Diana Reiss : You may think you ’ re looking through a window at a dolphin spinning playfully, but what you ’ re actually looking through is a two-way mirror at a dolphin looking at itself spinning playfully. This is a dolphin that is self-aware. This dolphin has self-awareness. It ’ s a young dolphin named Bayley. I ’ ve been very interested in understanding the nature of the intelligence of dolphins for the past 30 years. How do we explore intelligence in this animal that ’ s so different from us? And what I ’ ve used is a very simple research tool, a mirror, and we ’ ve gained great information, reflections of these animal minds. Dolphins aren ’ t the only animals, the only non-human animals, to show mirror self-recognition. We used to think this was a uniquely human ability, but we learned that the great apes, our closest relatives, also show this ability. Then we showed it in dolphins, and then later in elephants. We did this work in my lab with the dolphins and elephants, and it ’ s been recently shown in the magpie. Now, it ’ s interesting, because we ’ ve embraced this Darwinian view of a continuity in physical evolution, this physical continuity. But we ’ ve been much more reticent, much slower at recognizing this continuity in cognition, in emotion, in consciousness in other animals. Other animals are conscious. They ’ re emotional. They ’ re aware. There have been multitudes of studies with many species over the years that have given us exquisite evidence for thinking and consciousness in other animals, other animals that are quite different than we are in form. We are not alone. We are not alone in these abilities. And I hope, and one of my biggest dreams, is that, with our growing awareness about the consciousness of others and our relationship with the rest of the animal world, that we ’ ll give them the respect and protection that they deserve. So that ’ s a wish I ’ m throwing out here for everybody, and I hope I can really engage you in this idea. Now, I want to return to dolphins, because these are the animals that I feel like I ’ ve been working up closely and personal with for over 30 years. And these are real personalities. They are not persons, but they ’ re personalities in every sense of the word. And you can ’ t get more alien than the dolphin. They are very different from us in body form. They ’ re radically different. They come from a radically different environment. In fact, we ’ re separated by 95 million years of divergent evolution. Look at this body. And in every sense of making a pun here, these are true non-terrestrials. I wondered how we might **interface** with these animals. In the 1980s, I developed an underwater keyboard. This was a custom-made touch-screen keyboard. What I wanted to do was give the dolphins choice and control. These are big brains, highly social animals, and I thought, well, if we give them choice and control, if they can hit a symbol on this keyboard — and by the way, it was **interfaced** by fiber optic cables from Hewlett-Packard with an Apple II computer. This seems prehistoric now, but this was where we were with technology. So the dolphins could hit a key, a symbol, they heard a computer-generated whistle, and they got an object or activity. Now here ’ s a little video. This is Delphi and Pan, and you ’ re going to see Delphi hitting a key, he hears a computer-generated whistle — — and gets a **ball**, so they can actually ask for things they want. What was **remarkable** is, they explored this keyboard on their own. There was no intervention on our part. They explored the keyboard. They played around with it. They figured out how it worked. And they started to quickly imitate the sounds they were hearing on the keyboard. They imitated on their own. Beyond that, though, they started learning associations between the symbols, the sounds and the objects. What we saw was self-organized learning, and now I ’ m imagining, what can we do with new technologies? How can we create **interfaces**, new windows into the minds of animals, with the technologies that exist today? So I was thinking about this, and then, one day, I got a call from Peter. Peter Gabriel : I make noises for a living. On a good day, it ’ s music, and I want to talk a little bit about the most amazing music-making experience I ever had. I ’ m a farm boy. I grew up surrounded by animals, and I would look in these eyes and wonder what was going on there? So as an adult, when I started to read about the amazing breakthroughs with Penny Patterson and Koko, with Sue Savage-Rumbaugh and Kanzi, Panbanisha, Irene Pepperberg, Alex the parrot, I got all excited. What was amazing to me also was they seemed a lot more adept at getting a handle on our language than we were on getting a handle on theirs. I work with a lot of musicians from around the world, and often we don ’ t have any common language at all, but we sit down behind our instruments, and suddenly there ’ s a way for us to connect and emote. So I started cold-calling, and eventually got through to Sue Savage-Rumbaugh, and she invited me down. I went down, and the bonobos had had access to percussion instruments, musical toys, but never before to a keyboard. At first they did what infants do, just bashed it with their fists, and then I asked, through Sue, if Panbanisha could try with one finger only. Sue Savage-Rumbaugh : Can you play a grooming song? I want to hear a grooming song. Play a real quiet grooming song. PG : So groom was the subject of the piece. So I ’ m just behind, jamming, yeah, this is what we started with. Sue ’ s encouraging her to continue a little more. She discovers a note she likes, finds the octave. She ’ d never sat at a keyboard before. Nice triplets. SSR : You did good. That was very good. PG : She hit good. So that night, we began to dream, and we thought, perhaps the most amazing tool that man ’ s created is the Internet, and what would happen if we could somehow find new **interfaces**, visual-audio **interfaces** that would allow these **remarkable** sentient beings that we share the planet with access? And Sue

Savage-Rumbaugh got excited about that, called her friend Steve Woodruff, and we began hustling all sorts of people whose work related or was inspiring, which led us to Diana, and led us to Neil. Neil Gershenfeld : Thanks, Peter. PG : Thank you. NG : So Peter approached me. I lost it when I saw that clip. He approached me with a vision of doing these things not for people, for animals. And then I was struck in the history of the Internet. This is what the Internet looked like when it was born and you can call that the Internet of middle-aged white men, mostly middle-aged white men. Vint Cerf : NG : Speaking as one. Then, when I first came to TED, which was where I met Peter, I showed this. This is a $1 web server, and at the time that was radical. And the possibility of making a web server for a dollar grew into what became known as the Internet of Things, which is literally an industry now with tremendous implications for health care, energy efficiency. And we were happy with ourselves. And then when Peter showed me that, I realized we had missed something, which is the rest of the planet. So we started up this interspecies Internet project. Now we started talking with TED about how you bring dolphins and great apes and elephants to TED, and we realized that wouldn ' t work. So we ' re going to bring you to them. So if we could switch to the audio from this computer, we ' ve been video conferencing with cognitive animals, and we ' re going to have each of them just briefly introduce them. And so if we could also have this up, great. So the first site we ' re going to meet is Cameron Park Zoo in Waco, with orangutans. In the daytime they live outside. It ' s nighttime there now. So can you please go ahead? Terri Cox : Hi, I ' m Terri Cox with the Cameron Park Zoo in Waco, Texas, and with me I have KeraJaan and Mei, two of our Bornean orangutans. During the day, they have a beautiful, large outdoor habitat, and at night, they come into this habitat, into their night quarters, where they can have a climate-controlled and secure environment to sleep in. We participate in the Apps for Apes program Orangutan Outreach, and we use iPads to help stimulate and enrich the animals, and also help raise awareness for these critically endangered animals. And they share 97 percent of our DNA and are incredibly intelligent, so it ' s so exciting to think of all the opportunities that we have via technology and the Internet to really enrich their lives and open up their world. We ' re really excited about the possibility of an interspecies Internet, and K. J. has been enjoying the conference very much. NG : That ' s great. When we were rehearsing last night, he had fun watching the elephants. Next user group are the dolphins at the National Aquarium. Please go ahead. Allison Ginsburg : Good evening. Well, my name is Allison Ginsburg, and we ' re live in Baltimore at the National Aquarium. Joining me are three of our eight Atlantic bottlenose dolphins : 20-year-old Chesapeake, who was our first dolphin born here, her four-year-old daughter Bayley, and her half sister, 11-year-old Maya. Now, here at the National Aquarium we are committed to excellence in animal care, to research, and to conservation. The dolphins are pretty intrigued as to what ' s going on here tonight. They ' re not really used to having cameras here at 8 o ' clock at night. In addition, we are very committed to doing different types of research. As Diana mentioned, our animals are involved in many different research studies. NG : Those are for you. Okay, that ' s great, thank you. And the third user group, in Thailand, is Think Elephants. Go ahead, Josh. Josh Plotnik : Hi, my name is Josh Plotnik, and I ' m with Think Elephants International, and we ' re here in the Golden Triangle of Thailand with the Golden Triangle Asian Elephant Foundation elephants. And we have 26 elephants here, and our research is focused on the evolution of intelligence with elephants, but our foundation Think Elephants is focused on bringing elephants into classrooms around the world virtually like this and showing people how incredible these animals are. So we ' re able to bring the camera right up to the elephant, put food into the elephant ’ s mouth, show people what ’ s going on inside their mouths, and show everyone around the world how incredible these animals really are. NG : Okay, that ’ s great. Thanks Josh. And once again, we ’ ve been building great relationships among them just since we ’ ve been rehearsing. So at that point, if we can go back to the other computer, we were starting to think about how you integrate the rest of the biomass of the planet into the Internet, and we went to the best possible person I can think of, which is Vint Cerf, who is one of the founders who gave us the Internet. Vint? VC : Thank you, Neil. A long time ago in a galaxy — oops, wrong script. Forty years ago, Bob Kahn and I did the design of the Internet. Thirty years ago, we turned it on. Just last year, we turned on the production Internet. You ’ ve been using the experimental version for the last 30 years. The production version, it uses IP version 6. It has 3. 4 times 10 to the 38th possible terminations. That ’ s a number only that Congress can appreciate. But it leads to what is coming next. When Bob and I did this design, we thought we were building a system to connect computers together. What we very quickly discovered is that this was a system for connecting people together. And what you ’ ve seen tonight tells you that we should not restrict this network to one species, that these other intelligent, sentient species should be part of the system too. This is the system as it looks today, by the way. This is what the Internet looks like to a computer that ’ s trying to figure out where the traffic is supposed to go. This is generated by a program that ’ s looking at the connectivity of the Internet, and how all the **various** networks are connected together. There are about 400, 000 networks, interconnected, run independently by 400, 000 different operating agencies, and the only reason this works is that they all use the same standard TCP / IP protocols. Well, you know where this is headed. The Internet of Things tell us that a lot of computer-enabled appliances and devices are going to become part of this system too : appliances that you use around the house, that you use in your office, that you carry around with yourself or in the car. That ’ s the Internet of Things that ’ s coming. Now, what ’ s important about what these people are doing is that they ’ re beginning to learn how to communicate with species that are not us but share a common sensory environment. We ’ re beginning to explore what it means to communicate with something that isn ’ t just another person. Well, you can see what ’ s coming next. All kinds of possible sentient beings may be interconnected through this system, and I can ’ t wait to see these experiments unfold. What happens after that? Well, let ’ s see. There are machines that need to talk to machines and that we need to talk to, and so as time goes on, we ’ re going to have to learn how to communicate with computers and how to get computers to communicate with us in the way that we ’ re accustomed to, not with keyboards, not with mice, but with speech and gestures and all the natural human language that we ’ re accustomed to. So we ’ ll need something like C3PO to become a translator between ourselves and some of the other machines we live with. Now, there is a project that ’ s underway called the interplanetary Internet. It ’ s in operation between Earth and Mars. It ’ s operating on the International Space Station. It ’ s part of the spacecraft that ’ s in orbit around the Sun that ’ s rendezvoused with two planets. So the interplanetary system is on its way, but there ’ s a last project, which the Defense Advanced Research Projects Agency, which funded the original ARPANET, funded the Internet, funded the interplanetary architecture, is now funding a project to design a spacecraft to get to the nearest star in 100 years ’ time. What that means is that what we ’ re learning with these interactions with other species will teach us, ultimately, how we might interact with an alien from another world. I can hardly wait. June Cohen : So first of all, thank you, and I would like to acknowledge that four people who could talk to us for full four days actually managed to stay to four minutes each, and we thank you for that. I have so many questions, but maybe a few practical things that the audience might want to know. You ’ re launching this idea here at TED — PG : Today. JC : Today. This is the first time you ’ re talking about it. Tell me a little bit about where you ’ re going to take the idea. What ’ s next? PG : I think we want to engage as many people here as possible in helping us think of smart **interfaces** that will make all this possible. NG : And just mechanically, there ’ s a 501 and web infrastructure and all of that, but it ’ s not quite ready to turn on, so we ’ ll roll that out, and contact us if you want the information on it. The idea is this will be — much like the Internet functions as a network of networks, which is Vint ’ s core contribution, this will be a wrapper around all of these initiatives, that are wonderful individually, to link them globally. JC : Right, and do you have a web address that we might look for yet? NG : Shortly. JC : Shortly. We will come back to you on that. And very quickly, just to clarify. Some people might have looked at the video that you showed and thought, well, that ’ s just a webcam. What ’ s special about it? If you could talk for just a moment about how you want to go past that? NG : So this is scalable video infrastructure, not for a few to a few but many to many, so that it scales to symmetrical video sharing and content sharing across these sites around the planet. So there ’ s a lot of back-end signal processing, not for one to many, but for many to many. JC : Right, and then on a practical level, which technologies are you looking at first? I know you mentioned that a keyboard is a really key part of this. DR : We ’ re trying to develop an interactive touch screen for dolphins. This is sort of a continuation of some of the earlier work, and we just got our first seed money today towards that, so it ’ s our first project. JC : Before the talk, even. DR : Yeah. JC : Wow. Well done. All right, well thank you all so much for joining us. It ’ s such a delight to have you on the stage. DR : Thank you. VC : Thank you.

We ’ re 25, 26 years after the advent of the Macintosh, which was an astoundingly seminal event in the history of human-machine **interface** and in computation in general. It fundamentally changed the way that people thought about computation, thought about computers, how they used them and who and how many people were able to use them. It was such a radical change, in fact, that the early Macintosh development team in ’ 82, ’ 83, ’ 84 had to write an entirely new operating system from the ground up. Now, this is an interesting little message, and it ’ s a lesson that has since, I think, been forgotten or lost or something, and that is, namely, that the OS is the **interface**. The **interface** is the OS. It ’ s like the land and the king they ’ re inseparable, they are one. And to write a new operating system was not a capricious matter. It wasn ’ t just a matter of tuning up some graphics routines. There were no graphics routines. There were no mouse drivers. So it was a necessity. But in the quarter-century since then, we ’ ve seen all of the fundamental supporting technologies go berserk. So memory capacity and disk capacity have been multiplied by something between 10, 000 and a million. Same thing for processor speeds. Networks, we didn ’ t have networks at all at the time of the Macintosh ’ s introduction, and that has become the single most salient aspect of how we live with computers. And, of course, graphics : Today 84 dollars and 97 cents at Best Buy buys you more graphics power than you could have gotten for a million bucks from SGI only a decade ago. So we ’ ve got that incredible ramp-up. Then, on the side, we ’ ve got the Web and, increasingly, the cloud, which is fantastic, but also — in the regard in which an **interface** is fundamental — kind of a distraction. So we ’ ve forgotten to invent new **interfaces**. Certainly we ’ ve seen in recent years a lot of change in that regard, and people are starting to wake up about that. So what happens next? Where do we go from there? The problem, as we see it, has to do with a single, simple word :”space,”or a single, simple phrase :”real world geometry.”Computers and the programming languages that we talk to them in, that we teach them in, are hideously insensate when it comes to space. They don ’ t understand real world space. It ’ s a funny thing because the rest of us occupy it quite frequently and quite well. They also don ’ t understand time, but that ’ s a matter for a separate talk. So what happens if you start to explain space to them? One thing you might get is something like the Luminous Room. The Luminous Room is a system in which it ’ s considered that input and output spaces are co-located. That ’ s a strangely simple, and yet unexplored idea, right? When you use a mouse, your hand is down here on the mouse pad. It ’ s not even on the same plane as what you ’ re talking about : The pixels are up on the **display**. So here was a room in which all the walls, floors, ceilings, pets, potted plants, whatever was in there, were capable, not only of **display** but of sensing as well. And that means input and output are in the same space enabling stuff like this. That ’ s a digital storage in a physical container. The contract is the same as with real word objects in real world containers. Has to come back out, whatever you put in. This little design experiment that was a small office here knew a few other tricks as well. If you presented it with a chess board, it tried to figure out what you might mean by that. And if there was nothing for them to do, the chess pieces eventually got bored and hopped away. The academics who were overseeing this work thought that that was too frivolous, so we built deadly serious applications like this optics prototyping workbench in which a toothpaste cap on a cardboard box becomes a laser. The beam splitters and lenses are represented by physical objects, and the system projects down the laser beam path. So you ’ ve got an **interface** that has no **interface**. You operate the world as you operate the real world, which is to say, with your hands. Similarly, a digital wind tunnel with digital wind flowing from right to left — not that **remarkable** in a sense ; we didn ’ t invent the mathematics. But if you **displayed** that on a CRT or flat panel **display**, it would be meaningless to hold up an arbitrary object, a real world object in that. Here, the real world merges with the simulation. And finally, to pull out all the stops, this is a system called Urp, for urban planners, in which we give architects and urban planners back the models that we confiscated when we insisted that they use CAD systems. And we make the machine meet them half way. It projects down digital shadows, as you see here. And if you introduce tools like this inverse clock, then you can control the sun ’ s position in the sky. That ’ s 8 a. m. shadows. They get a little shorter at 9 a. m. There you are, swinging the sun around. Short shadows at noon and so forth. And we built up a series of tools like this. There are inter-shadowing studies that children can operate, even though they don ’ t know anything about urban planning : To move a building, you simply reach out your hand and you move the building. A material wand makes the building into a sort of Frank Gehry thing that reflects light in all directions. Are you blinding passers by and motorists on the freeways? A zoning tool connects distant structures, a building and a roadway. Are you going to get sued by the zoning commission? And so forth. Now, if these ideas seem familiar or perhaps even a little dated, that ’ s great ; they should seem familiar. This work is 15 years old. This stuff was undertaken at MIT and the Media Lab under the incredible direction of Professor Hiroshi Ishii, director of the Tangible Media Group. But it was that work that was seen by Alex McDowell, one of the world ’ s legendary production designers. But Alex was preparing a little, sort of obscure, indie, arthouse film called”Minority Report”for Steven Spielberg, and invited us to come out from MIT and design the **interfaces** that would appear in that film. And the great thing about it was that Alex was so dedicated to the idea of verisimilitude, the idea that the putative 2054 that we were painting in the film be believable, that he allowed us to take on that design work as if it were an R&D effort. And the result is sort of gratifyingly perpetual. People still reference those sequences in”Minority Report”when they talk about new UI design. So this led full circle, in a strange way, to build these ideas into what we believe is the necessary future of human machine **interface** : the **Spatial** Operating Environment, we call it. So here we have a bunch of stuff, some images. And, using a hand, we can actually exercise six degrees of freedom, six degrees of navigational control. And it ’ s fun to fly through Mr. Beckett ’ s eye. And you can come back out through the scary orangutan. And that ’ s all well and good. Let ’ s do something a little more difficult. Here, we have a whole bunch of disparate images. We can fly around them. So navigation is a fundamental issue. You have to be able to navigate in 3D. Much of what we want computers to help us with in the first place is inherently **spatial**. And the part that isn ’ t **spatial** can often be spatialized to allow our wetware to make greater sense of it. Now we can distribute this stuff in many different ways. So we can throw it out like that. Let ’ s reset it. We can organize it this way. And, of course, it ’ s not just about navigation, but about manipulation as well. So if we don ’ t like stuff, or we ’ re intensely curious about Ernst Haeckel ’ s scientific falsifications, we can pull them out like that. And then if it ’ s time for analysis, we can pull back a little bit and ask for a different distribution. Let ’ s just come down a bit and fly around. So that ’ s a different way to look at stuff. If you ’ re of a more analytical nature then you might want, actually, to look at this as a color histogram. So now we ’ ve got the stuff color-sorted, angle maps onto color. And now, if we want to select stuff, 3D, space, the idea that we ’ re tracking hands in real space becomes really important because we can reach in, not in 2D, not in fake 2D, but in actual 3D. Here are some selection planes. And we ’ ll perform this Boolean operation because we really love yellow and tapirs on green grass. So, from there to the world of real work. Here ’ s a logistics system, a small piece of one that we ’ re currently building. There ’ re a lot of elements. And one thing that ’ s very important is to combine traditional tabular data with three-dimensional and geospatial information. So here ’ s a familiar place. And we ’ ll bring this back here for a second. Maybe select a little bit of that. And bring out this graph. And we should, now, be able to fly in here and have a closer look. These are logistics elements that are scattered across the United States. One thing that three-dimensional interactions and the general idea of imbuing computation with space affords you is a final destruction of that unfortunate one-to-one pairing between human beings and computers. That ’ s the old way, that ’ s the old mantra : one machine, one human, one mouse, one screen. Well, that doesn ’ t really cut it anymore. In the real world, we have people who collaborate ; we have people who have to work together, and we have many different **displays**. And we might want to look at these **various** images. We might want to ask for some help. The author of this new pointing device is sitting over there, so I can pull this from there to there. These are unrelated machines, right? So the computation is space soluble and network soluble. So I ’ m going to leave that over there because I have a question for Paul. Paul is the designer of this wand, and maybe its easiest for him to come over here and tell me in person what ’ s going on. So let me get some of these out of the way. Let ’ s pull this apart : I ’ ll go ahead and explode it. Kevin, can you help? Let me see if I can help us find the circuit board. Mind you, it ’ s a sort of gratuitous field- stripping exercise, but we do it in the lab all the time.

All right. So collaborative work, whether it ' s immediately co-located or distant and distinct, is always important. And again, that stuff needs to be undertaken in the context of space. And finally, I ' d like to leave you with a glimpse that takes us back to the world of imagery. This is a system called TAMPER, which is a slightly whimsical look at what the future of editing and media manipulation systems might be. We at Oblong believe that media should be accessible in much more fine-grained form. So we have a large number of **movies** stuck inside here. And let ' s just pick out a few elements. We can zip through them as a possibility. We can grab elements off the front, where upon they reanimate, come to life, and drag them down onto the table here. We ' ll go over to Jacques Tati here and grab our blue friend and put him down on the table as well. We may need more than one. And we probably need, well, we probably need a cowboy to be quite honest. Yeah, let ' s take that one. You see, cowboys and French farce people don ' t go well together, and the system knows that. Let me leave with one final thought, and that is that one of the greatest English language writers of the last three decades suggested that great art is always a gift. And he wasn ' t talking about whether the novel costs 24. 95 [dollars], or whether you have to spring 70 million bucks to buy the stolen Vermeer ; he was talking about the circumstances of its creation and of its existence. And I think that it ' s time that we asked for the same from technology. Technology is capable of expressing and being imbued with a certain generosity, and we need to demand that, in fact. For some of this kind of technology, ground center is a combination of design, which is crucially important. We can ' t have advances in technology any longer unless design is integrated from the very start. And, as well, as of efficacy, agency. We ' re, as human beings, the creatures that create, and we should make sure that our machines aid us in that task and are built in that same image. So I will leave you with that. Thank you. Chris Anderson : So to ask the obvious question — actually this is from Bill Gates — when? CA : When real? When for us, not just in a lab and on a stage? Can it be for every man, or is this just for corporations and **movie** producers? JU : No, it has to be for every human being. That ' s our goal entirely. We won ' t have succeeded unless we take that next big step. I mean it ' s been 25 years. Can there really be only one **interface**? There can ' t. CA : But does that mean that, at your desk or in your home, you need projectors, cameras? You know, how can it work? JU : No, this stuff will be built into the bezel of every **display**. It ' ll be built into architecture. The gloves go away in a matter of months or years. So this is the inevitability about it. CA : So, in your mind, five years time, someone can buy this as part of a standard computer **interface**? JU : I think in five years time when you buy a computer, you ' ll get this. CA : Well that ' s cool. The world has a habit of surprising us as to how these things are actually used. What do you think, what in your mind is the first killer app for this? JU : That ' s a good question, and we ask ourselves that every day. At the moment, our early-adopter customers — and these systems are deployed out in the real world — do all the big data intensive, data heavy problems with it. So, whether it ' s logistics and supply chain management or natural gas and resource extraction, financial services, pharmaceuticals, bioinformatics, those are the topics right now, but that ' s not a killer app. And I understand what you ' re asking. CA : C ' mon, c ' mon. Martial arts, games. C ' mon. John, thank you for making science-fiction real. JU : It ' s been a great pleasure. Thank you to you all.

Text Sample 865: POS Dim 6 – 2010 – Score 4.00 – 2010/t002780.txt

We live on a human-dominated planet, putting unprecedented pressure on the systems on Earth. This is bad news, but perhaps surprising to you, it ’ s also part of the good news. We ’ re the first generation â thanks to science â to be informed that we may be undermining the stability and the ability of planet Earth to support human development as we know it. It ’ s also good news, because the planetary risks we ’ re facing are so large, that business as usual is not an option. In fact, we ’ re in a phase where transformative change is necessary, which opens the window for innovation, for new ideas and new paradigms. This is a scientific journey on the challenges facing humanity in the global phase of sustainability. On this journey, I ’ d like to bring, apart from yourselves, a good friend, a stakeholder, who ’ s always absent when we deal with the negotiations on environmental issues, a stakeholder who refuses to compromise â planet Earth. So I thought I ’ d bring her with me today on stage, to have her as a witness of a **remarkable** journey, which humbly reminds us of the period of grace we ’ ve had over the past 10, 000 years. This is the living conditions on the planet over the last 100, 000 years. It ’ s a very important period â it ’ s roughly half the period when we ’ ve been fully modern humans on the planet. We ’ ve had the same, roughly, abilities that developed civilizations as we know it. This is the environmental conditions on the planet. Here, used as a proxy, temperature variability. It was a jumpy ride. 80, 000 years back in a crisis, we leave Africa, we colonize Australia in another crisis, 60, 000 years back, we leave Asia for Europe in another crisis, 40, 000 years back, and then we enter the remarkably stable Holocene phase, the only period in the whole history of the planet, that we know of, that can support human development. A thousand years into this period, we abandon our hunting and gathering patterns. We go from a couple of million people to the seven billion people we are today. The Mesopotamian culture : we invent agriculture, we domesticate animals and plants. You have the Roman, the Greek and the story as you know it. The only phase, as we know it that can support humanity. The trouble is we ’ re putting a quadruple sqeeze on this poor planet, a quadruple sqeeze, which, as its first squeeze, has population growth of course. Now, this is not only about numbers ; this is not only about the fact that we ’ re seven billion people committed to nine billion people, it ’ s an equity issue as well. The majority of the environmental impacts on the planet have been caused by the rich minority, the 20 percent that jumped onto the industrial bandwagon in the mid-18th century. The majority of the planet, aspiring for development, having the right for development, are in large aspiring for an unsustainable lifestyle, a momentous pressure. The second pressure on the planet is, of course the climate agenda â the big issue â where the policy interpretation of science is that it would be enough to stabilize greenhouse gases at 450 ppm to avoid average temperatures exceeding two degrees, to avoid the risk that we may be destabilizing the West Antarctic Ice Sheet, holding six meters â level rising, the risk of destabilizing the Greenland Ice Sheet, holding another seven meters â sea level rising. Now, you would have wished the climate pressure to hit a strong planet, a resilient planet, but unfortunately, the third pressure is the ecosystem decline. Never have we seen, in the past 50 years, such a sharp decline of ecosystem functions and services on the planet, one of them being the ability to regulate climate on the long term, in our forests, land and biodiversity. The forth pressure is surprise, the notion and the evidence that we need to abandon our old paradigm, that ecosystems behave linearly, predictably, controllably in our â so to say â linear systems, and that in fact, surprise is universal, as systems tip over very rapidly, abruptly and often irreversibly. This, dear friends, poses a human pressure on the planet of momentous scale. We may, in fact, have entered a new geological era â the Anthropocene, where humans are the predominant driver of change at a planetary level. Now, as a scientist, what ' s the evidence for this? Well, the evidence is, unfortunately, ample. It ' s not only carbon dioxide that has this hockey stick pattern of accelerated change. You can take virtually any parameter that matters for human well-being â nitrous oxide, methane, deforestation, overfishing land degredation, loss of species â they all show the same pattern over the past 200 years. Simultaneously, they branch off in the mid- 50s, 10 years after the Second World War, showing very clearly that the great acceleration of the human enterprise starts in the mid-50s. You see, for the first time, an imprint on the global level. And I can tell you, you enter the disciplinary research in each of these, you find something remarkably important, the conclusion that we may have come to the point where we have to bend the curves, that we may have entered the most challenging and exciting decade in the history humanity on the planet, the decade when we have to bend the curves. Now, as if this was not enough â to just bend the curves and understanding the accelerated pressure on the planet â we also have to recognize the fact that systems do have multiple stable states, separated by thresholds â **illustrated** here by this **ball** and cup diagram, where the depth of the cup is the resilience of the system. Now, the system may gradually â under pressure of climate change, erosion, biodiversity loss â lose the depth of the cup, the resilience, but appear to be healthy and appear to suddenly, under a threshold, be tipping over. Upff. Sorry. Changing state and literally ending up in an undesired situation, where new biophysical logic takes over, new species take over, and the system gets locked. Do we have evidence of this? Yes, coral reef systems. Biodiverse, low-nutrient, hard coral systems under multiple pressures of overfishing, unsustainable tourism, climate change. A trigger and the system tips over, loses its resilience, soft corals take over, and we get undesired systems that cannot support economic and social development. The Arctic â a beautiful system â a regulating biome at the planetary level, taking the knock after knock on climate change, appearing to be in a good state. No scientist could predict that in 2007, suddenly, what could be crossing a threshold. The system suddenly, very surprisingly, loses 30 to 40 percent of its summer ice cover. And the drama is, of course, that when the system does this, the logic may change. It may get locked in an undesired state, because it changes color, absorbs more energy, and the system may get stuck. In my mind, the largest red flag warning for humanity that we are in a precarious situation. As a sideline, you know that the only red flag that popped up here was a submarine from an unnamed country that planted a red flag at the bottom of the Arctic to be able to control the oil resources. Now, if we have evidence, which we now have, that wetlands, forests, [unclear] monsoon system, the rainforests, behave in this nonlinear way. 30 or so scientists around the world gathered and asked a question for the first time,"Do we have to put the planet into the the pot?"So we have to ask ourselves : are we threatening this extraordinarily stable Holocene state? Are we in fact putting ourselves in a situation where we ' re coming too close to thresholds that could lead to deleterious and very undesired, if now catastrophic, change for human development? You know, you don ' t want to stand there. In fact, you ' re not even allowed to stand where this gentleman is standing, at the foaming, slippery waters at the threshold. In fact, there ' s a fence quite upstream of this threshold, beyond which you are in a danger zone. And this is the new paradigm, which we gathered two, three years back, recognizing that our old paradigm of just analyzing and pushing and predicting parameters into the future, aiming at minimalizing environmental impacts, is of the past. Now we to ask ourselves : which are the large environmental processes that we have to be stewards of to keep ourselves safe in the Holocene? And could we even, thanks to major advancements in Earth systems science, identify the thresholds, the points where we may expect non-linear change? And could we even define a planetary boundary, a fence, within which we then have a safe operating space for humanity? This work, which was published in”Nature,”late 2009, after a number of years of analysis, led to the final proposition that we can only find nine planetary boundaries with which, under active stewardship, would allow ourselves to have a safe operating space. These include, of course, climate. It may surprise you that it ’ s not only climate. But it shows that we are interconnected, among many systems on the planet, with the three big systems, climate change, stratospheric ozone depletion and ocean acidification being the three big systems, where the scientific evidence of large-scale thresholds in the paleo-record of the history of the planet. But we also include, what we call, the slow variables, the systems that, under the hood, regulate and buffer the capacity of the resilience of the planet â the interference of the big nitrogen and phosphorus cycles on the planet, land use change, rate of biodiversity loss, freshwater use, functions which regulate biomass on the planet, carbon sequestration, diversity. And then we have two parameters which we were not able to quantify â air pollution, including warming gases and air-polluting sulfates and nitrates, but also chemical pollution. Together, these form an integrated whole for guiding human development in the Anthropocene, understanding that the planet is a complex self-regulating system. In fact, most evidence indicates that these nine may behave as three Musketeers,”One for all. All for one.”You degrade forests, you go beyond the boundary on land, you undermine the ability of the climate system to stay stable. The drama here is, in fact, that it may show that the climate challenge is the easy one, if you consider the whole challenge of sustainable development. Now this is the Big Bang equivalent then of human development within the safe operating space of the planetary boundaries. What you see here in black line is the safe operating space, the quantified boundaries, as suggested by this analysis. The yellow dot in the middle here is our starting point, the pre-industrial point, where we ’ re very safely in the safe operating space. In the ’ 50s, we start branching out. In the ’ 60s already, through the green revolution and the Haber-Bosch process of fixing nitrogen from the atmosphere â you know, human ’ s today take out more nitrogen from the atmosphere than the whole biosphere does naturally as a whole. We don ’ t transgress the climate boundary until the early ’ 90s, actually, right after Rio. And today, we are in a situation where we estimate that we ’ ve transgressed three boundaries, the rate of biodiversity loss, which is the sixth extinction period in the history of humanity â one of them being the extinctions of the dinosaurs â nitrogen and climate change. But we still have some degrees of freedom on the others, but we are approaching fast on land, water, phosphorus and oceans. But this gives a new paradigm to guide humanity, to put the light on our, so far over-powered industrial vehicle, which operates as if we ’ re only on a dark, straight highway. Now the question then is : how gloomy is this? Is then sustainable development utopia? Well, there ’ s no science to suggest. In fact, there is ample science to indicate that we can do this transformative change, that we have the ability to now move into a new innovative, a transformative gear, across scales. The drama is, of course, is that 200 countries on this planet have to simultaneously start moving in the same direction. But it changes fundamentally our governance and management paradigm, from the current linear, command and control thinking, looking at efficiencies and optimization towards a much more flexible, a much more adaptive approach, where we recognize that redundancy, both in social and environmental systems, is key to be able to deal with a turbulent era of global change. We have to invest in persistence, in the ability of social systems and ecological systems to withstand shocks and still remain in that desired cup. We have to invest in transformations capability, moving from crisis into innovation and the ability to rise after a crisis, and of course to adapt to unavoidable change. This is a new paradigm. We ’ re not doing that at any scale on governance. But is it happening anywhere? Do we have any examples of success on this mind shift being applied at the local level? Well, yes, in fact we do and the list can start becoming longer and longer. There ’ s good news here, for example, from Latin America, where plow-based farming systems of the ’ 50s and ’ 60s led farming basically to a dead-end, with lower and lower yields, degrading the organic matter and fundamental problems at the livelihood levels in Paraguay, Uruguay and a number of countries, Brazil, leading to innovation and entrepreneurship among farmers in partnership with scientists into an agricultural revolution of zero tillage systems combined with mulch farming with locally adapted technologies, which today, for example, in some countries, have led to a tremendous increase in area under mulch, zero till farming which, not only produces more food, but also sequesters carbon. The Australian Great Barrier Reef is another success story. Under the realization from tourist operators, fishermen, the Australian Great Barrier Reef Authority and scientists that the Great Barrier Reef is doomed under the current governance regime. Global change, beautification rack culture, overfishing and unsustainable tourism, all together placing this system in the realization of crisis. But the window of opportunity was innovation and new mindset, which today has led to a completely new governance strategy to build resilience, acknowledge redundancy and invest in the whole system as an integrated whole, and then allow for much more redundancy in the system. Sweden, the country I come from, has other examples, where wetlands in southern Sweden were seen as â as in many countries â as flood-prone polluted nuisance in the peri-urban regions. But again, a crisis, new partnerships, actors locally, transforming these into a key component of sustainable urban planning. So crisis leading into opportunities. Now, what about the future? Well, the future, of course, has one massive challenge, which is feeding a world of nine billion people. We need nothing less than a new green revolution, and the planet boundaries shows that agriculture has to go from a source of greenhouse gases to a sink. It has to basically do this on current land. We cannot expand anymore, because it erodes the planetary boundaries. We cannot continue consuming water as we do today, with 25 percent of world rivers not even reaching the ocean. And we need a transformation. Well, interestingly, and based on my work and others in Africa, for example, we ’ ve shown that even the most vulnerable small-scale rainfall farming systems, with innovations and supplementary irrigation to bridge dry spells and droughts, sustainable sanitation systems to close the loop on nutrients from toilets back to farmers ’ fields, and innovations in tillage systems, we can triple, quadruple, yield levels on current land. Elinor Ostrom, the latest Nobel laureate of economics, clearly shows empirically across the world that we can govern the commons if we invest in trust, local, action-based partnerships and cross-scale institutional innovations, where local actors, together, can deal with the global commons at a large scale. But even on the hard policy area we have innovations. We know that we have to move from our fossil dependence very quickly into a low-carbon economy in record time. And what shall we do? Everybody talks about carbon taxes â it won ’ t work â emission schemes, but for example, one policy measure, feed-in tariffs on the energy system, which is already applied, from China doing it on offshore wind systems, all the way to the U. S. where you give the guaranteed price for investment in renewable energy, but you can subsidize electricity to poor people. You get people out of poverty. You solve the climate issue with regards to the energy sector, while at the same time, stimulating innovation â examples of things that can be out scaled quickly at the planetary level. So there is â no doubt â opportunity here, and we can list many, many examples of transformative opportunities around the planet. The key though in all of these, the red thread, is the shift in mindset, moving away from a situation where we simply are pushing ourselves into a dark future, where we instead backcast our future, and we say,"What is the playing field on the planet? What are the planetary boundaries within which we can safely operate?"and then backtrack innovations within that. But of course, the drama is, it clearly shows that incremental change is not an option. So, there is scientific evidence. They sort of say the harsh news, that we are facing the largest transformative development since the industrialization. In fact, what we have to do over the next 40 years is much more dramatic and more exciting than what we did when we moved into the situation we ' re in today. Now, science indicates that, yes, we can achieve a prosperous future within the safe operating space, if we move simultaneously, collaborating on a global level, from local to global scale, in transformative options, which build resilience on a finite planet. Thank you.

One thing the world needs, one thing this country desperately needs is a better way of conducting our political debates. We need to rediscover the lost art of democratic argument. If you think about the arguments we have, most of the time it ' s shouting matches on cable television, ideological food fights on the floor of Congress. I have a suggestion. Look at all the arguments we have these days over health care, over bonuses and bailouts on Wall Street, over the gap between rich and poor, over affirmative action and same-sex marriage. Lying just beneath the surface of those arguments, with passions raging on all sides, are big questions of moral philosophy, big questions of justice. But we too rarely **articulate** and defend and argue about those big moral questions in our politics. So what I would like to do today is have something of a discussion. First, let me take a famous philosopher who wrote about those questions of justice and morality, give you a very short lecture on Aristotle of ancient Athens, Aristotle ' s theory of justice, and then have a discussion here to see whether Aristotle ' s ideas actually inform the way we think and argue about questions today. So, are you ready for the lecture? According to Aristotle, justice means giving people what they deserve. That ' s it ; that ' s the lecture. Now, you may say, well, that ' s obvious enough. The real questions begin when it comes to arguing about who deserves what and why. Take the example of flutes. Suppose we ' re distributing flutes. Who should get the best ones? Let ' s see what people — What would you say? Who should get the best flute? You can just call it out. Michael Sandel : At random. You would do it by lottery. Or by the first person to rush into the hall to get them. Who else? MS : The best flute players. MS : The worst flute players. How many say the best flute players? Why? Actually, that was Aristotle ' s answer too. But here ' s a harder question. Why do you think, those of you who voted this way, that the best flutes should go to the best flute players? Peter : The greatest benefit to all. MS : The greatest benefit to all. We ' ll hear better music if the best flutes should go to the best flute players. That ' s Peter? MS : All right. Well, it ' s a good reason. We ' ll all be better off if good music is played rather than terrible music. But Peter, Aristotle doesn ' t agree with you that that ' s the reason. That ' s all right. Aristotle had a different reason for saying the best flutes should go to the best flute players. He said, that ' s what flutes are for — to be played well. He says that to reason about just distribution of a thing, we have to reason about, and sometimes argue about, the purpose of the thing, or the social activity — in this case, musical performance. And the point, the essential nature, of musical performance is to produce excellent music. It ’ ll be a happy byproduct that we ’ ll all benefit. But when we think about justice, Aristotle says, what we really need to think about is the essential nature of the activity in question and the qualities that are worth honoring and admiring and recognizing. One of the reasons that the best flute players should get the best flutes is that musical performance is not only to make the rest of us happy, but to honor and recognize the excellence of the best musicians. Now, flutes may seem... the distribution of flutes may seem a trivial case. Let ’ s take a contemporary example of the dispute about justice. It had to do with golf. Casey Martin — a few years ago, Casey Martin — did any of you hear about him? He was a very good golfer, but he had a disability. He had a bad leg, a circulatory problem, that made it very painful for him to walk the course. In fact, it carried risk of injury. He asked the PGA, the Professional Golfers ’ Association, for permission to use a golf cart in the PGA tournaments. They said,”No. Now that would give you an unfair advantage.”He sued, and his case went all the way to the Supreme Court, believe it or not, the case over the golf cart, because the law says that the disabled must be accommodated, provided the accommodation does not change the essential nature of the activity. He says,”I ’ m a great golfer. I want to compete. But I need a golf cart to get from one hole to the next.”Suppose you were on the Supreme Court. Suppose you were deciding the justice of this case. How many here would say that Casey Martin does have a right to use a golf cart? And how many say, no, he doesn ’ t? All right, let ’ s take a poll, show of hands. How many would rule in favor of Casey Martin? And how many would not? How many would say he doesn ’ t? All right, we have a good division of opinion here. Someone who would not grant Casey Martin the right to a golf cart, what would be your reason? Raise your hand, and we ’ ll try to get you a microphone. What would be your reason? MS : It would be an unfair advantage if he gets to ride in a golf cart. All right, those of you, I imagine most of you who would not give him the golf cart worry about an unfair advantage. What about those of you who say he should be given a golf cart? How would you answer the objection? Yes, all right. Audience : The cart ’ s not part of the game. MS : What ’ s your name? MS : Charlie says — We ’ ll get Charlie a microphone in case someone wants to reply. Tell us, Charlie, why would you say he should be able to use a golf cart? Charlie : The cart ’ s not part of the game. MS : But what about walking from hole to hole? Charlie : It doesn ’ t matter ; it ’ s not part of the game. MS : Walking the course is not part of the game of golf? Charlie : Not in my book, it isn ’ t. MS : All right. Stay there, Charlie. Who has an answer for Charlie? All right, who has an answer for Charlie? What would you say? Audience : The endurance element is a very important part of the game, walking all those holes. MS : Walking all those holes? That ’ s part of the game of golf? MS : What ’ s your name? MS : Warren. Charlie, what do you say to Warren? Charley : I ’ ll stick to my original thesis. MS : Warren, are you a golfer? Warren : I am not a golfer. Charley : And I am. You know, it ’ s interesting. In the case, in the lower court, they brought in golfing greats to testify on this very issue. Is walking the course essential to the game? And they brought in Jack Nicklaus and Arnold Palmer. And what do you suppose they all said? Yes. They agreed with Warren. They said, yes, walking the course is strenuous physical exercise. The fatigue factor is an important part of golf. And so it would change the fundamental nature of the game to give him the golf cart. Now, notice, something interesting — Well, I should tell you about the Supreme Court first. The Supreme Court decided. What do you suppose they said? They said yes, that Casey Martin must be provided a golf cart. Seven to two, they ruled. What was interesting about their ruling and about the discussion we ' ve just had is that the discussion about the right, the justice, of the matter depended on figuring out what is the essential nature of golf. And the Supreme Court justices wrestled with that question. And Justice Stevens, writing for the majority, said he had read all about the history of golf, and the essential point of the game is to get very small **ball** from one place into a hole in as few strokes as possible, and that walking was not essential, but incidental. Now, there were two dissenters, one of whom was Justice Scalia. He wouldn ' t have granted the cart, and he had a very interesting dissent. It ' s interesting because he rejected the Aristotelian premise underlying the majority ' s opinion. He said it ' s not possible to determine the essential nature of a game like golf. Here ' s how he put it."To say that something is essential is ordinarily to say that it is necessary to the achievement of a certain object. But since it is the very nature of a game to have no object except amusement, that is, what distinguishes games from productive activity, it is quite impossible to say that any of a game ' s arbitrary rules is essential."So there you have Justice Scalia taking on the Aristotelian premise of the majority ' s opinion. Justice Scalia ' s opinion is questionable for two reasons. First, no real sports fan would talk that way. If we had thought that the rules of the sports we care about are merely arbitrary, rather than designed to call forth the virtues and the excellences that we think are worthy of admiring, we wouldn ' t care about the outcome of the game. It ' s also objectionable on a second ground. On the face of it, it seemed to be — this debate about the golf cart — an argument about fairness, what ' s an unfair advantage. But if fairness were the only thing at stake, there would have been an easy and obvious solution. What would it be? Let everyone ride in a golf cart if they want to. Then the fairness objection goes away. But letting everyone ride in a cart would have been, I suspect, more anathema to the golfing greats and to the PGA, even than making an exception for Casey Martin. Why? Because what was at stake in the dispute over the golf cart was not only the essential nature of golf, but, relatedly, the question : What abilities are worthy of honor and recognition as athletic talents? Let me put the point as delicately as possible : Golfers are a little sensitive about the athletic status of their game. After all, there ' s no running or jumping, and the **ball** stands still. So if golfing is the kind of game that can be played while riding around in a golf cart, it would be hard to confer on the golfing greats the status that we confer, the honor and recognition that goes to truly great athletes. That **illustrates** that with golf, as with flutes, it ' s hard to decide the question of what justice requires, without grappling with the question,"What is the essential nature of the activity in question, and what qualities, what excellences connected with that activity, are worthy of honor and recognition?"Let ' s take a final example that ' s prominent in contemporary political debate : same-sex marriage. There are those who favor state recognition only of traditional marriage between one man and one woman, and there are those who favor state recognition of same-sex marriage. How many here favor the first policy : the state should recognize traditional marriage only? And how many favor the second, same-sex marriage? Now, put it this way : What ways of thinking about justice and morality underlie the arguments we have over marriage? The opponents of same-sex marriage say that the purpose of marriage, fundamentally, is procreation, and that ' s what ' s worthy of honoring and recognizing and encouraging. And the defenders of same-sex marriage say no, procreation is not the only purpose of marriage ; what about a lifelong, mutual, loving commitment? That ' s really what marriage is about. So with flutes, with golf carts, and even with a fiercely contested question like same-sex marriage, Aristotle has a point. Very hard to argue about justice without first arguing about the purpose of social institutions and about what qualities are worthy of honor and recognition. So let ’ s step back from these cases and see how they shed light on the way we might improve, elevate, the terms of political discourse in the United States, and for that matter, around the world. There is a tendency to think that if we engage too directly with moral questions in politics, that ’ s a recipe for disagreement, and for that matter, a recipe for intolerance and coercion. So better to shy away from, to ignore, the moral and the religious convictions that people bring to civic life. It seems to me that our discussion reflects the opposite, that a better way to mutual respect is to engage directly with the moral convictions citizens bring to public life, rather than to require that people leave their deepest moral convictions outside politics before they enter. That, it seems to me, is a way to begin to restore the art of democratic argument. Thank you very much. Thank you. Thank you. Thank you very much. Thanks. Thank you. Chris. Thanks, Chris. Chris Anderson : From flutes to golf courses to same-sex marriage — that was a genius link. Now look, you ’ re a pioneer of open education. Your lecture series was one of the first to do it big. What ’ s your vision for the next phase of this? MS : Well, I think that it is possible. In the classroom, we have arguments on some of the most fiercely held moral convictions that students have about big public questions. And I think we can do that in public life more generally. And so my real dream would be to take the public television series that we ’ ve created of the course — it ’ s available now, online, free for everyone anywhere in the world — and to see whether we can partner with institutions, at universities in China, in India, in Africa, around the world, to try to promote civic education and also a richer kind of democratic debate. CA : So you picture, at some point, live, in real time, you could have this kind of conversation, inviting questions, but with people from China and India joining in? MS : Right. We did a little bit of it here with 1, 500 people in Long Beach, and we do it in a classroom at Harvard with about 1, 000 students. Wouldn ’ t it be interesting to take this way of thinking and arguing, engaging seriously with big moral questions, exploring cultural differences and connect through a live video hookup, students in Beijing and Mumbai and in Cambridge, Massachusetts and create a global classroom. That ’ s what I would love to do. CA : So, I would imagine that there are a lot of people who would love to join you in that endeavor. Michael Sandel. Thank you so much.

Text Sample 867: POS Dim 6 – 2012 – Score 5.00 – 2012/t002322.txt

So a few weeks ago, a friend of mine gave this toy car to his 8-year-old son. But instead of going into a store and buying one, like we do normally, he went to this website and he downloaded a file, and then he printed it on this printer. So this idea that you can manufacture objects digitally using these machines is something that The Economist magazine defined as the Third Industrial Revolution. Actually, I argue that there is another revolution going on, and it ’ s the one that has to do with open-source hardware and the maker ’ s movement, because the printer that my friend used to print the toy is actually open-source. So you go to the same website, you can download all the files that you need in order to make that printer : the construction files, the hardware, the software, all the instruction is there. And also this is part of a large community where there are thousands of people around the world that are actually making these kinds of printers, and there ’ s a lot of innovation happening because it ’ s all open-source. You don ’ t need anybody ’ s permission to create something great. And that space is like the personal computer in 1976, like the Apples with the other companies are fighting, and we will see in a few years, there will be the Apple of this kind of market come out. Well, there ' s also another interesting thing. I said the electronics are open- source, because at the heart of this printer there is something I ' m really attached to : these Arduino boards, the motherboard that sort of powers this printer, is a project I ' ve been working on for the past seven years. It ' s an open-source project. I worked with these friends of mine that I have here. So the five of us, two Americans, two Italians and a Spaniard, we — You know, it ' s a worldwide project. So we came together in this design institute called the Interaction Design Institute Ivrea, which was teaching interaction design, this idea that you can take design from the simple shape of an object and you can move it forward to design the way you interact with things. Well, when you design an object that ' s supposed to interact with a human being, if you make a foam model of a mobile phone, it doesn ' t make any sense. You have to have something that actually interacts with people. So, we worked on Arduino and a lot of other projects there to create platforms that would be simple for our students to use, so that our students could just build things that worked, but they don ' t have five years to become an electronics engineer. We have one month. So how do I make something that even a kid can use? And actually, with Arduino, we have kids like Sylvia that you see here, that actually make projects with Arduino. I have 11-year-old kids stop me and show me stuff they built for Arduino that ' s really scary to see the capabilities that kids have when you give them the tools. So let ' s look at what happens when you make a tool that anybody can just pick up and build something quickly, so one of the examples that I like to sort of kick off this discussion is this example of this cat feeder. The gentleman who made this project had two cats. One was sick and the other one was healthy, so he had to make sure they ate the proper food. So he made this thing that recognizes the cat from a chip mounted inside on the collar of the cat, and opens the door and the cat can eat the food. This is made by recycling an old CD player that you can get from an old computer, some cardboard, tape, couple of sensors, a few blinking LEDs, and then suddenly you have a tool. You build something that you cannot find on the market. And I like this phrase :"Scratch your own itch."If you have an idea, you just go and you make it. This is the equivalent of sketching on paper done with electronics. So one of the features that I think is important about our work is that our hardware, on top of being made with love in Italy — as you can see from the back of the circuit — is that it ' s open, so we publish all the design files for the circuit online, so you can download it and you can actually use it to make something, or to modify, to learn. You know, when I was learning about programming, I learned by looking at other people ' s code, or looking at other people ' s circuits in magazines. And this is a good way to learn, by looking at other people ' s work. So the different elements of the project are all open, so the hardware is released with a Creative Commons license. So, you know, I like this idea that hardware becomes like a piece of culture that you share and you build upon, like it was a song or a poem with Creative Commons. Or, the software is GPL, so it ' s open-source as well. The documentation and the hands-on teaching methodology is also open-source and released as the Creative Commons. Just the name is protected so that we can make sure that we can tell people what is Arduino and what isn ' t. Now, Arduino itself is made of a lot of different open-source components that maybe individually are hard to use for a 12-year-old kid, so Arduino wraps everything together into a mashup of open-source technologies where we try to give them the best user experience to get something done quickly. So you have situations like this, where some people in Chile decided to make their own boards instead of buying them, to organize a workshop and to save money. Or there are companies that make their own variations of Arduino that fit in a certain market, and there ’ s probably, maybe like a 150 of them or something at the moment. This one is made by a company called Adafruit, which is run by this woman called Limor Fried, also known as Ladyada, who is one of the heroes of the open-source hardware movement and the maker movement. So, this idea that you have a new, sort of turbo-charged DIY community that believes in open-source, in collaboration, collaborates online, collaborates in different spaces. There is this magazine called Make that sort of gathered all these people and sort of put them together as a community, and you see a very technical project explained in a very simple language, beautifully typeset. Or you have websites, like this one, like Instructables, where people actually teach each other about anything. So this one is about Arduino projects, the page you see on the screen, but effectively here you can learn how to make a cake and everything else. So let ’ s look at some projects. So this one is a quadcopter. It ’ s a small model helicopter. In a way, it ’ s a toy, no? And so this one was military technology a few years ago, and now it ’ s open-source, easy to use, you can buy it online. DIY Drones is the community ; they do this thing called ArduCopter. But then somebody actually launched this start-up called Matternet, where they figured out that you could use this to actually transport things from one village to another in Africa, and the fact that this was easy to find, open-source, easy to hack, enabled them to prototype their company really quickly. Or, other projects. Matt Richardson : I ’ m getting a little sick of hearing about the same people on TV over and over and over again, so I decided to do something about it. This Arduino project, which I call the Enough Already, will mute the TV anytime any of these overexposed personalities is mentioned. I ’ ll show you how I made it. MB : Check this out. MR : Our producers caught up with Kim Kardashian earlier today to find out what she was planning on wearing to her — MB : Eh? MR : It should do a pretty good job of protecting our ears from having to hear about the details of Kim Kardashian ’ s wedding. MB : Okay. So, you know, again, what is interesting here is that Matt found this module that lets Arduino process TV signals, he found some code written by somebody else that generates infrared signals for the TV, put it together and then created this great project. It ’ s also used, Arduino ’ s used, in serious places like, you know, the Large Hadron Collider. There ’ s some Arduino **balls** collecting data and sort of measuring some parameters. Or it ’ s used for — So this is a musical **interface** built by a student from Italy, and he ’ s now turning this into a product. Because it was a student project becoming a product. Or it can be used to make an assistive device. This is a glove that understands the sign language and transforms the gestures you make into sounds and writes the words that you ’ re signing on a **display** And again, this is made of all different parts you can find on all the websites that sell Arduino-compatible parts, and you assemble it into a project. Or this is a project from the ITP part of NYU, where they met with this boy who has a severe disability, cannot play with the PS3, so they built this device that allows the kid to play baseball although he has limited movement capability. Or you can find it in arts projects. So this is the txtBomber. So you put a message into this device and then you roll it on the wall, and it basically has all these solenoids pressing the buttons on spray cans, so you just pull it over a wall and it just writes on the wall all the political messages. So, yeah. Then we have this plant here. This is called Botanicalls, because there ’ s an Arduino **ball** with a Wi-Fi module in the plant, and it ’ s measuring the well-being of the plant, and it ’ s creating a Twitter account where you can actually interact with the plant. So, you know, this plant will start to say,”This is really hot,”or there ’ s a lot of, you know,”I need water right now.”So it just gives a personality to your plant. Or this is something that twitters when the baby inside the belly of a pregnant woman kicks. Or this is a 14-year-old kid in Chile who made a system that detects earthquakes and publishes on Twitter. He has 280, 000 followers. He ’ s 14 and he anticipated a governmental project by one year. Or again, another project where, by analyzing the Twitter feed of a family, you can basically point where they are, like in the”Harry Potter”**movie**. So you can find out everything about this project on the website. Or somebody made a chair that twitters when somebody farts. It ’ s interesting how, in 2009, Gizmodo basically defined, said that this project actually gives a meaning to Twitter, so it was — a lot changed in between. So very serious project. When the Fukushima disaster happened, a bunch of people in Japan, they realized that the information that the government was giving wasn ’ t really open and really reliable, so they built this Geiger counter, plus Arduino, plus network **interface**. They made 100 of them and gave them to people around Japan, and essentially the data that they gathered gets published on this website called Cosm, another website they built, so you can actually get reliable real-time information from the field, and you can get unbiased information. Or this machine here, it ’ s from the DIY bio movement, and it ’ s one of the steps that you need in order to process DNA, and again, it ’ s completely open-source from the ground up. Or you have students in developing countries making replicas of scientific instruments that cost a lot of money to make. Actually they just build them themselves for a lot less using Arduino and a few parts. This is a pH probe. Or you get kids, like these kids, they ’ re from Spain. They learned how to program and to make robots when they were probably, like, 11, and then they started to use Arduino to make these robots that play football. They became world champions by making an Arduino-based robot. And so when we had to make our own educational robot, we just went to them and said, you know,”You design it, because you know exactly what is needed to make a great robot that excites kids.”Not me. I ’ m an old guy. What am I supposed to excite, huh? But as I — in terms of educational assets. There ’ s also companies like Google that are using the technology to create **interfaces** between mobile phones, tablets and the real world. So the Accessory Development Kit from Google is open-source and based on Arduino, as opposed to the one from Apple which is closed-source, NDA, sign your life to Apple. Here you are. There ’ s a giant maze, and Joey ’ s sitting there, and the maze is moving when you tilt the tablet. Also, I come from Italy, and the design is important in Italy, and yet very conservative. So we worked with a design studio called Habits, in Milan, to make this mirror, which is completely open-source. This doubles also as an iPod speaker. So the idea is that the hardware, the software, the design of the object, the fabrication, everything about this project is open-source and you can make it yourself. So we want other designers to pick this up and learn how to make great devices, to learn how to make interactive products by starting from something real. But when you have this idea, you know, what happens to all these ideas? There ’ s, like, thousands of ideas that I — You know, it would take seven hours for me to do all the **presentations**. I will not take all the seven hours. Thank you. But let ’ s start from this example : So, the group of people that started this company called Pebble, they prototyped a watch that communicates via Bluetooth with your phone, and you can **display** information on it. And they prototyped with an old LCD screen from a Nokia mobile phone and an Arduino. And then, when they had a final project, they actually went to Kickstarter and they were asking for 100, 000 dollars to make a few of them to sell. They got 10 million dollars. They got a completely fully funded start-up, and they don ’ t have to, you know, get VCs involved or anything, just excite the people with their great project. The last project I want to show you is this : It ’ s called ArduSat. It ’ s currently on Kickstarter, so if you want to contribute, please do it. It ’ s a satellite that goes into space, which is probably the least open-source thing you can imagine, and it contains an Arduino connected to a bunch of sensors. So if you know how to use Arduino, you can actually upload your experiments into this satellite and run them. So imagine, if you as a high school can have the satellite for a week and do satellite space experiments like that. So, as I said, there ’ s lots of examples, and I ’ m going to stop here. And I just want to thank the Arduino community for being the best, and just every day making lots of projects. Thank you. And thanks to the community. Chris Anderson : Massimo, you told me earlier today that you had no idea, of course, that it would take off like this. MB : No. CA : I mean, how must you feel when you read this stuff and you see what you ’ ve unlocked? MB : Well, it ’ s the work of a lot of people, so we as a community are enabling people to make great stuff, and I just feel overwhelmed. It ’ s just, it ’ s difficult to describe this. Every morning, I wake up and I look at all the stuff that Google Alerts sends me, and it ’ s just amazing. It ’ s just going into every field that you can imagine. CA : Thank you so much.

Text Sample 868: POS Dim 6 – 2012 – Score 4.00 – 2012/t002265.txt

I ’ d like to tell you about two games of chess. The first happened in 1997, in which Garry Kasparov, a human, lost to Deep Blue, a machine. To many, this was the dawn of a new era, one where man would be dominated by machine. But here we are, 20 years on, and the greatest change in how we relate to computers is the iPad, not HAL. The second game was a freestyle chess tournament in 2005, in which man and machine could enter together as partners, rather than adversaries, if they so chose. At first, the results were predictable. Even a supercomputer was beaten by a grandmaster with a relatively weak laptop. The surprise came at the end. Who won? Not a grandmaster with a supercomputer, but actually two American amateurs using three relatively weak laptops. Their ability to coach and manipulate their computers to deeply explore specific positions effectively counteracted the superior chess knowledge of the grandmasters and the superior computational power of other adversaries. This is an astonishing result : average men, average machines beating the best man, the best machine. And anyways, isn ’ t it supposed to be man versus machine? Instead, it ’ s about cooperation, and the right type of cooperation. We ’ ve been paying a lot of attention to Marvin Minsky ’ s vision for artificial intelligence over the last 50 years. It ’ s a sexy vision, for sure. Many have embraced it. It ’ s become the dominant school of thought in computer science. But as we enter the era of big data, of network systems, of open platforms, and embedded technology, I ’ d like to suggest it ’ s time to reevaluate an alternative vision that was actually developed around the same time. I ’ m talking about J. C. R. Licklider ’ s human-computer symbiosis, perhaps better termed”intelligence augmentation,”I. A. Licklider was a computer science titan who had a profound effect on the development of technology and the Internet. His vision was to enable man and machine to cooperate in making decisions, controlling complex situations without the inflexible dependence on predetermined programs. Note that word”cooperate.”Licklider encourages us not to take a toaster and make it Data from”Star Trek,”but to take a human and make her more capable. Humans are so amazing — how we think, our non-linear approaches, our creativity, iterative hypotheses, all very difficult if possible at all for computers to do. Licklider intuitively realized this, contemplating humans setting the goals, formulating the hypotheses, determining the criteria, and performing the evaluation. Of course, in other ways, humans are so limited. We ’ re terrible at scale, computation and volume. We require high-end talent management to keep the rock band together and playing. Licklider foresaw computers doing all the routinizable work that was required to prepare the way for insights and decision making. Silently, without much fanfare, this approach has been compiling victories beyond chess. Protein folding, a topic that shares the incredible expansiveness of chess — there are more ways of folding a protein than there are atoms in the universe. This is a world-changing problem with huge implications for our ability to understand and treat disease. And for this task, supercomputer field brute force simply isn ’ t enough. Foldit, a game created by computer scientists, **illustrates** the value of the approach. Non-technical, non-biologist amateurs play a video game in which they visually rearrange the structure of the protein, allowing the computer to manage the atomic forces and interactions and identify structural issues. This approach beat supercomputers 50 percent of the time and tied 30 percent of the time. Foldit recently made a notable and major scientific discovery by deciphering the structure of the Mason-Pfizer monkey virus. A protease that had eluded determination for over 10 years was solved was by three players in a matter of days, perhaps the first major scientific advance to come from playing a video game. Last year, on the site of the Twin Towers, the 9 / 11 memorial opened. It **displays** the names of the thousands of victims using a beautiful concept called”meaningful adjacency.”It places the names next to each other based on their relationships to one another : friends, families, coworkers. When you put it all together, it ’ s quite a computational challenge : 3, 500 victims, 1, 800 adjacency requests, the importance of the overall physical specifications and the final aesthetics. When first reported by the media, full credit for such a feat was given to an algorithm from the New York City design firm Local Projects. The truth is a bit more nuanced. While an algorithm was used to develop the underlying framework, humans used that framework to design the final result. So in this case, a computer had evaluated millions of possible layouts, managed a complex relational system, and kept track of a very large set of measurements and variables, allowing the humans to focus on design and compositional choices. So the more you look around you, the more you see Licklider ’ s vision everywhere. Whether it ’ s augmented reality in your iPhone or GPS in your car, human-computer symbiosis is making us more capable. So if you want to improve human-computer symbiosis, what can you do? You can start by designing the human into the process. Instead of thinking about what a computer will do to solve the problem, design the solution around what the human will do as well. When you do this, you ’ ll quickly realize that you spent all of your time on the **interface** between man and machine, specifically on designing away the friction in the interaction. In fact, this friction is more important than the power of the man or the power of the machine in determining overall capability. That ’ s why two amateurs with a few laptops handily beat a supercomputer and a grandmaster. What Kasparov calls process is a byproduct of friction. The better the process, the less the friction. And minimizing friction turns out to be the decisive variable. Or take another example : big data. Every interaction we have in the world is recorded by an ever growing array of sensors : your phone, your credit card, your computer. The result is big data, and it actually presents us with an opportunity to more deeply understand the human condition. The major emphasis of most approaches to big data focus on,”How do I store this data? How do I search this data? How do I process this data?”These are necessary but insufficient questions. The imperative is not to figure out how to compute, but what to compute. How do you impose human intuition on data at this scale? Again, we start by designing the human into the process. When PayPal was first starting as a business, their biggest challenge was not,”How do I send money back and forth online?”It was,”How do I do that without being defrauded by organized crime?”Why so challenging? Because while computers can learn to detect and identify fraud based on patterns, they can ’ t learn to do that based on patterns they ’ ve never seen before, and organized crime has a lot in common with this audience : brilliant people, relentlessly resourceful, entrepreneurial spirit — — and one huge and important difference : purpose. And so while computers alone can catch all but the cleverest fraudsters, catching the cleverest is the difference between success and failure. There ’ s a whole class of problems like this, ones with adaptive adversaries. They rarely if ever present with a repeatable pattern that ’ s discernable to computers. Instead, there ’ s some inherent component of innovation or disruption, and increasingly these problems are buried in big data. For example, terrorism. Terrorists are always adapting in minor and major ways to new circumstances, and despite what you might see on TV, these adaptations, and the detection of them, are fundamentally human. Computers don ’ t detect novel patterns and new behaviors, but humans do. Humans, using technology, testing hypotheses, searching for insight by asking machines to do things for them. Osama bin Laden was not caught by artificial intelligence. He was caught by dedicated, resourceful, brilliant people in partnerships with **various** technologies. As appealing as it might sound, you cannot algorithmically data mine your way to the answer. There is no”Find Terrorist”button, and the more data we integrate from a vast variety of sources across a wide variety of data formats from very disparate systems, the less effective data mining can be. Instead, people will have to look at data and search for insight, and as Licklider foresaw long ago, the key to great results here is the right type of cooperation, and as Kasparov realized, that means minimizing friction at the **interface**. Now this approach makes possible things like combing through all available data from very different sources, identifying key relationships and putting them in one place, something that ’ s been nearly impossible to do before. To some, this has terrifying privacy and civil liberties implications. To others it foretells of an era of greater privacy and civil liberties protections, but privacy and civil liberties are of fundamental importance. That must be acknowledged, and they can ’ t be swept aside, even with the best of intents. So let ’ s explore, through a couple of examples, the impact that technologies built to drive human-computer symbiosis have had in recent time. In October, 2007, U. S. and coalition forces raided an al Qaeda safe house in the city of Sinjar on the Syrian border of Iraq. They found a treasure trove of documents : 700 biographical sketches of foreign fighters. These foreign fighters had left their families in the Gulf, the Levant and North Africa to join al Qaeda in Iraq. These records were human resource forms. The foreign fighters filled them out as they joined the organization. It turns out that al Qaeda, too, is not without its bureaucracy. They answered questions like,”Who recruited you?””What ’ s your hometown?””What occupation do you seek?”In that last question, a surprising insight was revealed. The vast majority of foreign fighters were seeking to become suicide bombers for martyrdom — hugely important, since between 2003 and 2007, Iraq had 1, 382 suicide bombings, a major source of instability. Analyzing this data was hard. The originals were sheets of paper in Arabic that had to be scanned and translated. The friction in the process did not allow for meaningful results in an operational time frame using humans, PDFs and tenacity alone. The researchers had to lever up their human minds with technology to dive deeper, to explore non-obvious hypotheses, and in fact, insights emerged. Twenty percent of the foreign fighters were from Libya, 50 percent of those from a single town in Libya, hugely important since prior statistics put that figure at three percent. It also helped to hone in on a figure of rising importance in al Qaeda, Abu Yahya al-Libi, a senior cleric in the Libyan Islamic fighting group. In March of 2007, he gave a speech, after which there was a surge in participation amongst Libyan foreign fighters. Perhaps most clever of all, though, and least obvious, by flipping the data on its head, the researchers were able to deeply explore the coordination networks in Syria that were ultimately responsible for receiving and transporting the foreign fighters to the border. These were networks of mercenaries, not ideologues, who were in the coordination business for profit. For example, they charged Saudi foreign fighters substantially more than Libyans, money that would have otherwise gone to al Qaeda. Perhaps the adversary would disrupt their own network if they knew they cheating would-be jihadists. In January, 2010, a devastating 7. 0 earthquake struck Haiti, third deadliest earthquake of all time, left one million people, 10 percent of the population, homeless. One seemingly small aspect of the overall relief effort became increasingly important as the delivery of food and water started rolling. January and February are the dry months in Haiti, yet many of the camps had developed standing water. The only institution with detailed knowledge of Haiti ’ s floodplains had been leveled in the earthquake, leadership inside. So the question is, which camps are at risk, how many people are in these camps, what ’ s the timeline for flooding, and given very limited resources and infrastructure, how do we prioritize the relocation? The data was incredibly disparate. The U. S. Army had detailed knowledge for only a small section of the country. There was data online from a 2006 environmental risk conference, other geospatial data, none of it integrated. The human goal here was to identify camps for relocation based on priority need. The computer had to integrate a vast amount of geospacial information, social media data and relief organization information to answer this question. By implementing a superior process, what was otherwise a task for 40 people over three months became a simple job for three people in 40 hours, all victories for human-computer symbiosis. We ’ re more than 50 years into Licklider ’ s vision for the future, and the data suggests that we should be quite excited about tackling this century ’ s hardest problems, man and machine in cooperation together. Thank you.

Text Sample 869: POS Dim 6 – 2012 – Score 4.00 – 2012/t002165.txt

The kind of neuroscience that I do and my colleagues do is almost like the weatherman. We are always chasing storms. We want to see and measure storms â brainstorms, that is. And we all talk about brainstorms in our daily lives, but we rarely see or listen to one. So I always like to start these talks by actually introducing you to one of them. Actually, the first time we recorded more than one neuron â a hundred brain cells simultaneously â we could measure the electrical sparks of a hundred cells in the same animal, this is the first image we got, the first 10 seconds of this recording. So we got a little snippet of a thought, and we could see it in front of us. I always tell the students that we could also call neuroscientists some sort of astronomer, because we are dealing with a system that is only comparable in terms of number of cells to the number of galaxies that we have in the universe. And here we are, out of billions of neurons, just recording, 10 years ago, a hundred. We are doing a thousand now. And we hope to understand something fundamental about our human nature. Because, if you don ’ t know yet, everything that we use to define what human nature is comes from these storms, comes from these storms that roll over the hills and valleys of our brains and define our memories, our beliefs, our feelings, our plans for the future. Everything that we ever do, everything that every human has ever done, do or will do, requires the toil of populations of neurons producing these kinds of storms. And the sound of a brainstorm, if you ’ ve never heard one, is somewhat like this. You can put it louder if you can. My son calls this”making popcorn while listening to a badly-tuned A. M. station.”This is a brain. This is what happens when you route these electrical storms to a loudspeaker and you listen to a hundred brain cells firing, your brain will sound like this â my brain, any brain. And what we want to do as neuroscientists in this time is to actually listen to these symphonies, these brain symphonies, and try to extract from them the messages they carry. In particular, about 12 years ago we created a preparation that we named brain- machine **interfaces**. And you have a scheme here that describes how it works. The idea is, let ’ s have some sensors that listen to these storms, this electrical firing, and see if you can, in the same time that it takes for this storm to leave the brain and reach the legs or the arms of an animal â about half a second â let ’ s see if we can read these signals, extract the motor messages that are embedded in it, translate it into digital commands and send it to an artificial device that will reproduce the voluntary motor wheel of that brain in real time. And see if we can measure how well we can translate that message when we compare to the way the body does that. And if we can actually provide feedback, sensory signals that go back from this robotic, mechanical, computational actuator that is now under the control of the brain, back to the brain, how the brain deals with that, of receiving messages from an artificial piece of machinery. And that ’ s exactly what we did 10 years ago. We started with a superstar monkey called Aurora that became one of the superstars of this field. And Aurora liked to play video games. As you can see here, she likes to use a joystick, like any one of us, any of our kids, to play this game. And as a good primate, she even tries to cheat before she gets the right answer. So even before a target appears that she ’ s supposed to cross with the **cursor** that she ’ s controlling with this joystick, Aurora is trying to find the target, no matter where it is. And if she ’ s doing that, because every time she crosses that target with the little **cursor**, she gets a drop of Brazilian orange juice. And I can tell you, any monkey will do anything for you if you get a little drop of Brazilian orange juice. Actually any primate will do that. Think about that. Well, while Aurora was playing this game, as you saw, and doing a thousand trials a day and getting 97 percent correct and 350 milliliters of orange juice, we are recording the brainstorms that are produced in her head and sending them to a robotic arm that was learning to reproduce the movements that Aurora was making. Because the idea was to actually turn on this brain-machine **interface** and have Aurora play the game just by thinking, without interference of her body. Her brainstorms would control an arm that would move the **cursor** and cross the target. And to our shock, that ’ s exactly what Aurora did. She played the game without moving her body. So every trajectory that you see of the **cursor** now, this is the exact first moment she got that. That ’ s the exact first moment a brain intention was liberated from the physical domains of a body of a primate and could act outside, in that outside world, just by controlling an artificial device. And Aurora kept playing the game, kept finding the little target and getting the orange juice that she wanted to get, that she craved for. Well, she did that because she, at that time, had acquired a new arm. The robotic arm that you see moving here 30 days later, after the first video that I showed to you, is under the control of Aurora ’ s brain and is moving the **cursor** to get to the target. And Aurora now knows that she can play the game with this robotic arm, but she has not lost the ability to use her biological arms to do what she pleases. She can scratch her back, she can scratch one of us, she can play another game. By all purposes and means, Aurora ’ s brain has incorporated that artificial device as an extension of her body. The model of the self that Aurora had in her mind has been expanded to get one more arm. Well, we did that 10 years ago. Just fast forward 10 years. Just last year we realized that you don ’ t even need to have a robotic device. You can just build a computational body, an avatar, a monkey avatar. And you can actually use it for our monkeys to either interact with them, or you can train them to assume in a virtual world the first-person perspective of that avatar and use her brain activity to control the movements of the avatar ’ s arms or legs. And what we did basically was to train the animals to learn how to control these avatars and explore objects that appear in the virtual world. And these objects are visually identical, but when the avatar crosses the surface of these objects, they send an electrical message that is proportional to the microtactile texture of the object that goes back directly to the monkey ’ s brain, informing the brain what it is the avatar is touching. And in just four weeks, the brain learns to process this new sensation and acquires a new sensory pathway â like a new sense. And you truly liberate the brain now because you are allowing the brain to send motor commands to move this avatar. And the feedback that comes from the avatar is being processed directly by the brain without the interference of the skin. So what you see here is this is the design of the task. You ’ re going to see an animal basically touching these three targets. And he has to select one because only one carries the reward, the orange juice that they want to get. And he has to select it by touch using a virtual arm, an arm that doesn ’ t exist. And that ’ s exactly what they do. This is a complete liberation of the brain from the physical constraints of the body and the motor in a perceptual task. The animal is controlling the avatar to touch the targets. And he ’ s sensing the texture by receiving an electrical message directly in the brain. And the brain is deciding what is the texture associated with the reward. The legends that you see in the **movie** don ’ t appear for the monkey. And by the way, they don ’ t read English anyway, so they are here just for you to know that the correct target is shifting position. And yet, they can find them by tactile discrimination, and they can press it and select it. So when we look at the brains of these animals, on the top panel you see the alignment of 125 cells showing what happens with the brain activity, the electrical storms, of this sample of neurons in the brain when the animal is using a joystick. And that ’ s a picture that every neurophysiologist knows. The basic alignment shows that these cells are coding for all possible directions. The bottom picture is what happens when the body stops moving and the animal starts controlling either a robotic device or a computational avatar. As fast as we can reset our computers, the brain activity shifts to start representing this new tool, as if this too was a part of that primate ’ s body. The brain is assimilating that too, as fast as we can measure. So that suggests to us that our sense of self does not end at the last layer of the epithelium of our bodies, but it ends at the last layer of electrons of the tools that we ’ re commanding with our brains. Our violins, our cars, our bicycles, our soccer **balls**, our clothing â they all become assimilated by this voracious, amazing, dynamic system called the brain. How far can we take it? Well, in an experiment that we ran a few years ago, we took this to the limit. We had an animal running on a treadmill at Duke University on the East Coast of the United States, producing the brainstorms necessary to move. And we had a robotic device, a humanoid robot, in Kyoto, Japan at ATR Laboratories that was dreaming its entire life to be controlled by a brain, a human brain, or a primate brain. What happens here is that the brain activity that generated the movements in the monkey was transmitted to Japan and made this robot walk while footage of this walking was sent back to Duke, so that the monkey could see the legs of this robot walking in front of her. So she could be rewarded, not by what her body was doing but for every correct step of the robot on the other side of the planet controlled by her brain activity.

Funny thing, that round trip around the globe took 20 milliseconds less than it takes for that brainstorm to leave its head, the head of the monkey, and reach its own muscle. The monkey was moving a robot that was six times bigger, across the planet. This is one of the experiments in which that robot was able to walk autonomously. This is CB1 fulfilling its dream in Japan under the control of the brain activity of a primate. So where are we taking all this? What are we going to do with all this research, besides studying the properties of this dynamic universe that we have between our ears? Well the idea is to take all this knowledge and technology and try to restore one of the most severe neurological problems that we have in the world. Millions of people have lost the ability to translate these brainstorms into action, into movement. Although their brains continue to produce those storms and code for movements, they cannot cross a barrier that was created by a lesion on the spinal cord. So our idea is to create a bypass, is to use these brain-machine **interfaces** to read these signals, larger-scale brainstorms that contain the desire to move again, bypass the lesion using computational microengineering and send it to a new body, a whole body called an exoskeleton, a whole robotic suit that will become the new body of these patients. And you can see an image produced by this consortium. This is a nonprofit consortium called the Walk Again Project that is putting together scientists from Europe, from here in the United States, and in Brazil together to work to actually get this new body built â a body that we believe, through the same plastic mechanisms that allow Aurora and other monkeys to use these tools through a brain-machine **interface** and that allows us to incorporate the tools that we produce and use in our daily life. This same mechanism, we hope, will allow these patients, not only to imagine again the movements that they want to make and translate them into movements of this new body, but for this body to be assimilated as the new body that the brain controls. So I was told about 10 years ago that this would never happen, that this was close to impossible. And I can only tell you that as a scientist, I grew up in southern Brazil in the mid- ’ 60s watching a few crazy guys telling [us] that they would go to the Moon. And I was five years old, and I never understood why NASA didn ’ t hire Captain Kirk and Spock to do the job ; after all, they were very proficient â but just seeing that as a kid made me believe, as my grandmother used to tell me, that”impossible is just the possible that someone has not put in enough effort to make it come true.”So they told me that it ’ s impossible to make someone walk. I think I ’ m going to follow my grandmother ’ s advice. Thank you.

Text Sample 870: POS Dim 6 – 2016 – Score 5.00 – 2016/t001311.txt

The world is filled with incredible objects and rich cultural heritage. And when we get access to them, we are blown away, we fall in love. But most of the time, the world ’ s population is living without real access to arts and culture. What might the connections be when we start exploring our heritage, the beautiful locations and the art in this world? Before we get started in this **presentation**, I just want to take care of a few housekeeping points. First, I am no expert in art or culture. I fell into this by mistake, but I ’ m loving it. Secondly, all of what I ’ m going to show you belongs to the amazing museums, archives and foundations that we partner with. None of this belongs to Google. And finally, what you see behind me is available right now on your mobile phones, on your laptops. This is our current platform, where you can explore thousands of museums and objects at your fingertips, in extremely high-definition detail. The diversity of the content is what ’ s amazing. If we just had European paintings, if we just had modern art, I think it gets a bit boring. For example, this month, we launched the"Black History"channel with 82 curated exhibitions, which talk about arts and culture in that community. We also have some amazing objects from Japan, centered around craftsmanship, called"Made in Japan."And one of my favorite exhibitions, which actually is the idea of my talk, is — I didn ' t expect to become a fan of Japanese dolls. But I am, thanks to this exhibition, that has really taught me about the craftsmanship behind the soul of a Japanese doll. Trust me, it ' s very exciting. Take my word for it. So, moving on swiftly. One quick thing I wanted to showcase in this platform, which you can share with your kids and your friends right now, is you can travel to all these amazing institutions virtually, as well. One of our recent ideas was with The Guggenheim Museum in New York, where you can get a taste of what it might feel like to actually be there. You can go to the ground floor and obviously, most of you, I assume, have been there. And you can see the architectural masterpiece that it is. But imagine this accessibility for a kid in Bombay who ' s studying architecture, who hasn ' t had a chance to go to The Guggenheim as yet. You can obviously look at objects in the Guggenheim Museum, you can obviously get into them and so on and so forth. There ' s a lot of information here. But this is not the purpose of my talk today. This exists right now. What we now have are the building blocks to a very exciting future, when it comes to arts and culture and accessibility to arts and culture. So I am joined today onstage by my good friend and artist in residence at our office in Paris, Cyril Diagne, who is the professor of interactive design at ECAL University in Lausanne, Switzerland. What Cyril and our team of engineers have been doing is trying to find these connections and visualize a few of these. So I ' m going to go quite quick now. This object you see behind me — oh, just clarification : Always, seeing the real thing is better. In case people think I ' m trying to replicate the real thing. So, moving on. This object you see behind me is the Venus of Berekhat Ram. It ' s one of the oldest objects in the world, found in the Golan Heights around 233, 000 years ago, and currently residing at the Israel Museum in Jerusalem. It is also one of the oldest objects on our platform. So let ' s zoom. We start from this one object. What if we zoomed out and actually tried to experience our own cultural big **bang**? What might that look like? This is what we deal with on a daily basis at the Cultural Institute — over six million cultural **artifacts** curated and given to us by institutions, to actually make these connections. You can travel through time, you can understand more about our society through these. You can look at it from the perspective of our planet, and try to see how it might look without borders, if we just organized art and culture. We can also then plot it by time, which obviously, for the data geek in me, is very fascinating. You can spend hours looking at every decade and the contributions in that decade and in those years for art, history and cultures. We would love to spend hours showing you each and every decade, but we don ' t have the time right now. So you can go on your phone and actually do it yourself. But if you don ' t mind and can hold your applause till later, I don ' t want to run out of time, because I want to show you a lot of cool stuff. So, just very quickly : you can move on from here to another very interesting idea. Beyond the pretty picture, beyond the nice visualization, what is the purpose, how is this useful? This next idea comes from discussions with curators that we ' ve been having at museums, who, by the way, I ' ve fallen in love with, because they dedicate their whole life to try to tell these stories. One of the curators told me,"Amit, what would it be like if you could create a virtual curator ' s table where all these six million objects are **displayed** in a way for us to look at the connections between them?"You can spend a lot of time, trust me, looking at different objects and understanding where they come from. It ' s a crazy Matrix experience. Just moving on, let ' s take the world-famous Vincent Van Gogh, who is very well- represented on this platform. Thanks to the diversity of the institutions we have, we have over 211 high-definition, amazing artworks by this artist, now organized in one beautiful view. And as it resolves, and as Cyril goes deeper, you can see all the self-portraits, you can see still life. But I just wanted to highlight one very quick example, which is very timely :"The Bedroom."This is an artwork where three copies exist — one at the Van Gogh Museum in Amsterdam, one at the Orsay in Paris and one at the Art Institute of Chicago, which, actually, currently is hosting a reunion of all three artworks physically, I think only for the second time ever. But, it is united digitally and virtually for anybody to look at in a very different way, and you won ' t get pushed in the line in the crowd. So let ' s take you and let ' s travel through"The Bedroom"very quickly, so you can experience what we are doing for every single object. We want the image to speak as much as it can on a digital platform. And all you need is an internet connection and a computer And, Cyril, if you can go deeper, quickly. I ' m sorry, this is all live, so you have to give Cyril a little bit of — and this is available for every object : modern art, contemporary art, Renaissance — you name it, even sculpture. Sometimes, you don ' t know what can attract you to an artwork or to a museum or to a cultural discovery. So for me, personally, it was quite a challenge because when I decided to make this my full-time job at Google, my mother was not very supportive. I love my mother, but she thought I was wasting my life with this museum stuff. And for her, a museum is what you do when you go on vacation and you tick-mark and it ' s over, right? And it took around four and a half years for me to convince my lovely Indian mother that actually, this is worthwhile. And the way I did it was, I realized one day that she loves gold. So I started showing her all objects that have the material gold in them. And the first thing my mom asks me is,"How can we buy these?"And obviously, my salary is not that high, so I was like,"We can ' t actually do that, mom. But you can explore them virtually."And so now my mom — every time I meet her, she asks me,"Any more gold, any more silver in your project? Can you show me?"And that ' s the idea I ' m trying to **illustrate**. It does not matter how you get in, as long as you get in. Once you get in, you ' re hooked. Moving on from here very quickly, there is kind of a playful idea, actually, to **illustrate** the point of access, and I ' m going to go quite quickly on this one. We all know that seeing the artwork in person is amazing. But we also know that most of us can ' t do it, and the ones that can afford to do it, it ' s complicated. So — Cyril, can we load up our art trip, what do we call it? We don ' t have a good name for this. But essentially, we have around 1, 000 amazing institutions, 68 countries. But let ' s start with Rembrandt. We might have time for only one example. But thanks to the diversity, we ' ve got around 500 amazing Rembrandt object artworks from 46 institutions and 17 countries. Let ' s say that on your next vacation, you want to go see every single one of them. That is your itinerary, you will probably travel 53, 000 kilometers, visit around, I think, 46 institutions, and just FYI, you might release 10 tons of CO2 emissions. But remember, it ' s art, so you can justify it, perhaps, in some way. Moving on swiftly from here, is something a little bit more technical and more interesting. All that we ' ve shown you so far uses metadata to make the connections. But obviously we have something cool nowadays that everyone likes to talk about, which is machine learning. So what we thought is, let ' s strip out all the metadata, let ' s look at what machine learning can do based purely on visual recognition of this entire collection. What we ended up with is this very interesting map, these clusters that have no reference point information, but has just used visuals to cluster things together. Each cluster is an art to us by itself of discovery. But one of the clusters we want to show you very quickly is this amazing cluster of portraits that we found from museums around the world. If you could zoom in a little bit more, Cyril. Just to show you, you can just travel through portraits. And essentially, you can do nature, you can do horses and clusters galore. When we saw all these portraits, we were like,”Hey, can we do something fun for kids, or can we do something playful to get people interested in portraits?”Because I haven ’ t really seen young kids really excited to go to a portrait gallery. I wanted to try to figure something out. So we created something called the portrait matcher. It ’ s quite self-explanatory, so I ’ m just going to let Cyril show his beautiful face. And essentially what ’ s happening is, with the movement of his head, we are matching different portraits around the world from museums. And I don ’ t know about you, but I ’ ve shown it to my nephew and sister, and the reaction is just phenomenal. All they ask me is,”When can we go see this?”And by the way, if we ’ re nice, maybe, Cyril, you can smile and find a happy one? Oh, perfect. By the way, this is not rehearsed. Congrats, Cyril. Great stuff. Oh wow. OK, let ’ s move on ; otherwise, this will just take the whole time. So, art and culture can be fun also, right? For our last quick experiment — we call all of these”experiments”— our last quick experiment comes back to machine learning. We show you clusters, visual clusters, but what if we could ask the machine to also name these clusters? What if it could automatically tag them, using no actual metadata? So what we have is this kind of explorer, where we have managed to match, I think, around 4, 000 labels. And we haven ’ t really done anything special here, just fed the collection. And we found interesting categories. We can start with horses, a very straightforward category. You would expect to see that the machine has put images of horses, right? And it has, but you also notice, right over there, that it has a very abstract image that it has still managed to recognize and cluster as horses. We also have an amazing head in terms of a horse. And each one has the tags as to why it got categorized in this. So let ’ s move to another one which I found very funny and interesting, because I don ’ t understand how this category came up. It ’ s called”Lady in Waiting.”If, Cyril, you do it very quickly, you will see that we have these amazing images of ladies, I guess, in waiting or posing. I don ’ t really understand it. But I ’ ve been trying to ask my museum contacts, you know,”What is this? What ’ s going on here?”And it ’ s fascinating. Coming back to gold very quickly, I wanted to search for gold and see how the machine tagged all the gold. But, actually, it doesn ’ t tag it as gold. We are living in popular times. It tags it as”bling-bling.”I ’ m being hard on Cyril, because I ’ m moving too fast. Essentially, here you have all the bling-bling of the world ’ s museums organized for you. And finally, to end this talk and these experiments, what I hope you feel after this talk is happiness and emotion. And what would we see when we see happiness? If we actually look at all the objects that have been tagged under”happiness,”you would expect happiness, I guess. But there was one that came up that was very fascinating and interesting, which was this artwork by Douglas Coupland, our friend and artist in residence as well, called,”I Miss My Pre- Internet Brain.”I don ’ t know why the machine feels like it misses its pre- Internet brain and it ’ s been tagged here, but it ’ s a very interesting thought. I sometimes do miss my pre-Internet brain, but not when it comes to exploring arts and culture online. So take out your phones, take out your computers, go visit museums. And just a quick call-out to all the amazing archivists, historians, curators, who are sitting in museums, preserving all this culture. And the least we can do is get our daily dose of art and culture for ourselves and our kids. Thank you.

So a while ago, I tried an experiment. For one year, I would say yes to all the things that scared me. Anything that made me nervous, took me out of my comfort zone, I forced myself to say yes to. Did I want to speak in public? No, but yes. Did I want to be on live TV? No, but yes. Did I want to try acting? No, no, no, but yes, yes, yes. And a crazy thing happened : the very act of doing the thing that scared me undid the fear, made it not scary. My fear of public speaking, my social anxiety, **poof**, gone. It ’ s amazing, the power of one word.”Yes”changed my life.”Yes”changed me. But there was one particular yes that affected my life in the most profound way, in a way I never imagined, and it started with a question from my toddler. I have these three amazing daughters, Harper, Beckett and Emerson, and Emerson is a toddler who inexplicably refers to everyone as”honey.”as though she ’ s a Southern waitress.”Honey, I ’ m gonna need some milk for my sippy cup.”The Southern waitress asked me to play with her one evening when I was on my way somewhere, and I said,”Yes.”And that yes was the beginning of a new way of life for my family. I made a vow that from now on, every time one of my children asks me to play, no matter what I ’ m doing or where I ’ m going, I say yes, every single time. Almost. I ’ m not perfect at it, but I try hard to practice it. And it ’ s had a magical effect on me, on my children, on our family. But it ’ s also had a stunning side effect, and it wasn ’ t until recently that I fully understood it, that I understood that saying yes to playing with my children likely saved my career. See, I have what most people would call a dream job. I ’ m a writer. I imagine. I make stuff up for a living. Dream job. No. I ’ m a titan. Dream job. I create television. I executive produce television. I make television, a great deal of television. In one way or another, this TV season, I ’ m responsible for bringing about 70 hours of programming to the world. Four television programs, 70 hours of TV — Three shows in production at a time, sometimes four. Each show creates hundreds of jobs that didn ’ t exist before. The budget for one episode of network television can be anywhere from three to six million dollars. Let ’ s just say five. A new episode made every nine days times four shows, so every nine days that ’ s 20 million dollars worth of television, four television programs, 70 hours of TV, three shows in production at a time, sometimes four, 16 episodes going on at all times : 24 episodes of”Grey ’ s,”21 episodes of”Scandal,”15 episodes of”How To Get Away With Murder,”10 episodes of”The Catch,”that ’ s 70 hours of TV, that ’ s 350 million dollars for a season. In America, my television shows are back to back to back on Thursday night. Around the world, my shows air in 256 territories in 67 languages for an audience of 30 million people. My brain is global, and 45 hours of that 70 hours of TV are shows I personally created and not just produced, so on top of everything else, I need to find time, real quiet, creative time, to gather my fans around the campfire and tell my stories. Four television programs, 70 hours of TV, three shows in production at a time, sometimes four, 350 million dollars, campfires burning all over the world. You know who else is doing that? Nobody, so like I said, I ’ m a titan. Dream job. Now, I don ’ t tell you this to impress you. I tell you this because I know what you think of when you hear the word”writer.”I tell you this so that all of you out there who work so hard, whether you run a company or a country or a classroom or a store or a home, take me seriously when I talk about working, so you ’ ll get that I don ’ t peck at a computer and imagine all day, so you ’ ll hear me when I say that I understand that a dream job is not about dreaming. It ’ s all job, all work, all reality, all blood, all sweat, no tears. I work a lot, very hard, and I love it. When I ’ m hard at work, when I ’ m deep in it, there is no other feeling. For me, my work is at all times building a nation out of thin air. It is manning the **troops**. It is painting a canvas. It is hitting every high note. It is running a **marathon**. It is being Beyonc. And it is all of those things at the same time. I love working. It is creative and mechanical and exhausting and exhilarating and hilarious and disturbing and clinical and maternal and cruel and judicious, and what makes it all so good is the hum. There is some kind of shift inside me when the work gets good. A hum begins in my brain, and it grows and it grows and that hum sounds like the open road, and I could drive it forever. And a lot of people, when I try to explain the hum, they assume that I ' m talking about the writing, that my writing brings me joy. And don ' t get me wrong, it does. But the hum — it wasn ' t until I started making television that I started working, working and making and building and creating and collaborating, that I discovered this thing, this buzz, this rush, this hum. The hum is more than writing. The hum is action and activity. The hum is a drug. The hum is music. The hum is light and air. The hum is God ' s whisper right in my ear. And when you have a hum like that, you can ' t help but strive for greatness. That feeling, you can ' t help but strive for greatness at any cost. That ' s called the hum. Or, maybe it ' s called being a workaholic. Maybe it ' s called genius. Maybe it ' s called ego. Maybe it ' s just fear of failure. I don ' t know. I just know that I ' m not built for failure, and I just know that I love the hum. I just know that I want to tell you I ' m a titan, and I know that I don ' t want to question it. But here ' s the thing : the more successful I become, the more shows, the more episodes, the more barriers broken, the more work there is to do, the more **balls** in the air, the more eyes on me, the more history stares, the more expectations there are. The more I work to be successful, the more I need to work. And what did I say about work? I love working, right? The nation I ' m building, the **marathon** I ' m running, the **troops**, the canvas, the high note, the hum, the hum, the hum. I like that hum. I love that hum. I need that hum. I am that hum. Am I nothing but that hum? And then the hum stopped. Overworked, overused, overdone, burned out. The hum stopped. Now, my three daughters are used to the truth that their mother is a single working titan. Harper tells people,”My mom won ' t be there, but you can text my nanny.”And Emerson says,”Honey, I ' m wanting to go to ShondaLand.”They ' re children of a titan. They ' re baby titans. They were 12, 3, and 1 when the hum stopped. The hum of the engine died. I stopped loving work. I couldn ' t restart the engine. The hum would not come back. My hum was broken. I was doing the same things I always did, all the same titan work, 15-hour days, working straight through the weekends, no regrets, never surrender, a titan never sleeps, a titan never quits, full hearts, clear eyes, yada, whatever. But there was no hum. Inside me was silence. Four television programs, 70 hours of TV, three shows in production at a time, sometimes four. Four television programs, 70 hours of TV, three shows in production at a time... I was the perfect titan. I was a titan you could take home to your mother. All the colors were the same, and I was no longer having any fun. And it was my life. It was all I did. I was the hum, and the hum was me. So what do you do when the thing you do, the work you love, starts to taste like dust? Now, I know somebody ' s out there thinking,”Cry me a river, stupid writer titan lady.”But you know, you do, if you make, if you work, if you love what you do, being a teacher, being a banker, being a mother, being a painter, being Bill Gates, if you simply love another person and that gives you the hum, if you know the hum, if you know what the hum feels like, if you have been to the hum, when the hum stops, who are you? What are you? What am I? Am I still a titan? If the song of my heart ceases to play, can I survive in the silence? And then my Southern waitress toddler asks me a question. I ' m on my way out the door, I ' m late, and she says,”Momma, wanna play?”And I ' m just about to say no, when I realize two things. One, I ' m supposed to say yes to everything, and two, my Southern waitress didn ' t call me”honey.”She ' s not calling everyone”honey”anymore. When did that happen? I ’ m missing it, being a titan and mourning my hum, and here she is changing right before my eyes. And so she says,”Momma, wanna play?”And I say,”Yes.”There ’ s nothing special about it. We play, and we ’ re joined by her sisters, and there ’ s a lot of laughing, and I give a dramatic reading from the book Everybody Poops. Nothing out of the ordinary. And yet, it is extraordinary, because in my pain and my panic, in the homelessness of my humlessness, I have nothing to do but pay attention. I focus. I am still. The nation I ’ m building, the **marathon** I ’ m running, the **troops**, the canvas, the high note does not exist. All that exists are sticky fingers and gooey kisses and tiny voices and crayons and that song about letting go of whatever it is that Frozen girl needs to let go of. It ’ s all peace and simplicity. The air is so rare in this place for me that I can barely breathe. I can barely believe I ’ m breathing. Play is the opposite of work. And I am happy. Something in me **loosens**. A door in my brain swings open, and a rush of energy comes. And it ’ s not instantaneous, but it happens, it does happen. I feel it. A hum creeps back. Not at full volume, barely there, it ’ s quiet, and I have to stay very still to hear it, but it is there. Not the hum, but a hum. And now I feel like I know a very magical secret. Well, let ’ s not get carried away. It ’ s just love. That ’ s all it is. No magic. No secret. It ’ s just love. It ’ s just something we forgot. The hum, the work hum, the hum of the titan, that ’ s just a replacement. If I have to ask you who I am, if I have to tell you who I am, if I describe myself in terms of shows and hours of television and how globally badass my brain is, I have forgotten what the real hum is. The hum is not power and the hum is not work-specific. The hum is joy-specific. The real hum is love-specific. The hum is the electricity that comes from being excited by life. The real hum is confidence and peace. The real hum ignores the stare of history, and the **balls** in the air, and the expectation, and the pressure. The real hum is singular and original. The real hum is God ’ s whisper in my ear, but maybe God was whispering the wrong words, because which one of the gods was telling me I was the titan? It ’ s just love. We could all use a little more love, a lot more love. Any time my child asks me to play, I will say yes. I make it a firm rule for one reason, to give myself permission, to free me from all of my workaholic guilt. It ’ s a law, so I don ’ t have a choice, and I don ’ t have a choice, not if I want to feel the hum. I wish it were that easy, but I ’ m not good at playing. I don ’ t like it. I ’ m not interested in doing it the way I ’ m interested in doing work. The truth is incredibly humbling and humiliating to face. I don ’ t like playing. I work all the time because I like working. I like working more than I like being at home. Facing that fact is incredibly difficult to handle, because what kind of person likes working more than being at home? Well, me. I mean, let ’ s be honest, I call myself a titan. I ’ ve got issues. And one of those issues isn ’ t that I am too relaxed. We run around the yard, up and back and up and back. We have 30-second dance parties. We sing show tunes. We play with **balls**. I blow bubbles and they pop them. And I feel stiff and delirious and confused most of the time. I itch for my cell phone always. But it is OK. My tiny humans show me how to live and the hum of the universe fills me up. I play and I play until I begin to wonder why we ever stop playing in the first place. You can do it too, say yes every time your child asks you to play. Are you thinking that maybe I ’ m an idiot in diamond shoes? You ’ re right, but you can still do this. You have time. You know why? Because you ’ re not Rihanna and you ’ re not a Muppet. Your child does not think you ’ re that interesting. You only need 15 minutes. My two- and four-year-old only ever want to play with me for about 15 minutes or so before they think to themselves they want to do something else. It ’ s an amazing 15 minutes, but it ’ s 15 minutes. If I ’ m not a ladybug or a piece of candy, I ’ m invisible after 15 minutes. And my 13-year-old, if I can get a 13-year-old to talk to me for 15 minutes I ' m Parent of the Year. 15 minutes is all you need. I can totally pull off 15 minutes of uninterrupted time on my worst day. Uninterrupted is the key. No cell phone, no laundry, no anything. You have a busy life. You have to get dinner on the table. You have to force them to bathe. But you can do 15 minutes. My kids are my happy place, they ' re my world, but it doesn ' t have to be your kids, the fuel that feeds your hum, the place where life feels more good than not good. It ' s not about playing with your kids, it ' s about joy. It ' s about playing in general. Give yourself the 15 minutes. Find what makes you feel good. Just figure it out and play in that arena. I ' m not perfect at it. In fact, I fail as often as I succeed, seeing friends, reading books, staring into space."Wanna play?"starts to become shorthand for indulging myself in ways I ' d given up on right around the time I got my first TV show, right around the time I became a titan-in-training, right around the time I started competing with myself for ways unknown. 15 minutes? What could be wrong with giving myself my full attention for 15 minutes? Turns out, nothing. The very act of not working has made it possible for the hum to return, as if the hum ' s engine could only refuel while I was away. Work doesn ' t work without play. It takes a little time, but after a few months, one day the floodgates open and there ' s a rush, and I find myself standing in my office filled with an unfamiliar melody, full on groove inside me, and around me, and it sends me spinning with ideas, and the humming road is open, and I can drive it and drive it, and I love working again. But now, I like that hum, but I don ' t love that hum. I don ' t need that hum. I am not that hum. That hum is not me, not anymore. I am bubbles and sticky fingers and dinners with friends. I am that hum. Life ' s hum. Love ' s hum. Work ' s hum is still a piece of me, it is just no longer all of me, and I am so grateful. And I don ' t give a crap about being a titan, because I have never once seen a titan play Red Rover, Red Rover. I said yes to less work and more play, and somehow I still run my world. My brain is still global. My campfires still burn. The more I play, the happier I am, and the happier my kids are. The more I play, the more I feel like a good mother. The more I play, the freer my mind becomes. The more I play, the better I work. The more I play, the more I feel the hum, the nation I ' m building, the **marathon** I ' m running, the **troops**, the canvas, the high note, the hum, the hum, the other hum, the real hum, life ' s hum. The more I feel that hum, the more this strange, quivering, uncocooned, awkward, brand new, alive non-titan feels like me. The more I feel that hum, the more I know who I am. I ' m a writer, I make stuff up, I imagine. That part of the job, that ' s living the dream. That ' s the dream of the job. Because a dream job should be a little bit dreamy. I said yes to less work and more play. Titans need not apply. Wanna play? Thank you.

Text Sample 872: POS Dim 6 – 2016 – Score 4.00 – 2016/t001140.txt

In the last couple of years, I have produced what I call"The Dead Mall Series,"32 short films and counting about dead malls. Now, for those of you who are not familiar with what a dead mall is, it ' s basically a shopping mall that has fallen into hard times. So it either has few shops and fewer shoppers, or it ' s abandoned and crumbling into ruin. No sale at Penny ' s. I started producing this series in early 2015 after going through kind of a dark period in my life where I just didn ' t want to create films anymore. I put my camera away and I just stopped. So in 2015, I decided to make a short film about the Owings Mills Mall. Owings Mills Mall opened in 1986. I should know because I was there on opening day. I was there with my family, along with every other family in

Baltimore, and you had to drive around for 45 minutes just to find a parking spot. So if you can imagine, that ’ s not happening at the malls today. My first mall job that I had as a teenager was at a sporting goods store called Herman ’ s World of Sports. Maybe you remember. Herman ’ s World of Sports. You guys remember that? Yeah, so I worked in a lady ’ s shoe store. I worked in a leather goods store, and I also worked in a video store, and not being one who was very fond of the retail arts — I got fired from every single job. In between these low-paying retail jobs, I did what any normal teenager did in the 1990s. I shoplifted. I ’ m just kidding. I hung out with my friends at the mall. Everyone ’ s like,”Oh my God, what kind of talk is this?”Hanging out at the mall could be fun, but it could be really lame, too, like sharing a cigarette with a 40-year-old unemployed mall rat who has put on black lipstick for the night while you ’ re on your break from your crappy minimum wage job. As I stand here today, Owings Mills has been gutted and it ’ s ready for the wrecking **ball**. The last time I was there, it was in the evening, and it was about three days before they closed the mall for good. And you kind of felt — they never announced the mall was closing, but you had this sort of feeling, this ominous feeling, that something big was going to happen, like it was the end of the road. It was a very creepy walk through the mall. Let me show you. So when I started producing”The Dead Mall Series,”I put the videos up onto YouTube, and while I thought they were interesting, frankly I didn ’ t think others would share the enthusiasm for such a drab and depressing topic. But apparently I was wrong, because a lot of people started to comment. And at first the comments were like — basically like,”Oh my God, that ’ s the mall from my childhood. What happened?”And then I would get comments from people who were like,”There ’ s a dead mall in my town. You should come and film it.”So I started to travel around the mid-Atlantic region filming these dead malls. Some were open. Some were abandoned. It was kind of always hard to get into the ones that were abandoned, but I somehow always found a way in. The malls that are still open, they always do this weird thing — like the dead malls. They ’ ll have three stores left, but they try to spruce it up to make it appear like things are on the up-and-up. For example, you ’ ll have an empty store and they bring the gate down. So at Owings Mills, for example, they put this tarp over the gate. Right? And it ’ s got a stock photo of a woman who is so happy and she ’ s holding a blouse, and she ’ s like — And then there ’ s a guy standing next to her, with, like, an espresso cup, and he ’ s like — And it says,”What brings you today?”I wanted to be scared and depressed. Thank you. So the comments just kept pouring in on the videos, from all over the country, and then all over the world. And I started to think, this could really be something, but I had to get creative, because I ’ m like, how long are people going to sit and watch me waddling through an empty mall? So the original episodes I filmed with an iPhone. So I ’ d walk through the mall with an iPhone, and, you know. Like that. And security — because malls, they don ’ t like photography — so the security would come up and be like,”Put that away,”and I ’ m like,”OK.”So I had to get creative and sneaky, so I started using a hidden camera and different techniques to get the footage that I needed, and basically what I wanted to do was make the video like it was a first-person experience, like you are sitting — put your headphones on watching the screen — it ’ s like, you ’ re there in the video, like a video game, basically. I also started to use music, collaborating with artists who create music called vaporwave. And vaporwave is a music genre that emerged in the early 2010s among internet communities. Here ’ s an example. That ’ s by an artist named Disconscious from an album he did called”Hologram Plaza.”So if you look that up, you can hear more of those tunes. Vaporwave is more than an art form. It ’ s like a movement. It ’ s nihilistic, it ’ s angsty, but it ’ s somehow comforting. The whole aesthetic is a way of dealing with things you can ' t do anything about, like no jobs, or sitting in your parents ' basement eating ramen noodles. Vaporwave came out of this generation ' s desire to express their hopelessness, the same way that the pre-internet generation did sitting around in the food court. One of my favorite malls I ' ve been to is in Corpus Christi, and it ' s called the Sunrise Mall. When I was a kid, my favorite thing to do was watch **movies**, and I used to watch **movies** over and over and over again. And one of my favorite films was"The Legend of Billie Jean."Now, for those of you who have seen"The Legend of Billie Jean,"you ' ll know that it ' s a great film. I love it. And Helen Slater and Christian Slater — and if you didn ' t know, they are not related. Many people thought that they were brother and sister. They ' re not. But anyway, Sunrise Mall was used in the film as a filming location. The mall is exactly the same as it was in 1984. We ' re talking 32 years later. Let me show you. Dan Bell : And here ' s Billie Jean running across the fountain, being chased by Hubie Pyatt ' s friends. And she jumps over here. And you can see the shot right here is what it looks like today. It ' s pretty incredible. I mean, honestly, it ' s exactly the same. And there they are falling in the fountain, and she runs up the stairs. This is a nice shot of the whole thing here. Dan Bell : I love that so much. I always think in my head, if I owned a dead mall — why don ' t they embrace their **vintage** look? Put in a bar, like, put vegan food in the food court and invite millennials and hipsters to come and drink and eat, and I guarantee you within three weeks H&M and Levi ' s will be **banging** on the door trying to get space. I don ' t know why they don ' t do this, but apparently, it ' s only in my mind, it goes all day. Anyway, in closing — When they first asked me to do this talk, I said,"Do you have the right person?"These talks are supposed to be kind of inspiring and — I remembered something, though. I put my camera down three or four years ago, and it took going to these malls for me to be inspired again. And to see my audience and people from all over the world writing me and saying,"God, I love your videos,"is incredible. I don ' t know how to even explain it, as an artist, how fulfilling that is. If you would have told me a year ago that I would be standing on this stage talking to all of you wonderful people, I would have never believed it. I am humbled and so appreciative. Thank you very much.

Nicholas Negroponte : Can we switch to the video disc, which is in play mode? I ' m really interested in how you put people and computers together. We will be using the TV screens or their equivalents for electronic books of the future. Very interested in **touch-sensitive displays**, high-tech, **high-touch**, not having to pick up your fingers to use them. There is another way where computers touch people : wearing, physically wearing. Suddenly on September 11th, the world got bigger. NN : Thank you. Thank you. When I was asked to do this, I was also asked to look at all 14 TED Talks that I had given, chronologically. The first one was actually two hours. The second one was an hour, and then they became half hours, and all I noticed was my bald spot getting bigger. Imagine seeing your life, 30 years of it, go by, and it was, to say the least, for me, quite a shocking experience. So what I ' m going to do in my time is try and share with you what happened during the 30 years, and then also make a prediction, and then tell you a little bit about what I ' m doing next. And I put on a slide where TED 1 happened in my life. And it ' s rather important because I had done 15 years of research before it, so I had a backlog, so it was easy. It ' s not that I was Fidel Castro and I could talk for two hours, or Bucky Fuller. I had 15 years of stuff, and the Media Lab was about to start. So that was easy. But there are a couple of things about that period and about what happened that are really quite important. One is that it was a period when computers weren ’ t yet for people. And the other thing that sort of happened during that time is that we were considered sissy computer scientists. We weren ’ t considered the real thing. So what I ’ m going to show you is, in retrospect, a lot more interesting and a lot more accepted than it was at the time. So I ’ m going to characterize the years and I ’ m even going to go back to some very early work of mine, and this was the kind of stuff I was doing in the ’ 60s : very direct manipulation, very influenced as I studied architecture by the architect Moshe Safdie, and you can see that we even built robotic things that could build habitat-like structures. And this for me was not yet the Media Lab, but was the beginning of what I ’ ll call sensory computing, and I pick fingers partly because everybody thought it was ridiculous. Papers were published about how stupid it was to use fingers. Three reasons : One was they were low-resolution. The other is your hand would occlude what you wanted to see, and the third, which was the winner, was that your fingers would get the screen dirty, and hence, fingers would never be a device that you ’ d use. And this was a device we built in the ’ 70s, which has never even been picked up. It ’ s not just touch sensitive, it ’ s pressure sensitive. Voice : Put a yellow circle there. NN : Later work, and again this was before TED 1 — Voice : Move that west of the diamond. Create a large green circle there. Man : Aw, shit. NN : — was to sort of do **interface** concurrently, so when you talked and you pointed and you had, if you will, multiple channels. Entebbe happened. 1976, Air France was hijacked, taken to Entebbe, and the Israelis not only did an extraordinary rescue, they did it partly because they had practiced on a physical model of the airport, because they had built the airport, so they built a model in the desert, and when they arrived at Entebbe, they knew where to go because they had actually been there. The U. S. government asked some of us, ’ 76, if we could replicate that computationally, and of course somebody like myself says yes. Immediately, you get a contract, Department of Defense, and we built this truck and this rig. We did sort of a simulation, because you had video discs, and again, this is ’ 76. And then many years later, you get this truck, and so you have Google Maps. Still people thought, no, that was not serious computer science, and it was a man named Jerry Wiesner, who happened to be the president of MIT, who did think it was computer science. And one of the keys for anybody who wants to start something in life : Make sure your president is part of it. So when I was doing the Media Lab, it was like having a gorilla in the front seat. If you were stopped for speeding and the officer looked in the window and saw who was in the passenger seat, then,”Oh, continue on, sir.”And so we were able, and this is a cute, actually, device, parenthetically. This was a lenticular photograph of Jerry Wiesner where the only thing that changed in the photograph were the lips. So when you oscillated that little piece of lenticular sheet with his photograph, it would be in lip sync with zero bandwidth. It was a zero- bandwidth **teleconferencing** system at the time. So this was the Media Lab ’ s — this is what we said we ’ d do, that the world of computers, publishing, and so on would come together. Again, not generally accepted, but very much part of TED in the early days. And this is really where we were headed. And that created the Media Lab. One of the things about age is that I can tell you with great confidence, I ’ ve been to the future. I ’ ve been there, actually, many times. And the reason I say that is, how many times in my life have I said,”Oh, in 10 years, this will happen,”and then 10 years comes. And then you say,”Oh, in five years, this will happen.”And then five years comes. So I say this a little bit with having felt that I ’ d been there a number of times, and one of the things that is most quoted that I ’ ve ever said is that computing is not about computers, and that didn ’ t quite get enough traction, and then it started to. It started to because people caught on that the medium wasn ’ t the message. And the reason I show this car in actually a rather ugly slide is just again to tell you the kind of story that characterized a little bit of my life. This is a student of mine who had done a Ph. D. called”Backseat Driver.”It was in the early days of GPS, the car knew where it was, and it would give audio instructions to the driver, when to turn right, when to turn left and so on. Turns out, there are a lot of things in those instructions that back in that period were pretty challenging, like what does it mean, take the next right? Well, if you ’ re coming up on a street, the next right ’ s probably the one after, and there are lots of issues, and the student did a wonderful thesis, and the MIT patent office said”Don ’ t patent it. It ’ ll never be accepted. The liabilities are too large. There will be insurance issues. Don ’ t patent it.”So we didn ’ t, but it shows you how people, again, at times, don ’ t really look at what ’ s happening. Some work, and I ’ ll just go through these very quickly, a lot of sensory stuff. You might recognize a young Yo-Yo Ma and tracking his body for playing the cello or the hypercello. These fellows literally walked around like that at the time. It ’ s now a little bit more discreet and more commonplace. And then there are at least three heroes I want to quickly mention. Marvin Minsky, who taught me a lot about common sense, and I will talk briefly about Muriel Cooper, who was very important to Ricky Wurman and to TED, and in fact, when she got onstage, she said, the first thing she said was,”I introduced Ricky to Nicky.”And nobody calls me Nicky and nobody calls Richard Ricky, so nobody knew who she was talking about. And then, of course, Seymour Papert, who is the person who said,”You can ’ t think about thinking unless you think about thinking about something.”And that ’ s actually — you can unpack that later. It ’ s a pretty profound statement. I ’ m showing some slides that were from TED 2, a little silly as slides, perhaps. Then I felt television really was about **displays**. Again, now we ’ re past TED 1, but just around the time of TED 2, and what I ’ d like to mention here is, even though you could imagine intelligence in the device, I look today at some of the work being done about the Internet of Things, and I think it ’ s kind of tragically pathetic, because what has happened is people take the oven panel and put it on your cell phone, or the door key onto your cell phone, just taking it and bringing it to you, and in fact that ’ s actually what you don ’ t want. You want to put a chicken in the oven, and the oven says,”Aha, it ’ s a chicken,”and it cooks the chicken.”Oh, it ’ s cooking the chicken for Nicholas, and he likes it this way and that way.”So the intelligence, instead of being in the device, we have started today to move it back onto the cell phone or closer to the user, not a particularly enlightened view of the Internet of Things. Television, again, television what I said today, that was back in 1990, and the television of tomorrow would look something like that. Again, people, but they laughed cynically, they didn ’ t laugh with much appreciation. Telecommunications in the 1990s, George Gilder decided that he would call this diagram the Negroponte switch. I ’ m probably much less famous than George, so when he called it the Negroponte switch, it stuck, but the idea of things that came in the ground would go in the air and stuff in the air would go into the ground has played itself out. That is the original slide from that year, and it has worked in lockstep obedience. We started Wired magazine. Some people, I remember we shared the reception desk periodically, and some parent called up irate that his son had given up Sports Illustrated to subscribe for Wired, and he said,”Are you some porno magazine or something?”and couldn ’ t understand why his son would be interested in Wired, at any rate. I will go through this a little quicker. This is my favorite, 1995, back page of Newsweek magazine. Okay.

Read it. [”Nicholas Negroponte, director of the MIT Media Lab, predicts that we ’ ll soon buy books and newspapers straight over the Internet. Uh, sure.”—Clifford Stoll, Newsweek, 1995] You must admit that gives you, at least it gives me pleasure when somebody says how dead wrong you are.”Being Digital”came out. For me, it gave me an opportunity to be more in the trade press and get this out to the public, and it also allowed us to build the new Media Lab, which if you haven ’ t been to, visit, because it ’ s a beautiful piece of architecture aside from being a wonderful place to work. So these are the things we were saying in those TEDs. [Today, multimedia is a desktop or living room experience, because the apparatus is so clunky. This will change dramatically with small, bright, thin, high-resolution **displays**. — 1995] We came to them. I looked forward to it every year. It was the party that Ricky Wurman never had in the sense that he invited many of his old friends, including myself. And then something for me changed pretty profoundly. I became more involved with computers and learning and influenced by Seymour, but particularly looking at learning as something that is best approximated by computer programming. When you write a computer program, you ’ ve got to not just list things out and sort of take an algorithm and translate it into a set of instructions, but when there ’ s a bug, and all programs have bugs, you ’ ve got to de-bug it. You ’ ve got to go in, change it, and then re-execute, and you iterate, and that iteration is really a very, very good approximation of learning. So that led to my own work with Seymour in places like Cambodia and the starting of One Laptop per Child. Enough TED Talks on One Laptop per Child, so I ’ ll go through it very fast, but it did give us the chance to do something at a relatively large scale in the area of learning, development and computing. Very few people know that One Laptop per Child was a $1 billion project, and it was, at least over the seven years I ran it, but even more important, the World Bank contributed zero, USAID zero. It was mostly the countries using their own treasuries, which is very interesting, at least to me it was very interesting in terms of what I plan to do next. So these are the **various** places it happened. I then tried an experiment, and the experiment happened in Ethiopia. And here ’ s the experiment. The experiment is, can learning happen where there are no schools. And we dropped off tablets with no instructions and let the children figure it out. And in a short period of time, they not only turned them on and were using 50 apps per child within five days, they were singing”ABC”songs within two weeks, but they hacked Android within six months. And so that seemed sufficiently interesting. This is perhaps the best picture I have. The kid on your right has sort of nominated himself as teacher. Look at the kid on the left, and so on. There are no adults involved in this at all. So I said, well can we do this at a larger scale? And what is it that ’ s missing? The kids are giving a press conference at this point, and sort of writing in the dirt. And the answer is, what is missing? And I ’ m going to skip over my prediction, actually, because I ’ m running out of time, and here ’ s the question, is what ’ s going to happen? I think the challenge is to connect the last billion people, and connecting the last billion is very different than connecting the next billion, and the reason it ’ s different is that the next billion are sort of low-hanging fruit, but the last billion are rural. Being rural and being poor are very different. Poverty tends to be created by our society, and the people in that community are not poor in the same way at all. They may be primitive, but the way to approach it and to connect them, the history of One Laptop per Child, and the experiment in Ethiopia, lead me to believe that we can in fact do this in a very short period of time. And so my plan, and unfortunately I haven ’ t been able to get my partners at this point to let me announce them, but is to do this with a stationary satellite. There are many reasons that stationary satellites aren ’ t the best things, but there are a lot of reasons why they are, and for two billion dollars, you can connect a lot more than 100 million people, but the reason I picked two, and I will leave this as my last slide, is two billion dollars is what we were spending in Afghanistan every week. So surely if we can connect Africa and the last billion people for numbers like that, we should be doing it. Thank you very much. Chris Anderson : Stay up there. Stay up there. NN : You ’ re going to give me extra time? CA : No. That was wickedly clever, wickedly clever. You gamed it beautifully. Nicholas, what is your prediction? NN : Thank you for asking. I ’ ll tell you what my prediction is, and my prediction, and this is a prediction, because it ’ ll be 30 years. I won ’ t be here. But one of the things about learning how to read, we have been doing a lot of consuming of information going through our eyes, and so that may be a very inefficient channel. So my prediction is that we are going to ingest information You ’ re going to swallow a pill and know English. You ’ re going to swallow a pill and know Shakespeare. And the way to do it is through the bloodstream. So once it ’ s in your bloodstream, it basically goes through it and gets into the brain, and when it knows that it ’ s in the brain in the different pieces, it deposits it in the right places. So it ’ s ingesting. CA : Have you been hanging out with Ray Kurzweil by any chance? NN : No, but I ’ ve been hanging around with Ed Boyden and hanging around with one of the speakers who is here, Hugh Herr, and there are a number of people. This isn ’ t quite as far-fetched, so 30 years from now. CA : We will check it out. We ’ re going to be back and we ’ re going to play this clip 30 years from now, and then all eat the red pill. Well thank you for that. Nicholas Negroponte. NN : Thank you.

Type is something we consume in enormous quantities. In much of the world, it ’ s completely inescapable. But few consumers are concerned to know where a particular typeface came from or when or who designed it, if, indeed, there was any human agency involved in its creation, if it didn ’ t just sort of materialize out of the software ether. But I do have to be concerned with those things. It ’ s my job. I ’ m one of the tiny handful of people who gets badly bent out of shape by the bad spacing of the T and the E that you see there. I ’ ve got to take that slide off. I can ’ t stand it. Nor can Chris. There. Good. So my talk is about the connection between technology and design of type. The technology has changed a number of times since I started work : photo, digital, desktop, screen, web. I ’ ve had to survive those changes and try to understand their implications for what I do for design. This slide is about the effect of tools on form. The two letters, the two K ’ s, the one on your left, my right, is modern, made on a computer. All straight lines are dead straight. The curves have that kind of mathematical smoothness that the Bzier formula imposes. On the right, ancient Gothic, cut in the resistant material of steel by hand. None of the straight lines are actually straight. The curves are kind of subtle. It has that spark of life from the human hand that the machine or the program can never capture. What a contrast. Well, I tell a lie. A lie at TED. I ’ m really sorry. Both of these were made on a computer, same software, same Bzier curves, same font format. The one on your left was made by Zuzana Licko at Emigre, and I did the other one. The tool is the same, yet the letters are different. The letters are different because the designers are different. That ’ s all. Zuzana wanted hers to look like that. I wanted mine to look like that. End of story. Type is very adaptable. Unlike a fine art, such as sculpture or architecture, type hides its methods. I think of myself as an industrial designer. The thing I design is manufactured, and it has a function : to be read, to convey meaning. But there is a bit more to it than that. There ' s the sort of aesthetic element. What makes these two letters different from different interpretations by different designers? What gives the work of some designers sort of characteristic personal style, as you might find in the work of a fashion designer, an automobile designer, whatever? There have been some cases, I admit, where I as a designer did feel the influence of technology. This is from the mid- ' 60s, the change from metal type to photo, hot to cold. This brought some benefits but also one particular drawback : a spacing system that only provided 18 discrete units for letters to be accommodated on. I was asked at this time to design a series of condensed sans serif types with as many different variants as possible within this 18- unit box. Quickly looking at the arithmetic, I realized I could only actually make three of related design. Here you see them. In Helvetica Compressed, Extra Compressed, and Ultra Compressed, this rigid 18-unit system really boxed me in. It kind of determined the proportions of the design. Here are the typefaces, at least the lower cases. So do you look at these and say,"Poor Matthew, he had to submit to a problem, and by God it shows in the results."I hope not. If I were doing this same job today, instead of having 18 spacing units, I would have 1, 000. Clearly I could make more variants, but would these three members of the family be better? It ' s hard to say without actually doing it, but they would not be better in the proportion of 1, 000 to 18, I can tell you that. My instinct tells you that any improvement would be rather slight, because they were designed as functions of the system they were designed to fit, and as I said, type is very adaptable. It does hide its methods. All industrial designers work within constraints. This is not fine art. The question is, does a constraint force a compromise? By accepting a constraint, are you working to a lower standard? I don ' t believe so, and I ' ve always been encouraged by something that Charles Eames said. He said he was conscious of working within constraints, but not of making compromises. The distinction between a constraint and a compromise is obviously very subtle, but it ' s very central to my attitude to work. Remember this reading experience? The phone book. I ' ll hold the slide so you can enjoy the nostalgia. This is from the mid- ' 70s early trials of Bell Centennial typeface I designed for the U. S. phone books, and it was my first experience of digital type, and quite a baptism. Designed for the phone books, as I said, to be printed at tiny size on newsprint on very high-speed rotary presses with ink that was kerosene and lampblack. This is not a hospitable environment for a typographic designer. So the challenge for me was to design type that performed as well as possible in these very adverse production conditions. As I say, we were in the infancy of digital type. I had to draw every character by hand on quadrille graph paper — there were four weights of Bell Centennial — pixel by pixel, then encode them raster line by raster line for the keyboard. It took two years, but I learned a lot. These letters look as though they ' ve been chewed by the dog or something or other, but the missing pixels at the intersections of strokes or in the crotches are the result of my studying the effects of ink spread on cheap paper and reacting, revising the font accordingly. These strange **artifacts** are designed to compensate for the undesirable effects of scale and production process. At the outset, AT&T had wanted to set the phone books in Helvetica, but as my friend Erik Spiekermann said in the Helvetica **movie**, if you ' ve seen that, the letters in Helvetica were designed to be as similar to one another as possible. This is not the recipe for legibility at small size. It looks very elegant up on a slide. I had to disambiguate these forms of the figures as much as possible in Bell Centennial by sort of opening the shapes up, as you can see in the bottom part of that slide. So now we ' re on to the mid- ' 80s, the early days of digital outline fonts, vector technology.

There was an issue at that time with the size of the fonts, the amount of data that was required to find and store a font in computer memory. It limited the number of fonts you could get on your typesetting system at any one time. I did an analysis of the data, and found that a **typical** serif face you see on the left needed nearly twice as much data as a sans serif in the middle because of all the points required to define the elegantly curved serif brackets. The numbers at the bottom of the slide, by the way, they represent the amount of data needed to store each of the fonts. So the sans serif, in the middle, sans the serifs, was much more economical, 81 to 151.”Aha,”I thought.”The engineers have a problem. Designer to the rescue.”I made a serif type, you can see it on the right, without curved serifs. I made them polygonal, out of straight line segments, chamfered brackets. And look, as economical in data as a sans serif. We call it Charter, on the right. So I went to the head of engineering with my numbers, and I said proudly,”I have solved your problem.””Oh,”he said.”What problem?”And I said,”Well, you know, the problem of the huge data you require for serif fonts and so on.””Oh,”he said.”We solved that problem last week. We wrote a compaction routine that reduces the size of all fonts by an order of magnitude. You can have as many fonts on your system as you like.””Well, thank you for letting me know,”I said. Foiled again. I was left with a design solution for a nonexistent technical problem. But here is where the story sort of gets interesting for me. I didn ’ t just throw my design away in a fit of pique. I persevered. What had started as a technical exercise became an aesthetic exercise, really. In other words, I had come to like this typeface. Forget its origins. Screw that. I liked the design for its own sake. The simplified forms of Charter gave it a sort of plain- spoken quality and unfussy spareness that sort of pleased me. You know, at times of technical innovation, designers want to be influenced by what ’ s in the air. We want to respond. We want to be pushed into exploring something new. So Charter is a sort of parable for me, really. In the end, there was no hard and fast causal link between the technology and the design of Charter. I had really misunderstood the technology. The technology did suggest something to me, but it did not force my hand, and I think this happens very often. You know, engineers are very smart, and despite occasional frustrations because I ’ m less smart, I ’ ve always enjoyed working with them and learning from them. Apropos, in the mid- ’ 90s, I started talking to Microsoft about screen fonts. Up to that point, all the fonts on screen had been adapted from previously existing printing fonts, of course. But Microsoft foresaw correctly the movement, the stampede towards electronic communication, to reading and writing onscreen with the printed output as being sort of secondary in importance. So the priorities were just tipping at that point. They wanted a small core set of fonts that were not adapted but designed for the screen to face up to the problems of screen, which were their coarse resolution **displays**. I said to Microsoft, a typeface designed for a particular technology is a self-obsoleting typeface. I ’ ve designed too many faces in the past that were intended to mitigate technical problems. Thanks to the engineers, the technical problems went away. So did my typeface. It was only a stopgap. Microsoft came back to say that affordable computer monitors with better resolutions were at least a decade away. So I thought, well, a decade, that ’ s not bad, that ’ s more than a stopgap. So I was persuaded, I was convinced, and we went to work on what became Verdana and Georgia, for the first time working not on paper but directly onto the screen from the pixel up. At that time, screens were binary. The pixel was either on or it was off. Here you see the outline of a letter, the cap H, which is the thin black line, the contour, which is how it is stored in memory, **superimposed** on the bitmap, which is the grey area, which is how it ’ s **displayed** on the screen. The bitmap is rasterized from the outline.

Here in a cap H, which is all straight lines, the two are in almost perfect sync on the Cartesian grid. Not so with an O. This looks more like bricklaying than type design, but believe me, this is a good bitmap O, for the simple reason that it ’ s symmetrical in both x and y axes. In a binary bitmap, you actually can ’ t ask for more than that. I would sometimes make, I don ’ t know, three or four different versions of a difficult letter like a lowercase A, and then stand back to choose which was the best. Well, there was no best, so the designer ’ s judgment comes in in trying to decide which is the least bad. Is that a compromise? Not to me, if you are working at the highest standard the technology will allow, although that standard may be well short of the ideal. You may be able to see on this slide two different bitmap fonts there. The”a”in the upper one, I think, is better than the”a”in the lower one, but it still ain ’ t great. You can maybe see the effect better if it ’ s reduced. Well, maybe not. So I ’ m a pragmatist, not an idealist, out of necessity. For a certain kind of temperament, there is a certain kind of satisfaction in doing something that cannot be perfect but can still be done to the best of your ability. Here ’ s the lowercase H from Georgia Italic. The bitmap looks jagged and rough. It is jagged and rough. But I discovered, by experiment, that there is an optimum slant for an italic on a screen so the strokes break well at the pixel boundaries. Look in this example how, rough as it is, how the left and right legs actually break at the same level. That ’ s a victory. That ’ s good, right there. And of course, at the lower depths, you don ’ t get much choice. This is an S, in case you were wondering. Well, it ’ s been 18 years now since Verdana and Georgia were released. Microsoft were absolutely right, it took a good 10 years, but screen **displays** now do have improved **spatial** resolution, and very much improved photometric resolution thanks to anti-aliasing and so on. So now that their mission is accomplished, has that meant the demise of the screen fonts that I designed for coarser **displays** back then? Will they outlive the now-obsolete screens and the flood of new web fonts coming on to the market? Or have they established their own sort of evolutionary niche that is independent of technology? In other words, have they been absorbed into the typographic mainstream? I ’ m not sure, but they ’ ve had a good run so far. Hey, 18 is a good age for anything with present-day rates of attrition, so I ’ m not complaining. Thank you.

George and Charlotte Blonsky, who were a married couple living in the Bronx in New York City, invented something. They got a patent in 1965 for what they call,”a device to assist women in giving birth.”This device consists of a large, round table and some machinery. When the woman is ready to deliver her child, she lies on her back, she is strapped down to the table, and the table is rotated at high speed. The child comes flying out through centrifugal force. If you look at their patent carefully, especially if you have any engineering background or talent, you may decide that you see one or two points where the design is not perfectly adequate. Doctor Ivan Schwab in California is one of the people, one of the main people, who helped answer the question,”Why don ’ t woodpeckers get headaches?”And it turns out the answer to that is because their brains are packaged inside their skulls in a way different from the way our brains, we being human beings, true, have our brains packaged. They, the woodpeckers, typically will peck, they will **bang** their head on a piece of wood thousands of times every day. Every day! And as far as anyone knows, that doesn ’ t bother them in the slightest. How does this happen? Their brain does not slosh around like ours does. Their brain is packed in very tightly, at least for blows coming right from the front. Not too many people paid attention to this research until the last few years when, in this country especially, people are becoming curious about what happens to the brains of football players who **bang** their heads repeatedly. And the woodpecker maybe relates to that. There was a paper published in the medical journal The Lancet in England a few years ago called"A man who pricked his finger and smelled putrid for 5 years."Dr. Caroline Mills and her team received this patient and didn ' t really know what to do about it. The man had cut his finger, he worked processing chickens, and then he started to smell really, really bad. So bad that when he got in a room with the doctors and the nurses, they couldn ' t stand being in the room with him. It was intolerable. They tried every drug, every other treatment they could think of. After a year, he still smelled putrid. After two years, still smelled putrid. Three years, four years, still smelled putrid. After five years, it went away on its own. It ' s a mystery. In New Zealand, Dr. Lianne Parkin and her team tested an old tradition in her city. They live in a city that has huge hills, San Francisco-grade hills. And in the winter there, it gets very cold and very icy. There are lots of injuries. The tradition that they tested, they tested by asking people who were on their way to work in the morning, to stop and try something out. Try one of two conditions. The tradition is that in the winter, in that city, you wear your socks on the outside of your boots. And what they discovered by experiment, and it was quite graphic when they saw it, was that it ' s true. That if you wear your socks on the outside rather than the inside, you ' re much more likely to survive and not slip and fall. Now, I hope you will agree with me that these things I ' ve just described to you, each of them, deserves some kind of prize. And that ' s what they got, each of them got an Ig Nobel prize. In 1991, I, together with bunch of other people, started the Ig Nobel prize ceremony. Every year we give out 10 prizes. The prizes are based on just one criteria. It ' s very simple. It ' s that you ' ve done something that makes people laugh and then think. What you ' ve done makes people laugh and then think. Whatever it is, there ' s something about it that when people encounter it at first, their only possible reaction is to laugh. And then a week later, it ' s still rattling around in their heads and all they want to do is tell their friends about it. That ' s the quality we look for. Every year, we get in the neighborhood of 9, 000 new nominations for the Ig Nobel prize. Of those, consistently between 10 percent and 20 percent of those nominations are people who nominate themselves. Those self-nominees almost never win. It ' s very difficult, numerically, to win a prize if you want to. Even if you don ' t want to, it ' s very difficult numerically. You should know that when we choose somebody to win an Ig Nobel prize, We get in touch with that person, very quietly. We offer them the chance to decline this great honor if they want to. Happily for us, almost everyone who ' s offered a prize decides to accept. What do you get if you win an Ig Nobel prize? Well, you get several things. You get an Ig Nobel prize. The design is different every year. These are always handmade from extremely cheap materials. You ' re looking at a picture of the prize we gave last year, 2013. Most prizes in the world also give their winners some cash, some money. We don ' t have any money, so we can ' t give them. In fact, the winners have to pay their own way to come to the Ig Nobel ceremony, which most of them do. Last year, though, we did manage to scrape up some money. Last year, each of the 10 Ig Nobel prize winners received from us 10 trillion dollars. A $10 trillion bill from Zimbabwe. You may remember that Zimbabwe had a little adventure for a few years there of inflation. They ended up printing bills that were in denominations as large as 100 trillion dollars. The man responsible, who runs the national bank there, by the way, won an Ig Nobel prize in mathematics. The other thing you win is an invitation to come to the ceremony, which happens at Harvard University. And when you get there, you come to Harvard ' s biggest meeting place and classroom. It fits 1, 100 people, it ' s jammed to the gills, and up on the stage, waiting to shake your hand, waiting to hand you your Ig Nobel prize, are a bunch of Nobel prize winners. That ' s the heart of the ceremony. The winners are kept secret until that moment, even the Nobel laureates who will shake their hand don ' t know who they are until they ' re announced. I am going to tell you about just a very few of the other medical-related prizes we ' ve given. Keep in mind, we ' ve given 230 prizes. There are lots of these people who walk among you. Maybe you have one. A paper was published about 30 years ago called"Injuries due to Falling Coconuts."It was written by Dr. Peter Barss, who is Canadian. Dr. Barss came to the ceremony and explained that as a young doctor, he wanted to see the world. So he went to Papua New Guinea. When he got there, he went to work in a hospital, and he was curious what kinds of things happen to people that bring them to the hospital. He looked through the records, and he discovered that a surprisingly large number of people in that hospital were there because of injuries due to falling coconuts. One **typical** thing that happens is people will come from the highlands, where there are not many coconut trees, down to visit their relatives on the coast, where there are lots. And they ' ll think that a coconut tree is a fine place to stand and maybe lie down. A coconut tree that is 90 feet tall, and has coconuts that weigh two pounds that can drop off at any time. A team of doctors in Europe published a series of papers about colonoscopies. You ' re all familiar with colonoscopies, one way or another. Or in some cases, one way and another. They, in these papers, explained to their fellow doctors who perform colonoscopies, how to minimize the chance that when you perform a colonoscopy, your patient will explode. Dr. Emmanuel Ben-Soussan one of the authors, flew in from Paris to the ceremony, where he explained the history of this, that in the 1950s, when colonoscopies were becoming a common technique for the first time, people were figuring out how to do it well. And there were some difficulties at first. The basic problem, I ' m sure you ' re familiar with, that you ' re looking inside a long, narrow, dark place. And so, you want to have a larger space. You add some gas to inflate it so you have room to look around. Now, that ' s added to the gas, the methane gas, that ' s already inside. The gas that they used at first, in many cases, was oxygen. So they added oxygen to methane gas. And then they wanted to be able to see, they needed light, so they ' d put in a light source, which in the 1950s was very hot. So you had methane gas, which is flammable, oxygen and heat. They stopped using oxygen pretty quickly. Now it ' s rare that patients will explode, but it does still happen. The final thing that I want to tell you about is a prize we gave to Dr. Elena Bodnar. Dr. Elena Bodnar invented a brassiere that in an emergency can be quickly separated into a pair of protective face **masks**. One to save your life, one to save the life of some lucky bystander. Why would someone do this, you might wonder. Dr. Bodnar came to the ceremony and she explained that she grew up in Ukraine. She was one of the doctors who treated victims of the Chernobyl power plant meltdown. And they later discovered that a lot of the worst medical problems came from the particles people breathed in. So she was always thinking after that about could there be some simple **mask** that was available everywhere when the unexpected happens. Years later, she moved to America. She had a baby, One day she looked, and on the floor, her infant son had picked up her bra, and had her bra on his face. And that ' s where the idea came from. She came to the Ig Nobel ceremony with the first prototype of the bra and she demonstrated : ["Paul Krugman, Nobel laureate in economics"] ["Wolfgang Ketterle, Nobel laureate in physics"] I myself own an emergency bra. It ' s my favorite bra, but

I would be happy to share it with any of you, should the need arise. Thank you.

Text Sample 876: POS Dim 6 – 2015 – Score 4.00 – 2015/t001578.txt

This is a play called”Sell / Buy / Date.”It ’ s my first since”Bridge and Tunnel,”which I did on Broadway, and this one, I â thank you â I ’ ve excerpted it just for you, so here we go. Right. Class, let ’ s be absolutely certain all electronic devices are switched off before we begin. So class, hopefully you ’ ll recognize what you just heard me say as the â? Very good, the cellular phone announcement. Right? This was also known as a mobile phone. So you ’ ll remember, people of that era would have had an external electronic device, right, something like this, and they all would have carried one of these around with them, and amongst their biggest fears was the sheer mortification that one of these might ring at some inopportune moment. Right? So a bit of trivia about that era for you. So the format of today ’ s class is I will be presenting multiple BERT modules today from that period in history, right, so starting circa 2016. And remember, this was the very first year of the BERT program. So we ’ ve got quite a few of these to get through. Bear in mind, I will be living into **various** different bodies, different ages, also what were then called races, or ethnic groups, as you ’ ll remember from Unit 1. And â â and along the gender continuum, I will be living into males as well. It was quite binary at that time. Also, don ’ t forget, we are reading the book module for next week ’ s focus on gender. Now, I know some of you have requested the book in pill form. I know people still believe ingesting it is better for retention, but since we are trying to experience what our forebears did, right, let ’ s please just consider doing the actual ocular reading, okay? And also, how many people have your emotional shunts engaged? Right. Please toggle them off. Okay? I know it ’ s challenging, but I want you to be able to feel the entire natural emo range, all right? It is essential to this part of the syllabus. Yes, Macy? All right. I understand. If you ’ re unwilling to â All right, well, we can discuss that after class. All right, we will discuss your concerns. Just relax. Nobody ’ s died and gone to composting. Okay. After class. Okay? After class. Let ’ s just get started, okay. This first subject identified as a middle-class homemaker. Remember, these early modules in these people ’ s full identities were protected, and this allowed them to speak more freely on our topic, which for many of them was taboo. Okay honey, now, I ’ m ready when you are. No, sweetheart, I said, I ’ m ready when you are. I ’ m freezing. It ’ s like a meat locker in here in this recording studio. I should have brought a shmata. All this fancy technology but they can ’ t afford heat. What is he saying? I can ’ t hear you! I can ’ t hear you through the glass, honey! There you are in my ear. Oh, you can hear me? The whole time. Oh, yes, I am a little chilly. Yes, oh the cold is for the machines, the new technology. Okay. Yes, now remind me again, you ’ re recording not only my voice but my feelings and my memories? Right. Yes, BERT, yes, I read about it. Bio-Empathetic Resonant Technology. Right, right, so people will be able to feel my experience and my memory? Okay. No, right, I ’ m ready. I just thought you were going to give me a test to see how my memory ’ s doing. I was going to tell you you ’ re too late, it ’ s already bad news. No, no, go ahead, honey. Oh, that ’ s the first question? What do I think of prostitution? Are you soliciting me, young man? I ’ ve heard of May-December romances, but what are you, about 20 years old? Eighteen? Eighteen years. I think I have candies in my purse older than 18 years old. I ’ m teasing you, sweetheart. No, I ’ m comfortable with any question. Sure. So about the prostitution â oh, sex worker, sex worker. No, just in my day, they called it prostitution, not sex work. Oh, because it includes pornography also?

Okay. No, well, I guess when I was a girl, we didn ’ t really have a name for that either. We would have said dirty magazines, I suppose, or dirty **movies**. Well, it ’ s not like what you have with the Internet. No, well, I don ’ t mind sharing. My late husband and I, we were a very romantic couple. Lots of tenderness, you understand. Well, as you get older, you know, at one point I thought my husband might be helped by using some of the pills men can take, but he wasn ’ t interested in those, so I thought, what about maybe watching an adult **movie** on the Internet? Just for inspiration, you understand. Well, at the time, neither of us were very good on the computer, so usually, if we needed help with the Internet, we would just call our children or our grandchildren, but obviously, in this case, that wasn ’ t an option, so I thought, I ’ ll have a look myself, just to see. How difficult could it be? You search for certain key words and you look â Oh wow is right, young man. You can ’ t imagine what I saw. Well, first of all, I was just trying to find, you know, couples, normal couples making love, but this, so many people together at one time. You couldn ’ t tell which part belonged to which body. How they even got the cameras to capture some of this, I couldn ’ t tell you. But the one thing they didn ’ t capture was making love. There was lots of making of something, but they took the love part right out of it, you know, the fun. It was all very extreme, you know? Like you would say, with the extreme sports. Lots of endurance, but never tenderness. So anyway, needless to say, that was $19. 95 I ’ ll never get back again, but it only showed up on the credit card as”entertainment services,”so my husband was never the wiser, and after all of that, well, you could say it turned out he didn ’ t need the extra inspiration after all. Right, so next subject is a young woman â â Next subject, class, is a young woman called Bella, a university student interviewed in 2016 during what was called an Intro to Feminist Porn class as part of her major in sex work at a college in the Bay Area. Yeah, I just want to, like, get a recording of, like, you guys recording me, like a meta recording, or whatever. It ’ s just like this whole experience is just, like, really amazing, and I ’ d like to capture that for, like, Instagram and my Tumblr. So, like, hi guys, it ’ s me, Bella, and I am, like, being interviewed right now for this, like, really amazing Bio-Empathetic Resonance Technology, which is, like, basically where they are, like, recording, as you can see from these, whatever, like, electrodes, the formation of, like, neuropeptides in my hippocampus, or whatever. They will later be able to reconstitute these as, like, my own actual memory, like actual experiences, so other people can, like, actually feel what I ’ m feeling right now. Okay. Okay. So, like, hello, BERT person of the future who is experiencing me. This is what it feels like to be, like, a college freshman, and also the, like, headache that you are experiencing through me is the, like, residual effect of the Jell- O shots which I had last night at the bi-weekly feminist **pole** dancing party which I cohost on Wednesdays. It ’ s called”Don ’ t Get All Polemical”â â and it ’ s in Beekman Hall, and, what else, like, non-Jell-O shots are also available for vegans, and, oh, okay, yeah, totally, yeah, we should also focus on your questions also. So for your record, I am, like, a sex work studies major but minoring in social media with a concentration on notable YouTube memes. Yes, well, of course, like, I consider myself to be, like, obviously, like, a feminist. I was named for Bella Abzug, who was, like, a famous, like, feminist from history, and, like, also I feel that it is, like, important to, like, represent women who are, like, sex-positive feminists. What is sex-negative? Well, like, I guess I would ask, like, what do you think sex-negative is? Yeah, because, like, the terms that we use are, like, so important, because, like, we call it sex work because it helps people understand that, like, it ’ s work, and, like, you know, just like there are, like, healthcare providers and, like, insurance providers, like, we think of these workers as, like, sex care providers. Yeah, but like, I don

’ t think of myself like, providing direct sex care services per se as, like, being a requirement for me to be, like, an advocate. Like, I support other women ’ s right to choose it voluntarily, like, if they enjoy it. Yeah, but, like, I see myself going forward as more likely, like, protecting sex workers ’, like, legal freedoms and rights. Yeah, so, like, basically, I ’ m planning on becoming a lawyer. Right, class. So these next two modules are also circa 2016. One subject is an Irishwoman with a particularly noteworthy relationship to this issue, but first will be a West Indian woman, a self-described escort who was recorded at a sex workers ’ rights rally and parade. She was interviewed whilst marching in full carnival headdress and very little else. All right, you want me to start talking now. Yeah, I told you, you can put those wires anywhere you want to as long as it don ’ t get in the way. Yeah, no, but, tell me again what the name of â BERT? BERT. Yeah, I was telling you, you know, I think I have in all my time I have had at least one client with that name, so this won ’ t be the first time I had BERT all over me. Oh, I ’ m sorry, but you got to get into the spirit of it if you ’ re going to interview me. All right? You can say it. No justice, no piece! No justice, no piece! But you see the sign? You get it? P-I-E-C-E. No justice, no piece of us. You understand? Right, so that ’ s the part where I was telling you is that when I first came to this country, I worked every job I could find. I was a nanny ; I was a home care attendant for all these different old people, and then I said, child, if I have to touch another white man ’ s backside, I might as well get paid a lot more money for it than this, you understand? Pshh, you know how hard it is being a domestic worker? Some of these men, they ’ re heavy. You have to pick them up and flip them over. Now, I let them pick me up and flip me over, you understand? Well, you have to have a sense of humor about it, that ’ s what I think. No, but see, listen, you find me somebody who don ’ t hate some part of their job. I mean, there ’ s a lot of things about this job that I hate, but the money is not one of them, and I will tell you, as long as this is the best possibility for me to make real money, I am going to be Jamaican-No-Fakin ’ if that ’ s what they want to call me. No, I ’ m not even from Jamaica. That ’ s how they market me. My family is from Trinidad and the Virgin Islands. They don ’ t know what I do, but you know what? My children, they know that their school fees are paid, they have their books and their computer, and this way, I know that they have a chance. So I ’ m not going to tell you that what I do, it ’ s easy, I ’ m not going to tell you that I feel â what ’ s that you said, liberated? But I ’ m going to tell you that I feel paid. Right. Thanks, that ’ s lovely, and just the cup of tea, love, and just a splash of the whiskey. It ’ s perfect, that ’ s grand. Just a drop more. A splash. Perfect. What was your name? Peter? Is that right, so, Peter? Right. So that, that is the unique part of it for me, right, is that I ended up in both, first in the convent, and then in the prostitution after. That ’ s right. So one woman at the university here in Dublin, she wrote about me. She said, Maureen Fitzroy is the living embodiment of the whore-virgin dichotomy. Right? Doesn ’ t it sound like something you need to go into hospital? Well, I ’ ve got this terrible dichotomy. Doesn ’ t it. Right. Well, for me though, it was, as a girl, it started with me dad. I mean, half the time, when he spoke to us, it was just a sort of tell us we were all useless rotten idiots and we had no morals, that type of thing. And I certainly didn ’ t do myself any favors. By the time I was 16, I had started messing about with this older fella, and he wanted it to be our little secret, and I did as I was told, didn ’ t I, and when that got back to me dad, he had me sent straightaway to the convent. Well no, that older fella, he would still come to find me in the convent. Yeah, he ’ d leave me notes tucked into the holes in the brick at the back of the charity shop so we could meet. And he ’ d tell me how he ’ s leaving his wife, and I believed him, until I got pregnant. I did, Peter, and I left him a note about it in our special place there, and I never did hear from him again. No, I gave it up for adoption so it could have a decent life, and then they wouldn ’ t let me back into the convent. No, my one sister Virginia gave me a fiver for the coach to Dublin, and that ’ s how I ended up here. Well, surprise, surprise, I fell in love with another fella much older than me, and I always say I was just so happy because he didn ’ t drink, I married the bastard. Well, he didn ’ t drink, but he did have just the wee heroin problem, didn ’ t he, and â That ’ s right, and before I knew it, he was the one who turned me on to the prostitution, my own husband. He had me supporting the both of us. I was 18. Well, it wasn ’ t Pretty Woman, I can tell you that. That Julia Roberts, if she ’ d ever had to sleep with a man to put a few pounds in her pocket, I don ’ t think she ’ d ever have made that film. Well, for your record, my opinion of the legalization, I ’ d say I ’ m against it. I just, I don ’ t care what these young girls say. You know, living like that, you ’ re just lost, and, you know, I ’ m 63 years old. I ’ m still trying to find who I am. You know, I never was a wife or a nun, or a prostitute even, really, not really. Nobody ever asked who I wanted to be. They just told me, and if you legalize it, then you ’ re really telling these girls,”Go on and get lost for a living,”and a lot of them, they ’ ll do as they ’ re told. All right, so four perspectives from four quite â â four quite different voices there, right? One woman saying sex itself is natural but the sex industry seems to mechanize or industrialize it. Then the second woman considered sex work to be empowering, liberating, and feminist, though she, herself, notably, did not seem keen to do it. The third woman, who actually was a so-called sex worker did not agree that it was liberating but she wanted the right to the economic empowerment, and then we hear the fourth woman saying not only prostitution itself but proscribed roles for women in general prevented her from ever finding who she was, right? So another fact most people did not know was the average age of an at-risk girl being introduced to the sex industry was 12 or 13. Also consider that the age when all girls in that society first became exposed to sexualized images of women was quite a bit earlier, right? This was a doll called Barbie, right? I initially thought she was an educational tool for anorexia prevention â â but actually she was considered by many to be a wholesome symbol of femininity, and often young girls began what was called dieting. Remember this? This was restricting food intake on purpose by the age of six, and defining themselves based on attractiveness by around that same time. Right? Yes? Right, Bradley, okay, excellent point. So there was a lucrative market in that society in convincing all people they had to look a certain way to even have a sex life, right? But girls, especially, were expected to be”sexy”while avoiding being perceived as”sluts”for being sexual. Right? So there ’ s that shame piece we ’ ve heard about. Yes. Valerie, right? Okay, very good. Of course, men were having sex as well, but you ’ ll remember from the reading, what were male sluts called? Very good, they were called men. So not easy living in a world like that, right? Though it was not all bad news either. Most women in the early 2000s considered themselves empowered, and men generally felt they were also evolved in this area, and, in fact, most people would have been aware of issues like human trafficking, for example, but they would have seen that as quite separate from more recreational adult entertainment. And so we ’ ll just very briefly, class â we don ’ t have a lot of time â we ’ ll just very briefly hear from a man on our topic at this stage. So this next subject was interviewed on the night of his bachelor party. Dude, can you, all right, can you just keep it down? I ’ m trying to talk to BERT right now. Oh, your name ’ s not BERT. BERT ’ s the name of the, oh, all right. No, no, no, totally, it ’ s totally fine. I ’ m mostly sober, so I just want to be helpful. Yeah, and I totally believe in causes, yeah, like, all that stuff. And actually, I ’ m wearing Toms right now. Yeah, Toms, like, the shoes, like, you buy a pair and then a kid in Africa gets clean water. Yeah. Totally. But what was the question again? Sorry. Of course I believe in women ’ s rights. I ’ m marrying a woman. No, but I mean, like, just because I ’ m in a strip club parking lot doesn ’ t mean that I ’ m, like, a sexist or whatever. My fiancee is totally amazing, she ’ s totally a strong girl, woman, smart woman, like, the whole thing. Yeah, she knows I ’ m here. She ’ s probably at a strip club herself right now, like, as a joke, same as me. My best man, I told him he could surprise me, and he thought this would be hilarious, but this is not something. Yeah, we all went to B school together. Wharton. Yeah, so, dude, can you guys â All right, but it ’ s my bachelor party, and I can spend it in the parking lot with Anderson Cooper if I want to. All right, I ’ ll see you in there. All right, okay, so Anderson, so, like, first of all, stripping, but then, like, all the other things you ’ re talking about, prostitution and all that stuff, that ’ s, like, not the same thing at all. You know? Like, you keep calling it the sex industry or whatever, but it ’ s like, if the girl wants to be an exotic dancer and she ’ s 18, like, that ’ s her right. Whoa, whoa, I hear what you ’ re saying, but I just feel like people, they just want to make it seem like all dudes are just, like, predators, that we would just automatically go to a prostitute, or whatever. Even, like, when I pledged, you know, like when I rushed my fraternity. My brothers who I ’ m close to, those guys, they ’ re all like me. We ’ re just normal people, but, like, there ’ s this myth that you must be that guy who is kind of an asshole, and like, all bros before hos or whatever. And actually, like, bros before hos, it doesn ’ t mean like what it sounds like. It ’ s actually just like a joking way of saying that you care about your brothers and you put them first. Yeah, but, you can ’ t blame the media, either. I mean, like, if you go watch”Hangover 2,”and you think that ’ s an instruction manual for your life, like, I don ’ t know what to tell you. You know? You don ’ t watch”Bourne Identity”and go drive your car over a gondola in Venice. Well, yeah, okay, like, if you ’ re a little kid or whatever, of course it ’ s different, but â Yeah, all right, I remember one thing like that. I was at this kid ’ s house one time playing GTA, uh, Grand Theft Auto? Dude, are you from Canada? So, like, whatever, with Grand Theft Auto, you ’ re this kid, like, you ’ re this guy walking around or whatever, and you can basically, like, the more cops you kill, the more points you get, and stuff like that. But also, you can find prostitutes and obviously you can do sexual stuff with them, but you can, like, kill them and take your money back. Yeah, this kid, I remember he ran over a couple of them a few times with his car and he got all these points. We were, like, 10, I think. It felt pretty terrible, actually. No, I don ’ t think I said anything, I just finished playing and went home. All right class, so then there were men who had more than just a passing relationship to this issue. The next subject described himself as a reformed and remorseful pimp turned motivational speaker, life coach and therapist, but if you want to know more about him, you ’ ll have to come to the entire play. Thank you so much, you beautiful TED audience. I will see you for”Sell / Buy / Date.”

Text Sample 877: POS Dim 6 – 2015 – Score 4.00 – 2015/t001563.txt

I love a great mystery, and I ’ m fascinated by the greatest unsolved mystery in science, perhaps because it ’ s personal. It ’ s about who we are, and I can ’ t help but be curious. The mystery is this : What is the relationship between your brain and your conscious experiences, such as your experience of the taste of chocolate or the feeling of velvet? Now, this mystery is not new. In 1868, Thomas Huxley wrote,”How it is that anything so **remarkable** as a state of consciousness comes about as the result of irritating nervous tissue is just as unaccountable as the appearance of the genie when Aladdin rubbed his lamp."Now, Huxley knew that brain activity and conscious experiences are correlated, but he didn ' t know why. To the science of his day, it was a mystery. In the years since Huxley, science has learned a lot about brain activity, but the relationship between brain activity and conscious experiences is still a mystery. Why? Why have we made so little progress? Well, some experts think that we can ' t solve this problem because we lack the necessary concepts and intelligence. We don ' t expect monkeys to solve problems in quantum mechanics, and as it happens, we can ' t expect our species to solve this problem either. Well, I disagree. I ' m more optimistic. I think we ' ve simply made a false assumption. Once we fix it, we just might solve this problem. Today, I ' d like tell you what that assumption is, why it ' s false, and how to fix it. Let ' s begin with a question : Do we see reality as it is? I open my eyes and I have an experience that I describe as a red tomato a meter away. As a result, I come to believe that in reality, there ' s a red tomato a meter away. I then close my eyes, and my experience changes to a gray field, but is it still the case that in reality, there ' s a red tomato a meter away? I think so, but could I be wrong? Could I be misinterpreting the nature of my perceptions? We have misinterpreted our perceptions before. We used to think the Earth is flat, because it looks that way. Pythagorus discovered that we were wrong. Then we thought that the Earth is the unmoving center of the Universe, again because it looks that way. Copernicus and Galileo discovered, again, that we were wrong. Galileo then wondered if we might be misinterpreting our experiences in other ways. He wrote :"I think that tastes, odors, colors, and so on reside in consciousness. Hence if the living creature were removed, all these qualities would be annihilated."Now, that ' s a stunning claim. Could Galileo be right? Could we really be misinterpreting our experiences that badly? What does modern science have to say about this? Well, neuroscientists tell us that about a third of the brain ' s cortex is engaged in vision. When you simply open your eyes and look about this room, billions of neurons and trillions of synapses are engaged. Now, this is a bit surprising, because to the extent that we think about vision at all, we think of it as like a camera. It just takes a picture of objective reality as it is. Now, there is a part of vision that ' s like a camera : the eye has a lens that focuses an image on the back of the eye where there are 130 million photoreceptors, so the eye is like a 130-megapixel camera. But that doesn ' t explain the billions of neurons and trillions of synapses that are engaged in vision. What are these neurons up to? Well, neuroscientists tell us that they are creating, in real time, all the shapes, objects, colors, and motions that we see. It feels like we ' re just taking a snapshot of this room the way it is, but in fact, we ' re constructing everything that we see. We don ' t construct the whole world at once. We construct what we need in the moment. Now, there are many demonstrations that are quite compelling that we construct what we see. I ' ll just show you two. In this example, you see some red discs with bits cut out of them, but if I just rotate the disks a little bit, suddenly, you see a 3D cube pop out of the screen. Now, the screen of course is flat, so the three-dimensional cube that you ' re experiencing must be your construction. In this next example, you see glowing blue bars with pretty sharp edges moving across a field of dots. In fact, no dots move. All I ' m doing from frame to frame is changing the colors of dots from blue to black or black to blue. But when I do this quickly, your visual system creates the glowing blue bars with the sharp edges and the motion. There are many more examples, but these are just two that you construct what you see. But neuroscientists go further. They say that we reconstruct reality. So, when I have an experience that I describe as a red tomato, that experience is actually an accurate reconstruction of the properties of a real red tomato that would exist even if I weren ' t looking. Now, why would neuroscientists say that we don ' t just construct, we reconstruct? Well, the standard argument given is usually an evolutionary one. Those of our ancestors who saw more accurately had a competitive advantage compared to those who saw less accurately, and therefore they were more likely to pass on their genes. We are the offspring of those who saw more accurately, and so we can be confident that, in the normal case, our perceptions are accurate. You see this in the standard textbooks. One textbook says, for example,"Evolutionarily speaking, vision is useful precisely because it is so accurate."So the idea is that accurate perceptions are fitter perceptions. They give you a survival advantage. Now, is this correct? Is this the right interpretation of evolutionary theory? Well, let ' s first look at a couple of examples in nature. The Australian jewel beetle is dimpled, glossy and brown. The female is flightless. The male flies, looking, of course, for a hot female. When he finds one, he alights and mates. There ' s another species in the outback, Homo sapiens. The male of this species has a massive brain that he uses to hunt for cold beer. And when he finds one, he drains it, and sometimes throws the bottle into the outback. Now, as it happens, these bottles are dimpled, glossy, and just the right shade of brown to tickle the fancy of these beetles. The males swarm all over the bottles trying to mate. They lose all interest in the real females. Classic case of the male leaving the female for the bottle. The species almost went extinct. Australia had to change its bottles to save its beetles. Now, the males had successfully found females for thousands, perhaps millions of years. It looked like they saw reality as it is, but apparently not. Evolution had given them a hack. A female is anything dimpled, glossy and brown, the bigger the better. Even when crawling all over the bottle, the male couldn ' t discover his mistake. Now, you might say, beetles, sure, they ' re very simple creatures, but surely not mammals. Mammals don ' t rely on tricks. Well, I won ' t dwell on this, but you get the idea. So this raises an important technical question : Does natural selection really favor seeing reality as it is? Fortunately, we don ' t have to wave our hands and guess ; evolution is a mathematically precise theory. We can use the equations of evolution to check this out. We can have **various** organisms in artificial worlds compete and see which survive and which thrive, which sensory systems are more fit. A key notion in those equations is fitness. Consider this steak : What does this steak do for the fitness of an animal? Well, for a hungry lion looking to eat, it enhances fitness. For a well-fed lion looking to mate, it doesn ' t enhance fitness. And for a rabbit in any state, it doesn ' t enhance fitness, so fitness does depend on reality as it is, yes, but also on the organism, its state and its action. Fitness is not the same thing as reality as it is, and it ' s fitness, and not reality as it is, that figures centrally in the equations of evolution. So, in my lab, we have run hundreds of thousands of evolutionary game simulations with lots of different randomly chosen worlds and organisms that compete for resources in those worlds. Some of the organisms see all of the reality, others see just part of the reality, and some see none of the reality, only fitness. Who wins? Well, I hate to break it to you, but perception of reality goes extinct. In almost every simulation, organisms that see none of reality but are just tuned to fitness drive to extinction all the organisms that perceive reality as it is. So the bottom line is, evolution does not favor veridical, or accurate perceptions. Those perceptions of reality go extinct. Now, this is a bit stunning. How can it be that not seeing the world accurately gives us a survival advantage? That is a bit counterintuitive. But remember the jewel beetle. The jewel beetle survived for thousands, perhaps millions of years, using simple tricks and hacks. What the equations of evolution are telling us is that all organisms, including us, are in the same boat as the jewel beetle. We do not see reality as it is. We

’ re shaped with tricks and hacks that keep us alive. Still, we need some help with our intuitions. How can not perceiving reality as it is be useful? Well, fortunately, we have a very helpful metaphor : the desktop **interface** on your computer. Consider that blue icon for a TED Talk that you ’ re writing. Now, the icon is blue and rectangular and in the lower right corner of the desktop. Does that mean that the text file itself in the computer is blue, rectangular, and in the lower right-hand corner of the computer? Of course not. Anyone who thought that misinterprets the purpose of the **interface**. It ’ s not there to show you the reality of the computer. In fact, it ’ s there to hide that reality. You don ’ t want to know about the **diodes** and resistors and all the megabytes of software. If you had to deal with that, you could never write your text file or edit your photo. So the idea is that evolution has given us an **interface** that hides reality and guides adaptive behavior. Space and time, as you perceive them right now, are your desktop. Physical objects are simply icons in that desktop. There ’ s an obvious objection. Hoffman, if you think that train coming down the track at 200 MPH is just an icon of your desktop, why don ’ t you step in front of it? And after you ’ re gone, and your theory with you, we ’ ll know that there ’ s more to that train than just an icon. Well, I wouldn ’ t step in front of that train for the same reason that I wouldn ’ t carelessly drag that icon to the trash can : not because I take the icon literally — the file is not literally blue or rectangular — but I do take it seriously. I could lose weeks of work. Similarly, evolution has shaped us with perceptual symbols that are designed to keep us alive. We ’ d better take them seriously. If you see a snake, don ’ t pick it up. If you see a cliff, don ’ t jump off. They ’ re designed to keep us safe, and we should take them seriously. That does not mean that we should take them literally. That ’ s a logical error. Another objection : There ’ s nothing really new here. Physicists have told us for a long time that the metal of that train looks solid but really it ’ s mostly empty space with microscopic particles zipping around. There ’ s nothing new here. Well, not exactly. It ’ s like saying, I know that that blue icon on the desktop is not the reality of the computer, but if I pull out my trusty magnifying glass and look really closely, I see little pixels, and that ’ s the reality of the computer. Well, not really — you ’ re still on the desktop, and that ’ s the point. Those microscopic particles are still in space and time : they ’ re still in the user **interface**. So I ’ m saying something far more radical than those physicists. Finally, you might object, look, we all see the train, therefore none of us constructs the train. But remember this example. In this example, we all see a cube, but the screen is flat, so the cube that you see is the cube that you construct. We all see a cube because we all, each one of us, constructs the cube that we see. The same is true of the train. We all see a train because we each see the train that we construct, and the same is true of all physical objects. We ’ re inclined to think that perception is like a window on reality as it is. The theory of evolution is telling us that this is an incorrect interpretation of our perceptions. Instead, reality is more like a 3D desktop that ’ s designed to hide the complexity of the real world and guide adaptive behavior. Space as you perceive it is your desktop. Physical objects are just the icons in that desktop. We used to think that the Earth is flat because it looks that way. Then we thought that the Earth is the unmoving center of reality because it looks that way. We were wrong. We had misinterpreted our perceptions. Now we believe that spacetime and objects are the nature of reality as it is. The theory of evolution is telling us that once again, we ’ re wrong. We ’ re misinterpreting the content of our perceptual experiences. There ’ s something that exists when you don ’ t look, but it ’ s not spacetime and physical objects. It ’ s as hard for us to let go of spacetime and objects as it is for the jewel beetle to let go of its bottle. Why? Because we ’ re blind to our own blindnesses. But we have an advantage over the jewel beetle : our science and technology. By peering through the lens of a telescope we discovered that the Earth is not the unmoving center of reality, and by peering through the lens of the theory of evolution we discovered that spacetime and objects are not the nature of reality. When I have a perceptual experience that I describe as a red tomato, I am interacting with reality, but that reality is not a red tomato and is nothing like a red tomato. Similarly, when I have an experience that I describe as a lion or a steak, I ' m interacting with reality, but that reality is not a lion or a steak. And here ' s the kicker : When I have a perceptual experience that I describe as a brain, or neurons, I am interacting with reality, but that reality is not a brain or neurons and is nothing like a brain or neurons. And that reality, whatever it is, is the real source of cause and effect in the world — not brains, not neurons. Brains and neurons have no causal powers. They cause none of our perceptual experiences, and none of our behavior. Brains and neurons are a species-specific set of symbols, a hack. What does this mean for the mystery of consciousness? Well, it opens up new possibilities. For instance, perhaps reality is some vast machine that causes our conscious experiences. I doubt this, but it ' s worth exploring. Perhaps reality is some vast, interacting network of conscious agents, simple and complex, that cause each other ' s conscious experiences. Actually, this isn ' t as crazy an idea as it seems, and I ' m currently exploring it. But here ' s the point : Once we let go of our massively intuitive but massively false assumption about the nature of reality, it opens up new ways to think about life ' s greatest mystery. I bet that reality will end up turning out to be more fascinating and unexpected than we ' ve ever imagined. The theory of evolution presents us with the ultimate dare : Dare to recognize that perception is not about seeing truth, it ' s about having kids. And by the way, even this TED is just in your head. Thank you very much. Chris Anderson : If that ' s really you there, thank you. So there ' s so much from this. I mean, first of all, some people may just be profoundly depressed at the thought that, if evolution does not favor reality, I mean, doesn ' t that to some extent undermine all our endeavors here, all our ability to think that we can think the truth, possibly even including your own theory, if you go there? Donald Hoffman : Well, this does not stop us from a successful science. What we have is one theory that turned out to be false, that perception is like reality and reality is like our perceptions. That theory turns out to be false. Okay, throw that theory away. That doesn ' t stop us from now postulating all sorts of other theories about the nature of reality, so it ' s actually progress to recognize that one of our theories was false. So science continues as normal. There ' s no problem here. CA : So you think it ' s possible — — This is cool, but what you ' re saying I think is it ' s possible that evolution can still get you to reason. DH : Yes. Now that ' s a very, very good point. The evolutionary game simulations that I showed were specifically about perception, and they do show that our perceptions have been shaped not to show us reality as it is, but that does not mean the same thing about our logic or mathematics. We haven ' t done these simulations, but my bet is that we ' ll find that there are some selection pressures for our logic and our mathematics to be at least in the direction of truth. I mean, if you ' re like me, math and logic is not easy. We don ' t get it all right, but at least the selection pressures are not uniformly away from true math and logic. So I think that we ' ll find that we have to look at each cognitive faculty one at a time and see what evolution does to it. What ' s true about perception may not be true about math and logic. CA : I mean, really what you ' re proposing is a kind of modern-day Bishop Berkeley interpretation of the world : consciousness causes matter, not the other way around. DH : Well, it ' s slightly different than Berkeley. Berkeley thought that, he was a deist, and he thought that the ultimate nature of reality is God and so forth, and I don ’ t need to go where Berkeley ’ s going, so it ’ s quite a bit different from Berkeley. I call this conscious realism. It ’ s actually a very different approach. CA : Don, I could literally talk with you for hours, and I hope to do that. Thanks so much for that. DH : Thank you.

We ’ ve evolved with tools, and tools have evolved with us. Our ancestors created these hand axes 1. 5 million years ago, shaping them to not only fit the task at hand but also their hand. However, over the years, tools have become more and more specialized. These sculpting tools have evolved through their use, and each one has a different form which matches its function. And they leverage the dexterity of our hands in order to manipulate things with much more precision. But as tools have become more and more complex, we need more complex controls to control them. And so designers have become very adept at creating **interfaces** that allow you to manipulate parameters while you ’ re attending to other things, such as taking a photograph and changing the focus or the aperture. But the computer has fundamentally changed the way we think about tools because computation is dynamic. So it can do a million different things and run a million different applications. However, computers have the same static physical form for all of these different applications and the same static **interface** elements as well. And I believe that this is fundamentally a problem, because it doesn ’ t really allow us to interact with our hands and capture the rich dexterity that we have in our bodies. And my belief is that, then, we must need new types of **interfaces** that can capture these rich abilities that we have and that can physically adapt to us and allow us to interact in new ways. And so that ’ s what I ’ ve been doing at the MIT Media Lab and now at Stanford. So with my colleagues, Daniel Leithinger and Hiroshi Ishii, we created inFORM, where the **interface** can actually come off the screen and you can physically manipulate it. Or you can visualize 3D information physically and touch it and feel it to understand it in new ways. Or you can interact through gestures and direct deformations to sculpt digital clay. Or **interface** elements can arise out of the surface and change on demand. And the idea is that for each individual application, the physical form can be matched to the application. And I believe this represents a new way that we can interact with information, by making it physical. So the question is, how can we use this? Traditionally, urban planners and architects build physical models of cities and buildings to better understand them. So with Tony Tang at the Media Lab, we created an **interface** built on inFORM to allow urban planners to design and view entire cities. And now you can walk around it, but it ’ s dynamic, it ’ s physical, and you can also interact directly. Or you can look at different views, such as population or traffic information, but it ’ s made physical. We also believe that these dynamic shape **displays** can really change the ways that we remotely collaborate with people. So when we ’ re working together in person, I ’ m not only looking at your face but I ’ m also gesturing and manipulating objects, and that ’ s really hard to do when you ’ re using tools like Skype. And so using inFORM, you can reach out from the screen and manipulate things at a distance. So we used the pins of the **display** to represent people ’ s hands, allowing them to actually touch and manipulate objects at a distance. And you can also manipulate and collaborate on 3D data sets as well, so you can gesture around them as well as manipulate them. And that allows people to collaborate on these new types of 3D information in a richer way than might be possible with traditional tools. And so you can also bring in existing objects, and those will be captured on one side and transmitted to the other. Or you can have an object that ’ s linked between two places, so as I move a **ball** on one side, the **ball** moves on the other as well. And so we do this by capturing the remote user using a depth-sensing camera like a Microsoft Kinect. Now, you might be wondering how does this all work, and essentially, what it is, is 900 linear actuators that are connected to these mechanical linkages that allow motion down here to be propagated in these pins above. So it ’ s not that complex compared to what ’ s going on at CERN, but it did take a long time for us to build it. And so we started with a single motor, a single linear actuator, and then we had to design a custom circuit board to control them. And then we had to make a lot of them. And so the problem with having 900 of something is that you have to do every step 900 times. And so that meant that we had a lot of work to do. So we sort of set up a mini-sweatshop in the Media Lab and brought undergrads in and convinced them to do”research”— and had late nights watching **movies**, eating pizza and screwing in thousands of screws. You know — research. But anyway, I think that we were really excited by the things that inFORM allowed us to do. Increasingly, we ’ re using mobile devices, and we interact on the go. But mobile devices, just like computers, are used for so many different applications. So you use them to talk on the phone, to surf the web, to play games, to take pictures or even a million different things. But again, they have the same static physical form for each of these applications. And so we wanted to know how can we take some of the same interactions that we developed for inFORM and bring them to mobile devices. So at Stanford, we created this haptic edge **display**, which is a mobile device with an array of linear actuators that can change shape, so you can feel in your hand where you are as you ’ re reading a book. Or you can feel in your pocket new types of tactile sensations that are richer than the vibration. Or buttons can emerge from the side that allow you to interact where you want them to be. Or you can play games and have actual buttons. And so we were able to do this by embedding 40 small, tiny linear actuators inside the device, and that allow you not only to touch them but also back-drive them as well. But we ’ ve also looked at other ways to create more complex shape change. So we ’ ve used pneumatic actuation to create a morphing device where you can go from something that looks a lot like a phone... to a wristband on the go. And so together with Ken Nakagaki at the Media Lab, we created this new high- resolution version that uses an array of servomotors to change from interactive wristband to a touch-input device to a phone. And we ’ re also interested in looking at ways that users can actually deform the **interfaces** to shape them into the devices that they want to use. So you can make something like a game controller, and then the system will understand what shape it ’ s in and change to that mode. So, where does this point? How do we move forward from here? I think, really, where we are today is in this new age of the Internet of Things, where we have computers everywhere — they ’ re in our pockets, they ’ re in our walls, they ’ re in almost every device that you ’ ll buy in the next five years. But what if we stopped thinking about devices and think instead about environments? And so how can we have smart furniture or smart rooms or smart environments or cities that can adapt to us physically, and allow us to do new ways of collaborating with people and doing new types of tasks? So for the Milan Design Week, we created TRANSFORM, which is an interactive table-scale version of these shape **displays**, which can move physical objects on the surface ; for example, reminding you to take your keys. But it can also transform to fit different ways of interacting. So if you want to work, then it can change to sort of set up your work system. And so as you bring a device over, it creates all the affordances you need and brings other objects to help you accomplish those goals. So, in conclusion, I really think that we need to think about a new, fundamentally different way of interacting with computers. We need computers that can physically adapt to us and adapt to the ways that we want to use them and really harness the rich dexterity that we have of our hands, and our ability to think spatially about information by making it physical. But looking forward, I think we need to go beyond this, beyond devices, to really think about new ways that we can bring people together, and bring our information into the world, and think about smart environments that can adapt to us physically. So with that, I will leave you. Thank you very much.

