going to secure the world for you, for my people."But then if you actually look at a lot of his economic policies, like health care reform, which is about private health care accounts, that ' s not security, that ' s risk. Educational vouchers : that ' s risk. Deregulation : that ' s risk. There ' s really a contradiction between the security of the mindset and a lot of the policies, which are very risk-oriented. And what I would say, especially having spent this year, the people in rural Minnesota, in New Mexico — they ' ve got enough risk in their lives. And so they ' re going to say,"No thank you."And I think his health care repeal will fail for that reason. CA : But despite the criticisms you just made of him, it does at least seem that he ' s listening to a surprisingly wide range of voices ; it ' s not like everyone is coming from the same place. And maybe that leads to a certain amount of chaos and confusion, but — GC : I actually don ' t think he ' s listening to a wide range of voices. I think he ' s listening to very few people. That ' s just my impression of it. I believe that some of the things he said last night had Ivanka all over them. So I believe he was listening to her before that speech. And he was Teleprompter Trump last night, as opposed to **Twitter** Trump. And that ' s why, before we came out here, I said,"We better check **Twitter** to see if anything ' s changed."And also I think you have to keep in mind that because he ' s such a unique character, what was the bar that we were expecting last night? Was it here or here or here? And so he comes out and gives a looking political speech, and everyone goes,"Wow! He can do it."It just depends on which direction he goes. DB : Yeah, and we ' re trying to build bridges here, and especially for an audience that may have contempt for Trump, it ' s important to say, no, this is a real thing. But as I try my best to go an hour showing respect for him, my thyroid is surging, because I think the oddities of his character really are condemnatory and are going to doom him. CA : Your reputation is as a conservative. People would you describe you as right of center, and yet here you are with this visceral reaction against him and some of what he stands for. I mean, I ' m — how do you have a conversation? The people who support him, on evidence so far, are probably pretty excited. He ' s certainly shown real engagement in a lot of what he promised to do, and there is a strong desire to change the system radically. People hate what government has become and how it ' s left them out. GC : I totally agree with that, but I think that when he was proposing a huge government program last night that we used to call the bad s-word,"stimulus,"I find it completely **ironic**. To spend a trillion dollars on something — that is not a conservative viewpoint. Then again, I don ' t really believe he ' s a Republican. DB : And I would say, as someone who identifies as conservative : first of all, to be conservative is to believe in the limitations of politics. Samuel Johnson said,"Of all the things that human hearts endure, how few are those that kings can cause and cure."Politics is a limited realm ; what matters most is the moral nature of the society. And so I have to think character comes first, and a man who doesn ' t pass the character threshold cannot be a good president. Second, I ' m the kind of conservative who — I harken back to Alexander Hamilton, who was a Latino hip-hop star from the heights — but his definition of America was very future-oriented. He was a poor boy from the islands who had this rapid and amazing rise to success, and he wanted government to give poor boys and girls like him a chance to succeed, using limited but energetic government to create social mobility. For him and for Lincoln and for Teddy Roosevelt, the idea of America was the idea of the future. We may have division and racism and slavery in our past, but we have a common future. The definition of America that Steve Bannon stands for is backwards-looking. It ' s nostalgic ; it ' s for the past. And that is not traditionally the American identity. That ' s traditionally, frankly, the Russian identity. That ' s how they define virtue. And so I think it is a fundamental and foundational betrayal of what conservatism used to stand for. CA : Well, I ' d like actually like to hear from you, and if we see some comments coming in from some of you, we ' ll — oh, well here ' s one right now. Jeffrey Alan Carnegie : I ' ve tried to convince progressive friends that they need to understand what motivates Trump supporters, yet many of them have given up trying to understand in the face of what they perceive as lies, selfishness and **hatred**. How would you reach out to such people, the Tea Party of the left, to try to bridge this divide? GC : I actually think there are commonalities in anger, as I expressed earlier. So I think you can come to the table, both being passionate about something. So at least you care. And I would like to believe — the c-word has also become a horrible word —"compromise,"right? So you have the far left and the far right, and compromise — forget it. Those groups don ' t want to even think about it. But you have a huge swath of voters, myself included, who are registered independents, like 40 percent of us, right? So there is a huge faction of America that wants to see change and wants to see people come together. It ' s just that we have to figure out how to do that. CA : So let ' s talk about that for a minute, because we ' re having these TED Dialogues, we ' re trying to bridge. There ' s a lot of people out there, right now, perhaps especially on the left, who think this is a terrible idea, that actually, the only moral response to the great tyranny that may be about to emerge in America is to resist it at every stage, is to fight it tooth and nail, it ' s a mistake to try and do this. Just fight! Is there a case for that? DB : It depends what"fight"means. If it means literal fighting, then no. If it means marching, well maybe marching to raise consciousness, that seems fine. But if you want change in this country, we do it through parties and politics. We organize parties, and those parties are big, diverse, messy coalitions, and we engage in politics, and politics is always morally unsatisfying because it ' s always a bunch of compromises. But politics is essentially a competition between partial truths. The Trump people have a piece of the truth in America. I think Trump himself is the wrong answer to the right question, but they have some truth, and it ' s truth found in the epidemic of opiates around the country, it ' s truth found in the spread of loneliness, it ' s the truth found in people whose lives are inverted. They peaked professionally at age 30, and it ' s all been downhill since. And so, understanding that doesn ' t take fighting, it takes conversation and then asking,"What are we going to replace Trump with?"GC : But you saw fighting last night, even at the speech, because you saw the Democratic women who came and wore white to honor the suffragette movement. I remember back during the campaign where some Trump supporters wanted to actually get rid of the amendment that allowed us to vote as women. It was like, what? So I don ' t know if that ' s the right way to fight. It was interesting, because I was looking in the audience, trying to see Democratic women who didn ' t wear white. So there ' s a lot going on there, and there ' s a lot of ways to fight that are not necessarily doing that. CA : I mean, one of the key questions, to me, is : The people who voted for Trump but, if you like, are more in the center, like they ' re possibly amenable to persuasion — are they more likely to be persuaded by seeing a passionate uprising of people saying,"No, no, no, you can ' t!"or will that actually piss them off and push them away? DB : How are any of us persuaded? Am I going to persuade you by saying,"Well, you ' re kind of a bigot, you ' re supporting bigotry, you ' re supporting sexism. You ' re a primitive, fascistic rise from some **authoritarian** past"? That ' s probably not going to be too persuasive to you. And so the way any of us are persuaded is by : a) some basic show of respect for the point of view, and saying,"I think this guy is not going to get you where you need to go."And there are two phrases you ' ve heard over and over again, wherever you go in the country. One, the phrase"flyover country."And that ' s been heard for years, but I would say this year, I heard it almost on an hourly basis, a sense of feeling invisible. And then the sense a sense of the phrase"political correctness."Just that rebellion :"They ' re not even letting us say what we think."And I teach at Yale. The narrowing of debate is real. CA : So you would say this is a trap that liberals have fallen into by **celebrating** causes they really believe in, often expressed through the language of"political correctness."They have done damage. They have pushed people away. DB : I would say a lot of the argument, though, with"descent to fascism,""authoritarianism"— that just feels over-the-top to people. And listen, I ' ve written eight million anti-Trump columns, but it is a problem, especially for the coastal media, that every time he does something slightly wrong, we go to 11, and we ' re at 11 every day. And it just strains credibility at some point. CA : Crying wolf a little too loud and a little too early. But there may be a time when we really do have to cry wolf. GC : But see — one of the most important things to me is how the conservative media handles Trump. Will they call him out when things are not true, or will they just go along with it? To me, that is what is essential in this entire discussion, because when you have followers of somebody who don ' t really care if he tells the truth or not, that can be very dangerous. So to me, it ' s : How is the conservative media going to respond to it? I mean, you ' ve been calling them out. But how will other forms of conservative media deal with that as we move forward? DB : It ' s all shifted, though. The conservative media used to be Fox or Charles Krauthammer or George Will. They ' re no longer the conservative media. Now there ' s another whole set of institutions further right, which is Breitbart and Infowars, Alex Jones, Laura Ingraham, and so they ' re the ones who are now his base, not even so much Fox. CA : My last question for the time being is just on this question of the truth. I mean, it ' s one of the scariest things to people right now, that there is no agreement, nationally, on what is true. I ' ve never seen anything like it, where facts are so massively disputed. Your whole newspaper, sir, is delivering fake news every day. DB : And failing. CA : And failing. My commiserations. But is there any path whereby we can start to get some kind of consensus, to believe the same things? Can online communities play a role here? How do we fix this? GC : See, I understand how that happened. That ' s another groundswell kind of emotion that was going on in the middle of America and not being heard, in thinking that the mainstream media was biased. There ' s a difference, though, between being biased and being fake. To me, that is a very important distinction in this conversation. So let ' s just say that there was some bias in the mainstream media. OK. So there are ways to try and mend that. But what Trump ' s doing is nuclearizing that and saying,"Look, we ' re just going to call all of that fake."That ' s where it gets dangerous. CA : Do you think enough of his supporters have a greater loyalty to the truth than to any... Like, the principle of not supporting something that is demonstrably not true actually matters, so there will be a correction at some point? DB : I think the truth eventually comes out. So for example, Donald Trump has based a lot of his economic policy on this supposition that Americans have lost manufacturing jobs because they ' ve been stolen by the Chinese. That is maybe 13 percent of the jobs that left. The truth is that 87 percent of the jobs were replaced by technology. That is just the truth. And so as a result, when he says,"I ' m going to close TPP and all the jobs will come roaring back,”they will not come roaring back. So that is an actual fact, in my belief. And — GC : But I ’ m saying what his supporters think is the truth, no matter how many times you might say that, they still believe him. DB : But eventually either jobs will come back or they will not come back, and at that point, either something will work or it doesn ’ t work, and it doesn ’ t work or not work because of great marketing, it works because it actually addresses a real problem and so I happen to think the truth will out. CA : If you ’ ve got a question, please raise your hand here. Yael Eisenstat : I ’ ll speak into the box. My name ’ s Yael Eisenstat. I hear a lot of this talk about how we all need to start talking to each other more and understanding each other more, and I ’ ve even written about this, published on this subject as well, but now today I keep hearing liberals — yes, I live in New York, I can be considered a liberal — we sit here and self-analyze : What did we do to not understand the Rust Belt? Or : What can we do to understand Middle America better? And what I ’ d like to know : Have you seen any attempts or conversations from Middle America of what can I do to understand the so-called coastal elites better? Because I ’ m just offended as being put in a box as a coastal elite as someone in Middle America is as being considered a flyover state and not listened to. CA : There you go, I can hear Facebook cheering as you — DB : I would say — and this is someone who has been conservative all my adult life — when you grow up conservative, you learn to speak both languages. Because if I ’ m going to listen to music, I ’ m not going to listen to Ted Nugent. So a lot of my favorite rock bands are all on the left. If I ’ m going to go to a school, I ’ m going probably to school where the culture is liberal. If I ’ m going to watch a sitcom or a late-night comedy show, it ’ s going to be liberal. If I ’ m going to read a good newspaper, it ’ ll be the New York Times. As a result, you learn to speak both languages. And that actually, at least for a number of years, when I started at National Review with William F. Buckley, it made us sharper, because we were used to arguing against people