Cloe Shasha : So welcome, Ibram, and thank you so much for joining us. Ibram X. Kendi : Well, thank you, Cloe, and Whitney, and thank you everyone for joining this conversation. And so, a few weeks ago, on the same day we learned about the brutal murder of George Floyd, we also learned that a white woman in Central Park who chose not to leash her dog and was told by a black man nearby that she needed to leash her dog, instead decided to threaten this black male, instead decided to call the police and claim that her life was being threatened. And of course, when we learned about that through a video, many Americans were outraged, and this woman, Amy Cooper, ended up going on national TV and saying, like countless other Americans have said right after they engaged in a racist act,”I am not racist.”And I say countless Americans, because when you really think about the history of Americans expressing racist ideas, supporting racist policies, you ’ re really talking about a history of people who have claimed they ’ re not racist, because everyone claims that they ’ re not racist, whether we ' re talking about the Amy Coopers of the world, whether we ' re talking about Donald Trump, who, right after he said that majority-black Baltimore is a rat and rodent-infested mess that no human being would want to live in, and he was challenged as being racist, he said,"Actually, I ' m the least racist person anywhere in the world."And so really the heartbeat of racism itself has always been denial, and the sound of that heartbeat has always been,"I ' m not racist."And so what I ' m trying to do with my work is to really get Americans to eliminate the concept of"not racist"from their vocabulary, and realize we ' re either being racist or anti-racist. We ' re either expressing ideas that suggest certain racial groups are better or worse than others, superior or inferior than others. We ' re either being racist, or we ' re being anti-racist. We ' re expressing notions that the racial groups are **equals**, despite any cultural or even ethnic differences. We ' re either supporting policies that are leading to racial **inequities** and injustice, like we saw in Louisville, where Breonna Taylor was murdered, or we ' re supporting policies and pushing policies that are leading to justice and **equity** for all. And so I think we should be very clear about whether we ' re expressing racist ideas, about whether we ' re supporting racist policies, and admit when we are, because to be anti-racist is to admit when we expressed a racist idea, is to say,"You know what? When I was doing that in Central Park, I was indeed being racist. But I ' m going to change. I ' m going to strive to be anti-racist."And to be racist is to constantly deny the racial **inequities** that pervade American society, to constantly deny the racist ideas that pervade American minds. And so I want to built a just and **equitable** society, and the only way we ' re going to even begin that process is if we admit our racism and start building an anti-racist world. Thank you. CS : Thank you so much for that. You know, your book,"How to Be an Antiracist,"has become a bestseller in light of what ' s been happening, and you ' ve been speaking a bit to the ways in which anti-racism and racism are the only two polar opposite ways to hold a view on racism. I ' m curious if you could talk a little bit more about what the basic tenets of anti-racism are, for people who aren ' t as familiar with it in terms of how they can be anti-racist. IXK : Sure. And so I mentioned in my talk that the heartbeat of racism is denial, and really the heartbeat of anti-racism is **confession**, is the recognition that to grow up in this society is to literally at some point in our lives probably internalize ideas that are racist, ideas that suggest certain racial groups are better or worse than others, and because we believe in racial hierarchy, because Americans have been systematically taught that black people are more dangerous, that black people are more criminal-like, when we live in a society where black people are 40 percent of the national incarcerated population, that ' s going to seem normal to people. When we live in a society in a city like Minneapolis where black people are 20 percent of the population but more than 60 percent of the people being subjected to police shootings, it ' s going to seem normal. And so to be anti-racist is to believe that there ' s nothing wrong or inferior about black people or any other racial group. There ' s nothing dangerous about black people or any other racial group. And so when we see these racial disparities all around us, we see them as abnormal, and then we start to figure out, OK, what policies are behind so many black people being killed by police? What policies are behind so many Latinx people being disproportionately infected with COVID? How can I be a part of the struggle to upend those policies and replace them with more antiracist policies? Whitney Pennington Rodgers : And so it sounds like you do make that distinction, then, between not racist and anti-racist. I guess, could you talk a little bit more about that and break that down? What is the difference between the two? IXK : In the most simplest way, a not racist is a racist who is in denial, and an anti-racist is someone who is willing to admit the times in which they are being racist, and who is willing to recognize the **inequities** and the racial problems of our society, and who is willing to challenge those racial **inequities** by challenging policy. And so I ' m saying this because literally slaveholders, slave traders, imagined that their ideas in our terms were not racist. They would say things like,"Black people are the cursed descendants of Ham, and they ' re cursed forever into enslavement."This isn ' t,"I ' m not racist."This is,"God ' s law."They would say things, like, you know,"Based on science, based on ethnology, based on natural history, black people by nature are predisposed to slavery and servility. This is nature ' s law. I ' m not racist. I ' m actually doing what nature said I ' m supposed to be doing."And so this construct of being not racist and denying one ' s racism goes all the way back to the origins of this country. CS : Yeah. And why do you think it has been so hard for some people now to still accept that neutrality is not enough when it comes to racism? IXK : I think because it takes a lot of work to be anti-racist. You have to be very vulnerable, right? You have to be willing to admit that you were wrong. You have to be willing to admit that if you have more, if you ' re white, for instance, and you have more, it may not be because you are more. You have to admit that, yeah, you ' ve worked hard potentially, in your life, but you ' ve also had certain advantages which provided you with opportunities that other people did not have. You have to admit those things, and it ' s very difficult for people to be publicly, and even privately, self-critical. I think it ' s also the case of, and I should have probably led with this, how people define"racist."And so people tend to define"racist"as, like, a fixed category, as an identity. This is essential to who a person is. Someone becomes a racist. And so therefore – And then they also connect a racist with a bad, evil person. They connect a racist with a Ku Klux Klansman or woman. And they ' re like,"I ' m not in the Ku Klux Klan, I ' m not a bad person and I ' ve done good things in my life. I ' ve done good things to people of color. And so therefore I can ' t be racist. I ' m not that. That ' s not my identity. But that ' s actually not how we should be defining racist. Racist is a descriptive term. It describes what a person is saying or doing in any given moment, and so when a person in one moment is expressing a racist idea, in that moment they are being racist when they ' re saying black people are lazy. If in the very next moment they ' re appreciating the cultures of native people, they ' re being anti-racist. WPR : And we ' re going to get to some questions from our community in a moment, but I think when a lot of people hear this idea that you ' re putting forward, this idea of anti-racism, there ' s this feeling that this is something that only concerns the white community. And so could you speak a little bit to how the black community and nonwhite, other ethnic minorities can participate in and think about this idea of anti-racism? IXK : Sure. So if white Americans commonly say,"I ' m not racist,"people of color commonly say,"I can ' t be racist, because I ' m a person of color."And then some people of color say they can ' t be racist because they have no power. And so, first and foremost, what I ' ve tried to do in my work is to push back against this idea that people of color have no power. There ' s nothing more disempowering to say, or to think, as a person of color, than to say you have no power. People of color have long utilized the most basic power that every human being has, and that ' s the power to resist policy – that ' s the power to resist racist policies, that ' s the power to resist a racist society. But if you ' re a person of color, and you believe that people coming here from Honduras and El Salvador are invading this country, you believe that these Latinx **immigrants** are animals and rapists, then you ' re certainly not, if you ' re black or Asian or native, going to be a part of the struggle to defend Latinx **immigrants**, to recognize that Latinx **immigrants** have as much to give to this country as any other group of people, you ' re going to view these people as”taking away your jobs,”and so therefore you ’ re going to support racist rhetoric, you ’ re going to support racist policies, and even though that is probably going to be **harming** you, in other words, it ’ s going to be **harming**, if you ’ re black, **immigrants** coming from Haiti and Nigeria, if you ’ re Asian, **immigrants** coming from India. So I think