Text Sample 879: POS Dim 6 – 2020 – Score 6.00 – 2020/t004276.txt

Arthur Brooks : Starting when I was eight or nine years old, I literally wanted to be the greatest French horn player in the world. That was what I always wanted to do. That was my whole life dream. Adam Grant : What was behind that? AB : I was ambitious. I wanted to play for a lot of people. And I guess that was just simply expressed in the only thing that I really knew how to do, the only thing I really cared about, which was music. AG : Arthur Brooks was a natural. He could read music before he could actually read. He played in youth orchestras as a kid, prestigious ones. Eventually he dropped out of college to go on tour. AB : I went on the road playing classical music. I did that for six years. I saw all 50 states from the back of a van. AG : Arthur recorded an album that played on classical radio stations across the country. But then something started to change. AB : I realized, about age 21, that things were starting to go south, and I couldn ’ t explain it. Ordinarily, classical musicians, they will see their skills increase through their 20s, and sometimes even their 30s. So whereas if I were a baseball pitcher, it would be totally normal that I would be losing heat off my fastball by my early 20s. As a French horn player, I shouldn ’ t have been seeing that, but I was. AG : To turn things around he practiced his heart out. Finally, he got his big break, his debut at Carnegie Hall. AB : So I got ready for this concert, and the first half of the concert, I have to say, was phenomenal. It was really one of the best concerts I ’ d ever given. And in the second half, I had this experience where I had to actually talk to the audience and I walked toward the front of the stage to address the crowd, and I wasn ’ t watching my feet and I slipped, or something collapsed, I still don ’ t know, and I fell five feet into the audience. AG : You literally fell off the stage? AB : I literally fell off the stage. It was just ridiculous. It was... I wrecked my instrument, I fell on my instrument, I hurt my arm. And, of course, I did what you would do when you ’ re 22 years old. I jumped up and said,”I ’ m okay, folks.”And I obviously was not okay. AG : Oh, no. AB : It was just so terrible, Adam. It was so terrible. AG : Arthur tried to shake off the feeling that falling off the stage was a bad omen. He spent the next decade practicing. He studied with the best tutors in Europe. He got a job at a symphony in Barcelona, but – AB : It was a wreck. It was a slow-moving wreck in my career itself. I was in decline. Finally had to pack it in. I had to admit it to myself that I wasn ’ t the horn player I had always dreamed of being. And right now, I ’ m talking about it with you and, you know, we ’ re laughing and all that, but I ’ ve got to tell you, it kills me, I still hate it. AG : Arthur didn ’ t plan to quit music so early. He simply stopped being great at his job. And in the years since, it ’ s made him wonder, does career decline happened to all of us eventually? And is there anything we can do about it? I ’ m Adam Grant, and this is WorkLife, my podcast with TED. I ’ m an organizational psychologist. I study how to make work not suck. In this show, I ’ m inviting myself inside the minds of some truly unusual people, because they mastered something I wish everyone knew about work. Today, career staying power. It ’ s more about the choices you make than the age you reach. Thanks to Accenture for sponsoring this episode. Let ’ s be honest, we all have peaks and valleys in our careers, times when we hit our stride and do our best work, and times when we ’ re in a slump. Most of us are worried that as we age, our physical and mental skills will decline and we might enter into a permanent slump. And that fear is compounded by the fact that age is seldom seen as an asset in the modern workplace. Far too often, our older colleagues don ’ t get the respect they deserve. Arthur ’ s slump happened at a particularly early age, so he changed careers and became a public policy expert. AB : Basically I ’ m just an old fashioned, number-crunching, quantitative social scientist. AG : Given what he ’ s gone through, it ’ s not entirely surprising that his big area of focus now is career decline. AB : Career decline is a very personal and personalized phenomenon in which your skills are not what they once were. So you might be making as much, or more, money than you ever have before, but you know that you are not at the same level of technical adeptness that you had once attained, and / or you ’ re not on the trajectory to attain what you had hoped. AG : Maybe you felt your stomach lurch when someone younger than you has a smashing success in your field or your workplace. Or maybe you ’ ve been humming along feeling good about your work, until one day you noticed your skills don ’ t seem quite as sharp as they used to. In 2019, Arthur wrote a major story about this phenomenon in”The Atlantic.”The headline was”Your Professional Decline Is Coming Sooner Than You Think.”As in, long before you even start to see retirement on the horizon. AB : I mean the number one myth is that, you know, particularly in certain professions, like, let ’ s just say yours and mine, which is coming up with big ideas and sharing them, that that ’ ll never go into decline. Why? Because it doesn ’ t require, you know, strong biceps, and yet there ’ s overwhelming evidence that in idea professions people experience decline as well. They just don ’ t expect it. AG : What happens to our cognitive abilities as we age is not straightforward. It actually depends on what kind of mental skills we ’ re talking about. Psychologists have long distinguished between two kinds of intelligence : fluid and crystallized. Fluid intelligence is your raw processing power. It ’ s basically your IQ, your innate capacity for learning and problem solving. AB : That ’ s a big part of the modern idea economy. I ’ m going to come in here, I ’ m going to be a whizzbang person who comes up with brand new ideas. That ’ s actually what ’ s rewarded for young people because young people have high levels of fluid intelligence. It increases through your teens and 20s, and maybe through your 30s, although it tends to start declining for most people in their 30s and 40s, and it makes this original idea generation harder. Now that doesn ’ t mean that you ’ re going to be unsuccessful, but it means if you ’ re relying entirely on this fluid intelligence, you ’ re going to struggle. AG : A common refrain in Silicon Valley is that young people are just smarter. When it comes to fluid intelligence, that ’ s generally true. But the story changes with crystallized intelligence, your acquired ability to solve problems by applying your knowledge and experience. AB : Your ability to synthesize things that you didn ’ t necessarily invent, that ’ s crystallized intelligence and that tends to happen later. AG : Think about how crystallized intelligence comes in handy in your job. If you ’ re in sales, you ’ ve used it to tailor your pitches to different clients based on what you ’ ve learned about them in the past. If you ’ re in government, you ’ ve relied on it to get around red tape. If you ’ re in finance, maybe you ’ ve applied it to predict how markets are affected by crises. Crystallized intelligence peaks much later than fluid intelligence, in large part because our body of knowledge keeps growing. AB : Think of it like a library. Think of the brain as basically filling up with a lot of volumes. And that means you have a lot of crystallized intelligence. AG :

Depth and breadth of knowledge aren ’ t the only benefits of aging. Evidence suggests that self-control and socio-emotional skills often keep climbing, too. Many of us continue gaining willpower and emotional intelligence well into our 40s and 50s. We ’ re still getting better at delaying gratification, reading other people ’ s emotions and regulating our own moods. Even into our 70s and 80s, we ’ re still improving at ignoring sunk costs, all of which can enhance our job performance. But Arthur doesn ’ t think that ’ s enough to keep us from declining. AB : Everybody falls in their game at some particular point. AG : At what age do you think the average person is going to start to face significant career decline? AB : I ’ ve got to give you the social scientist answer – it depends but if I were to guess, I ’ ve got to say that in your mid-40s is when you ’ re likely to see the peak of your originality and creativity, and you should be making plans in your 40s to how you can be the best creator with your crystallized intelligence, how you can be the best instructor, the best synthesizer, you can possibly be. AG : OK, so this is where I want to start disagreeing with you. So my read of the evidence is that people don ’ t inherently become less creative. One of the things that happens as people ’ s careers advance is they tend to produce less, just, you know, in terms of overall volume. I think it ’ s not ability. I think it ’ s motivation that ’ s dropping. I think, you know, a lot of people become complacent and they feel like they ’ ve achieved enough success, and so they may scale back a little bit. It may be that priorities outside of work become more important to them. And if we can maintain that motivation, there ’ s no inherent reason why the quality of creative output would decline. What do you think? AB : Hmm, I ’ m willing to entertain your hypothesis. AG : OK, cool. So there ’ s a study I really like of scientists, filmmakers and artists, showing that as they advance from their 20s and 30s toward their 50s and 60s, they do less work. The scientists run fewer experiments, the **filmmakers** don ’ t make as many **movies** and the artists produce fewer paintings. But those who stay productive, their hit rate was every bit as high in their 50s and 60s as it was in their 20s and 30s. So, you know, I think about Frank Lloyd Wright designing Fallingwater at 68 years old, his crowning architectural achievement. Or I ’ m sure you ’ ve come across Raymond Davis Jr, the scientists who measured neutrinos from the sun. He didn ’ t build the key detector until he was 51 and kept running his experiments until he was 88, the year he won the Nobel Prize. I ’ d be willing to bet that we would either uncover, or even create more Frank Lloyd Wrights and more Raymond Davises if we had ways of keeping more people motivated to produce into and past mid career. Agree or disagree? AB : I think that if there is a natural cadence to the average person ’ s life, and you ’ re saying it doesn ’ t have to be this way, then the societal goal will be one in which everybody is above average. And you know, that becomes an exercise in frustration. AG : In other words, that ’ s a nice theory about encouraging everyone to keep producing at maximum capacity for decades, but it might not be realistic if you ’ re not a superstar in your field. The rest of us are going to do what people naturally do. And Arthur wants there to be space for that path, too. He wants people to be excellent in their own way, which made me wonder if he thinks career decline is more inevitable for people who achieve excellence. AB : What goes up must come down ultimately, and the higher up you go, the more obvious it is that you ’ re not there anymore. That ’ s what I call the Law of Psychoprofessional Gravitation. You notice a lot when you were great and you ’ re not as great as you once were. And if you can do something to get on your crystallized intelligence curve, you get a different kind of productivity, and you can be successful in a different way. That ’ s the knowledge I want to get across. AG : He ’ s arguing that regardless of what field you ’ re in, as your fluid intelligence declines, you should make a change. Stop trying to innovate. Take what you ' ve learned and accomplished and shift into a mode where you can transmit your knowledge and skills to other people. Become a teacher or a mentor. AB : And frankly, the world needs those people. And we don ' t have enough of them. When I ' m at a certain point in my career, and I see that I ' m not on the top of my game, I need to start thinking, is what got me here, whether it ' s the insight or the innovation or whatever it happens to be that got me here, is it something that I can sustain? If it ' s not, start looking for something else. Specifically, start looking for a way that you can move into instruction mode. AG : In Arthur ' s case, after giving up on music, he spent years running a conservative think tank. And then having learned the lessons of his fall at Carnegie Hall, he took his own advice. AB : And I had somebody I really respect, and he said,"You know, when you are a chief executive and you have to be on the razor ' s edge every single day, you have two choices on how to step out of your chief executive job."And I said,"Well, good, two choices. I like two choices. You know, it ' s like the Monty Hall game. You know, door number one and door number two. So what ' s behind door number one?"And he said,"Leave before you ' re ready."And I said,"Oh, I don ' t like that. What ' s behind door number two?"And he says,"Leave on someone else ' s terms."I said,"Ooh, I really hate that one."AG : What did Arthur decide to do then? Exactly what he ' s suggesting you do. He went into teaching. AB : The bottom line is, when the stakes are high, it ' s worth leaving things before you ' re ready. AG : Arthur is content with how his career choices worked out. He wants you to walk off the stage before you fall off of it. I understand where he ' s coming from, but I ' d rather see you find your balance, or get on a different stage altogether. You do have choices beyond aging out and opting out. More on those after the break. OK, this is going to be a different kind of ad. I played a personal role in selecting the sponsors for this podcast, because they all have interesting cultures of their own. Today, we ' re going inside the workplace at Accenture. Gonzalo Adriazola : I ' m from Arequipa, which is the second largest city in Peru. We have the coast, we have the Andes and we have a bit of jungle. AG : This is Gonzalo Adriazola. When he was 19, he and his mother left Peru and moved to rural Ohio. GA : I don ' t think I fully processed that I was leaving a whole life behind. I think I was just excited for the future. AG : As a young immigrant to a new country, Gonzalo didn ' t know exactly what the future held, but his mother became a tremendous source of inspiration. From early on, she taught him about the importance of education. GA : She would always tell me,"I might not leave you anything, but I ' m going to leave you a good education."AG : Gonzalo got a job at a local restaurant while he applied to colleges. GA : When I got the acceptance letter, my mom and I were just, like, jumping and dancing and just so happy. AG : He headed to the Ohio State University, and it didn ' t take him long to fit in. He was crowned homecoming king, started working full time at a bank and found a community within the Hispanic Business Student Association. They sponsored a trip to a conference in Washington. GA : It ' s the largest gathering of professional Latinos in the US. I saw this one speaker and he was so good. He was so passionate, energetic. Besides being phenomenal, he looked like me, and this was the first time I had seen someone in person that looked like me that was a total boss. AG : At the end of the talk, Gonzalo went up to the speaker and asked for advice. GA : I asked him like,"I want to be a CEO one day. How do I get to be like you?"And he laughed and looked at me and told me that professional services firms, all they have is people. So they ' re going to do their best to make the best of you. And that ' s how I found out about consulting. AG : Research shows that role models can elevate our aspirations. When we see someone similar to us do something inspiring, it builds our confidence that we can follow in their footsteps. When Gonzalo graduated from college, he followed his role model ' s advice and went to work as a consultant at Accenture. GA : I was really happy to join the firm. And I mean, it has only been great experiences. AG : Gonzalo had accomplished a big goal, and for four years, he helped companies grow and perform better. But he had a nagging feeling that something was missing from his life. GA : As soon as I got to Accenture, I wanted to give back to Latin America. That was kind of, like, my life objective. I saw that we had worked with this microlending institution called Caja Arequipa, and I ' m like,"What are the odds?"AG : He reached out to the leadership team running the project. GA : They told me about, like, everything we were doing in regards to financial inclusion in Latin America. I was really excited to know that I was from that same city. Very welcoming to my help. AG : Alongside his consulting work, Gonzalo has been a leader in the Hispanic Employee Resource Group and volunteered his extra time to help the team in Latin America. His dedication paid off. Earlier this year, Accenture development partnerships moved him to Colombia where he joined the project team full time. GA : It was a dream come true. I called my mom. We laughed, we smiled, we danced. AG : This isn ' t the only way Gonzalo gives back. Every year he ' s gone back to the conference where he was first inspired by someone he felt he could relate to. GA : It feels like I ' m doing my mission. I was in their shoes one day and now I ' m the person lifting up, just as others lift me up. And there ' s people lifting me up right now. There ' s going to be a brighter future for my community. AG : Accenture is working to become one of the most truly human companies in the digital age. Learn more at Accenture. com / careers. Lyn Slater : I ' m not a Pollyanna about aging. There ' s certainly changes in my body. You know, I have my wrinkles, I have my white hair, but I think that I could generate content as much as someone who ' s younger than me. In fact, most of the peers who are at my level are all younger than me. AG : Lyn Slater is 65. She recently quit her career as a professor to become a full-time social media influencer. Lots of people call themselves influencers, but Lyn ' s version is a real job. LS : I ' m also known as The Accidental Icon. AG : The Accidental Icon has more than 700, 000 followers on Instagram, and she gets paid to run ads on her account for brands like Kate Spade, Visa and Teva. Her feed is filled with stylized photos of herself posing around New York City in designer clothes and large sunglasses. She ' s been featured in magazines like"Cosmo"and"In Style."And she ' s walked the runway at New York Fashion Week. Actually, she ' s walked more than one runway. LS : I have no background in the fashion industry, but I was in the runway show last spring with Kate Spade. I ' ve worked with them quite a bit. AG : Some people will tell you that most of us do our best work when we ' re younger, that when we approach retirement age, we should slow down, take up a hobby, play with the grandkids. But excellence later in your career is possible, and there are a few ways you can get there. Lyn is living proof that you don ' t have to avoid career decline by shifting from doing into teaching. You can actually reinvigorate your career by experimenting, by doing something new. In Lyn ' s case, she did something completely new. We saw her in action one Saturday near her home in Manhattan. LS : We ' re on Fifth Avenue in New York City. It ' s called Museum Mile because everywhere is a museum. I ' m going to be shooting my outfit outside. AG : She ' s with her partner who doubles as her photographer. Calvin : Your **bangs** are good. LS : Thank you. AG : Lyn is petite with a short white bob and **bangs** that stop just above her huge sunglasses. She takes off a long velvet coat and scans the brick facades of the Museum of the City of New York for her next spot of inspiration. LS : And right now, that little nook over there is really calling to me because it does look like a place... AG : Before becoming a social media influencer, she had an entirely different decades-long career in social work. She was an expert for

New York City family courts on child abuse issues. She wrote a seminal book on social work and law, and she spent the last 20 years as a professor of social work at Fordham University. She was quite an authority in her field, but she told me she ’ d become frustrated with the glacial pace of academia. Like, how long it takes to write and publish journal articles. LS : The whole process could take almost two years and maybe a handful of people would read it. And so, as I began to get more followers on Instagram and I began to do more things, you know, for example, I did a short film and within a couple of weeks, that was in front of, you know, millions of people. AG : Lyn went about as far from her original field of work as she could go. So what leads to a spectacular pivot like that? A dose of novelty. Research shows that curiosity is a key factor that can help you find creative peaks as you age, rather than decline. This is one way to stay productive and maintain motivation later in your career. Find something new to explore. For you, novelty might mean switching to a new team or a new market, getting certified in a fresh skill set, or mastering a hobby completely outside your experience. For Lyn, that hobby was fashion. LS : I ’ ve always had, sort of, what I call a very performative relationship with my clothes. I resist like crazy social categories or constructions of who I should be. AG : In this case, she was resisting the idea that a long time professor of social work wouldn ’ t also be interested in high fashion. She ’ d been toying with the idea of starting a fashion blog. And one day, unexpectedly, the name came to her. LS : It was the first week of school, and I always used to dress up for that. And I was meeting a friend for lunch and I had on a Yohji Yamamoto suit, and a couple of photographers started taking my picture and then a bunch of other photographers saw them do it so they came over, and my friend was making a joke like,”You ’ re an accidental icon.”AG : If you ’ re going to experiment with something new, it helps to fully immerse yourself in that world. Lyn was creative in where she looked for her mentors. LS : I found out that I could get a press pass to what is called the market shows, and I would spend hours talking with these young designers. They taught me a great deal about how clothing is made, what the processes are. That ’ s how I really began to understand fashion. AG : Instead of being intimidated by new technology and seeing it as something only young people can master, she went straight to the experts she knew. LS : My students helped me to figure out Instagram and Snapchat, and I started to take classes in social media and fashion and just random things, like, how to start your own **vintage** store. AG : In a study in the fashion industry, the more time designers and directors spend abroad, the more creative they became over their careers, but it wasn ’ t traveling or even living abroad that mattered. It was the amount of time they spent working abroad. They couldn ’ t just observe it from the sidelines. They had to be in the arena. That ’ s how they really internalize the novel elements of a foreign culture. For Lyn, seeking out new perspectives included small steps, too. LS : I do things that I don ’ t normally do. And so that could be very simple things, like taking a different route to work. It ’ s really, put yourself into different experiences that are creative and see where that takes you. AG : You may not aspire to quit your job and become an Instagram star, or to switch fields at all. And you don ’ t have to. There are ways to reach new heights while staying within your career path. Think about whether you ’ re a sprinter or a marathoner, not in terms of running, but how you go about generating creative ideas. Economists call the sprinters conceptual innovators. They typically start with a big idea and they tend to peak early, because they have eureka moments when they ’ re relatively new to a domain. Like Einstein at 16 imagining himself chasing a beam of light, or Mary Shelley at 18 starting to write”Frankenstein.”But as they accumulate knowledge, they ’ re more likely to get stuck in their ways and stop gaining new perspectives. There ’ s a term for that : cognitive entrenchment. The longer they stay in a field, the more likely they are to take for granted assumptions that need to be questioned. Marathoners, on the other hand, are experimental innovators. They usually discover their ideas through trial and error. They often peak later because it takes time to test out different approaches, like Darwin, spending decades tracing the origins of species, or da Vinci experimenting for years with different ways of modeling light in his paintings. But those habits allow them to sustain their peaks longer and peak again later as they explore new areas. That kind of experimentation is familiar to Lynda Weinman. Lynda Weinman : I ’ m an autodidactic person. I always love learning new things. AG : She got her start in the 1980s as an animator at a film studio. She often compared herself to her higher achieving peers who were sprinting ahead. LW : I remember when I was in my 20s watching some of my friends who were uber successful and I, you know, at my 30th birthday was in tears that I hadn ’ t accomplished what I wanted to accomplish yet with my life. AG : But she didn ’ t rush it. Instead, for the next 10 years, she kept chugging along, testing out different ways to build and use her skills. Finally, the year of her next big birthday, she created a website. Lynda called her site Lynda. com. LW : Well, when we started Lynda. com I was 40 and when we sold it I was 60. AG : She sold it in 2015 to LinkedIn, for, oh, 1. 5 billion dollars. Lynda. com was one of the first companies to offer professional learning online. Maybe you ’ ve heard of their courses in animation, design and software. Maybe you ’ ve even taken classes there that advanced your career. Many founders who are trying to grow a unicorn company, think they need to generate one brilliant idea and scale it rapidly. They think they need to be sprinters, but Lynda approached her career more like a marathoner. Her online learning company didn ’ t look anything like a success early on. Instead, she was constantly trying out new ideas and innovating over time. In some ways, Lynda was primed for this kind of scrappy test-and-learn approach. LW : I actually had a pretty troubled childhood. I moved in with my dad and my stepmom who weren ’ t expecting to raise me and my siblings. And, you know, it was just this feeling of having to find my way because all the adults in my life were, you know, having their own problems. And I think what I probably am is a very resourceful person who realized at an early age that it was on me to figure out my life. AG : During her early days as an animator, Lynda encountered her first computer. She was unimpressed, at first. LW : It was a Apple II Plus clone that my boyfriend brought home, and so to please him, I turned it on and I started pecking at the keys and I caught the bug that so many people since have caught. And he eventually called himself a computer widow, because I liked the computer more than him. AG : LW : I mean, I was just amazed at what it could do. AG : What it could do was draw. So Lynda got her own Macintosh and brought it into work. People started asking her to do projects for them. LW : Somehow they thought I knew more than they did, which was, you know, basically I ’ d had five minutes longer with something than they had. AG : Lynda was onto something. By experimenting with new tools and following her curiosities to uncharted places, she could carve out a niche and continue iterating instead of stagnating. LW : Oh, do I want to do what everybody else is doing, or I ’ m being asked to do something that only I know how to do, and maybe that ’ s more fun. AG : Lynda ran two more experiments. First, she started teaching in-person college classes in web design. Then when she saw a lack of good manuals for students, she wrote one herself. LW : Then it became a huge success, way bigger than any of us could have imagined. AG : Well, you ’ re being very modest, but can I get you to describe a little bit just how successful the book was? LW : I ’ m not sure how many millions it sold, but it was translated into many, many languages and it was the de facto web-design book for all colleges. It was the"it"book. AG : From there, Lynda continued to test out new methods of teaching. She started selling instructional videos on VHS tapes. Then, as technology changed, she switched to CDs, then DVDs. Then she launched the website Lynda. com. In the late ' 90s, she and her business partner and husband tried launching memberships on Lynda. com. They weren ' t exactly an instant hit. LW : In the beginning it was just an abject failure. It was cannibalizing some of our other work. AG : But they didn ' t give up. Not every experiment succeeds, and they don ' t all succeed right away. Memberships weren ' t growing like crazy, but there was steady growth. Lynda paid attention to that. Eventually they hit an inflection point. While Lynda. com was quietly adding hours of material to their catalog, more people were using the internet for online learning. Their online audience doubled each year. And in time that grew into a big number. By 2012, they had over a million paying users and over a hundred million dollars in revenue. LW : It was literally a very organic growth process. AG : Lynda could ' ve simply continued to develop her skills as an expert animator and would have had a nice career. She could ' ve kept teaching, too, but her greatest success came when her experimentation led her into entrepreneurship, turning her **various** projects into a business. She didn ' t listen to the narrative that as you get older, you should pull over into the slow lane. She saw some benefits of building something later in her career. LW : By the time you ' re 40, you believe in yourself more. You ' re a more seasoned human being that has better judgment and better experience and better confidence. AG : This might be one of the reasons why older founders are actually more successful than younger ones. In a study of several million entrepreneurs, 40-year-olds were more than twice as likely as 25-year-olds to launch a successful start-up. And they were also nearly a third more likely to be in the top 0. 1 percent of fastest-growing tech start-ups. Yes, sprinters sometimes get lucky right out of the gate, but marathoners know how to persevere. LW : I think everybody would probably like to be instantly successful and be revered and acknowledged and acclaimed and all those things, but when it happens to you too young, it actually can be very damaging. At least the people that I ' ve seen, who, you know, they burned bright and they burned all the way out. They didn ' t understand that it wasn ' t going to last forever and that they had to keep reinventing and they had to earn it again. AG : If you ' re worried that your career will decline, don ' t let your output decline, and don ' t let your curiosity stagnate either. It ' s never too late to invent or to reinvent yourself. LW : I think the older you are, the more valuable you can be. AG : I love that because I don ' t ever want to retire. Next time on"WorkLife."Working remotely is full of challenges that have made our work lives harder. Lizet Ocampo : So we turn our cameras on and there I am as something else. At first, we didn ' t realize it was a potato. We ' re like,"What is going on?"I just essentially was a potato for the meeting. AG : But some of the solutions might be easier than you think."WorkLife"is hosted by me, Adam Grant. The show is produced by TED with Transmitter Media. Our team includes Colin Helms, Gretta Cohn, Dan O ' Donnell, Constanza Gallardo, Grace Rubenstein, Michelle Quint, Angela Cheng and Anna Phelin. This episode was produced by Jessica Glazer. Our show is mixed by Rick Kwan. Original music by Hahnsdale Hsu and Allison Layton-Brown. Ad stories produced by Pineapple Street Studios. Special thanks to our sponsors, Accenture, BetterUp, Hilton and SAP. For their research thanks to Dean Simonton on creative productivity, Lu Liu and colleagues on career hot streaks, Ben Jones and colleagues on the success of older entrepreneurs, David Galenson on conceptual and experimental innovators, Erik Dane on cognitive entrenchment and Will Maddux, Adam Galinsky and colleagues on working abroad. In some ways, Lynda was primed for this kind of crap... Excuse me. In some ways, Lynda was primed for this kind of crap... It ’ s not crappy, it ’ s scrappy. In some ways, Lynda was primed for this kind of crappy... Sorry.

Text Sample 880: POS Dim 6 – 2020 – Score 5.00 – 2020/t004288.txt

Chris Anderson : Well, hello, Helen. Very nice to see you. CA : You staying well? Helen Walters : How ’ s it going? CA : These are mad, mad, mad, mad, mad days. So many emotions. Not all bad, happily, but I ’ m just so aware that, among the people listening to this, some are in really tough times right now. I hope this is going to be a beautiful hour of therapy and help in its own way, because we have with us just an extraordinary author, an extraordinary mind, Elizabeth Gilbert, obviously known for her astonishing best-selling success with”Eat, Pray, Love,”although her favorite book from my point of view is called”Big Magic,”where the subtitle is,”Creative Living Beyond Fear.””Creative Living Beyond Fear.”Now when you think about it, that is a pretty good agenda for today ’ s conversation, I think. Liz describes the emotional landscape of our lives, I think like no one else I ’ ve read, and I ’ m not even her target audience. She ’ s really extraordinary in doing that. She gave an amazing TED Talk 11 years ago now,”In pursuit of your creative genius.”It really reframed how to think of creativity. It ’ s been seen, like, 19 million times or something, and it ’ s really changed how a lot of people – they ’ re just open to the creative genius coming from the outside. So it ’ s a delight to welcome to the TED Connects stage Elizabeth Gilbert. Elizabeth Gilbert : Hey, Chris. CA : Great to see you. How are you? Where are you? Who are you living with or staying with? What ’ s up? EG : I ’ m fine. I don ’ t want to brag, but I ’ m in New Jersey, where anybody would want to be. I ’ m by myself. I ’ ve got a little house out in the country, and I think I ’ m on day 17 of no human contact other than virtually, and I ’ m well. I ’ m not anybody you need to be worrying about right now. So I ’ m good. CA : Wow. Well, so in a way, you ’ re having a related experience to what so many people are having. I mean, these are days of isolation for many people, and that brings with it lots of difficult emotions, in a way. And we ’ re going to go through many of them, I hope, in the next hour. So I ’ m hoping to talk with you about – I wrote down a list here : about anxiety, loneliness, curiosity, creativity, procrastination, grief, connection and hope. How about that? That ’ s our agenda. Are you up for that? EG : I think that ’ s the whole buffet. Just a little light tasting menu of all the mass of human emotions. Let ’ s do it. Absolutely. CA : I think it ’ s probably good to dive straight in with the anxiety that I know a lot of people are feeling right now. So many reasons to be anxious, both for yourself, your loved ones, and just for this time and for the world and how we all get through this. Have you been feeling anxiety, Liz? And how do you think of it? What can you say to us? EG : I have been, and I think you would have to be either a sociopath or totally enlightened not to be feeling anxiety at a moment like this. So I would say that the first thing that I would want to encourage everybody to do is to give themselves a measure of mercy and compassion for the difficult emotions that you ’ re feeling right now. They ’ re extremely understandable. I think sometimes our emotions about our emotions become a bigger problem, so if you ’ re feeling frightened and anxious, and then you ’ re layering shame on top of that because you feel like you should be handling it better, or you should be doing your isolation better, or you should be creating more while you ’ re alone, or you should be serving the world in some better way, now you ’ ve just multiplied the suffering, right? So I think that the antidote for that, first of all, is just a really warm, loving dose of compassion and mercy towards yourself, because if you ’ re in anxiety, you ’ re a person who is suffering right now, and that deserves a show of mercy. The second thing that I would say about anxiety is this, that here ’ s what I think is the central paradox of the human emotional landscape that I ’ m finding particularly fascinating right this moment, and it ’ s really come to light for me. So there are these two aspects of humanity that don ’ t match – hence the word paradox – but they really define us. And the first is that there is no species on earth more anxious than humans. It ’ s a hallmark of our species, because we have the ability slash curse to imagine a future. And also, once you ’ ve lived on earth for a little while, you have the experience to recognize this terrifying piece of information, which is that literally anything can happen at literally any moment to literally any person. And because we have these vast, rich, colorful imaginations, we can see all sorts of terrifying **movies** in our heads about all of the possibilities and all of the scariest things that could occur. And actually, one of the scariest things that could occur is occurring. It ’ s something that people have imagined in fiction and imagined in science, and it ’ s actually happening right now, so that ’ s quite terrifying. The paradox is that, in that level, we ’ re very bad, emotionally, at fear and anxiety, because we stir ourselves up to a very heated degree because of our imaginations about how horrible it can get, and it get can get very horrible, but we can imagine it even worse. The paradox is that we ’ re also the most capable, resourceful and resilient species that has ever lived on earth. So history has shown that when change comes to humanity – either on the global level, like it ’ s happening now, or on the personal level – we ’ re really good at it. We ’ re really good at adaptation. And I think that if we can remember that, it can help to actually mitigate the fear. And you can remember it in a historical perspective, by looking at what humanity has gone through, and what we have not only survived but figured out how to thrive through. And you can also look at it at a personal level, where you can make an inventory of what you yourself have survived, and notice, as I often notice, my panic and my anxiety about the imagined future is deadly on my nervous system, but I actually have discovered that when there ’ s an actual emergency in the moment, I tend to be pretty good at it. And I think most of us are like that. You ’ ll see that repeated in history in so many examples. I think about those heartbreaking and devastating phone messages that people were leaving for their loved ones from the towers on September 11th, and you can hear the calm, the calm in peoples ’ voices. The biggest emergency ever was happening, and in that moment, intuition told them what to do. The important thing to do now is to make this phone call. And I think if you can trust that when the point of emergency actually arrives, you ’ ll be able to meet it, and then when the world changes, you ’ ll be able to adapt to it – it certainly helps me calm down. CA : I mean, I guess there ’ s a reason why fear is there. It didn ’ t just evolve by accident. It ’ s supposed to direct our behavior and help us avoid danger, and it ’ s just that sometimes, it gets out of control and actually gets in our way and damages us. I mean, any specific advice on how someone could turn their fear into something useful, at this moment? EG : Can I tell you a story that I ’ m using as a touchstone for myself right now and drawing wonder and inspiration from? So, some of you may have heard of a young woman named Amanda Eller. She was in the news recently, because she got lost in Hawaii in the wilderness for 17 days, and there was a massive, massive hunt for her, because she had left her car, she ’ d gone for a simple hike, had left her phone in her car, went up into the woods, took a wrong turn, and then had this disastrous 17 days, fell off a cliff, broke her leg, walked for 40 miles on a broken knee, lost her shoes in a flash flood. She had to sleep packed in mud in order to protect herself from the cold and the mosquitoes. She was eating moths. I mean, just a harrowing story of survival. I met her recently, and she was so lit and radiant with this kind of serenity and this kind of wonder and joy, and I said,”How are you like this? You went through one of the most traumatizing things that a person could go through.”She said,”First of all, I discovered that I can survive anything,”going back to this idea of how resourceful and adaptive humans actually are. But the piece of her story that I am using like a life raft right now is that she said, on her second day in the jungle, when she realized that she was truly and very much in trouble – she ’ d already spent one night in the woods and she was completely lost and she was totally alone and no one knew where she was, and she was full of terror – she said she closed her eyes and she prayed or asked or requested, she made a wish to herself, to consciousness, to the universe, and she said,”Please take my fear away, and when I open my eyes, have it be gone, and have it be gone and have it not come back.”And she opened her eyes, and it was gone, and it was replaced by intuition. And I think intuition is a little bit the opposite of fear, because fear is the terror that you feel about a frightening imagined future. Intuition can only happen when you ’ re in the moment. And so, from that point forward, she did not experience fear for the rest of the time she was in the woods. She just was guided by some deep intuitive sense, located somewhere between her sternum and her navel, and in every moment, she would ask it,”Right or left?””Up or down?””Eat this? Don ’ t eat this?”And just trust it. Complete, absolute surrender to the intuition of the moment. And she said it hasn ’ t returned, the fear hasn ’ t returned, and she still guides her life that way. So it ’ s a return to some sense that there ’ s a navigational system within you that will, if you stay present in this actual moment, tell you what to do one moment to the next. Now, if you want to suffer, pop out of the moment and imagine a future, and then you can suffer indefinitely. So it is almost like a spiritual or meditation practice, and anybody out there who ’ s done any spiritual or meditation practices, this is what you were practicing for. You were practicing for this moment, and those of you who haven ’ t tried that, this might be a really [inaudible] to be centered in the instant. CA : Wow, that ’ s a **remarkable** story, and I guess what I ’ m hearing is two things. It ’ s one, just the reaching out to the universe there, but specifically, there was a decision to let go of the future and just to focus on the moment. EG : That ’ s it, yeah. Nothing will bring you more pain than the future, and what I ’ m seeing happening right now – I said this to you the other day, Chris – is there ’ s a relatively small percentage of the population who will suffer physically from this disease, and there ’ s a larger percentage who are going to suffer economically from it. But then there ’ s this massive, uncountable number of people who will and are suffering from it emotionally, and right now, those people are my concern, because they ’ re really in pain, and there ’ s millions and millions of them. CA : So you ’ re living there by yourself, Liz, and many others are in that same circumstance right now. I suspect some are feeling, like, crushing loneliness. Talk about that. How do you handle loneliness in a situation like this, when it ’ s so alien to everything that we as a social species are usually about? We crave other people. We crave touch. We crave hugs. We want to be there with people. How can we avoid this being a period of crushing loneliness? EG : I don ’ t think you can avoid it, but I think you can walk toward it. And I think that, for me, I ’ ve deliberately, many times in my life, gone off into isolation in order to face those things. I ’ ve gone on long meditation retreats. This year, I was in India, and I spent 17 days alone with no contact with anybody, which was a weird practice run for what ’ s happening right now. And as I see people really losing it and feeling like they ’ re crawling out of their skin, either from anxiety, fear, boredom, anger, blame, loneliness, depression, all of these things that come up when you are forced to just be in your own presence. I know all of those feelings because, as a meditator, I ’ ve experienced all of those, in stillness. The hardest person in the entire world to be with is yourself, and so the only way that I learned, as a meditator, to be able to survive and endure my own company was with universal human compassion toward me, and to recognize that this is a person who is suffering right now from loneliness, and this person needs kindness from self towards self. And it ’ s a very high teaching, but I think that it ’ s a very interesting moment to practice that. And so what I would suggest to people – and again, this takes a certain amount of resolve and it takes a certain amount of curiosity about learning more about the human experience – what I ’ m seeing people do is people are spinning away from that isolation because they ’ re so terrified of it. What happened with the world right now is that basically all of our pacifiers were yanked out of our mouths. Everything that we ever can do and reach for that can get us out of having to be in the existential crisis of being alone with ourselves was taken away. And I see people rushing to fill it, I mean, constant Zoom meetings and constant parties online and constant interaction, and all of that is lovely, but from a spiritual and psychological standpoint, from a creative standpoint, I would say if you have any curiosity about this, don ’ t be in such a hurry to rush away from an experience that could actually transform your life. I think sometimes the experiences that can transform us the most intimately are the ones that we want to run away from, and I think of a story that the Dalai Lama told about one of his teachers. When the Chinese invaded Tibet, and all the monks were running into India for safety, one of his teachers, who was one of the great masters, the last glimpse that the Dalai Lama had of him was that he was walking into China – very patiently and very slowly, toward it. Everybody else was running away from it – he was walking toward it, and I think there ’ s a level at which first responders do that, and in the real world, in an intimate way, they go into the emergency, they go toward the emergency. All the people who are trying to solve this now in worldly ways are walking toward the emergency. But there ’ s a way that you can do it emotionally as well and that is to walk with curiosity and with an open mind toward your most difficult and painful emotions without resistance, and say,”What is it like for a person to feel like they don ’ t have something to do for an hour?”And you can open up your compassion in that. There ’ s so many lessons in compassion that can be found here. How about a general universal mercy that we can all feel toward people who are in solitary confinement. Let ’ s have that be part of the conversation. Now you ’ ve experienced it for two days in your own house. Maybe it ’ s time to change the prison system? You see how hard this is. Or you can have compassion toward people who have lost a loved one and they ’ re alone. By feeling your own feelings, you can open up your feelings more universally toward the world. So I think there ’ s a great opportunity here for growth on the personal level, but you have to have almost a whimsical curiosity to be the one walking into China rather than the one away from it. And that ’ s how I ’ m doing it right now. CA : So let ’ s follow up on that word”curiosity”that you ’ ve used a few times there. I mean, a lot of wisdom that I ’ ve heard sort of thrown around online right now is,”This is a great time to follow your passion and dive deep into whatever it is you ’ ve most been wanting to do.”I mean, in”Big Magic,”you made an argument that following your passion isn ’ t necessarily the wisest strategy. You argued, no, don ’ t do that, follow curiosity. Does that apply now? Make that case. EG : Yeah, you know, I ’ ve been on a personal crusade to rid the world of the world”passion”as an instruction for people on how as they should be living, because I know that in my case, it brings me nothing but anxiety.”Purpose”is another one that has become a cudgel that we use to bludgeon ourselves into thinking that we ’ re not doing enough or that we ’ re doing life right or that you ’ re supposed to be more useful, more productive, you ’ re supposed to be changing the world, or uncovering some particular talent that only you have and with it, you ’ re supposed to transform everybody and monetize it, no pressure. I start to get hives even repeating that, but that ’ s what we ’ ve been taught, that purpose and passion are everything. I would like to replace it with a far gentler word, and I think”curiosity”is very gentle, because the stakes are so much lower. The stakes of passion say you have to shave your head and move to India and get rid of all your possessions and start up, like – It ’ s so intense. But curiosity is a very simple, universal experience that causes you to want to look at something just a tiny bit closer, and you don ’ t have to change your life around it. You just look, and it might be taking a weekend to try something new for a little while. It ’ s almost so easily missed, and I think so many times, we ’ re looking way up at the sky for the sign from God of what our passion and what our purpose is supposed to be, and meanwhile, there ’ s this lovely little trail of breadcrumbs of curiosity that if you can slow down – and again, this is about not rushing out of the experience of being silent, still and alone – if you can slow down, you might be able to see them. But if I could say one thing I ’ m noticing is an obstacle right now – because I think a lot of people thought,”Isolation, great, this is the perfect time for me to learn Italian and take that calligraphy class and start writing that novel,”and they find that they ’ re actually in a paralysis of anxiety and they ’ re not creating anything or doing anything. First of all, again, like, a blanket of mercy on you. These are hard times, and it might take you a minute in your nervous system and your mind to adjust to the new reality. But the second thing I would say is that when people are saying they ’ re having trouble with their creativity because they ’ re in isolation, I might daringly suggest that perhaps you ’ re not in enough isolation. And by that I mean, are you monitoring how much external stimulus you ’ re bringing of this disaster into your home? So if you ’ re sitting watching the news all day, what you ’ re doing is you ’ re bringing the disaster into your work space. You ’ re bringing it into your soul. You ’ re bringing it into your mind. And you ’ re going to create the opposite of a creative environment, an environment of fear, panic and urgency. So I think if you ’ re going to be a good steward of your creativity right now, you have to isolate a little bit from the news. And that doesn ’ t mean disconnecting, it means I get up every morning and after I ’ ve meditated, I read the New York Times and I give myself 40 minutes with it, and then that ’ s it for the day, because I know that if I bring in any more, I ’ m going to go into a traumatized state and then I won ’ t be able to follow my intuition, I won ’ t be able to help people, because I myself will be suffering, and I won ’ t be able to be present for this very interesting moment in my life and in history, and I want to remain present for it as much as I can. So there ’ s a discipline of being a good steward of your senses and deciding what you ’ re going to put your senses in front of. CA : Helen. HW : Liz, there ’ s an outpouring on Facebook of gratitude for you. People are so grateful, and grateful for the calm that you are instilling in us all, so thank you, from them and from me. We ’ ve also had a number of questions about grief. We ’ re kind of dealing with grief at a different scale at the moment. One person has already lost five people to coronavirus. And so any thoughts of how to manage grief at this scale or how to process this in a way that honors both them and yourself? EG : First of all, my condolences. And I think any words that I would say about somebody who just lost five family members could only be inadequate. Grief is bigger than us. It ’ s bigger than your efforts to manage it, and if you want to hold yourself and your family members compassionately through grief, you have to allow that it cannot be managed. And I think that grief management is something that we ’ ve kind of created in our very Western idea that if we can figure out something, we can avoid suffering from it, so if we can figure out how to translate grief and if we can figure out how to walk through grief, then we won ’ t have to experience the magnitude of it. Many of you know that I lost the love of my life two years ago from pancreatic and liver cancer, and I was with her when she died, and I ’ ve been walking through my own path of grief, so I know what it feels like to lose the person in the world who is the most important to you, which is of course the biggest fear that we all have. I know that you can survive it, but I know that you survive it by allowing yourself to feel it. And again, to go back to the metaphor of the monk walking directly into China, into conflict rather than away from it, do you have the courage to let it break over you like waves? I wish I could remember her name. There ’ s this extraordinary woman who wrote a book called”Here If I Need You,”and she ’ s a chaplain for the police department in Maine, and she ’ s in charge of knocking on people ’ s doors and giving them the worst news they ’ re ever going to hear in their life, when she goes with the police when something happens. And she told a story once that I found very moving and very helpful for me in my grief. She said what she ’ d witnessed through years and years of sitting with people through what is literally the worst moment of their life, the nightmare of that loss, is that when she knocks on that door and tells that person, your daughter, your family member, your husband, your mother has been killed, there ’ s this universal collapse where the person will just be – it is the tidal wave that comes and just takes you down and you lose all civilization, you lose all your attainments, all your wisdom. Nothing can stand up to that. You literally go to the floor. And you sob and you grieve, and she holds them through that. And then she said that what she ’ s learned is the most astonishing thing, that that never lasts more than a half an hour, that first wave. It can ’ t. You actually physiologically can ’ t sustain that, and if you let it break over you and you just allow it, then within a half an hour, usually sooner – and she said this has happened every single time she ’ s been with somebody with a loved one ’ s death – the very next thing that happens is that that person calms down, they catch a breath, and the next question they ask is a very reasonable question.”Where is the body? What do we do next? When can we have the funeral? Who else was in the car?”And with that question, she says, they start to rebuild their new life already with this new piece of information that even an hour ago would have seemed unsurvivable. And she uses that as an example of, once again, the tremendous psychological resilience of a human being. And it doesn ’ t mean that they will never grieve again. It doesn ’ t mean that their grieving journey is over. It just means that, somewhere in their mind, that it ’ s landed, and now, already, they ’ re making a plan about,”OK, who do we need to notify, what ’ s the next thing we need to do.”And again, if you can remember this as you go through your panic, if you can remember that in the moment of emergency, there will be an intuitive, deep sense that will tell you there ’ s going to be some next steps and it ’ s time for us to take those next steps, and if you can also remember that resilience is our shared genetic and psychological inheritance – we are, each and every one of us, no matter how anxious you feel you are, no matter how ridden by fear you feel you are, every single one of us is the genetic survivor of hundreds of thousands of years of survivors. Each one of us came from a line of people who made the next correct intuitive move, survived incredibly difficult things, and were able to pass their genes on. So almost to the biological level, you can relax into a trust that when the moment comes where you will be faced with the biggest challenge, you will be able to draw on a deep reservoir of shared human consciousness that will say,”Now it ’ s time to make the next move, and we can do this.”HW : So beautiful. So many more questions. I will be back. EG : Thanks, Helen. CA : Thank you, Liz. I think the author ’ s name was Kate

Braestrup. EG : That ’ s it. CA : I guess that ’ s a book, if you need a book right now,”Here If You Need Me”by Kate Braestrup. EG : Very good, yeah. CA : Liz, you and I got to have a conversation a few months after Rayya passed away. It was actually the first-ever episode of the TED Interview podcast we did. And I found that it was probably my favorite episode ever of the TED Interview. And it was so moving how you spoke about your grief then. And I feel like that ’ s a potential resource to people. I know we were both sitting there shedding tears, and I found that an extraordinary experience personally, to be sure. But somehow... in this moment, if you follow this journey of curiosity, if you walk towards some of the harder moments, do you think that this actually can be a creative time for people if they ’ re willing to do that? EG : Absolutely, and I don ’ t think creativity in this case has to necessarily mean that you write the Great American Novel or start that business you always intended to start. It doesn ’ t need to be so literal. We ’ re going to be creating new worlds and new lives on the other side of this, and we ’ re going to be doing that individually and we ’ re going to be doing that collectively. I think of the shoots of small trees that can only come up after massive forest fires, where seed pods have to explode under great heat. We ’ re in a kind of crucible moment right now, and I wouldn ’ t begin to have the hubris to predict what sort of creativity will come, but look, if history is any measure, what we ’ ll probably see is people at their best and people at their worst. But I think we ’ ll see more of people at their best, because that ’ s typically how it works. CA : I mean, your model of how creativity happens is that it doesn ’ t all come from within. It ’ s not like you have to sit there, saying,”OK, this is my moment to be creative. Come on. Be creative. Be creative.”It involves, fundamentally, an openness to something coming to you, to be open, to be curious, listening, but then just to be open to that moment. Perhaps that could apply even more now than ever, just because we have this huge distraction of the news, some other distractions are taken away. Is there a chance that if people listened, they actually can receive more at this moment? EG : I think so, and I think, again, if you stop thinking about your self-isolation and your social distancing as quarantine and you start thinking of it as a retreat, you ’ ll find that you can ’ t really tell the difference between quarantine and retreat. You know, a lot of you out there have dreamed, I ’ ve heard you, because I talked about going to India to an ashram for four months and God, I can ’ t tell you how many people I ’ ve heard say,”I wish I could do that.”I ’ m like,”Well, you got it.”And by the way, this is what it felt like. This is what it felt like to learn how to be present with yourself. I think my screen needs to move a bit. To learn how to be present with yourself means sitting in a lot of terror, sitting in a lot of anxiety, sitting in a lot of fear, sitting in a lot of shame, and being able to allow that without having to resist it, without having to reach outside yourself for something to numb yourself with. I also want to tell a story that a friend of mine, Martha Beck, told me about when she goes to South Africa and teaches animal-tracking courses. And she works with all these great African animal trackers, and these old men who have had these skills passed down for generations. And she was using it as an example of the difference between focus and openness. So I think sometimes the mistake people make when they want to be creative is they think they have to get really focused, and focus is an anxiety-producing energy as well. You ’ ve got to drill down and you feel your whole body tense. But what she described witnessing in these animal trackers is when they go out to hunt the lions, these old, old men, the very first thing they do is they sit down against a tree and they appear to go to sleep. They drop into a state that she calls and that the mystics call”wordless oneness.”And wordless oneness, you can also call meditation. You can also call it the zone. But it ’ s a stillness where you actually can drop your nervous system into such a quiet place that you have 360-degree awareness of your senses and of presence. And they ’ ll sit like that, apparently doing nothing, for an extremely long time, just looking through half-lidded eyes at the world. And then, maybe an hour, two hours in, all of the sudden, they ’ ll say,”The lion ’ s over there.”And so for me, I ’ ve learned to hold my creative wishes lightly in that same way. I ’ m between books right now and I don ’ t have an idea for a book and in the past, that would have made me really anxious, but now I know – take a lot of naps, go for a lot of walks, do a lot of drawings. I ’ m doing weird little art projects as I ’ m sitting here, to distract my mind. CA : Wait, wait. Bring that back. Hold that up. EG : Owls. CA : Aww. EG : Aren ’ t they dear? CA : They ’ re beautiful. Goodness me. EG : Well, I ’ m just playing with color and texture because it calms me, and I think if you can ’ t think of what to do right now, I would suggest doing what you used to do when you were 10 years old that made you feel happy and relaxed, and that ’ s often creativity and play. And for many of us who were anxious children – and I was an anxious child – we learned at an early age that we could sedate ourselves with our curiosity and with our play, and then, usually around adolescence, the world taught us that there were faster and more immediate ways to bump out of that anxiety through sex or substances or distraction or workaholism or whatever we did and not have to sit with ourselves. And I think right now is a really good opportunity – You actually were on the right track when you were 10, whatever it was. So, you know, get some LEGOs. Get some LEGOs, get some coloring books, just get your hands in the mud, do whatever it is that will actually ground you into this, again, to take you out of the futurizing and the future-tripping that ’ s going to cause you nothing but anxiety and not going to make you be of service. There ’ s such a thing, too, that I just want to touch on if I can, for a minute, about empathetic overload and empathetic meltdown. We ’ re taught that empathy is a good thing. I would suggest that in a case this traumatic, what you want to talk about replacing empathy with is compassion, and the difference is extremely important. So compassion means”I ’ m actually not suffering right now, you are, I see your suffering, and I want to help you.”That ’ s what compassion is. Empathy is”You ’ re suffering, and now I ’ m suffering because you ’ re suffering.”So now we have two people suffering and nobody who can serve, and nobody who can be of help, and if you knew how your empathetic suffering actually makes you into another patient who needs assistance, you would be more willing to dip into compassion. And what underlies compassion is the virtual courage, the courage to be able to sit with and witness somebody else ’ s pain without inhabiting it yourself so much that you become another person who is suffering and now, there are no helpers. And it takes an enormous amount of courage to be able to watch that without diving into it and joining it and becoming sick yourself. CA : I mean, if empathy is just a feeling, does compassion, your use of compassion imply that it ’ s turning that feeling into something potentially practical to actually do something, if you can, for that person? EG : It ’ s recognizing that if I feel your pain, I can ’ t help you in your pain, because now my pain has taken over me, and sometimes, I think all you need to do is know that and it makes you turn the ship. Right? One of my favorite teachers, Byron Katie, says,”My favorite thing about my suffering is that it isn ’ t yours.””My favorite thing about my suffering is that it isn ’ t yours. My favorite thing about your suffering is that it isn ’ t mine.”So it will be, eventually, we all take a turn suffering. You cannot move through this earth without it. When it ’ s your turn, you ’ ll know. When it ’ s not your turn, stay out of that field of somebody else ’ s pain, because you can ’ t help them when you ’ re in pain yourself. And then see if you can find the inner resolve and courage. And I think some of that is just based on accepting the Buddhist First Noble Truth, which is that suffering is an unavoidable aspect of life on earth. We ' re all going to be in it at some point. We ' ve all been in it at some point. And now, how can I help? I ' m not saying this is easy. I ' m just saying, also, if you ' re suffering from empathetic overload and empathetic meltdown, which means your adrenals are up, your stress is up, your endorphins are down, you ' re going into a parasympathetic collapse – this would be another time to discipline yourself to stay away from the news, because you actually will have a breakdown, and you won ' t be able to help the people around you who are the people who need help. CA : But have you seen any signs that if someone takes that empathy and compassion, let ' s say, and decides to act in some way, big or small, on behalf of someone, that actually shifts how they feel, that there ' s a healthiness to that? Or is that the language of just inducing more guilt in people? EG : No, I think there ' s a beautiful healthiness that can come from being of service, and that ' s also how I ' ve been medicating my anxiety through this, by showing up in ways that I can with whatever resources I ' ve got. Here ' s what you have to keep in mind, though, and this is what I keep reminding people. Right now, in my own personal sphere, there is more need than I have resources to fix. So I have to begin with that reality, and I have to have the courage to sit in that reality soberly and acknowledge that that ' s the case. The second thing I think emotional sobriety would require of me right now is to recognize that this is going to be a **marathon**, not a sprint. And so the first week of the crisis, I had this deluge of all my really energized, let ' s-save-the-world friends, all my creative friends, everybody was e-mailing, texting, Zooming, and they all had a response."Let ' s do this! Let ' s do this! Let ' s fix it this way!"And I found myself joining with some of them and not joining with others, just, again, based on my intuition, but I also found myself cautioning them,"Guys, this is a **marathon**."We ' re in mile one of what ' s going to be a very long **marathon**. So pace yourselves, and pace your resources. Don ' t overgive to the point where you collapse, because we ' re still going to need helpers two months from now, and we ' re still going to need helpers six months from now. And so, find a steady pace and be willing to be in it for the entire long haul. CA : Yeah. Helen. HW : Such great advice, Liz, and so many questions pouring in. One of them is from a therapist who confesses that she, and many of her clients, are having trouble with the letting go of control in this moment, and wonders if you have any advice on how to let go of control in order to be willing to feel everything that we ' re enduring. EG : Just this... This sense that you had that you had control was a myth to begin with. And that may not be comforting, except that I find it very comforting. You know, control is an illusion, and there are times where we ' re able to fool ourselves because we ' re so good at technology, we ' re so good at creating safe worlds where we ' re able to trick ourselves into believing that we ' re in control of any of this. But we ' re not, and the paradox, for me, of surrender is how relaxing it is. Nobody ever wants to surrender, because nobody wants to lose control, but if you recognize that you never had control, all you ever had was anxiety, and then you let go of the myth of control, you ' ll find that, I find that if I even say that sentence,"I ' m losing control,"and then I remind myself,"You never had control, all you had was anxiety, and that ' s what you ' re having right now."So you ' re not letting go of anything. Surrender means letting go of something you never even had. So there ' s an awakening that ' s happening right now, where what ' s happening is not that you ' re losing control. What ' s happening is that, for the first time, you ' re noticing that you never had it. And the world is doing its job. The job of the world is to change, constantly, and sometimes radically, and sometimes immediately, and it ' s doing its job, and that is also the norm of things. And again, we are adaptive and we ' re resilient and we can handle it. But I don ' t kid myself for a minute to think that I ' m in control of anything that ' s ever happening. My realm of control is extremely small. It ' s usually about, like, might be able to go get a glass of water right now. Like, there ' s not a lot that I ' m in control of. And I ' m actually I ' ve ever been. HW : One more question from online, if I may, and then I will jump off again. You know, Chris, you and I, we ' re all in a pretty privileged position. TED has been able to go remote. We ' re able to work remotely. But many, many, many millions of people in the US and beyond are not able to do that, and people are really suffering. How can we help? What are your thoughts about people who are not able to socially distance, who are losing their jobs, the global catastrophe that is unveiling? How can we think about that in a humane and compassionate way? EG : It ' s crushing, and again, as with the same case of the person who said they had lost five family members, I can ' t, sitting in this position of comfort and safety, say anything that I think is going to be accurate and appropriate to that, other than to say that I just think of this Indian proverb that I keep going back to, which is,"I store my grain in the belly of my neighbor."Western, capitalistic society has taught and trained us to hoard long before this, long before this happened and people were hoarding toilet paper and canned goods. Advertising and the whole capitalist model has taught us scarcity, it ' s taught us that you have to be surrounded by abundance in order to safe. The disconnect between those who have and those who have not has never been bigger, and never in my lifetime, and probably in any of our lifetimes, has there been an invitation, again, to release the stranglehold on your hoarding. This is not the time for hoarding. This is the time to store your grain in the belly of your neighbor, in a way that is emotionally sober and accurate to what you can give, and to look at that in a really honest way, to not put your own family in danger, to not put yourself in crisis, but to be able to say,"What can I offer in the immediacy?"And then, in the longer term, a conversation about redistribution of resources, and why do so few have so much and why do so many have so little? But that ' s not a conversation I can fix today. That ' s, again, outside of my realm of control. But what I can do is unleash the white-knuckled grip that I have on what ' s mine and make sure that I ' m going into the world with an open hand – again, not a panicked open hand, where I ' m going to destroy myself to save somebody else, because then there will be no helper left, but in a reasonable way. I cannot save everybody. I can save a few. And that ' s the tragic, but, I think, sobering reality that I can offer right now, and again, underlying all of that, undergirding all of that is a recognition that anything that I have to say about people who are in extraordinary suffering right now is not enough. HW : I ' ll be back. Thank you. EG : Thanks. CA : Liz, talk to me a minute about anger. Like, I think a lot of, just from the conversation we just had, or just listening to you there, there are so many reasons to feel angry right now about what ' s going on. And part of me feels we should be. That ' s what anger is for. It ' s to highlight things that are unjust and unfair and that we must pay attention to, and yet part of me is honestly scared of it. I think there could be an eruption of anger that ' s dangerous, both personally and for society. Have you felt anger? What are you doing with it? EG : I feel anger at every White House press conference, and I think all thinking people do. I feel angry that this wasn ' t taken more seriously early on. I feel angry at myself that I didn ' t take it more seriously early on. As much as I feel contempt and disgust for government officials who I feel were slow to recognize how serious this is, I also have to be really candid that three weeks ago, I was one of the people walking around saying,"Why is everybody overreacting to this so much?"So I think we also have to own our own piece of that, and I think there are rolling waves of awakening that are happening in people, and so a lot of the anger I feel right now is for people who aren ' t taking this seriously enough, who aren ' t quarantining themselves, who are putting other people in danger. But a month ago, that was me. I was in the Hong Kong airport, sallying through the Hong Kong airport while everybody was scurrying around in **masks** and gloves, and I was like,"What ' s the big deal?"It takes people as long as it takes them to come to awakening, and some people, we have to also acknowledge, never will. Anger has its place, and I think that righteous anger, which is the kind of anger that says a violation has occurred here, a humanitarian violation is occurring here, can be very stirring for transformation. Again, it ' s how comfortable can you be, sitting with these discomforting emotions, and what are you going to do with your anger? CA : Umh. EG : Are you going to lash out at the people you ' re quarantined with? Are you going to go on Twitter rants? Is that useful? Is that productive? And so I think – again, I keep using the words"emotional sobriety,"but the emotional sobriety that would be required is to feel that anger, acknowledge it, to show yourself mercy for how uncomfortable it is, and then to steadily, recognizing, again, that this is a **marathon** not a sprint, do what you reasonably can do to change the situation. CA : I mean, the part of me that ' s constantly looking for the better narrative hopes that the anger we feel now could almost displace some of – I mean, the world ' s been an angry place for the last couple years. There ' s been so much anger inflamed online. We ' ve made each other angry, often, probably, unnecessarily – outrage sparking outrage, disgust, etc. I mean, is there any hope that this is a massive societal shaking up? It ' s like, don ' t be so silly. Look at what actually matters here. And we can at least focus more attention onto the things that, yes, some things that we really should be angry about, but other things that maybe... you know, could lead people to say human connection really matters in this moment. People from all sides, we need each other. We just have to use this as a moment when we come together. How do you think about that? Like, how do we turn some of these negative emotions into a force for good that at least gives us some permission to hope that something special comes out of all this. EG : Well, I think you have to give yourself permission to hope, and I don ' t think it ' s unreasonable to give yourself permission to hope, because, again, our resilience, our resourcefulness, and the way that history has shown how catastrophe can lead to transformation, gives us, actually, I think, reasonable cause to hope. One thing that I ' m noticing that I ' m, like, a little bit amused by is that when people start predicting what the post-pandemic world is going to be, I notice that their predictions seem to be, suspiciously, in exact alignment with their personal worldview. So my friends who are utopians are already living in this utopian future where this is going to be the big change. My friends who are dystopians are already predicting that this is the official beginning of the police state and the disastrous new world order. I think there ' s a lot of hubris in trying to imagine what that new world could be. A quote that I love that a friend of mine always says is"When people aren ' t busy being the worst, they ' re the best."And I think that gives me hope. And it ' s true the other way, too. When people aren ' t busy being the best, they ' re the worst. I ' m terrible at social engineering, Chris, and you know this, and you have great, better minds than mine who can come on and talk about this on the global scale. The only world that I have a really intimate, familiar engagement with is this one, and on the individual level, what I understand is that the only world that any of us are ever going to live in is this one. And so minding this, and learning how to calm this, how to open this, how to get on the other side of the emotions that are causing harm to you and others, that ' s my work, you know? Personally, whatever role I have in the public sphere. CA : You ' re an extraordinary storyteller and you already told us one amazing story earlier on. Have you come across any other recent stories that have given you reason for hope, perhaps? EG : Well, I ' ll give you one, and this one, I delight in. Years ago, 20 years ago in New York City – 30 years ago, I was in my 20s – I was friends with a woman named Winifred, who was in her 90s. She was this really cool West Village bohemian artist who had lived in Greenwich Village for her entire life, had had a very storied and checkered and wild life, surrounding herself with intellectuals and poets and artists and adventure, and she ’ d had a lot of loss and a lot of gain, and she was this extremely passionate person who had friends of all ages, which was something I admired about her. I was friends with her. I was 25, she was 95. But I would call her my very good friend, and she had a lot of friends. She was so open to everything. And at her 95th birthday party, I asked her,”What have you learned, more than anything else?”Because she was such a creature of learning. I wrote about her in”Big Magic.”I said to her one time,”What ’ s your favorite book that you ’ ve ever read?”And she said,”I can ’ t say my favorite book because there ’ s been so many, but I can tell you my favorite subject, the history of ancient Mesopotamia, which I started learning when I was 80 and it changed my life.”And it did. She ’ d gone on these expeditions to Jordan and Iraq. She was just so full of living, you know? And I said to her,”What have you learned in all of your experiences? What is the most central thing that you ’ ve learned?”And she said,”Human beings can adapt to anything. Human beings can adapt to absolutely anything.”And then she said this great line :”If Martians landed on Earth tomorrow, it would be off the front pages of the newspaper by next Tuesday. We would already be used to it.”Right? And there ’ s a level at which I ’ m seeing this adaptation happening. And that is both a good and a bad thing. Right? We can get used to totalitarianism, but we can also get used to – I ’ ve gotten used to a world without the love of my life in it. We can adapt. And I keep using that line as a touchstone for myself, because I don ’ t know, nor do I presume to know, what the world is going to be after this. I know that it will be different from the one before. I also just have to point out that all y ’ all had a lot of complaints about the world we had before, and I do a lot of talking, I do a lot of going around the world, and [I don ’ t remember] any one of you raising your hand in any of the seminars I ’ ve taught over the last years, and saying,”We are living in a golden age and I ’ m so grateful and appreciative for all that I have,”now you want that world back, right? So let ’ s actually remember that as we go forward, that this moment, for some of us, that we ’ re in right now, might be one that we look back later and say,”Wow, actually, that was pretty good, and I didn ’ t have any gratitude for it.”So personally, I ’ m just hoping that at an intimate level – and again, this is not a socioeconomic, global political level, but it ’ s an invitation to actually be grateful for the safety that you have and the people that you have, and maybe carry that forward a little bit. Maybe. We ’ re really good at forgetting. Once a crisis is over, we ’ re really good at forgetting our gratitude. It ’ s one of our great gifts. But you might want to make a note to actually try to be grateful for what you have. CA : Thank you, Liz. I think we have a last question from our online friends. HW : Yeah, what crisis, right? So Liz, just a request for a concrete strategy to try and reduce the fear or the shame that is coming at this moment. EG : I ’ ll give you mine, and it may feel weird and out of reach and woo-woo, but I ’ m beyond that at this point, and it has been a game changer and a life changer for me. I have a 20-year-long practice of writing myself, every day, a letter from Love. Now this may not feel concrete. It may feel very airy. But what it does is that it helps me through my anxiety, and I need it every single day, because I ’ m anxious every single day. I wake up frightened every day. I wake up shamed every day. I wake up angry every day. All of the difficult emotions that run through the software of a human consciousness are running through my software all the time, and they cause me pain and they cause me fear, and they cause me distress, and they make me sick. So, 20 years ago, when I was going through a very bad divorce and a depression, I began this tactic, and the tactic is that I will sit down with a notebook and I will write to myself, from myself, a letter from Love. And what I mean by"Love"is not romantic love. It ' s the infinite, bottomlessly merciful source of all human compassion. And every single one of these letters begins the same way. It starts with me saying,"I need you."It ' s a dialogue. It starts with me saying,"I need you,"and Love saying,"I ' m right here."And then I say what I ' m going through."I ' m really angry right now. I ' m terrified. I ' m spinning. I can ' t sleep. I ' m anxious."And then I just allow to come through my hand whatever, if you could imagine the most loving, compassionate, merciful voice in the world, if they were in the room with you, what would you want them to say? And you say that to yourself. And so for me, that usually is a combination of these sorts of phrases :"I ' ve got you. I ' m right here. I see how distressed you are. It ' s all right. I don ' t need you to feel better."I think a lot of our anxiety is that we want to get out of that feeling as fast as we can, and what Love always says to me is,"It makes no difference to me whether you ' re anxious or afraid or angry or hurt. I ' m with you, and I ' ll be with you through this entire thing for however long it takes. I ' m not going anywhere. I ' ve got nowhere better to be right now than sitting with you, loving you. I ' ll be with you at the moment of your death. I was here with you at the moment of your birth. There ' s nothing you can do to lose me. You can ' t fail. You can ' t do this wrong. You are infinitely, bottomlessly loved."And it ' s so interesting to me that the opposite of fear in my life, in my emotional landscape, on the color palette, the opposite of fear isn ' t courage, the opposite of fear is love. And that presence, a sense of,"I ' ve got you,"right? Which is the thing that we ' d all want somebody to say."I ' ve got you, and it ' s going to be all right."I would love to know, neurologically, what actually happens in my mind when I do this, but what happens to me physiologically is that my mind, just hearing those words and seeing those words, settles, and then from there, I ' m able to take the next intuitive right action the best that I can. CA : Liz, you can say no to this, it may be a totally inappropriate thing to ask, but you don ' t happen to have a letter from the last day or two that you ' d consider reading, all or in part of? I don ' t know how long they are. EG : You ' re putting me on the spot. Let me see what we ' ve got. Let ' s see. OK, so here ' s one. So I was panicking because I want to offer my apartment in New York to a woman who is a COVID-19 nurse who ' s volunteered to come into New York City to help, and I ' m afraid that I ' ll infect my neighbors if I let her come and stay there. So I was up in the middle of the night, thinking, ethically, is it appropriate for me to do this? So I wrote,"I need you."And Love said,"I ' m right here."And then I said,"I want to offer that COVID-19 nurse my apartment, but I ' m afraid that my neighbors will get infected, and I ' m scared, and I don ' t know what the right move is. Help me."And Love said,"I don ' t actually know what the right answer to that is, but I ' m with you."And I said,"But what do you think I should do?"And Love said,"Why don ' t you just sit with me right here for a minute and be with me and know that you ' re held no matter what, that you cannot make the wrong choice, that it doesn ' t matter in the grand scheme of things. You ' re my beloved, I ' ve got you. I can see how much you ' re spinning, I can see how tired you are, and it doesn ' t matter to me whether you make this decision in the next minute, in the next day, or not at all. I ' m with you, and I ' ll sit with you through this entire thing, and I ' ll love you no matter what you decide to do at the end of this. I will be just as much with you at the end of this decision as am I with you now."And then, I said,"So what do you think I should do?"And Love says,"I think you should go get a glass of water, and I think you should lie down and get some rest, and we ' ll talk about it some more in the morning.”What I have found over the years of writing myself these letters from Love is that Love never gives advice. This is actually really good for all of you who love to give unsolicited advice to people. Love never gives advice beyond,”Why don ’ t you get a glass of water? Why don ’ t you rest? We ’ ll try this again tomorrow. You ’ re doing your best, this is a hard time, and I ’ ve got you.”So I ’ ve got 20 years of those journals, and I ’ m assuming that I ’ m going to need it for the rest of my life. CA : Wow. I don ’ t know, Helen, I think we might be done. I think I ’ m done. I can ’ t ask any more after that. HW : How beautiful. Good grief. CA : Liz, you ’ re really phenomenal. You ’ ve just got this unique way of **articulating** what others can ’ t **articulate**, and you ’ ve brought all of us to a very tender, intimate place, and thank you for that. EG : Thank you, Chris. HW : Thank you so much. EG : And thank you, Helen. Take care of yourselves, everybody. We ’ re right here with each other through this. We can do this. CA : Thank you, Liz. Goodbye. HW : Thank you. CA : Oof. HW : Oof. HW : Deep breaths. CA : Yeah. No. That was special. That was special to me. I know that you are all in different circumstances online, and that there are so many elements to this thing. There ’ s the problems that those of us who are isolated have, and in many ways, those are the luxurious problems, and we ’ re really aware of that. But they ’ re still problems, and we ’ re going to give space on these TED Connects to many other voices as well. I think we ’ re hoping to hear next week from a doctor at the front line, a voice from India, we hope, on some of the horrifying things that are happening there, and also some pretty amazing proposals for how the world could come out of this, like specific proposals on how we get past this period of lockdown to bring back the economy. All of this matters. So I guess we want Helen and everyone to come back, calendar this, share with friends, and help us figure out how to use this time best. HW : I also wanted to flag that I don ’ t know if you were able to tune in for Susan David ’ s conversation earlier in the week. We have launched a new podcast with Susan that launched on Monday. We ’ re calling it”Checking In with Susan David,”and she is going to be sharing daily tips on how to deal with this pandemic. And so you can find that wherever you find podcasts in this day and age. For this conversation, we will be archiving it. It will be on Facebook, and we ’ ll also put it onto TED. com. You can find the TED Interview podcast that Chris and Liz did last year, which I confess just made me weep for... too long. You can find that at go. ted. com / tedconnects. But that ’ s it from us. And tomorrow, I want to flag that we have a very special treat, which is less chat, more beauty. We will be joined by the unbelievably talented Butterscotch, who is a beatboxer and a singer and a musician and a sage, and an all-around delight, and she is going to be giving us a glimpse into her world and delighting us all with some sonic deliciousness. So do tune in tomorrow. CA : Thanks so much, everyone. We ’ re in this together. Stay safe. See you soon. HW : See you soon. Be well.

Text Sample 881: POS Dim 6 – 2020 – Score 4.00 – 2020/t004244.txt

Chris Anderson : Al, welcome. So look, just six months ago – it seems a lifetime ago, but it really was just six months ago – climate seemed to be on the lips of every thinking person on the planet. Recent events seem to have swept it all away from our attention. How worried are you about that? Al Gore : Well, first of all Chris, thank you so much for inviting me to have this conversation. People are reacting differently to the climate crisis in the midst of these other great challenges that have taken over our awareness, appropriately. One reason is something that you mentioned. People get the fact that when scientists are warning us in ever more dire terms and setting their hair on fire, so to speak, it ’ s best to listen to what they ’ re saying, and I think that lesson has begun to sink in in a new way. Another similarity, by the way, is that the climate crisis, like the COVID-19 pandemic, has revealed in a new way the shocking injustices and inequalities and disparities that affect communities of color and low-income communities. There are differences. The climate crisis has effects that are not measured in years, as the pandemic is, but consequences that are measured in centuries and even longer. And the other difference is that instead of depressing economic activity to deal with the climate crisis, as nations around the world have had to do with COVID-19, we have the opportunity to create tens of millions of new jobs. That sounds like a political phrasing, but it ’ s literally true. For the last five years, the fastest-growing job in the US has been solar installer. The second-fastest has been wind turbine technician. And the”Oxford Review of Economics,”just a few weeks ago, pointed the way to a very jobs-rich recovery if we emphasize renewable energy and sustainability technology. So I think we are crossing a tipping point, and you need only look at the recovery plans that are being presented in nations around the world to see that they ’ re very much focused on a green recovery. CA : I mean, one obvious impact of the pandemic is that it ’ s brought the world ’ s economy to a shuddering halt, thereby reducing greenhouse gas emissions. I mean, how big an effect has that been, and is it unambiguously good news? AG : Well, it ’ s a little bit of an illusion, Chris, and you need only look back to the Great Recession in 2008 and ’ 09, when there was a one percent decline in emissions, but then in 2010, they came roaring back during the recovery with a four percent increase. The latest estimates are that emissions will go down by at least five percent during this induced coma, as the economist Paul Krugman perceptively described it, but whether it goes back the way it did after the Great Recession is in part up to us, and if these green recovery plans are actually implemented, and I know many countries are determined to implement them, then we need not repeat that pattern. After all, this whole process is occurring during a period when the cost of renewable energy and electric vehicles, batteries and a range of other sustainability approaches are continuing to fall in price, and they ’ re becoming much more competitive. Just a quick reference to how fast this is : five years ago, electricity from solar and wind was cheaper than electricity from fossil fuels in only one percent of the world. This year, it ’ s cheaper in two-thirds of the world, and five years from now, it will be cheaper in virtually 100 percent of the world. EVs will be cost-competitive within two years, and then will continue falling in price. And so there are changes underway that could interrupt the pattern we saw after the Great Recession. CA : The reason those pricing differentials happen in different parts of the world is obviously because there ’ s different amounts of sunshine and wind there and different building costs and so forth. AG : Well, yes, and government policies also account for a lot. The world is continuing to subsidize fossil fuels at a ridiculous amount, more so in many developing countries than in the US and developed countries, but it ’ s subsidized here as well. But everywhere in the world, wind and solar will be cheaper as a source of electricity than fossil fuels, within a few years. CA : I think I ’ ve heard it said that the fall in emissions caused by the pandemic isn ’ t that much more than, actually, the fall that we will need every single year if we ’ re to meet emissions targets. Is that true, and, if so, doesn ’ t that seem impossibly daunting? AG : It does seem daunting, but first look at the number. That number came from a study a little over a year ago released by the IPCC as to what it would take to keep the Earth ’ s temperatures from increasing more than 1. 5 degrees Celsius. And yes, the annual reductions would be significant, on the order of what we ’ ve seen with the pandemic. And yes, that does seem daunting. However, we do have the opportunity to make some fairly dramatic changes, and the plan is not a mystery. You start with the two sectors that are closest to an effective transition – electricity generation, as I mentioned – and last year, 2019, if you look at all of the new electricity generation built all around the world, 72 percent of it was from solar and wind. And already, without the continuing subsidies for fossil fuels, we would see many more of these plants being shut down. There are some new fossil plants being built, but many more are being shut down. And where transportation is concerned, the second sector ready to go, in addition to the cheaper prices for EVs that I made reference to before, there are some 45 jurisdictions around the world – national, regional and municipal – where laws have been passed beginning a phaseout of internal combustion engines. Even India said that by 2030, less than 10 years from now, it will be illegal to sell any new internal combustion engines in India. There are many other examples. So the past small reductions may not be an accurate guide to the kind we can achieve with serious national plans and a focused global effort. CA : So help us understand just the big picture here, Al. I think before the pandemic, the world was emitting about 55 gigatons of what they call”CO2 equivalent,”so that includes other greenhouse gases like methane dialed up to be the equivalent of CO2. And am I right in saying that the IPCC, which is the global organization of scientists, is recommending that the only way to fix this crisis is to get that number from 55 to zero by 2050 at the very latest, and that even then, there ' s a chance that we will end up with temperature rises more like two degrees Celsius rather than 1. 5? I mean, is that approximately the big picture of what the IPCC is recommending? AG : That ' s correct. The global goal established in the Paris Conference is to get to net zero on a global basis by 2050, and many people quickly add that that really means a 45 to 50 percent reduction by 2030 to make that pathway to net zero feasible. CA : And that kind of timeline is the kind of timeline where people couldn ' t even imagine it. It ' s just hard to think of policy over 30 years. So that ' s actually a very good shorthand, that humanity ' s task is to cut emissions in half by 2030, approximately speaking, which I think boils down to about a seven or eight percent reduction a year, something like that, if I ' m not wrong. AG : Not quite. Not quite that large but close, yes. CA : So it is something like the effect that we ' ve experienced this year may be necessary. This year, we ' ve done it by basically shutting down the economy. You ' re talking about a way of doing it over the coming years that actually gives some economic growth and new jobs. So talk more about that. You ' ve referred to changing our energy sources, changing how we transport. If we did those things, how much of the problem does that solve? AG : Well, we can get to – well, in addition to doing the two sectors that I mentioned, we also have to deal with manufacturing and all the use cases that require temperatures of a thousand degrees Celsius, and there are solutions there as well. I ' ll come back and mention an exciting one that Germany has just embarked upon. We also have to tackle regenerative agriculture. There is the opportunity to sequester a great deal of carbon in topsoils around the world by changing the agricultural techniques. There is a farmer-led movement to do that. We need to also retrofit buildings. We need to change our management of forests and the ocean. But let me just mention two things briefly. First of all, the high temperature use cases. Angela Merkel, just 10 days ago, with the leadership of her minister Peter Altmaier, who is a good friend and a great public servant, have just embarked on a green hydrogen strategy to make hydrogen with zero marginal cost renewable energy. And just a word on that, Chris : you ' ve heard about the intermittency of wind and solar – solar doesn ' t produce electricity when the sun ' s not shining, and wind doesn ' t when the wind ' s not blowing – but batteries are getting better, and these technologies are becoming much more efficient and powerful, so that for an increasing number of hours of each day, they ' re producing often way more electricity than can be used. So what to do with it? The marginal cost for the next kilowatt-hour is zero. So all of a sudden, the very energy-intensive process of cracking hydrogen from water becomes economically feasible, and it can be substituted for coal and gas, and that ' s already being done. There ' s a Swedish company already making steel with green hydrogen, and, as I say, Germany has just embarked on a major new initiative to do that. I think they ' re pointing the way for the rest of the world. Now, where building retrofits are concerned, just a moment on this, because about 20 to 25 percent of the global warming pollution in the world and in the US comes from inefficient buildings that were constructed by companies and individuals who were trying to be competitive in the marketplace and keep their margins acceptably high and thereby skimping on insulation and the right windows and LEDs and the rest. And yet the person or company that buys that building or leases that building, they want their monthly utility bills much lower. So there are now ways to close that so-called agent-principal divide, the differing incentives for the builder and occupier, and we can retrofit buildings with a program that literally pays for itself over three to five years, and we could put tens of millions of people to work in jobs that by definition cannot be outsourced because they exist in every single community. And we really ought to get serious about doing this, because we ' re going to need all those jobs to get sustainable prosperity in the aftermath of this pandemic. CA : Just going back to the hydrogen economy that you referred to there, when some people hear that, they think,"Oh, are you talking about hydrogen-fueled cars?"And they ' ve heard that that probably won ' t be a winning strategy. But you ' re thinking much more broadly than that, I think, that it ' s not just hydrogen as a kind of storage mechanism to act as a buffer for renewable energy, but also hydrogen could be essential for some of the other processes in the economy like making steel, making cement, that are fundamentally carbon-intensive processes right now but could be transformed if we had much cheaper sources of hydrogen. Is that right? AG : Yes, I was always skeptical about hydrogen, Chris, principally because it ' s been so expensive to make it, to"crack it out of water,"as they say. But the game-changer has been the incredible abundance of solar and wind electricity in volumes and amounts that people didn ' t expect, and all of a sudden, it ' s cheap enough to use for these very energy-intensive processes like creating green hydrogen. I ' m still a bit skeptical about using it in vehicles. Toyota ' s been betting on that for 25 years and it hasn ' t really worked for them. Never say never, maybe it will, but I think it ' s most useful for these high-temperature industrial processes, and we already have a pathway for decarbonizing transportation with electricity that ' s working extremely well. Tesla ' s going to be soon the most valuable automobile company in the world, already in the US, and they ' re about to overtake Toyota. There is now a semitruck company that ' s been stood up by Tesla and another that is going to be a hybrid with electricity and green hydrogen, so we ' ll see whether or not they can make it work in that application. But I think electricity is preferable for cars and trucks. CA : We ' re coming to some community questions in a minute. Let me ask you, though, about nuclear. Some environmentalists believe that nuclear, or maybe new generation nuclear power is an essential part of the equation if we ' re to get to a truly clean future, a clean energy future. Are you still pretty skeptical on nuclear, Al? AG : Well, the market ' s skeptical about it, Chris. It ' s been a crushing disappointment for me and for so many. I used to represent Oak Ridge, where nuclear energy began, and when I was a young congressman, I was a booster. I was very enthusiastic about it. But the cost overruns and the problems in building these plants have become so severe that utilities just don ’ t have an appetite for them. It ’ s become the most expensive source of electricity. Now, let me hasten to add that there are some older nuclear reactors that have more useful time that could be added onto their lifetimes. And like a lot of environmentalists, I ’ ve come to the view that if they can be determined to be safe, they should be allowed to continue operating for a time. But where new nuclear power plants are concerned, here ’ s a way to look at it. If you are – you ’ ve been a CEO, Chris. If you were the CEO of – I guess you still are. If you were the CEO of an electric utility, and you told your executive team,”I want to build a nuclear power plant,”two of the first questions you would ask are, number one : How much will it cost? And there ’ s not a single engineering consulting firm that I ’ ve been able to find anywhere in the world that will put their name on an opinion giving you a cost estimate. They just don ’ t know. A second question you would ask is : How long will it take to build it, so we can start selling the electricity? And again, the answer you will get is,”We have no idea.”So if you don ’ t know how much it ’ s going to cost, and you don ’ t know when it ’ s going to be finished, and you already know that the electricity is more expensive than the alternate ways to produce it, that ’ s going to be a little discouraging, and, in fact, that ’ s been the case for utilities around the world. CA : OK. So there ’ s definitely an interesting debate there, but we ’ re going to come on to some community questions. Let ’ s have the first of those questions up, please. From Prosanta Chakrabarty :”People who are skeptical of COVID and of climate change seem to be skeptical of science in general. It may be that the singular message from scientists gets diluted and convoluted. How do we fix that?”AG : Yeah, that ’ s a great question, Prosanta. Boy, I ’ m trying to put this succinctly and shortly. I think that there has been a feeling that experts in general have kind of let the US down, and that feeling is much more pronounced in the US than in most other countries. And I think that the considered opinion of what we call experts has been diluted over the last few decades by the unhealthy dominance of big money in our political system, which has found ways to really twist economic policy to benefit elites. And this sounds a little radical, but it ’ s actually what has happened. And we have gone for more than 40 years without any meaningful increase in middle-income pay, and where the injustice experienced by African Americans and other communities of color are concerned, the differential in pay between African Americans and majority Americans is the same as it was in 1968, and the family wealth, the net worth – it takes 11 and a half so-called”**typical**”African American families to make up the net worth of one so-called”**typical**”White American family. And you look at the soaring incomes in the top one or the top one-tenth of one percent, and people say,”Wait a minute. Whoever the experts were that designed these policies, they haven ’ t been doing a good job for me.”A final point, Chris : there has been an assault on reason. There has been a war against truth. There has been a strategy, maybe it was best known as a strategy decades ago by the tobacco companies who hired actors and dressed them up as doctors to falsely reassure people that there were no health consequences from smoking cigarettes, and a hundred million people died as a result. That same strategy of diminishing the significance of truth, diminishing, as someone said, the authority of knowledge, I think that has made it kind of open season on any inconvenient truth – forgive another buzz phrase, but it is apt. We cannot abandon our devotion to the best available evidence tested in reasoned discourse and used as the basis for the best policies we can form. CA : Is it possible, Al, that one consequence of the pandemic is actually a growing number of people have revisited their opinions on scientists? I mean, you ’ ve had a chance in the last few months to say,”Do I trust my political leader or do I trust this scientist in terms of what they ’ re saying about this virus?”Maybe lessons from that could be carried forward? AG : Well, you know, I think if the polling is accurate, people do trust their doctors a lot more than some of the politicians who seem to have a vested interest in pretending the pandemic isn ’ t real. And if you look at the incredible bust at President Trump ’ s rally in Tulsa, a stadium of 19, 000 people with less than one-third filled, according to the fire marshal, you saw all the empty seats if you saw the news clips, so even the most loyal Trump supporters must have decided to trust their doctors and the medical advice rather than Dr. Donald Trump. CA : With a little help from the TikTok generation, perchance. AG : Well, but that didn ’ t affect the turnout. What they did, very cleverly, and I ’ m cheering them on, what they did was affect the Trump White House ’ s expectations. They ’ re the reason why he went out a couple days beforehand and said,”We ’ ve had a million people sign up.”But they didn ’ t prevent – they didn ’ t take seats that others could have otherwise taken. They didn ’ t affect the turnout, just the expectations. CA : OK, let ’ s have our next question here.”Are you concerned the world will rush back to the use of the private car out of fear of using shared public transportation?”AG : Well, that could actually be one of the consequences, absolutely. Now, the trends on mass transit were already inching in the wrong direction because of Uber and Lyft and the ridesharing services, and if autonomy ever reaches the goals that its advocates have hoped for then that may also have a similar effect. But there ’ s no doubt that some people are going to be probably a little more reluctant to take mass transportation until the fear of this pandemic is well and truly gone. CA : Yeah. Might need a vaccine on that one. AG : Yeah. CA : Next question. Sonaar Luthra, thank you for this question from LA.”Given the temperature rise in the Arctic this past week, seems like the rate we are losing our carbon sinks like permafrost or forests is accelerating faster than we predicted. Are our models too focused on human emissions?”Interesting question. AG : Well, the models are focused on the factors that have led to these incredible temperature spikes in the north of the Arctic Circle. They were predicted, they have been predicted, and one of the reasons for it is that as the snow and ice cover melts, the sun ’ s incoming rays are no longer reflected back into space at a 90 percent rate, and instead, when they fall on the dark tundra or the dark ocean, they ’ re absorbed at a 90 percent rate. So that ’ s a magnifier of the warming in the Arctic, and this has been predicted. There are a number of other consequences that are also in the models, but some of them may have to be recalibrated. The scientists are freshly concerned that the emissions of both CO2 and methane from the thawing tundra could be larger than they had hoped they would be. There ’ s also just been a brand-new study. I won ’ t spend time on this, because it deals with a kind of geeky term called”climate sensitivity,”which has been a factor in the models with large error bars because it ’ s so hard to pin down. But the latest evidence indicates, worryingly, that the sensitivity may be greater than they had thought, and we will have an even more daunting task. That shouldn ’ t discourage us. I truly believe that once we cross this tipping point, and I do believe we ’ re doing it now, as I ’ ve said, then I think we ’ re going to find a lot of ways to speed up the emissions reductions. CA : We ’ ll take one more question from the community. Haha.”Geoengineering is making extraordinary progress. Exxon is investing in technology from Global Thermostat that seems promising. What do you think of these air and water carbon capture technologies?”Stephen Petranek. AG : Yeah. Well, you and I have talked about this before, Chris. I ’ ve been strongly opposed to conducting an unplanned global experiment that could go wildly wrong, and most are really scared of that approach. However, the term”geoengineering”is a nuanced term that covers a lot. If you want to paint roofs white to reflect more energy from the cityscapes, that ’ s not going to bring a danger of a runaway effect, and there are some other things that are loosely called”geoengineering”like that, which are fine. But the idea of blocking out the sun ’ s rays – that ’ s insane in my opinion. Turns out plants need sunlight for photosynthesis and solar panels need sunlight for producing electricity from the sun ’ s rays. And the consequences of changing everything we know and pretending that the consequences are going to precisely cancel out the unplanned experiment of global warming that we already have underway, you know, there are glitches in our thinking. One of them is called the”single solution bias,”and there are people who just have a hunger to say,”Well, that one solution, we just need to latch on to that and do that, and damn the consequences.”Well, it ’ s nuts. CA : But let me push back on this just a little bit. So let ’ s say that we agree that a single solution, all-or-nothing attempt at geoengineering is crazy. But there are scenarios where the world looks at emissions and just sees, in 10 years ’ time, let ’ s say, that they are just not coming down fast enough and that we are at risk of several other liftoff events where this train will just get away from us, and we will see temperature rises of three, four, five, six, seven degrees, and all of civilization is at risk. Surely, there is an approach to geoengineering that could be modeled, in a way, on the way that we approach medicine. Like, for hundreds of years, we don ’ t really understand the human body, people would try interventions, and some of them would work, and some of them wouldn ’ t. No one says in medicine,”You know, go in and take an all-or-nothing decision on someone ’ s life,”but they do say,”Let ’ s try some stuff.”If an experiment can be reversible, if it ’ s plausible in the first place, if there ’ s reason to think that it might work, we actually owe it to the future health of humanity to try at least some types of tests to see what could work. So, small tests to see whether, for example, seeding of something in the ocean might create, in a nonthreatening way, carbon sinks. Or maybe, rather than filling the atmosphere with sulfur dioxide, a smaller experiment that was not that big a deal to see whether, cost-effectively, you could reduce the temperature a little bit. Surely, that isn ’ t completely crazy and is at least something we should be thinking about in case these other measures don ’ t work? AG : Well, there ’ ve already been such experiments to seed the ocean to see if that can increase the uptake of CO_2. And the experiments were an unmitigated failure, as many predicted they would be. But that, again, is the kind of approach that ’ s very different from putting tinfoil strips in the atmosphere orbiting the Earth. That was the way that solar geoengineering proposal started. Now they ’ re focusing on chalk, so we have chalk dust all over everything. But more serious than that is the fact that it might not be reversible. CA : But, Al, that ’ s the rhetoric response. The amount of dust that you need to drop by a degree or two wouldn ’ t result in chalk dust over everything. It would be unbelievably – like, it would be less than the dust that people experience every day, anyway. I mean, I just – AG : First of all, I don ’ t know how you do a small experiment in the atmosphere. And secondly, if we were to take that approach, we would have to steadily increase the amount of whatever substance they decided. We ’ d have to increase it every single year, and if we ever stopped, then there would be a sudden snapback, like”The Picture of Dorian Gray,”that old book and **movie**, where suddenly all of the things caught up with you at once. The fact that anyone is even considering these approaches, Chris, is a measure of a feeling of desperation that some have begun to feel, which I understand, but I don ’ t think it should drive us toward these reckless experiments. And by the way, using your analogy to experimental cancer treatments, for example, you usually get informed consent from the patient. Getting informed consent from 7. 8 billion people who have no voice and no say, who are subject to the potentially catastrophic consequences of this wackadoodle proposal that somebody comes up with to try to rearrange the entire Earth ' s atmosphere and hope and pretend that it ' s going to cancel out, the fact that we ' re putting 152 million tons of heat-trapping, manmade global warming pollution into the sky every day. That ' s what ' s really insane. A scientist decades ago compared it this way. He said, if you had two people on a sinking boat and one of them says,"You know, we could probably use some mirrors to signal to shore to get them to build a sophisticated wave-generating machine that will cancel out the rocking of the boat by these guys in the back of the boat."Or you could get them to stop rocking the boat. And that ' s what we need to do. We need to stop what ' s causing the crisis. CA : Yeah, that ' s a great story, but if the effort to stop the people rocking in the back of the boat is as complex as the scientific proposal you just outlined, whereas the experiment to stop the waves is actually as simple as telling the people to stop rocking the boat, that story changes. And I think you ' re right that the issue of informed consent is a really challenging one, but, I mean, no one gave informed consent to do all of the other things we ' re doing to the atmosphere. And I agree that the moral hazard issue is worrying, that if we became dependent on geoengineering and took away our efforts to do the rest, that would be tragic. It just seems like, I wish it was possible to have a nuanced debate of people saying, you know what, there ' s multiple dials to a very complex problem. We ' re going to have to adjust several of them very, very carefully and keep talking to each other. Wouldn ' t that be a goal to just try and have a more nuanced debate about this, rather than all of that geoengineering can ' t work? AG : Well, I ' ve said some of it, you know, the benign forms that I ' ve mentioned, I ' m not ruling those out. But blocking the Sun ' s rays from the Earth, not only do you affect 7. 8 billion people, you affect the plants and the animals and the ocean currents and the wind currents and natural processes that we ' re in danger of disrupting even more. Techno-optimism is something I ' ve engaged in in the past, but to latch on to some brand-new technological solution to rework the entire Earth ' s natural system because somebody thinks he ' s clever enough to do it in a way that precisely cancels out the consequences of using the atmosphere as an open sewer for heat-trapping manmade gases. It ' s much more important to stop using the atmosphere as an open sewer. That ' s what the problem is. CA : All right, well, we ' ll agree that that is the most important thing, for sure, and speaking of which, do you believe the world needs carbon pricing, and is there any prospect for getting there? AG : Yes. Yes to both questions. For decades, almost every economist who is asked about the climate crisis says,"Well, we just need to put a price on carbon."And I have certainly been in favor of that approach. But it is daunting. Nevertheless, there are 43 jurisdictions around the world that already have a price on carbon. We ' re seeing it in Europe. They finally straightened out their carbon pricing mechanism. It ' s an emissions trading version of it. We have places that have put a tax on carbon. That ' s the approach the economists prefer. China is beginning to implement its national emissions trading program. California and quite a few other states in the US are already doing it. It can be given back to people in a revenue-neutral way. But the opposition to it, Chris, which you ' ve noted, is impressive enough that we do have to take other approaches, and I would say most climate activists are now saying, look, let ' s don ' t make the best the enemy of the better. There are other ways to do this as well. We need every solution we can rationally employ, including by regulation. And often, when the political difficulty of a proposal becomes too difficult in a market-oriented approach, the fallback is with regulation, and it ' s been given a bad name, regulation, but many places are doing it. I mentioned phasing out internal combustion engines. That ' s an example. There are 160 cities in the US that have already by regulation ordered that within a date certain, 100 percent of all their electricity will have to come from renewable sources. And again, the market forces that are driving the cost of renewable energy and sustainability solutions ever downward, that gives us the wind at our back. This is working in our favor. CA : I mean, the pushback on carbon pricing often goes further from parts of the environmental movement, which is to a pushback on the role of business in general. Business is actually – well, capitalism – is blamed for the climate crisis because of unrelenting growth, to the point where many people don ' t trust business to be part of the solution. The only way to go forward is to regulate, to force businesses to do the right thing. Do you think that business has to be part of the solution? AG : Well, definitely, because the allocation of capital needed to solve this crisis is greater than what governments can handle. And businesses are beginning, many businesses are beginning to play a very constructive role. They ' re getting a demand that they do so from their customers, from their investors, from their boards, from their executive teams, from their families. And by the way, the rising generation is demanding a brighter future, and when CEOs interview potential new hires, they find that the new hires are interviewing them. They want to make a nice income, but they want to be able to tell their family and friends and peers that they ' re doing something more than just making money. One illustration of how this new generation is changing, Chris : there are 65 colleges in the US right now where the College Young Republican Clubs have joined together to jointly demand that the Republican National Committee change its policy on climate, lest they lose that entire generation. This is a global phenomenon. The Greta Generation is now leading this in so many ways, and if you look at the polling, again, the vast majority of young Republicans are demanding a change on climate policy. This is really a movement that is building still. CA : I was going to ask you about that, because one of the most painful things over the last 20 years has just been how climate has been politicized, certainly in the US. You ' ve probably felt yourself at the heart of that a lot of the time, with people attacking you personally in the most merciless, and unfair ways, often. Do you really see signs that that might be changing, led by the next generation? AG : Yeah, there ' s no question about it. I don ' t want to rely on polls too much. I ' ve mentioned them already. But there was a new one that came out that looked at the wavering Trump supporters, those who supported him strongly in the past and want to do so again. The number one issue, surprisingly to some, that is giving them pause, is the craziness of President Trump and his administration on climate. We ' re seeing big majorities of the Republican Party overall saying that they ' re ready to start exploring some real solutions to the climate crisis. I think that we ' re really getting there, no question about it. CA : I mean, you ' ve been the figurehead for raising this issue, and you happen to be a Democrat. Is there anything that you can personally do to – I don ' t know – to open the tent, to welcome people, to try and say,"This is beyond politics, dear friends"? AG : Yeah. Well, I ' ve tried all of those things, and maybe it ' s made a little positive difference. I ' ve worked with the Republicans extensively. And, you know, well after I left the White House, I had Newt Gingrich and Pat Robertson and other prominent Republicans appear on national TV ads with me saying we ' ve got to solve the climate crisis. But the petroleum industry has really doubled down enforcing discipline within the Republican Party. I mean, look at the attacks they ' ve launched against the Pope when he came out with his encyclical and was demonized, not by all for sure, but there were hawks in the anti-climate movement who immediately started training their guns on Pope Francis, and there are many other examples. They enforce discipline and try to make it a partisan issue, even as Democrats reach out to try to make it bipartisan. I totally agree with you that it should not be a partisan issue. It didn ’ t use to be, but it ’ s been artificially weaponized as an issue. CA : I mean, the CEOs of oil companies also have kids who are talking to them. It feels like some of them are moving and are trying to invest and trying to find ways of being part of the future. Do you see signs of that? AG : Yeah. I think that business leaders, including in the oil and gas companies, are hearing from their families. They ’ re hearing from their friends. They ’ re hearing from their employees. And, by the way, we ’ ve seen in the tech industry some mass walkouts by employees who are demanding that some of the tech companies do more and get serious. I ’ m so proud of Apple. Forgive me for parenthetically praising Apple. You know, I ’ m on the board, but I ’ m such a big fan of Tim Cook and my colleagues at Apple. It ’ s an example of a tech company that ’ s really doing fantastic things. And there ’ s some others as well. There are others in many industries. But the pressures on the oil and gas companies are quite extraordinary. You know, BP just wrote down 12 and a half billion dollars ’ worth of oil and gas assets and said that they ’ re never going to see the light of day. Two-thirds of the fossil fuels that have already been discovered cannot be burned and will not be burned. And so that ’ s a big economic risk to the global economy, like the subprime mortgage crisis. We ’ ve got 22 trillion dollars of subprime carbon assets, and just yesterday, there was a major report that the fracking industry in the US is seeing now a wave of bankruptcies because the price of the fracked gas and oil has fallen below levels that make them economic. CA : Is the shorthand of what ’ s happened there that electric cars and electric technologies and solar and so forth have helped drive down the price of oil to the point where huge amounts of the reserves just can ’ t be developed profitably? AG : Yes, that ’ s it. That ’ s mainly it. The projections for energy sources in the next several years uniformly predict that electricity from wind and solar is going to continue to plummet in price, and therefore using gas or coal to make steam to turn the turbines is just not going to be economical. Similarly, the electrification of the transportation sector is having the same effect. Some are also looking at the trend in national, regional and local governance. I mentioned this before, but they ’ re predicting a very different energy future. But let me come back, Chris, because we talked about business leaders. I think you were getting in a question a moment ago about capitalism itself, and I do want to say a word on that, because there are a lot of people who say maybe capitalism is the basic problem. I think the current form of capitalism we have is desperately in need of reform. The short-term outlook is often mentioned, but the way we measure what is of value to us is also at the heart of the crisis of modern capitalism. Now, capitalism is at the base of every successful economy, and it balances supply and demand, unlocks a higher fraction of the human potential, and it ’ s not going anywhere, but it needs to be reformed, because the way we measure what ’ s valuable now ignores so-called negative externalities like pollution. It also ignores positive externalities like investments in education and health care, mental health care, family services. It ignores the depletion of resources like groundwater and topsoil and the web of living species. And it ignores the distribution of incomes and net worths, so when GDP goes up, people cheer, two percent, three percent – wow! – four percent, and they think,”Great!”But it ’ s accompanied by vast increases in pollution, chronic underinvestment in public goods, the depletion of irreplaceable natural resources, and the worst inequality crisis we ’ ve seen in more than a hundred years that is threatening the future of both capitalism and democracy. So we have to change it. We have to reform it. CA : So reform capitalism, but don ’ t throw it out. We ’ re going to need it as a tool as we go forward if we ’ re to solve this. AG : Yeah, I think that ’ s right, and just one other point : the worst environmental abuses in the last hundred years have been in jurisdictions that experimented during the 20th century with the alternatives to capitalism on the left and right. CA : Interesting. All right. Two last community questions quickly. Chadburn Blomquist :”As you are reading the tea leaves of the impact of the current pandemic, what do you think in regard to our response to combatting climate change will be the most impactful lesson learned?”AG : Boy, that ’ s a very thoughtful question, and I wish my answer could rise to the same level on short notice. I would say first, don ’ t ignore the scientists. When there is virtual unanimity among the scientific and medical experts, pay attention. Don ’ t let some politician dissuade you. I think President Trump is slowly learning that ’ s it ’ s kind of difficult to gaslight a virus. He tried to gaslight the virus in Tulsa. It didn ’ t come off very well, and tragically, he decided to recklessly roll the dice a month ago and ignore the recommendations for people to wear **masks** and to socially distance and to do the other things, and I think that lesson is beginning to take hold in a much stronger way. But beyond that, Chris, I think that this period of time has been characterized by one of the most profound opportunities for people to rethink the patterns of their lives and to consider whether or not we can ’ t do a lot of things better and differently. And I think that this rising generation I mentioned before has been even more profoundly affected by this interlude, which I hope ends soon, but I hope the lessons endure. I expect they will. CA : Yeah, it ’ s amazing how many things you can do without emitting carbon, that we ’ ve been forced to do. Let ’ s have one more question here. Frank Hennessy :”Are you encouraged by the ability of people to quickly adapt to the new normal due to COVID-19 as evidence that people can and will change their habits to respond to climate change?”AG : Yes, but I think we have to keep in mind that there is a crisis within this crisis. The impact on the African American community, which I mentioned before, on the Latinx community, Indigenous peoples. The highest infection rate is in the Navajo Nation right now. So some of these questions appear differently to those who are really getting the brunt of this crisis, and it is unacceptable that we allow this to continue. It feels one way to you and me and perhaps to many in our audience today, but for low-income communities of color, it ’ s an entirely different crisis, and we owe it to them and to all of us to get busy and to start using the best science and solve this pandemic. You know the phrase”pandemic economics.”Somebody said, the first principle of pandemic economics is take care of the pandemic, and we ’ re not doing that yet. We ’ re seeing the president try to goose the economy for his reelection, never mind the prediction of tens of thousands of additional American deaths, and that is just unforgivable in my opinion. CA : Thank you, Frank. So Al, you, along with others in the community played a key role in encouraging TED to launch this initiative called”Countdown.”Thank you for that, and I guess this conversation is continuing among many of us. If you ’ re interested in climate, watching this, check out the Countdown website, countdown. ted. com, and be part of 10 / 10 / 2020, when we are trying to put out an alert to the world that climate can ’ t wait, that it really matters, and there ’ s going to be some amazing content free to the world on that day. Thank you, Al, for your inspiration and support in doing that. I wonder whether you could end today ’ s session just by painting us a picture, like how might things roll out over the next decade or so? Just tell us whether there is still a story of hope here. AG : I ’ d be glad to. I ’ ve got to get one plug in. I ’ ll make it brief. July 18 through July 26, The Climate Reality Project is having a global training. We ’ ve already had 8, 000 people register. You can go to climatereality. com. Now, a bright future. It begins with all of the kinds of efforts that you ’ ve thrown yourself into in organizing Countdown. Chris, you and your team have been amazing to work with, and I ’ m so excited about the Countdown project. TED has an unparalleled ability to spread ideas that are worth spreading, to raise consciousness, to enlighten people around the world, and it ’ s needed for climate and the solutions to the climate crisis like it ’ s never been needed before, and I just want to thank you for what you personally are doing to organize this fantastic Countdown program. CA : Thank you. And the world? Are we going to do this? Do you think that humanity is going to pull this off and that our grandchildren are going to have beautiful lives where they can celebrate nature and not spend every day in fear of the next tornado or tsunami? AG : I am optimistic that we will do it, but the answer is in our hands. We have seen dark times in periods of the past, and we have risen to meet the challenge. We have limitations of our long evolutionary heritage and elements of our culture, but we also have the ability to transcend our limitations, and when the chips are down, and when survival is at stake and when our children and future generations are at stake, we ’ re capable of more than we sometimes allow ourselves to think we can do. This is such a time. I believe we will rise to the occasion, and we will create a bright, clean, prosperous, just and fair future. I believe it with all my heart. CA : Al Gore, thank you for your life of work, for all you ’ ve done to elevate this issue and for spending this time with us now. Thank you. AG : Back at you. Thank you.

Text Sample 882: POS Dim 6 – 2025 – Score 2.00 – 2025/t003002.txt

HW : Hi everyone, I am Helen Walters. I am head of Media and Curation here at TED. Welcome to another episode of TED Explains the World with the one and only, Ian Bremmer. It is Monday, February 24, a little more than a month since President Trump was inaugurated once more, and safe to say, a lot has been going on. So we figured we ’ d check in with Ian to determine what we should really be paying attention to amid the extreme noise. Ian, hi. Ian Bremmer : Helen, great to be back with you. HW : So we asked the TED community to share their questions for you, and we wanted them to share what they ’ re most curious to know. And we really got some amazing questions that I plan to pepper this conversation with. So let ’ s start with one right now. Two months into 2025, where does the US stand? IB : Very powerfully, in the sense that the US economy, of course, is performing considerably better than any of the other G7 economies coming still out of the pandemic. Technologically, only close competitor is China, ahead of the US in some areas, behind the US and other critical areas. But compared to every other country in the world, the US is head and shoulders and neck or waist above them. Militarily, of course, the US is the only country with global ability to project power. No one else is close. And the US dollar is still the global reserve currency, no one is approximate challenger. I say all of those things because those are the things that haven ’ t really changed over the course of the last few months, but I suspect that isn ’ t what the questioner was asking. What they were really asking is what ’ s happening politically. And politically, the United States is unwinding its own global order. It is no longer particularly interested in promoting collective security or NATO. It ’ s no longer really interested in promoting involvement and leadership of multilateral institutions, of consistent rule of law and free trade that ’ s well regulated, certainly not very interested in promoting democracy around the world. I mean, this is an environment where other countries around the world have to figure out how to adapt to the United States, and that the US has become the principal driver of geopolitical risk and uncertainty in the world today, unlike any other time in my lifetime and yours, that ’ s perhaps the biggest change. HW : That is quite a statement. Alright, you are a geopolitical expert.

Let ’ s talk about Europe. So Defense Secretary Pete Hegseth stated that America ’ s foreign policy focus no longer lies in Europe. Vice President JD Vance caused some raised eyebrows, dropped jaws and, I suspect, some choice expletives after his recent speech at the Munich Security Conference, in which he accused European leaders of suppressing free speech and warned of the threat from within. So you were in Munich. Was it as dramatic as the stories we read had it? And what happens next? IB : It was. I was in the room. I was maybe 30 feet away from him when he gave that speech. Standing right in the front, right next to me was the president of Czechia, the president of Finland, the prime minister of Sweden, watching all of them and their reactions. What he said, let ’ s keep in mind, this is the Munich Security Conference. It ’ s been going on now for something like 61 years. And he was the head of the US delegation. And every year the head of the US delegation gives a big speech on the state of the transatlantic alliance and on global security. And he didn ’ t do that. I mean, the people in the audience were expecting a challenging speech. They were expecting that the Americans would be less committed to the alignment with the Europeans on Ukraine. The US had just had that direct Trump phone call with Vladimir Putin, 90 minutes long. Hadn ’ t coordinated that with the Europeans, never mind the Ukrainians, in advance. So, I mean, they were definitely prepared for a very challenging plenary. But Vance did none of that. Vance said,”I ’ m not going to talk about Ukraine or Russia or China, because the biggest problem is actually what ’ s happening inside Europe. The biggest problem, essentially, are you guys sitting in front of me, that I ’ m speaking to, because you ’ re suppressing free speech. You ’ re suppressing the far right. You ’ ve been infected by the woke mind virus, and you aren ’ t real democracies as a consequence.”And specifically he said, and this is something that I think is underappreciated in the United States, he attacked the German firewall. And said that – And let me explain what the German firewall is. That is a principle by the leaders of all of the mainstream German parties and their supporters that they will not, under any circumstances, work with, enter into coalition with the Alternative for Deutschland party, the AfD. Because the AfD, under surveillance from German intelligence agencies, is considered to be a neo-Nazi party. And the United States, of course, after World War II, led de-nazification of Germany. The day before, Vance had actually gone to Dachau and visited a concentration camp, and then came to speak in Germany about the firewall needing to be ended. And at that point someone yelled out from the crowd,”This is unacceptable!”And it was right in the front. And people in the room, about 1, 500 people in the room, standing room only, couldn ’ t see who it was. They ’ d just see the back of his head. I saw who it was. It was the German Defense Minister, Pistorius. And in 15 years of me going to the Munich Security Conference, I have never seen anything remotely like that. And the reason I mention all of this, and of course, on the back of that, let me be clear, Vance refused to meet with the German chancellor because he ’ s basically, well, he ’ s not relevant. He ’ s only going to be there for a couple more months until a new government, so why should I bother? But does meet with the leader of this AfD, goes and meets with her directly, does a bilateral that evening. So that is a very important backdrop for this last weekend ’ s German elections, where the victor, Friedrich Mertz, who is going to be the next chancellor, actually referred specifically to America ’ s intervention in German democracy and support of the AfD being every bit as bad as what the Kremlin is doing inside Germany, and also said that the Europeans need to develop a defense policy which is independent of the United States, in other words, essentially saying that it will be the end of NATO. Again, staggering comments, unheard of, impossible to imagine even two weeks ago. And that ’ s why it ’ s very critical that you have the context of what happened between Vance, Elon Musk over the past couple of months, Trump, with the Germans, with the Europeans. So you can understand why the incoming German chancellor would make a statement like that. HW : What should we make of all of the conversation about the rise of Nazism, the return of Nazism? Obviously, the AfD just won 20 percent in the German election. We ’ ve also seen people allegedly giving Nazi salutes at **various** US conventions and speeches. Do you think this is overblown? Is this a fear that people have rationally? And what should we make of that? IB : In Germany, the Alternative for Deutschland, are winning all of former East Germany. This is a group that increasingly understands that they ’ re never going to really catch up to the rest of Germany. Remember, Germany hasn ’ t really grown in five years now. They ’ ve been in recession for the last two. And the average citizen, the average voter, living in former East Germany no longer are just angry about not catching up. They ’ re basically saying,”I ’ m done with this system.”So that ’ s why you ’ re getting this very strident, revanchist nationalism that is, you know, it ’ s not just taking a hard line on illegal immigrants. The AfD even supports removing citizens of Germany that they claim have not adequately integrated into German culture and nationality. And so, I mean, this is some very, very strong stuff, stuff that really does feel like what they were doing back in Nazi Germany. But in former East Germany, they win. They get the largest number of votes, where, in much of the wealthier part of West Germany, including, you know, where I was, in Munich, the AfD can ’ t break out of single digits. So it ’ s a very, very divided country. And also the AfD is doing very, very well among young men. There ’ s a clear gender divide here as well, just as there is in the United States. In the US, I mean, I, of course, saw Elon Musk and that, you know, sort of grabbing his heart, saying,”My heart goes out to you”and then doing what appeared to be mimicking a Nazi salute. And then Steve Bannon doing the same without the initial heartfelt comment. It clearly was trolling. Clearly was trying to get a reaction from folks. It ’ s very performative. And it ’ s meant to also, you know, attack and attach, make the left lose their minds on something that isn ’ t very critical to what the Trump administration is trying to do compared to the revolutionary changes inside the US government that they are very much prioritizing right now. So I ’ m very concerned about the rise of neo-Nazism in Germany. I am very much not concerned about that in the US. I ’ m concerned about other things I ’ m thinking is being used as gaslighting for those that can use distractions or can be distracted by them. And I would also say that this election in Germany wasn ’ t surprising. It was exactly as the polls have expected for several months now. But the key elections in Germany and the key elections in Europe are the next cycle. I ’ ve spoken with a lot of people around the Trump administration that believe that the Europeans are one electoral cycle behind the United States. So in other words, Trumpism is coming, just not quite yet. And so in the UK, you ’ ve got Labour for a full term. But the Reform Party is increasingly the most popular. And just with a little nudge, maybe a little external money, and Elon said he ’ s already thinking about giving them 100 million dollars, which is a massive amount in UK politics, not so much in the US, that the Conservatives would fragment, a rump group would join with Reform, and they could win the next elections. In France, you ’ ve had all of these governments continue to collapse. Macron, very unpopular. Marine Le Pen and the National Rally party could easily win upcoming elections in 2027. In 2029, in Germany, if the Germans are incapable of turning their economy around, incapable of unwinding their debt break and spending some of the capital that ’ s just sitting there and as their debt to GDP goes down, but their economy contracts at the same time, then AfD could easily win in 2029, and then the firewall is no more. And then, of course, in the European Union elections overall, in five years ’ time, now four and a half, you could easily see the Patriots front, which is the equivalent to the far right grouping that these parties are a part of, they could all come together and be the dominant party. And then the EU as we know it is really a thing of the past. So these are existential changes that are happening not just for NATO right now, but also for the EU and quite plausibly, for the future of democracy as we know it. HW : Alright, let ’ s turn to Ukraine. So President Trump accused President Zelenskyy of starting the war with Russia and called him”a dictator without elections.”Last week, senior American and Russian officials met in Riyadh to discuss a potential cease-fire with no Ukrainians present. Now Zelenskyy has offered to step down in return for Ukrainian admission to NATO, although apparently he doesn ’ t really mean this. So what happens to Ukraine now? What should we be paying attention to? IB : Well, I mean, I think he would mean it if NATO membership happened. I ’ d love to see Trump call his bluff on that. But of course it ’ s not going to. And he wasn ’ t saying that six months or a year ago. He ’ s saying it now that NATO is truly being pulled off the table. I think it ’ s the right thing for him to do. It is, again, performative and helps to remind those around the world that Ukraine is fighting for self-determination. They ’ re fighting for the ability to join their own alliance, as any country in the world should be able to do. But that is not Trump ’ s belief. Trump believes that what you get to do is determined by how powerful you are, not by the fact that you happen to run a country. And indeed, the territorial integrity is something that is afforded to powerful countries, but not so much for weak countries. And that ’ s the way he feels about Panama, and that ’ s the way he feels about Denmark and Greenland. And that ’ s certainly the way he feels about Ukraine. So right now, as you and I are speaking, the United States is putting forward a new UN resolution at the General Assembly that says that the war has to end as fast as possible but does not recognize Ukraine ’ s territorial integrity, which has been a core precept of the international order that the United States has supported since creating the United Nations and since the end of World War II in 1945. The Americans are now throwing that out. And the Russians, of course, are fully supportive of that. America ’ s allies in Europe are not. But the US has gotten the Saudis to agree, and they ’ re getting a unified Arab block. The Americans have privately worked with a lot of poorer countries in Africa, in the Asia Pacific and others, smaller countries, and saying,”You ’ re not going to get any aid from the US unless you vote in favor of this new resolution.”I fully expect the resolution is going to pass. But of course, what that means is that the Americans are preparing to cut a deal on Ukraine over the heads of the Ukrainians. In other words, the US and Russia together will figure out what a ceasefire should and should not entail as part of a broader US-Russia rapprochement. This is obviously a disaster for the Ukrainians and the Ukrainians who initially refuse to accept this so-called deal, on Ukrainian natural resources that would grant the Americans $500 billion in access to such resources in return for”paying off”aid that the Americans had granted to the Ukrainians without conditions or strings, but apparently no longer. And so, you know, what does this all mean? Well it means it ’ s yet another case of why people shouldn ’ t trust the United States from one administration to the next, because foreign policy will change completely. And what you thought was an American commitment won ’ t stand. It shows that there is a fundamental rift between the Americans and the Europeans and indeed, Emmanuel Macron in the United States right now, as you and I speak, hoping that he can do something that will keep Trump from, as Macron believes, essentially surrendering to, conceding to, the Russian position and maintaining some level of coordination with the Europeans. But he doesn ’ t have a lot to offer. And the Ukrainians, you know, now in a position of desperation where maybe they will end up signing over a lot of their natural resources to the Americans. But what, if anything, will they get in return for that? And how empowered will the Russians be in any deal that is cut? And will an independent Ukraine even be able to survive, and what will the terms that will be required of them? Of course, Putin is saying things like, no European **troops** of any sort, whether in a NATO formulation or not, would be allowed as peacekeepers in Ukraine. Well, then, how would you guarantee, what kind of security commitments would you give to the Ukrainians? These are all open questions, but apparently questions that President Trump is prepared to largely resolve on Russia ' s terms. And again, this is such a dramatic change from where the United States and where the Western order was just a month or two ago. HW : So let ' s take some quick-fire questions from our community related to this topic. And I think the first one is particularly pertinent to what you just said, so it ' s simple. What does Putin have over Trump? IB : I don ' t think that Putin"has"anything over Trump. If he did, then why wouldn ' t Trump have granted Russia more in his first term? In his first term he gave the Ukrainians those javelin anti-tank missiles that Obama refused to give. And, you know, he thought they were too risky. He increased sanctions against Russia. Now that was his administration with a lot of hawkish in orientation advisors around him that he doesn ' t have this time around. They ' re all directly loyal to him. But, I mean, if it was a priority for him, he could have stopped it. And if the Russians had something over him, then why wouldn ' t they have used it in that case? It feels like a conspiracy theory. I don ' t buy it. I think very differently. We can explain what ' s happening because number one, Trump wants to end wars. It ' s very popular with his base. He ' s said this on Gaza. He ' s said this on Iran, where Israel wants him to support attacks on Iran ' s nuclear capabilities, and Trump has said no. And he ' s showing this on Ukraine. He doesn ' t want to spend money on the Ukrainians going forward after spending over 100 billion dollars under the last three years from the Biden administration. He doesn ' t want to spend that money going forward. And he also doesn ' t value a strong Europe. He actually thinks that a weak Europe is in America ' s interests, where you have more Brexits. He used to always talk to the French about that during his first term,"Why won ' t you do Brexit?"He wants all of these MAGA-type populist parties, including the AfD, to win in Europe because that legitimizes his own popularity. Just like he loves Milei in Argentina or Bukele in El Salvador. And so I think if you put those things together, you actually get to why Trump is doing what he ' s doing with the Russians without needing to create a story about Trump somehow being threatened by some secret, shadowy information that the Russians have on Trump that they ' ve let him know about but nobody else knows. I just don ' t buy that. HW : Great. OK, another community question. If the US hands Ukraine to Russia, will Russia keep going? Will they attempt to take over Europe? IB : It ' s interesting that Trump just met with the Polish president, President Duda. It was supposed to be an hour meeting, it was only 10 minutes. So he kind of embarrassed him at home in Poland. But he did say that the US is still committed to maintaining a **troop** presence on the ground in Poland. And so it ' s very hard to imagine the Russians rolling through Ukraine and then into Poland, even though there ' s been lots of asymmetric warfare, for example, and even there have been, you know, Russian missiles launched into Lviv, Ukrainian air defense, missile defense, and with Polish villagers getting killed because of the fighting. So, I mean, there ' s been spillover. But America is still going to be in Poland. Why is that? They get along pretty well, and the Poles are heading towards five percent of GDP defense spend this year, which has been the high water mark of American demands of defense spend. So he ' s, you know, been consistent on that over the past months. Baltic states. I mean, they ’ re all spending a lot more money on their defense. And so, I mean, in principle, you could imagine the United States maintaining these rotational deployments in the Baltics, which would prevent the Russians from invading. But might Trump say, as part of a deal,”Why do we have all those **troops** there?”You mentioned Pete Hegseth saying the Americans need to get **troops** out of Europe and get them to Asia, which is where their principal competitive, you know, sort of, strategy is going to be oriented. And the US hasn ’ t been pressing the Japanese or the Indians, the principal partners, allies in Asia vis-à-vis China, the way they ’ ve been pressing the French, the Brits, the Germans in Europe. So I think it is certainly plausible that the Russians will do more, especially with those countries that refuse to align with a Trump rapprochement towards Russia. The countries I would be most worried about are Moldova, are Georgia. I ’ d be most worried about the countries that are in the so-called”near abroad”that aren ’ t a part of NATO, and aren ’ t going to become a part of NATO, and therefore are much more vulnerable. But certainly in terms of Russia ’ s willingness to engage in espionage, to fund actors on the ground for arson attacks, assassinations, critical infrastructure attacks on fiber networks, on pipelines, I think all of those things are likely to increase against European states across the board, on the back of this US-Russia rapprochement. HW : OK, final community question for this segment. What happens if the US no longer supports NATO? IB : It ’ s possible that the United States is moving towards a similar posture in Europe that they presently have in Asia, which is strong individual bilateral deals with a number of countries : South Korea, Japan, Australia, but not a collective security agreement, where those countries together have more of a call on the United States and there ’ s a lot more free riding. So I could imagine that NATO falls apart and becomes that. The danger is that even though the Europeans now understand the nature of the threat, that it is very plausible and maybe even baseline, that the Americans are going to leave Europe collectively on its own. That that seriousness does not equate to the ability to increase spending adequately in the near term. The Germans did manage to pull together an electoral outcome that will allow for a so-called grand coalition, just barely. So you ’ ll have a two-party government in all likelihood instead of a three. But you also have a blocking capacity on the part of the far right and the far left that will prevent the Germans from really blowing out their spending, including their defense spending, unless they can pull something off before that new government is formed. Which is possible, but it ’ s unlikely to be very big. The Brits are now talking about maybe moving the 2. 5 percent of GDP defense spend over years with a very challenging fiscal environment. The Spaniards, not even close, the Italians, not even close. So what does a European military capability really look like? And without the Americans, the answer is it ’ s not there. It ’ s not there. So I think that if NATO falls apart, the reality is that most of Europe will be incredibly vulnerable to external attack, especially Russian attack, And there won ’ t be a way for them to defend themselves, and some of them will break and therefore want to work more directly and individually with the United States. And that could be the end, not only of NATO, but it could be the end of the European Union. I think this is, the stakes are incredibly high, this is an existential challenge for European governments that needed to take this seriously 30 years ago, 20 years ago, certainly in 2014, when the Russians invaded Ukraine, certainly, certainly in 2016 when Trump was elected, and certainly, certainly, certainly in 2022 when the Russians then invaded all of Ukraine. And at every point the Europeans were basically saying,”We ’ re still fine with the Americans basically doing this.”And now they are in very serious trouble. HW : No time like the present, I suppose. Alright, let ’ s move on. So I mentioned the discussions in Saudi and obviously also on the agenda there with the discussions about Gaza and Trump ' s proposal to build a Gaza Riviera. What should we make of that? Or as one of our community members asked, what is the actual solution for Gaza? And surely it isn ' t what the US is proposing. IB : Well, look, here ' s what ' s interesting. You know, Trump says a lot of things, and when they don ' t work [out], he backs out fairly quickly. And you know, I thought – just stick with Ukraine for one second on this. It was interesting to me that Trump has said that he doesn ' t want to talk to Zelenskyy because he has no cards, he has no leverage. And so why should he let him at the table? And so Trump ' s going to cut the deal. Very interesting that if that is true, then why is it that the Secretary of Treasury brings this deal and says,"You ' ve got to sign this right now, Zelenskyy"And Zelenskyy refuses. And then a few days later, the Americans come back with a new deal with altered terms that are not quite as predatory vis-à-vis Ukraine. Why would the Americans change their tune for someone that has no leverage? Because, I don ' t think it ' s because Trump is a nice guy. He ' s not going soft at 78. I think it ' s because he overstated how little leverage Ukraine has. Ukraine is very popular among the GOP in the House and Senate, far more than Putin. Zelenskyy is far more popular in the United States among the voting population than Putin. And of course, he ' s also much more popular among the Europeans and even globally than Putin. And so it turns out that maybe there is a little bit of leverage that Zelenskyy has, and maybe Trump does have to give a little bit more. So this is relevant in the context of Gaza, because Trump was very annoyed that, you know, despite his ability to get a cease fire between Hamas and Israel over the goal line, that his friends in the Middle East were not coming up with a plan for Gaza. Where they were supposed to provide security and provide investment and lead reconstruction and deal with the Palestinian populations in the interim. And that wasn ' t happening. And so Trump then meeting with Prime Minister Netanyahu from Israel in Washington, then after that, summoning the Jordanian king, who was the ally that is most reliant on the United States and so, therefore, most needing to say yes to whatever Trump orders of him. Basically says, as you mentioned, Helen, that Gaza is going to be a Riviera, that the US is going to turn this into an incredible place. They ' re going to build wonderful homes for the Palestinians someplace else. And the Palestinians will all volunteer to leave Gaza and go to those homes, and Gaza will be depopulated and new people will come in and live there. That was the plan. And when he was asked, standing there with King Abdullah from Jordan, under whose authority? Trump ' s response was :"Under my authority."And that went over like a lead balloon among America ' s allies in the Middle East. They all said,"We ' re not up for this. We ' re not resettling Palestinian populations. They won ' t actually leave voluntarily. This will would actually be a huge problem for Israel ' s own national security long-term. And we ' re going to come up with another plan. And our plan will keep the Palestinians on the ground in Gaza."At which point Trump pivots to work with the new plan. And his advisers say that Trump was only trying to start the conversation. And what he said was his plan is not actually what he ' s going to do. So, what ' s sustainable? What would be sustainable would be a lot of Gulf money going in and maybe some European money too, though they ' re going to be really pressed, given everything you and I just talked about, to try to reconstruct a completely devastated Gaza that eventually some two million-plus Palestinians will be able to live normal lives in, and the governance will be provided by some technocratic group of a Palestinian Authority that will be working with, selected by, those that are involved in the reconstruction and the security. Namely the Egyptians, the Jordanians, the Saudis and the Emiratis. That is the best possible deal that they ' re going to get. But that ’ s happening as Israel has just evacuated forcibly another 40, 000 Palestinians from refugee camps in the West Bank, sending tanks in for the first time in decades and probably precipitating more Israeli settlers taking more land on the ground in the West Bank. And so, as we are possibly taking a small step towards a sustainable solution in Gaza, we are taking a slightly larger step away from a sustainable solution for the Palestinians in the West Bank, twas ever thus over the past decades in this incredibly horrible problem and conflict. HW : And why is Israel doing that? I mean, are they feeling emboldened by the US, or why the incursions in the West Bank now? IB : Well, I think they ’ re feeling emboldened by their own successes. They have shown that they are the dominant military power in the Middle East, and they have the ability to determine the level of escalation unilaterally, and their adversaries and enemies can ’ t really do any damage to them. They proved that after October 7, in their response to Hamas. They proved that in decapitating and taking out the military capabilities of Hezbollah. And they ’ ve proved that also with overturning – they didn ’ t do it, but the fact that the Assad regime in Syria is gone, which means that the Iranians no longer have a land bridge to get additional weapons to what had been the strongest adversary of Israel militarily, Hezbollah. So all of that has shown that Israel can decide outcomes. They ’ re the ones that have all the power here. And also that depopulation of Gaza is very popular among Israelis. There was a poll recently in the Jerusalem Post, which is pretty mainstream in Israel. 80 percent of Israeli respondents said that they wanted to depopulate Gaza of all Palestinians. Taking more land is very popular, especially in the West Bank, especially among Netanyahu ’ s present right-wing coalition, that he would like to keep together, to continue to govern. And this is a sop to them as he is looking to potentially extend the ceasefire in Gaza and move from phase one to phase two, which is facing some delays and open questions right now. So, yes, certainly, the United States has been underpinning that military capability of Israel. And I think it is instructive to remember that not only does the US provide more military aid in peacetime to any country in the world, to Israel, but that unlike in Ukraine, where the Trump administration is saying,”No, I ’ m not happy with the grants, you ’ ve got to pay that back,”The billions and billions that the United States sends to Israel, nobody is suggesting that that should be alone or that the Americans should get technology rights or mineral rights or anything else from Israel, despite the fact that Trump ’ s policy is America First. Israel is a very clear exception to America First in Trump ’ s visioning of it. HW : Alright, so we talked about the fact that the foreign policy focus of America is shifting to Asia. So what are you hearing about how China is feeling in all of this? And what should we be paying attention to on that front? IB : China has had a couple of good weeks economically and specifically on the back of that huge announcement of DeepSeek, which has, you know, far less money behind it than the comparable American chatbots but is performing at an extremely high level. And, you know, given the fact that there are all of these export controls on semiconductors and other parts of advanced technology, that this is giving people more of a belief that the Chinese really are capable of driving innovation even in that space. And they ’ re, of course, dominating the post-carbon energy space. We see that with electric vehicles and batteries. But we ’ re also seeing that with massive investment now in green hydrogen, for example, we ’ re seeing it in advanced nuclear capabilities, all of these things. And so there is more investment in that space that the Chinese are not only driving as a state, but that they ’ re also increasingly able to raise and move in their own private sector. So the story that you and I have been discussing for the last couple of years is the Chinese economy is radically underperforming. That is still true, but there is an emerging counter-narrative here that I would be remiss not to mention. Now more broadly, what the Chinese here are seeing is that Trump ’ s direct policies are going to hurt them economically. His tariffs that he ’ s already announced on China, the 10 percent, on a whole bunch of Chinese goods for export, the reciprocal tariffs that are global, that will clearly hurt China and that they ’ ll have a hard time negotiating out of, and also the willingness of the United States to expand their export controls, their sanctions on China, especially in areas that are considered relevant, even loosely relevant to American national security. All of that is going to constrain Chinese growth. All of that is going to negatively impact the Chinese economy. That ’ s the downside. And the Americans are doing that not only in bilateral relations with China but also pressuring other countries to get Chinese tech out of their supply chain. And you see that with Americans pushing other countries that produce semiconductors to take the Chinese out. They ’ re pushing American allies and trade partners to get China out of the export chain. So Mexico being pushed very hard by Trump to stop allowing China to pass goods through Mexico into the United States. India, same conversation. Vietnam, same conversation. A lot of that going on. So baseline, the US-China relationship is getting worse. But the Chinese see huge advantages in America ’ s reversion to unilateralism that we haven ’ t really seen since the original America First movement in the run up to World War II. Charles Lindbergh saying,”Don ’ t get into the war, don ’ t fight the Nazis. The US is far away. This isn ’ t our our problem.”And now you have the Americans not only doing that with Russia and Ukraine with the new America First, but you also see that happening with the Americans pulling out of the Paris Climate Accord, again, pulling out of the World Health Organization. You see it with the Americans shutting down USAID. And America has historically been responsible for about 40 percent of global humanitarian support and aid. And absolutely, some of that is corrupt. Absolutely, some of that is on woke programs that the vast majority of American taxpayers would never support. But the majority of that money is actually spent on programs that are really important in advancing American soft power and influence over countries in the Global South, all over the world. The Chinese know that. That ’ s why they ’ ve started humanitarian programs. It ’ s not out of some great love for, you know, providing foreign aid for these countries. It ’ s more because they see it creates influence. Now the Americans are leaving a vacuum that the Chinese can absolutely take advantage of. And we ’ ll see this across, you know, sort of, microstates in the Pacific. We ’ ll see this across sub-Saharan Africa. We ’ ll see this across South America. The Chinese see huge opportunities from the United States creating a leadership vacuum. And the place they ’ re most capable of doing that is if the US stops paying dues in the United Nations, where China is number two, and they ’ ll suddenly have the most influence over all the key positions, which will give them a role in global governance that they ’ ve really been constrained from having over the past decades. HW : What do you think are the chances that the US stops paying its dues to the UN? IB : You know, if it were up to Congress and only Congress and Trump doesn ’ t lean on them, I ’ d say fairly low. I ’ d say that they ’ d probably, you know, cut back on some programs. But in terms of baseline dues, they ’ d keep paying it. But Trump personally, I think increasingly sees the UN as hostile to the United States. That ’ s particularly true in terms of Israel policy, which Trump is leaning in on. And, you know – let me put it this way. Tulsi Gabbard did not have the votes to get confirmed. There were Republican senators that were going to vote against her. And Elon called those individual senators and threatened them. And this was, you know, fully aligned with what Trump wanted Elon to do. And those votes went away. And the only person that ended up voting against Tulsi was

McConnell. And as a consequence, it went through. So look, I think that we should not underestimate the level of power and control that Trump and Elon have over the Republican Party this time around, compared to 2017, where it was really the Republican Party that was much stronger than Trump, both in his administration creating a lot of guardrails, but also in Congress. This time around, Trump has all the chips and he ’ s using them. So if he decides he wants to stop paying dues, I think that ’ s what ’ s going to happen. This is a much more revolutionary presidency, domestically, where last time around it was much more transactional. HW : Alright. Let ’ s talk a little bit more about what ’ s actually happening inside the US. You bring up Elon, who obviously with DOGE has been sending out emails and asking for information from people and kind of trying to do a lot very quickly. Some of these high-profile moves are – I think what ’ s interesting is that no one would really argue that there isn ’ t inefficiency in government, that that ’ s an understood reality. But the way that some of these moves are being made are maybe going to cause irreparable damage. And that ’ s to people from red states, that ’ s to scientists, that ’ s to veterans, that ’ s to people who voted for Trump and that ’ s to people around the world. You talk about soft power and the United States, but what about actually what ’ s happening inside the United States? And why do you think that the administration is willing to go so quickly, to go so fast and to cause such damage? IB : Well, and you saw Trump this weekend saying that he wants Elon to move faster, to be more aggressive. And I don ’ t think that was just a troll. I think that ’ s true. Trump is 78 years old, and with his friends he talks about the fact that he doesn ’ t have much time. That in two years ’ time, the Democrats could take the House in four years ’ time, you know, that ’ s it. He ’ s not talking privately of”I ’ m going to be president for life.”He also knows he was almost killed. He was shot in the head. And do I think that changes somebody? Absolutely. I think that he believes that he was saved by God, and that his level of confidence that what he is doing is fundamentally right and necessary now is so much higher than the insecurity that I frequently saw in him in his first presidency. So I think his willingness to push, push, push, and his view that Elon is a great activator and executor on that intention, and someone that he had nowhere close to someone with that kind of capability and energy and execution ability in his first term. And now he does. So first of all, I think that relationship between Trump and Elon isn ’ t going anywhere. I think it ’ s actually very stable. People that say it is are people that want it to go away. But hope is not a strategy. And I also think that the intention of revolutionary politics domestically is to shoot first and ask questions later. It ’ s to break things. It ’ s a view that the bureaucracy has been weaponized against Trump first and foremost, and also against the will of the American people. And therefore it must be broken. And you ’ re going to break eggs when you want to make that omelet. Now your point is that there are a lot of Republicans that work in government. There are a lot of Republicans and Trump voters that are losing their jobs and that are not being treated with a level of care and compassion as a result of what Trump and Elon are doing. And I think there will be a backlash. But I ’ m not so sure that a one-term, 78-year-old-Trump presidency cares all that much about that. And, you know, if that means that his popularity slips to like, the high 30s, frankly, you know, in a very, very polarized country, high 30s isn ’ t that bad. It still means 80, 90 percent of the people that voted for him still support him, and I think he ’ s probably more comfortable with that this time around. So I think a lot more has to happen before we can start talking about whether there ’ s really going to be significant pushback against what Trump is trying to accomplish at home. HW : Do you expect to see any of Congress standing up to Trump? We saw the governor of Maine recently kind of take him on. Do you expect to see more of that, or do you feel like for the next two years at least, people will just go where Trump takes them? IB : Well, sure, but, you know, in the case of Maine, that ' s a Democrat. So I don ' t know how much that means. I don ' t expect to see a lot of Republicans standing up against him. And of course, since the Republicans control the House and the Senate, that ' s the only thing that really matters. I mean, you know, you saw Kash Patel got through, Pete Hegseth got through. Now look, I actually think that a lot of the members of cabinet are very capable. I mean, they ' ve been picked for their loyalty and they will be loyal to Trump, but they ' re very capable. I think JD Vance is very capable. Mike Waltz, I know quite well. Marco Rubio, over the years. These are people that are very well respected, have been by their colleagues and could have served under any Republican administration. But there are some people that are completely incapable for the roles that they have been selected, completely incapable. They would not be selected in a role in any cabinet, in any democracy. And yet here they are, serving in critical roles in the most powerful country in the world. And yes, I ' m talking about the Secretary of Defense. I ' m talking about the Secretary of Health and Human Services. I ' m talking about the Director of National Intelligence. I ' m talking about the Director of FBI. These are important roles. And they were all confirmed. And if you ' re a Republican senator – and senator – I ' m not talking about the House here where, you know, it ' s a lot more diffuse and there are a lot more wackos and it ' s easier to get in. But Senate has always been like, responsible and more oriented towards bipartisanship and the rest, and they are utterly petrified of what it means if they publicly get crosswise with President Trump and number two, Elon. And they ' re not willing to do it. So I think that there ' s very little belief that you are going to see Congress step up. I think that you will see justices step up because those justices are independent. The problem is that many of those justices are progressive and have a known progressive lean. And so when cases come up and justices that have that political lean oppose something Trump wants, his willingness, his administration ' s willingness to attack them and refuse to execute on that judicial decision, unconstitutionally, is real. Now the case will of course go then up to the Supreme Court eventually. And I don ' t feel the same way about Trump refusing to listen to adhere to the rulings of the Supreme Court. But if there ' s 100 rulings like that and you overwhelm the judicial process, you quickly see how you might erode a core check on executive power in the United States. And Trump and Elon clearly intend to every day test those checks and balances and break them if they can. I mean, that is the intent, that is the intent. HW : So you mentioned democracy. When we last spoke, you said very clearly that the US is not Hungary, meaning that democracy is not threatened and that the US is not in danger of turning into an autocracy. Do you stand by that? IB : Yes, I do. I mean, in the sense that I think in two years we ' re going to have midterm elections, and they will be largely free and fair. And in four years we ' ll have presidential elections. And US elections are held at the federal level, right? They ' re held state by state. They make the rules. It ' s very easy to make people believe that the election has been stolen. It ' s extremely hard to actually rig an American election. And I don ' t believe that that is very likely at all. It ' s very unlikely. The American military, despite the firings that we ' ve seen just last Friday, is still an independent and professional military that I believe will carry out its orders and its duties professionally. I see the judiciary in the United States as independent and a clear check on the executive power in the United States. Where I see a problem, is that the US is becoming more kleptocratic every day. And the US was already much more of a kleptocracy over the past 10 years under Democrats and Republicans than any other advanced industrial democracy in the world. Clearly, money buys power in America in a way that it doesn ’ t in any other major democracy, wealthy democracy. That is getting dramatically worse. I saw specifically that Elon Musk, who is a walking conflict of interest at the highest level, met with Narendra Modi, the Prime Minister of India, in Blair House, so part of the official White House complex, right after Trump met with him. And Trump was asked later in the day, was Modi meeting with Elon in Elon ’ s private-sector capacity to advance his business interests or his official capacity to advance the policies of the United States? And Trump answered honestly. He said,”I don ’ t know.”And how could he know, right? Because, I mean, those two things are completely intertwined. But that is not remotely acceptable for rule of law in a functional democracy, and yet nothing is being done about it. In fact, it ’ s getting more and more entrenched every day. So the single place where the United States was least functional as an advanced democracy is now getting far, far worse. And I don ’ t see any checks and balances on that. I think that ’ s a very, very serious problem. HW : Alright, Ian, thank you, as always for all of your insights. Let ’ s close out with a couple more questions from our community. And this one indeed relates to the kleptocratic conversation that you were just raising. So why are the billionaires enabling fascism? What do they get out of it? IB : Fascism is a very politically loaded argument. That ’ s a political system where the cruelty against a subgroup or a perceived subgroup in the society is the intention, the expressed intention of the policy. And I certainly wouldn ’ t define the United States as a fascist system today. But I do believe that billionaires in the United States, at least a significant subset of them, are really under-interested in the well-being of their fellow countrymen and women. And this is a country that really makes heroic the individual. And it undermines the community. We ’ ve seen a significant erosion of civic engagement in the United States and civic associations. The church is not what it was in the US. Fewer people go, fewer people trust the church. Public education is not what it was. And wealthy people increasingly opt out. The family is not what it was. It ’ s increasingly atomized and people spend much more, much more of their time being, you know, isolated and atomized and intermediated by algorithms. And you and I have spoken about that problem in the past. We are increasingly a society of individuals as opposed to a nation together. I will tell you that that is a real problem when you have large numbers of billionaires that believe that they built it themselves, that they ’ re not responsible to a collective whole for any of their success and therefore they ’ re not accountable for their fellow citizens. And that ’ s what I think we have. I think we have a lot of winners in the United States and not a lot of leaders. And when you have winners, you have losers. When you have winners, you don ’ t have a collectivity. I will say that in this anti-DEI thing, I have a lot of sympathy for the people that don ’ t like DEI. I thought it was rammed down the throats of a lot of people And I ’ ve said this before, it was well beyond what the average American was willing to tolerate, and also it came with a level of high-handedness that that basically said, if you ’ re not with us in supporting these programs, you ’ re evil, you ’ re stupid, you ’ re uneducated. That ’ s unacceptable, too. It was a completely, you know, sort of oppositional way to try to have what ’ s a very challenging conversation. But I ’ ve never been a champion of diversity for diversity ’ s sake. What ’ s amazing about the history of the United States is despite all of our diversity, we find commonalities with each other. We find connectedness. That ’ s what ’ s amazing, is the connectedness, is that, you know, on this world, we ’ ve got eight billion people. And despite how different we all are, we all actually connect as human beings. That is what we need to focus on, not the diversity, the connectedness. And I think that ’ s what the billionaires today in the United States are losing. They ’ re doing incredibly well themselves. They ’ ve got theirs, they ’ ve got access to power, they ’ re paying good money for it, they ’ re going to get even more. But they ’ re forgetting that for us to succeed as a society and as a planet, we have to be connected to each other. You can ’ t throw out diversity and forget connectedness, and that ’ s what we ’ re forgetting right now. That ’ s why the country feels so much trauma and pain right now. And I think why the United States has given up on a lot of its really aspirational values that made such a difference to the world, that almost lost World War II for many generations. And now we ’ re giving it all away. HW : I mean, I think that ’ s why you find that diversity and inclusion go hand in hand, that that ’ s actually speaking to that. But in some of the moves that are being made to kind of throw out any type of diversity, to scan documents, to find words in order to highlight programs that are wasteful, that we ’ re actually going to lose what many, many studies actually highlight as being the benefits of diversity and the fact that you need diversity in order to be actually successful. IB : Shooting first and asking questions later, you know, moving fast and breaking things, those things make sense in a turbocharged venture capital technology environment. They do not work in government. They don ’ t work in government at all. In government, we have something called checks and balances, and we need them. And moving fast and breaking things undermines those checks and balances. So we ’ re going to do a lot of damage unintentionally. A lot of people are going to get hurt. A lot of folks don ’ t care about that in power right now, but they should because it would be much, much better. I know people want to move fast, but actually to think a little bit, do a little bit of your own research before you decide to kill that program, before you decide to fire that person. We ’ d be in a lot better shape as a government right now. HW : OK, the final question that I have for you actually comes from my 10-year-old son, and it ’ s a bit of a miserable question. We have a very lovely house, I promise. But his question nonetheless is are we heading into World War III? So, Ian, what should I tell him? IB : No, no, I don ’ t think we ’ re heading into World War III but we are absolutely heading into a world of much greater conflict. I think it ’ s much more likely, for example, in the next five, 10 years, that we ’ ll have a nuclear weapon go off. And I thought that was pretty unlikely since the Cuban Missile Crisis. In other words, over the course of my life. I think we ’ re going to see a lot more terrorism at scale, because a lot more people are going to feel angry and disaffected, I think. You know, you saw that assassination of the CEO of UnitedHealthcare just a few dozen blocks from my house. I think you ’ re going to see more things like that. And so, no, not World War III because the fact is that outside of the US and China, all the other countries know that they need to work with everybody. And there are even forces inside US-China that are trying to make sure that you don ’ t throw the baby out with the bathwater. But underneath that World War III risk, there ’ s an awful lot of damage that ’ s going to get done, an awful lot of crisis that I think we ’ re going to have to live through before we start to see what we create on the other side. A lot of defense as well, that we ’ re going to be playing in this environment. HW : Well, Ian, it is always a pleasure to talk to you, and we ’ re so glad that you are scanning the world to understand what is happening and then you come here and explain it to us all. Couldn ’ t be more grateful and thank you for everything. IB : Thank you.

- I don ’ t remember exactly, but... I use the most expensive hair color in the world. It ’ s not that I care about the money, it ’ s that I care about my hair. It ’ s not just the color. I expect great color. What ’ s worth more to me is the way my hair feels. Feels good around my neck. I can ’ t remember it. I can ’ t finish it all. If only we had more time. - Why don ’ t we have more time? - I ’ m dying. I ’ m croaking! - It ’ s tough, coming home. But this is what you do for a parent that you love. But, you know? She ’ s not my mother. Technically. In my own family, there ’ s a lot of dysfunction, a lot of mental illness, a lot of substance abuse. Every generation. My parents divorced when I was about five. My mother moved us out of state, so we had to fly to New York to see my father ’ cause he was already working in advertising, and New York was the only place to be. - Many of the commercials you see on television begin life here. - Advertising is one of the main sources of messaging about who you should be. - Nowadays, most of you women lead two lives, combining homemaking with the role of glamorous hostess. - And in the ’ 60s, the ads were often made from a male point of view. - In the pre-production meeting, everybody who has anything to do with the commercial is there. - It was mostly men. These superstar art directors and writers. Like my father, Gene Case.”Mad Men”was like home **movies**, and he was Don Draper. He was very witty, but I don ’ t think my father realized how powerful his words were. He knew it professionally. But with his kids, he could be incredibly cutting. Flay you just with a phrase. But it ’ s the time with my mother that was the nightmare. She had a horrible childhood, but she sure as hell didn ’ t make any effort to overcome that in her relations with us. You know, it was really horrifying to my mother that I was not popular. But I was also really awkward because she had been undermining my confidence for all my life. She would pick apart your personality in detail. I was lazy, I looked bad, I acted bad, I was awkward. Emotionally, just out for blood. At a certain point in the night, I would know,”OK, the situation is dangerous. I need to get outta here.”I had this fantasy when I was in fourth grade that I vividly remember that some kind of outside agency was gonna come in and determine from all the salt on my pillow that I was crying myself to sleep every night and do something about it. No, it was awful. It was awful. And that was the point where Ilon came into my life. - Ilon, do you need anything to eat? - I don ’ t think so, but look up this wallpaper, Waverly Fabrics, and see if they have a rose pattern. - OK. Oh, what about this one here? - That ’ s not it. - No? - No, first of all, I was an art dir... I was a creative director at an advertising agency. The first thing I know is what I ’ m looking at. Ilon the girl. I don ’ t remember particularly being into advertising, but somehow I found myself in it. And I seemed to be very good at it. First of all, I ’ d always listened to everybody. And I noticed that I saw things differently than other people. - Women could get somewhere in advertising, but they were marginalized. - Women were given a lesser role. All the men were always arguing with you and always taking credit. - And one of the things that was coming through loud and clear is that women are for men. - Glory, glory, hallelujah Glory, glory, hallelujah Glory, glory, hallelujah His truth is marching on - Men were always the ones who everyone was pleasing. - What will your eyes say to him tonight? Wait till the fellas take a look at this plunging backline. - You look at ads from that period, and it ’ s jaw-dropping. - This is one of our nation ’ s most beautiful sights, the kind of girl who keeps her figure. - But that ’ s what feminism was pushing back against. - I was a feminist. I knew women were equal if not superior to men from the time I was a little girl. - And in advertising, she wanted to be a trailblazer that way. At one point, she worked in the same agency with my father, and that ’ s how they met. - He was a good writer, and I was a good writer. I liked the fact that he was good at what he did and cared about it. We got engaged, and then we got married. - I ’ m sitting there in the background. I ’ m grinning. I ’ m so thrilled because I adored her instantly. I thought she was super cool. And she treated me like I mattered. - She was a sweet little girl, and she deserved some caretaking. My mother was kinda terrible, so I knew that she needed support, and I gave her support. And that was what we did. - She was interested in me. She listened to me. Treated me like I was lovable. - She didn ’ t have anyone to recognize her being, to support her, to see who she could be, who she was. - She was very interested in what I would do with my life, and the assumption was that it would be something worthwhile. She just went way, way beyond the call of duty to make me feel like I was worth it. And she did that for a lot of other women, too. - I was working at McCann Erickson. We were given an assignment. L ’ Oréal, they wanted a campaign for Preference, it ’ s a hair color. - She ’ s in this room full of men brainstorming for this ad. - The men were busy flirting with the women, telling us we all looked like models and we didn ’ t look like advertising people, you know? - They ’ re like,”Oh, this woman is gonna be standing by an open window, and the wind will be blowing the curtains.”And she ’ s thinking, you know, this is just making the woman totally an object. - I was feeling angry. I ’ m not interested in writing anything about looking good for men. Fuck ’ em. Fuck you too. - Why fuck me? - Well, you ’ re a man. - Yeah, but I ’ m here trying to help you tell your story. - Yeah, that ’ s good. I like that part. I was pissed. We weren ’ t there to just dance for the men. - It is what she said. She just thought,”Fuck you.”And wrote this. - I just opened my eyes and knew. Because I ’ m worth it. The campaign got approved, but all the men were always telling you that you were doing something wrong or they knew how to do it better. - The agency insisted on a male voiceover. - She uses the most expensive hair color in the world, Preference by L ’ Oréal. - You know, it was just totally different. - Smooth and silky, but with body. It feels good against her neck. Actually, she doesn ’ t mind spending more for L ’ Oréal. Because she ’ s worth it. - It was wrong. This was not for men but for women and for other human beings. - I use the most expensive hair color in the world, Preference by L ’ Oréal. It ’ s not that I care about the money, it ’ s that I care about my hair. It ’ s not just the color, I expect great color. What ’ s worth more to me is the way my hair feels. Smooth and silky, but with body. It feels good against my neck. Actually, I don ’ t mind spending more for L ’ Oréal. Because I ’ m worth it. - I wrote that. - It was everywhere. It was a national campaign. - Yes, it ’ s expensive, but I ’ m worth it. - What they realized after they started running it was that that was only the tip of the iceberg. - It was supporting women, finally. - And I ’ m worth it. And I ’ m worth it. I ’ m worth it. - It ’ s a four-word feminist manifesto, defying this social pressure to think about yourself in relation to men. - You ’ re worth it. I ’ m worth it. I ’ m worth it. - It was a very big success. - At a certain point, L ’ Oréal adopted it as the tagline for their entire business. - Parce que je le vaux bien. - Even today, that ’ s their motto. - Because I ’ m worth it. - ’ Cause you ’ re worth it. - You ’ re worth it. - We ’ re worth it. - And I ’ m worth it. - She wrote the most influential tagline in women ’ s beauty advertising. - I ’ m worth it. - It ’ s magic, that phrase. - Those words just get better with age, don ’ t they? - I ’ m worth it. Because you are and always will be. - She came up with that line because she believed it. She believed it about herself, and she believed that women should believe it. She did that for me. You know, even after they split up, she was still a big part of my life. I ’ ve always kind of felt like I dodged a bullet that I have watched take down other members of my family. She saved me. And today, I am a professor of English at Williams College. I teach Victorian literature, and I also teach women ’ s, gender and sexuality studies. She was my mother. She also taught me how to be a mother. I had been very uncertain about motherhood for myself because my role model for that was so nightmarish. But Ilon really taught me, I can do this. I can be a good mother. She made me believe that I was worth it. And I was not either the first or the last. - I have to go away now. Go to my room. - It ’ s been lovely. - It ’ s been lovely. Oh... I ’ m not interested in advertising. I don ’ t give a shit. It wasn ’ t like it was my whole life. It was just a portion. It ’ s about humans ; it ’ s not about advertising. It ’ s about caring for people because... we ’ re all worth it, or no one is worth it.

We know more about other planets than our own, and today, I want to show you a new type of robot designed to help us better understand our own planet. It belongs to a category known in the oceanographic community as an unmanned surface vehicle, or USV. And it uses no fuel. Instead, it relies on wind power for propulsion. And yet, it can sail around the globe for months at a time. So I want to share with you why we built it, and what it means for you. A few years ago, I was on a sailboat making its way across the Pacific, from San Francisco to Hawaii. I had just spent the past 10 years working nonstop, developing video games for hundreds of millions of users, and I wanted to take a step back and look at the big picture and get some much-needed thinking time. I was the navigator on board, and one evening, after a long session analyzing weather data and plotting our course, I came up on deck and saw this beautiful sunset. And a thought occurred to me : How much do we really know about our oceans? The Pacific was stretching all around me as far as the eye could see, and the waves were rocking our boat forcefully, a sort of constant reminder of its untold power. How much do we really know about our oceans? I decided to find out. What I quickly learned is that we don ’ t know very much. The first reason is just how vast oceans are, covering 70 percent of the planet, and yet we know they drive complex planetary systems like global weather, which affect all of us on a daily basis, sometimes dramatically. And yet, those activities are mostly invisible to us. Ocean data is scarce by any standard. Back on land, I had grown used to accessing lots of sensors — billions of them, actually. But at sea, in situ data is scarce and expensive. Why? Because it relies on a small number of ships and buoys. How small a number was actually a great surprise. Our National Oceanic and Atmospheric Administration, better known as NOAA, only has 16 ships, and there are less than 200 buoys offshore globally. It is easy to understand why : the oceans are an unforgiving place, and to collect in situ data, you need a big ship, capable of carrying a vast amount of fuel and large crews, costing hundreds of millions of dollars each, or, big buoys tethered to the ocean floor with a four-mile-long cable and weighted down by a set of train wheels, which is both dangerous to deploy and expensive to maintain. What about satellites, you might ask? Well, satellites are fantastic, and they have taught us so much about the big picture over the past few decades. However, the problem with satellites is they can only see through one micron of the surface of the ocean. They have relatively poor **spatial** and temporal resolution, and their signal needs to be corrected for cloud cover and land effects and other factors. So what is going on in the oceans? And what are we trying to measure? And how could a robot be of any use? Let ’ s zoom in on a small cube in the ocean. One of the key things we want to understand is the surface, because the surface, if you think about it, is the nexus of all air-sea interaction. It is the **interface** through which all energy and gases must flow. Our sun radiates energy, which is absorbed by oceans as heat and then partially released into the atmosphere. Gases in our atmosphere like CO2 get dissolved into our oceans. Actually, about 30 percent of all global CO2 gets absorbed. Plankton and microorganisms release oxygen

into the atmosphere, so much so that every other breath you take comes from the ocean. Some of that heat generates evaporation, which creates clouds and then eventually leads to precipitation. And pressure gradients create surface wind, which moves the moisture through the atmosphere. Some of the heat radiates down into the deep ocean and gets stored in different layers, the ocean acting as some kind of planetary-scale boiler to store all that energy, which later might be released in short-term events like hurricanes or long-term phenomena like El Nio. These layers can get mixed up by vertical upwelling currents or horizontal currents, which are key in transporting heat from the tropics to the **poles**. And of course, there is marine life, occupying the largest ecosystem in volume on the planet, from microorganisms to fish to marine mammals, like seals, dolphins and whales. But all of these are mostly invisible to us. The challenge in studying those ocean variables at scale is one of energy, the energy that it takes to deploy sensors into the deep ocean. And of course, many solutions have been tried — from wave-actuated devices to surface drifters to sun-powered electrical drives — each with their own compromises. Our team breakthrough came from an unlikely source — the pursuit of the world speed record in a wind-powered land yacht. It took 10 years of research and development to come up with a novel wing concept that only uses three watts of power to control and yet can propel a vehicle all around the globe with seemingly unlimited autonomy. By adapting this wing concept into a marine vehicle, we had the genesis of an ocean drone. Now, these are larger than they appear. They are about 15 feet high, 23 feet long, seven feet deep. Think of them as surface satellites. They ’ re laden with an array of science-grade sensors that measure all key variables, both oceanographic and atmospheric, and a live satellite link transmits this high- resolution data back to shore in real time. Our team has been hard at work over the past few years, conducting missions in some of the toughest ocean conditions on the planet, from the Arctic to the tropical Pacific. We have sailed all the way to the polar ice shelf. We have sailed into Atlantic hurricanes. We have rounded Cape Horn, and we have slalomed between the oil rigs of the Gulf of Mexico. This is one tough robot. Let me share with you recent work that we did around the Pribilof Islands. This is a small group of islands deep in the cold Bering Sea between the US and Russia. Now, the Bering Sea is the home of the walleye pollock, which is a whitefish you might not recognize, but you might likely have tasted if you enjoy fish sticks or surimi. Yes, surimi looks like crabmeat, but it ’ s actually pollock. And the pollock fishery is the largest fishery in the nation, both in terms of value and volume — about 3. 1 billion pounds of fish caught every year. So over the past few years, a fleet of ocean drones has been hard at work in the Bering Sea with the goal to help assess the size of the pollock fish stock. This helps improve the quota system that ’ s used to manage the fishery and help prevent a collapse of the fish stock and protects this fragile ecosystem. Now, the drones survey the fishing ground using acoustics, i. e., a sonar. This sends a sound wave downwards, and then the reflection, the echo from the sound wave from the seabed or schools of fish, gives us an idea of what ’ s happening below the surface. Our ocean drones are actually pretty good at this repetitive task, so they have been gridding the Bering Sea day in, day out. Now, the Pribilof Islands are also the home of a large colony of fur seals. In the 1950s, there were about two million individuals in that colony. Sadly, these days, the population has rapidly declined. There ’ s less than 50 percent of that number left, and the population continues to fall rapidly. So to understand why, our science partner at the National Marine Mammal Laboratory has fitted a GPS tag on some of the mother seals, glued to their furs. And this tag measures location and depth and also has a really cool little camera that ’ s triggered by sudden acceleration. Here is a **movie** taken by an artistically inclined seal, giving us unprecedented insight into an underwater hunt deep in the Arctic, and the shot of this pollock prey just seconds before it gets devoured. Now, doing work in the Arctic is very tough, even for a robot. They had to survive a snowstorm in August and interferences from bystanders — that little spotted seal enjoying a ride. Now, the seal tags have recorded over 200, 000 dives over the season, and upon a closer look, we get to see the individual seal tracks and the repetitive dives. We are on our way to decode what is really happening over that foraging ground, and it ' s quite beautiful. Once you **superimpose** the acoustic data collected by the drones, a picture starts to emerge. As the seals leave the islands and swim from left to right, they are observed to dive at a relatively shallow depth of about 20 meters, which the drone identifies is populated by small young pollock with low calorific content. The seals then swim much greater distance and start to dive deeper to a place where the drone identifies larger, more adult pollock, which are more nutritious as fish. Unfortunately, the calories expended by the mother seals to swim this extra distance don ' t leave them with enough energy to lactate their pups back on the island, leading to the population decline. Further, the drones identify that the water temperature around the island has significantly warmed. It might be one of the driving forces that ' s pushing the pollock north, and to spread in search of colder regions. So the data analysis is ongoing, but already we can see that some of the pieces of the puzzle from the fur seal mystery are coming into focus. But if you look back at the big picture, we are mammals, too. And actually, the oceans provide up to 20 kilos of fish per human per year. As we deplete our fish stocks, what can we humans learn from the fur seal story? And beyond fish, the oceans affect all of us daily as they drive global weather systems, which affect things like global agricultural output or can lead to devastating destruction of lives and property through hurricanes, extreme heat and floods. Our oceans are pretty much unexplored and undersampled, and today, we still know more about other planets than our own. But if you divide this vast ocean in six-by-six-degree squares, each about 400 miles long, you ' d get about 1, 000 such squares. So little by little, working with our partners, we are deploying one ocean drone in each of those boxes, the hope being that achieving planetary coverage will give us better insights into those planetary systems that affect humanity. We have been using robots to study distant worlds in our solar system for a while now. Now it is time to quantify our own planet, because we cannot fix what we cannot measure, and we cannot prepare for what we don ' t know. Thank you.

Chris Anderson : Elon, hey, welcome back to TED. It ' s great to have you here. Elon Musk : Thanks for having me. CA : So, in the next half hour or so, we ' re going to spend some time exploring your vision for what an exciting future might look like, which I guess makes the first question a little ironic : Why are you boring? EM : Yeah. I ask myself that frequently. We ' re trying to dig a hole under LA, and this is to create the beginning of what will hopefully be a 3D network of tunnels to alleviate congestion. So right now, one of the most soul-destroying things is traffic. It affects people in every part of the world. It takes away so much of your life. It ' s horrible. It ' s particularly horrible in LA. CA : I think you ' ve brought with you the first visualization that ' s been shown of this. Can I show this? EM : Yeah, absolutely. So this is the first time — Just to show what we ' re talking about. So a couple of key things that are important in having a 3D tunnel network. First of all, you have to be able to integrate the entrance and exit of the tunnel seamlessly into the fabric of the city. So by having an elevator, sort of a car skate, that ' s on an elevator, you can integrate the entrance and exits to the tunnel network just by using two parking spaces. And then the car gets on a skate. There ' s no speed limit here, so we ' re designing this to be able to operate at 200 kilometers an hour. CA : How much? EM : 200 kilometers an hour, or about 130 miles per hour. So you should be able to get from, say, Westwood to LAX in six minutes — five, six minutes. CA : So possibly, initially done, it ' s like on a sort of toll road-type basis. EM : Yeah. CA : Which, I guess, alleviates some traffic from the surface streets as well. EM : So, I don ' t know if people noticed it in the video, but there ' s no real limit to how many levels of tunnel you can have. You can go much further deep than you can go up. The deepest mines are much deeper than the tallest buildings are tall, so you can alleviate any arbitrary level of urban congestion with a 3D tunnel network. This is a very important point. So a key rebuttal to the tunnels is that if you add one layer of tunnels, that will simply alleviate congestion, it will get used up, and then you ' ll be back where you started, back with congestion. But you can go to any arbitrary number of tunnels, any number of levels. CA : But people — seen traditionally, it ' s incredibly expensive to dig, and that would block this idea. EM : Yeah. Well, they ' re right. To give you an example, the LA subway extension, which is — I think it ' s a two-and-a-half mile extension that was just completed for two billion dollars. So it ' s roughly a billion dollars a mile to do the subway extension in LA. And this is not the highest utility subway in the world. So yeah, it ' s quite difficult to dig tunnels normally. I think we need to have at least a tenfold improvement in the cost per mile of tunneling. CA : And how could you achieve that? EM : Actually, if you just do two things, you can get to approximately an order of magnitude improvement, and I think you can go beyond that. So the first thing to do is to cut the tunnel diameter by a factor of two or more. So a single road lane tunnel according to regulations has to be 26 feet, maybe 28 feet in diameter to allow for crashes and emergency vehicles and sufficient ventilation for combustion engine cars. But if you shrink that diameter to what we ' re attempting, which is 12 feet, which is plenty to get an electric skate through, you drop the diameter by a factor of two and the cross-sectional area by a factor of four, and the tunneling cost scales with the cross-sectional area. So that ' s roughly a half-order of magnitude improvement right there. Then tunneling machines currently tunnel for half the time, then they stop, and then the rest of the time is putting in reinforcements for the tunnel wall. So if you design the machine instead to do continuous tunneling and reinforcing, that will give you a factor of two improvement. Combine that and that ' s a factor of eight. Also these machines are far from being at their power or thermal limits, so you can jack up the power to the machine substantially. I think you can get at least a factor of two, maybe a factor of four or five improvement on top of that. So I think there ' s a fairly straightforward series of steps to get somewhere in excess of an order of magnitude improvement in the cost per mile, and our target actually is — we ' ve got a pet snail called Gary, this is from Gary the snail from"South Park,"I mean, sorry,"SpongeBob SquarePants."So Gary is capable of — currently he ' s capable of going 14 times faster than a tunnel-boring machine. CA : You want to beat Gary. EM : We want to beat Gary. He ' s not a patient little fellow, and that will be victory. Victory is beating the snail. CA : But a lot of people imagining, dreaming about future cities, they imagine that actually the solution is flying cars, drones, etc. You go aboveground. Why isn ' t that a better solution? You save all that tunneling cost. EM : Right. I ' m in favor of flying things. Obviously, I do rockets, so I like things that fly. This is not some inherent bias against flying things, but there is a challenge with flying cars in that they ' ll be quite noisy, the wind force generated will be very high. Let ' s just say that if something ' s flying over your head, a whole bunch of flying cars going all over the place, that is not an anxiety-reducing situation. You don ' t think to yourself,"Well, I feel better about today."You ' re thinking,"Did they service their hubcap, or is it going to come off and guillotine me?"Things like that. CA : So you ' ve got this vision of future cities with these rich, 3D networks of tunnels underneath. Is there a tie-in here with Hyperloop? Could you apply these tunnels to use for this Hyperloop idea you released a few years ago. EM : Yeah, so we ' ve been sort of puttering around with the Hyperloop stuff for a while. We built a Hyperloop test track adjacent to SpaceX, just for a student competition, to encourage innovative ideas in transport. And it actually ends up being the biggest vacuum chamber in the world after the Large Hadron Collider, by volume. So it was quite fun to do that, but it was kind of a hobby thing, and then we think we might — so we ' ve built a little pusher car to push the student pods, but we ' re going to try seeing how fast we can make the pusher go if it ' s not pushing something. So we ' re cautiously optimistic we ' ll be able to be faster than the world ' s fastest bullet train even in a. 8-mile stretch. CA : Whoa. Good brakes. EM : Yeah, I mean, it ' s — yeah. It ' s either going to smash into tiny pieces or go quite fast. CA : But you can picture, then, a Hyperloop in a tunnel running quite long distances. EM : Exactly. And looking at tunneling technology, it turns out that in order to make a tunnel, you have to — In order to seal against the water table, you ' ve got to typically design a tunnel wall to be good to about five or six atmospheres. So to go to vacuum is only one atmosphere, or near-vacuum. So actually, it sort of turns out that automatically, if you build a tunnel that is good enough to resist the water table, it is automatically capable of holding vacuum. CA : Huh. EM : So, yeah. CA : And so you could actually picture, what kind of length tunnel is in Elon ' s future to running Hyperloop? EM : I think there ' s no real length limit. You could dig as much as you want. I think if you were to do something like a DC-to-New York Hyperloop, I think you ' d probably want to go underground the entire way because it ' s a high- density area. You ' re going under a lot of buildings and houses, and if you go deep enough, you cannot detect the tunnel. Sometimes people think, well, it ' s going to be pretty annoying to have a tunnel dug under my house. Like, if that tunnel is dug more than about three or four tunnel diameters beneath your house, you will not be able to detect it being dug at all. In fact, if you ' re able to detect the tunnel being dug, whatever device you are using, you can get a lot of money for that device from the Israeli military, who is trying to detect tunnels from Hamas, and from the US Customs and Border patrol that try and detect drug tunnels. So the reality is that earth is incredibly good at absorbing vibrations, and once the tunnel depth is below a certain level, it is undetectable. Maybe if you have a very sensitive seismic instrument, you might be able to detect it. CA : So you ' ve started a new company to do this called The Boring Company. Very nice. Very funny. EM : What ' s funny about that? CA : How much of your time is this? EM : It ' s maybe... two or three percent. CA : You ' ve called it a hobby. This is what an Elon Musk hobby looks like. EM : I mean, it really is, like — This is basically interns and people doing it part time. We bought some second-hand machinery. It ' s kind of puttering along, but it ' s making good progress, so — CA : So an even bigger part of your time is being spent on electrifying cars and transport through Tesla. Is one of the motivations for the tunneling project the realization that actually, in a world where cars are electric and where they ' re self-driving, there may end up being more cars on the roads on any given hour than there are now? EM : Yeah, exactly. A lot of people think that when you make cars autonomous, they ' ll be able to go faster and that will alleviate congestion. And to some degree that will be true, but once you have shared autonomy where it ’ s much cheaper to go by car and you can go point to point, the affordability of going in a car will be better than that of a bus. Like, it will cost less than a bus ticket. So the amount of driving that will occur will be much greater with shared autonomy, and actually traffic will get far worse. CA : You started Tesla with the goal of persuading the world that electrification was the future of cars, and a few years ago, people were laughing at you. Now, not so much. EM : OK. I don ’ t know. I don ’ t know. CA : But isn ’ t it true that pretty much every auto manufacturer has announced serious electrification plans for the short- to medium-term future? EM : Yeah. Yeah. I think almost every automaker has some electric vehicle program. They vary in seriousness. Some are very serious about transitioning entirely to electric, and some are just dabbling in it. And some, amazingly, are still pursuing fuel cells, but I think that won ’ t last much longer. CA : But isn ’ t there a sense, though, Elon, where you can now just declare victory and say, you know,”We did it.”Let the world electrify, and you go on and focus on other stuff? EM : Yeah. I intend to stay with Tesla as far into the future as I can imagine, and there are a lot of exciting things that we have coming. Obviously the Model 3 is coming soon. We ’ ll be unveiling the Tesla Semi truck. CA : OK, we ’ re going to come to this. So Model 3, it ’ s supposed to be coming in July-ish. EM : Yeah, it ’ s looking quite good for starting production in July. CA : Wow. One of the things that people are so excited about is the fact that it ’ s got autopilot. And you put out this video a while back showing what that technology would look like. EM : Yeah. CA : There ’ s obviously autopilot in Model S right now. What are we seeing here? EM : Yeah, so this is using only cameras and GPS. So there ’ s no LIDAR or radar being used here. This is just using passive optical, which is essentially what a person uses. The whole road system is meant to be navigated with passive optical, or cameras, and so once you solve cameras or vision, then autonomy is solved. If you don ’ t solve vision, it ’ s not solved. So that ’ s why our focus is so heavily on having a vision neural net that ’ s very effective for road conditions. CA : Right. Many other people are going the LIDAR route. You want cameras plus radar is most of it. EM : You can absolutely be superhuman with just cameras. Like, you can probably do it ten times better than humans would, just cameras. CA : So the new cars being sold right now have eight cameras in them. They can ’ t yet do what that showed. When will they be able to? EM : I think we ’ re still on track for being able to go cross-country from LA to New York by the end of the year, fully autonomous. CA : OK, so by the end of the year, you ’ re saying, someone ’ s going to sit in a Tesla without touching the steering wheel, tap in”New York,”off it goes. EM : Yeah. CA : Won ’ t ever have to touch the wheel — by the end of 2017. EM : Yeah. Essentially, November or December of this year, we should be able to go all the way from a parking lot in California to a parking lot in New York, no controls touched at any point during the entire journey. CA : Amazing. But part of that is possible because you ’ ve already got a fleet of Teslas driving all these roads. You ’ re accumulating a huge amount of data of that national road system. EM : Yes, but the thing that will be interesting is that I ’ m actually fairly confident it will be able to do that route even if you change the route dynamically. So, it ’ s fairly easy — If you say I ’ m going to be really good at one specific route, that ’ s one thing, but it should be able to go, really be very good, certainly once you enter a highway, to go anywhere on the highway system in a given country. So it ’ s not sort of limited to LA to New York. We could change it and make it Seattle-Florida, that day, in real time. So you were going from LA to New York. Now go from LA to Toronto. CA : So leaving aside regulation for a second, in terms of the technology alone, the time when someone will be able to buy one of your cars and literally just take the hands off the wheel and go to sleep and wake up and find that they ’ ve arrived, how far away is that, to do that safely? EM : I think that ’ s about two years. So the real trick of it is not how do you make it work say 99. 9 percent of the time, because, like, if a car crashes one in a thousand times, then you ’ re probably still not going to be comfortable falling asleep. You shouldn ’ t be, certainly. It ’ s never going to be perfect. No system is going to be perfect, but if you say it ’ s perhaps — the car is unlikely to crash in a hundred lifetimes, or a thousand lifetimes, then people are like, OK, wow, if I were to live a thousand lives, I would still most likely never experience a crash, then that ’ s probably OK. CA : To sleep. I guess the big concern of yours is that people may actually get seduced too early to think that this is safe, and that you ’ ll have some horrible incident happen that puts things back. EM : Well, I think that the autonomy system is likely to at least mitigate the crash, except in rare circumstances. The thing to appreciate about vehicle safety is this is probabilistic. I mean, there ’ s some chance that any time a human driver gets in a car, that they will have an accident that is their fault. It ’ s never zero. So really the key threshold for autonomy is how much better does autonomy need to be than a person before you can rely on it? CA : But once you get literally safe hands-off driving, the power to disrupt the whole industry seems massive, because at that point you ’ ve spoken of people being able to buy a car, drops you off at work, and then you let it go and provide a sort of Uber-like service to other people, earn you money, maybe even cover the cost of your lease of that car, so you can kind of get a car for free. Is that really likely? EM : Yeah. Absolutely this is what will happen. So there will be a shared autonomy fleet where you buy your car and you can choose to use that car exclusively, you could choose to have it be used only by friends and family, only by other drivers who are rated five star, you can choose to share it sometimes but not other times. That ’ s 100 percent what will occur. It ’ s just a question of when. CA : Wow. So you mentioned the Semi and I think you ’ re planning to announce this in September, but I ’ m curious whether there ’ s anything you could show us today? EM : I will show you a teaser shot of the truck. It ’ s alive. CA : OK. EM : That ’ s definitely a case where we want to be cautious about the autonomy features. Yeah. CA : We can ’ t see that much of it, but it doesn ’ t look like just a little friendly neighborhood truck. It looks kind of badass. What sort of semi is this? EM : So this is a heavy duty, long-range semitruck. So it ’ s the highest weight capability and with long range. So essentially it ’ s meant to alleviate the heavy-duty trucking loads. And this is something which people do not today think is possible. They think the truck doesn ’ t have enough power or it doesn ’ t have enough range, and then with the Tesla Semi we want to show that no, an electric truck actually can out-torque any diesel semi. And if you had a tug-of-war competition, the Tesla Semi will tug the diesel semi uphill. CA : That ’ s pretty cool. And short term, these aren ’ t driverless. These are going to be trucks that truck drivers want to drive. EM : Yes. So what will be really fun about this is you have a flat torque RPM curve with an electric motor, whereas with a diesel motor or any kind of internal combustion engine car, you ’ ve got a torque RPM curve that looks like a hill. So this will be a very spry truck. You can drive this around like a sports car. There ’ s no gears. It ’ s, like, single speed. CA : There ’ s a great **movie** to be made here somewhere. I don ’ t know what it is and I don ’ t know that it ends well, but it ’ s a great **movie**. EM : It ’ s quite bizarre test-driving. When I was driving the test prototype for the first truck. It ’ s really weird, because you ’ re driving around and you ’ re just so nimble, and you ’ re in this giant truck. CA : Wait, you ’ ve already driven a prototype? EM : Yeah, I drove it around the parking lot, and I was like, this is crazy. CA : Wow. This is no vaporware. EM : It ’ s just like, driving this giant truck and making these mad maneuvers. CA : This is cool. OK, from a really badass picture to a kind of less badass picture. This is just a cute house from”Desperate Housewives”or something. What on earth is going on here? EM : Well, this **illustrates** the picture of the future that I think is how things will evolve. You ’ ve got an electric car in the driveway. If you look in between the electric car and the house, there are actually three Powerwalls stacked up against the side of the house, and then that house roof is a solar roof. So that ’ s an actual solar glass roof. CA : OK. EM : That ’ s a picture of a real — well, admittedly, it ’ s a real fake house. That ’ s a real fake house. CA : So these roof tiles, some of them have in them basically solar power, the ability to — EM : Yeah. Solar glass tiles where you can adjust the texture and the color to a very fine-grained level, and then there ’ s sort of microlouvers in the glass, such that when you ’ re looking at the roof from street level or close to street level, all the tiles look the same whether there is a solar cell behind it or not. So you have an even color from the ground level. If you were to look at it from a helicopter, you would be actually able to look through and see that some of the glass tiles have a solar cell behind them and some do not. You can ’ t tell from street level. CA : You put them in the ones that are likely to see a lot of sun, and that makes these roofs super affordable, right? They ’ re not that much more expensive than just tiling the roof. EM : Yeah. We ’ re very confident that the cost of the roof plus the cost of electricity — A solar glass roof will be less than the cost of a normal roof plus the cost of electricity. So in other words, this will be economically a no-brainer, we think it will look great, and it will last — We thought about having the warranty be infinity, but then people thought, well, that might sound like were just talking rubbish, but actually this is toughened glass. Well after the house has collapsed and there ’ s nothing there, the glass tiles will still be there. CA : I mean, this is cool. So you ’ re rolling this out in a couple week ’ s time, I think, with four different roofing types. EM : Yeah, we ’ re starting off with two, two initially, and the second two will be introduced early next year. CA : And what ’ s the scale of ambition here? How many houses do you believe could end up having this type of roofing? EM : I think eventually almost all houses will have a solar roof. The thing is to consider the time scale here to be probably on the order of 40 or 50 years. So on average, a roof is replaced every 20 to 25 years. But you don ’ t start replacing all roofs immediately. But eventually, if you say were to fast- forward to say 15 years from now, it will be unusual to have a roof that does not have solar. CA : Is there a mental model thing that people don ’ t get here that because of the shift in the cost, the economics of solar power, most houses actually have enough sunlight on their roof pretty much to power all of their needs. If you could capture the power, it could pretty much power all their needs. You could go off-grid, kind of. EM : It depends on where you are and what the house size is relative to the roof area, but it ’ s a fair statement to say that most houses in the US have enough roof area to power all the needs of the house. CA : So the key to the economics of the cars, the Semi, of these houses is the falling price of lithium-ion batteries, which you ’ ve made a huge bet on as Tesla. In many ways, that ’ s almost the core competency. And you ’ ve decided that to really, like, own that competency, you just have to build the world ’ s largest manufacturing plant to double the world ’ s supply of lithium-ion batteries, with this guy. What is this? EM : Yeah, so that ’ s the Gigafactory, progress so far on the Gigafactory. Eventually, you can sort of roughly see that there ’ s sort of a diamond shape overall, and when it ’ s fully done, it ’ ll look like a giant diamond, or that ’ s the idea behind it, and it ’ s aligned on true north. It ’ s a small detail. CA : And capable of producing, eventually, like a hundred gigawatt hours of batteries a year. EM : A hundred gigawatt hours. We think probably more, but yeah. CA : And they ’ re actually being produced right now. EM : They ’ re in production already.

CA : You guys put out this video. I mean, is that speeded up? EM : That ’ s the slowed down version. CA : How fast does it actually go? EM : Well, when it ’ s running at full speed, you can ’ t actually see the cells without a strobe light. It ’ s just blur. CA : One of your core ideas, Elon, about what makes an exciting future is a future where we no longer feel guilty about energy. Help us picture this. How many Gigafactories, if you like, does it take to get us there? EM : It ’ s about a hundred, roughly. It ’ s not 10, it ’ s not a thousand. Most likely a hundred. CA : See, I find this amazing. You can picture what it would take to move the world off this vast fossil fuel thing. It ’ s like you ’ re building one, it costs five billion dollars, or whatever, five to 10 billion dollars. Like, it ’ s kind of cool that you can picture that project. And you ’ re planning to do, at Tesla — announce another two this year. EM : I think we ’ ll announce locations for somewhere between two and four Gigafactories later this year. Yeah, probably four. CA : Whoa. No more teasing from you for here? Like — where, continent? You can say no. EM : We need to address a global market. CA : OK. This is cool. I think we should talk for — Actually, global market. I ’ m going to ask you one question about politics, only one. I ’ m kind of sick of politics, but I do want to ask you this. You ’ re on a body now giving advice to a guy — EM : Who? CA : Who has said he doesn ’ t really believe in climate change, and there ’ s a lot of people out there who think you shouldn ’ t be doing that. They ’ d like you to walk away from that. What would you say to them? EM : Well, I think that first of all, I ’ m just on two advisory councils where the format consists of going around the room and asking people ’ s opinion on things, and so there ’ s like a meeting every month or two. That ’ s the sum total of my contribution. But I think to the degree that there are people in the room who are arguing in favor of doing something about climate change, or social issues, I ’ ve used the meetings I ’ ve had thus far to argue in favor of immigration and in favor of climate change. And if I hadn ’ t done that, that wasn ’ t on the agenda before. So maybe nothing will happen, but at least the words were said. CA : OK. So let ’ s talk SpaceX and Mars. Last time you were here, you spoke about what seemed like a kind of incredibly ambitious dream to develop rockets that were actually reusable. And you ’ ve only gone and done it. EM : Finally. It took a long time. CA : Talk us through this. What are we looking at here? EM : So this is one of our rocket boosters coming back from very high and fast in space. So just delivered the upper stage at high velocity. I think this might have been at sort of Mach 7 or so, delivery of the upper stage. CA : So that was a sped-up — EM : That was the slowed down version. CA : I thought that was the sped-up version. But I mean, that ’ s amazing, and several of these failed before you finally figured out how to do it, but now you ’ ve done this, what, five or six times? EM : We ’ re at eight or nine. CA : And for the first time, you ’ ve actually reflown one of the rockets that landed. EM : Yeah, so we landed the rocket booster and then prepped it for flight again and flew it again, so it ’ s the first reflight of an orbital booster where that reflight is relevant. So it ’ s important to appreciate that reusability is only relevant if it is rapid and complete. So like an aircraft or a car, the reusability is rapid and complete. You do not send your aircraft to Boeing in- between flights. CA : Right. So this is allowing you to dream of this really ambitious idea of sending many, many, many people to Mars in, what, 10 or 20 years time, I guess. EM : Yeah. CA : And you ’ ve designed this outrageous rocket to do it. Help us understand the scale of this thing. EM : Well, visually you can see that ’ s a person. Yeah, and that ’ s the vehicle. CA : So if that was a skyscraper, that ’ s like, did I read that, a 40-story skyscraper? EM : Probably a little more, yeah. The thrust level of this is really — This configuration is about four times the thrust of the Saturn V moon rocket. CA : Four times the thrust of the biggest rocket humanity ever created before. EM : Yeah. Yeah. CA : As one does. EM : Yeah. In units of 747, a 747 is only about a quarter of a million pounds of thrust, so for every 10 million pounds of thrust, there ' s 40 747s. So this would be the thrust equivalent of 120 747s, with all engines blazing. CA : And so even with a machine designed to escape Earth ' s gravity, I think you told me last time this thing could actually take a fully loaded 747, people, cargo, everything, into orbit. EM : Exactly. This can take a fully loaded 747 with maximum fuel, maximum passengers, maximum cargo on the 747 — this can take it as cargo. CA : So based on this, you presented recently this Interplanetary Transport System which is visualized this way. This is a scene you picture in, what, 30 years time? 20 years time? People walking into this rocket. EM : I ' m hopeful it ' s sort of an eight- to 10-year time frame. Aspirationally, that ' s our target. Our internal targets are more aggressive, but I think — CA : OK. EM : While vehicle seems quite large and is large by comparison with other rockets, I think the future spacecraft will make this look like a rowboat. The future spaceships will be truly enormous. CA : Why, Elon? Why do we need to build a city on Mars with a million people on it in your lifetime, which I think is kind of what you ' ve said you ' d love to do? EM : I think it ' s important to have a future that is inspiring and appealing. I just think there have to be reasons that you get up in the morning and you want to live. Like, why do you want to live? What ' s the point? What inspires you? What do you love about the future? And if we ' re not out there, if the future does not include being out there among the stars and being a multiplanet species, I find that it ' s incredibly depressing if that ' s not the future that we ' re going to have. CA : People want to position this as an either or, that there are so many desperate things happening on the planet now from climate to poverty to, you know, you pick your issue. And this feels like a distraction. You shouldn ' t be thinking about this. You should be solving what ' s here and now. And to be fair, you ' ve done a fair old bit to actually do that with your work on sustainable energy. But why not just do that? EM : I think there ' s — I look at the future from the standpoint of probabilities. It ' s like a branching stream of probabilities, and there are actions that we can take that affect those probabilities or that accelerate one thing or slow down another thing. I may introduce something new to the probability stream. Sustainable energy will happen no matter what. If there was no Tesla, if Tesla never existed, it would have to happen out of necessity. It ' s tautological. If you don ' t have sustainable energy, it means you have unsustainable energy. Eventually you will run out, and the laws of economics will drive civilization towards sustainable energy, inevitably. The fundamental value of a company like Tesla is the degree to which it accelerates the advent of sustainable energy, faster than it would otherwise occur. So when I think, like, what is the fundamental good of a company like Tesla, I would say, hopefully, if it accelerated that by a decade, potentially more than a decade, that would be quite a good thing to occur. That ' s what I consider to be the fundamental aspirational good of Tesla. Then there ' s becoming a multiplanet species and space-faring civilization. This is not inevitable. It ' s very important to appreciate this is not inevitable. The sustainable energy future I think is largely inevitable, but being a space- faring civilization is definitely not inevitable. If you look at the progress in space, in 1969 you were able to send somebody to the moon. 1969. Then we had the Space Shuttle. The Space Shuttle could only take people to low Earth orbit. Then the Space Shuttle retired, and the United States could take no one to orbit. So that ' s the trend. The trend is like down to nothing. People are mistaken when they think that technology just automatically improves. It does not automatically improve. It only improves if a lot of people work very hard to make it better, and actually it will, I think, by itself degrade, actually. You look at great civilizations like Ancient Egypt, and they were able to make the pyramids, and they forgot how to do that. And then the Romans, they built these incredible aqueducts. They forgot how to do it. CA : Elon, it almost seems, listening to you and looking at the different things you ’ ve done, that you ’ ve got this unique double motivation on everything that I find so interesting. One is this desire to work for humanity ’ s long-term good. The other is the desire to do something exciting. And often it feels like you feel like you need the one to drive the other. With Tesla, you want to have sustainable energy, so you made these super sexy, exciting cars to do it. Solar energy, we need to get there, so we need to make these beautiful roofs. We haven ’ t even spoken about your newest thing, which we don ’ t have time to do, but you want to save humanity from bad AI, and so you ’ re going to create this really cool brain-machine **interface** to give us all infinite memory and telepathy and so forth. And on Mars, it feels like what you ’ re saying is, yeah, we need to save humanity and have a backup plan, but also we need to inspire humanity, and this is a way to inspire. EM : I think the value of beauty and inspiration is very much underrated, no question. But I want to be clear. I ’ m not trying to be anyone ’ s savior. That is not the — I ’ m just trying to think about the future and not be sad. CA : Beautiful statement. I think everyone here would agree that it is not — None of this is going to happen inevitably. The fact that in your mind, you dream this stuff, you dream stuff that no one else would dare dream, or no one else would be capable of dreaming at the level of complexity that you do. The fact that you do that, Elon Musk, is a really **remarkable** thing. Thank you for helping us all to dream a bit bigger. EM : But you ’ ll tell me if it ever starts getting genuinely insane, right? CA : Thank you, Elon Musk. That was really, really fantastic. That was really fantastic.