every day. The problem now that ’ s happened is you have ghettoization on the right and you can live entirely in rightworld, so as a result, the quality of argument on the right has diminished, because you ’ re not in the other side all the time. But I do think if you ’ re living in Minnesota or Iowa or Arizona, the coastal elites make themselves aware to you, so you know that language as well, but it ’ s not the reverse. CA : But what does Middle America not get about coastal elites? So the critique is, you are not dealing with the real problems. There ’ s a feeling of a snobbishness, an elitism that is very off-putting. What are they missing? If you could plant one piece of truth from the mindset of someone in this room, for example, what would you say to them? DB : Just how insanely wonderful we are. No, I reject the category. The problem with populism is the same problem with elitism. It ’ s just a **prejudice** on the basis of probably an over-generalized social class distinction which is too simplistic to apply in reality. Those of us in New York know there are some people in New York who are completely awesome, and some people who are pathetic, and if you live in Iowa, some people are awesome and some people are pathetic. It ’ s not a question of what degree you have or where you happen to live in the country. The distinction is just a crude simplification to arouse political power. GC : But I would encourage people to watch a television news show or read a column that they normally wouldn ’ t. So if you are a Trump supporter, watch the other side for a day, because you need to come out of the bubble if you ’ re ever going to have a conversation. And both sides — so if you ’ re a liberal, then watch something that ’ s very conservative. Read a column that is not something you would normally read, because then you gain perspective of what the other side is thinking, and to me, that ’ s a start of coming together. I worry about the same thing you worry about, these bubbles. I think if you only watch certain entities, you have no idea what the rest of the world is talking about. DB : I think not only watching, being part of an organization that meets at least once a month that puts you in direct contact with people completely unlike yourself is something we all have a responsibility for. I may get this a little wrong, but I think of the top-selling automotive models in this country, I think the top three or four are all pickup trucks. So ask yourself : How many people do I know who own a pickup truck? And it could be very few or zero for a lot of people. And that ' s sort of a warning sign kind of a problem. Where can I join a club where I ' ll have a lot in common with a person who drives a pickup truck because we have a common interest in whatever? CA : And so the internet is definitely contributing to this. A question here from Chris Ajemian :"How do you feel structure of communications, especially the prevalence of social media and individualized content, can be used to bring together a political divide, instead of just filing communities into echo chambers?"I mean, it looks like Facebook and Google, since the election, are working hard on this question. They ' re trying to change the algorithms so that they don ' t amplify fake news to the extent that it happened last time round. Do you see any other promising signs of...? GC :... or amplify one side of the equation. CA : Exactly. GC : I think that was the constant argument from the right, that social media and the internet in general was putting articles towards the top that were not their worldview. I think, again, that fed into the anger. It fed into the anger of :"You ' re pushing something that ' s not what I believe."But social media has obviously changed everything, and I think Trump is the example of **Twitter** changing absolutely everything. And from his point of view, he ' s reaching the American people without a filter, which he believes the media is. CA : Question from the audience. Destiny : Hi. I ' m Destiny. I have a question regarding political correctness, and I ' m curious : When did political correctness become synonymous with **silencing**, versus a way that we speak about other people to show them respect and preserve their dignity? GC : Well, I think the conservative media really pounded this issue for the last 10 years. I think that they really, really spent a lot of time talking about political correctness, and how people should have the ability to say what they think. Another reason why Trump became so popular : because he says what he thinks. It also makes me think about the fact that I do believe there are a lot of people in America who agree with Steve Bannon, but they would never say it publicly, and so voting for Trump gave them the opportunity to agree with it silently. DB : On the issue of **immigration**, it ' s a legitimate point of view that we have too many **immigrants** in the country, that it ' s economically costly. CA : That we have too many — DB : **Immigrants** in the country, especially from Britain. GC : I kind of like the British accent, OK? CA : I **apologize**. America, I am sorry. I ' ll go now. DB : But it became sort of impermissible to say that, because it was a sign that somehow you must be a bigot of some sort. So the political correctness was not only cracking down on speech that we would all find completely offensive, it was cracking down on some speech that was legitimate, and then it was turning speech and thought into action and treating it as a crime, and people getting fired and people thrown out of schools, and there were speech codes written. Now there are these diversity teams, where if you say something that somebody finds offensive, like,"Smoking is really dangerous,"you can say"You ' re insulting my group,"and the team from the administration will come down into your dorm room and put thought police upon you. And so there has been a genuine narrowing of what is permissible to say. And some of it is legitimate. There are certain words that there should be some social sanction against, but some of it was used to enforce a political agenda. CA : So is that a project you would urge on liberals, if you like — progressives — to rethink the ground rules around political correctness and accept a little more uncomfortable language in certain circumstances? Can you see that being solved to an extent that others won ’ t be so offended? DB : I mean, most American universities, especially elite universities, are overwhelmingly on the left, and there ’ s just an ease of temptation to use your overwhelming cultural power to try to enforce some sort of thought that you think is right and correct thought. So, be a little more self-suspicious of, are we doing that? And second, my university, the University of Chicago, sent out this letter saying, we will have no safe spaces. There will be no critique of micro-aggression. If you get your feelings hurt, well, welcome to the world of education. I do think that policy — which is being embraced by a lot of people on the left, by the way — is just a corrective to what ’ s happened. CA : So here ’ s a question from Karen Holloway : How do we foster an American culture that ’ s forward-looking, like Hamilton, that expects and deals with change, rather than wanting to have everything go back to some fictional past? That ’ s an easy question, right? GC : Well, I ’ m still a believer in the American dream, and I think what we can teach our children is the basics, which is that hard work and believing in yourself in America, you can achieve whatever you want. I was told that every single day. When I got in the real world, I was like, wow, that ’ s maybe not always so true. But I still believe in that. Maybe I ’ m being too optimistic. So I still look towards the future for that to continue. DB : I think you ’ re being too optimistic. GC : You do? DB : The odds of an American young person **exceeding** their parents ’ salary — a generation ago, like 86 percent did it. Now 51 percent do it. There ’ s just been a problem in social mobility in the country. CA : You ’ ve written that this entire century has basically been a disaster, that the age of sunny growth is over and we ’ re in deep trouble. DB : Yeah, I mean, we averaged, in real terms, population-adjusted, two or three percent growth for 50 years, and now we ’ ve had less than one percent growth. And so there ’ s something seeping out. And so if I ’ m going to tell people that they should take risks, one of the things we ’ re seeing is a rapid decline in mobility, the number of people who are moving across state lines, and that ’ s especially true among millennials. It ’ s young people that are moving less. So how do we give people the security from which they can take risk? And I ’ m a big believer in attachment theory of raising children, and attachment theory is based on the motto that all of life is a series of daring adventures from a secure base. Have you parents given you a secure base? And as a society, we do not have a secure base, and we won ’ t get to that”Hamilton,”risk-taking, energetic ethos until we can supply a secure base. CA : So I wonder whether there ’ s ground here to create almost like a **shared** agenda, a bridging conversation, on the one hand recognizing that there is this really deep problem that the system, the economic system that we built, seems to be misfiring right now. Second, that maybe, if you ’ re right that it ’ s not all about **immigrants**, it ’ s probably more about technology, if you could win that argument, that de-emphasizes what seems to me the single most divisive territory between Trump supporters and others, which is around the role of the other. It ’ s very offensive to people on the left to have the other demonized to the extent that the other seems to be demonized. That feels deeply immoral, and maybe people on the left could agree, as you said, that **immigration** may have happened too fast, and there is a limit beyond which human societies struggle, but nonetheless this whole problem becomes de-emphasized if automation is the key issue, and then we try to work together on recognizing that it ’ s real, recognizing that the problem probably wasn ’ t properly addressed or seen or heard, and try to figure out how to rebuild communities using, well, using what? That seems to me to become the fertile conversation of the future : How do we rebuild communities in this modern age, with technology doing what it ’ s doing, and reimagine this bright future? GC : That ’ s why I go back to optimism. I ’ m not being... it ’ s not like I ’ m not looking at the facts, where we ’ ve come or where we ’ ve come from. But for gosh sakes, if we don ’ t look at it from an optimistic point of view — I ’ m refusing to do that just yet. I ’ m not raising my 12- and 13-year-old to say,”Look, the world is dim.”CA ; We ’ re going to have one more question from the room here. Questioner : Hi. Hello. Sorry. You both mentioned the infrastructure plan and Russia and some other things that wouldn ’ t be traditional Republican priorities. What do you think, or when, will Republicans be motivated to take a stand against Trumpism? GC : After last night, not for a while. He changed a lot last night, I believe. DB : His popularity among Republicans — he ’ s got 85 percent approval, which is higher than Reagan had at this time, and that ’ s because society has just gotten more polarized. So people follow the party much more than they used to. So if you ’ re waiting for Paul Ryan and the Republicans in Congress to flake away, it ’ s going to take a little while. GC : But also because they ’ re all concerned about reelection, and Trump has so much power with getting people either for you or against you, and so, they ’ re vacillating every day, probably :”Well, should I go against or should I not?”But last night, where he finally sounded presidential, I think most Republicans are breathing a sigh of relief today. DB : The half-life of that is short. GC : Right — I was just going to say, until **Twitter** happens again. CA : OK, I want to give each of you the chance to imagine you ’ re speaking to — I don ’ t know — the people online who are watching this, who may be Trump supporters, who may be on the left, somewhere in the middle. How would you advise them to bridge or to relate to other people? Can you share any final wisdom on this? Or if you think that they shouldn ’ t, tell them that as well. GC : I would just start by saying that I really think any change and coming together starts from the top, just like any other organization. And I would love if, somehow, Trump supporters or people on the left could encourage their leaders to show that compassion from the top, because imagine the change that we could have if Donald Trump tweeted out today, to all of his supporters,”Let ’ s not be vile anymore to each other. Let ’ s have more understanding. As a leader, I ’ m going to be more inclusive to all of the people of America.”To me, it starts at the top. Is he going to do that? I have no idea. But I think that everything starts from the top, and the power that he has in encouraging his supporters to have an understanding of where people are coming from on the other side. CA : David. DB : Yeah, I guess I would say I don ’ t think we can teach each other to be civil, and give us sermons on civility. That ’ s not going to do it. It ’ s substance and how we act, and the nice thing about Donald Trump is he smashed our categories. All the categories that we thought we were thinking in, they ’ re obsolete. They were great for the 20th century. They ’ re not good for today. He ’ s got an agenda which is about closing borders and closing trade. I just don ’ t think it ’ s going to work. I think if we want to rebuild communities, recreate jobs, we need a different set of agenda that smashes through all our current divisions and our current categories. For me, that agenda is Reaganism on macroeconomic policy, Sweden on welfare policy and cuts across right and left. I think we have to have a dynamic economy that creates growth. That ’ s the Reagan on economic policy. But people have to have that secure base. There have to be nurse-family partnerships ; there has to be universal preschool ; there have to be **charter** schools ; there have to be college programs with wraparound programs for parents and communities. We need to help **heal** the crisis of social **solidarity** in this country and help **heal** families, and government just has to get a lot more involved in the way liberals like to rebuild communities. At the other hand, we have to have an economy that ’ s free and open the way conservatives used to like. And so getting the substance right is how you smash through the partisan identities, because the substance is what ultimately shapes our polarization. CA : David and Gretchen, thank you so much for an absolutely fascinating conversation. Thank you. That was really, really interesting. Hey, let ' s keep the conversation going. We ' re continuing to try and figure out whether we can add something here, so keep the conversation going on Facebook. Give us your thoughts from whatever part of the political spectrum you ' re on, and actually, wherever in the world you are. This is not just about America. It ' s about the world, too. But we ' re not going to end today without music, because if we put music in every political conversation, the world would be completely different, frankly. It just would. Up in Harlem, this extraordinary woman, Vy Higginsen, who ' s actually right here — let ' s get a shot of her. She created this program that brings **teens** together, teaches them the joy and the impact of gospel music, and hundreds of **teens** have gone through this program. It ' s transformative for them. The music they made, as you already heard, is extraordinary, and I can ' t think of a better way of ending this TED Dialogue than welcoming Vy Higginsen ' s Gospel **Choir** from Harlem. Thank you. **Choir** : O beautiful for spacious skies For amber waves of grain For purple mountain majesties Above the fruited plain America! America! America! America! God shed his grace on thee And crown thy good with brotherhood From sea to shining sea From sea to shining sea