it ’ s critically important for even people of color to realize they have the power to resist, and when people of color view other people of color as the problem, they ’ re not going to view racism as the problem. And anyone who is not viewing racism as the problem is not being anti-racist. CS : You touched on this a bit in your beginning talk here, but you ’ ve talked about how racism is the reason that black communities and communities of color are systematically disadvantaged in America, which has led to so many more deaths from COVID-19 in those communities. And yet the media is often placing the blame on people of color for their vulnerability to illness. So I ’ m curious, in line with that, what is the relationship between anti-racism and the potential for **systemic** change? IXK : I think it ’ s a direct relationship, because when you are – when you believe and have consumed racist ideas, you ’ re not going to even believe change is necessary because you ’ re going to believe that racial inequality is normal. Or, you ’ re not going to believe change is possible. In other words, you ’ re going to believe that the reason why black people are being killed by police at such high rates or the reason why Latinx people are being infected at such high rates is because there ’ s something wrong with them, and nothing can be changed. And so you wouldn ’ t even begin to even see the need for **systemic** structural change, let alone be a part of the struggle for **systemic** structural change. And so, to be anti-racist, again, is to recognize that there ’ s only two causes of racial **inequity** : either there ’ s something wrong with people, or there ’ s something wrong with power and policy. And if you realize that there ’ s nothing wrong with any group of people, and I keep mentioning groups – I ’ m not saying individuals. There ’ s certainly black individuals who didn ’ t take coronavirus seriously, which is one of the reasons why they were infected. But there are white people who didn ’ t take coronavirus seriously. No one has ever proven, actually studies have shown that black people were more likely to take the coronavirus seriously than white people. We ’ re not talking about individuals here, and we certainly should not be individualizing groups. We certainly should not be looking at the individual behavior of one Latinx person or one black person, and saying they ’ re representatives of the group. That ’ s a racist idea in and of itself. And so I ’ m talking about groups, and if you believe that groups are **equals**, then the only other alternative, the only other explanation to persisting **inequity** and injustice, is power and policy. And to then spend your time transforming and challenging power and policy is to spend your time being anti-racist. WPR : So we have some questions that are coming in from the audience. First one here is from a community member that asks,”When we talk about white privilege, we talk also about the privilege not to have the difficult conversations. Do you feel that ’ s starting to change?”IXK : I hope so, because I think that white Americans, too, need to simultaneously recognize their privileges, the privileges that they have accrued as a result of their whiteness, and the only way in which they ’ re going to be able to do that is by initiating and having these conversations. But then they also should recognize that, yes, they have more, white Americans have more, due to racist policy, but the question I think white Americans should be having, particularly when they ’ re having these conversations among themselves, is, if we had a more **equitable** society, would we have more? Because what I ’ m asking is that, you know, white Americans have more because of racism, but there are other groups of people in other Western democracies who have more than white Americans, and then you start to ask the question, why is it that people in other countries have free health care? Why is it that they have paid family leave? Why is it that they have a massive **safety** net? Why is it that we do not? And one of the major answers to why we do not here have is racism. One of the major answers as to why Donald Trump is President of the United States is racism. And so I ’ m not really asking white Americans to be altruistic in order to be anti-racist. We ’ re really asking people to have intelligent self-interest. Those four million, I should say five million poor whites in 1860 whose poverty was the direct result of the riches of a few thousand white slaveholding families, in order to challenge slavery, we weren ’ t saying, you know, we need you to be altruistic. No, we actually need you to do what ’ s in your self-interest. Those tens of millions of Americans, white Americans, who have lost their jobs as a result of this pandemic, we ’ re not asking them to be altruistic. We ’ re asking them to realize that if we had a different type of government with a different set of priorities, then they would be much better off right now. I ’ m sorry, don ’ t get me started. CS : No, we ’ re grateful to you. Thank you. And in line with that, obviously these protests and this movement have led to some progress : the removal of Confederate monuments, the Minneapolis City Council pledging to dismantle the police department, etc. But what do you view as the greatest priority on a policy level as this fight for justice continues? Are there any ways in which we could learn from other countries? IXK : I don ’ t actually think necessarily there ’ s a singular policy priority. I mean, if someone was to force me to answer, I would probably say two, and that is, high quality free health care for all, and when I say high quality, I ’ m not just talking about Medicare For All, I ’ m talking about a simultaneous scenario in which in rural southwest Georgia, where the people are predominantly black and have some of the highest death rates in the country, those counties in southwest Georgia, from COVID, that they would have **access** to health care as high quality as people do in Atlanta and New York City, and then, simultaneously, that that health care would be free. So many Americans not only of course are dying this year of COVID but also of heart disease and cancer, which are the number one killers before COVID of Americans, and they ’ re disproportionately black. And so I would say that, and then secondarily, I would say reparations. And many Americans claim that they believe in racial **equality**, they want to bring about racial **equality**. Many Americans recognize just how critical economic livelihood is for every person in this country, in this economic system. But then many Americans reject or are not supportive of reparations. And so we have a situation in which white Americans are, last I checked, their median wealth is 10 times the median wealth of black Americans, and according to a recent study, by 2053 – between now, I should say, and 2053, white median wealth is projected to grow, and this was before this current recession, and black median wealth is expected to redline at zero dollars, and that, based on this current recession, that may be pushed up a decade. And so we not only have a racial wealth gap, but we have a racial wealth gap that ’ s growing. And so for those Americans who claim they are committed to racial **equality** who also recognize the importance of economic livelihood and who also know that wealth is inherited, and the majority of wealth is inherited, and when you think of the inheritance, you ’ re thinking of past, and the past policies that many Americans consider to be racist, whether it ’ s slavery or even redlining, how would we even begin to close this growing racial wealth gap without a massive program like reparations? WPR : Well, sort of connected to this idea of thinking about wealth disparity and wealth inequality in this country, we have a question from community member Dana Perls. She asks,”How do you suggest liberal white organizations effectively address problems of racism within the work environment, particularly in environments where people remain silent in the face of racism or make token statements without looking internally?"IXK : Sure. And so I would make a few suggestions. One, for several decades now, every workplace has publicly pledged a commitment to diversity. Typically, they have diversity statements. I would basically rip up those diversity statements and write a new statement, and that ’ s a statement committed to anti-racism. And in that statement you would clearly define what a racist idea is, what an anti-racist idea is, what a racist policy is and what an anti-racist policy is. And you would state as a workplace that you ’ re committed to having a culture of anti-racist ideas and having an institution made up of anti-racist policies. And so then everybody can measure everyone ’ s ideas and the policies of that workplace based on that document. And I think that that could begin the process of transformation. I also think it ’ s critically important for workplaces to not only diversify their staff but diversify their upper administration. And I think that ’ s absolutely critical as well. CS : We have some more questions coming in from the audience. We have one from Melissa Mahoney, who is asking,"Donald Trump seems to be making supporting Black Lives Matter a partisan issue, for example making fun of Mitt Romney for participating in a peaceful protest. How do we uncouple this to make it nonpartisan?"IXK : Well, I mean, I think that to say the lives of black people is a Democratic declaration is simultaneously stating that Republicans do not value black life. If that ’ s essentially what Donald Trump is saying, if he ’ s stating that there ’ s a problem with marching for black lives, then what is the solution? The solution is not marching. What ’ s the other alternative? The other alternative is not marching for black lives. The other alternative is not caring when black people die of police **violence** or COVID. And so to me, the way in which we make this a nonpartisan issue is to strike back or argue back in that way, and obviously Republicans are going to claim they ’ re not saying that, but it ’ s a very simple thing : either you believe black lives matter or you don ’ t, and if you believe black lives matter because you believe in human rights, then you believe in the human right for black people and all people to live and to not have to fear police **violence** and not have to fear the state and not have to fear that a peaceful protest is going to be broken up because some politician wants to get a campaign op, then you ’ re going to institute policy that shows it. Or, you ’ re not. WPR : So I want to ask a question just about how people can think about anti-racism and how they can actually bring this into their lives. I imagine that a lot of folks, they hear this and they ’ re like, oh, you know, I have to be really thoughtful about how my actions and my words are perceived. What is the perceived intention behind what it is that I ’ m saying, and that that may feel exhausting, and I think that connects even to this idea of policy. And so I ’ m curious. There is a huge element of thoughtfulness that comes along with this work of being anti-racist. And what is your reaction and response to those who feel concerned about the mental exhaustion from having to constantly think about how your actions may hurt or **harm** others? IXK : So I think part of the concern that people have about mental exhaustion is this idea that they don ’ t ever want to make a mistake, and I think to be anti-racist is to make mistakes, and is to recognize when we make a mistake. For us, what ’ s critical is to have those very clear definitions so that we can assess our words, we can assess our deeds, and when we make a mistake, we just own up to it and say,"You know what, that was a racist idea.""You know what, I was supporting a racist policy, but I ’ m going to change."The other thing I think is important for us to realize is in many ways we are addicted, and when I say we, individuals and certainly this country, is addicted to racism, and that ’ s one of the reasons why for so many people they ’ re just in denial. People usually deny their addictions. But then, once we realize that we have this addiction, everyone who has been addicted, you know, you talk to friends and family members who are overcoming an addiction to substance abuse, they ’ re not going to say that they ’ re just **healed**, that they don ’ t have to think about this regularly. You know, someone who is overcoming alcoholism is going to say,”You know what, this is a day-by-day process, and I take it day by day and moment by moment, and yes, it ’ s difficult to restrain myself from reverting back to what I ’ m addicted to, but at the same time it ’ s liberating, it ’ s freeing, because I ’ m no longer having to wallow in that addiction. And so I think, and I ’ m no longer having to hurt people due to my addiction.”And I think that ’ s critical. We spend too much time thinking about how we feel and less time thinking about how our actions and ideas make others feel. And I think that ’ s one thing that the George Floyd video forced Americans to do was to really see and hear, especially, how someone feels as a result of their racism. CS : We have another question from the audience. This one is asking about,”Can you speak to the intersectionality between the work of anti-racism, feminism and **gay** rights? How does the work of anti-racism relate and affect the work of these other human rights issues?”IXK : Sure. So I define a racist idea as any idea that suggests a racial group is superior or inferior to another racial group in any way. And I use the term racial group as opposed to race because every race is a collection of racialized intersectional groups, and so you have black women and black men and you have black heterosexuals and black queer people, just as you have Latinx women and white women and Asian men, and what ’ s critical for us to understand is there hasn ’ t just been racist ideas that have targeted, let ’ s say, black people. There has been racist ideas that have been developed and have targeted black women, that have targeted black lesbians, that have targeted black transgender women. And oftentimes these racist ideas targeting these intersectional groups are intersecting with other forms of bigotry that is also targeting these groups. To give an example about black women, one of the oldest racist ideas about black women was this idea that they ’ re inferior women or that they ’ re not even women at all, and that they ’ re inferior to white women, who are the pinnacle of womanhood. And that idea has intersected with this sexist idea that suggests that women are weak, that the more weak a person is, a woman is, the more woman she is, and the stronger a woman is, the more masculine she is. These two ideas have intersected to constantly degrade black women as this idea of the strong, black masculine woman who is inferior to the weak, white woman. And so the only way to really understand these constructs of a weak, superfeminine white woman and a strong, hypermasculine black woman is to understand sexist ideas, is to reject sexist ideas, and I ’ ll say very quickly, the same goes for the intersection of racism and homophobia, in which black queer people have been subjected to this idea that they are more hypersexual because there ’ s this idea of queer people as being more hypersexual than heterosexuals. And so black queer people have been tagged as more hypersexual than white queer people and black heterosexuals. And you can ’ t really see that and understand that and reject that if you ’ re not rejecting and understanding and challenging homophobia too. WPR : And to this point of challenging, we have another question from Maryam Mohit in our community, who asks,”How do you see **cancel** culture and anti-racism interacting. For example, when someone did something obviously racist in the past and it comes to light?”How do we respond to that? IXK : Wow. So I think it ’ s very, very complex. I do obviously encourage people to transform themselves, to change, to admit those times in which they were being racist, and so obviously we as a community have to give people that ability to do that. We can ’ t, when someone admits that they were being racist, we can ’ t immediately obviously **cancel** them. But I also think that there are people who do something so egregious and there are people who are so unwilling to recognize how egregious what they just did is, so in a particular moment, so not just the horrible, vicious act, but then on top of that the refusal to even admit the horrible, vicious act. In that case, I could see how people would literally want to **cancel** them, and I think that we have to, on the other hand, we have to have some sort of consequence, public consequence, cultural consequence, for people acting in a racist manner, especially in an extremely egregious way. And for many people, they ' ve decided, you know what, I ' m just going to **cancel** folks. And I ' m not going to necessarily critique them, but I do think we should try to figure out a way to discern those who are refusing to transform themselves and those who made a mistake and recognized it and truly are committed to transforming themselves. CS : Yeah, I mean, one of the concerns many activists have been expressing is that the energy behind the Black Lives Matter movement has to stay high for anti-racist change to truly take place. I think that applies to what you just said as well. And I guess I ' m curious what your opinion is on when the protests start to wane and people ' s donation-matching campaigns fade into the background, how can we all ensure that this conversation about anti-racism stays central? IXK : Sure. So in"How to Be an Antiracist,"in one of the final chapters, is this chapter called"Failure."I talked about what I call feelings advocacy, and this is people feeling bad about what ' s happening, what happened to George Floyd or what happened to Ahmaud Arbery or what happened to Breonna Taylor. They just feel bad about this country and where this country is headed. And so the way they go about feeling better is by coming to a demonstration. The way they go about feeling better is by donating to a particular organization. The way they go about feeling better is reading a book. And so if this is what many Americans are doing, then once they feel better, in other words once the individual feels better through their participation in book clubs or demonstrations or donation campaigns, then nothing is going to change except, what, their own feelings. And so we need to move past our feelings. And this isn ' t to say that people shouldn ' t feel bad, but we should use our feelings, how horrible we feel about what is going on, to put into place, put into practice, anti-racist power and policies. In other words, our feelings should be driving us. They shouldn ' t be the end all. This should not be about making us feel better. This should be about transforming this country, and we need to keep our eyes on transforming this country, because if we don ' t, then once people feel better after this is all over, then we ' ll be back to the same situation of being horrified by another video, and then feeling bad, and then the cycle will only continue. WPR : You know, I think when we think about what sort of changes we can implement and how we could make the system work better, make our governments work better, make our police work better, are there models in other countries where – obviously the history in the United States is really unique in terms of thinking about race and oppression. But when you look to other nations and other cultures, are there other models that you look at as examples that we could potentially implement here? IXK : I mean, there are so many. There are countries in which police officers don ' t wear weapons. There are countries who have more people than the United States but less prisoners. There are countries who try to fight **violent** crime not with more police and prisons but with more jobs and more opportunities, because they know and see that the communities with the highest levels of **violent** crime tend to be communities with high levels of poverty and long-term **unemployment**. I think that – And then, obviously, other countries provide pretty sizable social **safety** nets for people such that people are not committing crimes out of poverty, such that people are not committing crimes out of despair. And so I think that it ' s critically important for us to first and foremost think through, OK, if there ' s nothing wrong with the people, then how can we go about reducing police **violence**? How can we go about reducing racial health **inequities**? What policies can we change? What policies have worked? These are the types of questions we need to be asking, because there ' s never really been anything wrong with the people. CS : In your"Atlantic"piece called"Who Gets To Be Afraid in America,"you wrote,"What I am, a black male, should not matter. Who I am should matter."And I feel that ' s kind of what you ' re saying, that in other places maybe that ' s more possible, and I ' m curious when you imagine a country in which who you are mattered first, what does that look like? IXK : Well, what it looks like for me as a black American is that people do not view me as dangerous and thereby make my existence dangerous. It allows me to walk around this country and to not believe that people are going to fear me because of the color my skin. It allows me to believe, you know what, I didn ' t get that job because I could have done better on my interview, not because of the color of my skin. It allows me to – a country where there ' s racial **equity**, a country where there ' s racial justice, you know, a country where there ' s shared opportunity, a country where African American culture and Native American culture and the cultures of Mexican Americans and Korean Americans are all valued equally, that no one is being asked to assimilate into white American culture. There ' s no such thing as standard professional wear. There ' s no such thing as, well, you need to learn how to speak English in order to be an American. And we would truly not only have **equity** and justice for all but we would somehow have found a way to appreciate difference, to appreciate all of the human ethnic and cultural difference that exists in the United States. This is what could make this country great, in which we literally become a country where you could literally travel around this country and learn about cultures from all over the world and appreciate those cultures, and understand even your own culture from what other people are doing. There ' s so much beauty here amid all this pain and I just want to peel away and remove away all of those scabs of racist policies so that people can **heal** and so that we can see true beauty. WPR : And Ibram, when you think about this moment, where do you see that on the spectrum of progress towards reaching that true beauty? IXK : Well, I think, for me, I always see progress and resistance in demonstrations and know just because people are calling from town squares and from city halls for progressive, **systemic** change that that change is here, but people are calling and people are calling in small towns, in big cities, and people are calling from places we ' ve heard of and places we need to have heard of. People are calling for change, and people are fed up. I mean, we ' re living in a time in which we ' re facing a viral pandemic, a racial pandemic within that viral pandemic of people of color disproportionately being infected and dying, even an economic pandemic with over 40 million Americans having lost their jobs, and certainly this pandemic of police **violence**, and then people demonstrating against police **violence** only to suffer police **violence** at demonstrations. I mean, people see there ' s a fundamental problem here, and there ' s a problem that can be solved. There ' s an America that can be created, and people are calling for this, and that is always the beginning. The beginning is what we ' re experiencing now. CS : I think that this next audience question follows well from that, which is,"What gives you hope right now?"IXK : So certainly resistance to racism has always given me hope, and so even if, let ' s say, six months ago we were not in a time in which almost every night all over this country people were demonstrating against racism, but I could just look to history when people were resisting. And so resistance always brings me hope, because it is always resistance, and of course it ' s stormy, but the rainbow is typically on the other side. But I also receive hope philosophically, because I know that in order to bring about change, we have to believe in change. There ' s just no way a change maker can be cynical. It ' s impossible. So I know I have to believe in change in order to bring it about. WPR : And we have another question here which addresses some of the things you talked about before in terms of the structural change that we need to bring about. From Maryam Mohit :"In terms of putting into practice the transformative policies, is then the most important thing to loudly vote the right people into office at every level who can make those structural changes happen?"IXK : So I think that that is part of it. I certainly think we should vote into office people who, from school boards to the President of the United States, people who are committed to instituting anti-racist policies that lead to **equity** and justice, and I think that that ' s critically important, but I don ' t think that we should think that that ' s the only thing we should be focused on or the only thing that we should be doing. And there are institutions, there are **neighborhoods** that need to be transformed, that are to a certain extent outside of the purview of a policymaker who is an elected official. There are administrators and CEOs and presidents who have the power to transform policies within their spheres, within their institutions, and so we should be focused there. The last thing I ' ll say about voting is, I wrote a series of pieces for"The Atlantic"early this year that sought to get Americans thinking about who I call"the other swing voter,"and not the traditional swing voter who swings from Republican to Democrat who are primarily older and white. I ' m talking about the people who swing from voting Democrat to not voting at all. And these people are typically younger and they ' re typically people of color, but they ' re especially young people of color, especially young black and Latinx Americans. And so we should view these people, these young, black and Latino voters who are trying to decide whether to vote as swing voters in the way we view these people who are trying to decide between whether to vote for, let ' s say, Trump or Biden in the general election. In other words, to view them both as swing voters is to view them both in a way that, OK, we need to persuade these people. They ' re not political cattle. We ' re not just going to turn them out. We need to encourage and persuade them, and then we also for these other swing voters need to make it easier for them to vote, and typically these young people of color, it ' s the hardest for them to vote because of voter suppression policies. CS : Thank you, Ibram. Well, we ' re going to come to a close of this interview, but I would love to ask you to read something that you wrote a couple of days ago on Instagram. You wrote this beautiful caption on a photo of your daughter, and I ' m wondering if you ' d be willing to share that with us and briefly tell us how we could each take this perspective into our own lives. IXK : Sure, so yeah, I posted a picture of my four-year-old daughter Imani, and in the caption I wrote,"I love, and because I love, I resist. There have been many theories on what ' s fueling the growing demonstrations against racism in public and private. Let me offer another one : love. We love. We know the lives of our loved ones, especially our black loved ones, are in danger under the **violence** of racism. People ask me all the time what fuels me. It is the same : love, love of this little girl, love of all the little and big people who I want to live full lives in the fullness of their humanity, not barred by racist policies, not degraded by racist ideas, not terrorized by racist **violence**. Let us be anti-racist. Let us defend life. Let us defend our human rights to live and live fully, because we love."And, you know, Cloe, I just wanted to sort of emphasize that at the heart of being anti-racist is love, is **loving** one ' s country, loving one ' s humanity, loving one ' s relatives and family and friends, and certainly loving oneself. And I consider love to be a verb. I consider love to be, I ' m helping another, and even myself, to constantly grow into a better form of myself, of themselves, that they ' ve expressed who they want to be. And so to love this country and to love humanity is to push humanity constructively to be a better form of itself, and there ’ s no way we ’ re going to be a better form, there ’ s no way we can build a better humanity, while we still have on the shackles of racism. WPR : I think that ’ s so beautiful. I appreciate everything you ’ ve shared, Ibram. I feel like it ’ s made it really clear this is not an easy fix. Right? There is no band-aid option here that will make this go away, that this takes work from all of us, and I really appreciate all of the honesty and thoughtfulness that you ’ ve brought to this today. IXK : You ’ re welcome. Thank you so much for having this conversation with me. CS : Thank you so much, Ibram. We ’ re really grateful to you for joining us. IXK : Thank you.