Text Sample 886: POS Dim 6 – 2017 – Score 4.00 – 2017/t000586.txt

A confession : I am an archaeologist and a museum curator, but a paradoxical one. For my museum, I collect things, but I also return things back to where they came from. I love museums because they ’ re social and educational, but I ’ m most drawn to them because of the magic of objects : a one-million-year-old hand axe, a totem **pole**, an impressionist painting all take us beyond our own imaginations. In museums, we pause to muse, to gaze upon our human empire of things in meditation and wonder. I understand why US museums alone host more than 850 million visits each year. Yet, in recent years, museums have become a battleground. Communities around the world don ’ t want to see their culture in distant institutions which they have no control over. They want to see their cultural treasures repatriated, returned to their places of origin. Greece seeks the return of the Parthenon Marbles, a collection of classical sculptures held by the British Museum. Egypt demands antiquities from Germany. New Zealand ’ s Maori want to see returned ancestral tattooed heads from museums everywhere. Yet these claims pale in comparison to those made by Native Americans. Already, US museums have returned more than one million **artifacts** and 50, 000 sets of Native American skeletons. To **illustrate** what ’ s at stake, let ’ s start with the War Gods. This is a wood carving made by members of the Zuni tribe in New Mexico. In the 1880s, anthropologists began to collect them as evidence of American Indian religion. They came to be seen as beautiful, the precursor to the stark sculptures of Picasso and Paul Klee, helping to usher in the modern art movement. From one viewpoint, the museum did exactly as it ’ s supposed to with the War God. It helped introduce a little-known art form for the world to appreciate. But from another point of view, the museum had committed a terrible crime of cultural violence. For Zunis, the War God is not a piece of art, it is not even a thing. It is a being. For Zunis, every year, priests ritually carve new War Gods, the Ahayu : da, breathing life into them in a long ceremony. They are placed on sacred shrines where they live to protect the Zuni people and keep the universe in balance. No one can own or sell a War God. They belong only to the earth. And so Zunis want them back from museums so they can go to their shrine homes to fulfill their spiritual purpose. What is a curator to do? I believe that the War Gods should be returned. This might be a startling answer. After all, my conclusion contradicts the refrain of the world ' s most famous archaeologist :"That belongs in a museum!"is what Indiana Jones said, not just to drive **movie** plots, but to drive home the unquestionable good of museums for society. I did not come to my view easily. I grew up in Tucson, Arizona, and fell in love with the Sonoran Desert ' s past. I was amazed that beneath the city ' s bland strip malls was 12, 000 years of history just waiting to be discovered. When I was 16 years old, I started taking archaeology classes and going out on digs. A high school teacher of mine even helped me set up my own laboratory to study animal bones. But in college, I came to learn that my future career had a dark history. Starting in the 1860s, Native American skeletons became a tool for science, collected in the thousands to prove new theories of social and racial hierarchies. Native American human remains were plundered from graves, even taken fresh from battlefields. When archaeologists came across white graves, the skeleton was often quickly reburied, while Native bones were deposited as specimens on museum shelves. In the wake of war, stolen land, boarding schools, laws banning religion, anthropologists collected sacred objects in the belief that Native peoples were on the cusp of extinction. You can call it racism or colonialism, but the labels don ' t matter as much as the fact that over the last century, Native American rights and culture were taken from them. In 1990, after years of Native protests, the US government, through the US Congress, finally passed a law that allowed Native Americans to reclaim cultural items, sacred objects and human remains from museums. Many archaeologists were panicked. For scientists, it can be hard to fully grasp how a piece of wood can be a living god or how spirits surround bones. And they knew that modern science, especially with DNA, can provide luminous insights into the past. As the anthropologist Frank Norwick declared,"We are doing important work that benefits all of mankind. We are not returning anything to anyone."As a college student, all of this was an enigma that was hard to decipher. Why did Native Americans want their heritage back from the very places preserving it? And how could scientists spend their entire lives studying dead Indians but seem to care so little about living ones? I graduated but wasn ' t sure what to do next, so I traveled. One day, in South Africa, I visited Nelson Mandela ' s former prison cell on Robben Island. I had an epiphany. Here was a man who helped a country bridge vast divides to seek, however imperfectly, reconciliation. I ' m no Mandela, but I ask myself : Could I, too, plant seeds of hope in the ruins of the past? In 2007, I was hired as a curator at the Denver Museum of Nature and Science. Our team agreed that unlike many other institutions, we needed to proactively confront the legacy of museum collecting. We started with the skeletons in our closet, 100 of them. After months and then years, we met with dozens of tribes to figure out how to get these remains home. And this is hard work. It involves negotiating who will receive the remains, how to respectfully transfer them, where will they go. Native American leaders become undertakers, planning funerals for dead relatives they had never wanted unearthed. A decade later, the Denver Museum and our Native partners have reburied nearly all of the human remains in the collection. We have returned hundreds of sacred objects. But I ' ve come to see that these battles are endless. Repatriation is now a permanent feature of the museum world. Hundreds of tribes are waiting their turn. There are always more museums with more stuff. Every catalogued War God in an American public museum has now been returned — 106, so far — but there are more beyond the reach of US law, in private collections and outside our borders. In 2014, I had the chance to travel with a respected religious leader from the Zuni tribe named Octavius Seowtewa to visit five museums in Europe with War Gods. At the Ethnological Museum of Berlin, we saw a War God with a history of dubious care. An overly enthusiastic curator had added chicken feathers to it. Its necklace had once been stolen. At the Muse du quai Branly in Paris, an official told us that the War God there is now state property with no provisions for repatriation. He insisted that the War God no longer served Zunis but museum visitors. He said,"We give all of the objects to the world."At the British Museum, we were warned that the Zuni case would establish a dangerous precedent for bigger disputes, such as the Parthenon Marbles, claimed by Greece. After visiting the five museums, Octavius returned home to his people empty- handed. He later told me,"It hurts my heart to see the Ahayu:da so far away. They all belong together. It ' s like a family member that ' s missing from a family dinner. When one is gone, their strength is broken."I wish that my colleagues in Europe and beyond could see that the War Gods do not represent the end of museums but the chance for a new beginning. When you walk the halls of a museum, you ' re likely just seeing about one percent of the total collections. The rest is in storage. Even after returning 500 cultural items and skeletons, my museum still retains 99. 999 percent of its total collections. Though we no longer have War Gods, we have Zuni traditional pottery, jewelry, tools, clothing and arts. And even more precious than these objects are the relationships that we formed with Native Americans through the process of repatriation. Now, we can ask Zunis to share their culture with us. Not long ago, I had the chance to visit the returned War Gods. A shrine sits up high atop a mesa overlooking beautiful Zuni homeland. The shrine is enclosed by a roofless stone building threaded at the top with barbed wire to ensure that they ' re not stolen again. And there they are, inside, the Ahayu:da, 106 War Gods amid offerings of turquoise, cornmeal, shell, even T-shirts... a modern gift to ancient beings. And standing there, I got a glimpse at the War Gods ' true purpose in the world. And it occurred to me then that we do not get to choose the histories that we inherit. Museum curators today did not pillage ancient graves or steal spiritual objects, but we can accept responsibility for correcting past mistakes. We can help restore dignity, hope and humanity to Native Americans, the very people who were once the voiceless objects of our curiosity. And this doesn ' t even require us to fully understand others ' beliefs, only that we respect them. Museums are temples to things past. Now they must also become places for living cultures. As I turned to walk away from the shrine, I drank in the warm summer air, and I watched an eagle turn lazy circles high above. I thought of the Zunis, whose offerings ensure that their culture is not dead and gone but alive and well, and I could think of no better place for the War Gods to be. Thank you.

Text Sample 887: POS Dim 6 – 2018 – Score 4.00 – 2018/t000633.txt

It ' s like a dream. Imagine, in the empty desert, you come upon a huge wheel ringed in skeletons, and someone invites you to come pull a series of heavy ropes at its base, so you walk to one side, where a team is waiting, and you all throw your backs into it, and you pull in turn, and eventually, the wheel roars to life, lights begin to flicker, and the audience cheers, and you ' ve just activated Peter Hudson ' s"Charon,"one of the world ' s largest zoetropes. This is the farthest thing from marketable art. It ' s huge, it ' s dangerous, it takes a dozen people to run, and it doesn ' t go with the sofa. It ' s beautifully crafted and completely useless, and it ' s wonderful. You ' re unlikely to see works like"Charon"in the art-world headlines. These days, the buying and selling of artwork often gets more attention than the works themselves. In the last year, a Jean-Michel Basquiat sold for 110 million dollars, the highest price ever achieved for the work of an American artist, and a painting by Leonardo da Vinci sold for 450 million, setting a new auction record. Still, these are big, important artists, but still, when you look at these works and you look at the headlines, you have to ask yourself,"Do I care about these because they move me, or do I care about them because they ' re expensive and I think they ' re supposed to?"In our contemporary world, it can be hard to separate those two things. But what if we tried? What if we redefined art ' s value — not by its price tag, but by the emotional connection it creates between the artist and the audience, or the benefits it gives our society, or the fulfillment it gives the artists themselves? This is Nevada ' s Black Rock Desert, about as far as you can get from the galleries of New York and London and Hong Kong. And here, for just about 30 years, at Burning Man, a movement has been forming that does exactly that. Since its early anarchist years, Burning Man has grown up. Today, it ' s more of an experiment in collective dreaming. It ' s a year-round community, and every August, for a single week, 70, 000 people power down their technology and pilgrimage out into the desert to build an anti-consumerist society outside the bounds of their everyday lives. The conditions are brutal. Strangers will hug you, and every year, you will swear it was better the last, but it ' s still ridiculous and freeing and alive, and the art is one thing that thrives here. So this is me on the desert playa last year with my brother, obviously hard at work. I ' d been studying the art of Burning Man for several years, for an exhibition I curated at the Smithsonian ' s Renwick Gallery, and what fascinates me the most isn ' t the quality of the work here, which is actually rather high, it ' s why people come out here into the desert again and again to get their hands dirty and make in our increasingly digital age. Because it seems like this gets to something that ' s essentially human. Really, the entire encampment of Burning Man could be thought of as one giant interactive art installation driven by the participation of everyone in it. One thing that sets this work aside from the commercial art world is that anyone who makes work can show it. These days, around 300 art installations and countless artistic gestures go to the playa. None of them are sold there. At the end of the week, if the works aren ' t burned, artists have to cart them back out and store them. It ' s a tremendous labor of love. Though there is certainly a Burning Man aesthetic, pioneered by artists like Kate Raudenbush and Michael Christian, much of the distinctive character of the work here comes from the desert itself. For a work to succeed, it has to be portable enough to make the journey, rugged enough to withstand the wind and weather and participants, stimulating in daylight and darkness, and engaging without interpretation. Encounters with monumental and intimate works here feel surreal. Scale has a tendency to fool the eyes. What looked enormous in an artist ' s studio could get lost on the playa, but there are virtually no **spatial** limits, so artists can dream as big as they can build. Some pieces bowl you over by their grace and others by the sheer audacity it took to bring them here. Burning Man ' s irreverent humor comes out in pieces like Rebekah Waites '"Church Trap,"a tiny country chapel set precariously on a wooden beam, like a mousetrap, that lured participants in to find religion — it was built and burned in 2013... while other works, like Christopher Schardt ' s"Firmament,"aim for the sublime. Here, under a canopy of dancing lights set to classical music, participants could escape the thumping rave beats and chaos all around. At night, the city swarms with mutant vehicles, the only cars allowed to roam the playa. And if necessity is the mother of invention, here, absurdity is its father. They zigzag from artwork to artwork like some bizarre, random public transportation system, pulsing with light and sound. When artists stop worrying about critics and collectors and start making work for themselves, these are the kinds of marvelous toys they create. And what ' s amazing is that, by and large, when people first come to Burning Man, they don ' t know how to make this stuff. It ' s the active collaborative maker community there that makes this possible. Collectives like Five Ton Crane come together to share skills and take on complex projects a single artist would never even attempt, from a Gothic rocket ship that appears ready to take off at any moment to a fairytale home inside a giant boot complete with shelves full of artist-made books, a blackbird pie in the oven and a climbable beanstalk. Skilled or unskilled, all are welcome. In fact, part of the charm and the innovation of the work here is that so many makers aren ' t artists at all, but scientists or engineers or welders or garbage collectors, and their works cross disciplinary boundaries, from a grove of origami mushrooms that developed out of the design for a yurt to a tree that responds to the voices and biorhythms of all those around it through 175, 000 LEDs embedded in its leaves. In museums, a **typical** visitor spends less than 30 seconds with a work of art, and I often watch people wander from label to label, searching for information, as though the entire story of a work of art could be contained in that one 80- word text. But in the desert, there are no gatekeepers and no placards explaining the art, just natural curiosity. You see a work on the horizon, and you ride towards it. When you arrive, you walk all around it, you touch it, you test it. Is it sturdy enough to climb on? Will I be impaled by it? Art becomes a place for extended interaction, and although the **display** might be short-lived, the experience stays with you. Nowhere is that truer at Burning Man than at the Temple. In 2000, David Best and Jack Haye built the first Temple, and after a member of their team was killed tragically in an accident shortly before the event, the building became a makeshift memorial. By itself, it ' s a magnificent piece of architecture, but the structure is only a shell until it disappears under a thick blanket of messages."I miss you.""Please forgive me.""Even a broken crayon still colors."Intimate testaments to the most universal of human experiences, the experience of loss. The collective emotion in this place is overpowering and indescribable, before it ' s set afire on the last night of the event. Every year, something compels people from all different walks of life, from all over the world, to go out into the desert and make art when there is no money in it. The work ' s not always refined, it ' s not always viable, it ' s not even always good, but it ' s authentic and optimistic in a way we rarely see anywhere else. In these cynical times, it ' s comforting to know that we ' re still capable of great feats of imagination, and that when we search for connection, we come together and build cathedrals in the dust. Forget the price tags. Forget the big names. What is art for in our contemporary world if not this? Thank you.

Text Sample 888: POS Dim 6 – 2018 – Score 4.00 – 2018/t000502.txt
It ' s 4am, you ' ve been awake for forty hours, when you unlock a puzzle containing this video of some kind of dance-off between a chicken and a roller- skating beaver. The confusion and delight you ' re experiencing is a **typical** moment at the MIT Mystery Hunt, which is basically the Olympics meets Burning Man for a specific type of nerd. Today, I ' m going to take you inside this strange,

intellectually masochistic and incredibly joyful world. But first, I have to explain what I mean when I say"puzzle."A puzzle-hunt- style puzzle is a data set. It can be a grid of letters, a sudoku, a video, an audio — it can be anything that contains hidden information that can eventually resolve into an answer that is a word or a phrase. So, to give you an example, this is a puzzle called"Master Pieces."It consists of 10 images of LEGO people looking at piles of LEGOs. And to save us some time, I ' m going to explain what ' s going on here. Each of the piles of LEGOs is a deconstructed work of art in the style of a famous artist. So, does anybody recognize the artist on the left? They used a lot of red. I heard"Rothko,"yeah. The second one? Mondrian. Alex Rosenthal : Yeah, well done. And the third one? This is the hardest one — Yeah, Klimt, I heard it. Well done, the color is the biggest clue there. So the puzzle has **various** clues that tell you what matters here are the artists, not the specific works of art. And what you need to do is then look at what you haven ' t used yet, which is the number of LEGO people in each painting. And you can count them and then count into the artists ' last names by the same number of letters. So there ' s three people in front of the Rothko on the left, so you take the third letter, which is a T. There ' s only one in front of the Mondrian, so you take the first letter, M. And there ' s three again in front of Klimt, so you take the third letter, I. You do that for all 10 of the original artists and put them in the order, and you get the answer, which is"illuminate."Puzzles like this are about communicating an idea. But where I ' m trying to be as clear as possible for you now, puzzles have to navigate the line between abstraction and clarity. They have to be obtuse enough to make you work for it, but elegant enough so you can get to the aha moment, where everything clicks into place. Puzzle solvers are junkies for this aha moment — it feels like a brief high and an instant of pristine clarity. And there ' s also a deeper fulfillment at play here, which is that humans are innate problem-solvers. That ' s why we love crosswords and escape rooms and figuring out how to explore the bottom of the ocean. Solving deviously difficult puzzles expands our minds in new directions, and it also helps us come at problems from diverse perspectives. These puzzles come in **various** puzzle hunts, which come in **various** shapes and sizes. There ' s one-hour ones designed for novices, 24-hour road rallies, and the puzzle hunt of puzzle hunts, the MIT Mystery Hunt. This is an event that takes place once a year and has around 2, 000 people descending on MIT ' s campus and solving puzzles in teams that range from a single person to over 100. My team has 60 people on it — that includes a national crossword puzzle tournament champion, a particle physicist, a composer, an actual deep-sea explorer, and me, feeling like"Mr. Bean goes to Bletchley Park."That ' s actually an apt comparison, because one year involved a puzzle where you had to construct a working Enigma machine out of pieces of cardboard. Each Mystery Hunt has a theme. Past ones have included"The Matrix"and"Alice in Wonderland."It ' s often pop culture- and literary-based themes. And the goal is to find the coin that ' s been hidden somewhere on MIT ' s campus. And in order to get there, you have to solve around 150 puzzles and do **various** events and challenges. I had done this for about 10 years without ever dreaming of winning, until January of 2016, where 53 hours into a hunt whose theme is the **movie**"Inception,"we haven ' t slept in days, so everything is hilarious... The tables are covered in piles of papers, of our notes and completed puzzles. The whiteboards are an unintelligible mess of three days ' worth of insights. And we ' re stuck on two puzzles. If we could crack them, we would get into the endgame, and after hours of work, in a magical moment, they both fall within 10 seconds of each other, and soon, we ' re on the final runaround, a series of clues that will lead us to the coin, and we ' re racing through the halls of MIT, trying not to knock over or terrify tour groups, when we realize we ’ re not alone, there ’ s another team on the runaround as well, and we don ’ t know who ’ s ahead. So, we ’ re a mess of anxiety, anticipation, exhilaration and sleep deprivation, when we arrive at the Alchemist, a sculpture in which we find... this coin. Yeah. And in claiming it, we win the MIT Mystery Hunt by a tiny margin of five minutes. What I didn ’ t mention before is that the prize for winning is that you get to construct the whole hunt for the following year. The punishment for winning is that you have to construct the whole hunt for the following year. At the beginning of 2016, I had never constructed a puzzle before — I had solved plenty of puzzles, but constructing and solving are entirely different beasts. But once again, I was lucky to be on a team full of brilliant mentors and collaborators. So, from a constructor ’ s point of view, a puzzle is where I have an idea, and instead of telling you what it is, I ’ m going to leave a trail of breadcrumbs so you can figure it out for yourself, and have the joy and experience of the aha moment. This is another way of looking at the aha moment. And what ’ s incredible to me is that this experience, which is very emotional and kind of almost physical, is something that can be carefully designed. So, to show you what I mean, this is a puzzle I co-constructed with my friend Matt Gruskin. It ’ s a text adventure, which is the old-school adventure game format, where you ’ re exploring, going north, east, south and west, picking up items and using them. And you could get to the end of the game part, but you won ’ t have solved the puzzle. In order to do so, you have to recognize a hidden layer of information, and the easiest way of seeing it is by mapping the game out. That looks something like this. Does anybody recognize what this is? Yeah, exactly. This text adventure takes place within”Settlers of Catan.”Who here knows what”Settlers”is? Nerds. If you don ’ t know,”Settlers”is a board game where you ’ re competing against other people to collect resources and use them to build structures. And within the text adventure, we hid information in **various** ways, with which you could reconstruct an entire game. You could figure out the roads, the cities, the towns, the resources, the numbers on the tiles, even the dice rolls. You put all that information together and you could extract an answer in a way that ’ s too complicated to explain right now. But find me afterwards if you really want to know. But what this puzzle emphasized for me is the value of perspective shifts in inspiring an aha. So, in this puzzle, you go from experiencing the world on the ground, as a character, to looking down on it from above as if you ’ re playing a board game, and in that shift, you completely reframe all the information you ’ ve been given. The hardest part of construction for me is coming up with a great idea for an aha. Fortunately, the world is a torrent of ideas and information. I ’ ve seen fantastic puzzles constructed out of the waggle dances of bees, and the **remarkable** coincidence that the 88 keys of a piano can be perfectly mapped to the 88 constellations in the sky. Once you find that out, you can ’ t not construct the puzzle, and it ’ s going to be about having the solvers make that connection in their own minds. Whether you give them stars on a keyboard or play the celestial music of the cosmos, you ’ re getting them there, one way or another. Before long, you find yourself staring at a turtle, and asking yourself,”Is this a puzzle?”And also, staring at a turtle and saying,”I never appreciated what multitudes this contains in its shell alone.”This might be a familiar experience to you, if you ’ ve ever been watching a TED Talk and asked yourself,”Is this a puzzle?”I ’ m not telling. But what I will say is that puzzles can be found in the most unexpected of places. That brings us back to one of my favorite puzzles of all time, which was constructed by Trip Payne. And this time, I ’ m going to play it for you with the sound on, so get ready to name that tune. Who knows what that is? Yeah,”You Make Me Feel Like a Natural Woman.”So you can identify that and seven other songs and clips, and then look at the videos themselves for clues, where the way that they are filmed and edited together plus things like the cutaways to the panel of five people sitting at a table, which is reminiscent of a panel of judges, all of this can suggest”reality competition show.”And either through internet research, or from just recognizing this, you can get to the aha, which is that these clips are shot- for-shot recreations of lip-synch battles from”RuPaul ’ s Drag Race.”So, why do we do this? You tell me, I don ’ t know. So, first of all, it ’ s really fun. But I think it also improves our lives in **various** ways. Being able to solve puzzles, when I ’ m confronted with a challenge, has allowed me to explore it from multiple perspectives before I lock in an approach. Also, the process of solving is great training for working with a team, knowing when to listen, when to share, and how to recognize and celebrate insight and being able to construct ahas is a very powerful tool. Think of how powerful and exciting and convincing an idea is that comes from your own mind, where you make all the connections yourself. So in January of 2017, after tens of thousands of hours of work, we finally run our Mystery Hunt. And it ’ s a different sort of satisfaction than the quick high of an aha moment. Instead, it ’ s the slow burn of saying something through perplexing abstraction, yet being understood. And when it was all over, in our exhaustion, we turned to each other and the world, and we said,”We ’ re never doing this again. It ’ s too much work. It ’ s really fun, but no more winning.”One year later, in January of 2018, we won the MIT Mystery Hunt again. So, we ’ re currently I don ’ t know how many tens of thousands of hours of work in, and we ’ re two months out from the 2019 Hunt. So, thank you for listening, I have to go write a puzzle.

Text Sample 889: POS Dim 6 – 2018 – Score 4.00 – 2018/t000550.txt

Do you remember when you were a child, you probably had a favorite toy that was a constant companion, like Christopher Robin had Winnie the Pooh, and your imagination fueled endless adventures? What could be more innocent than that? Well, let me introduce you to my friend Cayla. Cayla was voted toy of the year in countries around the world. She connects to the internet and uses speech recognition technology to answer your child ’ s questions, respond just like a friend. But the power doesn ’ t lie with your child ’ s imagination. It actually lies with the company harvesting masses of personal information while your family is innocently chatting away in the safety of their home, a dangerously false sense of security. This case sounded alarm bells for me, as it is my job to protect consumers ’ rights in my country. And with billions of devices such as cars, energy meters and even vacuum cleaners expected to come online by 2020, we thought this was a case worth investigating further. Because what was Cayla doing with all the interesting things she was learning? Did she have another friend she was loyal to and shared her information with? Yes, you guessed right. She did. In order to play with Cayla, you need to download an app to access all her features. Parents must consent to the terms being changed without notice. The recordings of the child, her friends and family, can be used for targeted advertising. And all this information can be shared with unnamed third parties. Enough? Not quite. Anyone with a smartphone can connect to Cayla within a certain distance. When we confronted the company that made and programmed Cayla, they issued a series of statements that one had to be an IT expert in order to breach the security. Shall we fact-check that statement and live hack Cayla together? Here she is. Cayla is equipped with a Bluetooth device which can transmit up to 60 feet, a bit less if there ’ s a wall between. That means I, or any stranger, can connect to the doll while being outside the room where Cayla and her friends are. And to **illustrate** this, I ' m going to turn Cayla on now. Let ' s see, one, two, three. There. She ' s on. And I asked a colleague to stand outside with his smartphone, and he ' s connected, and to make this a bit creepier... let ' s see what kids could hear Cayla say in the safety of their room. Man : Hi. My name is Cayla. What is yours? Finn Myrstad : Uh, Finn. Man : Is your mom close by? FM : Uh, no, she ' s in the store. Man : Ah. Do you want to come out and play with me? FM : That ' s a great idea. Man : Ah, great. FM : I ' m going to turn Cayla off now. We needed no password or to circumvent any other type of security to do this. We published a report in 20 countries around the world, exposing this significant security flaw and many other problematic issues. So what happened? Cayla was banned in Germany, taken off the shelves by Amazon and Wal-Mart, and she ' s now peacefully resting at the German Spy Museum in Berlin. However, Cayla was also for sale in stores around the world for more than a year after we published our report. What we uncovered is that there are few rules to protect us and the ones we have are not being properly enforced. We need to get the security and privacy of these devices right before they enter the market, because what is the point of locking a house with a key if anyone can enter it through a connected device? You may well think,"This will not happen to me. I will just stay away from these flawed devices."But that won ' t keep you safe, because simply by connecting to the internet, you are put in an impossible take-it-or-leave-it position. Let me show you. Like most of you, I have dozens of apps on my phone, and used properly, they can make our lives easier, more convenient and maybe even healthier. But have we been lulled into a false sense of security? It starts simply by ticking a box. Yes, we say, I ' ve read the terms. But have you really read the terms? Are you sure they didn ' t look too long and your phone was running out of battery, and the last time you tried they were impossible to understand, and you needed to use the service now? And now, the power imbalance is established, because we have agreed to our personal information being gathered and used on a scale we could never imagine. This is why my colleagues and I decided to take a deeper look at this. We set out to read the terms of popular apps on an average phone. And to show the world how unrealistic it is to expect consumers to actually read the terms, we printed them, more than 900 pages, and sat down in our office and read them out loud ourselves, streaming the experiment live on our websites. As you can see, it took quite a long time. It took us 31 hours, 49 minutes and 11 seconds to read the terms on an average phone. That is longer than a **movie marathon** of the"Harry Potter"**movies** and the"Godfather"**movies** combined. And reading is one thing. Understanding is another story. That would have taken us much, much longer. And this is a real problem, because companies have argued for 20 to 30 years against regulating the internet better, because users have consented to the terms and conditions. As we ' ve shown with this experiment, achieving informed consent is close to impossible. Do you think it ' s fair to put the burden of responsibility on the consumer? I don ' t. I think we should demand less take-it-or-leave-it and more understandable terms before we agree to them. Thank you. Now, I would like to tell you a story about love. Some of the world ' s most popular apps are dating apps, an industry now worth more than, or close to, three billion dollars a year. And of course, we ' re OK sharing our intimate details with our other half. But who else is snooping, saving and sharing our information while we are baring our souls? My team and I decided to investigate this. And in order to understand the issue from all angles and to truly do a thorough job, I realized I had to download one of the world ' s most popular dating apps myself. So I went home to my wife... who I had just married."Is it OK if I establish a profile on a very popular dating app for purely scientific purposes?"This is what we found. Hidden behind the main menu was a preticked box that gave the dating company access to all my personal pictures on Facebook, in my case more than 2, 000 of them, and some were quite personal. And to make matters worse, when we read the terms and conditions, we discovered the following, and I ' m going to need to take out my reading glasses for this one. And I ' m going to read it for you, because this is complicated. All right.”By posting content”— and content refers to your pictures, chat and other interactions in the dating service —”as a part of the service, you automatically grant to the company, its affiliates, licensees and successors an irrevocable”— which means you can ' t change your mind —”perpetual”— which means forever —”nonexclusive, transferrable, sublicensable, fully paid-up, worldwide right and license to use, copy, store, perform, **display**, reproduce, record, play, adapt, modify and distribute the content, prepare derivative works of the content, or incorporate the content into other works and grant and authorize sublicenses of the foregoing in any media now known or hereafter created.”That basically means that all your dating history and everything related to it can be used for any purpose for all time. Just imagine your children seeing your sassy dating photos in a birth control ad 20 years from now. But seriously, though — what might these commercial practices mean to you? For example, financial loss : based on your web browsing history, algorithms might decide whether you will get a mortgage or not. Subconscious manipulation : companies can analyze your emotions based on your photos and chats, targeting you with ads when you are at your most vulnerable. Discrimination : a fitness app can sell your data to a health insurance company, preventing you from getting coverage in the future. All of this is happening in the world today. But of course, not all uses of data are malign. Some are just flawed or need more work, and some are truly great. And there is some good news as well. The dating companies changed their policies globally after we filed a legal complaint. But organizations such as mine that fight for consumers ' rights can ' t be everywhere. Nor can consumers fix this on their own, because if we know that something innocent we said will come back to haunt us, we will stop speaking. If we know that we are being watched and monitored, we will change our behavior. And if we can ' t control who has our data and how it is being used, we have lost the control of our lives. The stories I have told you today are not random examples. They are everywhere, and they are a sign that things need to change. And how can we achieve that change? Well, companies need to realize that by prioritizing privacy and security, they can build trust and loyalty to their users. Governments must create a safer internet by ensuring enforcement and up-to-date rules. And us, the citizens? We can use our voice to remind the world that technology can only truly benefit society if it respects basic rights. Thank you so much.

Text Sample 890: POS Dim 6 – 2019 – Score 4.00 – 2019/t000918.txt

As a roboticist, I get asked a lot of questions.”When we will they start serving me breakfast?”So I thought the future of robotics would be looking more like us. I thought they would look like me, so I built eyes that would simulate my eyes. I built fingers that are dextrous enough to serve me... baseballs. Classical robots like this are built and become functional based on the fixed number of joints and actuators. And this means their functionality and shape are already fixed at the moment of their conception. So even though this arm has a really nice throw — it even hit the tripod at the end — it ' s not meant for cooking you breakfast per se. It ' s not really suited for scrambled eggs. So this was when I was hit by a new vision of future robotics : the transformers. They drive, they run, they fly, all depending on the ever- changing, new environment and task at hand. To make this a reality, you really have to rethink how robots are designed. So, imagine a robotic module in a polygon shape and using that simple polygon shape to reconstruct multiple different forms to create a new form of robot for different tasks. In CG, computer graphics, it ' s not any news — it ' s been done for a while, and that ' s how most of the **movies** are made. But if you ' re trying to make a robot that ' s physically moving, it ' s a completely new story. It ' s a completely new paradigm. But you ' ve all done this. Who hasn ' t made a paper airplane, paper boat, paper crane? Origami is a versatile platform for designers. From a single sheet of paper, you can make multiple shapes, and if you don ' t like it, you unfold and fold back again. Any 3D form can be made from 2D surfaces by folding, and this is proven mathematically. And imagine if you were to have an intelligent sheet that can self-fold into any form it wants, anytime. And that ' s what I ' ve been working on. I call this robotic origami,"robogami."This is our first robogami transformation that was made by me about 10 years ago. From a flat-sheeted robot, it turns into a pyramid and back into a flat sheet and into a space shuttle. Quite cute. Ten years later, with my group of ninja origami robotic researchers — about 22 of them right now — we have a new generation of robogamis, and they ' re a little more effective and they do more than that. So the new generation of robogamis actually serve a purpose. For example, this one actually navigates through different terrains autonomously. So when it ' s a dry and flat land, it crawls. And if it meets sudden rough terrain, it starts rolling. It does this — it ' s the same robot — but depending on which terrain it meets, it activates a different sequence of actuators that ' s on board. And once it meets an obstacle, it jumps over it. It does this by storing energy in each of its legs and releasing it and catapulting like a slingshot. And it even does gymnastics. Yay. So I just showed you what a single robogami can do. Imagine what they can do as a group. They can join forces to tackle more complex tasks. Each module, either active or passive, we can assemble them to create different shapes. Not only that, by controlling the folding joints, we ' re able to create and attack different tasks. The form is making new task space. And this time, what ' s most important is the assembly. They need to autonomously find each other in a different space, attach and detach, depending on the environment and task. And we can do this now. So what ' s next? Our imagination. This is a simulation of what you can achieve with this type of module. We decided that we were going to have a four-legged crawler turn into a little dog and make small gaits. With the same module, we can actually make it do something else : a manipulator, a **typical**, classical robotic task. So with a manipulator, it can pick up an object. Of course, you can add more modules to make the manipulator legs longer to attack or pick up objects that are bigger or smaller, or even have a third arm. For robogamis, there ' s no one fixed shape nor task. They can transform into anything, anywhere, anytime. So how do you make them? The biggest technical challenge of robogami is keeping them super thin, flexible, but still remaining functional. They ' re composed of multiple layers of circuits, motors, microcontrollers and sensors, all in the single body, and when you control individual folding joints, you ' ll be able to achieve soft motions like that upon your command. Instead of being a single robot that is specifically made for a single task, robogamis are optimized to do multi-tasks. And this is quite important for the difficult and unique environments on the Earth as well as in space. Space is a perfect environment for robogamis. You cannot afford to have one robot for one task. Who knows how many tasks you will encounter in space? What you want is a single robotic platform that can transform to do multi-tasks. What we want is a deck of thin robogami modules that can transform to do multiples of performing tasks. And don ’ t take my word for it, because the European Space Agency and Swiss Space Center are sponsoring this exact concept. So here you see a couple of images of reconfiguration of robogamis, exploring the foreign land aboveground, on the surface, as well as digging into the surface. It ’ s not just exploration. For astronauts, they need additional help, because you cannot afford to bring interns up there, either. They have to do every tedious task. They may be simple, but super interactive. So you need robots to facilitate their experiments, assisting them with the communications and just docking onto surfaces to be their third arm holding different tools. But how will they be able to control robogamis, for example, outside the space station? In this case, I show a robogami that is holding space debris. You can work with your vision so that you can control them, but what would be better is having the sensation of touch directly transported onto the hands of the astronauts. And what you need is a haptic device, a haptic **interface** that recreates the sensation of touch. And using robogamis, we can do this. This is the world ’ s smallest haptic **interface** that can recreate a sensation of touch just underneath your fingertip. We do this by moving the robogami by microscopic and macroscopic movements at the stage. And by having this, not only will you be able to feel how big the object is, the roundness and the lines, but also the stiffness and the texture. Alex has this **interface** just underneath his thumb, and if he were to use this with VR goggles and hand controllers, now the virtual reality is no longer virtual. It becomes a tangible reality. The blue **ball**, red **ball** and black **ball** that he ’ s looking at is no longer differentiated by colors. Now it is a rubber blue **ball**, sponge red **ball** and billiard black **ball**. This is now possible. Let me show you. This is really the first time this is shown live in front of a public grand audience, so hopefully this works. So what you see here is an atlas of anatomy and the robogami haptic **interface**. So, like all the other reconfigurable robots, it multitasks. Not only is it going to serve as a mouse, but also a haptic **interface**. So for example, we have a white background where there is no object. That means there is nothing to feel, so we can have a very, very flexible **interface**. Now, I use this as a mouse to approach skin, a muscular arm, so now let ’ s feel his biceps, or shoulders. So now you see how much stiffer it becomes. Let ’ s explore even more. Let ’ s approach the ribcage. And as soon as I move on top of the ribcage and between the intercostal muscles, which is softer and harder, I can feel the difference of the stiffness. Take my word for it. So now you see, it ’ s much stiffer in terms of the force it ’ s giving back to my fingertip. So I showed you the surfaces that aren ’ t moving. How about if I were to approach something that moves, for example, like a beating heart? What would I feel? This can be your beating heart. This can actually be inside your pocket while you ’ re shopping online. Now you ’ ll be able to feel the difference of the sweater that you ’ re buying, how soft it is, if it ’ s actually cashmere or not, or the bagel that you ’ re trying to buy, how hard it is or how crispy it is. This is now possible. The robotics technology is advancing to be more personalized and adaptive, to adapt to our everyday needs. This unique specie of reconfigurable robotics is actually the platform to provide this invisible, intuitive **interface** to meet our exact needs. These robots will no longer look like the characters from the **movies**. Instead, they will be whatever you want them to be. Thank you.

Every other night in Japan, I step out of my apartment, I climb up a hill for 15 minutes, and then I head into my local health club, where three **ping-pong** tables are set up in a studio. And space is limited, so at every table, one pair of players practices forehands, another practices backhands, and every now and then, the **balls** collide in midair and everybody says,”Wow!”Then, choosing lots, we select partners and play doubles. But I honestly couldn ’ t tell you who ’ s won, because we change partners every five minutes. And everybody is trying really hard to win points, but nobody is keeping track of who is winning games. And after an hour or so of furious exertion, I can honestly tell you that not knowing who has won feels like the ultimate victory. In Japan, it ’ s been said, they ’ ve created a competitive spirit without competition. Now, all of you know that geopolitics is best followed by watching **ping-pong**. The two strongest powers in the world were fiercest enemies until, in 1972, an American **ping-pong** team was allowed to visit Communist China. And as soon as the former adversaries were gathered around some small green tables, each of them could claim a victory, and the whole world could breathe more easily. China ’ s leader, Mao Zedong, wrote a whole manual on **ping-pong**, and he called the sport”a spiritual nuclear weapon.”And it ’ s been said that the only honorary lifelong member of the US Table Tennis Association is the then- President Richard Nixon, who helped to engineer this win-win situation through **ping-pong** diplomacy. But long before that, really, the history of the modern world was best told through the bouncing white **ball**.”**Ping-pong**”sounds like a cousin of”sing-song,”like something Eastern, but actually, it ’ s believed that it was invented by high-class Brits during Victorian times, who started hitting wine corks over walls of books after dinner. No exaggeration. And by the end of World War I, the sport was dominated by players from the former Austro-Hungarian Empire : eight out of nine early world championships were claimed by Hungary. And Eastern Europeans grew so adept at hitting back everything that was hit at them that they almost brought the whole sport to a standstill. In one championship match in Prague in 1936, the first point is said to have lasted two hours and 12 minutes. The first point! Longer than a”Mad Max”**movie**. And according to one of the players, the umpire had to retire with a sore neck before the point was concluded. That player started hitting the **ball** back with his left hand and dictating chess moves between shots. Many in the audience started, of course, filing out, as that single point lasted maybe 12, 000 strokes. And an emergency meeting of the International Table Tennis Association had to be held then and there, and soon the rules were changed so that no game could last longer than 20 minutes. Sixteen years later, Japan entered the picture, when a little-known watchmaker called Hiroji Satoh showed up at the world championships in Bombay in 1952. And Satoh was not very big, he wasn ’ t highly rated, he was wearing spectacles, but he was armed with a paddle that was not pimpled, as other paddles were, but covered by a thick spongy rubber foam. And thanks to this silencing secret weapon, the little-known Satoh won a gold medal. One million people came out into the streets of Tokyo to greet him upon his return, and really, Japan ’ s postwar resurgence was set into motion. What I learned, though, at my regular games in Japan, is more what could be called the inner sport of global domination, sometimes known as life. We never play singles in our club, only doubles, and because, as I say, we change partners every five minutes, if you do happen to lose, you ’ re very likely to win six minutes later. We also play best-of-two sets, so often, there ’ s no loser at all. **Ping-pong** diplomacy. And I always remember that as a boy growing up in England, I was taught that the point of a game was to win. But in Japan, I ’ m encouraged to believe that, really, the point of a game is to make as many people as possible around you feel that they are winners. So you ’ re not careening up and down as an individual might, but you ’ re part of a regular, steady chorus. The most skillful players in our club deploy their skills to turn a

9-1 lead for their team into a 9-9 game in which everybody is intensely involved. And my friend who hits these high, looping lobs that smaller players flail at and miss — well, he wins a lot of points, but I think he ' s thought of as a loser. In Japan, a game of **ping-pong** is really like an act of love. You ' re learning how to play with somebody, rather than against her. And I ' ll confess, at first, this seemed to me to take all the fun out of the sport. I couldn ' t exult after a tremendous upset victory against our strongest players, because six minutes later, with a new partner, I was falling behind again. On the other hand, I never felt disconsolate. And when I flew away from Japan and started playing singles again with my English archrival, I noticed that after every defeat, I was really brokenhearted. But after every victory, I couldn ' t sleep either, because I knew there was only one way to go, and that was down. Now, if I were trying to do business in Japan, this would lead to endless frustration. In Japan, unlike elsewhere, if the score is still level after four hours, a baseball game ends in a tie, and because the league standings are based on winning percentage, a team with quite a few ties can finish ahead of a team with more victories. One of the first times an American was ever brought over to Japan to lead a professional Japanese baseball team, Bobby Valentine, in 1995, he took this really mediocre squad, he lead them to a stunning second-place finish, and he was instantly fired. Why?"Well,"said the team spokesman,"because of his emphasis on winning."Official Japan can feel quite a lot like that point that was said to last two hours and 12 minutes, and playing not to lose can take all the imagination, the daring, the excitement, out of things. At the same time, playing **ping-pong** in Japan reminds me why choirs regularly enjoy more fun than soloists. In a choir, your only job is to play your small part perfectly, to hit your notes with feeling, and by so doing, to help to create a beautiful harmony that ' s much greater than the sum of its parts. Yes, every choir does need a conductor, but I think a choir releases you from a child ' s simple sense of either-ors. You come to see that the opposite of winning isn ' t losing — it ' s failing to see the larger picture. As my life goes on, I ' m really startled to see that no event can properly be assessed for years after it has unfolded. I once lost everything I owned in the world, every last thing, in a wildfire. But in time, I came to see that it was that seeming loss that allowed me to live on the earth more gently, to write without notes, and actually, to move to Japan and the inner health club known as the **ping-pong** table. Conversely, I once stumbled into the perfect job, and I came to see that seeming happiness can stand in the way of true joy even more than misery does. Playing doubles in Japan really relieves me of all my anxiety, and at the end of an evening, I notice everybody is filing out in a more or less equal state of delight. I ' m reminded every night that not getting ahead isn ' t the same thing as falling behind any more than not being lively is the same thing as being dead. And I ' ve come to understand why it is that Chinese universities are said to offer degrees in **ping-pong**, and why researchers have found that ping- pong can actually help a little with mild mental disorders and even autism. But as I watch the 2020 Olympics in Tokyo, I ' m going to be keenly aware that it won ' t be possible to tell who ' s won or who ' s lost for a very long time. You remember that point I mentioned that was said to last for two hours and 12 minutes? Well, one of the players from that game ended up, six years later, in the concentration camps of Auschwitz and Dachau. But he walked out alive. Why? Simply because a guard in the gas chamber recognized him from his **ping-pong** playing days. Had he been the winner of that epic match? It hardly mattered. As you recall, many people had filed out before even the first point was concluded. The only thing that saved him was the fact that he took part. The best way to win any game, Japan tells me every other night, is never, never to think about the score. Thank you.

So my story starts on July 4, 1992, the day my mother followed her college sweetheart to New York City from Egypt. As fireworks exploded behind the skyline, my father looked at my mother jokingly and said,"Look, habibti, Americans are celebrating your arrival."Unfortunately, it didn ' t feel much like a celebration when, growing up, my mother and I would wander past Queens into New York City streets, and my mother with her hijab and long flowy dresses would tighten her hand around my small fingers as she stood up against weathered comments like,"Go back to where you came from,""Learn English,""Stupid immigrant."These words were meant to make us feel unsafe, insecure in our own neighborhoods, in our own skin. But it was these same streets that made me fall in love with New York. Queens is one of the most diverse places in the world, with immigrant parents holding stories that always start with something between three and 15 dollars in a pocket, a voyage across a vast sea and a cash-only hustle sheltering families in jam-packed, busted apartments. And it was these same families that worked so hard to make sure that we had safe micro-communities — we, as immigrant children, to feel affirmed and loved in our identities. But it was mostly the women. And these women are the reason why, regardless of these statements that my mom faced, she remained unapologetic. And these women were some of the most powerful women I have ever met in my entire life. I mean, they had networks for everything. They had rotations for who watched whose kids when, for saving extra cash, for throwing belly dance parties and memorizing Koran and learning English. And they would collect small gold tokens to fundraise for the local mosque. And it was these same women, when I decided to wear my hijab, who supported me through it. And when I was bullied for being Muslim, I always felt like I had an army of unapologetic North African aunties who had my back. And so every morning at 15, I would wake up and stand in front of a mirror, and wrap beautiful bright silk around my head the way my mother does and my grandmother did. And one day that summer 2009, I stepped out into the streets of New York City on my way to volunteer at a domestic violence organization that a woman in my neighborhood had started. And I remember at that moment I felt a yank at the back of my head. Then someone pulled and grabbed me, trying to remove my hijab from off of my head. I turned around to a tall, broad- shouldered man, pure hate in his eyes. I struggled and fought back, and finally was able to get away, hid myself in the bathroom of that organization and cried and cried. I kept thinking to myself,"Why does he hate me? He doesn ' t even know me."Hate crimes against Muslims in the US increased by 1, 600 percent post-9 / 11, and one in every four women in the US will suffer some form of gender violence. And it may not seem like it, but Islamophobia and anti-Muslim violence is a form of gender violence, given the visibility of Muslim women in our hijabs. And so I was not alone, and that horrified me. It made me want to do something. It made me want to go out there and make sure that no one I loved, that no woman would have to feel this insecure in her own skin. So I started to think about how the women in my own neighborhood were able to build community for themselves, and how they were able to use the very little resources they had to actually offer something. And I began to think about what I could potentially offer to build safety and power for women. And through this journey, I learned a couple of things, and this is what I want to share with you today, some of these lessons. So lesson number one : start with what you know. At the time, I had been doing Shotokan karate for as long as I could remember, and so I had a black belt. Yeah. And so, I thought — surprise. I thought that maybe I should go out into my neighborhood and teach self- defense to young girls. And so I actually went out and knocked on doors, spoke to community leaders, to parents, to young women, and finally was able to secure a free community center basement and convince enough young women that they should come to my class. And it actually all worked out, because when I pitched the idea, most of the responses were, like,"All right, cute, this 5 ' 1"hijabi girl who knows karate. How nice."But in reality, I became the Queens, New York version of Mr. Miyagi at 16 years old, and I started teaching 13 young women in that community center basement self-defense. And with every single self-defense move, for eight sessions over the course of that summer, we began to understand the power of our bodies, and we began to share our experiences about our identities. And sometimes there were shocking realizations, and other times there were tears, but mostly it was laughs. And I ended that summer with this incredible sisterhood, and I began to feel much safer in my own skin. And it was because of these women that we just kept teaching. I never thought that I would continue, but we just kept teaching. And today, nine years, 17 cities, 12 countries, 760 courses and thousands of women and girls later, I ' m still teaching. And what started as a self-defense course in the basement of a community center is now an international grassroots organization focused on building safety and power for women around the world : Malikah. Now, for lesson number two : start with who you know. Oftentimes, it could be quite exciting, especially if you ' re an expert in something and you want to have impact, to swoop into a community and think you have the magic recipe. But very early on I learned that, as esteemed philosopher Kendrick Lamar once said, it ' s really important to be humble and to sit down. So, basically, at 15 years old, the only community that I had any business doing work with were the 14-year-old girls in my neighborhood, and that ' s because I was friends with them. Other than that, I didn ' t know what it meant to be a child of Bengali immigrants in Brooklyn or to be Senegalese in the Bronx. But I did know young women who were connected to those communities, and it was quite **remarkable** how they already had these layers of trust and awareness and relationship with their communities. So like my mother and the women in her neighborhood, they had these really strong social networks, and it was about providing capacity and believing in other women ' s definition of safety. Even though I was a self-defense instructor, I couldn ' t come into a community and define safety for any other woman who was not part of my own community. And it was because, as our network expanded, I learned that self-defense is not just physical. It ' s actually really emotional work. I mean, we would do a 60- minute self-defense class, and then we ' d have 30 minutes reserved for just talking and healing. And in those 30 minutes, women would share what brought them to the class to begin with but also **various** other experiences with violence. And, as an example, one time in one of those classes, one woman actually started to talk about the fact that she had been in a domestic violence relationship for over 30 years, and it was her first time being able to **articulate** that because we had established that safe space for her. So it ' s powerful work, but it only happens when we believe in women ' s agency to define what safety and what power looks like for themselves. All right, for lesson number three — and this was the hardest thing for me — the most important thing about this work is to start with the joy. When I started doing this work, I was reacting to a hate-based attack, so I was feeling insecure and anxious and overwhelmed. I was really afraid. And it makes sense, because if you take a step back, and I can imagine that a lot of women in this room can probably relate to this, the feeling, an overwhelming feeling of insecurity, is oftentimes with us constantly. I mean, imagine this : walking home late at night, hearing footsteps behind you. You wonder if you should walk faster or if you should slow down. You keep your keys in your hand in case you need to use them. You say,”Text me when you get home. I want to make sure you are safe.”And we mean those words. We ’ re afraid to put down our drinks. We ’ re afraid to speak too much or too little in a meeting. And imagine being woman and black and trans and queer and Latinx and undocumented and poor and immigrant, and you could then only imagine how overwhelming this work can be, especially within the context of personal safety. However, when I took a step to reflect on what brought me to this work to begin with, I began to realize it was actually the love that I had for women in my community. It was the way I saw them gather, their ability to build for each other, that inspired me to keep doing this work day in and day out. So whether I was in a refugee camp in Jordan or a community center in Dallas, Texas or a corporate office in Silicon Valley, women gathered in beautifully magical ways and they built together and supported each other in ways that shifted culture to empower and build safety for women. And that is how the change happens. It was through those relationships we built together. That ’ s why we don ’ t just teach self-defense, but we also throw dance parties and host potlucks and write love notes to each other and sing songs together. And it ’ s really about the friendship, and it ’ s been so, so fun. So the last thing I want to leave you with is that the key takeaway for me in teaching self-defense all of these years is that I actually don ’ t want women, as cool as the self-defense moves are, to go out and use these self-defense techniques. I don ’ t want any woman to have to de-escalate any violent situation. But for that to happen, the violence shouldn ’ t happen, and for the violence not to happen, the systems and the cultures that allow for this violence to take place to begin with needs to stop. And for that to happen, we need all hands on deck. So I ’ ve given you my secret recipe, and now it ’ s up to you. To start with what you know, to start with who you know and to start with joy. But just start. Thank you so much.

Text Sample 893: POS Dim 6 – 2022 – Score 4.00 – 2022/t003655.txt

David Biello : In the wake of Dr. Anthony Fauci ’ s announcement that he will be retiring as the head of the National Institute of Allergy and Infectious Diseases at the end of the year, I ’ ve invited him to join me for a conversation on the future of the COVID-19 pandemic, reflections on his career and the future of public health. Please welcome Brooklyn ’ s own Dr. Fauci. Anthony Fauci : Hi, David, nice to see you, thank you for having me. DB : Thank you for joining us. So my first question is very simple. Is the COVID-19 pandemic over? AF : You know, David, there ’ s a lot of misinterpretation about what the meaning of the word”over”is, it means different things to different people. I ’ m sure you ’ re referring to the comment made by the President a day or two ago. If you ’ re talking about the fulminant phase of the outbreak, when we were having anywhere from 800, 000 to 900, 000 infections a day and 3, 000 to 4, 000 deaths per day, that was several months ago. We are much, much better off now than we were then. So in that case, that fulminant phase of the outbreak is behind us. But as the President made very clear on the second half of his sentence, is that, which they don ’ t seem to show, is that he actually said we still have a lot of work to do, there ’ s still a challenge ahead, we ’ ve got to get people vaccinated. We still have a number of cases, we have 400 deaths per day. That ’ s an unacceptably high level. So again, it depends on the semantics of what your definition is. We don ’ t want anyone to get the impression that we don ’ t have a lot of work to do. We ’ ve got to get the level of infection considerably lower than it is. And we ’ ve certainly got to get the level of deaths lower than it is. So again, it depends on the semantics of what you mean by"end."DB : Well, let ' s get into those semantics then. What conditions would need to exist for the pandemic to be over? AF : You know, that ' s a call that officially is made by the World Health Organization. You know, my colleagues and I oh, it must have been more than ten years ago, because of the lack of clarity on what a pandemic means to one person versus another, we wrote a paper in the Journal of Infectious Diseases in which we talked about all the different variations of interpretations. Is it a widespread phenomenon? Is it the widespread nature throughout the world that makes it officially a pandemic? Or is it widespread and accelerating? Or is it widespread causing serious disease? It means different things to different people. So rather than try and give a definition, that ' s my definition versus another, we should stick with what the WHO is saying. And as Dr. Tedros said, that we ' re seeing the light at the end of the tunnel on that. So, again, you might interpret that, well, if that ' s the case, is it over? Well, again, what does"over"mean? There ' s a lot of semantics there, David. The easiest way not to confuse people is to say we still have a lot of cases, we still have 400 deaths, we only have 67 percent of the population vaccinated, we ' ve got to do better than that. Of those, only one half have gotten a single boost. And as a nation, we lag behind other developed countries and even some low- and middle-income countries in the level of vaccinations that we ' ve been able to implement. So if you want to look it that way, we have a lot of work to do, and that ' s exactly what the President said. DB : So speaking of vaccines, what ' s your advice? I know we have the bivalent available now. What is your advice on which vaccines to get and when that ' s appropriate? AF : Well, first, you ' ve got to get your primary series. So, I mean, that ' s the one where I said only 67 percent of the country has gotten their primary series, which for the most part, with some exceptions, is an mRNA vaccine, either Moderna or Pfizer, given anywhere from three to four weeks apart as the primary. Then the issue is about giving people booster shots. So right now, if you ' re asking a clear question, of today, with the bivalent BA. 4-5 boosters or updated vaccines is a better terminology to use, they are available now throughout the country. We ' ve ordered 171 million doses. Who should get it? Anyone who is vaccinated with the primary series and has not received a shot longer than two months ago should get it. So if I got my last shot, let ' s say in July – August, September, two months later, you should get the bivalent. If you were infected three months or more ago, you should then get the updated vaccine. Let me give you an example for clarity for the audience. I was infected in the end of June of this year, even though I had been vaccinated. Fortunately, because I was vaccinated, I had a relatively mild illness. At my age, had I not been vaccinated, the chances are I could have had a real severe outcome because elderly are more prone to get severity of disease. So if you take the end of June, take the end of July, the end of August, the end of September. I plan to get my updated BA. 4-5 bivalent at the end of September, the first week in October. DB : I think that ' s a very useful advice, and actually I will be doing the same. How are you personally navigating this stage in the pandemic? What precautions are you taking, if any? AF : Well, I certainly continue to take precautions. And I think it ' s important that you ask me personally that question, because people have different levels of risk of severity of disease. I am a person who is relatively healthy, but I ' m at an elderly age. I ' m 81 years old. I ' m going to be 82 in December. So I, statistically, would have more of a risk. So the precautions I take, I stay up to date on my vaccinations, number one. And when I go to a place that ' s a congregate indoor setting where there are a lot of people and I don ' t know the status of their infection, their vaccination or what have you, I would, for the most part, wear a **mask**. When I ' m with people who I know what their status is, people who are recently vaccinated or people who come in and test before they come in, I could have a dinner in my home or in the home of a friend without any concern. But if I go to crowded places, certainly on an airplane, even though it isn ’ t required any more, if I go on a prolonged or even a short airplane trip, again, because of my increased risk as an elderly person, I wear a **mask** on the plane. DB : So switching gears a little bit, or taking a step back, are consecutive pandemics kind of our new reality? We obviously had the monkeypox outbreak. And if that is the case, how do we cope with consecutive pandemics? AF : Well, you know, we have had, probably without the general public noticing it much, we have had, in the history of our civilization, outbreaks of emerging infections, some of which turn into pandemics. We ’ ve had them before recorded history. We ’ ve had them in the lifetime of some of us, you and I. We ’ re going through one right now. So given the fact that most of the outbreaks of new infections come from the animal-human **interface**, which is sometimes intruded upon, as it were, where people, either by climate change or by intruding on forests,”uninhabited by human”places in the world, you ’ re going to get jumping of species. Or in markets where you put animals from the wild in contact with humans, which is exactly what happened with SARS-CoV-1 and highly likely happened with SARS-CoV-2. We will continue to get outbreaks. Pandemic flu generally comes from a situation where you have the animal species that harbor influenza, pigs, fowl, birds and humans together in that environment. That ’ s how you get the bird flu that tend to challenge us a fair amount or the swine flu. So the short answer to your question, David, is that we will continue to get outbreaks of new infections. The critical issue is how do you prevent them from becoming pandemics? And that ’ s what ’ s called pandemic preparedness, which is a combination of scientific preparedness, like we did with the rapid development of vaccines for COVID-19, which was a highly successful scientific endeavor, matched with a public health response, which we didn ’ t do as well, in the public health response, because we had spread of infection in a way that we could have done better in controlling it. DB : So speaking of that, this is not your first epidemic, but you ’ ve made historic contributions to the AIDS epidemic and now COVID-19. But is there anything you wish you had done differently in those cases? AF : Well, there always is. I mean, it ’ s a question of when you ’ re involved – Nobody is perfect, certainly not I or any of my colleagues. But when you ’ re dealing with an emerging, moving, dynamic target, which by definition is what a pandemic is, particularly if it ’ s with a pathogen that you ’ ve never had experience with, like HIV in the very early 1980s, or the COVID-19 pandemic in the first months of 2020, you could always say, if we knew then what we know now, and there was a lot of things that we didn ’ t know, we certainly would have done things differently. And that ’ s why you have to be humble and modest to realize if you are going to be following the science, the science which gives you data and information and evidence is going to change, particularly in the early phases of the outbreak. Did we know how easily it was spread from human to human? No. Did we know that it was aerosol spread? No. We thought in the beginning it was like influenza, mostly droplets from a sick person. Did we know that 50 to 60 percent of the transmissions were [from] someone who had no symptoms at all, which clearly impacts how you approach an outbreak? Did we realize that instead of the **typical** outbreak, where it goes up, it comes down and then you ’ re done with it, we had no concept that you ’ d be seeing different waves and different variants that came along. So the answer to your question, if we knew all of that from the beginning, we certainly would have done things differently. But unfortunately we didn ’ t. And you try to be flexible enough and humble enough to change and modify how you approach things based on the recent data. That

’ s not flip-flopping. That is truly following the evidence and following the data. DB : Right, that ’ s just how science works, it ’ s constantly updating and especially in a real-time situation like this pandemic. But are there any, I don ’ t know, specific regrets you have, something you would take back if you could? AF : Well, it depends. Yeah, I mean, obviously in the beginning when we were under the impression, or didn ’ t fully realize that there was aerosol spread, we were under the impression, which was true, because we were told that, that there weren ’ t enough **masks** for the health care providers. And if we started everybody hoarding **masks**, there wouldn ’ t be **masks** available to the health care providers. We didn ’ t realize that out of the health care setting, like the hospital setting, that **masks** were effective in preventing acquisition and transmission. We didn ’ t know that. We know it now for sure, but we didn ’ t know it then. We didn ’ t know that the silent spread from people who were without symptoms. And that meant we didn ’ t know that, while we were looking for sick people, there were many, many, many more people without symptoms that were in society spreading the infection in a way that was not detectable, below the radar screen. Had we known that, I absolutely would have said right from the beginning, everybody wear a **mask** all the time in an indoor setting. But we didn ’ t say that then. It was only when it became obvious. So if we had known that early on, we would have told people to wear a **mask**. However, I must say, David, given the reluctance of people to wear **masks**, even now that we know all that stuff, I ’ m wondering how well that would have been received if at a time when there were ten or so documented infections, if you told the country that everybody should wear a **mask** in an indoor setting, not so sure that would have been broadly accepted. DB : Yeah. And this seems to be something that, the United States anyway, has been through before, with the Spanish flu and **masking** and then anti-mask protests. And it seems to be in our, let ’ s say, societal immune response to these pandemics. Flipping it a little bit, how do we make sure we ’ re not caught so, sort of, unprepared next time? AF : Well, you know, it ’ s interesting, David, what you mean by unprepared, because the Johns Hopkins School of Public Health evaluated different countries ’ preparedness for a pandemic. And guess who was evaluated to be first in the world? The United States of America. Guess who has the most deaths per population? The United States of America. So, you know, there ’ s preparedness, and there ’ s response, there ’ s execution of your preparedness plans that we did not do so well for any of a number of complicated reasons, one of which was the fact, and is, that this outbreak occurred at a time of really profound and deep divisiveness in our own country. That where we had something we hadn ’ t seen before, where political ideology played a role in whether you did or did not accept the recommended public health countermeasures, be it wearing a **mask**, indoor settings, quarantining, taking a vaccine, getting a boost. If you look at the country and look at the demography of the country with regard to ideology, there should never be that red states vaccinate much less than blue states. There ’ s no reason for that at all because public health risks and public health implementation should be uniform throughout. And we didn ’ t see that. DB : Yeah, let ’ s talk about that a little bit more because obviously, you ’ ve had to cope with an incredibly polarized response to your work in which not just ordinary citizens, but even politicians have called for your resignation and **various** other things. How do you deal with that, how do you keep your cool? You ’ re quite cool about this. AF : Well, calling for your resignation is mild compared to having somebody arrested who was trying to kill you. So, I mean, there ’ s a big spectrum of pushing back against public health people. And that ’ s one of the really unfortunate things. I mean, I keep my cool because that ’ s just the nature of the kind of person that I am. When you ’ re dealing with a very, very difficult situation, you ’ ve got to keep your cool. I mean, I learned that in my early training in medicine. When you ’ re in the middle of emergency, somebody is dying in front of you, you ’ ve got to keep your cool all the time. And that ’ s something that ’ s just part of my inherent training as a physician and as a person. But what we faced was well beyond that. I mean, public health officials, not only myself, I ’ m a very visible one, but many of my colleagues are being threatened and hassled and harassed, themselves and their families, the way my family is being harassed, merely because of saying things that are purely public health, common sense, tried and true principles of how to keep people safe. That is really extraordinary that that ’ s going on in our country. DB : Yeah. I ’ m also going to ascribe it to the Brooklyn upbringing. That gave you some cool, too. But a quick follow up, how do you, like, with all that going on, with those horrifying threats, how do you unwind from all this? How do you, you know, keep it together and give yourself some space to breathe? AF : Well, I have an extraordinarily supportive family, my wife who ’ s with me, my children are grown and live in different parts of the country. But they are very supportive of me with texts and calls and knowing what I ’ m going through. So I have three daughters, which they, you know, they try to take care of their daddy, so it really helps. But my wife is extremely supportive, and we do things together. I mean, I work a preposterous amount of hours a day, but every day I try to get some exercise in and it ’ s usually a few mile walk with my wife, whether that ’ s on the weekends very early in the morning, or during the week late at night when I come home. We try to get some form of exercise in to diffuse the tension, hopefully every day. And we ’ re pretty successful at that. AF : Well, good for you. So you ’ re retiring after a very long and distinguished career. Congratulations. You will have successors. What lessons would you want to offer your successors based on your tenure? AF : First of all, I ’ m not retiring in the classic sense. As my wife, says, David, I ’ m”rewiring,”not retiring, because I do intend to be very active. And that was one of the reasons why I stepped down at this point in time. Because while I still have the enthusiasm, the energy and thank goodness, the good health to be able to do something else for the next few years, I want to use the benefit of my experience of being at the NIH for almost 60 years, for being the director of the Institute for 38 years, and for having the privilege of advising seven presidents of the United States on public health issues, to use that experience to hopefully inspire by writing, reading, traveling, lecturing, inspiring the younger generation of scientists and would-be scientists to at least consider a career in public service, particularly in the arena of public health, and science and medicine. Having said that, my advice to the person who will ultimately replace me would be to focus on the science and be consistent with the science and do not get distracted by a lot of the peripheral things, the disinformation, the misinformation, the attacks on medicine and science and public health. Focus like a laser beam on what your job is and don ’ t get distracted by all the other noise that ’ s out there because there is a lot more noise now than there was a few decades ago. And by noise, I mean misinformation and disinformation about science. DB : For sure. I ’ ve definitely noticed that as the science curator. But pivoting a bit, let ’ s talk about hope. What gives you hope about the future? Are there treatments or other things coming down the pipeline that you ’ re excited about? AF : Well, science is an absolutely phenomenal discipline. It ’ s discovery. It ’ s... brand new knowledge. Pushing back the frontiers of knowledge that we would not have imagined we would be in. If you look at medicine and science, how it ’ s changed in a very, very positive way from the time I stepped into medical school in 1962 to the time now of the things that are available to me as a physician and as a scientist. I have great hope that if we continue the investments in basic and applied science, that we will be able to accomplish things in the arena of health, individual health, and public health and global health that were really unimaginable just decades ago. So I have a great deal of optimism about what the future holds for science and medicine. And that ' s the reason why one of the things I ' m going to try and do in my rewired post-government life is to encourage young individuals to consider a career in medicine, science and public health, because the opportunities are really limitless. We are at a stage now the likes of which people who antidated us never would have imagined the opportunities in science that we have. So I ' m very optimistic about where we ' re going. DB : Me, too. But you mentioned earlier how climate change is affecting pandemics. What worries you about the future that we ' re facing? AF : Well, just some of the things that you mentioned. We do have a growing element of anti-science in society. Disturbingly, growing in the United States. And when I talk to my colleagues internationally, depending upon the country that they live in to a greater or lesser degree, there ' s some element of that. The thing that bothers me is a denial of science and what science is showing us. A denial of the issues of climate and the environment, a denial of scientific principles and conspiracy theories about things that push people away. I mean, some of them are laughable, but you would be astounded, David, at the number of people who believe it. That the vaccines were made by Bill Gates and I and we put a chip in it so that we could follow people around and know what they ' re doing and get into their head. The idea that there ' s a conspiracy, that we ' re making billions of dollars on vaccines, and that ' s why people are promoting vaccines, so that people like me and others who are public figures... I mean, based on no data. But once it gets into the social media, it explodes and conspiracy theories explode. Even though all of the evidence proves it wrong, proving something wrong today doesn ' t seem to matter much. That ' s really strange and weird, isn ' t it, David? DB : Yeah, yeah. Well, it ' s, I think, an old phenomenon. There ' s a famous saying that I ' m going to mangle about by the time the truth gets out of the barn, the lie is halfway around the world. And that ' s definitely the world we ' re living in. I do know you have to go and, you know, finish out your tenure and then get ready for your rewiring, which I ' m excited about. I ' m excited to see what ' s next. But do you have a last bit of advice for the public? One thing you hope everyone takes away from your time as director and your time in public health? AF : Yeah, David, there are so many things, but I think one thing that stands out, particularly in the climate and the environment that we ' re in right now, is that people need to get involved in a proactive way in spreading the truth about what scientific principles are and what they mean and how they can be of great benefit to society and to try and make our population more science literate than it is right now by talking about things. The truth, you know, the easiest way to counter misinformation and disinformation is to be enthusiastic about spreading correct information. A little bit about the metaphor that you said about the truth and lies. Be spreaders of facts and truth. Everybody ' s got to be a contributor to that. And that ' s one of the things I think we can do better. DB : Yeah, I would agree. And we ' re definitely trying here at TED. Well, Dr. Fauci, I know our members are incredibly thankful, I personally am incredibly thankful. So thank you so much for your work and for joining us today. AF : My pleasure, David, thank you so much for having me. [Want to join conversations like this live?] [Become a TED Member!] [Sign up at ted. com / membership]

Bruno Giussani : It ’ s difficult to think clearly of the Russian invasion of Ukraine, because wars, while they unfold, they ’ re kind of shrouded in a sort of fog. Information is abundant : the millions of refugees, the shocking suffering and the destruction, the politics. But sense is lacking. And that ’ s going to be the focus of this Membership conversation as we enter the third week of the war. We won ’ t talk about the events of the day but try to project a longer arc, a broader context. Our guest is geopolitical analyst Ian Bremmer. He ’ s the founder and president of Eurasia Group, and we asked him to lay the scene by talking first about the geopolitical shifts that have already been brought by the war in Ukraine. And after, we ’ re going to have a conversation, including questions from TED Members who are participating in this call. Ian, welcome. Ian Bremmer : Thank you very much. I ’ ll start by saying that in my lifetime, the most important geopolitical **artifact** is the fall of the Berlin Wall. I mean, you see it if you go into the new NATO headquarters in Brussels, just built a few years ago. And anyone that has a piece, something they ’ re very proud of, they know it affected their entire lives. I think that in 30 years ’ time, and I fear that in 30 years ’ time, if we look back, a second most important geopolitical **artifact** will be a piece of the rubble of the Maidan in Kyiv. I believe that the war that we are seeing right now is no more and no less than the end of the peace dividend that we all thought we had when the wall came down in 1989. The idea that the world could focus more on globalization and goods and services and people and ideas going faster and faster across borders, leading to unprecedented growth in human development and a global middle class. I think that this is a tipping point. Won ’ t end globalization, but it does end the peace dividend. It does mean that the Europeans overnight will and must prioritize spending on defense policy, on national security, coordination, on NATO. And the speech that was given by Olaf Scholz, the new chancellor, two weeks ago, in my view, the most significant speech given by a European leader in the post-Cold War environment, precisely because it ’ s now the post-post-Cold War environment, sending weapons to the Ukrainians, committing to over two percent of GDP spend on defense, investing in a new fund for defense infrastructure. But also recognizing that the way that the Germans and the Europeans as a whole looked at the world and looked at themselves was, unfortunately for all of us, outdated. A few other points I ’ d like to raise, just to kick off this conversation. One : One of the reasons I ’ m pretty negative about this, and I ’ m not usually very negative, I ’ m usually an existential optimist, I ’ m someone that ’ s just happy there ’ s water in the glass. But when I look at this conflict, I ’ m much more concerned. And that is because I do not see a scenario, a plausible scenario, in the foreseeable future where Putin emerges from this war in anything less than a radically weakened position compared to where he was before he announced the invasion. And I believe that both in terms of his domestic political orientation, how stable he is in his own country, also, of course, Russia ’ s economic position, and finally, Russia ’ s position in terms of global security and European security : ostensibly, the very reason that Putin began the war to begin with. Second big point is that the decoupling that we are seeing from Europe and the United States with Russia is, in my view, permanent. And that would be true even if there were a negotiated settlement and all the Russian **troops** were to pull out of Ukraine and we had peace. I still think that a lot of those companies would not come back with Putin in power. I ’ m convinced that the decisions by the Europeans to ramp up their national security capabilities will be permanent. Permanent deployments coming in the Baltic states, for example, forward deployments in Poland and Bulgaria and Romania. And also an unwind of Europe ’ s massive energy dependence : coal, oil and most importantly, gas on Russia. That does not make Russia a global pariah because you can ' t be a global pariah if the soon-to-be most important economy in the world, China, is actually your bestie on the global stage, and that indeed continues to be true despite China ' s efforts to portray themselves, towards Europe at least, as more neutral. We are going to see the Russians as a supplicant economically, in terms of energy flows, financially, in terms of transactions, and technologically, perhaps most important, aligned with China. That has big geopolitical implications long-term. Also, a lot of other developing economies, like the Indians, like the Gulf states, like Brazil, are also not going to work with Russia as a pariah. They ' ll continue to engage. Are there any silver linings? And I think there are a few. Of course, there is a much greater renewed purpose and mission of NATO. I mean, this is an organization that just a couple of years ago, France President Emmanuel Macron referred to as"brain-dead."It was increasingly drifting in terms of its importance. The Americans were focusing much more on Asia, the pivot. Not today. Today, NATO is purposeful, it ' s aligned, it ' s consolidated. it ' s going to get more resources, not less. That ' s also true of the European Union as a whole, even when we talk about countries like Hungary and Poland that have been much less aligned in terms of rule of law, in terms of an independent judiciary, much more aligned in terms of the importance of common values of Europe compared to that of what we ' re seeing in Moscow. I mentioned the German security and policy shift. The UK-EU relationship is much smoother and more functional than at any point since Brexit process actually started. And even the United States. I mean, if you watched the State of the Union for a brief moment in time, five or 10 minutes, when all of the Democrats and Republicans were standing and applauding together, you could be forgiven for believing that the United States had a functional representative democracy. Now I ' m not sure how long this is going to last, but at least as of now, leaders of the Democratic and Republican Party see Putin as much more of a threat, an enemy, than they do their opponents across the aisle in domestic politics. And two weeks ago, that was not true. That ' s significant. Final silver lining, and I wish it was more of one, but the Chinese, as much as they are strategically aligned with Russia and with the person of President Putin, they do not want a second Cold War. And they would rather a negotiated settlement. They ' re not willing to push very hard for it. But they certainly do not see a radical decoupling of the Russian, and potentially the Chinese economy, from the rest of the world, from Europe, from the US, from the advanced industrial democracies, as in any way in their interest. And ultimately, that does create at least some buffer, some guardrail on how much this is likely to escalate as a conflict going forward. BG : I want to make a step back and unpack some of that, maybe starting with a question that relates to your last point and is probably on the mind of many. And it is : Is there still some real space for negotiation? Is there still a potential relationship between Russia and Ukraine? IB : The foreign ministers of Russia and Ukraine just met recently in Turkey. It was as much of a non-event as the three preceding negotiations of more junior representatives of their teams on the Belarus border. The one thing that has been accomplished to a small degree has been humanitarian corridors, extending out of a number of Ukrainian cities that are being pounded by Russian military. That ' s because the Ukrainians are interested in protecting their civilians, and the Russians are interested in taking a lot of territory without necessarily having to kill so many Ukrainians, that could cause problems for them internationally as well as domestically inside Russia. But that is nowhere close to a negotiated settlement. Now, I mean, everyone I know that ' s involved in the negotiations right now responds that the President Putin himself is hell-bent on taking Kyiv and on removing Zelenskyy from power. Now I think, and by the way, they ' re getting quite close to being able to accomplish that militarily on the ground. I think within the next couple of weeks, certainly, it looks very likely. A couple of points here. One, there is no reason to put any stock in anything that the Russians are saying publicly in terms of their diplomacy. They lied to the face of every world leader about the invasion that they said they were not going to do into Ukraine. And then just today, Foreign Minister Sergey Lavrov publicly said, well, the Russians didn ' t attack Ukraine. I mean, this is Orwellian stuff, right? So first of all, do not report on Russian public statements as if they bear any semblance to reality on the ground. Secondarily, this looks like a huge loss for Putin right now. He understands it, and I think he would have a hard time, even with his control of information, spinning this to his public without removing Zelenskyy, without the"de-Nazification,"as he calls it – which is an obscenity in an environment where the Ukrainian president is actually Jewish – the disarmament of Ukraine, and of course, the ability of the Russians to change how they feel about Ukraine as a threat to the Russian homeland. BG : What level of support can we give Ukraine militarily, intel, economic, before Putin considers taking a strike on a NATO country? IB : Well, it ' s interesting the way you framed that, Bruno. Because I mean, I think that Putin is already considering strikes on NATO countries. I mean, there were massive attacks, cyberattacks and disinformation attacks, by Russia against NATO countries with reckless abandon over the course of the past years. And in fact, when President Biden met with Putin in Geneva back in June, it seems like years and years ago at this point, Biden set the agenda. Ukraine was largely not discussed, but what was discussed was cyberattacks on critical infrastructure. Because you may remember Bruno, that meeting came right after the cyber attacks against the Colonial Pipeline. And the Russians after that indeed pulled back on supporting those attacks by their criminal cyber syndicates. I expect those attacks to restart in very short order against NATO countries. I also believe that the fact that the West is sending weapons to Ukraine and is providing real-time intelligence reports on the disposition of Russian **troops** on the ground in Ukraine to better allow the Ukrainians to defend themselves and blow the Russians up, that is considered by the Russians to be an act of war, and they will retaliate. And how they retaliate is the question. I don ' t think they ' re going to send **troops** into Poland. But you know, when the Americans under Reagan were providing that kind of support to the mujahideen to help them defeat the Soviets in Afghanistan, the Soviets saw that as an act of war, and they engaged in acts of terrorism against the mujahideen in Pakistan. And I absolutely think that that is on the table in terms of front line NATO countries especially, like Poland, like the Baltic states, like Bulgaria, Romania. Would that be considered an Article V attack? Would that force NATO countries to strike the Russians back? I ' m not sure it would. Not directly, not militarily. So I mean, I do think that the fact that the NATO countries see there is some sort of a big red line between sending **troops** in, for example, and doing a no-fly zone because that could cause World War III, but everything short of that is just a proxy war. The Russians don ' t see it that way. And that gives the Russians some advantage tactically in terms of their willingness to escalate. BG : You ' re describing a spiral of escalation here that will touch the globe and not only Ukraine, not only the eastern flank of Europe, which means that not only this war has ripple effects everywhere, but this is also starting a sort of realignment of the global geopolitical situation and context. To me, it has been very striking how Europe and the US have kind of moved very fast in a cohesive way. And it has chosen, after years of prioritizing the economics in their international and global dealings, it ' s chosen to put politics over markets. It has adopted sanctions that will hurt Russia, but will also hurt Western businesses. It ' s the discussion about decoupling that you put forward before, an active kind of fencing out of the Russian economy. Talk to us about how do you see this decoupling playing out. IB : Yeah, I mean, I do think that for the Europeans, this is a permanent move. I mean, I ’ ve spoken to top leaders in the German government who tell me that Nord Stream was a strategic mistake, and they understand it. Who say that, you know, Scholz making this speech from the Social Democratic Party on the center left is the equivalent of Nixon going to China. No one else could have made that move. But having made it, everyone is on board. The popularity in Germany, even given the massive economic consequences, is extraordinary and is across the board. And what they need to do now is ensure that the diversification of fossil fuels in the near term away from Russia, towards Qatar and Azerbaijan and even, you know, sort of the United States for LNG, can be done as fast as humanly possible. And that further, even though it ’ s going to cost a lot, some of it will be uneconomic, the move towards renewables actually picks up and is faster. The Italians, Mario Draghi, I think his shift in strategic orientation that they will do, this is his”whatever it takes”moment. He had that in response to the 2008 financial crisis as the head of the European Central Bank, and that made him”Super Mario.”This is making him Super Mario as the Italian prime minister. This is the”whatever it takes”moment for the Italians who never make public statements that undermine their economic, their commercial interests like this in such a strategic way. The French, of course, have less to be concerned about in the sense that most of their energy comes from nuclear power and is domestic. So they are not as affected directly by a cut-off from Russia. And also because Macron fancies himself, especially as the leader of the European Commission this year, the rotating leadership, occupying the presidency, but also with his elections coming up, and just given his personal belief that he can drive diplomacy, I believe that even after Kyiv falls and after Zelenskyy is either killed or forced out that the Americans will not want to engage in direct diplomacy, the Germans probably won ’ t. The French will. And by the way, the Chinese will too. And I do believe that there is a potential, and this is a danger for the cohesiveness of the West, that the Chinese and Macron end up being the post-Kyiv Normandy format of diplomacy. That ’ s something that the Americans and the Germans right now are starting to worry about quite a bit. Now that ’ s the European shift. And I think, as I said, I think it ’ s permanent. I believe the UK is in that camp as well. I ’ m not so sure the United States is going to be as committed for as long a term. It doesn ’ t affect the Americans as much economically, it doesn ’ t affect the Americans as much in terms of a direct security issue. None of those refugees are coming to the United States. But also American inequality, American political polarization and dysfunction is so much greater than what you experience on the continent in Europe. So the potential that in six months ’ time or in two years ’ time, as we ’ re thinking about the 2024 election, that the Americans have largely forgotten about this Russia issue instead, are focusing once again on domestic political opponents as principal adversaries, which deeply undermines NATO, much more than anything that would come from the Europeans, I think that is a real open question going forward that is perhaps as significant as the question of where the Chinese go. BG : Let me pick up on the point you made about energy, because somehow Putin ’ s calculus can really change if Russian oil and gas stops flowing to Europe, if it becomes part of the sanctions, right? And this war indeed can kind of be read as a war about energy. Selling energy funds it for Russia, being dependent on Russian energy makes the European response more constrained. Rising energy insecurity, rising energy cost may or probably will destabilize European politics and economy in the coming months. How would you look at this from the perspective of energy, and is there any likelihood that

Russian oil and gas is going to stop flowing, either because Putin cuts it or the Europeans sanction it? IB : Yeah, or because it ' s blown up in some of the transit in Ukraine? I mean, keep in mind, so much of the gas transit is going through large pipeline networks, which have some redundancy across all of Ukraine. But there ' s a big war that ' s going on right there, and lots of people that could have incentive to create problems. The Americans, of course, the Canadians, have said that they ' re cutting off oil import from Russia, but those are nominal numbers, so they don ' t matter very much to the markets. The Europeans, as I said, want to decouple themselves as quickly as possible, but they believe that doing that this year would be economic suicide. So there isn ' t, despite everything we see from Russia, they ' re using thermobaric weapons now against the Ukrainian people, the Americans are warning that they could use chemical, biological weapons against Ukraine. I mean, you know, you even have some people saying, what if they use a tactical nuclear weapon? I mean... God willing, none of these things come to pass. But it is very hard to see a military scenario in Ukraine that leads the Europeans to completely cut off their inbound gas from Russia this year. It ' s very hard to see. And also, I would say, it ' s very hard to see any level of economic sanction that would change the mind of the Russians in terms of their military decision making on the ground in Ukraine. Now, I think there are a lot of things that the West is doing in terms of providing weapons for the Ukrainians that are having an impact on the ground. A lot more Russians are getting killed. It won ' t prevent them from taking to Kyiv, again in my mind I feel quite confident about that. But it ' s quite possible, perhaps even likely, that the west of Ukraine will remain in Ukrainian hands, which means that, you know, after this fighting is"over,"that a rump Ukrainian state in exile exists in the West, run by Zelenskyy or someone that ' s aligned with him, and that they continue to get enormous economic and military support from all of the NATO countries. So even though I don ' t think that the energy situation will become so parlous that it would affect Putin ' s decision making, I do think that the West ' s response does matter on the ground. BG : The war is kind of having radiating economic shock waves around the world now, ripple effects on food markets, for example and food security. We talk a lot about energy security, what about food security? IB : Well, you have the largest grain producer in the world invading the fifth largest grain producer in the world on the back of a two-year pandemic that ' s still ongoing. We don ' t talk about it much anymore, but it ' s still there. And of course, this hit the poorest countries in the world the hardest. The level of indebtedness and the unsustainability of paying that debt off was already becoming a massive problem for so many of the developing countries in the world. And the IMF provided a lot of relief in special drawing rights and direct aid over the course of the past 12 months, but that money is now running to an end. And what happens when commodity prices spike up and we have severe supply chain challenges with energy and food, and those things are obviously very related. What happens is that a lot of people die. What happens is we see a lot more starvation. The World Food Organization says about 10 million people a year die of starvation. That number in the next 12 months is going to be a lot higher than it otherwise would have been. The number of people who are food stressed in the world is going to go way up in sub-Saharan Africa, in Yemen, in Afghanistan, in Bangladesh. It ' s going to go way up. And you know, it ' s horrible to think about, but the massive impact of this Russia crisis is going to be much more global inequality. And this is, of course, a direct consequence of the end of the peace dividend more structurally. That over the last 30 years of globalization, what did you have? A lot of people were left behind, but the biggest thing you had was the explosion of a single global middle class. On the back of the pandemic and now this Russia-Ukraine war and the decoupling of the Russian economy from the West, which doesn ' t matter so much in terms of the size of the Russian economy, but it matters immensely in terms of commodities globally and supply chain, those two things are going to seriously unwind the growth of this global middle class, and they ' re going to stress developing countries to a much greater degree. They will lead to financial crises in countries like Turkey, for example, that will no longer be able to service their debt. You ' ll see more Lebanons out there. You ' ll see some in Latin America, you ' ll see some in sub-Saharan Africa. Those are the knock-on effects and so, so many people that have been saying over the last few weeks,"Why are we paying so much attention to Ukraine? It ' s because they ' re white people, because they ' re European. We wouldn ' t pay that much attention if they were Afghans or if they were, you know, Afghanis or if they were Yemenis. We wouldn ' t."I mean, first of all, you ' ve got millions and millions of Ukrainian refugees, and we ' re not paying as much attention to them as we did to the Syrian refugees precisely because of race, precisely because the Europeans are more willing to integrate millions and millions of"fellow Europeans"into Europe. But we are paying much more attention to the Ukraine crisis and we should, because the impact on the poorest people around the world is vastly greater from this conflict than anything that we ' ve seen in any of those smaller economies with less impact, despite all of the human depredation that ' s happened over the past 30 years. BG : Ian, I want to talk for a second about climate because another crisis that has, kind of, disappeared from the headlines is the climate crisis, right? Ten days ago, the IPCC released a report that the secretary general of the UN described as an"atlas of human suffering,"if I remember correctly. And it has been basically ignored. Over the last several years, much of the world had started to embark, with more or less enthusiasm, on a process of transitioning away from oil and gas and into kind of a clean energy future. And now the war comes in and we look at what you just described, the unraveling of global supply chains, the dependency on energy and so on. And there are kind of two schools of thought here. One says this war is going to accelerate the adoption of clean energy because we need to diminish dependence from Russia and these fossil fuels. And the other says, the other school of thought says it ' s going to derail the transition to clean energy because suddenly the priority is no longer decarbonization, suddenly the priority is energy security, energy supply. IB : The Europeans are largely in the first camp, and they will move towards faster decoupling and investment accordingly. The Americans are largely in the second camp, and they will move towards"Let ' s focus more on fossil fuels and partisan divide on this issue,"accordingly. The Chinese, who are the largest carbon emitter in the world by a long margin, though not per capita and not historically, but still in terms of every year totals, they will continue on the same path they ' ve been on, which is a net-zero target but without yet a very strong plan on how to get there and not feeling a lot of pressure to provide that plan, because they think the Americans are completely incoherent and incapable of effectuating a strategic long-term plan on climate themselves. So I mean, what we have is a lot of progress on climate and, of course, technology around renewable energies and around electric batteries and supply chain continue to get cheaper and cheaper as more money is being invested in it. And that does make me long-term more optimistic that by 2045, a majority of the world ' s energy will probably be coming from renewables. And five years ago, I wouldn ' t have said that. But still, I mean, when the news today is that the Americans are sending a high-level delegation to Caracas to figure out if we can reopen relations with Venezuela to get them to produce more oil again. With the Iranians, let ' s do any deal possible to get back into the JCPOA, the nuclear deal, so that we can get that oil on the market. Calling the Saudis, calling the Emiratis, and they ’ re not willing to take Biden ’ s phone call on this issue while they ’ re talking to Putin. Those are warning signals that in the near term, we ’ ve got some big challenges and a lot of those challenges are going to be filled with fossil fuels and fossil fuel development. And so I do think that the fact that both of the answers to your question are true in different places on net-net is more negative for how quickly we can transition. BG : Let ’ s talk a bit about China. Brigid, I think, who ’ s listening in asks,”What do you believe Xi Jinping is learning from the world ’ s response to the crisis, to the Ukrainian war?”IB : Well, certainly learning that this was a red line for the West. And I think that this would have surprised, it obviously surprised Putin, I think it would have surprised Xi Jinping as well. Xi Jinping saw Afghanistan. He saw that Merkel was out. He saw that Macron is focused on strategic autonomy. He sees Biden as much more focused on China and Asia. I think that this is a surprise to Xi Jinping. But Xi Jinping also sees that a lot of the world is not with NATO on this issue. 141 countries, if I remember correctly, voted to censor the Russians for their invasion of Ukraine at the United Nations General Assembly. But very large numbers of that 141 are not on board with all of these sanctions against Russia. They ’ re happy with the diplomatic censure, but they need to continue to work with the Russians. The Chinese see that too. The Chinese see just how much more fragmented the global order is. I thought the most significant thing that we ’ ve seen from the Chinese so far two issues. The first is, of course, when Putin went to Beijing and Xi Jinping made the public announcement that”this is our best friend on the global stage, and we will work much more strategically with them economically, diplomatically and militarily going forward.”And Xi Jinping knew very well where Ukraine was heading at that point and also knew that the likelihood of an invasion was coming. Didn ’ t stop him from making that announcement in the slightest. And then after the invasion, and it ’ s going badly, I mean, if you watch Chinese social media, the fact is that the censorship is all about Ukraine. I mean, the Chinese media space is pursuing a relentlessly pro-Putin policy. They have media embedded with Russian **troops** on the ground in Ukraine. Now, publicly, the Chinese government wants to be seen as :”We ’ re neutral, we like the Russians, we like the Ukrainians, we still want to work with everybody.”But the fact is that China feels no problem being publicly completely aligned with Putin, despite the fact that they are invading a democratic government with 44 million people in the middle of Europe. That ’ s a pretty astonishing statement from the Chinese. And there ’ s no question that they have learned that they ’ re in a vastly better economic position than they used to be, and that gives them influence. They are a government who projects its power primarily through economic and technological means, as opposed to Russia that projects it primarily through military means. And the Chinese believe that there is a level of decoupling that is already going on as the Americans focus on more industrial policy, as they focus on America first for American workers. A US foreign policy for the American middle class, as Biden put it, is one that really pushes a lot of capital to leave a country like China, which had served as the factory for the world, but at the expense of a lot of labor coming out of advanced industrial economies. And now, yes, there are definitely some dangers that come from the Chinese being perceived as too close to Russia, and they won ’ t want that, and they ’ ll want to make sure that they ’ re engaging diplomatically with the Europeans to try to minimize that damage. But I thought it was very interesting, and I ’ m not sure this is public yet, that the Chinese ambassador to Russia recently, in the last few days, organized a meeting of a lot of the top investors Chinese investors in Russia, saying,”This is a unique opportunity, the West is leaving, we should be going in and doing more. Because they ’ re going to be completely reliant on us going forward.”That is not a message that the Chinese ambassador delivers unless he is told directly to from Beijing. BG : Ian, I ’ m going to jump from topic to topic because there are several questions in the chat. Nancy is asking about whether Putin can be removed from power. There ’ s been a lot of discussion lately about regime change in Russia, either endogenous, like a palace coup, or provoked by sanctions and other policies. And so she asks,”How likely is that Putin will face a challenge from inside Russia, whether a popular uprising, a coup or other?”IB : It ’ s very, very unlikely until it happens. I mean, in the sense that there is absolutely no purpose in trying to say, oh, I mean, you know, there are rumors that Defense Minister Shoigu is unhappy and, you know, he might be making a move. And I ’ ve seen these from relatively credible analysts, I ’ m like, no, no, if there are such rumors, then we know it ’ s not happening because that ’ s the end of Shoigu and his family. But it ’ s very clear that there is more pressure on Putin now than at any point since he ’ s been president. Domestic pressure on Putin. About 10, 000 Russians have been arrested so far, detained, most of them have been released, for nonviolent anti-war protests. The Russians have shut down all the Western media. They ’ ve shut down all the Russian opposition and independent media. So Putin has control of the space, though if you look at Russian conversations on Telegram, you ’ ll still see a bunch of people that are seriously, seriously anti-war. But, you know, once the economy starts truly imploding and you can ’ t find goods on shelves in Russia in major cities, and this is coming, you know, very soon, this is a matter of days, in many of these cities, those demonstrations will likely become greater, some of them can become violent. You know, that ’ ll increase the pressure. Then you have the issue of how the Russians are fighting on the ground. I mean, what happens if you get a lot of desertions? We haven ’ t seen that so far. What happens if you get orders to bomb Kyiv and a whole bunch of Russian fighter pilots, bomber pilots, decide not to and they defect to Poland, to Germany. That would have a big impact on morale. That has not happened so far. I mean, do be aware of the fact that the Ukrainians are winning the war on information, and that means that the information that you are getting in the West about the war is much more pro-Ukrainian – morale, enthusiasm, how well the military is doing – than what ’ s actually happening on the ground. And also be aware of the fact that the Russians completely control the war on information inside Russia. BG : Exactly. IB : They ’ re not getting a balanced view. They ’ re getting a completely pro-Putin view. And most of them actually believe it in the same way that most people that voted for Trump in the US believe that the election was stolen and Trump is still president. I mean, it ’ s much worse in Russia in that regard than it is in the United States, and I think that that ’ s underappreciated in the West. So even though I think there ’ s pressure, I really don ’ t think that it ’ s super likely that Putin is out anytime imminently. BG : Ed is asking whether you see any off-ramp for Putin. IB : I think that the most likely off-ramp for Putin is after Kyiv is taken and Zelenskyy is removed one way or the other, at that point, the possibility of the Russians accepting a frozen conflict or a cease fire that could lead to ongoing negotiations is a lot higher because Putin can sell that as a win back home much more easily. But also because further Russian attacks at that point serve much less purpose for the Russians, are much harder to bring about, and potentially have much more negative consequences. So for me, that would be the near-term potential break where we could at least freeze issues largely where they are. Now whether that could then eventually lead to a climbdown or not, I mean, the Russians have been very happy with frozen conflicts on their borders for years and years and years. I ’ m thinking about Nagorno-Karabakh between Armenia and Azerbaijan, which basically stayed in place until the Azeris, over the course of a decade got enough military capacity that they could forcibly change the situation on the ground. Which, by the way, the Ukrainians might also be eventually thinking about because the West will be supplying them with advanced weapons all the way through. I ' m thinking South Ossetia in Georgia. I ' m also, of course, thinking about the two pieces of Ukraine they took back in 2014. So be aware of the fact that a negotiation that creates a cease fire does not mean you ' re anywhere close to a resolution or an end of the fighting that we ' re seeing. BG : Someone else in the chat, who didn ' t sign by his or her name, is asking about the nuclear fear that hangs over the conflict. How should we think of that? IB : Yeah, we don ' t like it when Putin uses the N-word, and there ' s no question, I mean, he and his direct reports have rattled nuclear sabers on at least five times that I ' ve seen in the past few weeks. I think that... In 1962, I wasn ' t alive, we had the Cuban Missile Crisis. There was a real possibility of nuclear confrontation between the world ' s two superpowers. At least for the last 30 years, there ' s been no chance of that. Functionally, no chance of that. I think we ' re now back in a world where a Cuban Missile Crisis is again a reality. Now, that doesn ' t mean that I think nuclear war is likely or imminent. I don ' t. And in fact, there is active deconfliction going on even today : the Americans and Russians with a new hotline, the secretary general of the UN, with the Russian defense minister engaging in deconfliction measures with UN offices being invited to Moscow. So as bad as it is right now, people that have been doing this for a long time are trying to avoid nuclear war. But that ' s the point. Is we ' re now in a situation where the conflict that we ' re going to experience needs to be actively managed because of the danger of nuclear confrontation. So it now becomes a risk on the horizon that we must be continually aware of, even if only at a low level, as we take and consider further actions, as we consider diplomacy, as we consider escalation. It is now on the table in a way that frankly is so debilitating. I mean, as human beings all on this call, one of the most painful things to think about is the fact that we still have these 5, 000 nuclear warheads in Russia and 5, 000 the United States that are still pointed at each other, and they still have the potential to destroy the planet. And we haven ' t had any real lessons that we ' ve been able to learn institutionally from 1962. BG : 5, 000 being a generic figure, not the exact figure, but we are kind of in that order of magnitude. Then of course, there is the question of civilian nuclear, so the two power plants, nuclear power plants, that have been seized by the Russians. One has been slightly damaged by a bomb, the other has been turned off. But those are also potentially gigantic nuclear problems just waiting to happen. IB : Chemical weapons, biological weapons. I mean, look, we have had two million refugees from Ukraine in two weeks. As this continues, you ' re looking at five to 10 million refugees. I mean, it is hard – Just take a step for a moment just as a human being. Imagine what it would take for a quarter of your country ' s population to say :"I am not living here anymore. I am leaving everything because of the condition of the country, because of this unjust war that has been imposed upon you by your neighbor."That ' s what we ' re looking at. And again, it ' s important for us to, you know, not lose the humanity of this crisis and the extraordinary hardship that is being visited upon 44 million Ukrainians that have done nothing wrong, they have committed no sin other than their desire to have an independent country. BG : One other country that has not yet taken a very clear position is India. IB : Well, they ' re a member of the Quad, and their relationship with China is pretty bad, and that ' s mutual. But in terms of Russia, there ' s been a longstanding relationship, trade relationship, defense relationship between India and Russia that the Russians are not going to jettison, and they see no reason to jettison it. And as long as you ' ve got a whole bunch of other countries out there that are substantial, that are willing to say, we ’ re going to keep playing **ball** with the Russians then the Indians will too. And that ’ s why you ’ ve got the abstention in the United Nations vote. And that ’ s why you ’ ve had very careful comments as opposed to overt and strong condemnation coming from the Indian leadership. BG : Phil in the chat is asking,”Will this cause a fragmentation of the financial system with kind of a Western system and an Eastern system?”So two different SWIFT-like systems, two different credit card systems, crypto, what ’ s the role of crypto in all this? IB : I hope not. I mean, I will tell you that before the invasion started, if you talk to most Western CEOs, and I ’ m talking across the entire sweep of sectors, so it ’ s finance and it ’ s manufacturing and its services and it ’ s tech, most of them would have told you that they did not in any way plan on reducing their footprint in China, and a lot of them said that China was their most important growth market in the world. Not a surprise. China is going to be the largest economy in the world in 2030. So, you know, a world that you ’ re decoupling is not a good world when China is going to be number one economically. I mean, that obviously is going to hurt the West in a big way. So there are strong incentives against that, and there remain very strong and powerful entrenched interests in the United States and Europe that will resist direct decoupling. Despite the fact that there are these more incremental moves towards friendsourcing and insourcing because, you know, Chinese labor is more expensive, you don ’ t need as much labor to get capital moving, given robotics and big data, deep learning all of those things. But I do think that the Russia conflict risks a level of second-order decoupling. Because if the Russians end up financially integrated with China in their own, not-as-effective SWIFT system, and all of their energy ends up going to China and the Chinese build that infrastructure and they get a discount on it, and Russia ’ s technology and their military industrial complex gets serviced by Chinese semiconductors and Chinese componentry, well, I do think that there will be knock-on decoupling that will be longer term and more strategic from the United States, from the Europeans and even from Japan and South Korea. So that is a worry, and I think the Chinese are highly aware of that. And over the coming months, they will do everything they can, both with the Europeans in particular, but also, I expect at least with some of the Asian economies, to try to limit the impact of that. Now, keep in mind, we haven ’ t talked at all about Asia yet outside of China. The new Japanese Prime Minister Kishida is at least as hawkish in his orientation towards China and Russia as Abe was. He is providing support for the Ukrainians, including some military capacity – unheard of for the Japanese. He ’ s allowing Ukrainian refugees – unheard of for the Japanese. And yesterday, the South Koreans had a very, very tight election, and Yoon is now in charge. He is on the right, and he is the guy that is strongly anti-China, was talking about South Korea having nuclear capabilities, wants a new THAAD missile defense system for the South Koreans and wants to rebuild the relationship with Tokyo. That matters. And that ’ s a big strategic change in the geopolitical map that will look more problematic on the decoupling front from Beijing ’ s perspective. BG : Three final quick questions that all come from the chat, Ian. One is, because you mentioned the rest of Asia outside of China,”What about the rest of the world? What about Africa and Latin America? How do they factor into this conversation or don ’ t they?”IB : They factor in. I mean, those that have significant commodities do well because the prices are going to be so high. Those that don ’ t are going to be under massive pressure for reasons we already talked about, but they are not going to be forced to pick a side on this one. I just don ’ t see it. In the same way that if you were Colombia in the last couple of years, you know, you found, even though you ’ re working very closely with an American ally, you ’ re still dealing with Huawei and 5G. This is knock-on effects of all of this. These are countries that are not going to take on significant economic burden, given how much they ’ re suffering right now geopolitically. BG : Another one is about sanctions. How do we even know when and how, at what point we start rolling back sanctions? IB : I think that as long as Ukraine is occupied by the Russian government for the foreseeable future and Putin is there, I can ’ t see these sanctions getting unwound. Now, if a rump Ukrainian government that is democratically elected were prepared to sue for peace and retakes most of Ukraine, but they give away Crimea and they give away the Donbass, could you see in that environment some of these sanctions unwound? Sure. But I mean, I am suggesting that I think that many of these sanctions are functionally permanent. They reflect a new way of doing business. And when people ask me what ’ s going to happen when this is over, my response is, what do you mean over? What ’ s over is the peace dividend. We are now in a new environment. BG : And one of the figures of this new environment and I want to close with that, is President Zelenskyy of Ukraine, who was not taken very seriously when he was elected, he has come out as a significant figure in this war. What do you make of President Zelenskyy? How do you read this character? IB : He ’ s very courageous. I ’ m obviously inspired by his ability to communicate and rally his people and take personal risk in Kyiv while this invasion is going on. But I ’ m very conflicted because I think many of the steps that Zelenskyy took in the run-up to this conflict actually made the likelihood of conflict worse. He was unwilling to take the advice of the Americans and Europeans seriously in the months leading up to the conflict. He was unwilling to mobilize his people to ready them for the potential of conflict. He was certainly unwilling to give an inch in terms of Ukraine ’ s desire to be a member of NATO, even though he knew completely that no one in NATO was prepared to offer a membership action plan, let alone actually bring them in as members. And part of that is a lack of experience and lack of any business being in that position in the run-up to this crisis. So I ’ m very deeply conflicted in my personal views on Zelenskyy, given the way he behaved before the invasion, compared to the extraordinary leadership that he has **displayed** to all of us over the last two weeks. BG : Ian, thank you for taking the time, for sharing your knowledge, and your analysis with us. We deeply appreciate it. Thank you very much. IB : Good to see all of you. Creating intelligence on a computer. This has been the Holy Grail for artificial intelligence for quite some time. But how do we get there? So we view ourselves as highly intelligent beings. So it ’ s logical to study our own brains, the **substrate** of our cognition, for creating artificial intelligence. Imagine if we could replicate how our own brains work on a computer. But now consider the journey that would be required. The human brain contains 86 billion neurons. Each is constantly communicating with thousands of others, and each has individual characteristics of its own. Capturing the human brain on a computer may simply be too big and too complex a problem to tackle with the technology and the knowledge that we have today. I believe that we can capture a brain on a computer, but we have to start smaller. Much smaller. These insects have three of the most fascinating brains in the world to me. While they do not possess human-level intelligence, each is **remarkable** at a particular task. Think of them as highly trained specialists. African dung beetles are really good at rolling large **balls** in straight lines. Now, if you ' ve ever made a snowman, you know that rolling a large **ball** is not easy. Now picture trying to make that snowman when the **ball** of snow is as big as you are and you ' re standing on your head. Sahara desert ants are navigation specialists. They might have to wander a considerable distance to forage for food. But once they do find sustenance, they know how to calculate the straightest path home. And the dragonfly is a hunting specialist. In the wild, dragonflies capture approximately 95 percent of the prey they choose to go after. These insects are so good at their specialties that neuroscientists such as myself study them as model systems to understand how animal nervous systems solve particular problems. And in my own research, I study brains to bring these solutions, the best that biology has to offer, to computers. So consider the dragonfly brain. It has only on the order of one million neurons. Now, it ' s still not easy to unravel a circuit of even one million neurons. But given the choice between trying to tease apart the one-million-neuron brain versus the 86-billion-neuron brain, which would you choose to try first? When studying these smaller insect brains, the immediate goal is not human intelligence. We study these brains for what the insects do well. And in the case of the dragonfly, that ' s interception. So when dragonflies are hunting, they do more than just fly straight at the prey. They fly in such a way that they will intercept it. They aim for where the prey is going to be. Much like a soccer player, running to intercept a pass. To do this correctly, dragonflies need to perform what is known as a coordinate transformation, going from the eye ' s frame of reference, or what the dragonfly sees, to the body ' s frame of reference, or how the dragonfly needs to turn its body to intercept. Coordinate transformations are a basic calculation that animals need to perform to interact with the world. We do them instinctively every time we reach for something. When I reach for an object straight in front of me, my arm takes a very different trajectory than if I turn my head, look at that same object when it is off to one side and reach for it there. In both cases, my eyes see the same image of that object, but my brain is sending my arm on a very different trajectory based on the position of my neck. And dragonflies are fast. This means they calculate fast. The latency, or the time it takes for a dragonfly to respond once it sees the prey turn, is about 50 milliseconds. This latency is **remarkable**. For one thing, it ' s only half the time of a human eye blink. But for another thing, it suggests that dragonflies capture how to intercept in only relatively or surprisingly few computational steps. So in the brain, a computational step is a single neuron or a layer of neurons working in parallel. It takes a single neuron about 10 milliseconds to add up all its inputs and respond. The 50-millisecond response time means that once the dragonfly sees its prey turn, there ' s only time for maybe four of these computational steps or four layers of neurons, working in sequence, one after the other, to calculate how the dragonfly needs to turn. In other words, if I want to study how the dragonfly does coordinate transformations, the neural circuit that I need to understand, the neural circuit that I need to study, can have at most four layers of neurons. Each layer may have many neurons, but this is a small neural circuit. Small enough that we can identify it and study it with the tools that are available today. And this is what I ' m trying to do. I have built a model of what I believe is the neural circuit that calculates how the dragonfly should turn. And here is the cool result. In the model, dragonflies do coordinate transformations in only one computational step, one layer of neurons. This is something we can test and understand. In a computer simulation, I can predict the activities of individual neurons while the dragonfly is hunting. For example, here I am predicting the action potentials, or the spikes, that are fired by one of these neurons when the dragonfly sees the prey move. To test the model, my collaborators and I are now comparing these predicted neural responses with responses of neurons recorded in living dragonfly brains. These are ongoing experiments in which we put living dragonflies in virtual reality. Now, it ' s not practical to put VR goggles on a dragonfly. So instead, we show **movies** of moving targets to the dragonfly, while an electrode records activity patterns of individual neurons in the brain. Yeah, he likes the **movies**. If the responses that we record in the brain match those predicted by the model, we will have identified which neurons are responsible for coordinate transformations. The next step will be to understand the specifics of how these neurons work together to do the calculation. But this is how we begin to understand how brains do basic or primitive calculations. Calculations that I regard as building blocks for more complex functions, not only for interception but also for cognition. The way that these neurons compute may be different from anything that exists on a computer today. And the goal of this work is to do more than just write code that replicates the activity patterns of neurons. We aim to build a computer chip that not only does the same things as biological brains but does them in the same way as biological brains. This could lead to drones driven by computers the same size of the dragonfly ' s brain that captures some targets and avoid others. Personally, I ' m hoping for a small army of these to defend my backyard from mosquitoes in the summer. The GPS on your phone could be replaced by a new navigation device based on dung beetles or ants that could guide you to the straight or the easy path home. And what would the power requirements of these devices be like? As small as it is – Or, sorry – as large as it is, the human brain is estimated to have the same power requirements as a 20-watt light bulb. Imagine if all brain-inspired computers had the same extremely low-power requirements. Your smartphone or your smartwatch probably needs charging every day. Your new brain-inspired device might only need charging every few months, or maybe even every few years. The famous physicist, Richard Feynman, once said,"What I cannot create, I do not understand."What I see in insect nervous systems is an opportunity to understand brains through the creation of computers that work as brains do. And creation of these computers will not just be for knowledge. There ' s potential for real impact on your devices, your vehicles, maybe even artificial intelligences. So next time you see an insect, consider that these tiny brains can lead to **remarkable** computers. And think of the potential that they offer us for the future. Thank you.

I became obsessed with the relationship between the brain and the mind after suffering a series of concussions playing football and rugby in college. I felt my mind change for years after. I was studying computers at the time, and it felt as though I had damaged my hardware and that my software was running differently. Over the following years, a close friend suffered a serious neck injury and multiple friends and family members were struggling with crippling mental health issues. All around me, people that I loved dearly were being afflicted by ailments of the nervous system or the mind. I was grappling with all of this while pursuing an MFA in Design and Technology at Parsons when a friend and fellow student showed me an open-source tutorial on how to build a low-cost single-channel EEG system to detect brain activity. After a couple long nights of hacking and tinkering, I saw my brainwaves dancing across the screen for the very first time. And that moment changed my life. In that moment, I felt as though I had the possibility to help myself and the people I loved. And I also realized that I couldn ' t do it alone. I needed help. So in 2013, in Brooklyn, with some like-minded friends, I started OpenBCI, an open-source neurotechnology company. In the beginning, our goal was to build an inward-pointing telescope and to share the blueprints with the world so that anybody with a computer could begin peering into their own brain. At first, we were an EEG-only company. We sold brain sensors to measure brain activity. I thought that ' s what people wanted. But over time, we discovered people doing very strange things with our technology. Some people were connecting the equipment to the stomach to measure the neurons in the gut and study gut-brain connection and the microbiome. Others were using the tools to build new muscle sensors and controllers for prosthetics and robotics. And some were designing new devices and peripheral add-ons that could be connected to the platform to measure new types of data that I had never heard of before. What we learned from all of this is that the brain by itself is actually quite boring. Turns out brain data alone lacks context. And what we ultimately care about is not the brain, but the mind, consciousness, human cognition. When we have things like EMG sensors to measure muscle activity or ECG sensors to measure heart activity, eye trackers and even environmental sensors to measure the world around us, all of this makes the brain data much more useful. But the organs around our body, our sensory receptors, are actually much easier to collect data from than the brain, and also arguably much more important for determining the things that we actually care about : emotions, intentions and the mind overall. Additionally, we realized that people weren ' t just interested in reading from the brain and the body. They were also interested in modulating the mind through **various** types of sensory stimulation. Things like light, sound, haptics and electricity. It ' s one thing to record the mind, it ' s another to modulate it. The idea of a combined system that can both read from and write to the brain or body is referred to as a closed-loop system or bidirectional human **interface**. This concept is truly profound, and it will define the next major revolution in computing technology. When you have products that not just are designed for the average user but are designed to actually adapt to their user, that ' s something truly special. When we know what the data of an emotion or a feeling looks like and we know how to make that data go up or down, then using AI, we can build constructive or destructive interference patterns to either amplify or suppress those emotions or feelings. In the very near future, we will have computers that we are resonantly and subconsciously connected to, enabling empathetic computing for the very first time. In 2018, we put these learnings to work and began development of a new tool for cognitive exploration. Named after my friend Gael, who passed from ALS in 2016, we call it Galea. It ' s a multimodal bio-sensing headset, and it is absolutely packed with sensors. It can measure the user ' s heart, skin, muscles, eyes and brain, and it combines that capability with head-mounted **displays** or augmented and virtual reality headsets. Additionally, we ' re exploring the integration of non-invasive electrical neural stimulation as a feature. The Galea software suite can turn the raw sensor data into meaningful metrics. With some of the sensors, we ' re able to provide new forms of real-time interactivity and control. And with all of the sensors, we ' re able to make quantifiable inferences about high-level states of mind, things like stress, fatigue, cognitive workload and focus. In 2019, a legendary neurohacker by the name of Christian Bayerlein reached out to me. He was actually one of our very first Kickstarter backers when we got started, early on. Christian was a very smart, intelligent, happy-go-lucky and easygoing guy. And so I worked up the courage to ask him,"Hey, Christian, can we connect you to our sensors?"At which point he said,"I thought you would never ask."So after 20 minutes, we had him rigged up to a bunch of electrodes, and we provided him with four new inputs to a computer. Little digital buttons, that he could control voluntarily. This essentially doubled his number of inputs to a computer. Years later, after many setbacks due to COVID, we flew to Germany to work with Christian in person to implement the first prototype of what we ' re going to be demoing here today. Christian then spent months training with that prototype and sending his data across the Atlantic to us in Brooklyn from Germany and flying a virtual drone in our offices. The first thing that we did was scour Christian ' s body for residual motor function. We then connected electrodes to the four muscles that he had the most voluntary control over, and then we turned those muscles into digital buttons. We then applied some smart **filtering** and signal processing to adapt those buttons into something more like a slider or a digital potentiometer. After that, we turned those four sliders and mapped them to a new virtual joystick. Christian then combined that new joystick with the joystick that he uses with his lip to control his wheelchair, and with the two joysticks combined, Christian finally had control over all the manual controls of a drone. I ' m going to stop talking about it, and we ' re going to show you. Christian, welcome. At this point, I ' m going to ask everybody to turn off your Bluetooth and put your phones in airplane mode so that you don ' t get hit in the face with a drone. How are you feeling, Christian? Christian Bayerlein : Yeah, let ' s do it. Conor Russomanno : Awesome. This is a heads-up **display** that ' s showing all of Christian ' s biometric data, as well as some information about the drone. On the left here, we can see Christian ' s muscle data. Christian is now going to attempt to fly the drone. How are you feeling, Christian, feeling good? CB : Yes. CR : All right. Rock and roll. Let ' s take this up for a joyride. Whenever you ' re ready. CB : I ' m ready. CR : All right, take her up. And now let ' s do something we probably shouldn ' t do and fly it over the audience. Alright, actually, let ' s do this. I ' m going to ask for people to call out some commands in the audience. So how about you? Straight forward. Straight forward. Alright. How about you? Man : Up! CR : Not down. Oh, he ' s doing what he wants right now. Amazing. Alright, let ' s bring it back. And what I ' m going to do right now is take control of the controller so that you guys know that there isn ' t someone backstage flying this drone. All right, Christian, you ' re alright with that? CB : Yeah. CR : Unplug. Forward. And we ' re going to land this guy now. CB : I think I was better than you. CR : Amazing. Now I ' m going to unplug it so it doesn ' t turn on on its own. Perfect. Christian has repurposed dormant muscles from around his body for extended and augmented interactivity. We have turned those muscles into a generic controller that in this case we ' ve mapped into a drone, but what ' s really cool is that joystick can be applied to anything. Another thing that ' s really cool is that even in individuals who are not living with motor disabilities, there exist dozens of dormant muscles around the body that we can tap into for augmented and expanded control interactivity. And lastly, all the code related to that virtual joystick, we ' re going to open source so that you can implement it and improve upon it. There ' s three things that have stood out to me from working on this project and many others over the years. One, we cannot conflate the brain with the mind. In order to understand emotions and tensions and the mind overall, we have to measure data from all over the body, not just the brain. Two, open-source technology access and literacy is one way that we can combat the potential ethical challenges we face in introducing neural technology to society. But that ' s not enough. We have to do much, much more than that. It ' s very important, imperative, that we set up guardrails and design the future that we want to live in. Three. It ' s the courage and resilience of trailblazers like Christian who don ' t get bogged down by what they can ' t do, but instead strive to prove that the impossible is in fact possible. And since none of this would have been possible without you, Christian, the stage is yours. CB : Yeah, hi, everybody. Audience : Hi. CB : I ’ m excited to be here today. I was born with a genetic condition that affects my mobility and requires me to have assistance. Despite my disability, I ’ m a very happy and fulfilled person. What truly holds me back are not my physical limitations. It ’ s rather the barriers in the environment. I ’ m a tech nerd and political activist. I believe that technology can empower disabled people. It can help create a better, more inclusive and accessible world for everyone. This demonstration is a perfect example. We saw what ’ s possible when cutting edge technology is combined with human curiosity and creativity. So let ’ s build tools that empower people, applications that break down barriers and systems that unlock a world of possibilities. I think that ’ s an idea worth spreading. Thank you.

I was supposed to go in the very first session. And I had a plan. And that plan was I ’ d do TED, I ’ d see Vancouver, I ’ d chill out, I ’ d get this thing done, then I ’ d relax. I ’ d listen to other people ’ s speeches, rob their best ideas, bring them home and sound incredibly, incredibly brainy. And then your man, Chris, rings me last weekend. He says,”You know that last thing, the first thing? Why don ’ t you go last?”I ’ m like,”Oh, man.”That brought to mind the words of the great American philosopher, Mike Tyson. Who said of plans,”Everybody has a plan until they get a punch in the face.”And of course, you know, doing the last gig at TED, it ’ s not about the pressure, that ’ s not the problem. The pressure isn ’ t the problem. The problem is the sobriety. But the speeches have been amazing, right? And if I could kind of encapsulate them all, it ’ s really been about, as far as I can see, the pace of change and what that ’ s doing to us demographically, politically, socially, economically. Extraordinary stuff. And I ’ d now like to quote from a great liberal, democrat, a friend of TED, Vladimir Lenin. Who said of change and crises that there are decades when nothing happens and there are weeks when decades happen. And we ’ re living through those weeks, you get that feeling, and it ’ s really difficult to know where to start to think about these... How do you analyze this stuff? Now, if I was an American economist or a Canadian economist or, God forbid, an English economist – Actually the nice thing is they ’ re not good at economics anymore. It ’ s so beautiful, isn ’ t it? Praise the Lord. Praise the Lord. But I ’ d come here armed with the tools of my trade. You know, the graphs and the charts and the maths and all that good stuff. But I ’ m an Irish economist, so I ’ m only going to come here armed with some lines and some verses of poetry. Yeah. Thank you very much, the poets in the corner. We ’ re a small minority. But perfectly formed. Now, I want to talk to you about a poem that was written in 1919 called”The Second Coming”by W. B. Yeats, our national poet. And the fascinating thing about crisis, so in 1919, 100-odd years ago – the fascinating thing about crisis is that every generation feels that their crisis is the big one. We ’ re kind of narcissistic about it, right? But every generation experiences crisis. Every generation, our parents, our grandparents, they all did. How we deal with the crisis is the definitive issue for our generation. So Yates is sitting in Dublin, 1919. He ’ s trying to make sense of the world, right? His world is changing rapidly. The German Empire is over. The Austrian Empire is over. The Ottoman Empire is over. Ireland has declared a war of independence against Britain, which, if you were a betting man, you wouldn ’ t really give us, not our side, you wouldn ’ t have given us good odds. And Yeats is trying to figure out not just what is happening, but what is likely to happen. And he writes these words, and just listen to them and imagine they were written now."The Second Coming.""Turning and turning in the widening gyre / The falcon cannot hear the falconer ; / Things fall apart ; the centre cannot hold ; / Mere anarchy is loosed on the world, / A blood-dimmed tide is loosed, and everywhere / The procession of innocence is drowned ; / The best lack all conviction, the worst / Are full of passionate intensity."Just let those words lie."Things fall apart, the best people lack conviction, the worst are full of passionate intensity."Now, this is Yeats writing 100 years ago, and the historical rhythm and repetition is clear, I think, to all of us. But what really interests me as an economist is the contrast between what Yeats, the poet, was saying back then and what all the economists, the people who were employed to think about the future, were saying. So, Yeats said,"The center will not hold."Three years after he wrote this, three years, three to four years, Mussolini was in power in Italy, Stalin was on the ascendancy in the Soviet Union and a little, small, unprepossessing man with a mustache called Adolf Hitler had just orchestrated a putsch in Munich. Yates was right. Yates was right. And what were all the economists saying back then? The people who were paid to think about the future? They were all saying,"Oh, don ' t worry, we ' ll go back to the gold –"Not all, the vast majority –"We will go back to the gold standard. We ' ll trade again. Germany will pay all its reparations and the First World War will have been the war to end all wars."How wrong could they be? So what ' s always bugged me is why did the poet get things so right at a tipping point, and the economists get things so wrong? And I believe it is because the poet, the artist, the musician, these types of people give themselves, at a tipping point, the permission to think unconventionally. They see the world differently. Do we value the unconventional thinker? Do we? And maybe the best way to answer that question is to go all the way back to school, to the place we begin to learn. Now just bring yourselves back to your school days. Remember yourself at 13. Just remember the person you were. I remember the classroom. I remember the teachers, I remember the building, I remember the break, I remember everything. I remember the sports day, I remember the whole thing. In fact, there ' s a gang of five of us who ' ve hung around since we were in school. And those five lads I was in school with spent the entire of our school years looking out the window They just didn ' t get it. They just didn ' t get school at all. And they ' ve gone on to have incredibly successful lives in their own individual ways. But their intelligence, their form of intelligence, was not recognized. And as we get older, we realize the world is full of **various** different intelligences. But back in school, we only really recognized one type of intelligence. And that was like the little kid who could come in – big, wide-eyed kid, right? – he ' d come in, could absorb all this information into his head or her head, opened some sort of weird compartment, stuff it all in, stuff, stuff, stuff it all in. And then, in early June, when the weather gets good in Ireland – and I presume it ' s the same all over the place except for Vancouver – write like bejesus, right? That was the type of intelligence we rewarded. It ' s like getting a prize for being a walking filing cabinet, right? That ' s one intelligence. It is an intelligence, but it ' s only one type of intelligence. And what about all the other kids over here, the kids who didn ' t get it?... They weren ' t not only recognized, their intelligence was besmirched, humiliated and belittled. My daughter is dyslexic. She hated every single day of school. And as a result of this system, we have a strange thing in our society where there are thousands of incredibly clever people who left school feeling stupid. But the corollary is also the case. There are many actually quite stupid people – You know where I ' m going – Who left school feeling very, very clever. And those kids, when they were really good kids, they used to get the best marks in school. In Ireland, we have a little star over the right. And of course, the teacher told them they were clever, and the priests, the nuns, and of course, their mummy told them they were clever, right? If you want to get a sense of an Irish mummy, an Irish mummy is the sort of mother that makes an American soccer mom look unambitious. I know, I have one, right? I am the son of a retired schoolteacher. If anybody else in the room is the son or daughter of a schoolteacher, we can form a self-help group later on to deal with our trauma, right? But those sort of kids, they do extremely, extremely well in school, then they do very, very well in college. And then they get on, because they do very, well, on to the graduate trainee programs and they join the big banks, and they join the big firms and they join insurance companies, they join the consultancies, and they ’ re on the fast track. They ’ re on the fast track career-wise. And something weird happens as their career progresses. We like to think that we surround ourselves with people who think differently, but we don ’ t. There ’ s something called confirmation bias. We actually surround ourselves with people who confirm our biases. And how this works in institutions is the following. We end up employing people who think like us, right? And like, if you imagine an interview process, so the person goes into the interview and there ’ s two clever persons saying,”No, no, you ’ re clever.””You ’ re clever, you ’ re amazing.””You ’ ve got that grade.””You went to that university.””I read that paper you wrote.””You ’ re clever, clever, amazing.””Feck it, just have the job.”So the interview becomes – By the way, I said”feck”there. Not the other word. Feck is a sort of a linguistic version of a white lie. OK? It ’ s used at home. Now, what actually happens is the interview process just becomes like a Tinder for people who can do algebra. OK. So they all go into the institution and then what you get, you get groupthink because everyone ’ s thinking the same way. And of course, because these people have always been the clever kids with the right answer, they defined themselves,”I ’ m the person with the right answer.”And what happens when you ’ re the person who always has the right answer? It ’ s very hard to be wrong. So it breeds a sort of an overconfidence. And we know that overconfidence and overconfident people can really overestimate their competence ’ s critical moments. The thing comes from a thing called Dunning-Kruger in psychology. It ’ s a great story. A fella goes in to rob a bank in America. Somewhere, I think Pittsburgh, down there somewhere. In the ’ 90s, a lad goes into rob a bank, OK? He runs into the bank... he ’ s got no **mask**, no balaclava, no nothing, right? The security camera looks at him. And he winks at it. He winks again, big smile,”Hi, how are you?”He goes in, holds up the bank, robs the thing. Goes off. Coppers, come in, look at the securities.”See this geezer, just waved to the camera. Does anyone know him?””Oh, yeah, he lives around the corner, around the second block, sixth house, up third floor.”So they arrive and **bang** on the door, the man ’ s there, I presume, kind of eating a takeaway or something. And copper said,”We want to **bang** you off for the bank robbery.”And he said,”How do you mean, the bank robbery?””We ’ ve got you on camera for the bank robbery... here we go.””How do you mean?””We ’ ve got you!””How could you possibly know? I wore the juice!”Copper looks at him, says,”What?”Do you remember when we were kids? Invisible ink? And you put lemon juice on the invisible ink – this is a true story – and you disappear. Your man covered his face with lemon juice and he thought he was invisible. The overconfident overestimating their competence. Now, when the psychologists thought about this, they actually did lots and lots of tests. And apparently it ’ s true, that this is a thing in society. And surprise, surprise, the Dunning-Kruger effect is much more prevalent in men than women. Who would have known? Shock horror. I can see it in my own family. Our son, for example, comes home, teenager, after doing an exam. Hasn ’ t done a tap of work, right? Comes in the door and everyone in the family ’ s in the kitchen saying,”How did you do in your exam?”And he says,”Oh, Jesus, I aced that, man, no problem.”And he fails all the time. All the time. So you see these things and that again it happens. And of course, how this happens in institutions is you get very overconfident people, very intelligent, can ’ t make mistakes. And we saw that in the 2008 financial crisis. 2008, the biggest financial crisis the world has ever seen. And the vast majority of economists and the Fed and the Bank of England and the European Central Bank and Wall Street missed the whole thing. In fact, the Queen of England went to the LSC about two or three months after the crash and she said,”If you chaps were so clever, how come none of you saw this coming?”And she was right. Because they all were wearing the juice. The economics juice. Now, JK Galbraith, very famous Canadian economist. But Galbraith said something fascinating about the conventional person. He said,”When faced with the choice between changing his mind and finding the proof not to do so, the conventional man always gets busy looking for the proof.”And that ’ s when we make big mistakes at these critical moments. Leonard Cohen, the Canadian poet, put it differently, the same idea. Cohen said,”There is a crack in everything. And that is how the light gets in.”What Cohen was saying to us was, look for the cracks, look into the cracks. That ’ s where we ’ ll see the big picture. So let ’ s just leave the Canadian poet, go back to an Irish poet. The words of”The Second Coming”again, our world right now.”Turning and turning in the widening gyre / The falcon cannot hear the falconer ; / Things fall apart ; the center cannot hold ; / Mere anarchy is loosed on the world, / A blood-dimmed tide is loosed, and everywhere, / The procession of innocence is drowned.”And why, says Yeats? Because the best lack all conviction and the worst are full of passionate intensity. Now apply that to our world. And if you, at this tipping point say,”Nah, you know, it ’ s not my problem, I lack all conviction.”Right?”I go and watch baseball,”or rounders or whatever that game is you guys watch, right? But if you lack all conviction, what actually happens is the worst people in our society, with their passionate intensity, their certitude, their simple ideas, they will win the day at this tipping point. And they will win the day because the best people back away from the responsibility. And what Yates was also saying about the best people was the following. He said, mandate the best. The poets, the artists, the musicians, because they are the people who see the possibilities. They see the possibilities because they see the world from a different angle. They have to be part of the solution. So my idea that I think is worth spreading is the following. If you want to understand the world a little bit more clearly, listen less to my tribe, the economists, and listen more to Yeats ’ s tribe, the poets. Thank you very much. Thank you very much.

Every month I spend a week on the front line. For over a year now, I have been a member of Aerial Reconnaissance Unit. Before the invasion, I had only used a drone to scout locations for my architectural practice. Now I pilot a UAV to help Ukrainian artillery spot targets. This time two years ago, I would probably introduce myself as the CEO of an architectural studio. Maybe I would also brag about co-owning two cafes in Kyiv, which I also designed. To be clear, I still am an architect and an entrepreneur. It ’ s just that now I consider those roles supporting. As a military volunteer, I have monthly shifts. This means I still get to spend time at home, my safe haven, trying to make sense of this new life. I travel back and forth from Kyiv to the front line and back to Kyiv. Not your regular commute, I suppose. Even though Kyiv suffers constant missile attacks, the contrast in between the capital and the hotspots is quite stark.

Back home, I can walk my dog Eva, grab a coffee and just barricade myself in my office. Of course, our work is often interrupted by the air-raid alarms, but this is something we have grown to live with. Compared to dusty trenches near Kherson, our bureau ' s open-space office seems like a perfect work environment. But somehow, whenever I try to focus, I keep thinking back to those trenches. It is there, just a few miles from the battlefield, where I can feel the most productive. And it is then, in times of distress, when I can clearly see what the future holds. Of course, it hasn ' t always been this way. Before Russia launched its full-scale war, I had a pretty regular life. Well, maybe not that regular. My architectural studio was busy pushing the envelope. We renovated an old church in San Francisco, California, turned a former military arsenal into a teeming food hall. And even designed the art installation for the Ukrainian polar research base. Seriously, here ' s the proof. All the way from Antarctica. All I ' m saying, we were doing just fine. Great, even. But then came the sickest plot twist one could imagine. On February 24, 2022, I woke up to the sounds of explosions. Now, I don ' t know if you know many people from Ukraine, but our humor can be rather dark. But back then, we all went numb. Most of my teammates fled to safer areas, unsure whether they would have a home to return to. Some stayed in Kyiv, sheltering in basements and subway stations. The others decided to take up arms for the first time ever. After the shock came a revelation. We had to turn our fear into action. So on day two, I stepped into a new role, switching from the coffee co-owner to emergency kitchen cofounder. And since there was plenty of food left in storage, we decided to cook meals for territorial defense units. Partnering up with other restaurants, we founded an organization called Kyiv Volunteer. Many people came in to help – musicians and lawyers, drivers and architects – all united around a common goal. And to give you a sense of scale, on peak days, we served up to 15, 000 hot meals to the military and medics. While our pots were clanking, Russian **troops** were advancing. Ukraine ' s future remained uncertain, but we were too busy to dwell on that thought. Working underground allowed us to prioritize the needs and address them, one by one. First we focused on basics : shelter, food, medicine. Then we had to address the recovery, both physical and mental. Talking to people on our humanitarian mission, we got a simple yet fundamental notion. What we all craved most was the sense of home. Not four walls and roof per se, but the little things. The rose bush behind the kitchen window. The attic full of hidden treasures. That slightly crooked bench by the gate, always attracting the neighborhood cats. No matter where Ukrainians happen to spend the night, be it in an emergency shelter or some Good Samaritan ' s home, they ' re always trying to make it feel cozy. Sometimes we even better our temporary homes by, say, fixing a long-broken fence. This observation led us to another insight. Home is the temple. And architecture can be heailing. When done with empathy, architecture can help people to sustain the trauma and envision the brighter future. Even if this future is still up in the air. Two weeks into invasion, my team and I remembered : we were still architects and could use our expertise for a good cause. This was when our bureau started working on an idea we call RE:Ukraine Housing. Knowing that nothing is more permanent than temporary, we tasked ourselves with raising the standard of temporary housing. Being both architects and displaced people, we knew how to make a difference. So what is the first thing that comes to your mind when you think of temporary housing? Probably those **typical** refugee camps, built from shipping containers. So this is something our team sought to change. Dignity no matter what. These four words became a basis for our work and in a way, our mission. In merely two weeks, we developed a system of dignified, temporary accommodation. Our vision of what displaced people need to feel at ease. We want residents to feel equally comfortable, so we made our rooms fit different life scenarios, whether it ’ s an elderly couple or a single parent with a newborn. We also knew people would need a place to work, study and care for their kids, so we provided them the space to do this as well. And to avoid **spatial** segregation, we proposed to make public spaces, open to anyone, building bridges in between host communities and IDPs. Technology-wise, we didn ’ t reinvent the wheel. But this is what and how we suggest building that made people reconsider the very essence of temporary housing. This May, after a year of preparation and paperwork, we broke ground on our pilot settlement. Bucha District, once known as the site of Russian atrocities, became a home for our big idea and a symbolic place to create new, happier memories. Now, RE:Ukraine is not just a housing project but a pilot for a recovery program. Our goal is to help displaced people get back on their feet and reintegrate, leaving their trauma behind. And since many places in the world are devastated by wars and climate change, the displacement challenge is the global one. Though rooted in Ukraine, the model can be replicated, helping to accommodate the displaced people elsewhere. Watching Ukrainians flock to Bucha and other liberated areas, translated into another insight. Our folks don ’ t want to wait to fix what ’ s broken. Fixing is the first thing we do after every attack, despite the threat of anything being destroyed again. Public spaces like schools and hospitals restored by local authorities. But when it comes to private housing, people are often left with this task [on] their own. So to help smaller householders rebuild, we created RE:Ukraine Villages, a free online tool for rural housing restoration. With just a few clicks, the tool generates you a step-by-step manual to restore a house or to design a new one from scratch. Floor plans, façade scans, technical description, a list of materials. Fool-proof guides for homeowners and volunteers. To show you how it works, here ’ s the project generated with the tool. And the model of a house one may build based on this manual. To preserve the traditional image of Ukrainian village, we decided to base our builder on a local design code. And since every region has its own quirks, the tool had to reflect them. So the Kyiv region became the starting point for our research. Our architects traveled from village to village exploring different types of roofing, windows and cornices. Then came the developers who transformed the data in an accessible tool. Just imagine, that tool can generate you over 211 million unique house configurations for the Kyiv region alone. And each house, though designed with modern materials, looks super familiar, like the one Ukrainians spent their summer holidays at. A reminder of happier days and a wholesome image of home. The peak of our work fell on the end 2022. This was when Russia targetted the power plants, to plunge our cities in total darkness. Our team had to work around the power cut schedule, trying to get the work done during the four-hour spans. This was when we discovered how to charge our computers from the car inverter. Now, I hope none of you ever happen to face a blackout. But if you do, remember this life hack. And to give you some context, the minibus we used as the power bank is the same I use on my military missions. So this is what Ukrainians call war-work-life balance. The thing we mastered over the last year and a half. Now, I would be lying if I said I ’ m not proud of our accomplishments, I truly am. But just imagine how much more we could achieve if not for the war. Despair and uncertainty can fuel your ideas. But do we really need to wait for this kind of fuel? The best time is always now. So if you have the privilege of living in peace, use this time wisely. And don ’ t worry too much about the future. It ’ s not that scary if you embrace it with dignity. Thank you.

Text Sample 899: POS Dim 6 – 2024 – Score 6.00 – 2024/t003277.txt
Chris Anderson : We are 10 days away or so from the 40-year anniversary of TED ’ s founding. 40 years! Unbelievable. And today we get to listen to the man who really has been the driver of TED for the whole first part of that voyage, an amazing man. Please welcome the incomparable Richard Saul Wurman. Richard Saul Wurman : Thank you, Chris. That ’ s the first time I ever heard you say that. CA : Ricky, it ’ s great to have you here. Thank you so much, for so much. Gosh, where to start? I think I would love to hear a bit about your story before TED was even a glimmer in your mind. Who are you? How did you become this information architect that conceived of this conference? RSW : I had the realization that there was two kinds of people, vertical and horizontal people. And success, in terms of money, power, fame, getting better at a certain task – painting, sculpture, playing the cello, being a magician – comes from doing that one thing better and better and better through your life. And you are, if you have the right PR or you just stand out yourself, you gain success in that profession and in society. And my attention span points to horizontality. I ’ m just as interested when I walk down the street in what ’ s left and what ’ s right, and the sign over there. And that horizontality is a life devoted to seeing patterns. And every meeting that I went, every gathering I went to, if it was eye, ear, nose and throat specialists, it was on the road to becoming a nose specialist and then one nostril. The whole society was being focused and still is, in many ways, most gatherings are about one thing, and people talk to each other about the one thing they can talk to each other about. And part of it is getting a job or selling a paper or getting a grant within that one specialty. And that ’ s good. This is not a pejorative. This is an observation of one of the ways, the major way the world turns. But when I went to the University of Pennsylvania in architecture, I got a special deal with the dean that I could take as many courses as I wanted as long as I kept a very high average. And so I was in class, every day, every night, taking very odd courses, inside painting and snuff bottles and Japanese swords and integration technology and ethnology and things on illuminated manuscripts and painting and history of astronomy. And I realized that I didn ’ t take notes because I had no time to study, that I engineered reverse-engineering, that you take notes, not to take notes, you take notes so you can study them. To pass the test. That all the educational system was about taking a test. And my learning was about my memory. So I learned to listen. And I see and visualize patterns between things. CA : And so although Ricky, you qualified as an architect and worked as an architect, but how long was it before you really thought of yourself and described yourself as an”information architect?”RSW : I graduated in 1958 / 9 with a master ’ s degree. And I was an assistant professor of architecture. And the first book I did was when I was 26 years old, and it was a book of comparative maps of 50 cities in the world. And that was my first book, was information architecture. Because the comparative analysis of things was the systemic way of showing maps to the same scale, which people basically don ’ t ever do now. If you look at the road atlases, every map on every page is a different scale. So I would say when I was 26. CA : And even from those early days, it feels like you had this obsession with just what it is to explain something. You know, how you make information interesting and useful. And it sounds like that came precisely because you were willing to go broad. You were willing not just to look at a thing in itself but how it connected, how the dots connected. RSW : Well, I don ’ t like to fail, but I was willing to fail, and I embrace it so I see what doesn ’ t work and what I can ’ t understand. So yes, explaining is a key word, but we ’ ve never explained how do you explain things. And we don ’ t understand how we understand things. They ’ re very simple. And when we ask a question,

most of the word is”quest.”There ’ s no”quest”in the question. We ask lousy questions. And information, most of the word is”inform,”and most information is data, doesn ’ t inform. I ’ m talking dumb words now, Chris. These are simple words : memory, memorize, understand, understand, explain, explain. They ’ re all simple : quest – question inform – information. CA : Well I ’ m going to come back to some of those questions at the end because I would love to know what you would say now about understanding understanding. But before then, talk about, like, you started to get very involved in conferences. There was a big conference that you were involved with before TED. Talk about that. RSW : Yes, I was a little schlepper in Philadelphia, and I ’ d done, with my partner, Al Levy, I ’ d done a book called”Our Man-made Environment”for kids. And had a nonprofit called GEE, Group for Environmental Education, GEE! And TIME Magazine, which was important then, TIME Magazine was the record of the week in the world that you believed, if it got into TIME Magazine. They did a big story on this book. I mean, we were just schleppers, a little teeny office in Philadelphia, architectural practice, Murphy, Levi, Wurman, MLW. And it was picked up and the people from Aspen from the International Design Conference in Aspen, asked my partner and myself, Al and myself, to come out and speak. He got ill. And this was one of the big moments in my life. I went out and I worked my – I just, I gave a speech. I think it ’ s the last speech I worked out and wrote before I gave it. In fact, it ’ s the one and only, but I had it down and I gave it. I don ’ t know if the audience liked it so much, but some of the board liked it because it was complex. It was very dense because I was trying to – I was ambitious, I really was ambitious. And the board was the stars of the design world, the stars. And at the end of the speech, somebody came up to me from the board and said,”That was a very good speech,”and very soon, I was in my 30s, I was the youngest person, they put me on the board before the conference was over. And before the year was out, and this was in June, before the year was out, I was asked to do the conference after the next one. So in ’ 70 I was put on the board. ’ 72 – they already had the person chosen for ’ 71 – ’ 72, I did a conference there for 1, 200 people called the Invisible City, and when you did a conference there, it was not funded, hardly funded at all. And you were God, you ’ re, you know, it ’ s nice to be king. I was in charge of the whole thing. And at that conference, Lou Kahn came and talked, incredible people came, and I learned how to fail and how to have things work. And I learned that you can ’ t go to school for this, but that I felt really comfortable being on stage. In fact, I was more comfortable being on stage than in the audience. Because I was seeing things were going wrong when I was in the audience and onstage, it was my mistake, and I enjoyed that. I knew I could do it better. So that was it and it was the best conference in the world, not mine. The National Design Conference, which was in Aspen, and the whole town was, the Aspen Institute was connected to it, and it was, 1, 200 people came from around the world. My partner in my guidebook company, I had a guidebook company called Access Press, and it was on the process of doing guides to 22 cities around the world. So I had that. And around the corner from me was a gentleman by the name of Harry Marks. The CEO of CBS was Frank Stanton. So Harry had never met Frank, and his eyes were wide open because he was such a big deal. But we were in California, and Harry and I were talking, and Harry wanted to do something because he was tired of what he was doing in television, which was doing ads for television programs on television networks. He invented this idea. And he said he knew I did the Aspen conference. Why don ’ t I invent a conference, and we ’ ll go into business together. So I got Frank to give me 10, 000 dollars, Harry to give me 10, 000 dollars, they both had money. I put in 10, 000 dollars, I didn ’ t have any money. And we were going to do this conference. But we signed a paper, and this is how close TED came to not happening, we signed a paper, quite clear, because Frank did not want to be attached to any failure. He was failure adverse, as sometimes top executives are. And Harry was just a little nervous of that. And I was a loose cannon, as you know. And we signed a paper that if we didn ’ t have X number of people signed up by December, we ’ d give the money back, and we wouldn ’ t do it. And so I was unethical. I was a liar. I broke that commitment. Neither one of them ever forgave me. And they have a right not to forgive me because I was not – I broke my word. But by that time, my assistant Janet Smith and I went down all the numbers and it showed that with the number of people who were signed up, and if we sell the rest of the tickets at 100 dollars each – was 395 – we sold them for 100 bucks, we could not break even, but we would lose less than if we canceled it now. And we ’ d even have to shell out more money because we had rented the room and rented the hotels and committed to things. So I went ahead and basically, the two of them never talked to me again. Frank broke off his relationship as partner of my guidebook company, more or less. And Harry didn ’ t talk except six years later. The first one was so good. Because we did it ’ 84, this is now 1989, Harry comes and says so many people have told him to do it again. CA : Alright, so he was ready to talk to you then. But before we go there, I want to go back to this first one and where the insight came from that there might be synergy between technology, entertainment and design? I mean, look, this was the year – RSW : You ’ re going to make me say it : the conference is not about the audience. I don ’ t care about synergy or about transforming the audience. I don ’ t care about getting letters in, I don ’ t care about rah rah rah. What I cared about was pleasing myself. I invited the people I wanted to hear from. It worked. The whole measure is me. These were interesting people to me, that most of them I hadn ’ t met, but calling them on the phone and appealing to their ego and the fact that some of them I knew, and if they were coming, other people would come. CA : Right. Before you could invite them, you had to invite them to something. And what you invited them to was this weird conference that was these three industries coming together. Did that just emerge from the discussions between the three of you that you were all kind of, from those three industries in some way? And so you thought, you know what? We could pull these things together. Who thought TED, T-E-D? How did that happen? RSW : I did that. I think up names for things. The logo that you now have, I hand drew. That ’ s not a typeface. I drew that logo. CA : Well, thank you. RSW : You ’ re welcome. CA : But why, who thought that technology, entertainment and design, as opposed to, say, software, architecture, there are many other ways that you could have combined. Why these three industries as the heart of something special? RSW : Chris, you tell me a better three things, and I will do it next time. That turned out to be OK. That ’ s all. CA : I mean, it turned out to be amazing. 1984 was the year that the Apple Mac was created. It was the year you had – RSW : The Mac was shown there for the first time. You could touch it. It was announced a month before, but the real ones, the people in the audience could touch. Mickey Schulhof could give away shiny little mirrors, and nobody had a CD player. I just happened to – CA : Right. But so like, right at that time, so a CD, you know, it ’ s technology, it ’ s entertainment and design, that it must have felt like an aha moment to a bunch of people then that, gosh, there really is this connectivity. And I just think it ’ s beautiful how that happened. And tell me this, Richard, even from the start – RSW : The name, the E is the one that many people, you know, to you, say,”Oh, it ’ s technology, education, design.”And it ’ s my way of being for entertainment, being understandable, ways of pulling you into understanding as opposed to the educational system. Design is what I was, and technology was out there. It ’ s a pretty dumb thing

: technology, entertainment, design. CA : Sir Ken Robinson himself said that when you reveal that you ’ re in education, everyone runs away from you at parties. It ’ s OK. But I mean, it worked out incredibly well. And I ’ m curious about like, did it happen that from the first conference that because people weren ’ t just talking to their own industry, that they made an extra effort to have their words accessible to a general audience? Was that something you insisted on? Did it just happen? How did that happen? How did that turn out? RSW : Build the **ball** field, they ’ ll come. You set up a situation where you gave people permission to talk to other people, and they get in touch with their curiosity. The people I invited, they had a **filter** of people I knew who were curious. They were open. The people in the audience who came were curious because they heard about it, and they wanted to know what the hell I was doing. So I mean, I wasn ’ t invisible at that point, and Frank Stanton was not invisible at that point. So they had a little trust, that was all. It wasn ’ t so planned. It was just trying to do good work. That ’ s all, it was not, I don ’ t – I can ’ t write a doctoral dissertation on the planning of what I did. I just did something that felt good. And it was good. CA : If people do want to get a flavor of that first conference, there ’ s actually a talk online by Nicholas Negroponte, the founder of the MIT Media Lab. RSW : He announced it at that conference. He got up and he said,”I ’ m closing the architecture machine and opening, you know, the MIT Media Lab. And he was codirector with the president of MIT. CA : He gave quite a long talk, longer than most TED Talks would be now, and made some predictions that have actually held up pretty well. RSW : If somebody kept on talking, it was good, I let them. But basically, it was supposed to be under 20 minutes. CA : So that first one, only a few hundred people showed up, less than you hoped for. And you lost money. You each lost 7, 000 dollars, I think you told me, of your 10. Each. And so TED didn ’ t then happen for another five or six years until – RSW : I wasn ’ t going to do it again. I didn ’ t want to do it, that was it. I tried that and it was good, but I was on to other things, and I was trying to make a living because I was not in good shape, you know, financially. CA : So Harry Marks came to you in ’ 89 and said,”Actually, it was a commercial failure, but people loved it. How about it? Maybe the time is better now.”How did he persuade you? RSW : This time, I wrote a letter you couldn ’ t get out of, that said if we don ’ t have enough money by a certain date, I can ’ t afford to lose any money. So I did something which was radically different than the lie, breaking a contract the first time. But then it filled up, and it filled up from then on in. But Harry didn ’ t like working with me, and after that conference, he says,”I just want out. I can ’ t, I don ’ t want to do this.”And we didn ’ t argue, we just didn ’ t get along. We just didn ’ t get along. CA : You bought him out for a dollar, right? RSW : He wanted a dollar so it was legal. So he wrote the contract, and he asked for a dollar, and I kept it. And there was never any problems about that afterwards. CA : And so you then held TED every year in Monterey, California. And there was this just growing buzz. I mean, that was the ’ 90s when there was just this growing sense of optimism and excitement about technology and everything it was connected to. I mean, talk about some of those early years, Richard, was there a moment when you just,”Oh my goodness, this thing is going to be amazing. This is more amazing than I know.”What really got you excited in some of those early years? RSW : It just changed my life. It just absolutely changed my life. And it changed the life of many people who were there, and it created circles in their lives. And there was not one person but even today, people said that the friends they have now are dominated by the friends they met at TED. It changed people ’ s acceptance of things outside of their circle and changed their businesses and expanded their feelings that they touched other things. And I wasn ’ t trying to do that. It just did that. It just did that. CA : There ’ s a lot of people listening here who are interested in events, and I think would love to tap into your wisdom about what it was that made it special. You were a very unusual and **remarkable** host. You sat on the stage while the speaker was speaking. You were unafraid to cut them off if they were getting boring. Like your client, as it were, was the audience, not the speaker. Or maybe the client was just your own interest and that that was a proxy for audience interest. What was it that made this thing become so special? RSW : It was human, that ’ s all. There was no lectern. So you couldn ’ t read a speech. I curated it by asking – not always done, not every speech was wonderful, but the best were wonderful – and I asked people to say something they hadn ’ t said before. And... I wasn ’ t interested in good speakers, I was interested in good conversations. I was interested in seeing things before other people saw them. I would interrupt some speakers if I didn ’ t understand something. So I was, in that sense, I curated for the audience, I was their conscience. And I think it was joyful, between the animal acts. I had animal acts because I always wanted to have animal acts. I mean in that sense, I was a pig in shit, I loved being there. CA : You were the ringmaster. RSW : Well, I enjoyed it as much as I hope when you were there, and you said you started coming in ’ 98. Did you know I was having a good time there? It was not painful. I mean, there was attention to detail. I tried to make the details of how – you had your program in your badge. You just held up your badge, and it was the program. You didn ’ t have to carry anything. And then I gave away all those free things until it got – Wired Magazine did a story and said I invented the idea of swag at that time. And I didn ’ t even know I invented it. But we gave away, you know, huge amounts of stuff that people sent in. And nobody would sell anything from the stage. So it wasn ’ t commercial. I didn ’ t have a political point of view, and I didn ’ t have a financial point of view. I had just – wasn ’ t it fun to learn these things? And, you know, some of them, they were up there were maybe slightly boring, but something I was interested in. And then sometimes people other people were interested in. You were there, you could tell me what it was like being there. What was it like being there, Chris? CA : Well, it was overwhelming for the first day, and I didn ’ t get it actually, for the first day. Like, I was intrigued, but I didn ’ t understand why. Like most people, I was in my groove, focused on, you know, trying to make magazines and trying to figure out why exactly am I listening to a designer talk about a chair or an architect or this? You know, it wasn ’ t until day three that you started to realize that something that someone said is connected in a really surprising way with something someone else had said. RSW : Absolutely. CA : And you realize, you know, that all of the best ideas happen through a weird kind of serendipity of things bumping together from outside your normal frame of reference. That ’ s how innovation happens. And Ricky, the human element like – Aimee Mullins, you brought her onstage and you did something that few people would dare to do today, I think. Like, she had lost her legs. She had artificial legs that she had used as an athlete to win. And you invited her to take them off. RSW : But nobody knew that she had artificial legs. They were so good. CA : Right! So this is the showman – RSW : And then I said,”Today, Aimee, take off your legs.”CA : The showman in you, there is a big showman in you, and it was like, you know, how could we really surprise people? I know, let ’ s ask someone, let ’ s ask a speaker to take off her legs. That doesn ’ t happen every day at a conference. And the thing is, she was completely cool with it and so human and told her story of her own empowerment, of how, you know, this technology and help for other people and so forth, that she just felt strong and full of possibility. And I was, by that stage, in the back row of the auditorium, you know, weeping, like, tears rolling down my cheeks. So that was when, I think, I really knew that this was not just interesting but truly special, like, it was moving. And I spoke with other people there, and they said things like,”This is the first week I carve out of my calendar every year.”Well, that gets your attention. That ’ s pretty special. Tell me about – You had courage on stage to do things that, again, most people wouldn ’ t do, and you insisted on a certain kind of vibe from speakers and audience. So there was the time, famously, when Nicholas Negroponte came back, like in his first talk, he was wearing a sort of jacket and tie. And you weren ’ t happy about that. What happened next? RSW : Well, I mean... I ’ d said that the dress is casual and no ties, suits, please. Because that has an effect, it ’ s different. So I just got scissors and cut off his tie. And the audience gasped. And then it became a joke. But people remember that because it was something. I ’ ll tell you a speech that – the audience came up with names. These are not mine, I didn ’ t create these. The audience did somehow. If somebody was there for the first time and they came out in conversation, people in the audience would say to them,”Oh, you ’ re a TED Virgin.”They came up with those things. They came up with things, a”TED moment”when something happened, like cutting off a tie. Or if you remember, Sherwin Nuland, I don ’ t know if you were there. CA : I was there, that was an astonishing talk. RSW : That was one of the most moving things for me. I ’ ll tell you a story of what curation is. Sherwin called me on the phone. I did not know him well. He had been to a conference, and he trusted me for some reason. I think because I don ’ t lie. And he said he ’ s always wanted to tell a story, and he thought he would do it at TED, would it be OK with me? I said, I don ’ t even want to know what the story is. If you want to tell a story, that ’ s for you to do. He says, well, it ’ s, OK. And he got up – and he was well-known then as a doctor and I mean, quite well. I always felt very humbled by getting him to come because he was quite famous in his field. And he came on stage, and he started a talk regularly. And then I looked at him, with the thing of, well, what ’ s the story you ’ re going to tell? And he nodded, and I nodded. And then he told the story, which I then cried, of course I cry a lot, but I cried heavily for his talk. And he talked about being clinically depressed. And committed to treatment in a hospital and committed you know, maybe for the rest of his life. I mean, he was really bad. And he asked for electroshock therapy because he could, as a doctor, which you ’ re supposed to get maximum three times, but it was not thought of well at that time. And by the conference, he gave this talk, it was a horror to think of that, but he asked for it to be given to him ten times. More than three times what the limit was, and it basically cured him. And he told a story which was a shock. His wife didn ’ t know that story, his second wife didn ’ t know it. He had never told the story before. CA : Whoa. She found out when he was onstage? RSW : She heard it for the first time then. It was just astonishing. CA : He must have worried that she would have not let him tell it. You can watch that talk online now. There ’ s this incredible moment when he says, he tells the history of electroshock therapy and then says – RSW : Did I get it right because I haven ’ t seen it? CA : You ’ ve said it exactly right. He says,”And then you may ask, why am I telling you this? Well, it ’ s for a specific reason.”And when he revealed that he himself had been, this was his treatment, yeah, the shock in the room was unbelievable. And it ’ s just a brilliant talk. Wow. So, look, I ’ m going to, in about less than ten minutes, I ’ m going to bring in – RSW : I want to give a compliment to you. Because I ’ ve been working on this. And you see, you ’ ve just interviewed me. You ’ ve messed me up here. I ’ ve been thinking about what you ’ ve done. And, you know, when I did the last one, I was petulant, and I missed it. And then over the years, I saw you, and I wouldn ’ t do this, I would do this. And then I ’ ve been thinking lately what you have done. And in a different style, but amazing what you have been able to do. And I looked online, and I researched you, you have 25 programs that go on. 25 programs. In a recent correspondence with you, I talked about an orchard and apple trees, and I don ' t think you knew what I was getting at, and I didn ' t quite either. But I read a book on Johnny Appleseed, and it was somewhat nonsense because he did – It was a person, and he did carry seeds with him all the time that he got from cider factories. They gave him the free seeds, and he did take them around and he planted them. But you really can ' t get good apples from a seed. You can ' t plant a tree. So what ' s the relationship between you and I, Chris? I think I gave you a tree. But you, as you do to grow American Delicious, all the apples you can grow, you grafted them, and you have grafted a tree with 25 different apples. 25 branches. And that ' s where the apples have come from, from these. Because apple seeds don ' t grow apple trees, apples on apple trees. Little apples, but not big apples. And you have done – It was amazing. For a thing that almost didn ' t happen because of the fear of failure to something that then filled up a year in advance, to something that was the first person who signed up came each time, to selling it, to my petulance, to you doing things that, I think you didn ' t want to do TEDx in the beginning. And then you were convinced to do it. Lara Stein, you had some great people. June Cohen with TED Talks and Lara. And they convinced you to do it. I would have said no because that would have been TED Light. I would have thought, oh, you don ' t want to do that. And it ' s been wonderful. I ' ve spoken at a few TEDxs, and they have been really interesting. And you did 13, 000 of them! 13, 000 TEDxs! So my hat ' s off to you at this time. CA : Maybe even more now. Well, you ' re a kind man. Thank you. That ' s very kind. We should probably tell people just a bit about how the transition happened, because it was a very intense time, you know, like, it was the year 2000. So I ' d be coming to TED for two years when, I think, word got out that you were thinking that it was maybe time to sell, you ' d reached the grand old age of 65 or something like that. And of course, companies like Ziff Davis and Time Warner and so forth were in the hunt for this amazing media property. I had a small media company and had become convinced that this thing was so special. And there was almost like a two-part thing to this, like I came and saw you and your wife Gloria, and we spoke about dreams and values. And, you know, I think you had, your fear was this thing you ' d created would get eaten by some corporation and turned into a, you know, a money-making thing or whatever. It would lose its magic. You probably feared that a bit with me as well. But the one thing I held on to was that, you know, I ' m not a big company, you know, we ' re an entrepreneurial-driven company. At the time, I was still working for the company I ' d founded, Future, and we had this magazine, Business 2. 0, and that seemed like there were connections with a lot of the internet people at TED in that magazine. Somehow you agreed to sell it to me. I suspect you may have got more money elsewhere. I don ' t know, but you sold it to me for, I think it ' s public record, it was six million dollars of cash and six million dollars of stock, I think, there or thereabouts. And the six million dollars of stock disappeared basically, basically because my company blew up soon after that. I don ' t know whether you were able to exit any of that in time. I hope you were. RSW : I have to correct you because we have to get the story straight online. It was 14 million dollars, 12 million in cash and two million in stock. And the stock bankrupted. The stock disappeared. CA : OK, there you go. See, I put my rose-tinted glasses on there, hoping that we hadn ' t spent that much on it initially because I then bought it back from that same company. When the company was blowing up, and it was time for me to leave and I had no money, I had a foundation with a bit of money in it. And so that foundation bought TED off the company for six million dollars in cash. And like, I now, with the benefit of hindsight, that seems like one of the best philanthropic investments ever made. From your point of view, you must have, during that period, I think you felt angered about aspects of the sale, like, you almost had some form of seller ’ s remorse or felt misled or whatever, and we definitely went through a couple of years where things were hard between us. RSW : We had difficult years. And I will take half of the blame for that. And I was petulant because all of a sudden I wasn ’ t doing this every year, and it was my life, and I missed it. So three years passed for a non-compete, and I invented a new conference called EG. CA : Back in Monterey. RSW : And it was... It was not in Monterey, we did it in LA. CA : It moved to Monterey later, right, I think. Maybe. RSW : It went back to Monterey, but the first one was not in Monterey. Because I was going to show everybody and myself I could do it not in Monterey and do it. And it was petulance. It turned out well and then I gave it away, because I realized what a baby I was. And then, you know, it was difficult. It was difficult for you, difficult for me. And then, I would say in the last, you ’ ve been doing it for about 20 years, I did it for about 20 years in the 40 years, give or take a few years. You put together something **remarkable**. I think each of us put together something **remarkable**, different, and yet really kissing cousins. It ’ s the tree and the branches of what you ’ ve done that I think is terrific, just terrific. And I got to do the animal acts. You haven ’ t had any animal acts. CA : You know, we ought to do something about that. Just, you know, 40th anniversary coming up, if only for that. We ’ ve definitely had a lot of animals on screen, spectacular animals. And those are some of the best talks, honestly. RSW : I don ’ t know if you were there for when the bear came on stage? CA : I wasn ’ t there for the bear. RSW : They had a black bear. CA : Amazing. RSW : They had a bear that they walked down the aisle. Two people with chains walked down this big black bear down the aisle on the stage. And I was told by the animal trainer, you know,”Go up and kiss it,”it turns out he thought I would be scared and not do it. And I went up and kissed him, and he turned white and said,”Very quietly, back up very slowly, you could be dead.”And I wasn ’ t supposed to do that. And he could have just taken my belly out with a hand. And that happened. CA : So you told me that story on stage in Monterey when we had you back, and you actually gave me my best – when things were still a bit awkward with us – and you gave me my best-ever line on stage, because I asked you,”Well, did anyone warn the bear?”And people liked that. I mean, in context, it went down. You have this amazing courage and this amazing sense of showmanship that I think has helped. You know, the whole problem with interesting information is that it gets lost in the sea of just noise out there, and it needs all the help it can get in terms of drama, theatricality and so forth. And I think it is one of the pieces of your genius, Ricky, which we ’ ve tried to carry forward, probably have not done in the way that you could. And we miss that. One thing that did happen, though, which and I ’ m, you know, this is just serendipity. I mean, technology came along that allowed TED to be shared with the world. And that, of course, is what what changed everything. We possibly, like, if I ’ d owned it privately, might never have done it. I might have been too frightened to do it. But because it was owned by a nonprofit, we decided we had to do it. Thank you, June Cohen, thank you, Kelly Stoetzel. And, you know, there was an amazing team around at that time who were brave. Jason Wishnow, the video editor, played a role. But we went for it and everything changed, you know, TED went viral and demand for the conference, to our surprise, went up, not down. And most people in the community said,”This is really cool, I can share it now with my family. Thank you.”And you know, it took us on our journey. But I think one of the areas that was uncomfortable for some people in the community and for you, was this feeling that what had been a dinner party, it had been created for the interests of everyone there, had to some extent become an annoying sort of place of”do-goodery”and”let ’ s make the world a better place”and all the rest of it. I mean, how much do you think there is a fundamental conflict there between what is interesting and what is useful for the public good? This is the question I find myself asking. RSW : It ’ s a fine line between, I think it ’ s particularly difficult right now where the”do-goodery”thing and the”watching what you say”thing and all those things, I would have been tarred and feathered for what I said and what I did when I ran TED, because it ’ s not acceptable. I think it is difficult. Your job has become much more difficult in curating now. CA : Possibly. Ricky, I ’ ve got a question from someone in the audience who sat there in the front row for many years of your curation and for many of mine, the wonderful Jim Young. RSW : Oh! CA : He wants to know what was the most memorable moment of your TED experience. Give us one more. RSW : Well, Jim, since you sat in the front row, it was probably two or three times your neck was almost broken when I threw out hats into the audience, and Jeff Bezos leapt from the fourth row across your head and almost broke the necks of everybody in the front row. And then we saw how ambitious he was, was to get a hat, and then he turned out OK. CA : We have to assume he wasn ’ t quite as financially successful then, you know, a hat was meaningful. RSW : You remember those times when people used to jump for the hats? CA : Yeah, no. Absolutely. RSW : But it was nice having you in the front row. It was unlike any other conference where the front row was the place you really wanted to be. Those were the prized seats, not the back row, where a lot of people sit when they go to a conference. CA : So people got married at TED. Engaged or married. Do you remember? RSW : Yes, Chris Fralic. Fralic got engaged on stage, yes? CA : Yeah. Yep yep yep. Chris Fralic is actually in the audience, and so it ’ s very cool that you remember that. RSW : Hi, Chris, yes, yes, I remember that. So my memory hasn ’ t gone anyway, and I ’ m going to be 89 next month. CA : I mean, that ’ s amazing. There ’ s a question here from Todd.”How do you inspire lifelong learning and innovating in people who don ’ t care to learn nor understand, nor change anything?”RSW : I don ’ t think... I think all you can do is give people permission, and if they want to take it, they should be exposed to things that are interesting and available. But no, everybody doesn ’ t have to be like me or you, Chris, or anybody else. One doesn ’ t have to learn. One doesn ’ t have to do things. But it should be available in a form that ’ s honest and understandable. And data by itself is not information, and it ’ s not accessible, and it doesn ’ t inform. So I believe that I have a responsibility, and others do, to make things available. And that ’ s why I invented the term”information architects,”to see the systemic way, not just making things look good. There ’ s a lot of charts, graphs and information that looks good. A lot of people who speak well and pretty and give good **presentations**, but you can ’ t understand it. So understanding, the thing you said you were going to get into later on in this, and explaining, first you have to explain something so you can understand something so you can take action. But that action goes back to having it clearly explained in the beginning. CA : Yeah. So Manoush Zomorodi, who ’ s the host of TED Radio Hour now, has a question that, you know,”Information has become much more nicheified. People want to know exactly what they ’ re getting before they watch / listen. How can we get people to be more general and curious?”RSW : That ’ s why we have the word E for entertaining. You have to make it so – Not entertaining like some song. CA : Song and dance. RSW : Not that. Entertaining in that it feels warm and interesting. You have a warm place. And when something is explained to you that you didn ’ t understand, it feels warm. And you feel warm when you ’ re entertained well. You have to make that available, and then it ’ s up to the person.

It ’ s not something that you need to be tested on. CA : Right. RSW : It ’ s not a homogenous audience out there. It ’ s not our duty to make a homogenous audience. CA : So the question in the audience from Dave,”One of your iconic books is ’ Information Anxiety. ’ What do you see humans are anxious about? What should we be anxious or concerned about?”RSW : Well, I ’ ve done two books called”Information Anxiety”and”Information Anxiety 2,”and might do a book called”3,”and they have a place. The first was just to show the difference between data and things that inform you. And there ’ s a duty, if you ’ re going to have data, to make it understandable to a 12-year-old. To make things you do understandable. And it ’ s your duty that if you don ’ t understand and you ’ re interested, to ask a good question. A question that has a quest. And a good question is better than a brilliant answer. That changed,”Information Anxiety 2”changed because the internet changed our ability and the masses of available data. And so it became more of a crisis of how – and cartography comes in here – how you find your way, how you map your way through information. And that ’ s why the underpinning of all of our data is cartography, not necessarily a map of a city, but the map of understanding. And that ’ s why Esri and people who make cartographic things are so important, because they show the pattern of understanding, and it makes things available and reduces your anxiety because everything takes place someplace. CA : Adrian Neubauer would like to know,”How do you think TED has changed our conceptual understanding of the lecture and lecturing?”So can you talk about the convergence of storytelling and lecturing? RSW : Well, I ’ ve seen the conference world change after TED. Now, I can ’ t say it changed because of TED, but I have a belief that it did. It was bumped along the way. Maybe somebody else would have done a TED-like thing and bumped it away a year later. I don ’ t know, but I believe that TED existed and had no right to exist, not supported by an institution or a university or a company or anything else, it was an independent thing, not based on our society and our businesses in society. That it has changed how companies put on gatherings, how other people put on gatherings, certainly changed Davos, which had no entertainment or anything. But I mean, Davos is a conference made up of back rooms. I mean it ’ s a whole city. They ’ ve turned all the hotels into back rooms. So everything is a closet in there. But they put a patina of entertainment. But there ’ s some genuine understanding and genuine mixed conferences that a lot of people put on today, and some very good ones besides TED. There ’ s The Nantucket Project is one. There ’ s one that used to be put on from with a TEDster Tony Chan up in Boston. There ’ s a number of conferences that I think were directly affected and given permission to happen because a schlepper from Philadelphia could put on a thing, and it became OK that they can do it, too. So I think it ’ s had an effect. CA : I completely agree. I think one of the things we ’ ve really tried to hold on to is when talks become boring, is when it ’ s clear the speaker has an agenda to promote or it ’ s about, here ’ s a company, here is an organization, here is something that I need to promote as opposed to :”I ’ m here with other human beings. There is something really interesting to me in my mind, something that has really lit me up, and I want to share it.”And the fact that people can share it and others can feel that same thing and learn from it, and that it can change their life ten years later, that is what is so beautiful, Richard. And you know, when I came, the first job title I took at TED was TED Custodian. Now this was before I understood properly that sometimes in America that means, you know, bathroom cleaner. But I still like the name. And because what I was promising to do there was... The values that started with what matters, what is interesting, what lights people up, what is inspiring, what is human, what is important and what can cross boundaries out of one sphere into another, that seemed to me so special, and I was determined not to let that go for anything. And so, despite the fact that we ’ ve occasionally disagreed, I have tried to stay true to that. And I think overall, TED has still stayed true to that. And one of the reasons it ’ s special is because it is still a place where no matter what your start point is, so long as you come in with curiosity and an open heart, you will learn something that matters. And that all came from you, my friend. That all came from you. And you know, thank you so much for that. I ’ m going to ask this question from Katherine McCartney. RSW : I ’ m going to interrupt for one second. You said something earlier, that I sat on stage the whole time. Let me give you a hint, there ’ s two reasons why I did that. I was the only person that saw the audience, remember, I kept the house lights up so I could see the audience. I watched the audience. That was very important to me, to sense the audience. And two, getting up and down off the stage is about four minutes, two minutes up and two minutes down. So I gave people four times 50. I gave 200 minutes back to the audience for somebody just getting up and down off the stage to introduce the next person. So it was a way to give the audience more for their money, and I didn ’ t have to get up and down because I was really fat then. CA : That ’ s beautiful. I like that explanation. I ’ ve got good news that through technological advances, we have figured out how to get up on stage again and back off in less than four minutes. RSW : OK. But you know what I ’ m saying. CA : I know exactly what you ’ re saying. Katherine McCartney, who was with me during the transition here, from your TED to ours. RSW : I know who she is, yes. CA : Dear colleague. So she wants to know what moment in your history would you wish you could repeat, either to change the outcome or just to enjoy the moment again? RSW : I can ’ t say the things that come instantly in my head right now, because it wouldn ’ t be good online. CA : Or you could just say it, and we could love you for it. RSW : Oh yeah, edit it out. I will tell you in the after speak, after we speak afterwards. But I think that ’ s a very good question. And I think that question should be mulled around. And anybody who ’ s listening, I hope there ’ s a few people listening, mull around in your heads. How would you answer that question? What, if anything, would you want to redo or repeat or change or do again? And it ’ s not singular things that come up because your mind, at least my mind, goes to different subjects, different moments. CA : I ’ ll ask this question, then, a more specific version of that. I don ’ t know that this is what Katherine was aiming at, but do you... With all that you now know, do you regret the decision to sell TED to me? RSW : Huh. I think, if I look back on it, I probably should have waited three years or so to get some of the ideas out of my system that made me petulant after I sold it. But selling it and doing other things also, because when I was doing TED I was also doing guidebooks. For eight years, I was doing TEDMED. So I got into medicine. And maybe a couple of years, but not selling it. No, I think when you learn how to do something fairly well, you shouldn ’ t do it anymore. For me, I ’ m speaking for myself. And I ’ ve done that with different things in my life, painting, sculpture, different things. I did some of them OK. And then it ’ s time to do something else. So I knew there was a time to do something else. But when it came up, the reality of it caught me off guard. But I think absolutely, If I can take the longer view of an old fart, I gave it to the right person. I sold it to the right person, no doubt, because I can ’ t imagine another person doing anything near what you were doing or squeezing the life out of it. So I think I sold it to, what turns out to be, the best person. CA : Well, those are moving words, obviously, to me. And I will say from my part that I can ’ t imagine a different version of my life. I mean, I loved being an entrepreneur. It was fun building a company. I didn ’ t find out who I wanted to be, Ricky, until I had a chance to pick up this amazing thing that you created. And especially when we had a chance to start sharing it with the world, it suddenly felt, gosh, you know, the fact that we ’ re in a time when ideas can spread beyond a theater to millions of people was such an extraordinary thing. And, you know, just learning to this day of people who gave a talk in that theater that you identified, and by the way, what a special magical theater, that theater in Monterey was. RSW : It turned out to be perfect. Well, see, let me tell you, that wasn ’ t by chance, I had done three conferences in that theater before I did TED. And I learned the town and the theater. So I didn ’ t go there as an amateur, just choosing that place. That ’ s why that place was important. And when I did it in New York or did it in Toronto, it wasn ’ t as good. CA : It was magic. So I can ’ t imagine a different version of it. And I think there are probably many, many millions of people around the world who, if they only knew this story, your story, would want to right now take off the hat and nod at you and say, thank you, Richard Saul Wurman, you ’ ve made a difference to my life. RSW : Chris, that ’ s lovely. CA : On behalf of so many people, thank you. RSW : Thank you, Chris, for having me. [Want to support TED?] [Become a TED Member!] [Learn more at ted. com / membership]

Let me show you something. To be precise, I ’ m going to show you nothing. This was the world 540 million years ago. Pure, endless darkness. It wasn ’ t dark due to a lack of light. It was dark because of a lack of sight. Although sunshine did **filter** 1, 000 meters beneath the surface of ocean, a light permeated from hydrothermal vents to seafloor, brimming with life, there was not a single eye to be found in these ancient waters. No retinas, no corneas, no lenses. So all this light, all this life went unseen. There was a time that the very idea of seeing didn ’ t exist. It [had] simply never been done before. Until it was. So for reasons we ’ re only beginning to understand, trilobites, the first organisms that could sense light, emerged. They ’ re the first inhabitants of this reality that we take for granted. First to discover that there is something other than oneself. A world of many selves. The ability to see is thought to have ushered in Cambrian explosion, a period in which a huge variety of animal species entered fossil records. What began as a passive experience, the simple act of letting light in, soon became far more active. The nervous system began to evolve. Sight turning to insight. Seeing became understanding. Understanding led to actions. And all these gave rise to intelligence. Today, we ’ re no longer satisfied with just nature ’ s gift of visual intelligence. Curiosity urges us to create machines to see just as intelligently as we can, if not better. Nine years ago, on this stage, I delivered an early progress report on computer vision, a subfield of artificial intelligence. Three powerful forces converged for the first time. Aa family of algorithms called neural networks. Fast, specialized hardware called graphic processing units, or GPUs. And big data. Like the 15 million images that my lab spent years curating called ImageNet. Together, they ushered in the age of modern AI. We ’ ve come a long way. Back then, just putting labels on images was a big breakthrough. But the speed and accuracy of these algorithms just improved rapidly. The annual ImageNet challenge, led by my lab, gauged the performance of this progress. And on this plot, you ’ re seeing the annual improvement and milestone models. We went a step further and created algorithms that can segment objects or predict the dynamic relationships among them in these works done by my students and collaborators. And there ’ s more. Recall last time I showed you the first computer-vision algorithm that can describe a photo in human natural language. That was work done with my brilliant former student, Andrej Karpathy. At that time, I pushed my luck and said,"Andrej, can we make computers to do the reverse?"And Andrej said,"Ha ha, that ' s impossible."Well, as you can see from this post, recently the impossible has become possible. That ' s thanks to a family of diffusion models that powers today ' s generative AI algorithm, which can take human-prompted sentences and turn them into photos and videos of something that ' s entirely new. Many of you have seen the recent impressive results of Sora by OpenAI. But even without the enormous number of GPUs, my student and our collaborators have developed a generative video model called Walt months before Sora. And you ' re seeing some of these results. There is room for improvement. I mean, look at that cat ' s eye and the way it goes under the wave without ever getting wet. What a cat-astrophe. And if past is prologue, we will learn from these mistakes and create a future we imagine. And in this future, we want AI to do everything it can for us, or to help us. For years I have been saying that taking a picture is not the same as seeing and understanding. Today, I would like to add to that. Simply seeing is not enough. Seeing is for doing and learning. When we act upon this world in 3D space and time, we learn, and we learn to see and do better. Nature has created this virtuous cycle of seeing and doing powered by"**spatial** intelligence."To **illustrate** to you what your **spatial** intelligence is doing constantly, look at this picture. Raise your hand if you feel like you want to do something. In the last split of a second, your brain looked at the geometry of this glass, its place in 3D space, its relationship with the table, the cat and everything else. And you can predict what ' s going to happen next. The urge to act is innate to all beings with **spatial** intelligence, which links perception with action. And if we want to advance AI beyond its current capabilities, we want more than AI that can see and talk. We want AI that can do. Indeed, we ' re making exciting progress. The recent milestones in **spatial** intelligence is teaching computers to see, learn, do and learn to see and do better. This is not easy. It took nature millions of years to evolve **spatial** intelligence, which depends on the eye taking light, project 2D images on the retina and the brain to translate these data into 3D information. Only recently, a group of researchers from Google are able to develop an algorithm to take a bunch of photos and translate that into 3D space, like the examples we ' re showing here. My student and our collaborators have taken a step further and created an algorithm that takes one input image and turn that into 3D shape. Here are more examples. Recall, we talked about computer programs that can take a human sentence and turn it into videos. A group of researchers in University of Michigan have figured out a way to translate that line of sentence into 3D room layout, like shown here. And my colleagues at Stanford and their students have developed an algorithm that takes one image and generates infinitely plausible spaces for viewers to explore. These are prototypes of the first budding signs of a future possibility. One in which the human race can take our entire world and translate it into digital forms and model the richness and nuances. What nature did to us implicitly in our individual minds, **spatial** intelligence technology can hope to do for our collective consciousness. As the progress of **spatial** intelligence accelerates, a new era in this virtuous cycle is taking place in front of our eyes. This back and forth is catalyzing robotic learning, a key component for any embodied intelligence system that needs to understand and interact with the 3D world. A decade ago, ImageNet from my lab enabled a database of millions of high-quality photos to help train computers to see. Today, we ' re doing the same with behaviors and actions to train computers and robots how to act in the 3D world. But instead of collecting static images, we develop simulation environments powered by 3D **spatial** models so that the computers can have infinite varieties of possibilities to learn to act. And you ’ re just seeing a small number of examples to teach our robots in a project led by my lab called Behavior. We ’ re also making exciting progress in robotic language intelligence. Using large language model-based input, my students and our collaborators are among the first teams that can show a robotic arm performing a variety of tasks based on verbal instructions, like opening this drawer or unplugging a charged phone. Or making sandwiches, using bread, lettuce, tomatoes and even putting a napkin for the user. Typically I would like a little more for my sandwich, but this is a good start. In that primordial ocean, in our ancient times, the ability to see and perceive one ’ s environment kicked off the Cambrian explosion of interactions with other life forms. Today, that light is reaching the digital minds. **Spatial** intelligence is allowing machines to interact not only with one another, but with humans, and with 3D worlds, real or virtual. And as that future is taking shape, it will have a profound impact to many lives. Let ’ s take health care as an example. For the past decade, my lab has been taking some of the first steps in applying AI to tackle challenges that impact patient outcome and medical staff burnout. Together with our collaborators from Stanford School of Medicine and partnering hospitals, we ’ re piloting smart sensors that can detect clinicians going into patient rooms without properly washing their hands. Or keep track of surgical instruments. Or alert care teams when a patient is at physical risk, such as falling. We consider these techniques a form of ambient intelligence, like extra pairs of eyes that do make a difference. But I would like more interactive help for our patients, clinicians and caretakers, who desperately also need an extra pair of hands. Imagine an autonomous robot transporting medical supplies while caretakers focus on our patients or augmented reality, guiding surgeons to do safer, faster and less invasive operations. Or imagine patients with severe paralysis controlling robots with their thoughts. That ’ s right, brainwaves, to perform everyday tasks that you and I take for granted. You ’ re seeing a glimpse of that future in this pilot study from my lab recently. In this video, the robotic arm is cooking a Japanese sukiyaki meal controlled only by the brain electrical signal, non-invasively collected through an EEG cap. Thank you. The emergence of vision half a billion years ago turned a world of darkness upside down. It set off the most profound evolutionary process : the development of intelligence in the animal world. AI ’ s breathtaking progress in the last decade is just as astounding. But I believe the full potential of this digital Cambrian explosion won ’ t be fully realized until we power our computers and robots with **spatial** intelligence, just like what nature did to all of us. It ’ s an exciting time to teach our digital companion to learn to reason and to interact with this beautiful 3D space we call home, and also create many more new worlds that we can all explore. To realize this future won ’ t be easy. It requires all of us to take thoughtful steps and develop technologies that always put humans in the center. But if we do this right, the computers and robots powered by **spatial** intelligence will not only be useful tools but also trusted partners to enhance and augment our productivity and humanity while respecting our individual dignity and lifting our collective prosperity. What excites me the most in the future is a future in which that AI grows more perceptive, insightful and spatially aware, and they join us on our quest to always pursue a better way to make a better world. Thank you.

How often are you frustrated by the time it takes to accurately get things in your mind into a computer? It is even worse for people like me, whose first language is not based on letters. I live and work in Australia, but I am originally from Taiwan. I moved to Sydney eight years ago and now run a university research center there. Most of us use keyboards every day to get things in our minds into the computer. We have to learn to type. The fact that you have to learn to do some things shows how unnatural it is. The finger-driven touch screen has been around for 60 years. It ' s convenient, but it is also slow. There are other ways to control computers – joystick or gestures – but they are not very useful in capturing the words in your mind. And it is words – they are critical to communication for human beings. The problem is about to be over, because of AI. Today, I will show you how AI can turn the speech in your mind into words on screen. Getting from the brain to the computer efficiently is a real bottleneck for any computer application. It has been my passion for 25 years. Many of you, or most of you, have heard of"brain-computer **interface**,"BCI. I have been working on BCI, for the direct communication between the brain and machine, since 2004. I developed a series of EEG headsets that do this. But they are not new. What is new is an **interface** that works in a natural way, based on how our brain is working naturally. Imagine reading words when someone is thinking, translating the brain signals into words. Today, you will see this in action, and with no implants. We are using AI to decode the brain signals on the top of your head and identify the biomarkers of speaking. That means that you can send the words in your mind into the computer with wearable technology. It ' s exciting, and I believe it will open up the bottleneck of how we engage with computers. We are making exciting progress in decoding EEG to test this. It ' s natural. We have had very promising results in decoding EEG when someone is speaking aloud. The frontier we are working on now is to decode EEG when the speech is not spoken aloud, the words that flow in your mind when you are listening to others or when you are talking to yourself or thinking. We are well on the way to make it a reality. Who would like to see this in action? Great, we are ready to demonstrate it to you. I am going to invite two of my team, Charles and Daniel, to show it to us again. This is the first world premiere for us, so I hope you can be patient with us. We are getting around 50 percent accuracy... in decoding the brain signals into words when someone is speaking silently. Here shows how it will work. We have a collection of words that we have trained our technology with. They are combined into sentences. Charles will select one sentence, and Daniel will read the sentence word by word, silently, and produce the brain signals that will be picked up by our sensors. Our technology will decode the brain signals into words. Charles, Daniel, are you ready to go ahead? This is the sentence that Daniel is going to read silently. Sorry, please keep silent. Here are the – decoded words. They are likely the intended words. You can see the probability ranking of the decoded words by our technology. The pattern shows our predicted sentence... is not so correct. Sorry, you see the other 50 percent, the system doesn ' t work. But actually, you still can see some keywords where we got it. Let ' s invite Charles and Daniel to do it again, but please keep silent when he ' s reading silently. Here is the sentence, another sentence that Daniel will read word by word, silently. Again, here are the decoded words. They are likely the intended words. The pattern shows our predictive sentence is very close to the ground-truth sentence this time. Thank you, thank you. How does it work? We pick up the brain signals with sensors and amplify and **filter** them to reduce the noise and get the right biomarkers. We use AI for the task. We use deep learning to decode the brain signals into the intended words. And then we use the large language model to make the match of the decoded words and make up for the mistakes in EEG decoding. All of this is going on in the AI, but for the user, the interaction is natural, through thoughts and natural language. We are very excited about the advances that we are making in understanding words and sentences. Another thing that is very natural to people is looking at something that has their attention. Imagine if you could select an item just by looking at it, not by picking it off the shelf or punching a code into the vending machine. Two years ago, in a project about hands-free control of robots, we were very excited about robot control via visual identification of the fingers. We are now beyond that. We need not any fingers. The AI is making it natural. There are four objects on the table. Toy car, toy animal, plastic flower and some food, which is also plastic, not left over from the breakfast this morning. You can also see the four objects ' photo on the screen. Daniel is going to look at the photos, and select an item in his mind. If it is working as it should, you will see the selected item pop up on screen. We use photos for this because they are very controllable. To show that this is not all just built into my **presentation**, Charles will pick up one item for Daniel to select in mind. Please, Charles. It ' s a car. So, Daniel, select... the car in his mind. Hamburger. It ' s incorrect. It ' s unlucky that the 30-percent error rate came with us again. Let ' s invite Charles and Daniel to show it again. It ' s a duck, a lovely duck. OK. Good. Thank you. Thank you. Daniel did this for his PhD. It ' s very impressive, isn ' t it? When Daniel selects an item in his mind, his brain recognizes and identifies the object and triggers his EEGs. Our technology decodes the triggers. We are working on our way through the technical challenges. We will work on overcoming the interference issue. That ' s why I asked for the phones to be turned off. Different people have different neural signatures, which are important to decoding accuracy. One reason I brought Daniel along here is because he can give off great neural signatures. Yeah, he can give us a great neural signature, as far as our technology is concerned. They are still cables here as well. It is not yet very portable. Probably one biggest barrier to people using this will be :"How do I turn it off?"Any one of you will have had times when you are happy that the people you are with don ' t know what you are really thinking. There are serious privacy and ethical issues that will have to be dealt with. I am very passionate about how important this technology can be. One exciting point is linking the brain-computer **interface** to wearable computers. You already have a computer on your head. The brain will be a natural **interface**. It is not only about controlling a computer. The natural BCI also provides another way for people to communicate with people. For example, it allows people who are not able to speak to communicate with others, or such as when privacy or silence are required. If your idea of nature is a lovely forest, you could wonder how natural this could be. My answer is, it ' s natural language, it ' s the natural thought process that you are using. There are no unnatural implants in your body. I am challenging you to think about what you regard as natural communication. Turning the speech in your mind into words. There is a standard way to finish up when talking with people – you say :"Just think about it."I hope you are as excited as we are for the prospect of a future in which, when you just think about something, the words in your mind appear on screen. Thank you.