I remember the first time that I saw people injecting drugs. I had just arrived in Vancouver to lead a research project in HIV prevention in the infamous Downtown East Side. It was in the lobby of the Portland Hotel, a supportive housing project that gave rooms to the most marginalized people in the city, the so-called"difficult to house."I ' ll never forget the young woman standing on the stairs repeatedly jabbing herself with a needle, and screaming,"I can ' t find a vein,"as blood splattered on the wall. In response to the desperate state of affairs, the drug use, the poverty, the **violence**, the soaring rates of HIV, Vancouver **declared** a public health emergency in 1997. This opened the door to expanding **harm** reduction services, distributing more needles, increasing **access** to methadone, and, finally, opening a supervised injection site. Things that make injecting drugs less hazardous. But today, 20 years later, **harm** reduction is still viewed as some sort of radical concept. In some places, it ' s still illegal to carry a clean needle. Drug users are far more likely to be arrested than to be offered methadone therapy. Recent proposals for supervised injection sites in cities like Seattle, Baltimore and New York have been met with stiff opposition : opposition that goes against everything we know about addiction. Why is that? Why are we still stuck on the idea that the only option is to stop using — that any drug use will not be tolerated? Why do we ignore countless personal stories and overwhelming scientific evidence that **harm** reduction works? Critics say that **harm** reduction doesn ' t stop people from using illegal drugs. Well, actually, that is the whole point. After every criminal and societal sanction that we can come up with, people still use drugs, and far too many die. Critics also say that we are giving up on people by not focusing our attention on treatment and recovery. In fact, it is just the opposite. We are not giving up on people. We know that if recovery is ever going to happen we must keep people alive. Offering someone a clean needle or a safe place to inject is the first step to treatment and recovery. Critics also claim that **harm** reduction gives the wrong message to our children about drug users. The last time I looked, these drug users are our children. The message of **harm** reduction is that while drugs can hurt you, we still must reach out to people who are addicted. A needle exchange is not an advertisement for drug use. Neither is a methadone clinic or a supervised injection site. What you see there are people sick and hurting, hardly an endorsement for drug use. Let ’ s take supervised injection sites, for example. Probably the most misunderstood health intervention ever. All we are saying is that allowing people to inject in a clean, dry space with fresh needles, surrounded by people who care is a lot better than injecting in a dingy alley, sharing contaminated needles and hiding out from police. It ’ s better for everybody. The first supervised injection site in Vancouver was at 327 Carol Street, a narrow room with a concrete floor, a few chairs and a box of clean needles. The police would often lock it down, but somehow it always mysteriously reopened, often with the aid of a crowbar. I would go down there some evenings to provide medical care for people who were injecting drugs. I was always struck with the commitment and compassion of the people who operated and used the site. No judgment, no hassles, no fear, lots of profound conversation. I learned that despite unimaginable **trauma**, physical pain and mental illness, that everyone there thought that things would get better. Most were convinced that, someday, they ’ d stop using drugs altogether. That room was the forerunner to North America ’ s first government-sanctioned supervised injection site, called INSITE. It opened in September of 2003 as a three-year research project. The conservative government was intent on closing it down at the end of the study. After eight years, the battle to close INSITE went all the way up to Canada ’ s Supreme Court. It pitted the government of Canada against two people with a long history of drug use who knew the benefits of INSITE firsthand : Dean Wilson and Shelley Tomic. The court ruled in favor of keeping INSITE open by nine to zero. The justices were scathing in their response to the government ’ s case. And I quote :”The effect of denying the services of INSITE to the population that it serves and the correlative increase in the risk of death and disease to injection drug users is grossly disproportionate to any benefit that Canada might derive from presenting a uniform stance on the possession of narcotics.”This was a hopeful moment for **harm** reduction. Yet, despite this strong message from the Supreme Court, it was, until very recently, impossible to open up any new sites in Canada. There was one interesting thing that happened in December of 2016, when due to the overdose crisis, the government of British Columbia allowed the opening of overdose prevention sites. Essentially ignoring the federal approval process, community groups opened up about 22 of these de facto illegal supervised injection sites across the **province**. Virtually overnight, thousands of people could use drugs under supervision. Hundreds of overdoses were reversed by Naloxone, and nobody died. In fact, this is what ’ s happened at INSITE over the last 14 years : 75, 000 different individuals have injected illegal drugs more than three and a half million times, and not one person has died. Nobody has ever died at INSITE. So there you have it. We have scientific evidence and successes from needle exchanges methadone and supervised injection sites. These are common-sense, compassionate approaches to drug use that improve health, bring connection and greatly reduce **suffering** and death. So why haven ’ t **harm** reduction programs taken off? Why do we still think that drug use is law **enforcement** issue? Our disdain for drugs and drug users goes very deep. We are bombarded with images and media stories about the horrible impacts of drugs. We have stigmatized entire communities. We applaud military-inspired operations that bring down drug dealers. And we appear unfazed by building more jails to incarcerate people whose only crime is using drugs. Virtually millions of people are caught up in a hopeless cycle of incarceration, **violence** and poverty that has been created by our drug laws and not the drugs themselves. How do I explain to people that drug users deserve care and support and the freedom to live their lives when all we see are images of guns and handcuffs and jail cells? Let ’ s be clear : criminalization is just a way to institutionalize stigma. Making drugs illegal does nothing to stop people from using them. Our paralysis to see things differently is also based on an entirely false narrative about drug use. We have been led to believe that drug users are irresponsible people who just want to get high, and then through their own personal failings spiral down into a life of crime and poverty, losing their jobs, their families and, ultimately, their lives. In reality, most drug users have a story, whether it ’ s childhood **trauma**, **sexual** abuse, mental illness or a personal tragedy. The drugs are used to **numb** the pain. We must understand that as we approach people with so much **trauma**. At its core, our drug policies are really a social justice issue. While the media may focus on overdose deaths like Prince and Michael Jackson, the majority of the **suffering** happens to people who are living on the margins, the poor and the dispossessed. They don ’ t vote ; they are often alone. They are society ’ s disposable people. Even within health care, drug use is highly stigmatized. People using drugs avoid the health care system. They know that once engaged in clinical care or admitted to hospital, they will be treated poorly. And their supply line, be it heroin, cocaine or crystal meth will be interrupted. On top of that, they will be asked a barrage of questions that only serve to expose their losses and **shame**.”What drugs do you use?””How long have you been living on the **street**?””Where are your children?””When were you last in jail?”Essentially :”Why the hell don ’ t you stop using drugs?”In fact, our entire medical approach to drug use is upside down. For some reason, we have decided that abstinence is the best way to treat this. If you ’ re lucky enough, you may get into a detox program. If you live in a community with Suboxone or methadone, you may get on a substitution program. Hardly ever would we offer people what they desperately need to survive : a safe prescription for opioids. Starting with abstinence is like asking a new diabetic to quit sugar or a severe asthmatic to start running marathons or a depressed person to just be happy. For any other medical condition, we would never start with the most extreme option. What makes us think that strategy would work for something as complex as addiction? While unintentional overdoses are not new, the scale of the current crisis is unprecedented. The Center for Disease Control estimated that 64, 000 Americans died of a drug overdose in 2016, far **exceeding** car crashes or homicides. Drug- related mortality is now the leading cause of death among men and women between 20 and 50 years old in North America Think about that. How did we get to this point, and why now? There is a kind of perfect storm around opioids. Drugs like Oxycontin, Percocet and Dilaudid have been liberally distributed for decades for all kinds of pain. It is estimated that two million Americans are daily opioid users, and over 60 million people received at least one prescription for opioids last year. This massive dump of prescription drugs into communities has provided a steady source for people wanting to self-medicate. In response to this prescription epidemic, people have been cut off, and this has greatly reduced the **street** supply The unintended but predictable consequence is an overdose epidemic. Many people who were reliant on a steady supply of prescription drugs turned to heroin. And now the illegal drug market has tragically switched to synthetic drugs, mainly fentanyl. These new drugs are cheap, potent and extremely hard to dose. People are literally being poisoned. Can you imagine if this was any other kind of poisoning epidemic? What if thousands of people started dying from poisoned meat or baby **formula** or coffee? We would be treating this as a true emergency. We would immediately be supplying safer alternatives. There would be changes in legislation, and we would be supporting the **victims** and their families. But for the drug overdose epidemic, we have done none of that. We continue to demonize the drugs and the people who use them and blindly pour even more resources into law **enforcement**. So where should we go from here? First, we should fully embrace, fund and scale up **harm** reduction programs across North America. I know that in places like Vancouver, **harm** reduction has been a lifeline to care and treatment. I know that the number of overdose deaths would be far higher without **harm** reduction. And I personally know hundreds of people who are alive today because of **harm** reduction. But **harm** reduction is just the start. If we truly want to make an impact on this drug crisis, we need to have a serious conversation about prohibition and criminal punishment. We need to recognize that drug use is first and foremost a public health issue and turn to comprehensive social and health solutions. We already have a model for how this can work. In 2001, Portugal was having its own drug crisis. Lots of people using drugs, high crime rates and an overdose epidemic. They defied global conventions and decriminalized all drug possession. Money that was spent on drug **enforcement** was redirected to health and rehabilitation programs. The results are in. Overall drug use is down dramatically. Overdoses are uncommon. Many more people are in treatment. And people have been given their lives back. We have come so far down the road of prohibition, punishment and **prejudice** that we have become indifferent to the **suffering** that we have inflicted on the most vulnerable people in our society. This year even more people will get caught up in the illegal drug trade. Thousands of children will learn that their mother or father has been sent to jail for using drugs. And far too many parents will be notified that their son or daughter has died of a drug overdose. It doesn ’ t have to be this way. Thank you.