Text Sample 353: POS Dim 3 – 2020 – Score 17.00 – 2020/t004246.txt
Audrey Tang : Very happy to be joining you, and good local time, everyone. David Biello : So, tell us about – Sorry to – Tell us about digital tools and COVID. AT : Sure. Yeah, I ’ m really happy to share with you how Taiwan successfully countered the COVID using the power of digital democracy tools. As we know, democracy improves as more people participate. And digital technology remains one of the best ways to improve participation, as long as the focus is on finding common ground, that is to say, prosocial media instead of antisocial media. And there ’ s three key ideas that I would like to share today about digital democracy that is fast, fair and fun. First about the fast part. Whereas many jurisdictions began countering coronavirus only this year, Taiwan started last year. Last December, when Dr. Li Wenliang, the PRC whistleblower, posted that there are new SARS cases, he got inquiries and eventually punishments from PRC police institutions. But at the same time, the Taiwan equivalent of Reddit, the Ptt board, has someone called nomorepipe reposting Dr. Li Wenliang ’ s whistleblowing. And our medical officers immediately noticed this post and issued an order that says all passengers flying in from Wuhan to Taiwan need to start health inspections the very next day, which is the first day of January. And this says to me two things. First, the civil society trusts the government enough to talk about possible new SARS outbreaks in the public forum. And the government trusts citizens enough to take it seriously and treat it as if SARS has happened again, something we ’ ve always been preparing for, since 2003. And because of this open civil society, according to the CIVICUS Monitor after the Sunflower Occupy, Taiwan is now the most open society in the whole of Asia. We enjoy the same freedom of speech, of assembly, [unclear] as other liberal democracies, but with the emphasis on keeping an open mind to novel ideas from the society. And that is why our schools and businesses still remain open today, there was no lockdown, it ’ s been a month with no local confirmed cases. So the fast part. Every day, our Central Epidemic Command Center, or CECC, holds a press conference, which is always livestreamed, and we work with the journalists, they answer all the questions from the journalists, and whenever there ’ s a new idea coming in from the social sector, anyone can pick up their phone and call 1922 and tell that idea to the CECC. For example, there was one day in April where a young boy has said he doesn ’ t want to go to school because his school mates may laugh at him because all he had is a pink medical mask. The very next day, everybody in the CECC press conference started wearing pink medical masks, making sure that everybody learns about gender mainstreaming. And so this kind of rapid response system builds trust between the government and the civil society. And the second focus is **fairness**. Making sure everybody can use their national health insurance card to collect masks from nearby pharmacies, not only do we publish the stock level of masks of

all pharmacies, 6, 000 of them, we publish it every 30 seconds. That ’ s why our civic hackers, our civil engineers in the digital space, built more than 100 tools that enable people to view a map, or people with blindness who talk to **chat** bots, voice assistants, all of them can get the same inclusive **access** to information about which pharmacies near them still have masks. And because the national health insurance single payer is more than 99. 9 percent of health coverage, people who show any symptoms will then be able to take the medical mask, go to a local clinic, knowing fully that they will get treated fairly without incurring any financial burden. And so people designed a dashboard that lets everybody see our supply is indeed growing, and whether there ’ s over- or undersupply, so that we codesign this distribution system with the pharmacies, with the whole of society. So based on this analysis, we show that there was a peak at 70 percent, and that remaining 20 percent of people were often young, work very long hours, when they go off work, the pharmacies also went off work, and so we work with convenience stores so that everybody can collect their mask anytime, 24 hours a day. So we ensure **fairness** of all kinds, based on the digital democracy ’ s feedback. And finally, I would like to acknowledge that this is a very stressful time. People feel anxious, outraged, there ’ s a lot of panic buying, a lot of conspiracy theories in all economies. And in Taiwan, our counter-disinformation strategy is very simple. It ’ s called”humor over rumor.”So when there was a panic buying of tissue paper, for example, there was a rumor that says,”Oh, we ’ re ramping up mass production, it ’ s the same material as tissue papers, and so we ’ ll run out of tissue paper soon.”And our premier showed a very memetic picture that I simply have to share with you. In very large print, he shows his bottom, wiggling it a little bit, and then the large print says”Each of us only have one pair of buttocks.”And of course, the serious table shows that tissue paper came from South American materials, and medical masks come from **domestic** materials, and there ’ s no way that ramping up production of one will hurt the production of the other. And so that went absolutely viral. And because of that, the panic buying died down in a day or two. And finally, we found out the person who spread the rumor in the first place was the tissue paper reseller. And this is not just a single shock point in social media. Every single day, the daily press conference gets translated by the spokesdog of the Ministry of Health and Welfare, that translated a lot of things. For example, our physical distancing is phrased as saying”If you are outdoors, you need to keep two dog-lengths away, if you are indoor, three dog-lengths away,”and so on. And hand sanitation rules, and so on. So because all this goes viral, we make sure that the factual humor spreads faster than rumor. And they serve as a vaccine, as inoculation, so that when people see the conspiracy theories, the R0 value of that will be below one, meaning that those ideas will not spread. And so I only have this five-minute briefing, the rest of it will be driven by your Q and A, but please feel free to read more about Taiwan ’ s counter-coronavirus strategy, at taiwancanhelp. us. Thank you. DB : That ’ s incredible. And I love this”humor versus rumor.”The problem here in the US, perhaps, is that the rumors seem to travel faster than any response, whether humorous or not. How do you defeat that aspect in Taiwan? AT : Yeah, we found that, of course, humor implicitly means there is a sublimation of upsetness, of outrage. And so as you see, for example, in our premier ’ s example, he makes fun of himself. He doesn ’ t make a joke at the expense of other people. And this was the key. Because people think it hilarious, they share it, but with no malicious or toxic intentions. People remember the actual payload, that table about materials used to produce masks, much more easily. If they make a joke that excludes parts of the society, of course, that part of society will feel outraged and we will end up creating more divisiveness, rather than prosocial behavior.

So the humor at no expense, not excluding any part of society, I think that was the key. DB : It ’ s also incredible because Taiwan has such close ties to the origin point of this. AT : PRC, yes. DB : The mainland. So given those close economic ties, how do you survive that kind of disruption? AT : Yeah, I mean, at this moment, it ’ s been almost a month now with no local confirmed cases, so we ’ re doing fine. And what we are doing, essentially, is just to respond faster than pretty much anyone. We started responding last year, whereas pretty much everybody else started responding this year. We tried to warn the world last year, but, anyway. So in any case, the point here is that if you start early enough, you get to make sure that the border control is the main point where you quarantine all the returning residents and so on, instead of waiting until the community spread stage, where even more human-right invading techniques would probably have to be deployed one way or the other. And so in Taiwan, we ’ ve not **declared** an emergency situation. We ’ re firmly under the constitutional law. Because of that, every measure the administration is taking is also applicable in non-coronavirus times. And this forces us to innovate. Much as the idea of”we are an open liberal democracy”prevented us from doing takedowns. And therefore, we have to innovate of humor versus rumor, because the easy path, the takedown of online speech, is not accessible to us. Our design criteria, which is no lockdowns, also prevented us from doing any, you know, very invasive privacy encroaching response system. So we have to innovate at the border, and make sure that we have a sufficient number of, for example, quarantine hotels or the so-called”digital fences,”where your phone is basically connected to the nearby telecoms, and they make sure that if they go out of the 15-meter or so radius, an SMS is sent to the local household managers or police and so on. But because we focus all these measures at the border, the vast majority of people live a normal life. DB : Let ’ s talk about that a little bit. So walk me through the digital tools and how they were applied to COVID. AT : Yes. So there ’ s three parts that I just outlined. The first one is the collective intelligence system. Through online spaces that we design to be devoid of **Reply** buttons, because we see that, when there ’ s **Reply** buttons, people focus on each other ’ s face part, not the book part, and without”**Reply**”buttons, you can get collective intelligence working out their rough consensus of where the direction is going with the response strategies. So we use a lot of new technologies, such as Polis, which is essentially a forum that lets you upvote and downvote each other ’ s feelings, but with real-time clustering, so that if you go to cohack. tw, you see six such conversations, talking about how to protect the most vulnerable people, how to make a smooth transition, how to make a fair distribution of supplies and so on. And people are free to voice their ideas, and upvote and downvote each other ’ s ideas. But the trick is that we show people the main divisive points, and the main consensual points, and we respond only to the ideas that can convince all the different opinion groups. So people are encouraged to post more eclectic, more nuanced ideas and they discover, at the end of this consultation, that