Text Sample 902: POS Dim 6 – 2021 – Score 5.00 – 2021/t004019.txt

Hello there, this is Chris Anderson, and I am hugely, hugely, tremendously excited to welcome you to a new series of the TED interview. Now, then, this season, we ' re trying something new. We ' re organising the whole season around a single theme, albeit a theme that some of you may consider inappropriate. But hear me out. The theme is the case for optimism. And yes, I know the world has been hit with extraordinarily ugly things in the last few years.

Political division, a racial reckoning, technology run amuck, not to mention a global pandemic and impending climate catastrophe. What on earth are we thinking in this context? Optimism just seems so naive and unwanted, almost annoying. So here ’ s my position. Don ’ t think of optimism as a feeling. It ’ s not just this sort of shallow feeling of hope. Optimism is a search. It ’ s a determination to look for a pathway forward somewhere out there. I believe I truly believe there are amazing people whose minds contain the ideas, the visions, the solutions that can actually create that pathway forward. If given the support and resources they need, they may very well light the path out of this dark place we ’ re in. So these are the people who can present not optimism, but a case for optimism. They ’ re the people I ’ m talking to this season. So let ’ s see if they can persuade us now. Then the place I want to start is with A. I. artificial intelligence. This, of course, is the next innovative technology that is going to change everything as we know it, for better or for worse. Today was painted not with the usual dystopian brush, but by someone who truly believes in its potential. Sam Altman is the former president of Y Combinator, the legendary startup accelerator. And in 2015, he and a team launched a company called Open Eye, dedicated to one noble purpose to develop A. I. so that it benefits humanity as a whole. You may have heard, by the way, recently a lot of buzz around in A. I. technology called T3 that was developed by open eye improve the quality of the amazing team of researchers and developers they have work in. There will be hearing a lot about three in the conversation ahead. But sticking to this lofty mission of developing A. I. for humanity and finding the resources to realize it haven ’ t been simple. Open A. I. is certainly not without its critics, but their goal couldn ’ t be more important. And honestly, I found it really quite exciting to hear Sam ’ s vision for where all this could lead. OK, let ’ s do this. So, Sam Altman, welcome. Thank you for having me. So, Sam, here we are in 2021. A lot of people are fearful of the future at this moment in world history. How would you describe your attitude to the future? I think that the combination of scientific and technological progress and better societal decision making, better societal governance is going to solve in the next couple of decades all of our current most pressing problems, there will be new ones. But I think we are going to get very safe, very inexpensive, carbon free nuclear energy to work. And I think we ’ re going to talk about that time that the climate disaster looks so bad and how lucky we are. We got saved by science and technology, I think. And we ’ ve already now seen this with the rapidity that we were able to get vaccines deployed. We are going to find that we are able to cure or at least treat a significant percentage of human disease, including I think we ’ ll just actually make progress in helping people have much longer decades, longer health spans. And I think in the next couple of decades, that will look pretty clear. I think we will build systems with AI and otherwise that make access to an incredibly high quality education more possible than ever before. I think the lives we look forward like one hundred years, fifty years, even the quality of life available to anyone then will be much better than the quality of life available in the very best case to anyone today, to any single person today. So, yeah, I ’ m super optimistic. I think, like, it ’ s always easy to do scroll and think about how bad are the bad things are, but the good things are really good and getting much better. Is it your sincere belief that artificial intelligence can actually make that future better? Certainly. How look, with any technology. I don ’ t think it will all be better. I think there are always positive and negative use cases of anything new, and it ’ s our job to maximize the positive ones, minimize the negative ones. But I truly, genuinely believe that the positive impacts will be orders of magnitude bigger than the negative ones. I think we ’ re seeing a glimpse of that now. Now that we have the first general purpose built out in the world and available via things like RPI, I think we are seeing evidence of just the breadth of services that we will be able to offer as the sort of technological revolution really takes hold. And we will have people interact with services that are smart, really smart, and it will feel like as strange as the world before mobile phones feels now to us. Hmm, yeah, you mentioned your API, I guess that stands for what, application programming **interface**? It ' s the technology that allows complex technology to be accessible to others. So give me a sense of a couple of things that have got you most excited that are already out there and then how that gives you visibility to a pathway forward that is even more exciting. So I think that the things that we ' re seeing now are very much glimpse of the future. We released three, which is a general-purpose natural language text model in the summer of twenty twenty. You know, there ' s hundreds of applications that are now using it in production that ' s ramping up all of the time. But there are things where people use three to really understand the intent behind the search query and deliver results and sort of understand not only intent, but all of the data and deliver the thing of what you want. So you can sort of describe a fuzzy thing and it ' ll understand documents. It can understand, you know, short documents, not full books yet, but bring you back to the context of what you want. There ' s been a lot of excitement about using the generative capabilities to create sort of games or sort of interactive stories or letting people develop characters or chat with a sort of virtual friend. There are applications that, for example, help a job seeker polish a tailored application for each individual company. There ' s the beginning of tutors that can sort of teach people about different concepts and take on different personas. And we can go on for a long time. But I think anything that you can imagine that you do today via computer that you would like to really understand and get to know you. And not only that, but understand all of the data and knowledge in the world and help you have the best experience that is is possible that that will happen. So what gets opened up? What new adjacent possible state is that as a result of these powers from this question, from the point of view of someone who ' s starting out on a career, for example, they ' re trying to figure out what would be a really interesting thing to do in the future that has only recently become possible. What are some new things that this opens up in a world where you can talk to a computer? And get. The output that would normally require you hiring the world experts back immediately for almost no money, I would say think about what ' s possible there. So that could be like, as you said, what can normally only the best programmer in the world or a really great programmer do for me. And can I now instead just ask in English and have that program written? So all these people that, you know, want to develop an app and they have an idea, but they don ' t know how to program. Now they can have it. You know, what is the service look like when anyone on Earth who wants really great medical advice? Can get better medical advice than any single doctor could ever get, because this has the total medical knowledge and reasoning ability that the some humanity has ever produced. When you want to learn something, you have sort of a tutor that understands your exact style, how you best learn everything you know, and custom teaches you whatever concept you want to learn someday. You can imagine that like. You have an eye that reads your email and your task list and your calendar and the documents you ' ve been sent and in any meeting maximally perfectly prepares you and has all of the information that you need in all the context of your entire career right there for you to go on for a long time. But I think this will just be powerful systems. So it ' s really fun playing around with Chapatti three, one compelling example of someone who ' s more tax base is try Googling The Guardian essay that was written entirely by different GP2 three queries and stitched together. It ' s an essay on why artificial intelligence isn ' t a threat to humanity. And that ' s impressive. It ' s very compelling. I actually tried inputting one of the three online uses. I asked the question what is interesting about some ollman? Oh no. Here ' s what it came back with. It was it was rather philosophical, actually. Came back with. I don ' t understand what you mean by interesting. It seems to me that this word has no unambiguous meaning in the context of human society beyond its literal definition as somewhat pleasing or entertaining. I do not believe there to be any such thing as INTERESTINGNESS except in the mind of a human or other sentient being that to my knowledge, this is an entirely subjective state that varies from person to person. However, I will grant that this is an interesting question to ask. This does not mean it has been answered. There is no answer to be found. Well, so you can agree that somewhere between profound and gibberish is that almost well, with the state of play is I mean, that ' s where we are today. I think somewhere between profound and jibberish is the right way to think about the current capabilities of CGP three. I think they would definitely had a bubble of hype about three last summer. But the thing about bubbles is the reason that smart people fall for them is there ' s a kernel of something really real and really interesting that people get overexcited about. And I think people definitely got and still are overexcited about 3:00 today, but still probably underestimated the potential of where these models will go in the future. And so maybe there ' s this like short term overhyped and long term under hype for the entire field, for tax models, for whatever you ' d like. It ' s going on. And as you said, there ' s clearly some gibberish in there. But on the other hand, those were like **well-formed** sentences. And there were a couple of ideas and there that I was like, oh, like they actually maybe that ' s right. And I think if artificial intelligence, even in its current very larval state, can make us confront new things and sort of inspire new ideas, that ' s already pretty impressive. Give us a sense of what ' s actually happening in the background there. I think it ' s hard to understand because you read these words seem like someone is trying to mean something. Obviously, I think you believe that there ' s whatever you ' ve built there, that there ' s a sort of thinking, sentient thing that ' s going, oh, I must answer this question. So so what how would you describe what ' s going on? You ' ve got something that has read the entire Internet, essentially all of Wikipedia, etc. We ' ve read something that ' s read like a small fraction of a random sampling of the Internet. We will eventually train something that has read as much of the Internet or more of the Internet than we ' ve done right now. But we have a very long way to go. I mean, we ' re still, I think, relative to what we will have operated at quite small scale with quite small eyes. But what is happening is there is a model that is ingesting lots of text and it is trying to predict the next word. So we use Transformer ' s they take in a context, which is a particular architecture of an A. I. model, they take in a context of a lot of words, let ' s say like a thousand or something like that. And they try to predict the word that comes next in the sequence. And there ' s like a lot of other things that happen, but fundamentally that ' s it, and I think this is interesting because in the process of playing that little game of trying to predict the next word, these models have to develop a representation and understanding of what is likely to come next and. I think it is maybe not perfectly accurate, but certainly worth considering to say that intelligence is very near the ability to make accurate predictions. What ' s confusing about this is that there are so many words on the Internet which are foolish as well as the words that are wise. And and how do you build a model that can distinguish between those two? And this is prompted actually by another example that I typed in. Like I asked, you know, what is a powerful idea, very interested in ideas. That was my question as a powerful idea. And it came back with several things, some of which seemed moderately pronouncements, which seemed moderately gibberish. But then he was he was one that it came back with the idea that the human race has, quote, evolved, unquote, is false evolution or adaptation within a species was abandoned by biology and genetics long ago. Wait a sec. That ' s news to me. What have you been reading? And I presume this has been pulled out of some recesses of the Internet, but how is it possible, even in theory, to imagine how a model can gravitate towards truth, wisdom, as opposed to just like majority views? Or how how how do you avoid something taking us further into the sort of the maze of errors and bad thinking and so forth that has already been a worrying feature for the last few years? It ' s a fantastic question, and I think it is the most interesting area of research that we need to pursue. Now, I think at this point, the questions of whether we can build really powerful general-purpose AI system, I won ' t say there in the rearview mirror. We still have a lot of hard engineering work to do, but I ' m pretty confident we ' re going to be able to. And now the questions are like, what should we build? And how and why and what data should we train on and how do we build systems not just that can do these like phenomenally impressive things, but that we can ensure do the things that we want and that understand the concepts of truth and falsehood and, you know, alignment with human values and misalignment with human values. One of the pieces of research that we put out last year that I was most proud of and most excited about is what we call reinforcement learning from human feedback. And we showed that we can take these giant models that are trained on a bunch of stuff, some of it good, some of the bad, and then with a really quite small amount of feedback from human judgment about, hey, this is good, this is bad, this is wrong, this is the behavior I want I don ' t want this behavior. We can feed that information from the human judges back into the model and we can teach the model, behave more like this and less like that. And it works better than I ever imagined it would. And that gives me a lot of hope that we can build an aligned system. We ' ll do other things, too, like I think curating data sets where there ' s just less sort of bad data to train on. It will go a very long way. And as these models get smarter, I think they inherently develop the ability to sort out bad data from good data. And as they get really smart, they ' ll even start to do something we call active learning, which is where they ask us for exactly the data they need when they ' re missing something, when they ' re unsure, when they don ' t understand. But I think as a result of simply scaling these models up, building better, I hate to use the word cognition because it sounds so anthropomorphic, but let ' s say building a better ability to reason into the models, to think, to challenge, to try to understand and combining that with this idea of online into human values via this technique we developed, that ' s going to go a very long way. Now, there ' s another question, which you sort of just kicked the **ball** down the field, too, which is how do we as a society decide to which set of human values do we align these powerful systems? Yeah, indeed. So if I if I understand rightly what you ' re saying, that you ' re saying that it ' s possible to look at the output at any one time of three. And if we don ' t like what it ' s coming up with, some ways human can say, no, that was off, don ' t do that. Whatever algorithm or process led you to that, undo it. Yeah. And that the system is that incredibly powerful at avoiding that same kind of mistake in future because it sort of replicates the instructions, correct? Yeah. And eventually and not much longer, I believe that we ' ll be able to not only say that was good, that was bad, but say that was bad for this reason. And also tell me how you got to that answer so I can make sure I understand. But at the end of the day, someone needs to decide who is the wise human or short humans who are looking at the results. So it ' s a big difference. Someone who who grew up with intelligent design world view could look at that and go, that ' s a brilliant outcome. Well, Goldstar done. And someone else would say something is done awfully wrong here. So how do you avoid and this is a version of the problem that a lot of the, I guess, Silicon Valley companies are facing right now in terms of the pushback they ' re getting on the output of social media and so forth. How do you assemble that pool of experts who stand for human values that we actually want? I mean, we talk about this all the time, I don ' t think this is like solely or even not even close to majorly up to opening night to decide, I think we need to begin a societal conversation now about how we ' re going to make those decisions, how we ' re going to make sure we have representational input in that, and how we sort of make these very difficult global governance systems. My personal belief is that we should have pretty broad rules about what these systems will never do and will always do. But then the individual user should get a system that kind of behaves like they want. And there will be people do have very different value systems. Some of them are just fundamentally incompatible. No one gets to use eye to, like, exploit other people, for example, and hopefully we can all agree on. But do you want the AI to like. You know, support you and your belief of intelligent design, like, do I think openly, I should say it can ' t, even though I disagree with that is like a scientific conclusion. No, I wouldn ' t take that stance. I think the thing to remember about all of this is that history is still quite extraordinarily weak. It ' s still has such big problems and it ' s still so unreliable that for most use cases it ' s still unsuitable. But when we think about a system that is like a thousand times more powerful and let ' s say a million times more reliable, it just doesn ' t it doesn ' t say gibberish very often. It doesn ' t totally lose the plot and get distracted or system like that is going to be one that a lot of the economic activity in the world comes to rely on. And I think it ' s very important that we don ' t have a small group of people sort of saying you can never use it for this thing that, like most of the world wants to use it for because it doesn ' t match our personal beliefs. Talk a bit more about some of the other uses of it, because one of the things that ' s most surprising is it ' s not just about sort of text responses. It ' s it can take generalized human instructions and build things up. For example, you can say to it, write a Python program that is designed to put a flashing **cursor** in one corner of the screen, in the Google logo in the other corner. And and it can go your way and do something like that. Shockingly, quite well, effectively. Yeah, I it can. That ' s amazing. I mean, this is amazing to me. That opens the door to. An entirely way to think about programers for the future, that you could you could have people who can program just in human natural language potentially and gain rapid efficiency. I do the engineering. We ' re not that far away from that world. We ' re not that far away from the world where you will write a spec in English. And for a simple enough program, I will just write the code for you. As you said, you can see glimpses of that even in this very week three which was not trained to code like. I think this is important to remember. We trained it on the language on the Internet very rarely, you know, Internet let language on the Internet also includes some code snippets. And that was enough, so if we really try to go train a model on code itself and that ' s where we decide to put the horsepower of the model into, just imagine what will be possible will be quite impressive. But I think what you ' re pointing to there is that because models like three to some degree or other, and it ' s like very hard to know exactly how much understand the underlying concepts of what ' s going on. And they ' re not just regurgitating things they found in a website, but they can really apply them and say, oh, yeah, I kind of like know about this word and this idea and code. And this is probably what you ' re trying to do. And I won ' t get it right always. But sometimes I will just generate this like a brand new program for nothing that anyone has ever asked before. And it will work. That ’ s pretty cool. And data is data. So it can do that from English to code. It can do that from English to French. Again, we never told it to learn about translation. We never told it about the concepts of English and French, but it learned them, even though we never said this is what English is and this is what French is and this is what it means to translate, it can still do it. Wow, I mean, for creative people, is there a world coming where the sort of the palette of possibility that they can be exposed to is just explodes? I mean, if you ’ re a musician, is there a near future where you can say to your eye, OK, I ’ m going to bed now, but in the morning I ’ d love you to present me with a thousand tuba jingles with words attached that you have of a sort of mean factor to the and you come down in the morning and the computer shows you the stuff. And one of them, you go, wow, that is it. That is a top 10 hit and you build a song from it. Or is that going to be released? Actually be the value add. We released something last year called Jukebox, which is very near what you described, where you can say I want music generated for me in this style or this kind of stuff, and it can come up with the words as well. And it ’ s like pretty cool. And I really enjoy listening to music that it creates. And I can sort of do four songs, two bars of a jingle, whatever you ’ d like. And one of my very favorite artists reached out, called to open it after we release this and said that he wanted to talk. And I was like, well, I like total fanboy here. I ’ d love to join that call. And I was so nervous that he was going to say, this is terrible. This is like a really sad thing for human creativity. Like, you know, why are you doing this? This is like whatever. And he was so excited. And he ’ s like, this has been so inspiring. I want to do a new album with this. You know, it ’ s like, give me all these new ideas. It ’ s making me much better at my job. I ’ m going to make better music because of this tool. And that was awesome. And I hope that ’ s how it all continues to go. And I think it is going to lead to this. We see a similar thing now with Dolly, where graphic designers sometimes tell us that they just they see this new set of possibilities because there ’ s new creative inspiration and they ’ re cycle time, like the amount of time it takes to just come up with an idea and be able to look at it and then decide whether to go down that path or head in a different direction goes down so much. And so I think it ’ s going to just be this like incredible creative explosion for humans. And how far away are we some before? And I it comes up with a genuinely powerful new idea, an idea that solves the problem that humans have been wrestling with. It doesn ’ t have to be as quite on the scale as of, OK, we ’ ve got a virus coming. Please describe to us what a what a national rational response should look like, but some kind of genuinely innovative idea or solution like one one internal question we ’ ve asked ourselves is, when will the first genuinely interesting, purely AI written TED talk show up? I think that ’ s a great milestone. I will say it ’ s always hard to guess timeline ’ s I ’ m sure I ’ ll be wrong on this, but I would guess the first genuinely interesting. Ted talk, thought of written delivered by an AIDS within the kind of the seven ish year time frame. Maybe a little bit less. And it feels like I mean, just reading that Guardian essay that was kind of it was a composite of several different GPG three responses to questions about, you know, the threats of robotics or whatever. If you throw in a human editor into the mix, you could probably imagine something much sooner. Indeed. Like tomorrow. Yeah. So the hybrid the hybrid version where it ’ s basically a tool assisted TED talk, but that it is better than any TED talk a human could generate in one hundred hours or whatever, if you can sort of combine human discretion with A. I. horsepower. I suspect that ’ s like our next year or two years from now kind of thing where it ’ s just really quite good. That ’ s that ’ s really interesting. How do you view the impact of A. I. on jobs? There ' s obviously been the familiar story is that every White-Collar job is now up for destruction. What ' s what ' s your view there? You know, it ' s I think it ' s always hard to make these predictions. That is definitely the familiar story now. Five years ago, it was every blue collar job is up for destruction, maybe like last year it was. Every creative job is up for destruction because of things like Jukebox I. I think there will be an enormous impact on. The job market, and I really hate it, I think it ' s kind of gross when people like working on I pretend like there ' s not going to be or sort of say, oh, don ' t worry about it. It ' ll just all obviously better. It doesn ' t always obviously get better. I think what is true is. Every technological revolution produces a change in jobs, we always find new ones, at least so far. It ' s difficult to predict from where we ' re sitting now what the new ones will be and this technological revolution is likely to be. Again, it ' s always tempting to say this time it ' s different. Maybe I ' ll be totally wrong. But from what I see now, this technological revolution is likely to be more. Dramatic. More of a staccato note than most, and I think we as a society need to figure out how we ' re going to cushion everybody through that. I ' ve got my own ideas about how to do that. I, I wouldn ' t say that I have any reason to believe they ' re the right ones, but doing nothing and not really engaging with the magnitude of what ' s about to happen, I think it ' s like not an acceptable answer. So there ' s going to be huge impact. It ' s difficult to predict where it shows up the most. I think previous predictions have mostly been wrong, but I I ' d like to see us all as a society, certainly as a field, engage in what what the shifts we want to make to the social contract are to kind of get through that in a way that is maximally beneficial to everybody. I mean, in every past revolution, there ' s always been a space for humans to move to. That is, if you like, moving up the food chain, it ' s sort of we ' ve retreated to the things that humans could uniquely do, think better, be more creative and so forth. I guess the worry about A. I. is that in principle, I believe this, that there is no human cognitive feat that won ' t ultimately be doable, probably better by artificial general touch, simply because of the extra firepower that ultimately they can have, the vast knowledge they bring to the table and so forth. Is that basically right, that there is ultimately no safe sort of space where we can say, oh, but that would never be able to do that on a very long time horizon? I agree with you, but that ' s such a long time horizon. I think that, you know, like maybe we ' ve merged by that point, like maybe we ' re all plugged in and then, like, we ' re this sort of symbiotic thing. Like, I think there ' s an interesting example, as we were talking about a few minutes ago, where right now we have these systems that have sort of enormous horsepower but no steering wheel. It ' s like, you know, incredible capabilities, but no judgment. And there ' s like these obvious ways in which today even a human plus three is far better than either on their own. Many people speak about a world where it ' s sort of A. I. as this external threat you speak about. At some point, we actually merge with eyes in some way. What do you mean by that? There ' s a lot of different versions of what I think is possible there, you know, in some sense, I ' d argue the merge has already like begun the human technology merge like we have this thing in our hands that sort of dictates a lot of what we think, but it gives us real superpowers and that can go much, much further. Maybe it goes all the way to like the Elon Musk vision of neuro link and having our brains plugged into computers and sort of like literally we have a computer on the back of our head or goes the other direction and we get uploaded into one. Or maybe it ' s just that we all have a chat bot that kind of constantly steers us and helps us make better decisions than we could. But in any case, I think the fundamental thing is it ' s not like the humans versus the eyes competing to be the. Smartest sentient thing on earth or beyond. But it ’ s that this idea of being on the same team. Hmm. I certainly get very excited by the sort of the medium term potential for creative people of all sorts if they ’ re willing to expand their palette of possibilities. But with the use of A. I. to be willing to. I mean, the one thing that the history of technology has shown again and again is that something this powerful and with this much benefit is unstoppable and you will get rewarded for embracing it the most and the earliest. So talk about what can go wrong with that, so let ’ s move away from just the sort of economic displacement factor. You were a co-founder of Open Eye because you saw existential risks to humanity from high today. What would you put as the sort of the most worrying of those risks? And how is open eye working to minimize? I still think all of the really horrifying risks exist. I am more confident, much more confident than I was five years ago when we started that there are technical things we can do about. How we build these systems and the research and the alignment that make us much more likely to end up in the kind of really wonderful camp, but, you know, like maybe open I fall behind and maybe somebody else feels ajai that thinks about it in a very different way or doesn ’ t care as much as we ’ d like about safety and the risks or how to strike a different trade off of how fast we should go with this and where we should sort of just say, like, you know, like let ’ s push on for the economic benefits. But I think all of this sort of like, you know, traditionally what ’ s been in the realm of sci fi risks are real and we should not ignore them. And I still lose sleep over them. And just to update people is artificial general intelligence. Right now, we have incredible examples of powerful AI operating on specific areas. Ajai is the ability of a computer mind to connect the dots and to make decisions at the same level of breadth that that humans have had. What ’ s your sort of elevator pitch on Ajai about how to identify and how to think of it? Yeah, I mean, the way that I would say it is that for a while we were in this world of like very narrow A. I., you know, that could like classify images of cats or whatever, more advanced stuff in that. But that kind of thing. We are now in the era of general purpose, AI, where you have these systems that are still very much imperfect tools, but that can generalize. And one thing like GPP three can write essays and translate between languages and write computer code and do very complicated search. It ’ s like a single model that understands enough of what ’ s really going on to do a broad array of tasks and learn new things quickly, sort of like people can. And then eventually we ’ ll get to this other realm. Some people call it ajai, some people call ostler things. But I think it implies that the systems are like to some degree self directed, have some intentionality of their own is a simple summary to say that, like the fundamental risk is that there ’ s the potential with general artificial intelligence of a sort of runaway effect of self-improvement that can happen far faster than any kind of humans can even keep up with, so that the day after you get to ajai, suddenly computers are thousands of times more advanced than us and we have no way of controlling what they do with that power. Yeah, and that is certainly in the risk space, which is that we build this thing and at some point somewhat suddenly, it ’ s much more powerful than we are, we haven ’ t really done the full merge yet. There ’ s an event horizon there and it ’ s sort of hard to see to the other side of it. Again, lots of reasons to think it will go OK. Lots of reasons to think we won ’ t even get to that scenario. But that is something that. I don ’ t think people should brush under the rug as much as they do, it ’ s in the possibility space for sure, and in the possibility subspace of that is one where, like, we didn ’ t actually do as good of a job on the alignment work as we thought. And this sort of child of humanity kind of acts in a very different way than we think. A framework that I find useful is to sort of think about like a two by two matrix, which is short timelines to ajai and long timelines to ajai and a slow take off and a fast take off on the other axis. And in the short timelines, fast take off quadrant, which is not where I think we ’ re going to be. But if we get there, I think there ’ s a lot of scenarios in the direction that you are describing that are worrisome. And we would want to spend a lot of effort planning for. I mean, the fact that a computer could start editing its own code and improving itself while we ’ re asleep and you wake up in the morning and it ’ s got smarter, that is the start of something super powerful and potentially scary. I have tremendous misgivings about letting my system, not one we have today, but one that we might not have and too many more years start editing its own code while we ’ re not paying attention. I think that ’ s the kind of thing that is worth a great deal of societal discussion about, you know, just because we can do that. Should we? Yes, because one of the things that ’ s that ’ s been most shocking to you about the last few years has been just the power of unintended consequences. It ’ s like you don ’ t have to have a belief that there ’ s some sort of waking up of of an alien intelligence that suddenly decided it wants to wreak havoc on humans. That may never happen. What you can have is just incredible power that goes amok. So a lot of people would argue that what ’ s happened in technology in the last few years is actually an example of that. You know, social media companies created these intelligences that were programmed to maximally harvest attention, for example, for sure. And they understand this from that turned out to be in some ways horrifying and extraordinarily damaging. Is that a meaningful sort of canary in the coal mine saying, look out, humanity, this could be really dangerous? And how how on earth do you protect against those kinds of unintended consequences? I think you raise a great point in general, which is these systems don ’ t have to wish ill to humanity to cause ill just when you have, like, very powerful systems. I mean, unintended consequences for sure. But another version of that is and I think this applies at the technical level, at the company level, at the societal level, incentives are superpower ’ s. Charlie Munger had this thing on, which is incentives are so powerful that if you can spend any time whatsoever working on the incentive system, that ’ s what you should do before you work on anything else. And I really believe that. And I think that applies to the individual models we build and what their reward functions look like. I think it applies to society in a big way, and I think it applies to our corporate structure at open. I you know, we sort of observe that if you have very well-meaning people, but they have this incentive to sort of maximize attention harvesting and profit forever through no one ’ s ill intentions, that leads to a quite undesirable outcome. And so we set up opening is this thing called a capped profit model specifically so that we don ’ t have the system incentive to just generate maximum value forever with an AGI that seems like obviously quite broken. But even though we knew that was bad and even though we all like to think of ourselves as good people, it took us a long time to figure out the right structure, to figure out a charter that ’ s going to govern us and a set of incentives that we believe will let us do our work. And kind of these we have these like three elements that we talk about a lot research sort of engineering, development and deployment policy and safety. Put those all together under a system where you don ’ t have to rely on. Anything but the natural incentives to push in a direction that we hope will minimize the sort of negative unintended consequences. So help me understand this, because this is I think this is confusing to some people. So you started opening. I initially I think Elon Musk, the co-founder, and there was a group of you and the argument was this technology is too powerful to be left, developed in secret and to be left developed purely by corporations who have whatever incentive they may have. We need a nonprofit that will develop and share knowledge openly. First of all, just even at that early stage, some people were confused about this. It was saying if this thing is so dangerous, why on earth would you want to make it secrets even more available? Well, maybe giving the tools to that sort of AI terrorist in his bedroom somewhere, I think I think we got misunderstood in the way we were talking about that. We certainly don ’ t think that the right thing to do is to, like, build this a super weapon and hand it to a terrorist. That ’ s obviously awful. One of the reasons that we like our API model is it lets us make the most powerful AI technology anyone in the world has, as far as we know, available to ever would like to use it, but to put some controls on its usage. And also, if we make a mistake, to be able to pull it back or change it or tweak it or improve it or whatever. But we do want to put and this is continued will continue to be true with appropriate restrictions and guardrails, very powerful technology in the hands of people. I think that is fair. I think that will lead to the best results for the society as a whole. And I think it will sort of maximize benefit. But that ’ s very different than sort of shipping the whole model and saying, here, do whatever you want with it. We ’ re able to enforce rules on it. We also think and this is part of the mission that like something the field was doing a lot of that we didn ’ t feel good about was sort of saying like, oh, we ’ re going to keep the pace of progress and capabilities secret. That doesn ’ t feel right, because I think we do need a societal conversation about what ’ s what ’ s going on here, what the impacts are going to be. And so we although we don ’ t always say, like, you know, here ’ s the super weapon, hopefully we do try to say, like, this is really serious. This is a big deal. This is going to affect all of us. We need to have a big conversation about what to do with it. Help me understand the structure a bit better, because you definitely surprised much people when you announced that Microsoft were putting a billion dollars into the organization and in return, I guess they get certain exclusive licensing rights. And so, for example, they are the exclusive licensee of CP3. So talk about that structure of how you win. Microsoft presumably have invested not purely for altruistic purposes. They think that they will make money on that billion dollars. I sure hope they do. I love capitalism, but I think that I really loved even more about Microsoft as a partner. And I ’ ll talk about the structure and the exclusive license in a minute is that we like went around to people that might find us. And we said one of the things here is that we ’ re going to try to make you some money. But like Adjei going well is more important. And we need you to sign this document that says if things don ’ t go the way we think and we can ’ t make you money like you just cheerfully walk away from it and we do the right thing for humanity. And they were like, yes, we are enthusiastic about that. We get that the mission comes first here. So again, I hope a phenomenal investment for them. But they were like they really pleasantly surprised us on the upside of how aligned they were with us, about how strange the world may get here and the need for us to have flexibility and put our mission first, even if that means they lose all their money, which I hope they don ’ t and don ’ t think they will. So the way it ’ s set up is that if at some point in the coming year or two, two years, Microsoft decide that there ’ s some incredible commercial opportunity that they could realize out of the eye that you ’ ve built and you feel actually, no, that ’ s that ’ s damaging. You can block it. You can veto it. Correct. So the four most powerful version of three and its successors are available via the API, and we intend for that to continue. What Microsoft has is the ability to sort of put that model directly into their own technology. If they want to do that. We don ’ t plan to do that with other people because we can ’ t have all these controls that we talked about earlier. But they ’ re like a close trusted partner and they really care about safety, too. But our goal is that anybody who wants to use the API can have the most powerful versions of what we ’ ve trained. And the structure of the API lets us continue to increase the safety and fix problems when we find them. But but the structure. So we start out as a non-profit, as you said, we realized pretty quickly that although we went into this thinking that the way to get to ajai would be about smarter and smarter algorithms, that we just needed bigger and bigger computers as well. And that was going to require a scale of capital that no one will, at least certainly not me, could figure out how to raise is a nonprofit. We also needed to sort of be able to compensate very highly compensated, talented individuals that do this, but are full for profit company had runaway incentives problem, among other things. Also just one about sort of fairness in society and wealth concentration that didn ’ t feel right to us either. And so we came up with this kind of hybrid where we have a nonprofit that governs what we do, and it has a subsidiary, LLC, that we structure in a way to make a fixed amount of profit so that all of our investors and employees, hopefully if things go how we like, if not no one gets any money, but hopefully they get to make this one time great return on their investment or the time that they spent it open their equity here. And then beyond that, all the value flows back to the nonprofit and we figure out how to share it as fairly as we can with the world. And I think that this structure and this nonprofit with this very strong charter in place and everybody who joins signing up for the mission come in first and the fact the world may get strange, I think that. That was at least the best idea we could come up with, and I think it feels so far like the incentive system is working, just as I sort of watch the way that we and our partners make decisions. But if I read it right, the cap on the gain that investors can make is 100 Axum. It ’ s a massive call that was for our very first round investors. It ’ s way, way lower. Like as we now take a bit of capital, it ’ s way, way lower. So your deal with Microsoft isn ’ t you can only make the first hundred billion dollars. I don ’ t know. It ’ s way lower than after that. We ’ re giving it to the world. It ’ s way lower than that. Have you disclosed what I don ’ t know if we have, so I won ’ t accidentally do it now. All right. OK, so explain a bit more about the charter and how it is that you. Hope to avoid or I guess help contribute to an eye that is safe for humanity. What do you see as the keys to us avoiding the worst mistakes and really holding on to something that ’ s that ’ s beneficial for humanity? My answer there is actually more about, like technical and societal issues than the charter. So if it ’ s OK for me to answer it from that perspective, sure. OK, I ’ m happy to talk about the charter to. I think this question of alignment that we talked about a little earlier is paramount, and then I think to understand that it ’ s useful to differentiate between accidental misuse of a system and intentional misuse of a system. So like intentional would be a bad actor saying, I ’ ve got this powerful system, I ’ m going to use it to like hack into all the computers in the world and wreak havoc on the power grids. And accidental would be kind of the Nick Bostrom make a lot of paper clips and view humans as collateral damage in both cases. But to varying degrees, if we can really, truly, technically solve the alignment problem and the societal problem of deciding to which set of human values do we align, then the systems understand right and wrong, and they understand probably better than we ever can, unintended consequences from complex actions and very complex systems. And, you know, if we can train a system which is like. Don ’ t harm humanity and the system can really understand what we mean when we say that, again, who is we and what does that have some asterisks on them? Sorry, go ahead. Well, that ’ s if they could understand what it means to not harm humanity, that there ’ s a lot wrapped up in that sentence. Because what ’ s been so striking to me about efforts so far is that they seem to have been based on a very naive view of human nature. Go back to the sort of Facebook and Twitter examples of, well, the engineers building some of the systems would say we ’ ve just designed them around what humans want to do. You said, well, if someone wants to click on something, we will give them more of that thing. And what could possibly be wrong with that? We ’ re just supporting human choice, ignoring the fact that humans are complicated, farshid animals for sure, who are constantly making choices, that a more effective version of themselves would agree is not in their long term interests. So that ’ s one part of it. And then you ’ ve got layered on top of that or the complications of systemic complexity where, you know, multiple choices by thousands of people end up creating a reality that possibly have designed for how how to cut through that. Like an AI has to make a decision based on a moment, on a specific data set. As those decisions get more powerful, how can we be confident that they don ’ t lead to this sort of system crashing basically in some way? I think that I ’ ve heard a lot of behavioral psychologists and other people that have studied this say in different ways, are that I hate to keep picking on Facebook, but we can do it one more time since we ’ re on the topic. Maybe you can ’ t in any given moment in night where you ’ re tired and you have a stressful day, stop yourself from the dopamine hit of scrolling and Instagram, even though you know that ’ s bad for you and it ’ s not leading to your best life. But if you were asked in a reflective moment where you were sort of fully alert and thoughtful, do you want to spend as much time as you do scrolling through Instagram? Does it make you happier or not? You would actually be able to give like the right long term answer? It ’ s sort of the spirit is willing, but the flesh is weak kind of moment. And one thing that I am hopeful is that humans do know what we want and what. On the whole, and presented with research or sort of an objective view about what makes us happy and doesn ’ t we ’ re pretty, what ’ s so great about it, they ’ re pretty good. But in any particular moment, we are subjected to our animal instincts and it is easy for the lower brain to take over the eye. Well, I think be an even higher brain. And as we can teach it, you know, here is what we really do value. Here ’ s what we really do want. It will help us make better decisions than we are capable of, even in our best moments. So is that being proposed and talked about as an actual rule? Because it strikes me that there is something potentially super profound here to introduce some kind of rule for development of AIDS that they have to tap into not. What humans one, which is an ill defined question, but as to what humans in reflective mode want. Yeah, we talk about this a lot. I mean, do you see a real chance where something like that could be incorporated as a sort of an absolute golden rule and and if you like, spread around the community so that it seeps into corporations and elsewhere? Because that I ’ ve seen no evidence that, well, a little corporation that was potentially a game changer. Corporations have this weird incentive problem. Right. What I was trying to speak about was something that I think should be technologically possible, and that ’ s something that we as a society should demand. And I think it is technically possible for this to be sort of like a layer above the neocortex that makes even better decisions for us and our welfare and our long term happiness and fulfillment than we could make on our own. And I think it is possible for us as a society to demand that. And if we can do like a pincer move between what the technology is capable of and what we what we as society demand, maybe we can make everybody in the middle that way. I mean, there are instances of even though companies have their incentives to make money and so forth, they also in the knowledge age. Can ’ t make money if they have pissed off too many of their employees and customers and investors by analogy of the climate space right now, you can see more and more companies, even those that are emitting huge amounts of carbon dioxide, saying, wait a sec, we ’ re struggling to recruit talented people because they don ’ t want to work for someone who

’ s evil. And their customers are saying, we don ’ t want to buy something that is evil. And so, you know, ultimately you can picture processes where they do better. And I I believe that most engineers, for example, work in Silicon Valley. Companies are actually good people who want to design great products for humanity. I think that the people who run these companies want to be a net contribution to humanity. It ’ s we ’ ve we ’ ve rushed really quickly and design stuff without thinking it through properly. And it ’ s led to a mess up. So it ’ s like, OK, don ’ t move fast, break things, slow down and build beautiful things that are built on a real version of human nature and on a real version of system complexity and the risks associated with systemic complexity. Is that the agenda that fundamentally you think that you can push somehow? Yes, but I think the way we can push it is by getting the incentive system right. I think most people are fundamentally extremely good. Very few people wake up in the morning thinking about how can I make the world a worse place? But the incentive systems that we ’ re in are so powerful. And even those engineers who join with the absolute best of intentions get sucked into this world where they ’ re like trying to go up from it all for and five or whatever Facebook calls those things and you like, it ’ s pretty exciting. You get caught up playing the game, you ’ re rewarded for kind of doing things that move the company ’ s key metrics. It ’ s like fun to get promoted. It feels good to make more money and the incentive systems of the company. And that ’ s what it rewards. An individual performance are maybe like not what we all want. And here I don ’ t want to pick on Facebook at all because I think there ’ s versions of this at play it like every big tech company, including in some ways I ’ m sure it open I but to the degree that we can better align the incentives of companies with the welfare of society and then the incentives of an individual at those companies within the now realign incentives for those companies, the more likely we are to be able to have things like ajai that. Follow an incentive system of. What we want in our most reflective best moments and are even better than what we could think of ourselves is is it still the vision for open eye that you will get to? Artificial general intelligence ahead of. The corporations, so that you can somehow put a stake in the ground and build it the right way. Is that really a realistic thing to to dream for? And if not, how do you live up to the mission and help ensure that this thing doesn ’ t go off the rails? I think it is. Look, I certainly don ’ t think we will be the only group to build an AGI, but I think we could be the first. And I think if you are the first, you have a lot of norms that empower. And I think you ’ ve already seen that. You know, we have released some of the most powerful systems to date. And I think the way that we have done that kind of in controlled release where we ’ ve released a bigger model than a bigger one than a bigger one, and we sort of try and talk about the potential misuse cases and we try to like talk about the importance of releasing this behind an API so that you can make changes. Other groups have followed suit in some of those directions, and I think that ’ s good. So, yes, I don ’ t think we can be the only I do think we can be ahead. And if we are ahead, I think we can use that leverage to hopefully push people in a better direction or maybe we ’ re wrong and somebody else has a better direction. We ’ re doing something about do you have a structural advantage in that your mission is to do this for everyone as opposed to for some corporate objective. And that that that allows you that. Why is it that we came out of open eye and not someone else? It ’ s like it ’ s surprising in some ways when you ’ re up against so much money and so much talent in these other companies that you came up with this platform ahead of. You know, in some sense it ’ s surprising and in some sense, like the startup wins most of the time, like I ’ m a huge believer in startups as the best force for innovation we have in the world today. I talked a little bit about how we combine these three. Different clans of research, engineering and sort of safety and policy that don ’ t normally combine well and I think we have an unusual strength, there were clearly like well funded. We have super talented people. But what we really have is like intense focus and self belief that what we ’ re doing is possible and good. And I appreciate the implied compliment. But, you know, we, like, work really hard. And if we stop doing that, I ’ m sure someone would run by us fast. Tell us a bit more about some of your prior life sentences. Yeah, for several years, you were running Y Combinator, which had incredible impact on some 70 companies. There are so many startup stories that began at Y Combinator. What were key drivers in your own life that took you on the path you ’ re on? And how did that path end up at Y Combinator? No exaggeration. I think I have back to back had the two jobs that are at least the most interesting to me in all of Silicon Valley. I, I was I went to college to study computer science. I was a major computer nerd growing up. I knew like a little bit about startups, but not very much. I started working on this project the same year I started working on that. This thing called Y Combinator started and funded me and my co-founders. And we dropped out of school and did this company, which I ran for like seven years. And then after that I got acquired. I had stayed close to my comment the whole time. I thought it was just this incredible group of people and spirit and set of incentives and just badly misunderstood by most of the world, but obvious to everyone within it that it was going to create huge amounts of value and do a lot of new things. My company had acquired PJI, who is the founder of ICI, and like truly one of the most incredible humans and business people. And Paul Burrell, Paul Graham asked me if I wanted to run it. And kind of like the central learning of my career, why I individual startups has been that if you really scale them up, **remarkable** things can happen. And I. I did it and I was like, one of the things that would make this exciting for me personally motivating would be if I could sort of push it in the direction of doing these hard tech companies, one of which became open. I describe actually what Y Combinator is, you know, how many people come through it to give us a couple of stories of its impact. Yeah. So you basically apply as a handful of people and an idea, maybe a prototype and say, I would like to start a company and will you please fund me? And we review those applications and we I shouldn ’ t say we anymore. I guess they fund four hundred companies a year. You get about one hundred and fifty thousand dollars while she takes about seven percent ownership and then gives you lots of advice and then networking and sort of this like fast track program for starting a startup. I haven ’ t looked at this in a while, but at one point a significant fraction of the billion dollar plus companies in the US that got started. It all came through the Wiki program, some recently in the news ones have been like Airbnb, Jordache, Coinbase, insta card stripe. And I think it ’ s just it has become an incredible way to help. People who understand technology get a three month course in business, but instead of like herding you with an MBA, we actually teach you the things that matter and kind of go on to do incredible, incredible work. What is it about entrepreneurs? Why do they matter? Some people just find them kind of annoying. But I think you would argue I think I would argue that they have done as much as anyone to shape the future. Why? What is it about them? I think it is the ability to take. And idea and by force of will to make it happen in the world and in an incentive system that rewards you for making the most impact on the most people like in our system. That ’ s how we get most of the things that that we use. That ’ s how we got the computer that I ’ m using, the software I ’ m using to talk to you on it. Like all of this, you know, everyone in life, everything has a balance sheet. There ’ s plenty of very annoying things about them. And there ’ s plenty of very annoying things about the system that sort of idolizes them. But we do get something really important in return. And I think that as a force for making things that make all of our lives better happen, it ' s very cool. Otherwise, you know, like if you have, like, a great idea, but you don ' t actually do anything useful with it for people, that ' s still cool. It ' s still intellectually interesting. But like, there ' s got to be something about the reward function in society that is like, did you actually do something useful? Did you create value? And I think entrepreneurship and startups are a wonderful way to do that. You know, we get all these great software companies. But I also think it ' s like how we ' re going to get ajai, how we ' re going to get nuclear fusion, how we ' re going to get life extension. And like on any of those topics are a long list of other things I could point to. There ' s like a number of startups that I think are doing incredible work, some of which will actually deliver. It is a truly amazing thing when you put the camera back and to believe that a human being could be lying awake at night and something pops inside their mind as a patterning of the neurons in their brain that is effectively them saying, aha, I can see a way where the future could be better and and they can actually picture it. And then they wake up and then they talk to other people and they persuade them and they persuade investors and so forth. And the fact that this this system can happen and that they can then actually change the history changes in some sense. It is mind boggling that that happens that way and it happens again and again. So you ' ve seen so many of these stories happen. What would you say? Is the is there a key thing that differentiates good entrepreneurs from others? If you could double down on one trait, what would it be? If I could pick only one, I would pick determination. I think that is the biggest predictor of success, the biggest differentiator predictor. And if you would allow a second, I would pick like communication skills or evangelism or something in that direction as well. There are all of the obvious ones that matter, like intelligence, but there ' s like a lot of smart people in the world. And when I look back at kind of the thousands of entrepreneurs I ' ve worked with, all of many of whom were like quite capable, I would say that ' s like one and two of the surprisingly differentiated characteristics. What it ' s it ' s what I look at, the different things that you ' ve built and you ' re working on. I mean, it could not be more foundational for the future. I mean, entrepreneurship. I know this is I agree that this is really what has driven the future. Do you see some people get really now they look at Silicon Valley and they look at this story and they worry about the culture. Right. That it ' s this is a bro culture. Do you see prospects of that changing anytime soon? And would you welcome it? Can we get better companies by really working to expand a group of people who can be entrepreneurs and who can contribute to aid, for example? For sure. And in fact, I think I ' m hopeful, since these are the two things I ' ve thought the most about. I ' m excited for the day when someone combines them and uses A. I. to better select who did more fairly, maybe even select who to fund and how to advise them and really kind of make entrepreneurship super widely available that will lead to like better outcomes and sort of more societal wealth for all of us. So are. So, yeah, I think. Broadening the set of people able to start companies and that sort of get the resources that you need, that is like an unequivocally good thing and it ' s something that I think Silicon Valley is making some progress in. But I hope we see a lot more. And I do really, truly think that the technology industry entrepreneurship is one of the greatest forces for self betterment. If we can just figure out how to be a little bit more inclusive in how we do things. My last question today is about ideas were spreading. If you could inject one idea into the mind of everyone listening, what what would the idea be? We ' ve touched on it a bunch, but the one idea would be the ajai really is going to happen. You have to engage with it seriously, and you shouldn ’ t just listen to this and then brush aside and go about life as if it ’ s not going to happen because it is going to affect everything. And we will all we all, I think, have an obligation, but also an opportunity to figure out what not means and how we want the world and this sort of one time shift to go on. I ’ m kind of awed by the breadth of things are engaged with. Thank you so much for spending so much time sharing your vision. Thanks so much for having me. OK, that ’ s it for today. You can read more about open eyes, vision and progress at open eye dotcom. If you want to try playing with yourself, it ’ s a little tricky. You have to find a website that has licensed the API. The one I went to was philosopher ehi dot com, where you just you pay a few dollars to get access to a very strange mind. That ’ s actually quite a lot of fun. The interview is part of the TED Audio Collective, a collection of podcasts dedicated to sparking curiosity and sharing ideas that matter. This show is produced by Kim Net2Phone Pittas and edited by Grace Rubenstein and Sheila Boffano, Sambor Islamic Sir. Fact Check is by Paul Durbin and special thanks to Michele Quent, Colin Helmes and Anna Felin. If you like the show, please write and review it. It helps other people find us. We read every review, so thanks so much for listening. See you next time.

Text Sample 903: POS Dim 6 – 2021 – Score 5.00 – 2021/t003567.txt

Exactly 12 years ago in a TEDx Talk, I introduced my seven species of robot. A unique three-legged robot called STriDER, a wheel-leg hybrid robot called IMPASS, an amoeba robot and many more. Now, 12 years is a pretty long time, especially in a cutting-edge field like robotics. How have our robots evolved during the past 12 years? What new species of robot have we built since then? Hello, my name is Dennis Hong, and today, I would like to show you our next seven species of robot. Since my last TEDx Talk, we ’ ve been focusing on the development of humanoid robots : robots that look like us, two legs, torso, two arms and a head. Let me show you some of the humanoid robots that we developed at our lab, RoMeLa. DARwIn is a miniature humanoid robot for research and education that we made fully open-source. CHARLI is considered the United States ’ very first full-sized humanoid robot. THOR-RD is for disaster relief applications and Shipboard Autonomous Fire fighting Robot, SAFFiR and THOR, which uses this unique biologically-inspired actuator. And many more. I think we built more than a dozen different types of humanoid robots. However, after more than a decade of humanoid robotics research, I ’ m starting to have different thoughts. Now humanoid robots are important and they ’ re great. However, they always fall down, they ’ re too unstable. And they ’ re painfully slow. Yes, these days we ’ re trying to develop technology that resolves these two problems, but still, they are too expensive and they ’ re too complicated. And most importantly, they ’ re too dangerous. You do not want to be next to these big, heavy moving robots. It might fall on top of you. So what do we do? Now, why is it so difficult to make robots walk with two feet? I mean, we do it all the time. So once I wanted to throw away everything I know about robotics for a moment and try to think fundamentally, why is it so difficult to make robots walk with two feet? And I found something fascinating. So check this out. Now, when your robot tries to move forward, one of the reasons why it constantly falls down is because the distance between your left and right leg. Because your legs move forward and backward, up and down, it creates this unwanted twisting forces, we call these moments, right? Now, this is a video called a RoboOne Competition. It ’ s a robot fighting competition. And people who participate in this competition are robot hobbyists. And if you look at the robots, they develop, it ’ s brilliant. It ’ s fast, it ’ s nimble, and it doesn ’ t fall down. And if you look carefully, they always walk sideways, Because if you walk sideways, your left and right leg line up, so your twisting moments disappear. I actually got this inspiration by watching sports, fencing or ballet. They always walk sideways, and I think this is the reason why. Now, one of the problems of trying to make robots move sideways is you cannot really use your knees. So what do we do? We rotate our legs. It looks kind of awkward, right? So actually, let ’ s change the entire torso like this and make it walk this way. Now, the problem of this kind of configuration is that you really cannot use your feet and ankles. So what do we do? We get rid of them. Now let ’ s make more changes, let ’ s change the shin. And while doing that, let ’ s change the head. And something strange starts to emerge. This is NABi, Non Anthropomorphic Biped. In other words, it ’ s a robot with two legs, but it does not look like a human. How does it walk? It walks like this. Simple, fast, easy, low cost. This is great. Now, I briefly mentioned about a robot called SAFFiR, Shipboard Autonomous Fire Fighting Robot that we built. This is a robot for Navy ships. And I don ’ t know if you ’ ve been on a Navy ship, but if you open this door, it has a really high door seal. We call that”knee-knockers.”Before we had this robot, it was very difficult for the robot to climb over it. But if a robot does not have to be like a human, we can do something like this. Make the knee rotate at 360 degrees. Brilliant! Isn ’ t this cool? Yeah. Our robots can climb stairs, but it ’ s rather difficult. But now we can climb stairs like this. Now, is this just simulation and animation? No. In two weeks, from the idea, analysis, design and fabrication, in two weeks, we built our first robot. And you have not seen anything like this. Man : You ’ re wild. And we use many different types of tricks. For example, utilize the springiness of the feet we can store the energy and make it hop and jump. When we first introduced NABi to the community, it had a pretty good impact on the community. However, this robot is great for walking forward and backward. But how does it change directions? It can ’ t. So we decided to work on the next version called ALPHRED. ALPHRED stands for Autonomous Leg Personal Helper Robot with Enhanced Dynamics. So think of this robot as two NABis stacked onto each other. So it looks like this. So this robot is axisymmetric, which means that there ’ s no forwards, backwards or sideways. Now, when it walks, it has a very wide stance, right? So it can walk like this. And this is great for unstructured outdoor environments. However, it ’ s pretty slow. If you want to make it go really fast, you can change your body configuration. And if you go like this, you can have your forward legs and backward legs, and then you can gallop like a horse. There you go. And when you lift two of the arms it can walk like NABi, then the two of the other legs can be used as arms to pick up boxes or press buttons. And we ’ re pretty excited about this new type of configuration. We call this multimodal locomotion, and this is ALPHRED. Now, while developing these robots, we ’ ve been also working on this new type of actuator. Now, when we say actuators, we ’ re talking about these devices that make the robots move just like muscles in humans. Now, most of the robots that exist today, electric robots, use electric motors with gears, right? And these are really strong, and they ’ re precise, they ’ re good for manufacturing. But for legs, we need something different. We need something like biological muscles that ’ s compliant, springy, and not only the position, but also change the force. And we developed a new type of actuator called the BEAR actuator. Now, using this BEAR actuator with the NABi, we developed a second version called NABi-2. Now, if you remember, NABi was our experiment for studying a new type of bipedal locomotion. But it turns out that this NABi with these new actuators doesn ’ t work very well in terms of walking. However, unexpectedly, we didn ’ t know this, but this robot is great for jumping and hopping. It can jump forward, backward and turn directions, it ’ s brilliant. But the really cool thing is, once it jumps and when it lands, the motors become generators, and the impact is changed to electricity. And it can charge its battery, so it ’ s very energy efficient. And NABi-2 is ready to go. Or not. But this is NABi-2. So BEAR actuator with NABi was NABi-2, then BEAR actuator with ALPHRED is – ALPHRED-2. And this is the next generation of ALPHRED. So this is the very first time we turned on the switch. Look carefully at the reaction of our students. Man : Whoa! Oh, my God! What the –? Dennis Hong : Excuse me. Oh, my! Man 2 : That was amazing! I think it jumped about 1. 4 meters. This is **remarkable**. Walking is also very fast and stable. So we wanted to do something more interesting. We wanted to make it do taekwondo. Whoa! DH : We ’ re just having too much fun. And ALPHRED-2 is ready to go. Now, ALPHRED-2 is actually a very practical robot. For example, this is an example of picking up a box, delivering it and putting it nicely on the ground or on the table. I sped up the video because it was pretty slow, but you can get an idea how we can use these new type of robots for different applications. And this is ALPHRED-2. Now, we looked at two legs. We looked at four legs. What about six legs? Of course, we have a hexapod robot. Now, this robot, HEX, is about the size of a small car. Now, the cool thing about six-legged robots is this. Now, to have static stability, the minimum number of contacts with the ground is three. Think of a camera tripod. If you have a hexapod robot, you can always have three-point contact with the ground. Three, three, three. And this makes it really great for outdoor environment, rough environment. This particular robot we ’ re developing for demining applications, getting rid of landmines underground autonomously. If you see it in person, it ’ s kind of scary, it ’ s big and goes like this. So this is HEX. We also have a smaller version, this is called SiLVIA : Six Legged Vehicle with Intelligent Articulation. And as I mentioned, these type of robots are really great for unstructured terrain such as this. It can also climb up and down stairs. And this robot might be the strongest six-legged robot out there. Man : Ah, 20 kilograms. DH : Now, the reason why we wanted to make it really strong is because we want this robot to do some very interesting new type of stuff. So this is the very first robot that can brace between walls and climb up. So it ’ s like Spiderman, isn ’ t that cool? And it has some other tricks, too. If you put suction cups on the feet, it can stick to the wall and climb. And if you give it an arm, it can do some fun stuff on the blackboard, too. And this is SiLVIA. So we talked about vertical mobility. Twelve years ago, in my last TEDx Talk, I introduced a robot called CLIMBeR. It ’ s a robot for climbing cliffs using cables like a human. But this year, we wanted to get rid of the cable. We wanted to make it do free climbing. And I ’ m very excited to introduce a brand new robot called SCALER, Spine Enhanced Climbing Autonomous Legged Exploration Robot. Now, when you first look at it, it looks like a quadruped robot, four-legged robot. It ’ s actually very strong, but strength is not all. We had to develop this new type of gripper, we call these spine grippers, that can really grab onto the surfaces. And this video, we just took it a few days ago. So literally, it ’ s taking its very first few steps. Now, why are we interested in cliff-climbing robots? Rescue missions, of course. But we ’ re really interested in the planetary applications. Now, as you know, on Mars, we had these Rovers discovering the new planet. However, the really science-rich sites are always at the cliffs, and these Rovers cannot get there. So something like this will enable those kind of exploration, in the science-rich sites on planetary surfaces. This is SCALER. Now, we talked about legs, but what about wheels? Of course, we have robots with wheels. This is called OmBURo, Omnidirectional Balancing Unicycle Robot. And as the name implies, it has one wheel, it ’ s omnidirectional, it can go forward, backwards, sideways and **diagonal**. But if we look at it, it doesn ’ t even need to change its orientation. When you see it, it ’ s almost like magic. It feels like it ’ s gliding over the surface. Isn ’ t that cool? It can also balance and climb very steep surfaces. Now it follows path, now, yes, it has one wheel, but actually has these smaller rollers in the rim to generate this kind of motion as well. So why do we want to build a robot like this? We like to have robots living with us in this environment, and this environment sometimes is crowded, a lot of people or obstacles. To go through people or to avoid obstacles, it ’ s very important to have a very small cross section, and probably a single wheel is the best way to have a very small cross section. And this is OmBURo. Now, I ’ ve shown you many different shapes, sizes, mechanism robots. And if you remember this, the whole thing started because we had problems with this bipedal locomotion. Is there a way to make these humanoid robots not fall at all? There is. And this robot is called BALLU. This is my son, Ethan, by the way. Ethan Man : Uh-oh. DH : What if robots never fell? What if we could change the direction of gravity? I ’ m very excited to show you our new robot, BALLU, Buoyancy Assisted Lightweight Leg Unit. This robot is a bipedal robot the size of a human being. But the body is a helium balloon. It ’ s a balloon with two legs. How does it walk? It walks like this. Very elegant, isn ’ t it? This robot might be the safest robot out there. It can walk forward, backwards, sideways. It can turn directions. We want this robot to be living with us. So it can climb upstairs, downstairs. Go over obstacles. It ’ s fun to play with. It can hop, now it can hop up to a height of a table top. Oh, this robot is a good dancer. If you turn on the music, it listens to beat and it dances to the beat. Now we do crazy things when we do experiments. Once, we opened the window and threw the robot out the window. Isn ’ t it great? It solves all the problems of bilateral locomotion. It ’ s cheap, it doesn ’ t fall down. However, it also creates new problems. This robot is horrible outdoors because if the wind blows, it floats away. Now, these are some of the images of our secret projects. I ’ m not going to explain it, but we ’ re using projection mapping, vortex cannons, many different things. Oh, this robot literally can walk on water. You put **ping-pong balls** on the foot, it can walk on water. It can also walk on a tightrope. Isn ’ t this cool? This is BALLU. By the way, all of our videos end with a **bang** like this. Isn ’ t that cool? This is BALLU. Thank you. Now all of these new inventions and creativity came from the problem of humanoid robots. However, secretly, we ’ ve still been working on humanoid robots. And this robot is called ARTEMIS, our latest one, Advanced Robotics Technology for Enhanced Mobility and Improved Stability. And this is the very first time I ’ m showing it to the general public. This is a sneak peek of what is about to come. Now, this robot, ARTEMIS, uses a new type of technology. It ’ s based on that BEAR actuator. And because it ’ s so new, you cannot buy any of these components. So we have to design and fabricate every single part of this robot. We have just finished assembly of the lower body, and I ’ m very excited to show you a sneak peek of robot ARTEMIS. And ARTEMIS is coming too, I cannot wait to show it to you, probably on stage in my next talk. I ’ ve shown you a lot of our newest creation robots from our lab RoMeLa. I would like to give credit to our brilliant, hardworking students at RoMeLa. But what is the source of this creativity? What ’ s the source of this energy? What is the secret to this crazy productivity? I think the next video will be able to answer that question. Man : Look at that. DH : You remember BALLU? We ’ re doing the experiment of dancing. By the way, this is Saturday, 2am in the morning. We ’ re having too much fun, so, yeah, let ’ s bring out all of our robots, one by one. You remember NABi? An early prototype of ALPHRED. Everybody ’ s favorite, DARwIn-OP. The rotating knee mechanism for NABi. The six-legged hexapod robot. This is RoMeLa, the Robotics and Mechanism Laboratory at UCLA. By the way, that ’ s me on the left, dancing. You probably haven ’ t seen a professor dance and party with their students while conducting serious experiments, right? Openness, freedom, trust, having fun and truly believing what you do can change the world. These are some of the secrets behind our next seven species of robot. Thank you very much.

Text Sample 904: POS Dim 6 – 2021 – Score 4.00 – 2021/t004057.txt
Hey, Mark Leifer ’ s, it ’ s Adam. Season four is launching this spring. In the meantime, some exciting news. Each season we ’ ve done a couple of bonus episodes where I have a discussion or a debate with a thought leader. You asked for more of those. So we ’ ve delivered. This is a new series we ’ re calling taken for granted. Get it? The gist, more unscripted conversations with fascinating people about rethinking things we ’ ve taken for granted. This is taken for granted by podcast with the TED Radio Collective, I ’ m an organizational psychologist. My job is to think again about how we work, lead and live. I ’ m delighted that we ’ re starting this series with someone who never fails to challenge how I think about the world. Renee Brown is a social work. Professor Bernie has spent two decades studying vulnerability, empathy and shame. She ’ s the host of two new podcasts, Unlocking US and Dare to Lead. Her TED talk is one of the most watched ever with more than 50 million views, one of the big reasons it was such a sensation is that she models what vulnerability looks like. I ’ m going in. I ’ m going to figure this stuff out. I ’ m going to spend a year. I ’ m going to understand how vulnerability works and I ’ m going to outsmart it. As you know, it ’ s not going to turn out well. I ’ ve long been fascinated with the power of vulnerability and impressed with the power of Bernier ’ s insights. I ’ m excited to learn from her about the nuances of vulnerability at work, especially in places where it seems risky. I will say from one interview to another, I cannot stand small talk. I love conversations that go deep right away, and you are the queen of going deep and being vulnerable. So I feel like I feel like I have extra permission to do that here. I ’ m the queen of vulnerability and I ’ m the assistant queen of, like, boundaries. So we ’ ll see. Let ’ s go. Let ’ s go as deep as we can go and then we ’ ll see. So I guess I guess the place I want to start today is to say that you have convinced millions and millions of people that vulnerability is not a sign of weakness. It can actually be a source of strength and of connection. And yet so many people struggle to be vulnerable at work and they decide to put on armor instead. And I wonder, just for starters, if you could talk a little bit about why people feel special pressure to put armor on at work and what kinds of armor they wear. Yeah, so I hope that the work does and I hope what I do is help people dispel the mythology about a vulnerability. I think that ’ s such an important place to start that there ’ s this idea that vulnerability is weakness. I think most of us were raised with that that kind of ethos like self protect. Be careful. Don ’ t put yourself out there. I mean, vulnerability is very simply defined as uncertainty, risk and emotional exposure. It ’ s the affect or emotion we feel in times of great uncertainty, risk. And when an emotional exposure just means I put myself out there. And so the first thing we have to do is dispel that notion. We are raised to believe it ’ s important to be brave, but then we ’ re taught not to be vulnerable. And they ’ re really. In my you know, based on my research and our data, there just is no courage without vulnerability. I tell the story of asking a group of soldiers a very simple question. Give me an example of courage in your life or an example of courage that you ’ ve observed in someone else that did not require

uncertainty, risk or emotional exposure. And I think I was at Fort Bragg and there was just absolute silence until one guy stood up and said, three tours, ma ’ am, there is no courage without vulnerability. Then a week later, I ’ m doing work with Pete Carroll and the Seattle Seahawks. We ’ re talking about vulnerability. I asked the same question to that group of players. Give me an example of courage on the field or off that doesn ’ t require vulnerability. And it was so funny to me because they they had to huddle for a minute and then they kind of came back and said, there is no courage without vulnerability, not on or off the field. If you ’ re not all in if you ’ re not putting yourself out there, you just can ’ t be brave. And so I think the job is dispelling the mythology about vulnerability is weakness at work. I think we armourer more because there ’ s less trust, there ’ s less confidence. And I think we slip into kind of who we think we ’ re supposed to be at work. And we armer up using things like cynicism, perfectionism, needing to be the knower and be right versus the learner and get it right. There are a lot of forms of armor that can sometimes be rewarded at work. I think that ’ s so true. I love your observation that that people will use expertise or performance as armor at work. And it it really struck a chord with me on a very deep level because I don ’ t want to I don ’ t want to get to psychoanalytic here. But I you know, I had this this defining experience, I guess, in many ways when I was 12, where all of my close friends dropped me because I wasn ’ t cool enough for them. And I never really realized until until you started talking about performance armor that my way of coping with with that experience was to try to be exceptionally good at whatever I did, because then people would respect me or look up to me here like me. And so first it was in sports saying, OK, if I can excel in diving, you know, then I ’ ll have I ’ ll have earned, you know, a badge or some admiration and and maybe I ’ ll be accepted as opposed to rejected. And then I got to college and started to redefine my identity around excellence in school, which which was something that then got reinforced. And then over time it felt like every single project I took on was was one where I knew I could excel. And that way I was just fortifying my armor more and more. And I started to feel like this is a mistake and I ’ m missing out on opportunities for learning and for challenging myself and stretching myself. And so I just I ’ d love to get your reactions on on this idea of for those of us who are so accustomed to to treating excellence or expertises as our armor, how do we let go of that? Well, first of all, I have to say that your story of when you are 12 is real trauma. I mean, that ’ s really that that ’ s trauma. And yes, there are different kinds of trauma and different sizes of the bucket. But when you ’ re 12, it ’ s all about belonging. And I think I have the same story. I was I was 13, not 12, but I have a very similar story. But I just got really good at, like smoking cigarettes and being wild, which was probably not the best thing to pick. But but we all have stories like that and we build our armor around those stories. And no one talks about the big developmental milestone of midlife, which can happen, I think, anywhere between our late 30s and probably mid 50s, which is the armor that we put on to protect us when we were children and have less agency and less control over what was happening. That armor no longer serves us and it is heavy. And what it actually does is prevent us from being seen and prevent us from growing into areas because that armor doesn ’ t grow with us. It stays kind of the same size, I think. And so I you know, for me, I kind of switched armor, you know, when I moved from being kind of the loud party girl to, OK, this is scary, but I ’ m going to try to be the smart kid. And that worked. And I was rewarded for it. Then I went I moved solidly into a life of. Proving, performing, perfecting until I actually physically and emotionally couldn ’ t do it anymore, and so I think, again, the big challenge of midlife is the armor that we ’ re carrying, their armor that we ’ re, you know, that ’ s got us locked in and the weapons that were carrying that kept us safe at some point. What is OK to let go of because it ’ s no longer serving and then how do we peel it off, which is the scary part. You know, I do think that as I peeled mine off and that was work I did with a therapist, and now I ’ m constantly trying new things that I don ’ t know whether I ’ m going to be good at or not. And I am failing, you know, on occasion, you know, but feels but now that I ’ ve changed the goal to stretching and learning instead of proving and perfecting. It feels so different. Does that make sense? It does it it resonates. And I ’ ve I guess I ’ ve I ’ ve gone through a similar shift in saying, look, I want to be the kind of person who takes on projects that matter. Yes. And where I have the potential to contribute something meaningful. And even if I fail, at least I didn ’ t fail to try. That ’ s right. Yes. And I have let me tell you, I have I have taken on a couple of things in the last several years where I have just failed. But I don ’ t regret it. I don ’ t regret it. It ’ s such a great place to be and part of I guess part of what I ’ ve been wondering is, as I ’ ve been applying applying your work to my own life and also talking in class about it quite a bit. So just just as a little bit of back story, every year, I have students at the undergrad level apply to my class. And one of the questions is, what ’ s your favorite TED talk? Yours is every year. One of the topics I think one of the things that jumped out at me after the first few years was it was mostly women who were naming you as their favorite talk. And and I ’ m wondering, I ’ m sure some of this, of course, is, you know, men tend to choose male role models. Women tend to choose female. But it also seems like vulnerability is easier for women to process and maybe adopt. And it ’ s something men struggle a lot more with. And I wondered if you could talk about what you found in your research there and a little bit of the psychology of why men struggle so much with vulnerability. I have moved from talking about men and women just to talking about folks who are, you know, trying to meet masculine norms and folks trying to meet feminine norms just to be more inclusive. But here ’ s the thing. In terms of masculine norms, the biggest shame trigger is do not be perceived as weak. So just think about that calculus for a second. I ’ m asking people to be vulnerable. Ninety nine percent of them are raised to believe that vulnerability is weakness, and they know in their heart that they ’ ll experience shame if they ’ re perceived as weak. And that ’ s so it becomes a very big ask for. People who really value complying with masculine norms in terms of women and feminine norms, the number one shame trigger is. Perfection do not be perceived as imperfect, do it all, do it. Well, never let them see you sweat. So now I ’ m saying, hey, I want you to be vulnerable about your setbacks and your failures and where you ’ re struggling and your emotions. So really the biggest barrier to vulnerability. Is shame the fear of shame? The fear that I ’ m going to put myself out there and I ’ m going to find myself experiencing, you know, the definition we use it for, shame is the incredibly painful experience of believing or feeling that we are unworthy, that we ’ re flawed and unworthy of love and belonging and connection. And so you can see how vulnerability is a really big ask. It ’ s a really big ask you. It ’ s so interesting. Your analysis reminds me of the Boston and Vandeleur work on precarious manhood, which it basically says, look, you know, the problem with most definitions of masculinity or masculine cultures is we have to demonstrate it over and over and over again. And so no matter how many times you ’ ve proven your strength, if you show just one tiny bit of weakness, then all of a sudden you ’ re no longer a man or you ’ re no longer strong. I don ’ t know. Have you been reading any of that work? Well, I. I found it by asking some folks on my research team what is an alternative to toxic masculinity. Interesting as a phrase, because I ’ m not sure that phrase is helpful. I am so with you. I hate the phrase. It ’ s it ’ s always bothered me just at a basic level, because it seems to imply that masculinity is inherently toxic as opposed to what you said, which is there ' s a there ' s a brand or a flavor of masculinity that can be toxic. And I guess I came to wondering, is that part of the reason why why you see so many men motivated to armor up at work because they have to keep proving their strength over and over again? This is super interesting. And this is I ' m like, this is me thinking out loud with you just spit **balling** right now. Why is vulnerability? So much. More difficult to talk about with men in suits. In organizations or hoodies and jeans, because I work in Silicon Valley a lot, right. Why is it more difficult to talk about with them than it is with. Trauma surgeons and firefighters and military and professional athletes, and I guess this hypothesis that ' s forming in my head right now, which, you know, who knows if it ' s right or not, would be. Where masculinity is, you know, where where that kind of strength is seen every day on the pitch or on the football field or in their jobs, they ' re not having to prove it so often because it ' s part of what they do. Wow. But they ' re more open to those conversations. Do you know what I ' m saying? That is so fascinating. Right. So if I ' m if I ' m a firefighter, everybody knows I ' m a badass. So if you if I if I break down outside of a burning building into tears, I ' ve I ' ve I ' ve established already that I ' m tough and I can I can handle extreme crises and difficult situations, whereas if I ' m a software engineer in Silicon Valley or I ' m a trader on Wall Street, I haven ' t been able to demonstrate my strength in the same way as that is. Is that what you ' re getting at? Yeah, I mean, it ' s what I ' m getting at because, I mean, it ' s totally what I get. I ' m getting that because I ' m thinking to this moment where I ' m on an Air Force base, talking to a general, doing a lot of work with and these are like serious, serious ass people like these are fighter pilot kind of folks. Right. And before we got started, he and I are talking about the work. And I said, you know, one of the things that ' s going to be really interesting is I want to talk about care and connection are irreducible needs when we lead, meaning we have to care for and be connected to the people we lead are we can ' t do it effectively. And up until that point, I had had so much pushback from people like, that ' s bullshit. I ' m not here to like you. I ' m here to lead you. And this general turned toward me and said from the highest ranks of the Air Force, we believe you cannot lead people that you do not feel affection toward. Which I think takes care in connection a little another step affections, a bigger word right in my book and I said, Huh? And he goes, Yeah, that ' s that ' s just common. If you cannot find a way to feel affection for people you lead, then we need to move them out of your direct report line. You know, as you as you walk through some of these stories and examples, what seems to set apart the contexts where even tough, masculine leaders appreciate the importance of vulnerability and affection, is there doing work with with heavy emotional demands? Yes, whereas I. I mean, I can I ' m sure you know, and I also know some some very successful people in knowledge work who have managed to pull off a, you know, a pretty extraordinary career without ever really having to to take off the **mask** and show what they ' re really feeling. And so is is there something also built into their work in addition to the fact that you get to prove your strength, that you can ' t you can ' t hide from the emotions altogether? Yeah, I think the thing that I would ask I would ask the great contributions that they made without taking off the **mask**, how much greater could they have been? What changes could they have made had they had that combination of intellect plus humanity and, you know, reading think again was a catalyst for me, re-examining my. Bad assumption that we ' re all hungry for brave leadership. Thank you, Renee. I ' m honored that you read my book, Think Again, let alone that it struck a chord. It kind of grabbed me by the shoulders and gave him gave me a little shake, like a big shake, actually. I don ’ t think we can make the mistake of assuming that everyone wants brave leadership. Yes, because brave leadership puts demands on people to also be courageous, to also be self-aware, to also put more importance on getting things right than being right. I don ’ t think brave leadership for the leader or for the people who are being led is for the faint of heart. So I ’ m not so sure that everyone wants courageous leadership. And that ’ s. That ’ s a tough thing, don ’ t you think? Yeah, I agree. I think the first thing that comes to mind is I read some research earlier this week showing that when leaders have employees who are courageous and daring, that sometimes they feel like that gives them a pass and they say, OK, you know, my people have got this. And so I don ’ t have to demonstrate the same integrity, which, of course, is the exact opposite of what you would want to see. And it goes to something I ’ ve been wondering about that your work has really pushed me to think a lot about, which is, you know, if if if I ’ m going to play who who believes in the value of courage and vulnerability. But I have a boss or a leader who doesn ’ t get it. Well, how do I manage up? I mean, obviously, in an ideal world, I would just leave. But if I don ’ t have that option, is there anything I can do to nudge a leader to take off the armor, to not be so ashamed to to be a little bit more real? So one thing is I never tell people to leave because I mean, leave if you can. But I just you know, I think you and I are both careful about that in our in our work. Right. Because the reality is you may have a sick kid and this is your insurance, you know, like or this is how you know, definitely when I tell people to leave in this job market right now. So we try to give people real tools. No, you can ’ t manage by teaching your boss this work and asking her to take off the armor. I mean, it just doesn ’ t work like that. What I would say is, let ’ s say you ’ re my boss and you ’ re you ’ re a pretty armored. You ’ re not your you don ’ t do vulnerability. And we just had a big disappointment setback in our team. And, you know, your style is to just move forward. And so what I might say, instead of saying, you know, look, I think we need to be vulnerable and take the armor off and, you know, really embrace this failure that ’ s going to get you fired or in trouble. So what I would say to this person and depending on how they are, is I would say, hey, Adam. I have a question for you. Do you think it could be helpful for us to dig in around what happened as a group? What I ’ m seeing, as I think people are making up different stories about how we ended up in this setback, and I wonder if it ’ d be helpful if we sat down and just talked through it so we could get on the same page and figure out just as a group what went wrong so we could embed that in our team and not repeat it. So I would just practice the work. Not try to influence people to do the work. Does that make sense? It does. It does. And to me, what ’ s so clever about that approach is it takes the leader out of the spotlight a little bit. Right. So I ’ m not attacking or criticizing my boss. I ’ m actually saying, hey, you know what a lot of people are? I love your phrase. You know, the story I ’ m making up is and here you ’ re saying a lot of people are making up different stories. And so, you know, maybe we need to actually get the either set the record straight or learn from something from this experience. And so you ’ re almost inviting the leader to be a problem solver as opposed to. Yes. Calling them the problem. That ’ s right. And so it is. We have this list of kind of we you know, we call hard conversations, rumbles. And in fact, I have one schedule today and it literally says in my calendar, ad sales rumball four o ’ clock. And so what I know what that means in our organization, our culture is we ’ re expecting a lot of different opinions. We ’ re expecting a lot of competing priorities. Bring up a point of view, bring a lot of curiosity, be prepared to listen more than you talk and be prepared from for some discomfort, because we ’ re going to stay in this until we understand each other better. And so it ’ s just an attention set up for us. We

’ re going to rumble. And so we have these rumble starters and language that we give people who go through our training where. If I again, if I ’ m talking to you and we have different takes on, you know, the perks of vulnerability, I ’ m just practicing my work with you. So I ’ m saying, you know, I hear you, Adam. That ’ s not my experience of how OP showed up in that meeting. Can you walk me through what you saw that that is leading you to this belief? There ’ s just language tools that we can use. Yeah, and, you know, I have to ask, because this term rumbles from is is such a great reframe of these hard conversations that many of us avoid. And there ’ s a part of me that thinks, OK, you ’ re you ’ re activating a new mindset. It ’ s we ’ re going into WWE. Let ’ s get ready to rumble. And I can ’ t wait this this could be fun, but there ’ s a part of me that also thinks, oh, do you do you actually do you ruminate even more going into them thinking, oh, God, I ’ ve got to rumble. This is going to be horrible. Does the framing help or hurt? It depends. I think it depends on the culture. Right. And it ’ s funny. And this is the age difference maybe because I ’ ve got I think I ’ ve probably got a decade on you. And so when I think of rumble, I think of West Side Story, I think musicals, you know. And so to me, that ’ s where it came from. It came from this idea of a rumble in West Side Story was part part argument, part dance, because, you know, as a musical. So in our culture, where my number one job is that as the kind of CEO of this organization that I lead is to normalize discomfort, we onboard for discomfort. We teach you how to fail and get back up when you are brand new and weak one like we normalize discomfort because I just can ’ t have people working for me who are only doing what they ’ re already good at doing. I just that ’ s not that ’ s not effective. Like, that ’ s not innovative. So for me, it just means like, I will definitely have people who are two levels, you know, apart from me, who, you know, their bosses boss report to me and they will say to me, hey, Brian, can I rumble with you on the social media strategy? I am not I ’ m not down with it yet. I don ’ t get it. And Michael Rumble what ’ s what ’ s what do you think? And as you and I both know, one way to really measure embedded change in in cultures, which is a hard thing to do. Right, is language like language is a big indicator. And so I think you can ’ t just start using the word rumble if it ’ s not paired with a deeper culture change. I think that makes a lot of sense, and it it leaves me wondering a little bit if if actually wondering a lot. I ’ m just going to wonder, no matter how much I ’ m wondering about it, I I love measuring culture change by looking at the vocabulary people use. I guess I guess maybe this is a little bit of a chicken in the egg. But is it possible that the vocabulary you ’ re introducing is is creating the change, not just reflecting it? Yeah, I think language is praksis. It is. It is the theory of change. It is the practice of change all wrapped up into one thing. And you know, the greatest compliment that I get, people would come up after a talk and say, I already knew everything you said. I had no words for it and I thought it was just me. And so that ’ s that ’ s the goal of the work to give people language, language is power. And and here ’ s the myth. Here ’ s what I tell people. We think. That giving language to hard emotions like shame, our grief are our hard experiences, gives those experiences or those emotions power, but giving language to hard things gives us power. Yeah, that ’ s you know, that ’ s so true when when we can name an emotion, it at least allows us to analyze it or to reflect on it and to control it a little bit, because we realize we have choices about what we call it. And when I do something wrong, as you pointed out so many times, I have a choice about whether I ’ m going to interpret what I ’ m feeling as shame. I ’ m a bad person or guilt. I did a bad thing. That ’ s right, you wanna hear something crazy? Yes, yes, yeah, let me tell you something crazy. So we have communities of facilitators and when we look at evaluation ’ s from that that kind of deeply therapeutic work where people will spend a facilitator will spend 12 weeks taking people through, you know, daring, greatly rising, strong curriculum in the end. And the evaluation, what we see over and over again, understanding the difference between shame and guilt was the most important part of this work. Just understanding that there ' s a difference between shame I am bad and guilt, I did something bad and that how we talk to ourselves or how we use shame or guilt to parent or lead has profoundly different outcomes. Right. Just understanding that I can look at my child and say, you know what? You ' re a wonderful kid. That was a really stupid choice and how different that is from your stupid kid. Yeah. Which changes who people are, you know. Welcome back to Taken for Granted and my conversation about vulnerability with Bernie Brown, one of the fears that a lot of people carry around is people are worried that if they ' re vulnerable at the wrong time or with the wrong person, especially if they ' re in a more performance oriented culture at work, that they might not be seen as competent. I ' d love to hear your latest thinking on, especially in a virtual world. How do I figure out what appropriate vulnerability is and how do I know whether it ' s safe to be vulnerable? So I would say you don ' t you ' ll never succeed in a performative culture if you don ' t have some of the things that really are vulnerable, like curiosity. If you pretend like you know everything in a performative culture and you ' re not a learner, that house of cards is going to collapse at some point. So what I think people are asking is how much is too much to share about my feelings? And that always leads me to this very simple sentence, vulnerability minus boundaries is not vulnerability. Are you sharing your your emotions, your experiences to move? Work connection, our relationship forward, or are you working your shit out with somebody and work is not a place to do that. So I ' ll give you an example that I think is. You know, in fact, what I tell the story, I tell the story a lot when I ' m talking, but I think about you sometimes, Adam, when I tell the story, because of things that I have read that you ' ve written. No, no, it ' s good, I think. But it ' s this is a nuanced life is nuance. Right. And so I was working with a group of newly funded CEOs from Silicon Valley. And after my talk, one of them came up to me and said, I ' m going to be vulnerable. I ' m going to tell my investors, I ' m going to tell my employees, look, we ' re in over our head. I don ' t know what I ' m doing. And we ' re bleeding money. Right, and he said, I ' m just going to be vulnerable. And I said. You must have stepped out to go to the bathroom and get a coffee during the part where I said vulnerability minus boundaries is not vulnerability. We always have to interrogate our intention around sharing and we have to question who we ' re sharing with and is that the right thing? And he ' s saying, so what do you think is going to happen? You don ' t think I should do it? I said, I think you ' ll never get funding again. And I think you will unfairly put the people who ' ve probably left great jobs to follow you over here into a terrible position of fear. And he said, so I don ' t understand. And I said, if you are literally in over your head, you don ' t know what to do next and you ' re bleeding money. You should absolutely share that with someone, but the question is, who is the appropriate person to tell? I so appreciate the nuance that you bring to this idea of vulnerability, to say, look, you know, just just because vulnerability helps to build trust doesn ' t mean you should share everything in all situations with other people now. And I think that ' s such a common misconception about the idea. I guess it comes up a lot in discussions about authenticity to you that people think that that, you know, OK, I ' m trying to be authentic and that means I don ' t need to have a **filter** or, you know, I can defend my actions by saying I was just being myself like, well, you were just being a jerk. That ' s that ' s not OK. Yes, that that ' s exactly right. Look, I know some of the most vulnerable and authentic leaders I have ever had the pleasure of working with. Truly authentic, truly vulnerable, personally disclose very little. And some of the leaders that I work with disclose everything are the least authentic and vulnerable people I ’ ve been around. OK, so this is totally fascinating. Are you saying that I don ’ t I can. No, no. I actually love this because I have been criticized on this before. And I think you just you just gave me a new way of thinking about this, which is you ’ re saying I can be vulnerable without disclosing a ton about my emotions or my life. Yes. How I guess. I think this is what I ’ ve been trying to do. I ’ ll just give you the back the background in case it ’ s helpful. I have feedback from a bunch of people I work with that when, you know, when there ’ s something difficult going on in my life, I don ’ t care much about it. And my fear has been that when, you know, when people know that there ’ s something difficult going on in my life and then I don ’ t open up about it, they ’ re going to think that I ’ m you know, I ’ m not being honest or authentic with them or I ’ m lacking vulnerability. And you ’ re saying there are ways that I can maintain my, I guess, my degree of privacy that I made up for naturally and still be vulnerable. So I ’ m excited about this. Tell me more. This is what vulnerability can look like. Hey, I ’ m I ’ m really struggling right now. I ’ ve got some stuff going on with my mom and it ’ s hard. And I want a job to know. And I want you to know what support looks like for me is I ’ ll check in with you if I need something from you. And I may take some time off, but I want to know for me, support looks like being able to share this with you and being able to bring it up with you when it ’ s helpful for me, but not having to field a lot of questions for it. So I appreciate being able to tell you. I appreciate that we all will need different things when we have hard things going on in our lives. This is what I need right now that is incredibly empowering because what so let me tell you what people are actually worried about, Adam, when you ’ ve got someone who compartmentalizes in segments and when they know something really difficult is going on, they ’ ve got they ’ ve got a parent in chemotherapy or they ’ ve got, you know, like some something ’ s really hard going on. They ’ re concerned about you for sure. But what they ’ re also concerned about is Bernie does not give me permission to be human. I am not safe here. Unless I to compartmentalize and bring do not bring my whole self here and what you ’ re doing when you say what I just said, which is I understand we all have different things and different needs, and I love being a part of team A team that can respect that. I do trust you and want you to know that these hard things are going on. And for me, support looks like this right now. That ’ s awesome. Does that make sense? It does, it ’ s a different interpretation than I had made, which is, you know, when when I ’ m the first or second time, I was like, oh, OK. You know, this is somebody who who wants, you know, who just expects me to open up more that idea. And we have different preferences. That ’ s OK. And as it happened a few more times, I felt like, OK, maybe what ’ s going on is people are worried that they ’ re not as close to me as they thought they were, because if they were, I would have shared this. And you ’ re saying, yes, maybe that, but also that they ’ re worried that if they want to share something with me, that I ’ m not going to be receptive to it because I don ’ t do it and return. If you ’ re my boss and you ’ re the person that really is very private and doesn ’ t like to disclose and and I know something ’ s going on. It creates eggshells for me. Because you ’ re not being explicit about what you want or don ’ t want, it ’ s just off limits. Yes, and if you said that to me, I ’ d say, man Adam. I really appreciate you normalizing that we have lives outside of work, and I really appreciate you normalizing that. We all need different things when we ’ re in a hard time. And what I really appreciate is you asking us, you trusting us enough to share that you ’ re having a hard time and ask for what you need, which is not to talk about it unless you bring it up. That safety, that psychological safety. It ’ s such a powerful conversation that I clearly need to have with a bunch of people having to add to my list now, but it also it also makes me think that this it might be helpful to clarify to people what closeness means to me. Yes. You know, when I think about closeness, it ’ s less about disclosing, you know, my deepest emotions or what ’ s going on in my personal life. It ’ s more about, number one, if I made time for you, if that means you matter to me first off. Yes. And number two, and maybe more importantly, I do not I do not see a connection between the frequency of communication and the depth of a friendship or collaboration. And I feel like the people I ’ m closest to, I sometimes go a year or more without talking to them and we can just pick right up where we left off. And I know that if I ever needed them, they would be there for me and vice versa. And I don ’ t think I ’ ve actually let anyone know that, God, it ’ s huge. It ’ s so important. And that that you know what that is? That ’ s authenticity. That ’ s authenticity because let me tell you something, you sitting down with this, folks are concerned because you ’ re not sharing enough and and pushing yourself to share with them is actually not authenticity that ’ s assessing and acclimating to what you think people need. It ’ s not being you. That ’ s why this sentence, what you know, what a support look like for me, what a support look like for you, and that we can build a team, that we can have different needs because we see each other and respect each other. That ’ s authenticity. It ’ s nothing more. Nothing less. So if I can quote you to you, I think I know well, I mean, I ’ m going to do it. You know, you said something really profound about this. You ’ ve said that I think tell me if I ’ m if I misapplying it here. But I think that another way of saying what you just said in your words is that if I were basically just sharing because people expected me to share, then I ’ m fitting in as opposed to belonging. That ’ s right. That ’ s right. That ’ s right. And and there is room for all of us, like I have pushed and pushed and pushed people to be more like at my level of sharing, which is kind of somewhere in the middle, like I have my own personal line I ’ ll share with vulnerable, but I never share with sentiment. I ’ m really clear on all that. I don ’ t my kids are not in my posts. I ’ m not you know, I just I ’ m a public person. But that doesn ’ t mean that I forfeited everything in my life. And so what true belonging is, if you ’ ve got a team of seven people. That have seven different ways of showing up and different levels of comfort with sharing and that all of them feel like they have a space there, because what ’ s not honored is a way of being was honored is actually authenticity. You know, and that ’ s what we ’ re looking for, but let me tell you, that ’ s a shit ton of work and it ’ s more work than saying authenticity is crying, three point five, which I have really had leaders come up to me and literally say, how many times do I have to cry in front of them to, like, really be considered vulnerable? And I said, yeah, like, you don ’ t get it. There ’ s no hack here. There ’ s no hard wiring here. It ’ s about understanding and seeing. People love that. Well, thank you. I ’ ve learned so much from your work. It ’ s been you know, it ’ s been eye opening. It ’ s been at **various** points uplifting and also a little bit arresting in the best ways. And it ’ s been just a real treat and delight to have you on work life. God, thank you so much. I have to say, this is just one of my favorite conversations ever. So thank you for inviting me. If you ’ re still hungry for more from Bernie and me, we just had another conversation for her podcast, Dare to Lead. It ’ s on Spotify, Renee, with Adam Grant on the power of knowing what you don ’ t know. Taken for granted is a member of the TED Audio Collective. The show is hosted by me, Adam Grant, and produced by TED with Transmitter Media. Our team includes Colin Helmes Credico and Dan O ’ Donnell, Joanne DeLuna, Grace Rubenstein, Michelle Quint and Ben Chang. And Add a few in this episode was produced by Constanza Gado and Jessica Glaser. Our show is mixed by Rick Original Music by Hartsdale Sue and Alison Layton Brown.

If you have credit card debt, you are far from alone. More than half of Americans are currently carrying around some form of credit card debt. And if you ’ re part of that majority or just want to put some preventative measures in place, I have four simple changes that can help you work towards becoming debt free. [Your Money and Your Mind with Wendy De La Rosa] Number one : prioritize your payments and prioritize them in the right way. So let ’ s say you have two cards, one with a 200 dollar balance and the other with a 1, 000 dollar balance. Which one do you pay off first? Well, if you ’ re like most people, when people have debt across multiple credit cards, they tend to pay off the one with a lower balance first because it feels like an easy win. It feels good. We call this the”completion bias.”When you give in to completion bias, you feel more productive because you ’ re able to check off quick tasks from your to-do list. And you might even get a rush of dopamine while you ’ re doing it. But rather than looking at the balance – 200 dollars versus 1, 000 dollars – what you should be looking at is the interest rate instead. If you ’ re busy paying off a credit card with a low interest, while the larger-interest-rate card lingers on and on, you could be in debt for much, much longer. You can still work the completion bias to your advantage. Here ’ s a quick tip : think of that 1, 000 dollar debt as a series of smaller, achievable tasks. For instance, you could decide to pay 100 dollars towards that credit card balance each month. And each time you pay that 100 dollars, you ’ re crossing something off your to-do list and achieving that completion high. You ’ ll not only get that completion high but you ’ ll have something to celebrate. Number two : call your credit card company and ask them to lower your interest rate. Get somebody on the phone. Typically, when you apply for a credit card, it ’ s either when you ’ re young or you lack liquidity. And in both instances, your credit score is lower. Your credit score is what lenders and banks and credit card companies use to determine how much of a risk it would be to lend you money. Now, the higher the credit score, the lower the risk, and the lower the interest rate. Conversely, the lower the credit score, the higher your interest rate, and the more money you ’ ll have to pay in interest in the long run. Over time, with on-time payments, your credit score improves. But guess what? Sometimes credit card companies don ’ t lower your interest rate as a result. But what we do know is that if you call, oftentimes, credit card companies will loosen up on their interest rates, given your credit score improvement. We only have a small sample, but in my research, we invited people to come in, call their credit card company and make the case for a lower interest rate. Fifty percent of them were successful. This is a simple way of having a fifty-fifty shot to save yourself thousands of dollars on interest. Now, while you have them on the phone, here ’ s tip number three : request a change in your payment date. The payment due date is usually a random day that the credit card companies set that doesn ’ t align with your cash flow. Now, I want you to think about when you typically get paid and what time of the month you usually have the most cash on hand. Based on that, pick a payment date that works best for you. I ’ ve seen that it ’ s easier for people to pay down their debt when they have more money in their bank account. So

if you have credit card debt, choose a new payment date that falls after your usual payday. So if you typically get paid on the 15th, the 16th might be a great day. Here ' s my last tip. Number four : fundamentally change how often you pay your credit card. So for example, if you usually pay 100 dollars a month towards your credit card debt, there are 12 months in a year, so in a year, you ' ll pay 1, 200 dollars. Good for you! But if you decide to spread that 100 dollar a month payment into weekly payments of 25 dollars, you ' ll end up paying more in the long run, because there are 52 weeks in a year. That means you ' ll end up paying 1, 300 dollars instead of 1, 200 dollars. You will also end up paying less on interest. It ' s a natural calendar hack that you can work to your benefit. And there are even companies that can help you do this automatically. These changes may seem small and subtle, but you ' ll be pleasantly surprised by the huge difference they ' ll make, whether you ' re overcoming debt or just trying to avoid it all together. I ' ll see you next episode with some more tips. Your future self will thank you.

Christiana Figueres : Today, February 19, 2021, at the beginning of a crucial year and a crucial decade for confronting the climate crisis, the United States rejoins the Paris Climate Agreement after four years of absence. Unanimously adopted by 195 nations, the Paris Agreement came into force in 2016, establishing targets and mechanisms to lead the global economy to a zero-emissions future. It was one of the most extraordinary examples of multilateralism ever, and one which I had the privilege to coordinate. One year later, the United States withdrew. The Biden-Harris administration is now bringing the United States back and has expressed strong commitment to responsible climate action. The two men you are about to see both played essential roles in birthing the Paris Agreement in 2015. Former Vice President Al Gore, a lifelong climate expert, made key contributions to the diplomatic process. John Kerry was the US Secretary of State and head of the US delegation. With his granddaughter sitting on his lap, he signed the Paris Agreement on behalf of the United States. He is now the US Special Envoy for Climate. TED Countdown has invited Al Gore to interview John Kerry as he begins his new role. Over to both of them. Al Gore : Well, thank you, Christiana, and John Kerry, thank you so much for doing this interview. I have to say on a personal basis, I was just absolutely thrilled when President Biden, then president-elect, announced you were going to be taking on this incredibly important role. And thank you for doing it. Let me just start by welcoming you to TED Countdown and asking you, how are you feeling as you step back into the middle of this issue that has been close to your heart for so long? John Kerry : Well, I feel safer being here with you. I honestly, I feel very energized, very focused. I think it ' s a privilege to be able to take on this task. And as you know better than anybody, it ' s going to take everybody coming together. There ' s going to have to be a massive movement of people to do what we have to do. So I feel privileged to be part of it, and I ' m honored to be here with you on this important day. AG : Well, it ' s been a privilege to be able to work with a dear friend for so long on this crisis. And, of course, on this historic day, when the United States now formally and legally rejoins the Paris Agreement, we have to acknowledge that the world is lagging behind the pace of change needed to successfully confront the climate crisis, because even if all countries kept the commitments made under the Paris Agreement – and I watched you sign it, you had your grandchild with you – I was there at the U. N, that was an inspiring moment, you signed on behalf of the United States, but even if all of those pledges were kept they ’ re not strong enough to keep the global temperature increase well below two degrees or below 1. 5 degrees, and emissions are still rising. So what needs to happen here in the US and globally in order to accelerate the pace of change? JK : Well, Al, you ’ re absolutely correct. It ’ s a very significant day, a day that never had to happen, America returning to this agreement. It is so sad that our previous president, without any scientific basis, without any legitimate economic rationale, decided to pull America out. And it hurt us and it hurt the world. Now we have an opportunity to try to make that up. And I approach that job with a lot of humility for the agony of the last four years of not moving faster. But we have to simply up our ambition on a global basis. United States is 15 percent of all the emissions. China is 30 percent. EU is somewhere around 14, 11, depends who you talk to. And India is about seven. So you add all those together, just four entities, and you ’ ve got well over 60 percent of all the emissions in the world. And yet none of those nations are at this moment doing enough to be able to get done what has to be done, let alone many others, at lower levels of emission. It ’ s going to take all of us. Even if tomorrow China went to zero, or the United States went to zero, you know full well, Al, we ’ re still not going to get there. We all have to be reducing greenhouse gas emissions. We have to do it much more rapidly. So the meeting in Glasgow rises in its importance. You and I, we ’ ve been to these meetings since way back in the beginning of the ’ 90s with Rio and even before, some of them parliamentary meetings. And we ’ re at this most critical moment where we have a capacity to define the decade of the ’ 20s, which will really make or break us in our ability to get to a 2050 net zero carbon economy. And so we all have to raise our ambition. That means coal has got to phase down faster. It means we ’ ve got to deploy renewables, all forms of alternative, renewable, sustainable energy. We ’ ve got to push the curve of discovery intensely. Whether we get to hydrogen economy or battery storage or any number of technologies, we are going to have to have an all-of-the-above approach to getting where we need to go to meet the target in this next 10 years. And I think Glasgow has to not only have countries come and raise ambition, but those countries are going to have to define in real terms, what their road map is for the next 10 years, then the next 30 years, so that we ’ re really talking a reality that we ’ ve never been able to completely assemble at any of these meetings thus far. AG : Well, hearing you talk, John, just highlights how painful it ’ s been for the US to be absent from the international effort for the last four years, and again, it makes me so happy President Biden has brought us back into the Paris Agreement. After this four year hiatus, how are you personally, as our Climate Envoy, planning to approach re-entry into the conversation? I know you ’ ve already started it, but is there anything tricky about that? Or I guess everything is tricky about it, but how are you planning to do it? JK : Well, I ’ m planning, first of all, to do it with humility, because I think it ’ s not appropriate for the United States to leap back in and start telling everybody what has to happen. We have to listen. We have to work very, very closely with other countries, many of whom have been carrying the load for the last four years in the absence of the United States. I don ’ t think we come in, Al, I want to emphasize this – I don ’ t believe we come to the table with our heads hanging down on behalf of many of our own efforts, because, as you know, President Obama worked very hard and we all did, together with you and others, to get the Paris Agreement. And we also have 38 states in America that have passed renewable portfolio laws. And during the four years of Trump being out, the governors of those 38 states, Republican and Democrat alike, continued to push forward and we ’ re still in movement. And more than a thousand mayors, the mayors of our biggest cities in America, all have forged ahead. So it ’ s not a totally, abjectly miserable story by the United States. I think we can come back and earn our credibility by stepping up in the next month or two with a strong national determined contribution. We ’ re going to have a summit on April, 22. That summit will bring together the major emitting nations of the world again. And because, as you recall in Paris, a number of nations felt left out of the conversation. The island states, some of the poorer nations, Bangladesh, others. And so we ’ re going to bring those stakeholders to the table, as well as the big emitters and developed countries, so that they can be heard from the get-go. And as we head on into Glasgow, hopefully we ’ ll be building a bigger momentum and we ’ ll have a larger consensus. And that ’ s our goal – have the summit, raise ambition, announce our national determined contribution, begin to break ground on entirely new initiatives, build towards the biodiversity convention in China, even though we ’ re not a party, we want to be helpful, and then go into the G7, the G20, the UNGA, the meeting of the United Nations in the fall, reconvene and reenergize, going for the last six weeks into Glasgow. In my judgment, Glasgow, and you ’ d know this full well, I think Glasgow is the last, best hope we have for our nations to really set us on that path. And so, you know, one key is, as I said, raising ambition. The other is defining how you ’ re going to get there, and then the third is finance. We ’ ve got to bring an unprecedented global finance plan to the table. And I think we ’ re already working with private sector entities. I believe there ’ s a way to do that in a very exciting way. AG : Well, that ’ s encouraging, and I ’ m going to come back to that in just a moment. But I ’ m glad you made those points about state and local governments actually moving forward during the last four years. A lot of US private companies have as well. And already I ’ m extremely encouraged by the suite of executive actions that President Biden has already taken during his first weeks in office. And there ’ s more to come. There ’ s also a push for legislative action to invest in the fantastic new opportunities in clean energy, electric vehicles and more. Yet you and I have both seen the difficulties of this approach in the past. How can we use all of this activity to well and truly convince the world that America is genuinely back to being part of the solution? I know we are. You know we are, but we ’ ve got to really restore that confidence. I think your appointment went a long way to doing that. But what else can we do to gain back the world ’ s confidence? JK : Well, we have to be honest and forthright and direct about the things that we ’ re prepared to do. And they have to be things we ’ re really going to do. We just held a meeting a few days ago with all of the domestic entities that President Biden has ordered to come to the table and be part of this effort. This is an all-of-government effort now. So we will have the Energy Department, the Homeland Security Department, the Defense Department, the Treasury. I mean, Janet Yellen was there talking about how she ’ s going to work and we ’ re going to work together to try to mobilize some of the finance. So I think, you know, we ’ re not going to convince anybody by just saying it. Nor should we. We have to do it. And I think the actions that we put together shortly after President Biden achieves the COVID legislation here, he will almost immediately introduce the rebuild effort, the infrastructure components, and those will be very much engaged in building out America ’ s grid capacity, doing things that we should have done years ago to facilitate the transmission of electricity from one part of the country to another, whether it ’ s renewable or otherwise. We just don ’ t have that ability now. We have a queue of backed up projects sitting in one of our regulatory agencies which have got to be broken free. And by creating this all-of-government effort, Al, our hope is we ’ re really going to be able to do that. The other thing that we ’ re doing is I ’ m reaching out, very rapidly, to colleagues all around the world. We ’ ve had meetings already, discussions with India, with Latin American countries, with

European countries, with the European Commission and others. And we ’ re going to try to build as much energy and momentum as possible towards these various benchmarks that I ’ ve talked about. And I mean, the proof will be in the pudding. We ’ re going to have to show people that we ’ ve got a strong NDC, we ’ re actually implementing, we ’ re passing legislation, and we ’ re moving forward in a collegiate manner with other countries around the world. For instance, I ’ ve talked to Australia, we had a very good conversation. Australia has had some differences with us. We ’ ve not been able to get on the same page completely. That was one of the problems in Madrid, as you recall, together with Brazil. Well, I ’ ve reached out to Brazil already, we ’ re starting to work on that. My hope is that we can build some new coalitions and approach this, hopefully in a new way. AG : Well, that ’ s exciting, and I do agree with your statement earlier that the COP26 conference in Glasgow this fall may be the world ’ s last, best chance, I like your phrase there. From your perspective, what would you list as the priorities for ensuring that this Glasgow conference is a success? JK : I think that perhaps one of the single most important things, which is why we ’ re focused on this summit of ours, is to get the 17 nations, that produced the vast majority of emissions, on the same page of committing to 2050 net zero, committing to this decade, having a road map that is going to lay down how they are going to accelerate the reduction of emissions in a way that keeps 1. 5 degrees as a floor alive and also in a way that guarantees that we are seeing the road map to get to net zero. I will personally be dissatisfied, disappointed if for our children ’ s sake and our grandkids sake we can ’ t say that when these adults came together to make this kind of a decision, we didn ’ t actually make it. We ’ ve got to make it. And I think if we can show people we ’ re actually on the road, I think you believe this as much as I do, that – I mean, you ’ re far more knowledgeable than I am about some of the technologies and you ’ ve helped break ground on some of them. The pace at which we are now beginning to accelerate, I mean, the reduction in cost of solar, the movement in storage and other kinds of things, I ’ m convinced we ’ re going to find one breakthrough or another. I don ’ t know what it ’ s going to be, but I do know that when we push the curve and we put the resources to work, the innovative creative capacity of humankind is such that we have an ability to surprise ourselves. We ’ ve always done it. When we went to the Moon in this incredible backdrop behind you. And that ’ s exactly what we did. And people today use products in everyday household use that came out of that quest that you never would have anticipated. That ’ s what ’ s going to happen now. We can move faster to electric vehicles. No question in my mind, we could absolutely phase down coal-fired emissions faster than we are in a plan to do it. So the available choices are there. The test is going to be whether we create the energy and momentum necessary to actually get those choices made. AG : One of the big challenges is one you referred to earlier on finance. Wealthy countries have promised financial assistance to the less wealthy countries to help them out with cutting emissions and to help them cope with the impacts of the climate crisis. But of course, we need to continue to work to meet this commitment, especially as countries around the world rebuild their economies in the wake of this pandemic. What are some of the most effective ways in which the wealthier countries can help those that don ’ t have as many resources, and why is this so important for the world to move forward? JK : Let me answer the last part first. It ’ s so important because it ’ s the only way we ’ re going to get there. I don ’ t believe that any government has either the money or the inclination to be able to do what ’ s necessary here. I believe the private sector, particularly driven by venture capital investment, by the quest to be able to create a product that then can help create wealth and actually provide a benefit to humankind drives a lot of things that we ’ ve done all through history. And I don ’ t think it ’ ll be any different now. I think the question is, can we pull together enough nations to leverage a uniform approach to the judgment about the kinds of investments that are being made. And I believe that if we can standardize to some degree, with disclosure requirements, which Janet Yellen is now seized of that issue, and Europe, there are folks working on that and European Commission elsewhere, if we could actually find a way to come together and harmonize some of those definitions and the marketplace begins to make those judgments as they qualify risk, looking way out, risk, because of climate crisis for investing is very, very real. And we all understand that. We spent 265 billion dollars in America two years ago just cleaning up after three storms, Maria, Harvey and Irma. And it ’ s crazy. You spend 265 billion to clean up after the storms, but we can ’ t put 100 billion together for the Green Climate Fund. That ’ s what this year has to be about. We ’ ve got to break that cycle. And I think business, I ’ m convinced of this, a lot of people will doubt me and say, have I lost my mind, but I ’ m convinced the private sector is going to be critical, if not the key to helping to make this happen. And that will leverage other money. I ’ ve talked to the IMF, we ’ ll be talking with the World Bank, we ’ re going to try to bring our own Finance Development Corporation in America. All of these things can help leverage investment into the sectors that can make the greatest difference to the rapid reduction of greenhouse gases. And I think people are going to get very excited about where this money is going to go and how much it is going to be. And my hope is in a matter of weeks to be in a position to make a couple of announcements with respect to that that could be helpful in building some of this momentum. AG : Well, that ’ s great. It sounds like some major news coming in a couple of weeks and just one example you used, the point about businessmen. I have a friend in Australia, Mike Cannon-Brookes, building a long undersea cable from the northern territories of Australia to take renewable electricity to Singapore. You have made the point about the need for the US to approach this with humility a number of times. In that spirit, what lessons can a country like ours learn from some of the lower income nations that are already beginning to tackle climate change? JK : Well, I think one of the most important things, Al, is to make sure that central to this transformation, to this transition to the new energy economy, central to it is environmental justice, is that we don ’ t leave people behind, that we ’ re not making whole communities the recipients of the downside of some particular choice, that the diesel trucks, for instance, aren ’ t all being routed through a particular low income community that doesn ’ t have the ability to make a different political decision. I think it is vital for the developed world to recognize that there are nations, 138 nations or more, way below one percent in terms of emissions. And they ’ re looking around some of them, like Tommy Remengesau, the president of Palau, who no longer can consider adaptation, he ’ s got to figure out where his people are going to go live, as do other very low-lying areas in the ocean. So that impact on people is really not known by the vast majority of people who live pretty good lives in a lot of countries in the world. And we have a responsibility to make sure that we ’ re learning the lesson of their lives and of their hopes and aspirations here. AG : Couldn ’ t agree more. And here in the US, if we had paid more attention to the differential impact on Black, Brown and Indigenous communities, we would have had a better early warning of what the whole country was facing. But let me shift subjects and ask you about China. I know that you, as you are close friends with Xie Zhenhua, as I have been over the years, and I was very happy when he was brought out of retirement to play the lead role for them. But the US is now in the middle of a somewhat contentious relationship with China. But successfully solving the climate crisis is going to require collaboration between the US and China, we ’ re the two biggest emitters and the two biggest economies. How can this collaboration be shaped, in your view? I know you played a role, as Joe Biden did before the Paris Agreement, in getting our two countries together. Can we do that again? JK : I hope so. I really do hope so, Al. As you just said, if we can – if we don ’ t get China to be cooperating and partnering with the rest of the world on this, we don ’ t solve the problem. And we unfortunately, we see too much investment in China right now in coal still. We ’ ve had some conversations about it. I was on a panel with Xie Zhenhua several months before the election by the University of California, and we had a very constructive conversation. My hope is that that will continue and can continue and that China will be just as constructive, if not more so, in this endeavor than they were in 2013 as we began the process to build up to Paris. AG : Well, that relationship is absolutely crucial. But in order to cover all the ground I want to cover here, let me shift again and ask you, what role do you expect that big corporations and also smaller businesses will play in moving this green transition forward? JK : I think they ’ re the biggest single players in it. I mean, governments are important and governments can and have made a difference with tax credits. For instance, our solar tax credit made an enormous difference and it will make one going forward. And even in the middle of COVID, we ’ ve been able to hold on to that. But we need to grow those kinds of efforts. But in the end, it ’ s not going to be government cash that makes this happen. It ’ s going to be the private sector investment that is coming in because it ’ s the right thing to do, because it ’ s also smart investing. And the truth is, you can talk to many – and you have, you ’ re one of the investors actually, Al – you and others have proven that you can invest in this sector of dealing with climate or environment or sustainability, whether it ’ s ESG or it ’ s pure climate. There are ways to have a good return on money. And during the last couple of years, we had something like, 13 to 17 trillion dollars sitting in parked banking situations around the world in net negative interest. In other words, they were paying for the privilege of sitting there, not invested in something. And so I think there ’ s just a massive opportunity here. And most of the CEOs I am talking to, at least now, are increasingly aware of the potential of these alternatives. And you were in early, I don ’ t know if you invested in it or not, but I know you ’ re involved with Tesla or have been. Tesla is the most highly valued automobile company in the world. And it only makes one thing : electric car. If that isn ’ t a message to people, I don ’ t know what is. AG : I wish I had invested in Tesla, John, but I ’ m a huge fan of Elon Musk and what he ’ s doing. I ’ m also a huge fan of Greta Thunberg. And I ’ m just curious what you think in practical terms is the real impact for change coming from these youth movements like Fridays for the Future? JK : I think it ’ s been gigantic and spectacular and in the best traditions of what young people do and have done historically. I mean, as you recall, in America, at least in the 1960s, it was young people who drove the environment movement, the peace movement, the women ’ s movement, the civil rights movement, and they were willing to put their lives on the line. And Greta has been just unbelievable. And in the way in which she has held adults accountable and it has created this wonderful movement. I ’ ve met so many young people, many of whom have worked in one fashion or another with me in the last few years, who were brought to it from Fridays for the Future, from the Sunrise Movement, or, you know, it ’ s all that focused youthful idealism and energy and it demands to be heard. And I think all of us, I mean, we should be ashamed of ourselves that we have to have people who were then 16 or 15 not going to school to get our attention. I mean, what the hell is the matter with adult leadership? That ’ s not leadership at all. So I salute her and all the young people who put themselves on the line. But I invite them, you know, it ' s not enough. You ' ve got to then – and I said this during the course of the election where I hope we created a lot of new voters. And I think environment, specifically climate crisis, became a real voting issue this year, just as it was back in 1970 when we created the EPA and the Clean Air Act and a host of things. And it proves that that kind of activism is necessary. And I hope we ' re going to keep young people at the table here and finish the job, that ' s the key now. AG : Yeah, I couldn ' t agree more. And another big movement that ' s having an impact is the environmental justice movement. You referred to it earlier. And I ' m so glad that President Biden is putting environmental justice at the heart of his climate agenda. It might be good if I could ask you to just take a moment and tell people why that is such an important part of this issue. JK : Well, I think it ' s important part of this issue for many reasons, the most basic is just moral, you know, what is morally right. And how do you redress a wrong that has for too many years held people back, killed people by virtue of disease or other things, and resulted in a basic inequality and unfairness in society. And I think you share a feeling, as I do, Al, that the fabric of a nation is built around certain organizational principles. And if you ' re holding yourselves out as a nation to be one thing, i. e. equal opportunity and fairness and all people created equal, and equal rights and so forth, if that ' s what you hold out there and it isn ' t there, eventually you get such a cynicism and such a backlash built up into your society that it doesn ' t hold together. To some degree, that is what we ' re seeing around the world today, is this nationalistic populism that is driven by this heightened inequality that has come through globalization that has mostly enriched already fairly well-off folks. And so if it ' s the upper one percent that ' s getting all the benefits and the rest of the world struggling to survive and they also have COVID, and then you tell them we ' ve got to do this or that in terms of climate, you ' re walking on very thin ice in terms of that sacred relationship between government and the people who are governed. It ' s not just an American phenomenon. You see it in Europe. You see it in alternative movements in various countries. And I think it is the great task of our generation not only to deal with climate, but to restore a sense of fairness to our economies, to our societies, to our world. And that is part of this battle, I think. AG : Yeah, I agree. And another common source of opposition to what governments are doing now has to do with the fear, both in the US and elsewhere, on the part of some, that jobs might be lost in this transition toward a green economy. You and I both know that there are a lot of jobs that can be created. But let me put the question to you. How can we approach this green transition in a way that lifts everyone up? JK : That is one of the most important things that we need to do, Al. And we can ' t lie to people. We can ' t say that some of the dislocation doesn ' t mean that a job that exists today might not be the same job in the future and that that person has to go through a process of getting there. And we need to make certain that nobody ' s abandoned. We need to make certain that there are real mechanisms in place to help folks be able to transition. And I just spoke the other day with Richie Trumka, the head of the American Federation of Labor, and he ' s been very focused on this. And we agreed to try to work through how do we integrate that into this transitional process so that we ' re guaranteeing that you don ' t abandon people. Now, one of the things we need to do is go to the places where there have been changes and there will be change. Southeastern Ohio, Kentucky, West Virginia. You know, if the marketplace is making the decision and it ' s – by the way, it ' s not government policy, it is the marketplace that has decided, in America at least, not to be building a new coal-fired plant. So where does that miner, or where does that person who worked in that supply chain go? We have to make sure that the new companies, that the new jobs are actually going into those communities that the coal community, the coal country, as we call it, in America, is actually being immediately and directly and realistically addressed in this to make sure that people are not abandoned and left behind. That is possible. That is doable. Historically, unfortunately, there have been too many words and not enough actual – not enough actually implementation and process. I think that can change. And I ’ m going to do everything possible in my ability to make sure that we do change it. AG : Well, that ’ s great. And another part of the context within which you are taking on this enormous challenge is the COVID pandemic, which has exposed the cost of ignoring pre-existing systemic risks, inequalities and sustainability. And now as we start to come out of this pandemic, how can we avoid sleepwalking back into old habits? JK : Boy, that ’ s probably the toughest of all. I mean, there ’ s a natural proclivity for people sometimes to just choose the easiest way. And clearly, some people already have and will resort to that. I think the key will be in President Biden ’ s proposal for the build back, which will actually fight hard to direct funds to the investments and to the sectors where we want to see a responsible build back. There ’ s another aspect, and I think that can be done, Al, I really feel that. For instance, someone who ’ s making a car today in South Carolina, where BMW has plants, and just to pick one place or Detroit, GM is obviously going to make this shift, they just announced it. The people building the car today are still going to have to put wheels on a car, build the car, put the seats in, do everything else. It ’ s just that instead of an internal combustion engine, they can be quickly trained to be able to put the platform in for the batteries and the engines themselves, etc, that will drive the car, the motors, that ’ s one way of dealing. Others are that there ’ s new work in some ways. We have to lay transmission lines in America. We do not have a grid in the United States, as you know. We have at east coast, west coast. Texas has its own grid, north part of America, but there ’ s a huge hole in the country. You can ’ t send energy efficiently from one place to another. We could lower prices for people and create more jobs in the build-out of all of that kind of new infrastructure. Not to mention the things that you and I, you know, there are going to be things that we can ’ t name today, some negative-emissions technology that ’ s going to grab CO2 out of the atmosphere and do something with it, like in Iceland, where they put it into the rock, mix it with liquid and it turns into stone. I mean, there are all kinds of different things people are exploring. Those are new jobs. AG : I just want to say, since we ’ ve come to the end of our time for this conversation, thank you again for taking on this crucial challenge on behalf of the United States of America and enabling the US to restore its traditional role in trying to bring the world together. And I know that everybody watching and listening to this conversation sends you their best wishes and hopes for all the success possible in this new work, John. Thank you so much for joining TED Countdown, and we wish you the very best. JK : Can I reciprocate for a minute? First of all, I want to thank you for your extraordinary leadership for years, I can remember when you were leading us in the Senate on this, and you ’ ve done so much since. And I am personally delighted to be working with you on this again and look forward to the next months and together with a lot of other folks. Let ’ s get this done.

I ’ ve spent the last couple of years traveling around the world giving talks to big corporations and little bitty start-ups and lots of leadership teams and women ’ s groups, and what I ’ ve been talking to people about, I ’ ve been trying really hard to convince people that we can change the way we work. But every time I do a talk, somebody comes backstage or follows me offstage and says,”You know, I ’ m so inspired by what you say. It ’ s so great, it makes so much sense. But we can ’ t.””We can ’ t because we ’ re regulated.””We can ’ t because our CFO says we can ’ t do it.””We can ’ t because we ’ re in Europe.””We can ’ t because we ’ re a service industry.””We can ’ t because we ’ re a nonprofit.”And then last year came the pandemic. And the pandemic changed everything all over the world. Service people started realizing that they had to suit up and wear masks and take temperatures and wash their hands. We had to start standing six feet apart in lines. We started working from home. We started working virtually. And we started learning all kinds of things because we had to. All that muscle around innovation and flexibility and creativity that we didn ’ t think we had, we had all along. And we now have realized that we can. So what have we learned? I mean, what did we learn right away? First of all, we learned we ’ re not family. The family is the toddler walking around behind you in the Zoom call with the pet. The family is somebody needing their diaper changed. The family is making sure you ’ re taking care of your mom. That ’ s your family. This is your team. And we ’ ve also learned that that separation between family and work has become this balancing act. And that when we used to say,”Well, this is my work home and this is my family home, and those are two completely different things,”for many of us, it ’ s exactly the same thing. You ’ re no longer at home and at work. For many of us, work is at home and the home is – and it ’ s confusing, and it ’ s creating a whole different level of complexity and coordination so that we understand that it ’ s easier actually to work when we can separate the work that we do as a team from the work that we do in our family. Furthermore, in order to be able to do all that, we have to recognize that we ’ re all adults. And here ’ s the deal about adults. Adults have responsibilities, adults have obligations. Adults have things that they have to commit to. And do you know that every single person that works for you, from the shop floor to the executive suite, is a grown-up? But we have been operating as if they aren ’ t. We operate as if only the smart adults are the people who are at the C Suite. And as we move through the organization, everybody sort of gets a little dumbed down and the rules get a lot stricter and we have to have more control. And the truth is, everybody ’ s a grown-up, we can see it now. Everybody has all of these things to figure out and coordinate. And so now we ’ re expecting from people adult behavior. We ’ re now focusing on the results that matter, not the work. And the way we track it now is we don ’ t walk by and see who ’ s working. We pay attention to what people are doing. And I think that that ’ s always been the best metric. And you know what? For the first time in my life, the concept of best practices is out the window. And you know what? We don ’ t care what Google ’ s doing because we ’ re not Google. We don ’ t care what some other company is doing. Nobody ’ s doing it best. We ’ re all figuring it out as we go along and we ’ re figuring it out for our organizations in our teams at this time. So in order for people to deliver the right results, in order for people ’ s hard work to matter, it has to be in the context of what success looks like for your organization. So if we start to think about context, it ’ s really important that we think about how we teach that. If we can teach everybody in the company how to read a profit and loss statement, if we can teach them what the different teams do, and what they ’ re setting out to accomplish, then people within their own small teams, and within themselves, can figure out what excellence looks like for them. And so then we can start operating relatively independently as a whole organization because we ’ re all moving in the same direction, trying to do the same thing. And there ’ s a really critically important part of making that work, and that ’ s communication. And everything about communication has changed. We tend to think that communication is this waterfall from the top to the bottom. The executives would tell somebody and the next level would tell somebody and we ’ d go all the way down to the shop floor and everybody would understand what ’ s going on. Well, it may not have worked that well then, but it certainly doesn ’ t work that well now. So now we have to recognize it ’ s a different heartbeat. What has it been before and what should it be now? How do we make sure that the messages are clear and consistent? Because that ’ s how people operate. That ’ s how those adults who get the freedom and the responsibility to produce great results operate best is when they understand what they need to know in order to make the best decisions. So that communication, that skill around being a great communicator is something that each of us needs to get better at. One of the things we have to do is think about what the right discipline is for that. If you used to communicate to your team by walking by and asking how they ’ re doing or if they had heard something, you ’ re going to have to schedule that now, it ’ s going to have to have discipline. We ’ ve got to check in with the people on the shop floor to make sure they ’ re hearing what they need to hear because it ’ s not going to automatically happen. One of the ideas I have is just jot down at the end of every day a sentence of what worked and what didn ’ t work. And you don ’ t have to look at it for a month. But when you look back, over a month, you want to look for,”Wow, that was surprising. I didn ’ t really think that would be as effective as it is.”Or maybe it would be, like,”We keep trying to have this in-person meeting in Zoom, and it turns out that there ’ s 14 people on the call and only two of them are talking. Maybe it ’ s an email.”So we have to rethink all of the ways, not just the work we ’ re doing, but the ways we ’ re doing it. So now I ’ m starting to hear a lot of nostalgia around the way it used to be. There are things we aren ’ t doing now that don ’ t matter. Maybe we don ’ t need to go back for five levels of approval. Maybe we don ’ t need to go back and do that annual performance review. Maybe we don ’ t need to do a whole bunch of things that were part of the way we do business that just aren ’ t making a difference. You know what? The way we used to do it not only is not the way of the future, but we ’ re discovering so many wonderful things right now. Let ’ s not lose it. We want to create a new organization, new workforce, that ’ s excited about taking all of the things that we ’ ve learned using that muscle, going forward. One of the most important things that we can do is realize the things that we aren ’ t doing now. The stuff that we ’ ve stopped doing and not go back and do it again. What if we don ’ t go back? What if we go forward and rethink the way we work? Thank you.

OK, so my name is Amber Cabral, and I teach people how to be good humans. What that essentially comes down to is I work with a lot of well-recognized brands on something that is a pretty consistent challenge day-to-day. And what that really comes down to is : how do we help people who are different from one another experience a sense of belonging and support in the workplace? Now we ’ ve all had that moment. We ’ ve been at work and we ’ re like,”Ah, I just don ’ t feel like I fit here.”And so I help organizations kind of start to figure out how to make the connections necessary for that to work. Now support sounds easy. Like we think we can just do that, because we do it all the time. We support people we love and care about. We support people that we think we understand, even if we don ’ t know them. But when it comes to people that we, like, don ’ t know at all or we don ’ t have that connection with, well, then we kind of get a little weird about it. And what we really need to do is pay attention to those differences, because there ’ s magic in those differences, there ’ s something in there that we actually have an opportunity to learn and grow from. But we ’ ve kind of been taught to politely ignore when we ’ re different from one another. We don ’ t actually pay attention to it. And here ’ s the thing : differences are inevitable. Look around this room. Think about your travel into this room today. You encountered all kinds of differences. We have different backgrounds, different ideas, different perspectives. We have different identities, we have different abilities, all of it. And it ’ s going to continue to be that way forever. But we still have this moment where we want to pull back when differences happen. And what I want to encourage you to do is instead of pull back, maybe take a moment and notice those differences. And not so that it ’ s awkward or weird. You know we try to do that thing where we see a thing, but we try to act like we don ’ t see the thing. Like, don ’ t do that! But definitely please, let ’ s be aware of the differences, because the magic that ’ s in those will help us move forward. And I ’ m going to give you some techniques based on just my own study and my own learnings that I think will help you be able to bridge some of those connections as we move forward, alright? So the first step... The first step – there are three. Let me warn you because sometimes we need to know that. Alright. The first step is to acknowledge that we all have some privilege. Now that word might have landed on some of you, like, ich. Right? But really. And I want to demonstrate it for you for just a moment. Did you wake up this morning with hot, clean running water? Did you think about it? Did you wonder if your shower was going to be your ideal temperature, or if you ’ d have clean water for your morning coffee or tea? Likely the answer is no. For most of us in this room. But I think we can all agree that access to water is indeed a privilege. In fact, a little more than a quarter of the world ’ s population does not have access to safely managed drinking water at home. So while it might be our norm, it is indeed a privilege. And this is how privilege shows up. We don ’ t see it. It ’ s regular to us. It ’ s a part of who we are. We don ’ t even think about it. But if we take a moment and we actually pay attention, what being aware of our privilege does for us is it helps us to see where we have access. It helps us see where we have ease. And access and ease give us power. Something as simple as being able to speak the language of our communities gives us privilege, and that privilege gives us power. So you may be wondering : how do I figure out my privileges if they ’ re regular? They ’ re everywhere. OK, let me give you a simple question you can ask yourself. What about me or my experience might someone look at and consider to be typical? It could be my upbringing. It could be the language I speak. It could be the way my body works. It could be my style of dress. It could be any of those elements. But it ’ s hidden in the things that we think of as everyday and regular. That ’ s where we ’ re going to find our privilege. So that leads me to the second step. The second step is we need to be willing to recognize the differences in folks and want to get to know them across those differences. Let me learn about your experiences so that I can develop empathy for you. That learning about the experiences part, it ’ s not just so that we can be curious. We love stories, alright? That ’ s great. Keep loving the stories. But also getting to know about folks ’ experience gives us a bit of perspective that we might not otherwise have. And so what we want to think about is, you know, considering the impact that having those kinds of connections can show for us. Even as a simple example, I mentioned we struggle to connect across differences. But think about this : a couple days ago, maybe a month ago, I saw online where Snoop Dogg, yes, the rapper Snoop Dogg, posted on his LinkedIn – which why he ’ s on LinkedIn, I have no idea – That he really valued his relationship with Martha Stewart. Now most of us have seen that relationship, and if we ’ re being honest, we kind of notice that there ’ s some differences between them that make that connection kind of unlikely, right? OK. But you know what? He pointed out specifically,”I learn so much from this friendship. I get so much value out of this relationship.”And it was the willingness of being able to connect across differences that most of us would kind of politely ignore, or would assume were not available to us. So learning about the experiences of others is about hearing the stories. Yes, but it ’ s also about having empathy and connection, and being able to broaden our view. Now I have another example where this happens, and this is the workplace, because I care a lot about how this shows up in the workplace, because we all, you know, at least for now, until the AI gets us, have to go into the workplace. OK, so when we ’ re thinking about the workplace, one of the things that always happens is interviews. I ’ ve had this conversation with a lot of my clients because clients are always thinking about how are we attracting and retaining talent. They ’ re always thinking about specifically Black folks, brown folks, young folks. And we want to make sure that we ’ re bridging those connections. But we know that our workplaces aren ’ t always inviting to those diverse identities. Now what my clients hear is a pipeline problem. But what I hear is an empathy problem. I ’ ll give an example of what that looks like. Candidates go into an interview. One of the questions is,”I ’ d like you to tell me about how you navigate ambiguity.”Most of the candidates tell a story about working in a previous position, having to solve a problem, not having a lot of resources or information, making some educated guesses and ultimately solving said problem amazingly. Alright? Creating a fantastic new product. We ’ ve heard this story. We work with those people. OK, great. But there ’ s one candidate, and when that question hits them, what they do is they tell a story about a 1989 Honda Accord. It ’ s a car that their father gave them before they went away to college. And it ran great. But the gas gauge didn ’ t work. So they talk about – feels real, right? Y ’ all know this person, too. So the gas gauge didn ’ t work. So they had to develop a process to make sure that they were able to track their miles so that they would know when they needed to fill up again. Right? They had to navigate the ambiguity of having no idea what was in their gas tank and make sure that they didn ’ t run out of gas, and they managed to do that.”I track my miles so that I know exactly when I need to fill up, so that I don ’ t have to worry about running out of gas.”How often would we hear a story like that in the workplace and discount that person? How often would we dismiss or not even consider the candidate because they didn ’ t give us a business example, or we didn ’ t hear it as a culture fit. When if we ’ re really honest with ourselves, the candidate with the Honda Accord not only navigated the ambiguity of not having any gas in the car, they also did something in their day-to-day life. It wasn ’ t just for work. This is one of the things I had to figure out how to do to survive. It ’ s innate. It ’ s in my body. Think about if we considered it that way. Think about if we considered getting to know folks ’ stories and having empathy for them as a part of the way that we evaluate where they have an opportunity to thrive and grow, instead of just listening for the things that we always listen for. That leads me to the third step. OK? The third step is extending your privilege to others. So I have another story. I was on a call the other day with a client. She is the head of HR for a pretty big company. It was she and I and one of her colleagues on the call. And as we were having the discussion, about 10 minutes in, she chimes in and says,”Wait, I ’ m going to hop off for a moment. I need to go change my top. I ’ ll be back.”A few minutes pass by. She returns to the call, and she ’ s in a plain black shirt. She ’ s taken her earrings off, makeup ’ s gone. So I ask, like,”Why ’ d you change clothes?”She says,”Oh, I ’ m getting my home appraised today.

So I ’ m actually going to pretend to be the cleaning lady, and my neighbor across the street is going to come over and pretend to be me. She ’ s white.”I ’ m nodding my head because I know what ’ s going on. The colleague on the call says,”Wait, what do you mean? I don ’ t understand.”So my client proceeds to explain about the stories about Black folks ’ homes being appraised for less when there ’ s evidence that the homeowners are Black. The colleague on the call is, like, almost outraged. Like,”What? Is that a real thing? I can ’ t believe this is happening.”Meanwhile, I am feeling grateful to the neighbor for being able to identify her privilege, for being able to empathize with my client, and for being willing to extend the privilege of her race in that situation. The three steps that I just covered with you are what most of us want when we think about support. I want someone to identify their privilege. I want somebody to actually hear my circumstances and experience, and empathize with me. And then I want you to extend your privilege respectfully and impactfully in the ways that you ’ re able to in that relationship. Now I have a little secret. A confession, if you will. There is a word I ’ ve been avoiding in this conversation. So I mentioned at the top of this, you know, dialogue that I work with lots of well-recognized brands. And what I didn ’ t tell you is that the work I do is DEI, or diversity, equity and inclusion. And the word that I ’ ve been avoiding is”allyship.”The three steps that we just talked through is what allyship looks like in action. Now I ’ ll be honest, I avoided it because I just wanted you to hear my talk. I know right now the media is all the rage. DEI is dying, right? And allyship is on its way with it. But I want us to just for a moment consider that maybe allyship isn ’ t grand historical gestures or another big program, or huge financial commitments. I mean, we need those too, but – It doesn ’ t have to just be that. It doesn ’ t have to just be those really big, visible things. It can be the small things, the things that we see and encounter every day. Allyship is understanding that the system is such that the way your neighbor is experiencing a home appraisal and the way you might be could be different, and being willing to step in and interrupt that impact. It could also be recognizing that access to job opportunities isn ’ t necessarily fair just because you got in. It ’ s left-handed scissors. It ’ s considering food allergies. It ’ s being willing to accept correction when you mispronounce someone ’ s name or misgender them. It ’ s all of those things that you encounter every single day. And I think when we think of it as just the big things, we miss an opportunity to step into what we independently, individually have the ability to do to be allies. And I know that word may still not sit well with a lot of you. But whether you call it support, love, friendship, solidarity, whatever you ’ d like to call it, let ’ s start taking the kinds of everyday actions that really bring it to life. Thank you.

Text Sample 909: NEG Dim 6 – 2024 – Score 1.00 – 2024/t003234.txt

I want to tell you what I see coming. I ’ ve been lucky enough to be working on AI for almost 15 years now. Back when I started, to describe it as fringe would be an understatement. Researchers would say,”No, no, we ’ re only working on machine learning.”Because working on AI was seen as way too out there. In 2010, just the very mention of the phrase”AGI,”artificial general intelligence, would get you some seriously strange looks and even a cold shoulder.”You ’ re actually building AGI?”people would say.”Isn ’ t that something out of science fiction?”People thought it was 50 years away or 100 years away, if it was even possible at all. Talk of AI was, I guess, kind of embarrassing. People generally thought we were weird. And I guess in some ways we kind of were. It wasn ’ t long, though, before AI started beating humans at a whole range of tasks that people previously thought were way out of reach. Understanding images, translating languages, transcribing speech, playing Go and chess and even diagnosing diseases. People started waking up to the fact that AI was going to have an enormous impact, and they were rightly asking technologists like me some pretty tough questions. Is it true that AI is going to solve the climate crisis? Will it make personalized education available to everyone? Does it mean we ' ll all get universal basic income and we won ' t have to work anymore? Should I be afraid? What does it mean for weapons and war? And of course, will China win? Are we in a race? Are we headed for a mass misinformation apocalypse? All good questions. But it was actually a simpler and much more kind of fundamental question that left me puzzled. One that actually gets to the very heart of my work every day. One morning over breakfast, my six-year-old nephew Caspian was playing with Pi, the AI I created at my last company, Inflection. With a mouthful of scrambled eggs, he looked at me plain in the face and said,"But Mustafa, what is an AI anyway?"He ' s such a sincere and curious and optimistic little guy. He ' d been talking to Pi about how cool it would be if one day in the future, he could visit dinosaurs at the zoo. And how he could make infinite amounts of chocolate at home. And why Pi couldn ' t yet play I Spy."Well,"I said,"it ' s a clever piece of software that ' s read most of the text on the open internet, and it can talk to you about anything you want.""Right. So like a person then?"I was stumped. Genuinely left scratching my head. All my boring stock answers came rushing through my mind."No, but AI is just another general-purpose technology, like printing or steam."It will be a tool that will augment us and make us smarter and more productive. And when it gets better over time, it ' ll be like an all-knowing oracle that will help us solve grand scientific challenges."You know, all of these responses started to feel, I guess, a little bit defensive. And actually better suited to a policy seminar than breakfast with a no-nonsense six-year-old."Why am I hesitating?"I thought to myself. You know, let ' s be honest. My nephew was asking me a simple question that those of us in AI just don ' t confront often enough. What is it that we are actually creating? What does it mean to make something totally new, fundamentally different to any invention that we have known before? It is clear that we are at an inflection point in the history of humanity. On our current trajectory, we ' re headed towards the emergence of something that we are all struggling to describe, and yet we cannot control what we don ' t understand. And so the metaphors, the mental models, the names, these all matter if we ' re to get the most out of AI whilst limiting its potential downsides. As someone who embraces the possibilities of this technology, but who ' s also always cared deeply about its ethics, we should, I think, be able to easily describe what it is we are building. And that includes the six-year-olds. So it ' s in that spirit that I offer up today the following metaphor for helping us to try to grapple with what this moment really is. I think AI should best be understood as something like a new digital species. Now, don ' t take this too literally, but I predict that we ' ll come to see them as digital companions, new partners in the journeys of all our lives. Whether you think we ' re on a 10-, 20- or 30-year path here, this is, in my view, the most accurate and most fundamentally honest way of describing what ' s actually coming. And above all, it enables everybody to prepare for and shape what comes next. Now I totally get, this is a strong claim, and I ' m going to explain to everyone as best I can why I ' m making it. But first, let me just try to set the context. From the very first microscopic organisms, life on Earth stretches back billions of years. Over that time, life evolved and diversified. Then a few million years ago, something began to shift. After countless cycles of growth and adaptation, one of life ' s branches began using tools, and that branch grew into us. We went on to produce a mesmerizing variety of tools, at first slowly and then with astonishing speed, we went from stone axes and fire to language, writing and eventually industrial technologies. One invention unleashed a thousand more. And in time, we became homo technologicus. Around 80 years ago, another new branch of technology began. With the invention of computers, we quickly jumped from the first mainframes and transistors to today ' s smartphones and virtual-reality headsets. Information, knowledge, communication, computation. In this revolution, creation has exploded like never before. And now a new wave is upon us. Artificial intelligence. These waves of history are clearly speeding up, as each one is amplified and accelerated by the last. And if you look back, it ' s clear that we are in the fastest and most consequential wave ever. The journeys of humanity and technology are now deeply intertwined. In just 18 months, over a billion people have used large language models. We ' ve witnessed one landmark event after another. Just a few years ago, people said that AI would never be creative. And yet AI now feels like an endless river of creativity, making poetry and images and music and video that stretch the imagination. People said it would never be empathetic. And yet today, millions of people enjoy meaningful conversations with AIs, talking about their hopes and dreams and helping them work through difficult emotional challenges. AIs can now drive cars, manage energy grids and even invent new molecules. Just a few years ago, each of these was impossible. And all of this is turbocharged by spiraling exponentials of data and computation. Last year, Inflection 2. 5, our last model, used five billion times more computation than the DeepMind AI that beat the old-school Atari games just over 10 years ago. That ' s nine orders of magnitude more computation. 10x per year, every year for almost a decade. Over the same time, the size of these models has grown from first tens of millions of parameters to then billions of parameters, and very soon, tens of trillions of parameters. If someone did nothing but read 24 hours a day for their entire life, they ' d consume eight billion words. And of course, that ' s a lot of words. But today, the most advanced AIs consume more than eight trillion words in a single month of training. And all of this is set to continue. The long arc of technological history is now in an extraordinary new phase. So what does this mean in practice? Well, just as the internet gave us the browser and the smartphone gave us apps, the cloud-based supercomputer is ushering in a new era of ubiquitous AIs. Everything will soon be represented by a conversational interface. Or, to put it another way, a personal AI. And these AIs will be infinitely knowledgeable, and soon they ' ll be factually accurate and reliable. They ' ll have near-perfect IQ. They ' ll also have exceptional EQ. They ' ll be kind, supportive, empathetic. These elements on their own would be transformational. Just imagine if everybody had a personalized tutor in their pocket and access to low-cost medical advice. A lawyer and a doctor, a business strategist and coach – all in your pocket 24 hours a day. But things really start to change when they develop what I call AQ, their"actions quotient."This is their ability to actually get stuff done in the digital and physical world. And before long, it won ' t just be people that have AIs. Strange as it may sound, every organization, from small business to nonprofit to national government, each will have their own. Every town, building and object will be represented by a unique interactive persona. And these won ' t just be mechanistic assistants. They ' ll be companions, confidants, colleagues, friends and partners, as varied and unique as we all are. At this point, AIs will convincingly imitate humans at most tasks. And we ' ll feel this at the most intimate of scales. An AI organizing a community get-together for an elderly neighbor. A sympathetic expert helping you make sense of a difficult diagnosis. But we ' ll also feel it at the largest scales. Accelerating scientific discovery, autonomous cars on the roads, drones in the skies. They ' ll both order the takeout and run the power station. They ' ll interact with us and, of course, with each other. They ' ll speak every language, take in every pattern of sensor data, sights, sounds, streams and streams of information, far surpassing what any one of us could consume in a thousand lifetimes. So what is this? What are these AIs? If we are to prioritize safety above all else, to ensure that this new wave always serves and amplifies humanity, then we need to find the right metaphors for what this might become. For years, we in the AI community, and I specifically, have had a tendency to refer to this as just tools. But that doesn ' t really capture what ' s actually happening here. AIs are clearly more dynamic, more ambiguous, more integrated and more emergent than mere tools, which are entirely subject to human control. So to contain this wave, to put human agency at its center and to mitigate the inevitable unintended consequences that are likely to arise, we should start to think about them as we might a new kind of digital species. Now it ' s just an analogy, it ' s not a literal description, and it ' s not perfect. For a start, they clearly aren ' t biological in any traditional sense, but just pause for a moment and really think about what they already do. They communicate in our languages. They see what we see. They consume unimaginably large amounts of information. They have memory. They have personality. They have creativity. They can even reason to some extent and formulate rudimentary plans. They can act autonomously if we allow them. And they do all this at levels of sophistication that is far beyond anything that we ' ve ever known from a mere tool. And so saying AI is mainly about the math or the code is like saying we humans are mainly about carbon and water. It ' s true, but it completely misses the point. And yes, I get it, this is a super arresting thought but I honestly think this frame helps sharpen our focus on the critical issues. What are the risks? What are the boundaries that we need to impose? What kind of AI do we want to build or allow to be built? This is a story that ' s still unfolding. Nothing should be accepted as a given. We all must choose what we create. What AIs we bring into the world, or not. These are the questions for all of us here today, and all of us alive at this moment. For me, the benefits of this technology are stunningly obvious, and they inspire my life ' s work every single day. But quite frankly, they ' ll speak for themselves. Over the years, I ' ve never shied away from highlighting risks and talking about downsides. Thinking in this way helps us focus on the huge challenges that lie ahead for all of us. But let ' s be clear. There is no path to progress where we leave technology behind. The prize for all of civilization is immense. We need solutions in health care and education, to our climate crisis. And if AI delivers just a fraction of its potential, the next decade is going to be the most productive in human history. Here ' s another way to think about it. In the past, unlocking economic growth often came with huge downsides. The economy expanded as people discovered new continents and opened up new frontiers. But they colonized populations at the same time. We built factories, but they were grim and dangerous places to work. We struck oil, but we polluted the planet. Now because we are still designing and building AI, we have the potential and opportunity to do it better, radically better. And today, we ' re not discovering a new continent and plundering its resources. We ' re building one from scratch. Sometimes people say that data or chips are the 21st century ' s new oil, but that ' s totally the wrong image. AI is to the mind what nuclear fusion is to energy. Limitless, abundant, world-changing. And AI really is different, and that means we have to think about it creatively and honestly. We have to push our analogies and our metaphors to the very limits to be able to grapple with what ' s coming. Because this is not just another invention. AI is itself an infinite inventor. And yes, this is exciting and promising and concerning and intriguing all at once. To be quite honest, it ' s pretty surreal. But step back, see it on the long view of glacial time, and these really are the very most appropriate metaphors that we have today. Since the beginning of life on Earth, we ’ ve been evolving, changing and then creating everything around us in our human world today. And AI isn ’ t something outside of this story. In fact, it ’ s the very opposite. It ’ s the whole of everything that we have created, distilled down into something that we can all interact with and benefit from. It ’ s a reflection of humanity across time, and in this sense, it isn ’ t a new species at all. This is where the metaphors end. Here ’ s what I ’ ll tell Caspian next time he asks. AI isn ’ t separate. AI isn ’ t even in some senses, new. AI is us. It ’ s all of us. And this is perhaps the most promising and vital thing of all that even a six-year-old can get a sense for. As we build out AI, we can and must reflect all that is good, all that we love, all that is special about humanity : our empathy, our kindness, our curiosity and our creativity. This, I would argue, is the greatest challenge of the 21st century, but also the most wonderful, inspiring and hopeful opportunity for all of us. Thank you. Chris Anderson : Thank you Mustafa. It ’ s an amazing vision and a super powerful metaphor. You ’ re in an amazing position right now. I mean, you were connected at the hip to the amazing work happening at OpenAI. You ’ re going to have resources made available, there are reports of these giant new data centers, 100 billion dollars invested and so forth. And a new species can emerge from it. I mean, in your book, you did, as well as painting an incredible optimistic vision, you were super eloquent on the dangers of AI. And I ’ m just curious, from the view that you have now, what is it that most keeps you up at night? Mustafa Suleyman : I think the great risk is that we get stuck in what I call the pessimism aversion trap. You know, we have to have the courage to confront the potential of dark scenarios in order to get the most out of all the benefits that we see. So the good news is that if you look at the last two or three years, there have been very, very few downsides, right? It ’ s very hard to say explicitly what harm an LLM has caused. But that doesn ’ t mean that that ’ s what the trajectory is going to be over the next 10 years. So I think if you pay attention to a few specific capabilities, take for example, autonomy. Autonomy is very obviously a threshold over which we increase risk in our society. And it ’ s something that we should step towards very, very closely. The other would be something like recursive self-improvement. If you allow the model to independently self-improve, update its own code, explore an environment without oversight, and, you know, without a human in control to change how it operates, that would obviously be more dangerous. But I think that we ’ re still some way away from that. I think it ’ s still a good five to 10 years before we have to really confront that. But it ’ s time to start talking about it now. CA : A digital species, unlike any biological species, can replicate not in nine months, but in nine nanoseconds, and produce an indefinite number of copies of itself, all of which have more power than we have in many ways. I mean, the possibility for unintended consequences seems pretty immense. And isn ’ t it true that if a problem happens, it could happen in an hour? MS : No. That is really not true. I think there ’ s no evidence to suggest that. And I think that, you know, that ’ s often referred to as the”intelligence explosion.”And I think it is a theoretical, hypothetical maybe that we ’ re all kind of curious to explore, but there ’ s no evidence that we ’ re anywhere near anything like that. And I think it ’ s very important that we choose our words super carefully. Because you ’ re right, that ’ s one of the weaknesses of the species framing, that we will design the capability for self-replication into it if people choose to do that. And I would actually argue that we should not, that would be one of the dangerous capabilities that we should step back from, right? So there ’ s no chance that this will”emerge”accidentally. I really think that ’ s a very low probability. It will happen if engineers deliberately design those capabilities in. And if they don ’ t take enough efforts to deliberately design them out. And so this is the point of being explicit and transparent about trying to introduce safety by design very early on. CA : Thank you, your vision of humanity injecting into this new thing the best parts of ourselves, avoiding all those weird, biological, freaky, horrible tendencies that we can have in certain circumstances, I mean, that is a very inspiring vision. And thank you so much for coming here and sharing it at TED. Thank you, good luck.

Auntie 1 : Why are you still single? Auntie 2 : How much do you earn? Auntie 3 : You look fat. Niceaunties : I just love aunties. Some of my aunties, I only see during Chinese New Year. I used to brace myself for inquisition prior to family gatherings. They call you fat but present you with platters of delicious food, made with love and great skill. This is exasperating and endearing. I ’ m not alone in this. This behavior and line of questioning is so common we even have memes for it. I grew up in a big family, where the women, my late grandmother, my mother and some of my 11 aunties, were expected to take care of children. They were big influences in my life, and I witnessed great personalities, strength, eccentricity and humor. They held back from fully expressing themselves because of societal pressures, family expectations and lack of support. My grandma spent most of her life at home. She did not travel and had little contact with the outside world. In the last 20 years of her life, she had dementia and was bedridden. I often imagined her in an alternate reality, where she ’ s out and about, having fun, laughing, chatting, enjoying life. But aunties are not just about family. Anyone of any age, of any culture, can be labelled an auntie. It is not something you really want to be associated with. As it could mean you ’ re old-fashioned, rigid in your thinking or naggy. So it is rather negative to be called one. Women of my generation live in fear of being labeled an auntie. But what if you could change this perception, turning it from dread to something fun and positive? Thank you. I ’ m a designer from Singapore, and in the last year, also an artist. I came across some intriguing and beautiful images on social media and then found out they were made with AI. Curious about what AI could do, I found a program, I signed up, I keyed in some words, and within seconds, images appeared. I was amazed and mesmerized. Never before have I found a medium that felt like the shortest path between my ideas and the visual. It became addictive. Rather than just making images, I wanted to do more with this tool, to tell stories about auntie culture. My mother engages in many social activities. She is very active, a result of her mother ’ s immobility and limited life. She dances and performs just like the aunties do in Singapore ’ s parks every day. This was a huge inspiration for me. So”Niceaunties”was born, a project about freedom, exuberance, self-expression and fun. It is a lighthearted perspective on the joyful side of auntie life. Also a surreal narrative, loosely based on the women in my family, their social lives, their relationships, their quirks, humor, and, of course, food. In the last 20 years, I worked in architecture, a profession of discipline, rules and clients. I always worked in a team. It was about fulfilling the client ’ s brief and budgets. With AI, it ’ s just me. It ’ s a breath of fresh air. This lack of restraint has transported me to an imaginary world, where my aunties can live freely as themselves, where anything fun can and does happen. For instance, aunties in public places, taking photos with sculptures in absurd ways. This is a common sight. A typical holiday photo becomes aunties trying to kiss the moon, but failing badly. Over the course of a year – instead of designing buildings, I developed”Niceaunties”into

a world-building project : the”Auntieverse.”Just like in any world, there are cities, citizens, their lives and their culture. Auntieverse is partly inspired by Singapore, where acronyms are used for everything. A sentence would typically sound like :”I ’ m going to take the MRT to the NTUC near my mom ’ s HDB to avoid the ERP.”In the Auntieverse, we have Tofu-Engineered Sushi Luxury Autos, aka TESLA. It ’ s a transportation factory – where aunties assemble food and legs to create vehicles running on leg power. It ’ s very sustainable. In Chinese dialects,”legs”have the same sound as”cars,”so a common joke would be to say,”Let ’ s get around on our own cars.”Meaning we can move around on our own legs, implying self-reliance. So I imagine at TESLA, we have the usual car assembly, a car wash and, of course, a car junkyard. But legs don ’ t just move cars around in the Auntieverse. Buildings use them too, as do animals and vegetables. Another destination in the Auntieverse is MoMA, the Museum of Modern Aunties... Where modern auntie culture is celebrated. This is a social space where aunties gather, hang out, eat, chitchat, have fun, chillax. So one day, I said to my mother that she should show others how to make, and then sell, her delicious food. She said”No lah, too tired.”So I imagined NASA, Nice Auntie Sushi Academy – A culinary school on the moon, where aunties share their cooking skills. Here, amazing food is made available for all, 24-7. Aunties in training learn how to forage fresh ingredients on the moon, how to slice fish, and the cat will ensure all lessons go according to plan. But food isn ’ t just used for eating – In the Auntieverse. It ’ s used for all kinds of relaxing activities. I would love to soak in this ramen hot tub with my aunties. Well, sushi is used extensively in Auntie Spa for all kinds of beauty treatments and relaxing body wraps, a reference to many aunties ’ beauty tips, like putting cucumbers and other foods on their faces and bodies. Personally, I have been rubbed down in coffee grounds, and then wrapped in cling film. It ’ s very unsettling. Along with many beauty treatments, like lasers and acupuncture, I felt like I had to try, under the promise of youth and beauty. So many women undergo the pain of these beauty treatments to maintain body ideals and notions of beauty standards. Sometimes, it feels like having construction sites on our faces and bodies. Does it actually work? I don ’ t know. On the lighter end of the spectrum, Aunties ’ Nail Spa provides many beautiful options for our fingers, including very useful tools for everyday life. Cute and practical. Meanwhile, on Auntlantis, a parallel world inspired by Plato and the Great Pacific Garbage Patch, my aunties take a break on the beach, after a day ’ s work cleaning out the ocean floor, in a world filled with plastic waste as we know it. My Auntieverse is an ever-expanding narrative of food, culture, family, relationships and the world we live in. I could not have imagined having created this without the help of AI. Before AI, I have never edited a video. This technology lowered the barrier to learning and allowed me to bring my imagination to life in only 12 months. But this isn ’ t just about AI. The Auntieverse is about honoring the memory of extraordinary women who nurtured one another and their families. It is about celebrating personalities and bringing into the spotlight the mundane and the bizarre, like some aunties ’ big permed hair.”The taller the hair, the closer to God,”some said. [Auntie ’ s Hair Spray] [smells nice] [holds shape] [animal testing] [long lasting] [while stocks last!] Thank you.

When I first moved to Singapore, I thought it was magical. Here ’ s this clean, bright, pretty, well-run city with twisted, tall skyscrapers made of steel and glass that ’ s rising out of what ’ s left of a tropical rainforest. And it wasn ’ t just tropical rainforests, it was animals. Walk around and you see sunbirds flitting amongst the flowers. You see hornbills hopping from branch to branch on campus. You see colugos and Sumatran flying dragons and paradise tree snakes gliding from tree to tree. All of this was just so amazing to me. The first week I came to Singapore there was a fight during the day, out in the open between a king cobra and a reticulated python on the campus of NTU. That same first week there was video of – and I ’ m trying to think which way I ’ m looking. There was video of a pangolin walking down the stairway between Yale-NUS and RC4. I started to look for a place to live. And I went to a flat that I wanted to rent. And I walked out on the balcony and a parakeet flew, a wild parakeet flew and landed on my shoulder. And the property manager asked me,”Are you going to take the flat?”And I said,”Of course I am. A little bird told me to.”This was just amazing to me. Everything about Singapore was just incredible to me. When I first moved here, I kept wondering to myself, you know, what is this place with these tall, twisted skyscrapers? And at the same time, we have brightly-colored birds flying, hornbills that are eyeing people on campus, gliding lizards and colugos and snakes. It was just amazing to me. To me, it was utterly fantastical. And everything, everywhere, was otters. So the otters started to blow up on social media just before I came to Singapore in 2015, and one family in particular started to get a lot of attention, the Bishan family, because it lived downtown near all the famous landmarks of Singapore. And so they were getting a lot of attention, and this was really exciting to me. And this is a video from 2016. These are phone videos for the most part, but this is the Bishan mom, and these are her second brood of pups. Now we never get this close to otters anymore, so I deserve some scolding. Those are some Yale-NUS students and an otter watcher. And if you look upstream, you ’ ll see the Bishan dad with a fish. And those whining noises. Those are begging calls from the pups. That is a little bit of something that ’ s not actually in my script. You can see the otters are sprainting, they have a communal latrine site. And I didn ’ t know this because I just started. And so I was actually sitting in their latrine. These otters that are swimming upriver here, these are the prior year ’ s brood. So these are three-yearling otters, they ’ re are sexually mature otters and they stay with the family. All of this was just incredible to me. And part of the reason it was incredible to everybody is that the otters were returning after a long absence. So we know that there were otters in Singapore sometime before the mid-20th century. And we know partly because of individual accounts, but partly because of things like this. This is Haw Par Villa and these are statues of otters in Haw Par Villa. But this installation was moved in 1937. So before 1937, we know that otters weren ’ t just present in Singapore, but they were prominent in Singapore. And prominent enough that their statues were put with Chinese legends. But then Singapore started to change. It modernized, it started to industrialize, and all of a sudden the waterways got filthy. And what happened was they started to fill with sludge, industrial pollution and dead animals to the point where they stank. And otters live in water, they eat fish in water, and they couldn ’ t eat and live in waterways that were that dirty. So they left. But things changed again. Singapore enacted policies to clean up their waterways, and they were really, really successful. So all of a sudden, instead of having waterways that were filled with filth, we had waterways that were filled with fish. And from the otters ’ point of view, they were feeding troughs, so they came back. And now we have lots of otters all over Singapore. We have about 12 families. These are smooth-coated otters. They ’ re a pretty large otter. The adults get up to about 10 kilograms, which is larger than the European common otter. They ’ re a little bit unusual as mammals go, because the adult offspring stay with the family as helpers. So a family group might have two dominant breeding individuals and one or two sets of adult offspring that are staying as helpers, and then a brood of pups, which is pretty typical. The family sizes are quite large in Singapore, we have families that are over 20 individuals, and we have more than a dozen families in Singapore. And those families are watched by otter watchers, some of whom go out and watch the otters every day. My students worked closely with some of the otter watchers, and we got to find out all sorts of interesting things. So these are otters playing. Otters have a really tough life. They wake up in the morning, they fish, they roll around in the grass, they play, they go to sleep. And then a few hours later, they do it again. So my students wanted to know whether adults and pups played differently. And what they did to look at this is [they] found literally dozens of interactions like this and looked at the frequencies of role switching among the individuals who are playing. So the pups here, if you watch them long enough, they do something where one pup will chase the other, and then it ’ ll switch roles so the second pup chases the first. It ’ s very much like”Tag, you ’ re it.”It turns out that pups do this a lot, and adults don ’ t do this much at all. If an adult is in a dominant position, it stays in a dominant position. But this tells us something. It tells us something about how play has different functions for pups versus adults. For pups, play is a way that they ’ re figuring things out and they ’ re learning. But for adults, they ’ re jockeying for a position in the social group. And that ’ s why they don ’ t give up their position of dominance. I don ’ t know if you noticed this, it was early in the video, but there ’ s a monitor lizard that ’ s watching the otters play. And it turns out this is pretty common. Monitor lizards and otters live in the same environments. They both eat fish, and they bump into each other all the time. And otters sometimes attack the monitor lizards, and sometimes they kill the monitor lizards, but not all the time. So my students wanted to know when do otters attack? What conditions lead to the otters attacking sometimes but not other times. This is a pair of otters that are approaching a monitor lizard, and if you notice, the monitor lizard ’ s frill is open, its throat frill is open. It ’ s in an aggressive posture right here. And in fact, just seconds after this picture was taken, the monitor lizard whipped its tail at the otters. So monitor lizards can also be aggressive. But most of the time, including here, they ’ re reacting to the otters. What my students found after looking at dozens of these kinds of interactions, was that otters were more likely to be aggressive if there were pups around, and they were most likely to be aggressive if there were more pups in a group than there were adults. So the otters are only aggressive to defend the pups. The otters are big and they ’ re fast and smart, and they don ’ t really have to worry about the monitor lizards very much. But the pups do because they ’ re small and they ’ re kind of dumb. It turns out that pups drive a lot of the things that otters do. So watch what ’ s going on here. Do you see how they ’ re swimming in a line? By the way, we never get this close to otters anymore. I scold my students if I see this, and I get scolded if I ’ m this close. We try and give otters a pretty wide berth. What they ’ re doing here is catching fish. But what ’ s interesting is they ’ re catching really small fish. This is called herding or corralling, depending on the medium in which they ’ re doing it. And it turns out that otters do this only when they have pups. And when they do it, they typically catch very small fish. So this isn ’ t a way for them to catch more fish, and it isn ’ t a way for them to catch larger fish. What it is, is a way for them to teach their pups how to hunt. And it ’ s not just that the pups are learning how to hunt by being with the adults. It ’ s that the adults are actively changing their behavior so that they can teach the pups what to do. So all of these discoveries, and there are a few more of them, we couldn ’ t have done without the otter watchers. And the otter watchers are incredibly dedicated to watching otters. We really owe them a lot, and I really want to kind of voice that gratitude towards them. And a lot of things motivate otter watchers. So otter watchers might be curious about the otters, they might like the otters. But a lot of the otter watchers are photographers, and that ' s their primary hobby. And for them, this is a chance to get really excellent photographs. The same thing in Singapore is true with birders. If you ' ve ever gone birding in Singapore, it ' s a little bit surreal because rather than go out and look for people with big binoculars, you look for people with big cameras. But otter watching and bird watching are gateways. They ' re gateways for people to interact with nature. And so people who might start otter watching because they want to get photographs of cute pups, might continue to do other things because they ' ve formed a connection with nature. And we see this all the time : that people care about nature when they form some connection to nature. Whether that connection is to otters or to a pair of hornbills on campus or to a bird that visits them on their balcony, we need these personal connections, and we see them all over the place. So that ' s one thing to emphasize. But I ' m not the only one who ' s thinking about this. Singapore has enacted a lot of policies that make these kinds of connections a lot easier. So we talked about Singapore cleaning up its waterways in the ' 70s and ' 80s. They ' ve done a lot of other things, too, including plant over a million trees. There are over 300 parks and nature reserves. Singapore has a plan that no one should be more than 10 minutes away from some kind of park. There are a lot of reasons to do this, and some of these are public health reasons. But one of the effects of this is that people will have more chances to interact with nature, and they ' ll have more chances to care. So I ' m really excited about these possibilities, especially in Singapore, especially because Singapore is one of the most densely populated countries in the world. Recently, NParks changed its motto. NParks had the motto that Singapore is a city in a garden, and they changed it to Singapore is the city in nature. And I think this is a real effort on Singapore ' s part to shift how they view their relationship to nature. I think we ' re trying to get away from something where nature is over there on the other side of a fence or a wall or something like that. Nature is something that ' s around us and above us and beside us, and Singapore is acknowledging that. And that ' s true in lots of places, including in cities. So I think this also raises other questions, such as : Can cities be wildlife refuges? Is the biodiversity we see in Singapore, is this the last hot ember of the biodiversity that was here before? Or is this something that we can protect and maybe foster and grow? Lots of cities have wildlife, it ' s not just Singapore. Most North American cities have wildlife like raccoons and coyotes, and some have bears and bobcats. But sometimes there are even more impressive things. For example, Los Angeles has mountain lions, and Mumbai has leopards. And there ' s still one jaguar kicking around Tucson. So there ' s still these big cats, not just, you know, predators, but big cats that are in other cities. And Singapore, unlike some of those cities, is just incredibly, incredibly dense in terms of human population. And yet we ' re ripe with wildlife. So I think it ' s a real question. Can we make cities that are wildlife refuges? Can we make cities that foster some kind of productive relationship between wildlife and humans? Can we make cities where we exist in close proximity, side by side? I think we can. The founder of Singapore, famously, or at least as legend has it, saw a large creature moving along and he thought it was a lion, and so he named Singapore after it. Singa Pura, Lion City. And much later, Singapore adopted its mascot of a merlion, which is supposed to celebrate Singapore ' s history as a sea city and this legacy of it being a Lion City. Obviously, there are no lions in Singapore outside of the zoo, and there never were. But we do have a ferocious mammalian predator that hunts in groups, that fights giant lizards.

That protects and teaches its offspring. And that ’ s frequent in the waterways around Singapore. Isn ’ t that predator sort of half fish and half lion? Singapore is magic.

When I was asked to do this TED Talk, I sat down with my cat, as you do, and I thought, what ’ s going to make the biggest difference to as many cats as possible? What could it be? And I looked at my cat for inspiration and thought,”Yes, that ’ s it, yes, Kato,”– that ’ s his name –”Let ’ s tell everybody about the power of play.”If some people seem to be the cat people like me, hands up. Yes, welcome. Other people seem to be dog people, hands up. You ’ re also welcome. It doesn ’ t matter if you ’ re not really a cat person. If cats aren ’ t really your thing, that ’ s fine. Just take the word cat in this talk and replace it with dog – or horse, goat, child, whatever your species of choice is. And that ’ s because play is so fundamental to happiness that it affects so many different types of animals. In fact, there ’ s research to show that even fish like to play. They actually jump into streams of bubbles and ride them to the top and jump out and do it again. In case you were wondering. Now when I tell people that I ’ m a cat behaviorist, other than the confused looks I get, which you can imagine, and people saying,”A cat, a cat what?”Then – they really are quite confused by it. Then if they don ’ t have a cat themselves, then they ’ ll soon tell me that,”Oh, yes, my mother ’ s neighbor ’ s friend ’ s sister has a cat,”and they ’ ll often ask me questions about that cat ’ s behavior. It ’ s a bit like those of you that are nurses and you get everybody ’ s medical questions. Now invariably, I ’ m often recommending interactive play and feeding enrichment. And that ’ s because it has such a positive difference, such a big impact on their happiness. As you can see here from my cat Kato, play is not only fun, it gets the gray matter working. It ’ s great way to connect with your cat. And it has lots of physical benefits as well, because all that extra exercise is an excellent tool for helping overweight cats shed those extra pounds. This is the very gorgeous Moodles, and she came into Cats Protection ’ s care weighing 6. 7 kilograms. Now her very fantastic owner not only continued the diet that was already in place, but she also implemented a program of interactive play and feeding enrichment. It ’ s certainly made dieting a lot more fun. And this is Moodles today at her target weight of four kilograms, and she ’ s a much happier and healthier cat for it. Play is important for every cat, young or old, all around the world. Now I know what you might be thinking.”I know how to play with my cat.”That ’ s fine. But if your cat were to give you a review, what ’ s it going to say? Now, it might not say”Could try harder.”But it might say :”Could try smarter.”So let ’ s have a look at how to play the cat way. I often act as a bit of a translator between cats and their caregivers. This cat, for example, is saying,”What is this? This mouse is dead. Bring it to me alive.”And that ’ s where the interactive play comes. Because if you just put it there in front of the cat, it ’ s not interesting. You need to make it move, you need to bring it to life. And so you bring the mouse to the cat, and the cat goes,”No, no, no, no, not like that. Make it run away from me.”Because let ’ s face it, not many – You know, no self-respecting mouse would ever go up to a cat and go,”Hiya! Here I am!”So we need to be thinking about how prey species actually move. And then we need to be thinking about the fact that cats have got different play styles. Some cats prefer a game of rabbit, a bit like this cat. And that ’ s where they grab the toy with their front claws and they bunny kick with the back legs. Other cats prefer a game where you move the toy across the floor, and maybe it makes like a little, a little quiver

over here and a mad dash across the floor, just like a mouse might. And then others prefer the toy to be moved up in the air, like this. So this is a game like an erratic moth. Now cats haven ’ t evolved to show an awful lot in their faces. If you find them hard to read, that ’ s OK, they ’ ve evolved that way. But if you look at this cat, you can see that the claws are out, the whiskers have come forwards and the mouth ’ s open, and they ’ re so engaged and focused on that toy. This is a cat showing the face of joy. You can also make it a lot more fun like this by just having it disappear out of sight, like under a newspaper or magazine like this. And that makes it much more interesting. It ’ s really important that the cat is actually allowed to catch and kill the toy. It makes the cat feel good. It ’ s those happy hormones. So very, very important, catch and kill the toy. And that ’ s where, spoiler alert, the laser pens can be a bit of a problem, because it can cause frustration where the cat can ’ t ever catch the red dot. So if you do have a laser toy at home, fear not. You just need to end the game always on a physical toy like this so they can actually catch and and kill the toy. You may be concerned, perhaps that, you know, maybe all of this play is just training our cats to become more proficient hunters. But you ’ ll be very pleased and relieved to hear that the latest research shows that if you just play with your cat for a few minutes, several times a day, it actually reduces hunting behavior. OK, now some people might think,”It ’ s all very well and good, but my cat doesn ’ t really like to play. They ’ re too old. They ’ re too lazy. That won ’ t work for my cat.”And some people really think that their cat doesn ’ t play at all. I had one client who said,”No, my cat doesn ’ t play.”And yet, during the conversation, I found out that her cat does play, but only for five minutes. This is play. It ’ s just that the owner expected her cat to play for half an hour or more. Much like a dog would. But cats are not small dogs. Now as children, we were taught not to play with our food. And I ’ m here to ask all of you to not only play with your cat ’ s food but, more importantly, get your cat to play with their food. Feeding cats in a way that ’ s more interesting gets their minds working. It ’ s mentally stimulating. In short, for very little effort, you can actually change your cat ’ s happiness and you can change their life in just three minutes, because that ’ s how long it takes to show a cat feeding enrichment, also known as puzzle feeders. And it simply just means feeding a cat in a way that ’ s much more interesting than just in a bowl. Now some people may have dabbled in feeding enrichment, probably accidentally, when they ’ ve gone down the pet shop and picked up a puzzle ball like this. And they ’ ve given it to their cat, and then they ’ ve got frustrated and thought,”It doesn ’ t work.”Because the cat ’ s disinterest has left them disheartened. But fear not, because I have a few handy tips up my sleeve and that is to keep it simple. Now, as much as I love, I do love the puzzle balls, they are brilliant, but these are medium-level toys. We need to start off really simple with something like this, OK? You can find this online. And you want to start everybody off in an egg box. It ’ s brilliant because they ’ re free, and you just put in the biscuits where the eggs would normally sit. And you need to pour it out with your fingers and show the cats how to use it. And then for the next level up, you can cover the biscuits with a bit of paper. If you want it to be really difficult, you can then shut the lid. And it ’ s so much fun watching these cats hunt for their food. Once they ’ ve mastered the egg box, you can move on to the toilet roll pyramid. This one is fantastic for children, a great one I ’ d like to see done in schools, particularly because there ’ s no sharp scissors involved. And you just need to sellotape all the joins front and back, and then put the biscuits in where the toilet roll tubes are, and then allow the cat to get them out. So you can see, very simple ideas, they ’ re free and a lot of fun. So those are my two tips. Keep it simple and show the cats how to do it. Many years ago, I helped a caregiver and I was explaining how to introduce a puzzle ball to the cat. So we talked through it, and she rung me up a while later, quite exasperated, and said,”Nicky, I ’ ve done what you said. I got down on my hands and knees, and I ’ ve been batting around this puzzle ball now for two hours, and the cat still doesn ’ t understand. She just follows me and eats all the biscuits.”Yeah, that cat knows what she ’ s doing. And that cat knows how to use a puzzle ball but she ’ s getting the caregiver to do all the hard work. And you get pairs of cats like this as well, where one cat does all the hard work and the other cat swoops on in and eats the biscuits. I particularly like this puzzle board because it ’ s got, if you can just about see, it ’ s got about four different sections on there. So it ’ s different ways for the cat to think and use their brain and figure out how they ’ re going to get the food. The little bowls you can see near the beginning, near the cat, are also really good for wet food, so it ’ s quite a good one for both wet and dry food. This one is one of our cats in care, in Cats Protection ’ s care, because we do use the feeding enrichment quite a lot. Now this is one of those”do not try this at home,”unless your cat has been doing a lot of enrichment and knows exactly what they ’ re doing, because this cat has worked through from easy through to middle right through to sort of hard, master level. But you can see that it ’ s a lot of fun. And also, it really does slow down feeding. It ’ s particularly good if you ’ ve got cats that will just eat a lot of food and then regurgitate it up. Where ’ s the biscuit? It ’ s on her back. They do make cute videos as well. So you can see that really, we ’ re not teaching cats how to play. They ’ re teaching us. We just have to listen to them, and we need to learn their preferences. Because once you get the basic principles of feeding enrichment, the world is your oyster, and you ’ re only limited by your imagination. So you just need to take the feeding enrichment and build up really slowly in complexity over time to your own individual cat ’ s pace. I think that feeding enrichment is just as fun for us as it is for the cats. So go ahead, give it a go. It ’ s fun, it ’ s easy, and it takes very little effort. You ’ ve got three minutes, right? It may not change the world, but it will change the world for your cat. Thank you very much.

I was born in Terengganu, a beautiful coastal state in Peninsular Malaysia. Growing up in a superstitious, conservative community, my siblings and I always had to follow the strangest rules that usually didn ’ t make sense to me. Things like : don ’ t whistle in the house, no nail clipping at night. And whenever we went out to play, we had to return home before sunset or before it got dark. This particular rule made the night seem mysterious to me. I spent my school year admiring the dark, but never got around to really exploring it. As I got older, I was really drawn to beautiful nature. While in mangrove forests, a forestry officer told me about kelip-kelip. A group of insects that can produce light that are easiest to see at night. Given my limited experience with darkness – I decided to take a boat ride across the mangrove estuary one night just to see what they look like. Well, the first 15 minutes of the journey was frightening. It was pitch-black out there, and the river was choppy. All I could hear was a faint breeze. As the river began to narrow, it was then that I noticed a mesmerizing sight. Countless tiny flashes of light started to flicker on the trees, all flashing in almost perfect unison. It was as if they were dancing to their own beat. That is the moment I will never forget. The moment I officially fell in love with kelip-kelip, known as fireflies in English. The rest is history. Now, I have been researching fireflies for more than 17 years, and I plan to spend my life uncovering and supporting the worlds of these creatures. There are more than

2, 000 firefly species that we know of, and they live all over the world. They are found in every continent except for Antarctica. Most of them have wings, and most species can emit light. The light is produced by special organs under their abdomens, and each species has its own unique light pattern. Some glow continuously, while others emit discreet flashing patterns, almost like a secret code. Fireflies are so much more than just pretty lights. They are an essential part of a healthy ecosystem. The life cycle of fireflies keeps the ecosystem balanced. Each firefly species in its [respective] life stage has specific needs for a habitat to thrive. They act as bioindicator to ascertain whether a particular habitat is healthy or not. For example, in a mangrove forest, when you see a population of fireflies decreasing, that could be due to water quality degradation, which can be a sign of a collapsing food chain. Why? Because firefly larvae eat snails, and snails need good water quality to thrive. In terrestrial habitats, firefly population declines can be attributed to light pollution. They are extremely sensitive to artificial light because this type of light can disorient, repel or blind them. So most of the time when you see a decline in firefly population, you can bet other species that live in the same habitat in which fireflies are found are also declining. This is indicative of an unhealthy ecosystem. This is bad for us, humans, too. It is a sign of overdevelopment that can induce climate effects such as flood and drought. As I delve deeper into the world of fireflies, I can ’ t help but wonder the fascinating mysteries that unfolded before me. It amazed me to learn that some firefly species prefer to fly solo in forests, searching for light signals from their nonwinged mates, while others choose to gather amongst trees where the ocean meets the land. Equally intriguing is the fact that some firefly species have larvae that dwell in slow-moving rivers and ponds, while others have larvae that stay on land. I find it inspiring. I find it inspiring to know that there are so many undiscovered species hiding within them. Imagine how many more remarkable firefly species are waiting to be found. And I have always wanted to find them. But it can be hard. There are other dangerous animals, too, at night. On one occasion, when I was in a place called Linggi, I stopped at a tree with firefly colonies to collect a few specimens. When we turned on our headlamps, we saw a row of red eyes. And soon we realized that we were surrounded by crocodiles. Audience : Oh! Sometimes the discovery of new species can be prompted by examining collections in the Natural History Museum. In 2016, I went to Singapore and studied a firefly collection from Southeast Asia at Lee Kong Chian Natural History Museum. I saw a firefly specimen lying in the collection that did not match any of the descriptions that I knew of. There ’ s no name attached to it, and nobody knew what it was. In fact, the first specimen of this unknown species was collected in 1989. That is akin to a human adult living up to 30 years without a name and without a proper description of this person. So my colleagues and I in 2018 went on a mission. We coordinated the first night survey to the habitat of this unknown firefly, which happens to be the last remaining freshwater swamp in Singapore. We spent three hours exploring only to be greeted by the empty darkness. We went home disappointed and tired. Not to mention dirty and smelly from the mud. We went in again three months later. Still nothing. At this point we thought, this is it. The species is gone for good. However, the third time ’ s the charm. During the third time visit to this swamp, we saw a few tiny flashes start to show up and perch on ferns. It was such an amazing feeling despite having to wade through the muddy, swampy waters and being feasted on by mosquitoes. The itchiness was still worth it. After two years of additional data collection and analysis, we confirmed that this unknown firefly species was new to science. It was also the first time since over a century that a new species of firefly, a luminous firefly from Singapore, was found. And so we named it Luciola singapura. There is a Malay saying."If you are going to reach into the pickle jar, might as well put your whole arm in."The further I have gone into this work as researcher and educator in the field of biodiversity and conservation at Monash University Malaysia, the more passionate I have become. I have transformed from a girl, a curious girl, wanting to know what kelip-kelip is, to a driven scientist committed to safeguarding the fireflies of the world. The problem is that firefly habitats are disappearing fast. We are now in a race against time to name species before they disappear. I am a cochair of the IUCN Firefly Specialist Group, but it is also my personal mission to collaborate, to work together with firefly lovers and stakeholders to identify and conserve threatened firefly species everywhere. Here ' s a flash of hope. Join me on this journey if you are keen. Fireflies need your help before they flash that one last time. Thank you.

I wrote this journal entry in 2013."I ' ve been sleeping restlessly for months. There ' s a constant feeling of tension in my body. I love ministry as a Catholic priest, the opportunity to share my faith with people and support them as we journey through life together. But I have a desire to share my life with another person. I knew, in discerning ministry, that celibacy, not getting married, was part of the package. But I don ' t know if I can do this any longer. I ' m rarely alone, but I feel bitterly lonely."I wrote this when I was on the cusp of making one of the biggest and most significant decisions of my life : whether to leave ministry as a Catholic priest. I think my life has been a reasonably unique and unusual one. Now in my early forties, I ' ve had careers as an opera singer, a Catholic priest, a corporate lawyer, and now, a management consultant. And when people hear the careers that I ' ve had, the most common question I get asked – maybe the one that ' s on your mind – is,"What on earth is the connection amongst it all?"Through all of these changes, through all of these careers, one constant has been present : the practice of reflection. Now people may think that reflection is something that happens in a dark, private room by candlelight or flashlight, to purge one ' s deepest, darkest secrets. But I want to bring this practice out of the dark and into the light. I want to share how this practice can help our everyday lives, and especially our work lives. I want to share how this practice helps to improve performance, to make better decisions, both big and small, and to build better relationships. Interestingly, in a 2020 survey of some 4, 000 respondents, conducted by BCG and BVA, the question was asked,"What makes a good leader? What are their main qualities and skills?"Notably, possessing a good capacity for reflection was listed as one of the top five skills, the others being empathy, listening, consideration and team development. Reflection is about learning. It ' s about looking at the events of our lives without judgment, but with a critical lens. I really like the way leadership professors James Bailey and Scheherazade Rehman describe it :"It requires taking an honest moment to look at what transpired, what worked, what didn ' t, what can be done and what can ' t. Reflection requires courage. It ' s thoughtful, and it ' s deliberate."So how do we do this, then? Let ' s take a look at sports. I grew up in Australia, and one of the most popular games played was cricket. Consistent high performance from batters, bowlers and fielders is essential. But given it ' s a team sport, it ' s not just about how... the individual performs, but about how the team performs collectively together. Cricketers reflect during a game, after a game and over time. During a game, they might think about a missed catch or how they could bat or bowl better the next delivery. After a game, they

might come together to watch video replays, to look at what worked and what didn ’ t, which might differ from what they actually experienced during the game itself. And then, over time, they might look to the patterns of their wins and losses, to glean even more meaningful conclusions and insights. The same process can and should be used in the workplace, and I don ’ t think we need to watch video replays of our meetings to dissect what took place. I don ’ t know about you, but that might feel kind of creepy. Reflection can be done through a variety of different formats : purposeful thinking, written journal entries, audio notes, pitches, a discussion with a mentor or honest friend. The point is to find what works for you and to make a regular commitment. To examine the events and experiences of your lives – what worked, what didn ’ t, and why – and then, to think about what and how you would like to do things differently next time. When we practice reflection as a habit, we gain even more meaningful insight, because we see patterns that reflection on stand-alone events doesn ’ t provide. I truly think reflection can help everyone – people in every industry, at every stage in one ’ s career, and in every point in one ’ s life. Let me share with you an example that I think most people can connect with. Most of us have meetings. I was due for a daily catch-up with a colleague. He had just led a client meeting for the first time. It was to give a progress update on the work stream he was responsible for in this project. He said to me that the meeting had gone terribly. He didn ’ t get through the actions taken. He wasn ’ t able to discuss the obstacles faced or the decisions required. He didn ’ t get to the next steps or the responsible persons. He felt angst, uneasy, upset. He was concerned about what the client had thought of him and the meeting, but more importantly, what the client felt about the work that was going on in the work stream. It would have been so easy for him to have pushed past this, to try and suppress the emotions, but that would have missed a massive opportunity. We took a few moments to think and objectively reflect over what took place, and then to put in place some commitments as to what and how he could do things differently next time. He decided that in [the] future, he would start each meeting with an agenda alignment, to make sure there was clarity on what needed to be achieved. And then, he ’ d resolve to make sure that he would take greater control over the meeting so that if topics came up beyond the scope of the agenda, that he ’ d note that a separate discussion should be had. Reflection helps to improve performance. Reflection helps to make better decisions. Imagine, for a moment, you ’ ve been in your current role for five years. It ’ s a creative role, but you don ’ t quite feel you ’ ve got that zing, that energy for it, anymore. You ’ ve been offered another opportunity in the organization. It ’ s actually a promotion. It ’ s a more senior role, managerial. But you ’ ll have responsibility for looking after 12 direct reports. A competitor has also recently reached out to you. They ’ ve offered you an opportunity for the same kind of role that you ’ ve got currently, but it pays a higher salary. There ’ s a big difference between being a creative and being a manager. So what is it that really makes you happy? What is it that really makes you fulfilled? Reflection provides a treasure trove of data to help you work through this. Have your reflections mentioned being bored with projects, or do you just want to try something new? Would you like to be a manager? Would you like to see people grow and form and develop them? Do you think you could do a better job than your own manager? Reflection provides great insight. It ’ s easy to get lost when you ’ ve got an opportunity of a fancier job title and more money. But reflection enables you to focus on what really matters, and to make better choices. Let me share with you a final example. Most of us have relationships in our work – bosses, customers, clients, suppliers, whomever. And I think most of us try to have good relationships with these people. If I ’ m honest, while I strive for this ambition, I haven ’ t always succeeded, but reflection has helped me to build better relationships. A number of years ago, I was giving a feedback session with a colleague, and after having done so, I took a few moments to jot down some thoughts as to how it went. I realized I had been too clinical. In fact, if only you could have seen the expressions on my colleague ’ s face. I ’ d raced through their various strengths and moved onto spending more time in their areas for development. If I ’ d really thought about this person, I would have spent far greater time actually on their strengths, actually emphasizing why they were such a valuable member of our organization, and then, creating a space where they felt psychologically safe, to be able to go on and explore these areas for development. Reflection has helped me to improve this and to build better relationships. So this might all sound a little fine and dandy, and may be obvious or trivial, but the truth is, so many of us don ’ t take time out for regular reflection. This practice has helped me and I am so grateful. After I left being a priest, I took some time out for reflection to think about who I was and what I wanted my life to be about. Reflection helped me to grapple with this, and it continues to help me today as I grapple with this and other topics. So as we end this day, or tomorrow, before you begin the next, sit down, take a breath, and reflect. And you ’ ll see the power that this habit brings to your life. Thank you.