Text Sample 350: POS Dim 3 – 2017 – Score 17.00 – 2017/t001102.txt

Vanessa Garrison : I am Vanessa, daughter of Annette, daughter of Olympia, daughter of Melvina, daughter of Katie, born 1878, Parish County, Louisiana. T. Morgan Dixon : And my name is Morgan, daughter of Carol, daughter of Letha, daughter of Willie, daughter of Sarah, born 1849 in Bardstown, Kentucky. VG : And in the tradition of our families, the great oral tradition of almost every Black church we know honoring the culture from which we draw so much power, we ’ re gonna start the way our mommas and grandmas would want us to start. TMD : In **prayer**. Let the words of my mouth, the **meditation** of our hearts, be acceptable in thy sight, oh Lord, my strength and my redeemer. VG : We call the names and rituals of our ancestors into this room today because from them we received a powerful blueprint for survival, strategies and tactics for healing carried across oceans by African women, passed down to generations of Black women in America who used those skills to navigate institutions of slavery and state-sponsored **discrimination** in order that we might stand on this stage. We walk in the footsteps of those women, our foremothers, legends like Ella Baker, Septima Clark, Fannie Lou Hamer, from whom we learned the power of organizing after she would had single-handedly registered 60, 000 voters in Jim Crow Mississippi. TMD : 60, 000 is a lot of people, so if you can imagine me and Vanessa inspiring 60, 000 women to walk with us last year, we were fired up. But today, 100, 000 Black women and girls stand on this stage with us. We are committed to **healing** ourselves, to lacing up our sneakers, to walking out of our front door every single day for total healing and transformation in our communities, because we understand that we are in the footsteps of a civil rights legacy like no other time before, and that we are facing a health crisis like never ever before. And so we ' ve had a lot of moments, great moments, including the time we had on our pajamas, we were working on our computer and Michelle Obama emailed us and invited us to the White House, and we thought it was spam. But this moment here is an opportunity. It is an opportunity that we don ' t take for granted, and so we thought long and hard about how we would use it. Would we talk to the women we hope to inspire, a million in the next year, or would we talk to you? We decided to talk to you, and to talk to you about a question that we get all the time, so that the millions of women who hopefully will watch this will never have to answer it again. It is : Why are Black women dying faster and at higher rates than any other group of people in America from preventable, obesity- related diseases? The question hurts me. I ' m shaking a little bit. It feels value-laden. It hurts my body because the weight represents so much. But we ' re going to talk about it and invite you into an inside conversation today because it is necessary, and because we need you. VG : Each night, before the first day of school, my grandmother would sit me next to the stove and with expert precision use a hot comb to press my hair. My grandmother was legendary, big, loud. She filled up a room with laughter and oftentimes curse words. She cooked a mean peach cobbler, had 11 children, a house full of grandchildren, and like every Black woman I know, like most all women I know, she had prioritized the care of others over caring for herself. We measured her strength by her capacity to endure pain and **suffering**. We **celebrated** her for it, and our choice would prove to be deadly. One night after pressing my hair before the first day of eighth grade, my grandmother went to bed and never woke up, dead at 66 years old from a heart attack. By the time I would graduate college, I would lose two more beloved family members to chronic disease : my aunt Diane, dead at 55, my aunt Tricia, dead at 63. After living with these losses, the hole that they left, I decided to calculate the life expectancy of the women in my family. Staring back at me, the number 65. I knew I could not sit by and watch another woman I loved die an early death. TMD : So we don ' t usually put our business in the **streets**. Let ' s just put that out there. But I have to tell you the statistics. Black women are dying at alarming rates, and I used to be a classroom teacher, and I was at South Atlanta High School, and I remember standing in front of my classroom, and I remember a statistic that half of Black girls will get diabetes unless diet and levels of activity change. Half of the girls in my classroom. So I couldn ' t teach anymore. So I started taking girls hiking, which is why we ' re called GirlTrek, but Vanessa was like, that is not going to move the dial on the health crisis ; it ' s cute. She was like, it ' s a cute hiking club. So what we thought is if we could rally a million of their mothers... 82 percent of Black women are over a healthy weight right now. 53 percent of us are obese. But the number that I cannot, that I cannot get out of my head is that every single day in America, 137 Black women die from a preventable disease, heart disease. That ' s every 11 minutes. 137 is more than gun **violence**, cigarette smoking and HIV combined, every day. It is roughly the amount of people that were on my plane from New Jersey to Vancouver. Can you imagine that? A plane filled with Black women crashing to the ground every day, and no one is talking about it. VG : So the question that you ' re all asking yourselves right now is why? Why are Black women dying? We asked ourselves that same question. Why is what ' s out there not working for them? Private weight loss companies, government interventions, public health campaigns. I ' m going to tell you why : because they focus on weight loss or looking good in skinny jeans without acknowledging the **trauma** that Black women hold in our bellies and bones, that has been embedded in our very DNA. The best advice from hospitals and doctors, the best medications from pharmaceutical companies to treat the congestive heart failure of my grandmother didn ’ t work because they didn ’ t acknowledge the **systemic** racism that she had dealt with since birth. A divestment in schools, discriminatory housing practices, predatory lending, a crack cocaine epidemic, mass incarceration putting more Black bodies behind bars than were owned at the height of slavery. But GirlTrek does. For Black women whose bodies are buckling under the weight of systems never designed to support them, GirlTrek is a lifeline. August 16, 2015, Danita Kimball, a member of GirlTrek in Detroit, received the news that too many Black mothers have received. Her son Norman, 23 years old, a father of two, was gunned down while on an afternoon drive. Imagine the **grief** that overcomes your body in that moment, the immobilizing fear. Now, know this, that just days after laying her son to rest, Danita Kimball posted online,”I don ’ t know what to do or how to move forward, but my sisters keep telling me I need to walk, so I will.”And then just days after that,”I got my steps in today for my baby Norm. It felt good to be out there, to walk.”TMD : Walking through pain is what we have always done. My mom, she ’ s in the middle right there, my mom desegregated her high school in 1955. Her mom walked down the steps of an abandoned school bus where she raised 11 kids as a sharecropper. And her mom stepped onto Indian territory fleeing the terrors of the Jim Crow South. And her mom walked her man to the door as he went off to fight in the Kentucky Colored Regiment, the Civil War. They were born slaves but they wouldn ’ t die slaves. Change-making, it ’ s in my blood. It ’ s what I do, and this health crisis ain ’ t nothing compared to the road we have traveled. So it ’ s like James Cleveland. I don ’ t feel no ways tired, so we got to work. We started looking at models of change. We looked all over the world. We needed something not only that was a part of our cultural inheritance like walking, but something that was scalable, something that was high-impact, something that we could replicate across this country. So we studied models like Wangari Maathai, who won the Nobel Peace Prize for inspiring women to plant 50 million trees in Kenya. She brought Kenya back from the brink of environmental devastation. We studied these systems of change, and we looked at walking scientifically. And what we learned is that walking just 30 minutes a day can single-handedly decrease 50 percent of your risk of diabetes, heart disease, stroke, even Alzheimer ’ s and dementia. We know that walking is the single most powerful thing that a woman can do for her health, so we knew we were on to something, because from Harriet Tubman to the women in Montgomery, when Black women walk, things change. VG : So how did we take this simple idea of walking and start a revolution that would catch a fire in **neighborhoods** across America? We used the best practices of the Civil Rights Movement. We huddled up in church basements. We did grapevine information sharing through beauty salons. We empowered and trained mothers to stand on the front lines. We took our message directly to the **streets**, and women responded. Women like LaKeisha in Chattanooga, Chrysantha in Detroit, Onika in New Orleans, women with difficult names and difficult stories join GirlTrek every day and commit to walking as a practice of self-care. Once walking, those women get to organizing, first their families, then their communities, to walk and talk and solve problems together. They walk and notice the abandoned building. They walk and notice the lack of **sidewalks**, the lack of green space, and they say,”No more.”Women like Susie Paige in Philadelphia, who after walking daily past an abandoned building in her **neighborhood**, decided,”I ’ m not waiting. Let me rally my team. Let me grab some supplies. Let me do what no one else has done for me and my community.”TMD : We know one woman can make a difference, because one woman has already changed the world, and her name is Harriet Tubman. And trust me, I love Harriet Tubman. I ’ m obsessed with her, and I used to be a history teacher. I will not tell you the whole history. I will tell you four things. So I used to have an old Saab — the kind of canvas top that drips on your head when it rains — and I drove all the way down to the eastern shore of Maryland, and when I stepped on the dirt that Harriet Tubman made her first escape, I knew she was a woman just like we are and that we could do what she had done, and we learned four things from Harriet Tubman. The first one : do not wait. Walk right now in the direction of your healthiest, most fulfilled life, because self-care is a revolutionary act. Number two : when you learn the way forward, come back and get a sister. So in our case, start a team with your friends — your friends, your family, your church. Number three : rally your allies. Every single person in this room is complicit in a Tubman-inspired takeover. And number four : find joy. The most underreported fact of Harriet Tubman is that she lived to be 93 years old, and she didn ’ t live just an ordinary life ; uh-uh. She was standing up for the good guys. She married a younger man. She adopted a child. I ’ m not kidding. She lived. And I drove up to her house of freedom in upstate New York, and she had planted apple trees, and when I was there on a Sunday, they were blooming. Do you call it — do they bloom? The apples were in season, and I was thinking, she left fruit for us, the legacy of Harriet Tubman, every single year. And we know that we are Harriet, and we know that there is a Harriet in every community in America. VG : We also know that there ’ s a Harriet in every community across the globe, and that they could learn from our Tubman Doctrine, as we call it, the four steps. Imagine the possibilities beyond the **neighborhoods** of Oakland and Newark, to the women working rice fields in Vietnam, tea fields in Sri Lanka, the women on the mountainsides in Guatemala, the **indigenous** reservations throughout the vast plains of the Dakotas. We believe that women walking and talking together to solve their problems is a global solution. TMD : And I ’ ll leave you with this, because we also believe it can become the center of social justice again. Vanessa and I were in Fort Lauderdale. We had an organizer training, and I was leaving and I got on the airplane, and I saw someone I knew, so I waved, and as I ’ m waiting in that long line that you guys know, waiting for people to put their stuff away, I looked back and I realized I didn ’ t know the woman but I recognized her. And so I blew her a kiss because it was Sybrina Fulton, Trayvon Martin ’ s mom, and she whispered”thank you”back to me. And I can ’ t help but wonder what would happen if there were groups of women walking on Trayvon ’ s block that day, or what would happen in the South Side of Chicago every day if there were groups of women and mothers and aunts and cousins walking, or along the polluted rivers of Flint, Michigan. I believe that walking can transform our communities, because it ’ s already starting to. VG : We believe that the personal is political. Our walking is for healing, for joy, for fresh air, quiet time, to connect and disconnect, to worship. But it ’ s also walking so we can be healthy enough to stand on the front lines for change in our communities, and it is our call to action to every Black woman listening, every Black woman in earshot of our voice, every Black woman who you know. Think about it : the woman working front desk reception at your job, the woman who delivers your mail, your neighbor — our call to action to them, to join us on the front lines for change in your community. TMD : And I ’ ll bring us back to this moment and why it ’ s so important for my dear, dear friend Vanessa and I. It ’ s because it ’ s not always easy for us, and in fact, we have both seen really, really dark days, from the hate speech to the summer of police brutality and **violence** that we saw last year, to even losing one of our walkers, Sandy Bland, who died in police custody. But the most courageous thing we do every day is we practice faith that goes beyond the facts, and we put feet to our **prayers** every single day, and when we get overwhelmed, we think of the words of people like Sonia

Sanchez, a poet laureate, who says,”Morgan, where is your fire? Where is the fire that burned holes through slave ships to make us breathe? Where is the fire that turned guts into chitlins, that took rhythms and make jazz, that took sit-ins and marches and made us jump boundaries and barriers? You ’ ve got to find it and pass it on.”So this is us finding our fire and passing it on to you. So please, stand with us, walk with us as we rally a million women to reclaim the **streets** of the 50 highest need communities in this country. We thank you so much for this opportunity.