everybody, actually, agrees with most things, with most of their neighbors on most of the issues. And that is what we call the social mandate, or the democratic mandate, that then informs our development of the counter-coronavirus strategy and helping the world with such tools. And so this is the first part, it ’ s called listening at scale for rough consensus. The second part I already covered is the distribute ledger, where everybody can go to a nearby pharmacy, present their NHI card, buy nine masks, or 10 if you ’ re a child, and see the stock level of that pharmacy on their phone actually decreasing by nine or 10 in a couple of minutes. And if they grow by nine or 10, of course, you call the 1922, and report something fishy is going on. But this is participatory accountability. This is published every 30 seconds. So everybody holds each other accountable, and that massively increases trust. And finally, the third one, the humor versus rumor, I think the important thing to see here is that wherever there ' s a trending disinformation or conspiracy theory, you respond to it with a humorous package within two hours. We have discovered, if we respond within two hours, then more people see the vaccination than the conspiracy theory. But if you respond four hours or a day afterwards, then that ' s a lost cause. You can ' t really counter that using humor anymore, you have to invite the person who spread those messages into cocreation workshops. But we ' re OK with that, too. DB : Your speed is incredible. I see Whitney has joined us with some questions. Whitney Pennington Rodgers : That ' s right, we have a few coming in already from the audience. Hi there, Audrey. And we ' ll start with one from our community member Michael Backes. He asks how long has humor versus rumor been a strategy that you ' ve implemented. Excuse me."How long has humor versus rumor strategy been implemented? Were comedians consulted to make the humor?"AT : Yes, definitely. Comedians are our most cherished colleagues. And each and every ministry has a team of what we call participation officers in charge of engaging with trending topics. And it ' s a more than 100 people-strong team now. We meet every month and also every couple of weeks on specific topics. It ' s been like that since late 2016, but it ' s not until our previous spokesperson, Kolas Yotaka, joined about a year and a half ago, do the professional comedians get to the team. Previously, this was more about inviting the people who post, you know, quotes like"Our tax filing system is explosively hostile,"and gets trending, and previously, the POs just invited those people. Everybody who complains about the finance minister ' s tax-filing experience gets invited to the cocreation of that tax filing experience. So previously, it was that. But Kolas Yotaka and the premier Su Tseng-chang said, wouldn ' t it be much better and reach more people if we add some dogs to it or cat ' s pictures to it? And that ' s been around for a year and a half. WPR : Definitely, I think it makes a lot of difference, just even seeing them without being part of the thought process behind that. And we have another question here from G. Ryan Ansin. He asks,"What would you rank the level of trust your community had before the pandemic, in order for the government to have a chance at properly controlling this crisis?"AT : I would say that a community trusts each other. And that is the main point of digital democracy. This is not about people trusting the government more. This is about the government trusting the citizens more, making the state transparent to the citizen, not the citizen transparent to the state, which would be some other regime. So making the state transparent to the citizens doesn ' t always elicit more trust, because you may see something wrong, something missing, something exclusively hostile to its user experience, an so on, of the state. So it doesn ' t necessarily lead to more trust from the government. Sorry, from the citizen to the government. But it always leads to more trust between the social sector stakeholders. So I would say the level of trust between the people who are working on, for example, medical officers, and people who are working with the pandemic responses, people who manufacture medical masks, and so on, all these people, the trust level between them is very high. And not necessarily they trust the government. But we don ' t need that for a successful response. If you ask a random person on the **street**, they will say Taiwan is performing so well because of the people. When the CECC tells us to wear the mask, we wear the mask. When the CECC tells us not to wear a mask, like, if you are keeping physical distance, we wear a mask anyway. And so because of that, I think it ' s the social sector ' s trust between those different stakeholders that ' s the key to the response. WPR : I will come back shortly with more questions, but I ' ll leave you guys to continue your conversation. AT : Awesome. DB : Well, clearly, part of that trust in government was maybe not there in 2014 during the Sunflower Movement. So talk to me about that and how that led to this, kind of, digital transformation. AT : Indeed. Before March 2014, if you asked a random person on the **street** in Taiwan, like, whether it ’ s possible for a minister – that ’ s me – to have their office in a park, literally a park, anyone can walk in and talk to me for 40 minutes at a time, I ’ m currently in that park, the Social Innovation Lab, they would say that this is crazy, right? No public officials work like that. But that was because on March 18, 2014, hundreds of young activists, most of them college students, occupied the legislature to express their profound opposition to a trade pact with Beijing under consideration, and the secretive manner in which it was pushed through the parliament by Kuomintang, the ruling party at the time. And so the protesters demanded, very simply, that the pact be scraped, and the government to institute a more transparent ratification process. And that drew widespread public support. It ended a little more than three weeks later, after the government promised and agreed on the four demands [unclear] of legislative oversight. A poll released after the occupation showed that more than 75 percent remained dissatisfied with the ruling government, illustrating the crisis of trust that was caused by a trade deal dispute. And to **heal** this rift and communicate better with everyday citizens, the administration reached out to the people who supported the occupiers, for example, the g0v community, which has been seeking to improve government transparency through the creation of open-source tools. And so, Jaclyn Tsai, a government minister at the time, attended our hackathon and proposed the establishment of novel platforms with the online community to exchange policy ideas. And an experiment was born called vTaiwan, that pioneerly used tools such as Polis, that allows for”agree”or”disagree”with no **Reply** button, that gets people ’ s rough consensus on issues such as crowdfunding, equity-based crowdfunding, to be precise, teleworking and many other cyber-related legislation, of which there is no existing unions or associations. And it proved to be very successful. They solved the Uber problem, for example, and by now, you can call an Uber – I just called an Uber this week – but in any case, they are operating as taxis. They set up a local taxi company called Q Taxi, and that was because on the platform, people cared about insurance, they care about registration, they care about all the sort of, protection of the passengers, and so on. So we changed the taxi regulations, and now Uber is just another taxi company along with the other co-ops. DB : So you ’ re actually, in a way, crowdsourcing laws that, well, then become laws. AT : Yeah, learn more at crowd. law. It ’ s a real website. DB : So, some might say that this seems easier, because Taiwan is an island, that maybe helps you control COVID, helps promote social cohesion, maybe it ’ s a smaller country than some. Do you think that this could be scaled beyond Taiwan? AT : Well, first of all, 23 million people is still quite some people. It ’ s not a city, as some usually say, you know,”Taiwan is a city-state.”Well, 23 million people, not quite a city-state. And what I ’ m trying to get at, is that the high population density and a variety of cultures – we have more than 20 national languages – doesn ’ t necessarily lead to social cohesion, as you said. Rather, I think, this is the humbleness of all the ministers in the counter-coronavirus response. They all took on an **attitude** of”So we learned about SARS”– many of them were in charge of the SARS back then, but that was classical epidemiology. This is SARS 2. 0, it has different characteristics. And the tools that we use are very different, because of the digital transformation. And so we are in it to learn together with the citizens. Our vice president at the time, Dr. Chen Chien-jen, an academician, literally wrote the textbook on epidemiology. However, he still says,”You know, what I ’ m going to do is record an online MOOC, a crash course on epidemiology, that shares with, I think, more than 20, 00 people enrolled the first day, I was among them, to learn about important ideas, like the R0 and the basic transmission and how the various different measures work, and then they asked people to innovate. If you think of a new way that the vice president did not think of, just call 1922, and your idea will become the next day ’ s press conference. And this is this colearning strategy, I think, that more than anything enabled the social cohesion, as you speak. But this is more of a robust civil society than the uniformity. There ’ s no uniformity at all in Taiwan, everybody is entitled to their ideas, and all the social innovations, ranging from using a traditional rice cooker to revitalize, to disinfect the mask, to pink medical mask, and so on, there ’ s all variety of very interesting ideas that get amplified by the daily press conference. DB : That ’ s beautiful. Now – oh, Whitney is back, so I will let her ask the next question. WPR : Sure, we ’ re having some more questions come in. One from our community member Aria Bendix. Aria asked,”How do you ensure that digital campaigns act quickly without sacrificing accuracy? In the US, there was a fear of inciting panic about COVID-19 in early January.”AT : This is a great question. So most of the scientific ideas about the COVID are evolving, right? The efficacy of masks, for example, is a very good example, because the different characteristics of previous respiratory diseases respond differently to the facial mask. And so, our digital campaigns