So we know forests play an essential role in regulating the Earth ’ s climate. However, most of what we know about those forests is actually based on things we can measure aboveground. So historically, ecologists like myself would come to this place, and we ’ d count the number of tree stems we ’ d find. We ’ d identify which species they are, and today we ’ d probably remotely sense features of this forest canopy from space. And all of this absolutely makes sense. Aboveground is where photosynthesis happens. Photosynthesis is how carbon and energy enter forests. Photosynthesis is how trees can remove carbon dioxide from the atmosphere. However, we also know most trees are limited in some way, by soil resources like water or nutrients. And to access those resources, trees have to build roots. And trees build an incredible amount of roots. So in some forests, there can be as much or more biomass belowground, in root structures, as aboveground, in stems and leaves. Decades of research have now made very clear that belowground ecology – so what ’ s going on in the soil – is really essential to understanding how these forest systems work. However, if you follow these root systems all the way out to their terminal ends, the finest tips in the root system, and you look closely – I mean super closely, like, you ’ re going to need a microscope closely – you discover a place where the tree stops being a plant, and starts becoming a fungus. So most trees on Earth form a partnership, or what scientists call symbiosis, with mycorrhizal fungi. So this, in my opinion, is one of the most remarkable images ever captured of these organisms. So in the background, at the top, you can see this dense network of fungal hyphae. These are essentially like roots, but for fungi, instead of plants. And in the foreground, you can see these incredible, multinucleated fungal spores, which look totally unreal, but absolutely are. These are the reproductive structures of the fungus. These have the potential to become entirely new fungal networks. Mycorrhizal fungi are essential to how basically all plants access limiting soil resources. There ’ s actually evidence that when plants first made the evolutionary transition from living in water to living on land, they evolved this symbiosis before they even evolved roots. And so this partnership between forests and their fungi is ancient, and it stretches back hundreds of millions of years. However, these roots don ’ t have to be just fungi. They can also be, for instance, bacteria. So these circular structures in this root network are called root nodules. They house symbiotic, nitrogen-fixing bacteria. And what these bacteria do is actually convert nitrogen gas in the atmosphere into plant-usable forms, and in turn, they nurture plant growth. And the complexity of soil biology just keeps going. So these root symbionts are embedded in an even more complex network of free-living bacterial and fungal decomposers, and archaea and protists, microscopic soil animals, viruses... The biodiversity of soil communities is astonishing. We now know a handful of soil can easily contain over 1, 000 coexisting microbial species. And so all of this, this is the soil microbiome. This is the forest microbiome, this is the ecosystem microbiome. So breakthroughs in DNA sequencing technology have finally turned the lights on belowground. DNA has allowed us to see these microbial communities in unprecedented detail, and, only recently, at unprecedented scales. Yet despite these breakthroughs, I ’ d argue we still don ’ t know the answers to seemingly simple questions, like this :”What does a healthy forest microbiome look like?”We ’ re far closer to answering a question like this for people than we are for plants. The Human Microbiome Project has really led in this area. So the human body is a microbial ecosystem. Each of us houses an incredibly biodiverse community of bacteria in our gut, and that has a profound impact on our health. This was discovered by medical microbiologists using DNA sequencing to characterize which bacteria live in hundreds of people ’ s bodies. And importantly, also noting health features of those same people. So, are they sick? And if so, with what? What ’ s their blood pressure, their digestive health, their mental health? And by combining all of that information, those microbiologists could begin to identify combinations of bacteria linked to health and disease. And these analyses became a road map for the development of human microbiome transplant therapies, which is essentially ecosystem restoration, but for your gut microbiome. And these therapies are now on the road to market to treat some of these diseases today. And so drawing from this work, my team asked,”What would it look like to take the Human Microbiome Project approach, but apply it to the forest?”What could we discover about the forest carbon cycle? Could we identify places where we could actually do belowground microbial restoration, and, in the process, combat climate change? Over the past three years, we ’ ve been working with forest scientists across Europe to do exactly that. In each of these locations, scientists have been documenting forest health for decades. And so, we asked our forest research partners to go out to each of these forests and collect a small sample of soil, which they then shipped back to our lab in Zurich so we could extract and sequence DNA, which allowed us to understand which microorganisms, and particularly fungi, live in each of these forests. And then finally, we used statistics and machine learning to relate which microorganisms live in a forest to a really important forest health metric : tree growth rate and carbon-capture rate aboveground. Now, once we controlled for the environmental drivers of tree growth – so how warm and wet each of these places is, as well as other variables we know control background site fertility – we discovered that particularly which fungi colonize the roots of these trees is linked to threefold variation in how fast these trees grow, how fast they remove carbon dioxide from the atmosphere. So put another way, these correlations imply that you could have two pine forests, sitting side by side, experiencing the same climate, growing in the same soils. But if one of them was colonized by the right community of fungi on its roots, it could be growing up to three times as fast as that adjacent forest. And furthermore, these patterns were not driven by the presence of particularly high-performing species or strains, but instead, they were driven by biodiverse and completely different communities of fungi. And so these fungal signatures are super exciting to us because they imply an opportunity to manage, and in many cases, actually rewild the forest fungal microbiome. So, for example, can we reintroduce fungal biodiversity into a managed timber forestry landscape? And in the process, can we make those trees grow faster? Can we make them capture more carbon in their tree stems and in their soils? Can we rewild the soil and combat climate change? And these aren ' t just rhetorical questions – we ' ve actually started doing this. So this is one of our field trials in Wales, in the United Kingdom. It ' s run in collaboration with the charity there called the Carbon Community. It ' s 28 acres, or 11 hectares, and it ' s set up as a block-randomized controlled trial. This is analogous to how you would run a drug trial, but in this case, it ' s for trees instead of people. And here, we do a pretty straightforward experiment. We either plant trees, business as usual – which is just direct planting of seedlings into the ground – or we plant trees, and at the moment of planting, we add a small handful of soil. But it ' s not just any soil. It ' s soil sourced from a forest our analyses have identified as harboring potentially high-performing fungi. So since we reintroduced microbial biodiversity into some of these sites, we ' ve observed that where we actually did that, we ' ve been able to accelerate tree growth and carbon capture in tree stems by 30 to 70 percent, depending on the tree species. Or put another way – where we manipulated and rewilded the invisible microbiology of this place, we ' ve begun to change how that entire place works. Now it ' s important to emphasize that we ' re really excited about these findings, but we also understand they ' re still early. We want to see many more large-scale field trials and many more locations with many more years of data. However, beyond just these carbon and climate outcomes, I think the most exciting thing here is that we can actually do this with wild and native and biodiverse combinations of microorganisms. And while we pointed this approach at forestry, in principle, this kind of science has the potential to generalize to all of our managed landscapes. We can begin asking questions like,"What does a healthy agricultural microbiome look like?"Thinking across both food and forest agriculture. And there ' s reason to think a biodiversity-first approach may be particularly powerful here. And that ' s because the history of agriculture has been an exercise in reductionism. We ' ve identified high-performing plant species, and then strains, and then we ' ve selectively bred them, and now we genetically modify them. And finally, we plant those organisms out in vast monocultures. So a single plant species as far as you can see. And to be clear, this has produced very productive agroecosystems. But it ' s also produced ecosystems we ' re coming to understand are remarkably fragile. Systems increasingly sensitive to extreme climate events, novel pathogens. Systems incredibly reliant on chemical inputs, we ' re coming to understand have really serious externalities. So we now have the data, computational tools and the ecological theory to start going the other way, to lean into biodiversity and complexity. And once we do, the question really becomes, by rewilding our soils, can we make our managed food and forest landscapes reservoirs of belowground biodiversity? And in the process, can we enhance yields and carbon capture and all the other services we ask of these ecosystems? I think there ' s a lot of reason to be incredibly hopeful here. And I think we also shouldn ' t be so surprised that these microscopic organisms have the potential for such enormous, ecosystem-scale effects. And that ' s because we ' ve known now, really for a long time, that forests are fungi. And they ' re incredibly biodiverse communities of bacteria and archaea and protists and microscopic soil animals and viruses. Soil is the literal foundation of terrestrial ecosystems, and the microbial life that inhabits soil represents some of the most complex and biodiverse communities of life on Earth. For the first time, DNA sequencing is turning the lights on belowground. It ’ s allowing us to see these organisms in unprecedented detail and at unprecedented scales. Imagine studying plant biology, but you never really knew if you ’ re looking at a sequoia tree or a sphagnum moss. And then, all of a sudden, you did. That ’ s what ’ s happening right now in global environmental microbiology. And so we should expect this revolution in our understanding of these microscopic organisms, and particularly fungi, to transform how we understand and how we manage our ecosystems in a foundational way. Thank you.

I am a planet hunter and keeper of the keys at NASA ’ s Exoplanet Archive. In March 2022, we reached a major milestone in space exploration : 5, 000 known exoplanets. For thousands of years, we ’ ve wondered about planets outside of our solar system, now called exoplanets. But our technology only recently caught up with our imaginations. And yes, 5, 000 planets is incredible. What ’ s even more incredible is how space research will change as a result. When I started grad school, there were about 100 known exoplanets, all radically different from the Earth and from each other. I was determined to find more. I spent four years looking at nearly 87, 000 stars, one by one. Now you might have this romantic idea that I was gazing intently through a telescope, pondering some gorgeous view of the universe. I was not. I was looking at data like this, measuring the brightness of each star over time. If the brightness dipped, just briefly, just a little bit, it could be because a planet had orbited in front of that star, blocking some of the light from reaching my telescope. So I spent four years looking for decimal-level changes in these data. And after four years, I ’ d found... nothing. Zero exoplanets. Thankfully, they still gave me the PhD, I think, for effort. Then I moved to Harvard, where I worked on my first NASA mission, called EPOXI. I still didn ’ t find any exoplanets. Then in March 2010, I joined the Kepler Mission, NASA ’ s grand experiment with putting one of our planet-hunting instruments into space. Monday was my first day on the base in Silicon Valley. It was mostly spent in HR. Tuesday, I sat down and looked at the data for the first time, and I found my first exoplanet. A few minutes later, I found another one. There ’ s a saying that we ’ re the generation that was born too late to explore Earth and too soon to explore space. That ’ s not true anymore. That day and every day since, I ’ ve gotten to explore space. Kepler made it possible for us to measure stellar brightness much more precisely than we had before. And eventually I helped find thousands of exoplanets. And we ’ ve really only searched our local corner of the galaxy to find those planets. That means there ’ s likely tens of billions of planets just in our Milky Way. Now with so much data, we can start sorting and grouping and categorizing these planets to find trends. Think of it this way : if you wanted to learn about dogs and you had five dogs in your study, well, you ’ d learn a lot about those five dogs. That they ’ re all good dogs. But maybe not about dogs in general. If you had 5, 000 dogs in your study, then you ’ d start to see that there were German Shepherds and Dobermanns and beagles, and that these different breeds have different features. With demographic-level data on exoplanets, we can start asking some of these big questions for the first time, like : Of those thousands and billions of planets in our galaxy, how many are like the Earth, or like Jupiter? How many planets does a typical star have? Can a planet orbit more than one star? Yes. Can a planet exist without any star at all? Also yes. One surprising result from the study of planet populations is that the most common kind of planet in our galaxy might be one we don ’ t have in our solar system : a super-Earth up to twice as big and ten times as heavy as our Earth. We ’ ve found evaporating planets, disintegrating planets, planets clustered together in a clockwork dance, ultra-puffy planets, ultra-dense planets. It ’ s truly a wild and wonderful menagerie that I get to corral at the NASA Exoplanet Archive. But it gets even more interesting than that. With so much data, we might finally be able to figure out how planets are made. We see baby stars being born in stellar nurseries surrounded by dust and gas. And we see all the stars surrounded by completed planetary systems. But we still don ’ t really know what happens in between. With more data, we might find planets at some middle stage or many middle stages. And from there, be able to map out a timeline of planetary development. What triggers these diffused clouds of dust and gas to collapse and transform? And how does the chaos and turmoil of dust become pebbles, and pebbles become boulders, and boulders become planetesimals? And from there, after an intense series of bombardments eventually settle into an ordered series of planets. How often is one of those planets solid and warm, with a water ocean lapping a sandy shore? Where do we come from, and how did we get here? The more we learn about exoplanets, the easier it is to target the ones we want. So far, we haven ’ t found any planets that are like the Earth. But I hope we will. NASA just spent the last few years studying the idea of a very large telescope in space with next-generation technology that would allow us to take an image, an actual photograph, of a planet like the Earth. With that photo, we could search for biomarkers, signatures of life. I ’ ll probably spend the rest of my career working on that mission. I hope I get to take that photo. Thank you.

Now, this is Joanna. Joanna works at a university in Poland. And one Saturday morning at 3am, she got up, packed her rucksack and traveled more than a thousand kilometers, only to have a political argument with a stranger. His name is Christof, and he ’ s a customer manager from Germany. And the two had never met before. They only knew that they were totally at odds over European politics, over migration, or the relationship to Russia or whatever. And they were arguing for almost one day. And after that, Joanna sent me a somewhat irritating email.”That was really cool, and I enjoyed every single minute of it!”So these are Tom from the UK and Nils from Germany. They also were strangers, and they are both supporters of their local football team, as you may imagine, Borussia Dortmund and Tottenham Hotspurs. And so they met on the very spot where football roots were invented, on some field in Cambridge. And they didn ’ t argue about football, but about Brexit. And after talking for many hours about this contentious topic, they also sent a rather unexpected email.”It was delightful, and we both enjoyed it very much.”So in spring 2019, more than 17, 000 Europeans from 33 countries signed up to have a political argument. Thousands crossed their borders to meet a stranger with a different opinion, and they were all part of a project called”Europe Talks.”Now, talking about politics amongst people with different opinions has become really difficult, not only in Europe. Families are splitting, friends no longer talk to each other. We stay in our bubbles. And these so-called filter bubbles are amplified by social media, but they are not, in the core, a digital product. The filter bubble has always been there. It ’ s in our minds. As many studies repeatedly have shown, we, for example, ignore effects that contradict our convictions. So

correcting fake news is definitely necessary, but it ’ s not sufficient to get a divided society to rethink itself. Fortunately, according to at least some research, there may be a simple way to get a new perspective : a personal one-on-one discussion with someone who doesn ’ t have your opinion. It enables you to see the world in a new way, through someone else ’ s eyes. Now, I ’ m the editor of”ZEIT ONLINE,”one of the major digital news organizations in Germany. And we started what became”Europe Talks”as a really modest editorial exercise. As many journalists, we were impressed by Trump and by Brexit, and Germany was getting divided, too, especially over the issue of migration. So the arrival of more than a million refugees in 2015 and 2016 dominated somewhat the debate. And when we were thinking about our own upcoming election in 2017, we definitely knew that we had to reinvent the way we were dealing with politics. So digital nerds that we are, we came up with obviously many very strange digital product ideas, one of them being a Tinder for politics — a dating platform for political opposites, a tool that could help get people together with different opinions. And we decided to test it and launched what techies would call a”minimum viable product.”So it was really simple. We called it”Deutschland spricht”—”Germany Talks”— and we started with that in May 2017. And it was really simple. We used mainly Google Forms, a tool that each and every one of us here can use to make surveys online. And everywhere in our content, we embedded simple questions like this :”Did Germany take in too many refugees?”You click yes or no. We asked you more questions, like,”Does the West treat Russia fairly?”or,”Should gay couples be allowed to marry?”And if you answered all these questions, we asked one more question :”Hey, would you like to meet a neighbor who totally disagrees with you?”So this was a really simple experiment with no budget whatsoever. We expected some hundred-ish people to register, and we planned to match them by hand, the pairs. And after one day, 1, 000 people had registered. And after some weeks, 12, 000 Germans had signed up to meet someone else with a different opinion. So we had a problem. We hacked a quick and dirty algorithm that would find the perfect Tinder matches, like people living as close as possible having answered the questions as differently as possible. We introduced them via email. And, as you may imagine, we had many concerns. Maybe no one would show up in real life. Maybe all the discussions in real life would be awful. Or maybe we had an axe murderer in our database. But then, on a Sunday in June 2017, something beautiful happened. Thousands of Germans met in pairs and talked about politics peacefully. Like Anno. He ’ s a former policeman who ’ s against — or was against — gay marriage, and Anne, she ’ s an engineer who lives in a domestic partnership with another woman. And they were talking for hours about all the topics where they had different opinions. At one point, Anno told us later, he realized that Anne was hurt by his statements about gay marriage, and he started to question his own assumptions. And after talking for three hours, Anne invited Anno to her summer party, and today, years later, they still meet from time to time and are friends. So our algorithm matched, for example, this court bailiff. He ’ s also a spokesperson of the right-wing populist party AfD in Germany, and this counselor for pregnant women. She used to be an active member of the Green Party. We even matched this professor and his student. It ’ s an algorithm. We also matched a father-in-law and his very own daughter-in-law, because, obviously, they live close by but have really different opinions. So as a general rule, we did not observe, record, document the discussions, because we didn ’ t want people to perform in any way. But I made an exception. I took part myself. And so I met in my trendy Berlin neighborhood called Prenzlauer Berg, I met Mirko. This is me talking to Mirko. Mirko didn ’ t want to be in the picture. He ’ s a young plant operator, and he looked like all the hipsters in our area, like with a beard and a beanie. We were talking for hours, and I found him to be a wonderful person. And despite the fact that we had really different opinions about most of the topics — maybe with the exception of women ' s rights, where I couldn ' t comprehend his thoughts — it was really nice. After our discussion, I Googled Mirko. And I found out that in his teenage years, he used to be a neo-Nazi. So I called him and asked,"Hey, why didn ' t you tell me?"And he said,"You know, I didn ' t tell you because I want to get over it. I just don ' t want to talk about it anymore."I thought that people with a history like that could never change, and I had to rethink my assumptions, as did many of the participants who sent us thousands of emails and also selfies. No violence was recorded whatsoever. And we just don ' t know if some of the pairs got married. But, at least, we were really excited and wanted to do it again, especially in version 2. 0, wanted to expand the diversity of the participants, because obviously in the first round, they were mainly our readers. And so we embraced our competition and asked other media outlets to join. We coordinated via Slack. And this live collaboration among 11 major German media houses was definitely a first in Germany. The numbers more than doubled : 28, 000 people applied this time. And the German president — you see him here in the center of the picture — became our patron. And so, thousands of Germans met again in the summer of 2018 to talk to someone else with a different opinion. Some of the pairs we invited to Berlin to a special event. And there, this picture was taken, until today my favorite symbol for"Germany Talks."You see Henrik, a bus driver and boxing trainer, and Engelbert, the director of a children ' s help center. They answered all of the seven questions we asked differently. They had never met before this day, and they had a really intensive discussion and seemed to get along anyway with each other. So this time we also wanted to know if the discussion would have any impact on the participants. So we asked researchers to survey the participants. And two-thirds of the participants said that they learned something about their partner ' s attitudes. Sixty percent agreed that their viewpoints converged. The level of trust in society seemed also higher after the event, according to the researchers. Ninety percent said that they enjoyed their discussion. Ten percent said they didn ' t enjoy their discussion, eight percent only because, simply, their partner didn ' t show up. After"Germany Talks,"we got approached by many international media outlets, and we decided this time to build a serious and secure platform. We called it"My Country Talks."And in this short period of time,"My Country Talks"has already been used for more than a dozen local and national events like"Het grote gelijk"in Belgium or"Suomi puhuu"in Finland or"Britain Talks"in the UK. And as I mentioned at the beginning, we also launched"Europe Talks,"together with 15 international media partners, from the"Financial Times"in the UK to"Helsingin Sanomat"in Finland. Thousands of Europeans met with a total stranger to argue about politics. So far, we have been approached by more than 150 global media outlets, and maybe someday there will be something like"The World Talks,"with hundreds of thousands of participants. But what matters here are not the numbers, obviously. What matters here is... Whenever two people meet to talk in person for hours without anyone else listening, they change. And so do our societies. They change little by little, discussion by discussion. What matters here is that we relearn how to have these face-to-face discussions, without anyone else listening, with a stranger. Not only with a stranger we are introduced to by a Tinder for politics, but also with a stranger in a pub or in a gym or at a conference. So please meet someone and have an argument and enjoy it very much. Thank you. Wow!

Text Sample 918: NEG Dim 6 – 2019 – Score 1.00 – 2019/t000009.txt

I am obsessed with forming healthy communities, and that ’ s why I started Twitch â to help people watch other people play video games on the internet. Thank you for coming to my TED talk. So in seriousness, video games and communities truly are quite related. From our early human history, we made our entertainment together in small tribes. We shared stories around the campfire, we sang together, we danced together. Our earliest entertainment was both shared and interactive. It wasn ’ t until pretty recently on the grand scale of human history that interactivity took a back seat and broadcast entertainment took over. Radio and records brought music into our vehicles, into our homes. TV and VHS brought sports and drama into our living rooms. This access to broadcast entertainment was unprecedented. It gave people amazing content around the globe. It created a shared culture for millions of people. And now, if you want to go watch or listen to Mozart, you don ’ t have to buy an incredibly expensive ticket and find an orchestra. And if you like to sing â I can show you the world â then you have something in common with people around the world. But with this amazing access, we allowed for a separation between creator and consumer, and the relationship between the two became much more one-way. We wound up in a world where we had a smaller class of professional creators and most of us became spectators, and as a result it became far easier for us to enjoy that content alone. There ’ s a trend counteracting this : scarcity. So, Vienna in the 1900s, was famous for its cafĂŠ culture. And one of the big drivers of that cafĂŠ culture was expensive newspapers that were hard to get, and as a result, people would go to the cafĂŠ and read the shared copy there. And once they ’ re in the cafe, they meet the other people also reading the same newspaper, they converse, they exchange ideas and they form a community. In a similar way, TV and cable used to be more expensive, and so you might not watch the game at home. Instead you ’ d go to the local bar and cheer along with your fellow sports fans there. But as the price of media continues to fall over time thanks to technology, this shared necessity that used to bring our communities together falls away. We have so many amazing options for our entertainment, and yet it ’ s easier than ever for us to wind up consuming those options alone. Our communities are bearing the consequences. For example, the number of people who report having at least two close friends is at an all-time low. I believe that one of the major contributing causes to this is that our entertainment today allows us to be separate. There is one trend reversing this atomization of our society : modern multiplayer video games. Games are like a shared campfire. They ’ re both interactive and connecting. Now these campfires may have beautiful animations, heroic quests, occasionally too many loot boxes, but games today are very different than the solitary activity of 20 years ago. They ’ re deeply complex, they ’ re more intellectually stimulating, and most of all, they ’ re intrinsically social. One of the recent breakout genres exemplifying this change is the battle royale. 100 people parachute onto an island in a last-man-standing competition. Think of it as being kind of like”American Idol,”but with a lot more fighting and a lot less Simon Cowell. You may have heard of”Fortnite,”which is a breakout example of the battle royale genre, which has been played by more than 250 million people around the world. It ’ s everyone from kids in your neighborhood to Drake and Ellen DeGeneres. 2. 3 billion people in the world play video games. Early games like”Tetris”and”Mario”may have been simple puzzles or quests, but with the rise of arcades and then internet play, and now massively multiplayer games of huge, thriving online communities, games have emerged as the one form of entertainment where consumption truly requires human connection. So this brings us to streaming. Why do people stream themselves playing video games? And why do hundreds of millions of people around the world congregate to watch them? I want you all the imagine for second â imagine you land on an alien planet, and on this planet, there ’ s a giant green rectangle. And in this green rectangle, aliens in matching outfits are trying to push a checkered sphere between two posts using only their feet. It ’ s pretty evenly matched, so the ball is just going back and forth, but there ’ s hundreds of millions of people watching from home anyway, and cheering and getting excited and engaged right along with them. Now I grew up watching sports with my dad, so I get why soccer is entertaining and engaging. But if you don ’ t watch sports, maybe you like watching”Dancing with the Stars”or you enjoy”Top Chef.”Regardless, the principle is the same. If there is an activity that you really enjoy, you ’ re probably going to like watching other people do it with skill and panache. It might be perplexing to an alien, but bonding over shared passion is a human universal. So gamers grew up expecting this live, interactive entertainment, and passive consumption just doesn ’ t feel as fulfilling. That ’ s why livestreaming has taken off with video games. Because livestreaming offers that same kind of interactive feeling. So when you imagine what ’ s happening on Twitch, I don ’ t want you to think of a million livestreams of video games. Instead, what I want you to picture is millions of campfires. Some of them are bonfires â huge, roaring bonfires with hundreds of thousands of people around them. Some of them are smaller, more intimate community gatherings where everyone knows your name. Let ’ s try taking a seat by one of those campfires right now. Hey Cohh, how ’ s it going? Cohh : Hey, how ’ s it going, Emmett? ES : So I ’ m here at TED with about 1, 000 of my closest friends, and we thought we ’ d come and join you guys for a little stream. Cohh : Awesome! It ’ s great to hear from you guys. ES : So Cohh, can you share with the TED audience here â what have you learned about your community on Twitch? Cohh : Ah, man, where to begin? I ’ ve been doing this for over five years now, and if there ’ s one thing that doesn ’ t cease to impress me on the daily, it ’ s just kind of how incredible this whole thing is for communication. I ’ ve been playing games for 20 years of my life, I ’ ve led online MMO guilds for over 10, and it ’ s the kind of thing where there ’ s very few places in life where you can go to meet so many people with similar interests. I was listening in a bit earlier ; I love the campfire analogy, I actually use a similar one. I see it all as a bunch of people on a big couch but only one person has the controller. So it ’ s kind of like a”Pass the snack!”situation, you know? 700 people that way â but it ’ s great and really it ’ s just â ES : So Cohh, what is going on in chat right now? Can you explain that a little bit to us? Because my eyesight isn ’ t that good but I see a lot of emotes. Cohh : So this is my community ; this is the Cohhilition. I stream every single day. I actually just wrapped up a 2, 000-day challenge, and as such, we have developed a pretty incredible community here in the channel. Right now we have about 6200 people with us. What you ’ re seeing is a spam of”Hello, TED”good- vibe emotes, love emotes,”this is awesome,””Hi, guys,””Hi, everyone.”Basically just a huge collection of people â huge collection of gamers that are all just experiencing a positive event together. ES : So is there anything that â can we poll chat? I want ask chat a question. Is there anything that chat would like the world, and particularly these people here with me at TED right now, to know about what they get out of playing video games and being part of this community? Cohh : Oh, wow. I am already starting to see a lot of answers here.”I like the good vibes.””Best communities are on Twitch.””They get us through the rough patches in life.”Oh, that ’ s a message I definitely see a lot on Twitch, which is very good.”A very positive community,””a lot of positivity,”which is pretty great. ES : So Cohh, before I get back to my TED talk, which I actually should probably get back to doing at some point â Do you have anything else that you want to share with me or any question you wanted to ask, you ’ ve always wanted to get out there before an audience? Cohh : Honestly, not too much. I mean, I absolutely love what you ’ re doing right now. I think that the interactive streaming is the big unexplored frontier of the future in entertainment, and thank you for doing everything you ’ re doing up there. The more people that hear about what you do, the better â for everyone on here. ES : Awesome, Cohh. Thanks so much. I ’ m going to get back to giving this talk now, but we should catch up later. Cohh : Sounds great! ES : So that was a new way to interact. We could influence what happened on the stream, we could cocreate the experience along with him, and we really had a multiplayer experience with chat and with Cohh. At Twitch, we ’ ve started calling this, as a result,”multiplayer entertainment.”Because going from watching a video alone to watching a live interactive stream is similar to the difference between going from playing a single-player game to playing a multiplayer game. Gamers are often as the forefront of exploration in new technology. Microcomputers, for example, were used early on for video games, and the very first handheld, digital mass-market devices weren ’ t cell phones, they were Gameboys... for video games. And as a result, one way that you can get a hint of what the future might hold is to look to this fun, interactive sandbox of video games and ask yourself,”what are these gamers doing today?”And that might give you a hint as to what the future is going to hold for all of us. One of the things we ’ re already seeing on Twitch is multiplayer entertainment coming to sports. So, Twitch and the NFL teamed up to offer livestreaming football, but instead of network announcers in suits streaming the game, we got Twitch users to come in and stream it themselves on their own channel and interact with their community and make it a real multiplayer experience. So I actually think that if you look out into the future â only hundreds of people today get to be sports announcers. It ’ s a tiny, tiny number of people who have that opportunity. But sports are about to go multiplayer, and that means that anyone who wants to around the world is going to get the opportunity to become a sports announcer, to give it a shot. And I think that ’ s going to unlock incredible amounts of new talent for all of us. And we ’ re not going to be asking,”Did you catch the game?”Instead, we ’ re going to be asking,”Whose channel did you catch the game on?”We already see this happening with cooking, with singing â we even see people streaming welding. And all of this stuff is going to happen around the metaphorical campfire. There ’ s going to be millions of these campfires lit over the next few years. And on every topic, you ’ re going to be able to find a campfire that will allow you to bond with your people around the world. For most of human history, entertainment was simply multiplayer. We sang together in person, we shared news together in the town square in person, and somewhere along the way, that two-way conversation turned into a one-way transmission. As someone who cares about communities, I am excited for a world where our entertainment could connect us instead of isolating us. A world where we can bond with each other over our shared interests and create real, strong communities. Games, streams and the interactions they encourage, are only just beginning to turn the wheel back to our interactive, community-rich, multiplayer past. Thank you all for sharing this experience here with me, and may you all find your best campfire.

Text Sample 919: NEG Dim 6 – 2019 – Score 1.00 – 2019/t000029.txt

Keith Kirkland : We believe in making the world a better place, and we ’ re trying to do that through design, but the world for us starts with our company.

Our first product, Wayband, is a wearable haptic navigation device for the blind and visually impaired. We had gotten an article published and it had made its way to this guy, Simon Wheatcroft. He reached out to us and he was like,”If you can have this technology ready by November, I ’ ll run the New York City Marathon with it.”We saw it and was kind of like, moonshot, this is probably not going to work, but let ’ s just do it and see how far we can get. [Dropbox is a collaborative platform whose mission is to design a more enlightened way of working. They are invested in understanding how teams like WearWorks achieve extraordinary outcomes.] Jennifer Brook : In Keith ’ s story, I see a microcosm that reflects a greater macrocosm in terms of an emerging set of values. What we found is that everyone has a set of tensions in their work and life, things like making a living and making a life, or fulfilling the organization ’ s needs and the needs of the individual. We navigate those tensions using our own unique strategies, for example, working remotely, learning new skills, or self care. Navigating these tensions is critical, because a lot is at stake for us when we show up to work, like our sense of purpose or our connection to our families and communities. And for me, in this organization, this is why we should care about designing a more enlightened way of working. KK : We see a company as a vehicle to design life with as opposed to something to conform to. JB : WearWorks is really thinking holistically about navigating their tensions. For example, when it comes to a tension like making a living and making a life, what kinds of cultural practices and policies need to be in place to support a strategy like flexible or remote work? KK : At WearWorks, we have this policy called WhereverWorks, and the basic idea is that we don ’ t really care where people are as long as the work gets done. And by doing so, we make our employees ridiculously happy. And by doing that, we get the best work from people. JB : We ’ re seeing that people everywhere are challenging these inherited, default ways of working. They want access to more choices, more agency, the freedom to decide how they want to work. This supports them to better navigate the tensions in their work and life for the sake of preserving what ’ s at stake for them. KK : We did a six-month sprint, and on November 5, 2017, Simon ran the first 15 miles of the New York City Marathon without any sight assistance. Working with the blind and visually impaired was a wonderful challenge. It ’ s a different feeling when you go to work every day and the thing that you do actually helped the needle of humanity, in some way, move forward. JB : WearWorks embodies what an enlightened way of working means for people out in the world today.

Every year, more than four to five million people die due to exposure to outdoor air pollution around the world. This petri dish that you are looking at contains approximately 20 minutes ’ worth of pollution captured off a pyrolysis plant. This is PM 2. 5. These particles â you can see it right now, but when they ’ re out there in the air, you won ’ t see them. These are so tiny that our lungs â our bodies cannot filter them, and they end up in our bodies â give us asthma and lung cancer if not treated in the right time. On a trip back to India, when I was a student in 2012, I took this picture. This picture stuck in my head. On one side, you see this exhaust of a diesel generator, the same generator which is a sign of human progress, which is a sign of rapid industrialization and what we have become as a society in the last 100 years, generating energy. But on the other side, you see this very interesting triangular, black-colored swatch, that is produced by the same residual particulate waste created by the emissions of the generator. Now, this picture gave me an idea and got me thinking about rethinking both pollution and inks, because it was making that black-colored mark. Now, the reality is that most of the black ink that we use conventionally is traditionally produced by conventionally burning fossil fuels in factories. There are factories around the world that are burning fossil fuels to produce carbon black, to make black inks that we use on an everyday basis. But given that millions of liters of fossil fuels are already being burned out there by our cars, our engines and our exhaust out there, what if you could capture that pollution and use it to recycle and make those inks? I decided to give this experiment a shot. I went back to my lab back in Boston and conducted a small experiment. In Boston, I couldn ’ t find much pollution to play with, so I resorted to using a candle. This was an experiment. I burnt a candle, built this contraption that would suck in that candle soot, mixed it with some vegetable oil and vodka, because to a DIY hacker, these were really easily available. And after mixing them, you could churn out a very rudimentary form of ink that would go into a cartridge, and now you could print with it. This was my”Hello, World!”of experimenting with printing with pollution. This is the same pollution that I showed you in the petri dish, which is the result of any fossil fuel that is being burned out there. In 2015, I decided to take this experimentation forward and set up a lab in India to work on the capture and recycling of air pollution. In the good times, the lab used to look something like this. But experimentations were not always controlled, and disasters happened. And while experimentation would happen, the lab would end up looking something like this. Well, we knew where we wanted to go, but we were not sure how exactly to reach there. The passersby who used to go by that lab through that building used to, at times, think,”These guys are making bombs in there,”because there was too much fire, wires and smoke in the same vicinity. We decided, let ’ s move to a garage and take experiments forward. We took a garage, and during the early stages, we were driving around Bangalore with contraptions like these. This is an early-stage prototype. Imagine the looks people gave us,”What are these cars driving around doing?”This is an early- stage prototype of our system that would capture pollution that is being released from a conventional diesel-based car. This is an early stage of the technology. We advanced the technology and created this into this version that would capture pollution from static sources of pollution, like a diesel generator. If you see, all the fumes disappear as soon as you turn this machine on. Without affecting the performance of the engine, we are able to capture 95 percent worth of pollution released from the diesel generator. This is the particulate matter that we are talking about that we capture, in this case, within three to four hours of operation of a generator. And while our experiments and our research was advancing, a very big company, a very big brand, approached us and said,”We want to take this idea further with you guys, and take this further in a very big celebrated form.”They said,”Let ’ s do a global art campaign with the inks that you are making off this pollution.”I ’ ll show you what the ink looks like. So, this pen is made by recycling 40 to 50 minutes of that car pollution that we are talking about, the same pollution that is in the petri dish. And it ’ s a very sharp black that you can write with. So I ’ m going to write... PM 2. 5, that ’ s incorrect. So this is a very sharp black that is generated by the same pollution. After much work on the lab-level research, we got an offer from a big corporation to do a very big trial of this idea. And it happened to be a brand, and we didn ’ t think twice. We said,”Let ’ s go ahead.”Inventing in the lab is one thing and taking ideas and deploying them in the real world is completely another. During early stages, we had to resort to using our own houses and own kitchens as our ink-making factories, and our own bedrooms and living rooms as the first assembly line for making these inks. This is my cofounder Nikhil ’ s own bedroom, that is being used to supply inks to artists all around the world, who would paint with AIR-INK. And that ’ s him, delivering AIR-INKs to the ports so that the artists around the world can use it. Soon, we started seeing that thousands of artists around the world started using AIR-INK, and artworks started emerging like this. Soon, thousands of black-and-white, pollution-made artworks started emerging on a global scale. And believe me, for a group of scientists and engineers and inventors, there was nothing more satisfying than that the product of their work is now being used by some of the finest artists around the world. This is the cover of”Contagious”magazine last year, that was done by using the same ink that we made back in our labs. This is a famous painting by the British artist, Christian Furr, who painted it for the song”Paint It Black”by The Rolling Stones. Now, there ’ s more to this pen and this ink than just the popular and pop-culture artworks. And now our goal is to create a company that can actually make some black money â I mean, just money â and high-quality printing processes and inks that can replace the conventional black inks that have been produced for the last thousands of years around the world. Soon after our growing popularity and artworks around the world, we started facing a very different kind of a problem. We started getting spammed by polluters, who would send us bags full of pollution to our office address, asking us,”What can we do with this pollution?”Our lab back in Bombay right now has pollution samples that have come from London, from India, from China, you name it. And this is just the beginning. This polluter sent us this specific image, asking us that these are all bags filled with PM 2. 5, and can we recycle it for him if we paid him some money. Well, what would he have done if we did not take that pollution? He would probably find a nearby river or a landfill and dump it over there. But now, because we had the economics of AIR- INK figured out on the other side, we could incentivize him to give us this pollution and make inks from it, and turn it into even more valuable products. Now, pollution, as we all know, is a global killer. We can ’ t claim that our ink will solve the world ’ s pollution problem. But it does show what can be done if you look at this problem slightly differently. Look at this T-shirt I ’ m holding right now. This is made from the same AIR-INK I ’ m talking about. It ’ s made from the same pollution that is inside this petri dish. And the same pollution we are all breathing in when we are walking outdoors. And we are on our way to do better than this. Thank you very much.

Text Sample 921: NEG Dim 6 – 2018 – Score 1.00 – 2018/t000025.txt

Aja Monet : Our story begins like all great, young love stories. Phillip Agnew : She slid in my DMs... AM : He liked about 50 of my photos, back-to-back, in the middle of the night â PA : What I saw was an artist committed to truth and justice â and she ’ s beautiful, but I digress. AM : Our story actually begins across many worlds, over maqluba and red wine in Palestine. But how did we get there? PA : Well, I was born in Chicago, the son of a preacher and a teacher. My ears first rung with church songs sung by my mother on Saturday mornings. My father ’ s South Side sermons summoned me. My first words were more notes than quotes. It was music that molded me. Later on, it was Florida A&M University that first introduced me to organizing. In 2012, a young black male named Trayvon Martin was murdered, and it changed my life and millions of others ’. We were a ragtag group of college kids and not-quite adults who had decided enough was enough. Art and organizing became our answer to anger and anxiety. We built a movement and it traveled around the world and to Palestine, in 2015. AM : I was born to a single mother in the Pink House projects of Brooklyn, New York. Maddened by survival, I gravitated inwards towards books, poems and my brother ' s hand-me-down Walkman. I saw train-station theater, subwoofing streets and hood murals. In high school, I found a community of metaphor magicians and truth-telling poets in an organization called Urban Word NYC. Adopted by the Black Arts movement, I won the legendary Nuyorican Poets Cafe Grand Slam title. At Sarah Lawrence College, I worked with artists to respond to Hurricane Katrina and the earthquake ; I discovered the impact of poetry and the ability to not just articulate our feelings, but to get us to work towards changing things and doing something about it, when a friend, Maytha Alhassen, invited me to Palestine... PA : We were a delegation of artists and organizers, and we immersed ourselves in Palestinian culture, music, their stories. Late into the night, we would have discussions about the role of art in politics and the role of politics in art. Aja and I disagree. AM : Oh, we disagree. PA : But we quite quickly and unsurprisingly fell in love. Exhibit A : me working my magic. AM : Obvious, isn ' t it? Four months later, this artist â PA : and this organizer â AM : moved into a little home with a big backyard, in Miami. PA : Listen, five months before this ever happened, I predicted it all. I ' m going to tell you â a friend sat me down and said,"You ' ve done so much for organizing, when are you going to settle down?"I looked him straight in the face and I said,"The only way that it would ever happen is if it is a collision. This woman would have to knock me completely off course."I didn ' t know how right I was. Our first few months were like any between young lovers : filled with hot, passionate, all-night... AM : nonstop... PA : discussions. PA : Aja challenged everything I knew and understood about the world. She forced me â AM : lovingly â PA : to see our organizing work with new eyes. She helped me see the unseen things and how artists illuminate our interior worlds. AM : There were many days I did not want to get up out of bed and face the exterior world. I was discouraged. There was so much loss and death and artists were being used to numb, lull and exploit. While winning awards, accolades and grants soothed so many egos, people were still dying and I was seeking community. Meeting Phillip brought so much joy, love, truth into my life, and it pulled me out of isolation. He showed me that community and relationships wasn ' t just about building great movements. It was integral in creating powerful, meaningful art, and neither could be done in solitude. PA : Yeah, we realized many of our artist and organizer friends were also lost in these cycles of sadness, and we were in movements that often found themselves at funerals. We asked ourselves what becomes of a generation all too familiar with the untimely ends of lives streamed daily on our Timelines? It was during one of our late-night discussions that we saw beyond art and organizing and began to see that art was organizing. AM : The idea was set : art was an anchor, not an accessory to movement. Our home was a home of radical imagination ; an instrument of our nurturing hearts ; a place of risk where were dared to laugh, love, cry, debate. Art, books, records and all this stuff decorated our walls, and there was lizards â walls of palm trees that guided our guests into our backyard, where our neighbors would come and feel right at home. The wind â the wind was an affirmation for the people who walked into the space. And we learned that in a world â a bewildering world of so much distraction â we were able to cultivate a space where people could come and be present, and artists and organizers could find refuge. PA : This became Smoke Signals Studio. AM : As we struggle to clothe, house, feed and educate our communities ; our spirits hunger for connection, joy and purpose ; and as our bodies are out on the front lines, our souls still need to be fed, or else we succumb to despair and depression. Our art possesses rhythmic communication, coded emotional cues, improvised feelings of critical thought. Our social movements should be like jazz : encouraging active participation, listening, spontaneity and freedom. What people see as a party... PA : is actually a movement meeting. See, we aren ’ t all protest and pain. Here ’ s a place to be loved, to be felt, to be heard, and where we prepare for the most pressing political issues in our neighborhoods. See, laws never change culture, but culture always changes laws. Art â Art as organizing is even changing and opening doors in places seen as the opposite of freedom. Our weekly poetry series is transforming the lives of men incarcerated at Dade Correctional, and we ’ re so excited to bring you all the published work of one of those men, Echo Martinez. In the intro, he says... AM :”Poetry for the people is a sick pen ’ s penicillin. It ’ s a cuff key to a prisoner ’ s dreams. The Molotov in the ink. It is knowledge, it is overstanding, it is tasting ingredients in everything you ’ ve been force-fed, but most of all, it ’ s a reminder that we all have voices, we all can be heard even if we have to scream.”In 2018, we created our first annual Maroon Poetry Festival at the TACOLCY Center in Liberty City. There, the Last Poets, Sonia Sanchez, Emory Douglas and the late, great Ntozake Shange, performed and met with local artists and organizers. We were able to honor them for their commitment to radical truth- telling. And in addition to that, we transformed a public park into the physical manifestation of the world we are organizing for. Everything that we put into poetry, we put into the art, into the creativity, into the curated kids ’ games and into the stunning stage design. PA : Our work is in a long line of cultural organizers that understood to use art to animate a radical future. Artists like June Jordan, Emory Douglas and Nina Simone. They understood what many of us are just now realizing â that to get people to build the ship, you ’ ve got to get them to long for the sea ; that data rarely moves people, but great art always does. This understanding â This understanding informed the thinking behind the Dream Defenders ’”Freedom Papers,”a radical political vision for the future of Florida that talked about people over profits. Now, we could have done a policy paper. Instead, artists and organizers came together in their poetry to create incredible murals and did the video that we see behind us. We joined the political precision of the Black Panther Party and the beautiful poetry of Puerto Rican poet MartĂn Espada to bring our political vision to life. AM : Now thousands of Floridians across age, race, gender and class see the”Freedom Papers”as a vision for the future of their lives. For decades, our artists and our art has been used to exploit, lull, numb, sell things to us and to displace our communities, but we believe that the personal is political and the heart is measured by what is done, not what one feels. And so art as organizing is not just concerned with artists ’ intentions, but their actual impact. Great art is not a monologue. Great art is a dialogue between the artist and the people. PA : Four years ago, this artist... AM : and this organizer... PA : found that we were not just a match. AM : We were a mirror. PA : Our worlds truly did collide, and in many ways... AM : they combined. PA : We learned so much about movement, about love and about art at its most impactful : when it articulates the impossible and when it erodes individualism, when it plays into the gray places of our black and white worlds, when it does what our democracy does not, when it reminds us that we are not islands, when it adorns every street but Wall Street and Madison Avenue, when it reminds us that we are not islands and refuses to succumb to the numbness, when it indicts empire and inspires each and every one of us to love, tell the truth and make revolution irresistible. AM : For the wizards â AM : For the wizards and ways of our defiance, love-riot visions of our rising, risen, raised selves. The overcoming grace â fires, bitter tongues, wise as rickety rocking chairs, suffering salt and sand skies. Memories unshackled and shining stitches on a stretch-marked heart. For the flowers that bloom in midnight scars. How we suffered and sought a North Star. When there was no light, we glowed. We sparked this rejoice, this righteous delight. We have a cause to take joy in. How we weathered and persisted, tenacious, no stone unturned. How we witnessed the horror of mankind and did not become that which horrified us. PA : Thank you. AM : Thank you.

Text Sample 922: NEG Dim 6 – 2018 – Score 1.00 – 2018/t000005.txt
So this is the first time I ’ ve told this story in public, the personal aspects of it. Yogi Berra was a world-famous baseball player who said,”If you come to a fork in the road, take it.”Researchers had been, for more than a century, studying the immune system as a way to fight cancer, and cancer vaccines have, unfortunately, been disappointing. They ’ ve only worked in cancers caused by viruses, like cervical cancer or liver cancer. So cancer researchers basically gave up on the idea of using the immune system to fight cancer. And the immune system, in any case, did not evolve to fight cancer ; it evolved to fight pathogens invading from the outside. So its job is to kill bacteria and viruses. And the reason the immune system has trouble with most cancers is that it doesn ’ t invade from the outside ; it evolves from its own cells. And so either the immune system does not recognize the cancer as a problem, or it attacks a cancer and also our normal cells, leading to autoimmune diseases like colitis or multiple sclerosis. So how do you get around that? Our answer turned out to be synthetic immune systems that are designed to recognize and kill cancer cells. That ’ s right — I said a synthetic immune system. You do that with genetic engineering and synthetic biology. We did it with the naturally occurring parts of the immune system, called B cells and T cells. These were our building blocks. T cells have evolved to kill cells infected with viruses, and B cells are the cells that make antibodies that are secreted and then bind to kill bacteria. Well, what if you combined these two functions in a way that was designed to repurpose them to fight cancer? We realized it would be possible to insert the genes for antibodies from B cells into T cells. So how do you do that? Well, we used an HIV virus as a Trojan horse to get past the T cells ’ immune system. The result is a chimera, a fantastic fire-breathing creature from Greek mythology, with a lion ’ s head, a goat ’ s body and a serpent ’ s tail. So we decided that the paradoxical thing that we had created with our B-cell antibodies, our T cells carrier and the HIV Trojan horse should be called”Chimeric Antigen Receptor T cells,”or CAR T cells. The virus also inserts genetic information to activate the T cells and program them into their killing mode. So when CAR T cells are injected into somebody with cancer, what happens when those CAR T cells see and bind to their tumor target? They act like supercharged killer T cells on steroids. They start this crash-defense buildup system in the body and literally divide and multiply by the millions, where they then attack and kill the tumor. All of this means that CAR T cells are the first living drug in medicine. CAR T cells break the mold. Unlike normal drugs that you take — they do their job and get metabolized, and then you have to take them again — CAR T cells stay alive and on the job for years. We have had CAR T cells stay in the bodies of our cancer patients now for more than eight years. And these designer cancer T cells, CAR T cells, have a calculated half-life of more than 17 years. So one infusion can do the job ; they stay on patrol for the rest of your life. This is the beginning of a new paradigm in medicine. Now, there was one major challenge to these T-cell infusions. The only source of T cells that will work in a patient are your own T cells, unless you happen to have an identical

twin. So for most of us, we ’ re out of luck. So what we did was to make CAR T cells. We had to learn to grow the patient ’ s own T cells. And we developed a robust platform for this in the 1990s. Then in 1997, we first tested CAR T cells in patients with advanced HIV-AIDS. And we found that those CAR T cells survived in the patients for more than a decade. And it improved their immune system and decreased their viruses, but it didn ’ t cure them. So we went back to the laboratory, and over the next decade made improvements to the CAR T cell design. And by 2010, we began treating leukemia patients. And our team treated three patients with advanced chronic lymphocytic leukemia in 2012. It ’ s a form of incurable leukemia that afflicts approximately 20, 000 adults every year in the United States. The first patient that we treated was a retired Marine sergeant and a prison corrections officer. He had only weeks to live and had, in fact, already paid for his funeral. The cells were infused, and within days, he had high fevers. He developed multiple organ failures, was transferred to the ICU and was comatose. We thought he would die, and, in fact, he was given last rites. But then, another fork in the road happened. So, around 28 days after the CAR T cell infusion, he woke up, and the physicians finally examined him, and the cancer was gone. The big masses that had been there had melted. Bone marrow biopsies found no evidence of leukemia, and that year, in our first three patients we treated, two of three have had durable remissions now for eight years, and one had a partial remission. The CAR T cells had attacked the leukemia in these patients and had dissolved between 2. 9 and 7. 7 pounds of tumor in each patient. Their bodies had become veritable bioreactors for these CAR T cells, producing millions and millions of CAR T cells in the bone marrow, blood and tumor masses. And we discovered that these CAR T cells can punch far above their weight class, to use a boxing analogy. Just one CAR T cell can kill 1, 000 tumor cells. That ’ s right — it ’ s a ratio of one to a thousand. The CAR T cell and its daughter progeny cells can divide and divide and divide in the body until the last tumor cell is gone. There ’ s no precedent for this in cancer medicine. The first two patients who had full remission remain today leukemia-free, and we think they are cured. These are people who had run out of options, and by all traditional methods they had, they were like modern-day Lazarus cases. All I can say is : thank goodness for those forks in the road. Our next step was to get permission to treat children with acute leukemia, the most common form of cancer in kids. The first patient we enrolled on the trial was Emily Whitehead, and at that time, she was six years old. She had gone through a series of chemotherapy and radiation treatments over several years, and her leukemia had always come back. In fact, it had come back three times. When we first saw her, Emily was very ill. Her official diagnosis was advanced, incurable leukemia. Cancer had invaded her bone marrow, her liver, her spleen. And when we infused her with the CAR T cells in the spring of April 2012, over the next few days, she did not get better. She got worse, and in fact, much worse. As our prison corrections officer had in 2010, she, in 2012, was admitted to the ICU, and this was the scariest fork in the whole road of this story. By day three, she was comatose and on life support for kidney failure, lung failure and coma. Her fever was as high as 106 degrees Fahrenheit for three days. And we didn ’ t know what was causing those fevers. We did all the standard blood tests for infections, and we could not find an infectious cause for her fever. But we did find something very unusual in her blood that had never been seen before in medicine. She had elevated levels of a protein called interleukin-6, or IL-6, in her blood. It was, in fact, more than a thousandfold above the normal levels. And here ’ s where yet another fork in the road came in. By sheer coincidence, one of my daughters has a form of pediatric arthritis. And as a result, I had been following as a cancer doc, experimental therapies for arthritis for my daughter, in case she would need them. And it so happened that just months before Emily was admitted to the hospital, a new therapy had been approved by the FDA to treat elevated levels of interleukin-6. And it was approved for the arthritis that my daughter had. It ' s called tocilizumab. And, in fact, it had just been added to the pharmacy at Emily ' s hospital, for arthritis. So when we found Emily had these very high levels of IL-6, I called her doctors in the ICU and said,"Why don ' t you treat her with this arthritis drug?"They said I was a cowboy for suggesting that. And since her fever and low blood pressure had not responded to any other therapy, her doctor quickly asked permission to the institutional review board, her parents, and everybody, of course, said yes. And they tried it, and the results were nothing short of striking. Within hours after treatment with tocilizumab, Emily began to improve very rapidly. Twenty-three days after her treatment, she was declared cancer-free. And today, she ' s 12 years old and still in remission. So we now call this violent reaction of the high fevers and coma, following CAR T cells, cytokine release syndrome, or CRS. We ' ve found that it occurs in nearly all patients who respond to the therapy. But it does not happen in those patients who fail to respond. So paradoxically, our patients now hope for these high fevers after therapy, which feels like"the worst flu in their life,"when they get CAR T-cell therapies. They hope for this reaction because they know it ' s part of the twisting and turning path back to health. Unfortunately, not every patient recovers. Patients who do not get CRS are often those who are not cured. So there ' s a strong link now between CRS and the ability of the immune system to eradicate leukemia. That ' s why last summer, when the FDA approved CAR T cells for leukemia, they also co-approved the use of tocilizumab to block the IL-6 effects and the accompanying CRS in these patients. That was a very unusual event in medical history. Emily ' s doctors have now completed further trials and reported that 27 out of 30 patients, the first 30 we treated, or 90 percent, had a complete remission after CAR T cells, within a month. A 90 percent complete remission rate in patients with advanced cancer is unheard of in more than 50 years of cancer research. In fact, companies often declare success in a cancer trial if 15 percent of the patients had a complete response rate. A remarkable study appeared in the"New England Journal of Medicine"in 2013. An international study has since confirmed those results. And that led to the approval by the FDA for pediatric and young adult leukemia in August of 2017. So as a first-ever approval of a cell and gene therapy, CAR T-cell therapy has also been tested now in adults with refractory lymphoma. This disease afflicts about 20, 000 a year in the United States. The results were equally impressive and have been durable to date. And six months ago, the FDA approved the therapy of this advanced lymphoma with CAR T cells. So now there are many labs and physicians and scientists around the world who have tested CAR T cells across many different diseases, and understandably, we ' re all thrilled with the rapid pace of advancement. We ' re so grateful to see patients who were formerly terminal return to healthy lives, as Emily has. We ' re thrilled to see long remissions that may, in fact, be a cure. At the same time, we ' re also concerned about the financial cost. It can cost up to 150, 000 dollars to make the CAR T cells for each patient. And when you add in the cost of treating CRS and other complications, the cost can reach one million dollars per patient. We must remember that the cost of failure, though, is even worse. The current noncurative therapies for cancer are also expensive and, in addition, the patient dies. So, of course, we ' d like to see research done now to make this more efficient and increase affordability to all patients. Fortunately, this is a new and evolving field, and as with many other new therapies and services, prices will come down as industry learns to do things more efficiently. When I think about all the forks in the road that have led to CAR T-cell therapy, there is one thing that strikes me as very important. We ’ re reminded that discoveries of this magnitude don ’ t happen overnight. CAR T-cell therapies came to us after a 30-year journey, along a road full of setbacks and surprises. In all this world of instant gratification and 24 / 7, on-demand results, scientists require persistence, vision and patience to rise above all that. They can see that the fork in the road is not always a dilemma or a detour ; sometimes, even though we may not know it at the time, the fork is the way home. Thank you very much.

I come from Egypt, which is also called Umm al-Dunya, the Mother of the World. It ’ s a rich country filled with stories of rebellion, stories of civilizational triumph and downfall and the rich, religious, ethnic, cultural and linguistic diversity. Growing up in such an environment, I became a strong believer in the power of storytelling. As I searched for the medium with which to tell my story, I stumbled upon graphic design. I would like to share with you a project of how graphic design can bring the Arabic language to life. But first, let me tell you why I want to do this. I believe that graphic design can change the world. At least in my very own city of Cairo, it helped overthrow two separate dictators. As you can see from those photos, the power and potential of graphic design as a tool for positive change is undeniably strong. Egypt ’ s 2011 revolution was also a grassroots design revolution. Everyone became a creator. People were the real designers and, just overnight, Cairo was flooded with posters, signage, graffiti. Visual communication was the medium that spoke far louder than words when the population of over 90 million voices were suppressed for almost 30 years. It was precisely this political and social suppression, coupled with decades of colonialism and miseducation that slowly eroded the significance of the Arabic script in the region. All of these countries once used Arabic. Now it ’ s just the green and the blue. To put it simply, the Arabic script is dying. In postcolonial Arab countries functioning in an increasingly globalized world, it is a growing alarm that less and less people are using the Arabic script to communicate. As I was studying my master ’ s in Italy, I noticed myself missing Arabic. I missed looking at the letters, digesting their meaning. So one day, I walked into one of the biggest libraries in Italy in search of an Arabic book. I was surprised to find that this is what they had under the category of”Arabic / Middle Eastern books.”Fear, terrorism and destruction. One word : ISIS. My heart ached that this is how we are portrayed to the world, even from a literary perspective. I asked myself : Whatever happened to the world-renowned writers like Naguib Mahfouz, Khalil Gibran, iconic poets like Mutanabbi, Nizar Qabbani? Think about this. The cultural products of an entire region of the world, as rich, as diverse, have been deemed redundant, if not ignored altogether. The cultural products of an entire region of the world have been barred from imparting any kind of real impact on global media productions and contemporary social discourse. And then I reminded myself of my number one belief : design can change the world. All you need is for someone to catch a glimpse of your work, feel, connect. And so I started. I thought about how can I stop the world from seeing us as evil, as terrorists of this planet, and start perceiving us as equals, fellow humans? How can I save and honor the Arabic script and share it with other people, other cultures? And then it hit me : What if I combined the two most significant symbols of innocence and Arab identity? Maybe then people could resonate. What ’ s more pure, innocent and fun as LEGO? It ’ s a universal child ’ s toy. You play with them, you build with them, and with them, you imagine endless possibilities. My eureka moment was to find a bilingual solution for Arabic education, because effective communication and education is the road to more tolerant communities. However, the Arabic and Latin scripts do not only represent different worlds but also create technical difficulties for both Eastern and Western communities on a daily basis. There are so many reasons why Arabic and Latin are different, but here are some of the main ones. Yes, both use upward and downward strokes, but have completely different baselines. Arabic tends to be more calligraphic and connectivity is important to the Arabic language, whose letters have to be mostly joined in order to articulate a given word. It also uses an entirely different system of punctuation and diacritics. But most importantly, Arabic has no capital letters. Instead it has four different letter forms : initial, medial, isolated and final. I want to introduce the Arabic language to young learners, foreign speakers, but most importantly help refugees integrate to their host societies through creating a bilingual learning system, a two-way flow of communication. And I called it"Let ' s Play."The idea is to simply create a fun and engaging way of learning Modern Standard Arabic through LEGO. These are the two words."Let ' s Play."Every colored bar marks an Arabic letter. As you can see, the letter is explained in form, sound and examples of words in function, in addition to the equivalent in Latin. Together, they form a fun pocket book with the 29 Arabic letters and the four different forms, plus a 400-word dictionary. So this is how the page looks like. You have the letter, the transliteration in Latin and the description underneath. I ' ll take you through the process. So first in my tiny studio in Florence, I built the letters. I photographed each letter separately, and then I retouched every letter and chose the correct color background and typefaces to use. Ultimately, I created the full letter set, which is 29 letters times four different forms. That ' s 116 letters build just in one week. I believe that information should and can be fun, portable. This book is the final product, which I would eventually like to publish and translate into as many languages in the world, so that Arabic teaching and learning becomes fun, easy and accessible globally. With this book, I hope to save my nation ' s beautiful script. Thank you. Working on this project was a form of visual meditation, like a Sufi dance, a prayer to a better planet. One set of building blocks made two languages. LEGO is just a metaphor. It ' s because we are all made of the same building unit, is that I can see a future where the barriers between people all come tumbling down. So no matter how ugly the world around us gets, or how many discouraging books on ISIS, the terrorist group, and not Isis, the ancient Egyptian goddess, continue to be published, I will keep building one colorful world. Shukran, which means"thank you."Thank you. Thank you so much. Thank you.

Hey look, if you guys are anything like me, you have found it harder and harder to turn around recently without seeing words like"free-range,""farm-to- table,""organically produced,"especially here in Colorado. Now, as we ' ve become more conscientious of the way that we eat in recent years, these once unfamiliar words have worked their way into our daily lexicon. When we started to pay more attention to the way that the food we were eating interacted with our bodies and with the earth, the food industry had to listen. And the results have been really powerful. Now, those of you out there from states like Washington and Oregon and, of course, my fellow Coloradans — y ' all know what I ' m talking about. Because this is not... Words like"all- natural"and"homegrown"are not just being used in our diets. There ' s this whole new industry using this language now. You guys know. It ' s weed, an industry that taxed a sale of about six billion dollars worth of product in 2016. So what if I were to propose to you that some of what you think you know about this legalized marijuana thing could be wrong? Listen, I get it — talking about issues with legal weed is a pretty quick way to get uninvited from the cool kids ' table. I know that better than most, but I intend to do it anyway. First, before I get started, let me be perfectly clear about one thing : my fight is not against the casual adult use of marijuana — I don ' t care about that. What I care deeply about is this new industry that is working to convince us that we are consuming something natural while fixing social ills, when we aren ' t. So let ' s start with a little bit of Weed 101. Cannabis is a plant that grows naturally and has been used within textiles and even traditional Chinese medicine for thousands of years. Genesis 1:12 even tells us :"I have given you all of the seed-bearing plants and herbs to use."It ' s the microphone — it ' s got a TV preacher sort of thing. Now, cannabis is made up of hundreds of different chemicals, but two of those chemicals are by far the most interesting. That ' s CBD and THC. CBD is where almost all of the medicinal properties lie. It ' s an incredibly fascinating part of the plant with real potential to help people. It also is totally nonintoxicating. You could take a bath in the stuff while vaping pure CBD and drinking a CBD smoothie, and you still couldn ' t get high. I ' ve tried. I haven ' t, I haven ' t. That ' d cost a lot of money. Now, for as interesting and remarkable a part of the plant as CBD is, it actually makes up a really tiny portion of the commercial market. The real money is being made in that other chemical — in THC. THC is the natural part of the plant that gets you high. And before the 1970s, cannabis contained less than half of a percent of THC. That ' s what ' s naturally occurring. Over the last 40 years, as we became better gardeners, that — that percentage of THC started to slowly but steadily rise, until recently, when the chemists started to get involved. So these guys moved grow cycles — sorry — these guys moved cultivation exclusively indoors, and they made grow cycles extremely and unnaturally short. They also started to use pesticides and fertilizers in some ways that we should be concerned with. In fact, I was recently talking to a buddy who had just left a job at a commercial grow operation because he was so concerned with the chemicals that he was being asked to interact with. Some of his fellow employees were actually encouraged to wear hazmat suits while they were spraying the chemical cocktails on the plants. With that kind of manipulation, the products that are being sold today can contain above 30 percent THC. And our concentrates — our concentrates can actually contain above 95 percent THC — a far cry from the natural plant. Listen, this isn ' t your grandpa ' s weed. This isn ' t your dad ' s weed. Like, this isn ' t even my weed. If you ' ve ever set foot inside one of the thousands of dispensaries that have sprung up in recent years, you know that what we ' re really selling in them is THC. All of the weed that you buy commercially lists exactly how much THC it contains, as do our other, much more popular products like vape pens, coffee, ice cream, condiments, granola, gum, candy, baked goods, suppositories. And, of course, lube. Pretty much — no, for real — pretty much anything that you can imagine introducing into the human body. The vast majority of cannabis that ' s being sold today — it isn ' t really cannabis. It ' s THC in either a pure form or in an extremely high and unnatural concentration. To say that we have legalized weed is subtly misleading. We have commercialized THC. And it ' s happened really quickly. Now, the reason why the commercial market has so rapidly exploded is because there is a hell of a lot of money to be made in satisfying and increasing our desire to get high. And that money is no longer really being made by the mom- and-pop shops. So industry groups and corporations —

groups like the Drug Policy Alliance, the Marijuana Policy Project, Arcview Investment, the Cannabis Industry Association — they ’ ve chased out and helped to chase out a lot of the small-time growers. So these cats know that the best way to continue to profit off of us is if they follow the alcohol industry ’ s 80 / 20 rule. It ’ s simple — it ’ s where 80 percent of the product is consumed by 20 percent of the consumers — the problemed users. The wealthy, white, weed lobbyists — and seriously, they are almost all rich, white men — they know that we will consume more of what they ’ re selling if they jack up the potency. They also know that we are more than twice as likely to consume THC regularly if we earn under 20, 000 dollars a year than those who earn over 50, 000 dollars a year. In other words, the poorer you are, the more likely you are to spend your money on their products. And in this country, income and race are highly correlated. One of the reasons we often hear cited for the legalization of marijuana is that it will help to stop the disproportionate incarceration rates among minorities, which is something everybody in this room should be extremely concerned with. Unfortunately, we don ’ t have to look any further than arrest rates for juveniles here in Colorado to counter that argument. According to the Colorado Department of Public Safety, since we opened retail in 2014 — almost all of which are in poor, minority neighborhoods — we saw an eight percent reduction in the arrest of white kids for all weed-related activity. Good on ’ em. During that same time period, there was a 29 percent increase in the arrest of Hispanic kids for weed-related activity and a 58 percent increase in the arrest of black kids for weed-related crimes. You guys heard that, right? We are actually arresting more people of color in Colorado than we were prior to commercialization. And you ’ re not reading that in the Post. Colorado Department of Safety. Legal marijuana coming into focus. Another big issue that we have is in school suspension rates. So, schools that are predominantly white — that is, they have a minority population of 25 percent or fewer — in the first full year of data collection following commercialization, these schools had a grand total of 190 drug-related suspensions, almost all of which are for THC. At the same time, schools with a minority population of 75 to 100 percent had 801 drug-related suspensions, almost all of which were for THC. When discussing minority populations, one that unfortunately often gets left out of the conversation is the LGBTQ community. Members of this community are more than twice as likely to consume THC than those who identify as heterosexual or cisgender. They also, unfortunately, have higher rates of mental illness and suicide. According to a study published in 2014 called”Going to Pot,”we see that the unnaturally high levels of THC found in today ’ s products actually compound those issues. They make them worse. Unfortunately, that seems to matter very little to the folks who are selling these products, because as you just saw, clearly, this is a good consumer base. Listen, man — I get it. In many circles, legalized marijuana is too much of a sacred cow to question. But we need to start this conversation, because what ’ s being sold today is not natural, and lobbyists and industry are using social justice as a smoke screen so that they can get richer. It ’ s been my own journey to sobriety that led me to begin questioning a lot of what I was seeing ; that ’ s kind of one of the things that we ’ re taught to do. When I left Boulder for the Washington, DC, area at 12 years old, I was transported into a world where the kind of shoes you wore mattered more than just about anything else. And my family was just too poor to help me play that game. So I was faced with a pretty real crisis of identity. In this new scene where there ’ s more blacktop than treetops, man, I just didn ’ t know who I was. So I smoked weed for the first time when I was 13. And I loved it. I instantly found this social group, and I also just really liked being high. I finally found a way to shut this up. I quickly turned to other drugs and alcohol, and something just woke up inside of my brain. I was a daily user within a couple of months. My addictive use mirrors many of the stories that I ' m sure you ' ve heard before. It started out as fun, it got scary, and then it was just necessary. Enough said. I got wasted for the last time on June 15 of 1996. And I — Thank you. And I ' ve spent the last 21 years trying to both put my life back in order as well as trying to find some peace in this world. And one of the ways I ' ve done that is by working inside of nonprofit drug and alcohol treatment for the last 10 years, with groups like Phoenix Multisport, the University of Colorado Hospital and NALGAP — the National Association for Lesbian, Gay, Transgender, Bisexual Treatment Providers and their Allies. Even after all of my work on the front lines and as a former consumer myself, I was shocked and pissed when I started to see what commercialization was doing to cannabis, because, you see, our hope for something pure and natural is making it hard for us to see what ' s really going on, and that is that the rich are getting richer on the backs of the poor and lying to our faces the entire time. Thank you. My friends, once again I fear that we are allowing industry to take advantage of the most challenged among us in order to turn a profit, much like we saw with tobacco and food in years past. So when we told the food industry that we understood the impact our choices were having, and that we demanded better for ourselves and our families, that industry got into line. So is there any reason why we couldn ' t demand the same thing from this and from future industries who are trying to get a piece of our paychecks? What if we made these guys answer some hard questions? What if we held them to a higher standard than we are right now? Because as it stands, for many in our community, the grass isn ' t greener on this side of commercialization. They ' ve just been sold a bag of goods. Thank you. Jeremy Duhon : I know this is a sensitive topic but a very important one, so thank you for bringing this up and helping us explore it. You know, a lot of folks are experiencing health benefits from marijuana and cannabis. What would you say to that part of the community? Ben Cort : I ' m actually glad you brought that up. I think one of the most important things that we can do right now is to separate out medicinal, and especially what ' s happening and some of the advances that are being made using parts of this plant and even some whole-plant medicines, from the commercial market for THC. That ' s, I think, crucial. We ' ve got to stop putting them together, and we ' ve got to say,"OK, here ' s the part about getting high, and here ' s the part about the medicine."JD : So it sounds like your talk is less about being anti-cannabis and more about raising awareness about aspects of commercialization. Is that a fair way to put it? BC : Yes. So, I am not the anti-weed guy. I ' m the pro-logic guy. For me to cast stones — listen, I ' m a drug addict. I don ' t get to do that, and I don ' t want to do that. But what ' s bothering me and what ' s so hard for me is to see the way that we are just embracing without asking the hard questions, when if this was another industry, we ' d be holding their feet to the fire on some stuff. And no, I ' m not the anti-weed guy, I ' m the pro-thought guy. So : think. I don ' t even care if you ' re smoking when you do it, just so long as you ' re an adult. So long as you ' re an adult, just think.

How many of us have ever seen something, thought that we should report it, but decided not to? And not that I need to see a show of hands, but I ' m sure this has happened to someone in this room before. In fact, when this question was asked to a group of employees, 46 percent of them responded by saying that they had seen something and decided not to report it. So if you raised your hand, or quietly raised your hand, don ' t feel bad, you ' re not alone. This message of if you see something to say something is really all around us. Even when driving down the highway, you see billboards like this, encouraging us to report crime without revealing ourselves. But I still feel like a lot of us are really uncomfortable coming forward in the name of the truth. I ' m an accounting professor, and I do fraud research. And in my class, I encourage my students to come forward with information if they see it. Or in other words, encouraging my students to become whistle-blowers. But if I ' m being completely honest with myself, I am really conflicted with this message that I ' m sending to my students. And here ' s why. Whistle-blowers are under attack. Headline after headline shows us this. Many people choose not to become whistle-blowers due to the fear of retaliation. From demotions to death threats, to job loss — perpetual job loss. Choosing to become a whistle- blower is an uphill battle. Their loyalty becomes into question. Their motives, their trustworthiness. So how can I, as a professor who really cares about her students encourage them to become whistle-blowers, when I know how the world truly feels about them? So, one day I was getting ready for my annual whistle-blower lecture with my students. And I was working on an article for"Forbes,"entitled"Wells Fargo and Millennial Whistle-blowing. What Do We Tell Them?"And as I was working on this piece and reading about the case, I became outraged. And what made me angry was when I came to the fact and realized that the employees that tried to whistle-blow were actually fired. And it really made me think about the message that I was sharing with my students. And it made me think : What if my students had been Wells Fargo employees? On the one hand, if they whistle-blew, they would have gotten fired. But on the other hand, if they didn ' t report the frauds that they knew, the way current regulation is written, employees are held responsible if they knew something and didn ' t report it. So criminal prosecution is a real option. What ' s a person supposed to do with those type of odds? I of all people know the valuable contributions that whistle-blowers make. In fact, most frauds are discovered by them. Forty two percent of frauds are discovered by a whistle-blower in comparison to other methods, like measurement review and external audit. And when you think about some of the more classic or historical fraud cases, it always is around a whistle-blower. Think Watergate — discovered by a whistle-blower. Think Enron — discovered by a whistle- blower. And who can forget about Bernard Madoff, discovered by a whistle- blower? It takes a tremendous amount of courage to come forward in the name of the truth. But when we think about the term whistle-blower, we often think of some very descriptive words : rat, snake, traitor, tattletale, weasel. And those are the nice words, the ones I can say from the stage. And so when I ' m not in class, I go around the country and I interview white- collar felons, whistle-blowers and victims of fraud. Because really I ' m trying to understand what makes them tick and to bring those experiences back into the classroom. But it ' s my interviews with whistle-blowers that really stick with me. And they stick with me, because they make me question my own courage. When given the opportunity, would I actually speak up? And so, this is a couple stories that I want to share with you. This is Mary. Mary Willingham is the whistle-blower from the University of North Carolina at Chapel Hill, academic fraud case. And Mary was a learning specialist at the university, and she worked with students, primarily student athletes. And what she noticed, when she was working with students, is they were turning in term papers that seemed well beyond their reading levels. She started to ask a couple of questions and she found out that there was a database where the student athletes could retrieve papers and turn them in. And then she found out that some of her colleagues were funneling students into fake classes, just to keep them eligible to play. Now, when Mary found this out, she was outraged. And so what she tried to do was go to her direct supervisor. But they didn ’ t do anything. And then Mary tried to go to some internal university administrators. And they didn ’ t do anything. So, what happens when nobody listens? You blog. So Mary decided to develop a blog. Her blog went viral within 24 hours, and she was contacted by a reporter. Now, when she was contacted by this reporter, her identity was known. She was exposed. And when she was exposed, she received a demotion, death threats, over collegiate sports. Mary didn ’ t do anything wrong. She didn ’ t participate in the fraud. She really thought that she was giving voice to students that were voiceless. But her loyalty was questioned. Her trustworthiness and her motives. Now, whistle-blowing doesn ’ t always have to end in demotions or death threats. Actually, in 2002, this was the cover of”Time”magazine, where we were actually honoring three brave whistle-blowers for their decision to come forward in the name of the truth. And when you look at the research, 22 percent of whistle-blowers actually report retaliation. So there is a huge population of people that report and are not retaliated against and that gives me hope. So this is Kathe. Kathe Swanson is a retired city clerk from the city of Dixon. And one day, Kathe was doing her job, just like she always did, and she stumbled upon a pretty interesting case. See, Kathe was at the end of the month, and she was doing her treasures report for the city, and typically, her boss, Rita Crundwell, gave her a list of accounts and said,”Kathe, call the bank and get these specific accounts.”And Kathe did her job. But this particular day, Rita was out of town, and Kathe was busy. She picks up the phone, she calls the bank and says,”Fax me all of the accounts.”And when she gets the fax, she sees that there is an account that has some withdrawals and deposits in it that she did not know about. It was an account controlled only by Rita. So Kathe looked at the information, she reported it to her direct supervisor, which was then-mayor Burke, and this led into a huge investigation, a six-month investigation. Come to find out, Kathe ’ s boss, Rita Crundwell, was embezzling money. Rita was embezzling 53 million dollars over a 20-year period, and Kathe just happened to stumble upon it. Kathe is a hero. And actually, I had the opportunity of interviewing Kathe for my documentary,”All the Queen ’ s Horses.”And Kathe wasn ’ t seeking fame. In fact, she really didn ’ t want to talk to me for a really long time, but through strategic stalking, she ended up doing the interview. But she was seeking fairness, not fame. And if it wasn ’ t for Kathe, who ’ s to say this fraud would have ever been discovered? So, remember that”Forbes”article I was talking about, that I was working on before my lecture? Well, I posted it and something really fantastic happened. I started receiving emails from whistle-blowers all over the world. And as I was receiving these emails and responding back to them, there was a common theme in the message that I received, and this is what it was : they all said this,”I blew the whistle, people really hate me now. I got fired, but guess what? I would do it all over again if I could.”And so as I kept reading this message, all these messages, I wanted to think, what could I share with my students? And so, I pulled it all together and this is what I learned. It ’ s important for us to cultivate hope. Whistle-blowers are hopeful. Despite popular belief, they ’ re not all disgruntled employees that have a beef with the company. Their hopefulness really is what drives them to come forward. We also have to cultivate commitment. Whistle-blowers are committed. And it ’ s that passion to their organization that makes them want to come forward. Whistle- blowers are humble. Again, they ’ re not seeking fame, but they are seeking fairness. And we need to continue to cultivate bravery. Whistle-blowers are brave. Often, they underestimated the impact whistle-blowing had on their family, but what they continue to comment on is how hard it is to withhold the truth. With that, I want to leave you with one additional name : Peter Buxtun. Peter Buxtun was a 27-year-old employee for the US Public Health Service. And he was hired to interview people that had sexually transmitted diseases. And through the course of his work, he noticed a clinical study that was going on within the organization. And it was a study that was looking at the progression of untreated syphilis. And so, there were 600 African American males that were in this study. They were enticed into the study through being given free medical exams, burial insurance. And so, what happened through the course of this study, is penicillin was discovered to help treat syphilis. And what Peter noticed was, the participants in this study were not given the penicillin to treat their syphilis. And the participants didn ' t know. So similar to Mary, Peter tried to report and talk to his internal supervisors, but no one listened. And so Peter thought this was completely unfair and he tried to report again, and finally talked to a reporter — very similar to Mary. And in 1972, this was the front page of the"New York Times":"Syphilis Victims in US Study Went Untreated for 40 Years."This is known to us today as the Tuskegee syphilis experiment. And Peter was the whistle-blower. What happened to the 600 men, you may wonder, the 600 original men? Twenty eight men died from syphilis. One hundred died from syphilis complications, forty wives were infected and 10 children were born with congenital syphilis. Who ' s to say what these numbers would be if it wasn ' t for the brave, courageous act of Peter? We ' re all connected to Peter, actually. If you know anybody that ' s in a clinical trial, the reason why we have informed consent today is because of Peter ' s courageous act. So let me ask you a question. That original question, a variation of the original question. How many of us have ever used the term snitch, rat tattletale, snake, weasel, leak? Anybody? Before you get the urge to do that again, I want you to think a little bit. It might be the Mary, the Peter, the Kathes of the world. You might be the person that could shape history, or they could be the person that shapes yours. Thank you.

Text Sample 926: NEG Dim 6 – 2025 – Score 1.00 – 2025/t003001.txt

- I don ' t remember exactly, but... I use the most expensive hair color in the world. It ' s not that I care about the money, it ' s that I care about my hair. It ' s not just the color. I expect great color. What ' s worth more to me is the way my hair feels. Feels good around my neck. I can ' t remember it. I can ' t finish it all. If only we had more time. - Why don ' t we have more time? - I ' m dying. I ' m croaking! - It ' s tough, coming home. But this is what you do for a parent that you love. But, you know? She ' s not my mother. Technically. In my own family, there ' s a lot of dysfunction, a lot of mental illness, a lot of substance abuse. Every generation. My parents divorced when I was about five. My mother moved us out of state, so we had to fly to New York to see my father ' cause he was already working in advertising, and New York was the only place to be. - Many of the commercials you see on television begin life here. - Advertising is one of the main sources of messaging about who you should be. - Nowadays, most of you women lead two lives, combining homemaking with the role of glamorous hostess. - And in the ' 60s, the ads were often made from a male point of view. - In the pre-production meeting, everybody who has anything to do with the commercial is there. - It was mostly men. These superstar art directors and writers. Like my father, Gene Case."Mad Men"was like home movies, and he was Don Draper. He was very witty, but I don ' t think my father realized how powerful his words were. He knew it professionally. But with his kids, he could be incredibly cutting. Flay you just with a phrase. But it ' s the time with my mother that was the nightmare. She had a horrible childhood, but she sure as hell didn ’ t make any effort to overcome that in her relations with us. You know, it was really horrifying to my mother that I was not popular. But I was also really awkward because she had been undermining my confidence for all my life. She would pick apart your personality in detail. I was lazy, I looked bad, I acted bad, I was awkward. Emotionally, just out for blood. At a certain point in the night, I would know,”OK, the situation is dangerous. I need to get outta here.”I had this fantasy when I was in fourth grade that I vividly remember that some kind of outside agency was gonna come in and determine from all the salt on my pillow that I was crying myself to sleep every night and do something about it. No, it was awful. It was awful. And that was the point where Ilon came into my life. - Ilon, do you need anything to eat? - I don ’ t think so, but look up this wallpaper, Waverly Fabrics, and see if they have a rose pattern. - OK. Oh, what about this one here? - That ’ s not it. - No? - No, first of all, I was an art dir... I was a creative director at an advertising agency. The first thing I know is what I ’ m looking at. Ilon the girl. I don ’ t remember particularly being into advertising, but somehow I found myself in it. And I seemed to be very good at it. First of all, I ’ d always listened to everybody. And I noticed that I saw things differently than other people. - Women could get somewhere in advertising, but they were marginalized. - Women were given a lesser role. All the men were always arguing with you and always taking credit. - And one of the things that was coming through loud and clear is that women are for men. - Glory, glory, hallelujah Glory, glory, hallelujah Glory, glory, hallelujah His truth is marching on - Men were always the ones who everyone was pleasing. - What will your eyes say to him tonight? Wait till the fellas take a look at this plunging backline. - You look at ads from that period, and it ’ s jaw-dropping. - This is one of our nation ’ s most beautiful sights, the kind of girl who keeps her figure. - But that ’ s what feminism was pushing back against. - I was a feminist. I knew women were equal if not superior to men from the time I was a little girl. - And in advertising, she wanted to be a trailblazer that way. At one point, she worked in the same agency with my father, and that ’ s how they met. - He was a good writer, and I was a good writer. I liked the fact that he was good at what he did and cared about it. We got engaged, and then we got married. - I ’ m sitting there in the background. I ’ m grinning. I ’ m so thrilled because I adored her instantly. I thought she was super cool. And she treated me like I mattered. - She was a sweet little girl, and she deserved some caretaking. My mother was kinda terrible, so I knew that she needed support, and I gave her support. And that was what we did. - She was interested in me. She listened to me. Treated me like I was lovable. - She didn ’ t have anyone to recognize her being, to support her, to see who she could be, who she was. - She was very interested in what I would do with my life, and the assumption was that it would be something worthwhile. She just went way, way beyond the call of duty to make me feel like I was worth it. And she did that for a lot of other women, too. - I was working at McCann Erickson. We were given an assignment. L ’ Oréal, they wanted a campaign for Preference, it ’ s a hair color. - She ’ s in this room full of men brainstorming for this ad. - The men were busy flirting with the women, telling us we all looked like models and we didn ’ t look like advertising people, you know? - They ’ re like,”Oh, this woman is gonna be standing by an open window, and the wind will be blowing the curtains.”And she ’ s thinking, you know, this is just making the woman totally an object. - I was feeling angry. I ’ m not interested in writing anything about looking good for men. Fuck ’ em. Fuck you too. - Why fuck me? - Well, you ’ re a man. - Yeah, but I ’ m here trying to help you tell your story. - Yeah, that ’ s good. I like that part. I was pissed. We weren ’ t there to just dance for the men. - It is what she said. She just thought,”Fuck you.”And wrote this. - I just opened my eyes and knew. Because I ’ m worth it. The campaign got approved, but all the men were always telling you that you were doing something wrong or they knew how to do it better. - The agency insisted on a male voiceover. - She uses the most expensive hair color in the world, Preference by L ’ Oréal. - You know, it was just totally different. - Smooth and silky, but with body. It feels good against her neck. Actually, she doesn ’ t mind spending more for L ’ Oréal. Because she ’ s worth it. - It was wrong. This was not for men but for women and for other human beings. - I use the most expensive hair color in the world, Preference by L ’ Oréal. It ’ s not that I care about the money, it ’ s that I care about my hair. It ’ s not just the color, I expect great color. What ’ s worth more to me is the way my hair feels. Smooth and silky, but with body. It feels good against my neck. Actually, I don ’ t mind spending more for L ’ Oréal. Because I ’ m worth it. - I wrote that. - It was everywhere. It was a national campaign. - Yes, it ’ s expensive, but I ’ m worth it. - What they realized after they started running it was that that was only the tip of the iceberg. - It was supporting women, finally. - And I ’ m worth it. And I ’ m worth it. I ’ m worth it. - It ’ s a four-word feminist manifesto, defying this social pressure to think about yourself in relation to men. - You ’ re worth it. I ’ m worth it. I ’ m worth it. - It was a very big success. - At a certain point, L ’ Oréal adopted it as the tagline for their entire business. - Parce que je le vaux bien. - Even today, that ’ s their motto. - Because I ’ m worth it. - ’ Cause you ’ re worth it. - You ’ re worth it. - We ’ re worth it. - And I ’ m worth it. - She wrote the most influential tagline in women ’ s beauty advertising. - I ’ m worth it. - It ’ s magic, that phrase. - Those words just get better with age, don ’ t they? - I ’ m worth it. Because you are and always will be. - She came up with that line because she believed it. She believed it about herself, and she believed that women should believe it. She did that for me. You know, even after they split up, she was still a big part of my life. I ’ ve always kind of felt like I dodged a bullet that I have watched take down other members of my family. She saved me. And today, I am a professor of English at Williams College. I teach Victorian literature, and I also teach women ’ s, gender and sexuality studies. She was my mother. She also taught me how to be a mother. I had been very uncertain about motherhood for myself because my role model for that was so nightmarish. But Ilon really taught me, I can do this. I can be a good mother. She made me believe that I was worth it. And I was not either the first or the last. - I have to go away now. Go to my room. - It ’ s been lovely. - It ’ s been lovely. Oh... I ’ m not interested in advertising. I don ’ t give a shit. It wasn ’ t like it was my whole life. It was just a portion. It ’ s about humans ; it ’ s not about advertising. It ’ s about caring for people because... we ’ re all worth it, or no one is worth it.

Text Sample 927: NEG Dim 6 – 2025 – Score 2.00 – 2025/t003002.txt

HW : Hi everyone, I am Helen Walters. I am head of Media and Curation here at TED. Welcome to another episode of TED Explains the World with the one and only, Ian Bremmer. It is Monday, February 24, a little more than a month since President Trump was inaugurated once more, and safe to say, a lot has been going on. So we figured we ’ d check in with Ian to determine what we should really be paying attention to amid the extreme noise. Ian, hi. Ian Bremmer : Helen, great to be back with you. HW : So we asked the TED community to share their questions for you, and we wanted them to share what they ’ re most curious to know. And we really got some amazing questions that I plan to pepper this conversation with. So let ’ s start with one right now. Two months into 2025, where does the US stand? IB : Very powerfully, in the sense that the US economy, of course, is performing considerably better than any of the other G7 economies coming still out of the pandemic. Technologically, only close competitor is China, ahead of the US in some areas, behind the US and other critical areas. But compared to every other country in the world, the US is head and shoulders and neck or waist above them. Militarily, of course, the US is the only country with global ability to project power. No one else is close. And the US dollar is still the global reserve currency, no one is approximate challenger. I say all of those things because those are the things that haven ’ t really changed over the course of the last few months, but I suspect that isn ’ t what the questioner was asking. What they were really asking is what ’ s happening politically. And politically, the United States is unwinding its own global order. It is no longer particularly interested in promoting collective security or NATO. It ’ s no longer really interested in promoting involvement and leadership of multilateral institutions, of consistent rule of law and free trade that ’ s well regulated, certainly not very interested in promoting democracy around the world. I mean, this is an environment where other countries around the world have to figure out how to adapt to the United States, and that the US has become the principal driver of geopolitical risk and uncertainty in the world today, unlike any other time in my lifetime and yours, that ’ s perhaps the biggest change. HW : That is quite a statement. Alright, you are a geopolitical expert. Let ’ s talk about Europe. So Defense Secretary Pete Hegseth stated that America ’ s foreign policy focus no longer lies in Europe. Vice President JD Vance caused some raised eyebrows, dropped jaws and, I suspect, some choice expletives after his recent speech at the Munich Security Conference, in which he accused European leaders of suppressing free speech and warned of the threat from within. So you were in Munich. Was it as dramatic as the stories we read had it? And what happens next? IB : It was. I was in the room. I was maybe 30 feet away from him when he gave that speech. Standing right in the front, right next to me was the president of Czechia, the president of Finland, the prime minister of Sweden, watching all of them and their reactions. What he said, let ’ s keep in mind, this is the Munich Security Conference. It ’ s been going on now for something like 61 years. And he was the head of the US delegation. And every year the head of the US delegation gives a big speech on the state of the transatlantic alliance and on global security. And he didn ’ t do that. I mean, the people in the audience were expecting a challenging speech. They were expecting that the Americans would be less committed to the alignment with the Europeans on Ukraine. The US had just had that direct Trump phone call with Vladimir Putin, 90 minutes long. Hadn ’ t coordinated that with the Europeans, never mind the Ukrainians, in advance. So, I mean, they were definitely prepared for a very challenging plenary. But Vance did none of that. Vance said,”I ’ m not going to talk about Ukraine or Russia or China, because the biggest problem is actually what ’ s happening inside Europe. The biggest problem, essentially, are you guys sitting in front of me, that I ’ m speaking to, because you ’ re suppressing free speech. You ’ re suppressing the far right. You ’ ve been infected by the woke mind virus, and you aren ’ t real democracies as a consequence.”And specifically he said, and this is something that I think is underappreciated in the United States, he attacked the German firewall. And said that – And let me explain what the German firewall is. That is a principle by the leaders of all of the mainstream German parties and their supporters that they will not, under any circumstances, work with, enter into coalition with the Alternative for Deutschland party, the AfD. Because the AfD, under surveillance from German intelligence agencies, is considered to be a neo-Nazi party. And the United States, of course, after World War II, led de-nazification of Germany. The day before, Vance had actually gone to Dachau and visited a concentration camp, and then came to speak in Germany about the firewall needing to be ended. And at that point someone yelled out from the crowd,"This is unacceptable!"And it was right in the front. And people in the room, about 1, 500 people in the room, standing room only, couldn ' t see who it was. They ' d just see the back of his head. I saw who it was. It was the German Defense Minister, Pistorius. And in 15 years of me going to the Munich Security Conference, I have never seen anything remotely like that. And the reason I mention all of this, and of course, on the back of that, let me be clear, Vance refused to meet with the German chancellor because he ' s basically, well, he ' s not relevant. He ' s only going to be there for a couple more months until a new government, so why should I bother? But does meet with the leader of this AfD, goes and meets with her directly, does a bilateral that evening. So that is a very important backdrop for this last weekend ' s German elections, where the victor, Friedrich Mertz, who is going to be the next chancellor, actually referred specifically to America ' s intervention in German democracy and support of the AfD being every bit as bad as what the Kremlin is doing inside Germany, and also said that the Europeans need to develop a defense policy which is independent of the United States, in other words, essentially saying that it will be the end of NATO. Again, staggering comments, unheard of, impossible to imagine even two weeks ago. And that ' s why it ' s very critical that you have the context of what happened between Vance, Elon Musk over the past couple of months, Trump, with the Germans, with the Europeans. So you can understand why the incoming German chancellor would make a statement like that. HW : What should we make of all of the conversation about the rise of Nazism, the return of Nazism? Obviously, the AfD just won 20 percent in the German election. We ' ve also seen people allegedly giving Nazi salutes at various US conventions and speeches. Do you think this is overblown? Is this a fear that people have rationally? And what should we make of that? IB : In Germany, the Alternative for Deutschland, are winning all of former East Germany. This is a group that increasingly understands that they ' re never going to really catch up to the rest of Germany. Remember, Germany hasn ' t really grown in five years now. They ' ve been in recession for the last two. And the average citizen, the average voter, living in former East Germany no longer are just angry about not catching up. They ' re basically saying,"I ' m done with this system."So that ' s why you ' re getting this very strident, revanchist nationalism that is, you know, it ' s not just taking a hard line on illegal immigrants. The AfD even supports removing citizens of Germany that they claim have not adequately integrated into German culture and nationality. And so, I mean, this is some very, very strong stuff, stuff that really does feel like what they were doing back in Nazi Germany. But in former East Germany, they win. They get the largest number of votes, where, in much of the wealthier part of West Germany, including, you know, where I was, in Munich, the AfD can ' t break out of single digits. So it ' s a very, very divided country. And also the AfD is doing very, very well among young men. There ' s a clear gender divide here as well, just as there is in the United States. In the US, I mean, I, of course, saw Elon Musk and that, you know, sort of grabbing his heart, saying,"My heart goes out to you"and then doing what appeared to be mimicking a Nazi salute. And then Steve Bannon doing the same without the initial heartfelt comment. It clearly was trolling. Clearly was trying to get a reaction from folks. It ' s very performative. And it ' s meant to also, you know, attack and attach, make the left lose their minds on something that isn ' t very critical to what the Trump administration is trying to do compared to the revolutionary changes inside the US government that they are very much prioritizing right now. So I ' m very concerned about the rise of neo-Nazism in Germany. I am very much not concerned about that in the US. I

’ m concerned about other things I ’ m thinking is being used as gaslighting for those that can use distractions or can be distracted by them. And I would also say that this election in Germany wasn ’ t surprising. It was exactly as the polls have expected for several months now. But the key elections in Germany and the key elections in Europe are the next cycle. I ’ ve spoken with a lot of people around the Trump administration that believe that the Europeans are one electoral cycle behind the United States. So in other words, Trumpism is coming, just not quite yet. And so in the UK, you ’ ve got Labour for a full term. But the Reform Party is increasingly the most popular. And just with a little nudge, maybe a little external money, and Elon said he ’ s already thinking about giving them 100 million dollars, which is a massive amount in UK politics, not so much in the US, that the Conservatives would fragment, a rump group would join with Reform, and they could win the next elections. In France, you ’ ve had all of these governments continue to collapse. Macron, very unpopular. Marine Le Pen and the National Rally party could easily win upcoming elections in 2027. In 2029, in Germany, if the Germans are incapable of turning their economy around, incapable of unwinding their debt break and spending some of the capital that ’ s just sitting there and as their debt to GDP goes down, but their economy contracts at the same time, then AfD could easily win in 2029, and then the firewall is no more. And then, of course, in the European Union elections overall, in five years ’ time, now four and a half, you could easily see the Patriots front, which is the equivalent to the far right grouping that these parties are a part of, they could all come together and be the dominant party. And then the EU as we know it is really a thing of the past. So these are existential changes that are happening not just for NATO right now, but also for the EU and quite plausibly, for the future of democracy as we know it. HW : Alright, let ’ s turn to Ukraine. So President Trump accused President Zelenskyy of starting the war with Russia and called him”a dictator without elections.”Last week, senior American and Russian officials met in Riyadh to discuss a potential cease-fire with no Ukrainians present. Now Zelenskyy has offered to step down in return for Ukrainian admission to NATO, although apparently he doesn ’ t really mean this. So what happens to Ukraine now? What should we be paying attention to? IB : Well, I mean, I think he would mean it if NATO membership happened. I ’ d love to see Trump call his bluff on that. But of course it ’ s not going to. And he wasn ’ t saying that six months or a year ago. He ’ s saying it now that NATO is truly being pulled off the table. I think it ’ s the right thing for him to do. It is, again, performative and helps to remind those around the world that Ukraine is fighting for self-determination. They ’ re fighting for the ability to join their own alliance, as any country in the world should be able to do. But that is not Trump ’ s belief. Trump believes that what you get to do is determined by how powerful you are, not by the fact that you happen to run a country. And indeed, the territorial integrity is something that is afforded to powerful countries, but not so much for weak countries. And that ’ s the way he feels about Panama, and that ’ s the way he feels about Denmark and Greenland. And that ’ s certainly the way he feels about Ukraine. So right now, as you and I are speaking, the United States is putting forward a new UN resolution at the General Assembly that says that the war has to end as fast as possible but does not recognize Ukraine ’ s territorial integrity, which has been a core precept of the international order that the United States has supported since creating the United Nations and since the end of World War II in 1945. The Americans are now throwing that out. And the Russians, of course, are fully supportive of that. America ’ s allies in Europe are not. But the US has gotten the Saudis to agree, and they ’ re getting a unified Arab block. The Americans have privately worked with a lot of poorer countries in Africa, in the Asia Pacific and others, smaller countries, and saying,"You ' re not going to get any aid from the US unless you vote in favor of this new resolution."I fully expect the resolution is going to pass. But of course, what that means is that the Americans are preparing to cut a deal on Ukraine over the heads of the Ukrainians. In other words, the US and Russia together will figure out what a ceasefire should and should not entail as part of a broader US-Russia rapprochement. This is obviously a disaster for the Ukrainians and the Ukrainians who initially refuse to accept this so-called deal, on Ukrainian natural resources that would grant the Americans $500 billion in access to such resources in return for"paying off"aid that the Americans had granted to the Ukrainians without conditions or strings, but apparently no longer. And so, you know, what does this all mean? Well it means it ' s yet another case of why people shouldn ' t trust the United States from one administration to the next, because foreign policy will change completely. And what you thought was an American commitment won ' t stand. It shows that there is a fundamental rift between the Americans and the Europeans and indeed, Emmanuel Macron in the United States right now, as you and I speak, hoping that he can do something that will keep Trump from, as Macron believes, essentially surrendering to, conceding to, the Russian position and maintaining some level of coordination with the Europeans. But he doesn ' t have a lot to offer. And the Ukrainians, you know, now in a position of desperation where maybe they will end up signing over a lot of their natural resources to the Americans. But what, if anything, will they get in return for that? And how empowered will the Russians be in any deal that is cut? And will an independent Ukraine even be able to survive, and what will the terms that will be required of them? Of course, Putin is saying things like, no European troops of any sort, whether in a NATO formulation or not, would be allowed as peacekeepers in Ukraine. Well, then, how would you guarantee, what kind of security commitments would you give to the Ukrainians? These are all open questions, but apparently questions that President Trump is prepared to largely resolve on Russia ' s terms. And again, this is such a dramatic change from where the United States and where the Western order was just a month or two ago. HW : So let ' s take some quick-fire questions from our community related to this topic. And I think the first one is particularly pertinent to what you just said, so it ' s simple. What does Putin have over Trump? IB : I don ' t think that Putin"has"anything over Trump. If he did, then why wouldn ' t Trump have granted Russia more in his first term? In his first term he gave the Ukrainians those javelin anti-tank missiles that Obama refused to give. And, you know, he thought they were too risky. He increased sanctions against Russia. Now that was his administration with a lot of hawkish in orientation advisors around him that he doesn ' t have this time around. They ' re all directly loyal to him. But, I mean, if it was a priority for him, he could have stopped it. And if the Russians had something over him, then why wouldn ' t they have used it in that case? It feels like a conspiracy theory. I don ' t buy it. I think very differently. We can explain what ' s happening because number one, Trump wants to end wars. It ' s very popular with his base. He ' s said this on Gaza. He ' s said this on Iran, where Israel wants him to support attacks on Iran ' s nuclear capabilities, and Trump has said no. And he ' s showing this on Ukraine. He doesn ' t want to spend money on the Ukrainians going forward after spending over 100 billion dollars under the last three years from the Biden administration. He doesn ' t want to spend that money going forward. And he also doesn ' t value a strong Europe. He actually thinks that a weak Europe is in America ' s interests, where you have more Brexits. He used to always talk to the French about that during his first term,"Why won ' t you do Brexit?"He wants all of these MAGA-type populist parties, including the AfD, to win in Europe because that legitimizes his own popularity. Just like he loves Milei in Argentina or Bukele in El Salvador. And so I think if you put those things together, you actually get to why Trump is doing what he ’ s doing with the Russians without needing to create a story about Trump somehow being threatened by some secret, shadowy information that the Russians have on Trump that they ’ ve let him know about but nobody else knows. I just don ’ t buy that. HW : Great. OK, another community question. If the US hands Ukraine to Russia, will Russia keep going? Will they attempt to take over Europe? IB : It ’ s interesting that Trump just met with the Polish president, President Duda. It was supposed to be an hour meeting, it was only 10 minutes. So he kind of embarrassed him at home in Poland. But he did say that the US is still committed to maintaining a troop presence on the ground in Poland. And so it ’ s very hard to imagine the Russians rolling through Ukraine and then into Poland, even though there ’ s been lots of asymmetric warfare, for example, and even there have been, you know, Russian missiles launched into Lviv, Ukrainian air defense, missile defense, and with Polish villagers getting killed because of the fighting. So, I mean, there ’ s been spillover. But America is still going to be in Poland. Why is that? They get along pretty well, and the Poles are heading towards five percent of GDP defense spend this year, which has been the high water mark of American demands of defense spend. So he ’ s, you know, been consistent on that over the past months. Baltic states. I mean, they ’ re all spending a lot more money on their defense. And so, I mean, in principle, you could imagine the United States maintaining these rotational deployments in the Baltics, which would prevent the Russians from invading. But might Trump say, as part of a deal,”Why do we have all those troops there?”You mentioned Pete Hegseth saying the Americans need to get troops out of Europe and get them to Asia, which is where their principal competitive, you know, sort of, strategy is going to be oriented. And the US hasn ’ t been pressing the Japanese or the Indians, the principal partners, allies in Asia vis-à-vis China, the way they ’ ve been pressing the French, the Brits, the Germans in Europe. So I think it is certainly plausible that the Russians will do more, especially with those countries that refuse to align with a Trump rapprochement towards Russia. The countries I would be most worried about are Moldova, are Georgia. I ’ d be most worried about the countries that are in the so-called”near abroad”that aren ’ t a part of NATO, and aren ’ t going to become a part of NATO, and therefore are much more vulnerable. But certainly in terms of Russia ’ s willingness to engage in espionage, to fund actors on the ground for arson attacks, assassinations, critical infrastructure attacks on fiber networks, on pipelines, I think all of those things are likely to increase against European states across the board, on the back of this US-Russia rapprochement. HW : OK, final community question for this segment. What happens if the US no longer supports NATO? IB : It ’ s possible that the United States is moving towards a similar posture in Europe that they presently have in Asia, which is strong individual bilateral deals with a number of countries : South Korea, Japan, Australia, but not a collective security agreement, where those countries together have more of a call on the United States and there ’ s a lot more free riding. So I could imagine that NATO falls apart and becomes that. The danger is that even though the Europeans now understand the nature of the threat, that it is very plausible and maybe even baseline, that the Americans are going to leave Europe collectively on its own. That that seriousness does not equate to the ability to increase spending adequately in the near term. The Germans did manage to pull together an electoral outcome that will allow for a so-called grand coalition, just barely. So you ’ ll have a two-party government in all likelihood instead of a three. But you also have a blocking capacity on the part of the far right and the far left that will prevent the Germans from really blowing out their spending, including their defense spending, unless they can pull something off before that new government is formed. Which is possible, but it ' s unlikely to be very big. The Brits are now talking about maybe moving the 2. 5 percent of GDP defense spend over years with a very challenging fiscal environment. The Spaniards, not even close, the Italians, not even close. So what does a European military capability really look like? And without the Americans, the answer is it ' s not there. It ' s not there. So I think that if NATO falls apart, the reality is that most of Europe will be incredibly vulnerable to external attack, especially Russian attack, And there won ' t be a way for them to defend themselves, and some of them will break and therefore want to work more directly and individually with the United States. And that could be the end, not only of NATO, but it could be the end of the European Union. I think this is, the stakes are incredibly high, this is an existential challenge for European governments that needed to take this seriously 30 years ago, 20 years ago, certainly in 2014, when the Russians invaded Ukraine, certainly, certainly in 2016 when Trump was elected, and certainly, certainly, certainly in 2022 when the Russians then invaded all of Ukraine. And at every point the Europeans were basically saying,"We ' re still fine with the Americans basically doing this."And now they are in very serious trouble. HW : No time like the present, I suppose. Alright, let ' s move on. So I mentioned the discussions in Saudi and obviously also on the agenda there with the discussions about Gaza and Trump ' s proposal to build a Gaza Riviera. What should we make of that? Or as one of our community members asked, what is the actual solution for Gaza? And surely it isn ' t what the US is proposing. IB : Well, look, here ' s what ' s interesting. You know, Trump says a lot of things, and when they don ' t work [out], he backs out fairly quickly. And you know, I thought – just stick with Ukraine for one second on this. It was interesting to me that Trump has said that he doesn ' t want to talk to Zelenskyy because he has no cards, he has no leverage. And so why should he let him at the table? And so Trump ' s going to cut the deal. Very interesting that if that is true, then why is it that the Secretary of Treasury brings this deal and says,"You ' ve got to sign this right now, Zelenskyy"And Zelenskyy refuses. And then a few days later, the Americans come back with a new deal with altered terms that are not quite as predatory vis-à-vis Ukraine. Why would the Americans change their tune for someone that has no leverage? Because, I don ' t think it ' s because Trump is a nice guy. He ' s not going soft at 78. I think it ' s because he overstated how little leverage Ukraine has. Ukraine is very popular among the GOP in the House and Senate, far more than Putin. Zelenskyy is far more popular in the United States among the voting population than Putin. And of course, he ' s also much more popular among the Europeans and even globally than Putin. And so it turns out that maybe there is a little bit of leverage that Zelenskyy has, and maybe Trump does have to give a little bit more. So this is relevant in the context of Gaza, because Trump was very annoyed that, you know, despite his ability to get a cease fire between Hamas and Israel over the goal line, that his friends in the Middle East were not coming up with a plan for Gaza. Where they were supposed to provide security and provide investment and lead reconstruction and deal with the Palestinian populations in the interim. And that wasn ' t happening. And so Trump then meeting with Prime Minister Netanyahu from Israel in Washington, then after that, summoning the Jordanian king, who was the ally that is most reliant on the United States and so, therefore, most needing to say yes to whatever Trump orders of him. Basically says, as you mentioned, Helen, that Gaza is going to be a Riviera, that the US is going to turn this into an incredible place. They ' re going to build wonderful homes for the Palestinians someplace else. And the Palestinians will all volunteer to leave Gaza and go to those homes, and Gaza will be depopulated and new people will come in and live there. That was the plan. And when he was asked, standing there with King Abdullah from Jordan, under whose authority? Trump ' s response was :"Under my authority."And that went over like a lead balloon among America ' s allies in the Middle East. They all said,"We ' re not up for this. We ' re not resettling Palestinian populations. They won ' t actually leave voluntarily. This will would actually be a huge problem for Israel ' s own national security long-term. And we ' re going to come up with another plan. And our plan will keep the Palestinians on the ground in Gaza."At which point Trump pivots to work with the new plan. And his advisers say that Trump was only trying to start the conversation. And what he said was his plan is not actually what he ' s going to do. So, what ' s sustainable? What would be sustainable would be a lot of Gulf money going in and maybe some European money too, though they ' re going to be really pressed, given everything you and I just talked about, to try to reconstruct a completely devastated Gaza that eventually some two million-plus Palestinians will be able to live normal lives in, and the governance will be provided by some technocratic group of a Palestinian Authority that will be working with, selected by, those that are involved in the reconstruction and the security. Namely the Egyptians, the Jordanians, the Saudis and the Emiratis. That is the best possible deal that they ' re going to get. But that ' s happening as Israel has just evacuated forcibly another 40, 000 Palestinians from refugee camps in the West Bank, sending tanks in for the first time in decades and probably precipitating more Israeli settlers taking more land on the ground in the West Bank. And so, as we are possibly taking a small step towards a sustainable solution in Gaza, we are taking a slightly larger step away from a sustainable solution for the Palestinians in the West Bank, twas ever thus over the past decades in this incredibly horrible problem and conflict. HW : And why is Israel doing that? I mean, are they feeling emboldened by the US, or why the incursions in the West Bank now? IB : Well, I think they ' re feeling emboldened by their own successes. They have shown that they are the dominant military power in the Middle East, and they have the ability to determine the level of escalation unilaterally, and their adversaries and enemies can ' t really do any damage to them. They proved that after October 7, in their response to Hamas. They proved that in decapitating and taking out the military capabilities of Hezbollah. And they ' ve proved that also with overturning – they didn ' t do it, but the fact that the Assad regime in Syria is gone, which means that the Iranians no longer have a land bridge to get additional weapons to what had been the strongest adversary of Israel militarily, Hezbollah. So all of that has shown that Israel can decide outcomes. They ' re the ones that have all the power here. And also that depopulation of Gaza is very popular among Israelis. There was a poll recently in the Jerusalem Post, which is pretty mainstream in Israel. 80 percent of Israeli respondents said that they wanted to depopulate Gaza of all Palestinians. Taking more land is very popular, especially in the West Bank, especially among Netanyahu ' s present right-wing coalition, that he would like to keep together, to continue to govern. And this is a sop to them as he is looking to potentially extend the ceasefire in Gaza and move from phase one to phase two, which is facing some delays and open questions right now. So, yes, certainly, the United States has been underpinning that military capability of Israel. And I think it is instructive to remember that not only does the US provide more military aid in peacetime to any country in the world, to Israel, but that unlike in Ukraine, where the Trump administration is saying,"No, I ' m not happy with the grants, you ' ve got to pay that back,"The billions and billions that the United States sends to Israel, nobody is suggesting that that should be alone or that the Americans should get technology rights or mineral rights or anything else from Israel, despite the fact that Trump ' s policy is America First. Israel is a very clear exception to America First in Trump ' s visioning of it. HW : Alright, so we talked about the fact that the foreign policy focus of America is shifting to Asia. So what are you hearing about how China is feeling in all of this? And what should we be paying attention to on that front? IB : China has had a couple of good weeks economically and specifically on the back of that huge announcement of DeepSeek, which has, you know, far less money behind it than the comparable American chatbots but is performing at an extremely high level. And, you know, given the fact that there are all of these export controls on semiconductors and other parts of advanced technology, that this is giving people more of a belief that the Chinese really are capable of driving innovation even in that space. And they ' re, of course, dominating the post-carbon energy space. We see that with electric vehicles and batteries. But we ' re also seeing that with massive investment now in green hydrogen, for example, we ' re seeing it in advanced nuclear capabilities, all of these things. And so there is more investment in that space that the Chinese are not only driving as a state, but that they ' re also increasingly able to raise and move in their own private sector. So the story that you and I have been discussing for the last couple of years is the Chinese economy is radically underperforming. That is still true, but there is an emerging counter-narrative here that I would be remiss not to mention. Now more broadly, what the Chinese here are seeing is that Trump ' s direct policies are going to hurt them economically. His tariffs that he ' s already announced on China, the 10 percent, on a whole bunch of Chinese goods for export, the reciprocal tariffs that are global, that will clearly hurt China and that they ' ll have a hard time negotiating out of, and also the willingness of the United States to expand their export controls, their sanctions on China, especially in areas that are considered relevant, even loosely relevant to American national security. All of that is going to constrain Chinese growth. All of that is going to negatively impact the Chinese economy. That ' s the downside. And the Americans are doing that not only in bilateral relations with China but also pressuring other countries to get Chinese tech out of their supply chain. And you see that with Americans pushing other countries that produce semiconductors to take the Chinese out. They ' re pushing American allies and trade partners to get China out of the export chain. So Mexico being pushed very hard by Trump to stop allowing China to pass goods through Mexico into the United States. India, same conversation. Vietnam, same conversation. A lot of that going on. So baseline, the US-China relationship is getting worse. But the Chinese see huge advantages in America ' s reversion to unilateralism that we haven ' t really seen since the original America First movement in the run up to World War II. Charles Lindbergh saying,"Don ' t get into the war, don ' t fight the Nazis. The US is far away. This isn ' t our our problem."And now you have the Americans not only doing that with Russia and Ukraine with the new America First, but you also see that happening with the Americans pulling out of the Paris Climate Accord, again, pulling out of the World Health Organization. You see it with the Americans shutting down USAID. And America has historically been responsible for about 40 percent of global humanitarian support and aid. And absolutely, some of that is corrupt. Absolutely, some of that is on woke programs that the vast majority of American taxpayers would never support. But the majority of that money is actually spent on programs that are really important in advancing American soft power and influence over countries in the Global South, all over the world. The Chinese know that. That ' s why they ' ve started humanitarian programs. It ' s not out of some great love for, you know, providing foreign aid for these countries. It ' s more because they see it creates influence. Now the Americans are leaving a vacuum that the Chinese can absolutely take advantage of. And we ' ll see this across, you know, sort of, microstates in the Pacific. We ' ll see this across sub-Saharan Africa. We ' ll see this across South America. The Chinese see huge opportunities from the United States creating a leadership vacuum. And the place they ' re most capable of doing that is if the US stops paying dues in the United Nations, where China is number two, and they ' ll suddenly have the most influence over all the key positions, which will give them a role in global governance that they ' ve really been constrained from having over the past decades. HW : What do you think are the chances that the US stops paying its dues to the UN? IB : You know, if it were up to Congress and only Congress and Trump doesn ' t lean on them, I ' d say fairly low. I ' d say that they ' d probably, you know, cut back on some programs. But in terms of baseline dues, they ' d keep paying it. But Trump personally, I think increasingly sees the UN as hostile to the United States. That ' s particularly true in terms of Israel policy, which Trump is leaning in on. And, you know – let me put it this way. Tulsi Gabbard did not have the votes to get confirmed. There were Republican senators that were going to vote against her. And Elon called those individual senators and threatened them. And this was, you know, fully aligned with what Trump wanted Elon to do. And those votes went away. And the only person that ended up voting against Tulsi was McConnell. And as a consequence, it went through. So look, I think that we should not underestimate the level of power and control that Trump and Elon have over the Republican Party this time around, compared to 2017, where it was really the Republican Party that was much stronger than Trump, both in his administration creating a lot of guardrails, but also in Congress. This time around, Trump has all the chips and he ' s using them. So if he decides he wants to stop paying dues, I think that ' s what ' s going to happen. This is a much more revolutionary presidency, domestically, where last time around it was much more transactional. HW : Alright. Let ' s talk a little bit more about what ' s actually happening inside the US. You bring up Elon, who obviously with DOGE has been sending out emails and asking for information from people and kind of trying to do a lot very quickly. Some of these high-profile moves are – I think what ' s interesting is that no one would really argue that there isn ' t inefficiency in government, that that ' s an understood reality. But the way that some of these moves are being made are maybe going to cause irreparable damage. And that ' s to people from red states, that ' s to scientists, that ' s to veterans, that ' s to people who voted for Trump and that ' s to people around the world. You talk about soft power and the United States, but what about actually what ' s happening inside the United States? And why do you think that the administration is willing to go so quickly, to go so fast and to cause such damage? IB : Well, and you saw Trump this weekend saying that he wants Elon to move faster, to be more aggressive. And I don ' t think that was just a troll. I think that ' s true. Trump is 78 years old, and with his friends he talks about the fact that he doesn ' t have much time. That in two years ' time, the Democrats could take the House in four years ' time, you know, that ' s it. He ' s not talking privately of"I ' m going to be president for life."He also knows he was almost killed. He was shot in the head. And do I think that changes somebody? Absolutely. I think that he believes that he was saved by God, and that his level of confidence that what he is doing is fundamentally right and necessary now is so much higher than the insecurity that I frequently saw in him in his first presidency. So I think his willingness to push, push, push, and his view that Elon is a great activator and executor on that intention, and someone that he had nowhere close to someone with that kind of capability and energy and execution ability in his first term. And now he does. So first of all, I think that relationship between Trump and Elon isn ' t going anywhere. I think it ' s actually very stable. People that say it is are people that want it to go away. But hope is not a strategy. And I also think that the intention of revolutionary politics domestically is to shoot first and ask questions later. It ' s to break things. It ' s a view that the bureaucracy has been weaponized against Trump first and foremost, and also against the will of the American people. And therefore it must be broken. And you ' re going to break eggs when you want to make that omelet. Now your point is that there are a lot of Republicans that work in government. There are a lot of Republicans and Trump voters that are losing their jobs and that are not being treated with a level of care and compassion as a result of what Trump and Elon are doing. And I think there will be a backlash. But I ' m not so sure that a one-term, 78-year-old-Trump presidency cares all that much about that. And, you know, if that means that his popularity slips to like, the high 30s, frankly, you know, in a very, very polarized country, high 30s isn ' t that bad. It still means 80, 90 percent of the people that voted for him still support him, and I think he ' s probably more comfortable with that this time around. So I think a lot more has to happen before we can start talking about whether there ' s really going to be significant pushback against what Trump is trying to accomplish at home. HW : Do you expect to see any of Congress standing up to Trump? We saw the governor of Maine recently kind of take him on. Do you expect to see more of that, or do you feel like for the next two years at least, people will just go where Trump takes them? IB : Well, sure, but, you know, in the case of Maine, that ' s a Democrat. So I don ' t know how much that means. I don ' t expect to see a lot of Republicans standing up against him. And of course, since the Republicans control the House and the Senate, that ' s the only thing that really matters. I mean, you know, you saw Kash Patel got through, Pete Hegseth got through. Now look, I actually think that a lot of the members of cabinet are very capable. I mean, they ' ve been picked for their loyalty and they will be loyal to Trump, but they ' re very capable. I think JD Vance is very capable. Mike Waltz, I know quite well. Marco Rubio, over the years. These are people that are very well respected, have been by their colleagues and could have served under any Republican administration. But there are some people that are completely incapable for the roles that they have been selected, completely incapable. They would not be selected in a role in any cabinet, in any democracy. And yet here they are, serving in critical roles in the most powerful country in the world. And yes, I ' m talking about the Secretary of Defense. I ' m talking about the Secretary of Health and Human Services. I ' m talking about the Director of National Intelligence. I ' m talking about the Director of FBI. These are important roles. And they were all confirmed. And if you ' re a Republican senator – and senator – I ' m not talking about the House here where, you know, it ' s a lot more diffuse and there are a lot more wackos and it ' s easier to get in. But Senate has always been like, responsible and more oriented towards bipartisanship and the rest, and they are utterly petrified of what it means if they publicly get crosswise with President Trump and number two, Elon. And they ' re not willing to do it. So I think that there ' s very little belief that you are going to see Congress step up. I think that you will see justices step up because those justices are independent. The problem is that many of those justices are progressive and have a known progressive lean. And so when cases come up and justices that have that political lean oppose something Trump wants, his willingness, his administration ' s willingness to attack them and refuse to execute on that judicial decision, unconstitutionally, is real. Now the case will of course go then up to the Supreme Court eventually. And I don ' t feel the same way about Trump refusing to listen to adhere to the rulings of the Supreme Court. But if there ' s 100 rulings like that and you overwhelm the judicial process, you quickly see how you might erode a core check on executive power in the United States. And Trump and Elon clearly intend to every day test those checks and balances and break them if they can. I mean, that is the intent, that is the intent. HW : So you mentioned democracy. When we last spoke, you said very clearly that the US is not Hungary, meaning that democracy is not threatened and that the US is not in danger of turning into an autocracy. Do you stand by that? IB : Yes, I do. I mean, in the sense that I think in two years we ’ re going to have midterm elections, and they will be largely free and fair. And in four years we ’ ll have presidential elections. And US elections are held at the federal level, right? They ’ re held state by state. They make the rules. It ’ s very easy to make people believe that the election has been stolen. It ’ s extremely hard to actually rig an American election. And I don ’ t believe that that is very likely at all. It ’ s very unlikely. The American military, despite the firings that we ’ ve seen just last Friday, is still an independent and professional military that I believe will carry out its orders and its duties professionally. I see the judiciary in the United States as independent and a clear check on the executive power in the United States. Where I see a problem, is that the US is becoming more kleptocratic every day. And the US was already much more of a kleptocracy over the past 10 years under Democrats and Republicans than any other advanced industrial democracy in the world. Clearly, money buys power in America in a way that it doesn ’ t in any other major democracy, wealthy democracy. That is getting dramatically worse. I saw specifically that Elon Musk, who is a walking conflict of interest at the highest level, met with Narendra Modi, the Prime Minister of India, in Blair House, so part of the official White House complex, right after Trump met with him. And Trump was asked later in the day, was Modi meeting with Elon in Elon ’ s private-sector capacity to advance his business interests or his official capacity to advance the policies of the United States? And Trump answered honestly. He said,”I don ’ t know.”And how could he know, right? Because, I mean, those two things are completely intertwined. But that is not remotely acceptable for rule of law in a functional democracy, and yet nothing is being done about it. In fact, it ’ s getting more and more entrenched every day. So the single place where the United States was least functional as an advanced democracy is now getting far, far worse. And I don ’ t see any checks and balances on that. I think that ’ s a very, very serious problem. HW : Alright, Ian, thank you, as always for all of your insights. Let ’ s close out with a couple more questions from our community. And this one indeed relates to the kleptocratic conversation that you were just raising. So why are the billionaires enabling fascism? What do they get out of it? IB : Fascism is a very politically loaded argument. That ’ s a political system where the cruelty against a subgroup or a perceived subgroup in the society is the intention, the expressed intention of the policy. And I certainly wouldn ’ t define the United States as a fascist system today. But I do believe that billionaires in the United States, at least a significant subset of them, are really under-interested in the well-being of their fellow countrymen and women. And this is a country that really makes heroic the individual. And it undermines the community. We ’ ve seen a significant erosion of civic engagement in the United States and civic associations. The church is not what it was in the US. Fewer people go, fewer people trust the church. Public education is not what it was. And wealthy people increasingly opt out. The family is not what it was. It ’ s increasingly atomized and people spend much more, much more of their time being, you know, isolated and atomized and intermediated by algorithms. And you and I have spoken about that problem in the past. We are increasingly a society of individuals as opposed to a nation together. I will tell you that that is a real problem when you have large numbers of billionaires that believe that they built it themselves, that they ’ re not responsible to a collective whole for any of their success and therefore they ’ re not accountable for their fellow citizens. And that ’ s what I think we have. I think we have a lot of winners in the United States and not a lot of leaders. And when you have winners, you have losers. When you have winners, you don ’ t have a collectivity. I will say that in this anti-DEI thing, I have a lot of sympathy for the people that don ’ t like DEI. I thought it was rammed down the throats of a lot of people And I ’ ve said this before, it was well beyond what the average American was willing to tolerate, and also it came with a level of high-handedness that that basically said, if you ’ re not with us in supporting these programs, you ’ re evil, you ’ re stupid, you ’ re uneducated. That ’ s unacceptable, too. It was a completely, you know, sort of oppositional way to try to have what ’ s a very challenging conversation. But I ’ ve never been a champion of diversity for diversity ’ s sake. What ’ s amazing about the history of the United States is despite all of our diversity, we find commonalities with each other. We find connectedness. That ’ s what ’ s amazing, is the connectedness, is that, you know, on this world, we ’ ve got eight billion people. And despite how different we all are, we all actually connect as human beings. That is what we need to focus on, not the diversity, the connectedness. And I think that ’ s what the billionaires today in the United States are losing. They ’ re doing incredibly well themselves. They ’ ve got theirs, they ’ ve got access to power, they ’ re paying good money for it, they ’ re going to get even more. But they ’ re forgetting that for us to succeed as a society and as a planet, we have to be connected to each other. You can ’ t throw out diversity and forget connectedness, and that ’ s what we ’ re forgetting right now. That ’ s why the country feels so much trauma and pain right now. And I think why the United States has given up on a lot of its really aspirational values that made such a difference to the world, that almost lost World War II for many generations. And now we ’ re giving it all away. HW : I mean, I think that ’ s why you find that diversity and inclusion go hand in hand, that that ’ s actually speaking to that. But in some of the moves that are being made to kind of throw out any type of diversity, to scan documents, to find words in order to highlight programs that are wasteful, that we ’ re actually going to lose what many, many studies actually highlight as being the benefits of diversity and the fact that you need diversity in order to be actually successful. IB : Shooting first and asking questions later, you know, moving fast and breaking things, those things make sense in a turbocharged venture capital technology environment. They do not work in government. They don ’ t work in government at all. In government, we have something called checks and balances, and we need them. And moving fast and breaking things undermines those checks and balances. So we ’ re going to do a lot of damage unintentionally. A lot of people are going to get hurt. A lot of folks don ’ t care about that in power right now, but they should because it would be much, much better. I know people want to move fast, but actually to think a little bit, do a little bit of your own research before you decide to kill that program, before you decide to fire that person. We ’ d be in a lot better shape as a government right now. HW : OK, the final question that I have for you actually comes from my 10-year-old son, and it ’ s a bit of a miserable question. We have a very lovely house, I promise. But his question nonetheless is are we heading into World War III? So, Ian, what should I tell him? IB : No, no, I don ’ t think we ’ re heading into World War III but we are absolutely heading into a world of much greater conflict. I think it ’ s much more likely, for example, in the next five, 10 years, that we ’ ll have a nuclear weapon go off. And I thought that was pretty unlikely since the Cuban Missile Crisis. In other words, over the course of my life. I think we ’ re going to see a lot more terrorism at scale, because a lot more people are going to feel angry and disaffected, I think. You know, you saw that assassination of the CEO of UnitedHealthcare just a few dozen blocks from my house. I think you ’ re going to see more things like that. And so, no, not World War III because the fact is that outside of the US and China, all the other countries know that they need to work with everybody. And there are even forces inside US-China that are trying to make sure that you don ’ t throw the baby out with the bathwater. But underneath that World War III risk, there ’ s an awful lot of damage that ’ s going to get done, an awful lot of crisis that I think we ’ re going to have to live through before we start to see what we create on the other side. A lot of defense as well, that we ’ re going to be playing in this environment. HW : Well, Ian, it is always a pleasure to talk to you, and we ’ re so glad that you are scanning the world to understand what is happening and then you come here and explain it to us all. Couldn ’ t be more grateful and thank you for everything. IB : Thank you.

Text Sample 928: NEG Dim 6 – 2020 – Score 1.00 – 2020/t003967.txt

Hi there, my name is Sean Sherman, I am a chef. Unfortunately, I don ’ t have food for you guys tonight. Food for thought, I guess, maybe. I ’ m here to talk about Native American food. I was born and raised in Pine Ridge in South Dakota, and our focus are on Indigenous foods. And, you know, it ’ s been a really interesting journey so far. I started my company called The Sioux Chef – S-I-O-U-X, a little play on words – back in 2014. But it had come from quite a few years of trying to research and understand because I kind of grew up in restaurants. I grew up in Pine Ridge. I grew up in Spearfish and in South Dakota in the Black Hills. And I started working a lot of touristy restaurants. And, you know, I had just a long career. All through high school and college, I worked restaurants. After college, I moved to Minneapolis. I became a chef at a young age in the city. And I ’ d just been cheffing for a long time. And a few years into my chef career, I realized the complete absence of Indigenous foods. And even for myself, I realized that I couldn ’ t even name – I could name less than a handful of Lakota recipes that were truly Lakota, things without cream of mushroom soup in it, right? So I was really trying – It, you know, put me on a path to try and understand what happened, like where are all the Native American foods at, you know? And so it ’ s been really interesting. So Indigenous foods, that shouldn ’ t be – there shouldn ’ t be a big question mark, you know, we should know about it, because no matter where we are in North America, we ’ re – you know, North America obviously begins, all of its history begins with Indigenous history, right? And no matter where we are, we ’ re standing on indigenous land. And so we should have a really good, strong sense of Native American food because it ’ s just the land that we ’ re on. It ’ s just the history of the land that we ’ re on. So for us, it became more than just serving foods. It really became talking about it and talking about why it isn ’ t here. And I think it ’ s a really important story for us to know. And it ’ s also really important to see the benefit of why understanding Indigenous foods could really help all of us in the future. So, you know, but where are all the Native American restaurants? We live in a world today, you know, where we have – as the US, we ’ re like food capitals of the world, right? We have some of the best restaurants in New York City, in Chicago and LA, and zero Indigenous restaurants that are focused on the land that they ’ re sitting on, which is kind of insane. You can have every other restaurants – and Indian restaurants don ’ t count, because that was my only choice on Facebook, because when I was trying to decide how to describe our restaurant – is it Indian or is it new American or old American? But anyways, so what we ' ve done is like we tried to focus on, first off, just understanding what were precontact foods, precolonial foods. And I realized that that term didn ' t even really make a lot of sense to people. So I think it ' s really important to go through the storyline because to understand colonial or what is a precolonial food, you have to understand colonialism itself. And to understand colonialism, the easiest way is just to Google it. So if you Google the word"colonialism,"you ' ll get a definition,"it ' s a policy or practice of acquiring full or partial political control over another country, occupying it with settlers and exploiting it economically."And this is something that ' s happened not uniquely here. It ' s happened all across the globe. So all over the Americas, North and South, all over Africa, all over India, all over Southeast Asia, Australia, New Zealand, Hawaii, you name it, like this has been a very common history for a lot of areas around the globe. For the US, which is our focus, because we ' re right here smack dab in the middle of the United States, it ' s really important to understand the history because the US did a really good job of smudging its history a little bit. So if you ' re going through high school, the history you get on Indigenous peoples probably isn ' t the best history. So you really should read a little bit more about what really happened. So let ' s start with Manifest Destiny, which is really kind of something that was born from the idea of what was originally doctrine of discovery, which basically gave European powers their own rights to say, if we discover it, then we own it. Right? But that policy doesn ' t really work that well, because if you go into an Apple Store and you discover a brand new MacBook, most likely you ' re not going to have the rights to walk out the door with it. But a lot of our policies and a lot of – like, our country was built on this notion that we just have this right to everything, right? And people have to remember how young our history is. We ' re such a young country, you know? There ' s like, barely any time has passed. So just go back a couple hundred years and, like, start with 1800s. So in 1800, the United States is still not much more than just the 13 colonies at that point in history. And it ' s the 1800s that are the most deadly century for Indigenous peoples. So a lot of really bad things happened during this time period, because in 1800, in reality, almost all of what is the US is still completely occupied by Indigenous peoples and communities and a huge diversity of them across the board. Even despite European powers having big land claims, you know, France has a big section and Spain ' s got big chunks and England is holding on to chunks and Russia is coming in and there ' s all sorts of just big land grabs happening. But in reality, it ' s the Indigenous communities that have always been there. But this century is a mass century of change, you know. So during this time period, things move really fast. So this is just a really tough time. And for me, this is like my great-grandfather ' s era because my great-grandfather was born in the late 1850s and during his lifetime, he sees so much change so quickly, he sees so many battles between the Lakota and the US government. He sees the Battle of Little Bighorn when he ' s 18 years old, during the battle on the Lakota side. He sees his kids having to go to boarding school, cut their hair, learn to speak English, learn Christianity. He sees his children – some of his children even grow up to fight for the US government. So it ' s such a crazy amount of change to see in one single lifetime, right? And during this time period, people are getting pushed around. At the beginning of that century, over 80 percent of that landmass was under Indigenous control. And by the end of the century less than two percent, only because of the reservation systems. And this is all just part of the story of why there aren ' t Native American restaurants, because we just went through a really traumatic time in history where we ' re still – we haven ' t even had the time to heal yet, let alone evolve, right, when it comes down to all this. So the US history, you know, there ' s a lot of these big movements like the Indian Removal Act of 1830, the Homestead Act of 1862, the Indian Appropriation Act that basically said we ' re wards the states, that we ' re not our own entities anymore, the Dawes Act of 1887. And all these pieces were very focused and the government was really, really good at what they did, you know. And it all starts with taking our food away from us. So the loss of Indigenous food is something that starts from the very beginning. George Washington, one of his very first things that he does is send General Sullivan out to push all the native people outside of the US. He wanted them captured. He wanted them brought back. And they went on this march that lasts a single summer and does just that. So after a single summer, there ' s no more native people in all of that New York area, from D. C. all the way up, basically. And they named George Washington the president. They gave the name for a US president : Town Destroyer, which is still the name that they use today because he just devastated a whole area. And this is the precedent that gets set for how the US government treats the Indigenous peoples throughout the next century, basically. So here, in our area, the very systematic destruction of bison, which they knew would hurt a lot of people, and it did. And by the end of the century, there was less than 500 on the planet. And it was very purposeful. So... But I think what ' s most damaging for us and why we don ' t have a lot of Indigenous restaurants out there was the loss of our education, because this whole generation, like my great-grandfather ' s generation and my grandfather ' s generation especially, like, those generations should have been getting the full extent of Indigenous education. They should have been learning everything their ancestors intended them to learn. How to fish, how to hunt, how to gather, how to identify plants, how to live sustainably, utilising plants and animals around us. But instead, we went through a really intense assimilation period where we basically, you know, the boarding school systems stripped this whole generation of all that knowledge and education. And it became very traumatic because this was not a fun situation for these kids to go through. This was a military-style school and they popped up all over the US, all over Canada. These kids being again forced to speak different languages, forced to learn new religions, forced to learn skills that had nothing to do with them. And being forced to is the situation. You know, a lot of these kids perished. We shouldn ' t have to worry about sending kids to school to see if they ' ll survive or not. But this was a very harsh situation for kids to go through. And they went through physical abuse, sexual abuse. They went through mental abuse. And we ' re still reeling from that in our communities today because of this direct link to the trauma that happened there. And being Indigenous in the 1900s wasn ' t much better. My grandparents were born before they were even citizens, which doesn ' t happen until 1924. And then in the 40s and 60s, the US government started dismantling a lot of tribes. So over 100 tribes got dismantled so they could continue to take over more land spaces. We couldn ' t vote until 1965. We couldn ' t celebrate religions until ' 78, you know. So what does it look like for me growing up in this? I was born in the mid-70s and growing up in postcolonial America. Like, what kind of foods was I eating? And I get asked that a lot because people in the media are always like,"You ' re native, like what kind of foods did you grow up with?"Because they want to hear a cool story like,"I ' d get up in the morning, take down an elk with a slingshot, we ' d have a big family feast."But that wasn ' t the reality, because like I grew up with the Commodity Food Program because we were poor, like a lot of people on the reservation. And we didn ' t even have the pretty cans when I was growing up. We just had, you know, these black and white cans, beef with juices. And that ' s dinner, you know, and that sucks. So... And Indian tacos, you know, even when I was a kid, I was like, why does our Lakota food taste like Mexican food? It didn ’ t even make sense to me at the time. Because we could do better than this. There ’ s so much more to learn and more to offer with indigenous foods. So it ’ s really important to understand what Indigenous foods are. But first, you have to understand just like how diverse our nation is. We ’ re so diverse, there ’ s all sorts of plants and animals out there. And when you layer Indigenous peoples on it, you can see so much amazing diversity, you know? This is a language map. So just look at all those huge color blocks and within those color blocks there ’ s all sorts of diversity within those two, right? Still today, we have 634 tribes in Canada, 573 in the US and 20 percent of Mexico identifies as Indigenous. So there ’ s an immense amount of indigeneity out there today and we should be celebrating that diversity because it ’ s awesome. You know, just compare colonial settler states to Indigenous territories and you can see that diversity. It should change everywhere we go. You know, the US, the food system shouldn ’ t just be hamburgers across the board, or in Canada shouldn ’ t just be poutine. We could do so much better describing our foods, right? And so we have to really focus on Indigenous education because it ’ s important for us to learn. So when we ’ re looking at Indigenous education, it ’ s a study of all these pieces, wild food, permaculture, native agriculture, seed saving, seasonal lifestyles, ethno-oceanography, hunting, fishing, whole animal butchery, mycology, salt, sugar and fat productions, crafting, land stewardship, cooking, metallurgy, Indigenous history, traditional medicines, food preservation, fermentation, nutrition, health, spirituality, gender roles, sustainability – all of that stuff is this really important education that we need to learn, you know. So let ’ s just break down some foods real quick. Proteins are easy. We learn about how natives were able to use every single part of a bison. But that ’ s just because we didn ’ t have the privilege to be wasteful. We figured out how to be resourceful with everything that we had and we treated everything like that. But basically, anything moving around is literally game. And we cut out beef, pork and chicken because those animals didn ’ t exist here. And there are other animals to eat out there that aren ’ t those three. So there ’ s just a ton of stuff out there. And you shouldn ’ t be afraid of something if it ’ s not a cow, a pig or a chicken because there ’ s a lot of cool foods out there, and even insects, it ’ s so normal in so many parts of the world and it was normal here, too. But for us, our biggest love is plant knowledge because you start to learn the plants around us, you just see food and medicine everywhere. The Western diet has never really taken the time to learn this amazing biology that surround us and all these plants all around us. Because there ’ s so much to learn. There ’ s all sorts of staples out there, like the timpsula, which is the prairie turnip which grows around these plains. Camas root from the Pacific Northwest, wild rice from the Great Lakes, even just seaweed out there in the oceans, which a lot of families were utilizing, or in the deserts where all the plants look like they want to hurt you or maim you. The Indigenous peoples knew how to live with them. And another piece like the domesticated piece, with all the agriculture, it ’ s really important, because we think of this as agriculture but we know how damaging this is. And it ’ s scary when you see headlines like,”What should we do if glyphosate was found in our Cheerios?”You guys should be really scared about that. That stuff ’ s really nasty, you know. But it ’ s just amazing to learn about Indigenous agriculture because it goes back so far and people figured out all sorts of ways to farm and build sustained, huge civilisations, whether they ’ re in the middle of the desert, whether they ’ re on the coastal regions, or way up here in the Dakotas. People were able to farm amazing things that had an amazing amount of diversity that we need to protect. We are the stewards of what ’ s left of this diversity. And a lot of it got wiped off the map in the 1800s with all that colonialism that was going on. So we have to be understanding so we can protect these for the next generation because these could disappear if we don ' t do anything about it. So it ' s really important to understand that. So to use Indigenous knowledge in today ' s world, it ' s just important to open up your eyes, you know, stop calling everything a weed because that just means you don ' t know what it is. You know, our kids can name more K-Pop bands than they can trees and that ' s your fault, you know? We need to teach them things that are important. Because, like, just look around. There ' s food everywhere and we should be making pantries, like our grandparents did, and our great-grandparents. They just used the food that was around us. So we should just be making our own pantries that tastes like where we are, what makes us unique in our own region. And that ' s why we should have Native American food restaurants all over the nation, run by Indigenous peoples. There ' s so much to explore. There ' s so much flavor. There ' s so much health. And it ' s just super healthy, you know, and it ' s fun for chefs to create and play with all these flavors. Chefs should be really excited about getting to learn all of these plants that aren ' t in their diet because they ' re just going out of a French cookbook. And for us, we just want to get this food back into tribal communities especially, and make people healthy and happy and break a lot of the cycle of, you know, government reliance on food and huge rates of type 2 diabetes and obesity and heart disease because of this low nutritional food base that the government ' s been feeding us for too long. And we just need to think about how we can adjust and make a better lifestyle. We need to use our land spaces better. Lawns are fucking stupid. We need to really do something better. We could just be growing food out there, you know? We could just be putting food plants everywhere. We need more community gardens, more permacultural landscapes. It ' s that easy. If we can grow 30 golf courses in Palm Springs in the middle of the desert, just think what we could do if we just did that for good and just put food everywhere, you know? An organic food, food that wants to grow in that certain region. So, you know, Indigenous diet is really the most ideal diet. It ' s healthy fats. It ' s diverse proteins, it ' s low carbs, it ' s low salt. It ' s a ton of plant diversity. It ' s organic agriculture. It ' s celebrating cultural and regional diversity. And it ' s seasonal. It ' s just really good. It ' s like what the paleo diet wishes it was, when it comes down to it, because that just makes sense, you know, and we need to protect this. We need to get this out there. And again, it ' s not unique here. There ' s Indigenous peoples all around the world and there ' s an Indigenous knowledge base that ' s basically untapped because of the colonial structure that ' s been put everywhere. We need to be protecting people in Africa and India and Southeast Asia and Australia, New Zealand, Hawaii, South America, North America. We need to protect those. We need to be celebrating diversity instead of trying to build stupid walls to keep people out. We need to have, you know, healthy food access, cultural food producers, regional food systems, local control of food systems, not governmental control, access to Indigenous education and environmental protections to protect a lot of this natural food that surround us. We need to be better connected to our nature around us and really, truly understand how it ' s a symbiotic relationship. We ' re not above it, right? If we can control our food, we can control our future. And for us, it ' s an exciting time to be Indigenous because we are taking all of these lessons from our ancestors that should have been passed down to us, relearning them and utilizing the world today with everything it has to offer and becoming something different. We ' re at the stage where we ' re ready to evolve. This is an Indigenous evolution and revolution at the same time. So I hope someday that you can drive across this nation, stop at Indigenous-run food businesses and see this amazing amount of diversity out there and just think about it, you know.

When I was six years old, growing up in Medellín, Colombia, I made one of the most impactful decisions of my life. I asked my mother to change my school, to the school where she was teaching. To my surprise, she said yes. So I switched from a rich, private Catholic school to a public school where 99 percent of the students live in a condition of extreme poverty. The only meal some of my friends ate a day was the one that was given in school. My friends and I lived close to each other, but worlds apart. I lived in a neighborhood with a museum, a library, parks, and they lived in a neighborhood with the lack of the most basic necessities, such as potable water or electricity. More importantly, they lived in a place surrounded by danger, from guns to landslides. Their suffering was not unique. Up in the mountains, in Medellín informal settlements, thousands of families were having the same problems [as] my friends and their families, fearing that the police or the rains would take their homes away. I learned so much from my friends, but what continued to surprise me the most is their resilience and optimism in the face of adversity. Growing up with people that I care [about] is what had led me to the story of informal settlements. I teach now at the University of Colorado, Boulder, in the program of environmental design. I study informal settlements because even if they are invisible to most of us, they represent one of humanity ' s biggest challenges. And yet they provide great insight in how cities develop and innovate. There are three crucial things that I have learned about informal settlements that I want to share with you today. The first one is that informal settlements are a widespread form of city making. The second one is that by making visible populations in informal settlements, we can save their lives. The third one is that we pay more attention to the creativity of people who live in these places, we could be aware of innovations that can save the planet. Informal settlements can be broadly described as self-built neighborhoods outside of city regulations in conditions of extreme poverty. Nowadays, more than a billion people live in informal settlements all around the world. By the year 2050, one in three people on the planet will live in one of these places without potable water, adequate sanitation and in condition of extreme poverty. This makes informal settlements, what some call the slums, the most common form of urbanization of the planet. The paradox of informal settlements is that they are vast and common. However, the people and the places in which they live are the most invisible. There is much that we don ' t know about these places and that ignorance creates barriers to develop tools to help them. A first step to make visible these populations is to record the conditions in which they live. However, many countries where the informal settlements are do not have the resources to map these populations. And the countries who have the resources sometimes have legal restrictions that impede the state organizations to support the work on informal settlements. These unknowns create vacuums to understand informality and support the dissemination of misconceptions about the real challenges and opportunities of informality. As I started to learn more about the informal settlements, I realized the scarcity of data available. Most of our understanding about informality comes from separate and unreliable sources. There is not a single database that contains all the informal settlements in the world. To try to aid in such a puzzle, I created alongside hundreds of collaborators the Atlas of Informality. The Atlas is a creative attempt to visualize these invisible populations in an effort to understand the unique process of informal city making. A crucial question that we wanted to resolve here was how these places evolve over time. This was important not only to understand the past, but more importantly, the future of informal settlements and the future of all world cities. We at Environmental Design Program created a protocol with open-access software, remote sensing tools and direct mapping to identify and map the change of informal settlements over the last 15 years all over the world. The key was to develop a tool that was simple to use and that allows us to reach most of the planet. A tool that allows to compare these places at the same level. We have now mapped more than 400 informal settlements all over the world, and we have realized how each one of them is changing and expanding as a result of the arriving populations. We discovered things expected. Regions are expanding at different rates. Informal settlements in Latin America and Africa are expanding more rapidly than those in Asia. More importantly, we discovered that the entire sample continues expanding at a rate of 9. 85 percent. But what [does] this obscure number mean? It means that every year 2, 300 square kilometers of informal settlements are created out of the expansion of existing ones. This expansion means that every year, at the informal settlement, a slum, a city larger that some of the largest cities on the planet, such as Moscow, Houston or Tokyo, is created out of the expansion of existing settlements. As these places continue to grow in darkness, we are blinded to what happens in the cities emerging every day. This is why I have dedicated my life to the co-production with communities that live in informal settlements. Not only to try to improve their conditions of living, but to learn from them about the unique process of informal city making. Working with families and community members over the last 10 years, I have learned that to solve the informal settlements most challenging problems new cutting-edge strategies are needed. And that the source of that innovation resides already within the knowledge of these communities. I have learned that for each problem there is a community-based solution spearheaded by the people living there. For example, we learn fascinating things from communities like Carpinelo or Manantiales de Paz in Colombia, who organized themselves to build infrastructure improvements. They call these”combites”. These infrastructure improvements go from the creation of water systems to stairways, to roads. At the family level, we find incredible financing mechanisms. Like they ’ re renting of rooms to pay for home expansions or the creation of micro businesses tailored to the surrounding populations. One of my goals now is the emulation of those strategies at larger scales. Creative informal solutions follow a disruptive process that breaks away with traditional ways in which we think about cities. Planners, city officials and architects tend to operate in cities in similar ways as those set up at the beginning of the 20th century. What forced them and us to think about the informal settlements as a pathology, as a disease, as something that needs to be eradicated. This old-fashioned way of looking at slums forces the use of obsolete strategies. As a result, slum eradication programs have left millions homeless and have only displayed the problem to other places. In unbelievable contrast, the resources of informal dwellers for these populations to find unconventional ways to solve the same problems. Their solutions are less environmentally impactful and rely less on the need of big infrastructure improvements. These solutions could be as physical as the creation of pedestrian-friendly compact neighborhoods, or as strategic as the setup of community-based banking systems. These solutions could work both for informal settlements with less resources and to cities in the search of more sustainable development. Making these places visible is not only essential to help impoverished communities, it ’ s also vital for the rest of us. These populations living in scarcity are forced to innovate and create these disruptive urban products. Informal communities have always thrived, finding new opportunities out of necessity, from unofficial moto-taxis, private vehicles that serve the public, a response for the need for affordable transportation systems, or like the renting of rooms to pay for home expansions, what makes homes in informal settlements a self-sustainable urban model. Think about how radical this idea is. That instead of getting a loan to pay for your home, your home is the business that pays for the place that you live in. Of course, I don ’ t want to romanticize these solutions, as they are the result of innovation out of dramatic suffering. But what I want to say is that there is much that we could learn from them. In fact, I think there are some that are already learning. I argue that today, some of the most disruptive urban products, such as the ride apps, similar to the moto-taxis, or the home-sharing economy, similar to the self-financing urban model in informal settlements, started decades ago in the confines of informal settlements. If we pay more attention to visibilizing these invisible populations, we will not only have the opportunity to support the effort of billions, but we could learn from them how we can change the planet. Now, thinking back about my schoolmates, the communities which I collaborate with and the billions living in informal settlements, there are three things that we all need to do. The first one is that we need to make these communities more visible. They are part of our cities, they deserve to be respected and accounted. Second is that we need to pay more attention to the creativity and innovation that happen in these places. The next billion-dollar business, the next urban sustainable solution has already been invented in one of the thousands informal settlements around the world. And finally, we need to apply what we learned there. For the future one third of the planet and for our cities that need to be safe. Thank you.

First, a warning. As far as offensive words go, you are now entering a hard-hat area. We ’ re going to be unabashed in this, I am talking to you about a very particular word, a very powerful word, a very”see you next Tuesday”word. A word that is still so offensive that the funders of this event would only let me talk about it if we censored it on the slides, which rather proves my point, don ’ t you think? I love this word. Oh, my God, I love everything about this word, not just what it signifies, but the actual sound of it, the fact that the C and the T just cushion that”nnn”sound into this monosyllabic that you can just spit like a bullet or you can extend it out and roll it round your mouth,”cuuunt.”I love its dexterity. I love the fact that in Scotland it ’ s a term of endearment, but in America it ’ s horrendously offensive. I love it means something different with your friends than it does if you said it to your boss, it would probably cost you your job. I do not recommend it. I love this word. I love the fact that the first three letters are still the same chalice shape, all rolling through the word until they ’ re stopped in that plosive T at the end. I think the thing that I love most about it is its status as the nastiest of all the nasty words. Although that title is under some contention now. There are other obvious heavyweight contenders for the most offensive word. The N-word, for example. But here ’ s what I would say to you. I know why that word is offensive. I can look at the history, that word enabled the brutalization and racial genocide of an entire group of people. It played its part in dehumanizing Black people. What did”cunt”do? Does it not strike anyone else as odd that a word that just means the vulva could even be regarded in the same league of offense as the N-word? Are we saying that vulvas are that offensive? Surely not. But what I want to talk to you today about is how did we get here? Has it always been this offensive and how did it come to be so? The answer is no, it was not. But let ' s look at the history of it first of all. Where in the cunt does”cunt”come from? It ' s one of those words that ' s so old, etymologists and linguists, they lose sight of it eventually. It ' s the oldest word for the vulva that we have in the English language. It might even be the oldest in the world. There are some theories. There are also similar cognitions in Germanic languages all across Europe. The Vikings would be talking about”kuntas,”the Germans had”kuntō,”Dutch,”kont,”Germanic”kott,”and I think at one point we had”kott,”which I think may be due for a revival. After that, it gets a bit confusing as to what this word actually means. One of the leading theories is that it shares this root, this Proto-Indo-European root with this”gen”sound, which you also see in”genetics,””gene,”and that means”to create.”Another theory is that it comes from this sound,”gune,”which gives us”woman,”gynecology.”Create,””woman.”But what really fascinates linguists is this sound, the”cuu”sound, because that gave us”cunt”also it gave us”cunning.””Cunning”originally didn ' t mean”sneaky.”It meant you knew something. Cunning folk, cunning women were wise women. And in Scotland still today, if you can something, it means you know something.”I ken this.”It also gave us”queen”and”cow,”slightly bizarre, which is slightly less highbrow, but – It turns up again in the Middle Ages in”quaint,”which means”knowledge”and also means”cunt.”It has a Latin variation as well,”cunnis,”which also means”cunt,”which turns up all over the Roman world, including in graffiti in Pompeii. Some of my favorite Roman graffiti from the city of Pompeii I won ' t try and do the Latin, but it ' s translated to be”A hairy cunt is better fucked than a smooth one.””It wants cock and holds in steam.”There you go. However, I put it to you that the word”cunt,”as offensive as it may be today, stems from a root that means”woman,””knowledge,””create,””cow.”Has it always been this offensive? No. But we ' ll talk about this. So when we talk about these words,”vulva,””vagina,”trying to offer more palatable alternatives to”cunt,””vagina,”the word turns up in the 17th century. It ' s taken directly from Latin and it means a scabbard. It means something that a sword goes into.”Vulva”doesn ' t do much better. That appears in the 14th century, and it means”womb,”but some people suggest it comes from the French and means”wrapper.”Both these words derive their meaning and their import from the penis, basically. That ' s what a vagina is. It ' s something a sword goes into. I say that these words aren ' t as feminist as”cunt,”which comes from a word that means”queen,””create,””wisdom,””cow.”But when did it first start being used in English as we recognize it today? Gropecunte Lane, this is the first recorded incident in the Oxford English Dictionary, it turns up in 1230, a street name in London called Gropecunte Lane, which was exactly what it sounds like, this was in the red-light district of Southwark, it was a lane for groping cunts. And there wasn ' t just one in London, there was one in Bristol, there was one in York. It appears all over the British Isles. Here it is, the one in Bristol. Sorry, Oxford, there it is just in blue. But whereas Glaswegians might be calling each other and their friends”cunts,”it seems that medieval people were calling their children”cunts”because it turns up in a number of names, bizarrely enough. Godwin Clawecunte is recorded in 1066, Gunoka Cuntles in 1219, John Fillecunt in 1246, Robert Clevecunt, 1302, and a Miss Bele Wydecunthe turns up in the Norfolk subsidiary role. We don ' t know if these are aliases or if they ' re jokes, but we do have a lot of fun with medieval names. In fact, originally the word”fuck”did not mean what it means today. It means to strike something to hit, which gives us the fabulous name of a dairy farmer in 1290 who ' s known as Simon Fuckebotere. So was it this offensive to medieval people? No, it wasn ' t.”Cunts”turn up all over medieval culture and medieval literature. And they are certainly not offensive, it ' s just a descriptive term. Here ' s some examples. The”Proverbs of Hendyng”from 1325 advises women to”give your cunt cunningly and make your demands later,”i. e. get a ring on it first before you give it up. There ’ s a Welsh poet called Gwerful Mechain from the 15th century, and she advises male poets to celebrate the fine bright curtain of a cunt that flaps in place of greeting. It might surprise us that medieval culture was this open about cunts, but the truth was, they were more sexually liberated than we actually give them credit for. This idea of them being in a tower with a chastity belt on is largely a hatchet job on their reputation done by the Victorians. Now, it wasn ’ t a sexually liberated utopia. They had their own hang-ups, but they weren ’ t that offended by sex. What will get you in trouble, swearwords in the Middle Ages, was religious ones, blasphemous ones. If you said something like,”God ’ s wounds”or”God ’ s teeth,”that ’ s what you ’ d say if you caught your soft and danglies in your fly. One medieval poet who dropped the C-bomb with the precision of a military drone is this chap, Geoffrey Chaucer, who turns up in GCSEs and A-levels syllabuses, although his cunt jokes are generally not dwelled upon. He doesn ’ t use the word”cunt,”he uses the word”queynte”here, which again means”knowledge”and it means”cunt.”So this is his joke,”As the clerkes ben ful subtile and ful queynte, And prively he caughte hire by the queynte.”A rough translation means”the clerk was really cunning and he caught her by the cunt.”Shakespeare. It ’ s been suggestion that he uses that play, a quaint - queynte - cunt, in his Sonnet number 20. Here he is. It certainly turns up in a lot of his work. It ’ s a lot ruder than we often give him credit for. In Hamlet, act three, scene two, Hamlet says to Ophelia, he says,”Shall I lie in your lap?”And she says,”Oh, no, my Lord.”And then he says,”Do you think I meant country matters?”When David Tennant played that part, he paused”Do you think I meant count-ry matters?”to try and really drive it home. Another one,”Twelfth Night,”Malvolio says of his mistress ’ s handwriting,”There be her Cs, her Us, her Ts and thus she makes the very great Ps,”punning on”cunt”and”piss”simultaneously. The immortal Bard ’ s status as a smut peddler is often swept under the cultural rug. In 1807, Thomas Bowdler published”The Family Shakespeare,”where he edited out all of these jokes, all of the rude bits, and made it a completely cunt-free affair. It ’ s no surprise that about this time we start to get the first libel laws in Britain, the first banning of seditious and offensive pamphlets with the rise of Puritanism. For Shakespeare to be veiling his cunt jokes in kind of cheeky double entendres suggests that it ’ s not quite as free and open as Gunoka Cuntles and Gropecunte Lane would once have had. The Puritans repressed sexuality, we know this, and language is extremely important battleground for sexual liberation. How do you talk about your bodies if the very words you ’ re trying to use are considered to be offensive? How do you do that? And by the time we get to the Restoration period, the early modern period,”cunt”is most certainly offensive. And this chap here, John Wilmot Earl of Rochester, is the absolute poster boy of”fuck you.”If the Puritans tried to dam up sexuality, this guy surfed to notoriety on a wave of sexual repression that was unleashed when the plug was pulled on the Puritan rule. He uses”cunt”a lot and he ’ s very naughty about it. He wrote this poem about his mistress and how jealous he was of her other lovers.”When your lewd cunt came spewing home Drenched with the seed of half the town, My dram of sperm was supped up after For the digestive surfeit water. Full gorged at another time With a vast meal of slime Which your devouring cunt had drawn From porters ’ backs and footmen ’ s brawn.”Sorry, everyone. He uses that word to shock, and it ’ s easy to look at his work and think that he ’ s sexually liberated, but he ’ s actually quite angry at cunts and their owners and that goes all the way through it. From here on out, cunt is an offensive, naughty word. Georgian cunts, here we go. I ’ ll just let that settle.

So what happens about the 18th century is the print industry really explodes. And of course, we being humans, we didn ’ t just want to publish nice books. We published porn, yay. There ’ s a huge proliferation of porn that comes out of the 18th century. But oddly enough, most of it shies away from using that word”cunt.”In 1785, Francis Grose published his book,”A Dictionary of the Vulgar Tongue,”which is basically a dictionary of slang. And he defined”cunt”as a”nasty name for a nasty thing.”Such modesty from someone who also uses the word”buccaneer ’ s boot,””lobster pot,””skut”and”Mrs. Frub ’ s parlor”for the vulva. This book here,”Harris ’ s List,”this is an almanac, it ’ s a directory of sex workers in London at the time, who were selling sex. And it lists not only their address and their prices, but very, very intimate descriptions of what they do and their vulvas. But it doesn ’ t use”cunt”very much. This one here, this is an illustration, fabulous illustration from”Fanny Hill,”what ’ s often called the first pornographic novel, which was published in 1748 by John Cleland, who famously boasted that he did it without writing any rude words at all. These texts tend to use expressions like”mossy grot,””cupid ’ s coal hole,””Venus ’ s mound,”but we shy away from”cunt.”Victorians ; so despite their reputation for being sexually prudish, pornography flowed underneath Victoria upper-crust society like a river of slime in”Ghostbusters II.”They had pornography all over the place, visual and literary, and they had a lot of fun with”cunt.”One of their pornographic magazines”The Pearl”was published from 1879 to 1880. and it published in it”nursery rhymes”every month. I ’ ve got some here for you to have a look at.”There was a young lady of Hitchin, Who was scrotching her cunt in the kitchen ; Her father said, ’ Rose, It ’ s the crabs, I suppose. ’ ’ You ’ re right, pa, the buggers are itching. ’””There was a young man of Bombay Who fashioned a cunt out of clay ; But the heat of his prick Turned it into a brick, And chafed all his foreskin away.”Yeah, well done, Victorians, well done. Interestingly, it ’ s also in the 19th century that we get the first recorded use of”cunt”being used as an insult. As an actual,”You are a cunt.”That ’ s the first time that it ’ s used in the 19th century. In the 17th century, it started being used as a kind of a derogatory collective noun for women. Samuel Pepys writes about this aphrodisiac that ’ s going to make all the”cunts”chase after him. Charming. That ’ s when they weren ’ t stabbing him with pins for being too sexually aggressive. Anyway, the Victorians liked a well-placed”cunt.”One of the most important”cunt”moments in history is this. Is the publication and the subsequent obscenity trial of”Lady Chatterley ’ s Lover.”This book contained 14”cunts”and 40”fucks,”and it was banned and it had to go on trial in order to be published. And it was shocking, not just because of the graphic scenes of sex and the language used, but because it smashes down class boundaries. If you ’ re not familiar with this, it ’ s about Lady Constance Chatterley, a married woman who embarks on affair with with Sean Bean here but with Mellors the gamekeeper. And the idea is that it doesn ’ t matter all her heirs and graces and titles, she ’ s got a cunt, she ’ s a sexual woman and that levels them. But one of the pivotal scenes is where Mellors tries to tell her what”cunt”means. I won ’ t do the accent.”Nay nay! Fuck ’ s only what animals do, but cunt ’ s a lot more than that. It ’ s thee, dost see : there ’ s a lot more beside an animal, aren ’ t ter? Even ter fuck? Cunt! Eh, that ’ s the beauty of thee lass!””Cunt. That ’ s the beauty of thee, lass!”I love that. Now, despite a jury that agreed a work stuffed full of cunts does have artistic merit and they allowed it to be published, and you can see the pictures of the people queuing around the streets to get their hands on this book once it was,”cunt”never really made it back into the mainstream. Feminists have maintained a rather uneasy relationship with”cunt.”This is Judy Chicago. She led what was called The Cunt Art Movement of the 1970s. It first turned up in a film, a mainstream cinema in 1971 in”Carnal Knowledge”with Jack Nicholson, who screamed at a woman that she is a ball-busting son of a cunt bitch, or words to that effect. And in”The Exorcist”as well. It appears in”The Vagina Monologues,”1996, I think it was, with Eve Ensler when she talks about reclaiming”cunt.”But it ’ s still not off the linguistic naughty step, despite all of this work. Cunts today. It was it was finally admitted to the Oxford English Dictionary, despite having been around for thousands of years, in the ’ 70s. And then in 2014, they relented a little bit more and they added”cunty,””cuntish,””cunted”and”cunting.”So we all know exactly what that means. The Ofcom, the regulator for UK TV censorship in 2016 released a poll of what they regarded to be the most offensive words and”cunt”was bang up there. It was on top. It is still regarded as a horrendously offensive word. But here ’ s what I want to leave you with. What do you call yours? Because as far as I can see, words for vulva or cunts fall into a few categories. We ’ ve got child-like : a tuppence, a Twinkie, a foof, a minky, a Mary. Very medical : a vulva, pudendum, vagina. Slightly detached : down there, it ’ s down there. Bits, special area. Violent : axe wound, penis flytrap, gash or a growler. The taxi driver on my way in told me that Glaswegian slang for cunnilingus is”growling at the badger,”which – I ’ ll leave that with you. Or they just tend to be unpleasant, horrible images of fish and meat and general putrescence, fish taco, bacon sandwich, badly stuffed kebab, bearded clam, etc. Are these better alternatives to”cunt?”But I think the reason that we ’ re not prepared and we can ’ t handle”cunt”is because we can ’ t handle cunts generally. While it ’ s been linguistically sanitized, culturally, the only cunts we seem to be OK with are the ones that have been plucked and buffed and waxed and glued and covered in glitter. So, vajazzled by the way. The vaginoplasty business is booming. You can have your labia cut off, you can have your hymen rebuilt, you can have your pelvic floor resprung. Are we this uncomfortable with the cunt actually as it is? It ’ s a seat of enormous and awesome power. It can eat a penis and push out a baby, it ’ s not a twinkle. It is an old word. It ’ s an offensive word. But it ’ s an ancient and honest one, and this is the thing. This is the original word, everything else came after. So welcome to Team Cunt.

Text Sample 931: NEG Dim 6 – 2015 – Score 1.00 – 2015/t002700.txt

So, I ’ m here to recruit you. But not in the sense that you ’ re thinking. I know I ’ m a politician. I ’ ll save that for another day. I ’ m here to try and encourage you to take up a leadership role in public service in your country and on your continent. I ’ m here to convince you that your country and your continent need you - not later, not when you ’ re older and more experienced, but now - and that whether you realize it or not, your country ’ s politics are going to be doomed to fail unless you ’ re willing to get involved right now. So my recruitment pitch comes with a single disclaimer : I resigned from public office 18 months ago. I did it in order to take stock of my time in office, to think about the work that I had done, to capacitate myself with skills, knowledge, contacts, allies and experiences, and to find a little bit of personal and professional perspective. It ’ s one of the best decisions I think I ’ ve ever made. I imagine that some time during the next 18 minutes while I ’ m pitching you, you ’ re going to think,”Yeah, it ’ s easy for you to say I should go into public service. You ’ ve already done it and you ’ ve left.”But I hope I ’ ll be able to convince you that, in fact, we all find ourselves in exactly the same boat right now. Because being outside of politics for 18 months has reminded me just how important it is and just how much the political landscapes in my country and in your countries and on our continent are truly lacking in good leadership and political talent. So, I want to make a deal with you. I ’ m not going to return to active politics unless you come with me. I ’ m not going to do it alone. I won ’ t go back unless I can convince smart, entrepreneurial, highly skilled, talented, experienced young Africans like yourselves and millions more like you across the continent, that the best chance that our countries have, not just for survival but for lasting prosperity, is if our most talented citizens step forward and make themselves available, either for political party, leadership or for public service and government. So over the next 16-or-so minutes that are remaining, I ’ m going to alternately flatter you, as I just have, I ’ m going to challenge you, I ’ m going to talk to you about my experiences, about a couple of facts and figures ; I may even frighten you a little bit. And it ’ ll be entirely worth it if that fear convinces you of the urgency of the point in history that we find ourselves in today. Everything I say today will be in service of a single objective : convincing you, showing you, that your countries need you ; that Africa ’ s prosperity may depend on many things - entrepreneurialism, industrial development, health reform, social upliftment - but that all of these hinge upon the success of politics and government in our countries. I can ’ t begin a talk about public service, of course, without honoring my former president Nelson Mandela, the father of democratic South Africa. President Mandela passed away on this day in 2013. I really believe that when the people of my country look back on the day that he passed away, it ’ ll be seen as an inflection point in South Africa ’ s history. The day we decided whether we could, indeed, go it alone without him. What ’ s written in those history books will depend entirely on whether this generation, which includes all of you sitting in this room, recognizes that the time has come for us to take up the work that President Mandela left for us, before that work is captured by people who would use power and politics for empty vanity and personal gain. I ’ m referring, of course, to the young man who was here in London this very past week. Defiling the name of the visionary leader, the intellectual and political strategist, the formidable athlete, the Prince of the Abathembu nation who served as a South Africa ’ s first democratic president. The young man who tried to taint President Mandela ’ s legacy with a few throwaway lines, all in service of getting cheap headlines, which he got. People like this, who we leave public service to when we stay out of the fray of public service, are the reason your country and my country needs you and needs us. So let us begin. I want to first talk to you about the African diaspora. You may have heard about a study in 2013 that revealed that cash transfers from Africans living outside of the continent have now begun to exceed donor aid from foreign countries into Africa. In 2012, total remittances to Africa stood at 60 billion dollars while in the same year, official development aid to Sub-Saharan Africa totalled 44. 6 billion by comparison. Now, this got me thinking. If we can do such great work with our money from outside of Africa, what can we do with our skills, our talent, our experiences, our education and our passion for our countries and for our continent? I ’ ve spent the past semester at the Harvard Kennedy School as a fellow at the Institute of Politics. I ran a seminar which was called”How to build a democracy? Lessons from South Africa.”It was also about Zimbabwe and Malawi. And it wasn ’ t intended to make it seem like we got everything right in South Africa, but it was asking the critical question : Now that we have this legacy of peaceful transition, of constitutionalism, of difficult negotiations, which were very, very difficultly gotten, are we going to be successful in entrenching that democracy and making it last into the future? Now, one of the benefits of being an African in an academic setting like New England is that other African students reach out to you, they want to talk to you, and many of them express to you their desire to enter public service. So

I had students knocking down my door, wanting to talk to me in office hours about the fact that they have Ghanean parents but they were born in Texas. They really wanted to give back to Ghana, but they ' re afraid that if they go home, nobody will take them seriously as real Africans. I had students who said they had families, wives, children, husbands, partners to take care of, perhaps they were better off staying in the United States and providing for their families back home rather than going back and getting into public service. This got me thinking about the question of skills remittance, of talent remittance, of social and political remittance. If these young people have the passion to give back to their communities monetarily, imagine how different our politics would be if those same skills, influence, leadership, talent were put at work in service of the public good. And that includes all of you in this room because many of you are also part of the diaspora. I ' m here to recruit you. I ' m here to make a deal with you. I ' m not going back unless I take you with me. Now, I know that most of you, if not the vast majority of you, are completely fed up, turned off, discouraged, disgusted by politics, either in your country, in this country, all over the world. Perhaps you are discouraged by the fact that governments are slow to deliver. Perhaps they ' re inefficient. Perhaps they are thoroughly corrupt and rotten to the core. Perhaps they ' re responsible for conflicts that have claimed lives and livelihoods in the countries from which you come. So why would you sink your time and your energies into such a compromised system? One of the most powerful analyses of conflict, inefficiency, corruption, stagnation which I ' ve encountered in recent months is the question of a political economy. There is a reason that our governments are not performing as they should. It ' s not just because of a failure within the system. Consider the political economy of conflict and corruption in your own country. Why is it so difficult to overcome? Who is making money or amassing power because things don ' t work the way they should? Where does the back stop? Who has an incentive to keep the system dysfunctional? And how can we work together to overcome their total infection of the system, to ensure that we don ' t lose our grip on the very principle of democratic governance? The answer, I ' m afraid, because you were born into this political time, is simply by taking over - you have to get involved. There ' s no way around it. You have to join political organizations in numbers large enough to influence change from within. You have to actively seek to take up a leadership role in government, in the state, in the public service and deftly but decisively move its priorities to where they should be : not in the service of people who want to amass power and money for themselves, but to better the lives of the highest number of people. There will always be government, whether we like it or not, whether we find it palatable or not. But there won ' t always be democracy. If we ignore politics, the people who have been quietly lobbying our governments to prioritize development ahead of democracy, these are the people who will have their way, and the systems that we now take for granted will dissolve before our eyes. When I was campaigning in South Africa last year for the 2014 general election, the voter registration numbers looked a little bit like this, six months before the election : 23 % of potential voters in the 18-to-19-year-old age group were registered to vote. In the age group 20 to 29 years old, 55 % were registered. And from 30 upwards, the number varied from 79 to 100 % ; in fact, there were more people aged 80 and over who were registered than were in the census numbers in South Africa. Imagine that. Fully 100 % of people over a certain age consider voting to be an indispensable right, 21 years into democracy, and do not shirk their responsibility to register and turn out at the polls. But in the 18-to-19-year-old age group - and we must remember 19 is the average age on our continent ; 26 is the average age in South Africa - the number is 23 % to 55

%. What ’ s the political economy of voter apathy? Who benefits when we stay out of the system? Who gets to keep the status quo and empower themselves and enrich themselves and continue to infect our political system like a cancer. Who banks by us continuing with the status quo? Now even as I say all of this to you, that your country and your continent need you to enter public service, I know that if you take up my challenge, you ’ re going to face huge amounts of resistance - all because of these political economies that I have just described. I did. I was told that I was too young. I was too female. I didn ’ t have enough experience though no one could define what experience was enough. I had too much of a white accent ; I wasn ’ t a real African. I straightened my hair and wore weaves ; I wasn ’ t a real African. We should be honest about the things that hold people back from entering public service - humiliation, degradation ; it ’ s not an easy road - but all of these things should illustrate to you the extent to which the status quo is designed to enrich and empower a few at the expense of the many, and it should impart to you the urgency of you, as a generation, of now getting involved in public service to change that very culture. And if you decide to enter public service, you may even be tempted to believe some of these criticisms. They ’ re designed to keep you out ; that ’ s how gatekeeping works. Somebody is benefiting from the absence of excellence and disruption in politics and government. But these are challenges that have to be faced on. There is no other route ; there is no wishing this away. They are the reason that your country and your continent need you. We have this thing in politics in Africa ; it ’ s called the”big man.”The cult of personality - we ’ ve all heard different terminologies for it. In South Africa, in particular, this entails waiting for a great person to come and save us from ourselves. Currently, we ’ re waiting for Cyril Ramaphosa or Nkosazana Dlamini-Zuma or [inaudible] to come and save South Africa from itself, to save us from the mess that we find ourselves in that perhaps another big man put us in. But how can a single personality be held responsible for building or for running a whole nation? And where do we turn when they fail? If we haven ’ t cultivated any kind of pipeline of energetic, young people who wanted to enter public service now or in the future and, critically, who can do the job better, are we doomed to always have to choose between mediocrity and ego, and mediocrity and ego? Is that it? Is that all our government will ever be? Or worse : Are we going to stand by while presidents change constitutions so they can serve a third term and a fourth term and a fifth term, claiming that three million people signed a petition stating that they are the only person who can do the job? Is that what we ’ ll do? Now, there ’ s a new energy around entrepreneurism and innovation and growth in Africa today. But that energy isn ’ t going to translate into lasting prosperity unless we get our politics right. Political leaders who are gatekeepers of the status quo will claim that any success is their success. They ’ ll centralize power, and they ’ ll demand that we all be grateful for those little green shoots of achievement, and then they ’ ll claim that nobody else can do the job. They ’ ll argue that development must come first, freedom can come later, and that they are the best benevolent dictator to do the job. They ’ ll take your political voice from you when times are a little bit good, and when times go bad, they will refuse to give it back. There is no prosperity for our continent without a vibrant, diverse, and truly competitive politics, founded upon excellence, transparency and commitment to the public good. Our politics will not have any of these qualities unless talented, young people, the best people, step forward at this moment in Africa ’ s history, when we ’ re emerging from that stereotype of the dark continent, the hopeless continent, and commit themselves to public service. We must run for office. We must work in the civil service. We must disrupt the political status quo. We must prevent the rush to the bottom. You really are the ones that you have been waiting for. There are no great saviors waiting somewhere in the wings to save us from future problems. There ’ s nobody who is waiting in the wings to come and save us from ourselves ; there ’ s just us. And I ’ m not going back without you. So, will you take up the challenge? Thank you.

We are built out of very small stuff, and we are embedded in a very large cosmos, and the fact is that we are not very good at understanding reality at either of those scales, and that ’ s because our brains haven ’ t evolved to understand the world at that scale. Instead, we ’ re trapped on this very thin slice of perception right in the middle. But it gets strange, because even at that slice of reality that we call home, we ’ re not seeing most of the action that ’ s going on. So take the colors of our world. This is light waves, electromagnetic radiation that bounces off objects and it hits specialized receptors in the back of our eyes. But we ’ re not seeing all the waves out there. In fact, what we see is less than a 10 trillionth of what ’ s out there. So you have radio waves and microwaves and X- rays and gamma rays passing through your body right now and you ’ re completely unaware of it, because you don ’ t come with the proper biological receptors for picking it up. There are thousands of cell phone conversations passing through you right now, and you ’ re utterly blind to it. Now, it ’ s not that these things are inherently unseeable. Snakes include some infrared in their reality, and honeybees include ultraviolet in their view of the world, and of course we build machines in the dashboards of our cars to pick up on signals in the radio frequency range, and we built machines in hospitals to pick up on the X-ray range. But you can ’ t sense any of those by yourself, at least not yet, because you don ’ t come equipped with the proper sensors. Now, what this means is that our experience of reality is constrained by our biology, and that goes against the common sense notion that our eyes and our ears and our fingertips are just picking up the objective reality that ’ s out there. Instead, our brains are sampling just a little bit of the world. Now, across the animal kingdom, different animals pick up on different parts of reality. So in the blind and deaf world of the tick, the important signals are temperature and butyric acid ; in the world of the black ghost knifefish, its sensory world is lavishly colored by electrical fields ; and for the echolocating bat, its reality is constructed out of air compression waves. That ’ s the slice of their ecosystem that they can pick up on, and we have a word for this in science. It ’ s called the umwelt, which is the German word for the surrounding world. Now, presumably, every animal assumes that its umwelt is the entire objective reality out there, because why would you ever stop to imagine that there ’ s something beyond what we can sense. Instead, what we all do is we accept reality as it ’ s presented to us. Let ’ s do a consciousness-raiser on this. Imagine that you are a bloodhound dog. Your whole world is about smelling. You ’ ve got a long snout that has 200 million scent receptors in it, and you have wet nostrils that attract and trap scent molecules, and your nostrils even have slits so you can take big nosefuls of air. Everything is about smell for you. So one day, you stop in your tracks with a revelation. You look at your human owner and you think,”What is it like to have the pitiful, impoverished nose of a human? What is it like when you take a feeble little noseful of air? How can you not know that there ’ s a cat 100 yards away, or that your neighbor was on this very spot six hours ago?”So because we ’ re humans, we ’ ve never experienced that world of smell, so we don ’ t miss it, because we are firmly settled into our umwelt. But the question is, do we have to be stuck there? So as a neuroscientist, I ’ m interested in the way that technology might expand our umwelt, and how that ’ s going to change the experience of being human. So we already know that we can marry our technology to our biology, because there are hundreds of thousands of people walking around with artificial hearing and artificial vision. So the way this works is, you take a microphone and you digitize the signal, and you put an electrode strip directly into the inner ear. Or, with the retinal implant, you take a camera and you digitize the signal, and then you plug an electrode grid directly into the optic nerve. And as recently as 15 years ago, there were a lot of scientists who thought these technologies wouldn ’ t work. Why? It ’ s because these technologies speak the language of Silicon Valley, and it ’ s not exactly the same dialect as our natural biological sense organs. But the fact is that it works ; the brain figures out how to use the signals just fine. Now, how do we understand that? Well, here ’ s the big secret : Your brain is not hearing or seeing any of this. Your brain is locked in a vault of silence and darkness inside your skull. All it ever sees are electrochemical signals that come in along different data cables, and this is all it has to work with, and nothing more. Now, amazingly, the brain is really good at taking in these signals and extracting patterns and assigning meaning, so that it takes this inner cosmos and puts together a story of this, your subjective world. But here ’ s the key point : Your brain doesn ’ t know, and it doesn ’ t care, where it gets the data from. Whatever information comes in, it just figures out what to do with it. And this is a very efficient kind of machine. It ’ s essentially a general purpose computing device, and it just takes in everything and figures out what it ’ s going to do with it, and that, I think, frees up Mother Nature to tinker around with different sorts of input channels. So I call this the P. H. model of evolution, and I don ’ t want to get too technical here, but P. H. stands for Potato Head, and I use this name to emphasize that all these sensors that we know and love, like our eyes and our ears and our fingertips, these are merely peripheral plug-and-play devices : You stick them in, and you ’ re good to go. The brain figures out what to do with the data that comes in. And when you look across the animal kingdom, you find lots of peripheral devices. So snakes have heat pits with which to detect infrared, and the ghost knifefish has electroreceptors, and the star-nosed mole has this appendage with 22 fingers on it with which it feels around and constructs a 3D model of the world, and many birds have magnetite so they can orient to the magnetic field of the planet. So what this means is that nature doesn ’ t have to continually redesign the brain. Instead, with the principles of brain operation established, all nature has to worry about is designing new peripherals. Okay. So what this means is this : The lesson that surfaces is that there ’ s nothing really special or fundamental about the biology that we come to the table with. It ’ s just what we have inherited from a complex road of evolution. But it ’ s not what we have to stick with, and our best proof of principle of this comes from what ’ s called sensory substitution. And that refers to feeding information into the brain via unusual sensory channels, and the brain just figures out what to do with it. Now, that might sound speculative, but the first paper demonstrating this was published in the journal Nature in 1969. So a scientist named Paul Bach-y-Rita put blind people in a modified dental chair, and he set up a video feed, and he put something in front of the camera, and then you would feel that poked into your back with a grid of solenoids. So if you wiggle a coffee cup in front of the camera, you ’ re feeling that in your back, and amazingly, blind people got pretty good at being able to determine what was in front of the camera just by feeling it in the small of their back. Now, there have been many modern incarnations of this. The sonic glasses take a video feed right in front of you and turn that into a sonic landscape, so as things move around, and get closer and farther, it sounds like"Bzz, bzz, bzz."It sounds like a cacophony, but after several weeks, blind people start getting pretty good at understanding what ' s in front of them just based on what they ' re hearing. And it doesn ' t have to be through the ears : this system uses an electrotactile grid on the forehead, so whatever ' s in front of the video feed, you ' re feeling it on your forehead. Why the forehead? Because you ' re not using it for much else. The most modern incarnation is called the brainport, and this is a little electrogrid that sits on your tongue, and the video feed gets turned into these little electrotactile signals, and blind people get so good at using this that they can throw a ball into a basket, or they can navigate complex obstacle courses. They can come to see through their tongue. Now, that sounds completely insane, right? But remember, all vision ever is is electrochemical signals coursing around in your brain. Your brain doesn ' t know where the signals come from. It just figures out what to do with them. So my interest in my lab is sensory substitution for the deaf, and this is a project I ' ve undertaken with a graduate student in my lab, Scott Novich, who is spearheading this for his thesis. And here is what we wanted to do : we wanted to make it so that sound from the world gets converted in some way so that a deaf person can understand what is being said. And we wanted to do this, given the power and ubiquity of portable computing, we wanted to make sure that this would run on cell phones and tablets, and also we wanted to make this a wearable, something that you could wear under your clothing. So here ' s the concept. So as I ' m speaking, my sound is getting captured by the tablet, and then it ' s getting mapped onto a vest that ' s covered in vibratory motors, just like the motors in your cell phone. So as I ' m speaking, the sound is getting translated to a pattern of vibration on the vest. Now, this is not just conceptual : this tablet is transmitting Bluetooth, and I ' m wearing the vest right now. So as I ' m speaking — — the sound is getting translated into dynamic patterns of vibration. I ' m feeling the sonic world around me. So, we ' ve been testing this with deaf people now, and it turns out that after just a little bit of time, people can start feeling, they can start understanding the language of the vest. So this is Jonathan. He ' s 37 years old. He has a master ' s degree. He was born profoundly deaf, which means that there ' s a part of his umwelt that ' s unavailable to him. So we had Jonathan train with the vest for four days, two hours a day, and here he is on the fifth day. Scott Novich : You. David Eagleman : So Scott says a word, Jonathan feels it on the vest, and he writes it on the board. SN : Where. Where. DE : Jonathan is able to translate this complicated pattern of vibrations into an understanding of what ' s being said. SN : Touch. Touch. DE : Now, he ' s not doing this — — Jonathan is not doing this consciously, because the patterns are too complicated, but his brain is starting to unlock the pattern that allows it to figure out what the data mean, and our expectation is that, after wearing this for about three months, he will have a direct perceptual experience of hearing in the same way that when a blind person passes a finger over braille, the meaning comes directly off the page without any conscious intervention at all. Now, this technology has the potential to be a game-changer, because the only other solution for deafness is a cochlear implant, and that requires an invasive surgery. And this can be built for 40 times cheaper than a cochlear implant, which opens up this technology globally, even for the poorest countries. Now, we ' ve been very encouraged by our results with sensory substitution, but what we ' ve been thinking a lot about is sensory addition. How could we use a technology like this to add a completely new kind of sense, to expand the human umvelt? For example, could we feed real-time data from the Internet directly into somebody ' s brain, and can they develop a direct perceptual experience? So here ' s an experiment we ' re doing in the lab. A subject is feeling a real- time streaming feed from the Net of data for five seconds. Then, two buttons appear, and he has to make a choice. He doesn ’ t know what ’ s going on. He makes a choice, and he gets feedback after one second. Now, here ’ s the thing : The subject has no idea what all the patterns mean, but we ’ re seeing if he gets better at figuring out which button to press. He doesn ’ t know that what we ’ re feeding is real-time data from the stock market, and he ’ s making buy and sell decisions. And the feedback is telling him whether he did the right thing or not. And what we ’ re seeing is, can we expand the human umvelt so that he comes to have, after several weeks, a direct perceptual experience of the economic movements of the planet. So we ’ ll report on that later to see how well this goes. Here ’ s another thing we ’ re doing : During the talks this morning, we ’ ve been automatically scraping Twitter for the TED2015 hashtag, and we ’ ve been doing an automated sentiment analysis, which means, are people using positive words or negative words or neutral? And while this has been going on, I have been feeling this, and so I am plugged in to the aggregate emotion of thousands of people in real time, and that ’ s a new kind of human experience, because now I can know how everyone ’ s doing and how much you ’ re loving this. It ’ s a bigger experience than a human can normally have. We ’ re also expanding the umvelt of pilots. So in this case, the vest is streaming nine different measures from this quadcopter, so pitch and yaw and roll and orientation and heading, and that improves this pilot ’ s ability to fly it. It ’ s essentially like he ’ s extending his skin up there, far away. And that ’ s just the beginning. What we ’ re envisioning is taking a modern cockpit full of gauges and instead of trying to read the whole thing, you feel it. We live in a world of information now, and there is a difference between accessing big data and experiencing it. So I think there ’ s really no end to the possibilities on the horizon for human expansion. Just imagine an astronaut being able to feel the overall health of the International Space Station, or, for that matter, having you feel the invisible states of your own health, like your blood sugar and the state of your microbiome, or having 360-degree vision or seeing in infrared or ultraviolet. So the key is this : As we move into the future, we ’ re going to increasingly be able to choose our own peripheral devices. We no longer have to wait for Mother Nature ’ s sensory gifts on her timescales, but instead, like any good parent, she ’ s given us the tools that we need to go out and define our own trajectory. So the question now is, how do you want to go out and experience your universe? Thank you. Chris Anderson : Can you feel it? DE : Yeah. Actually, this was the first time I felt applause on the vest. It ’ s nice. It ’ s like a massage. CA : Twitter ’ s going crazy. Twitter ’ s going mad. So that stock market experiment. This could be the first experiment that secures its funding forevermore, right, if successful? DE : Well, that ’ s right, I wouldn ’ t have to write to NIH anymore. CA : Well look, just to be skeptical for a minute, I mean, this is amazing, but isn ’ t most of the evidence so far that sensory substitution works, not necessarily that sensory addition works? I mean, isn ’ t it possible that the blind person can see through their tongue because the visual cortex is still there, ready to process, and that that is needed as part of it? DE : That ’ s a great question. We actually have no idea what the theoretical limits are of what kind of data the brain can take in. The general story, though, is that it ’ s extraordinarily flexible. So when a person goes blind, what we used to call their visual cortex gets taken over by other things, by touch, by hearing, by vocabulary. So what that tells us is that the cortex is kind of a one-trick pony. It just runs certain kinds of computations on things. And when we look around at things like braille, for example, people are getting information through bumps on their fingers. So I don ’ t think we have any reason to think there ’ s a theoretical limit that we know the edge of. CA

: If this checks out, you ’ re going to be deluged. There are so many possible applications for this. Are you ready for this? What are you most excited about, the direction it might go? DE : I mean, I think there ’ s a lot of applications here. In terms of beyond sensory substitution, the things I started mentioning about astronauts on the space station, they spend a lot of their time monitoring things, and they could instead just get what ’ s going on, because what this is really good for is multidimensional data. The key is this : Our visual systems are good at detecting blobs and edges, but they ’ re really bad at what our world has become, which is screens with lots and lots of data. We have to crawl that with our attentional systems. So this is a way of just feeling the state of something, just like the way you know the state of your body as you ’ re standing around. So I think heavy machinery, safety, feeling the state of a factory, of your equipment, that ’ s one place it ’ ll go right away. CA : David Eagleman, that was one mind-blowing talk. Thank you very much. DE : Thank you, Chris.