Text Sample 351: POS Dim 3 – 2020 – Score 27.00 – 2020/t004255.txt

Chris Anderson : Hello, TED community, welcome back for another live conversation. It ’ s a big one today, as big as they get. You know, when we created this”Build Back Better”series our thought was how could we address issues arising out of the pandemic, how could we imagine building back from that. But the events of this past week, the horrific death of George Floyd and the daily protests that have followed, I mean, they provided a new urgency which we, of course, simply have to address. I mean, can we build back better from this? I think before we can even start to answer that question, we just have to seek to understand the immensity of this moment. Whitney Pennington Rodgers : That ’ s right, Chris. Right now, so many people in the United States and beyond are grappling with feelings of anger and frustration, deep, deep sadness and really helplessness. No matter who you are, you have questions about what to do now, how to make things better. And as we ’ ve seen, **violence** like this unfolds for many, many years. What is the path forward? CA : So – We ’ re joined today by a group of activists, organizers and leaders known for their crucial work in social justice and civil rights. We ’ re so grateful to have them here to engage in a discussion about racial injustice in America, the unbearable acts of **violence** that we ’ ve – Acts of **violence** against the black community that we ’ ve witnessed, the dangers to a nation riven by anger and fear. And how on earth we can move forward from this to something better. So first, each of our four guests will share their thoughts on how we move forward from this moment. And then we ’ ll engage as a group, including you, the TED community. WPR : And we ’ d like to thank our partner, the Project Management Institute. Their generous support has helped make today ’ s interviews possible, and of course, as Chris mentioned, we want you to take part in the conversation, so please share your questions using our Ask a question feature and continue to share your thoughts in the discussion thread. CA : Thanks, Whitney. OK, let ’ s get this moving. Our first guest. Dr. Phillip Atiba Goff is the founder and CEO of the Center for Policing Equity. They work with police departments across America, including in Minneapolis, to seek measurable responses to racial bias. Phil, I can scarcely imagine how the stress in the last week must have been for you. Welcome, and over to you for your opening comments. Phillip Atiba Goff : Thanks, Chris. Yeah, this week has been a gut punch to anybody who felt like we could be making progress in the way that we put forward public **safety** that empowers particularly vulnerable communities. We started working in Minneapolis about five years ago. At the time, it was, like most major cities in the United States, a department that had a long history of unaccounted for **violence** from law **enforcement**, targeting the most vulnerable black communities. And we tried to put into place a number of things that we know work. Change the culture, so that the culture can be accountable to the values of the community. And what we saw was small but measurable progress. We always knew, with small and measurable progress, that you ’ re one tragic incident from going back to ground zero. But the events of the last week and a half haven ' t brought us back to ground zero, they ' ve torched ground zero, and we ' ve dug a hole that we have to dig ourselves out of. What I hear from police chiefs who call me, from activists I talk to, from folks in the communities that are literally on fire right now, I hear folks saying, I had one activist say to me that the pain that he was feeling was too large to fit into his body. And without thinking about it, I said right back,"That ' s because it ' s too large to fit into a lifetime."What we ' re seeing isn ' t just the response to one gruesome, cruel, public execution. A lynching. It ' s not just the reaction to three of them : Ahmaud Arbery, Breonna Taylor and then George Floyd. What we ' re seeing is the bill come due for the unpaid debts that this country owes to its black residents. And it comes due usually every 20 to 30 years. It was Ferguson just six years ago, but about 30 years before that, it was in the **streets** of Los Angeles, after the verdict that exonerated the police that beat Rodney King on video. It was Newark, it was Watts, it was Chicago, it was Tulsa, it was Chicago again. If we don ' t take a full accounting of these debts that are owed, then we ' re going to keep paying it. Part of what I ' ve been experiencing in the last week and a half, and what I ' ve been sharing with the people who do this work, who are serious about it, is the acknowledgment, the soul-crushing reality that at some point, when things stop being on fire, the cameras are going to turn to something else. And the history that we have in this country is not just a history of vicious neglect and a targeted abuse of black communities, it ' s also one where we lose our attention for it. And what that means for communities like in Baton Rouge, for those who still grieve Alton Sterling, and in Baltimore, for those who are still grieving Freddie Gray, is that there is not just a chance, there ' s a likelihood that we are a month or two months out from this with no more to show for it than what we had to show after Michael Brown Jr. And holding the weight of that, individually and collectively, is just too much. It ' s just too heavy a load for a person or a people, or a generation to hold up. What we ' re seeing is the unrepentant sins, the unpaid debts. And so the solution can ' t just be that we fix policing. It can ' t be only incremental reform. It can ' t be only systems of accountability to catch cops after they ' ve killed somebody. Because there ' s no such thing as justice for George Floyd. There ' s maybe accountability. There ' s maybe some relief from the people who are still around, who loved him, for his daughter who spoke out yesterday and said,"My Daddy changed the world."There won ' t be justice for a man who ' s dead when he didn ' t have to be. But we ' re not going to get to where we need to go just by reforming police. So in addition to the work that CPE is known for with the data, we have been encouraging departments and cities to take the money that should be going to invest in communities, and take it from police budgets, bring it to the communities. People ask,"Well, what could it possibly look like? How could we imagine it?"And I tell people, there is a place where we do this in the United States right now. We ' ve all heard about it, whispered, some of us have even been there, some of us live there. The place is called the suburbs, where we already have enough resources to give to people, so they don ' t need the police for public **safety** in the first place. If someone has a substance abuse issue, they can go to a clinic. If somebody has a medical issue, they ' ve got insurance, they can go to a hospital. If there ' s a **domestic** dispute, they have friends, they have support. You don ' t need to enter a badge and a gun into it. If we hadn ' t disinvested from all the public resources that were available in communities that most needed those, we wouldn ' t need police in the first place, and many have been arguing, even more loudly recently, that we don ' t. If we would just take the money that we use to punish, and instead invest it in the promise and the genius of the community that could be there. So I don ' t know all the ways we ’ re going to get there. I know it ’ s going to take everything and. It ’ s going to need the kind of **systemic** change and the management tools that we traditionally offer. It ’ s also going to need a quantum change in the way that we think about public **safety**. But mostly, this isn ’ t just a policing problem. This is the unpaid debts that are owed to black America. The bill is coming due. And we need to start getting an accounting together, so we ’ re not just paying off the interest of the damn thing. WPR : Thank you, Phil. Rashad Robinson is the president of Color Of Change, a civil rights organization that advocates for racial justice for the black community. To date, more than four million people have signed their petition to arrest the officers involved in the murder of George Floyd. And of course, one was arrested last week. Thank you so much for being with us, Rashad, welcome. Rashad Robinson : Thank you. And thank you for having me. It ’ s an opportunity that I ’ m taking today to just tell you about how you can get involved. How you can take action, because right now, strategic action is critical for all of us to do the work to change the rules that far too often keep the systems in place that hold us back. Make no mistake, the criminal justice system is not broken. It is operating exactly the way it was designed. At every single level, the criminal justice system is not about providing justice, but about ensuring that certain people, certain communities are protected, while other communities are violated. And so I wan to talk a little bit today about Color Of Change, about activism, about the work that ’ s happening on the ground from other organizations all around the country, and the way that you can channel this energy. What we talk about at Color Of Change is how do you channel presence into power. Far too often we mistake presence and visibility for power, presence retweets the stories of the movement, people feeling **passion** about change could sometimes make us feel like change is inevitable, but power is actually the ability to change the rules. And right now, every day, people are taking action, and what we ’ re trying to channel that energy into is a couple of things. First is a whole set of demands at the federal level and at the local level. As Phil described, policing operates on many different channels. And what we need to recognize is that while there are a lot of things that can happen at the federal level, locally all around the country there are decisions that are being made in communities around how policing is executed, where community needs to hold a deeper level of accountability, at the state level we need new laws. So at Color Of Change, we ’ ve built a whole platform around a set of demands and are working to build more energy for everyday people to take action. We ’ re fighting for justice for Ahmaud Arbery, Breonna Taylor and George Floyd, we ’ re also fighting for justice for other folks whose names you haven ’ t heard, Nina Pop and others, whose stories of injustice and the relationship to the criminal justice system represent all the ways in which fighting right now is important. Over the last couple of years, we have worked to build a movement, to hold district attorneys accountable and to change the role of district attorneys in our country. And through the Winning Justice platform at Color Of Change, www. winningjustice. org, what we have worked to do is channel the energy of everyday people to take action. So, for folks who are watching what ’ s happening on TV, seeing it on their social media feeds and are outraged about what ’ s happening in Georgia, what ’ s happening in Tennessee, what ’ s happening in Minnesota, you yourself, probably, most likely, live in a place, in a community where you have a district attorney that will not hold police accountable, that will not prosecute police when they **harm**, hurt black folks, when they violate the laws, you live in a community where police are part of the structure that is racking up mass incarceration, but many other aspects of our system are racking up mass incarceration, and district attorneys are at the center of it. You live in those communities and you need to do something about it. And so at winningjustice. org, we ' ve created the only searchable, national database on the 2, 400 prosecutors around the country. We ' re building local squads and communities for folks to be able to engage around efforts that hold DAs accountable. We ' ve worked with our partners across the movement, from our friends in Black Lives Matter, to folks who do policy work, to our friends at local ACLU chapters around the country, to build six demands. Six demands that folks can get behind in terms of pushing for reform, and then we ' ve built public education material. But the only way that we work to change the way that prosecution happens in this country is that if people get involved. If people raise their voice, if people join us in pushing for real change. At the end of the day, I want people to recognize though, and Phillip talked a little bit about this, is that people don ' t experience issues, they experience life. That the forces that hold us back are deeply interrelated, a racist criminal justice system requires a racist media culture to survive, a political inequality follows economic inequality, they all go hand in hand. And so I also want us to not take ourselves out of the equation. We likely work inside of corporations that may post symbols for Black Lives Matter one day, and then support politicians that work to destroy Black Lives Matter the next day. We oftentimes are engaged in practices inside of our companies or in our daily lives supporting media properties and others that are **harming** our communities, are telling stories. Recently, we produced a report at Color Of Change with the Norman Lear school at USC. It ' s called"Normalizing Injustice,"and it can be found at changehollywood. org. And"Normalizing Injustice"looks at the 22 crime procedurals, those crime shows on TV. And looks at all of the ways in which they, sort of, create a warped perception about our view of justice. They create sort of an incentive for the type of policing we see on the country, and actually serve as a PR arm for law **enforcement**. We ' ve been working in writers rooms around the country to work to push folks to tell better stories, but we need folks to be both active listeners, and we need folks in the industry to push back and challenge those, not only the structures that lead to that content coming on the air, but the proliferation across our airwaves. At the end of the day, we have an opportunity in this moment to make change. Inflection points are those moments where we have an opportunity to make huge leaps forward, or the real, real threat of falling backwards. In our hands is the ability to do some incredible things about undoing so many of the injustices that have stood in the way of progress for far too long. But everyday people must get involved. We must channel that presence into power, and we must build the type of power that changes the rules. Racism in so many ways is like water pouring over a floor with holes in it. Every single – In every single way, it will find the holes. And so for us, we cannot simply accept charitable solutions to structural problems, but we actually have to work for structural change. And so I want to end by saying one thing about how we talk about black people and how we talk about black communities in this moment. Because we have to say what we mean, and we have to build the