focus on the idea of getting the rough consensus through. So basically, it ’ s a reflection of the society, through Polis, through Slido, through the joint platform, the various tools that vTaiwan has prototyped, we know that people are feeling a rough consensus about things and we ’ re responding to the society, saying,”This is what you all feel and this is what we ’ re doing to respond to your feelings. And the scientific consensus is still developing, but we know, for example, people feel that wearing a mask mostly protects you, because it reminds you to not touch your face and wash your hands properly.”And these, regardless of everything else, are the two things that everybody agrees with. So we just capitalize on that and say,”OK, wash your hands properly, and don ’ t touch your face, and wearing a mask reminds you of that.”And that lets us cut through the kind of, very ideologically charged debates and focus on what people generally resonate with one another. And that ’ s how we act quickly without sacrificing scientific accuracy. WPR : And this next question sort of feels connected to this as well. It ’ s a question from an anonymous community member.”Pragmatically, do you think any of your policies could be applied in the United States under the current Trump administration?”AT : Quite a few, actually. We work with many states in the US and abroad on what we call”epicenter to epicenter diplomacy.”So what we ’ re doing essentially is, for example, there was a **chat** bot in Taiwan that lets you, but especially people under home quarantine, to ask the **chat** bot anything. And if there is a scientific adviser who already wrote a frequently asked question, the **chat** bot just responds with that, but otherwise, they will call the science advisory board and write an accessible response to that, and the spokesdog would translate that into a cute dog meme. And so this feedback cycle of people very easily **accessing**, finding, and asking a scientist, and an open API that allows for voice assistance and other third-party developers to get through it, resonates with many US states, and I think many of them are implementing it. And before the World Health Assembly, I think three days before, we held a 14 countries [unclear] lateral meeting, kind of, pre-WHA, where we shared many small, like, quick wins like this. And I think many jurisdictions took some of that, including the humor versus rumor. Many of them said that they ’ re going to recruit comedians now. WPR : I love that. DB : I hope so. WPR : I hope so too. And we have one more question, which is actually a follow-up, from Michael Backes, who asked a question earlier.”Does the Ministry plan to publish their plans in a white paper?”Sounds like you ’ re already sharing your plans with folks, but do you have a plan to put it out on paper? AT : Of course. Yeah, and multiple white papers. So if you go to taiwancanhelp. us, that is where most of our strategy is, and that website is actually crowdsourced as well, and it shows that more than five million now, I think, medical masks donated to the humanitarian aid. It ’ s also crowdsourced. People who have some masks in their homes, who did not collect the rationed masks, they can use an app, say,”I want to dedicate this to international humanitarian aid,”and half of them choose to publish their names, so you can also see the names of people who participated in this. And there ’ s also an”Ask Taiwan Anything”website, at fightcovid. edu. tw, that outlines, in white paper form, all the response strategies, so check those out. WPR : Great. Well, I will disappear and be back later with some other questions. DB : A blizzard of white papers, if you will. I ’ d like to turn the focus on you a little bit. How does a conservative anarchist become a digital minister? AT : Yeah, by occupying the parliament, and through that. More interestingly, I would say that I go working with the government, but never for the government. And I work with the people, not for the people. I ’ m like this Lagrange point between the people ’ s movements on one side and the government on the other side. Sometimes right in the middle, trying to do some coach or translation work. Sometimes in a kind of triangle point, trying to supply both sides with tools for prosocial communication. But always with this idea of getting the shared values out of different positions, out of varied positions. Because all too often, democracy is built as a showdown between opposing values. But in the pandemic, in the infodemic, in climate change, in many of those structural issues, the virus or carbon dioxide doesn ’ t sit down and negotiate with you. It ’ s a structural issue that requires common values built out of different positions. And so that is why my working principle is radical transparency. Every conversation, including this one, is on the record, including the internal meetings that I hold. So you can see all the different meeting transcripts in my YouTube channel, in the SayIt platform, where people can see, after I became digital minister, I held 1, 300 meetings with more than 5, 000 speakers, with more than 260, 000 utterances. And every one of them has a URL that becomes a social object that people can have a conversation on. And because of that, for example, when Uber ’ s David Plouffe visited me to lobby for Uber, because of radical transparency, he is very much aware of that, and so he made all the arguments based on public good, based on sustainability, and things like that, because he knows that the other sides would see his positions very clearly and transparently. So that encourages people to add on each other ’ s argument, instead of attacking each other ’ s person, you know, credits and things like that. And so I think that, more than anything, is the main principle of conserving the anarchism of the internet, which is about, you know, nobody can force anyone to hook to the internet, or to adhere to a new internet protocol. Everything has to be done using rough consensus and running code. DB : I wish you had more counterparts all around the world. Maybe you wish you had more counterparts all around the world. AT : That ’ s why these ideas are worth spreading. DB : There you go. So one of the challenges that might arise with some of these digital tools is **access**. How do you approach that part of it for folks maybe who don ’ t have the best broadband connection or the latest mobile phone or whatever it might be that ’ s required? AT : Well, anywhere in Taiwan, even on the top of Taiwan, almost 4, 000 meters high, the Saviah, or the Jade Mountain, you ’ re guaranteed to have 10 megabits per second over 4G or fiber or cable, with just 16 US dollars a month, an unlimited plan. And actually, on the top of the mountain, it ’ s faster, fewer people use that bandwidth. And if you don ’ t, it ’ s my fault. It

’ s personally my fault. In Taiwan, we have broadband as a human right. And so when we ’ re deploying 5G, we ’ re looking at places where the 4G has the weakest signal, and we begin with those places in our 5G deployment. And only by deploying broadband as a human right can we say that this is for everybody. That digital democracy actually strengthens democracy. Otherwise, we would be excluding parts of the society. And this also applies to, for example, you can go to a local digital opportunity center to rent a tablet that ’ s guaranteed to be manufactured in the past three years, and things like that, to enable, also, the different digital **access** by the digital opportunity centers, universities and schools, and public libraries, very important. And if people who prefer to talk in their town hall, I personally go to that town hall with a 360 recorder, and livestream that to Taipei and to other municipalities, where the central government ’ s public servants can join in a connected room style, but listening to the local people who set the agenda. So people still do face-to-face meetings, we ’ re not doing this to replace face-to-face meetings. We ’ re bringing more stakeholders from central government in the local town halls, and we ’ re amplifying their voices by making sure the transcripts, the mind maps, and things like that are spread through the internet in real time, but we don ’ t ever ask the elderly to, say,”Oh, you have to learn typing, otherwise you don ’ t do democracy.”It ’ s not our style. But that requires broadband. Because if you don ’ t have broadband, but only a very limited bandwidth, you are forced to use text-based communication. DB : That ’ s right. Well, with **access**, of course, comes **access** for folks who maybe will misuse the platform. You talked a little bit about disinformation and using humor to beat rumor. But sometimes, disinformation is more weaponized. How do you combat those kinds of attacks, really? AT : Right, so you mean malinformation, then. So essentially, information designed to cause intentional public **harm**. And that ’ s no laughing matter. So for that, we have an idea called”notice and public notice.”So this is a Reuters photo, and I will read the original caption. The original caption says”A teenage extradition bill protester in Hong Kong is seen during a march to demand democracy and political reform in Hong Kong.”OK, a very neutral title by the Reuters. But there was a spreading of malinformation back last November, just leading to our presidential election, that shows something else entirely. This is the same photo – that says”This 13-year-old thug bought new iPhones, game consoles and brand-name sports shoes, and recruiting his brothers to murder police and collect 200, 000 dollars.”And this, of course, is a weapon designed to sow discord, and to elicit in Taiwan ’ s voters a kind of distaste for Hong Kong. And because they know that this is the main issue. And had we resorted to takedowns, that will not work, because that would only evoke more outrage. So we didn ’ t do a takedown. Instead, we worked with the fact checkers and professional journalists to attribute this original message back to the first day that it was posted. And it came from Zhongyang Zhengfawei. That is the main political and legal unit of the central party, in the Central Communist Party, in CCP. And we know that it ’ s their Weibo account that first did this new caption. So we sent out a public notice and with the partners in social media companies, pretty much all of them, they just put this very small reminder next to each time that this is shared with the wrong caption, that says”This actually came from the central propaganda unit of the CCP. Click here to learn more. To learn about the whole story.”And that, we found, that has worked, because people understand this is then not a news material. This is rather an appropriation