Text Sample 933: NEG Dim 6 – 2015 – Score 1.00 – 2015/t001615.txt

I ’ m a potter, which seems like a fairly humble vocation. I know a lot about pots. I ’ ve spent about 15 years making them. One of the things that really excites me in my artistic practice and being trained as a potter is that you very quickly learn how to make great things out of nothing ; that I spent a lot of time at my wheel with mounds of clay trying stuff ; and that the limitations of my capacity, my ability, was based on my hands and my imagination ; that if I wanted to make a really nice bowl and I didn ’ t know how to make a foot yet, I would have to learn how to make a foot ; that that process of learning has been very, very helpful to my life. I feel like, as a potter, you also start to learn how to shape the world. There have been times in my artistic capacity that I wanted to reflect on other really important moments in the history of the U. S., the history of the world where tough things happened, but how do you talk about tough ideas without separating people from that content? Could I use art like these old, discontinued firehoses from Alabama, to talk about the complexities of a moment of civil rights in the ’ 60s? Is it possible to talk about my father and I doing labor projects? My dad was a roofer, construction guy, he owned small businesses, and at 80, he was ready to retire and his tar kettle was my inheritance. Now, a tar kettle doesn ’ t sound like much of an inheritance. It wasn ’ t. It was stinky and it took up a lot of space in my studio, but I asked my dad if he would be willing to make some art with me, if we could reimagine this kind of nothing material as something very special. And by elevating the material and my dad ’ s skill, could we start to think about tar just like clay, in a new way, shaping it differently, helping us to imagine what was possible? After clay, I was then kind of turned on to lots of different kinds of materials, and my studio grew a lot because I thought, well, it ’ s not really about the material, it ’ s about our capacity to shape things. I became more and more interested in ideas and more and more things that were happening just outside my studio. Just to give you a little bit of context, I live in Chicago. I live on the South Side now. I ’ m a West Sider. For those of you who are not Chicagoans, that won ’ t mean anything, but if I didn ’ t mention that I was a West Sider, there would be a lot of people in the city that would be very upset. The neighborhood that I live in is Grand Crossing. It ’ s a neighborhood that has seen better days. It is not a gated community by far. There is lots of abandonment in my neighborhood, and while I was kind of busy making pots and busy making art and having a good art career, there was all of this stuff that was happening just outside my studio. All of us know about failing housing markets and the challenges of blight, and I feel like we talk about it with some of our cities more than others, but I think a lot of our U. S. cities and beyond have the challenge of blight, abandoned buildings that people no longer know what to do anything with. And so I thought, is there a way that I could start to think about these buildings as an extension or an expansion of my artistic practice? And that if I was thinking along with other creatives — architects, engineers, real estate finance people — that us together might be able to kind of think in more complicated ways about the reshaping of cities. And so I bought a building. The building was really affordable. We tricked it out. We made it as beautiful as we could to try to just get some activity happening on my block. Once I bought the building for about 18, 000 dollars, I didn ’ t have any money left. So I started sweeping the building as a kind of performance. This is performance art, and people would come over, and I would start sweeping. Because the broom was free and sweeping was free. It worked out. But we would use the building, then, to stage exhibitions, small dinners, and we found that that building on my block, Dorchester — we now referred to the block as Dorchester projects — that in a way that building became a kind of gathering site for lots of different kinds of activity. We turned the building into what we called now the Archive House. The Archive House would do all of these amazing things. Very significant people in the city and beyond would find themselves in the middle of the hood. And that ’ s when I felt like maybe there was a relationship between my history with clay and this new thing that was starting to develop, that we were slowly starting to reshape how people imagined the South Side of the city. One house turned into a few houses, and we always tried to suggest that not only is creating a beautiful vessel important, but the contents of what happens in those buildings is also very important. So we were not only thinking about development, but we were thinking about the program, thinking about the kind of connections that could happen between one house and another, between one neighbor and another. This building became what we call the Listening House, and it has a collection of discarded books from the Johnson Publishing Corporation, and other books from an old bookstore that was going out of business. I was actually just wanting to activate these buildings as much as I could with whatever and whoever would join me. In Chicago, there ’ s amazing building stock. This building, which had been the former crack house on the block, and when the building became abandoned, it became a great opportunity to really imagine what else could happen there. So this space we converted into what we call Black Cinema House. Black Cinema House was an opportunity in the hood to screen films that were important and relevant to the folk who lived around me, that if we wanted to show an old Melvin Van Peebles film, we could. If we wanted to show”Car Wash,”we could. That would be awesome. The building we soon outgrew, and we had to move to a larger space. Black Cinema House, which was made from just a small piece of clay, had to grow into a much larger piece of clay, which is now my studio. What I realized was that for those of you who are zoning junkies, that some of the things that I was doing in these buildings that had been left behind, they were not the uses by which the buildings were built, and that there are city policies that say,”Hey, a house that is residential needs to stay residential.”But what do you do in neighborhoods when ain ’ t nobody interested in living there? That the people who have the means to leave have already left? What do we do with these abandoned buildings? And so I was trying to wake them up using culture. We found that that was so exciting for folk, and people were so responsive to the work, that we had to then find bigger buildings. By the time we found bigger buildings, there was, in part, the resources necessary to think about those things. In this bank that we called the Arts Bank, it was in pretty bad shape. There was about six feet of standing water. It was a difficult project to finance, because banks weren ’ t interested in the neighborhood because people weren ’ t interested in the neighborhood because nothing had happened there. It was dirt. It was nothing. It was nowhere. And so we just started imagining, what else could happen in this building? And so now that the rumor of my block has spread, and lots of people are starting to visit, we ’ ve found that the bank can now be a center for exhibition, archives, music performance, and that there are people who are now interested in being adjacent to those buildings because we brought some heat, that we kind of made a fire. One of the archives that we ’ ll have there is this Johnson Publishing Corporation. We ’ ve also started to collect memorabilia from American history, from people who live or have lived in that neighborhood. Some of these images are degraded images of black people, kind of histories of very challenging content, and where better than a neighborhood with young people who are constantly asking themselves about their identity to talk about some of the complexities of race and class? In some ways, the bank represents a hub, that we ’ re trying to create a pretty hardcore node of cultural activity, and that if we could start to make multiple hubs and connect some cool green stuff around there, that the buildings that we ’ ve purchased and rehabbed, which is now around 60 or 70 units, that if we could land miniature Versailles on top of that, and connect these buildings by a beautiful greenbelt — — that this place where people never wanted to be would become an important destination for folk from all over the country and world. In some ways, it feels very much like I ’ m a potter, that we tackle the things that are at our wheel, we try with the skill that we have to think about this next bowl that I want to make. And it went from a bowl to a singular house to a block to a neighborhood to a cultural district to thinking about the city, and at every point, there were things that I didn ’ t know that I had to learn. I ’ ve never learned so much about zoning law in my life. I never thought I ’ d have to. But as a result of that, I ’ m finding that there ’ s not just room for my own artistic practice, there ’ s room for a lot of other artistic practices. So people started asking us,”Well, Theaster, how are you going to go to scale?”and,”What ’ s your sustainability plan?”And what I found was that I couldn ’ t export myself, that what seems necessary in cities like Akron, Ohio, and Detroit, Michigan, and Gary, Indiana, is that there are people in those places who already believe in those places, that are already dying to make those places beautiful, and that often, those people who are passionate about a place are disconnected from the resources necessary to make cool things happen, or disconnected from a contingency of people that could help make things happen. So now, we ’ re starting to give advice around the country on how to start with what you got, how to start with the things that are in front of you, how to make something out of nothing, how to reshape your world at a wheel or at your block or at the scale of the city. Thank you so much. June Cohen : Thank you. So I think many people watching this will be asking themselves the question you just raised at the end : How can they do this in their own city? You can ’ t export yourself. Give us a few pages out of your playbook about what someone who is inspired about their city can do to take on projects like yours? Theaster Gates : One of the things I ’ ve found that ’ s really important is giving thought to not just the kind of individual project, like an old house, but what ’ s the relationship between an old house, a local school, a small bodega, and is there some kind of synergy between those things? Can you get those folk talking? I ’ ve found that in cases where neighborhoods have failed, they still often have a pulse. How do you identify the pulse in that place, the passionate people, and then how do you get folk who have been fighting, slogging for 20 years, reenergized about the place that they live? And so someone has to do that work. If I were a traditional developer, I would be talking about buildings alone, and then putting a"For Lease"sign in the window. I think that you actually have to curate more than that, that there ' s a way in which you have to be mindful about, what are the businesses that I want to grow here? And then, are there people who live in this place who want to grow those businesses with me? Because I think it ' s not just a cultural space or housing ; there has to be the recreation of an economic core. So thinking about those things together feels right. JC : It ' s hard to get people to create the spark again when people have been slogging for 20 years. Are there any methods you ' ve found that have helped break through? TG : Yeah, I think that now there are lots of examples of folk who are doing amazing work, but those methods are sometimes like, when the media is constantly saying that only violent things happen in a place, then based on your skill set and the particular context, what are the things that you can do in your neighborhood to kind of fight some of that? So I ' ve found that if you ' re a theater person, you have outdoor street theater festivals. In some cases, we don ' t have the resources in certain neighborhoods to do things that are a certain kind of splashy, but if we can then find ways of making sure that people who are local to a place, plus people who could be supportive of the things that are happening locally, when those people get together, I think really amazing things can happen. JC : So interesting. And how can you make sure that the projects you ' re creating are actually for the disadvantaged and not just for the sort of vegetarian indie movie crowd that might move in to take advantage of them. TG : Right on. So I think this is where it starts to get into the thick weeds. JC : Let ' s go there. TG : Right now, Grand Crossing is 99 percent black, or at least living, and we know that maybe who owns property in a place is different from who walks the streets every day. So it ' s reasonable to say that Grand Crossing is already in the process of being something different than it is today. But are there ways to think about housing trusts or land trusts or a mission-based development that starts to protect some of the space that happens, because when you have 7, 500 empty lots in a city, you want something to happen there, but you need entities that are not just interested in the development piece, but entities that are interested in the stabilization piece, and I feel like often the developer piece is really motivated, but the other work of a kind of neighborhood consciousness, that part doesn ' t live anymore. So how do you start to grow up important watchdogs that ensure that the resources that are made available to new folk that are coming in are also distributed to folk who have lived in a place for a long time. JC : That makes so much sense. One more question : You make such a compelling case for beauty and the importance of beauty and the arts. There would be others who would argue that funds would be better spent on basic services for the disadvantaged. How do you combat that viewpoint, or come against it? TG : I believe that beauty is a basic service. Often what I have found is that when there are resources that have not been made available to certain under-resourced cities or neighborhoods or communities, that sometimes culture is the thing that helps to ignite, and that I can ' t do everything, but I think that there ' s a way in which if you can start with culture and get people kind of reinvested in their place, other kinds of adjacent amenities start to grow, and then people can make a demand that ' s a poetic demand, and the political demands that are necessary to wake up our cities, they also become very poetic. JC : It makes perfect sense to me. Theaster, thank you so much for being here with us today. Thank you. Theaster Gates.

Hello everybody. Audience : Hello. Keith Lowe : Fantastic! This is like a schoolroom or something. My name is Keith Lowe. I am an historian of the Second World War and its aftermath, and even I have to admit that I ' ve chosen a pretty crowded field to study. I went into my local bookshop recently, and this is what I saw. Thousands of books about the Second World War are published every year, and, actually, to tell you the truth, this is only a very tiny selection of what ' s on offer. We in the West, and, actually, increasingly people in other parts of the world too, we are just a little bit obsessed by the Second World War. We have whole TV stations which seem devoted to it. We write books about it, we write novels about it, we make films about it. We have university courses which are devoted to the Second World War. Whole museums are built to house World War II collections. Even our politicians like to get in on this act. Whenever there is an important anniversary of the war, they tend to gather and commemorate it, and make speeches. So, for example, at the 70th anniversary of the D-Day landings, June 2014, 17 heads of state took time out of their schedules to come and spend the day on the Normandy beaches. Seventeen! This included people like Barack Obama, Vladimir Putin, the chancellor of Germany, Angela Merkel, and so on. From my own country, we sent not only our Prime Minister, but also Queen Elisabeth II, who is - I mean, she is now in her nineties and largely retired from public life. What other international event can do all this? Even international summits struggle to get so many world leaders into one place at the same time. My question is : Why? What is it that all these world leaders, in fact what is it that all of us, think it is that we ' re remembering? Why are we all so obsessed by the the Second World War? You might think that somebody like me would be pretty pleased with this situation. As long as the World War II industry is booming, I am always going to have a job, right? But actually there is something about it that I find really a little bit disturbing, and I don ' t know whether that is just because I have an inherent distrust of a lot of politicians, or whether it ' s because I ' ve been trained to always question everything. But it strikes me that a lot of the rhetoric that gets thrown around about the Second World War, particularly by people like politicians and journalists and diplomats and so on, a lot of it doesn ' t seem to be about the Second World War at all ; it seems to be about something else. I ' m not sure if I ' ve exactly put my finger on precisely what that thing is, but it seems to be something like a way of fostering national pride, or just trying to get people to feel good about themselves. Along the way, it seems to me that the Second World War has been turned into a little bit of a cartoon, where everybody knows who the good guys were, and everybody knows who the bad guys were. There is precious little space left anymore for any of that difficult grey area in between. To give you some kind of an idea about what on earth it is I am going on about, let me tell you a story from my own country, from Britain. In Britain, we like to think we are the real heroes of the Second World War. We tell stories about how we stood alone against the Nazis, about how we endured the bombing of the Blitz ; how we kept calm and carried on, and eventually fought our way back into Europe and liberated it. We still call the Second World War"Our Finest Hour", as if it is some kind of golden age in our history. So whenever there is any kind of anniversary, or important event based around the Second World War, we Brits really go for it. One of these events happened quite recently, in the summer of 2012, when we opened up a brand new war memorial right in the middle of central London. It was a memorial to the men of Bomber Command, the men who flew the planes over Germany, dropped bombs and so on. This is what it looks like. As you can see, it ' s not exactly a shy and retiring piece of architecture, it ' s actually quite huge. It ' s by far the largest war memorial that we have in London, and I can tell you there are a lot of war memorials in London. As you walk into this thing, there is an inscription which tells you that it ' s dedicated to the 55, 000 men of Bomber Command who lost their lives during World War II. Now, when this first opened, in the summer of 2012, I went along to have a look, see what I thought of it, have a walk around. There is something really quite moving about it actually. You step in through these great big pillars, and, up on the wall, you can see carved into the stone, there is a quotation from Winston Churchill saying exactly how much we owe to these men who lost their lives. Parts of the memorial are built out of an actual World War II aircraft that was shot down during the war. So they put a lot of thought into this. It ' s actually really quite inspiring. So as I was walking around this monument, I couldn ' t help but feel this real surge of pride. I felt proud of these men who had given their lives for something that I hold dear. I felt proud of my country, I felt proud of the British way of life which had produced heroes like this. And yet, there was this little voice in the back of my head which just wouldn ' t go away because I know that 55, 000 men of Bomber Command died during World War II, but I also know that 500, 000 Germans died beneath the bombs that these men dropped. A lot of those Germans were Nazis, and I dare say that a lot of them probably deserved it. But the vast majority of these people were just ordinary men, women and children, just like you and me. Are any of these people at all mentioned on this memorial? Of course they are not. If you would suggest such a thing in the summer of 2012, you probably would have been lynched. The Germans were our enemies during the Second World War. You can ' t mention the Germans on a British national monument. And yet not to mention them, to pretend that somehow this didn ' t happen, or even worse, that somehow it doesn ' t matter, that too makes me feel a little bit uncomfortable. Okay, the Germans are a difficult problem, so let ' s just put them to one side for a minute, and let ' s think instead about the other nationalities. And here is where the story starts getting interesting. Because if there is one thing that we Brits always forget about the bomber war, it ' s the fact that we didn ' t only bomb Germany. More than a third of British and American bombs dropped on Europe during the war were dropped not on Germany but on those countries we were supposed to be liberating. As a consequence, 50, 000 French civilians were killed by our bombs. 10, 000 Dutch civilians were killed by our bombs. Are any of these people mentioned on this memorial? Of course they ' re not. And it was while I was thinking about that particular group, that it finally dawned on me - actually something I probably should have realized right from the start - which is that memorials like this aren ' t designed to tell the whole story ; they are only designed to tell those parts of the story that make British people feel good about themselves. That ' s all very well and good, but it does come at a cost. And I couldn ' t help thinking when I was walking around this thing : This was the summer of 2012, this was the summer when the Olympic Games was coming to London. So at exactly the moment when the entire world was arriving in our city, the message that we were advertising was that we will remember our wartime dead, but we won ' t remember yours. It ' s like the exact opposite of the Olympic spirit. It ' s not only the British who do this, of course it ' s not. Every nation does it, the Americans, for example. The Americans like to call their wartime veterans"the greatest generation that any society has ever produced", as if they have some kind of monopoly on heroism or something. They backed it up with a thousand Hollywood movies full of square- jawed American heroes defeating evil in the name of truth and freedom. The Chinese are the same. You know that in 2013 alone, Chinese TV companies produced over 200 TV dramatizations about the Second World War, each of them telling almost an identical story. Only, of course, this time, it ' s the Japanese who are all the evil monsters, and the Chinese who are all selfless heroes. And, of course, I could say the same thing about the French or the Koreans or the Norwegians or the Greeks. We all do this. We all like to think that we were the heroes. We all like to think that we were the victims. But what we don ’ t like to remember is those grey areas. And it ’ s that which I find most uncomfortable about this, because, as far as I am concerned, it ’ s the grey areas that make history interesting. In a sense, all good history is about the grey areas. But a lot of people don ’ t seem to have time for complicated stories. They don ’ t have time for difficult and uncomfortable emotions. In fact, I ’ m quickly coming to the conclusion that a lot of people don ’ t really have time for history at all. What they really want is a myth. Now, you might ask yourselves : What does any of this matter? I mean, we all like a good story, don ’ t we? If that story makes us feel good about ourselves, then so much the better. It ’ s all in the past anyway, so what does it matter? But that ’ s just the problem, isn ’ t it? Because it ’ s not all in the past. And there is a dark side to all of these stories and myths that can be really damaging. When the former Yugoslavia tore itself apart in the 1990s, it did so with World War II songs on its lips, and World War II atrocities in its heart. When the Ukraine crisis broke out in 2014, Ukrainians and Russians accused one another of acting like Nazis. And then, of course, Hillary Clinton weighed in and started comparing Vladimir Putin to Hitler. These sorts of comparisons don ’ t do anything to foster rational debate. If you were in an argument with someone, the last thing that is going to calm things down is that you start accusing them of being a Nazi. If you don ’ t believe me, next time you ’ re in an argument with your wife or your husband, give it a try and see what kind of reaction you get. I can see some of you seem to have tried it. My point is that as soon as we start bringing the Second World War into any of our arguments, we get so sort of carried away with our own national myths that all we actually end up doing is stirring things back up again. Let me give you a couple of examples. Take this economic crisis which has rocked the world since 2008. Here we are in Athens, and you all know about the economic crisis. All across Southern Europe, people have been suffering a real austerity, and largely this has been imposed by the European Union. But it ’ s not always the European Union that gets the blame for this. Quite often, as the largest and most powerful country in the union, it ’ s Germany that gets the blame. Now, how has this been portrayed in the press? Have we had a calm, rational economic debate about it? This is the way that the Italian press portrayed the situation in 2012 :”Quarto Reich.””The Fourth Reich.”This is the Italian way of saying that modern-day Germany is no better than the Nazis, as if there is a direct link between World War II and today. And take a look at that picture. They ’ ve managed to dig something out that makes it look like Angela Merkel is making a Nazi salute. How about the Greek press? How have the Greeks portrayed it? Well, here is a Greek newspaper. from the same year, 2012, and you will notice a photograph of Angela Merkel once again, this time in a Nazi uniform. Obviously, it has been photoshopped. But what about that headline in red?”Memorandum macht frei.”This is a direct reference to the motto that was written above the gates of the concentration camps in places like Auschwitz and Dachau. The implication here is that the whole of Greece is going to become like one giant German concentration camp as a consequence of the economic deal they ’ ve had to do. Now, this is the sort of thing that makes an historian like me want to just give up and go and become a window cleaner or something. I mean, it ’ s historical nonsense. None of these headlines have anything to do with the Second World War at all. They are about a modern-day problem, a modern situation. The only reason to mention the Second World War is to provoke an emotional response. If I have one message that I want you to take away with you today, it is this : Whenever you hear a politician, or a journalist, or a diplomat, mention the Second World War, I want alarm bells to ring. Because when public figures speak about the Second World War, they are not talking about what actually happened, they ' re invoking a myth. So whenever you hear a politician mention the war, I want you to ask yourselves what it is he is really trying to do. Is he trying to inspire you? - In which case that is relatively harmless. Or is he trying to fill you with fear? Is he trying to draw people together? In which case, again, that is relatively harmless. Or is he really trying to drive people apart? And above all, I want you to remind yourselves, and to remind everybody you know, that the Second World War is over. We live in a different world, with different values and different problems. These problems will never be solved, and they certainly will never be solved peacefully, if all we can think to do is to resurrect the Second World War. You know, history is a messy business, particularly the history of the Second World War. It ' s not there to make us feel good about ourselves ; it ' s often ugly and uncomfortable, and desperately complicated. It ' s full of those grey areas. If we could all just learn to accept that, then this world, our world, would be a much more peaceful place. Thank you.

Two years ago, I have to say there was no problem. Two years ago, I knew exactly what an icon looked like. It looks like this. Everybody ' s icon, but also the default position of a curator of Italian Renaissance paintings, which I was then. And in a way, this is also another default selection. Leonardo da Vinci ' s exquisitely soulful image of the"Lady with an Ermine."And I use that word, soulful, deliberately. Or then there ' s this, or rather these : the two versions of Leonardo ' s"Virgin of the Rocks"that were about to come together in London for the very first time. In the exhibition that I was then in the absolute throes of organizing. I was literally up to my eyes in Leonardo, and I had been for three years. So, he was occupying every part of my brain. Leonardo had taught me, during that three years, about what a picture can do. About taking you from your own material world into a spiritual world. He said, actually, that he believed the job of the painter was to paint everything that was visible and invisible in the universe. That ' s a huge task. And yet, somehow he achieves it. He shows us, I think, the human soul. He shows us the capacity of ourselves to move into a spiritual realm. To see a vision of the universe that ' s more perfect than our own. To see God ' s own plan, in some sense. So this, in a sense, was really what I believed an icon was. At about that time, I started talking to Tom Campbell, director here of the Metropolitan Museum, about what my next move might be. The move, in fact, back to an earlier life, one I ' d begun at the British Museum, back to the world of three dimensions — of sculpture and of decorative arts — to take over the department of European sculpture and decorative arts, here at the Met. But it was an incredibly busy time. All the conversations were done at very peculiar times of the day — over the phone. In the end, I accepted the job without actually having been here. Again, I ' d been there a couple of years before, but on that particular visit. So, it was just before the time that the Leonardo show was due to open when I finally made it back to the Met, to New York, to see my new domain. To see what European sculpture and decorative arts looked like, beyond those Renaissance collections with which I was so already familiar. And I thought, on that very first day, I better tour the galleries. Fifty-seven of these galleries — like 57 varieties of baked beans, I believe. I walked through and I started in my comfort zone in the Italian Renaissance. And then I moved gradually around, feeling a little lost sometimes. My head, also still full of the Leonardo exhibition that was about to open, and I came across this. And I thought to myself : What the hell have I done? There was absolutely no connection in my mind at all and, in fact, if there was any emotion going on, it was a kind of repulsion. This object felt utterly and completely alien. Silly at a level that I hadn ’ t yet understood silliness to be. And then it was made worse — there were two of them. So, I started thinking about why it was, in fact, that I disliked this object so much. What was the anatomy of my distaste? Well, so much gold, so vulgar. You know, so nouveau riche, frankly. Leonardo himself had preached against the use of gold, so it was absolutely anathema at that moment. And then there ’ s little pretty sprigs of flowers everywhere. And finally, that pink. That damned pink. It ’ s such an extraordinarily artificial color. I mean, it ’ s a color that I can ’ t think of anything that you actually see in nature, that looks that shade. The object even has its own tutu. This little flouncy, spangly, bottomy bit that sits at the bottom of the vase. It reminded me, in an odd kind of way, of my niece ’ s fifth birthday party. Where all the little girls would come either as a princess or a fairy. There was one who would come as a fairy princess. You should have seen the looks. And I realize that this object was in my mind, born from the same mind, from the same womb, practically, as Barbie Ballerina. And then there ’ s the elephants. Those extraordinary elephants with their little, sort of strange, sinister expressions and Greta Garbo eyelashes, with these golden tusks and so on. I realized this was an elephant that had absolutely nothing to do with a majestic march across the Serengeti. It was a Dumbo nightmare. But something more profound was happening as well. These objects, it seemed to me, were quintessentially the kind that I and my liberal left friends in London had always seen as summing up something deplorable about the French aristocracy in the 18th century. The label had told me that these pieces were made by the Svres Manufactory, made of porcelain in the late 1750s, and designed by a designer called Jean-Claude Duplessis, actually somebody of extraordinary distinction as I later learned. But for me, they summed up a kind of, that sort of sheer uselessness of the aristocracy in the 18th century. I and my colleagues had always thought that these objects, in way, summed up the idea of, you know — no wonder there was a revolution. Or, indeed, thank God there was a revolution. There was a sort of idea really, that, if you owned a vase like this, then there was really only one fate possible. So, there I was — in a sort of paroxysm of horror. But I took the job and I went on looking at these vases. I sort of had to because they ’ re on a through route in the Met. So, almost anywhere I went, there they were. They had this kind of odd sort of fascination, like a car accident. Where I couldn ’ t stop looking. And as I did so, I started thinking : Well, what are we actually looking at here? And what I started with was understanding this as really a supreme piece of design. It took me a little time. But, that tutu for example — actually, this is a piece that does dance in its own way. It has an extraordinary lightness and yet, it is also amazing balanced. It has these kinds of sculptural ingredients. And then the play between — actually really quite carefully disposed color and gilding, and the sculptural surface, is really rather remarkable. And then I realized that this piece went into the kiln four times, at least four times in order to arrive at this. How many moments for accident can you think of that could have happened to this piece? And then remember, not just one, but two. So he ’ s having to arrive at two exactly matched vases of this kind. And then this question of uselessness. Well actually, the end of the trunks were originally candle holders. So what you would have had were candles on either side. Imagine that effect of candlelight on that surface. On the slightly uneven pink, on the beautiful gold. It would have glittered in an interior, a little like a little firework. And at that point, actually, a firework went off in my brain. Somebody reminded me that, that word ’ fancy ’ — which in a sense for me, encapsulated this object — actually comes from the same root as the word ’ fantasy. ’ And that what this object was just as much in a way, in its own way, as a Leonardo da Vinci painting, is a portal to somewhere else. This is an object of the imagination. If you think about the mad 18th-century operas of the time — set in the Orient. If you think about divans and perhaps even opium-induced visions of pink elephants, then at that point, this object starts to make sense. This is an object which is all about escapism. It ’ s about an escapism that happens — that the aristocracy in France sought very deliberately to distinguish themselves from ordinary people. It ’ s not an escapism that we feel particularly happy with today, however. And again, going on thinking about this, I realize that in a way we ’ re all victims of a certain kind of tyranny of the triumph of modernism whereby form and function in an object have to follow one another, or are deemed to do so. And the extraneous ornament is seen as really, essentially, criminal. It ’ s a triumph, in a way, of bourgeois values rather than aristocratic ones. And that seems fine. Except for the fact that it becomes a kind of sequestration of imagination. So just as in the 20th century, so many people had the idea that their faith took place on the Sabbath day, and the rest of their lives — their lives of washing machines and orthodontics — took place on another day. Then, I think we ’ ve started doing the same. We ’ ve allowed ourselves to lead our fantasy lives in front of screens. In the dark of the cinema, with the television in the corner of the room. We ’ ve eliminated, in a sense, that constant of the imagination that these vases represented in people ’ s lives. So maybe it ’ s time we got this back a little. I think it ’ s beginning to happen. In London, for example, with these extraordinary buildings that have been appearing over the last few years. Redolent, in a sense, of science fiction, turning London into a kind of fantasy playground. It ’ s actually amazing to look out of a high building nowadays there. But even then, there ’ s a resistance. London has called these buildings the Gherkin, the Shard, the Walkie Talkie — bringing these soaring buildings down to Earth. There ’ s an idea that we don ’ t want these anxious-making, imaginative journeys to happen in our daily lives. I feel lucky in a way, I ’ ve encountered this object. I found him on the Internet when I was looking up a reference. And there he was. And unlike the pink elephant vase, this was a kind of love at first sight. In fact, reader, I married him. I bought him. And he now adorns my office. He ’ s a Staffordshire figure made in the middle of the 19th century. He represents the actor, Edmund Kean, playing Shakespeare ’ s Richard III. And it ’ s based, actually, on a more elevated piece of porcelain. So I loved, on an art historical level, I loved that layered quality that he has. But more than that, I love him. In a way that I think would have been impossible without the pink Svres vase in my Leonardo days. I love his orange and pink breeches. I love the fact that he seems to be going off to war, having just finished the washing up. He seems also to have forgotten his sword. I love his pink little cheeks, his munchkin energy. In a way, he ’ s become my sort of alter ego. He ’ s, I hope, a little bit dignified, but mostly rather vulgar. And energetic, I hope, too. I let him into my life because the Svres pink elephant vase allowed me to do so. And before that Leonardo, I understood that this object could become part of a journey for me every day, sitting in my office. I really hope that others, all of you, visiting objects in the museum, and taking them home and finding them for yourselves, will allow those objects to flourish in your imaginative lives. Thank you very much.

Chris Anderson : We had Edward Snowden here a couple days ago, and this is response time. And several of you have written to me with questions to ask our guest here from the NSA. So Richard Ledgett is the 15th deputy director of the National Security Agency, and he ’ s a senior civilian officer there, acts as its chief operating officer, guiding strategies, setting internal policies, and serving as the principal advisor to the director. And all being well, welcome, Rick Ledgett, to TED. Richard Ledgett : I ’ m really thankful for the opportunity to talk to folks here. I look forward to the conversation, so thanks for arranging for that. CA : Thank you, Rick. We appreciate you joining us. It ’ s certainly quite a strong statement that the NSA is willing to reach out and show a more open face here. You saw, I think, the talk and interview that Edward Snowden gave here a couple days ago. What did you make of it? RL : So I think it was interesting. We didn ’ t realize that he was going to show up there, so kudos to you guys for arranging a nice surprise like that. I think that, like a lot of the things that have come out since Mr. Snowden started disclosing classified information, there were some kernels of truth in there, but a lot of extrapolations and half-truths in there, and I ’ m interested in helping to address those. I think this is a really important conversation that we ’ re having in the United States and internationally, and I think it is important and of import, and so given that, we need to have that be a fact-based conversation, and we want to help make that happen. CA : So the question that a lot of people have here is, what do you make of Snowden ’ s motivations for doing what he did, and did he have an alternative way that he could have gone? RL : He absolutely did have alternative ways that he could have gone, and I actually think that characterizing him as a whistleblower actually hurts legitimate whistleblowing activities. So what if somebody who works in the NSA — and there are over 35, 000 people who do. They ’ re all great citizens. They ’ re just like your husbands, fathers, sisters, brothers, neighbors, nephews, friends and relatives, all of whom are interested in doing the right thing for their country and for our allies internationally, and so there are a variety of venues to address if folks have a concern. First off, there ’ s their supervisor, and up through the supervisory chain within their organization. If folks aren ’ t comfortable with that, there are a number of inspectors general. In the case of Mr. Snowden, he had the option of the NSA inspector general, the Navy inspector general, the Pacific Command inspector general, the Department of Defense inspector general, and the intelligence community inspector general, any of whom would have both kept his concerns in classified channels and been happy to address them. He had the option to go to congressional committees, and there are mechanisms to do that that are in place, and so he didn ’ t do any of those things. CA : Now, you had said that Ed Snowden had other avenues for raising his concerns. The comeback on that is a couple of things : one, that he certainly believes that as a contractor, the avenues that would have been available to him as an employee weren ’ t available, two, there ’ s a track record of other whistleblowers, like [Thomas Andrews Drake] being treated pretty harshly, by some views, and thirdly, what he was taking on was not one specific flaw that he ’ d discovered, but programs that had been approved by all three branches of government. I mean, in that circumstance, couldn ’ t you argue that what he did was reasonable? RL : No, I don ’ t agree with that. I think that the — sorry, I ’ m getting feedback through the microphone there — the actions that he took were inappropriate because of the fact that he put people ’ s lives at risk, basically, in the long run, and I know there ’ s been a lot of talk in public by Mr. Snowden and some of the journalists that say that the things that have been disclosed have not put national security and people at risk, and that is categorically not true. They actually do. I think there ’ s also an amazing arrogance to the idea that he knows better than the framers of the Constitution in how the government should be designed and work for separation of powers and the fact that the executive and the legislative branch have to work together and they have checks and balances on each other, and then the judicial branch, which oversees the entire process. I think that ’ s extremely arrogant on his part. CA : Can you give a specific example of how he put people ’ s lives at risk? RL : Yeah, sure. So the things that he ’ s disclosed, the capabilities, and the NSA is a capabilities-based organization, so when we have foreign intelligence targets, legitimate things of interest — like, terrorists is the iconic example, but it includes things like human traffickers, drug traffickers, people who are trying to build advanced weaponry, nuclear weapons, and build delivery systems for those, and nation-states who might be executing aggression against their immediate neighbors, which you may have some visibility into some of that that ’ s going on right now, the capabilities are applied in very discrete and measured and controlled ways. So the unconstrained disclosure of those capabilities means that as adversaries see them and recognize,”Hey, I might be vulnerable to this,”they move away from that, and we have seen targets in terrorism, in the nation-state area, in smugglers of various types, and other folks who have, because of the disclosures, moved away from our ability to have insight into what they ’ re doing. The net effect of that is that our people who are overseas in dangerous places, whether they ’ re diplomats or military, and our allies who are in similar situations, are at greater risk because we don ’ t see the threats that are coming their way. CA : So that ’ s a general response saying that because of his revelations, access that you had to certain types of information has been shut down, has been closed down. But the concern is that the nature of that access was not necessarily legitimate in the first place. I mean, describe to us this Bullrun program where it ’ s alleged that the NSA specifically weakened security in order to get the type of access that you ’ ve spoken of. RL : So there are, when our legitimate foreign intelligence targets of the type that I described before, use the global telecommunications system as their communications methodology, and they do, because it ’ s a great system, it ’ s the most complex system ever devised by man, and it is a wonder, and lots of folks in the room there are responsible for the creation and enhancement of that, and it ’ s just a wonderful thing. But it ’ s also used by people who are working against us and our allies. And so if I ’ m going to pursue them, I need to have the capability to go after them, and again, the controls are in how I apply that capability, not that I have the capability itself. Otherwise, if we could make it so that all the bad guys used one corner of the Internet, we could have a domain, badguy. com. That would be awesome, and we could just concentrate all our efforts there. That ’ s not how it works. They ’ re trying to hide from the government ’ s ability to isolate and interdict their actions, and so we have to swim in that same space. But I will tell you this. So NSA has two missions. One is the Signals Intelligence mission that we ’ ve unfortunately read so much about in the press. The other one is the Information Assurance mission, which is to protect the national security systems of the United States, and by that, that ’ s things like the communications that the president uses, the communications that control our nuclear weapons, the communications that our military uses around the world, and the communications that we use with our allies, and that some of our allies themselves use. And so we make recommendations on standards to use, and we use those same standards, and so we are invested in making sure that those communications are secure for their intended purposes. CA : But it sounds like what you ’ re saying is that when it comes to the Internet at large, any strategy is fair game if it improves America ’ s safety. And I think this is partly where there is such a divide of opinion, that there ’ s a lot of people in this room and around the world who think very differently about the Internet. They think of it as a momentous invention of humanity, kind of on a par with the Gutenberg press, for example. It ’ s the bringer of knowledge to all. It ’ s the connector of all. And it ’ s viewed in those sort of idealistic terms. And from that lens, what the NSA has done is equivalent to the authorities back in Germany inserting some device into every printing press that would reveal which books people bought and what they read. Can you understand that from that viewpoint, it feels outrageous? RL : I do understand that, and I actually share the view of the utility of the Internet, and I would argue it ’ s bigger than the Internet. It is a global telecommunications system. The Internet is a big chunk of that, but there is a lot more. And I think that people have legitimate concerns about the balance between transparency and secrecy. That ’ s sort of been couched as a balance between privacy and national security. I don ’ t think that ’ s the right framing. I think it really is transparency and secrecy. And so that ’ s the national and international conversation that we ’ re having, and we want to participate in that, and want people to participate in it in an informed way. So there are things, let me talk there a little bit more, there are things that we need to be transparent about : our authorities, our processes, our oversight, who we are. We, NSA, have not done a good job of that, and I think that ’ s part of the reason that this has been so revelational and so sensational in the media. Nobody knew who we were. We were the No Such Agency, the Never Say Anything. There ’ s takeoffs of our logo of an eagle with headphones on around it. And so that ’ s the public characterization. And so we need to be more transparent about those things. What we don ’ t need to be transparent about, because it ’ s bad for the U. S., it ’ s bad for all those other countries that we work with and that we help provide information that helps them secure themselves and their people, it ’ s bad to expose operations and capabilities in a way that allows the people that we ’ re all working against, the generally recognized bad guys, to counter those. CA : But isn ’ t it also bad to deal a kind of body blow to the American companies that have essentially given the world most of the Internet services that matter? RL : It is. It ’ s really the companies are in a tough position, as are we, because the companies, we compel them to provide information, just like every other nation in the world does. Every industrialized nation in the world has a lawful intercept program where they are requiring companies to provide them with information that they need for their security, and the companies that are involved have complied with those programs in the same way that they have to do when they ’ re operating in Russia or the U. K. or China or India or France, any country that you choose to name. And so the fact that these revelations have been broadly characterized as”you can ’ t trust company A because your privacy is suspect with them”is actually only accurate in the sense that it ’ s accurate with every other company in the world that deals with any of those countries in the world. And so it ’ s being picked up by people as a marketing advantage, and it ’ s being marketed that way by several countries, including some of our allied countries, where they are saying,”Hey, you can ’ t trust the U. S., but you can trust our telecom company, because we ’ re safe.”And they ’ re actually using that to counter the very large technological edge that U. S. companies have in areas like the cloud and Internet-based technologies. CA : You ’ re sitting there with the American flag, and the American Constitution guarantees freedom from unreasonable search and seizure. How do you characterize the American citizen ’ s right to privacy? Is there such a right? RL : Yeah, of course there is. And we devote an inordinate amount of time and pressure, inordinate and appropriate, actually I should say, amount of time and effort in order to ensure that we protect that privacy. and beyond that, the privacy of citizens around the world, it ' s not just Americans. Several things come into play here. First, we ' re all in the same network. My communications, I ' m a user of a particular Internet email service that is the number one email service of choice by terrorists around the world, number one. So I ' m there right beside them in email space in the Internet. And so we need to be able to pick that apart and find the information that ' s relevant. In doing so, we ' re going to necessarily encounter Americans and innocent foreign citizens who are just going about their business, and so we have procedures in place that shreds that out, that says, when you find that, not if you find it, when you find it, because you ' re certain to find it, here ' s how you protect that. These are called minimization procedures. They ' re approved by the attorney general and constitutionally based. And so we protect those. And then, for people, citizens of the world who are going about their lawful business on a day-to-day basis, the president on his January 17 speech, laid out some additional protections that we are providing to them. So I think absolutely, folks do have a right to privacy, and that we work very hard to make sure that that right to privacy is protected. CA : What about foreigners using American companies ' Internet services? Do they have any privacy rights? RL : They do. They do, in the sense of, the only way that we are able to compel one of those companies to provide us information is when it falls into one of three categories : We can identify that this particular person, identified by a selector of some kind, is associated with counterterrorist or proliferation or other foreign intelligence target. CA : Much has been made of the fact that a lot of the information that you ' ve obtained through these programs is essentially metadata. It ' s not necessarily the actual words that someone has written in an email or given on a phone call. It ' s who they wrote to and when, and so forth. But it ' s been argued, and someone here in the audience has talked to a former NSA analyst who said metadata is actually much more invasive than the core data, because in the core data you present yourself as you want to be presented. With metadata, who knows what the conclusions are that are drawn? Is there anything to that? RL : I don ' t really understand that argument. I think that metadata ' s important for a couple of reasons. Metadata is the information that lets you find connections that people are trying to hide. So when a terrorist is corresponding with somebody else who ' s not known to us but is engaged in doing or supporting terrorist activity, or someone who ' s violating international sanctions by providing nuclear weapons-related material to a country like Iran or North Korea, is trying to hide that activity because it ' s illicit activity. What metadata lets you do is connect that. The alternative to that is one that ' s much less efficient and much more invasive of privacy, which is gigantic amounts of content collection. So metadata, in that sense, actually is privacy- enhancing. And we don ' t, contrary to some of the stuff that ' s been printed, we don ' t sit there and grind out metadata profiles of average people. If you ' re not connected to one of those valid intelligence targets, you are not of interest to us. CA : So in terms of the threats that face America overall, where would you place terrorism? RL : I think terrorism is still number one. I think that we have never been in a time where there are more places where things are going badly and forming the petri dish in which terrorists take advantage of the lack of governance. An old boss of mine, Tom Fargo, Admiral Fargo, used to describe it as arcs of instability. And so you have a lot of those arcs of instability in the world right now, in places like Syria, where there ' s a civil war going on and you have massive numbers, thousands and thousands of foreign fighters who are coming into Syria to learn how to be terrorists and practice that activity, and lots of those people are Westerners who hold passports to European countries or in some cases the United States, and so they are basically learning how to do jihad and have expressed intent to go out and do that later on in their home countries. You ’ ve got places like Iraq, which is suffering from a high level of sectarian violence, again a breeding ground for terrorism. And you have the activity in the Horn of Africa and the Sahel area of Africa. Again, lots of weak governance which forms a breeding ground for terrorist activity. So I think it ’ s very serious. I think it ’ s number one. I think number two is cyber threat. I think cyber is a threat in three ways : One way, and probably the most common way that people have heard about it, is due to the theft of intellectual property, so basically, foreign countries going in, stealing companies ’ secrets, and then providing that information to state-owned enterprises or companies connected to the government to help them leapfrog technology or to gain business intelligence that ’ s then used to win contracts overseas. That is a hugely costly set of activities that ’ s going on right now. Several nation- states are doing it. Second is the denial-of-service attacks. You ’ re probably aware that there have been a spate of those directed against the U. S. financial sector since 2012. Again, that ’ s a nation-state who is executing those attacks, and they ’ re doing that as a semi-anonymous way of reprisal. And the last one is destructive attacks, and those are the ones that concern me the most. Those are on the rise. You have the attack against Saudi Aramco in 2012, August of 2012. It took down about 35, 000 of their computers with a Wiper-style virus. You had a follow-on a week later to a Qatari company. You had March of 2013, you had a South Korean attack that was attributed in the press to North Korea that took out thousands of computers. Those are on the rise, and we see people expressing interest in those capabilities and a desire to employ them. CA : Okay, so a couple of things here, because this is really the core of this, almost. I mean, first of all, a lot of people who look at risk and look at the numbers don ’ t understand this belief that terrorism is still the number one threat. Apart from September 11, I think the numbers are that in the last 30 or 40 years about 500 Americans have died from terrorism, mostly from homegrown terrorists. The chance in the last few years of being killed by terrorism is far less than the chance of being killed by lightning. I guess you would say that a single nuclear incident or bioterrorism act or something like that would change those numbers. Would that be the point of view? RL : Well, I ’ d say two things. One is, the reason that there hasn ’ t been a major attack in the United States since 9 / 11, that is not an accident. That ’ s a lot of hard work that we have done, that other folks in the intelligence community have done, that the military has done, and that our allies around the globe have done. You ’ ve heard the numbers about the tip of the iceberg in terms of numbers of terrorist attacks that NSA programs contributed to stopping was 54, 25 of those in Europe, and of those 25, 18 of them occurred in three countries, some of which are our allies, and some of which are beating the heck out of us over the NSA programs, by the way. So that ’ s not an accident that those things happen. That ’ s hard work. That ’ s us finding intelligence on terrorist activities and interdicting them through one way or another, through law enforcement, through cooperative activities with other countries and sometimes through military action. The other thing I would say is that your idea of nuclear or chem-bio-threat is not at all far-fetched and in fact there are a number of groups who have for several years expressed interest and desire in obtaining those capabilities and work towards that. CA : It ’ s also been said that, of those 54 alleged incidents, that as few as zero of them were actually anything to do with these controversial programs that Mr. Snowden revealed, that it was basically through other forms of intelligence, that you ’ re looking for a needle in a haystack, and the effects of these programs, these controversial programs, is just to add hay to the stack, not to really find the needle. The needle was found by other methods. Isn ’ t there something to that? RL : No, there ’ s actually two programs that are typically implicated in that discussion. One is the section 215 program, the U. S. telephony metadata program, and the other one is popularly called the PRISM program, and it ’ s actually section 702 of the FISA Amendment Act. But the 215 program is only relevant to threats that are directed against the United States, and there have been a dozen threats where that was implicated. Now what you ’ ll see people say publicly is there is no”but for”case, and so there is no case where, but for that, the threat would have happened. But that actually indicates a lack of understanding of how terrorist investigations actually work. You think about on television, you watch a murder mystery. What do you start with? You start with a body, and then they work their way from there to solve the crime. We ’ re actually starting well before that, hopefully before there are any bodies, and we ’ re trying to build the case for who the people are, what they ’ re trying to do, and that involves massive amounts of information. Think of it is as mosaic, and it ’ s hard to say that any one piece of a mosaic was necessary to building the mosaic, but to build the complete picture, you need to have all the pieces of information. On the other, the non-U. S. -related threats out of those 54, the other 42 of them, the PRISM program was hugely relevant to that, and in fact was material in contributing to stopping those attacks. CA : Snowden said two days ago that terrorism has always been what is called in the intelligence world”a cover for action,”that it ’ s something that, because it invokes such a powerful emotional response in people, it allows the initiation of these programs to achieve powers that an organization like yours couldn ’ t otherwise have. Is there any internal debate about that? RL : Yeah. I mean, we debate these things all the time, and there is discussion that goes on in the executive branch and within NSA itself and the intelligence community about what ’ s right, what ’ s proportionate, what ’ s the correct thing to do. And it ’ s important to note that the programs that we ’ re talking about were all authorized by two different presidents, two different political parties, by Congress twice, and by federal judges 16 different times, and so this is not NSA running off and doing its own thing. This is a legitimate activity of the United States foreign government that was agreed to by all the branches of the United States government, and President Madison would have been proud. CA : And yet, when congressmen discovered what was actually being done with that authorization, many of them were completely shocked. Or do you think that is not a legitimate reaction, that it ’ s only because it ’ s now come out publicly, that they really knew exactly what you were doing with the powers they had granted you? RL : Congress is a big body. There ’ s 535 of them, and they change out frequently, in the case of the House, every two years, and I think that the NSA provided all the relevant information to our oversight committees, and then the dissemination of that information by the oversight committees throughout Congress is something that they manage. I think I would say that Congress members had the opportunity to make themselves aware, and in fact a significant number of them, the ones who are assigned oversight responsibility, did have the ability to do that. And you ’ ve actually had the chairs of those committees say that in public. CA : Now, you mentioned the threat of cyberattacks, and I don ’ t think anyone in this room would disagree that that is a huge concern, but do you accept that there ’ s a tradeoff between offensive and defensive strategies, and that it ’ s possible that the very measures taken to,”weaken encryption,”and allow yourself to find the bad guys, might also open the door to forms of cyberattack? RL : So I think two things. One is, you said weaken encryption. I didn ’ t. And the other one is that the NSA has both of those missions, and we are heavily biased towards defense, and, actually, the vulnerabilities that we find in the overwhelming majority of cases, we disclose to the people who are responsible for manufacturing or developing those products. We have a great track record of that, and we ’ re actually working on a proposal right now to be transparent and to publish transparency reports in the same way that the Internet companies are being allowed to publish transparency reports for them. We want to be more transparent about that. So again, we eat our own dog food. We use the standards, we use the products that we recommend, and so it ’ s in our interest to keep our communications protected in the same way that other people ’ s need to be. CA : Edward Snowden, when, after his talk, was wandering the halls here in the bot, and I heard him say to a couple of people, they asked him about what he thought of the NSA overall, and he was very complimentary about the people who work with you, said that it ’ s a really impassioned group of employees who are seeking to do the right thing, and that the problems have come from just some badly conceived policies. He came over certainly very reasonably and calmly. He didn ’ t come over like a crazy man. Would you accept that at least, even if you disagree with how he did it, that he has opened a debate that matters? RL : So I think that the discussion is an important one to have. I do not like the way that he did it. I think there were a number of other ways that he could have done that that would have not endangered our people and the people of other nations through losing visibility into what our adversaries are doing. But I do think it ’ s an important conversation. CA : It ’ s been reported that there ’ s almost a difference of opinion with you and your colleagues over any scenario in which he might be offered an amnesty deal. I think your boss, General Keith Alexander, has said that that would be a terrible example for others ; you can ’ t negotiate with someone who ’ s broken the law in that way. But you ’ ve been quoted as saying that, if Snowden could prove that he was surrendering all undisclosed documents, that a deal maybe should be considered. Do you still think that? RL : Yeah, so actually, this is my favorite thing about that”60 Minutes”interview was all the misquotes that came from that. What I actually said, in response to a question about, would you entertain any discussions of mitigating action against Snowden, I said, yeah, it ’ s worth a conversation. This is something that the attorney general of the United States and the president also actually have both talked about this, and I defer to the attorney general, because this is his lane. But there is a strong tradition in American jurisprudence of having discussions with people who have been charged with crimes in order to, if it benefits the government, to get something out of that, that there ’ s always room for that kind of discussion. So I ’ m not presupposing any outcome, but there is always room for discussion. CA : To a lay person it seems like he has certain things to offer the U. S., the government, you, others, in terms of putting things right and helping figure out a smarter policy, a smarter way forward for the future. Do you see, has that kind of possibility been entertained at all? RL : So that ’ s out of my lane. That ’ s not an NSA thing. That would be a Department of Justice sort of discussion. I ’ ll defer to them. CA : Rick, when Ed Snowden ended his talk, I offered him the chance to share an idea worth spreading. What would be your idea worth spreading for this group? RL : So I think, learn the facts. This is a really important conversation, and it impacts, it ’ s not just NSA, it ’ s not just the government, it ’ s you, it ’ s the Internet companies. The issue of privacy and personal data is much bigger than just the government, and so learn the facts. Don ’ t rely on headlines, don ’ t rely on sound bites, don ’ t rely on one-sided conversations. So that ’ s the idea, I think, worth spreading. We have a sign, a badge tab, we wear badges at work with lanyards, and if I could make a plug, my badge lanyard at work says,”Dallas Cowboys.”Go Dallas. I ’ ve just alienated half the audience, I know. So the lanyard that our people who work in the organization that does our crypto- analytic work have a tab that says,”Look at the data.”So that ’ s the idea worth spreading. Look at the data. CA : Rick, it took a certain amount of courage, I think, actually, to come and speak openly to this group. It ’ s not something the NSA has done a lot of in the past, and plus the technology has been challenging. We truly appreciate you doing that and sharing in this very important conversation. Thank you so much. RL : Thanks, Chris.

Thank you. You ’ re nice to invite me. What I want to do is talk a little bit about Watergate - which was a long time ago - what we ’ ve learned about corruption, what we ’ ve learned about Nixon since then - because of his secret taping system, there ’ s so much that comes out ; it ’ s almost as if every season, there is a new batch of Nixon tapes - and then try to address the question a little bit, What does that mean? What does Watergate, what does the kind of corruption that leads to the resignation of a president entail, and what happened? The beginning of Watergate was five burglars caught in the Democratic headquarters at the Watergate, and it seemed bizarre. I remember that morning being called in to the Post, and there ’ s, you know, burglars - I was sent down to the courthouse where the burglars were arraigned. They all had business suits. Now, there are lots of burglars in Washington ; none to my knowledge ever had business suits. And they were there before the judge, and the judge asked the leader where he worked, and the leader said, and the judge said,”Speak up!”And so it was James McCord, he said,”CIA.”And the judge then said,”No, speak up so we can hear.”And so, McCord said,”CIA.”I was in the front row, listening - and I ’ m going to speak English here because that ’ s what happened - I said, not in a whisper but kind of blurted it out,”Holy shit.”So it was 26 months of Watergate and the revelations that sort of tumbled out, and as you look at it now, you know, What really was Watergate? Wasn ’ t just that burglary ; it was the series of illegal activities designed to subvert the process of electing a president in this country and nominating - in the case in 1972 - of the Democratic opponent to Nixon. Sam Ervin, who led the Senate Watergate Committee, addressed the question,”What was Watergate?”and he said,”It was this subversion, but why? Why Watergate?”And his answer, which I think is right, is it was”a lust for political power,”retaining that political power that Nixon had. So as you look at”What was Watergate?”it was really five wars conducted by Nixon, led by Nixon. The first war was, interestingly enough, the war against the anti-war movement, the anti-Vietnam war movement, which was growing. Nixon had inherited the Vietnam War from President Johnson. He wanted to do it his way, which was”We ’ re going to withdraw troops, but we ’ re going to bomb and bomb and bomb,”which of course is what they did, but he hated the anti-war movement so strongly that he had one of his aides in the White House, Thomas Charles Huston, draw up a top-secret plan of how to deal with the domestic opposition, people who were thought to be radicals or were radicals. This Huston plan - Huston, in proposing it to Nixon, in writing said,”Oh, this is illegal,”because it involved break-ins, wiretapping, surveillance - everything necessary to bring the anti-war movement, or the violent parts of the anti-war movement, to toe. And Nixon approved it. J. Edgar Hoover, the FBI Director, objected, not because he thought, gee, these are illegal things, but he thought and he knew that break-ins, wiretapping, surveillance - that ’ s the job of the FBI, that ’ s our turf. We don ’ t want to share it. And so Nixon rescinded the Huston plan. But then, things in 1971 got so intense, and there ’ s a tape of a meeting in the Oval Office. It was June 17th, 1971. Now, this is a year before the Watergate

burglary, and it ' s Nixon, his Chief of Staff, Haldeman, and Henry Kissinger, the National Security Advisor, and there is a document that they want to get out of the Brookings Institution that ' s going to help in criticizing President Johnson and his conduct of the war, and they ' re talking about it, and, literally, Bob Haldeman said,"Oh, if we get this document, we ' ll be able to blackmail Lyndon Johnson."Think about it. Can you imagine John Adams, the second president, sitting around and saying,"Let ' s get something so we can blackmail George Washington"? But here, that was the proposal, and Nixon said,"Well, I want to burglarize the Brookings Institution to get this document."Listen to the tape. It is chilling - President of the United States saying,"Let ' s blow the safe,""I want to do this on a thievery basis."You know, it ' s that anybody would talk this way ; that your President would talk this way is stunning. Now, the second war of Nixon was against the news media ; set up an operation in the White House called the"Plumbers,"led by Howard Hunt and Gordon Liddy. They were to find out leaks to the news media. There were 17 wiretaps of reporters, White House officials to gain information. They burglarized the psychiatrist ' s office of Daniel Ellsberg, who had leaked the Pentagon Papers to The New York Times and The Washington Post. Now think of that. The government has decided - and Ellsberg is under criminal indictment also - they decide they ' re going to get him, so let ' s break into his psychiatrist ' s office to get dirt on him. The third war was to take this apparatus of Hunt and Liddy in the Plumbers, and the wiretapping and the break- ins and bring it into the White House and to turn it against the Democrats - and that was the Watergate operation - and sabotage and espionage that accompanied that. The fourth war was, significantly, the war against justice, which is the cover-up :"Oh, my God, we ' ve been caught. Now we have to lie."And if you listen to some of these tapes - here is the President of the United States proposing to his counsel, John Dean,"Well, we have to pay the Watergate burglars for their silence,"and John Dean, the counsel, says on this tape, said,"Well, it ' s going to be expensive."And Nixon said,"Well, how much?"And Dean said,"Well, a million dollars."Nixon :"Oh, I know where I can get that."In the White House. Level of criminality which is astonishing. Then the whole series of investigations, special prosecutor of Senate Watergate Committee, the impeachment investigation of Nixon, and he resigns in August, 1974. And what happened there, he lived for 20 more years, and the fifth war was the war against history, to say,"Oh, no, Watergate was really not that important. I did not commit impeachable offenses,"having surrogates go out and say,"Well, there are unanswered questions about Watergate"- which there are. But I think in a very important way, you look at Nixon and this record on the tapes - what he did is - the presidency is supposed to be something that can do good for a majority of people in the country. Listen to those tapes ; time and time again, it ' s"Let ' s use the power of the Presidency as an instrument of personal revenge. Let ' s get the IRS, the FBI, the CIA on Nixon ' s real or perceived opponents."The dog - and this is ultimately, I think, the final corruption of Nixon in Watergate - the dog that doesn ' t bark on the tapes. No one, to my knowledge, ever says, What does the country need? What would be good for the people? It ' s all in this vicious way of let ' s screw somebody, let ' s help Nixon ' s career, let ' s prosecute the Vietnam War so he ' ll get reelected even though - in one memo in my latest book, Nixon actually wrote out, which we didn ' t know at the time, just found this out last year, he said,"Well, the bombing has achieved zilch, nothing."And what did he do the year he was running for reelection? He increased the bombing, intensified it : 1. 1 million tons of bombs in Southeast Asia. So the day Nixon resigned, he called his aides, friends, cabinet officers to the East Room of the White House and had his wife, two daughters, son-in-law standing there, and there was no script - it was Nixon raw - and he talked about his mother and his father, and he was sweating. It was just a lot of people worried that he was going to come unglued, because it was televised nationally. Then at the end, Nixon kind of waved his hand,"Ah, here is why I called you all here."And he said the following :"Always remember, others may hate you, but those who hate you don ’ t win unless you hate them, and then you destroy yourself."Now think of the wisdom in that : hate was the poison, hate was what drove him and his presidency, and at that moment he had to leave office, he understood the poison and how hate had destroyed him, had put the country on edge, and if there is anything to reflect on now if you look back, as we ’ ve seen the current presidential election, on the surface and underneath, there is too much contempt, too much hate, and that, if you think about it, we need to know what ’ s really going on. We don ’ t know enough, and if we don ’ t know what ’ s going on, the judge who said it got it right :"Democracies die in darkness."And history proves that. And we think we ’ re resilient - I think we are. We think we ’ re strong. We think that we have a process that will protect us from that. But if we are infected with hate and infected with the lack of knowledge - who these people really are, what ’ s inside, what ’ s driving them - we could partake of losing our wonderful democracy. Thank you very much.

I love football. I started playing when I was 12 years old. It has been a dominant presence in my life ever since. From youth football, to high-school, and college, and now as a coach. Football has played a huge role in shaping me as a person. Recently, I achieved my dream job of becoming varsity line coach at my high-school alma mater. Last March I was at a coaching clinic. It was late in the afternoon and I was tired. These coaching clinics can tend to be a bit of a drag at times. Hours and hours, and days and days of the presentations on the x ’ s and o ’ s of football. There was one presentation, though, that looked interesting. It was titled"Disneyland."This presentation changed my life. This talk was not about the x ’ s and o ’ s of football. But rather about the emotional truth of why we coaches coach. We are coaches so that we can have a meaningful impact on young people ’ s lives, and help them become better people. As coaches, we want to have the kind of impact that assure that one day our players can hold hands with their children and walk into Disneyland. The moral of this incredible message was this : as coaches, we can preach to our players that it is more important for them be better people than it is great football players. But if we are not honest with them and do not practice what we preach, it will never work. In other words, teenagers are adept at sensing bullshit. As coaches, we must be willing to share our truth. And sharing our truth is the only way we can have the kind of impact we truly want to have. The coach who gave this presentation, his truth was that his son became a drug addict due to the bullying and pressure he was subjected to from his dad being the head football coach at his school in Eagle, Idaho, a program that at the time was not very succesful. I went from a presentation on how to run the power against a 3-4 defense to the most honest, emotional and inspirational talks on coaching philosophy I ’ d ever heard. So it got me thinking. What ’ s my bullshit? What is unique about me that I bring to the table that will have a meaningful impact? What is my truth? My truth is this. I ’ m a former college football player. I ’ m a current high-school football coach. And I am gay. I battled with this truth for a long time. Personally, professionally and certainly in my coaching and athletic career. It was an identity crisis that had a tremendous impact on my life. Long before I heard this presentation on Disneyland I thought about coming out in football. In the beginning, I told myself”You ’ re gay and you will take it to the grave.”Now, I ’ ve come a long way since that day. Thank you. Thank you. I ’ ve come a long way since that day, but the process almost cost me my life. I chose to come out to family and friends starting in August of 2014. I told my immediate family first, and then I carefully picked my way through family and friends, trying to choose the right time and place. Only being part way out of the closet meant that I had to be two different people and always be very aware of where I was and whom I was with. It caused a constant state of panic and anxiety. So the question became,”Is it important for me to come out publicly?”Yes it is, and here is why. My time in-and-out of the closet helped my realize that there are other people in my situation. And it is not a pretty one. It also helped me realize that coming out is not about sharing my bedroom habits, but about giving myself permission to live my life in its entirety. Let me explain. After talking to one of my fellow coaches, he told me :”I don ’ t talk about my sex life with players, why would you?”And it ’ s a legitimate question, but a common misconception about coming out. Again, I ’ m not talking about my sex life. I ’ m talking about my life. It ’ s often said that your private life is your private life. But imagine you are put in a situation where going virtually anywhere and doing very normal, healthy, human activities with your significant other could have substantial consequences on your life, reputation and career. You gain a very new perspective on what your private life actually is. That ’ s how being in the closet affected my life. It was quite literally a closet. No space, no freedom and no comfort. It ’ s a suffocating lifestyle with measurable effects. It wore me down until eventually I was abusing alcohol and prescription medications to keep my anxiety in check. It was a horrible time in my life. When you are put in a situation of having to live a double life, it strips you off dignity and normal coping mechanisms. At that time the only place I felt somewhat safe was at home. I was living with my parents, who had been nothing but supportive, but I did not feel comfortable bringing guys around them yet. So there I was. No safe place, no place to be myself, facing a new lifestyle I did not know how to navigate, the anxiety and depression were inescapable. And I responded the only way I felt I could at the time. Drugs and alcohol. Football teaches so many great life lessons to those who play or coach. Perseverance, toughness, respect, self-esteem. But the one negative thing that it does teach is that being gay is not OK. To be frank, the word”faggot”is used almost as much as the word”football.”There is a misconception about the prominence of gay men in football, and it has serious consequences. I ’ m the perfect example of this issue. An all-state player in high-school. A two-year varsity captain among a select few in school history to go play for a top tier division 1 football program. The youngest line coach in the history of the school. And I was ready to kill myself. Because I thought that even though this program was like a second family to me, I feared they would shun me. It was a crushing weight that I was carrying with me all the time. Months and months of sleep deprivation, severe anxiety and depression. And honestly, a lack of the will to live began to catch up with me. It was too much. I was desperate for a way out. Any way out. One night I reached for a bottle of vodka and a couple of pills. I didn ’ t see a way out. I just wanted it to be over. If I couldn ’ t be me and still live my life, what was the point? I passed out on the bathroom floor, and my mom found me. I was fortunate to wake up the next day. I escaped an overdose. It was the scariest moment of my life. When I woke up the next day, I knew I really wasn ’ t ready to give up. And when I heard that talk on Disneyland, I knew how, when and why it was important for me to share my story. I worried for so long about how the football community would react. And while at this point only time will tell, my experience has given me a theory. It ’ s simple. One day, being gay in football will be normal. But in order for that to happen, those of us who are gay need to stand up and own it. The coaches I know are perfect examples of this. I have been met with nothing but love and support from my fellow coaching friends. But now the challenge is to change this. And not just on the private level. The odds of a gay teen or young adult abusing drugs, alcohol, or experiencing anxiety, depression, or even attempting suicide are drastically high. When it comes to football, the social norm that we ’ ve created leaves many without hope. We ’ ve made incredible progress in the equal rights movement under the law. But now we must tackle a different problem. Social equality and the message we send to young people who play football. Continue to use sports to inspire, connect and to share a positive message. A healthy person cannot live life in the dark. And if you are out there, stand up and own it. Thank you.

”Judge, I want to tell you something. I want to tell you something. I been watching you and you ’ re not two-faced. You treat everybody the same.”That was said to me by a transgender prostitute who before I had gotten on the bench had fired her public defender, insulted the court officer and yelled at the person sitting next to her,”I don ’ t know what you ’ re looking at. I look better than the girl you ’ re with.”She said this to me after I said her male name low enough so that it could be picked up by the record, but I said her female name loud enough so that she could walk down the aisle towards counselor ’ s table with dignity. This is procedural justice, also known as procedural fairness, at its best. You see, I am the daughter of an African-American garbageman who was born in Harlem and spent his summers in the segregated South. Soy la hija de una peluquera dominicana. I do that to make sure you ’ re still paying attention. I ’ m the daughter of a Dominican beautician who came to this country for a better life for her unborn children. My parents taught me, you treat everyone you meet with dignity and respect, no matter how they look, no matter how they dress, no matter how they spoke. You see, the principles of fairness were taught to me at an early age, and unbeknownst to me, it would be the most important lesson that I carried with me to the Newark Municipal Court bench. And because I was dragged off the playground at the early age of 10 to translate for family members as they began to migrate to the United States, I understand how daunting it can be for a person, a novice, to navigate any government system. Every day across America and around the globe, people encounter our courts, and it is a place that is foreign, intimidating and often hostile towards them. They are confused about the nature of their charges, annoyed about their encounters with the police and facing consequences that might impact their relationships, their finances and even their liberty. Let me paint a picture for you of what it ’ s like for the average person who encounters our courts. First, they ’ re annoyed as they ’ re probed going through court security. They finally get through court security, they walk around the building, they ask different people the same question and get different answers. When they finally get to where they ’ re supposed to be, it gets really bad when they encounter the courts. What would you think if I told you that you could improve people ’ s court experience, increase their compliance with the law and court orders, all the while increasing the public ’ s trust in the justice system with a simple idea? Well, that simple idea is procedural justice and it ’ s a concept that says that if people perceive they are treated fairly and with dignity and respect, they ’ ll obey the law. Well, that ’ s what Yale professor Tom Tyler found when he began to study as far back in the ’ 70s why people obey the law. He found that if people see the justice system as a legitimate authority to impose rules and regulations, they would follow them. His research concluded that people would be satisfied with the judge ’ s rulings, even when the judge ruled against them, if they perceived that they were treated fairly and with dignity and respect. And that perception of fairness begins with what? Begins with how judges speak to court participants. Now, being a judge is sometimes like having a reserve seat to a tragic reality show that has no commercial interruptions and no season finale. It ’ s true. People come before me handcuffed, drug-sick, depressed, hungry and mentally ill. When I saw that their need for help was greater than my fear of appearing vulnerable on the bench, I realized that not only did I need to do something, but that in fact I could do something. The good news is is that the principles of procedural justice are easy and can be implemented as quickly as tomorrow. The even better news, that it can be done for free. The first principle is voice. Give people an opportunity to speak, even when you ’ re not going to let them speak. Explain it.”Sir, I ’ m not letting you speak right now. You don ’ t have an attorney. I don ’ t want you to say anything that ’ s going to hurt your case.”For me, assigning essays to defendants has been a tremendous way of giving them voice. I recently gave an 18-year-old college student an essay. He lamented his underage drinking charge. As he stood before me reading his essay, his voice cracking and his hands trembling, he said that he worried that he had become an alcoholic like his mom, who had died a couple of months prior due to alcohol- related liver disease. You see, assigning a letter to my father, a letter to my son,”If I knew then what I know now...””If I believed one positive thing about myself, how would my life be different?”gives the person an opportunity to be introspective, go on the inside, which is where all the answers are anyway. But it also gives them an opportunity to share something with the court that goes beyond their criminal record and their charges. The next principle is neutrality. When increasing public trust in the justice system, neutrality is paramount. The judge cannot be perceived to be favoring one side over the other. The judge has to make a conscious decision not to say things like,”my officer,””my prosecutor,””my defense attorney.”And this is challenging when we work in environments where you have people assigned to your courts, the same people coming in and out of your courts as well. When I think of neutrality, I ’ m reminded of when I was a new Rutgers Law grad and freshly minted attorney, and I entered an arbitration and I was greeted by two grey-haired men who were joking about the last game of golf they played together and planning future social outings. I knew my client couldn ’ t get a fair shot in that forum. The next principle is understand. It is critical that court participants understand the process, the consequences of the process and what ’ s expected of them. I like to say that legalese is the language we use to confuse. I am keenly aware that the people who appear before me, many of them have very little education and English is often their second language. So I speak plain English in court. A great example of this was when I was a young judge — oh no, I mean younger judge. When I was a younger judge, a senior judge comes to me, gives me a script and says,”If you think somebody has mental health issues, ask them these questions and you can get your evaluation.”So the first time I saw someone who had what I thought was a mental health issue, I went for my script and I started to ask questions.”Um, sir, do you take psycho — um, psychotrop — psychotropic medication?””Nope.””Uh, sir, have you treated with a psychiatrist before?””Nope.”But it was obvious that the person was suffering from mental illness. One day, in my frustration, I decided to scrap the script and ask one question.”Ma ’ am, do you take medication to clear your mind?””Yeah, judge, I take Haldol for my schizophrenia, Xanax for my anxiety.”The question works even when it doesn ’ t.”Mr. L, do you take medication to clear your mind?””No, judge, I don ’ t take no medication to clear my mind. I take medication to stop the voices in my head, but my mind is fine.”You see, once people understand the question, they can give you valuable information that allows the court to make meaningful decisions about the cases that are before them. The last principle is respect, that without it none of the other principles can work. Now, respect can be as simple as,”Good afternoon, sir.””Good morning, ma ’ am.”It ’ s looking the person in the eye who is standing before you, especially when you ’ re sentencing them. It ’ s when I say,”Um, how are you doing today? And what ’ s going on with you?”And not as a greeting, but as someone who is actually interested in the response. Respect is the difference between saying,”Ma ’ am, are you having difficulty understanding the information in the paperwork?”versus,”You can read and write, can ’ t you?”when you ’ ve realized there ’ s a literacy issue. And the good thing about respect is that it ’ s contagious. People see you being respectful to other folks and they impute that respect to themselves. You see, that ’ s what the transgender prostitute was telling me. I ’ m judging you just as much as you think you may be judging me. Now, I am not telling you what I think, I am telling you what I have lived, using procedural justice to change the culture at my courthouse and in the courtroom. After sitting comfortably for seven months as a traffic court judge, I was advised that I was being moved to the criminal court, Part Two, criminal courtroom. Now, I need you to understand, this was not good news. It was not. Part Two was known as the worst courtroom in the city, some folks would even say in the state. It was your typical urban courtroom with revolving door justice, you know, your regular lineup of low-level offenders — you know, the low-hanging fruit, the drug-addicted prostitute, the mentally ill homeless person with quality-of-life tickets, the high school dropout petty drug dealer and the misguided young people — you know, those folks doing a life sentence 30 days at a time. Fortunately, the City of Newark decided that Newarkers deserved better, and they partnered with the Center for Court Innovation and the New Jersey Judiciary to create Newark Community Solutions, a community court program that provided alternative sanctions. This means now a judge can sentence a defendant to punishment with assistance. So a defendant who would otherwise get a jail sentence would now be able to get individual counseling sessions, group counseling sessions as well as community giveback, which is what we call community service. The only problem is that this wonderful program was now coming to Newark and was going to be housed where? Part Two criminal courtroom. And the attitudes there were terrible. And the reason that the attitudes were terrible there was because everyone who was sent there understood they were being sent there as punishment. The officers who were facing disciplinary actions at times, the public defender and prosecutor felt like they were doing a 30-day jail sentence on their rotation, the judges understood they were being hazed just like a college sorority or fraternity. I was once told that an attorney who worked there referred to the defendants as”the scum of the earth”and then had to represent them. I would hear things from folks like,”Oh, how could you work with those people? They ’ re so nasty. You ’ re a judge, not a social worker.”But the reality is that as a society, we criminalize social ills, then sent people to a judge and say,”Do something.”I decided that I was going to lead by example. So my first foray into the approach came when a 60-something-year- old man appeared before me handcuffed. His head was lowered and his body was showing the signs of drug withdrawal. I asked him how long he had been addicted, and he said,”30 years.”And I asked him,”Do you have any kids?”And he said,”Yeah, I have a 32-year-old son.”And I said,”Oh, so you ’ ve never had the opportunity to be a father to your son because of your addiction.”He began to cry. I said,”You know what, I ’ m going to let you go home, and you ’ ll come back in two weeks, and when you come back, we ’ ll give you some assistance for your addiction.”Surprisingly, two weeks passed and he was sitting the courtroom. When he came up, he said,”Judge, I came back to court because you showed me more love than I had for myself.”And I thought, my God, he heard love from the bench? I could do this all day. Because the reality is that when the court behaves differently, then naturally people respond differently. The court becomes a place you can go to for assistance, like the 60-something-year-old schizophrenic homeless woman who was in distress and fighting with the voices in her head, and barges into court, and screams,”Judge! I just came by to see how you were doing.”I had been monitoring her case for a couple of months, her compliance with her medication, and had just closed out her case a couple of weeks ago. On this day she needed help, and she came to court. And after four hours of coaxing by the judge, the police officers and the staff, she is convinced to get into the ambulance that will take her to crisis unit so that she can get her medication. People become connected to their community when the court changes, like the 50-something-year-old man who told me,”Community service was terrible, Judge. I had to clean the park, and it was full of empty heroin envelopes, and the kids had to play there.”As he wrung his hands, he confessed,”Judge, I realized that it was my fault, because I used that same park to get high, and before you sent me there to do community service, I had never gone to the park when I wasn ’ t high, so I never noticed the children playing there.”Every addict in the courtroom lowered their head. Who better to teach that lesson? It helps the court reset its relationship with the community, like with the 20- something-year-old guy who gets a job interview through the court program. He gets a job interview at an office cleaning company, and he comes back to court to proudly say,”Judge, I even worked in my suit after the interview, because I wanted the guy to see how bad I wanted the job.”It ’ s what happens when a person in authority treats you with dignity and respect, like the 40-something-year-old guy who struts down the aisle and says,”Judge, do you notice anything different?”And when I look up, he ’ s pointing at his new teeth that he was able to get after getting a referral from the program, but he was able to get them to replace the old teeth that he lost as a result of years of heroin addiction. When he looks in the mirror, now he sees somebody who is worth saving. You see, I have a dream and that dream is that judges will use these tools to revolutionize the communities that they serve. Now, these tools are not miracle cure-alls, but they get us light-years closer to where we want to be, and where we want to be is a place that people enter our halls of justice and believe they will be treated with dignity and respect and know that justice will be served there. Imagine that, a simple idea. Thank you.

Text Sample 940: NEG Dim 6 – 2012 – Score 1.00 – 2012/t002459.txt

I ’ m going to start here. This is a hand-lettered sign that appeared in a mom and pop bakery in my old neighborhood in Brooklyn a few years ago. The store owned one of those machines that can print on plates of sugar. And kids could bring in drawings and have the store print a sugar plate for the top of their birthday cake. But unfortunately, one of the things kids liked to draw was cartoon characters. They liked to draw the Little Mermaid, they ’ d like to draw a smurf, they ’ d like to draw Micky Mouse. But it turns out to be illegal to print a child ’ s drawing of Micky Mouse onto a plate of sugar. And it ’ s a copyright violation. And policing copyright violations for children ’ s birthday cakes was such a hassle that the College Bakery said,"You know what, we ’ re getting out of that business. If you ’ re an amateur, you don ’ t have access to our machine anymore. If you want a printed sugar birthday cake, you have to use one of our prefab images — only for professionals."So there ’ s two bills in Congress right now. One is called SOPA, the other is called PIPA. SOPA stands for the Stop Online Piracy Act. It ’ s from the Senate. PIPA is short for PROTECTIP, which is itself short for Preventing Real Online Threats to Economic Creativity and Theft of Intellectual Property — because the congressional aides who name these things have a lot of time on their hands. And what SOPA and PIPA want to do is they want to do this. They want to raise the cost of copyright compliance to the point where people simply get out of the business of offering it as a capability to amateurs. Now the way they propose to do this is to identify sites that are substantially infringing on copyright — although how those sites are identified is never fully specified in the bills — and then they want to remove them from the domain name system. They want to take them out of the domain name system. Now the domain name system is the thing that turns human-readable names, like Google. com, into the kinds of addresses machines expect — 74. 125. 226. 212. Now the problem with this model of censorship, of identifying a site and then trying to remove it from the domain name system, is that it won ’ t work. And you ’ d think that would be a pretty big problem for a law, but Congress seems not to have let that bother them too much. Now the reason it won ’ t work is that you can still type 74. 125. 226. 212 into the browser or you can make it a clickable link and you ’ ll still go to Google. So the policing layer around the problem becomes the real threat of the act. Now to understand how Congress came to write a bill that won ’ t accomplish its stated goals, but will produce a lot of pernicious side effects, you have to understand a little bit about the back story. And the back story is this : SOPA and PIPA, as legislation, were drafted largely by media companies that were founded in the 20th century. The 20th century was a great time to be a media company, because the thing you really had on your side was scarcity. If you were making a TV show, it didn ’ t have to be better than all other TV shows ever made ; it only had to be better than the two other shows that were on at the same time — which is a very low threshold of competitive difficulty. Which meant that if you fielded average content, you got a third of the U. S. public for free — tens of millions of users for simply doing something that wasn ’ t too terrible. This is like having a license to print money and a barrel of free ink. But technology moved on, as technology is wont to do. And slowly, slowly, at the end of the 20th century, that scarcity started to get eroded — and I don ’ t mean by digital technology ; I mean by analog technology. Cassette tapes, video cassette recorders, even the humble Xerox machine created new opportunities for us to behave in ways that astonished the media business. Because it turned out we ’ re not really couch potatoes. We don ’ t really like to only consume. We do like to consume, but every time one of these new tools came along, it turned out we also like to produce and we like to share. And this freaked the media businesses out — it freaked them out every time. Jack Valenti, who was the head lobbyist for the Motion Picture Association of America, once likened the ferocious video cassette recorder to Jack the Ripper and poor, helpless Hollywood to a woman at home alone. That was the level of rhetoric. And so the media industries begged, insisted, demanded that Congress do something. And Congress did something. By the early 90s, Congress passed the law that changed everything. And that law was called the Audio Home Recording Act of 1992. What the Audio Home Recording Act of 1992 said was, look, if people are taping stuff off the radio and then making mixtapes for their friends, that is not a crime. That ’ s okay. Taping and remixing and sharing with your friends is okay. If you make lots and lots of high quality copies and you sell them, that ’ s not okay. But this taping business, fine, let it go. And they thought that they clarified the issue, because they ’ d set out a clear distinction between legal and illegal copying. But that wasn ’ t what the media businesses wanted. They had wanted Congress to outlaw copying full-stop. So when the Audio Home Recording Act of 1992 was passed, the media businesses gave up on the idea of legal versus illegal distinctions for copying because it was clear that if Congress was acting in their framework, they might actually increase the rights of citizens to participate in our own media environment. So they went for plan B. It took them a while to formulate plan B. Plan B appeared in its first full-blown form in 1998 — something called the Digital Millennium Copyright Act. It was a complicated piece of legislation, a lot of moving parts. But the main thrust of the DMCA was that it was legal to sell you uncopyable digital material — except that there ’ s no such things as uncopyable digital material. It would be, as Ed Felton once famously said,”Like handing out water that wasn ’ t wet.”Bits are copyable. That ’ s what computers do. That is a side effect of their ordinary operation. So in order to fake the ability to sell uncopyable bits, the DMCA also made it legal to force you to use systems that broke the copying function of your devices. Every DVD player and game player and television and computer you brought home — no matter what you thought you were getting when you bought it — could be broken by the content industries, if they wanted to set that as a condition of selling you the content. And to make sure you didn ’ t realize, or didn ’ t enact their capabilities as general purpose computing devices, they also made it illegal for you to try to reset the copyability of that content. The DMCA marks the moment when the media industries gave up on the legal system of distinguishing between legal and illegal copying and simply tried to prevent copying through technical means. Now the DMCA had, and is continuing to have, a lot of complicated effects, but in this one domain, limiting sharing, it has mostly not worked. And the main reason it hasn ’ t worked is the Internet has turned out to be far more popular and far more powerful than anyone imagined. The mixtape, the fanzine, that was nothing compared to what we ’ re seeing now with the Internet. We are in a world where most American citizens over the age of 12 share things with each other online. We share written things, we share images, we share audio, we share video. Some of the stuff we share is stuff we ’ ve made. Some of the stuff we share is stuff we ’ ve found. Some of the stuff we share is stuff we ’ ve made out of what we ’ ve found, and all of it horrifies those industries. So PIPA and SOPA are round two. But where the DMCA was surgical — we want to go down into your computer, we want to go down into your television set, down into your game machine, and prevent it from doing what they said it would do at the store — PIPA and SOPA are nuclear and they ’ re saying, we want to go anywhere in the world and censor content. Now the mechanism, as I said, for doing this, is you need to take out anybody pointing to those IP addresses. You need to take them out of search engines, you need to take them out of online directories, you need to take them out of user lists. And because the biggest producers of content on the Internet are not Google and Yahoo, they ’ re us, we ’ re the people getting policed. Because in the end, the real threat to the enactment of PIPA and SOPA is our ability to share things with one another. So what PIPA and SOPA risk doing is taking a centuries-old legal concept, innocent until proven guilty, and reversing it — guilty until proven innocent. You can ’ t share until you show us that you ’ re not sharing something we don ’ t like. Suddenly, the burden of proof for legal versus illegal falls affirmatively on us and on the services that might be offering us any new capabilities. And if it costs even a dime to police a user, that will crush a service with a hundred million users. So this is the Internet they have in mind. Imagine this sign everywhere — except imagine it doesn ’ t say College Bakery, imagine it says YouTube and Facebook and Twitter. Imagine it says TED, because the comments can ’ t be policed at any acceptable cost. The real effects of SOPA and PIPA are going to be different than the proposed effects. The threat, in fact, is this inversion of the burden of proof, where we suddenly are all treated like thieves at every moment we ’ re given the freedom to create, to produce or to share. And the people who provide those capabilities to us — the YouTubes, the Facebooks, the Twitters and TEDs — are in the business of having to police us, or being on the hook for contributory infringement. There ’ s two things you can do to help stop this — a simple thing and a complicated thing, an easy thing and a hard thing. The simple thing, the easy thing, is this : if you ’ re an American citizen, call your representative, call your senator. When you look at the people who co-signed on the SOPA bill, people who ’ ve co-signed on PIPA, what you see is that they have cumulatively received millions and millions of dollars from the traditional media industries. You don ’ t have millions and millions of dollars, but you can call your representatives, and you can remind them that you vote, and you can ask not to be treated like a thief, and you can suggest that you would prefer that the Internet not be broken. And if you ’ re not an American citizen, you can contact American citizens that you know and encourage them to do the same. Because this seems like a national issue, but it is not. These industries will not be content with breaking our Internet. If they break it, they will break it for everybody. That ’ s the easy thing. That ’ s the simple thing. The hard thing is this : get ready, because more is coming. SOPA is simply a reversion of COICA, which was purposed last year, which did not pass. And all of this goes back to the failure of the DMCA to disallow sharing as a technical means. And the DMCA goes back to the Audio Home Recording Act, which horrified those industries. Because the whole business of actually suggesting that someone is breaking the law and then gathering evidence and proving that, that turns out to be really inconvenient.”We ’ d prefer not to do that,”says the content industries. And what they want is not to have to do that. They don ’ t want legal distinctions between legal and illegal sharing. They just want the sharing to go away. PIPA and SOPA are not oddities, they ’ re not anomalies, they ’ re not events. They ’ re the next turn of this particular screw, which has been going on 20 years now. And if we defeat these, as I hope we do, more is coming. Because until we convince Congress that the way to deal with copyright violation is the way copyright violation was dealt with with Napster, with YouTube, which is to have a trial with all the presentation of evidence and the hashing out of facts and the assessment of remedies that goes on in democratic societies. That ’ s the way to handle this. In the meantime, the hard thing to do is to be ready. Because that ’ s the real message of PIPA and SOPA. Time Warner has called and they want us all back on the couch, just consuming — not producing, not sharing — and we should say,”No.”Thank you.

Good morning. I ’ m here today to talk about autonomous flying beach balls. No, agile aerial robots like this one. I ’ d like to tell you a little bit about the challenges in building these, and some of the terrific opportunities for applying this technology. So these robots are related to unmanned aerial vehicles. However, the vehicles you see here are big. They weigh thousands of pounds, are not by any means agile. They ’ re not even autonomous. In fact, many of these vehicles are operated by flight crews that can include multiple pilots, operators of sensors, and mission coordinators. What we ’ re interested in is developing robots like this — and here are two other pictures — of robots that you can buy off the shelf. So these are helicopters with four rotors, and they ' re roughly a meter or so in scale, and weigh several pounds. And so we retrofit these with sensors and processors, and these robots can fly indoors. Without GPS. The robot I ' m holding in my hand is this one, and it ' s been created by two students, Alex and Daniel. So this weighs a little more than a tenth of a pound. It consumes about 15 watts of power. And as you can see, it ' s about eight inches in diameter. So let me give you just a very quick tutorial on how these robots work. So it has four rotors. If you spin these rotors at the same speed, the robot hovers. If you increase the speed of each of these rotors, then the robot flies up, it accelerates up. Of course, if the robot were tilted, inclined to the horizontal, then it would accelerate in this direction. So to get it to tilt, there ' s one of two ways of doing it. So in this picture, you see that rotor four is spinning faster and rotor two is spinning slower. And when that happens, there ' s a moment that causes this robot to roll. And the other way around, if you increase the speed of rotor three and decrease the speed of rotor one, then the robot pitches forward. And then finally, if you spin opposite pairs of rotors faster than the other pair, then the robot yaws about the vertical axis. So an on-board processor essentially looks at what motions need to be executed and combines these motions, and figures out what commands to send to the motors — 600 times a second. That ' s basically how this thing operates. So one of the advantages of this design is when you scale things down, the robot naturally becomes agile. So here, R is the characteristic length of the robot. It ' s actually half the diameter. And there are lots of physical parameters that change as you reduce R. The one that ' s most important is the inertia, or the resistance to motion. So it turns out the inertia, which governs angular motion, scales as a fifth power of R. So the smaller you make R, the more dramatically the inertia reduces. So as a result, the angular acceleration, denoted by the Greek letter alpha here, goes as 1 over R. It ' s inversely proportional to R. The smaller you make it, the more quickly you can turn. So this should be clear in these videos. On the bottom right, you see a robot performing a 360-degree flip in less than half a second. Multiple flips, a little more time. So here the processes on board are getting feedback from accelerometers and gyros on board, and calculating, like I said before, commands at 600 times a second, to stabilize this robot. So on the left, you see Daniel throwing this robot up into the air, and it shows you how robust the control is. No matter how you throw it, the robot recovers and comes back to him. So why build robots like this? Well, robots like this have many applications. You can send them inside buildings like this, as first responders to look for intruders, maybe look for biochemical leaks, gaseous leaks. You can also use them for applications like construction. So here are robots carrying beams, columns and assembling cube-like structures. I ' ll tell you a little bit more about this. The robots can be used for transporting cargo. So one of the problems with these small robots is their payload-carrying capacity. So you might want to have multiple robots carry payloads. This is a picture of a recent experiment we did — actually not so recent anymore — in Sendai, shortly after the earthquake. So robots like this could be sent into collapsed buildings, to assess the damage after natural disasters, or sent into reactor buildings, to map radiation levels. So one fundamental problem that the robots have to solve if they are to be autonomous, is essentially figuring out how to get from point A to point B. So this gets a little challenging, because the dynamics of this robot are quite complicated. In fact, they live in a 12-dimensional space. So we use a little trick. We take this curved 12-dimensional space, and transform it into a flat, four-dimensional space. And that four-dimensional space consists of X, Y, Z, and then the yaw angle. And so what the robot does, is it plans what we call a minimum-snap trajectory. So to remind you of physics : You have position, derivative, velocity ; then acceleration ; and then comes jerk, and then comes snap. So this robot minimizes snap. So what that effectively does, is produce a smooth and graceful motion. And it does that avoiding obstacles. So these minimum-snap trajectories in this flat space are then transformed back into this complicated 12-dimensional space, which the robot must do for control and then execution. So let me show you some examples of what these minimum-snap trajectories look like. And in the first video, you ’ ll see the robot going from point A to point B, through an intermediate point. So the robot is obviously capable of executing any curve trajectory. So these are circular trajectories, where the robot pulls about two G ’ s. Here you have overhead motion capture cameras on the top that tell the robot where it is 100 times a second. It also tells the robot where these obstacles are. And the obstacles can be moving. And here, you ’ ll see Daniel throw this hoop into the air, while the robot is calculating the position of the hoop, and trying to figure out how to best go through the hoop. So as an academic, we ’ re always trained to be able to jump through hoops to raise funding for our labs, and we get our robots to do that. So another thing the robot can do is it remembers pieces of trajectory that it learns or is pre-programmed. So here, you see the robot combining a motion that builds up momentum, and then changes its orientation and then recovers. So it has to do this because this gap in the window is only slightly larger than the width of the robot. So just like a diver stands on a springboard and then jumps off it to gain momentum, and then does this pirouette, this two and a half somersault through and then gracefully recovers, this robot is basically doing that. So it knows how to combine little bits and pieces of trajectories to do these fairly difficult tasks. So I want change gears. So one of the disadvantages of these small robots is its size. And I told you earlier that we may want to employ lots and lots of robots to overcome the limitations of size. So one difficulty is : How do you coordinate lots of these robots? And so here, we looked to nature. So I want to show you a clip of Aphaenogaster desert ants, in Professor Stephen Pratt ’ s lab, carrying an object. So this is actually a piece of fig. Actually you take any object coated with fig juice, and the ants will carry it back to the nest. So these ants don ’ t have any central coordinator. They sense their neighbors. There ’ s no explicit communication. But because they sense the neighbors and because they sense the object, they have implicit coordination across the group. So this is the kind of coordination we want our robots to have. So when we have a robot which is surrounded by neighbors — and let ’ s look at robot I and robot J — what we want the robots to do, is to monitor the separation between them, as they fly in formation. And then you want to make sure that this separation is within acceptable levels. So again, the robots monitor this error and calculate the control commands 100 times a second, which then translates into motor commands, 600 times a second. So this also has to be done in a decentralized way. Again, if you have lots and lots of robots, it ’ s impossible to coordinate all this information centrally fast enough in order for the robots to accomplish the task. Plus, the robots have to base their actions only on local information — what they sense from their neighbors. And then finally, we insist that the robots be agnostic to who their neighbors are. So this is what we call anonymity. So what I want to show you next is a video of 20 of these little robots, flying in formation. They ’ re monitoring their neighbors ’ positions. They ’ re maintaining formation. The formations can change. They can be planar formations, they can be three-dimensional formations. As you can see here, they collapse from a three-dimensional formation into planar formation. And to fly through obstacles, they can adapt the formations on the fly. So again, these robots come really close together. As you can see in this figure-eight flight, they come within inches of each other. And despite the aerodynamic interactions with these propeller blades, they ’ re able to maintain stable flight. So once you know how to fly in formation, you can actually pick up objects cooperatively. So this just shows that we can double, triple, quadruple the robots ’ strength, by just getting them to team with neighbors, as you can see here. One of the disadvantages of doing that is, as you scale things up — so if you have lots of robots carrying the same thing, you ’ re essentially increasing the inertia, and therefore you pay a price ; they ’ re not as agile. But you do gain in terms of payload-carrying capacity. Another application I want to show you — again, this is in our lab. This is work done by Quentin Lindsey, who ’ s a graduate student. So his algorithm essentially tells these robots how to autonomously build cubic structures from truss-like elements. So his algorithm tells the robot what part to pick up, when, and where to place it. So in this video you see — and it ’ s sped up 10, 14 times — you see three different structures being built by these robots. And again, everything is autonomous, and all Quentin has to do is to give them a blueprint of the design that he wants to build. So all these experiments you ’ ve seen thus far, all these demonstrations, have been done with the help of motion-capture systems. So what happens when you leave your lab, and you go outside into the real world? And what if there ’ s no GPS? So this robot is actually equipped with a camera, and a laser rangefinder, laser scanner. And it uses these sensors to build a map of the environment. What that map consists of are features — like doorways, windows, people, furniture — and it then figures out where its position is, with respect to the features. So there is no global coordinate system. The coordinate system is defined based on the robot, where it is and what it ’ s looking at. And it navigates with respect to those features. So I want to show you a clip of algorithms developed by Frank Shen and Professor Nathan Michael, that shows this robot entering a building for the very first time, and creating this map on the fly. So the robot then figures out what the features are, it builds the map, it figures out where it is with respect to the features, and then estimates its position 100 times a second, allowing us to use the control algorithms that I described to you earlier. So this robot is actually being commanded remotely by Frank, but the robot can also figure out where to go on its own. So suppose I were to send this into a building, and I had no idea what this building looked like. I can ask this robot to go in, create a map, and then come back and tell me what the building looks like. So here, the robot is not only solving the problem of how to go from point A to point B in this map, but it ’ s figuring out what the best point B is at every time. So essentially it knows where to go to look for places that have the least information, and that ’ s how it populates this map. So I want to leave you with one last application. And there are many applications of this technology. I ’ m a professor, and we ’ re passionate about education. Robots like this can really change the way we do K-12 education. But we ’ re in Southern California, close to Los Angeles, so I have to conclude with something focused on entertainment. I want to conclude with a music video. I want to introduce the creators, Alex and Daniel, who created this video. So before I play this video, I want to tell you that they created it in the last three days, after getting a call from Chris. And the robots that play in the video are completely autonomous. You will see nine robots play six different instruments. And of course, it ’ s made exclusively for TED 2012. Let ’ s watch.

Text Sample 942: NEG Dim 6 – 2012 – Score 1.00 – 2012/t002446.txt

When I was nine years old, I went off to summer camp for the first time. And my mother packed me a suitcase full of books, which to me seemed like a perfectly natural thing to do. Because in my family, reading was the primary group activity. And this might sound antisocial to you, but for us it was really just a different way of being social. You have the animal warmth of your family sitting right next to you, but you are also free to go roaming around the adventureland inside your own mind. And I had this idea that camp was going to be just like this, but better. I had a vision of 10 girls sitting in a cabin cozily reading books in their matching nightgowns. Camp was more like a keg party without any alcohol. And on the very first day, our counselor gathered us all together and she taught us a cheer that she said we would be doing every day for the rest of the summer to instill camp spirit. And it went like this :"R-O-W-D-I-E, that ' s the way we spell rowdie. Rowdie, rowdie, let ' s get rowdie."Yeah. So I couldn ' t figure out for the life of me why we were supposed to be so rowdy, or why we had to spell this word incorrectly. But I recited a cheer. I recited a cheer along with everybody else. I did my best. And I just waited for the time that I could go off and read my books. But the first time that I took my book out of my suitcase, the coolest girl in the bunk came up to me and she asked me,"Why are you being so mellow?"— mellow, of course, being the exact opposite of R-O-W-D-I-E. And then the second time I tried it, the counselor came up to me with a concerned expression on her face and she repeated the point about camp spirit and said we should all work very hard to be outgoing. And so I put my books away, back in their suitcase, and I put them under my bed, and there they stayed for the rest of the summer. And I felt kind of guilty about this. I felt as if the books needed me somehow, and they were calling out to me and I was forsaking them. But I did forsake them and I didn ' t open that suitcase again until I was back home with my family at the end of the summer. Now, I tell you this story about summer camp. I could have told you 50 others just like it — all the times that I got the message that somehow my quiet and introverted style of being was not necessarily the right way to go, that I should be trying to pass as more of an extrovert. And I always sensed deep down that this was wrong and that introverts were pretty excellent just as they were. But for years I denied this intuition, and so I became a Wall Street lawyer, of all things, instead of the writer that I had always longed to be — partly because I needed to prove to myself that I could be bold and assertive too. And I was always going off to crowded bars when I really would have preferred to just have a nice dinner with friends. And I made these self- negating choices so reflexively, that I wasn ' t even aware that I was making them. Now this is what many introverts do, and it ' s our loss for sure, but it is also our colleagues ' loss and our communities ' loss. And at the risk of sounding grandiose, it is the world ' s loss. Because when it comes to creativity and to leadership, we need introverts doing what they do best. A third to a half of the population are introverts — a third to a half. So that ' s one out of every two or three people you know. So even if you ' re an extrovert yourself, I ' m talking about your coworkers and your spouses and your children and the person sitting next to you right now — all of them subject to this bias that is pretty deep and real in our society. We all internalize it from a very early age without even having a language for what we ' re doing. Now, to see the bias clearly, you need to understand what introversion is. It ' s different from being shy. Shyness is about fear of social judgment. Introversion is more about, how do you respond to stimulation, including social stimulation. So extroverts really crave large amounts of stimulation, whereas introverts feel at their most alive and their most switched-on and their most capable when they ' re in quieter, more low-key environments. Not all the time — these things aren ' t absolute — but a lot of the time. So the key then to maximizing our talents is for us all to put ourselves in the zone of stimulation that is right for us. But now here ' s where the bias comes in. Our most important institutions, our schools and our workplaces, they are designed mostly for extroverts and for extroverts ' need for lots of stimulation. And also we have this belief system right now that I call the new groupthink, which holds that all creativity and all productivity comes from a very oddly gregarious place. So if you picture the typical classroom nowadays : When I was going to school, we sat in rows. We sat in rows of desks like this, and we did most of our work pretty autonomously. But nowadays, your typical classroom has pods of desks — four or five or six or seven kids all facing each other. And kids are working in countless group assignments. Even in subjects like math and creative writing, which you think would depend on solo flights of thought, kids are now expected to act as committee members. And for the kids who prefer to go off by themselves or just to work alone, those kids are seen as outliers often or, worse, as problem cases. And the vast majority of teachers reports believing that the ideal student is an extrovert as opposed to an introvert, even though introverts actually get better grades and are more knowledgeable, according to research. Okay, same thing is true in our workplaces. Now, most of us work in open plan offices, without walls, where we are subject to the constant noise and gaze of our coworkers. And when it comes to leadership, introverts are routinely passed over for leadership positions, even though introverts tend to be very careful, much less likely to take outsize risks — which is something we might all favor nowadays. And interesting research by Adam Grant at the Wharton School has found that introverted leaders often deliver better outcomes than extroverts do, because when they are managing proactive employees, they ' re much more likely to let those employees run with their ideas, whereas an extrovert can, quite unwittingly, get so excited about things that they ' re putting their own stamp on things, and other people ' s ideas might not as easily then bubble up to the surface. Now in fact, some of our transformative leaders in history have been introverts. I ' ll give you some examples. Eleanor Roosevelt, Rosa Parks, Gandhi — all these people described themselves as quiet and soft-spoken and even shy. And they all took the spotlight, even though every bone in their bodies was telling them not to. And this turns out to have a special power all its own, because people could feel that these leaders were at the helm not because they enjoyed directing others and not out of the pleasure of being looked at ; they were there because they had no choice, because they were driven to do what they thought was right. Now I think at this point it ' s important for me to say that I actually love extroverts. I always like to say some of my best friends are extroverts, including my beloved husband. And we all fall at different points, of course, along the introvert / extrovert spectrum. Even Carl Jung, the psychologist who first popularized these terms, said that there ' s no such thing as a pure introvert or a pure extrovert. He said that such a man would be in a lunatic asylum, if he existed at all. And some people fall smack in the middle of the introvert / extrovert spectrum, and we call these people ambiverts. And I often think that they have the best of all worlds. But many of us do recognize ourselves as one type or the other. And what I ' m saying is that culturally, we need a much better balance. We need more of a yin and yang between these two types. This is especially important when it comes to creativity and to productivity, because when psychologists look at the lives of the most creative people, what they find are people who are very good at exchanging ideas and advancing ideas, but who also have a serious streak of introversion in them. And this is because solitude is a crucial ingredient often to creativity. So Darwin, he took long walks alone in the woods and emphatically turned down dinner-party invitations. Theodor Geisel, better known as Dr. Seuss, he dreamed up many of his amazing creations in a lonely bell tower office that he had in the back of his house in La Jolla, California. And he was actually afraid to meet the young children who read his books for fear that they were expecting him this kind of jolly Santa Claus-like figure and would be disappointed with his more reserved persona. Steve Wozniak invented the first Apple computer sitting alone in his cubicle in Hewlett-Packard where he was working at the time. And he says that he never would have become such an expert in the first place had he not been too introverted to leave the house when he was growing up. Now, of course, this does not mean that we should all stop collaborating — and case in point, is Steve Wozniak famously coming together with Steve Jobs to start Apple Computer — but it does mean that solitude matters and that for some people it is the air that they breathe. And in fact, we have known for centuries about the transcendent power of solitude. It ' s only recently that we ' ve strangely begun to forget it. If you look at most of the world ' s major religions, you will find seekers — Moses, Jesus, Buddha, Muhammad — seekers who are going off by themselves alone to the wilderness, where they then have profound epiphanies and revelations that they then bring back to the rest of the community. So, no wilderness, no revelations. This is no surprise, though, if you look at the insights of contemporary psychology. It turns out that we can ' t even be in a group of people without instinctively mirroring, mimicking their opinions. Even about seemingly personal and visceral things like who you ' re attracted to, you will start aping the beliefs of the people around you without even realizing that that ' s what you ' re doing. And groups famously follow the opinions of the most dominant or charismatic person in the room, even though there ' s zero correlation between being the best talker and having the best ideas — I mean zero. So — You might be following the person with the best ideas, but you might not. And do you really want to leave it up to chance? Much better for everybody to go off by themselves, generate their own ideas freed from the distortions of group dynamics, and then come together as a team to talk them through in a well- managed environment and take it from there. Now if all this is true, then why are we getting it so wrong? Why are we setting up our schools this way, and our workplaces? And why are we making these introverts feel so guilty about wanting to just go off by themselves some of the time? One answer lies deep in our cultural history. Western societies, and in particular the U. S., have always favored the man of action over the"man"of contemplation. But in America ' s early days, we lived in what historians call a culture of character, where we still, at that point, valued people for their inner selves and their moral rectitude. And if you look at the self-help books from this era, they all had titles with things like"Character, the Grandest Thing in the World."And they featured role models like Abraham Lincoln, who was praised for being modest and unassuming. Ralph Waldo Emerson called him"A man who does not offend by superiority."But then we hit the 20th century, and we entered a new culture that historians call the culture of personality. What happened is we had evolved an agricultural economy to a world of big business. And so suddenly people are moving from small towns to the cities. And instead of working alongside people they ' ve known all their lives, now they are having to prove themselves in a crowd of strangers. So, quite understandably, qualities like magnetism and charisma suddenly come to seem really important. And sure enough, the self-help books change to meet these new needs and they start to have names like"How to Win Friends and Influence People."And they feature as their role models really great salesmen. So that ' s the world we ' re living in today. That ' s our cultural inheritance. Now none of this is to say that social skills are unimportant, and I ' m also not calling for the abolishing of teamwork at all. The same religions who send their sages off to lonely mountain tops also teach us love and trust. And the problems that we are facing today in fields like science and in economics are so vast and so complex that we are going to need armies of people coming together to solve them working together. But I am saying that the more freedom that we give introverts to be themselves, the more likely that they are to come up with their own unique solutions to these problems. So now I ' d like to share with you what ' s in my suitcase today. Guess what? Books. I have a suitcase full of books. Here ' s Margaret Atwood,"Cat ' s Eye."Here ' s a novel by Milan Kundera. And here ' s"The Guide for the Perplexed"by Maimonides. But these are not exactly my books. I brought these books with me because they were written by my grandfather ' s favorite authors. My grandfather was a rabbi and he was a widower who lived alone in a small apartment in Brooklyn that was my favorite place in the world when I was growing up, partly because it was filled with his very gentle, very courtly presence and partly because it was filled with books. I mean literally every table, every chair in this apartment had yielded its original function to now serve as a surface for swaying stacks of books. Just like the rest of my family, my grandfather ' s favorite thing to do in the whole world was to read. But he also loved his congregation, and you could feel this love in the sermons that he gave every week for the 62 years that he was a rabbi. He would takes the fruits of each week ' s reading and he would weave these intricate tapestries of ancient and humanist thought. And people would come from all over to hear him speak. But here ' s the thing about my grandfather. Underneath this ceremonial role, he was really modest and really introverted — so much so that when he delivered these sermons, he had trouble making eye contact with the very same congregation that he had been speaking to for 62 years. And even away from the podium, when you called him to say hello, he would often end the conversation prematurely for fear that he was taking up too much of your time. But when he died at the age of 94, the police had to close down the streets of his neighborhood to accommodate the crowd of people who came out to mourn him. And so these days I try to learn from my grandfather ' s example in my own way. So I just published a book about introversion, and it took me about seven years to write. And for me, that seven years was like total bliss, because I was reading, I was writing, I was thinking, I was researching. It was my version of my grandfather ' s hours of the day alone in his library. But now all of a sudden my job is very different, and my job is to be out here talking about it, talking about introversion. And that ' s a lot harder for me, because as honored as I am to be here with all of you right now, this is not my natural milieu. So I prepared for moments like these as best I could. I spent the last year practicing public speaking every chance I could get. And I call this my"year of speaking dangerously."And that actually helped a lot. But I ' ll tell you, what helps even more is my sense, my belief, my hope that when it comes to our attitudes to introversion and to quiet and to solitude, we truly are poised on the brink on dramatic change. I mean, we are. And so I am going to leave you now with three calls for action for those who share this vision. Number one : Stop the madness for constant group work. Just stop it. Thank you. And I want to be clear about what I ' m saying, because I deeply believe our offices should be encouraging casual, chatty cafe-style types of interactions — you know, the kind where people come together and serendipitously have an exchange of ideas. That is great. It ' s great for introverts and it ' s great for extroverts. But we need much more privacy and much more freedom and much more autonomy at work. School, same thing. We need to be teaching kids to work together, for sure, but we also need to be teaching them how to work on their own. This is especially important for extroverted children too. They need to work on their own because that is where deep thought comes from in part. Okay, number two : Go to the wilderness. Be like Buddha, have your own revelations. I ’ m not saying that we all have to now go off and build our own cabins in the woods and never talk to each other again, but I am saying that we could all stand to unplug and get inside our own heads a little more often. Number three : Take a good look at what ’ s inside your own suitcase and why you put it there. So extroverts, maybe your suitcases are also full of books. Or maybe they ’ re full of champagne glasses or skydiving equipment. Whatever it is, I hope you take these things out every chance you get and grace us with your energy and your joy. But introverts, you being you, you probably have the impulse to guard very carefully what ’ s inside your own suitcase. And that ’ s okay. But occasionally, just occasionally, I hope you will open up your suitcases for other people to see, because the world needs you and it needs the things you carry. So I wish you the best of all possible journeys and the courage to speak softly. Thank you very much. Thank you. Thank you.

Text Sample 943: NEG Dim 6 – 2010 – Score 1.00 – 2010/t002906.txt

I think I ’ ll start out and just talk a little bit about what exactly autism is. Autism is a very big continuum that goes from very severe â the child remains nonverbal â all the way up to brilliant scientists and engineers. And I actually feel at home here, because there ’ s a lot of autism genetics here. You wouldn ’ t have any â It ’ s a continuum of traits. When does a nerd turn into Asperger, which is just mild autism? I mean, Einstein and Mozart and Tesla would all be probably diagnosed as autistic spectrum today. And one of the things that is really going to concern me is getting these kids to be the ones that are going to invent the next energy things that Bill Gates talked about this morning. OK, now, if you want to understand autism : animals. I want to talk to you now about different ways of thinking. You have to get away from verbal language. I think in pictures. I don ’ t think in language. Now, the thing about the autistic mind is it attends to details. This is a test where you either have to pick out the big letters or the little letters, and the autistic mind picks out the little letters more quickly. And the thing is, the normal brain ignores the details. Well, if you ’ re building a bridge, details are pretty important because it ’ ll fall down if you ignore the details. And one of my big concerns with a lot of policy things today is things are getting too abstract. People are getting away from doing hands-on stuff. I ’ m really concerned that a lot of the schools have taken out the hands-on classes, because art, and classes like that â those are the classes where I excelled. In my work with cattle, I noticed a lot of little things that most people don ’ t notice would make the cattle balk. For example, this flag waving right in front of the veterinary facility. This feed yard was going to tear down their whole veterinary facility ; all they needed to do was move the flag. Rapid movement, contrast. In the early ’ 70s when I started, I got right down in the chutes to see what cattle were seeing. People thought that was crazy. A coat on a fence would make them balk, shadows would make them balk, a hose on the floor â people weren ’ t noticing these things. A chain hanging down... And that ’ s shown very, very nicely in the movie. In fact, I loved the movie, how they duplicated all my projects. That ’ s the geek side. My drawings got to star in the movie, too. And, actually, it ’ s called”Temple Grandin,”not”Thinking in Pictures.”So what is thinking in pictures? It ’ s literally movies in your head. My mind works like Google for images. When I was a young kid, I didn ’ t know my thinking was different. I thought everybody thought in pictures. Then when I did my book,”Thinking in Pictures,”I started interviewing people about how they think. And I was shocked to find out that my thinking was quite different. Like if I say,”Think about a church steeple,”most people get this sort of generalized generic one. Now, maybe that ’ s not true in this room, but it ’ s going to be true in a lot of different places. I see only specific pictures. They flash up into my memory, just like Google for pictures. And in the movie, they ’ ve got a great scene in there, where the word”shoe”is said, and a whole bunch of ’ 50s and ’ 60s shoes pop into my imagination. OK, there ’ s my childhood church ; that ’ s specific. There ’ s some more, Fort Collins. OK, how about famous ones? And they just kind of come up, kind of like this. Just really quickly, like Google for pictures. And they come up one at a time, and then I think,”OK, well, maybe we can have it snow, or we can have a thunderstorm,”and I can hold it there and turn them into videos. Now, visual thinking was a tremendous asset in my work designing cattle- handling facilities. And I ’ ve worked really hard on improving how cattle are treated at the slaughter plant. I ’ m not going to go into any gucky slaughter slides. I ’ ve got that stuff up on YouTube, if you want to look at it. But one of the things that I was able to do in my design work is I could test- run a piece of equipment in my mind, just like a virtual reality computer system. And this is an aerial view of a recreation of one of my projects that was used in the movie. That was like just so super cool. And there were a lot of, kind of, Asperger types and autism types working out there on the movie set, too. But one of the things that really worries me is : Where ’ s the younger version of those kids going today? They ’ re not ending up in Silicon Valley, where they belong. One of the things I learned very early on because I wasn ’ t that social, is I had to sell my work, and not myself. And the way I sold livestock jobs is I showed off my drawings, I showed off pictures of things. Another thing that helped me as a little kid is, boy, in the ’ 50s, you were taught manners. You were taught you can ’ t pull the merchandise off the shelves in the store and throw it around. When kids get to be in third or fourth grade, you might see that this kid ’ s going to be a visual thinker, drawing in perspective. Now, I want to emphasize that not every autistic kid is going to be a visual thinker. Now, I had this brain scan done several years ago, and I used to joke around about having a gigantic Internet trunk line going deep into my visual cortex. This is tensor imaging. And my great big Internet trunk line is twice as big as the control ’ s. The red lines there are me, and the blue lines are the sex and age-matched control. And there I got a gigantic one, and the control over there, the blue one, has got a really small one. And some of the research now is showing that people on the spectrum actually think with the primary visual cortex. Now, the thing is, the visual thinker is just one kind of mind. You see, the autistic mind tends to be a specialist mind â good at one thing, bad at something else. And where I was bad was algebra. And I was never allowed to take geometry or trig. Gigantic mistake. I ’ m finding a lot of kids who need to skip algebra, go right to geometry and trig. Now, another kind of mind is the pattern thinker. More abstract. These are your engineers, your computer programmers. This is pattern thinking. That praying mantis is made from a single sheet of paper â no scotch tape, no cuts. And there in the background is the pattern for folding it. Here are the types of thinking : photo-realistic visual thinkers, like me ; pattern thinkers, music and math minds. Some of these oftentimes have problems with reading. You also will see these kind of problems with kids that are dyslexic. You ’ ll see these different kinds of minds. And then there ’ s a verbal mind, they know every fact about everything. Now, another thing is the sensory issues. I was really concerned about having to wear this gadget on my face. And I came in half an hour beforehand so I could have it put on and kind of get used to it, and they got it bent so it ’ s not hitting my chin. But sensory is an issue. Some kids are bothered by fluorescent lights ; others have problems with sound sensitivity. You know, it ' s going to be variable. Now, visual thinking gave me a whole lot of insight into the animal mind. Because think about it : an animal is a sensory-based thinker, not verbal â thinks in pictures, thinks in sounds, thinks in smells. Think about how much information there is on the local fire hydrant. He knows who ' s been there â When they were there. Are they friend or foe? Is there anybody he can go mate with? There ' s a ton of information on that fire hydrant. It ' s all very detailed information. And looking at these kind of details gave me a lot of insight into animals. Now, the animal mind, and also my mind, puts sensory-based information into categories. Man on a horse, and a man on the ground â that is viewed as two totally different things. You could have a horse that ' s been abused by a rider. They ' ll be absolutely fine with the veterinarian and with the horseshoer, but you can ' t ride him. You have another horse, where maybe the horseshoer beat him up, and he ' ll be terrible for anything on the ground with the veterinarian, but a person can ride him. Cattle are the same way. Man on a horse, a man on foot â they ' re two different things. You see, it ' s a different picture. See, I want you to think about just how specific this is. Now, this ability to put information into categories, I find a lot of people are not very good at this. When I ' m out troubleshooting equipment or problems with something in a plant, they don ' t seem to be able to figure out :"Do I have a training-people issue? Or do I have something wrong with the equipment?"In other words, categorize equipment problem from a people problem. I find a lot of people have difficulty doing that. Now, let ' s say I figure out it ' s an equipment problem. Is it a minor problem, with something simple I can fix? Or is the whole design of the system wrong? People have a hard time figuring that out. Let ' s just look at something like, you know, solving problems with making airlines safer. Yeah, I ' m a million-mile flier. I do lots and lots of flying, and if I was at the FAA, what would I be doing a lot of direct observation of? It would be their airplane tails. You know, five fatal wrecks in the last 20 years, the tail either came off, or steering stuff inside the tail broke in some way. It ' s tails, pure and simple. And when the pilots walk around the plane, guess what? They can ' t see that stuff inside the tail. Now as I think about that, I ' m pulling up all of that specific information. It ' s specific. See, my thinking ' s bottom-up. I take all the little pieces and I put the pieces together like a puzzle. Now, here is a horse that was deathly afraid of black cowboy hats. He ' d been abused by somebody with a black cowboy hat. White cowboy hats, that was absolutely fine. Now, the thing is, the world is going to need all of the different kinds of minds to work together. We ' ve got to work on developing all these different kinds of minds. And one of the things that is driving me really crazy as I travel around and I do autism meetings, is I ' m seeing a lot of smart, geeky, nerdy kids, and they just aren ' t very social, and nobody ' s working on developing their interest in something like science. And this brings up the whole thing of my science teacher. My science teacher is shown absolutely beautifully in the movie. I was a goofball student when I was in high school. I just didn ' t care at all about studying, until I had Mr. Carlock ' s science class. He was now Dr. Carlock in the movie. And he got me challenged to figure out an optical illusion room. This brings up the whole thing of you ' ve got to show kids interesting stuff. You know, one of the things that I think maybe TED ought to do is tell all the schools about all the great lectures that are on TED, and there ' s all kinds of great stuff on the Internet to get these kids turned on. Because I ' m seeing a lot of these geeky, nerdy kids, and the teachers out in the Midwest and other parts of the country when you get away from these tech areas, they don ' t know what to do with these kids. And they ' re not going down the right path. The thing is, you can make a mind to be more of a thinking and cognitive mind, or your mind can be wired to be more social. And what some of the research now has shown in autism is there may by extra wiring back here in the really brilliant mind, and we lose a few social circuits here. It ' s kind of a trade- off between thinking and social. And then you can get to the point where it ' s so severe, you ' re going to have a person that ' s going to be non-verbal. In the normal human mind, language covers up the visual thinking we share with animals. This is the work of Dr. Bruce Miller. He studied Alzheimer ' s patients that had frontal temporal lobe dementia. And the dementia ate out the language parts of the brain. And then this artwork came out of somebody who used to install stereos in cars. Now, Van Gogh doesn ' t know anything about physics, but I think it ' s very interesting that there was some work done to show that this eddy pattern in this painting followed a statistical model of turbulence, which brings up the whole interesting idea of maybe some of this mathematical patterns is in our own head. And the Wolfram stuff â I was taking notes and writing down all the search words I could use, because I think that ' s going to go on in my autism lectures. We ' ve got to show these kids interesting stuff. And they ' ve taken out the auto- shop class and the drafting class and the art class. I mean, art was my best subject in school. We ' ve got to think about all these different kinds of minds, and we ' ve got to absolutely work with these kind of minds, because we absolutely are going to need these kinds of people in the future. And let ' s talk about jobs. OK, my science teacher got me studying, because I was a goofball that didn ' t want to study. But you know what? I was getting work experience. I ' m seeing too many of these smart kids who haven ' t learned basic things, like how to be on time â I was taught that when I was eight years old. How to have table manners at granny ' s Sunday party. I was taught that when I was very, very young. And when I was 13, I had a job at a dressmaker ' s shop sewing clothes. I did internships in college, I was building things, and I also had to learn how to do assignments. You know, all I wanted to do was draw pictures of horses when I was little. My mother said,"Well let ' s do a picture of something else."They ' ve got to learn how to do something else. Let ' s say the kid is fixated on Legos. Let ' s get him working on building different things. The thing about the autistic mind is it tends to be fixated. Like if the kid loves race cars, let ' s use race cars for math. Let ' s figure out how long it takes a race car to go a certain distance. In other words, use that fixation in order to motivate that kid, that ' s one of the things we need to do. I really get fed up when the teachers, especially when you get away from this part of the country, they don ' t know what to do with these smart kids. It just drives me crazy. What can visual thinkers do when they grow up? They can do graphic design, all kinds of stuff with computers, photography, industrial design. The pattern thinkers â they ' re the ones that are going to be your mathematicians, your software engineers, your computer programmers, all of those kinds of jobs. And then you ' ve got the word minds ; they make great journalists, and they also make really, really good stage actors. Because the thing about being autistic is, I had to learn social skills like being in a play. You just kind of... you just have to learn it. And we need to be working with these students. And this brings up mentors. You know, my science teacher was not an accredited teacher. He was a NASA space scientist. Some states now are getting it to where, if you have a degree in biology or in chemistry, you can come into the school and teach biology or chemistry. We need to be doing that. Because what I ' m observing is, the good teachers, for a lot of these kids, are out in the community colleges. But we need to be getting some of these good teachers into the high schools. Another thing that can be very, very, very successful is : there ' s a lot of people that may have retired from working in the software industry, and they can teach your kid. And it doesn ' t matter if what they teach them is old, because what you ’ re doing is you ’ re lighting the spark. You ’ re getting that kid turned on. And you get him turned on, then you ’ ll learn all the new stuff. Mentors are just essential. I cannot emphasize enough what my science teacher did for me. And we ’ ve got to mentor them, hire them. And if you bring them in for internships in your companies, the thing about the autism, Asperger-y kind of mind, you ’ ve got to give them a specific task. Don ’ t just say,”Design new software.”You ’ ve got to tell them something more specific :”We ’ re designing software for a phone and it has to do some specific thing, and it can only use so much memory.”That ’ s the kind of specificity you need. Well, that ’ s the end of my talk. And I just want to thank everybody for coming. It was great to be here. Oh â you have a question for me? OK. Chris Anderson : Thank you so much for that. You know, you once wrote â I like this quote :”If by some magic, autism had been eradicated from the face of the Earth, then men would still be socializing in front of a wood fire at the entrance to a cave.”Temple Grandin : Because who do you think made the first stone spear? It was the Asperger guy, and if you were to get rid of all the autism genetics, there ’ d be no more Silicon Valley, and the energy crisis would not be solved. CA : I want to ask you a couple other questions, and if any of these feel inappropriate, it ’ s OK just to say,”Next question.”But if there is someone here who has an autistic child, or knows an autistic child and feels kind of cut off from them, what advice would you give them? TG : Well, first of all, we ’ ve got to look at age. If you have a two, three or four-year-old, no speech, no social interaction, I can ’ t emphasize enough : Don ’ t wait. You need at least 20 hours a week of one-to-one teaching. The thing is, autism comes in different degrees. About half of the people on the spectrum are not going to learn to talk, and they won ’ t be working in Silicon Valley. That would not be a reasonable thing for them to do. But then you get these smart, geeky kids with a touch of autism, and that ’ s where you ’ ve got to get them turned on with doing interesting things. I got social interaction through shared interests â I rode horses with other kids, I made model rockets with other kids, did electronics lab with other kids. And in the ’ 60s, it was gluing mirrors onto a rubber membrane on a speaker to make a light show. That was, like, we considered that super cool. CA : Is it unrealistic for them to hope or think that that child loves them, as some might, as most, wish? TG : Well, I tell you, that child will be loyal, and if your house is burning down, they ’ re going to get you out of it. CA : Wow. So most people, if you ask them what they ’ re most passionate about, they ’ d say things like,”My kids”or”My lover.”What are you most passionate about? TG : I ’ m passionate about that the things I do are going to make the world a better place. When I have a mother of an autistic child say,”My kid went to college because of your book or one of your lectures,”that makes me happy. You know, the slaughter plants I worked with in the ’ 80s ; they were absolutely awful. I developed a really simple scoring system for slaughter plants, where you just measure outcomes : How many cattle fell down? How many got poked with the prodder? How many cattle are mooing their heads off? And it ’ s very, very simple. You directly observe a few simple things. It ’ s worked really well. I get satisfaction out of seeing stuff that makes real change in the real world. We need a lot more of that, and a lot less abstract stuff. CA : Totally. CA : When we were talking on the phone, one of the things you said that really astonished me was that one thing you were passionate about was server farms. Tell me about that. TG : Well, the reason why I got really excited when I read about that, it contains knowledge. It ’ s libraries. And to me, knowledge is something that is extremely valuable. So, maybe over 10 years ago now, our library got flooded. This is before the Internet got really big. And I was really upset about all the books being wrecked, because it was knowledge being destroyed. And server farms, or data centers, are great libraries of knowledge. CA : Temple, can I just say, it ’ s an absolute delight to have you at TED. Thank you so much. TG : Well, thank you so much. Thank you.

Text Sample 944: NEG Dim 6 – 2010 – Score 1.00 – 2010/t002904.txt

I think it was in my second grade that I was caught drawing the bust of a nude by Michelangelo. I was sent straight away to my school principal, and my school principal, a sweet nun, looked at my book with disgust, flipped through the pages, saw all the nudes â you know, I ’ d been seeing my mother draw nudes and I ’ d copy her â and the nun slapped me on my face and said,”Sweet Jesus, this kid has already begun.”I had no clue what she was talking about, but it was convincing enough for me never to draw again until the ninth grade. Thanks to a really boring lecture, I started caricaturing my teachers in school. And, you know, I got a lot of popularity. I don ’ t play sports. I ’ m really bad at sports. I don ’ t have the fanciest gadgets at home. I ’ m not on top of the class. So for me, cartooning gave me a sense of identity. I got popular, but I was scared I ’ d get caught again. So what I did was I quickly put together a collage of all the teachers I had drawn, glorified my school principal, put him right on top, and gifted it to him. He had a good laugh at the other teachers and put it up on the notice board. This is a part of that. And I became a school hero. All my seniors knew me. I felt really special. I have to tell you a little bit about my family. That ’ s my mother. I love her to bits. She ’ s the one who taught me how to draw and, more importantly, how to love. She ’ s a bit of a hippie. She said,”Don ’ t say that,”but I ’ m saying it anyway. The rest of my family are boring academics, busy collecting Ivy League decals for our classic Ambassador car. My father ’ s a little different. My father believed in a holistic approach to living, and, you know, every time he taught us, he ’ d say,”I hate these books, because these books are hijacked by Industrial Revolution.”While he still held that worldview, I was 16, I got the best lawyer in town, my older brother Karthik, and I sat him down, and I said,”Pa, from today onwards I ’ ve decided I ’ m going to be disciplined, I ’ m going to be curious, I ’ m going to learn something new every day, I ’ m going to be very hard working, and I ’ m not going to depend on you emotionally or financially.”And he was very impressed. He was all tearing up. Ready to hug me. And I said,”Hold that thought.”I said,”Can I quit school then?”But, to cut a long story short, I quit school to pursue a career as a cartoonist. I must have done about 30, 000 caricatures. I would do birthday parties, weddings, divorces, anything for anyone who wanted to use my services. But, most importantly, while I was traveling, I taught children cartooning, and in exchange, I learned how to be spontaneous. And mad and crazy and fun. When I started teaching them, I said let me start doing this professionally. When I was 18 I started my own school. However, an 18 year-old trying to start a school is not easy unless you have a big patron or a big supporter. So I was flipping through the pages of the Times of India when I saw that the Prime Minister of India was visiting my home town, Bangalore. And, you know, just like how every cartoonist knows Bush here, and if you had to meet Bush, it would be the funnest thing because his face was a cartoonist ’ s delight. I had to meet my Prime Minister. I went to the place where his helicopter was about to land. I saw layers of security. I caricatured my way through three layers by just impressing the guards, but I got stuck. I got stuck at the third. And what happened was, to my luck, I saw a nuclear scientist at whose party I had done cartoons. I ran up to him, and said,”Hello, sir. How do you do?”He said,”What are you doing here, Raghava?”I said,”I ’ m here to meet the Prime Minister.”He said,”Oh, so am I.”I hopped into his car, and off we went through the remaining layers of security. Thank you. I sat him down, I caricatured him, and since then I ’ ve caricatured hundreds of celebrities. This is one I remember fondly. Salman Rushdie was pissed-off I think because I altered the map of New York, if you notice. Anyway, the next slide I ’ m about to show you â Should I just turn that off? The next slide I ’ m about to show you, is a little more serious. I was hesitant to include this in my presentation because this cartoon was published soon after 9 / 11. What was, for me, a very naive observation, turned out to be a disaster. That evening, I came home to hundreds of hate mails, hundreds of people telling me how they could have lived another day without seeing this. I was also asked to leave the organization, a cartoonists ’ organization in America, that for me was my lifeline. That ’ s when I realized, you know, cartoons are really powerful, art comes with responsibility. Anyway, what I did was I decided that I need to take a break. I quit my job at the papers, I closed my school, and I wrapped up my pencils and my brushes and inks, and I decided to go traveling. When I went traveling, I remember, I met this fabulous old man, who I met when I was caricaturing, who turned out to be an artist, in Italy. He invited me to his studio. He said,”Come and visit.”When I went, I saw the ghastliest thing ever. I saw this dead, naked effigy of himself hanging from the ceiling. I said,”Oh, my God. What is that?”And I asked him, and he said,”Oh, that thing? In the night, I die. In the morning, I am born again.”I thought he was koo koo, but something about that really stuck. I loved it. I thought there was something really beautiful about that. So I said,”I am dead, so I need to be born again.”So, I wanted to be a painter like him, except, I don ’ t know how to paint. So, I tried going to the art store. You know, there are a hundred types of brushes. Forget it, they will confuse you even if you know how to draw. So I decided, I ’ m going to learn to paint by myself. I ’ m going to show you a very quick clip to show you how I painted and a little bit about my city, Bangalore. They had to be larger than life. Everything had to be larger. The next painting was even bigger. And even bigger. And for me it was, I had to dance while I painted. It was so exciting. Except, I even started painting dancers. Here for example is a Flamenco dancer, except there was one problem. I didn ’ t know the dance form, so I started following them, and I made some money, sold my paintings and would rush off to France or Spain and work with them. That ’ s Pepe Linares, the renowned Flamenco singer. But I had one problem, my paintings never danced. As much energy as I put into them while making them, they never danced. So I decided â I had this crazy epiphany at two in the morning. I called my friends, painted on their bodies, and had them dance in front of a painting. And, all of a sudden, my paintings came alive. And then I was fortunate enough to actually perform this in California with Velocity Circus. And I sat like you guys there in the audience. And I saw my work come alive. You know, normally you work in isolation, and you show at a gallery, but here, the work was coming alive, and it had some other artists working with me. The collaborative effort was fabulous. I said, I ’ m going to collaborate with anybody and everybody I meet. I started doing fashion. This is a fashion show we held in London. The best collaboration, of course, is with children. They are ruthless, they are honest, but they ’ re full of energy and fun. This is a work, a library I designed for the Robin Hood Foundation. And I must say, I spent time in the Bronx working with these kids. And, in exchange for me working with them, they taught me how to be cool. I don ’ t think I ’ ve succeeded, but they ’ ve taught me. They said,”Stop saying sorry. Say, my bad.”Then I said, all this is good, but I want to paint like a real painter. American education is so expensive. I was in India, and I was walking down the streets, and I saw a billboard painter. And these guys paint humongous paintings, and they look really good. And I wondered how they did it from so close. So, one day I had the opportunity to meet one of these guys, and I said,”How do you paint like that? Who taught you?”And he said,”Oh, it ’ s very easy. I can teach you, but we ’ re leaving the city, because billboard painters are a dying, extinct bunch of artists, because digital printing has totally replaced them and hijacked them.”I said, in exchange for education in how to paint, I will support them, and I started a company. And since then, I ’ ve been painting all over the place. This is a painting I did of my wife in my apartment. This is another painting. And, in fact, I started painting on anything, and started sending them around town. Since I mentioned my wife, the most important collaboration has been with her, Netra. Netra and I met when she was 18. I must have been 19 and a half then, and it was love at first sight. I lived in India. She lived in America. She ’ d come every two months to visit me, and then I said I ’ m the man, I ’ m the man, and I have to reciprocate. I have to travel seven oceans, and I have to come and see you. I did that twice, and I went broke. So then I said,”Nets, what do I do?”She said,”Why don ’ t you send me your paintings? My dad knows a bunch of rich guys. We ’ ll try and con them into buying it, and then...”But it turned out, after I sent the works to her, that her dad ’ s friends, like most of you, are geeks. I ’ m joking. No, they were really big geeks, and they didn ’ t know much about art. So Netra was stuck with 30 paintings of mine. So what we did was we rented a little van and we drove all over the east coast trying to sell it. She contacted anyone and everyone who was willing to buy my work. She made enough money, she sold off the whole collection and made enough money to move me for four years with lawyers, a company, everything, and she became my manager. That ’ s us in New York. Notice one thing, we ’ re equal here. Something happened along the line. But this brought me â with Netra managing my career â it brought me a lot of success. I was really happy. I thought of myself as a bit of a rockstar. I loved the attention. This is all the press we got, and we said, it ’ s time to celebrate. And I said that the best way to celebrate is to marry Netra. I said,”Let ’ s get married.”And I said,”Not just married. Let ’ s invite everyone who ’ s helped us, all the people who bought our work.”And you won ’ t believe it, we put together a list of 7, 000 people, who had made a difference â a ridiculous list, but I was determined to bring them to India, so â a lot of them were in India. 150 artists volunteered to help me with my wedding. We had fashion designers, installation artists, models, we had makeup artists, jewelry designers, all kinds of people working with me to make my wedding an art installation. And I had a special installation in tribute to my in-laws. I had the vegetable carvers work on that for me. But all this excitement led to the press writing about us. We were in the papers, we ’ re still in the news three years later, but, unfortunately, something tragic happened right after. My mother fell very ill. I love my mother and I was told all of a sudden that she was going to die. And they said you have to say bye to her, you have to do what you have to do. And I was devastated. I had shows booked up for another year. I was on a high. And I couldn ’ t. I could not. My life was not exuberant. I could not live this larger than life person. I started exploring the darker abscesses of the human mind. Of course, my work turned ugly, but another thing happened. I lost all my audiences. The Bollywood stars who I would party with and buy my work disappeared. The collectors, the friends, the press, everyone said,”Nice, but thank you.””No thank you,”was more like it. But I wanted people to actually feel my work from their gut, because I was painting it from my gut. If they wanted beauty, I said, this is the beauty I ’ m willing to give you. It ’ s politicized. Of course, none of them liked it. My works also turned autobiographical. At this point, something else happened. A very, very dear friend of mine came out of the closet, and in India at that time, it was illegal to be gay, and it ’ s disgusting to see how people respond to a gay person. I was very upset. I remember the time when my mother used to dress me up as a little girl â that ’ s me there â because she wanted a girl, and she has only boys. Anyway, I don ’ t know what my friends are going to say after this talk. It ’ s a secret. So, after this, my works turned a little violent. I talked about this masculinity that one need not perform. And I talked about the weakness of male sexuality. This time, not only did my collectors disappear, the political activists decided to ban me and to threaten me and to forbid me from showing. It turned nasty, and I ’ m a bit of a chicken. I can ’ t deal with any threat. This was a big threat. So, I decided it was time to end and go back home. This time I said let ’ s try something different. I need to be reborn again. And I thought the best way, as most of you know who have children, the best way to have a new lease on life, is to have a child. I decided to have a child, and before I did that, I quickly studied what can go wrong. How can a family get dysfunctional? And Rudra was born. That ’ s my little son. And two magical things happened after he was born. My mother miraculously recovered after a serious operation, and this man was elected president of this country. You know I sat at home and I watched. I teared up and I said that ’ s where I want to be. So Netra and I wound up our life, closed up everything we had, and we decided to move to New York. And this was just eight months ago. I moved back to New York, my work has changed. Everything about my work has become more whimsical. This one is called”What the Fuck Was I Thinking?”It talks about mental incest. You know, I may appear to be a very nice, clean, sweet boy. But I ’ m not. I ’ m capable of thinking anything. But I ’ m very civil in my action, I assure you. These are just different cartoons. And, before I go, I want to tell you a little story. I was talking to mother and father this morning, and my dad said,”I know you have so much you want to say, but you have to talk about your work with children.”So I said, okay. I work with children all over the world, and that ’ s an entirely different talk, but I want to leave you with one story that really, really inspired me. I met Belinda when she was 16. I was 17. I was in Australia, and Belinda had cancer, and I was told she ’ s not going to live very long. They, in fact, told me three weeks. I walk into her room, and there was a shy girl, and she was bald, and she was trying to hide her baldness. I whipped out my pen, and I started drawing on her head and I drew a crown for her. And then, we started talking, and we spent a lovely time â I told her how I ended up in Australia, how I backpacked and who I conned, and how I got a ticket, and all the stories. And I drew it out for her. And then I left. Belinda died and within a few days of her death, they published a book for her, and she used my cartoon on the cover. And she wrote a little note, she said,”Hey Rags, thank you for the magic carpet ride around the world.”For me, my art is my magic carpet ride. I hope you will join me in this magic carpet ride, and touch children and be honest. Thank you so much.

Last year here at TED I asked you to give me your data, to put your data on the web, on the basis that if people put data onto the web â government data, scientific data, community data, whatever it is â it will be used by other people to do wonderful things, in ways that they never could have imagined. So, today I ’ m back just to show you a few things, to show you, in fact, there is an open data movement afoot, now, around the world. The cry of”Raw data now!”which I made people make in the auditorium, was heard around the world. So, let ’ s roll the video. A classic story, the first one which lots of people picked up, was when in March â on March 10th in fact, soon after TED â Paul Clarke, in the U. K. government, blogged,"Oh, I ' ve just got some raw data. Here it is, it ' s about bicycle accidents."Two days it took the Times Online to make a map, a mashable map â we call these things mash-ups â a mashed-up user interface that allows you to go in there and have a look and find out whether your bicycle route to work was affected. Here ' s more data, traffic survey data, again, put out by the U. K. government, and because they put it up using the Linked Data standards, then a user could just make a map, just by clicking. Does this data affect things? Well, let ' s get back to 2008. Look at Zanesville, Ohio. Here ' s a map a lawyer made. He put on it the water plant, and which houses are there, which houses have been connected to the water. And he got, from other data sources, information to show which houses are occupied by white people. Well, there was too much of a correlation, he felt, between which houses were occupied by white people and which houses had water, and the judge was not impressed either. The judge was not impressed to the tune of 10. 9 million dollars. That ' s the power of taking one piece of data, another piece of data, putting it together, and showing the result. Let ' s look at some data from the U. K. now. This is U. K. government data, a completely independent site, Where Does My Money Go. It allows anybody to go there and burrow down. You can burrow down by a particular type of spending, or you can go through all the different regions and compare them. So, that ' s happening in the U. K. with U. K. government data. Yes, certainly you can do it over here. Here ' s a site which allows you to look at recovery spending in California. Take an arbitrary example, Long Beach, California, you can go and have a look at what recovery money they ' ve been spending on different things such as energy. In fact, this is the graph of the number of data sets in the repositories of data. gov, and data. gov. uk. And I ' m delighted to see a great competition between the U. K. in blue, and the U. S. in red. How can you use this stuff? Well, for example, if you have lots of data about places you can take, from a postcode â which is like a zip plus four â for a specific group of houses, you can make paper, print off a paper which has got very, very specific things about the bus stops, the things specifically near you. On a larger scale, this is a mash-up of the data which was released about the Afghan elections. It allows you to set your own criteria for what sort of things you want to look at. The red circles are polling stations, selected by your criteria. And then you can select also other things on the map to see what other factors, like the threat level. So, that was government data. I also talked about community-generated data â in fact I edited some. This is the wiki map, this is the Open Street Map."Terrace Theater"I actually put on the map because it wasn ' t on the map before TED last year. I was not the only person editing the open street map. Each flash on this visualization â put together by ITO World â shows an edit in 2009 made to the Open Street Map. Let ' s now spin the world during the same year. Every flash is an edit. Somebody somewhere looking at the Open Street Map, and realizing it could be better. You can see Europe is ablaze with updates. Some places, perhaps not as much as they should be. Here focusing in on Haiti. The map of Port au-Prince at the end of 2009 was not all it could be, not as good as the map of California. Fortunately, just after the earthquake, GeoEye, a commercial company, released satellite imagery with a license, which allowed the open-source community to use it. This is January, in time lapse, of people editing... that ' s the earthquake. After the earthquake, immediately, people all over the world, mappers who wanted to help, and could, looked at that imagery, built the map, quickly building it up. We ' re focusing now on Port-au-Prince. The light blue is refugee camps these volunteers had spotted from the [satellite images]. So, now we have, immediately, a real-time map showing where there are refugee camps â rapidly became the best map to use if you ' re doing relief work in Port-au-Prince. Witness the fact that it ' s here on this Garmin device being used by rescue team in Haiti. There ' s the map showing, on the left-hand side, that hospital â actually that ' s a hospital ship. This is a real-time map that shows blocked roads, damaged buildings, refugee camps â it shows things that are needed [for rescue and relief work]. So, if you ' ve been involved in that at all, I just wanted to say : Whatever you ' ve been doing, whether you ' ve just been chanting,"Raw data now!"or you ' ve been putting government or scientific data online, I just wanted to take this opportunity to say : Thank you very much, and we have only just started!

Thank y ' all! This is going to be a motivational speech. Because â imagine my motivation standing between this strong, healthy crowd... and lunch. So... I ' m @Falkvinge on Twitter. Feel free to quote me if I say something memorable, stupid, funny, whatever. I love seeing my name on Twitter. So... Hi! I ' m Rick. I ' m a politician. I ' m sorry. How many in here have heard of the Swedish Pirate Party before? Let ' s see a show of hands. OK, that ' s practically everybody. Probably due to the fact that we are Sweden ' s neighbor. I frequently ask how many have heard of any other political party and there ' s always just scattered hands in the audience compared to this first question which is one-half to two-thirds. This is actually the first time ever that does not match. It was practically everybody. So, for those who haven ' t heard of us : well, the Pirate Party, we love the net. We love copying and sharing, and we love civil liberties. For that, some people call us pirates. Probably in an attempt to make us bow our heads and feel shame. That didn ' t work very well. We decided to stand tall about it instead. And so in 2006, I founded a new political party. I led it for its first five years. And the European elections, the last European elections, we became the largest party and the most coveted youth demographic, sub-30. And what ' s interesting is we did that on less than one percent of the competition ' s budget. We had a campaign budget total of 50, 000 euros. They had six million between them â and we beat them. That gave us a cost efficiency advantage of over two orders of magnitude. And I ' m gonna share the secret recipe of how we did that. We developed swarm methodologies. And they can be applied to any business or social cause. Well, almost any â there ' s a small asterisk by the end, and I ' ll get to that in just a minute. But applying these â and we ' ve done this dozens of times, we know that this works. We ' ve put two people in the European Parliament, we have 45 people in various German state parliaments, we ' re in the Icelandic parliament, the Czech senate, many, many, many more, local councils â and, as said, we ' ve spread to 70 countries. And that ' s not bad for a political movement that hasn ' t even been around for a decade. So today we ' re going to talk a bit about â how people are motivated to be part of change, to be part of something bigger than themselves. And how you can channel this into an organization that harnesses this great power of wanting to make the world a better place. And in the end, come out a little on the better. When I speak to businesspeople, I frequently make them very upset when I contradict them and say that no, your employees are not your most valuable asset. Your most valuable asset is the thousands of people who want to work for you for free. And you don ' t let them. They get very upset about that. A swarm is a congregation of tens of thousands of volunteers that have chosen of their own will to converge on a common goal. There ' s this"Futurama"quote :"When push comes to shove, you gotta do what you love â even if it ’ s not a good idea.”I mean, seriously, what kind of idiot thinks they can change the world by starting a political party? This kind of idiot, apparently. But it works! What you need to do is to put a stake in the ground. You need to announce your goal. Just say,”I want to accomplish this.”I ’ m going to do this. And it doesn ’ t need to be very costly. My announcement was just two lines in a chat channel.”Hey, look, the Pirate Party has its website up now after New Year ’ s.”And the address. That was all the advertising I ever did. The next time I had several hundred activists wanting to work with us. When you provide such a focus point, a swarm intelligence emerges. When people can rally to a flag. And that ’ s what gives you this two orders of magnitude of cost efficiency. It ’ s a huge advantage â you ’ re running circles around all the legacy organizations. And there are four goals that need to be fulfilled in your goal in order for this to work. These four criteria are that your goal must be : tangible, credible, inclusive and epic. Let ’ s take a look at them : It needs to be tangible. A lot of people say,”Well, you know, we should make the world a better place,”or,”Yeah, we should all feel good now.”Not going to work. You need a binary. Are we there yet, or are we not there yet? It needs to be credible. Somebody seeing the project plan that you ’ re posting needs to see that, yes, this project plan will take us from where we are to where we want to be. You need to break it down into subgoals that each by themselves are seen as doable, and when you add the subgoals together, we ’ ve gone to where we want. It needs to be â and this is where it gets exciting in terms of working swarmwise â it needs to be inclusive. Anybody who sees this project plan needs to immediately say,”I want to do this â and there ’ s my spot!”And they will be able to jump right into the project and start working on it without asking anybody ’ s permission. And that is exactly what ’ ll happen. And, last but not least, it needs to be epic. It needs to energize people. It needs to electrify people. Shoot for the moon! On second thought, don ’ t shoot for the moon, we ’ ve already been there â shoot for Mars! In contrast, you will never be able to get a volunteer swarm forming around making the most correct tax audit ever. Doesn ’ t electrify people. Go to Mars. A lot of people kind of balk at the obstacles. We ’ re going to climb a huge mountain. So how do you motivate people to do that? Well, it turns out that obstacles are not the problem. Not knowing the obstacles is the problem. If you know how high the mountain is, you know exactly what it takes to scale it. We know exactly how far away Mars is and what it takes to get there. If you can plan it like a project, you can plan what resources you need and you can execute it, exactly like a project. Let ’ s see : we ’ re going to Mars, we need two dozen volunteer rocket scientists, one dozen volunteer metallurgists, some crazy dude who will mix rocket fuel in his backyard and so on. When you can list the resources, you know what you need to get there. When you know what you need to get there, you can go there. And the next thing is to encourage this development of a swarm intelligence, which is where the cost efficiency comes in. There ’ s a TED Talk on motivation that debunks that we work for money, and it presents science on how we ’ re really motivated by three things, in terms of larger creative tasks, when we work for something bigger than ourselves. We work for autonomy, mastery and purpose. We ’ ve covered purpose already. As in, working for something bigger, tangible, credible, inclusive and epic. So, where that motivation talk ends, what it doesn ’ t answer is, how do you build an organization that harnesses this motivational power. And this is where working swarmwise comes in, this is where swarm intelligence comes in. Turns out that there are three factors that you optimize for â and each of these are in complete opposite to what you learn at a business school. But it works. We know it works. We have people in many, many parliaments to prove it. Those three factors are : speed, trust and scalability.

We optimize for speed by cutting bottlenecks out of the loop, cutting them out of the decision loop. That means cutting yourself out of the decision loop, which can be hard. But you ’ ve got to communicate your vision so passionately, so strongly, that everybody knows what the goal is and can find something, some step that takes the movement just a little closer to that goal. And when tens of thousands of people do that on a weekly basis, you become an unstoppable force. We had a three-person rule in our organization, saying that if three self-identified volunteers in the movement were in agreement that something was good for the movement, they had the green light from the highest office to go ahead and act in the name of the organization, including spending resources. When you talk about this kind of empowerment to traditional businesspeople, they think you belong in a zoo. But you know what? I led this organization for five years, there were 50, 000 registered members and many, many more anonymous activists. It was not abused once. Everybody had the key to the treasure chest. It was not abused one single time. Turns out when you give people the keys to the castle, and look them in the eye and say,”I trust you,”they step up to the plate. And that ’ s a beautiful thing to see happen. Obviously, not everything went according to plan, but that ’ s a different thing. We made mistakes. We should expect mistakes. If you ’ re pioneering something, that means you must, by definition, venture into the unknown. When you ’ re trying the unknown, some things won ’ t go as planned. That ’ s part of the definition of venturing into the unknown. To find the great, you must allow mistakes to happen. So you must communicate that we expect some things to go wrong to create a risk-positive environment. Therefore we optimize for iteration speed. Meaning that we try, we fail, we try again, we fail faster, we fail better, we try again, we fail better again. Maybe after we ’ ve tried 15 times, we ’ ve mastered some specific subject, so you want to minimize the time it takes to try those 15 times. We optimize on trust. We encourage diversity. You need to communicate your vision so strongly so that everybody can translate it into their own context because language is an incredibly strong inclusionary and exclusionary social marker. This one-brand-fits-all message â forget it! That ’ s what they teach you at business school â it doesn ’ t work. Or at least, it doesn ’ t give you the cost-efficiency advantage of working swarmwise. This leads to a lot of different approaches tried in parallel in different social groups who try out different methods of working toward the goal. Some of them will work but in order to find the great ones, you need this diversity. And you need to communicate that we need that diversity. If somebody on this side does not understand what those guys are doing, that ’ s OK because we all trust each other to work for the better of the movement. And it ’ s OK that I don ’ t understand their social context. I ’ m not expected to â I understand my social context. I contribute with something I know. Make people aware of this diversity. Finally, scalability. Get feet on the ground. Again, in business school, they teach you to use a lean organization. Forget that. Just scale up the organization from the get-go. Start with 10, 000 empty boxes and an org chart covering down to every minor city. When you have lots and lots of small responsibilities in such a scaffolding that supports the swarm, supports the activists, you ’ ll find that these boxes in the org charts are getting filled in quite rapidly, and they start to get filled in beyond your horizon with people you ’ ve never heard of. And so, this swarm keeps growing to tens of thousands of people, each taking on something small with very, very decentralized mandate to act on the organization. And this is when a swarm intelligence emerges. This is when you have this beehive logic where everybody knows what ’ s to be done. Everybody is taking their own small steps towards it. So the swarm starts to act as a coherent organism. And it ’ s amazing to watch. This is when you ’ re awarded by the cost-efficiency advantage over your competitors by two orders of magnitude. Two orders of magnitude. This is not just a silver bullet. So we ’ ve been talking a lot about the big picture today. You can use these swarm methods for a lot of stuff. Do you want to change the world? Do you want to bring clean water to a billion people? Teach three billion people to read? Maybe you ’ re into social change ; you want to introduce unconditional basic income. Or maybe you want to take humanity to Mars. You can do this using these methods. You can do this. It ’ s about leadership. It ’ s about deciding what you want to do and telling it to the world. Because no matter whether you think you can or cannot change the world, no matter whether you think you can or cannot change the world, you are probably right. So one question I want everybody here to ask themselves today is the observation that change doesn ’ t just happen, somebody makes it happen â do you want to be that person? Do you want to be that person? And then one last thing : There ’ s one component more that ’ s required to work swarmwise that I haven ’ t mentioned yet. And that is fun. This goes beyond just enjoying your job, this goes beyond having a pinball machine in the office. Because this is actually required to succeed in a swarmwise scenario. This is required to succeed to get that cost-efficiency advantage of two orders of magnitude. For the reason that you need to attract volunteers. And people, in this aspect, are rather predictable. People will go to other people who are having fun. In contrast, they will walk an extra mile to avoid people who are not having fun. So, having fun is more than just having a pinball machine in the office. It ’ s an absolute and unavoidable requirement for organizational and operational success when you ’ re working swarmwise. So, in summary â a recipe for a swarm organization using these motivational methods to a huge competitive advantage. Your goal : it needs to be tangible, credible, inclusive and epic. Your organization needs to be optimized for speed, trust and scalability. You need to enjoy yourselves. And that will reward you with two orders of magnitude of cost-efficiency advantage. Thank you.

There ’ s so many of you. When I was a kid, I hid my heart under the bed, because my mother said,”If you ’ re not careful, someday someone ’ s going to break it.”Take it from me : Under the bed is not a good hiding spot. I know because I ’ ve been shot down so many times, I get altitude sickness just from standing up for myself. But that ’ s what we were told.”Stand up for yourself.”And that ’ s hard to do if you don ’ t know who you are. We were expected to define ourselves at such an early age, and if we didn ’ t do it, others did it for us. Geek. Fatty. Slut. Fag. And at the same time we were being told what we were, we were being asked,”What do you want to be when you grow up?”I always thought that was an unfair question. It presupposes that we can ’ t be what we already are. We were kids. When I was a kid, I wanted to be a man. I wanted a registered retirement savings plan that would keep me in candy long enough to make old age sweet. When I was a kid, I wanted to shave. Now, not so much. When I was eight, I wanted to be a marine biologist. When I was nine, I saw the movie”Jaws,”and thought to myself,”No, thank you.”And when I was 10, I was told that my parents left because they didn ’ t want me. When I was 11, I wanted to be left alone. When I was 12, I wanted to die. When I was 13, I wanted to kill a kid. When I was 14, I was asked to seriously consider a career path. I said,”I ’ d like to be a writer.”And they said,”Choose something realistic.”So I said,”Professional wrestler.”And they said,”Don ’ t be stupid.”See, they asked me what I wanted to be, then told me what not to be. And I wasn

’ t the only one. We were being told that we somehow must become what we are not, sacrificing what we are to inherit the masquerade of what we will be. I was being told to accept the identity that others will give me. And I wondered, what made my dreams so easy to dismiss? Granted, my dreams are shy, because they ’ re Canadian. My dreams are self-conscious and overly apologetic. They ’ re standing alone at the high school dance, and they ’ ve never been kissed. See, my dreams got called names too. Silly. Foolish. Impossible. But I kept dreaming. I was going to be a wrestler. I had it all figured out. I was going to be The Garbage Man. My finishing move was going to be The Trash Compactor. My saying was going to be,”I ’ m taking out the trash!”And then this guy, Duke”The Dumpster”Droese, stole my entire shtick. I was crushed, as if by a trash compactor. I thought to myself,”What now? Where do I turn?”Poetry. Like a boomerang, the thing I loved came back to me. One of the first lines of poetry I can remember writing was in response to a world that demanded I hate myself. From age 15 to 18, I hated myself for becoming the thing that I loathed : a bully. When I was 19, I wrote,”I will love myself despite the ease with which I lean toward the opposite.”Standing up for yourself doesn ’ t have to mean embracing violence. When I was a kid, I traded in homework assignments for friendship, then gave each friend a late slip for never showing up on time, and in most cases, not at all. I gave myself a hall pass to get through each broken promise. And I remember this plan, born out of frustration from a kid who kept calling me”Yogi,”then pointed at my tummy and said,”Too many picnic baskets.”Turns out it ’ s not that hard to trick someone, and one day before class, I said,”Yeah, you can copy my homework,”and I gave him all the wrong answers that I ’ d written down the night before. He got his paper back expecting a near-perfect score, and couldn ’ t believe it when he looked across the room at me and held up a zero. I knew I didn ’ t have to hold up my paper of 28 out of 30, but my satisfaction was complete when he looked at me, puzzled, and I thought to myself,”Smarter than the average bear, motherfucker.”This is who I am. This is how I stand up for myself. When I was a kid, I used to think that pork chops and karate chops were the same thing. I thought they were both pork chops. My grandmother thought it was cute, and because they were my favorite, she let me keep doing it. Not really a big deal. One day, before I realized fat kids are not designed to climb trees, I fell out of a tree and bruised the right side of my body. I didn ’ t want to tell my grandmother because I was scared I ’ d get in trouble for playing somewhere I shouldn ’ t have been. The gym teacher noticed the bruise, and I got sent to the principal ’ s office. From there, I was sent to another small room with a really nice lady who asked me all kinds of questions about my life at home. I saw no reason to lie. As far as I was concerned, life was pretty good. I told her, whenever I ’ m sad, my grandmother gives me karate chops. This led to a full-scale investigation, and I was removed from the house for three days, until they finally decided to ask how I got the bruises. News of this silly little story quickly spread through the school, and I earned my first nickname : Porkchop. To this day, I hate pork chops. I ’ m not the only kid who grew up this way, surrounded by people who used to say that rhyme about sticks and stones, as if broken bones hurt more than the names we got called, and we got called them all. So we grew up believing no one would ever fall in love with us, that we ’ d be lonely forever, that we ’ d never meet someone to make us feel like the sun was something they built for us in their toolshed. So broken heartstrings bled the blues, and we tried to empty ourselves so we ’ d feel nothing. Don ’ t tell me that hurts less than a broken bone, that an ingrown life is something surgeons can cut away, that there ’ s no way for it to metastasize ; it does. She was eight years old, our first day of grade three when she got called ugly. We both got moved to the back of class so we would stop getting bombarded by spitballs. But the school halls were a battleground. We found ourselves outnumbered day after wretched day. We used to stay inside for recess, because outside was worse. Outside, we ’ d have to rehearse running away, or learn to stay still like statues, giving no clues that we were there. In grade five, they taped a sign to the front of her desk that read,”Beware of dog.”To this day, despite a loving husband, she doesn ’ t think she ’ s beautiful, because of a birthmark that takes up a little less than half her face. Kids used to say,”She looks like a wrong answer that someone tried to erase, but couldn ’ t quite get the job done.”And they ’ ll never understand that she ’ s raising two kids whose definition of beauty begins with the word”Mom,”because they see her heart before they see her skin, because she ’ s only ever always been amazing. He was a broken branch grafted onto a different family tree, adopted, not because his parents opted for a different destiny. He was three when he became a mixed drink of one part left alone and two parts tragedy, started therapy in eighth grade, had a personality made up of tests and pills, lived like the uphills were mountains and the downhills were cliffs, four-fifths suicidal, a tidal wave of antidepressants, and an adolescent being called”Popper,”one part because of the pills, 99 parts because of the cruelty. He tried to kill himself in grade 10 when a kid who could still go home to Mom and Dad had the audacity to tell him,”Get over it.”As if depression is something that could be remedied by any of the contents found in a first-aid kit. To this day, he is a stick of TNT lit from both ends, could describe to you in detail the way the sky bends in the moment before it ’ s about to fall, and despite an army of friends who all call him an inspiration, he remains a conversation piece between people who can ’ t understand sometimes being drug- free has less to do with addiction and more to do with sanity. We weren ’ t the only kids who grew up this way. To this day, kids are still being called names. The classics were”Hey, stupid,””Hey, spaz.”Seems like every school has an arsenal of names getting updated every year. And if a kid breaks in a school and no one around chooses to hear, do they make a sound? Are they just background noise from a soundtrack stuck on repeat, when people say things like,”Kids can be cruel.”Every school was a big top circus tent, and the pecking order went from acrobats to lion tamers, from clowns to carnies, all of these miles ahead of who we were. We were freaks — lobster-claw boys and bearded ladies, oddities juggling depression and loneliness, playing solitaire, spin the bottle, trying to kiss the wounded parts of ourselves and heal, but at night, while the others slept, we kept walking the tightrope. It was practice, and yes, some of us fell. But I want to tell them that all of this is just debris left over when we finally decide to smash all the things we thought we used to be, and if you can ’ t see anything beautiful about yourself, get a better mirror, look a little closer, stare a little longer, because there ’ s something inside you that made you keep trying despite everyone who told you to quit. You built a cast around your broken heart and signed it yourself,”They were wrong.”Because maybe you didn ’ t belong to a group or a clique. Maybe they decided to pick you last for basketball or everything. Maybe you used to bring bruises and broken teeth to show-and-tell, but never told, because how can you hold your ground if everyone around you wants to bury you beneath it? You have to believe that they were wrong. They have to be wrong. Why else would we still be here? We grew up learning to cheer on the underdog because we see ourselves in them. We stem from a root planted in the belief that we are not what we were called. We are not abandoned cars stalled out and sitting empty on some highway, and if in some way we are, don ’ t worry. We only got out to walk and get gas. We are graduating members from the class of We Made It, not the faded echoes of voices crying out,”Names will never hurt me.”Of course they did. But our lives will only ever always continue to be a balancing act that has less to do with pain and more to do with beauty.

So raise your hand if you know someone in your immediate family or circle of friends who suffers from some form of mental illness. Yeah. I thought so. Not surprised. And raise your hand if you think that basic research on fruit flies has anything to do with understanding mental illness in humans. Yeah. I thought so. I ’ m also not surprised. I can see I ’ ve got my work cut out for me here. As we heard from Dr. Insel this morning, psychiatric disorders like autism, depression and schizophrenia take a terrible toll on human suffering. We know much less about their treatment and the understanding of their basic mechanisms than we do about diseases of the body. Think about it : In 2013, the second decade of the millennium, if you ’ re concerned about a cancer diagnosis and you go to your doctor, you get bone scans, biopsies and blood tests. In 2013, if you ’ re concerned about a depression diagnosis, you go to your doctor, and what do you get? A questionnaire. Now, part of the reason for this is that we have an oversimplified and increasingly outmoded view of the biological basis of psychiatric disorders. We tend to view them — and the popular press aids and abets this view — as chemical imbalances in the brain, as if the brain were some kind of bag of chemical soup full of dopamine, serotonin and norepinephrine. This view is conditioned by the fact that many of the drugs that are prescribed to treat these disorders, like Prozac, act by globally changing brain chemistry, as if the brain were indeed a bag of chemical soup. But that can ’ t be the answer, because these drugs actually don ’ t work all that well. A lot of people won ’ t take them, or stop taking them, because of their unpleasant side effects. These drugs have so many side effects because using them to treat a complex psychiatric disorder is a bit like trying to change your engine oil by opening a can and pouring it all over the engine block. Some of it will dribble into the right place, but a lot of it will do more harm than good. Now, an emerging view that you also heard about from Dr. Insel this morning, is that psychiatric disorders are actually disturbances of neural circuits that mediate emotion, mood and affect. When we think about cognition, we analogize the brain to a computer. That ’ s no problem. Well it turns out that the computer analogy is just as valid for emotion. It ’ s just that we don ’ t tend to think about it that way. But we know much less about the circuit basis of psychiatric disorders because of the overwhelming dominance of this chemical imbalance hypothesis. Now, it ’ s not that chemicals are not important in psychiatric disorders. It ’ s just that they don ’ t bathe the brain like soup. Rather, they ’ re released in very specific locations and they act on specific synapses to change the flow of information in the brain. So if we ever really want to understand the biological basis of psychiatric disorders, we need to pinpoint these locations in the brain where these chemicals act. Otherwise, we ’ re going to keep pouring oil all over our mental engines and suffering the consequences. Now to begin to overcome our ignorance of the role of brain chemistry in brain circuitry, it ’ s helpful to work on what we biologists call”model organisms,”animals like fruit flies and laboratory mice, in which we can apply powerful genetic techniques to molecularly identify and pinpoint specific classes of neurons, as you heard about in Allan Jones ’ s talk this morning. Moreover, once we can do that, we can actually activate specific neurons or we can destroy or inhibit the activity of those neurons. So if we inhibit a particular type of neuron, and we find that a behavior is blocked, we can conclude that those neurons are necessary for that behavior. On the other hand, if we activate a group of neurons and we find that that produces the behavior, we can conclude that those neurons are sufficient for the behavior. So in this way, by doing this kind of test, we can draw cause and effect relationships between the activity of specific neurons in particular circuits and particular behaviors, something that is extremely difficult, if not impossible, to do right now in humans. But can an organism like a fruit fly, which is — it ' s a great model organism because it ' s got a small brain, it ' s capable of complex and sophisticated behaviors, it breeds quickly, and it ' s cheap. But can an organism like this teach us anything about emotion-like states? Do these organisms even have emotion-like states, or are they just little digital robots? Charles Darwin believed that insects have emotion and express them in their behaviors, as he wrote in his 1872 monograph on the expression of the emotions in man and animals. And my eponymous colleague, Seymour Benzer, believed it as well. Seymour is the man that introduced the use of drosophila here at CalTech in the ' 60s as a model organism to study the connection between genes and behavior. Seymour recruited me to CalTech in the late 1980s. He was my Jedi and my rabbi while he was here, and Seymour taught me both to love flies and also to play with science. So how do we ask this question? It ' s one thing to believe that flies have emotion-like states, but how do we actually find out whether that ' s true or not? Now, in humans we often infer emotional states, as you ' ll hear later today, from facial expressions. However, it ' s a little difficult to do that in fruit flies. It ' s kind of like landing on Mars and looking out the window of your spaceship at all the little green men who are surrounding it and trying to figure out,"How do I find out if they have emotions or not?"What can we do? It ' s not so easy. Well, one of the ways that we can start is to try to come up with some general characteristics or properties of emotion-like states such as arousal, and see if we can identify any fly behaviors that might exhibit some of those properties. So three important ones that I can think of are persistence, gradations in intensity, and valence. Persistence means long-lasting. We all know that the stimulus that triggers an emotion causes that emotion to last long after the stimulus is gone. Gradations of intensity means what it sounds like. You can dial up the intensity or dial down the intensity of an emotion. If you ' re a little bit unhappy, the corners of your mouth turn down and you sniffle, and if you ' re very unhappy, tears pour down your face and you might sob. Valence means good or bad, positive or negative. So we decided to see if flies could be provoked into showing the kind of behavior that you see by the proverbial wasp at the picnic table, you know, the one that keeps coming back to your hamburger the more vigorously you try to swat it away, and it seems to keep getting irritated. So we built a device, which we call a puff-o-mat, in which we could deliver little brief air puffs to fruit flies in these plastic tubes in our laboratory bench and blow them away. And what we found is that if we gave these flies in the puff-o-mat several puffs in a row, they became somewhat hyperactive and continued to run around for some time after the air puffs actually stopped and took a while to calm down. So we quantified this behavior using custom locomotor tracking software developed with my collaborator Pietro Perona, who ' s in the electrical engineering division here at CalTech. And what this quantification showed us is that, upon experiencing a train of these air puffs, the flies appear to enter a kind of state of hyperactivity which is persistent, long-lasting, and also appears to be graded. More puffs, or more intense puffs, make the state last for a longer period of time. So now we wanted to try to understand something about what controls the duration of this state. So we decided to use our puff-o-mat and our automated tracking software to screen through hundreds of lines of mutant fruit flies to see if we could find any that showed abnormal responses to the air puffs. And this is one of the great things about fruit flies. There are repositories where you can just pick up the phone and order hundreds of vials of flies of different mutants and screen them in your assay and then find out what gene is affected in the mutation. So doing the screen, we discovered one mutant that took much longer than normal to calm down after the air puffs, and when we examined the gene that was affected in this mutation, it turned out to encode a dopamine receptor. That ’ s right — flies, like people, have dopamine, and it acts on their brains and on their synapses through the same dopamine receptor molecules that you and I have. Dopamine plays a number of important functions in the brain, including in attention, arousal, reward, and disorders of the dopamine system have been linked to a number of mental disorders including drug abuse, Parkinson ’ s disease, and ADHD. Now, in genetics, it ’ s a little counterintuitive. We tend to infer the normal function of something by what doesn ’ t happen when we take it away, by the opposite of what we see when we take it away. So when we take away the dopamine receptor and the flies take longer to calm down, from that we infer that the normal function of this receptor and dopamine is to cause the flies to calm down faster after the puff. And that ’ s a bit reminiscent of ADHD, which has been linked to disorders of the dopamine system in humans. Indeed, if we increase the levels of dopamine in normal flies by feeding them cocaine after getting the appropriate DEA license — oh my God — — we find indeed that these cocaine-fed flies calm down faster than normal flies do, and that ’ s also reminiscent of ADHD, which is often treated with drugs like Ritalin that act similarly to cocaine. So slowly I began to realize that what started out as a rather playful attempt to try to annoy fruit flies might actually have some relevance to a human psychiatric disorder. Now, how far does this analogy go? As many of you know, individuals afflicted with ADHD also have learning disabilities. Is that true of our dopamine receptor mutant flies? Remarkably, the answer is yes. As Seymour showed back in the 1970s, flies, like songbirds, as you just heard, are capable of learning. You can train a fly to avoid an odor, shown here in blue, if you pair that odor with a shock. Then when you give those trained flies the chance to choose between a tube with the shock-paired odor and another odor, it avoids the tube containing the blue odor that was paired with shock. Well, if you do this test on dopamine receptor mutant flies, they don ’ t learn. Their learning score is zero. They flunk out of CalTech. So that means that these flies have two abnormalities, or phenotypes, as we geneticists call them, that one finds in ADHD : hyperactivity and learning disability. Now what ’ s the causal relationship, if anything, between these phenotypes? In ADHD, it ’ s often assumed that the hyperactivity causes the learning disability. The kids can ’ t sit still long enough to focus, so they don ’ t learn. But it could equally be the case that it ’ s the learning disabilities that cause the hyperactivity. Because the kids can ’ t learn, they look for other things to distract their attention. And a final possibility is that there ’ s no relationship at all between learning disabilities and hyperactivity, but that they are caused by a common underlying mechanism in ADHD. Now people have been wondering about this for a long time in humans, but in flies we can actually test this. And the way that we do this is to delve deeply into the mind of the fly and begin to untangle its circuitry using genetics. We take our dopamine receptor mutant flies and we genetically restore, or cure, the dopamine receptor by putting a good copy of the dopamine receptor gene back into the fly brain. But in each fly, we put it back only into certain neurons and not in others, and then we test each of these flies for their ability to learn and for hyperactivity. Remarkably, we find we can completely dissociate these two abnormalities. If we put a good copy of the dopamine receptor back in this elliptical structure called the central complex, the flies are no longer hyperactive, but they still can ’ t learn. On the other hand, if we put the receptor back in a different structure called the mushroom body, the learning deficit is rescued, the flies learn well, but they ’ re still hyperactive. What that tells us is that dopamine is not bathing the brain of these flies like soup. Rather, it ’ s acting to control two different functions on two different circuits, so the reason there are two things wrong with our dopamine receptor flies is that the same receptor is controlling two different functions in two different regions of the brain. Whether the same thing is true in ADHD in humans we don ’ t know, but these kinds of results should at least cause us to consider that possibility. So these results make me and my colleagues more convinced than ever that the brain is not a bag of chemical soup, and it ’ s a mistake to try to treat complex psychiatric disorders just by changing the flavor of the soup. What we need to do is to use our ingenuity and our scientific knowledge to try to design a new generation of treatments that are targeted to specific neurons and specific regions of the brain that are affected in particular psychiatric disorders. If we can do that, we may be able to cure these disorders without the unpleasant side effects, putting the oil back in our mental engines, just where it ’ s needed. Thank you very much.

The first thing I want to do is say thank you to all of you. The second thing I want to do is introduce my co-author and dear friend and co-teacher. Ken and I have been working together for almost 40 years. That ’ s Ken Sharpe over there. So there is among many people â certainly me and most of the people I talk to â a kind of collective dissatisfaction with the way things are working, with the way our institutions run. Our kids ’ teachers seem to be failing them. Our doctors don ’ t know who the hell we are, and they don ’ t have enough time for us. We certainly can ’ t trust the bankers, and we certainly can ’ t trust the brokers. They almost brought the entire financial system down. And even as we do our own work, all too often, we find ourselves having to choose between doing what we think is the right thing and doing the expected thing, or the required thing, or the profitable thing. So everywhere we look, pretty much across the board, we worry that the people we depend on don ’ t really have our interests at heart. Or if they do have our interests at heart, we worry that they don ’ t know us well enough to figure out what they need to do in order to allow us to secure those interests. They don ’ t understand us. They don ’ t have the time to get to know us. There are two kinds of responses that we make to this sort of general dissatisfaction. If things aren ’ t going right, the first response is : let ’ s make more rules, let ’ s set up a set of detailed procedures to make sure that people will do the right thing. Give teachers scripts to follow in the classroom, so even if they don ’ t know what they ’ re doing and don ’ t care about the welfare of our kids, as long as they follow the scripts, our kids will get educated. Give judges a list of mandatory sentences to impose for crimes, so that you don ’ t need to rely on judges using their judgment. Instead, all they have to do is look up on the list what kind of sentence goes with what kind of crime. Impose limits on what credit card companies can charge in interest and on what they can charge in fees. More and more rules to protect us against an indifferent, uncaring set of institutions we have to deal with. Or â or maybe and â in addition to rules, let ’ s see if we can come up with some really clever incentives so that, even if the people we deal with don ’ t particularly want to serve our interests, it is in their interest to serve our interest â the magic incentives that will get people to do the right thing even out of pure selfishness. So we offer teachers bonuses if the kids they teach score passing grades on these big test scores that are used to evaluate the quality of school systems. Rules and incentives â”sticks”and”carrots.”We passed a bunch of rules to regulate the financial industry in response to the recent collapse. There ’ s the Dodd-Frank Act, there ’ s the new Consumer Financial Protection Agency that is temporarily being headed through the backdoor by Elizabeth Warren. Maybe these rules will actually improve the way these financial services companies behave. We ’ ll see. In addition, we are struggling to find some way to create incentives for people in the financial services industry that will have them more interested in serving the long-term interests even of their own companies, rather than securing short-term profits. So if we find just the right incentives, they ’ ll do the right thing â as I said â selfishly, and if we come up with the right rules and regulations, they won ’ t drive us all over a cliff. And Ken [Sharpe] and I certainly know that you need to reign in the bankers. If there is a lesson to be learned from the financial collapse it is that. But what we believe, and what we argue in the book, is that there is no set of rules, no matter how detailed, no matter how specific, no matter how carefully monitored and enforced, there is no set of rules that will get us what we need. Why? Because bankers are smart people. And, like water, they will find cracks in any set of rules. You design a set of rules that will make sure that the particular reason why the financial system”almost-collapse”can ’ t happen again. It is naive beyond description to think that having blocked this source of financial collapse, you have blocked all possible sources of financial collapse. So it ’ s just a question of waiting for the next one and then marveling at how we could have been so stupid as not to protect ourselves against that. What we desperately need, beyond, or along with, better rules and reasonably smart incentives, is we need virtue. We need character. We need people who want to do the right thing. And in particular, the virtue that we need most of all is the virtue that Aristotle called”practical wisdom.”Practical wisdom is the moral will to do the right thing and the moral skill to figure out what the right thing is. So Aristotle was very interested in watching how the craftsmen around him worked. And he was impressed at how they would improvise novel solutions to novel problems â problems that they hadn ’ t anticipated. So one example is he sees these stonemasons working on the Isle of Lesbos, and they need to measure out round columns. Well if you think about it, it ’ s really hard to measure out round columns using a ruler. So what do they do? They fashion a novel solution to the problem. They created a ruler that bends, what we would call these days a tape measure â a flexible rule, a rule that bends. And Aristotle said,”Hah, they appreciated that sometimes to design rounded columns, you need to bend the rule.”And Aristotle said often in dealing with other people, we need to bend the rules. Dealing with other people demands a kind of flexibility that no set of rules can encompass. Wise people know when and how to bend the rules. Wise people know how to improvise. The way my co-author, Ken, and I talk about it, they are kind of like jazz musicians. The rules are like the notes on the page, and that gets you started, but then you dance around the notes on the page, coming up with just the right combination for this particular moment with this particular set of fellow players. So for Aristotle, the kind of rule-bending, rule exception-finding and improvisation that you see in skilled craftsmen is exactly what you need to be a skilled moral craftsman. And in interactions with people, almost all the time, it is this kind of flexibility that is required. A wise person knows when to bend the rules. A wise person knows when to improvise. And most important, a wise person does this improvising and rule- bending in the service of the right aims. If you are a rule-bender and an improviser mostly to serve yourself, what you get is ruthless manipulation of other people. So it matters that you do this wise practice in the service of others and not in the service of yourself. And so the will to do the right thing is just as important as the moral skill of improvisation and exception- finding. Together they comprise practical wisdom, which Aristotle thought was the master virtue. So I ’ ll give you an example of wise practice in action. It ’ s the case of Michael. Michael ’ s a young guy. He had a pretty low-wage job. He was supporting his wife and a child, and the child was going to parochial school. Then he lost his job. He panicked about being able to support his family. One night, he drank a little too much, and he robbed a cab driver â stole 50 dollars. He robbed him at gunpoint. It was a toy gun. He got caught. He got tried. He got convicted. The Pennsylvania sentencing guidelines required a minimum sentence for a crime like this of two years, 24 months. The judge on the case, Judge Lois Forer thought that this made no sense. He had never committed a crime before. He was a responsible husband and father. He had been faced with desperate circumstances. All this would do is wreck a family. And so she improvised a sentence â 11 months, and not only that, but release every day to go to work. Spend your night in jail, spend your day holding down a job. He did. He served out his sentence. He made restitution and found himself a new job. And the family was united. And it seemed on the road to some sort of a decent life â a happy ending to a story involving wise improvisation from a wise judge. But it turned out the prosecutor was not happy that Judge Forer ignored the sentencing guidelines and sort of invented her own, and so he appealed. And he asked for the mandatory minimum sentence for armed robbery. He did after all have a toy gun. The mandatory minimum sentence for armed robbery is five years. He won the appeal. Michael was sentenced to five years in prison. Judge Forer had to follow the law. And by the way, this appeal went through after he had finished serving his sentence, so he was out and working at a job and taking care of his family and he had to go back into jail. Judge Forer did what she was required to do, and then she quit the bench. And Michael disappeared. So that is an example, both of wisdom in practice and the subversion of wisdom by rules that are meant, of course, to make things better. Now consider Ms. Dewey. Ms. Dewey ’ s a teacher in a Texas elementary school. She found herself listening to a consultant one day who was trying to help teachers boost the test scores of the kids, so that the school would reach the elite category in percentage of kids passing big tests. All these schools in Texas compete with one another to achieve these milestones, and there are bonuses and various other treats that come if you beat the other schools. So here was the consultant ’ s advice : first, don ’ t waste your time on kids who are going to pass the test no matter what you do. Second, don ’ t waste your time on kids who can ’ t pass the test no matter what you do. Third, don ’ t waste your time on kids who moved into the district too late for their scores to be counted. Focus all of your time and attention on the kids who are on the bubble, the so-called”bubble kids”â kids where your intervention can get them just maybe over the line from failing to passing. So Ms. Dewey heard this, and she shook her head in despair while fellow teachers were sort of cheering each other on and nodding approvingly. It ’ s like they were about to go play a football game. For Ms. Dewey, this isn ’ t why she became a teacher. Now Ken and I are not naive, and we understand that you need to have rules. You need to have incentives. People have to make a living. But the problem with relying on rules and incentives is that they demoralize professional activity, and they demoralize professional activity in two senses. First, they demoralize the people who are engaged in the activity. Judge Forer quits, and Ms. Dewey in completely disheartened. And second, they demoralize the activity itself. The very practice is demoralized, and the practitioners are demoralized. It creates people â when you manipulate incentives to get people to do the right thing â it creates people who are addicted to incentives. That is to say, it creates people who only do things for incentives. Now the striking thing about this is that psychologists have known this for 30 years. Psychologists have known about the negative consequences of incentivizing everything for 30 years. We know that if you reward kids for drawing pictures, they stop caring about the drawing and care only about the reward. If you reward kids for reading books, they stop caring about what ’ s in the books and only care about how long they are. If you reward teachers for kids ’ test scores, they stop caring about educating and only care about test preparation. If you were to reward doctors for doing more procedures â which is the current system â they would do more. If instead you reward doctors for doing fewer procedures, they will do fewer. What we want, of course, is doctors who do just the right amount of procedures and do the right amount for the right reason â namely, to serve the welfare of their patients. Psychologists have known this for decades, and it ’ s time for policymakers to start paying attention and listen to psychologists a little bit, instead of economists. And it doesn ’ t have to be this way. We think, Ken and I, that there are real sources of hope. We identify one set of people in all of these practices who we call canny outlaws. These are people who, being forced to operate in a system that demands rule-following and creates incentives, find away around the rules, find a way to subvert the rules. So there are teachers who have these scripts to follow, and they know that if they follow these scripts, the kids will learn nothing. And so what they do is they follow the scripts, but they follow the scripts at double-time and squirrel away little bits of extra time during which they teach in the way that they actually know is effective. So these are little ordinary, everyday heroes, and they ’ re incredibly admirable, but there ’ s no way that they can sustain this kind of activity in the face of a system that either roots them out or grinds them down. So canny outlaws are better than nothing, but it ’ s hard to imagine any canny outlaw sustaining that for an indefinite period of time. More hopeful are people we call system-changers. These are people who are looking not to dodge the system ’ s rules and regulations, but to transform the system, and we talk about several. One in particular is a judge named Robert Russell. And one day he was faced with the case of Gary Pettengill. Pettengill was a 23-year-old vet who had planned to make the army a career, but then he got a severe back injury in Iraq, and that forced him to take a medical discharge. He was married, he had a third kid on the way, he suffered from PTSD, in addition to the bad back, and recurrent nightmares, and he had started using marijuana to ease some of the symptoms. He was only able to get part-time work because of his back, and so he was unable to earn enough to put food on the table and take care of his family. So he started selling marijuana. He was busted in a drug sweep. His family was kicked out of their apartment, and the welfare system was threatening to take away his kids. Under normal sentencing procedures, Judge Russell would have had little choice but to sentence Pettengill to serious jail-time as a drug felon. But Judge Russell did have an alternative. And that ’ s because he was in a special court. He was in a court called the Veterans ’ Court. In the Veterans ’ Court â this was the first of its kind in the United States. Judge Russell created the Veterans ’ Court. It was a court only for veterans who had broken the law. And he had created it exactly because mandatory sentencing laws were taking the judgment out of judging. No one wanted non-violent offenders â and especially non-violent offenders who were veterans to boot â to be thrown into prison. They wanted to do something about what we all know, namely the revolving door of the criminal justice system. And what the Veterans ’ Court did, was it treated each criminal as an individual, tried to get inside their problems, tried to fashion responses to their crimes that helped them to rehabilitate themselves, and didn ’ t forget about them once the judgment was made. Stayed with them, followed up on them, made sure that they were sticking to whatever plan had been jointly developed to get them over the hump. There are now 22 cities that have Veterans ’ Courts like this. Why has the idea spread? Well, one reason is that Judge Russell has now seen 108 vets in his Veterans ’ Court as of February of this year, and out of 108, guess how many have gone back through the revolving door of justice into prison. None. None. Anyone would glom onto a criminal justice system that has this kind of a record. So here ’ s is a system-changer, and it seems to be catching. There ’ s a banker who created a for-profit community bank that encouraged bankers â□□ I know this is hard to believe â□□ encouraged bankers who worked there to do well by doing good for their low-income clients. The bank helped finance the rebuilding of what was otherwise a dying community. Though their loan recipients were high-risk by ordinary standards, the default rate was extremely low. The bank was profitable. The bankers stayed with their loan recipients. They didn ’ t make loans and then sell the loans. They serviced the loans. They made sure that their loan recipients were staying up with their payments. Banking hasn ’ t always been the way we read about it now in the newspapers. Even Goldman Sachs once used to serve clients, before it turned into an institution that serves only itself. Banking wasn ’ t always this way, and it doesn ’ t have to be this way. So there are examples like this in medicine â□□ doctors at Harvard who are trying to transform medical education, so that you don ’ t get a kind of ethical erosion and loss of empathy, which characterizes most medical students in the course of their medical training. And the way they do it is to give third-year medical students patients who they follow for an entire year. So the patients are not organ systems, and they ’ re not diseases ; they ’ re people, people with lives. And in order to be an effective doctor, you need to treat people who have lives and not just disease. In addition to which there ’ s an enormous amount of back and forth, mentoring of one student by another, of all the students by the doctors, and the result is a generation â□□ we hope â□□ of doctors who do have time for the people they treat. We ’ ll see. So there are lots of examples like this that we talk about. Each of them shows that it is possible to build on and nurture character and keep a profession true to its proper mission â□□ what Aristotle would have called its proper telos. And Ken and I believe that this is what practitioners actually want. People want to be allowed to be virtuous. They want to have permission to do the right thing. They don ’ t want to feel like they need to take a shower to get the moral grime off their bodies everyday when they come home from work. Aristotle thought that practical wisdom was the key to happiness, and he was right. There ’ s now a lot of research being done in psychology on what makes people happy, and the two things that jump out in study after study â□□ I know this will come as a shock to all of you â□□ the two things that matter most to happiness are love and work. Love : managing successfully relations with the people who are close to you and with the communities of which you are a part. Work : engaging in activities that are meaningful and satisfying. If you have that, good close relations with other people, work that ’ s meaningful and fulfilling, you don ’ t much need anything else. Well, to love well and to work well, you need wisdom. Rules and incentives don ’ t tell you how to be a good friend, how to be a good parent, how to be a good spouse, or how to be a good doctor or a good lawyer or a good teacher. Rules and incentives are no substitutes for wisdom. Indeed, we argue, there is no substitute for wisdom. And so practical wisdom does not require heroic acts of self-sacrifice on the part of practitioners. In giving us the will and the skill to do the right thing â□□ to do right by others â□□ practical wisdom also gives us the will and the skill to do right by ourselves. Thanks.