narrative that gets us to where we want to go. So far too often, we talk about black communities as vulnerable, we talk about black people as vulnerable, but vulnerability is a personal trait, black communities have been under attack. Black communities have been exploited, black communities have been targeted, and we need to say that, so we don ' t put the onus on fixing black families and communities, but we put the onus on fixing the structures that have **harmed** us. We will say things like,"Black people are less likely to get loans from banks,"instead of saying that banks are less likely to give loans to black people. This is our opportunity to build the type of progress that makes real change, and at the center of this story, we need to show and elevate the images not just of the pain that we are facing, but of the joy, the brilliance and the creativity that black people have brought to this country. Black people are the protagonist of this story, and we need to make sure that as we work to build a new tomorrow, we ensure that the heroes are at the center of the liberation that we all need. Thank you. CA : Thank you, Rashad. Dr. Bernice King is the CEO of the King Center in Atlanta, Georgia. The center is a living memorial to her father, Dr. Martin Luther King Jr. It ’ s dedicated to inspiring new generations to carry his work forward. In this moment, when so many are hurting, how can we better approach unity and collective healing? Dr. King, over to you. Bernice King : My heart is a little heavy right now, because I was that six-year-old. I was five years old when my father was assassinated. And he did change the world. But the tragedy is that we didn ’ t hear what he was saying to us as a prophet to this nation. And his words are now reverberating back to us. Change, we all know, is necessary right now. And yet, it ’ s not easy. We know that there has to be changes in policing in this nation of ours. But I want to talk about America ’ s choice at a greater level. The prophet said to us,”We still have a choice today : nonviolent coexistence, or **violent** coannihilation.”What we have witnessed over the last eight days has placed that choice before us. We have seen literally in the **streets** of our nation people who have been following the path of nonviolent protest, and people who have been hell-bent on destruction. Those choices are now looking at us, and we have to make a choice. The history of this nation was founded in **violence**. In fact, my father said America is the greatest purveyor of **violence**. And the only way forward is if we repent for being a nation built on **violence**. And I ’ m not just talking about physical **violence**. I ’ m talking about **systemic violence**, I ’ m talking about policy **violence**, I ’ m talking about what he spoke of are the triple evils of poverty, racism and militarism. All **violent**. Albert Einstein said something to us. He said we cannot solve problems on the same level of thinking in which they were created. And so if we are going to move forward, we are going to have to deconstruct these systems of **violence** that we have set in America. And we ’ re going to have to reconstruct on another foundation. That foundation happens to be love and nonviolence. And so, as we move forward, we can correct course if we make that choice that Daddy said, nonviolent coexistence. And not continue on the pathway of **violent** coannihilation. So what does that look like? That looks like some deconstruction work in order to get to the construction. We have to deconstruct our thinking. We ’ ve got to deconstruct the way in which we see people and deconstruct the way in which we operate, practice and engage and set policy. And so I believe that there ’ s a lot of heart, h-e-a-r-t work to do, in the midst of all the h-a-r-d, hard work to do. Because heart work is hard work. One of the things we have to do is we have to ensure that everyone, especially my white brothers and sisters, have to engage in the heart work, the antiracism work, in our hearts. No one is exempt from this, especially in my white community. We must do that work in our hearts, the antiracism work. The second thing is that I encourage people to look at the nonviolence training that we [have] at the King Center, thekingcenter. org, so that we learn the foundation of understanding our interrelatedness and interconnectedness. That we understand our loyalties and our commitments and our policy-making can no longer be devoted to one group of people, but has to be devoted to the greater good of all people. And so I ’ m inviting people to even join us on our own line of protest that ’ s happening every night at seven o ’ clock pm on the King Center Facebook page, because so many people have things that they want to express and contribute to this. We all have to change and have to make a choice. It is a choice to change the direction that we have been going. We need a revolution of values in this country. That ’ s what my Daddy said. He changed the world, he changed hearts, and now, what has happened over the last seven, eight years and through history, we have to change course. And we all have to participate in changing America with the true revolution of values, where people are at the center, and not profit. Where morality is at the center, and not our military might. America does have a choice. We can either choose to go down continually that path of destruction, or we can choose nonviolent coexistence. And as my mother said, struggle is a never-ending process, freedom is never really won. You earn it and win it in every generation. Every generation is called to this freedom struggle. You as a person may want to exempt yourself, but every generation is called. And so I encourage corporations in America to start doing antiracism work within corporate America. I encourage every industry to start doing antiracism work, and pick up the banner of understanding nonviolent change, personally, and from a social change perspective. We can do this. We can make the right choice to ultimately build the beloved community. Thank you. WPR : Thank you, Dr. King. Anthony Romero is the executive director of American Civil Liberties Union. As one of the nation ' s oldest social justice organizations, the ACLU has advocated for racial **equality** and shown deep support to the black community in moments of crisis. And in moments like these, black voices are almost always the loudest and at times the **silence** from our nonblack brothers and sisters can feel deafening. How we can bring our allies into the mix, to better support ending **systemic violence** and racism against the black communities, is a question top of mind for a lot of us. Anthony, welcome to the show, and thank you so much for being with us. Anthony Romero : Great. Thank you, thank you Whitney, thank you, Chris, for inviting me to join this TED community. I think community is really important right now. With so many of us feeling trepidation, the weariness, the anger, the fear, the frustration, the terrorism that we ' ve experienced in our communities. This is a time to huddle around a virtual campfire, with your posse, with your family, with your loved ones, with your network. It ' s not a time to be isolated or alone. And I think for allies in this struggle, those of us who don ' t live this experience every day, it is time for us to lean in. You can ' t change the channel, you can ' t tune out, you can ' t say,"This is too hard."It is not that hard for us to listen and learn and heed. It is the only way we ' re going to build out of this, by hearing the voices of Rashad, and Phil and Dr. King. By hearing the voices of our neighbors and loved ones, by hearing the voices on **Twitter** of people who we don ' t know. And so white communities and allied organizations need to pay even closer attention. This is the test of your character. How willing are you to lean in and to engage. For me, I have – These have been really hard couple of weeks. I feel like this is really a test of whether or not we really believe in the American experiment. Do we really believe it? Do we really believe that out of many, one, a country with no unifying language, no unifying culture, no unifying religion, can we really become one people? All **equal** before the law? All bound together with a belief in the rule of law? Do we really believe that or do we just think it ' s a nice saying to see on the back of a paper dollar? And for me, this is a referendum on the American experiment. On whether we really believe, and... the future is in our hands. And this is not like other crises, I ' ve been the head of the ACLU for almost 20 years, I feel like I ' ve seen it all. This is different. And this is different because it is cumulative, like Phil and Rashad and Dr. King told us, this is centuries of **systemic discrimination**, and the bill has come due. And it will continue to be due, and we will pay. Unless we really do something quite different. I have been scratching my head at the ACLU for the last week. We ' ve been at this for 100 years. My organization has been working on this from its inception. In 1931, we were involved with this report about lawlessness in law **enforcement**. That was our first report that we got behind in 1931. We opened up our first door fronts after the riots in Watts, so that we can bring legal services and lawyers to the communities so they could demand justice from the police departments. You know, we brought Miranda, you know, the right to remain silent, and we brought Gideon, the right to a court-appointed attorney if you can ’ t afford one. We fought Bloomberg on”stop-and-frisk,”it took him years and he lost in front of our litigation to finally **apologize**. We ’ ve been at this for 100 years. And for the communities that have lived this for 400 years, God. I ’ ve been scratching my head, thinking. It ain ’ t working. We don ’ t need another pattern and practice lawsuit. We don ’ t need another training program on racial bias or implicit bias in police departments, we don ’ t need to file another lawsuit on qualified immunity, we don ’ t need to, kind of, bring another race **discrimination** or gender **discrimination** lawsuit to integrate the police department. Yeah, we ’ ve done that and we will continue to do that. For me, where I ’ ve come, is that we need to defund the budgets of these police departments. It ’ s the only way we ’ re going to take the power back. And the more I read over the last couple of weeks about where this country is, the more I ’ m clear that that is my North star at the moment. We will continue to bring the litigation on qualified immunity, we will do the efforts to hold unaccountable law **enforcement** officials accountable, we will bring pattern and practice lawsuits, because the justice department is not doing that, so we will continue to do all that good work. But the real thing is, we ’ re going to go after those budgets. When you look at the fact that we spend 100 million dollars on policing, more than incarceration, that the city of Minneapolis spent 30 percent of their budget on policing. The city of Oakland, 41 percent on policing. That when you have New York City police department spend more money on policing than it does on housing and preservation development, community youth services, **homelessness**. We ’ re going after the money. And that ’ s hard-core advocacy. Bills drop in local legislatures to cut the funding for police, to stop these programs that give the federal military surplus to police departments, so they become, like, little mini armies, these don ’ t look like police officers, these look like standing armies. And the enemy are communities of color. So we need to take away their toys. We need to cut their budgets. We need to shrink the police infrastructure, so that we can get police out of the quotidian lives of people of color and communities of color. The ubiquitousness of police **enforcement** on things that the police do not have a role, should not have a role to play. People should not lose their lives over whether or not a cigarette pack has a proper tax stamp, or whether a 20-dollar bill was forged or not. That ’ s not worthy of spending our dollars on police. Get them out of that business, let ’ s focus on the most important and the most serious of crimes, and that ’ s it. That ’ s it. We ’ re going to depolice our communities. Shrink those budgets. We ’ re going to reinvest those moneys in local communities, it will be like water on stone campaigns, local legislatures, local city counsels, lab report cards, for people who talk out of both sides of their mouths and say,”We believe in police reform,”and yet, they ’ re still going to vote for 30 or 40 percent for the police? We ’ re going to put that right to the public. And I think we just have to stay at it, because I think that ’ s the only way we can get at this in a different way. Because much of what we tried to do is just simply not working. You know, with that, I struggle with, how do you find the optimism in this moment, because you have to find the optimism. You have to find the way to still think that even though on the face of so many setbacks, there ’ s been change. It ’ s been too little, too slow, not enough. We need to kind of, rock it, boost it. But you can ’ t lose sight of the optimism. And you know, I ’ ve been thinking about who are the folks inspiring me, and Dr. King ’ s father, of course, and the words of

Rashad and Patrisse Cullors and others have inspired me. But I find inspiration in the words of a scholar I really don ’ t like bringing up, Sam Huntington, kind of often criticized as being a conservative, a racist. But sometimes you can find inspiration even in your enemy ’ s words. And in one of his books, which I pulled off the shelf I have, he writes about how America is a disappointment, because it failed to live up to its aspirations. And he actually started talking about, America is a failure because it doesn ’ t live up to its ideals. But it ’ s not a failure, it ’ s not a bunch of lies. It ’ s a disappointment. And in the disappointment also is the fact that there ’ s hope. I ’ m paraphrasing it, but I think we have to kind of, wrap all of that together, and think about the disappointment and the hope and the resolve to do better. And we need to listen and lean in, and I thank the TED community, I thank Dr. King, I thank Rashad, I thank Phil. Thank you. CA : Wow. Thank you to all four of you, that was astonishing. I guess we ’ re bringing everyone back now to have a conversation among us, to answer questions from our community, I hope you ’ re entering those questions. So I don ’ t know whether we can bring back our guests onto the screen at this point. Welcome back. Let me start with a question to you, Dr. King, I was so inspired by what you said. Your father, of course, also deeply understood the anger that leads to protest. I think he said that protests are the language of the unheard. And I ’ m wondering what you would say to someone right now who is angered beyond measure by what ’ s happened, and also sees this could be the moment, you know, like, someone who believes the system is so fundamentally broken, that our best choice is to tear it down, that that is actually – This may be a once-in-a-generation moment to do that. And so to actually believe that protest, including **violent** protest, actually is the way right now. What would you say to someone who felt that? BK : First, I just wanted to make just a slight correction, he said riots are the language of the unheard. CA : I **apologize**, I **apologize**. But that is the point even more powerfully, yeah. BK : Yes. Protest we must, and we must continue to always protest, to keep the issues in the awareness before people, but you know, when a person is angry, sometimes it ’ s hard to reach them. I ’ ve been on that journey, I was at a stage of my life where I was so angry, I wanted to destroy, and I ’ m the daughter of Martin Luther King Jr., and grew up in a household of love and nonviolence and forgiveness, and I had to go through that journey I was surrounded by the right kind of influences, fortunately. Because that would have been a sad story. But I think it ’ s really allowing ourselves to hear the anger and allowing the space for the anger, but also trying to help young people rechannel that energy. And we ’ ve got to start ensuring that we connect them to some of the work that has been and now is elevated to another place. Color Of Change, the work that you ’ re doing, the ACLU, the work that they ’ re doing, because sometimes, there ’ s this disconnection that intensifies the emotion and makes you feel **helpless**. But if you can channel that anger, connect it with action that is toward creating the social and economic change, then it begins to build you up, and then you can begin to become more constructive with the anger. WPR : We have some questions that are coming in from our community, but before we do that, you all shared such powerful, meaningful statements right now, and many of you touched on the fact that this is not the first time that we ’ re experiencing this. The murder of George Floyd, Ahmaud Arbery, Breonna Taylor, this is one of – these are three of many, many instances just like this, and I ’ d love to hear you all address was has, sort of, brought us to this boiling point, what has contributed to this moment where we ’ re now experiencing things, Anthony, as you said, that feels so much worse than other moments? And that ’ s it, anyone who feels comfortable to take that question. AR : Rashad, I want to hear you. BK : I wanted to say something. I think we ’ ve always been at that moment.

But this moment is different, because of the void in leadership. There ’ s no real moral voice in our country, and the person who sits in the office of the presidency is not, you know, leading in the right way. And has kind of – no, not kind of, has given license to certain things. And so now it ’ s, you know, he ’ s lit the fires. WPR : Yeah. RR : The thing I ’ ll add... The thing I ’ ll add here is, you know, a couple of things. For the last couple of months, we have been both seeing and experiencing all of the ways that this country ’ s decisions of underinvestment, of targeting black communities, has been killing black people through COVID. And while we ’ ve been in our homes, we have also been watching how the media has blamed us as we have been the essential workers in so many places and trying to ensure that this country keeps going. We ’ ve watched white men with guns show up to capitols demanding, basically, black and brown people go back to work. And then we see this eight-minute video with a police officer, with his knee on someone ’ s neck, after seeing that video of Ahmaud Arbery and hearing the story of Breonna Taylor, and we see him looking in the camera, basically knowing that America was not going to punish him. And what I think it is is that it ’ s just enough is enough, that people didn ’ t feel that they had a channel for that outrage, and because people had been inside, and because people had been experiencing all the ways in which the structures had also been colluding to kill us, that what we ’ re seeing is alignment of all of those things, where people are making demands that are much bigger and much bolder than before. And we recognize that while we don ’ t have leadership at the federal level, we also have to recognize that no political party can say that they have been 100 percent, neither political party can say they ’ ve been 100 percent on the right side of all these issues. And so people are mobilizing, they are fighting back like never before, and in some ways, people are unwilling to accept answers like,”Just go vote,”or,”Just participate in the process,”because we recognize that black people have been voting, black people have been part of voting, and part of ensuring that. And so that I think is why this moment feels so much different, combined with, for the last seven years, since Trayvon, we have seen the growth of a new movement of activists and leaders all around the country, who are also in a very different place to be able to move the needle on so much of what ’ s possible. CA : We have a question here from Genesis Be. If we can get that up here.”Here in Mississippi, the police is synonymous with the Klan, historically. How do we purge law **enforcement** of white supremacists?”PAG : So I guess that ’ s partially to me, being the psychologist of bias. I ’ ll say that just yesterday we had an officer in Denver who posted on social media himself and two other officers saying,”Let ’ s go start a riot.”He was fired that day. I worry about all the officers that the FBI has now, for almost half a decade, been warning us, law **enforcement** and unions being infiltrated by white supremacists. And all the officers that have social media accounts, but they ’ re private. You know, the Invisible Institute has put some things forward. We ’ re not talking seriously about the **domestic** terrorism threat that white supremacy represents. So the first thing that we ’ ve got to do is we ’ ve got to take it seriously. We have to actually say out loud, and I can ’ t believe that on a day like today, or a week like this week, I have to say out loud, white supremacy is alive and well and a driving force of American politics. This shouldn ’ t be controversial. I shouldn ’ t be looking forward to getting hate mail in my inbox for it, but that ’ s the reality. So the first part of solving a problem is acknowledging that it exists. But the second thing is we need to arm municipalities, that ’ s law **enforcement**, but even more so communities, with the ability to take action when someone violates their values. Right now, I think about the case in Philadelphia where Charles Ramsey, when he was a commissioner there, fired six officers, right.

Concerns about racial bias and concerns about police brutality, and those six officers were back on the same job inside of three months. We now have a law **enforcement** system that says you can lose your job in one jurisdiction, and get the same job as law **enforcement** in another jurisdiction. And without the national registry and the capacity for law **enforcement** to make different decisions, we ' re going to have this exact problem, not just in Mississippi, but in Minneapolis, and Louisville and New York and LA. CA : Phil, how much of the problem stems from the fact that police unions have a huge amount of power to protect and sometimes reinstate so called bad apple officers? PAG : Yeah, I ' m getting this question a lot, and police unions are one of the most labor forces of the United States, and are unique within the labor movement, right? So it ' s police unions and teachers ' unions are the two largest and could not be two different groups of folks. When I talk to union leadership, that ' s the leadership what wants to talk to Dr. Blackenstein, right, when I talk to union leadership, what they say is no one hates a bad officer more than a good officer. But the union contracts, the new negotiations, don ' t look like that ' s true. What they look like is anybody gets in trouble, and the union ' s only job is to make sure whatever officer is in trouble, gets to maintain their job. The perverse incentive here is that when people run for union leadership, no one can run saying,"These people shouldn ' t be in the union."It ' s very hard to do that. What you can run on is say,"If this person didn ' t protect you enough, I ' ll protect you even more. The bigots? I ' ll protect even them."So we have this perverse incentive where union leadership ends up not really representing the values even of the rest of the union members. But they have massive, outsized negotiating power. So yes, engaging with and appropriate rightsizing of labor protections, for folks whose jobs are difficult, but who should not be protected from the basic values of human rights, human dignity and public **safety**. It ' s got to be part of the process. I mean, when unions are negotiating a two-year ban on keeping of records, so that there ' s no ability even to trace what ' s happening in the state of California, historically in terms of police misconduct, that ' s not in the interest of public **safety**, public legitimacy, or our democracy. AR : Yeah, the thing I would add, Chris, is that I think the labor union piece is a critically important one to think through. Because I think, like Phil said, they are a key part of the puzzle that we have to solve for. And you know, it ' s frustrating when you look at a place in Minneapolis, and Phil knows better than I, but when mayor Jacob Frey, the one who ' s on TV all the time, saying many of the right things that you want an elected official to say at times like this, when he banned his police department from attending the"warrior training"that was being offered, it was the Minneapolis Police Federation, local union that defied him and sent their police to the training. And so we need to really be clear that we need to have the police forces under civilian control. I know this sounds so elementary, I feel like I ' m talking about a Latin American, kind of, totalitarian context, but we need to exert civilian control of our police in a way that we have yet not been able to think through, and a key part of that is the labor unions of the police. And there are moments when you can find common ground. When we brought one of our COVID-related lawsuits to deal with the outbreak of the pandemic in a Maryland jail, we worked really hard, I worked the phones with the head of police unions. We got one of the local unions to serve as plaintiff in our lawsuit. Because we understood that the incarcerated folks who were being denied **access** to masks, social distancing and the conditions and lack of testing, and lack of PP, that the people who were also going to be in **harm** ' s way were going to be the guards as well. And they were going to be the vectors, communicating the disease out into the community. So if you can find ways of bringing that relationship. But make no mistake, when you go after their budgets, and you start taking away kind of, their munitions, and their seat at the budgeting table, oh, are you going to have a battle on your hands, right? And we have to think about also as we shrink the budgets for police, how do we – we deploy people in the police departments to other meaningful jobs, right? Because you can ’ t just throw them out into the **street**, and say,”You ’ re on your own, you ’ re **homeless**, good luck to you.”That ’ s not a way to deal with redemption. So we have to really think about all these pieces in a much more cohesive way. WPR : We have another question here from the audience. From Paul Rucker :”The end of summer of 1919 was followed by the Tulsa Race Massacre, the Johnson-Reed Anti-Immigration Act of 1924, and also the rise of the KKK. Is there a possibility that white supremacy will get stronger if we don ’ t seize this opportunity?”Rashad, I think this might be something that would be great to hear your perspective on, working so deeply in activism. RR : I ’ m having a little trouble hearing. WPR : Oh, I ’ m so sorry. RR : No, it ’ s OK. CA : Can you read the question on the screen, Rashad? RR : Oh, I heard that, I heard you. WPR : Yes, I think it might just be my mic is having some issues here.”Is there a possibility that white supremacy will get stronger if we don ’ t seize this opportunity.”Yes, absolutely yes. You know, to be clear, right, if we don ’ t have the right diagnosis of white supremacy, if we think of white supremacy as just hoods, if we think of white supremacy as just folks who are operating, you know, with, you know – in some of these underground networks that have grown, if we ’ re just thinking about white supremacy and white nationalism as people who marched with tiki torches in Charlottesville, then we will really mistake all the ways in which our systems and structures have white supremacy embedded, and allow for something like a Tulsa Race Massacre to happen, something like anti-immigration to happen, but on a day-to-day basis allow for the targeting of black communities through predatory practices by banks. The targeting of black communities through predatory practices like **bail**. A whole set of systems that can be produced day in and day out. We live in a country where the rules are far too often designed in ways that create a caste system, that create a different standard for some over others, and so when I talked about the inflection point, right, of this moment where something could really go forward and something could turn backwards, we are seeing this right now with this current president. And as we look at what could be happening with the next election, we have to be very, very clear that Donald Trump doesn ’ t just operate on his own. He ’ s enabled by big corporations who benefit from him being in office, and so continue to turn a blind eye to all the things that he does. They may post”Black Lives Matter,”but they show up to the White House and engage with Donald Trump. And then we have a whole set of politicians that may sometimes say that he said something that was wrong, but then allow for – but support his platform in other ways. You know, true co-conspiracy in the effort to dismantle white supremacy and white nationalism is not a thing that people can do on vacation. It is a 365-day project of us constantly working to dismantle all of the structures that have been put in **harm** ’ s way. The final thing I will just add, because someone mentioned about police unions, and I want to just add that one of the problems with police unions, and many of us have been in this position, I think, is that I have shown up to the table with police unions on many occasions. I remember going to the White House during the last administration and being around a table as we were talking about policing and police reform. And having members of the Fraternal Order of Police leadership say things like,”All of this talk of racial profiling is new to us.”It is one thing for folks to not agree with you on the policy reforms necessary. It is another thing for people to say that our demands are too aspirational. It ’ s another thing to be gaslit and told the problem doesn ’ t actually exist at all.