I ’ m going to have a pretty simple idea that I ’ m just going to tell you over and over until I get you to believe it, and that is all of us are makers. I really believe that. All of us are makers. We ’ re born makers. We have this ability to make things, to grasp things with our hands. We use words like”grasp”metaphorically to also think about understanding things. We don ’ t just live, but we make. We create things. Well I ’ m going to show you a group of makers from Maker Faire and various places. It doesn ’ t come out particularly well, but that ’ s a particularly tall bicycle. It ’ s a scraper bike ; it ’ s called — from Oakland. And this is a particularly small scooter for a gentleman of this size. But he ’ s trying to power it, or motorize it, with a drill. And the question he had is,”Can I do it? Can it be done?”Apparently it can. So makers are enthusiasts ; they ’ re amateurs ; they ’ re people who love doing what they do. They don ’ t always even know why they ’ re doing it. We have begun organizing makers at our Maker Faire. There was one held in Detroit here last summer, and it will be held again next summer, at the Henry Ford. But we hold them in San Francisco — — and in New York. And it ’ s a fabulous event to just meet and talk to these people who make things and are there to just show them to you and talk about them and have a great conversation. Guy : I might get one of those. Dale Dougherty : These are electric muffins. Guy : Where did you guys get those? Muffin : Will you glide with us? DD : I know Ford has new electric vehicles coming out. We got there first. Lady : Will you glide with us? DD : This is something I call”swinging in the rain.”And you can barely see it, but it ’ s — a controller at top cycles the water to fall just before and after you pass through the bottom of the arc. So imagine a kid :”Am I going to get wet? Am I going to get wet? No, I didn ’ t get wet. Am I going to get wet? Am I going to get wet?”That ’ s the experience of a clever ride. And of course, we have fashion. People are remaking things into fashion. I don ’ t know if this is called a basket-bra, but it ought to be something like that. We have art students getting together, taking old radiator parts and doing an iron-pour to make something new out of it. They did that in the summer, and it was very warm. Now this one takes a little bit of explaining. You know what those are, right? Billy-Bob, or Billy Bass, or something like that. Now the background is — the guy who did this is a physicist. And here he ’ ll explain a little bit about what it does. Richard Carter : I ’ m Richard Carter, and this is the Sashimi Tabernacle Choir. Choir : When you hold me in your arms DD : This is all computer-controlled in an old Volvo. Choir : I ’ m hooked on a feelin ’ I ’ m high on believin ’ That you ’ re in love with me DD : So Richard came up from Houston last year to visit us in Detroit here and show the wonderful Sashimi Tabernacle Choir. So, are you a maker? How many people here would say you ’ re a maker, if you raise your hand? That ’ s a pretty good — but there ’ s some of you out there that won ’ t admit that you ’ re makers. And again, think about it. You ’ re makers of food ; you ’ re makers of shelter ; you ’ re makers of lots of different things, and partly what interests me today is you ’ re makers of your own world, and particularly the role that technology has in your life. You ’ re really a driver or a passenger — to use a Volkswagen phrase. Makers are in control. That ’ s what fascinates them. That ’ s why they do what they do. They want to figure out how things work ; they want to get access to it ; and they want to control it. They want to use it to their own purpose. Makers today, to some degree, are out on the edge. They ’ re not mainstream. They ’ re a little bit radical. They ’ re a bit subversive in what they do. But at one time, it was fairly commonplace to think of yourself as a maker. It was not something you ’ d even remark upon.

And I found this old video. And I ’ ll tell you more about it, but just... Narrator : Of all things Americans are, we are makers. With our strengths and our minds and spirit, we gather, we form, and we fashion. Makers and shapers and put-it-togetherers. DD : So it goes on to show you people making things out of wood, a grandfather making a ship in a bottle, a woman making a pie — somewhat standard fare of the day. But it was a sense of pride that we made things, that the world around us was made by us. It didn ’ t just exist. We made it, and we were connected to it that way. And I think that ’ s tremendously important. Now I ’ m going to tell you one funny thing about this. This particular reel — it ’ s an industrial video — but it was shown in drive-in theaters in 1961 — in the Detroit area, in fact — and it preceded Alfred Hitchcock ’ s”Psycho.”So I like to think there was something going on there of the new generation of makers coming out of this, plus”Psycho.”This is Andrew Archer. I met Andrew at one of our community meetings putting together Maker Faire. Andrew had moved to Detroit from Duluth, Minnesota. And I talked to his mom, and I ended up doing a story on him for a magazine called Kidrobot. He ’ s just a kid that grew up playing with tools instead of toys. He liked to take things apart. His mother gave him a part of the garage, and he collected things from yard sales, and he made stuff. And then he didn ’ t particularly like school that much, but he got involved in robotics competitions, and he realized he had a talent, and, more importantly, he had a real passion for it. And he began building robots. And when I sat down next to him, he was telling me about a company he formed, and he was building some robots for automobile factories to move things around on the factory floor. And that ’ s why he moved to Michigan. But he also moved here to meet other people doing what he ’ s doing. And this kind of gets to this important idea today. This is Jeff and Bilal and several others here in a hackerspace. And there ’ s about three hackerspaces or more in Detroit. And there ’ s probably even some new ones since I ’ ve been here last. But these are like clubs — they ’ re sharing tools, sharing space, sharing expertise in what to make. And so it ’ s a very interesting phenomenon that ’ s going across the world. But essentially these are people that are playing with technology. Let me say that again : playing. They don ’ t necessarily know what they ’ re doing or why they ’ re doing it. They ’ re playing to discover what the technology can do, and probably to discover what they can do themselves, what their own capabilities are. Now the other thing that I think is taking off, another reason making is taking off today, is there ’ s some great new tools out there. And you can ’ t see this very well on the screen, but Arduino — Arduino is an open-source hardware platform. It ’ s a micro-controller. If you don ’ t know what those are, they ’ re just the”brains.”So they ’ re the brains of maker projects, and here ’ s an example of one. And I don ’ t know if you can see it that well, but that ’ s a mailbox — so an ordinary mailbox and an Arduino. So you figure out how to program this, and you put this in your mailbox. And when someone opens your mailbox, you get a notification, an alert message goes to your iPhone. Now that could be a dog door, it could be someone going somewhere where they shouldn ’ t, like a little brother into a little sister ’ s room. There ’ s all kinds of different things that you can imagine for that. Now here ’ s something — a 3D printer. That ’ s another tool that ’ s really taken off — really, really interesting. This is Makerbot. And there are industrial versions of this — about 20, 000 dollars. These guys came up with a kit version for 750 dollars, and that means that hobbyists and ordinary folks can get a hold of this and begin playing with 3D printers. Now they don ’ t know what they want to do with it, but they ’ re going to figure it out. They will only figure it out by getting their hands on it and playing with it. One of the coolest things is, Makerbot sent out an upgrade, some new brackets for the box. Well you printed out the brackets and then replaced the old brackets with the new ones. Isn ’ t that cool? So makers harvest technology from all the places around us. This is a radar speed detector that was developed from a Hot Wheels toy. And they do interesting things. They ’ re really creating new areas and exploring areas that you might only think — the military is doing drones — well, there is a whole community of people building autonomous airplanes, or vehicles — something that you could program to fly on its own, without a stick or anything, to figure out what path it ’ s going. Fascinating work they ’ re doing. We just had an issue on space exploration, DIY space exploration. This is probably the best time in the history of mankind to love space. You could build your own satellite and get it into space for like 8, 000 dollars. Think how much money and how many years it took NASA to get satellites into space. In fact, these guys actually work for NASA, and they ’ re trying to pioneer using off-the- shelf components, cheap things that aren ’ t specialized that they can combine and send up into space. Makers are a source of innovation, and I think it relates back to something like the birth of the personal computer industry. This is Steve Wozniak. Where does he learn about computers? It ’ s the Homebrew Computer Club — just like a hackerspace. And he says,”I could go there all day long and talk to people and share ideas for free.”Well he did a little bit better than free. But it ’ s important to understand that a lot of the origins of our industries — even like Henry Ford — come from this idea of playing and figuring things out in groups. Well, if I haven ’ t convinced you that you ’ re a maker, I hope I could convince you that our next generation should be makers, that kids are particularly interested in this, in this ability to control the physical world and be able to use things like micro-controllers and build robots. And we ’ ve got to get this into schools, or into communities in many, many ways — the ability to tinker, to shape and reshape the world around us. There ’ s a great opportunity today — and that ’ s what I really care about the most. An the answer to the question : what will America make? It ’ s more makers. Thank you very much.

The maxim,”Know thyself”has been around since the ancient Greeks. Some attribute this golden world knowledge to Plato, others to Pythagoras. But the truth is it doesn ’ t really matter which sage said it first, because it ’ s still sage advice, even today.”Know thyself.”It ’ s pithy almost to the point of being meaningless, but it rings familiar and true, doesn ’ t it?”Know thyself.”I understand this timeless dictum as a statement about the problems, or more exactly, the confusions, of consciousness. I ’ ve always been fascinated with knowing the self. This fascination led me to submerge myself in art, study neuroscience, and later, to become a psychotherapist. Today I combine all my passions as the CEO of InteraXon, a thought-controlled computing company. My goal, quite simply, is to help people become more in tune with themselves. I take it from this little dictum,”Know thyself.”If you think about it, this imperative is kind of the defining characteristic of our species, isn ’ t it? I mean, it ’ s self-awareness that separates Homo sapiens from earlier instances of our mankind. Today we ’ re often too busy tending to our iPhones and iPods to really stop and get to know ourselves. Under the deluge of minute-to-minute text conversations, e-mails, relentless exchange of media channels and passwords and apps and reminders and Tweets and tags, we lose sight of what all this fuss is supposed to be about in the first place : Ourselves. Much of the time we ’ re transfixed by all of the ways we can reflect ourselves out into the world. And we can barely find the time to reflect deeply back in on our own selves. We ’ ve cluttered ourselves up with all this. And we feel like we have to get far, far away to a secluded retreat, leaving it all behind. So we go far away to the top of a mountain, assuming that perching ourselves on a piece is bound to give us the respite we need to sort the clutter, the chaotic everyday, and find ourselves again. But on that mountain where we gain that beautiful peace of mind, what are we really achieving? It ’ s really only a successful escape. Think of the term we use,”Retreat.”This is the term that armies use when they ’ ve lost a battle. It means we ’ ve got to get out of here. Is this how we feel about the pressures of our world, that in order to get inside ourselves, you have to run for the hills? And the problem with escaping your day-to-day life is that you have to come home, eventually. So when you think about it, we ’ re almost like a tourist visiting ourselves over there. And eventually, that vacation ’ s got to come to an end. So my question to you is, can we find ways to know ourselves without the escape? Can we redefine our relationship with the technologized world in order to have the heightened sense of self-awareness that we seek? Can we live here and now in our wired web and still follow those ancient instructions,”Know thyself?”I say the answer is yes. And I ’ m here today to share a new way that we ’ re working with technology to this end, to get familiar with our inner self like never before — humanizing technology and furthering that age-old quest of ours to more fully know the self. It ’ s called thought-controlled computing. You may or may not have noticed that I ’ m wearing a tiny electrode on my forehead. This is actually a brainwave sensor that ’ s reading the electrical activity of my brain as I give this talk. These brainwaves are being analyzed and we can see them as a graph. Let me show you what it looks like. That blue line there is my brainwave. It ’ s the direct signal being recorded from my head, rendered in real time. The green and red bars show that same signal displayed by frequency, with lower frequencies here and higher frequencies up here. You ’ re actually looking inside my head as I speak. These graphs are compelling, they ’ re undulating, but from a human ’ s perspective, they ’ re actually not very useful. That ’ s why we ’ ve spent a lot of time thinking about how to make this data meaningful to the people who use it. For instance, what if I could use this data to find out how relaxed I am at any moment? Or what if I can take that information and put it into an organic shape up on the screen? The shape on the right over here has become an indicator of what ’ s going on in my head. The more relaxed I am, the more the energy ’ s going to fall through it. I may also be interested in knowing how focused I am, so I can put my level of attention into the circuit board on the other side. And the more focused my brain is, the more the circuit board is going to surge with energy. Ordinarily, I would have no way of knowing how focused or relaxed I was in any tangible way. As we know, our feelings about how we ’ re feeling are notoriously unreliable. We ’ ve all had stress creep up on us without even noticing it until we lost it on someone who didn ’ t deserve it, and then we realize that we probably should have checked in with ourselves a little earlier. This new awareness opens up vast possibilities for applications that help improve our lives and ourselves. We ’ re trying to create technology that uses the insights to make our work more efficient, our breaks more relaxing and our connections deeper and more fulfilling than ever. I ’ m going to share some of these visions with you in a bit, but first I want to take a look at how we got here. By the way, feel free to check in on my head at any time. My team at InteraXon and I have been developing thought-controlled application for almost a decade now. In the first phase of development, we were really enthused by all the things we could control with our mind. We were making things activate, light up and work just by thinking. We were transcending the space between the mind and the device. We brought to life a vast array of prototypes and products that you could control with your mind, like thought- controlled home appliances or slot-car games or video games or a levitating chair. We created technology and applications that engaged people ’ s imaginations, and it was really exciting. And then we were asked to do something really big for the Olympics. We were invited to create a massive installation at the Vancouver 2010 winter Olympics, were used in Vancouver, got to control the lighting on the CN Tower, the Canadian Parliament buildings and Niagara Falls from all the way across the country using their minds. Over 17 days at the Olympics, 7, 000 visitors from all over the world actually got to individually control the light from the CN Tower, parliament and Niagara in real time with their minds from across the country, 3, 000 km away. So controlling stuff with your mind is pretty cool. But we ’ re always interested in multitiered levels of human interaction. And so we began looking into inventing thought-controlled applications in a more complex frame than just control. And that was responsiveness. We realized that we had a system that allowed technology to know something about you. And it could join into the relationship with you. We created the responsive room where the lights, music and blinds adjusted to your state. They followed these little shifts in your mental activity. So as you settled into relaxation at the end of a hard day, on the couch in our office, the music would mellow with you. When you read, the desk lamp would get brighter. If you nod off, the system would know, dimming to darkness as you do. We then realized that if technology could know something about you and use it to help you, there ’ s an even more valuable application than that. That you could know something about yourself. We could know sides of ourselves that were all but invisible and come to see things that were previously hidden. Let me show you an example of what I ’ m talking about here. Here ’ s an application that I created for the iPad. So the goal of the original game Zen Bound is to wrap a rope around a wooden form. So you use it with your headset. The headset connects wirelessly to an iPad or a smartphone. In that headset, you have fabric sensors on your forehead and above the ear. In the original Zen Bound game, you play it by scrolling your fingers over the pad. In the game that we created, of course, you control the wooden form that ’ s on the screen there with your mind. As you focus on the wooden form, it rotates. The more you focus, the faster the rotation. This is for real. This is not a fake. What ’ s really interesting to me though is at the end of the game, you get stats and feedback about how you did. You have graphs and charts that tell you how your brain was doing — not just how much rope you used or what your high score is, but what was going on inside of your mind. And this is valuable feedback that we can use to understand what ’ s going on inside of ourselves. I like to call this”intra-active.”Normally, we think about technology as interactive. This technology is intra-active. It understands what ’ s inside of you and builds a sort of responsive relationship between you and your technology so that you can use this information to move you forward. So you can use this information to understand you in a responsive loop. At InteraXon — intra-active technology is one of our really defining mandates. It ’ s how we understand the world inside and reflect it outside into this tight loop. For example, thought-controlled computing can teach children with ADD how to improve their focus. With ADD, children have a low proportion of beta waves for focus states and a high proportion of theta states. So you can create applications that reward focused brain states. So you can imagine kids playing video games with their brain waves and improving their ADD symptoms as they do it. This can be as effective as Ritalin. Perhaps even more importantly, thought-controlled computing can give children with ADD insights into their own fluctuating mental states, so they can better understand themselves and their learning needs. The way these children will be able to use their new awareness to improve themselves will upend many of the damaging and widespread social stigmas that people who are diagnosed as different are challenged with. We can peer inside our heads and interact with what was once locked away from us, what once mystified and separated us. Brainwave technology can understand us, anticipate our emotions and find the best solutions for our needs. Imagine this collected awareness of the individual computed and reflected across an entire lifespan. Imagine the insights that you can gain from this kind of second sight. It would be like plugging into your own personal Google. On the subject of Google, today you can search and tag images based on the thoughts and feelings you had while you watched them. You can tag pictures of baby animals as happy, or whatever baby animals are to you, and then you can search that database, navigating with your feelings, rather than the keywords that just hint at them. Or you could tag Facebook photos with the emotions that you had associated with those memories and then instantly prioritize the streams that catch your attention, just like this. Humanizing technology is about taking what ' s already natural about the human-tech experience and building technology seamlessly in tandem with it. As it aligns with our human behaviors, it can allow us to make better sense of what we do and, more importantly, why. Creating a big picture out of all the important little details that make up who we are. With humanized technology we can monitor the quality of your sleep cycles. When our productivity starts to slacken, we can go back to that data and see how we can make more effective balance between work and play. Do you know what causes fatigue in you or what brings out your energetic self, what triggers cause you to be depressed or what fun things are going to bring you out of that funk? Imagine if you had access to data that allowed you to rank on a scale of overall happiness which people in your life made you the happiest, or what activities brought you joy. Would you make more time for those people? Would you prioritize? Would you get a divorce? What thought-controlled computing can allow you to do is build colorful layered pictures of our lives. And with this, we can get the skinny on our psychological happenings and build a story of our behaviors over time. We can begin to see the underlying narratives that propel us forward and tell us about what ' s going on. And from this, we can learn how to change the plot, the outcome and the character of our personal stories. Two millennia ago, those Greeks had some powerful insights. They knew that a fundamental piece falls into place when you start to live out their little phrase, when you come into contact with yourself. They understood the power of human narrative and the value that we place on humans as changing, evolving and growing. But they understood something more fundamental — the sheer joy in discovery, the delight and fascination that we get from the world and being ourselves in it ; the richness that we get from seeing, feeling and knowing the lives that we are. My mom ' s an artist, and as a child, I ' d often see her bring things to life with the stroke of a brush. One moment, it was all white space, pure possibility. The next, it was alive with her colorful ideas and expressions. As I sat easel- side, watching her transform canvas after canvas, I learned that you could create your own world. I learned that our own inner worlds — our ideas, emotions and imaginations — were, in fact, not bound by our brains and bodies. If you could think it, if you could discover it, you could bring it to life. To me, thought-controlled computing is as simple and powerful as a paintbrush — one more tool to unlock and enliven the hidden worlds within us. I look forward to the day that I can sit beside you, easel-side, watching the world that we can create with our new toolboxes and the discoveries that we can make about ourselves. Thank you.

Text Sample 952: NEG Dim 6 – 2009 – Score 1.00 – 2009/t002995.txt

Today I ’ m going to talk to you about the problem of other minds. And the problem I ’ m going to talk about is not the familiar one from philosophy, which is,”How can we know whether other people have minds?”That is, maybe you have a mind, and everyone else is just a really convincing robot. So that ’ s a problem in philosophy, but for today ’ s purposes I ’ m going to assume that many people in this audience have a mind, and that I don ’ t have to worry about this. There is a second problem that is maybe even more familiar to us as parents and teachers and spouses and novelists, which is,”Why is it so hard to know what somebody else wants or believes?”Or perhaps, more relevantly,”Why is it so hard to change what somebody else wants or believes?”I think novelists put this best. Like Philip Roth, who said,”And yet, what are we to do about this terribly significant business of other people? So ill equipped are we all, to envision one another ’ s interior workings and invisible aims.”So as a teacher and as a spouse, this is, of course, a problem I confront every day. But as a scientist, I ’ m interested in a different problem of other minds, and that is the one I ’ m going to introduce to you today. And that problem is,”How is it so easy to know other minds?”So to start with an illustration, you need almost no information, one snapshot of a stranger, to guess what this woman is thinking, or what this man is. And put another way, the crux of the problem is the machine that we use for thinking about other minds, our brain, is made up of pieces, brain cells, that we share with all other animals, with monkeys and mice and even sea slugs. And yet, you put them together in a particular network, and what you get is the capacity to write Romeo and Juliet. Or to say, as Alan Greenspan did,”I know you think you understand what you thought I said, but I ’ m not sure you realize that what you heard is not what I meant.”So, the job of my field of cognitive neuroscience is to stand with these ideas, one in each hand. And to try to understand how you can put together simple units, simple messages over space and time, in a network, and get this amazing human capacity to think about minds. So I ’ m going to tell you three things about this today. Obviously the whole project here is huge. And I ’ m going to tell you just our first few steps about the discovery of a special brain region for thinking about other people ’ s thoughts. Some observations on the slow development of this system as we learn how to do this difficult job. And then finally, to show that some of the differences between people, in how we judge others, can be explained by differences in this brain system. So first, the first thing I want to tell you is that there is a brain region in the human brain, in your brains, whose job it is to think about other people ’ s thoughts. This is a picture of it. It ’ s called the Right Temporo-Parietal Junction. It ’ s above and behind your right ear. And this is the brain region you used when you saw the pictures I showed you, or when you read Romeo and Juliet or when you tried to understand Alan Greenspan. And you don ’ t use it for solving any other kinds of logical problems. So this brain region is called the Right TPJ. And this picture shows the average activation in a group of what we call typical human adults. They ’ re MIT undergraduates. The second thing I want to say about this brain system is that although we human adults are really good at understanding other minds, we weren ’ t always that way. It takes children a long time to break into the system. I ’ m going to show you a little bit of that long, extended process. The first thing I ’ m going to show you is a change between age three and five, as kids learn to understand that somebody else can have beliefs that are different from their own. So I ’ m going to show you a five-year-old who is getting a standard kind of puzzle that we call the false belief task. Rebecca Saxe : This is the first pirate. His name is Ivan. And you know what pirates really like? Child : What? RS : Pirates really like cheese sandwiches. Child : Cheese? I love cheese! RS : Yeah. So Ivan has this cheese sandwich, and he says,”Yum yum yum yum yum! I really love cheese sandwiches.”And Ivan puts his sandwich over here, on top of the pirate chest. And Ivan says,”You know what? I need a drink with my lunch.”And so Ivan goes to get a drink. And while Ivan is away the wind comes, and it blows the sandwich down onto the grass. And now, here comes the other pirate. This pirate is called Joshua. And Joshua also really loves cheese sandwiches. So Joshua has a cheese sandwich and he says,”Yum yum yum yum yum! I love cheese sandwiches.”And he puts his cheese sandwich over here on top of the pirate chest. Child : So, that one is his. RS : That one is Joshua ’ s. That ’ s right. Child : And then his went on the ground. RS : That ’ s exactly right. Child : So he won ’ t know which one is his. RS : Oh. So now Joshua goes off to get a drink. Ivan comes back and he says,”I want my cheese sandwich.”So which one do you think Ivan is going to take? Child : I think he is going to take that one. RS : Yeah, you think he ’ s going to take that one? All right. Let ’ s see. Oh yeah, you were right. He took that one. So that ’ s a five-year-old who clearly understands that other people can have false beliefs and what the consequences are for their actions. Now I ’ m going to show you a three-year-old who got the same puzzle. RS : And Ivan says,”I want my cheese sandwich.”Which sandwich is he going to take? Do you think he ’ s going to take that one? Let ’ s see what happens. Let ’ s see what he does. Here comes Ivan. And he says,”I want my cheese sandwich.”And he takes this one. Uh-oh. Why did he take that one? Child : His was on the grass. So the three-year-old does two things differently. First, he predicts Ivan will take the sandwich that ’ s really his. And second, when he sees Ivan taking the sandwich where he left his, where we would say he ’ s taking that one because he thinks it ’ s his, the three-year-old comes up with another explanation : He ’ s not taking his own sandwich because he doesn ’ t want it, because now it ’ s dirty, on the ground. So that ’ s why he ’ s taking the other sandwich. Now of course, development doesn ’ t end at five. And we can see the continuation of this process of learning to think about other people ’ s thoughts by upping the ante and asking children now, not for an action prediction, but for a moral judgment. So first I ’ m going to show you the three-year-old again. RS. : So is Ivan being mean and naughty for taking Joshua ’ s sandwich? Child : Yeah. RS : Should Ivan get in trouble for taking Joshua ’ s sandwich? Child : Yeah. So it ’ s maybe not surprising he thinks it was mean of Ivan to take Joshua ’ s sandwich, since he thinks Ivan only took Joshua ’ s sandwich to avoid having to eat his own dirty sandwich. But now I ’ m going to show you the five-year-old. Remember the five-year-old completely understood why Ivan took Joshua ’ s sandwich. RS : Was Ivan being mean and naughty for taking Joshua ’ s sandwich? Child : Um, yeah. And so, it is not until age seven that we get what looks more like an adult response. RS : Should Ivan get in trouble for taking Joshua ’ s sandwich? Child : No, because the wind should get in trouble. He says the wind should get in trouble for switching the sandwiches. And now what we ’ ve started to do in my lab is to put children into the brain scanner and ask what ’ s going on in their brain as they develop this ability to think about other people ’ s thoughts. So the first thing is that in children we see this same brain region, the Right TPJ, being used while children are thinking about other people. But it ’ s not quite like the adult brain. So whereas in the adults, as I told you, this brain region is almost completely specialized — it does almost nothing else except for thinking about other people ’ s thoughts — in children it ’ s much less so, when they are age five to eight, the age range of the children I just showed you. And actually if we even look at eight to 11-year-olds, getting into early adolescence, they still don ’ t have quite an adult-like brain region. And so, what we can see is that over the course of childhood and even into adolescence, both the cognitive system, our mind ’ s ability to think about other minds, and the brain system that supports it are continuing, slowly, to develop. But of course, as you ’ re probably aware, even in adulthood, people differ from one another in how good they are at thinking of other minds, how often they do it and how accurately. And so what we wanted to know was, could differences among adults in how they think about other people ’ s thoughts be explained in terms of differences in this brain region? So, the first thing that we did is we gave adults a version of the pirate problem that we gave to the kids. And I ’ m going to give that to you now. So Grace and her friend are on a tour of a chemical factory, and they take a break for coffee. And Grace ’ s friend asks for some sugar in her coffee. Grace goes to make the coffee and finds by the coffee a pot containing a white powder, which is sugar. But the powder is labeled”Deadly Poison,”so Grace thinks that the powder is a deadly poison. And she puts it in her friend ’ s coffee. And her friend drinks the coffee, and is fine. How many people think it was morally permissible for Grace to put the powder in the coffee? Okay. Good. So we ask people, how much should Grace be blamed in this case, which we call a failed attempt to harm? And we can compare that to another case, where everything in the real world is the same. The powder is still sugar, but what ’ s different is what Grace thinks. Now she thinks the powder is sugar. And perhaps unsurprisingly, if Grace thinks the powder is sugar and puts it in her friend ’ s coffee, people say she deserves no blame at all. Whereas if she thinks the powder was poison, even though it ’ s really sugar, now people say she deserves a lot of blame, even though what happened in the real world was exactly the same. And in fact, they say she deserves more blame in this case, the failed attempt to harm, than in another case, which we call an accident. Where Grace thought the powder was sugar, because it was labeled”sugar”and by the coffee machine, but actually the powder was poison. So even though when the powder was poison, the friend drank the coffee and died, people say Grace deserves less blame in that case, when she innocently thought it was sugar, than in the other case, where she thought it was poison and no harm occurred. People, though, disagree a little bit about exactly how much blame Grace should get in the accident case. Some people think she should deserve more blame, and other people less. And what I ’ m going to show you is what happened when we look inside the brains of people while they ’ re making that judgment. So what I ’ m showing you, from left to right, is how much activity there was in this brain region, and from top to bottom, how much blame people said that Grace deserved. And what you can see is, on the left when there was very little activity in this brain region, people paid little attention to her innocent belief and said she deserved a lot of blame for the accident. Whereas on the right, where there was a lot of activity, people paid a lot more attention to her innocent belief, and said she deserved a lot less blame for causing the accident. So that ’ s good, but of course what we ’ d rather is have a way to interfere with function in this brain region, and see if we could change people ’ s moral judgment. And we do have such a tool. It ’ s called Trans-Cranial Magnetic Stimulation, or TMS. This is a tool that lets us pass a magnetic pulse through somebody ’ s skull, into a small region of their brain, and temporarily disorganize the function of the neurons in that region. So I ’ m going to show you a demo of this. First, I ’ m going to show you that this is a magnetic pulse. I ’ m going to show you what happens when you put a quarter on the machine. When you hear clicks, we ’ re turning the machine on. So now I ’ m going to apply that same pulse to my brain, to the part of my brain that controls my hand. So there is no physical force, just a magnetic pulse. Woman : Ready, Rebecca? RS : Yes. Okay, so it causes a small involuntary contraction in my hand by putting a magnetic pulse in my brain. And we can use that same pulse, now applied to the RTPJ, to ask if we can change people ’ s moral judgments. So these are the judgments I showed you before, people ’ s normal moral judgments. And then we can apply TMS to the RTPJ and ask how people ’ s judgments change. And the first thing is, people can still do this task overall. So their judgments of the case when everything was fine remain the same. They say she deserves no blame. But in the case of a failed attempt to harm, where Grace thought that it was poison, although it was really sugar, people now say it was more okay, she deserves less blame for putting the powder in the coffee. And in the case of the accident, where she thought that it was sugar, but it was really poison and so she caused a death, people say that it was less okay, she deserves more blame. So what I ’ ve told you today is that people come, actually, especially well equipped to think about other people ’ s thoughts. We have a special brain system that lets us think about what other people are thinking. This system takes a long time to develop, slowly throughout the course of childhood and into early adolescence. And even in adulthood, differences in this brain region can explain differences among adults in how we think about and judge other people. But I want to give the last word back to the novelists, and to Philip Roth, who ended by saying,”The fact remains that getting people right is not what living is all about anyway. It ’ s getting them wrong that is living. Getting them wrong and wrong and wrong, and then on careful reconsideration, getting them wrong again.”Thank you. Chris Anderson : So, I have a question. When you start talking about using magnetic pulses to change people ’ s moral judgments, that sounds alarming. Please tell me that you ’ re not taking phone calls from the Pentagon, say. RS : I ’ m not. I mean, they ’ re calling, but I ’ m not taking the call. CA : They really are calling? So then seriously, you must lie awake at night sometimes wondering where this work leads. I mean, you ’ re clearly an incredible human being, but someone could take this knowledge and in some future not- torture chamber, do acts that people here might be worried about. RS : Yeah, we worry about this. So, there ’ s a couple of things to say about TMS. One is that you can ’ t be TMSed without knowing it. So it ’ s not a surreptitious technology. It ’ s quite hard, actually, to get those very small changes. The changes I showed you are impressive to me because of what they tell us about the function of the brain, but they ’ re small on the scale of the moral judgments that we actually make. And what we changed was not people ’ s moral judgments when they ’ re deciding what to do, when they ’ re making action choices. We changed their ability to judge other people ’ s actions. And so, I think of what I ’ m doing not so much as studying the defendant in a criminal trial, but studying the jury. CA : Is your work going to lead to any recommendations in education, to perhaps bring up a generation of kids able to make fairer moral judgments? RS : That ’ s one of the idealistic hopes. The whole research program here of studying the distinctive parts of the human brain is brand new. Until recently, what we knew about the brain were the things that any other animal ’ s brain could do too, so we could study it in animal models. We knew how brains see, and how they control the body and how they hear and sense. And the whole project of understanding how brains do the uniquely human things — learn language and abstract concepts, and thinking about other people ’ s thoughts — that ’ s brand new. And we don ’ t know yet what the implications will be of understanding it. CA : So I ’ ve got one last question. There is this thing called the hard problem of consciousness, that puzzles a lot of people. The notion that you can understand why a brain works, perhaps. But why does anyone have to feel anything? Why does it seem to require these beings who sense things for us to operate? You ’ re a brilliant young neuroscientist. I mean, what chances do you think there are that at some time in your career, someone, you or someone else, is going to come up with some paradigm shift in understanding what seems an impossible problem? RS : I hope they do. And I think they probably won ’ t. CA : Why? RS : It ’ s not called the hard problem of consciousness for nothing. CA : That ’ s a great answer. Rebecca Saxe, thank you very much. That was fantastic.

Good morning everybody. I ’ d like to talk about a couple of things today. The first thing is water. Now I see you ’ ve all been enjoying the water that ’ s been provided for you here at the conference, over the past couple of days. And I ’ m sure you ’ ll feel that it ’ s from a safe source. But what if it wasn ’ t? What if it was from a source like this? Then statistics would actually say that half of you would now be suffering with diarrhea. I talked a lot in the past about statistics, and the provision of safe drinking water for all. But they just don ’ t seem to get through. And I think I ’ ve worked out why. It ’ s because, using current thinking, the scale of the problem just seems too huge to contemplate solving. So we just switch off : us, governments and aid agencies. Well, today, I ’ d like to show you that through thinking differently, the problem has been solved. By the way, since I ’ ve been speaking, another 13, 000 people around the world are suffering now with diarrhea. And four children have just died. I invented Lifesaver bottle because I got angry. I, like most of you, was sitting down, the day after Christmas in 2004, when I was watching the devastating news of the Asian tsunami as it rolled in, playing out on TV. The days and weeks that followed, people fleeing to the hills, being forced to drink contaminated water or face death. That really stuck with me. Then, a few months later, Hurricane Katrina slammed into the side of America.”Okay,”I thought,”here ’ s a First World country, let ’ s see what they can do.”Day one : nothing. Day two : nothing. Do you know it took five days to get water to the Superdome? People were shooting each other on the streets for TV sets and water. That ’ s when I decided I had to do something. Now I spent a lot of time in my garage, over the next weeks and months, and also in my kitchen — much to the dismay of my wife. However, after a few failed prototypes, I finally came up with this, the Lifesaver bottle. Okay, now for the science bit. Before Lifesaver, the best hand filters were only capable of filtering down to about 200 nanometers. The smallest bacteria is about 200 nanometers. So a 200-nanometer bacteria is going to get through a 200-nanometer hole. The smallest virus, on the other hand, is about 25 nanometers. So that ’ s definitely going to get through those 200 nanometer holes. Lifesaver pores are 15 nanometers. So nothing is getting through. Okay, I ’ m going to give you a bit of a demonstration. Would you like to see that? I spent all the time setting this up, so I guess I should. We ’ re in the fine city of Oxford. So — someone ’ s done that up. Fine city of Oxford, so what I ’ ve done is I ’ ve gone and got some water from the River Cherwell, and the River Thames, that flow through here. And this is the water. But I got to thinking, you know, if we were in the middle of a flood zone in Bangladesh, the water wouldn ’ t look like this. So I ’ ve gone and got some stuff to add into it. And this is from my pond. Have a smell of that, mister cameraman. Okay. Right. We ’ re just going to pour that in there. Audience : Ugh! Michael Pritchard : Okay. We ’ ve got some runoff from a sewage plant farm. So I ’ m just going to put that in there. Put that in there. There we go. And some other bits and pieces, chuck that in there. And I ’ ve got a gift here from a friend of mine ’ s rabbit. So we ’ re just going to put that in there as well. Okay. Now. The Lifesaver bottle works really simply. You just scoop the water up. Today I

’ m going to use a jug just to show you all. Let ’ s get a bit of that poo in there. That ’ s not dirty enough. Let ’ s just stir that up a little bit. Okay, so I ’ m going to take this really filthy water, and put it in here. Do you want a drink yet? Okay. There we go. Replace the top. Give it a few pumps. Okay? That ’ s all that ’ s necessary. Now as soon as I pop the teat, sterile drinking water is going to come out. I ’ ve got to be quick. Okay, ready? There we go. Mind the electrics. That is safe, sterile drinking water. Cheers. There you go Chris. What ’ s it taste of? Chris Anderson : Delicious. Michael Pritchard : Okay. Let ’ s see Chris ’ s program throughout the rest of the show. Okay? Okay. Lifesaver bottle is used by thousands of people around the world. It ’ ll last for 6, 000 liters. And when it ’ s expired, using failsafe technology, the system will shut off, protecting the user. Pop the cartridge out. Pop a new one in. It ’ s good for another 6, 000 liters. So let ’ s look at the applications. Traditionally, in a crisis, what do we do? We ship water. Then, after a few weeks, we set up camps. And people are forced to come into the camps to get their safe drinking water. What happens when 20, 000 people congregate in a camp? Diseases spread. More resources are required. The problem just becomes self-perpetuating. But by thinking differently, and shipping these, people can stay put. They can make their own sterile drinking water, and start to get on with rebuilding their homes and their lives. Now, it doesn ’ t require a natural disaster for this to work. Using the old thinking, of national infrastructure and pipe work, is too expensive. When you run the numbers on a calculator, you run out of noughts. So here is the”thinking different”bit. Instead of shipping water, and using man-made processes to do it, let ’ s use Mother Nature. She ’ s got a fantastic system. She picks the water up from there, desalinates it, for free, transports it over there, and dumps it onto the mountains, rivers, and streams. And where do people live? Near water. All we ’ ve go to do is make it sterile. How do we do that? Well, we could use the Lifesaver bottle. Or we could use one of these. The same technology, in a jerry can. This will process 25, 000 liters of water ; that ’ s good enough for a family of four, for three years. And how much does it cost? About half a cent a day to run. Thank you. So, by thinking differently, and processing water at the point of use, mothers and children no longer have to walk four hours a day to collect their water. They can get it from a source nearby. So with just eight billion dollars, we can hit the millennium goal ’ s target of halving the number of people without access to safe drinking water. To put that into context, The U. K. government spends about 12 billion pounds a year on foreign aid. But why stop there? With 20 billion dollars, everyone can have access to safe drinking water. So the three-and-a-half billion people that suffer every year as a result, and the two million kids that die every year, will live. Thank you.

Today I want to talk to you about swimming across the North Pole, across the most northern place in the whole world. And perhaps the best place to start is with my late father. He was a great storyteller. He could tell a story about an event, and so you felt you were absolutely there at the moment. And one of the stories he told me so often when I was a young boy was of the first British atomic bomb test. He had been there and watched it go off. And he said that the explosion was so loud and the light was so intense, that he actually had to put his hands in front of his face to protect his eyes. And he said that he could actually see an x-ray of his fingers, because the light was so bright. And I know that watching that atomic bomb going off had a very, very big impact on my late father. Every holiday I had as a young boy was in a national park. What he was trying to do with me was to inspire me to protect the world, and show me just how fragile the world is. He also told me about the great explorers. He loved history. He would tell me about Captain Scott walking all the way to the South Pole and Sir Edmund Hillary climbing up Mount Everest. And so ever since I think I was just six years old, I dreamed of going to the polar regions. I really, really wanted to go to the Arctic. There was something about that place which drew me to it. And, well, sometimes it takes a long time for a dream to come true. But seven years ago, I went to the Arctic for the first time. And it was so beautiful that I ' ve been back there ever since, for the last seven years. I love the place. But I have seen that place change beyond all description, just in that short period of time. I have seen polar bears walking across very, very thin ice in search of food. I have swum in front of glaciers which have retreated so much. And I have also, every year, seen less and less sea ice. And I wanted the world to know what was happening up there. In the two years before my swim, 23 percent of the arctic sea ice cover just melted away. And I wanted to really shake the lapels of world leaders to get them to understand what is happening. So I decided to do this symbolic swim at the top of the world, in a place which should be frozen over, but which now is rapidly unfreezing. And the message was very clear : Climate change is for real, and we need to do something about it. And we need to do something about it right now. Well, swimming across the North Pole, it ' s not an ordinary thing to do. I mean, just to put it in perspective, 27 degrees is the temperature of a normal indoor swimming pool. This morning, the temperature of the English Channel was 18 degrees. The passengers who fell off the Titanic fell into water of just five degrees centigrade. Fresh water freezes at zero. And the water at the North Pole is minus 1. 7. It ' s fucking freezing. I ' m sorry, but there is no other way to describe it. And so I had to assemble an incredible team around me to help me with this task. I assembled this team of 29 people from 10 nations. Some people think that swimming is a very solo sport, you just dive into the sea and off you go. It couldn ' t be further from the truth for me. And I then went and did a huge amount of training, swimming in icy water, backwards and forwards. But the most important thing was to train my mind to prepare myself for what was going to happen. And I had to visualize the swim. I had to see it from the beginning all the way to the end. I had to taste the salt water in my mouth. I had to see my coach screaming for me,"Come on Lewis! Come on! Go! Go! Go! Don ' t slow down!"And so I literally swam across the North Pole hundreds and hundreds of times in my mind. And then, after a year of training, I felt ready. I felt confident that I could actually do this swim. So myself and the five members of the team, we hitched a ride on an icebreaker which was going to the North Pole. And on day four, we decided to just do a quick five minute test swim. I had never swum in water of minus 1. 7 degrees before, because it ' s just impossible to train in those types of conditions. So we stopped the ship, as you do. We all got down onto the ice, and I then got into my swimming costume and I dived into the sea. I have never in my life felt anything like that moment. I could barely breathe. I was gasping for air. I was hyperventilating so much, and within seconds my hands were numb. And it was — the paradox is that you ' re in freezing cold water, but actually you ' re on fire. I swam as hard as I could for five minutes. I remember just trying to get out of the water. I climbed out of the ice. And I remember taking the goggles off my face and looking down at my hands in sheer shock, because my fingers had swollen so much that they were like sausages. And they were swollen so much, I couldn ' t even close them. What had happened is that we are made partially of water, and when water freezes it expands. And so what had actually happened is that the cells in my fingers had frozen and expanded. And they had burst. And I was in so much agony. I immediately got rushed onto the ship and into a hot shower. And I remember standing underneath the hot shower and trying to defrost my fingers. And I thought, in two days ’ time, I was going to do this swim across the North Pole. I was going to try and do a 20-minute swim, for one kilometer across the North Pole. And this dream which I had had ever since I was a young boy with my father, was just going out the window. There is no possibility that this was going to happen. And I remember then getting out of the shower and realizing I couldn ’ t even feel my hands. And for a swimmer, you need to feel your hands because you need to be able to grab the water and pull it through with you. The next morning, I woke up and I was in such a state of depression, and all I could think about was Sir Ranulph Fiennes. For those of you who don ’ t know him, he ’ s the great British explorer. A number of years ago, he tried to ski all the way to the North Pole. He accidentally fell through the ice into the sea. And after just three minutes in that water, he was able to get himself out. And his hands were so badly frostbitten that he had to return to England. He went to a local hospital and there they said,”Ran, there is no possibility of us being able to save these fingers. We are going to actually have to take them off.”And Ran decided to go into his tool shed and take out a saw and do it himself. And all I could think of was, if that happened to Ran after three minutes, and I can ’ t feel my hands after five minutes, what on earth is going to happen if I try 20 minutes? At the very best, I ’ m going to end up losing some fingers. And at worst, I didn ’ t even want to think about it. We carried on sailing through the ice packs towards the North Pole. And my close friend David, he saw the way I was thinking, and he came up to me and he said,”Lewis, I ’ ve known you since you were 18 years old. I ’ ve known you, and I know, Lewis, deep down, right deep down here, that you are going to make this swim. I so believe in you Lewis. I ’ ve seen the way you ’ ve been training. And I realize the reason why you ’ re going to do this. This is such an important swim. We stand at a very, very important moment in this history, and you ’ re going to make a symbolic swim here to try to shake the lapels of world leaders. Lewis, have the courage to go in there, because we are going to look after you every moment of it.”And I just, I got so much confidence from him saying that, because he knew me so well. So we carried on sailing and we arrived at the North Pole. And we stopped the ship, and it was just as the scientists had predicted. There were open patches of sea everywhere. And I went down into my cabin and I put on my swimming costume. And then the doctor strapped on a chest monitor, which measures my core body temperature and my heart rate. And then we walked out onto the ice. And I remember looking into the ice, and there were big chunks of white ice in there, and the water was completely black. I had never seen black water before. And it is 4, 200 meters deep. And I said to myself,”Lewis, don ’ t look left, don ’ t look right. Just scuttle forward and go for it.”And so I now want to show you a short video of what happened there on the ice. Narrator : We ’ re just sailing out of harbor now, and it ’ s at this stage when one can have a bit of a wobble mentally. Everything just looks so gray around here, and looks so cold. We ’ ve just seen our first polar bears. It was absolutely magical. A mother and a cub, such a beautiful sight. And to think that in 30, 40 years they could become extinct. It ’ s a very frightening, very, very frightening thought. We ’ re finally at the North Pole. This is months and months and months of dreaming to get here, years of training and planning and preparation. Ooh. In a couple of hours ’ time I ’ m going to get in here and do my swim. It ’ s all a little bit frightening, and emotional. Amundson, you ready? Amudson : Ready. Lewis Pugh : Ten seconds to swim. Ten seconds to swim. Take the goggles off. Take the goggles off! Man : Take the shoes. Take the shoes. Well done lad! You did it! You did it Lewis! You did it! You did it man! LP : How on earth did we do that? Man : Against the current! You did it against the current! LP : Thank you very much. Thank you very much. Thank you so much. Audience : Encore! LP : I ’ d just like to end off by just saying this : It took me four months again to feel my hands. But was it worth it? Yes, absolutely it was. There are very, very few people who don ’ t know now about what is happening in the Arctic. And people ask me,”Lewis, what can we do about climate change?”And I say to them, I think we need to do three things. The first thing we need to do is we need to break this problem down into manageable chunks. You saw during that video all those flags. Those flags represented the countries from which my team came from. And equally, when it comes to climate change, every single country is going to have to make cuts. Britain, America, Japan, South Africa, the Congo. All of us together, we ’ re all on the same ship together. The second thing we need to do is we need to just look back at how far we have come in such a short period of time. I remember, just a few years ago, speaking about climate change, and people heckling me in the back and saying it doesn ’ t even exist. I ’ ve just come back from giving a series of speeches in some of the poorest townships in South Africa to young children as young as 10 years old. Four or five children sitting behind a desk, and even in those poorest conditions, they all have a very, very good grasp of climate change. We need to believe in ourselves. Now is the time to believe. We ’ ve come a long way. We ’ re doing good. But the most important thing we must do is, I think, we must all walk to the end of our lives and turn around, and ask ourselves a most fundamental question. And that is,”What type of world do we want to live in, and what decision are we going to make today to ensure that we all live in a sustainable world?”Ladies and gentlemen, thank you very, very much.

You know, when Chris first approached me to speak at TED, I said no, because I felt like I wasn ’ t going to be able to make that personal connection, you know, that I wanted to. It ’ s such a large conference. But he explained to me that he was in a bind, and that he was having trouble finding the kind of sex appeal and star power that the conference was known for. So I said fine, Ted — I mean Chris. I ’ ll come on two conditions. One : I want to speak as early in the morning as possible. And two : I want to pick the theme for TED 2006. And luckily he agreed. And the theme, in two years, is going to be”Cute Pictures Of Puppies.”[How to Dance Properly BASIC TWIRL] [NEW SCHOOL] [OLD SCHOOL] [WHO ’ S YOUR DADDY?] [”RIDE THE PONY”] [MAKE LOVE TO THE CROWD] [SMACKING THAT ASS] [STIR THE POT OF LOVE] [HANGING OUT... CASUAL] [WORD.] I invented the Placebo Camera. It doesn ’ t actually take pictures, but it ’ s a hell of a lot cheaper, and you still feel like you were there.”Dear Sir, good day, compliments of the day, and my best wishes to you and family. I know this letter will come to you surprisingly, but let it not be a surprise to you, for nature has a way of arriving unannounced, and, as an adage says, originals are very hard to find, but their echoes sound ouder. So I decided to contact you myself, for you to assure me of safety and honesty, if I have to entrust any amount of money under your custody. I am Mr Micheal Bangura, the son of late Mr Thaimu Bangura who was the Minister of Finance in Sierra Leone but was killed during the civil war. Knowing your country to be economical conducive for investment, and your people as transparent and trustworthy to engage in business, on which premise I write you. Before my father death, he had the sum of 23 million

United States dollars, which he kept away from the rebel leaders during the course of the war. This fund was supposed to be used for the rehabilitation of water reserves all over the country, before the outbreak of war. When the war broke out, the rebel leader demanded the fund be given to him, my father insisted it was not in his possession, and he was killed because of his refusal to release the fund. Meanwhile, my mother and I is the only person who knows about it because my father always confide in me. I made an arrangement with a Red Cross relief worker, who used his official van to transport the money to Lungi Airport, Freetown, although he did not know the real contents of the box. The fund was deposited as a family reasure, in a safe, reliable security company in Dakar, Senegal, where I was only given temporary asylum. I do not wish to invest the money in Senegal due to unfavorable economic climate, and so close to my country. The only assistance I need from you, which I know you would do for me, are the following : one, be a silent partner and receive the funds in your account in trust ; two, provide a bank account under your control to which the funds will be remitted ; three, receive the funds into your account in trust ; take out your commission ; and leave the rest of the money until I arrive, after the transfer is complete. Sincerely, Mr Micheal Bangura.”This is really embarrassing. I was told backstage that I have 18 minutes. I only prepared 15. So if it ’ s cool, I ’ d like to just wait for three. I ’ m really sorry. What ’ s your name? Mark Surfas. It ’ s pretty cool, huh? Pursuing happiness. Are you a virgin? Virgin? I mean — no, I mean like in the TED sense? Are you? Oh, yeah? So what are you, like, a thousand, two thousand, somewhere in there? Huh? Oh? You don ’ t know what I ’ m talking about? Ah, Mark — Surfas. 1, 860 — am I good? And that ’ s nothing to be ashamed of. That ’ s nothing to be ashamed of. Yeah, I was hanging out with some Google guys last night. Really cool, we were getting wasted. And they were telling me that Google software has gotten so advanced that, based on your interaction with Google over your lifetime, they can actually predict what you are going to say — next. And I was like,”Get the fuck out of here. That ’ s crazy.”But they said,”No, but don ’ t show anyone.”But they slipped up. And they said that I could just type in”What was I going to say next?”and my name, and it would tell me. And I have to tell you, this is an unadulterated piece of software, this is a real Internet browser and this is the actual Google site, and we ’ re going to test it out live today. What was I going to say next? And”Ze Frank”— that ’ s me. Am I feeling lucky? Am I feeling lucky? Audience : Yes! Yeah! Ze Frank : Oh! Amazing. In March of 2001 — I filmed myself dancing to Madonna ’ s”Justify My Love.”On a Thursday, I sent out a link to a website that featured those clips to 17 of my closest friends, as part of an invitation to my — an invitation to my th — th — 26th birthday party. By Monday, over a million people were coming to this site a day. Within a week, I received a call from Earthlink that said, due to a 10 cents per megabyte overage charge, I owed them 30, 000 dollars. Needless to say, I was able to leave my job. [WAS LAID OFF] And, finally, you know, become freelance. [UNEMPLOYED] But some people refer to me more as, like, an Internet guru or — [JACKASS] swami. I knew I had something. I ’ d basically distilled a very difficult-to-explain and complex philosophy, which I won ’ t get into here, because it ’ s a little too deep for all of you, but — It ’ s about what makes websites popular, and, you know, it ’ s — [DANCE LIKE AN IDIOT AND DON ’ T SELL ANYTHING] It ’ s unfortunate that I don ’ t have more time. Maybe I can come back next year, or something like that. I ’ m obsessed with email. I get a lot of it. Four years later, I still get probably two or three hundred emails a day from people I don ’ t know, and it ’ s been an amazing opportunity to kind of get to know different cultures, you know? It ’ s like a microscope to the rest of the world. You can kind of peer into other people

’ s lives. And I also feel like I get a lot of inspiration from the average user. For example, somebody wrote,”Hey Ze, if you ever come to Boulder, you should rock out with us,”and I said,”Why wait?”[rocking out] And they said,”Hey Ze, thanks for rocking out, but I meant the kind of rocking out where we ’ d be naked.”And that was embarrassing. But you know, it ’ s kind of a collaboration between me and the fans, so I said,”Sure.”[rocking out naked] I hear a lot of you whispering. And I know what you ’ re saying,”Holy crap! How is his presentation so smooth?”And I have to say that it ’ s not all me this year. I guess Chris has to take some credit here, because in years past, I guess there ’ s been some sort of subpar speakers at TED. I don ’ t know. And so, this year, Chris sent us a TED conference simulator. Which really allowed us as speakers to get there, in the trenches, and practice at home so that we would be ready for this experience. And I ’ ve got to say that, you know, it ’ s really, really great to be here. I ’ d like to tell all of you a little joke. Not just the good stuff, though. You can do heckler mode. Voice : Hey, moron, get off the stage! ZF : You get off the stage. Voice : We want Malcolm Gladwell. In case you run over time. Just one last thing I ’ d like to say, I ’ d, really — I ’ d like to thank all of you for being here. And frog mode.”Ah, the first time that I made love to a rock shrimp —”[Spam jokes are the new airplane jokes] It ’ s true. Some people say to me,”Ze, you ’ re doing all this stuff, this Internet stuff, and you ’ re not making any money.””Why?”And I say,”Mom, Dad — I ’ m trying.”I don ’ t know if you ’ re all aware of this, but the video game market, kids are playing these video games, but, supposedly, there ’ s tons of money. I mean, like, I think, 100, 000 dollars or so a year is being spent on these things. So I decided to try my hand. I came up with a few games. This is called”Atheist.”I figured it would be popular with the young kids. OK. Look, I ’ ll move around and say some things. [Game over. There is no replay.] So that didn ’ t go over so well. I don ’ t really understand why you ’ re laughing. Should have done this before I tried to pitch it.”Buddhist,”of course, looks very, very similar to”Atheist.”But you come back as a duck. And this is great because, you know, for a quarter, you can play this for a long time. And Chris had said in an email that we should really bring something new to TED, something that we haven ’ t shown anyone. So, I made this for TED. It ’ s”Christian.”It ’ s the third in the series. I ’ m hoping it ’ s going to do well this year. Do you have a preference? Good choice. So you can wait for the Second Coming, which is a random number between one and 500 million. So really, what are we talking about here? Oh, tech joy. Tech joy, to me, means something, because I get a lot of joy out of tech. And in fact, making things using technology — and I ’ m being serious here, even though I ’ m using my sarcastic voice — I won ’ t — hold on. Making things, you know — making things actually does give me a lot of joy. It ’ s the process of creation that keeps me sort of a bubble and a half above perpetual anxiety in my life, and it ’ s that feeling of being about 80 percent complete on a project — where you know you still have something to do, but it ’ s not finished, and you ’ re not starting something — that really fills my entire life. And so, what I ’ ve done is, I started getting interested in creating online social spaces to share that feeling with people who don ’ t consider themselves artists. We ’ re in a culture of guru-ship. It ’ s so hard to use some software because, you know, it ’ s unapproachable, people feel like they have to read the manual. So I try to create these very minimal activities that allow people to express themselves, and, hopefully — Whoa! I ’ m like — on the page, but it doesn ’ t exist. It ’ s, like — seriously, though — I try to create meaningful environments for people to express themselves. Here I created a contest called,”When Office Supplies Attack,”which, I think, really resonated with the working population. Over 500 entries in three weeks. Toilet paper fashion. Again, people from all over the country. The watch is particularly incredible. Online drawing tools — you ' ve probably seen a lot of them. I think they ' re wonderful. It ' s a chance for people to get to play with crayons and all that kind of stuff. But I ' m interested in the process of creating, as the real event that I ' m interested in. And the problem is that a lot of people suck at drawing, and they get bummed out at this, sort of, you know, stick figure, awful little thing that they created. And eventually, it just makes them stop playing with it, or they draw penises and things like that. So, the Scribbler is an attempt to create a generative tool. In other words, it ' s a helping tool. You can draw your simple stick figure, and it collaborates with you to create sort of a post-war German etching. In fact, it ' s tuned to be better at drawing things that look worse. So, we go ahead, and we start scribbling. So the idea is that you can really, you know, partake in this process, but watch something really crappy look beautiful. And here are some of my favorites. This is the little trap marionette that was submitted to me. Very cool. Darling. Beautiful stuff. I mean this is incredible. An 11-year-old girl drew this and submitted it. It ' s just gorgeous. I ' m dead serious here. This is not a joke. But, I think it ' s a really fun and wonderful thing. So this is called the"Fiction Project."This is an online space, which is basically a refurbished message board that encourages collaborative fiction writing. These are haikus. None of the haikus were written by the same person. In fact, each line is contributed by a different person at a different time. I think that the"now tied up, tied down, mistress cruel approaches me, now tied down, it ' s up."It ' s an amazing way, and I ' ll tell you, if you come home, and your spouse, or whoever it is, says,"Let ' s talk"— That, like, chills you to the very core. But it ' s peripheral activities like these that allow people to get together, doing fun things. They actually get to know each other, and it ' s sort of like low-threshold peripheral activities that I think are the key to bringing up some of our bonding social capital that we ' re lacking. And very, very quickly — I love puppets. Here ' s a puppet. It dances to music. Lotte Reiniger, an amazing shadow puppeteer in the 20s, that started doing more elaborate things. I became interested in puppets, and I just want to show one last thing to you. Oh, this is how you make puppets. Chris Anderson : Ladies and gentlemen, Mr. Ze Frank.

Text Sample 956: NEG Dim 6 – 2004 – Score 1.00 – 2004/t000459.txt

When you have 21 minutes to speak, two million years seems like a really long time. But evolutionarily, two million years is nothing. And yet, in two million years, the human brain has nearly tripled in mass, going from the one-and-a-quarter-pound brain of our ancestor here, Habilis, to the almost three-pound meatloaf everybody here has between their ears. What is it about a big brain that nature was so eager for every one of us to have one? Well, it turns out when brains triple in size, they don ' t just get three times bigger ; they gain new structures. And one of the main reasons our brain got so big is because it got a new part, called the"frontal lobe,"particularly, a part called the"pre-frontal cortex."What does a prefrontal cortex do for you that should justify the entire architectural overhaul of the human skull in the blink of evolutionary time? Well, it turns out the prefrontal cortex does lots of things, but one of the most important things it does is it ' s an experience simulator. Pilots practice in flight simulators so that they don ' t make real mistakes in planes. Human beings have this marvelous adaptation that they can actually have experiences in their heads before they try them out in real life. This is a trick that none of our ancestors could do, and that no other animal can do quite like we can. It ' s a marvelous adaptation. It ' s up there with opposable thumbs and standing upright and language as one of the things that got our species out of the trees and into the shopping mall. All of you have done this. Ben and Jerry ' s doesn ' t have"liver and onion"ice cream, and it ' s not because they whipped some up, tried it and went,"Yuck!"It ' s because, without leaving your armchair, you can simulate that flavor and say"yuck"before you make it. Let ' s see how your experience simulators are working. Let ' s just run a quick diagnostic before I proceed with the rest of the talk. Here ' s two different futures that I invite you to contemplate. You can try to simulate them and tell me which one you think you might prefer. One of them is winning the lottery. This is about 314 million dollars. And the other is becoming paraplegic. Just give it a moment of thought. You probably don ' t feel like you need a moment of thought. Interestingly, there are data on these two groups of people, data on how happy they are. And this is exactly what you expected, isn ' t it? But these aren ' t the data. I made these up! These are the data. You failed the pop quiz, and you ' re hardly five minutes into the lecture. Because the fact is that a year after losing the use of their legs and a year after winning the lotto, lottery winners and paraplegics are equally happy with their lives. Don ' t feel too bad about failing the first pop quiz, because everybody fails all of the pop quizzes all of the time. The research that my laboratory has been doing, that economists and psychologists around the country have been doing, has revealed something really quite startling to us, something we call the"impact bias,"which is the tendency for the simulator to work badly, for the simulator to make you believe that different outcomes are more different than, in fact, they really are. From field studies to laboratory studies, we see that winning or losing an election, gaining or losing a romantic partner, getting or not getting a promotion, passing or not passing a college test, on and on, have far less impact, less intensity and much less duration than people expect them to have. A recent study — this almost floors me — a recent study showing how major life traumas affect people suggests that if it happened over three months ago, with only a few exceptions, it has no impact whatsoever on your happiness. Why? Because happiness can be synthesized. Sir Thomas Brown wrote in 1642,"I am the happiest man alive. I have that in me that can convert poverty to riches, adversity to prosperity. I am more invulnerable than Achilles ; fortune hath not one place to hit me."What kind of remarkable machinery does this guy have in his head? Well, it turns out it ' s precisely the same remarkable machinery that all of us have. Human beings have something that we might think of as a"psychological immune system,"a system of cognitive processes, largely nonconscious cognitive processes, that help them change their views of the world, so that they can feel better about the worlds in which they find themselves. Like Sir Thomas, you have this machine. Unlike Sir Thomas, you seem not to know it. We synthesize happiness, but we think happiness is a thing to be found. Now, you don ' t need me to give you too many examples of people synthesizing happiness, I suspect, though I ' m going to show you some experimental evidence. You don ' t have to look very far for evidence. I took a copy of the"New York Times"and tried to find some instances of people synthesizing happiness. Here are three guys synthesizing happiness."I ' m better off physically, financially, mentally...""I don ' t have one minute ' s regret. It was a glorious experience.""I believe it turned out for the best."Who are these characters who are so damn happy? The first one is Jim Wright. Some of you are old enough to remember : he was the chairman of the House of Representatives, and he resigned in disgrace when this young Republican named Newt Gingrich found out about a shady book deal that he had done. He lost everything. The most powerful Democrat in the country lost everything : he lost his money, he lost his power. What does he have to say all these years later about it?"I am so much better off physically, financially, mentally and in almost every other way.”What other way would there be to be better off? Vegetably? Minerally? Animally? He ’ s pretty much covered them there. Moreese Bickham is somebody you ’ ve never heard of. Moreese Bickham uttered these words upon being released. He was 78 years old. He ’ d spent 37 years in Louisiana State Penitentiary for a crime he didn ’ t commit. He was ultimately [released for good behavior halfway through his sentence.] What did he have to say about his experience?”I don ’ t have one minute ’ s regret. It was a glorious experience.”Glorious! This guy ’ s not saying,”There were some nice guys. They had a gym.””Glorious”— a word we usually reserve for something like a religious experience. Harry S. Langerman uttered these words. He ’ s somebody you might have known but didn ’ t, because in 1949, he read a little article in the paper about a hamburger stand owned by these two brothers named McDonald. And he thought,”That ’ s a really neat idea!”So he went to find them. They said,”We can give you a franchise on this for 3, 000 bucks.”Harry went back to New York, asked his brother, an investment banker, to loan him 3, 000 dollars, and his brother ’ s immortal words were,”You idiot, nobody eats hamburgers.”He wouldn ’ t lend him the money. Of course, six months later, Ray Kroc had exactly the same idea. It turns out, people do eat hamburgers, and Ray Kroc, for a while, became the richest man in America. And then, finally, some of you recognize this young photo of Pete Best, who was the original drummer for the Beatles, until they, you know, sent him out on an errand and snuck away and picked up Ringo on a tour. Well, in 1994, when Pete Best was interviewed — yes, he ’ s still a drummer ; yes, he ’ s a studio musician — he had this to say :”I ’ m happier than I would have been with the Beatles.”OK, there ’ s something important to be learned from these people, and it is the secret of happiness. Here it is, finally to be revealed. First : accrue wealth, power and prestige, then lose it. Second : spend as much of your life in prison as you possibly can. Third : make somebody else really, really rich. And finally : never, ever join the Beatles. Yeah, right. Because when people synthesize happiness, as these gentlemen seem to have done, we all smile at them, but we kind of roll our eyes and say,”Yeah, right, you never really wanted the job.””Oh yeah, right — you really didn ’ t have that much in common with her, and you figured that out just about the time she threw the engagement ring in your face.”We smirk, because we believe that synthetic happiness is not of the same quality as what we might call”natural happiness.”What are these terms? Natural happiness is what we get when we get what we wanted, and synthetic happiness is what we make when we don ’ t get what we wanted. And in our society, we have a strong belief that synthetic happiness is of an inferior kind. Why do we have that belief? Well, it ’ s very simple. What kind of economic engine would keep churning if we believed that not getting what we want could make us just as happy as getting it? With all apologies to my friend Matthieu Ricard, a shopping mall full of Zen monks is not going to be particularly profitable, because they don ’ t want stuff enough. I want to suggest to you that synthetic happiness is every bit as real and enduring as the kind of happiness you stumble upon when you get exactly what you were aiming for. Now, I ’ m a scientist, so I ’ m going to do this not with rhetoric, but by marinating you in a little bit of data. Let me first show you an experimental paradigm that ’ s used to demonstrate the synthesis of happiness among regular old folks. This isn ’ t mine, it ’ s a 50- year-old paradigm called the”free choice paradigm.”It ’ s very simple. You bring in, say, six objects, and you ask a subject to rank them from the most to the least liked. In this case, because this experiment uses them, these are Monet prints. Everybody ranks these Monet prints from the one they like the most to the one they like the least. Now we give you a choice :”We happen to have some extra prints in the closet. We ’ re going to give you one as your prize to take home. We happen to have number three and number four,”we tell the subject. This is a bit of a difficult choice, because neither one is preferred strongly to the other, but naturally, people tend to pick number three, because they liked it a little better than number four. Sometime later — it could be 15 minutes, it could be 15 days — the same stimuli are put before the subject, and the subject is asked to re-rank the stimuli.”Tell us how much you like them now.”What happens? Watch as happiness is synthesized. This is the result that ’ s been replicated over and over again. You ’ re watching happiness be synthesized. Would you like to see it again? Happiness!”The one I got is really better than I thought! That other one I didn ’ t get sucks!”That ’ s the synthesis of happiness. Now, what ’ s the right response to that?”Yeah, right!”Now, here ’ s the experiment we did, and I hope this is going to convince you that”Yeah, right!”was not the right response. We did this experiment with a group of patients who had anterograde amnesia. These are hospitalized patients. Most of them have Korsakoff syndrome, a polyneuritic psychosis. They drank way too much, and they can ’ t make new memories. They remember their childhood, but if you walk in and introduce yourself and then leave the room, when you come back, they don ’ t know who you are. We took our Monet prints to the hospital. And we asked these patients to rank them from the one they liked the most to the one they liked the least. We then gave them the choice between number three and number four. Like everybody else, they said,”Gee, thanks Doc! That ’ s great! I could use a new print. I ’ ll take number three.”We explained we would have number three mailed to them. We gathered up our materials, and we went out of the room and counted to a half hour. Back into the room, we say,”Hi, we ’ re back.”The patients, bless them, say,”Ah, Doc, I ’ m sorry, I ’ ve got a memory problem ; that ’ s why I ’ m here. If I ’ ve met you before, I don ’ t remember.””Really, Jim, you don ’ t remember? I was just here with the Monet prints?””Sorry, Doc, I just don ’ t have a clue.””No problem, Jim. All I want you to do is rank these for me, from the one you like the most to the one you like the least.”What do they do? Well, let ’ s first check and make sure they ’ re really amnesiac. We ask these amnesiac patients to tell us which one they own, which one they chose last time, which one is theirs. And what we find is, amnesiac patients just guess. These are normal controls, where if I did this with you, all of you would know which print you chose. But if I do this with amnesiac patients, they don ’ t have a clue. They can ’ t pick their print out of a lineup. Here ’ s what normal controls do : they synthesize happiness. Right? This is the change in liking score, the change from the first time they ranked to the second time they ranked. Normal controls show — that was the magic I showed you ; now I ’ m showing it to you in graphical form —”The one I own is better than I thought. The one I didn ’ t own, the one I left behind, is not as good as I thought.”Amnesiacs do exactly the same thing. Think about this result. These people like better the one they own, but they don ’ t know they own it.”Yeah, right”is not the right response! What these people did when they synthesized happiness is they really, truly changed their affective, hedonic, aesthetic reactions to that poster. They ’ re not just saying it because they own it, because they don ’ t know they own it. When psychologists show you bars, you know that they are showing you averages of lots of people. And yet, all of us have this psychological immune system, this capacity to synthesize happiness, but some of us do this trick better than others. And some situations allow anybody to do it more effectively than other situations do. It turns out that freedom, the ability to make up your mind and change your mind, is the friend of natural happiness, because it allows you to choose among all those delicious futures and find the one that you would most enjoy. But freedom to choose, to change and make up your mind, is the enemy of synthetic happiness, and I ’ m going to show you why. Dilbert already knows, of course.”Dogbert ’ s tech support. How may I abuse you?””My printer prints a blank page after every document.””Why complain about getting free paper?””Free? Aren ’ t you just giving me my own paper?””Look at the quality of the free paper compared to your lousy regular paper! Only a fool or a liar would say that they look the same!””Now that you mention it, it does seem a little silkier!””What are you doing?””I ’ m helping people accept the things they cannot change.”Indeed. The psychological immune system works best when we are totally stuck, when we are trapped. This is the difference between dating and marriage. You go out on a date with a guy, and he picks his nose ; you don ’ t go out on another date. You ’ re married to a guy and he picks his nose? He has a heart of gold. Don ’ t touch the fruitcake! You find a way to be happy with what ’ s happened. Now, what I want to show you is that people don ’ t know this about themselves, and not knowing this can work to our supreme disadvantage. Here ’ s an experiment we did at Harvard. We created a black-and-white photography course, and we allowed students to come in and learn how to use a darkroom. So we gave them cameras, they went around campus, they took 12 pictures of their favorite professors and their dorm room and their dog, and all the other things they wanted to have Harvard memories of. They bring us the camera, we make up a contact sheet, they figure out which are the two best pictures. We now spend six hours teaching them about darkrooms, and they blow two of them up. They have two gorgeous 8 x 10 glossies of meaningful things to them, and we say,”Which one would you like to give up?””I have to give one up?””Yes, we need one as evidence of the class project. So you have to give me one. You have to make a choice. You get to keep one, and I get to keep one.”Now, there are two conditions in this experiment. In one case, the students are told,”But you know, if you want to change your mind, I ’ ll always have the other one here, and in the next four days, before I actually mail it to headquarters”— yeah,”headquarters”—”I ’ ll be glad to swap it out with you. In fact, I ’ ll come to your dorm room, just give me an email. Better yet, I ’ ll check with you. You ever want to change your mind, it ’ s totally returnable.”The other half of the students are told exactly the opposite :”Make your choice, and by the way, the mail is going out, gosh, in two minutes, to England. Your picture will be winging its way over the Atlantic. You will never see it again.”Half of the students in each of these conditions are asked to make predictions about how much they ’ re going to come to like the picture that they keep and the picture they leave behind. Other students are just sent back to their little dorm rooms and they are measured over the next three to six days on their satisfaction with the pictures. Look at what we find. First of all, here ’ s what students think is going to happen. They think they ’ re going to maybe come to like the picture they chose a little more than the one they left behind. But these are not statistically significant differences. It ’ s a very small increase, and it doesn ’ t much matter whether they were in the reversible or irreversible condition. Wrong-o. Bad simulators. Because here ’ s what ’ s really happening. Both right before the swap and five days later, people who are stuck with that picture, who have no choice, who can never change their mind, like it a lot. And people who are deliberating —”Should I return it? Have I gotten the right one? Maybe this isn ’ t the good one. Maybe I left the good one?”— have killed themselves. They don ’ t like their picture. In fact, even after the opportunity to swap has expired, they still don ’ t like their picture. Why? Because the [reversible] condition is not conducive to the synthesis of happiness. So here ’ s the final piece of this experiment. We bring in a whole new group of naive Harvard students and we say,”You know, we ’ re doing a photography course, and we can do it one of two ways. We could do it so that when you take the two pictures, you ’ d have four days to change your mind, or we ’ re doing another course where you take the two pictures and you make up your mind right away and you can never change it. Which course would you like to be in?”Duh! Sixty-six percent of the students, two-thirds, prefer to be in the course where they have the opportunity to change their mind. Hello? Sixty-six percent of the students choose to be in the course in which they will ultimately be deeply dissatisfied with the picture — because they do not know the conditions under which synthetic happiness grows. The Bard said everything best, of course, and he ’ s making my point here but he ’ s making it hyperbolically :”’ Tis nothing good or bad But thinking makes it so.”It ’ s nice poetry, but that can ’ t exactly be right. Is there really nothing good or bad? Is it really the case that gall bladder surgery and a trip to Paris are just the same thing? That seems like a one-question IQ test. They can ’ t be exactly the same. In more turgid prose, but closer to the truth, was the father of modern capitalism, Adam Smith, and he said this. This is worth contemplating :”The great source of both the misery and disorders of human life seems to arise from overrating the difference between one permanent situation and another. Some of these situations may, no doubt, deserve to be preferred to others, but none of them can deserve to be pursued with that passionate ardor which drives us to violate the rules either of prudence or of justice, or to corrupt the future tranquility of our minds, either by shame from the remembrance of our own folly, or by remorse for the horror of our own injustice.”In other words : yes, some things are better than others. We should have preferences that lead us into one future over another. But when those preferences drive us too hard and too fast because we have overrated the difference between these futures, we are at risk. When our ambition is bounded, it leads us to work joyfully. When our ambition is unbounded, it leads us to lie, to cheat, to steal, to hurt others, to sacrifice things of real value. When our fears are bounded, we ’ re prudent, we ’ re cautious, we ’ re thoughtful. When our fears are unbounded and overblown, we ’ re reckless, and we ’ re cowardly. The lesson I want to leave you with, from these data, is that our longings and our worries are both to some degree overblown, because we have within us the capacity to manufacture the very commodity we are constantly chasing when we choose experience. Thank you.

Text Sample 957: NEG Dim 6 – 2004 – Score 1.00 – 2004/t000446.txt

About 15 years ago, I went to visit a friend in Hong Kong. And at the time I was very superstitious. So, upon landing â this was still at the old Hong Kong airport that ’ s Kai Tak, when it was smack in the middle of the city â I thought,”If I see something good, I ’ m going to have a great time here in my two weeks. And if I see something negative, I ’ m going to be miserable, indeed.”So the plane landed in between the buildings and got to a full stop in front of this little billboard. And I actually went to see some of the design companies in Hong Kong in my stay there. And it turned out that â I just went to see, you know, what they are doing in Hong Kong. But I actually walked away with a great job offer. And I flew back to Austria, packed my bags, and, another week later, I was again on my way to Hong Kong still superstitions and thinking,”Well, if that ’ Winner ’ billboard is still up, I ’ m going to have a good time working here. But if it ’ s gone, it ’ s going to be really miserable and stressful.”So it turned out that not only was the billboard still up but they had put this one right next to it. On the other hand, it also taught me where superstition gets me because I really had a terrible time in Hong Kong. However, I did have a number of real moments of happiness in my life â of, you know, I think what the conference brochure refers to as”moments that take your breath away.”And since I ’ m a big list maker, I actually listed them all. Now, you don ’ t have to go through the trouble of reading them and I won ’ t read them for you. I know that it ’ s incredibly boring to hear about other people ’ s happinesses. What I did do, though is, I actually looked at them from a design standpoint and just eliminated all the ones that had nothing to do with design. And, very surprisingly, over half of them had, actually, something to do with design. So there are, of course, two different possibilities. There ’ s one from a consumer ’ s point of view â where I was happy while experiencing design. And I ’ ll just give you one example. I had gotten my first Walkman. This is 1983. My brother had this great Yamaha motorcycle that he was willing to borrow to me freely. And The Police ’ s”Synchronicity”cassette had just been released and there was no helmet law in my hometown of Bregenz. So you could drive up into the mountains freely blasting The Police on the new Sony Walkman. And I remember it as a true moment of happiness. You know, of course, they are related to this combination of at least two of them being, you know, design objects. And, you know, there ’ s a scale of happiness when you talk about in design but the motorcycle incident would definitely be, you know, situated somewhere here â right in there between Delight and Bliss. Now, there is the other part, from a designer ’ s standpoint â if you ’ re happy while actually doing it. And one way to see how happy designers are when they ’ re designing could be to look at the authors ’ photos on the back of their monographs? So, according to this, the Australians and the Japanese as well as the Mexicans are very happy. While, somewhat, the Spaniards... and, I think, particularly, the Swiss, don ’ t seem to be doing all that well. Last November, a museum opened in Tokyo called The Mori Museum, in a skyscraper, up on the 56th floor. And their inaugural exhibit was called”Happiness.”And I went, very eagerly, to see it, because â well, also, with an eye on this conference. And they interestingly sectioned the exhibit off into four different areas. Under”Arcadia,”they showed things like this, from the Edo period â a hundred ways to write”happiness”in different forms. Or they had this apple by Yoko Ono â that, of course, later on was, you know, made into the label for The Beatles. Under”Nirvana”they showed this Constable painting. And there was a little â an interesting theory about abstraction. This is a blue field â it ’ s actually an Yves Klein painting. And the theory was that if you abstract an image, you really, you know open as much room for the un-representable â and, therefore, you know, are able to involve the viewer more. Then, under”Desire,”they showed these Shunsho paintings â also from the Edo period â ink on silk. And, lastly, under”Harmony,”they had this 13th- century mandala from Tibet. Now, what I took away from the exhibit was that maybe with the exception of the mandala most of the pieces in there were actually about the visualization of happiness and not about happiness. And I felt a little bit cheated, because the visualization â that ’ s a really easy thing to do. And, you know, my studio â we ’ ve done it all the time. This is, you know, a book. A happy dog â and you take it out, it ’ s an aggressive dog. It ’ s a happy David Byrne and an angry David Byrne. Or a jazz poster with a happy face and a more aggressive face. You know, that ’ s not a big deal to accomplish. It has gotten to the point where, you know, within advertising or within the movie industry,”happy”has gotten such a bad reputation that if you actually want to do something with the subject and still appear authentic, you almost would have to, you know, do it from a cynical point of view. This is, you know, the movie poster. Or we, a couple of weeks ago, designed a box set for The Talking Heads where the happiness visualized on the cover definitely has, very much, a dark side to it. Much, much more difficult is this, where the designs actually can evoke happiness â and I ’ m going to just show you three that actually did this for me. This is a campaign done by a young artist in New York, who calls himself”True.”Everybody who has ridden the New York subway system will be familiar with these signs? True printed his own version of these signs. Met every Wednesday at a subway stop with 20 of his friends. They divided up the different subway lines and added their own version. So this is one. Now, the way this works in the system is that nobody ever looks at these signs. So you ’ re you ’ re really bored in the subway, and you kind of stare at something. And it takes you a while until it actually â you realize that this says something different than what it normally says. I mean, that ’ s, at least, how it made me happy. Now, True is a real humanitarian. He didn ’ t want any of his friends to be arrested, so he supplied everybody with this fake volunteer card. And also gave this fake letter from the MTA to everybody â sort of like pretending that it ’ s an art project financed by The Metropolitan Transit Authority. Another New York project. This is at P. S. 1 â a sculpture that ’ s basically a square room by James Turrell, that has a retractable ceiling. Opens up at dusk and dawn every day. You don ’ t see the horizon. You ’ re just in there, watching the incredible, subtle changes of color in the sky. And the room is truly something to be seen. People ’ s demeanor changes when they go in there. And, for sure, I haven ’ t looked at the sky in the same way after spending an hour in there. There are, of course, more than those three projects that I ’ m showing here. I would definitely say that observing Vik Muniz ’”Cloud”a couple of years ago in Manhattan for sure made me happy, as well. But my last project is, again, from a young designer in New York. He ’ s from Korea originally. And he took it upon himself to print 55, 000 speech bubbles â empty speech bubbles stickers, large ones and small ones. And he goes around New York and just puts them, empty as they are, on posters. And other people go and fill them in. This one says,”Please let me die in peace.”I think that was â the most surprising to myself was that the writing was actually so good. This is on a musician poster, that says :”I am concerned that my CD will not sell more than 200, 000 units and that, as a result, my recoupable advance from my label will be taken from me, after which, my contract will be cancelled, and I ’ ll be back doing Journey covers on Bleecker Street.”I think the reason this works so well is because everybody involved wins. Jee gets to have his project ; the public gets a sweeter environment ; and different public gets a place to express itself ; and the advertisers finally get somebody to look at their ads. Well, there was a question, of course, that was on my mind for a while : You know, can I do more of the things that I like doing in design and less of the ones that I don ’ t like to be doing? Which brought me back to my list making â you know, just to see what I actually like about my job. You know, one is : just working without pressure. Then : working concentrated, without being frazzled. Or, as Nancy said before, like really immerse oneself into it. Try not to get stuck doing the same thing â or try not get stuck behind the computer all day. This is, you know, related to it : getting out of the studio. Then, of course, trying to, you know, work on things where the content is actually important for me. And being able to enjoy the end results. And then I found another list in one of my diaries that actually contained all the things that I thought I learned in my life so far. And, just about at that time, an Austrian magazine called and asked if we would want to do six spreads â design six spreads that work like dividing pages between the different chapters in the magazine? And the whole thing just fell together. So I just picked one of the things that I thought I learned â in this case,”Everything I do always comes back to me”â and we made these spreads right out of this. So it was :”Everything I do always comes back to me.”A couple of weeks ago, a French company asked us to design five billboards for them. Again, we could supply the content for it. So I just picked another one. And this was two weeks ago. We flew to Arizona â the designer who works with me, and myself â and photographed this one. So it ' s :"Trying to look good limits my life."And then we did one more of these. This is, again, for a magazine, dividing pages. This is :"Having"â this is the same thing ; it ' s just, you know, photographed from the side. This is from the front. Then it ' s :"guts."Again, it ' s the same thing â"guts"is just the same room, reworked. Then it ' s :"always works out."Then it ' s"for,"with the light on. And it ' s"me."Thank you so much.

So I understand that this meeting was planned, and the slogan was From Was to Still. And I am illustrating Still. Which, of course, I am not agreeing with because, although I am 94, I am not still working. And anybody who asks me,"Are you still doing this or that?"I don ' t answer because I ' m not doing things still, I ' m doing it like I always did. I still have — or did I use the word still? I didn ' t mean that. I have my file which is called To Do. I have my plans. I have my clients. I am doing my work like I always did. So this takes care of my age. I want to show you my work so you know what I am doing and why I am here. This was about 1925. All of these things were made during the last 75 years. But, of course, I ' m working since 25, doing more or less what you see here. This is Castleton China. This was an exhibition at the Museum of Modern Art. This is now for sale at the Metropolitan Museum. This is still at the Metropolitan Museum now for sale. This is a portrait of my daughter and myself. These were just some of the things I ' ve made. I made hundreds of them for the last 75 years. I call myself a maker of things. I don ' t call myself an industrial designer because I ' m other things. Industrial designers want to make novel things. Novelty is a concept of commerce, not an aesthetic concept. The industrial design magazine, I believe, is called"Innovation."Innovation is not part of the aim of my work. Well, makers of things : they make things more beautiful, more elegant, more comfortable than just the craftsmen do. I have so much to say. I have to think what I am going to say. Well, to describe our profession otherwise, we are actually concerned with the playful search for beauty. That means the playful search for beauty was called the first activity of Man. Sarah Smith, who was a mathematics professor at MIT, wrote,"The playful search for beauty was Man ' s first activity — that all useful qualities and all material qualities were developed from the playful search for beauty."These are tiles. The word,"playful"is a necessary aspect of our work because, actually, one of our problems is that we have to make, produce, lovely things throughout all of life, and this for me is now 75 years. So how can you, without drying up, make things with the same pleasure, as a gift to others, for so long? The playful is therefore an important part of our quality as designer. Let me tell you some about my life. As I said, I started to do these things 75 years ago. My first exhibition in the United States was at the Sesquicentennial exhibition in 1926 — that the Hungarian government sent one of my hand-drawn pieces as part of the exhibit. My work actually took me through many countries, and showed me a great part of the world. This is not that they took me — the work didn ' t take me — I made the things particularly because I wanted to use them to see the world. I was incredibly curious to see the world, and I made all these things, which then finally did take me to see many countries and many cultures. I started as an apprentice to a Hungarian craftsman, and this taught me what the guild system was in Middle Ages. The guild system : that means when I was an apprentice, I had to apprentice myself in order to become a pottery master.

In my shop where I studied, or learned, there was a traditional hierarchy of master, journeyman and learned worker, and apprentice, and I worked as the apprentice. The work as an apprentice was very primitive. That means I had to actually learn every aspect of making pottery by hand. We mashed the clay with our feet when it came from the hillside. After that, it had to be kneaded. It had to then go in, kind of, a mangle. And then finally it was prepared for the throwing. And there I really worked as an apprentice. My master took me to set ovens because this was part of oven-making, oven-setting, in the time. And finally, I had received a document that I had accomplished my apprenticeship successfully, that I had behaved morally, and this document was given to me by the Guild of Roof- Coverers, Rail-Diggers, Oven-Setters, Chimney Sweeps and Potters. I also got at the time a workbook which explained my rights and my working conditions, and I still have that workbook. First I set up a shop in my own garden, and made pottery which I sold on the marketplace in Budapest. And there I was sitting, and my then-boyfriend — I didn ' t mean it was a boyfriend like it is meant today — but my boyfriend and I sat at the market and sold the pots. My mother thought that this was not very proper, so she sat with us to add propriety to this activity. However, after a while there was a new factory being built in Budapest, a pottery factory, a large one. And I visited it with several ladies, and asked all sorts of questions of the director. Then the director asked me, why do you ask all these questions? I said, I also have a pottery. So he asked me, could he please visit me, and then finally he did, and explained to me that what I did now in my shop was an anachronism, that the industrial revolution had broken out, and that I rather should join the factory. There he made an art department for me where I worked for several months. However, everybody in the factory spent his time at the art department. The director there said there were several women casting and producing my designs now in molds, and this was sold also to America. I remember that it was quite successful. However, the director, the chemist, model maker — everybody — concerned himself much more with the art department — that means, with my work — than making toilets, so finally they got a letter from the center, from the bank who owned the factory, saying, make toilet-setting behind the art department, and that was my end. So this gave me the possibility because now I was a journeyman, and journeymen also take their satchel and go to see the world. So as a journeyman, I put an ad into the paper that I had studied, that I was a down-to-earth potter ' s journeyman and I was looking for a job as a journeyman. And I got several answers, and I accepted the one which was farthest from home and practically, I thought, halfway to America. And that was in Hamburg. Then I first took this job in Hamburg, at an art pottery where everything was done on the wheel, and so I worked in a shop where there were several potters. And the first day, I was coming to take my place at the turntable — there were three or four turntables — and one of them, behind where I was sitting, was a hunchback, a deaf-mute hunchback, who smelled very bad. So I doused him in cologne every day, which he thought was very nice, and therefore he brought bread and butter every day, which I had to eat out of courtesy. The first day I came to work in this shop there was on my wheel a surprise for me. My colleagues had thoughtfully put on the wheel where I was supposed to work a very nicely modeled natural man ' s organs. After I brushed them off with a hand motion, they were very — I finally was now accepted, and worked there for some six months. This was my first job. If I go on like this, you will be here till midnight. So I will try speed it up a little Moderator : Eva, we have about five minutes. Eva Zeisel : Are you sure? Moderator : Yes, I am sure. EZ : Well, if you are sure, I have to tell you that within five minutes I will talk very fast. And actually, my work took me to many countries because I used my work to fill my curiosity. And among other things, other countries I worked, was in the Soviet Union, where I worked from ’ 32 to ’ 37 — actually, to ’ 36. I was finally there, although I had nothing to do — I was a foreign expert. I became art director of the china and glass industry, and eventually under Stalin ’ s purges — at the beginning of Stalin ’ s purges, I didn ’ t know that hundreds of thousands of innocent people were arrested. So I was arrested quite early in Stalin ’ s purges, and spent 16 months in a Russian prison. The accusation was that I had successfully prepared an Attentat on Stalin ’ s life. This was a very dangerous accusation. And if this is the end of my five minutes, I want to tell you that I actually did survive, which was a surprise. But since I survived and I ’ m here, and since this is the end of the five minutes, I will — Moderator : Tell me when your last trip to Russia was. Weren ’ t you there recently? EZ : Oh, this summer, in fact, the Lomonosov factory was bought by an American company, invited me. They found out that I had worked in ’ 33 at this factory, and they came to my studio in Rockland County, and brought the 15 of their artists to visit me here. And they invited myself to come to the Russian factory last summer, in July, to make some dishes, design some dishes. And since I don ’ t like to travel alone, they also invited my daughter, son-in-law and granddaughter, so we had a lovely trip to see Russia today, which is not a very pleasant and happy view. Here I am now, if this is the end? Thank you.

I coined my own definition of success in 1934, when I was teaching at a high school in South Bend, Indiana, being a little bit disappointed, and [disillusioned] perhaps, by the way parents of the youngsters in my English classes expected their youngsters to get an A or a B. They thought a C was all right for the neighbors ’ children, because they were all average. But they weren ’ t satisfied when their own — it would make the teacher feel that they had failed, or the youngster had failed. And that ’ s not right. The good Lord in his infinite wisdom didn ’ t create us all equal as far as intelligence is concerned, any more than we ’ re equal for size, appearance. Not everybody could earn an A or a B, and I didn ’ t like that way of judging, and I did know how the alumni of various schools back in the ’ 30s judged coaches and athletic teams. If you won them all, you were considered to be reasonably successful — not completely. Because I found out — we had a number of years at UCLA where we didn ’ t lose a game. But it seemed that we didn ’ t win each individual game by the margin that some of our alumni had predicted — And quite frequently I really felt that they had backed up their predictions in a more materialistic manner. But that was true back in the 30s, so I understood that. But I didn ’ t like it, I didn ’ t agree with it. I wanted to come up with something I hoped could make me a better teacher, and give the youngsters under my supervision, be it in athletics or the English classroom, something to which to aspire, other than just a higher mark in the classroom, or more points in some athletic contest. I thought about that for quite a spell, and I wanted to come up with my own definition. I thought that might help. And I knew how Mr. Webster defined it, as the accumulation of material possessions or the attainment of a position of power or prestige, or something of that sort, worthy accomplishments perhaps, but in my opinion, not necessarily indicative of success. So I wanted to come up with something of my own. And I recalled — I was raised on a small farm in Southern Indiana, and Dad tried to teach me and my brothers that you should never try to be better than someone else. I ’ m sure at the time he did that, I didn ’ t — it didn ’ t — well, somewhere, I guess in the hidden recesses of the mind, it popped out years later. Never try to be better than someone else, always learn from others. Never cease trying to be the best you can be — that ’ s under your control. If you get too engrossed and involved and concerned in regard to the things over which you have no control, it will adversely affect the things over which you have control. Then I ran across this simple verse that said,”At God ’ s footstool to confess, a poor soul knelt, and bowed his head. ’ I failed! ’ he cried. The Master said, ’ Thou didst thy best, that is success. ’”From those things, and one other perhaps, I coined my own definition of success, which is : Peace of mind attained only through self-satisfaction in knowing you made the effort to do the best of which you ’ re capable. I believe that ’ s true. If you make the effort to do the best of which you ’ re capable, trying to improve the situation that exists for you, I think that ’ s success, and I don ’ t think others can judge that ; it ’ s like character and reputation — your reputation is what you ’ re perceived to be ; your character is what you really are. And I think that character is much more important than what you are perceived to be. You ’ d hope they ’ d both be good, but they won ’ t necessarily be the same. Well, that was my idea that I was going to try to get across to the youngsters. I ran across other things. I love to teach, and it was mentioned by the previous speaker that I enjoy poetry, and I dabble in it a bit, and love it. There are some things that helped me, I think, be better than I would have been. I know I ’ m not what I ought to be, what I should be, but I think I ’ m better than I would have been if I hadn ’ t run across certain things. One was just a little verse that said,”No written word, no spoken plea can teach our youth what they should be ; nor all the books on all the shelves — it ’ s what the teachers are themselves.”That made an impression on me in the 1930s. And I tried to use that more or less in my teaching, whether it be in sports, or whether it be in the English classroom. I love poetry and always had an interest in that somehow. Maybe it ’ s because Dad used to read to us at night, by coal oil lamp — we didn ’ t have electricity in our farm home. And Dad would read poetry to us. So I always liked it. And about the same time I ran across this one verse, I ran across another one. Someone asked a lady teacher why she taught, and after some time, she said she wanted to think about that. Then she came up and said,”They ask me why I teach, and I reply, ’ Where could I find such splendid company? ’ There sits a statesman, strong, unbiased, wise ; another Daniel Webster, silver-tongued. A doctor sits beside him, whose quick, steady hand may mend a bone, or stem the life-blood ’ s flow. And there a builder ; upward rise the arch of a church he builds, wherein that minister may speak the word of God, and lead a stumbling soul to touch the Christ. And all about, a gathering of teachers, farmers, merchants, laborers — those who work and vote and build and plan and pray into a great tomorrow. And I may say, I may not see the church, or hear the word, or eat the food their hands may grow, but yet again I may ; And later I may say, I knew him once, and he was weak, or strong, or bold or proud or gay. I knew him once, but then he was a boy. They ask me why I teach and I reply, ’ Where could I find such splendid company? ’”And I believe the teaching profession — it ’ s true, you have so many youngsters, and I ’ ve got to think of my youngsters at UCLA — 30-some attorneys, 11 dentists and doctors, many, many teachers and other professions. And that gives you a great deal of pleasure, to see them go on. I always tried to make the youngsters feel that they ’ re there to get an education, number one ; basketball was second, because it was paying their way, and they do need a little time for social activities, but you let social activities take a little precedence over the other two, and you ’ re not going to have any very long. So that was the idea that I tried to get across to the youngsters under my supervision. I had three rules, pretty much, that I stuck with practically all the time. I ’ d learned these prior to coming to UCLA, and I decided they were very important. One was"Never be late."Later on I said certain things — the players, if we were leaving for somewhere, had to be neat and clean. There was a time when I made them wear jackets and shirts and ties. Then I saw our chancellor coming to school in denims and turtlenecks, and thought, it ' s not right for me to keep this other [rule] so I let them just — they had to be neat and clean. I had one of my greatest players that you probably heard of, Bill Walton. He came to catch the bus ; we were leaving for somewhere to play. And he wasn ' t clean and neat, so I wouldn ' t let him go. He couldn ' t get on the bus, he had to go home and get cleaned up to get to the airport. So I was a stickler for that. I believed in that. I believe in time ; very important. I believe you should be on time, but I felt at practice, for example — we start on time, we close on time. The youngsters didn ' t have to feel that we were going to keep them over. When I speak at coaching clinics, I often tell young coaches — and at coaching clinics, more or less, they ' ll be the younger coaches getting in the profession. Most of them are young, you know, and probably newly-married. And I tell them,"Don ' t run practices late, because you ' ll go home in a bad mood, and that ' s not good, for a young married man to go home in a bad mood. When you get older, it doesn ' t make any difference, but —"So I did believe : on time. I believe starting on time, and I believe closing on time. And another one I had was, not one word of profanity. One word of profanity, and you are out of here for the day. If I see it in a game, you ' re going to come out and sit on the bench. And the third one was, never criticize a teammate. I didn ' t want that. I used to tell them I was paid to do that. That ' s my job. I ' m paid to do it. Pitifully poor, but I am paid to do it. Not like the coaches today, for gracious sakes, no. It ' s a little different than it was in my day. Those were three things that I stuck with pretty closely all the time. And those actually came from my dad. That ' s what he tried to teach me and my brothers at one time. I came up with a pyramid eventually, that I don ' t have the time to go on that. But that helped me, I think, become a better teacher. It ' s something like this : And I had blocks in the pyramid, and the cornerstones being industriousness and enthusiasm, working hard and enjoying what you ' re doing, coming up to the apex, according to my definition of success. And right at the top, faith and patience. And I say to you, in whatever you ' re doing, you must be patient. You have to have patience to — we want things to happen. We talk about our youth being impatient a lot, and they are. They want to change everything. They think all change is progress. And we get a little older — we sort of let things go. And we forget there is no progress without change. So you must have patience, and I believe that we must have faith. I believe that we must believe, truly believe. Not just give it word service, believe that things will work out as they should, providing we do what we should. I think our tendency is to hope things will turn out the way we want them to much of the time, but we don ' t do the things that are necessary to make those things become reality. I worked on this for some 14 years, and I think it helped me become a better teacher. But it all revolved around that original definition of success. You know, a number of years ago, there was a Major League Baseball umpire by the name of George Moriarty. He spelled Moriarty with only one ' i '. I ' d never seen that before, but he did. Big league baseball players — they ' re very perceptive about those things, and they noticed he had only one ' i ' in his name. You ' d be surprised how many also told him that that was one more than he had in his head at various times. But he wrote something where I think he did what I tried to do in this pyramid. He called it"The Road Ahead, or the Road Behind."He said,"Sometimes I think the Fates must grin as we denounce them and insist the only reason we can ' t win, is the Fates themselves have missed. Yet there lives on the ancient claim : we win or lose within ourselves. The shining trophies on our shelves can never win tomorrow ’ s game. You and I know deeper down, there ’ s always a chance to win the crown. But when we fail to give our best, we simply haven ’ t met the test, of giving all and saving none until the game is really won ; of showing what is meant by grit ; of playing through when others quit ; of playing through, not letting up. It ’ s bearing down that wins the cup. Of dreaming there ’ s a goal ahead ; of hoping when our dreams are dead ; of praying when our hopes have fled ; yet losing, not afraid to fall, if, bravely, we have given all. For who can ask more of a man than giving all within his span. Giving all, it seems to me, is not so far from victory. And so the Fates are seldom wrong, no matter how they twist and wind. It ’ s you and I who make our fates — we open up or close the gates on the road ahead or the road behind.”Reminds me of another set of threes that my dad tried to get across to us : Don ’ t whine. Don ’ t complain. Don ’ t make excuses. Just get out there, and whatever you ’ re doing, do it to the best of your ability. And no one can do more than that. I tried to get across, too, that — my opponents will tell you — you never heard me mention winning. Never mention winning. My idea is that you can lose when you outscore somebody in a game, and you can win when you ’ re outscored. I ’ ve felt that way on certain occasions, at various times. And I just wanted them to be able to hold their head up after a game. I used to say that when a game is over, and you see somebody that didn ’ t know the outcome, I hope they couldn ’ t tell by your actions whether you outscored an opponent or the opponent outscored you. That ’ s what really matters : if you make an effort to do the best you can regularly, the results will be about what they should be. Not necessarily what you ’ d want them to be but they ’ ll be about what they should ; only you will know whether you can do that. And that ’ s what I wanted from them more than anything else. And as time went by, and I learned more about other things, I think it worked a little better, as far as the results. But I wanted the score of a game to be the byproduct of these other things, and not the end itself. I believe it was one great philosopher who said — no, no — Cervantes. Cervantes said,”The journey is better than the end.”And I like that. I think that it is — it ’ s getting there. Sometimes when you get there, there ’ s almost a let down. But it ’ s the getting there that ’ s the fun. As a basketball coach at UCLA, I liked our practices to be the journey, and the game would be the end, the end result. I liked to go up and sit in the stands and watch the players play, and see whether I ’ d done a decent job during the week. There again, it ’ s getting the players to get that self-satisfaction, in knowing that they ’ d made the effort to do the best of which they are capable. Sometimes I ’ m asked who was the best player I had, or the best teams. I can never answer that. As far as the individuals are concerned — I was asked one time about that, and they said,”Suppose that you, in some way, could make the perfect player. What would you want?”And I said,”Well, I ’ d want one that knew why he was at UCLA : to get an education, he was a good student, really knew why he was there in the first place. But I ’ d want one that could play, too. I ’ d want one to realize that defense usually wins championships, and who would work hard on defense. But I ’ d want one who would play offense, too. I ’ d want him to be unselfish, and look for the pass first and not shoot all the time. And I ’ d want one that could pass and would pass. I ’ ve had some that could and wouldn ’ t, and I ’ ve had some that would and could. So, yeah, I ’ d want that. And I wanted them to be able to shoot from the outside. I wanted them to be good inside too. I ’ d want them to be able to rebound well at both ends, too. Why not just take someone like Keith Wilkes and let it go at that. He had the qualifications. Not the only one, but he was one that I used in that particular category, because I think he made the effort to become the best. There was a couple. I mention in my book,”They Call Me Coach,”two players that gave me great satisfaction, that came as close as I think anyone I ever had to reach their full potential : one was Conrad Burke, and one was Doug McIntosh. When I saw them as freshmen, on our freshmen team — freshmen couldn ’ t play varsity when I taught. I thought,”Oh gracious, if these two players, either one of them”— they were different years, but I thought about each one at the time he was there —”Oh, if he ever makes the varsity, our varsity must be pretty miserable, if he ’ s good enough to make it.”And you know, one of them was a starting player for a season and a half. The other one, his next year, played 32 minutes in a national championship game, Did a tremendous job for us. The next year, he was a starting player on the national championship team, and here I thought he ’ d never play a minute, when he was — so those are the things that give you great joy, and great satisfaction to see. Neither one of those youngsters could shoot very well. But they had outstanding shooting percentages, because they didn ’ t force it. And neither one could jump very well, but they kept good position, and so they did well rebounding. They remembered that every shot that ’ s taken, they assumed would be missed. I ’ ve had too many stand around and wait to see if it ’ s missed, then they go and it ’ s too late, somebody else is in there ahead of them. They weren ’ t very quick, but they played good position, kept in good balance. And so they played pretty good defense for us. So they had qualities that — they came close to — as close to reaching possibly their full potential as any players I ever had. So I consider them to be as successful as Lewis Alcindor or Bill Walton, or many of the others that we had ; there were some outstanding players. Have I rambled enough? I was told that when he makes his appearance, I was supposed to shut up.

I thought I would read poems I have that relate to the subject of youth and age. I was sort of astonished to find out how many I have actually. The first one is dedicated to Spencer, and his grandmother, who was shocked by his work. My poem is called”Dirt.”My grandmother is washing my mouth out with soap ; half a long century gone and still she comes at me with that thick cruel yellow bar. All because of a word I said, not even said really, only repeated. But”Open,”she says,”open up!”her hand clawing at my head. I know now her life was hard ; she lost three children as babies, then her husband died too, leaving young sons, and no money. She ’ d stand me in the sink to pee because there was never room in the toilet. But oh, her soap! Might its bitter burning have been what made me a poet? The street she lived on was unpaved, her flat, two cramped rooms and a fetid kitchen where she stalked and caught me. Dare I admit that after she did it I never really loved her again? She lived to a hundred, even then. All along it was the sadness, the squalor, but I never, until now loved her again. When that was published in a magazine I got an irate letter from my uncle.”You have maligned a great woman.”It took some diplomacy. This is called”The Dress.”It ’ s a longer poem. In those days, those days which exist for me only as the most elusive memory now, when often the first sound you ’ d hear in the morning would be a storm of birdsong, then the soft clop of the hooves of the horse hauling a milk wagon down your block, and the last sound at night as likely as not would be your father pulling up in his car, having worked late again, always late, and going heavily down to the cellar, to the furnace, to shake out the ashes and damp the draft before he came upstairs to fall into bed — in those long-ago days, women, my mother, my friends ’ mothers, our neighbors, all the women I knew — wore, often much of the day, what were called house-dresses, cheap, printed, pulpy, seemingly purposefully shapeless light cotton shifts that you wore over your nightgown and, when you had to go look for a child, hang wash on the line, or run down to the grocery store on the corner, under a coat, the twisted hem of the nightgown always lank and yellowed, dangling beneath. More than the curlers some of the women seemed constantly to have in their hair in preparation for some great event — a ball, one would think — that never came to pass ; more than the way most women ' s faces not only were never made up during the day, but seemed scraped, bleached, and, with their plucked eyebrows, scarily masklike ; more than all that it was those dresses that made women so unknowable and forbidding, adepts of enigmas to which men could have no access, and boys no conception. Only later would I see the dresses also as a proclamation : that in your dim kitchen, your laundry, your bleak concrete yard, what you revealed of yourself was a fabulation ; your real sensual nature, veiled in those sexless vestments, was utterly your dominion. In those days, one hid much else as well : grown men didn ' t embrace one another, unless someone had died, and not always then ; you shook hands or, at a ball game, thumped your friend ' s back and exchanged blows meant to be codes for affection ; once out of childhood you ' d never again know the shock of your father ' s whiskers on your cheek, not until mores at last had evolved, and you could hug another man, then hold on for a moment, then even kiss. What release finally, the embrace : though we were wary — it seemed so audacious — how much unspoken joy there was in that affirmation of equality and communion, no matter how much misunderstanding and pain had passed between you by then. We knew so little in those days, as little as now, I suppose about healing those hurts : even the women, in their best dresses, with beads and sequins sewn on the bodices, even in lipstick and mascara, their hair aflow, could only stand wringing their hands, begging for peace, while father and son, like thugs, like thieves, like Romans, simmered and hissed and hated, inflicting sorrows that endured, the worst anyway, through the kiss and embrace, bleeding from brother to brother, into the generations. In those days there was still countryside close to the city, farms, cornfields, cows ; even not far from our building with its blurred brick and long shadowy hallway you could find tracts with hills and trees you could pretend were mountains and forests. Or you could go out by yourself even to a half-block-long empty lot, into the bushes : like a creature of leaves you ' d lurk, crouched, crawling, simplified, savage, alone ; already there was wanting to be simpler, wanting, when they called you, never to go back. This is another longish one, about the old and the young. It actually happened right at the time we met. Part of the poem takes place in space we shared and time we shared. It ' s called"The Neighbor."Her five horrid, deformed little dogs who incessantly yap on the roof under my window. Her cats, God knows how many, who must piss on her rugs — her landing ' s a sickening reek. Her shadow once, fumbling the chain on her door, then the door slamming fearfully shut, only the barking and the music — jazz — filtering as it does, day and night into the hall. The time it was Chris Connor singing"Lush Life"— how it brought back my college sweetheart, my first real love, who — till I left her — played the same record. And head on my shoulder, hand on my thigh, sang sweetly along, of regrets and depletions she was too young for, as I was too young, later, to believe in her pain. It startled, then bored, then repelled me. My starting to fancy she ' d ended up in this fire-trap in the Village, that my neighbor was her. My thinking we ' d meet, recognize one another, become friends, that I ' d accomplish a penance. My seeing her, it wasn ' t her, at the mailbox. Gray-yellow hair, army pants under a nightgown, her turning away, hiding her ravaged face in her hands, muttering an inappropriate"Hi."Sometimes there are frightening goings-on in the stairwell. A man shouting,"Shut up!"The dogs frantically snarling, claws scrabbling, then her — her voice hoarse, harsh, hollow, almost only a tone, incoherent, a note, a squawk, bone on metal, metal gone molten, calling them back,"Come back darlings, come back dear ones. My sweet angels, come back."Medea she was, next time I saw her. Sorceress, tranced, ecstatic, stock-still on the sidewalk ragged coat hanging agape, passersby flowing around her, her mouth torn suddenly open as though in a scream, silently though, as though only in her brain or breast had it erupted. A cry so pure, practiced, detached, it had no need of a voice, or could no longer bear one. These invisible links that allure, these transfigurations, even of anguish, that hold us. The girl, my old love, the last lost time I saw her when she came to find me at a party, her drunkenly stumbling, falling, sprawling, skirt hiked, eyes veined red, swollen with tears, her shame, her dishonor. My ignorant, arrogant coarseness, my secret pride, my turning away. Still life on a rooftop, dead trees in barrels, a bench broken, dogs, excrement, sky. What pathways through pain, what junctures of vulnerability, what crossings and counterings? Too many lives in our lives already, too many chances for sorrow, too many unaccounted-for pasts."Behold me,"the god of frenzied, inexhaustible love says, rising in bloody splendor,"Behold me."Her making her way down the littered vestibule stairs, one agonized step at a time. My holding the door. Her crossing the fragmented tiles, faltering at the step to the street, droning, not looking at me,"Can you help me?"Taking my arm, leaning lightly against me. Her wavering step into the world. Her whispering,"Thanks love."Lightly, lightly against me. I think I ' ll lighten up a little. Another, different kind of poem of youth and age. It ' s called"Gas."Wouldn ' t it be nice, I think, when the blue-haired lady in the doctor ' s waiting room bends over the magazine table and farts, just a little, and violently blushes. Wouldn ' t it be nice if intestinal gas came embodied in visible clouds, so she could see that her really quite inoffensive pop had only barely grazed my face before it drifted away. Besides, for this to have happened now is a nice coincidence. Because not an hour ago, while we were on our walk, my dog was startled by a backfire and jumped straight up like a horse bucking. And that brought back to me the stable I worked on weekends when I was 12, and a splendid piebald stallion, who whenever he was mounted would buck just like that, though more hugely of course, enormous, gleaming, resplendent. And the woman, her face abashedly buried in her"Elle"now, reminded me — I ' d forgotten that not the least part of my awe consisted of the fact that with every jump he took the horse would powerfully fart. Phwap! Phwap! Phwap! Something never mentioned in the dozens of books about horses and their riders I devoured in those days. All that savage grandeur, the steely glinting hooves, the eruptions driven from the creature ' s mighty innards, breath stopped, heart stopped, nostrils madly flared, I didn ' t know if I wanted to break him, or be him. This is called"Thirst."Many — most of my poems actually are urban poems. I happen to be reading a bunch that aren ' t."Thirst."Here was my relation with the woman who lived all last autumn and winter, day and night, on a bench in the 103rd Street subway station, until finally one day she vanished. We regarded each other, scrutinized one another. Me shyly, obliquely, trying not to be furtive. She boldly, unblinkingly, even pugnaciously, wrathfully even, when her bottle was empty. I was frightened of her. I felt like a child. I was afraid some repressed part of myself would go out of control, and I ' d be forever entrapped in the shocking seethe of her stench. Not excrement merely, not merely surface and orifice going unwashed, rediffusion of rum, there was will in it, and intention, power and purpose — a social, ethical rage and rebellion — despair too, though, grief, loss. Sometimes I ' d think I should take her home with me, bathe her, comfort her, dress her. She wouldn ' t have wanted me to, I would think. Instead, I ' d step into my train. How rich I would think, is the lexicon of our self-absolving. How enduring, our bland fatal assurance that reflection is righteousness being accomplished. The dance of our glances, the clash, pulling each other through our perceptual punctures, then holocaust, holocaust, host on host of ill, injured presences, squandered, consumed. Her vigil somewhere I know continues. Her occupancy, her absolute, faithful attendance. The dance of our glances, challenge, abdication, effacement, the perfume of our consternation. This is a newer poem, a brand new poem. The title is"This Happened."A student, a young woman in a fourth-floor hallway of her lycee, perched on the ledge of an open window chatting with friends between classes ; a teacher passes and chides her,"Be careful, you might fall,"almost banteringly chides her,"You might fall,"and the young woman, 18, a girl really, though she wouldn ' t think that, as brilliant as she is, first in her class, and"Beautiful, too,"she ' s often told, smiles back, and leans into the open window, which wouldn ' t even be open if it were winter — if it were winter someone would have closed it — leans into the window, farther, still smiling, farther and farther, though it takes less time than this, really an instant, and lets herself fall. Herself fall. A casual impulse, a fancy, never thought of until now, hardly thought of even now... No, more than impulse or fancy, the girl knows what she ' s doing, the girl means something, the girl means to mean, because it occurs to her in that instant, that beautiful or not, bright yes or no, she ' s not who she is, she ' s not the person she is, and the reason, she suddenly knows, is that there ' s been so much premeditation where she is, so much plotting and planning, there ' s hardly a person where she is, or if there is, it ' s not her, or not wholly her, it ' s a self inhabited, lived in by her, and seemingly even as she thinks it she knows what ' s been missing : grace, not premeditation but grace, a kind of being in the world spontaneously, with grace. Weightfully upon me was the world. Weightfully this self which graced the world yet never wholly itself. Weightfully this self which weighed upon me, the release from which is what I desire and what I achieve. And the girl remembers, in this infinite instant already now so many times divided, the sadness she felt once, hardly knowing she felt it, to merely inhabit herself. Yes, the girl falls, absurd to fall, even the earth with its compulsion to take unto itself all that falls must know that falling is absurd, yet the girl falling isn ' t myself, or she is myself, but a self I took of my own volition unto myself. Forever. With grace. This happened. I ' ll read just one more. I don ' t usually say that. I like to just end. But I ' m afraid that Ricky will come out here and shake his fist at me. This is called"Old Man,"appropriately enough."Special : big tits,"Says the advertisement for a soft-core magazine on our neighborhood newsstand. But forget her breasts. A lush, fresh-lipped blond, skin glowing gold, sprawls there, resplendent. 60 nearly, yet these hardly tangible, hardly better than harlots, can still stir me. Maybe a coming of age in the American sensual darkness, never seeing an unsmudged nipple, an uncensored vagina, has left me forever infected with an unquenchable lust of the eye. Always that erotic murmur, I ' m hardly myself if I ' m not in a state of incipient desire. God knows though, there are worse twists your obsessions can take. Last year in Israel, a young ultra-orthodox Rabbi guiding some teenage girls through the Shrine of the Shoah forbade them to look in one room. Because there were images in it he said were licentious. The display was a photo. Men and women stripped naked, some trying to cover their genitals, others too frightened to bother, lined up in snow waiting to be shot and thrown into a ditch. The girls, to my horror, averted their gaze. What carnal mistrust had their teacher taught them. Even that though. Another confession : Once in a book on pre-war Poland, a studio portrait, an absolute angel, an absolute angel with tormented, tormenting eyes. I kept finding myself at her page. That she died in the camps made her — I didn ' t dare wonder why —

more present, more precious. Died in the camps, that too people — or Jews anyway — kept from their children back then. But it was like sex, you didn ’ t have to be told. Sex and death, how close they can seem. So constantly conscious now of death moving towards me, sometimes I think I confound them. My wife ’ s loveliness almost consumes me. My passion for her goes beyond reasonable bounds. When we make love, her holding me everywhere all around me, I ’ m there and not there. My mind teems, jumbles of faces, voices, impressions, I live my life over, as though I were drowning. Then I am drowning, in despair at having to leave her, this, everything, all, unbearable, awful. Still, to be able to die with no special contrition, not having been slaughtered, or enslaved. And not having to know history ’ s next mad rage or regression, it might be a relief. No. Again, no. I don ’ t mean that for a moment. What I mean is the world holds me so tightly — the good and the bad — my own follies and weakness that even this counterfeit Venus with her sham heat, and her bosom probably plumped with gel, so moves me my breath catches. Vamp. Siren. Seductress. How much more she reveals in her glare of ink than she knows. How she incarnates our desperate human need for regard, our passion to live in beauty, to be beauty, to be cherished by glances, if by no more, of something like love, or love. Thank you.

You know, one of the intense pleasures of travel and one of the delights of ethnographic research is the opportunity to live amongst those who have not forgotten the old ways, who still feel their past in the wind, touch it in stones polished by rain, taste it in the bitter leaves of plants. Just to know that Jaguar shamans still journey beyond the Milky Way, or the myths of the Inuit elders still resonate with meaning, or that in the Himalaya, the Buddhists still pursue the breath of the Dharma, is to really remember the central revelation of anthropology, and that is the idea that the world in which we live does not exist in some absolute sense, but is just one model of reality, the consequence of one particular set of adaptive choices that our lineage made, albeit successfully, many generations ago. And of course, we all share the same adaptive imperatives. We ’ re all born. We all bring our children into the world. We go through initiation rites. We have to deal with the inexorable separation of death, so it shouldn ’ t surprise us that we all sing, we all dance, we all have art. But what ’ s interesting is the unique cadence of the song, the rhythm of the dance in every culture. And whether it is the Penan in the forests of Borneo, or the Voodoo acolytes in Haiti, or the warriors in the Kaisut desert of Northern Kenya, the Curandero in the mountains of the Andes, or a caravanserai in the middle of the Sahara — this is incidentally the fellow that I traveled into the desert with a month ago — or indeed a yak herder in the slopes of Qomolangma, Everest, the goddess mother of the world. All of these peoples teach us that there are other ways of being, other ways of thinking, other ways of orienting yourself in the Earth. And this is an idea, if you think about it, can only fill you with hope. Now, together the myriad cultures of the world make up a web of spiritual life and cultural life that envelops the planet, and is as important to the well-being of the planet as indeed is the biological web of life that you know as a biosphere. And you might think of this cultural web of life as being an ethnosphere, and you might define the ethnosphere as being the sum total of all thoughts and dreams, myths, ideas, inspirations, intuitions brought into being by the human imagination since the dawn of consciousness. The ethnosphere is humanity ’ s great legacy. It ’ s the symbol of all that we are and all that we can be as an astonishingly inquisitive species. And just as the biosphere has been severely eroded, so too is the ethnosphere — and, if anything, at a far greater rate. No biologists, for example, would dare suggest that 50 percent of all species or more have been or are on the brink of extinction because it simply is not true, and yet that — the most apocalyptic scenario in the realm of biological diversity — scarcely approaches what we know to be the most optimistic scenario in the realm of cultural diversity. And the great indicator of that, of course, is language loss. When each of you in this room were born, there were 6, 000 languages spoken on the planet. Now, a language is not just a body of vocabulary or a set of grammatical rules. A language is a flash of the human spirit. It ’ s a vehicle through which the soul of each particular culture comes into the material world. Every language is an old-growth forest of the mind, a watershed, a thought, an ecosystem of spiritual possibilities. And of those 6, 000 languages, as we sit here today in Monterey, fully half are no longer being whispered into the ears of children. They ’ re no longer being taught to babies, which means, effectively, unless something changes, they ’ re already dead. What could be more lonely than to be enveloped in silence, to be the last of your people to speak your language, to have no way to pass on the wisdom of the ancestors or anticipate the promise of the children? And yet, that dreadful fate is indeed the plight of somebody somewhere on Earth roughly every two weeks, because every two weeks, some elder dies and carries with him into the grave the last syllables of an ancient tongue. And I know there ’ s some of you who say,”Well, wouldn ’ t it be better, wouldn ’ t the world be a better place if we all just spoke one language?”And I say,”Great, let ’ s make that language Yoruba. Let ’ s make it Cantonese. Let ’ s make it Kogi.”And you ’ ll suddenly discover what it would be like to be unable to speak your own language. And so, what I ’ d like to do with you today is sort of take you on a journey through the ethnosphere, a brief journey through the ethnosphere, to try to begin to give you a sense of what in fact is being lost. Now, there are many of us who sort of forget that when I say”different ways of being,”I really do mean different ways of being. Take, for example, this child of a Barasana in the Northwest Amazon, the people of the anaconda who believe that mythologically they came up the milk river from the east in the belly of sacred snakes. Now, this is a people who cognitively do not distinguish the color blue from the color green because the canopy of the heavens is equated to the canopy of the forest upon which the people depend. They have a curious language and marriage rule which is called”linguistic exogamy :”you must marry someone who speaks a different language. And this is all rooted in the mythological past, yet the curious thing is in these long houses, where there are six or seven languages spoken because of intermarriage, you never hear anyone practicing a language. They simply listen and then begin to speak. Or, one of the most fascinating tribes I ever lived with, the Waorani of northeastern Ecuador, an astonishing people first contacted peacefully in 1958. In 1957, five missionaries attempted contact and made a critical mistake. They dropped from the air 8 x 10 glossy photographs of themselves in what we would say to be friendly gestures, forgetting that these people of the rainforest had never seen anything two-dimensional in their lives. They picked up these photographs from the forest floor, tried to look behind the face to find the form or the figure, found nothing, and concluded that these were calling cards from the devil, so they speared the five missionaries to death. But the Waorani didn ’ t just spear outsiders. They speared each other. 54 percent of their mortality was due to them spearing each other. We traced genealogies back eight generations, and we found two instances of natural death and when we pressured the people a little bit about it, they admitted that one of the fellows had gotten so old that he died getting old, so we speared him anyway. But at the same time they had a perspicacious knowledge of the forest that was astonishing. Their hunters could smell animal urine at 40 paces and tell you what species left it behind. In the early ’ 80s, I had a really astonishing assignment when I was asked by my professor at Harvard if I was interested in going down to Haiti, infiltrating the secret societies which were the foundation of Duvalier ’ s strength and Tonton Macoutes, and securing the poison used to make zombies. In order to make sense out of sensation, of course, I had to understand something about this remarkable faith of Vodoun. And Voodoo is not a black magic cult. On the contrary, it ’ s a complex metaphysical worldview. It ’ s interesting. If I asked you to name the great religions of the world, what would you say? Christianity, Islam, Buddhism, Judaism, whatever. There ’ s always one continent left out, the assumption being that sub-Saharan Africa had no religious beliefs. Well, of course, they did and Voodoo is simply the distillation of these very profound religious ideas that came over during the tragic Diaspora of the slavery era. But, what makes Voodoo so interesting is that it ’ s this living relationship between the living and the dead. So, the living give birth to the spirits. The spirits can be invoked from beneath the Great Water, responding to the rhythm of the dance to momentarily displace the soul of the living, so that for that brief shining moment, the acolyte becomes the god. That ’ s why the Voodooists like to say that”You white people go to church and speak about God. We dance in the temple and become God.”And because you are possessed, you are taken by the spirit — how can you be harmed? So you see these astonishing demonstrations : Voodoo acolytes in a state of trance handling burning embers with impunity, a rather astonishing demonstration of the ability of the mind to affect the body that bears it when catalyzed in the state of extreme excitation. Now, of all the peoples that I ’ ve ever been with, the most extraordinary are the Kogi of the Sierra Nevada de Santa Marta in northern Colombia. Descendants of the ancient Tairona civilization which once carpeted the Caribbean coastal plain of Colombia, in the wake of the conquest, these people retreated into an isolated volcanic massif that soars above the Caribbean coastal plain. In a bloodstained continent, these people alone were never conquered by the Spanish. To this day, they remain ruled by a ritual priesthood but the training for the priesthood is rather extraordinary. The young acolytes are taken away from their families at the age of three and four, sequestered in a shadowy world of darkness in stone huts at the base of glaciers for 18 years : two nine-year periods deliberately chosen to mimic the nine months of gestation they spend in their natural mother ’ s womb ; now they are metaphorically in the womb of the great mother. And for this entire time, they are inculturated into the values of their society, values that maintain the proposition that their prayers and their prayers alone maintain the cosmic — or we might say the ecological — balance. And at the end of this amazing initiation, one day they ’ re suddenly taken out and for the first time in their lives, at the age of 18, they see a sunrise. And in that crystal moment of awareness of first light as the Sun begins to bathe the slopes of the stunningly beautiful landscape, suddenly everything they have learned in the abstract is affirmed in stunning glory. And the priest steps back and says,”You see? It ’ s really as I ’ ve told you. It is that beautiful. It is yours to protect.”They call themselves the”elder brothers”and they say we, who are the younger brothers, are the ones responsible for destroying the world. Now, this level of intuition becomes very important. Whenever we think of indigenous people and landscape, we either invoke Rousseau and the old canard of the”noble savage,”which is an idea racist in its simplicity, or alternatively, we invoke Thoreau and say these people are closer to the Earth than we are. Well, indigenous people are neither sentimental nor weakened by nostalgia. There ’ s not a lot of room for either in the malarial swamps of the

Asmat or in the chilling winds of Tibet, but they have, nevertheless, through time and ritual, forged a traditional mystique of the Earth that is based not on the idea of being self-consciously close to it, but on a far subtler intuition : the idea that the Earth itself can only exist because it is breathed into being by human consciousness. Now, what does that mean? It means that a young kid from the Andes who ’ s raised to believe that that mountain is an Apu spirit that will direct his or her destiny will be a profoundly different human being and have a different relationship to that resource or that place than a young kid from Montana raised to believe that a mountain is a pile of rock ready to be mined. Whether it ’ s the abode of a spirit or a pile of ore is irrelevant. What ’ s interesting is the metaphor that defines the relationship between the individual and the natural world. I was raised in the forests of British Columbia to believe those forests existed to be cut. That made me a different human being than my friends amongst the Kwagiulth who believe that those forests were the abode of Huxwhukw and the Crooked Beak of Heaven and the cannibal spirits that dwelled at the north end of the world, spirits they would have to engage during their Hamatsa initiation. Now, if you begin to look at the idea that these cultures could create different realities, you could begin to understand some of their extraordinary discoveries. Take this plant here. It ’ s a photograph I took in the Northwest Amazon just last April. This is ayahuasca, which many of you have heard about, the most powerful psychoactive preparation of the shaman ’ s repertoire. What makes ayahuasca fascinating is not the sheer pharmacological potential of this preparation, but the elaboration of it. It ’ s made really of two different sources : on the one hand, this woody liana which has in it a series of beta- carbolines, harmine, harmaline, mildly hallucinogenic — to take the vine alone is rather to have sort of blue hazy smoke drift across your consciousness — but it ’ s mixed with the leaves of a shrub in the coffee family called Psychotria viridis. This plant had in it some very powerful tryptamines, very close to brain serotonin, dimethyltryptamine, 5-methoxydimethyltryptamine. If you ’ ve ever seen the Yanomami blowing that snuff up their noses, that substance they make from a different set of species also contains methoxydimethyltryptamine. To have that powder blown up your nose is rather like being shot out of a rifle barrel lined with baroque paintings and landing on a sea of electricity. It doesn ’ t create the distortion of reality ; it creates the dissolution of reality. In fact, I used to argue with my professor, Richard Evan Shultes — who is a man who sparked the psychedelic era with his discovery of the magic mushrooms in Mexico in the 1930s — I used to argue that you couldn ’ t classify these tryptamines as hallucinogenic because by the time you ’ re under the effects there ’ s no one home anymore to experience a hallucination. But the thing about tryptamines is they cannot be taken orally because they ’ re denatured by an enzyme found naturally in the human gut called monoamine oxidase. They can only be taken orally if taken in conjunction with some other chemical that denatures the MAO. Now, the fascinating things are that the beta- carbolines found within that liana are MAO inhibitors of the precise sort necessary to potentiate the tryptamine. So you ask yourself a question. How, in a flora of 80, 000 species of vascular plants, do these people find these two morphologically unrelated plants that when combined in this way, created a kind of biochemical version of the whole being greater than the sum of the parts? Well, we use that great euphemism,”trial and error,”which is exposed to be meaningless. But you ask the Indians, and they say,”The plants talk to us.”Well, what does that mean? This tribe, the Cofan, has 17 varieties of ayahuasca, all of which they distinguish a great distance in the forest, all of which are referable to our eye as one species. And then you ask them how they establish their taxonomy and they say,”I thought you knew something about plants. I mean, don ’ t you know anything?”And I said,”No.”Well, it turns out you take each of the 17 varieties in the night of a full moon, and it sings to you in a different key. Now, that ’ s not going to get you a Ph. D. at Harvard, but it ’ s a lot more interesting than counting stamens. Now — — the problem — the problem is that even those of us sympathetic with the plight of indigenous people view them as quaint and colorful but somehow reduced to the margins of history as the real world, meaning our world, moves on. Well, the truth is the 20th century, 300 years from now, is not going to be remembered for its wars or its technological innovations, but rather as the era in which we stood by and either actively endorsed or passively accepted the massive destruction of both biological and cultural diversity on the planet. Now, the problem isn ’ t change. All cultures through all time have constantly been engaged in a dance with new possibilities of life. And the problem is not technology itself. The Sioux Indians did not stop being Sioux when they gave up the bow and arrow any more than an American stopped being an American when he gave up the horse and buggy. It ’ s not change or technology that threatens the integrity of the ethnosphere. It is power, the crude face of domination. Wherever you look around the world, you discover that these are not cultures destined to fade away ; these are dynamic living peoples being driven out of existence by identifiable forces that are beyond their capacity to adapt to : whether it ’ s the egregious deforestation in the homeland of the Penan — a nomadic people from Southeast Asia, from Sarawak — a people who lived free in the forest until a generation ago, and now have all been reduced to servitude and prostitution on the banks of the rivers, where you can see the river itself is soiled with the silt that seems to be carrying half of Borneo away to the South China Sea, where the Japanese freighters hang light in the horizon ready to fill their holds with raw logs ripped from the forest — or, in the case of the Yanomami, it ’ s the disease entities that have come in, in the wake of the discovery of gold. Or if we go into the mountains of Tibet, where I ’ m doing a lot of research recently, you ’ ll see it ’ s a crude face of political domination. You know, genocide, the physical extinction of a people is universally condemned, but ethnocide, the destruction of people ’ s way of life, is not only not condemned, it ’ s universally, in many quarters, celebrated as part of a development strategy. And you cannot understand the pain of Tibet until you move through it at the ground level. I once travelled 6, 000 miles from Chengdu in Western China overland through southeastern Tibet to Lhasa with a young colleague, and it was only when I got to Lhasa that I understood the face behind the statistics you hear about : 6, 000 sacred monuments torn apart to dust and ashes, 1. 2 million people killed by the cadres during the Cultural Revolution. This young man ’ s father had been ascribed to the Panchen Lama. That meant he was instantly killed at the time of the Chinese invasion. His uncle fled with His Holiness in the Diaspora that took the people to Nepal. His mother was incarcerated for the crime of being wealthy. He was smuggled into the jail at the age of two to hide beneath her skirt tails because she couldn ’ t bear to be without him. The sister who had done that brave deed was put into an education camp. One day she inadvertently stepped on an armband of Mao, and for that transgression, she was given seven years of hard labor. The pain of Tibet can be impossible to bear, but the redemptive spirit of the people is something to behold. And in the end, then, it really comes down to a choice : do we want to live in a monochromatic world of monotony or do we want to embrace a polychromatic world of diversity? Margaret Mead, the great anthropologist, said, before she died, that her greatest fear was that as we drifted towards this blandly amorphous generic world view not only would we see the entire range of the human imagination reduced to a more narrow modality of thought, but that we would wake from a dream one day having forgotten there were even other possibilities. And it ' s humbling to remember that our species has, perhaps, been around for [150, 000] years. The Neolithic Revolution — which gave us agriculture, at which time we succumbed to the cult of the seed ; the poetry of the shaman was displaced by the prose of the priesthood ; we created hierarchy specialization surplus — is only 10, 000 years ago. The modern industrial world as we know it is barely 300 years old. Now, that shallow history doesn ' t suggest to me that we have all the answers for all of the challenges that will confront us in the ensuing millennia. When these myriad cultures of the world are asked the meaning of being human, they respond with 10, 000 different voices. And it ' s within that song that we will all rediscover the possibility of being what we are : a fully conscious species, fully aware of ensuring that all peoples and all gardens find a way to flourish. And there are great moments of optimism. This is a photograph I took at the northern tip of Baffin Island when I went narwhal hunting with some Inuit people, and this man, Olayuk, told me a marvelous story of his grandfather. The Canadian government has not always been kind to the Inuit people, and during the 1950s, to establish our sovereignty, we forced them into settlements. This old man ' s grandfather refused to go. The family, fearful for his life, took away all of his weapons, all of his tools. Now, you must understand that the Inuit did not fear the cold ; they took advantage of it. The runners of their sleds were originally made of fish wrapped in caribou hide. So, this man ' s grandfather was not intimidated by the Arctic night or the blizzard that was blowing. He simply slipped outside, pulled down his sealskin trousers and defecated into his hand. And as the feces began to freeze, he shaped it into the form of a blade. He put a spray of saliva on the edge of the shit knife and as it finally froze solid, he butchered a dog with it. He skinned the dog and improvised a harness, took the ribcage of the dog and improvised a sled, harnessed up an adjacent dog, and disappeared over the ice floes, shit knife in belt. Talk about getting by with nothing. And this, in many ways — — is a symbol of the resilience of the Inuit people and of all indigenous people around the world. The Canadian government in April of 1999 gave back to total control of the Inuit an area of land larger than California and Texas put together. It ' s our new homeland. It ' s called Nunavut. It ' s an independent territory. They control all mineral resources. An amazing example of how a nation-state can seek restitution with its people. And finally, in the end, I think it ' s pretty obvious at least to all of all us who ' ve traveled in these remote reaches of the planet, to realize that they ' re not remote at all. They ' re homelands of somebody. They represent branches of the human imagination that go back to the dawn of time. And for all of us, the dreams of these children, like the dreams of our own children, become part of the naked geography of hope. So, what we ' re trying to do at the National Geographic, finally, is, we believe that politicians will never accomplish anything. We think that polemics — — we think that polemics are not persuasive, but we think that storytelling can change the world, and so we are probably the best storytelling institution in the world. We get 35 million hits on our website every month. 156 nations carry our television channel. Our magazines are read by millions. And what we ' re doing is a series of journeys to the ethnosphere where we ' re going to take our audience to places of such cultural wonder that they cannot help but come away dazzled by what they have seen, and hopefully, therefore, embrace gradually, one by one, the central revelation of anthropology : that this world deserves to exist in a diverse way, that we can find a way to live in a truly multicultural, pluralistic world where all of the wisdom of all peoples can contribute to our collective well-being. Thank you very much.

Text Sample 962: NEG Dim 6 – 2003 – Score 1.00 – 2003/t000450.txt

I was asked to come here and speak about creation. And I only have 15 minutes, and I see they ’ re counting already. And I can â in 15 minutes, I think I can touch only a very rather janitorial branch of creation, which I call”creativity.”Creativity is how we cope with creation. While creation sometimes seems a bit un-graspable, or even pointless, creativity is always meaningful. See, for instance, in this picture. You know, creation is what put that dog in that picture, and creativity is what makes us see a chicken on his hindquarters. When you think about â you know, creativity has a lot to do with causality too. You know, when I was a teenager, I was a creator. I just did things. Then I became an adult and started knowing who I was, and tried to maintain that persona â I became creative. It wasn ’ t until I actually did a book and a retrospective exhibition, that I could track exactly â looks like all the craziest things that I had done, all my drinking, all my parties â they followed a straight line that brings me to the point that actually I ’ m talking to you at this moment. Though it ’ s actually true, you know, the reason I ’ m talking to you right now is because I was born in Brazil. If I was born in Monterey, probably would be in Brazil. You know, I was born in Brazil and grew up in the ’ 70s under a climate of political distress, and I was forced to learn to communicate in a very specific way â in a sort of a semiotic black market. You couldn ’ t really say what you wanted to say ; you had to invent ways of doing it. You didn ’ t trust information very much. That led me to another step of why I ’ m here today, is because I really liked media of all kinds. I was a media junkie, and eventually got involved with advertising. My first job in Brazil was actually to develop a way to improve the readability of billboards, and based on speed, angle of approach and actually blocks of text. It was very â actually, it was a very good study, and got me a job in an ad agency. And they also decided that I had to â to give me a very ugly Plexiglas trophy for it. And another point â why I ’ m here â is that the day I went to pick up the Plexiglas trophy, I rented a tuxedo for the first time in my life, picked the thing â didn ’ t have any friends. On my way out, I had to break a fight apart. Somebody was hitting somebody else with brass knuckles. They were in tuxedos, and fighting. It was very ugly. And also â advertising people do that all the time â â and I â well, what happened is when I went back, it was on the way back to my car, the guy who got hit decided to grab a gun â I don ’ t know why he had a gun â and shoot the first person he decided to be his aggressor. The first person was wearing a black tie, a tuxedo. It was me. Luckily, it wasn ’ t fatal, as you can all see. And, even more luckily, the guy said that he was sorry and I bribed him for compensation money, otherwise I press charges. And that ’ s how â with this money I paid for a ticket to come to the United States in 1983, and that ’ s very â the basic reason I ’ m talking to you here today : because I got shot. Well, when I started working with my own work, I decided that I shouldn ’ t do images. You know, I became â I took this very iconoclastic approach. Because when I decided to go into advertising, I wanted to do â I wanted to airbrush naked people on ice, for whiskey commercials, that ’ s what I really wanted to do. But I â they didn ’ t let me do it, so I just â you know, they would only let me do other things. But I wasn ’ t into selling whiskey ; I was into selling ice. The first works were actually objects. It was kind of a mixture of found object, product design and advertising. And I called them relics. They were displayed first at Stux Gallery in 1983. This is the clown skull. Is a remnant of a race of â a very evolved race of entertainers. They lived in Brazil, long time ago. This is the Ashanti joystick. Unfortunately, it has become obsolete because it was designed for Atari platform. A Playstation II is in the works, maybe for the next TED I ’ ll bring it. The rocking podium. This is the pre-Columbian coffeemaker. Actually, the idea came out of an argument that I had at Starbucks, that I insisted that I wasn ’ t having Colombian coffee ; the coffee was actually pre-Columbian. The Bonsai table. The entire Encyclopedia Britannica bound in a single volume, for travel purposes. And the half tombstone, for people who are not dead yet. I wanted to take that into the realm of images, and I decided to make things that had the same identity conflicts. So I decided to do work with clouds. Because clouds can mean anything you want. But now I wanted to work in a very low-tech way, so something that would mean at the same time a lump of cotton, a cloud and Durer ’ s praying hands â although this looks a lot more like Mickey Mouse ’ s praying hands. But I was still, you know â this is a kitty cloud. They ’ re called”Equivalents,”after Alfred Stieglitz ’ s work.”The Snail.”But I was still working with sculpture, and I was really trying to go flatter and flatter.”The Teapot.”I had a chance to go to Florence, in â I think it was ’ 94, and I saw Ghiberti ’ s”Door of Paradise.”And he did something that was very tricky. He put together two different media from different periods of time. First, he got an age-old way of making it, which was relief, and he worked this with three- point perspective, which was brand-new technology at the time. And it ’ s totally overkill. And your eye doesn ’ t know which level to read. And you become trapped into this kind of representation. So I decided to make these very simple renderings, that at first they are taken as a line drawing â you know, something that ’ s very â and then I did it with wire. The idea was to â because everybody overlooks white â like pencil drawings, you know? And they would look at it â”Ah, it ’ s a pencil drawing.”Then you have this double take and see that it ’ s actually something that existed in time. It had a physicality, and you start going deeper and deeper into sort of narrative that goes this way, towards the image. So this is”Monkey with Leica.””Relaxation.””Fiat Lux.”And the same way the history of representation evolved from line drawings to shaded drawings. And I wanted to deal with other subjects. I started taking that into the realm of landscape, which is something that ’ s almost a picture of nothing. I made these pictures called”Pictures of Thread,”and I named them after the amount of yards that I used to represent each picture. These always end up being a photograph at the end, or more like an etching in this case. So this is a lighthouse. This is”6, 500 Yards,”after Corot.”9, 000 Yards,”after Gerhard Richter. And I don ’ t know how many yards, after John Constable. Departing from the lines, I decided to tackle the idea of points, like which is more similar to the type of representation that we find in photographs themselves. I had met a group of children in the Caribbean island of Saint Kitts, and I did work and play with them. I got some photographs from them. Upon my arrival in New York, I decided â they were children of sugar plantation workers. And by manipulating sugar over a black paper, I made portraits of them. These are â â Thank you. This is”Valentina, the Fastest.”It was just the name of the child, with the little thing you get to know of somebody that you meet very briefly.”Valicia.””Jacynthe.”But another layer of representation was still introduced. Because I was doing this while I was making these pictures, I realized that I could add still another thing I was trying to make a subject â something that would interfere with the themes, so chocolate is very good, because it has â it brings to mind ideas that go from scatology to romance. And so I decided to make these pictures, and they were very large, so you had to walk away from it to be able to see them. So they ’ re called”Pictures of Chocolate.”Freud probably could explain chocolate better than I. He was the first subject. And Jackson Pollock also. Pictures of crowds are particularly interesting, because, you know, you go to that â you try to figure out the threshold with something you can define very easily, like a face, goes into becoming just a texture.”Paparazzi.”I used the dust at the Whitney Museum to render some pieces of their collection. And I picked minimalist pieces because they ’ re about specificity. And you render this with the most non-specific material, which is dust itself. Like, you know, you have the skin particles of every single museum visitor. They do a DNA scan of this, they will come up with a great mailing list. This is Richard Serra. I bought a computer, and [they] told me it had millions of colors in it. You know an artist ’ s first response to this is, who counted it? You know? And I realized that I never worked with color, because I had a hard time controlling the idea of single colors. But once they ’ re applied to numeric structure, then you can feel more comfortable. So the first time I worked with colors was by making these mosaics of Pantone swatches. They end up being very large pictures, and I photographed with a very large camera â an 8x10 camera. So you can see the surface of every single swatch â like in this picture of Chuck Close. And you have to walk very far to be able to see it. Also, the reference to Gerhard Richter ’ s use of color charts â and the idea also entering another realm of representation that ’ s very common to us today, which is the bit map. I ended up narrowing the subject to Monet ’ s”Haystacks.”This is something I used to do as a joke â you know, make â the same like â Robert Smithson ’ s”Spiral Jetty”â and then leaving traces, as if it was done on a tabletop. I tried to prove that he didn ’ t do that thing in the Salt Lake. But then, just doing the models, I was trying to explore the relationship between the model and the original. And I felt that I would have to actually go there and make some earthworks myself. I opt for very simple line drawings â kind of stupid looking. And at the same time, I was doing these very large constructions, being 150 meters away. Now I would do very small ones, which would be like â but under the same light, and I would show them together, so the viewer would have to really figure it out what one he was looking. I wasn ’ t interested in the very large things, or in the small things. I was more interested in the things in between, you know, because you can leave an enormous range for ambiguity there. This is like you see â the size of a person over there. This is a pipe. A hanger. And this is another thing that I did â you know working â everybody loves to watch somebody draw, but not many people have a chance to watch somebody draw in â a lot of people at the same time, to evidence a single drawing. And I love this work, because I did these cartoonish clouds over Manhattan for a period of two months. And it was quite wonderful, because I had an interest â an early interest â in theater, that ’ s justified on this thing. In theater, you have the character and the actor in the same place, trying to negotiate each other in front of an audience. And in this, you ’ d have like a â something that looks like a cloud, and it is a cloud at the same time. So they ’ re like perfect actors. My interest in acting, especially bad acting, goes a long way. Actually, I once paid like 60 dollars to see a very great actor to do a version of”King Lear,”and I felt really robbed, because by the time the actor started being King Lear, he stopped being the great actor that I had paid money to see. On the other hand, you know, I paid like three dollars, I think â and I went to a warehouse in Queens to see a version of”Othello”by an amateur group. And it was quite fascinating, because you know the guy â his name was Joey Grimaldi â he impersonated the Moorish general â you know, for the first three minutes he was really that general, and then he went back into plumber, he worked as a plumber, so â plumber, general, plumber, general â so for three dollars, I saw two tragedies for the price of one. See, I think it ’ s not really about impression, making people fall for a really perfect illusion, as much as it is to make â I usually work at the lowest threshold of visual illusion. Because it ’ s not about fooling somebody, it ’ s actually giving somebody a measure of their own belief : how much you want to be fooled. That ' s why we pay to go to magic shows and things like that. Well, I think that ' s it. My time is nearly up. Thank you very much.

Text Sample 963: NEG Dim 6 – 2003 – Score 1.00 – 2003/t000436.txt

I ' m supposed to scare you, because it ' s about fear, right? And you should be really afraid, but not for the reasons why you think you should be. You should be really afraid that — if we stick up the first slide on this thing — there we go — that you ' re missing out. Because if you spend this week thinking about Iraq and thinking about Bush and thinking about the stock market, you ' re going to miss one of the greatest adventures that we ' ve ever been on. And this is what this adventure ' s really about. This is crystallized DNA. Every life form on this planet — every insect, every bacteria, every plant, every animal, every human, every politician — is coded in that stuff. And if you want to take a single crystal of DNA, it looks like that. And we ' re just beginning to understand this stuff. And this is the single most exciting adventure that we have ever been on. It ' s the single greatest mapping project we ' ve ever been on. If you think that the mapping of America ' s made a difference, or landing on the moon, or this other stuff, it ' s the map of ourselves and the map of every plant and every insect and every bacteria that really makes a difference. And it ' s beginning to tell us a lot about evolution. It turns out that what this stuff is — and Richard Dawkins has written about this — is, this is really a river out of Eden. So, the 3. 2 billion base pairs inside each of your cells is really a history of where you ' ve been for the past billion years. And we could start dating things, and we could start changing medicine and archeology. It turns out that if you take the human species about 700 years ago, white Europeans diverged from black Africans in a very significant way. White Europeans were subject to the plague. And when they were subject to the plague, most people didn ' t survive, but those who survived had a mutation on the CCR5 receptor. And that mutation was passed on to their kids because they ' re the ones that survived, so there was a great deal of population pressure. In Africa, because you didn ' t have these cities, you didn ' t have that CCR5 population pressure mutation. We can date it to 700 years ago. That is one of the reasons why AIDS is raging across Africa as fast as it is, and not as fast across Europe. And we ' re beginning to find these little things for malaria, for sickle cell, for cancers. And in the measure that we map ourselves, this is the single greatest adventure that we ' ll ever be on. And this Friday, I want you to pull out a really good bottle of wine, and I want you to toast these two people. Because this Friday, 50 years ago, Watson and Crick found the structure of DNA, and that is almost as important a date as the 12th of February when we first mapped ourselves, but anyway, we ' ll get to that. I thought we ' d talk about the new zoo. So, all you guys have heard about DNA, all the stuff that DNA does, but some of the stuff we ' re discovering is kind of nifty because this turns out to be the single most abundant species on the planet. If you think you ' re successful or cockroaches are successful, it turns out that there ' s ten trillion trillion Pleurococcus sitting out there. And we didn ' t know that Pleurococcus was out there, which is part of the reason why this whole species-mapping project is so important. Because we ' re just beginning to learn where we came from and what we are. And we ' re finding amoebas like this. This is the amoeba dubia. And the amoeba dubia doesn ' t look like much, except that each of you has about 3. 2 billion letters, which is what makes you you, as far as gene code inside each of your cells, and this little amoeba which, you know, sits in water in hundreds and millions and billions, turns out to have

620 billion base pairs of gene code inside. So, this little thingamajig has a genome that ’ s 200 times the size of yours. And if you ’ re thinking of efficient information storage mechanisms, it may not turn out to be chips. It may turn out to be something that looks a little like that amoeba. And, again, we ’ re learning from life and how life works. This funky little thing : people didn ’ t used to think that it was worth taking samples out of nuclear reactors because it was dangerous and, of course, nothing lived there. And then finally somebody picked up a microscope and looked at the water that was sitting next to the cores. And sitting next to that water in the cores was this little Deinococcus radiodurans, doing a backstroke, having its chromosomes blown apart every day, six, seven times, restitching them, living in about 200 times the radiation that would kill you. And by now you should be getting a hint as to how diverse and how important and how interesting this journey into life is, and how many different life forms there are, and how there can be different life forms living in very different places, maybe even outside of this planet. Because if you can live in radiation that looks like this, that brings up a whole series of interesting questions. This little thingamajig : we didn ’ t know this thingamajig existed. We should have known that this existed because this is the only bacteria that you can see to the naked eye. So, this thing is 0. 75 millimeters. It lives in a deep trench off the coast of Namibia. And what you ’ re looking at with this namibiensis is the biggest bacteria we ’ ve ever seen. So, it ’ s about the size of a little period on a sentence. Again, we didn ’ t know this thing was there three years ago. We ’ re just beginning this journey of life in the new zoo. This is a really odd one. This is Ferroplasma. The reason why Ferroplasma is interesting is because it eats iron, lives inside the equivalent of battery acid, and excretes sulfuric acid. So, when you think of odd life forms, when you think of what it takes to live, it turns out this is a very efficient life form, and they call it an archaea. Archaea means”the ancient ones.”And the reason why they ’ re ancient is because this thing came up when this planet was covered by things like sulfuric acid in batteries, and it was eating iron when the earth was part of a melted core. So, it ’ s not just dogs and cats and whales and dolphins that you should be aware of and interested in on this little journey. Your fear should be that you are not, that you ’ re paying attention to stuff which is temporal. I mean, George Bush — he ’ s going to be gone, alright? Life isn ’ t. Whether the humans survive or don ’ t survive, these things are going to be living on this planet or other planets. And it ’ s just beginning to understand this code of DNA that ’ s really the most exciting intellectual adventure that we ’ ve ever been on. And you can do strange things with this stuff. This is a baby gaur. Conservation group gets together, tries to figure out how to breed an animal that ’ s almost extinct. They can ’ t do it naturally, so what they do with this thing is they take a spoon, take some cells out of an adult gaur ’ s mouth, code, take the cells from that and insert it into a fertilized cow ’ s egg, reprogram cow ’ s egg — different gene code. When you do that, the cow gives birth to a gaur. We are now experimenting with bongos, pandas, elands, Sumatran tigers, and the Australians — bless their hearts — are playing with these things. Now, the last of these things died in September 1936. These are Tasmanian tigers. The last known one died at the Hobart Zoo. But it turns out that as we learn more about gene code and how to reprogram species, we may be able to close the gene gaps in deteriorate DNA. And when we learn how to close the gene gaps, then we can put a full string of DNA together. And if we do that, and insert this into a fertilized wolf ’ s egg, we may give birth to an animal that hasn ’ t walked the earth since 1936. And then you can start going back further, and you can start thinking about dodos, and you can think about other species. And in other places, like Maryland, they ’ re trying to figure out what the primordial

ancestor is. Because each of us contains our entire gene code of where we ’ ve been for the past billion years, because we ’ ve evolved from that stuff, you can take that tree of life and collapse it back, and in the measure that you learn to reprogram, maybe we ’ ll give birth to something that is very close to the first primordial ooze. And it ’ s all coming out of things that look like this. These are companies that didn ’ t exist five years ago. Huge gene sequencing facilities the size of football fields. Some are public. Some are private. It takes about 5 billion dollars to sequence a human being the first time. Takes about 3 million dollars the second time. We will have a 1, 000-dollar genome within the next five to eight years. That means each of you will contain on a CD your entire gene code. And it will be really boring. It will read like this. The really neat thing about this stuff is that ’ s life. And Laurie ’ s going to talk about this one a little bit. Because if you happen to find this one inside your body, you ’ re in big trouble, because that ’ s the source code for Ebola. That ’ s one of the deadliest diseases known to humans. But plants work the same way and insects work the same way, and this apple works the same way. This apple is the same thing as this floppy disk. Because this thing codes ones and zeros, and this thing codes A, T, C, Gs, and it sits up there, absorbing energy on a tree, and one fine day it has enough energy to say, execute, and it goes [thump]. Right? And when it does that, pushes a. EXE, what it does is, it executes the first line of code, which reads just like that, AATCAGGGACCC, and that means : make a root. Next line of code : make a stem. Next line of code, TACGGGG : make a flower that ’ s white, that blooms in the spring, that smells like this. In the measure that you have the code and the measure that you read it — and, by the way, the first plant was read two years ago ; the first human was read two years ago ; the first insect was read two years ago. The first thing that we ever read was in 1995 : a little bacteria called Haemophilus influenzae. In the measure that you have the source code, as all of you know, you can change the source code, and you can reprogram life forms so that this little thingy becomes a vaccine, or this little thingy starts producing biomaterials, which is why DuPont is now growing a form of polyester that feels like silk in corn. This changes all rules. This is life, but we ’ re reprogramming it. This is what you look like. This is one of your chromosomes. And what you can do now is, you can outlay exactly what your chromosome is, and what the gene code on that chromosome is right here, and what those genes code for, and what animals they code against, and then you can tie it to the literature. And in the measure that you can do that, you can go home today, and get on the Internet, and access the world ’ s biggest public library, which is a library of life. And you can do some pretty strange things because in the same way as you can reprogram this apple, if you go to Cliff Tabin ’ s lab at the Harvard Medical School, he ’ s reprogramming chicken embryos to grow more wings. Why would Cliff be doing that? He doesn ’ t have a restaurant. The reason why he ’ s reprogramming that animal to have more wings is because when you used to play with lizards as a little child, and you picked up the lizard, sometimes the tail fell off, but it regrew. Not so in human beings : you cut off an arm, you cut off a leg — it doesn ’ t regrow. But because each of your cells contains your entire gene code, each cell can be reprogrammed, if we don ’ t stop stem cell research and if we don ’ t stop genomic research, to express different body functions. And in the measure that we learn how chickens grow wings, and what the program is for those cells to differentiate, one of the things we ’ re going to be able to do is to stop undifferentiated cells, which you know as cancer, and one of the things we ’ re going to learn how to do is how to reprogram cells like stem cells in such a way that they express bone, stomach, skin, pancreas. And you are likely to be wandering around — and your children — on regrown body parts in a reasonable period of time, in some places in the world where they don ’ t stop the research. How ’ s this stuff work? If each of you differs from the person next to you by one in a thousand, but only three percent codes, which means it ’ s only one in a thousand times three percent, very small differences in expression and punctuation can make a significant difference. Take a simple declarative sentence. Right? That ’ s perfectly clear. So, men read that sentence, and they look at that sentence, and they read this. Okay? Now, women look at that sentence and they say, uh-uh, wrong. This is the way it should be seen. That ’ s what your genes are doing. That ’ s why you differ from this person over here by one in a thousand. Right? But, you know, he ’ s reasonably good looking, but... I won ’ t go there. You can do this stuff even without changing the punctuation. You can look at this, right? And they look at the world a little differently. They look at the same world and they say... That ’ s how the same gene code — that ’ s why you have 30, 000 genes, mice have 30, 000 genes, husbands have 30, 000 genes. Mice and men are the same. Wives know that, but anyway. You can make very small changes in gene code and get really different outcomes, even with the same string of letters. That ’ s what your genes are doing every day. That ’ s why sometimes a person ’ s genes don ’ t have to change a lot to get cancer. These little chippies, these things are the size of a credit card. They will test any one of you for 60, 000 genetic conditions. That brings up questions of privacy and insurability and all kinds of stuff, but it also allows us to start going after diseases, because if you run a person who has leukemia through something like this, it turns out that three diseases with completely similar clinical syndromes are completely different diseases. Because in ALL leukemia, that set of genes over there over-expresses. In MLL, it ’ s the middle set of genes, and in AML, it ’ s the bottom set of genes. And if one of those particular things is expressing in your body, then you take Gleevec and you ’ re cured. If it is not expressing in your body, if you don ’ t have one of those types — a particular one of those types — don ’ t take Gleevec. It won ’ t do anything for you. Same thing with Receptin if you ’ ve got breast cancer. Don ’ t have an HER- 2 receptor? Don ’ t take Receptin. Changes the nature of medicine. Changes the predictions of medicine. Changes the way medicine works. The greatest repository of knowledge when most of us went to college was this thing, and it turns out that this is not so important any more. The U. S. Library of Congress, in terms of its printed volume of data, contains less data than is coming out of a good genomics company every month on a compound basis. Let me say that again : A single genomics company generates more data in a month, on a compound basis, than is in the printed collections of the Library of Congress. This is what ’ s been powering the U. S. economy. It ’ s Moore ’ s Law. So, all of you know that the price of computers halves every 18 months and the power doubles, right? Except that when you lay that side by side with the speed with which gene data ’ s being deposited in GenBank, Moore ’ s Law is right here : it ’ s the blue line. This is on a log scale, and that ’ s what superexponential growth means. This is going to push computers to have to grow faster than they ’ ve been growing, because so far, there haven ’ t been applications that have been required that need to go faster than Moore ’ s Law. This stuff does. And here ’ s an interesting map. This is a map which was finished at the Harvard Business School. One of the really interesting questions is, if all this data ’ s free, who ’ s using it? This is the greatest public library in the world. Well, it turns out that there ’ s about 27 trillion bits moving inside from the United States to the United States ; about 4. 6 trillion is going over to those European countries ; about 5. 5 ’ s going to Japan ; there ’ s almost no communication between Japan, and nobody else is literate in this stuff. It ’ s free. No one ’ s reading it. They ’ re focusing on the war ; they ’ re focusing on

Bush ; they ’ re not interested in life. So, this is what a new map of the world looks like. That is the genomically literate world. And that is a problem. In fact, it ’ s not a genomically literate world. You can break this out by states. And you can watch states rise and fall depending on their ability to speak a language of life, and you can watch New York fall off a cliff, and you can watch New Jersey fall off a cliff, and you can watch the rise of the new empires of intelligence. And you can break it out by counties, because it ’ s specific counties. And if you want to get more specific, it ’ s actually specific zip codes. So, you want to know where life is happening? Well, in Southern California it ’ s happening in 92121. And that ’ s it. And that ’ s the triangle between Salk, Scripps, UCSD, and it ’ s called Torrey Pines Road. That means you don ’ t need to be a big nation to be successful ; it means you don ’ t need a lot of people to be successful ; and it means you can move most of the wealth of a country in about three or four carefully picked 747s. Same thing in Massachusetts. Looks more spread out but — oh, by the way, the ones that are the same color are contiguous. What ’ s the net effect of this? In an agricultural society, the difference between the richest and the poorest, the most productive and the least productive, was five to one. Why? Because in agriculture, if you had 10 kids and you grow up a little bit earlier and you work a little bit harder, you could produce about five times more wealth, on average, than your neighbor. In a knowledge society, that number is now 427 to 1. It really matters if you ’ re literate, not just in reading and writing in English and French and German, but in Microsoft and Linux and Apple. And very soon it ’ s going to matter if you ’ re literate in life code. So, if there is something you should fear, it ’ s that you ’ re not keeping your eye on the ball. Because it really matters who speaks life. That ’ s why nations rise and fall. And it turns out that if you went back to the 1870s, the most productive nation on earth was Australia, per person. And New Zealand was way up there. And then the U. S. came in about 1950, and then Switzerland about 1973, and then the U. S. got back on top — beat up their chocolates and cuckoo clocks. And today, of course, you all know that the most productive nation on earth is Luxembourg, producing about one third more wealth per person per year than America. Tiny landlocked state. No oil. No diamonds. No natural resources. Just smart people moving bits. Different rules. Here ’ s differential productivity rates. Here ’ s how many people it takes to produce a single U. S. patent. So, about 3, 000 Americans, 6, 000 Koreans, 14, 000 Brits, 790, 000 Argentines. You want to know why Argentina ’ s crashing? It ’ s got nothing to do with inflation. It ’ s got nothing to do with privatization. You can take a Harvard-educated Ivy League economist, stick him in charge of Argentina. He still crashes the country because he doesn ’ t understand how the rules have changed. Oh, yeah, and it takes about 5. 6 million Indians. Well, watch what happens to India. India and China used to be 40 percent of the global economy just at the Industrial Revolution, and they are now about 4. 8 percent. Two billion people. One third of the global population producing 5 percent of the wealth because they didn ’ t get this change, because they kept treating their people like serfs instead of like shareholders of a common project. They didn ’ t keep the people who were educated. They didn ’ t foment the businesses. They didn ’ t do the IPOs. Silicon Valley did. And that ’ s why they say that Silicon Valley has been powered by ICs. Not integrated circuits : Indians and Chinese. Here ’ s what ’ s happening in the world. It turns out that if you ’ d gone to the U. N. in 1950, when it was founded, there were 50 countries in this world. It turns out there ’ s now about 192. Country after country is splitting, seceding, succeeding, failing — and it ’ s all getting very fragmented. And this has not stopped. In the 1990s, these are sovereign states that did not exist before 1990. And this doesn ’ t include fusions or name changes or changes in flags. We ’ re generating about 3. 12 states per year. People are taking control of their own states, sometimes for the better and sometimes for the worse. And the really interesting thing is, you and your kids are empowered to build great empires, and you don ’ t need a lot to do it. And, given that the music is over, I was going to talk about how you can use this to generate a lot of wealth, and how code works. Moderator : Two minutes. Juan Enriquez : No, I ’ m going to stop there and we ’ ll do it next year because I don ’ t want to take any of Laurie ’ s time. But thank you very much.

I thought in getting up to my TED wish I would try to begin by putting in perspective what I try to do and how it fits with what they try to do. We live in a world that everyone knows is interdependent, but insufficient in three major ways. It is, first of all, profoundly unequal : half the world ’ s people still living on less than two dollars a day ; a billion people with no access to clean water ; two and a half billion no access to sanitation ; a billion going to bed hungry every night ; one in four deaths every year from AIDS, TB, malaria and the variety of infections associated with dirty water — 80 percent of them under five years of age. Even in wealthy countries it is common now to see inequality growing. In the United States, since 2001 we ’ ve had five years of economic growth, five years of productivity growth in the workplace, but median wages are stagnant and the percentage of working families dropping below the poverty line is up by four percent. The percentage of working families without health care up by four percent. So this interdependent world which has been pretty good to most of us — which is why we ’ re all here in Northern California doing what we do for a living, enjoying this evening — is profoundly unequal. It is also unstable. Unstable because of the threats of terror, weapons of mass destruction, the spread of global disease and a sense that we are vulnerable to it in a way that we weren ’ t not so many years ago. And perhaps most important of all, it is unsustainable because of climate change, resource depletion and species destruction. When I think about the world I would like to leave to my daughter and the grandchildren I hope to have, it is a world that moves away from unequal, unstable, unsustainable interdependence to integrated communities — locally, nationally and globally — that share the characteristics of all successful communities : a broadly shared, accessible set of opportunities, a shared sense of responsibility for the success of the common enterprise and a genuine sense of belonging. All easier said than done. When the terrorist incidents occurred in the United Kingdom a couple of years ago, I think even though they didn ’ t claim as many lives as we lost in the United States on 9 / 11, I think the thing that troubled the British most was that the perpetrators were not invaders, but homegrown citizens whose religious and political identities were more important to them than the people they grew up with, went to school with, worked with, shared weekends with, shared meals with. In other words, they thought their differences were more important than their common humanity. It is the central psychological plague of humankind in the 21st century. Into this mix, people like us, who are not in public office, have more power to do good than at any time in history, because more than half the world ’ s people live under governments they voted in and can vote out. And even non-democratic governments are more sensitive to public opinion. Because primarily of the power of the Internet, people of modest means can band together and amass vast sums of money that can change the world for some public good if they all agree. When the tsunami hit South Asia, the United States contributed 1. 2 billion dollars.

30 percent of our households gave. Half of them gave over the Internet. The median contribution was somewhere around 57 dollars. And thirdly, because of the rise of non-governmental organizations. They, businesses, other citizens ’ groups, have enormous power to affect the lives of our fellow human beings. When I became president in 1993, there were none of these organizations in Russia. There are now a couple of hundred thousand. None in India. There are now at least a half a million active. None in China. There are now 250, 000 registered with the government, probably twice again that many who are not registered for political reasons. When I organized my foundation, and I thought about the world as it is and the world that I hope to leave to the next generation, and I tried to be realistic about what I had cared about all my life that I could still have an impact on. I wanted to focus on activities that would help to alleviate poverty, fight disease, combat climate change, bridge the religious, racial and other divides that torment the world, but to do it in a way that would either use whatever particular skills we could put together in our group to change the way some public good function was performed so that it would sweep across the world more. You saw one reference to that in what we were able to do with AIDS drugs. And I want to say that the head of our AIDS effort, and the person who also is primarily active in the wish I ’ ll make tonight, Ira Magaziner, is here with me and I want to thank him for everything he ’ s done. He ’ s over there. When I got out of office and was asked to work, first in the Caribbean, to try to help deal with the AIDS crisis, generic drugs were available for about 500 dollars a person a year. If you bought them in vast bulks, you could get them at a little under 400 dollars. The first country we went to work in, the Bahamas, was paying 3, 500 dollars for these drugs. The market was so terribly disorganized that they were buying this medicine through two agents who were gigging them sevenfold. So the very first week we were working, we got the price down to 500 dollars. And all of a sudden, they could save seven times as many lives for the same amount of money. Then we went to work with the manufacturers of AIDS medicines, one of whom was cited in the film, and negotiated a whole different change in business strategy, because even at 500 dollars, these drugs were being sold on a high- margin, low-volume, uncertain-payment basis. So we worked on improving the productivity of the operations and the supply chain, and went to a low-margin, high-volume, absolutely certain-payment business. I joked that the main contribution we made to the battle against AIDS was to get the manufacturers to change from a jewelry store to a grocery store strategy. But the price went to 140 dollars from 500. And pretty soon, the average price was 192 dollars. Now we can get it for about 100 dollars. Children ’ s medicine was 600 dollars, because nobody could afford to buy any of it. We negotiated it down to 190. Then, the French imposed their brilliantly conceived airline tax to create a something called UNITAID, got a bunch of other countries to help. That children ’ s medicine is now 60 dollars a person a year. The only thing that is keeping us from basically saving the lives of everybody who needs the medicine to stay alive are the absence of systems necessary to diagnose, treat and care for people and deliver this medicine. We started a childhood obesity initiative with the Heart Association in America. We tried to do the same thing by negotiating industry-right deals with the soft drink and the snack food industry to cut the caloric and other dangerous content of food going to our children in the schools. We just reorganized the markets. And it occurred to me that in this whole non-governmental world, somebody needs to be thinking about organizing public goods markets. And that is now what we ’ re trying to do, and working with this large cities group to fight climate change, to negotiate huge, big, volume deals that will enable cities which generate 75 percent of the world ’ s greenhouse gases, to

drastically and quickly reduce greenhouse gas emissions in a way that is good economics. And this whole discussion as if it ’ s some sort of economic burden, is a mystery to me. I think it ’ s a bird ’ s nest on the ground. When Al Gore won his well-deserved Oscar for the”Inconvenient Truth”movie, I was thrilled, but I had urged him to make a second movie quickly. For those of you who saw”An Inconvenient Truth,”the most important slide in the Gore lecture is the last one, which shows here ’ s where greenhouse gases are going if we don ’ t do anything, here ’ s where they could go. And then there are six different categories of things we can do to change the trajectory. We need a movie on those six categories. And all of you need to have it embedded in your brains and to organize yourselves around it. So we ’ re trying to do that. So organizing these markets is one thing we try to do. Now we have taken on a second thing, and this gets to my wish. It has been my experience in working in developing countries that while the headlines may all be — the pessimistic headlines may say, well, we can ’ t do this, that or the other thing because of corruption — I think incapacity is a far bigger problem in poor countries than corruption, and feeds corruption. We now have the money, given these low prices, to distribute AIDS drugs all over the world to people we cannot presently reach. Today these low prices are available in the 25 countries where we work, and in a total of 62 countries, and about 550, 000 people are getting the benefits of them. But the money is there to reach others. The systems are not there to reach the people. So what we have been trying to do, working first in Rwanda and then in Malawi and other places — but I want to talk about Rwanda tonight — is to develop a model for rural health care in a very poor area that can be used to deal with AIDS, TB, malaria, other infectious diseases, maternal and child health, and a whole range of health issues poor people are grappling with in the developing world, that can first be scaled for the whole nation of Rwanda, and then will be a model that could literally be implemented in any other poor country in the world. And the test is : one, will it do the job? Will it provide high quality care? And two, will it do it at a price that will enable the country to sustain a health care system without foreign donors after five to 10 years? Because the longer I deal with these problems, the more convinced I am that we have to — whether it ’ s economics, health, education, whatever — we have to build systems. And the absence of systems that function break the connection which got you all in this seat tonight. You think about whatever your life has been, however many obstacles you have faced in your life, at critical junctures you always knew there was a predictable connection between the effort you exerted and the result you achieved. In a world with no systems, with chaos, everything becomes a guerilla struggle, and this predictability is not there. And it becomes almost impossible to save lives, educate kids, develop economies, whatever. The person, in my view, who has done the best job of this in the health care area, of building a system in a very poor area, is Dr. Paul Farmer, who, many of you know, has worked for now 20 years with his group, Partners in Health, primarily in Haiti where he started, but they ’ ve also worked in Russia, in Peru and other places around the world. As poor as Haiti is, in the area where Farmer ’ s clinic is active — and they serve a catchment area far greater than the medical professionals they have would indicate they could serve — since 1988, they have not lost one person to tuberculosis, not one. And they ’ ve achieved a lot of other amazing health results. So when we decided to work in Rwanda on trying to dramatically increase the income of the country and fight the AIDS problem, we wanted to build a healthcare network, because it had been totally destroyed during the genocide in 1994, and the per capita income was still under a dollar a day. So I rang up, asked Paul Farmer if he would help. Because it seemed to me if we could prove there was a model in Haiti and a model in Rwanda that we could then take all over the country, number one, it would be a wonderful thing for a country that has suffered as much as any on Earth in the last 15 years, and number two, we would have something that could then be adapted to any other poor country anywhere in the world. And so we have set about doing that. Now, we started working together 18 months ago. And we ’ re working in an area called Southern Kayonza, which is one of the poorest areas in Rwanda, with a group that originally includes about 400, 000 people. We ’ re essentially implementing what Paul Farmer did in Haiti : he develops and trains paid community health workers who are able to identify health problems, ensure that people who have AIDS or TB are properly diagnosed and take their medicine regularly, who work on bringing about health education, clean water and sanitation, providing nutritional supplements and moving people up the chain of health care if they have problems of the severity that require it. The procedures that make this work have been perfected, as I said, by Paul Farmer and his team in their work in rural Haiti over the last 20 years. Recently we did an evaluation of the first 18 months of our efforts in Rwanda. And the results were so good that the Rwandan government has now agreed to adopt the model for the entire country, and has strongly supported and put the full resources of the government behind it. I ’ ll tell you a little bit about our team because it ’ s indicative of what we do. We have about 500 people around the world working in our AIDS program, some of them for nothing — just for transportation, room and board. And then we have others working in these other related programs. Our business plan in Rwanda was put together under the leadership of Diana Noble, who is an unusually gifted woman, but not unusual in the type of people who have been willing to do this kind of work. She was the youngest partner at Schroder Ventures in London in her 20s. She was CEO of a successful e-venture — she started and built Reed Elsevier Ventures — and at 45 she decided she wanted to do something different with her life. So she now works full-time on this for very little pay. She and her team of former business people have created a business plan that will enable us to scale this health system up for the whole country. And it would be worthy of the kind of private equity work she used to do when she was making a lot more money for it. When we came to this rural area, 45 percent of the children under the age of five had stunted growth due to malnutrition. 23 percent of them died before they reached the age of five. Mortality at birth was over two-and-a-half percent. Over 15 percent of the deaths among adults and children occurred because of intestinal parasites and diarrhea from dirty water and inadequate sanitation — all entirely preventable and treatable. Over 13 percent of the deaths were from respiratory illnesses — again, all preventable and treatable. And not a single soul in this area was being treated for AIDS or tuberculosis. Within the first 18 months, the following things happened : we went from zero to about 2, 000 people being treated for AIDS. That ’ s 80 percent of the people who need treatment in this area. Listen to this : less than four-tenths of one percent of those being treated stopped taking their medicine or otherwise defaulted on treatment. That ’ s lower than the figure in the United States. Less than three-tenths of one percent had to transfer to the more expensive second- line drugs. 400, 000 pregnant women were brought into counseling and will give birth for the first time within an organized healthcare system. That ’ s about 43 percent of all the pregnancies. About 40 percent of all the people — I said 400, 000. I meant 40, 000. About 40 percent of all the people who need TB treatment are now getting it — in just 18 months, up from zero when we started. 43 percent of the children in need of an infant feeding program to prevent malnutrition and early death are now getting the food supplements they need to stay alive and to grow. We ’ ve started the first malaria treatment programs they ’ ve ever had there. Patients admitted to a hospital that was destroyed during the genocide that we have renovated along with four other clinics, complete with solar power generators, good lab technology. We now are treating 325 people a month, despite the fact that almost 100 percent of the AIDS patients are now treated at home. And the most important thing is because we ’ ve implemented Paul Farmer ’ s model, using community health workers, we estimate that this system could be put into place for all of Rwanda for between five and six percent of GDP, and that the government could sustain that without depending on foreign aid after five or six years. And for those of you who understand healthcare economics you know that all wealthy countries spend between nine and 11 percent of GDP on health care, except for the United States, we spend 16 — but that ’ s a story for another day. We ’ re now working with Partners in Health and the Ministry of Health in Rwanda and our Foundation folks to scale this system up. We ’ re also beginning to do this in Malawi and Lesotho. And we have similar projects in Tanzania, Mozambique, Kenya and Ethiopia with other partners trying to achieve the same thing : to save as many lives as quickly as we can, but to do it in a systematic way that can be implemented nationwide and then with a model that can be implemented in any country in the world. We need initial upfront investment to train doctors, nurses, health administration and community health workers throughout the country, to set up the information technology, the solar energy, the water and sanitation, the transportation infrastructure. But over a five- to 10-year period, we will take down the need for outside assistance and eventually it will be phased out. My wish is that TED assist us in our work and help us to build a high-quality rural health system in a poor country, Rwanda, that can be a model for Africa, and indeed, for any poor country anywhere in the world. My belief is that this will help us to build a more integrated world with more partners and fewer terrorists, with more productive citizens and fewer haters, a place we ’ d all want our kids and our grandchildren to grow up in. It has been an honor for me, particularly, to work in Rwanda where we also have a major economic development project in partnership with Sir Tom Hunter, the Scottish philanthropist, where last year we, using the same thing with AIDS drugs, cut the cost of fertilizer and the interest rates on microcredit loans by 30 percent and achieved three- to four-hundred percent increases in crop yields with the farmers. These people have been through a lot and none of us, most of all me, helped them when they were on the verge of destroying each other. We ’ re undoing that now, and they are so over it and so into their future. We ’ re doing this in an environmentally responsible way. I ’ m doing my best to convince them not to run the electric grid to the 35 percent of the people that have no access, but to do it with clean energy. To have responsible reforestation projects, the Rwandans, interestingly enough, have been quite good, Mr. Wilson, in preserving their topsoil. There ’ s a couple of guys from southern farming families — the first thing I did when I went out to this place was to get down on my hands and knees and dig in the dirt and see what they ’ d done with it. We have a chance here to prove that a country that almost slaughtered itself out of existence can practice reconciliation, reorganize itself, focus on tomorrow and provide comprehensive, quality health care with minimal outside help. I am grateful for this prize, and I will use it to that end. We could use some more help to do this, but think of what it would mean if we could have a world-class health system in Rwanda — in a country with a less-than-one- dollar-a-day-per-capita income, one that could save hundreds of millions of lives over the next decade if applied to every similarly situated country on Earth. It ’ s worth a try and I believe it would succeed. Thank you and God bless you.