And that is what we are dealing with, and so we have to actually change the way that people see these institutions. Politicians who say that they are on the side of justice and reform, can no longer take money from police-only unions and Fraternal Order of Police. We actually have to create a new standard, a new litmus test of what does it mean to actually be with us. You can ’ t just **sing** our songs, use our hashtags and march in our marches, if you are on the other end of supporting the structures that put us in **harm** ’ s way, that literally kill us. And this is the opportunity for white allies to actually stand up in new ways. To be the type of ally, to do the type of allyship and the type of work that truly dismantles structures, not just provides charity. PAG : And I ’ ve got to add to that – so, Paul, thank you for the question, but we ’ re in a moment where people are looking at what ’ s happening on the **street**, as if a week and a half ago we weren ’ t in a midst of a global pandemic as the greatest news story, the biggest new story going on. One of the things I ’ m most worried about, and have been worried about since the beginning, what I ’ ve been talking to our chiefs about, is say, you must be out of the social distancing policing game. You can ’ t be the ones doing that, and the reason is this : We ’ re in a moment where creating scapegoats and enemies and others is incredibly politically advantageous for at least one side. And there is deliberate efforts to do exactly that. And we ’ ve seen that black communities are two and three and four times more likely to contract this virus, which feels like the manifestation of racial **discrimination**, because it is. But very soon, that ’ s going to look like black people made bad choices and they need to stay away from us. And when that happens, that ’ s when law **enforcements** get used to regulate where black movement can be. We used to call it sundown towns, I don ’ t know what we ’ re going to call it when it ’ s around COVID. But it ’ s coming. I ’ m already seeing that on communities like Nextdoor, and on Facebook groups. People who don ’ t think of themselves as white supremacists but just want the disease away, and the disease has a black and brown face. So we ’ re not only dealing with a moment of generational tension, between black communities and law **enforcement**, we ’ re dealing with a moment when people are looking for scapegoats, and black people ’ s vulnerability has always been our greatest casting note for being cast as scapegoats. So for folks who are worried about this, this is not inevitably a moment for change and reform and enlightenment and America ’ s best values, because historically, these have been precisely the moments when regression back to white supremacy has reigned supreme. So let ’ s not just look at everybody signaling. I don ’ t want to just see black and white cops on their knees, I want to see the policies. I want to see the things that will prevent this kind of thing from moving to the next stage. CA : Rashad, I want to respect the fact that you ’ ve got a hard stop at one. And so I just want to thank you for your participation in this. If you ’ ve got a couple of final words you want to share, that would be great, and then if it ’ s OK for the other three, I think there ’ s just a couple other questions I ’ d love to put and continue this conversation for just a moment longer, if possible. Rashad, any closing words? RR : The thing I want to say is that now is the time for action. And I want to invite people in to join us at Color Of Change to make justice real. And in so many ways, you can visit us at Color Of Change, you can take action. Five, 10, 15 years from now, we will be dealing with the impacts of what we did or didn ’ t do in this moment. How we stood up and how hard we were willing to fight. And as the other speakers have said, now is not the time for reform around the edges, now is time for dismantling the policies and practices that have held us back, and championing solutions and new rules that will move us forward. And so we hope that you will do something, whether it ’ s with us, or whether it ’ s with local organizations in your community, or other groups around the country. But this is an opportunity to make change, and I believe that we can make justice real, if we find the **passion** and the energy to work together to achieve it. So thank you all for having me, and I hope that we have an opportunity to build, not just online, but offline, in the months to come. CA : Thanks so much, Rashad. We ’ re just going to ask this last question of you. This one is from David Fenton.”How can the movement unite around a clear, simple platform of policies to enshrine in legislation? Like making all complaints against cops public, banning all choke holds, ensuring independent review boards, etc.?”WPR : That seems like a great place for you to chime in, Dr. King, if you have some thoughts on that. PAG : I think that was to go to you, Dr. King. BK : Oh, OK. You know, this may sound simplistic, but it ’ s a Nike thing, I think we have to just do it, we have to see our work as interconnected. I think there ’ s been efforts towards people working in that vein, but we have to intensify that. And in doing it, one of the things that my father said, and I know people sometimes get tired of hearing me say,”My father said,”but I just think, I wish, should I say, we had really listened to him, because we wouldn ’ t be on this platform right now having this type of conversation. But he left something with us, sort of a blueprint in”Where Do We Go From Here : Chaos or Community?”, his book, and he said, going forward, the meddlesome task is to organize our strength into compelling power. And that is so key, because oftentimes we organize merely around **passion**. But people have certain areas of strength and talent and giftedness, and we ’ ve got to figure out how to build our coalitions based on these strengths. You know, people do different things well. And so, in order to unite in an effective way that they might not elude the demand that we ’ re making, I think that ’ s what ’ s going to happen. People have to do their own personal assessment within their organization, I call it a SWAT analysis. And then that SWAT analysis has to happen across organizations, so that we can make sure that we are moving in a united manner, off of the strengths that each organization brings, so that we can maximize the impact and the effectiveness to do things like this, in terms of getting the legislation in place that is needed in this hour. CA : Thanks so much. Just quick closing words from you, Anthony, and then from you, Phil. Anthony. AR : You know, I would just say that what gives me hope are the young folk. You have to believe that among this group, this groups of young ’ uns, seeing what they ’ re seeing, living with this president, with these instincts, seeing the continued indifference that mainstream communities have given to issues of racial justice, or economic justice, you ’ ve got to believe that what comes out of this very hot fire, is something even more powerful and strong than we ’ ve ever seen before. That ’ s what gets me through the hard days that we ’ re now experiencing, this thinking, there is another Dr. King among the young ’ uns, Dr. King. And I have to believe that what they ’ re seeing and what they ’ re witnessing and their righteous indignation and their frustration and their anger is going to be miraculously a beautiful blossoming of a new opportunity, of a new change. This generation will take us there, I have to believe that. My generation has failed them miserably. So I ’ m just looking forward to the new ones. CA : Thank you, Anthony. WPR : Phil. Thank you, Anthony. PAG : So it really has been a privilege to be on with you all. To David ’ s question, let me say that a number of civil rights organizations, I believe the ACLU among them, CPE, Center for Policing Equity, and hundreds more have signed on to principles for legislation that would include eight pillars. It ’ s been led by the Leadership Conference for Civil and Human Rights. And it includes a federal ban on choke holds, it includes a national registry for officers who have engaged in misconduct. I also think that it ’ s important at this moment to get, we ’ ve got law **enforcement** ’ s chiefs of major cities willing to say, if we emerge from this moment and our profession hasn ’ t changed, then we have failed again. So it ’ s a critical time to get behind, I would direct you to LCCHR ’ s website for the eight pillars, because I won ’ t remember them all right now, and to start calling your local law **enforcement**, and say,”Yes, own that.”You should be signing on, they should be going public with letters that do all of that. But I ’ ll also say this. For a path forward in the principles, I ’ ll end where I started, which is that this is bigger than policing. These are the unpaid debts owed to black communities for stolen labor, owed to native communities for stolen land, for stolen culture, for years taken away and for lives lost in it. This is bigger than policing. If we don ’ t understand the size of it, then there ’ s no solution that ’ s really, truly proportional to the moment. But in this moment, when we ’ re seeing trillion of dollars in bailouts, mostly for corporations, it is absolutely a time when we can do things that normally, people could pretend that ’ s too much, it ’ s too big, we can ’ t. We have literally all the money in the world that can be spent and directed towards making us the society we pretend to be, before moments like this happen. And so the thing that gives me hope is that the lies have to be obvious now. The lies have to be, that was a reasonable use of force. The lie has to be, we don ’ t have the money. The lie has to be, that ’ s too hard, it ’ s too big of a challenge. This stuff feels impossible every day except today, because the alternative is we lose everything. Everything is at stake, our democracy is at stake, the people we choose to be, we claim to be, that ’ s at stake. And in the face of that, I think we can do impossible things. I think we can be mighty. So my hope for all of us is first, that we wake up tomorrow with more peace in the evening than war, and that we hold on to what ’ s possible from this moment at the same time that we hold on to the size of the task in front of us. I don ’ t want to come with half measures out of this. I don ’ t want to come out with radicalized youth and indifferent aged... I don ’ t know what the contrast... The radicalized youth and indifferent people who are old like me. I want to come out with a unified country that understands that the costs that we owe are big, and our pockets are deep enough to match it. CA : Wow. Thank you to each of you for extraordinary eloquence. Really, so powerful. This conversation, obviously, continues, I know that there ’ s many people listening, you have other questions, this, I think, from TED ’ s point of view is just the start of the conversation. To the extent that our job is to amplify the voices that matter, we couldn ’ t be prouder to be amplifying further your extraordinary voices. So thank you for being part of this today. PAG : Thank you. WPR : Thank you all.