Text Sample 965: NEG Dim 6 – 2007 – Score 1.00 – 2007/t000401.txt

So I want to talk to you today about AIDS in sub-Saharan Africa. And this is a pretty well-educated audience, so I imagine you all know something about AIDS. You probably know that roughly 25 million people in Africa are infected with the virus, that AIDS is a disease of poverty, and that if we can bring Africa out of poverty, we would decrease AIDS as well. If you know something more, you probably know that Uganda, to date, is the only country in sub-Saharan Africa that has had success in combating the epidemic. Using a campaign that encouraged people to abstain, be faithful, and use condoms — the ABC campaign — they decreased their prevalence in the 1990s from about 15 percent to 6 percent over just a few years. If you follow policy, you probably know that a few years ago the president pledged 15 billion dollars to fight the epidemic over five years, and a lot of that money is going to go to programs that try to replicate Uganda and use behavior change to encourage people and decrease the epidemic. So today I ’ m going to talk about some things that you might not know about the epidemic, and I ’ m actually also going to challenge some of these things that you think that you do know. To do that I ’ m going to talk about my research as an economist on the epidemic. And I ’ m not really going to talk much about the economy. I ’ m not going to tell you about exports and prices. But I ’ m going to use tools and ideas that are familiar to economists to think about a problem that ’ s more traditionally part of public health and epidemiology. And I think in that sense, this fits really nicely with this lateral thinking idea. Here I ’ m really using the tools of one academic discipline to think about problems of another. So we think, first and foremost, AIDS is a policy issue. And probably for most people in this room, that ’ s how you think about it. But this talk is going to be about understanding facts about the epidemic. It ’ s going to be about thinking about how it evolves, and how people respond to it. I think it may seem like I ’ m ignoring the policy stuff, which is really the most important, but I ’ m hoping that at the end of this talk you will conclude that we actually cannot develop effective policy unless we really understand how the epidemic works. And the first thing that I want to talk about, the first thing I think we need to understand is : how do people respond to the epidemic? So AIDS is a sexually transmitted infection, and it kills you. So this means that in a place with a lot of AIDS, there ’ s a really significant cost of sex. If you ’ re an uninfected man living in Botswana, where the HIV rate is 30 percent, if you have one more partner this year — a long-term partner, girlfriend, mistress — your chance of dying in 10 years increases by three percentage points. That is a huge effect. And so I think that we really feel like then people should have less sex. And in fact among gay men in the US we did see that kind of change in the 1980s. So if we look in this particularly high-risk sample, they ’ re being asked,”Did you have more than one unprotected sexual partner in the last two months?”Over a period from ’ 84 to ’ 88, that share drops from about 85 percent to 55 percent. It ’ s a huge change in a very short period of time. We didn ’ t see anything like that in Africa. So we don ’ t have quite as good data, but you can see here the share of single men having pre-marital sex, or married men having extra-marital sex, and how that changes from the early ’ 90s to late ’ 90s, and late ’ 90s to early 2000s. The epidemic is getting worse. People are learning more things about it. We see almost no change in sexual behavior. These are just tiny decreases — two percentage points — not significant. This seems puzzling. But I ’ m going to argue that you shouldn ’ t be surprised by this, and that to understand this you need to think about health the way than an economist does — as an investment. So if you ’ re a software engineer and you ’ re trying to think about whether to add some new functionality to your program, it ’ s important to think about how much it costs. It ’ s also important to think about what the benefit is. And one part of that benefit is how much longer you think this program is going to be active. If version 10 is coming out next week, there ’ s no point in adding more functionality into version nine. But your health decisions are the same. Every time you have a carrot instead of a cookie, every time you go to the gym instead of going to the movies, that ’ s a costly investment in your health. But how much you want to invest is going to depend on how much longer you expect to live in the future, even if you don ’ t make those investments. AIDS is the same kind of thing. It ’ s costly to avoid AIDS. People really like to have sex. But, you know, it has a benefit in terms of future longevity. But life expectancy in Africa, even without AIDS, is really, really low : 40 or 50 years in a lot of places. I think it ’ s possible, if we think about that intuition, and think about that fact, that maybe that explains some of this low behavior change. But we really need to test that. And a great way to test that is to look across areas in Africa and see : do people with more life expectancy change their sexual behavior more? And the way that I ’ m going to do that is, I ’ m going to look across areas with different levels of malaria. So malaria is a disease that kills you. It ’ s a disease that kills a lot of adults in Africa, in addition to a lot of children. And so people who live in areas with a lot of malaria are going to have lower life expectancy than people who live in areas with limited malaria. So one way to test to see whether we can explain some of this behavior change by differences in life expectancy is to look and see is there more behavior change in areas where there ’ s less malaria. So that ’ s what this figure shows you. This shows you — in areas with low malaria, medium malaria, high malaria — what happens to the number of sexual partners as you increase HIV prevalence. If you look at the blue line, the areas with low levels of malaria, you can see in those areas, actually, the number of sexual partners is decreasing a lot as HIV prevalence goes up. Areas with medium levels of malaria it decreases some — it doesn ’ t decrease as much. And areas with high levels of malaria — actually, it ’ s increasing a little bit, although that ’ s not significant. This is not just through malaria. Young women who live in areas with high maternal mortality change their behavior less in response to HIV than young women who live in areas with low maternal mortality. There ’ s another risk, and they respond less to this existing risk. So by itself, I think this tells a lot about how people behave. It tells us something about why we see limited behavior change in Africa. But it also tells us something about policy. Even if you only cared about AIDS in Africa, it might still be a good idea to invest in malaria, in combating poor indoor air quality, in improving maternal mortality rates. Because if you improve those things, then people are going to have an incentive to avoid AIDS on their own. But it also tells us something about one of these facts that we talked about before. Education campaigns, like the one that the president is focusing on in his funding, may not be enough, at least not alone. If people have no incentive to avoid AIDS on their own, even if they know everything about the disease, they still may not change their behavior. So the other thing that I think we learn here is that AIDS is not going to fix itself. People aren ’ t changing their behavior enough to decrease the growth in the epidemic. So we ’ re going to need to think about policy and what kind of policies might be effective. And a great way to learn about policy is to look at what worked in the past. The reason that we know that the ABC campaign was effective in Uganda is we have good data on prevalence over time. In Uganda we see the prevalence went down. We know they had this campaign. That ’ s how we learn about what works. It ’ s not the only place we had any interventions. Other places have tried things, so why don ’ t we look at those places and see what happened to their prevalence? Unfortunately, there ' s almost no good data on HIV prevalence in the general population in Africa until about 2003. So if I asked you,"Why don ' t you go and find me the prevalence in Burkina Faso in 1991?"You get on Google, you Google, and you find, actually the only people tested in Burkina Faso in 1991 are STD patients and pregnant women, which is not a terribly representative group of people. Then if you poked a little more, you looked a little more at what was going on, you ' d find that actually that was a pretty good year, because in some years the only people tested are IV drug users. But even worse — some years it ' s only IV drug users, some years it ' s only pregnant women. We have no way to figure out what happened over time. We have no consistent testing. Now in the last few years, we actually have done some good testing. In Kenya, in Zambia, and a bunch of countries, there ' s been testing in random samples of the population. But this leaves us with a big gap in our knowledge. So I can tell you what the prevalence was in Kenya in 2003, but I can ' t tell you anything about 1993 or 1983. So this is a problem for policy. It was a problem for my research. And I started thinking about how else might we figure out what the prevalence of HIV was in Africa in the past. And I think that the answer is, we can look at mortality data, and we can use mortality data to figure out what the prevalence was in the past. To do this, we ' re going to have to rely on the fact that AIDS is a very specific kind of disease. It kills people in the prime of their lives. Not a lot of other diseases have that profile. And you can see here — this is a graph of death rates by age in Botswana and Egypt. Botswana is a place with a lot of AIDS, Egypt is a place without a lot of AIDS. And you see they have pretty similar death rates among young kids and old people. That suggests it ' s pretty similar levels of development. But in this middle region, between 20 and 45, the death rates in Botswana are much, much, much higher than in Egypt. But since there are very few other diseases that kill people, we can really attribute that mortality to HIV. But because people who died this year of AIDS got it a few years ago, we can use this data on mortality to figure out what HIV prevalence was in the past. So it turns out, if you use this technique, actually your estimates of prevalence are very close to what we get from testing random samples in the population, but they ' re very, very different than what UNAIDS tells us the prevalences are. So this is a graph of prevalence estimated by UNAIDS, and prevalence based on the mortality data for the years in the late 1990s in nine countries in Africa. You can see, almost without exception, the UNAIDS estimates are much higher than the mortality-based estimates. UNAIDS tell us that the HIV rate in Zambia is 20 percent, and mortality estimates suggest it ' s only about 5 percent. And these are not trivial differences in mortality rates. So this is another way to see this. You can see that for the prevalence to be as high as UNAIDS says, we have to really see 60 deaths per 10, 000 rather than 20 deaths per 10, 000 in this age group. I ' m going to talk a little bit in a minute about how we can use this kind of information to learn something that ' s going to help us think about the world. But this also tells us that one of these facts that I mentioned in the beginning may not be quite right. If you think that 25 million people are infected, if you think that the UNAIDS numbers are much too high, maybe that ' s more like 10 or 15 million. It doesn ' t mean that AIDS isn ' t a problem. It ' s a gigantic problem. But it does suggest that that number might be a little big. What I really want to do, is I want to use this new data to try to figure out what makes the HIV epidemic grow faster or slower. And I said in the beginning, I wasn ' t going to tell you about exports. When I started working on these projects, I was not thinking at all about economics, but eventually it kind of sucks you back in. So I am going to talk about exports and prices. And I want to talk about the relationship between economic activity, in particular export volume, and HIV infections. So obviously, as an economist, I ' m deeply familiar with the fact that development, that openness to trade, is really good for developing countries. It ' s good for improving people ' s lives. But openness and inter-connectedness, it comes with a cost when we think about disease. I don ' t think this should be a surprise. On Wednesday, I learned from Laurie Garrett that I ' m definitely going to get the bird flu, and I wouldn ' t be at all worried about that if we never had any contact with Asia. And HIV is actually particularly closely linked to transit. The epidemic was introduced to the US by actually one male steward on an airline flight, who got the disease in Africa and brought it back. And that was the genesis of the entire epidemic in the US. In Africa, epidemiologists have noted for a long time that truck drivers and migrants are more likely to be infected than other people. Areas with a lot of economic activity — with a lot of roads, with a lot of urbanization — those areas have higher prevalence than others. But that actually doesn ' t mean at all that if we gave people more exports, more trade, that that would increase prevalence. By using this new data, using this information about prevalence over time, we can actually test that. And so it seems to be — fortunately, I think — it seems to be the case that these things are positively related. More exports means more AIDS. And that effect is really big. So the data that I have suggests that if you double export volume, it will lead to a quadrupling of new HIV infections. So this has important implications both for forecasting and for policy. From a forecasting perspective, if we know where trade is likely to change, for example, because of the African Growth and Opportunities Act or other policies that encourage trade, we can actually think about which areas are likely to be heavily infected with HIV. And we can go and we can try to have pre-emptive preventive measures there. Likewise, as we ' re developing policies to try to encourage exports, if we know there ' s this externality — this extra thing that ' s going to happen as we increase exports — we can think about what the right kinds of policies are. But it also tells us something about one of these things that we think that we know. Even though it is the case that poverty is linked to AIDS, in the sense that Africa is poor and they have a lot of AIDS, it ' s not necessarily the case that improving poverty — at least in the short run, that improving exports and improving development — it ' s not necessarily the case that that ' s going to lead to a decline in HIV prevalence. So throughout this talk I ' ve mentioned a few times the special case of Uganda, and the fact that it ' s the only country in sub-Saharan Africa with successful prevention. It ' s been widely heralded. It ' s been replicated in Kenya, and Tanzania, and South Africa and many other places. But now I want to actually also question that. Because it is true that there was a decline in prevalence in Uganda in the 1990s. It ' s true that they had an education campaign. But there was actually something else that happened in Uganda in this period. There was a big decline in coffee prices. Coffee is Uganda ' s major export. Their exports went down a lot in the early 1990s — and actually that decline lines up really, really closely with this decline in new HIV infections. So you can see that both of these series — the black line is export value, the red line is new HIV infections — you can see they ' re both increasing. Starting about 1987 they ' re both going down a lot. And then actually they track each other a little bit on the increase later in the decade. So if you combine the intuition in this figure with some of the data that I talked about before, it suggests that somewhere between 25 percent and 50 percent of the decline in prevalence in Uganda actually would have happened even without any education campaign. But that ' s enormously important for policy. We ' re spending so much money to try to replicate this campaign. And if it was only 50 percent as effective as we think that it was, then there are all sorts of other things maybe we should be spending our money on instead.

Trying to change transmission rates by treating other sexually transmitted diseases. Trying to change them by engaging in male circumcision. There are tons of other things that we should think about doing. And maybe this tells us that we should be thinking more about those things. I hope that in the last 16 minutes I ’ ve told you something that you didn ’ t know about AIDS, and I hope that I ’ ve gotten you questioning a little bit some of the things that you did know. And I hope that I ’ ve convinced you maybe that it ’ s important to understand things about the epidemic in order to think about policy. But more than anything, you know, I ’ m an academic. And when I leave here, I ’ m going to go back and sit in my tiny office, and my computer, and my data. And the thing that ’ s most exciting about that is every time I think about research, there are more questions. There are more things that I think that I want to do. And what ’ s really, really great about being here is I ’ m sure that the questions that you guys have are very, very different than the questions that I think up myself. And I can ’ t wait to hear about what they are. So thank you very much.

So, I kind of believe that we ’ re in like the”cave-painting”era of computer interfaces. Like, they ’ re very kind of â they don ’ t go as deep or as emotionally engaging as they possibly could be and I ’ d like to change all that. Hit me. OK. So I mean, this is the kind of status quo interface, right? It ’ s very flat, kind of rigid. And OK, so you could sex it up and like go to a much more lickable Mac, you know, but really it ’ s the kind of same old crap we ’ ve had for the last, you know, 30 years. Like I think we really put up with a lot of crap with our computers. I mean it ’ s point and click, it ’ s like the menus, icons, it ’ s all the kind of same thing. And so one kind of information space that I take inspiration from is my real desk. It ’ s so much more subtle, so much more visceral â you know, what ’ s visible, what ’ s not. And I ’ d like to bring that experience to the desktop. So I kind of have a â this is BumpTop. It ’ s kind of like a new approach to desktop computing. So you can bump things â they ’ re all physically, you know, manipulable and stuff. And instead of that point and click, it ’ s like a push and pull, things collide as you ’ d expect them. Just like on my real desk, I can â let me just grab these guys â I can turn things into piles instead of just the folders that we have. And once things are in a pile I can browse them by throwing them into a grid, or you know, flip through them like a book or I can lay them out like a deck of cards. When they ’ re laid out, I can pull things to new locations or delete things or just quickly sort a whole pile, you know, just immediately, right? And then, it ’ s all smoothly animated, instead of these jarring changes you see in today ’ s interfaces. Also, if I want to add something to a pile, well, how do I do that? I just toss it to the pile, and it ’ s added right to the top. It ’ s a kind of nice way. Also some of the stuff we can do is, for these individual icons we thought â I mean, how can we play with the idea of an icon, and push that further? And one of the things I can do is make it bigger if I want to emphasize it and make it more important. But what ’ s really cool is that since there ’ s a physics simulation running under this, it ’ s actually heavier. So the lighter stuff doesn ’ t really move but if I throw it at the lighter guys, right? So it ’ s cute, but it ’ s also like a subtle channel of conveying information, right? This is heavy so it feels more important. So it ’ s kind of cool. Despite computers everywhere paper really hasn ’ t disappeared, because it has a lot of, I think, valuable properties. And some of those we wanted to transfer to the icons in our system. So one of the things you can do to our icons, just like paper, is crease them and fold them, just like paper. Remember, you know, something for later. Or if you want to be destructive, you can just crumple it up and, you know, toss it to the corner. Also just like paper, around our workspace we ’ ll pin things up to the wall to remember them later, and I can do the same thing here, and you know, you ’ ll see post-it notes and things like that around people ’ s offices. And I can pull them off when I want to work with them. So, one of the criticisms of this kind of approach to organization is that, you know,”Okay, well my real desk is really messy. I don ’ t want that mess on my computer.”So one thing we have for that is like a grid align, kind of â so you get that more traditional desktop. Things are kind of grid aligned. More boring, but you still have that kind of colliding and bumping. And you can still do fun things like make shelves on your desktop. Let ’ s just break this shelf. Okay, that shelf broke. I think beyond the icons, I think another really cool domain for this software â I think it applies to more than just icons and your desktop â but browsing photographs. I think you can really enrich the way we browse our photographs and bring it to that kind of shoebox of, you know, photos with your family on the kitchen table kind of thing. I can toss these things around. They ’ re so much more tangible and touchable â and you know I can double-click on something to take a look at it. And I can do all that kind of same stuff I showed you before. So I can pile things up, I can flip through it, I can, you know â okay, let ’ s move this photo to the back, let ’ s delete this guy here, and I think it ’ s just a much more rich kind of way of interacting with your information. And that ’ s BumpTop. Thanks!

Sheryl Shade : Hi, Aimee. Aimee Mullins : Hi. SS : Aimee and I thought we ’ d just talk a little bit, and I wanted her to tell all of you what makes her a distinctive athlete. AM : Well, for those of you who have seen the picture in the little bio â it might have given it away â I ’ m a double amputee, and I was born without fibulas in both legs. I was amputated at age one, and I ’ ve been running like hell ever since, all over the place. SS : Well, why don ’ t you tell them how you got to Georgetown â why don ’ t we start there? Why don ’ t we start there? AM : I ’ m a senior in Georgetown in the Foreign Service program. I won a full academic scholarship out of high school. They pick three students out of the nation every year to get involved in international affairs, and so I won a full ride to Georgetown and I ’ ve been there for four years. Love it. SS : When Aimee got there, she decided that she ’ s, kind of, curious about track and field, so she decided to call someone and start asking about it. So, why don ’ t you tell that story? AM : Yeah. Well, I guess I ’ ve always been involved in sports. I played softball for five years growing up. I skied competitively throughout high school, and I got a little restless in college because I wasn ’ t doing anything for about a year or two sports-wise. And I ’ d never competed on a disabled level, you know â I ’ d always competed against other able-bodied athletes. That ’ s all I ’ d ever known. In fact, I ’ d never even met another amputee until I was 17. And I heard that they do these track meets with all disabled runners, and I figured,”Oh, I don ’ t know about this, but before I judge it, let me go see what it ’ s all about.”So, I booked myself a flight to Boston in ’ 95, 19 years old and definitely the dark horse candidate at this race. I ’ d never done it before. I went out on a gravel track a couple of weeks before this meet to see how far I could run, and about 50 meters was enough for me, panting and heaving. And I had these legs that were made of a wood and plastic compound, attached with Velcro straps â big, thick, five-ply wool socks on â you know, not the most comfortable things, but all I ’ d ever known. And I ’ m up there in Boston against people wearing legs made of all things â carbon graphite and, you know, shock absorbers in them and all sorts of things â and they ’ re all looking at me like, OK, we know who ’ s not going to win this race. And, I mean, I went up there expecting â I don ’ t know what I was expecting â but, you know, when I saw a man who was missing an entire leg go up to the high jump, hop on one leg to the high jump and clear it at six feet, two inches... Dan O ’ Brien jumped 5 ’ 11”in ’ 96 in Atlanta, I mean, if it just gives you a comparison of â these are truly accomplished athletes, without qualifying that word”athlete.”And so I decided to give this a shot : heart pounding, I ran my first race and I beat the national record-holder by three hundredths of a second, and became the new national record-holder on my first try out. And, you know, people said,”Aimee, you know, you ’ ve got speed â you ’ ve got natural speed â but you don ’ t have any skill or finesse going down that track. You were all over the place. We all saw how hard you were working.”And so I decided to call the track coach at Georgetown. And I thank god I didn ’ t know just how huge this man is in the track and field world. He ’ s coached five Olympians, and the man ’ s office is lined from floor to ceiling with All America certificates of all these athletes he ’ s coached. He ’ s just a rather intimidating figure. And I called him up and said,”Listen, I ran one race and I won...””I want to see if I can, you know â I need to just see if I can sit in on some of your practices, see what drills you do and whatever.”That ’ s all I wanted â just two practices.”Can I just sit in and see what you do?”And he said,”Well, we should meet first, before we decide anything.”You know, he ’ s thinking,”What am I getting myself into?”So, I met the man, walked in his office, and saw these posters and magazine covers of people he has coached. And we got to talking, and it turned out to be a great partnership because he ’ d never coached a disabled athlete, so therefore he had no preconceived notions of what I was or wasn ’ t capable of, and I ’ d never been coached before. So this was like,”Here we go â let ’ s start on this trip.”So he started giving me four days a week of his lunch break, his free time, and I would come up to the track and train with him. So that ’ s how I met Frank. That was fall of ’ 95. But then, by the time that winter was rolling around, he said,”You know, you ’ re good enough. You can run on our women ’ s track team here.”And I said,”No, come on.”And he said,”No, no, really. You can. You can run with our women ’ s track team.”In the spring of 1996, with my goal of making the U. S. Paralympic team that May coming up full speed, I joined the women ’ s track team. And no disabled person had ever done that â run at a collegiate level. So I don ’ t know, it started to become an interesting mix. SS : Well, on your way to the Olympics, a couple of memorable events happened at Georgetown. Why don ’ t you just tell them? AM : Yes, well, you know, I ’ d won everything as far as the disabled meets â everything I competed in â and, you know, training in Georgetown and knowing that I was going to have to get used to seeing the backs of all these women ’ s shirts â you know, I ’ m running against the next Flo-Jo â and they ’ re all looking at me like,”Hmm, what ’ s, you know, what ’ s going on here?”And putting on my Georgetown uniform and going out there and knowing that, you know, in order to become better â and I ’ m already the best in the country â you know, you have to train with people who are inherently better than you. And I went out there and made it to the Big East, which was sort of the championship race at the end of the season. It was really, really hot. And it ’ s the first â I had just gotten these new sprinting legs that you see in that bio, and I didn ’ t realize at that time that the amount of sweating I would be doing in the sock â it actually acted like a lubricant and I ’ d be, kind of, pistoning in the socket. And at about 85 meters of my 100 meters sprint, in all my glory, I came out of my leg. Like, I almost came out of it, in front of, like, 5, 000 people. And I, I mean, was just mortified â because I was signed up for the 200, you know, which went off in a half hour. I went to my coach :”Please, don ’ t make me do this.”I can ’ t do this in front of all those people. My legs will come off. And if it came off at 85 there ’ s no way I ’ m going 200 meters. And he just sat there like this. My pleas fell on deaf ears, thank god. Because you know, the man is from Brooklyn ; he ’ s a big man. He says,”Aimee, so what if your leg falls off? You pick it up, you put the damn thing back on, and finish the goddamn race!”And I did. So, he kept me in line. He kept me on the right track. SS : So, then Aimee makes it to the 1996 Paralympics, and she ’ s all excited. Her family ’ s coming down â it ’ s a big deal. It ’ s now two years that you ’ ve been running? AM : No, a year. SS : A year. And why don ’ t you tell them what happened right before you go run your race? AM : Okay, well, Atlanta. The Paralympics, just for a little bit of clarification, are the Olympics for people with physical disabilities â amputees, persons with cerebral palsy, and wheelchair athletes â as opposed to the Special Olympics, which deals with people with mental disabilities. So, here we are, a week after the Olympics and down at Atlanta, and I ’ m just blown away by the fact that just a year ago, I got out on a gravel track and couldn ’ t run 50 meters. And so, here I am â never lost. I set new records at the U. S. Nationals â the Olympic trials â that May, and was sure that I was coming home with the gold. I was also the only, what they call”bilateral BK”â below the knee. I was the only woman who would be doing the long jump. I had just done the long jump, and a guy who was missing two legs came up to me and says,”How do you do that? You know, we ’ re supposed to have a planar foot, so we can ’ t get off on the springboard.”I said,”Well, I just did it. No one told me that.”So, it ’ s funny â I ’ m three inches within the world record â and kept on from that point, you know, so I ’ m signed up in the long jump â signed up? No, I made it for the long jump and the 100-meter. And I ’ m sure of it, you know? I made the front page of my hometown paper that I delivered for six years, you know? It was, like, this is my time for shine. And we ’ re at the trainee warm-up track, which is a few blocks away from the Olympic stadium. These legs that I was on, which I ’ ll take out right now â I was the first person in the world on these legs. I was the guinea pig., I ’ m telling you, this was, like â talk about a tourist attraction. Everyone was taking pictures â”What is this girl running on?”And I ’ m always looking around, like, where is my competition? It ’ s my first international meet. I tried to get it out of anybody I could, you know,”Who am I running against here?””Oh, Aimee, we ’ ll have to get back to you on that one.”I wanted to find out times.”Don ’ t worry, you ’ re doing great.”This is 20 minutes before my race in the Olympic stadium, and they post the heat sheets. And I go over and look. And my fastest time, which was the world record, was 15. 77. Then I ’ m looking : the next lane, lane two, is 12. 8. Lane three is 12. 5. Lane four is 12. 2. I said,”What ’ s going on?”And they shove us all into the shuttle bus, and all the women there are missing a hand. So, I ’ m just, like â they ’ re all looking at me like ’ which one of these is not like the other, ’ you know? I ’ m sitting there, like,”Oh, my god. Oh, my god.”You know, I ’ d never lost anything, like, whether it would be the scholarship or, you know, I ’ d won five golds when I skied. In everything, I came in first. And Georgetown â that was great. I was losing, but it was the best training because this was Atlanta. Here we are, like, crĂ¨me de la crĂ¨me, and there is no doubt about it, that I ’ m going to lose big. And, you know, I ’ m just thinking,”Oh, my god, my whole family got in a van and drove down here from Pennsylvania.”And, you know, I was the only female U. S. sprinter. So they call us out and, you know â”Ladies, you have one minute.”And I remember putting my blocks in and just feeling horrified because there was just this murmur coming over the crowd, like, the ones who are close enough to the starting line to see. And I ’ m like,”I know! Look! This isn ’ t right.”And I ’ m thinking that ’ s my last card to play here ; if I ’ m not going to beat these girls, I ’ m going to mess their heads a little, you know? I mean, it was definitely the”Rocky IV”sensation of me versus Germany, and everyone else â Estonia and Poland â was in this heat. And the gun went off, and all I remember was finishing last and fighting back tears of frustration and incredible â incredible â this feeling of just being overwhelmed. And I had to think,”Why did I do this?”If I had won everything â but it was like, what was the point? All this training â I had transformed my life. I became a collegiate athlete, you know. I became an Olympic athlete. And it made me really think about how the achievement was getting there. I mean, the fact that I set my sights, just a year and three months before, on becoming an Olympic athlete and saying,”Here ’ s my life going in this direction â and I want to take it here for a while, and just seeing how far I could push it.”And the fact that I asked for help â how many people jumped on board? How many people gave of their time and their expertise, and their patience, to deal with me? And that was this collective glory â that there was, you know, 50 people behind me that had joined in this incredible experience of going to Atlanta. So, I apply this sort of philosophy now to everything I do : sitting back and realizing the progression, how far you ’ ve come at this day to this goal, you know. It ’ s important to focus on a goal, I think, but also recognize the progression on the way there and how you ’ ve grown as a person. That ’ s the achievement, I think. That ’ s the real achievement. SS : Why don ’ t you show them your legs? AM : Oh, sure. SS : You know, show us more than one set of legs. AM : Well, these are my pretty legs. No, these are my cosmetic legs, actually, and they ’ re absolutely beautiful. You ’ ve got to come up and see them. There are hair follicles on them, and I can paint my toenails. And, seriously, like, I can wear heels. Like, you guys don ’ t understand what that ’ s like to be able to just go into a shoe store and buy whatever you want. SS : You got to pick your height? AM : I got to pick my height, exactly. Patrick Ewing, who played for Georgetown in the ’ 80s, comes back every summer. And I had incessant fun making fun of him in the training room because he ’ d come in with foot injuries. I ’ m like,”Get it off! Don ’ t worry about it, you know. You can be eight feet tall. Just take them off.”He didn ’ t find it as humorous as I did, anyway. OK, now, these are my sprinting legs, made of carbon graphite, like I said, and I ’ ve got to make sure I ’ ve got the right socket. No, I ’ ve got so many legs in here. These are â do you want to hold that actually? That ’ s another leg I have for, like, tennis and softball. It has a shock absorber in it so it, like,”Shhhh,”makes this neat sound when you jump around on it. All right. And then this is the silicon sheath I roll over, to keep it on. Which, when I sweat, you know, I ’ m pistoning out of it. SS : Are you a different height? AM : In these? SS : In these. AM : I don ’ t know. I don ’ t think so. I may be a little taller. I actually can put both of them on. SS : She can ’ t really stand on these legs. She has to be moving, so... AM : Yeah, I definitely have to be moving, and balance is a little bit of an art in them. But without having the silicon sock, I ’ m just going to try slip in it. And so, I run on these, and have shocked half the world on these. These are supposed to simulate the actual form of a sprinter when they run. If you ever watch a sprinter, the ball of their foot is the only thing that ever hits the track. So when I stand in these legs, my hamstring and my glutes are contracted, as they would be had I had feet and were standing on the ball of my feet. AM : It ’ s a company in San Diego called Flex-Foot. And I was a guinea pig, as I hope to continue to be in every new form of prosthetic limbs that come out. But actually these, like I said, are still the actual prototype. I need to get some new ones because the last meet

I was at, they were everywhere. You know, it ’ s like a big â it ’ s come full circle. Moderator : Aimee and the designer of them will be at TEDMED 2, and we ’ ll talk about the design of them. AM : Yes, we ’ ll do that. SS : Yes, there you go. AM : So, these are the sprint legs, and I can put my other... SS : Can you tell about who designed your other legs? AM : Yes. These I got in a place called Bournemouth, England, about two hours south of London, and I ’ m the only person in the United States with these, which is a crime because they are so beautiful. And I don ’ t even mean, like, because of the toes and everything. For me, while I ’ m such a serious athlete on the track, I want to be feminine off the track, and I think it ’ s so important not to be limited in any capacity, whether it ’ s, you know, your mobility or even fashion. I mean, I love the fact that I can go in anywhere and pick out what I want â the shoes I want, the skirts I want â and I ’ m hoping to try to bring these over here and make them accessible to a lot of people. They ’ re also silicon. This is a really basic, basic prosthetic limb under here. It ’ s like a Barbie foot under this. It is. It ’ s just stuck in this position, so I have to wear a two-inch heel. And, I mean, it ’ s really â let me take this off so you can see it. I don ’ t know how good you can see it, but, like, it really is. There ’ re veins on the feet, and then my heel is pink, and my Achilles ’ tendon â that moves a little bit. And it ’ s really an amazing store. I got them a year and two weeks ago. And this is just a silicon piece of skin. I mean, what happened was, two years ago this man in Belgium was saying,”God, if I can go to Madame Tussauds ’ wax museum and see Jerry Hall replicated down to the color of her eyes, looking so real as if she breathed, why can ’ t they build a limb for someone that looks like a leg, or an arm, or a hand?”I mean, they make ears for burn victims. They do amazing stuff with silicon. SS : Two weeks ago, Aimee was up for the Arthur Ashe award at the ESPYs. And she came into town and she rushed around and she said,”I have to buy some new shoes!”We ’ re an hour before the ESPYs, and she thought she ’ d gotten a two-inch heel but she ’ d actually bought a three-inch heel. AM : And this poses a problem for me, because it means I ’ m walking like that all night long. SS : For 45 minutes. Luckily, the hotel was terrific. They got someone to come in and saw off the shoes. AM : I said to the receptionist â I mean, I am just harried, and Sheryl ’ s at my side â I said,”Look, do you have anybody here who could help me? Because I have this problem...”You know, at first they were just going to write me off, like,”If you don ’ t like your shoes, sorry. It ’ s too late.””No, no, no, no. I ’ ve got these special feet that need a two-inch heel. I have a three-inch heel. I need a little bit off.”They didn ’ t even want to go there. They didn ’ t even want to touch that one. They just did it. No, these legs are great. I ’ m actually going back in a couple of weeks to get some improvements. I want to get legs like these made for flat feet so I can wear sneakers, because I can ’ t with these ones. So... Moderator : That ’ s it. SS : That ’ s Aimee Mullins.

As a clergyman, you can imagine how out of place I feel. I feel like a fish out of water, or maybe an owl out of the air. I was preaching in San Jose some time ago, and my friend Mark Kvamme, who helped introduce me to this conference, brought several CEOs and leaders of some of the companies here in the Silicon Valley to have breakfast with me, or I with them. And I was so stimulated. And had such — it was an eye-opening experience to hear them talk about the world that is yet to come through technology and science. I know that we ’ re near the end of this conference, and some of you may be wondering why they have a speaker from the field of religion. Richard can answer that, because he made that decision. But some years ago I was on an elevator in Philadelphia, coming down. I was to address a conference at a hotel. And on that elevator a man said,"I hear Billy Graham is staying in this hotel."And another man looked in my direction and said,"Yes, there he is. He ' s on this elevator with us."And this man looked me up and down for about 10 seconds, and he said,"My, what an anticlimax!"I hope that you won ' t feel that these few moments with me is not a — is an anticlimax, after all these tremendous talks that you ' ve heard, and addresses, which I intend to listen to every one of them. But I was on an airplane in the east some years ago, and the man sitting across the aisle from me was the mayor of Charlotte, North Carolina. His name was John Belk. Some of you will probably know him. And there was a drunk man on there, and he got up out of his seat two or three times, and he was making everybody upset by what he was trying to do. And he was slapping the stewardess and pinching her as she went by, and everybody was upset with him. And finally, John Belk said,"Do you know who ' s sitting here?"And the man said,"No, who?"He said,"It ' s Billy Graham, the preacher."He said,"You don ' t say!"And he turned to me, and he said,"Put her there!"He said,"Your sermons have certainly helped me."And I suppose that that ' s true with thousands of people. I know that as you have been peering into the future, and as we ' ve heard some of it here tonight, I would like to live in that age and see what is going to be. But I won ' t, because I ' m 80 years old. This is my eightieth year, and I know that my time is brief. I have phlebitis at the moment, in both legs, and that ' s the reason that I had to have a little help in getting up here, because I have Parkinson ' s disease in addition to that, and some other problems that I won ' t talk about. But this is not the first time that we ' ve had a technological revolution. We ' ve had others. And there ' s one that I want to talk about. In one generation, the nation of the people of Israel had a tremendous and dramatic change that made them a great power in the Near East. A man by the name of David came to the throne, and King David became one of the great leaders of his generation. He was a man of tremendous leadership. He had the favor of God with him. He was a brilliant poet, philosopher, writer, soldier — with strategies in battle and conflict that people study even today. But about two centuries before David, the Hittites had discovered the secret of smelting and processing of iron, and, slowly, that skill spread. But they wouldn ' t allow the Israelis to look into it, or to have any. But David changed all of that, and he introduced the Iron Age to Israel. And the Bible says that David laid up great stores of iron, and which archaeologists have found, that in present-day Palestine, there are evidences of that generation. Now, instead of crude tools made of sticks and stones, Israel now had iron plows, and sickles, and hoes and military weapons. And in the course of one generation, Israel was completely changed. The introduction of iron, in some ways, had an impact a little bit like the microchip has had on our generation. And David found that there were many problems that technology could not solve. There were many problems still left. And they ' re still with us, and you haven ' t solved them, and I haven ' t heard anybody here speak to that. How do we solve these three problems that I ' d like to mention? The first one that David saw was human evil. Where does it come from? How do we solve it? Over again and again in the Psalms, which Gladstone said was the greatest book in the world, David describes the evils of the human race. And yet he says,"He restores my soul."Have you ever thought about what a contradiction we are? On one hand, we can probe the deepest secrets of the universe and dramatically push back the frontiers of technology, as this conference vividly demonstrates. We ' ve seen under the sea, three miles down, or galaxies hundreds of billions of years out in the future. But on the other hand, something is wrong. Our battleships, our soldiers, are on a frontier now, almost ready to go to war with Iraq. Now, what causes this? Why do we have these wars in every generation, and in every part of the world? And revolutions? We can ’ t get along with other people, even in our own families. We find ourselves in the paralyzing grip of self-destructive habits we can ’ t break. Racism and injustice and violence sweep our world, bringing a tragic harvest of heartache and death. Even the most sophisticated among us seem powerless to break this cycle. I would like to see Oracle take up that, or some other technological geniuses work on this. How do we change man, so that he doesn ’ t lie and cheat, and our newspapers are not filled with stories of fraud in business or labor or athletics or wherever? The Bible says the problem is within us, within our hearts and our souls. Our problem is that we are separated from our Creator, which we call God, and we need to have our souls restored, something only God can do. Jesus said,”For out of the heart come evil thoughts : murders, sexual immorality, theft, false testimonies, slander.”The British philosopher Bertrand Russell was not a religious man, but he said,”It ’ s in our hearts that the evil lies, and it ’ s from our hearts that it must be plucked out.”Albert Einstein — I was just talking to someone, when I was speaking at Princeton, and I met Mr. Einstein. He didn ’ t have a doctor ’ s degree, because he said nobody was qualified to give him one. But he made this statement. He said,”It ’ s easier to denature plutonium than to denature the evil spirit of man.”And many of you, I ’ m sure, have thought about that and puzzled over it. You ’ ve seen people take beneficial technological advances, such as the Internet we ’ ve heard about tonight, and twist them into something corrupting. You ’ ve seen brilliant people devise computer viruses that bring down whole systems. The Oklahoma City bombing was simple technology, horribly used. The problem is not technology. The problem is the person or persons using it. King David said that he knew the depths of his own soul. He couldn ’ t free himself from personal problems and personal evils that included murder and adultery. Yet King David sought God ’ s forgiveness, and said,”You can restore my soul.”You see, the Bible teaches that we ’ re more than a body and a mind. We are a soul. And there ’ s something inside of us that is beyond our understanding. That ’ s the part of us that yearns for God, or something more than we find in technology. Your soul is that part of you that yearns for meaning in life, and which seeks for something beyond this life. It ’ s the part of you that yearns, really, for God. I find [that] young people all over the world are searching for something. They don ’ t know what it is. I speak at many universities, and I have many questions and answer periods, and whether it ’ s Cambridge, or Harvard, or Oxford — I ’ ve spoken at all of those universities. I ’ m going to Harvard in about three or four — no, it ’ s about two months from now — to give a lecture. And I ’ ll be asked the same questions that I was asked the last few times I ’ ve been there. And it ’ ll be on these questions : where did I come from? Why am I here? Where am I going? What ’ s life all about? Why am I here? Even if you have no religious belief, there are times when you wonder that there ’ s something else. Thomas Edison also said,”When you see everything that happens in the world of science, and in the working of the universe, you cannot deny that there ’ s a captain on the bridge.”I remember once, I sat beside Mrs. Gorbachev at a White House dinner. I went to Ambassador Dobrynin, whom I knew very well. And I ’ d been to Russia several times under the Communists, and they ’ d given me marvelous freedom that I didn ’ t expect. And I knew Mr. Dobrynin very well, and I said,”I ’ m going to sit beside Mrs. Gorbachev tonight. What shall I talk to her about?”And he surprised me with the answer. He said,”Talk to her about religion and philosophy. That ’ s what she ’ s really interested in.”I was a little bit surprised, but that evening that ’ s what we talked about, and it was a stimulating conversation. And afterward, she said,”You know, I ’ m an atheist, but I know that there ’ s something up there higher than we are.”The second problem that King David realized he could not solve was the problem of human suffering. Writing the oldest book in the world was Job, and he said,”Man is born unto trouble as the sparks fly upward.”Yes, to be sure, science has done much to push back certain types of human suffering. But I ’ m — in a few months, I ’ ll be 80 years of age. I admit that I ’ m very grateful for all the medical advances that have kept me in relatively good health all these years. My doctors at the Mayo Clinic urged me not to take this trip out here to this — to be here. I haven ’ t given a talk in nearly four months. And when you speak as much as I do, three or four times a day, you get rusty. That ’ s the reason I ’ m using this podium and using these notes. Every time you ever hear me on the television or somewhere, I ’ m ad-libbing. I ’ m not reading. I never read an address. I never read a speech or a talk or a lecture. I talk ad lib. But tonight, I ’ ve got some notes here so that if I begin to forget, which I do sometimes, I ’ ve got something I can turn to. But even here among us, most — in the most advanced society in the world, we have poverty. We have families that self-destruct, friends that betray us. Unbearable psychological pressures bear down on us. I ’ ve never met a person in the world that didn ’ t have a problem or a worry. Why do we suffer? It ’ s an age- old question that we haven ’ t answered. Yet David again and again said that he would turn to God. He said,”The Lord is my shepherd.”The final problem that David knew he could not solve was death. Many commentators have said that death is the forbidden subject of our generation. Most people live as if they ’ re never going to die. Technology projects the myth of control over our mortality. We see people on our screens. Marilyn Monroe is just as beautiful on the screen as she was in person, and our — many young people think she ’ s still alive. They don ’ t know that she ’ s dead. Or Clark Gable, or whoever it is. The old stars, they come to life. And they ’ re — they ’ re just as great on that screen as they were in person. But death is inevitable. I spoke some time ago to a joint session of Congress, last year. And we were meeting in that room, the statue room. About 300 of them were there. And I said,”There ’ s one thing that we have in common in this room, all of us together, whether Republican or Democrat, or whoever.”I said,”We ’ re all going to die. And we have that in common with all these great men of the past that are staring down at us.”And it ’ s often difficult for young people to understand that. It ’ s difficult for them to understand that they ’ re going to die. As the ancient writer of Ecclesiastes wrote, he said, there ’ s every activity under heaven. There ’ s a time to be born, and there ’ s a time to die. I ’ ve stood at the deathbed of several famous people, whom you would know. I ’ ve talked to them. I ’ ve seen them in those agonizing moments when they were scared to death. And yet, a few years earlier, death never crossed their mind. I talked to a woman this past week whose father was a famous doctor. She said he never thought of God, never talked about God, didn ’ t believe in God. He was an atheist. But she said, as he came to die, he sat up on the side of the bed one day, and he asked the nurse if he could see the chaplain. And he said, for the first time in his life he ’ d thought about the inevitable, and about God. Was there a God? A few years ago, a university student asked me,”What is the greatest surprise in your life?”And I said,”The greatest surprise in my life is the brevity of life. It passes so fast.”But it does not need to have to be that way. Wernher von Braun, in the aftermath of World War II concluded, quote :”science and religion are not antagonists. On the contrary, they ’ re sisters.”He put it on a personal basis. I knew Dr. von Braun very well. And he said,”Speaking for myself, I can only say that the grandeur of the cosmos serves only to confirm a belief in the certainty of a creator.”He also said,”In our search to know God, I ’ ve come to believe that the life of Jesus Christ should be the focus of our efforts and inspiration. The reality of this life and His resurrection is the hope of mankind.”I ’ ve done a lot of speaking in Germany and in France, and in different parts of the world — 105 countries it ’ s been my privilege to speak in. And I was invited one day to visit Chancellor Adenauer, who was looked upon as sort of the founder of modern Germany, since the war. And he once — and he said to me, he said,”Young man.”He said,”Do you believe in the resurrection of Jesus Christ?”And I said,”Sir, I do.”He said,”So do I.”He said,”When I leave office, I ’ m going to spend my time writing a book on why Jesus Christ rose again, and why it ’ s so important to believe that.”In one of his plays, Alexander Solzhenitsyn depicts a man dying, who says to those gathered around his bed,”The moment when it ’ s terrible to feel regret is when one is dying.”How should one live in order not to feel regret when one is dying? Blaise Pascal asked exactly that question in seventeenth-century France. Pascal has been called the architect of modern civilization. He was a brilliant scientist at the frontiers of mathematics, even as a teenager. He is viewed by many as the founder of the probability theory, and a creator of the first model of a computer. And of course, you are all familiar with the computer language named for him. Pascal explored in depth our human dilemmas of evil, suffering and death. He was astounded at the phenomenon we ’ ve been considering : that people can achieve extraordinary heights in science, the arts and human enterprise, yet they also are full of anger, hypocrisy and have — and self- hatreds. Pascal saw us as a remarkable mixture of genius and self-delusion. On November 23, 1654, Pascal had a profound religious experience. He wrote in his journal these words :”I submit myself, absolutely, to Jesus Christ, my redeemer.”A French historian said, two centuries later,”Seldom has so mighty an intellect submitted with such humility to the authority of Jesus Christ.”Pascal came to believe not only the love and the grace of God could bring us back into harmony, but he believed that his own sins and failures could be forgiven, and that when he died he would go to a place called heaven. He experienced it in a way that went beyond scientific observation and reason. It was he who penned the well-known words,”The heart has its reasons, which reason knows not of.”Equally well known is Pascal ’ s Wager. Essentially, he said this :”if you bet on God, and open yourself to his love, you lose nothing, even if you ’ re wrong. But if instead you bet that there is no God, then you can lose it all, in this life and the life to come.”For Pascal, scientific knowledge paled beside the knowledge of God. The knowledge of God was far beyond anything that ever crossed his mind. He was ready to face him when he died at the age of 39. King David lived to be 70, a long time in his era. Yet he too had to face death, and he wrote these words :”even though I walk through the valley of the shadow of death, I will fear no evil, for you are with me.”This was David ’ s answer to three dilemmas of evil, suffering and death. It can be yours, as well, as you seek the living God and allow him to fill your life and give you hope for the future. When I was 17 years of age, I was born and reared on a farm in North Carolina. I milked cows every morning, and I had to milk the same cows every evening when I came home from school. And there were 20 of them that I had — that I was responsible for, and I worked on the farm and tried to keep up with my studies. I didn ’ t make good grades in high school. I didn ’ t make them in college, until something happened in my heart. One day, I was faced face-to-face with Christ. He said,”I am the way, the truth and the life.”Can you imagine that?”I am the truth. I ’ m the embodiment of all truth.”He was a liar. Or he was insane. Or he was what he claimed to be. Which was he? I had to make that decision. I couldn ’ t prove it. I couldn ’ t take it to a laboratory and experiment with it. But by faith I said, I believe him, and he came into my heart and changed my life. And now I ’ m ready, when I hear that call, to go into the presence of God. Thank you, and God bless all of you. Thank you for the privilege. It was great. Richard Wurman : You did it. Thanks.

’ Theme and variations ’ is one of those forms that require a certain kind of intellectual activity, because you are always comparing the variation with the theme that you hold in your mind. You might say that the theme is nature and everything that follows is a variation on the subject. I was asked, I guess about six years ago, to do a series of paintings that in some way would celebrate the birth of Piero della Francesca. And it was very difficult for me to imagine how to paint pictures that were based on Piero until I realized that I could look at Piero as nature — that I would have the same attitude towards looking at Piero della Francesca as I would if I were looking out a window at a tree. And that was enormously liberating to me. Perhaps it ’ s not a very insightful observation, but that really started me on a path to be able to do a kind of theme and variations based on a work by Piero, in this case that remarkable painting that ’ s in the Uffizi,”The Duke of Montefeltro,”who faces his consort, Battista. Once I realized that I could take some liberties with the subject, I did the following series of drawings. That ’ s the real Piero della Francesca — one of the greatest portraits in human history. And these, I ’ ll just show these without comment. It ’ s just a series of variations on the head of the Duke of Montefeltro, who ’ s a great, great figure in the Renaissance, and probably the basis for Machiavelli ’ s”The Prince.”He apparently lost an eye in battle, which is why he is always shown in profile. And this is Battista. And then I decided I could move them around a little bit — so that for the first time in history, they ’ re facing the same direction. Whoops! Passed each other. And then a visitor from another painting by Piero, this is from”The Resurrection of Christ”— as though the cast had just gotten of the set to have a chat. And now, four large panels : this is upper left ; upper right ; lower left ; lower right. Incidentally, I ’ ve never understood the conflict between abstraction and naturalism. Since all paintings are inherently abstract to begin with there doesn ’ t seem to be an argument there. On another subject — — I was driving in the country one day with my wife, and I saw this sign, and I said,”That is a fabulous piece of design.”And she said,”What are you talking about?”I said,”Well, it ’ s so persuasive, because the purpose of that sign is to get you into the garage, and since most people are so suspicious of garages, and know that they ’ re going to be ripped off, they use the word ’ reliable. ’ But everybody says they ’ re reliable. But, reliable Dutchman”— —”Fantastic!”Because as soon as you hear the word Dutchman — which is an archaic word, nobody calls Dutch people”Dutchmen”anymore — but as soon as you hear Dutchman, you get this picture of the kid with his finger in the dike, preventing the thing from falling and flooding Holland, and so on. And so the entire issue is detoxified by the use of”Dutchman.”Now, if you think I ’ m exaggerating at all in this, all you have to do is substitute something else, like”Indonesian.”Or even”French.”Now,”Swiss”works, but you know it ’ s going to cost a lot of money. I ’ m going to take you quickly through the actual process of doing a poster. I do a lot of work for the School of Visual Arts, where I teach, and the director of this school — a remarkable man named Silas Rhodes — often gives you a piece of text and he says,”Do something with this.”And so he did. And this was the text —”In words as fashion the same rule will hold / Alike fantastic if too new or old / Be not the first by whom the new are tried / Nor yet the last to lay the old aside.”I could make nothing of that. And I really struggled with this one. And the first thing I did, which was sort of in the absence of another idea, was say I ’ ll sort of write it out and make some words big, and I ’ ll have some kind of design on the back somehow, and I was hoping — as one often does — to stumble into something. So I took another crack at it — you ’ ve got to keep it moving — and I Xeroxed some words on pieces of colored paper and I pasted them down on an ugly board. I thought that something would come out of it, like”Words rule fantastic new old first last Pope”because it ’ s by Alexander Pope, but I sort of made a mess out of it, and then I thought I ’ d repeat it in some way so it was legible. So, it was going nowhere. Sometimes, in the middle of a resistant problem, I write down things that I know about it. But you can see the beginning of an idea there, because you can see the word”new”emerging from the”old.”That ’ s what happens. There ’ s a relationship between the old and the new ; the new emerges from the context of the old. And then I did some variations of it, but it still wasn ’ t coalescing graphically at all. I had this other version which had something interesting about it in terms of being able to put it together in your mind from clues. The W was clearly a W, the N was clearly an N, even though they were very fragmentary and there wasn ’ t a lot of information in it. Then I got the words”new”and”old”and now I had regressed back to a point where there seemed to be no return. I was really desperate at this point. And so, I do something I ’ m truthfully ashamed of, which is that I took two drawings I had made for another purpose and I put them together. It says”dreams”at the top. And I was going to do a thing, I say,”Well, change the copy. Let it say something about dreams, and come to SVA and you ’ ll sort of fulfill your dreams.”But, to my credit, I was so embarrassed about doing that that I never submitted this sketch. And, finally, I arrived at the following solution. Now, it doesn ’ t look terribly interesting, but it does have something that distinguishes it from a lot of other posters. For one thing, it transgresses the idea of what a poster ’ s supposed to be, which is to be understood and seen immediately, and not explained. I remember hearing all of you in the graphic arts —”If you have to explain it, it ain ’ t working.”And one day I woke up and I said,”Well, suppose that ’ s not true?”So here ’ s what it says in my explanation at the bottom left. It says,”Thoughts : This poem is impossible. Silas usually has a better touch with his choice of quotations. This one generates no imagery at all.”I am now exposing myself to my audience, right? Which is something you never want to do professionally.”Maybe the words can make the image without anything else happening. What ’ s the heart of this poem? Don ’ t be trendy if you want to be serious. Is doing the poster this way trendy in itself? I guess one could reduce the idea further by suggesting that the new emerges behind and through the old, like this.”And then I show you a little drawing — you see, you remember that old thing I discarded? Well, I found a way to use it. So, there ’ s that little alternative over there, and I say,”Not bad,”— criticizing myself —”but more didactic than visual. Maybe what wants to be said is that old and the new are locked in a dialectical embrace, a kind of dance where each defines the other.”And then more self-questioning —”Am I being simple-minded? Is this the kind of simple that looks obvious, or the kind that looks profound? There ’ s a significant difference. This could be embarrassing. Actually, I realize fear of embarrassment drives me as much as any ambition. Do you think this sort of thing could really attract a student to the school?”Well, I think there are two fresh things here — two fresh things. One is the sort of willingness to expose myself to a critical audience, and not to suggest that I am confident about what I ’ m doing. And as you know, you have to have a front. I mean — you ’ ve got to be confident ; if you don ’ t believe in your work, who else is going to believe in it? So that ’ s one thing, to introduce the idea of doubt into graphics.

That can be a big contribution. The other thing is to actually give you two solutions for the price of one ; you get the big one and if you don ’ t like that, how about the little one? And that too is a relatively new idea. And here ’ s just a series of experiments where I ask the question of — does a poster have to be square? Now, this is a little illusion. That poster is not folded. It ’ s not folded, that ’ s a photograph and it ’ s cut on the diagonal. Same cheap trick in the upper left- hand corner. And here, a very peculiar poster because, simply because of using the isometric perspective in the computer, it won ’ t sit still in the space. At times, it seems to be wider at the back than the front, and then it shifts. And if you sit here long enough, it ’ ll float off the page into the audience. But, we don ’ t have time. And then an experiment — a little bit about the nature of perspective, where the outside shape is determined by the peculiarity of perspective, but the shape of the bottle — which is identical to the outside shape — is seen frontally. And another piece for the art directors ’ club is”Anna Rees”casting long shadows. This is another poster from the School of Visual Arts. There were 10 artists invited to participate in it, and it was one of those things where it was extremely competitive and I didn ’ t want to be embarrassed, so I worked very hard on this. The idea was — and it was a brilliant idea — was to have 10 posters distributed throughout the city ’ s subway system so every time you got on the subway you ’ d be passing a different poster, all of which had a different idea of what art is. But I was absolutely stuck on the idea of”art is”and trying to determine what art was. But then I gave up and I said,”Well, art is whatever.”And as soon as I said that, I discovered that the word”hat”was hidden in the word”whatever,”and that led me to the inevitable conclusion. But then again, it ’ s on my list of didactic posters. My intent is to have a literary accompaniment that explains the poster, in case you don ’ t get it. Now this says,”Note to the viewer : I thought I might use a visual cliche of our time — Magritte ’ s everyman — to express the idea that art is mystery, continuity and history. I ’ m also convinced that, in an age of computer manipulation, surrealism has become banal, a shadow of its former self. The phrase ’ Art is whatever ’ expresses the current inclusiveness that surrounds art-making — a sort of ’ it ain ’ t what you do, it ’ s the way that you do it ’ notion. The shadow of Magritte falls across the central part of the poster a poetic event that occurs as the shadow man isolates the word ’ hat, ’ hidden in the word ’ whatever. ’ The four hats shown in the poster suggests how art might be defined : as a thing itself, the worth of the thing, the shadow of the thing, and the shape of the thing. Whatever.”OK. And the one that I did not submit, which I still like, I wanted to use the same phrase. There were wonderful experiments by Bruno Munari on letterforms some years ago — sort of, see how far you could go and still be able to read them. And that idea stuck in my head. But then I took the pieces that I had taken off and put them at the bottom. And, of course those are the remains, and they ’ re so labeled. But what really happens is that you read it as :”Art is whatever remains.”Thank you.

The National Portrait Gallery is the place dedicated to presenting great American lives, amazing people. And that ’ s what it ’ s about. We use portraiture as a way to deliver those lives, but that ’ s it. And so I ’ m not going to talk about the painted portrait today. I ’ m going to talk about a program I started there, which, from my point of view, is the proudest thing I did. I started to worry about the fact that a lot of people don ’ t get their portraits painted anymore,

and they ’ re amazing people, and we want to deliver them to future generations. So, how do we do that? And so I came up with the idea of the living self-portrait series. And the living self-portrait series was the idea of basically my being a brush in the hand of amazing people who would come and I would interview. And so what I ’ m going to do is, not so much give you the great hits of that program, as to give you this whole notion of how you encounter people in that kind of situation, what you try to find out about them, and when people deliver and when they don ’ t and why. Now, I had two preconditions. One was that they be American. That ’ s just because, in the nature of the National Portrait Gallery, it ’ s created to look at American lives. That was easy, but then I made the decision, maybe arbitrary, that they needed to be people of a certain age, which at that point, when I created this program, seemed really old. Sixties, seventies, eighties and nineties. For obvious reasons, it doesn ’ t seem that old anymore to me. And why did I do that? Well, for one thing, we ’ re a youth-obsessed culture. And I thought really what we need is an elders program to just sit at the feet of amazing people and hear them talk. But the second part of it — and the older I get, the more convinced I am that that ’ s true. It ’ s amazing what people will say when they know how the story turned out. That ’ s the one advantage that older people have. Well, they have other, little bit of advantage, but they also have some disadvantages, but the one thing they or we have is that we ’ ve reached the point in life where we know how the story turned out. So, we can then go back in our lives, if we ’ ve got an interviewer who gets that, and begin to reflect on how we got there. All of those accidents that wound up creating the life narrative that we inherited. So, I thought okay, now, what is it going to take to make this work? There are many kinds of interviews. We know them. There are the journalist interviews, which are the interrogation that is expected. This is somewhat against resistance and caginess on the part of the interviewee. Then there ’ s the celebrity interview, where it ’ s more important who ’ s asking the question than who answers. That ’ s Barbara Walters and others like that, and we like that. That ’ s Frost-Nixon, where Frost seems to be as important as Nixon in that process. Fair enough. But I wanted interviews that were different. I wanted to be, as I later thought of it, empathic, which is to say, to feel what they wanted to say and to be an agent of their self-revelation. By the way, this was always done in public. This was not an oral history program. This was all about 300 people sitting at the feet of this individual, and having me be the brush in their self-portrait. Now, it turns out that I was pretty good at that. I didn ’ t know it coming into it. And the only reason I really know that is because of one interview I did with Senator William Fulbright, and that was six months after he ’ d had a stroke. And he had never appeared in public since that point. This was not a devastating stroke, but it did affect his speaking and so forth. And I thought it was worth a chance, he thought it was worth a chance, and so we got up on the stage, and we had an hour conversation about his life, and after that a woman rushed up to me, essentially did, and she said,”Where did you train as a doctor?”And I said,”I have no training as a doctor. I never claimed that.”And she said,”Well, something very weird was happening. When he started a sentence, particularly in the early parts of the interview, and paused, you gave him the word, the bridge to get to the end of the sentence, and by the end of it, he was speaking complete sentences on his own.”I didn ’ t know what was going on, but I was so part of the process of getting that out. So I thought, okay, fine, I ’ ve got empathy, or empathy, at any rate, is what ’ s critical to this kind of interview. But then I began to think of other things. Who makes a great interview in this context? It had nothing to do with their intellect, the quality of their intellect. Some of them were very brilliant, some of them were, you know, ordinary people who would never claim to be intellectuals, but it was never about that. It was about their energy. It ’ s energy that creates extraordinary interviews and extraordinary lives. I ’ m convinced of it. And it had nothing to do with the energy of being young. These were people through their 90s. In fact, the first person I interviewed was George Abbott, who was 97, and Abbott was filled with the life force — I guess that ’ s the way I think about it — filled with it. And so he filled the room, and we had an extraordinary conversation. He was supposed to be the toughest interview that anybody would ever do because he was famous for being silent, for never ever saying anything except maybe a word or two. And, in fact, he did wind up opening up — by the way, his energy is evidenced in other ways. He subsequently got married again at 102, so he, you know, he had a lot of the life force in him. But after the interview, I got a call, very gruff voice, from a woman. I didn ’ t know who she was, and she said,”Did you get George Abbott to talk?”And I said,”Yeah. Apparently I did.”And she said,”I ’ m his old girlfriend, Maureen Stapleton, and I could never do it.”And then she made me go up with the tape of it and prove that George Abbott actually could talk. So, you know, you want energy, you want the life force, but you really want them also to think that they have a story worth sharing. The worst interviews that you can ever have are with people who are modest. Never ever get up on a stage with somebody who ’ s modest, because all of these people have been assembled to listen to them, and they sit there and they say,”Aw, shucks, it was an accident.”There ’ s nothing that ever happens that justifies people taking good hours of the day to be with them. The worst interview I ever did : William L. Shirer. The journalist who did”The Rise and Fall of the Third Reich.”This guy had met Hitler and Gandhi within six months, and every time I ’ d ask him about it, he ’ d say,”Oh, I just happened to be there. Didn ’ t matter.”Whatever. Awful. I never would ever agree to interview a modest person. They have to think that they did something and that they want to share it with you. But it comes down, in the end, to how do you get through all the barriers we have. All of us are public and private beings, and if all you ’ re going to get from the interviewee is their public self, there ’ s no point in it. It ’ s pre- programmed. It ’ s infomercial, and we all have infomercials about our lives. We know the great lines, we know the great moments, we know what we ’ re not going to share, and the point of this was not to embarrass anybody. This wasn ’ t — and some of you will remember Mike Wallace ’ s old interviews — tough, aggressive and so forth. They have their place. I was trying to get them to say what they probably wanted to say, to break out of their own cocoon of the public self, and the more public they had been, the more entrenched that person, that outer person was. And let me tell you at once the worse moment and the best moment that happened in this interview series. It all has to do with that shell that most of us have, and particularly certain people. There ’ s an extraordinary woman named Clare Boothe Luce. It ’ ll be your generational determinant as to whether her name means much to you. She did so much. She was a playwright. She did an extraordinary play called”The Women.”She was a congresswoman when there weren ’ t very many congresswomen. She was editor of Vanity Fair, one of the great phenomenal women of her day. And, incidentally, I call her the Eleanor Roosevelt of the Right. She was sort of adored on the Right the way Eleanor Roosevelt was on the Left. And, in fact, when we did the interview — I did the living self-portrait with her — there were three former directors of the CIA basically sitting at her feet, just enjoying her presence. And I thought, this is going to be a piece of cake, because I always have preliminary talks with these people for just maybe 10 or 15 minutes. We never talk before that because if you talk before, you don ’ t get it on the stage. So she and I had a delightful conversation. We were on the stage and then — by the way, spectacular. It was all part of Clare Boothe Luce ' s look. She was in a great evening gown. She was 80, almost that day of the interview, and there she was and there I was, and I just proceeded into the questions. And she stonewalled me. It was unbelievable. Anything that I would ask, she would turn around, dismiss, and I was basically up there — any of you in the moderate-to-full entertainment world know what it is to die onstage. And I was dying. She was absolutely not giving me a thing. And I began to wonder what was going on, and you think while you talk, and basically, I thought, I got it. When we were alone, I was her audience. Now I ' m her competitor for the audience. That ' s the problem here, and she ' s fighting me for that, and so then I asked her a question — I didn ' t know how I was going to get out of it — I asked her a question about her days as a playwright, and again, characteristically, instead of saying,"Oh yes, I was a playwright, and this is what blah blah blah,"she said,"Oh, playwright. Everybody knows I was a playwright. Most people think that I was an actress. I was never an actress."But I hadn ' t asked that, and then she went off on a tear, and she said,"Oh, well, there was that one time that I was an actress. It was for a charity in Connecticut when I was a congresswoman, and I got up there,"and she went on and on,"And then I got on the stage."And then she turned to me and said,"And you know what those young actors did? They upstaged me."And she said,"Do you know what that is?"Just withering in her contempt. And I said,"I ' m learning."And she looked at me, and it was like the successful arm-wrestle, and then, after that, she delivered an extraordinary account of what her life really was like. I have to end that one. This is my tribute to Clare Boothe Luce. Again, a remarkable person. I ' m not politically attracted to her, but through her life force, I ' m attracted to her. And the way she died — she had, toward the end, a brain tumor. That ' s probably as terrible a way to die as you can imagine, and very few of us were invited to a dinner party. And she was in horrible pain. We all knew that. She stayed in her room. Everybody came. The butler passed around canapes. The usual sort of thing. Then at a certain moment, the door opened and she walked out perfectly dressed, completely composed. The public self, the beauty, the intellect, and she walked around and talked to every person there and then went back into the room and was never seen again. She wanted the control of her final moment, and she did it amazingly. Now, there are other ways that you get somebody to open up, and this is just a brief reference. It wasn ' t this arm-wrestle, but it was a little surprising for the person involved. I interviewed Steve Martin. It wasn ' t all that long ago. And we were sitting there, and almost toward the beginning of the interview, I turned to him and I said,"Steve,"or"Mr. Martin, it is said that all comedians have unhappy childhoods. Was yours unhappy?"And he looked at me, you know, as if to say,"This is how you ' re going to start this thing, right off?"And then he turned to me, not stupidly, and he said,"What was your childhood like?"And I said — these are all arm wrestles, but they ' re affectionate — and I said,"My father was loving and supportive, which is why I ' m not funny."And he looked at me, and then we heard the big sad story. His father was an SOB, and, in fact, he was another comedian with an unhappy childhood, but then we were off and running. So the question is : What is the key that ' s going to allow this to proceed? Now, these are arm wrestle questions, but I want to tell you about questions that are more related to empathy and that really, very often, are the questions that people have been waiting their whole lives to be asked. And I ' ll just give you two examples of this because of the time constraints. One was an interview I did with one of the great American biographers. Again, some of you will know him, most of you won ' t, Dumas Malone. He did a five- volume biography of Thomas Jefferson, spent virtually his whole life with Thomas Jefferson, and by the way, at one point I asked him,"Would you like to have met him?”And he said,”Well, of course, but actually, I know him better than anyone who ever met him, because I got to read all of his letters.”So, he was very satisfied with the kind of relationship they had over 50 years. And I asked him one question. I said,”Did Jefferson ever disappoint you?”And here is this man who had given his whole life to uncovering Jefferson and connecting with him, and he said,”Well...”— I ’ m going to do a bad southern accent. Dumas Malone was from Mississippi originally. But he said,”Well,”he said,”I ’ m afraid so.”He said,”You know, I ’ ve read everything, and sometimes Mr. Jefferson would smooth the truth a bit.”And he basically was saying that this was a man who lied more than he wished he had, because he saw the letters. He said,”But I understand that.”He said,”I understand that.”He said,”We southerners do like a smooth surface, so that there were times when he just didn ’ t want the confrontation.”And he said,”Now, John Adams was too honest.”And he started to talk about that, and later on he invited me to his house, and I met his wife who was from Massachusetts, and he and she had exactly the relationship of Thomas Jefferson and John Adams. She was the New Englander and abrasive, and he was this courtly fellow. But really the most important question I ever asked, and most of the times when I talk about it, people kind of suck in their breath at my audacity, or cruelty, but I promise you it was the right question. This was to Agnes de Mille. Agnes de Mille is one of the great choreographers in our history. She basically created the dances in”Oklahoma,”transforming the American theater. An amazing woman. At the time that I proposed to her that — by the way, I would have proposed to her ; she was extraordinary — but proposed to her that she come on. She said,”Come to my apartment.”She lived in New York.”Come to my apartment and we ’ ll talk for those 15 minutes, and then we ’ ll decide whether we proceed.”And so I showed up in this dark, rambling New York apartment, and she called out to me, and she was in bed. I had known that she had had a stroke, and that was some 10 years before. And so she spent almost all of her life in bed, but — I speak of the life force — her hair was askew. She wasn ’ t about to make up for this occasion. And she was sitting there surrounded by books, and her most interesting possession she felt at that moment was her will, which she had by her side. She wasn ’ t unhappy about this. She was resigned. She said,”I keep this will by my bed, memento mori, and I change it all the time just because I want to.”And she was loving the prospect of death as much as she had loved life. I thought, this is somebody I ’ ve got to get in this series. She agreed. She came on. Of course she was wheelchaired on. Half of her body was stricken, the other half not. She was, of course, done up for the occasion, but this was a woman in great physical distress. And we had a conversation, and then I asked her this unthinkable question. I said,”Was it a problem for you in your life that you were not beautiful?”And the audience just — you know, they ’ re always on the side of the interviewee, and they felt that this was a kind of assault, but this was the question she had wanted somebody to ask her whole life. And she began to talk about her childhood, when she was beautiful, and she literally turned — here she was, in this broken body — and she turned to the audience and described herself as the fair demoiselle with her red hair and her light steps and so forth, and then she said,”And then puberty hit.”And she began to talk about things that had happened to her body and her face, and how she could no longer count on her beauty, and her family then treated her like the ugly sister of the beautiful one for whom all the ballet lessons were given. And she had to go along just to be with her sister for company, and in that process, she made a number of decisions. First of all, was that dance, even though it hadn ’ t been offered to her, was her life. And secondly, she had better be, although she did dance for a while, a choreographer because then her looks didn ’ t matter. But she was thrilled to get that out as a real, real fact in her life. It was an amazing privilege to do this series. There were other moments like that, very few moments of silence. The key point was empathy because everybody in their lives is really waiting for people to ask them questions, so that they can be truthful about who they are and how they became what they are, and I commend that to you, even if you ’ re not doing interviews. Just be that way with your friends and particularly the older members of your family. Thank you very much.

Well, this is such an honor. And it ’ s wonderful to be in the presence of an organization that is really making a difference in the world. And I ’ m intensely grateful for the opportunity to speak to you today. And I ’ m also rather surprised, because when I look back on my life the last thing I ever wanted to do was write, or be in any way involved in religion. After I left my convent, I ’ d finished with religion, frankly. I thought that was it. And for 13 years I kept clear of it. I wanted to be an English literature professor. And I certainly didn ’ t even want to be a writer, particularly. But then I suffered a series of career catastrophes, one after the other, and finally found myself in television. I said that to Bill Moyers, and he said,”Oh, we take anybody.”And I was doing some rather controversial religious programs. This went down very well in the U. K., where religion is extremely unpopular. And so, for once, for the only time in my life, I was finally in the mainstream. But I got sent to Jerusalem to make a film about early Christianity. And there, for the first time, I encountered the other religious traditions : Judaism and Islam, the sister religions of Christianity. And while I found I knew nothing about these faiths at all — despite my own intensely religious background, I ’ d seen Judaism only as a kind of prelude to Christianity, and I knew nothing about Islam at all. But in that city, that tortured city, where you see the three faiths jostling so uneasily together, you also become aware of the profound connection between them. And it has been the study of other religious traditions that brought me back to a sense of what religion can be, and actually enabled me to look at my own faith in a different light. And I found some astonishing things in the course of my study that had never occurred to me. Frankly, in the days when I thought I ’ d had it with religion, I just found the whole thing absolutely incredible. These doctrines seemed unproven, abstract. And to my astonishment, when I began seriously studying other traditions, I began to realize that belief — which we make such a fuss about today — is only a very recent religious enthusiasm that surfaced only in the West, in about the 17th century. The word”belief”itself originally meant to love, to prize, to hold dear. In the 17th century, it narrowed its focus, for reasons that I ’ m exploring in a book I ’ m writing at the moment, to include — to mean an intellectual assent to a set of propositions, a credo.”I believe :”it did not mean,”I accept certain creedal articles of faith.”It meant :”I commit myself. I engage myself.”Indeed, some of the world traditions think very little of religious orthodoxy. In the Quran, religious opinion — religious orthodoxy — is dismissed as”zanna :”self-indulgent guesswork about matters that nobody can be certain of one way or the other, but which makes people quarrelsome and stupidly sectarian. So if religion is not about believing things, what is it about? What I ’ ve found, across the board, is that religion is about behaving differently. Instead of deciding whether or not you believe in God, first you do something. You behave in a committed way, and then you begin to understand the truths of religion. And religious doctrines are meant to be summons to action ; you only understand them when you put them into practice. Now, pride of place in this

practice is given to compassion. And it is an arresting fact that right across the board, in every single one of the major world faiths, compassion — the ability to feel with the other in the way we ’ ve been thinking about this evening — is not only the test of any true religiosity, it is also what will bring us into the presence of what Jews, Christians and Muslims call”God”or the”Divine.”It is compassion, says the Buddha, which brings you to Nirvana. Why? Because in compassion, when we feel with the other, we dethrone ourselves from the center of our world and we put another person there. And once we get rid of ego, then we ’ re ready to see the Divine. And in particular, every single one of the major world traditions has highlighted — has said — and put at the core of their tradition what ’ s become known as the Golden Rule. First propounded by Confucius five centuries before Christ :”Do not do to others what you would not like them to do to you.”That, he said, was the central thread which ran through all his teaching and that his disciples should put into practice all day and every day. And it was — the Golden Rule would bring them to the transcendent value that he called”ren,”human-heartedness, which was a transcendent experience in itself. And this is absolutely crucial to the monotheisms, too. There ’ s a famous story about the great rabbi, Hillel, the older contemporary of Jesus. A pagan came to him and offered to convert to Judaism if the rabbi could recite the whole of Jewish teaching while he stood on one leg. Hillel stood on one leg and said,”That which is hateful to you, do not do to your neighbor. That is the Torah. The rest is commentary. Go and study it.”And”go and study it”was what he meant. He said,”In your exegesis, you must make it clear that every single verse of the Torah is a commentary, a gloss upon the Golden Rule.”The great Rabbi Meir said that any interpretation of Scripture which led to hatred and disdain, or contempt of other people — any people whatsoever — was illegitimate. Saint Augustine made exactly the same point. Scripture, he says,”teaches nothing but charity, and we must not leave an interpretation of Scripture until we have found a compassionate interpretation of it.”And this struggle to find compassion in some of these rather rebarbative texts is a good dress rehearsal for doing the same in ordinary life. But now look at our world. And we are living in a world that is — where religion has been hijacked. Where terrorists cite Quranic verses to justify their atrocities. Where instead of taking Jesus ’ words,”Love your enemies. Don ’ t judge others,”we have the spectacle of Christians endlessly judging other people, endlessly using Scripture as a way of arguing with other people, putting other people down. Throughout the ages, religion has been used to oppress others, and this is because of human ego, human greed. We have a talent as a species for messing up wonderful things. So the traditions also insisted — and this is an important point, I think — that you could not and must not confine your compassion to your own group : your own nation, your own co-religionists, your own fellow countrymen. You must have what one of the Chinese sages called”jian ai”: concern for everybody. Love your enemies. Honor the stranger. We formed you, says the Quran, into tribes and nations so that you may know one another. And this, again — this universal outreach — is getting subdued in the strident use of religion — abuse of religion — for nefarious gains. Now, I ’ ve lost count of the number of taxi drivers who, when I say to them what I do for a living, inform me that religion has been the cause of all the major world wars in history. Wrong. The causes of our present woes are political. But, make no mistake about it, religion is a kind of fault line, and when a conflict gets ingrained in a region, religion can get sucked in and become part of the problem. Our modernity has been exceedingly violent. Between 1914 and 1945, 70 million people died in Europe alone as a result of armed conflict. And so many of our institutions, even football, which used to be a pleasant pastime, now causes riots where people even die. And it ’ s not surprising that religion, too, has been affected by this violent ethos. There ’ s also a great deal, I think, of religious illiteracy around. People seem to think, now equate religious faith with believing things. As though that — we call religious people often believers, as though that were the main thing that they do. And very often, secondary goals get pushed into the first place, in place of compassion and the Golden Rule. Because the Golden Rule is difficult. I sometimes — when I ’ m speaking to congregations about compassion, I sometimes see a mutinous expression crossing some of their faces because a lot of religious people prefer to be right, rather than compassionate. Now — but that ’ s not the whole story. Since September the 11th, when my work on Islam suddenly propelled me into public life, in a way that I ’ d never imagined, I ’ ve been able to sort of go all over the world, and finding, everywhere I go, a yearning for change. I ’ ve just come back from Pakistan, where literally thousands of people came to my lectures, because they were yearning, first of all, to hear a friendly Western voice. And especially the young people were coming. And were asking me — the young people were saying,”What can we do? What can we do to change things?”And my hosts in Pakistan said,”Look, don ’ t be too polite to us. Tell us where we ’ re going wrong. Let ’ s talk together about where religion is failing.”Because it seems to me that with — our current situation is so serious at the moment that any ideology that doesn ’ t promote a sense of global understanding and global appreciation of each other is failing the test of the time. And religion, with its wide following... Here in the United States, people may be being religious in a different way, as a report has just shown — but they still want to be religious. It ’ s only Western Europe that has retained its secularism, which is now beginning to look rather endearingly old-fashioned. But people want to be religious, and religion should be made to be a force for harmony in the world, which it can and should be — because of the Golden Rule.”Do not do to others what you would not have them do to you”: an ethos that should now be applied globally. We should not treat other nations as we would not wish to be treated ourselves. And these — whatever our wretched beliefs — is a religious matter, it ’ s a spiritual matter. It ’ s a profound moral matter that engages and should engage us all. And as I say, there is a hunger for change out there. Here in the United States, I think you see it in this election campaign : a longing for change. And people in churches all over and mosques all over this continent after September the 11th, coming together locally to create networks of understanding. With the mosque, with the synagogue, saying,”We must start to speak to one another.”I think it ’ s time that we moved beyond the idea of toleration and move toward appreciation of the other. I ’ d — there ’ s one story I ’ d just like to mention. This comes from”The Iliad.”But it tells you what this spirituality should be. You know the story of”The Iliad,”the 10-year war between Greece and Troy. In one incident, Achilles, the famous warrior of Greece, takes his troops out of the war, and the whole war effort suffers. And in the course of the ensuing muddle, his beloved friend, Patroclus, is killed — and killed in single combat by one of the Trojan princes, Hector. And Achilles goes mad with grief and rage and revenge, and he mutilates the body. He kills Hector, he mutilates his body and then he refuses to give the body back for burial to the family, which means that, in Greek ethos, Hector ’ s soul will wander eternally, lost. And then one night, Priam, king of Troy, an old man, comes into the Greek camp incognito, makes his way to Achilles ’ tent to ask for the body of his son. And everybody is shocked when the old man takes off his head covering and shows himself. And Achilles looks at him and thinks of his father. And he starts to weep. And Priam looks at the man who has murdered so many of his sons, and he, too, starts to weep. And the sound of their weeping filled the house. The Greeks believed that weeping together created a bond between people. And then Achilles takes the body of Hector, he hands it very tenderly to the father, and the two men look at each other, and see each other as divine. That is the ethos found, too, in all the religions. It ’ s what is meant by overcoming the horror that we feel when we are under threat of our enemies, and beginning to appreciate the other. It ’ s of great importance that the word for”holy”in Hebrew, applied to God, is”Kadosh”: separate, other. And it is often, perhaps, the very otherness of our enemies which can give us intimations of that utterly mysterious transcendence which is God. And now, here ’ s my wish : I wish that you would help with the creation, launch and propagation of a Charter for Compassion, crafted by a group of inspirational thinkers from the three Abrahamic traditions of Judaism, Christianity and Islam, and based on the fundamental principle of the Golden Rule. We need to create a movement among all these people that I meet in my travels — you probably meet, too — who want to join up, in some way, and reclaim their faith, which they feel, as I say, has been hijacked. We need to empower people to remember the compassionate ethos, and to give guidelines. This Charter would not be a massive document. I ’ d like to see it — to give guidelines as to how to interpret the Scriptures, these texts that are being abused. Remember what the rabbis and what Augustine said about how Scripture should be governed by the principle of charity. Let ’ s get back to that. And the idea, too, of Jews, Christians and Muslims — these traditions now so often at loggerheads — working together to create a document which we hope will be signed by a thousand, at least, of major religious leaders from all the traditions of the world. And you are the people. I ’ m just a solitary scholar. Despite the idea that I love a good time, which I was rather amazed to see coming up on me — I actually spend a great deal of time alone, studying, and I ’ m not very — you ’ re the people with media knowledge to explain to me how we can get this to everybody, everybody on the planet. I ’ ve had some preliminary talks, and Archbishop Desmond Tutu, for example, is very happy to give his name to this, as is Imam Feisal Rauf, the Imam in New York City. Also, I would be working with the Alliance of Civilizations at the United Nations. I was part of that United Nations initiative called the Alliance of Civilizations, which was asked by Kofi Annan to diagnose the causes of extremism, and to give practical guidelines to member states about how to avoid the escalation of further extremism. And the Alliance has told me that they are very happy to work with it. The importance of this is that this is — I can see some of you starting to look worried, because you think it ’ s a slow and cumbersome body — but what the United Nations can do is give us some neutrality, so that this isn ’ t seen as a Western or a Christian initiative, but that it ’ s coming, as it were, from the United Nations, from the world — who would help with the sort of bureaucracy of this. And so I do urge you to join me in making — in this charter — to building this charter, launching it and propagating it so that it becomes — I ’ d like to see it in every college, every church, every mosque, every synagogue in the world, so that people can look at their tradition, reclaim it, and make religion a source of peace in the world, which it can and should be. Thank you very much.

So, as researchers, something that we often do is use immense resources to achieve certain capabilities, or achieve certain goals. And this is essential to the progress of science, or exploration of what is possible. But it creates this unfortunate situation where a tiny, tiny fraction of the world can actually participate in this exploration or can benefit from that technology. Something that motivates me, and gets me really excited about my research, is when I see simple opportunities to drastically change that distribution and make the technology accessible to a much wider percentage of the population. I ’ m going to show you two videos that have gotten a lot of attention that I think embody this philosophy. And they actually use the Nintendo Wii Remote. For those of you who aren ’ t familiar with this device, it ’ s a $40 video game controller. And it ’ s mostly advertised for its motion-sensing capabilities : so you can swing a tennis racket, or hit a baseball bat. But what actually interests me a lot more is the fact that in the tip of each controller is a relatively high-performing infrared camera. And I ’ m going to show you two demos of why this is useful. So here, I have my computer set up with the projector, and I have a Wii Remote sitting on top of it. And, for example, if you ’ re in a school that doesn ’ t have a lot money, probably a lot of schools, or if you ’ re in an office environment, and you want an interactive whiteboard, normally these cost about two to three thousand dollars. So I ’ m going to show you how to create one with a Wii Remote. Now, this requires another piece of hardware, which is this infrared pen. You can probably make this yourself for about five dollars with a quick trip to the Radio Shack. It ’ s got a battery, a button and an infrared LED — you guys can ’ t see it — but it turns on whenever I push the button. Now, what this means is that if I run this piece of software, the camera sees the infrared dot, and I can register the location of the camera pixels to the projector pixels. And now this is like an interactive whiteboard surface. So for about $50 of hardware, you can have your own whiteboard. This is Adobe Photoshop. Thank you. The software for this I ’ ve actually put on my website and have let people download it for free. In the three months this project has been public, it ’ s been downloaded over half a million times. So teachers and students all around the world are already using this. Although it does do it for 50 dollars, there are some limitations of this approach. You get about 80 percent of the way there, for one percent of the cost. Another nice thing is that a camera can see multiple dots, so this is actually a multi-touch, interactive whiteboard system as well. For the second demo, I have this Wii Remote that ’ s actually next to the TV. So it ’ s pointing away from the display, rather than pointing at the display. And why this is interesting is that if you put on, say, a pair of safety glasses, that have two infrared dots in them, they are going to give the computer an approximation of your head location. And why this is interesting is I have this sort of application running on the computer monitor, which has a 3D room, with some targets floating in it. And you can see that it looks like a 3D room. kind of like a video game, it sort of looks 3D, but for the most part, the image looks pretty flat, and bound to the surface of the screen. But if we turn on head tracking — the computer can change the image that ’ s on the screen and make it respond to the head movements. So let ’ s switch back to that. So this has actually been a little bit startling to the game-development community. Because this is about 10 dollars of additional hardware if you already have a Nintendo Wii. So I ’ m looking forward to seeing some games, and actually Louis Castle, that ’ s him down there, last week announced that Electronic Arts, one of the largest game publishers, is releasing a game in May that has a little Easter egg feature for supporting this type of head tracking. And that ’ s from less than five months from a prototype in my lab to a major commercial product. Thank you. But actually, to me, what ’ s almost more interesting than either of these two projects is how people actually found out about them. YouTube has really changed the way, or changed the speed, in which a single individual can actually spread an idea around the world. I ’ m doing some research in my lab with a video camera, and within the first week, a million people had seen this work, and literally within days, engineers, teachers and students from around the world were already posting their own YouTube videos of them using my system or derivatives of this work. So I hope to see more of that in the future, and hope online video distribution to be embraced by the research community. So thank you very much.

Text Sample 973: NEG Dim 6 – 2006 – Score 1.00 – 2006/t000497.txt

Good morning. How are you? Good. It ’ s been great, hasn ’ t it? I ’ ve been blown away by the whole thing. In fact, I ’ m leaving. There have been three themes running through the conference, which are relevant to what I want to talk about. One is the extraordinary evidence of human creativity in all of the presentations that we ’ ve had and in all of the people here ; just the variety of it and the range of it. The second is that it ’ s put us in a place where we have no idea what ’ s going to happen in terms of the future. No idea how this may play out. I have an interest in education. Actually, what I find is, everybody has an interest in education. Don ’ t you? I find this very interesting. If you ’ re at a dinner party, and you say you work in education — actually, you ’ re not often at dinner parties, frankly. If you work in education, you ’ re not asked. And you ’ re never asked back, curiously. That ’ s strange to me. But if you are, and you say to somebody, you know, they say,”What do you do?”and you say you work in education, you can see the blood run from their face. They ’ re like,”Oh my God. Why me?””My one night out all week.”But if you ask about their education, they pin you to the wall, because it ’ s one of those things that goes deep with people, am I right? Like religion and money and other things. So I have a big interest in education, and I think we all do. We have a huge vested interest in it, partly because it ’ s education that ’ s meant to take us into this future that we can ’ t grasp. If you think of it, children starting school this year will be retiring in 2065. Nobody has a clue, despite all the expertise that ’ s been on parade for the past four days, what the world will look like in five years ’ time. And yet, we ’ re meant to be educating them for it. So the unpredictability, I think, is extraordinary. And the third part of this is that we ’ ve all agreed, nonetheless, on the really extraordinary capacities that children have — their capacities for innovation. I mean, Sirena last night was a marvel, wasn ’ t she? Just seeing what she could do. And she ’ s exceptional, but I think she ’ s not, so to speak, exceptional in the whole of childhood. What you have there is a person of extraordinary dedication who found a talent. And my contention is, all kids have tremendous talents, and we squander them, pretty ruthlessly. So I want to talk about education, and I want to talk about creativity. My contention is that creativity now is as important in education as literacy, and we should treat it with the same status. Thank you. That was it, by the way. Thank you very much. So, 15 minutes left.”Well, I was born...”I heard a great story recently — I love telling it — of a little girl who was in a drawing lesson. She was six, and she was at the back, drawing, and the teacher said this girl hardly ever paid attention, and in this drawing lesson, she did. The teacher was fascinated. She went over to her, and she said,”What are you drawing?”And the girl said,”I ’ m drawing a picture of God.”And the teacher said,”But nobody knows what God looks like.”And the girl said,”They will in a minute.”When my son was four in England — actually, he was four everywhere, to be honest. If we ’ re being strict about it, wherever he went, he was four that year. He was in the Nativity play. Do you remember the story? No, it was big, it was a big story. Mel Gibson did the sequel, you may have seen it.”Nativity II.”But James got the part of Joseph, which we were thrilled about. We considered this to be one of the lead parts. We had the place crammed full of agents in T-shirts :”James

Robinson IS Joseph!”He didn ’ t have to speak, but you know the bit where the three kings come in? They come in bearing gifts, gold, frankincense and myrrh. This really happened. We were sitting there, and I think they just went out of sequence, because we talked to the little boy afterward and said,”You OK with that?”They said,”Yeah, why? Was that wrong?”They just switched. The three boys came in, four-year-olds with tea towels on their heads. They put these boxes down, and the first boy said,”I bring you gold.”And the second boy said,”I bring you myrrh.”And the third boy said,”Frank sent this.”What these things have in common is that kids will take a chance. If they don ’ t know, they ’ ll have a go. Am I right? They ’ re not frightened of being wrong. I don ’ t mean to say that being wrong is the same thing as being creative. What we do know is, if you ’ re not prepared to be wrong, you ’ ll never come up with anything original — if you ’ re not prepared to be wrong. And by the time they get to be adults, most kids have lost that capacity. They have become frightened of being wrong. And we run our companies like this. We stigmatize mistakes. And we ’ re now running national education systems where mistakes are the worst thing you can make. And the result is that we are educating people out of their creative capacities. Picasso once said this, he said that all children are born artists. The problem is to remain an artist as we grow up. I believe this passionately, that we don ’ t grow into creativity, we grow out of it. Or rather, we get educated out of it. So why is this? I lived in Stratford-on-Avon until about five years ago. In fact, we moved from Stratford to Los Angeles. So you can imagine what a seamless transition this was. Actually, we lived in a place called Snitterfield, just outside Stratford, which is where Shakespeare ’ s father was born. Are you struck by a new thought? I was. You don ’ t think of Shakespeare having a father, do you? Do you? Because you don ’ t think of Shakespeare being a child, do you? Shakespeare being seven? I never thought of it. I mean, he was seven at some point. He was in somebody ’ s English class, wasn ’ t he? How annoying would that be?”Must try harder.”Being sent to bed by his dad, to Shakespeare,”Go to bed, now!”To William Shakespeare.”And put the pencil down!””And stop speaking like that.””It ’ s confusing everybody.”Anyway, we moved from Stratford to Los Angeles, and I just want to say a word about the transition. Actually, my son didn ’ t want to come. I ’ ve got two kids ; he ’ s 21 now, my daughter ’ s 16. He didn ’ t want to come to Los Angeles. He loved it, but he had a girlfriend in England. This was the love of his life, Sarah. He ’ d known her for a month. Mind you, they ’ d had their fourth anniversary, because it ’ s a long time when you ’ re 16. He was really upset on the plane. He said,”I ’ ll never find another girl like Sarah.”And we were rather pleased about that, frankly — because she was the main reason we were leaving the country. But something strikes you when you move to America and travel around the world : every education system on earth has the same hierarchy of subjects. Every one. Doesn ’ t matter where you go. You ’ d think it would be otherwise, but it isn ’ t. At the top are mathematics and languages, then the humanities. At the bottom are the arts. Everywhere on earth. And in pretty much every system, too, there ’ s a hierarchy within the arts. Art and music are normally given a higher status in schools than drama and dance. There isn ’ t an education system on the planet that teaches dance every day to children the way we teach them mathematics. Why? Why not? I think this is rather important. I think math is very important, but so is dance. Children dance all the time if they ’ re allowed to, we all do. We all have bodies, don ’ t we? Did I miss a meeting? Truthfully, what happens is, as children grow up, we start to educate them progressively from the waist up. And then we focus on their heads. And slightly to one side. If you were to visit education as an alien and say”What ’ s it for, public education?”I think you ’ d have to conclude, if you look at the output, who really succeeds by this, who does everything they should, who gets all the brownie points, who are the winners — I think you ’ d have to conclude the whole purpose of public education throughout the world is to produce university professors. Isn ’ t it? They ’ re the people who come out the top. And I used to be one, so there. And I like university professors, but, you know, we shouldn ’ t hold them up as the high-water mark of all human achievement. They ’ re just a form of life. Another form of life. But they ’ re rather curious. And I say this out of affection for them : there ’ s something curious about professors. In my experience — not all of them, but typically — they live in their heads. They live up there and slightly to one side. They ’ re disembodied, you know, in a kind of literal way. They look upon their body as a form of transport for their heads. Don ’ t they? It ’ s a way of getting their head to meetings. If you want real evidence of out-of-body experiences, by the way, get yourself along to a residential conference of senior academics and pop into the discotheque on the final night. And there, you will see it. Grown men and women writhing uncontrollably, off the beat. Waiting until it ends, so they can go home and write a paper about it. Our education system is predicated on the idea of academic ability. And there ’ s a reason. Around the world, there were no public systems of education, really, before the 19th century. They all came into being to meet the needs of industrialism. So the hierarchy is rooted on two ideas. Number one, that the most useful subjects for work are at the top. So you were probably steered benignly away from things at school when you were a kid, things you liked, on the grounds you would never get a job doing that. Is that right?”Don ’ t do music, you ’ re not going to be a musician ; don ’ t do art, you won ’ t be an artist.”Benign advice — now, profoundly mistaken. The whole world is engulfed in a revolution. And the second is academic ability, which has really come to dominate our view of intelligence, because the universities design the system in their image. If you think of it, the whole system of public education around the world is a protracted process of university entrance. And the consequence is that many highly talented, brilliant, creative people think they ’ re not, because the thing they were good at at school wasn ’ t valued, or was actually stigmatized. And I think we can ’ t afford to go on that way. In the next 30 years, according to UNESCO, more people worldwide will be graduating through education than since the beginning of history. More people. And it ’ s the combination of all the things we ’ ve talked about : technology and its transformational effect on work, and demography and the huge explosion in population. Suddenly, degrees aren ’ t worth anything. Isn ’ t that true? When I was a student, if you had a degree, you had a job. If you didn ’ t have a job, it ’ s because you didn ’ t want one. And I didn ’ t want one, frankly. But now kids with degrees are often heading home to carry on playing video games, because you need an MA where the previous job required a BA, and now you need a PhD for the other. It ’ s a process of academic inflation. And it indicates the whole structure of education is shifting beneath our feet. We need to radically rethink our view of intelligence. We know three things about intelligence. One, it ’ s diverse. We think about the world in all the ways that we experience it. We think visually, we think in sound, we think kinesthetically. We think in abstract terms, we think in movement. Secondly, intelligence is dynamic. If you look at the interactions of a human brain, as we heard yesterday from a number of presentations, intelligence is wonderfully interactive. The brain isn ’ t divided into compartments. In fact, creativity — which I define as the process of having original ideas that have value — more often than not comes about through the interaction of different disciplinary ways of seeing things. By the way, there ’ s a shaft of nerves that joins the two halves of the brain, called the corpus callosum. It ’ s thicker in women. Following off from Helen yesterday, this is probably why women are better at multitasking. Because you are, aren ’ t you? There ’ s a raft of research, but I know it from my personal life. If my wife is cooking a meal at home, which is not often... thankfully. No, she ’ s good at some things. But if she ’ s cooking, she ’ s dealing with people on the phone, she ’ s talking to the kids, she ’ s painting the ceiling — she ’ s doing open-heart surgery over here. If I ’ m cooking, the door is shut, the kids are out, the phone ’ s on the hook, if she comes in, I get annoyed. I say,”Terry, please, I ’ m trying to fry an egg in here.””Give me a break.”Actually, do you know that old philosophical thing,”If a tree falls in a forest, and nobody hears it, did it happen?”Remember that old chestnut? I saw a great T-shirt recently, which said,”If a man speaks his mind in a forest, and no woman hears him, is he still wrong?”And the third thing about intelligence is, it ’ s distinct. I ’ m doing a new book at the moment called”Epiphany,”which is based on a series of interviews with people about how they discovered their talent. I ’ m fascinated by how people got to be there. It ’ s really prompted by a conversation I had with a wonderful woman who maybe most people have never heard of, Gillian Lynne. Have you heard of her? Some have. She ’ s a choreographer, and everybody knows her work. She did”Cats”and”Phantom of the Opera.”She ’ s wonderful. I used to be on the board of The Royal Ballet, as you can see. Gillian and I had lunch one day. I said,”How did you get to be a dancer?”It was interesting. When she was at school, she was really hopeless. And the school, in the ’ 30s, wrote to her parents and said,”We think Gillian has a learning disorder.”She couldn ’ t concentrate ; she was fidgeting. I think now they ’ d say she had ADHD. Wouldn ’ t you? But this was the 1930s, and ADHD hadn ’ t been invented at this point. It wasn ’ t an available condition. People weren ’ t aware they could have that. Anyway, she went to see this specialist. So, this oak-paneled room, and she was there with her mother, and she was led and sat on this chair at the end, and she sat on her hands for 20 minutes, while this man talked to her mother about all the problems Gillian was having at school, because she was disturbing people, her homework was always late, and so on. Little kid of eight. In the end, the doctor went and sat next to Gillian and said,”I ’ ve listened to all these things your mother ’ s told me. I need to speak to her privately. Wait here. We ’ ll be back. We won ’ t be very long,”and they went and left her. But as they went out of the room, he turned on the radio that was sitting on his desk. And when they got out of the room, he said to her mother,”Just stand and watch her.”And the minute they left the room, she was on her feet, moving to the music. And they watched for a few minutes, and he turned to her mother and said,”Mrs. Lynne, Gillian isn ’ t sick. She ’ s a dancer. Take her to a dance school.”I said,”What happened?”She said,”She did. I can ’ t tell you how wonderful it was. We walked in this room, and it was full of people like me — people who couldn ’ t sit still, people who had to move to think.”Who had to move to think. They did ballet, they did tap, jazz ; they did modern ; they did contemporary. She was eventually auditioned for the Royal Ballet School. She became a soloist ; she had a wonderful career at the Royal Ballet. She eventually graduated from the Royal Ballet School, founded the Gillian Lynne Dance Company, met Andrew Lloyd Webber. She ’ s been responsible for some of the most successful musical theater productions in history, she ’ s given pleasure to millions, and she ’ s a multimillionaire. Somebody else might have put her on medication and told her to calm down. What I think it comes to is this : Al Gore spoke the other night about ecology and the revolution that was triggered by Rachel Carson. I believe our only hope for the future is to adopt a new conception of human ecology, one in which we start to reconstitute our conception of the richness of human capacity. Our education system has mined our minds in the way that we strip-mine the earth for a particular commodity. And for the future, it won ’ t serve us. We have to rethink the fundamental principles on which we ’ re educating our children. There was a wonderful quote by Jonas Salk, who said,”If all the insects were to disappear from the Earth, within 50 years, all life on Earth would end. If all human beings disappeared from the Earth, within 50 years, all forms of life would flourish.”And he ’ s right. What TED celebrates is the gift of the human imagination. We have to be careful now that we use this gift wisely, and that we avert some of the scenarios that we ’ ve talked about. And the only way we ’ ll do it is by seeing our creative capacities for the richness they are and seeing our children for the hope that they are. And our task is to educate their whole being, so they can face this future. By the way — we may not see this future, but they will. And our job is to help them make something of it. Thank you very much.

On September 10, the morning of my seventh birthday, I came downstairs to the kitchen, where my mother was washing the dishes and my father was reading the paper or something, and I sort of presented myself to them in the doorway, and they said,”Hey, happy birthday!”And I said,”I ’ m seven.”And my father smiled and said,”Well, you know what that means, don ’ t you?”And I said,”Yeah, that I ’ m going to have a party and a cake and get a lot of presents?”And my dad said,”Well, yes. But more importantly, being seven means that you ’ ve reached the age of reason, and you ’ re now capable of committing any and all sins against God and man.”Now, I had heard this phrase,”age of reason,”before. Sister Mary Kevin had been bandying it about my second-grade class at school. But when she said it, the phrase seemed all caught up in the excitement of preparations for our first communion and our first confession, and everybody knew that was really all about the white dress and the white veil. And anyway, I hadn ’ t really paid all that much attention to that phrase,”age of reason.”So, I said,”Yeah, yeah, age of reason. What does that mean again?”And my dad said,”Well, we believe, in the Catholic Church, that God knows that little kids don ’ t know the difference between right and wrong, but when you ’ re seven, you ’ re old enough to know better. So, you ’ ve grown up and reached the age of reason, and now God will start keeping notes on you, and begin your permanent record.”And I said,”Oh... Wait a minute. You mean all that time, up till today, all that time I was so good, God didn ’ t notice it?”And my mom said,”Well, I noticed it.”And I thought,”How could I not have known this before? How could it not have sunk in when they ’ d been telling me? All that being good and no real credit for it. And worst of all, how could I not have realized this very important information until the very day that it was basically useless to me?”So I said,”Well, Mom and Dad, what about Santa Claus? I mean, Santa Claus knows if you ’ re naughty or nice, right?”And my dad said,”Yeah, but, honey, I think that ’ s technically just between Thanksgiving and Christmas.”And my mother said,”Oh, Bob, stop it. Let ’ s just tell her. I mean, she ’ s seven. Julie, there is no Santa Claus.”Now, this was actually not that upsetting to me. My parents had this whole elaborate story about Santa Claus : how they had talked to Santa Claus himself and agreed that instead of Santa delivering our presents over the night of Christmas Eve, like he did for every other family who got to open their surprises first thing Christmas morning, our family would give Santa more time. Santa would come to our house while we were at nine o ’ clock high mass on Christmas morning, but only if all of us kids did not make a fuss. Which made me very suspicious. It was pretty obvious that it was really our parents giving us the presents. I mean, my dad had a very distinctive wrapping style, and my mother ' s handwriting was so close to Santa ' s. Plus, why would Santa save time by having to loop back to our house after he ' d gone to everybody else ' s? There was only one obvious conclusion to reach from this mountain of evidence : our family was too strange and weird for even Santa Claus to come visit, and my poor parents were trying to protect us from the embarrassment, this humiliation of rejection by Santa, who was jolly — but let ' s face it, he was also very judgmental. So to find out that there was no Santa Claus at all was actually sort of a relief. I left the kitchen not really in shock about Santa, but rather, I was just dumbfounded about how I could have missed this whole age of reason thing. It was too late for me, but maybe I could help someone else, someone who could use the information. They had to fit two criteria : they had to be old enough to be able to understand the whole concept of the age of reason, and not yet seven. The answer was clear : my brother Bill. He was six. Well, I finally found Bill about a block away from our house at this public school playground. It was a Saturday, and he was all by himself, just kicking a ball against the side of a wall. I ran up to him and said,"Bill! I just realized that the age of reason starts when you turn seven, and then you ' re capable of committing any and all sins against God and man."And Bill said,"So?"And I said,"So, you ' re six. You have a whole year to do anything you want to and God won ' t notice it."And he said,"So?"And I said,"So? So everything!"And I turned to run. I was so angry with him. But when I got to the top of the steps, I turned around dramatically and said,"Oh, by the way, Bill — there is no Santa Claus."Now, I didn ' t know it at the time, but I really wasn ' t turning seven on September 10th. For my 13th birthday, I planned a slumber party with all of my girlfriends, but a couple of weeks beforehand my mother took me aside and said,"I need to speak to you privately. September 10th is not your birthday. It ' s October 10th."And I said,"What?"And she said..."Listen. The cut-off date to start kindergarten was September 15th.""So I told them that your birthday was September 10th, and then I wasn ' t sure that you weren ' t just going to go blab it all over the place, so I started to tell you your birthday was September 10th. But, Julie, you were so ready to start school, honey. You were so ready."I thought about it, and when I was four, I was already the oldest of four children, and my mother even had another child to come, so what I think she — understandably — really meant was that she was so ready, she was so ready. Then she said,"Don ' t worry, Julie. Every year on October 10th, when it was your birthday but you didn ' t realize it, I made sure that you ate a piece of cake that day."Which was comforting, but troubling. My mother had been celebrating my birthday with me, without me. What was so upsetting about this new piece of information was not that I had to change the date of my slumber party with all of my girlfriends. What was most upsetting was that this meant I was not a Virgo. I had a huge Virgo poster in my bedroom. And I read my horoscope every single day, and it was so totally me. And this meant that I was a Libra? So, I took the bus downtown to get the new Libra poster. The Virgo poster is a picture of a beautiful woman with long hair, sort of lounging by some water, but the Libra poster is just a huge scale. This was around the time that I started filling out physically, and I was filling out a lot more than a lot of the other girls, and frankly, the whole idea that my astrological sign was a scale just seemed ominous and depressing. But I got the new Libra poster, and I started to read my new Libra horoscope, and I was astonished to find that it was also totally me. It wasn ' t until years later, looking back on this whole age-of-reason, change- of-birthday thing, that it dawned on me : I wasn ' t turning seven when I thought I turned seven. I had a whole other month to do anything I wanted to before God started keeping tabs on me. Oh, life can be so cruel. One day, two Mormon missionaries came to my door. Now, I just live off a main thoroughfare in Los Angeles, and my block is — well, it ’ s a natural beginning for people who are peddling things door to door. Sometimes I get little old ladies from the Seventh Day Adventist Church showing me these cartoon pictures of heaven. And sometimes I get teenagers who promise me that they won ’ t join a gang and just start robbing people, if I only buy some magazine subscriptions from them. So normally, I just ignore the doorbell, but on this day, I answered. And there stood two boys, each about 19, in white, starched short-sleeved shirts, and they had little name tags that identified them as official representatives of the Church of Jesus Christ of Latter-day Saints, and they said they had a message for me, from God. I said,”A message for me? From God?”And they said,”Yes.”Now, I was raised in the Pacific Northwest, around a lot of Church of Latter-day Saints people and, you know, I ’ ve worked with them and even dated them, but I never really knew the doctrine, or what they said to people when they were out on a mission, and I guess I was sort of curious, so I said,”Well, please, come in.”And they looked really happy, because I don ’ t think this happens to them all that often. And I sat them down, and I got them glasses of water — Ok, I got it, I got it. I got them glasses of water. Don ’ t touch my hair, that ’ s the thing. You can ’ t put a video of myself in front of me and expect me not to fix my hair. Ok. So I sat them down and I got them glasses of water, and after niceties, they said,”Do you believe that God loves you with all his heart?”And I thought,”Well, of course I believe in God, but you know, I don ’ t like that word ’ heart, ’ because it anthropomorphizes God, and I don ’ t like the word, ’ his, ’ either, because that sexualizes God.”But I didn ’ t want to argue semantics with these boys, so after a very long, uncomfortable pause, I said,”Yes, yes, I do. I feel very loved.”And they looked at each other and smiled, like that was the right answer. And then they said,”Do you believe that we ’ re all brothers and sisters on this planet?”And I said,”Yes, I do.”And I was so relieved that it was a question I could answer so quickly. And they said,”Well, then we have a story to tell you.”And they told me this story all about this guy named Lehi, who lived in Jerusalem in 600 BC. Now, apparently in Jerusalem in 600 BC, everyone was completely bad and evil. Every single one of them : man, woman, child, infant, fetus. And God came to Lehi and said to him,”Put your family on a boat and I will lead you out of here.”And God did lead them. He led them to America. I said,”America? From Jerusalem to America by boat in 600 BC?”And they said,”Yes.”Then they told me how Lehi and his descendants reproduced and reproduced, and over the course of 600 years, there were two great races of them, the Nephites and the Lamanites, and the Nephites were totally good — each and every one of them — and the Lamanites were totally bad and evil — every single one of them just bad to the bone. Then, after Jesus died on the cross for our sins, on his way up to heaven, he stopped by America and visited the Nephites. And he told them that if they all remained totally, totally good — each and every one of them — they would win the war against the evil Lamanites. But apparently somebody blew it, because the Lamanites were able to kill all the Nephites. All but one guy, this guy named Mormon, who managed to survive by hiding in the woods. And he made sure this whole story was written down in reformed Egyptian hieroglyphics chiseled onto gold plates, which he then buried near Palmyra, New York. Well, I was just on the edge of my seat. I said,”What happened to the Lamanites?”And they said,”Well, they became our Native Americans, here in the U. S.”And I said,”So, you believe the Native Americans are descended from a people who were totally evil?”And they said,”Yes.”Then they told me how this guy named Joseph Smith found those buried gold plates right in his backyard, and he also found this magic stone back there that he put into his hat and then buried his face into, and this allowed him to translate the gold plates from the reformed Egyptian into English. Well, at this point I just wanted to give these two boys some advice about their pitch. I wanted to say —"Ok, don ' t start with this story."I mean, even the Scientologists know to start with a personality test before they start — telling people all about Xenu, the evil intergalactic overlord. Then, they said,"Do you believe that God speaks to us through his righteous prophets?"And I said,"No, I don ' t,"because I was sort of upset about this Lamanite story and this crazy gold plate story, but the truth was, I hadn ' t really thought this through, so I backpedaled a little and I said,"Well, what exactly do you mean by ' righteous '? And what do you mean by prophets? Like, could the prophets be women?"And they said,"No."And I said,"Why?"And they said,"Well, it ' s because God gave women a gift that is so spectacular, it is so wonderful, that the only gift he had left over to give men was the gift of prophecy."What is this wonderful gift God gave women, I wondered? Maybe their greater ability to cooperate and adapt? Women ' s longer lifespan? The fact that women tend to be much less violent than men? But no — it wasn ' t any of these gifts. They said,"Well, it ' s her ability to bear children."I said,"Oh, come on. I mean, even if women tried to have a baby every single year from the time they were 15 to the time they were 45, assuming they didn ' t die from exhaustion, it still seems like some women would have some time left over to hear the word of God."And they said,"No."Well, then they didn ' t look so fresh-faced and cute to me any more, but they had more to say. They said,"Well, we also believe that if you ' re a Mormon, and if you ' re in good standing with the church, when you die, you get to go to heaven and be with your family for all eternity."And I said,"Oh, dear. That wouldn ' t be such a good incentive for me."And they said,"Oh. Hey! Well, we also believe that when you go to heaven, you get your body restored to you in its best original state. Like, if you ' d lost a leg, well, you get it back. Or, if you ' d gone blind, you could see."I said,"Oh. Now, I don ' t have a uterus, because I had cancer a few years ago. So does this mean that if I went to heaven, I would get my old uterus back?"And they said,"Sure."And I said,"I don ' t want it back. I ' m happy without it."Gosh. What if you had a nose job and you liked it? Would God force you to get your old nose back? Then they gave me this Book of Mormon, told me to read this chapter and that chapter, and said they ' d come back and check in on me, and I think I said something like,"Please don ' t hurry,"or maybe just,"Please don ' t,"and they were gone. Ok, so I initially felt really superior to these boys, and smug in my more conventional faith. But then the more I thought about it, the more I had to be honest with myself. If someone came to my door and I was hearing Catholic theology and dogma for the very first time, and they said,"We believe that God impregnated a very young girl without the use of intercourse, and the fact that she was a virgin is maniacally important to us.""And she had a baby, and that ' s the son of God,"I mean, I would think that ' s equally ridiculous. I ' m just so used to that story. So, I couldn ' t let myself feel condescending towards these boys. But the question they asked me when they first arrived really stuck in my head : Did I believe that God loved me with all his heart? Because I wasn ' t exactly sure how I felt about that question. Now, if they had asked me,"Do you feel that God loves you with all his heart?"Well, that would have been much different, I think I would have instantly answered,"Yes, yes, I feel it all the time. I feel God ' s love when I ' m hurt and confused, and I feel consoled and cared for. I take shelter in God ' s love when I don ' t understand why tragedy hits, and I feel God ' s love when I look with gratitude at all the beauty I see."But since they asked me that question with the word"believe"in it, somehow it was all different, because I wasn ' t exactly sure if I believed what I so clearly felt.

About 10 years ago, I took on the task to teach global development to Swedish undergraduate students. That was after having spent about 20 years, together with African institutions, studying hunger in Africa. So I was sort of expected to know a little about the world. And I started, in our medical university, Karolinska Institute, an undergraduate course called Global Health. But when you get that opportunity, you get a little nervous. I thought, these students coming to us actually have the highest grade you can get in the Swedish college system, so I thought, maybe they know everything I ' m going to teach them about. So I did a pretest when they came. And one of the questions from which I learned a lot was this one :"Which country has the highest child mortality of these five pairs?"And I put them together so that in each pair of countries, one has twice the child mortality of the other. And this means that it ' s much bigger, the difference, than the uncertainty of the data. I won ' t put you at a test here, but it ' s Turkey, which is highest there, Poland, Russia, Pakistan and South Africa. And these were the results of the Swedish students. I did it so I got the confidence interval, which is pretty narrow. And I got happy, of course — a 1. 8 right answer out of five possible. That means there was a place for a professor of international health and for my course. But one late night, when I was compiling the report, I really realized my discovery. I have shown that Swedish top students know, statistically, significantly less about the world than the chimpanzees. Because the chimpanzee would score half right if I gave them two bananas with Sri Lanka and Turkey. They would be right half of the cases. But the students are not there. The problem for me was not ignorance ; it was preconceived ideas. I did also an unethical study of the professors of the Karolinska Institute, which hands out the Nobel Prize in Medicine, and they are on par with the chimpanzee there. This is where I realized that there was really a need to communicate, because the data of what ' s happening in the world and the child health of every country is very well aware. So we did this software, which displays it like this. Every bubble here is a country. This country over here is China. This is India. The size of the bubble is the population, and on this axis here, I put fertility rate. Because my students, what they said when they looked upon the world, and I asked them,"What do you really think about the world?"Well, I first discovered that the textbook was Tintin, mainly. And they said,"The world is still ' we ' and ' them. ' And ' we ' is the Western world and ' them ' is the Third World.""And what do you mean with ' Western world? '"I said."Well, that ' s long life and small family. And ' Third World ' is short life and large family."So this is what I could display here. I put fertility rate here — number of children per woman : one, two, three, four, up to about eight children per woman. We have very good data since 1962, 1960, about, on the size of families in all countries. The error margin is narrow. Here, I put life expectancy at birth, from 30 years in some countries, up to about 70 years. And in 1962, there was really a group of countries here that were industrialized countries, and they had small families and long lives. And these were the developing countries. They had large families and they had relatively short lives. Now, what has happened since 1962? We want to see the change. Are the students right? It ' s still two types of countries? Or have these developing countries got smaller families and they live here? Or have they got longer lives and live up there? Let ' s see. We stopped the world then. This is all UN statistics that have been available. Here we go. Can you see there? It ' s China there, moving against better health there, improving there. All the green Latin American countries are moving towards smaller families. Your yellow ones here are the Arabic countries, and they get longer life, but not larger families. The Africans are the green here. They still remain here. This is India ;

Indonesia is moving on pretty fast. In the ’ 80s here, you have Bangladesh still among the African countries. But now, Bangladesh — it ’ s a miracle that happens in the ’ 80s — the imams start to promote family planning, and they move up into that corner. And in the ’ 90s, we have the terrible HIV epidemic that takes down the life expectancy of the African countries. And the rest of them all move up into the corner, where we have long lives and small family, and we have a completely new world. Let me make a comparison directly between the United States of America and Vietnam. 1964 : America had small families and long life ; Vietnam had large families and short lives. And this is what happens. The data during the war indicate that even with all the death, there was an improvement of life expectancy. By the end of the year, family planning started in Vietnam, and they went for smaller families. And the United States up there is getting longer life, keeping family size. And in the ’ 80s now, they give up Communist planning and they go for market economy, and it moves faster even than social life. And today, we have in Vietnam the same life expectancy and the same family size here in Vietnam, 2003, as in United States, 1974, by the end of the war. I think we all, if we don ’ t look at the data, we underestimate the tremendous change in Asia, which was in social change before we saw the economic change. So let ’ s move over to another way here in which we could display the distribution in the world of income. This is the world distribution of income of people. One dollar, 10 dollars or 100 dollars per day. There ’ s no gap between rich and poor any longer. This is a myth. There ’ s a little hump here. But there are people all the way. And if we look where the income ends up, this is 100 percent of the world ’ s annual income. And the richest 20 percent, they take out of that about 74 percent. And the poorest 20 percent, they take about two percent. And this shows that the concept of developing countries is extremely doubtful. We think about aid, like these people here giving aid to these people here. But in the middle, we have most of the world population, and they have now 24 percent of the income. We heard it in other forms. And who are these? Where are the different countries? I can show you Africa. This is Africa. Ten percent of the world population, most in poverty. This is OECD — the rich countries, the country club of the UN. And they are over here on this side. Quite an overlap between Africa and OECD. And this is Latin America. It has everything on this earth, from the poorest to the richest in Latin America. And on top of that, we can put East Europe, we can put East Asia, and we put South Asia. And what did it look like if we go back in time, to about 1970? Then, there was more of a hump. And most who lived in absolute poverty were Asians. The problem in the world was the poverty in Asia. And if I now let the world move forward, you will see that while population increases, there are hundreds of millions in Asia getting out of poverty, and some others getting into poverty, and this is the pattern we have today. And the best projection from the World Bank is that this will happen, and we will not have a divided world. We ’ ll have most people in the middle. Of course it ’ s a logarithmic scale here, but our concept of economy is growth with percent. We look upon it as a possibility of percentile increase. If I change this and take GDP per capita instead of family income, and I turn these individual data into regional data of gross domestic product, and I take the regions down here, the size of the bubble is still the population. And you have the OECD there, and you have sub-Saharan Africa there, and we take off the Arab states there, coming both from Africa and from Asia, and we put them separately, and we can expand this axis, and I can give it a new dimension here, by adding the social values there, child survival. Now I have money on that axis, and I have the possibility of children to survive there. In some countries, 99. 7 % of children survive to five years of age ; others, only 70. And here, it seems, there is a gap between OECD, Latin America, East Europe, East Asia, Arab states, South Asia and sub-Saharan Africa. The linearity is very strong between child survival and money. But let me split sub-Saharan Africa. Health is there and better health is up there. I can go here, and I can split sub-Saharan Africa into its countries. And when it bursts, the size of each country bubble is the size of the population. Sierra Leone down there, Mauritius is up there. Mauritius was the first country to get away with trade barriers, and they could sell their sugar, they could sell their textiles, on equal terms as the people in Europe and North America. There ' s a huge difference [within] Africa. And Ghana is here in the middle. In Sierra Leone, humanitarian aid. Here in Uganda, development aid. Here, time to invest ; there, you can go for a holiday. There ' s tremendous variation within Africa, which we very often make that it ' s equal everything. I can split South Asia here. India ' s the big bubble in the middle. But there ' s a huge difference between Afghanistan and Sri Lanka. I can split Arab states. How are they? Same climate, same culture, same religion — huge difference. Even between neighbors — Yemen, civil war ; United Arab Emirates, money, which was quite equally and well-used. Not as the myth is. And that includes all the children of the foreign workers who are in the country. Data is often better than you think. Many people say data is bad. There is an uncertainty margin, but we can see the difference here : Cambodia, Singapore. The differences are much bigger than the weakness of the data. East Europe : Soviet economy for a long time, but they come out after 10 years very, very differently. And there is Latin America. Today, we don ' t have to go to Cuba to find a healthy country in Latin America. Chile will have a lower child mortality than Cuba within some few years from now. Here, we have high-income countries in the OECD. And we get the whole pattern here of the world, which is more or less like this. And if we look at it, how the world looks, in 1960, it starts to move. This is Mao Zedong. He brought health to China. And then he died. And then Deng Xiaoping came and brought money to China, and brought them into the mainstream again. And we have seen how countries move in different directions like this, so it ' s sort of difficult to get an example country which shows the pattern of the world. But I would like to bring you back to about here, at 1960. I would like to compare South Korea, which is this one, with Brazil, which is this one. The label went away for me here. And I would like to compare Uganda, which is there. I can run it forward, like this. And you can see how South Korea is making a very, very fast advancement, whereas Brazil is much slower. And if we move back again, here, and we put trails on them, like this, you can see again that the speed of development is very, very different, and the countries are moving more or less at the same rate as money and health, but it seems you can move much faster if you are healthy first than if you are wealthy first. And to show that, you can put on the way of United Arab Emirates. They came from here, a mineral country. They cached all the oil ; they got all the money ; but health cannot be bought at the supermarket. You have to invest in health. You have to get kids into schooling. You have to train health staff. You have to educate the population. And Sheikh Zayed did that in a fairly good way. In spite of falling oil prices, he brought this country up here. So we ' ve got a much more mainstream appearance of the world, where all countries tend to use their money better than they used it in the past. Now, this is, more or less, if you look at the average data of the countries — they are like this. That ' s dangerous, to use average data, because there is such a lot of difference within countries. So if I go and look here, we can see that Uganda today is where South Korea was in 1960. If I split Uganda, there ' s quite a difference within Uganda. These are the quintiles of Uganda. The richest 20 percent of Ugandans are there. The poorest are down there. If I split South Africa, it ' s like this. And if I go down and look at Niger, where there was such a terrible famine [recently], it ’ s like this. The 20 percent poorest of Niger is out here, and the 20 percent richest of South Africa is there, and yet we tend to discuss what solutions there should be in Africa. Everything in this world exists in Africa. And you can ’ t discuss universal access to HIV [treatment] for that quintile up here with the same strategy as down here. The improvement of the world must be highly contextualized, and it ’ s not relevant to have it on a regional level. We must be much more detailed. We find that students get very excited when they can use this. And even more, policy makers and the corporate sectors would like to see how the world is changing. Now, why doesn ’ t this take place? Why are we not using the data we have? We have data in the United Nations, in the national statistical agencies and in universities and other nongovernmental organizations. Because the data is hidden down in the databases. And the public is there, and the internet is there, but we have still not used it effectively. All that information we saw changing in the world does not include publicly funded statistics. There are some web pages like this, you know, but they take some nourishment down from the databases, but people put prices on them, stupid passwords and boring statistics. And this won ’ t work. So what is needed? We have the databases. It ’ s not a new database that you need. We have wonderful design tools and more and more are added up here. So we started a nonprofit venture linking data to design, we called”Gapminder,”from the London Underground, where they warn you,”Mind the gap.”So we thought Gapminder was appropriate. And we started to write software which could link the data like this. And it wasn ’ t that difficult. It took some person years, and we have produced animations. You can take a data set and put it there. We are liberating UN data, some few UN organization. Some countries accept that their databases can go out on the world. But what we really need is, of course, a search function, a search function where we can copy the data up to a searchable format and get it out in the world. And what do we hear when we go around? I ’ ve done anthropology on the main statistical units. Everyone says,”It ’ s impossible. This can ’ t be done. Our information is so peculiar in detail, so that cannot be searched as others can be searched. We cannot give the data free to the students, free to the entrepreneurs of the world.”But this is what we would like to see, isn ’ t it? The publicly funded data is down here. And we would like flowers to grow out on the net. One of the crucial points is to make them searchable, and then people can use the different design tools to animate it there. And I have pretty good news for you. I have good news that the [current], new head of UN statistics doesn ’ t say it ’ s impossible. He only says,”We can ’ t do it.”And that ’ s a quite clever guy, huh? So we can see a lot happening in data in the coming years. We will be able to look at income distributions in completely new ways. This is the income distribution of China, 1970. This is the income distribution of the United States, 1970. Almost no overlap. Almost no overlap. And what has happened? What has happened is this : that China is growing, it ’ s not so equal any longer, and it ’ s appearing here, overlooking the United States, almost like a ghost, isn ’ t it? It ’ s pretty scary. But I think it ’ s very important to have all this information. We need really to see it. And instead of looking at this, I would like to end up by showing the internet users per 1, 000. In this software, we access about 500 variables from all the countries quite easily. It takes some time to change for this, but on the axes, you can quite easily get any variable you would like to have. And the thing would be to get up the databases free, to get them searchable, and with a second click, to get them into the graphic formats, where you can instantly understand them. Now, statisticians don ’ t like it, because they say that this will not show the reality ; we have to have statistical, analytical methods. But this is hypothesis-generating. I end now with the world. There, the internet is coming. The number of internet users are going up like this. This is the GDP per capita. And it ' s a new technology coming in, but then amazingly, how well it fits to the economy of the countries. That ' s why the $100 computer will be so important. But it ' s a nice tendency. It ' s as if the world is flattening off, isn ' t it? These countries are lifting more than the economy, and it will be very interesting to follow this over the year, as I would like you to be able to do with all the publicly funded data. Thank you very much.

When I was five years old I fell in love with airplanes. Now I ' m talking about the ' 30s. In the ' 30s an airplane had two wings and a round motor, and was always flown by a guy who looked like Cary Grant. He had high leather boots, jodhpurs, an old leather jacket, a wonderful helmet and those marvelous goggles — and, inevitably, a white scarf, to flow in the wind. He ' d always walk up to his airplane in a kind of saunter, devil-may-care saunter, flick the cigarette away, grab the girl waiting here, give her a kiss. And then mount his airplane, maybe for the last time. Of course I always wondered what would happen if he ' d kissed the airplane first. But this was real romance to me. Everything about flying in those years, which was — you have to stop and think for a moment — was probably the most advanced technological thing going on at the time. So as a youngster, I tried to get close to this by drawing airplanes, constantly drawing airplanes. It ' s the way I got a part of this romance. And of course, in a way, when I say romance, I mean in part the aesthetics of that whole situation. I think the word is the holistic experience revolving around a product. The product was that airplane. But it built a romance. Even the parts of the airplane had French names. Ze fuselage, ze empanage, ze nessal. You know, from a romance language. So that it was something that just got into your spirit. It did mine. And I decided I had to get closer than just drawing fantasy airplanes. I wanted to build airplanes. So I built model airplanes. And I found that in doing the model airplanes the appearance drawings were not enough. You couldn ' t transfer those to the model itself. If you wanted it to fly you had to learn the discipline of flying. You had to learn about aeronautics. You had to learn what made an airplane stay in the air. And of course, as a model in those years, you couldn ' t control it. So it had to be self-righting, and stay up without crashing. So I had to give up the approach of drawing the fantasy shapes and convert it to technical drawings — the shape of the wing, the shape of the fuselage and so on — and build an airplane over these drawings that I knew followed some of the principles of flying. And in so doing, I could produce a model that would fly, stay in the air. And it had, once it was in the air, some of this romance that I was in love with. Well the act of drawing airplanes led me to, when I had the opportunity to choose a course in school, led me to sign up for aeronautical engineering. And when I was sitting in classes — in which no one asked me to draw an airplane — to my surprise. I had to learn mathematics and mechanics and all this sort of thing. I ' d wile away my time drawing airplanes in the class. One day a young man looked over my shoulder, he said,"You draw very well. You should be in the art department."And I said,"Why?"And he said,"Well for one thing, there are more girls there."So my romance was temporarily shifted. And I went into art because they appreciated drawing. Studied painting ; didn ' t do very well at that. Went through design, some architecture. Eventually hired myself out as a designer. And for the following 25 years, living in Italy, living in America, I doled out a piece of this romance to anybody who ' d pay for it — this sense, this aesthetic feeling, for the experience revolving around a designed object. And it exists. Any of you who rode the automobiles — was it yesterday? — at the track, you know the romance revolving around those high performance cars. Well in 25 years I was mostly putting out pieces of this romance and not getting a lot back in because design on call doesn ’ t always connect you with a circumstance in which you can produce things of this nature. So after 25 years I began to feel as though I was running dry. And I quit. And I started up a very small operation — went from 40 people to one, in an effort to rediscover my innocence. I wanted to get back where the romance was. And I couldn ’ t choose airplanes because they had gotten sort of unromantic at that point, even though I ’ d done a lot of airplane work, on the interiors. So I chose furniture. And I chose chairs specifically because I knew something about them. I ’ d designed a lot of chairs, over the years for tractors and trucks and submarines — all kinds of things. But not office chairs. So I started doing that. And I found that there were ways to duplicate the same approach that I used to use on the airplane. Only this time, instead of the product being shaped by the wind, it was shaped by the human body. So the discipline was — as in the airplane you learn a lot about how to deal with the air, for a chair you have to learn a lot about how to deal with the body, and what the body needs, wants, indicates it needs. And that ’ s the way, ultimately after some ups and downs, I ended up designing the chair I ’ m going to show you. I should say one more thing. When I was doing those model airplanes, I did everything. I conceived the kind of airplane. I basically engineered it. I built it. And I flew it. And that ’ s the way I work now. When I started this chair it was not a preconceived notion. Design nowadays, if you mean it, you don ’ t start with styling sketches. I started with a lot of loose ideas, roughly eight or nine years ago. And the loose ideas had something to do with what I knew happened with people in the office, at the work place — people who worked, and used task seating, a great many of them sitting in front of a computer all day long. And I felt, the one thing they don ’ t need, is a chair that interferes with their main reason for sitting there. So I took the approach that the chair should do as much for them as humanly possible or as mechanistically possible so that they didn ’ t have to fuss with it. So my idea was that, instead of sitting down and reaching for a lot of controls, that you would sit on the chair, and it would automatically balance your weight against the force required to recline. Now that may not mean a lot to some of you. But you know most good chairs do recline because it ’ s beneficial to open up this joint between your legs and your upper body for better breathing and better flow. So that if you sit down on my chair, whether you ’ re five feet tall or six foot six, it always deals with your weight and transfers the amount of force required to recline in a way that you don ’ t have to look for something to adjust. I ’ ll tell you right up front, this is a trade off. There are drawbacks to this. One is : you can ’ t accommodate everybody. There are some very light people, some extremely heavy people, maybe people with a lot of bulk up top. They begin to fall off the end of your chart. But the compromise, I felt, was in my favor because most people don ’ t adjust their chairs. They will sit in them forever. I had somebody on the bus out to the racetrack tell me about his sister calling him. He said she had one of the new, better chairs. She said,”Oh I love it.”She said,”But it ’ s too high.”So he said,”Well I ’ ll come over and look at it.”He came over and looked at it. He reached down. He pulled a lever. And the chair sank down. She said,”Oh it ’ s wonderful. How did you do that?”And he showed her the lever. Well, that ’ s typical of a lot of us working in chairs. And why should you get a 20-page manual about how to run a chair? I had one for a wristwatch once. 20 pages. Anyway, I felt that it was important that you didn ’ t have to make an adjustment in order to get this kind of action. The other thing I felt was that armrests had never really been properly approached from the standpoint of how much of an aid they could be to your work life. But I felt it was too much to ask to have to adjust each individual armrest in order to get it where you wanted. So I spent a long time. I said I worked eight or nine years on it. And each of these things went along sort of in parallel but incrementally were a problem of their own. I worked a long time on figuring out how to move the arms over a much greater arc — that is up and down — and make them a lot easier, so that you didn ' t have to use a button. And so after many trials, many failures, we came up with a very simple arrangement in which we could just move one arm or the other. And they go up easily. And stop where you want. You can put them down, essentially out of the way. No arms at all. Or you can pull them up where you want them. And this was another thing that I felt, while not nearly as romantic as Cary Grant, nevertheless begins to grab a little bit of aesthetic operation, aesthetic performance into a product. The next area that was of interest to me was the fact that reclining was a very important factor. And the more you can recline, in a way, the better it is. The more the angle between here and here opens up — and nowadays, with a screen in front of you, you don ' t want to have your eye drop too far in the recline, so we keep it at more or less the same level — but you transfer weight off your tailbones. Would everybody put their hand under their bottom and feel their tailbone? You feel that bone under there? Just your own. There ' s two of them, one on either side. All the weight of your upper torso — your arms, your head — goes right down through your back, your spine, into those bones when you sit. And that ' s a lot of load. Just relieving your arms with armrests takes 20 percent of that load off. Now that, if your spine is not held in a good position, will help bend your spine the wrong way, and so on. So to unload that great weight — if that indeed exists — you can recline. When you recline you take away a lot of that load off your bottom end, and transfer it to your back. At the same time, as I say, you open up this joint. And breathability is good. But to do that, if you have any amount of recline, it gets to the point where you need a headrest because nearly always, automatically hold your head in a vertical position, see? As I recline, my head says more or less vertical. Well if you ' re reclined a great deal, you have to use muscle force to hold your head there. So that ' s where a headrest comes in. Now headrest is a challenge because you want it to adjust enough so that it ' ll fit, you know, a tall guy and a short girl. So here we are. I ' ve got five inches of adjustment here in order to get the headrest in the right place. But then I knew from experience and looking around in offices where there were chairs with headrests that nobody would ever bother to reach back and turn a knob and adjust the headrest to put it in position. And you need it in a different position when you ' re upright, then when you ' re reclined. So I knew that had to be solved, and had to be automatic. So if you watch this chair as I recline, the headrest comes up to meet my neck. Ideally you want to put the head support in the cranial area, right there. So that part of it took a long time to work out. And there is a variety of other things : the shape of the cushions, the gel we put. We stole the idea from bicycle seats, and put gel in the cushions and in the armrests to absorb point load — distributes the loading so you don ' t get hard spots. You cant hit your elbow on bottom. And I did want to demonstrate the fact that the chair can accommodate people. While you ' re sitting in it you can adjust it down for the five-footer, or you can adjust it for the six-foot- six guy — all within the scope of a few simple adjustments.

One thing I wanted to say about film making is â about this film â in thinking about some of the wonderful talks we ’ ve heard here, Michael Moschen, and some of the talks about music, this idea that there is a narrative line, and that music exists in time. A film also exists in time ; it ’ s an experience that you should go through emotionally. And in making this film I felt that so many of the documentaries I ’ ve seen were all about learning something, or knowledge, or driven by talking heads, and driven by ideas. And I wanted this film to be driven by emotions, and really to follow my journey. So instead of doing the talking head thing, instead it ’ s composed of scenes, and we meet people along the way. We only meet them once. They don ’ t come back several times, so it really chronicles a journey. It ’ s something like life, that once you get in it you can ’ t get out. There are two clips I want to show you, the first one is a kind of hodgepodge, its just three little moments, four little moments with three of the people who are here tonight. It ’ s not the way they occur in the film, because they are part of much larger scenes. They play off each other in a wonderful way. And that ends with a little clip of my father, of Lou, talking about something that is very dear to him, which is the accidents of life. I think he felt that the greatest things in life were accidental, and perhaps not planned at all. And those three clips will be followed by a scene of perhaps what, to me, is really his greatest building which is a building in Dhaka, Bangladesh. He built the capital over there. And I think you ’ ll enjoy this building, it ’ s never been seen â it ’ s been still photographed, but never photographed by a film crew. We were the first film crew in there. So you ’ ll see images of this remarkable building. A couple of things to keep in mind when you see it, it was built entirely by hand, I think they got a crane the last year. It was built entirely by hand off bamboo scaffolding, people carrying these baskets of concrete on their heads, dumping them in the forms. It is the capital of the country, and it took 23 years to build, which is something they seem to be very proud of over there. It took as long as the Taj Mahal. Unfortunately it took so long that Lou never saw it finished. He died in 1974. The building was finished in 1983. So it continued on for many years after he died. Think about that when you see that building, that sometimes the things we strive for so hard in life we never get to see finished. And that really struck me about my father, in the sense that he had such belief that somehow, doing these things giving in the way that he gave, that something good would come out of it, even in the middle of a war, there was a war with Pakistan at one point, and the construction stopped totally and he kept working, because he felt,”Well when the war is done they ’ ll need this building.”So, those are the two clips I ’ m going to show. Roll that tape. Richard Saul Wurman : I remember hearing him talk at Penn. And I came home and I said to my father and mother,”I just met this man : doesn ’ t have much work, and he ’ s sort of ugly, funny voice, and he ’ s a teacher at school. I know you ’ ve never heard of him, but just mark this day that someday you will hear of him, because he ’ s really an amazing man.”Frank Gehry : I heard he had some kind of a fling with Ingrid Bergman. Is that true? Nathaniel Kahn : If he did he was a very lucky man. NK : Did you hear that, really? FG : Yeah, when he was in Rome. Moshe Safdie : He was a real nomad. And you know, when I knew him when I was in the office, he would come in from a trip, and he would be in the office for two or three days intensely, and he would pack up and go. You know he ’ d be in the office till three in the morning working with us and there was this kind of sense of the nomad in him. I mean as tragic as his death was in a railway station, it was so consistent with his life, you know? I mean I often think I ’ m going to die in a plane, or I ’ m going to die in an airport, or die jogging without an identification on me. I don ’ t know why I sort of carry that from that memory of the way he died. But he was a sort of a nomad at heart.

Louis Kahn : How accidental our existences are really and how full of influence by circumstance. Man : We are the morning workers who come, all the time, here and enjoy the walking, city ’ s beauty and the atmosphere and this is the nicest place of Bangladesh. We are proud of it. NK : You ’ re proud of it? Man : Yes, it is the national image of Bangladesh. NK : Do you know anything about the architect? Man : Architect? I ’ ve heard about him ; he ’ s a top-ranking architect. NK : Well actually I ’ m here because I ’ m the architect ’ s son, he was my father. Man : Oh! Dad is Louis Farrakhan? NK : Yeah. No not Louis Farrakhan, Louis Kahn. Man : Louis Kahn, yes! Man : Your father, is he alive? NK : No, he ’ s been dead for 25 years. Man : Very pleased to welcome you back. NK : Thank you. NK : He never saw it finished, Pop. No, he never saw this. Shamsul Wares : It was almost impossible, building for a country like ours. In 30, 50 years back, it was nothing, only paddy fields, and since we invited him here, he felt that he has got a responsibility. He wanted to be a Moses here, he gave us democracy. He is not a political man, but in this guise he has given us the institution for democracy, from where we can rise. In that way it is so relevant. He didn ’ t care for how much money this country has, or whether he would be able to ever finish this building, but somehow he has been able to do it, build it, here. And this is the largest project he has got in here, the poorest country in the world. NK : It cost him his life. SW : Yeah, he paid. He paid his life for this, and that is why he is great and we ’ ll remember him. But he was also human. Now his failure to satisfy the family life, is an inevitable association of great people. But I think his son will understand this, and will have no sense of grudge, or sense of being neglected, I think. He cared in a very different manner, but it takes a lot of time to understand that. In social aspect of his life he was just like a child, he was not at all matured. He could not say no to anything, and that is why, that he cannot say no to things, we got this building today. You see, only that way you can be able to understand him. There is no other shortcut, no other way to really understand him. But I think he has given us this building and we feel all the time for him, that ’ s why, he has given love for us. He could not probably give the right kind of love for you, but for us, he has given the people the right kind of love, that is important. You have to understand that. He had an enormous amount of love, he loved everybody. To love everybody, he sometimes did not see the very closest ones, and that is inevitable for men of his stature.

Text Sample 978: NEG Dim 6 – 2002 – Score 1.00 – 2002/t000333.txt

Thank you. Ooh, I ’ m like,”Phew, phew, calm down. Get back into my body now.”Usually when I play out, the first thing that happens is people scream out,”What ’ s she doing?!”I ’ ll play at these rock shows, be on stage standing completely still, and they ’ re like,”What ’ s she doing?! What ’ s she doing?!”And then I ’ ll kind of be like — — and then they ’ re like,”Whoa!”I ’ m sure you ’ re trying to figure out,”Well, how does this thing work?”Well, what I ’ m doing is controlling the pitch with my left hand. See, the closer I get to this antenna, the higher the note gets — — and you can get it really low. And with this hand I ’ m controlling the volume, so the further away my right hand gets, the louder it gets. So basically, with both of your hands you ’ re controlling pitch and volume and kind of trying to create the illusion that you ’ re doing separate notes, when really it ’ s continuously going... Sometimes I startle myself : I ’ ll forget that I have it on, and I ’ ll lean over to pick up something, and then it goes like — —”Oh!”And it ’ s like a funny sound effect that follows you around if you don ’ t turn the thing off. Maybe we ’ ll go into the next tune, because I totally lost where this is going. We ’ re going to do a song by David Mash called”Listen : the Words Are Gone,”and maybe I ’ ll have words come back into me afterwards if I can relax. So, I ’ m trying to think of some of the questions that are commonly asked ; there are so many. And... Well, I guess I could tell you a little of the history of the theremin. It was invented around the 1920s, and the inventor, Lon Theremin — he also was a musician besides an inventor — he came up with the idea for making the theremin, I think, when he was working on some shortwave radios. And there ’ d be that sound in the signal — it ’ s like — and he thought,”Oh, what if I could control that sound and turn it into an instrument, because there are pitches in it.”And so somehow through developing that, he eventually came to make the theremin the way it is now. And a lot of times, even kids nowadays, they ’ ll make reference to a theremin by going,”Whoo-hoo-hoo-hoo,”because in the ’ 50s it was used in the sci-fi horror movies, that sound that ’ s like... It ’ s kind of a funny, goofy sound to do. And sometimes if I have too much coffee, then my vibrato gets out of hand. You ’ re really sensitive to your body and its functions when you ’ re behind this thing. You have to stay so still if you want to have the most control. It reminds me of the balancing act earlier on — what Michael was doing — because you ’ re fighting so hard to keep the balance with what you ’ re playing with and stay in tune, and at the same time you don ’ t want to focus so much on being in tune all the time ; you want to be feeling the music. And then also, you ’ re trying to stay very, very, very still because little movements with other parts of your body will affect the pitch, or sometimes if you ’ re holding a low note — — and breathing will make it... If I pass out on the next song... I think of it almost like like a yoga instrument because it makes you so aware of every little crazy thing your body is doing, or just aware of what you don ’ t want it to be doing while you ’ re playing ; you don ’ t want to have any sudden movements. And if I go to a club and play a gig, people are like,”Here, have some drinks on us!”And it ’ s like,”Well, I ’ m about to go on soon ; I don ’ t want to be like — — you know?”It really does reflect the mood that you ’ re in also, if you ’ re... it ’ s similar to being a vocalist, except instead of it coming out of your throat, you ’ re controlling it just in the air and you don ’ t really have a point of reference ; you ’ re always relying on your ears and adjusting constantly. You just have to always adjust to what ’ s happening and realize you ’ ll have bummer notes come here and there and listen to it, adjust it, and just move on, or else you ’ ll get too tied up and go crazy. Like me. I think we will play another tune now. I ’ m going to do”Lush Life.”It ’ s one of my favorite tunes to play.

Video : Narrator : An event seen from one point of view gives one impression. Seen from another point of view, it gives quite a different impression. But it ’ s only when you get the whole picture you can fully understand what ’ s going on. Sasha Vucinic : It ’ s a great clip, isn ’ t it? And I found that in 29 seconds, it tells more about the power of, and importance of, independent media than I could say in an hour. So I thought that it will be good to start with it. And also start with a little bit of statistics. According to relevant researchers, 83 percent of the population of this planet lives in the societies without independent press. Think about that number : 83 percent of the population on the whole planet does not really know what is going on in their countries. The information they get gets filtered through somebody who either twists that information, or colors that information, does something with it. So they ’ re deprived of understanding their reality. That is just to understand how big and important this problem is.

Now those of you who are lucky enough to live in those societies that represent 17 percent, I think should enjoy it until it lasts. You know, Sunday morning, you flick the paper, get your cappuccino. Enjoy it while it lasts. Because as we heard yesterday, countries can lose stars from their flags, but they can also lose press freedom, as I guess Americans among us can tell us more about. But that ’ s totally another and separate topic. So I can go back to my story. My story starts — the story I want to share — starts in 1991. At that time I was running B92, the only independent, for that matter the only electronic media, in the country. And I guess we were sharing — we had that regular life of the only independent media in the country, operating in hostile environment, where government really wants to make your life miserable. And there are different ways. Yeah, it was the usual cocktail : a little bit of threats, a little bit of friendly advice, a little bit of financial police, a little bit of text control, so you always have somebody who never leaves your office. But what they really do, which is very powerful, and that is what governments in the late ’ 90s started doing if they don ’ t like independent media companies — you know, they threaten your advertisers. Once they threaten your advertisers, market forces are actually, you know, destroyed, and the advertisers do not want to come — no matter how much does it make sense for them — do not want to come and advertise. And you have a problem making ends meet. At that time at the beginning of the ’ 90s, we had that problem, which was, you know, survival below one side, but what was really painful for me was, remember, the beginning of the ’ 90s, Yugoslavia is falling apart. We were sitting over there with a country in a downfall, in a slow-motion downfall. And we all had all of that on tapes. We had the ability to understand what was going on. We were actually recording history. The problem was that we had to re-tape that history a week later ; because if we did not, we could not afford enough tapes to keep archives of that history. So if I gave you that picture, I don ’ t want to go too long on that. In that context a gentleman came to my office at that time. It was still 1991. He was running a media systems organization which is still in business, the gentleman is still in business. And what did I know at that time about media systems? I would think media systems were organizations, which means they should help you. So I prepared two plans for that meeting, two strategic plans : the small one and the big one. The small one was, I just wanted him to help us get those damn tapes, so we can keep that archive for the next 50 years. The big plan was to ask him for a 1, 000, 000-dollar loan. Because I thought, I still maintain, that serious and independent media companies are great business. And I thought that B92 will survive and be a great company once Milosevic is gone, which turned out to be true. It ’ s now probably either the biggest or the second biggest media company in the country. And I thought that the only thing that we needed at that time was 1, 000, 000-dollar loan to take us through those hard times. To make a long story short, the gentleman comes into the office, great suit and tie. I gave him what I thought was a brilliant explanation of the political situation and explained how hard and difficult the war will be. Actually, I underestimated the atrocities, I have to admit. Anyway, after that whole, big, long explanation, the only question he had for me — and this is not a joke — is, are we paying royalties after we broadcast music of Michael Jackson? That was really the only question he had. He left, and I remember being actually very angry at myself because I thought there must be an institution in the world that is providing loans to media companies. It ’ s so obvious, straight in your face, and somebody must have thought of it. Somebody must have started something like that. And I thought, I ’ m just dumb and I cannot find it. You know, in my defense, there was no Google at that time ; you could not just Google in ’ 91. So I thought that that ’ s actually my problem. Now we go from here, fast forward to 1995. I have — I left the country, I have a meeting with George Soros, trying for the third time to convince him that his foundation should invest in something that should operate like a media bank. And basically what I was saying is very simple. You know, forget about charity ; it doesn ’ t work. Forget about handouts ; 20, 000 dollars do not help anybody. What you should do is you should treat media companies as a business. It ’ s business anywhere. Media business, or any other business, it needs to be capitalized. And what these guys need, actually, is access to capital. So third meeting, arguments are pretty well exercised. At the end of the meeting he says, look, it is not going to work ; you will never see your money back ; but my foundations will put 500, 000 dollars so you can test the idea. See that it will not work. He said, I ’ ll give you a rope to hang yourself. I knew two things after that meeting. First, under no circumstances I want to hang myself. And second, that I have no idea how to make it work. You see, at the level of a concept, it was a great concept. But it ’ s one thing to have a concept ; it ’ s a totally separate thing to actually make it work. So I had absolutely no idea how that could actually work. Had the wrong idea ; I thought that we can be a bank. You see banks — I don ’ t know if there are any bankers over here ; I apologize in advance — but it ’ s the best job in the world. You know, you find somebody who is respectable and has a lot of money. You give them more money ; they repay you that over a time. You collect interest and do nothing in between. So I thought, why don ’ t we get into that business? So here we are having our first client, brilliant. First independent newspaper in Slovakia. The government cutting them off from all the printing facilities in Bratislava. So here ’ s the daily newspaper that has to be printed 400 kilometers away from the capital. It ’ s a daily newspaper with a deadline of 4 p. m. That means that they have no sports ; they have no latest news ; circulation goes down. It ’ s a kind of very nice, sophisticated way how to economically strangle a daily newspaper. They come to us with a request for a loan. They want to — the only way for them to survive is to get a printing press. And we said, that ’ s fine ; let ’ s meet ; you ’ ll bring us your business plan, which eventually they did. We start the meeting. I get these two pieces of paper, not like this, A4 format, so it ’ s much bigger. A lot of numbers there. A lot of numbers. But however you put it, you know, the numbers do not make any sense. And that ’ s the best they could do. We were the best that they could do. So that is how we understood what our method is. It ’ s not a bank. We had to actually go into these companies and earn our return by fixing them — by establishing management systems, by providing all that knowledge, how do you run a business on one side — while they all know how to run, how to create content. Just quickly on the results. Over these 10 years, 40 million dollars in affordable financing, average interest rate five percent to six percent. Lately we are going wild, charging seven percent from time to time. We do it in 17 countries of the developing world. And here is the most stunning number. Return rate — the one that Soros was so worried about — 97 percent. 97 percent of all the scheduled repayments came back to us on time. What do we typically finance? We finance anything that a media company would need, from printing presses to transmitters. What is most important is we do it either in form of loans, equities, lease — whatever is appropriate for, you know, supporting anybody. But what is most important here is, who do we finance? We believe that in the last 10 years companies that we ’ ve financed are actually the best media companies in the developing world. That is a”Who is Who”list. And I could spend hours talking about them, because they ’ re all kind of heroes. And I can, but I ’ ll give you just, maybe one, and depending on time I may give you two examples who we work with. You see we started working in Eastern and Central Europe, and moved to Russia. Our first loan in Russia was in Chelyabinsk. I ' ll bet half of you have never heard of that place. In the south of Russia there ' s a guy called Boris Nikolayevich Kirshin, who is running an independent newspaper there. The city was closed until early ' 90s because, of all things, they were producing glass for Tupolev planes. Anyway, he ' s running independent newspaper there. After two years working with us, he becomes the most respected newspaper in that small place. Governor comes to him one day, actually invites him to come to his office. He goes and sees the governor. The governor says, Boris Nikolayevich, I understand you are doing a great job, and you are the most respected newspaper in our district. And I want to offer you a deal. Can you please give me your newspaper for the next nine months, because I have elections — there are elections coming up in nine months. I will not run, but it ' s very important for me who is going to succeed me. So give me the paper for nine months. I ' ll give it back to you. I have no interest in being in media business. How much would that cost? Boris Nikolayevich says,"It ' s not for sale."The governor says,"We will close you."Boris Nikolayevich says,"No, you cannot do it."Six months later the newspaper was closed. Luckily, we had enough time to help Boris Nikolayevich take all the assets out of that company and bring him into a new one, to get all the subscription lists, rehire staff. So what the governor got was an empty shell. But that is what happens if you ' re in business of independent media, and if you are a banker for independent media. So it sounds like a great story. Somewhere down the road we opened a media management center. We started our media lab, sounds like a real great story. But there is a second angle to that. The second angle, like in this clip. If you take the camera above, you start thinking about these numbers again. 40 million dollars over 10 years spread over 17 countries. That is not too much, is it? It ' s actually just a drop in the sea. Because when you think about the importance, some of the issues that we were talking about last night — this last session we had about Africa and his hypothetical 50 billion dollars destined for Africa. All of those, not all, half of those problems mentioned last night — government accountability, corruption, how do you fight corruption, giving voice to unheard, to poor — it ' s why independent media is in business. And it ' s why it was invented. So from that perspective, what we did is just really one drop in the sea of that need that we can identify. Now ours is just one story. I ' m sure that in this room there are, like, 15 other wonderful stories of nonprofits doing spectacular work. Here is where the problem is, and I ' ll explain to you as well as I can what the problem is. And it ' s called fundraising. Imagine that this third of this room is filled with people who represent different foundations. Imagine two thirds over here running excellent organizations, doing very important work. Now imagine that every second person over here is deaf, does not hear, and switch the lights off. Now that is how difficult it is to match people from this side of the room with people of that side of the room. So we thought that some kind of a big idea is needed to reform, to totally rethink fundraising. You know, instead of people running in this dark, trying to find their own match, who will be willing, who has the same goals. Instead of all of that we thought there is — something new needs to be invented. And we came up with this idea of issuing bonds, press freedom bonds. If there are investors willing to finance U. S. government budget deficit, why wouldn ' t we find investors willing to finance press freedom deficit? We ' ve decided to do it this fall ; we will issue them, probably in denominations of 1, 000 dollars. I don ' t want to advertise them too much ; that ' s not the point. But the point is, if we ever survive to actually issue them, find enough investors that this can be considered a success, there ' s nothing stopping the next organization to start to issue bonds next spring. And those can be environmental bonds. And then two weeks later, Iqbal Quadir can issue his electricity in Bangladesh bonds. And before you know it, any social cause can be actually financed in this way. Now we do daydreaming in 11:30 with 55 seconds left. But let ’ s take the idea further. You do it, you start it in the States, because it ’ s, you know, concepts are very, very close to American minds. But you can actually bring it to Europe, too. You can bring it to Asia. You can, once you have all of those different points, you can make it easy for investors. Put all of those bonds at one place and they sit down and click. Once you have more than 10 of them you have to develop some kind of a matrix. What do investors get? On one side financial, on the other side social. So that brings the idea of some kind of rating agency, Morningstar type. It says, you know, social impact over here is spectacular, five stars. Financial, they give you one percent, only one star. Now take it to the last step. Once you have all of that put together, there ’ s not one reason why you couldn ’ t actually have a marketplace for all of that, where you cannot dispose of all of those bonds in a pretty quick way. And in that way you organize the financing so there are no dark rooms, no blind people running around to find each other. Thank you.

This is really a two-hour presentation I give to high school students, cut down to three minutes. And it all started one day on a plane, on my way to TED, seven years ago. And in the seat next to me was a high school student, a teenager, and she came from a really poor family. And she wanted to make something of her life, and she asked me a simple little question. She said,”What leads to success?”And I felt really badly, because I couldn ’ t give her a good answer. So I get off the plane, and I come to TED. And I think, jeez, I ’ m in the middle of a room of successful people! So why don ’ t I ask them what helped them succeed, and pass it on to kids? So here we are, seven years, 500 interviews later, and I ’ m going to tell you what really leads to success and makes TEDsters tick. And the first thing is passion. Freeman Thomas says,”I ’ m driven by my passion.”TEDsters do it for love ; they don ’ t do it for money. Carol Coletta says,”I would pay someone to do what I do.”And the interesting thing is : if you do it for love, the money comes anyway. Work! Rupert Murdoch said to me,”It ’ s all hard work. Nothing comes easily. But I have a lot of fun.”Did he say fun? Rupert? Yes! TEDsters do have fun working. And they work hard. I figured, they ’ re not workaholics. They ’ re workafrolics. Good! Alex Garden says,”To be successful, put your nose down in something and get damn good at it.”There ’ s no magic ; it ’ s practice, practice, practice. And it ’ s focus. Norman Jewison said to me,”I think it all has to do with focusing yourself on one thing.”And push! David Gallo says,”Push yourself. Physically, mentally, you ’ ve got to push, push, push.”You ’ ve got to push through shyness and self-doubt. Goldie Hawn says,”I always had self-doubts. I wasn ’ t good enough ; I wasn ’ t smart enough. I didn ’ t think I ’ d make it.”Now it ’ s not always easy to push yourself, and that ’ s why they invented mothers. Frank Gehry said to me,”My mother pushed me.”Serve! Sherwin Nuland says,”It was a privilege to serve as a doctor.”A lot of kids want to be millionaires. The first thing I say is :”OK, well you can ’ t serve yourself ; you ’ ve got to serve others something of value. Because that ’ s the way people really get rich.”Ideas! TEDster Bill Gates says,”I had an idea : founding the first micro- computer software company.”I ’ d say it was a pretty good idea. And there ’ s no magic to creativity in coming up with ideas — it ’ s just doing some very simple things. And I give lots of evidence. Persist! Joe Kraus says,”Persistence is the number one reason for our success.”You ’ ve got to persist through failure. You ’ ve got to persist through crap! Which of

course means”Criticism, Rejection, Assholes and Pressure.”So, the answer to this question is simple : Pay 4, 000 bucks and come to TED. Or failing that, do the eight things — and trust me, these are the big eight things that lead to success. Thank you TEDsters for all your interviews!

I don ’ t know about you, but I haven ’ t quite figured out exactly what technology means in my life. I ’ ve spent the past year thinking about what it really should be about. Should I be pro-technology? Should I embrace it full arms? Should I be wary? Like you, I ’ m very tempted by the latest thing. But at the other hand, a couple of years ago I gave up all of my possessions, sold all my technology — except for a bicycle — and rode across 3, 000 miles on the U. S. back roads under the power of my one body, fuelled mostly by Twinkies and junk food. And I ’ ve since then tried to keep technology at arm ’ s length in many ways, so it doesn ’ t master my life. At the same time, I run a website on cool tools, where I issue a daily obsession of the latest things in technology. So I ’ m still perplexed about what the true meaning of technology is as it relates to humanity, as it relates to nature, as it relates to the spiritual. And I ’ m not even sure we know what technology is. And one definition of technology is that which is first recorded. This is the first example of the modern use of technology that I can find. It was the suggested syllabus for dealing with the Applied Arts and Science at Cambridge University in 1829. Before that, obviously, technology didn ’ t exist. But obviously it did. I like one of the definitions that Alan Kay has for technology. He says technology is anything that was invented after you were born. So it sums up a lot of what we ’ re talking about. Danny Hillis actually has an update on that — he says technology is anything that doesn ’ t quite work yet. Which also, I think, gets into a little bit of our current idea. But I was interested in another definition of technology. Something, again, that went back to something more fundamental. Something that was deeper. And as I struggled to understand that, I came up with a way of framing the question that seemed to work for me in my investigations. And I ’ m, this morning, going to talk about this for the first time. So this is a very rough attempt to think out loud. The question that I came up with was this question : what does technology want? And by that, I don ’ t mean, does it want chocolate or vanilla? By what it wants, I mean, what are its inherent trends and biases? What are its tendencies over time? One way to think about this is thinking about biological organisms, which we ’ ve heard a lot about. And the trick that Richard Dawkins does, which is to say, to look at them as simply as genes, as vehicles for genes. So he ’ s saying, what do genes want? The selfish gene. And I ’ m applying a similar trick to say, what if we looked at the universe in our culture through the eyes of technology? What does technology want? Obviously, this in an incomplete question, just as looking at an organism as only a gene is an incomplete way of looking at it. But it ’ s still very, very productive. So I ’ m attempting to say, if we take technology ’ s view of the world, what does it want? And I think once we ask that question we have to go back, actually, to life. Because obviously, if we keep extending the origins of technology far back, I think we come back to life at some point. So that ’ s where I want to begin my little exploration, is in life. And like you heard from the previous speakers, we don ’ t really know what life there is on Earth right now. We have really no idea. Craig Venter ’ s tremendous and brilliant attempt to DNA sequence things in the ocean is great. Brian Farrell ’ s work is all part of this agenda to try and actually discover all the species on Earth. And one of the things that we should

do is just make a grid of the globe and randomly go and inspect all the places that the grid intersects, just to see what ’ s on life. And if we did that with our little Martian probe, which we have not done on Earth, we would begin to see some incredible species. This is not on another planet. These are things that are hidden away on our planet. This is an ant that stores its colleagues ’ honey in its abdomen. Each one of these organisms that we ’ ve described — that you ’ ve seen from Jamie and others, these magnificent things — what they ’ re doing, each one of them, is they ’ re hacking the rules of life. I can ’ t think of a single general principle of biology that does not have an exception somewhere by some organism. Every single thing that we can think of — and if you heard Olivia ’ s talk about the sexual habits, you ’ ll realize that there isn ’ t anything we can say that ’ s true for all life, because every single one of them is hacking something about it. This is a solar-powered sea slug. It ’ s a nudibranch that has incorporated chloroplast inside it to drive its energy. This is another version of that. This is a sea dragon, and the one on the bottom, the blue one, is a juvenile that has not yet swallowed the acid, has not yet taken in the brown-green algae pond scum into its body to give it energy. These are hacks, and if we looked at the general shape of the approaches to hacking life there are, current consensus, six kingdoms. Six different broad approaches : the plants, the animals, the fungi, the protests — the little things — the bacteria and the Archaea bacteria. The Archaeas. Those are the general approaches to life. That ’ s one way to look at life on Earth today. But a more interesting way, the current way to take the long view, is to look at it in an evolutionary perspective. And here we have a view of evolution where rather than having evolution go over the linear time, we have it coming out from the center. So in the center is the most primitive, and this is a genealogical chart of all life on earth. This is all the same six kingdoms. You see 4, 000 representative species, and you can see where we are. But what I like about this is it shows that every living organism on Earth today is equally evolved. Those fungi and bacteria are as highly evolved as humans. They ’ ve been around just as long and gone through just the same kind of trial and error to get here. But we see that each one of these is actually hacking, and has a different way of finding out how to do life. And if we take the long-term trends of life, if we begin to say, what does evolution want? There ’ s several things that we see. One of the things about evolution is that nowhere on Earth have we ever been where we don ’ t find life. We find life at the bottom of every long-term, long-distance drilling core into the center of rock that we bring up — and there ’ s bacteria in the pores of that rock. And wherever life is, it never retreats. It ’ s ubiquitous and it wants to be more. More and more of the inert matter of the globe is being touched and animated by life. The second thing is is we see diversity. We also see specialization. We see the movement from a general-purpose cell to the more specific and specialized. And we see a drift towards complexity that ’ s very intuitive. And actually, we have current data that does show that there is an actual drift towards complexity over time. And the last thing, I bring back this nudibranch. One of the things we see about life is that it moves from the inner to increasing sociability. And by that it means that there is more and more of life whose entire environment is other life. Like those chloroplast cells — they ’ re completely surrounded by other life. They never touch the inner matter. There is more and more co-evolution. And so the general, long-term trends of evolution are roughly these five : ubiquity, diversity, specialization, complexity and socialization. Now, I took that and said, OK, what are the long-term trends in technology? And again, my question is, what does technology want? And so, remarkably, I discovered that there ’ s also a drift toward specialization. That we see there ’ s a general hammer, and hammers become more and more specific over time. There ’ s obviously diversity. Huge numbers of things. This is all the contents of a Japanese home. I actually had my daughter — gave her a tally counter, and I gave her an assignment last summer to go around and count the number of species of technology in our household. And it came up with 6, 000 different species of products. I did some research and found out that the King of England, Henry VIII, had only about 7, 000 items in his household. And he was the King of England, and that was the entire wealth of England at the time. So we ’ re seeing huge numbers of diversity in the kinds of things. This is a scene from Star Wars where the 3PO comes out and he sees machines making machines. How depraved! Well, this is actually what we ’ re headed towards : world machines. And the technology is only being thrown out by other technologies. Most machines will only ever be in contact with other technology and not non-technology, or even life. And thirdly, the idea that machines are becoming biological and complex is at this point a cliche. And I ’ m happy to say, I was partly responsible for that cliche that machines are becoming biological, but that ’ s pretty evident. So the major trends in technology evolution actually are the same as in biological evolution. The same drives that we see towards ubiquity, towards diversity, towards socialization, towards complexity. That is maybe not a big surprise because if we map out, say, the evolution of armor, you can actually follow a sort of an evolutionary-type cladistic tree. I suggest that, in fact, technology is the seventh kingdom of life. That its operations and how it works is so similar that we can think of it as the seventh kingdom. And so it would be sort of approximately up there, coming out of the animal kingdom. And if we were to do that, we would find out — we could actually approach technology in this way. This is Niles Eldredge. He was the co-developer with Stephen Jay Gould of the theory of punctuated equilibrium. But as a sideline, he happens to collect cornets. He has one of the world ’ s largest collections — about 500 of them. And he has decided to treat them as if they were trilobites, or snails, and to do a morphological analysis, and try to derive their genealogical history over time. This is his chart, which is not quite published yet. But the most interesting aspect about this is that if you look at those red lines at the bottom, those indicate basically a parentage of a type of cornet that was no longer made. That does not happen in biology. When something is extinct, you can ’ t have it as your parent. But that does happen in technology. And it turns out that that ’ s so distinctive that you can actually look at this tree, and you can actually use it to determine that this is a technological system versus a biological system. In fact, this idea of resurrecting the whole idea is so important that I began to think about what happens with old technology. And it turns out that, in fact, technologies don ’ t die. So I suggested this to an historian of science, and he said,”Well, what about, you know, come on, what about steam cars? They ’ re not around anymore.”Well actually, they are. In fact, they ’ re so around that you can buy new parts for a Stanley steam automobile. And this is a website of a guy who ’ s selling brand new parts for the Stanley automobile. And the thing that I liked is sort of this one-click, add-to-your-cart button — — for buying steam valves. I mean, it was just — it was really there. And so, I began to think about, well, maybe that ’ s just a random sample. Maybe I should do this sort of in a more conservative way. So I took the great big 1895 Montgomery Ward ’ s catalog and I randomly went through it. And I took a page — not quite a random page — I took a page that was actually more difficult than others because lots of the pages are filled with things that are still being made. But I took this page and I said, how many of these things are still being made? And not antiques. I want to know how many of these things are still in production. And the answer is : all of them. All of them are still being produced. So you ’ ve got corn shellers. I don ’ t know who needs a corn sheller. Be it corn shellers — you ’ ve got ploughs ; you ’ ve got fan mills ; all these things — and these are not, again, antiques. These are — you can order these. You can go to the web and you can buy them now, brand-new made. So in a certain sense, technologies don ’ t die. In fact, you can buy, for 50 bucks, a stone-age knife made exactly the same way that they were made 10, 000 years ago. It ’ s short, bone handle, 50 bucks. And in fact, what ’ s important is that this information actually never died out. It ’ s not just that it was resurrected. It ’ s continued all along. And in Papua New Guinea, they were making stone axes until two decades ago, just as a course of practical matters. Even when we try to get rid of a technology, it ’ s actually very hard. So we ’ ve all heard about the Amish giving up cars. We ’ ve heard about the Japanese giving up guns. We ’ ve heard about this and that. But I actually went back and took what I could find, the examples in history where there have been prohibitions against technology, and then I tried to find out when they came back in, because they always came back in. And it turns out that the time, the duration of when they were outlawed and prohibited, is decreasing over time. And that basically, you can delay technology, but you can ’ t kill it. So this makes sense, because in a certain sense what culture is, is the accumulation of ideas. That ’ s what it ’ s for. It ’ s so that ideas don ’ t die out. And when we take that, we take this idea of what culture is doing and add it to what the long- term trajectory — again, in life ’ s evolution — we find that each case — each of the major transitions in life — what they ’ re really about is accelerating and changing the way in which evolution happens. They ’ re actually changing the way in which ideas are generated. So all these steps in evolution are increasing, basically, the evolution of evolvability. So what ’ s happening over time in life is that the ways in which you generate these new ideas, these new hacks, are increasing. And the real tricks are ways in which you kind of explore the way of exploring. And then what we see in the singularity, that prophesized by Kurzweil and others — his idea that technology is accelerating evolution. It ’ s accelerating the way in which we search for ideas. So if you have life hacking — life means hacking, the game of survival — then evolution is a way to extend the game by changing the rules of the game. And what technology is really about is better ways to evolve. That is what we call an”infinite game.”That ’ s the definition of”infinite game.”A finite game is play to win, and an infinite game is played to keep playing. And I believe that technology is actually a cosmic force. The origins of technology was not in 1829, but was actually at the beginning of the Big Bang, and at that moment the entire huge billions of stars in the universe were compressed. The entire universe was compressed into a little quantum dot, and it was so tight in there, there was no room for any difference at all. That ’ s the definition. There was no temperature. There was no difference whatsoever. And at the Big Bang, what it expanded was the potential for difference. So as it expands and as things expand what we have is the potential for differences, diversity, options, choices, opportunities, possibilities and freedoms. Those are all basically the same thing. And those are the things that technology brings us. That ’ s what technology is bringing us : choices, possibilities, freedoms. That ’ s what it ’ s about. It ’ s this expansion of room to make differences. And so a hammer, when we grab a hammer, that ’ s what we ’ re grabbing. And that ’ s why we continue to grab technology — because we want those things. Those things are good. Differences, freedom, choices, possibilities. And each time we make a new opportunity place, we ’ re allowing a platform to make new ones. And I think it ’ s really important. Because if you can imagine Mozart before the technology of the piano was invented — what a loss to society there would be. Imagine Van Gogh being born before the technologies of cheap oil paints. Imagine Hitchcock before the technologies of film. Somewhere, today, there are millions of young children being born whose technology of self-expression has not yet been invented. We have a moral obligation to invent technology so that every person on the globe has the potential to realize their true difference. We want a trillion zillion species of one individuals. That ’ s what technology really wants. I ’ m going to skip through some of the objections because I don ’ t have answers to why there ’ s deforestation. I don ’ t have an answer to the fact that there seem to be bad technologies. I don ’ t have an answer to how this impacts on our dignity, other than to suggest that maybe the seventh kingdom, because it ’ s so close to what life is about, maybe we can bring it back and have it help us monitor life. Maybe in some ways the fact that what we ’ re trying to do with technology is find a good home for it. It ’ s a terrible thing to spray DDT on cotton fields, but it ’ s a really good thing to use to eliminate millions of cases of death due to malaria in a small village. Our humanity is actually defined by technology. All the things that we think that we really like about humanity is being driven by technology. This is the infinite game. That ’ s what we ’ re talking about. You see, technology is a way to evolve the evolution. It ’ s a way to explore possibilities and opportunities and create more. And it ’ s actually a way of playing the game, of playing all the games. That ’ s what technology wants. And so when I think about what technology wants, I think that it has to do with the fact that every person here — and I really believe this — every person here has an assignment. And your assignment is to spend your life discovering what your assignment is. That recursive nature is the infinite game. And if you play that well, you ’ ll have other people involved, so even that game extends and continues even when you ’ re gone. That is the infinite game. And what technology is is the medium in which we play that infinite game. And so I think that we should embrace technology because it is an essential part of our journey in finding out who we are. Thank you.

In this rather long sort of marathon presentation, I ’ ve tried to break it up into three parts : the first being a whole lot of examples on how it can be a little bit more pleasurable to deal with a computer and really address the qualities of the human interface. And these will be some simple design qualities and they will also be some qualities of, if you will, the intelligence of interaction. Then the second part will really just be examples of new technologies — new media falling very much into that mold. Again, I will go through them as fast as possible. And then the last one will be some examples I ’ ve been able to collect, which I think illustrate this at least as best I can, in the world of entertainment. People have this belief — and I share most of it — that we will be using the TV screens or their equivalents for electronic books of the future. But then you think,”My God! What a terrible image you get when you look at still pictures on TV.”Well, it doesn ’ t have to be terrible. And that is a slide taken from a TV set and it was pre- processed to be very sympathetic to the TV medium, and it absolutely looks beautiful. Well, what ’ s happened? How did people get into this mess? Where you are now, all of a sudden, sitting in front of personal computers and video text — teletext systems, and somewhat horrified by what you see on the screen? Well, you have to remember that TV was designed to be looked at eight times the distance of the diagonal. So you get a 13-inch, 19-inch, whatever, TV, and then you should multiply that by eight and that ’ s the distance you should sit away from the TV set. Now we ’ ve put people 18 inches in front of a TV, and all the artifacts that none of the original designers expected to be seen, all of a sudden, are staring you in the face : the shadow mask, the scan lines, all of that. And they can be treated very easily ; there are actually ways of getting rid of them, there are actually ways of just making absolutely beautiful pictures. I ’ m talking here a little bit about display technologies. Let me talk about how you might input information. And my favorite example is always fingers. I ’ m very interested in touch-sensitive displays. High-tech, high-touch. Isn ’ t that what some of you said? It ’ s certainly a very important medium for input, and a lot of people think that fingers are a very low- resolution sort of stylus for inputting to a display. In fact, they ’ re not : it ’ s really a very, very high-resolution input medium — you have to just do it twice, you have to touch the screen and then rotate your finger slightly — and you can move a cursor with great accuracy. And so when you see on the market these systems that have just a few light emitting diodes on the side and are very low resolution, it ’ s nice that they exist because it still is better than nothing. But it, in some sense, misses the point : namely, that fingers are a very, very high-resolution input medium. Now, what are some of the other advantages? Well, the one advantage is that you don ’ t have to pick them up, and people don ’ t realize how important that is — not having to pick up your fingers to use them. When you think for a second of the mouse on Macintosh — and I will not criticize the mouse too much — when you ’ re typing — what you have — you want to now put something — first of all, you ’ ve got to find the mouse. You have to probably stop. Maybe not come to a grinding halt, but you ’ ve got to sort of find that mouse. Then you find the mouse, and you ’ re going to have to wiggle it a little bit to see where the cursor is on the screen. And then when you finally see where it is, then you ’ ve got to move it to get the cursor over there, and then —”Bang”— you ’ ve got to hit a button or do whatever. That ’ s four separate steps versus typing and then touching and typing and just doing it all in one motion — or one-and-a-half, depending on how you want to count. Again, what I ’ m trying to do is just illustrate the kinds of problems that I think face the designers of new computer systems and entertainment systems and educational systems from the perspective of the quality of that interface. And another advantage, of course, of using fingers is you have 10 of them. And we have never known how to do this technically, so this slide is a fake slide. We never succeeded in using ten fingers, but there are certain things you can do, obviously, with more than one-finger input, which is rather fascinating. What we did stumble across was something... Again, which is typical of the computer field, is when you have a bug that you can ’ t get rid of you turn it into a feature. And maybe... maybe a mouse is a new kind of bug. But the bug in our case was in touch-sensitive displays : we wanted to be able to draw — you know, rub your finger across the screen to input continuous points — and there was just too much friction created between your finger and the glass — if glass was the substrate, which it usually is. So we found that that actually was a feature in the sense you could build a pressure-sensitive display. And when you touch it with your finger, you can actually, then, introduce all the forces on the face of that screen, and that actually has a certain amount of value. Let me see if I can load another disc and show you, quickly, an example. Now, imagine a screen, which is not only touch-sensitive now, it ’ s pressure-sensitive. And it ’ s pressure-sensitive to the forces both in the plane of the screen — X, Y, and Z at least in one direction ; we couldn ’ t figure out how to come in the other direction. But let me get rid of the slide, and let ’ s see if this comes on. OK. So there is the pressure-sensitive display in operation. The person ’ s just, if you will, pushing on the screen to make a curve. But this is the interesting part. I want to stop it for a second because the movie is very badly made. And the particular display was built about six years ago, and when we moved from one room to another room, a rather large person sat on it and it got destroyed. So all we have is this record. But imagine that screen having lots of objects on it and the person has touched an object — one of N — like he did there, and then pushed on it. Now, imagine a program where some of those objects are physically heavy and some are light : one is an anvil on a fuzzy rug and the other one is a ping-pong ball on a sheet of glass. And when you touch it, you have to really push very hard to move that anvil across the screen, and yet you touch the ping-pong ball very lightly and it just scoots across the screen. And what you can do — oops, I didn ’ t mean to do that — what you can do is actually feed back to the user the feeling of the physical properties. So again, they don ’ t have to be weight ; they could be a general trying to move troops, and he ’ s got to move an aircraft carrier versus a little boat. In fact, they funded it for that very reason. The whole notion, then, is one that at the interface there are physical properties in that transducer — in this case it ’ s pressure and touches — that allow you to present things to the user that you could never present before. So it ’ s not simply looking at the quality or, if you will, the luxury of that interface, but it ’ s actually looking at the idea of presenting things that previously couldn ’ t be presented before. I want to move on to another example, which is one of a different sort, where we ’ re trying to use computer and video disc technology now to come up with a new kind of book. Here, the idea is that you ’ re going to take this book, if you will, and it ’ s going to come alive. You ’ re going to sort of breathe life into it. We are so used to doing monologues. Filmmakers, for example, are the experts in monologue making : you make a film and it has a well-formed beginning, middle and end, and in some sense the art of it is that. And you then say,”There ’ s an opportunity for making conversational movies.”Well, what does that mean? And it sort of nibbles at the core of the whole profession and all the assumptions of that medium. So, book writing is the same thing. What I ’ ll show you very quickly is a new kind of book where it is mixed now with... all sorts of things live in there, but you have to keep a few things in mind. One is that this book knows about itself. Each frame of the movie has information about itself. So it knows, or at least there is computer-readable information in the medium itself. It ’ s just not a static movie frame. That ’ s one thing. The other is that you have to realize that it is a random access medium, and you can, in fact, branch and expand and elaborate and shrink. And here — again, my favorite example — is the cookbook, the”Larousse Gastronomique.”And I think I use the example all too often, but it ’ s a great one because there is a classic ending in that little encyclopedia-style cookbook that tells you how to do something like penguin, and you get to the end of the recipe and it says,”Cook until done.”Now, that would be, if you will, the top green track, which doesn ’ t mean too much. But you might have to elaborate for me or for somebody who isn ’ t an expert, and say,”Cook at 380 degrees for 45 minutes.”And then for a real beginner, you would go down even further and elaborate more — say,”Open the oven, preheat, wait for the light to go out, open the door, don ’ t leave it open too long, put the penguin in and shut the door...”whatever. And that ’ s a much more elaborate one than you dribble back. That ’ s one kind of use of random access. And the other is where you want to explain the same thing in different ways. If you ’ re in a classroom situation and somebody asks a question, the last thing you do is repeat what you just said. You try and think of a different way of saying the same thing, or if you know the particular student and that student ’ s cognitive style, then you might say it in a way that you think would have a good impedance match with that student. There are all sorts of techniques you will use — and again, this is a different kind of branching. So, what I will show you is... it ’ s a rather boring book, but I ’ m afraid sometimes you have to do boring books because your sponsors aren ’ t necessarily interested in fiction and entertainment. And this is a book on how to repair a transmission. Now, I don ' t even know what vintage the transmission is, but let me just show you very quickly some of it, and we ' ll move on. Narrator : And continue to get descriptions for each of these chapters. Nicholas Negroponte : Now, this is his table of contents. Just a picture of the transmission, and as you rub your finger across the transmission it highlights the various parts. Narrator : When I find a chapter that I want to see, I just touch the text and the system will format pages for me to read. The words or phrases that are lit up in red are glossary words, so I can get a different definition by just touching the word, and the definition appears, superimposed over the illustration. NN : This is about the oil pan, or the oil filter and all that. This is relatively important because it sets the page... Narrator : This is another example of a page with glossary words highlighted in red. I can get a definition of these words just by touching them, and the definition will appear in the illustration corner. I can get back to the illustration, but in this case it ' s not a single frame, but it ' s actually a movie of someone coming into the frame and doing the repair that ' s described in the text. The two-headed slider is a speed control that allows me to watch the movie at various speeds, in forward or reverse. And the movie is displayed as a full frame movie. I can go back to the beginning... and play the movie at full speed. Here ' s another step-by-step procedure, only in this case — NN : Okay, this movie is... Everybody ' s heard of sound-sync movies — this is text-sync movies, so as the movie plays, the text gets highlighted. We highlight the text as we go through the movie. Repairman :... Not too far out. Front poles, preferably. Don ' t loosen them too far. If you loosen them too far, you ' ll have a big mess. NN : I suspect that some of you might not even understand that language. OK. I ' m at the third and last part of this, which I said I would make an attempt to at least give you some examples that may be more directly related to the world of entertainment. And of course, good education has got to be good entertainment, so my first example will be drawn from a very recent experiment that we ' ve been doing — in this case, in Senegal — where we have tried to use personal computers as a pedagogical medium. But not as teaching machines at all ; the whole notion is to use this as an instrument where there is a complete reversal of roles — the child is, if you will, the teacher and the machine is the student — and the art of computer programming is a vehicle that sort of approximates thinking about thinking. But teaching kids programming per se is utterly irrelevant. And there are just a few slides I want to go through, but there ' s a story I ' d like to tell. And that was when, before we did this in any developing countries — we ' re doing it, in fact, in three developing countries right now : Pakistan, Colombia and Senegal — we did it in some pretty rough areas of New York City. And one child, whose name I ' ve forgotten, was about seven or eight years old, absolutely considered mentally handicapped — couldn ' t read, didn ' t even make it in the lowest section of the school ' s classes — and was pretty much not in school, though physically there. But did hang around the, quote,"computer room,"where there were quite a few computers, and learned this particular language called Logo — and learned it with great ease and found it a lot of fun, it was very interesting. And one day, by chance, some visitors from the NIE came by in their double-breasted suits looking at this setup, and none of the children who were normally there, except for this one child, were there. He was, and he said,"Let me show you how this works,"and they got an absolutely ingenuous, wonderful description of Logo. And the child was just zipping right through it, showing them all sorts of things until they asked him how to do something which he couldn ' t explain and so he flipped through the manual, found the explanation and typed the command and got it to do what they asked. They were delighted, and by the time it was time to go see the principal, whom they ’ d actually come to see — not the computer room — they went upstairs and they said,”This is absolutely remarkable! That child was very articulate and showed us and even dealt with the things he couldn ’ t do automatically with that manual. It was just absolutely fantastic.”The principal said,”There ’ s a dreadful mistake, because that child can ’ t read. And you obviously have been hoodwinked or you ’ ve talked about somebody else.”And they all got up and they all went downstairs and the child was still there. And they did something very intelligent : they asked the child,”Can you read?”And the child said,”No, I can ’ t.”And then they said,”But wait a minute. You just looked through that manual and you found...”and he said,”Oh, but that ’ s not reading.”And so they said,”Well, what ’ s reading then?”He says,”Well, reading is this junk they give me in little books to read. It ’ s absolutely irrelevant, and I get nothing for it. But here, with a little bit of effort I get a lot of return.”And it really meant something to the child. The child read beautifully, it turned out, and was really very competent. So it actually meant something. And that story has many other anecdotes that are similar, but wow. The key to the future of computers in education is right there, and it is : when does it mean something to a child? There is a myth, and it truly is a myth : we believe — and I ’ m sure a lot of you believe in this room — that it is harder to read and write than it is to learn how to speak. And it ’ s not, but we think speech —”My God, little children pick it up somehow, and by the age of two they ’ re doing a mediocre job, and by three and four they ’ re speaking reasonably well. And yet you ’ ve got to go to school to learn how to read, and you have to sit in a classroom and somebody has to teach you. Hence, it must be harder.”Well, it ’ s not harder. What the truth is is that speaking has great value to a child ; the child can get a great deal by talking to you. Reading and writing is utterly useless. There is no reason for a child to read and write except blind faith, and that it ’ s going to help you. So what happens is you go to school and people say,”Just believe me, you ’ re going to like it. You ’ re going to like reading,”and just read and read. On the other hand, you give a kid — a three-year-old kid — a computer and they type a little command and — Poof! — something happens. And all of a sudden... You may not call that reading and writing, but a certain bit of typing and reading stuff on the screen has a huge payoff, and it ’ s a lot of fun. And in fact, it ’ s a powerful educational instrument. Well, in Senegal we found that this was the traditional classroom : 120 kids — three per desk — one teacher, a little bit of chalk. This student was one of our first students, and it ’ s the girl on the left leaning with her chalkboard, and she came... within two days — I want to show you the program she wrote, and remember her hairstyle. And that is the program she made. That ’ s what meant something to her, is doing the hair pattern, and actually did it within two days — an hour each day — and found it was, to her, absolutely the most meaningful piece... But rooted in that, little did she know how much knowledge she was acquiring about geometry and just math and logic and all the rest. And again, I could talk for three hours about this subject. I will come to my last example and then quit. And my last example — as some of my former colleagues, whom I see in the room, can imagine what it will be. Yes, it is. It ’ s our work — that was a while ago, and it still is my favorite project — of teleconferencing. And the reason it remains a favorite project is that we were asked to do a teleconferencing system where you had the following situation : you had five people at five different sites — they were known people — and you had to have these people in teleconference, such that each one was utterly convinced that the other four were physically present. Now, that is sufficiently zany that we would, obviously, jump to the bait, and we did. And the fact that we knew the people — we had to take a page out of the history of Walt Disney — we actually went so far as to build CRTs in the shapes of the people ’ s faces. So if I wanted to call my friend Peter Sprague on the phone, my secretary would get his head out and bring it and set it on the desk, and that would be the TV used for the occasion. And it ’ s uncanny : there ’ s no way I can explain to you the amount of eye contact you get with that physical face projected on a 3D CRT of that sort. The next thing that we had to do is to persuade them that there needed to be spatial correspondence, which is straightforward, but again, it ’ s something that didn ’ t fall naturally out of a telecommunications or computing style of thinking ; it was a very, if you will, architectural or spatial concept. And that was to recognize that when you sit around the table, the actual location of the people becomes rather important. And when somebody gets up, in fact, to go answer a phone or use a bathroom or something, the empty seat becomes, if you will, that person. And you point frequently to the empty seat and you say,”He or she wouldn ’ t agree,”and the empty chair is that person and the spatiality is crucial. So we said,”Well, these will be on round tables and the order around the table had to be the same, so that at my site, I would be, if you will, real and then at each other ’ s site you ’ d have these plastic heads. And the plastic heads, sometimes you want to project them. And there are a number of schemes, which I don ’ t want to dwell on, but this is the one that we finally used where we projected onto rear screen material that was molded in the face — literally in the face of the person. And I ’ ll show you one more slide, where this is actually made from something called a solid photograph and is the screen. Now, we track, on the person ’ s head, the head motions — so we transmit with a video the head positions — and so this head moves in about two axes. So if I, all of a sudden, turn to the person to my left and start talking to that person, then at the person to my right ’ s site, he ’ ll see these two plastic heads talking to each other. And then if that person interrupts, then those two heads may turn. And it really is reconstructing, quite accurately, teleconferencing.