of Reuters ’ news material and a copyright infringement and I think that ’ s part of the [unclear]. In any case, the point is that when people understand that this is an intentional narrative, they won ’ t just randomly share it. They may share it, but with a comment that says”This is what the Zhongyang Zhengfawei is trying to do to our democracy.”DB : Seems like some of the global social media companies could learn something from notice and public notice. AT : Public notice, that ’ s right. DB : What advice would you have for the **Twitters** and Facebooks and LINEs and WhatsApps, and you name it, of the world? AT : Yeah. So, just before our election, we said to all of them that we ’ re not making a law to kind of punish them. However, we ’ re sharing this very simple fact that there is this norm in Taiwan that we even have a separate branch of the government, the control branch, that published the campaign donation and expense. And it just so occurred to us that in the previous election, the mayoral one, there was a lot of candidates that did not include any social media advertisements in their expense to the Control Yuan. And so essentially, that means that there is a separate amount of political donation and expense that evades public scrutiny. And our Control Yuan published their numbers in raw data form, that is to say, they ’ re not statistics, but individual records of who donated for what cause, when, where, and investigative journalists are very happy, because they can then make investigative reports about the connections between the candidates and the people who fund them. But they cannot work with the same material from the global social media companies. So I said,”Look, this is very simple. This is the social norm here, I don ’ t really care about other jurisdictions. You either adhere to the social norm that is set by the Control Yuan and the investigative journalists, or maybe you will face social sanctions. And this is not the government mandate, but it ’ s the people fed up with, you know, black box, and that ’ s part of the Sunflower Occupy ’ s demands, also. And so Facebook actually published in the Ad Library, I think at that time, one of the fastest response strategies, where everybody who has basically any dark pattern advertisement will get revealed very quickly, and investigative journalists work with the local civic technologists to make sure that if anybody dare to use social media in such a divisive way, within an hour, there will be a report out condemning that. So nobody tried that during the previous presidential election season. DB : So change is possible. AT : Mhm. WPR : Hey there, we have some more questions from the community. There is an anonymous one that says,”I believe Taiwan is outside WHO entirely and has a 130-part preparation program – developed entirely on its own – to what extent does it credit its preparation to building its own system?”AT : Well, a little bit, I guess. We tried to warn the WHO, but at that point – we are not totally outside, we have limited scientific **access**. But we do not have any ministerial **access**. And this is very different, right? If you only have limited scientific **access**, unless the other side ’ s top epidemiologist happens to be the vice president, like in Taiwan ’ s case, they don ’ t always do the storytelling well enough to translate that into political action as our vice president did, right? So the lack of ministerial **access**, I think, is to the detriment of the global community, because otherwise, people could have responded as we did in the first day of January, instead of having to wait for weeks before the WHO **declared** that this is something, that there ’ s definitely human to human transmission, that you should inspect people coming in from Wuhan, which they eventually did, but that ’ s already two weeks or three weeks after what we did. WPR : Makes a lot of sense. DB : More scientists and technologists in politics. That sounds like that ’ s the answer. AT : Yeah. WPR : And then we have another question here from Kamal Srinivasan about your reopening strategy.”How are you enabling restaurants and retailers to open safely in Taiwan?”AT : Oh, they never closed, so... WPR : Oh! AT : Yeah, they never closed, there was no lockdown, there was no closure. We just said a very simple thing in the CECC press conference, that there ’ s going to be physical distancing. You maintain one and a half meters indoors or wear a mask. And that ’ s it. And so there are some restaurants that put up, I guess, red curtains, some put very cute teddy bears and so on, on the chairs, to make sure that people spread evenly, some installed see-through glass or plastic walls between the seats. There ' s various social innovations happening around. And I think the only shops that got closed for a while, because they could not innovate quick enough to respond to these rules, was the intimate escort bars. But eventually, even they invented new ways, by handing out these caps that are plastic shielding, but still leaves room for drinking behind it. And so they opened with that social innovation. DB : That ' s amazing. WPR : It is, yeah, it ' s a lot to learn from your strategies there. Thank you, I ' ll be back towards the end with some final questions. DB : I ' m very happy to hear that the restaurants were not closed down, because I think Taipei has some of the best food in the world of any city that I ' ve visited, so, you know, kudos to you for that. So the big concern when it comes to using digital tools for COVID or using digital tools for democracy is always privacy. You ' ve talked about that a little bit, but I ' m sure the citizens of Taiwan are perhaps equally concerned about their privacy, especially given the geopolitical context. AT : Definitely. DB : So how do you cope with those demands? AT : Yeah, we design with not only defensive strategy, like minimization of data collection, but also proactive measures, such as privacy-enhancing technologies. One of the top teams that emerged out of our cohack, the TW response from the Polis, how to make contact tracing easier, focused not on the contact tracers, not on the medical officers, but on the person. So they basically said,"OK, you have a phone, you can record your temperatures, you can record your whereabouts and things like that, but that is strictly in your phone. It doesn ' t even use Bluetooth. So there ' s no transmission. Technology uses open-source, you can check it, you can use it in airplane mode. And when the contact tracer eventually tells you that you are part of a high-risk group, and they really want your contact history, this tool can then generate a single-use URL that only contains the precise information, anonymized, that the contact tracers want. But it will not, like in a traditional interview, let you ask – they ask a question, they only want to know your whereabouts, but you answer with such accuracy that you end up compromising other people ' s privacy. So basically, this is about designing with an aim to enhance other people ' s privacy, because personal data is never truly personal. It ' s always social, it ' s always intersectional. If I take a selfie at a party, I inadvertently also take pretty much everybody else ' s who are in the picture, the surroundings, the ambiance, and so on, and if I upload it to a cloud service, then I actually decimate the bargaining power, the negotiation power of everybody around me, because then their data is part of the cloud, and the cloud doesn ' t have to compensate them or get their agreement for it. And so only by designing the tools with privacy enhancing as a positive value, and not enhancing only the person ' s own privacy, just like a medical mask, it protects you, but mostly it also protects others, right? So if we design tools using that idea, and always open-source and with an open API, then we ' re in a much better shape than in centralized or so-called cloud-based services. DB : Well, you ' re clearly living in the future, and I guess that ' s quite literal, in the sense of, it ' s tomorrow morning there. AT : Twelve hours. DB : Yes. Tell me, what do you see in the future? What comes next? AT : Yes, so I see the coronavirus as a great amplifier. If you start with an **authoritarian** society, the coronavirus, with all its lockdowns and so on, has the potential of making it even a more totalitarian society. If people place their trust, however, on the social sector, on the ingenuity of social innovators, then the pandemic, as in Taiwan, actually strengthens our democracy, so that people feel, truly, that everybody can think of something that improves the welfare of not just Taiwan, but pretty much everybody else in the world. And so, my point here is that the great amplifier comes if no matter you want it or not, but the society, what they can do, is do what Taiwan did after SARS. In 2003, when SARS came, we had to shut down an entire hospital, barricading it with no definite termination date. It was very traumatic, everybody above the age of 30 remembers how traumatic it was. The municipalities and the central government were saying very different things, and that is why after SARS, the constitutional courts charged the legislature to set up the system as you see today, and also that is why, when people responding to that crisis back in 2003 built this very robust response system that there ' s early drills. So just as the Sunflower Occupy, because of the crisis in trust let us build new tools that put trust first, I think the coronavirus is the chance for everybody who have survived through the first wave to settle on a new set of norms that will reinforce your founding values, instead of taking on alien values in the name of survival. DB : Yeah, let ' s hope so, and let ' s hope the rest of the world is as prepared as Taiwan the next time around. When it comes to digital democracy, though, and digital citizenship, where do you see that going, both in Taiwan and maybe in the rest of the world? AT : Well, I have my job description here, which I will read to you. It ' s literally my job description and the answer to that question. And so, here goes. When we see the internet of things, let ' s make it the internet of beings. When we see virtual reality, let ' s make it a **shared** reality. When we see machine learning, let ' s make it collaborative learning. When we see user experience, let ' s make it about human experience. And whenever we hear the singularity is near, let us always remember the plurality is here. Thank you for listening. DB : Wow. I have to give that a little clap, that was beautiful. Quite a job description too. So, conservative anarchist, digital minister, and with that job description – that ' s pretty impressive. AT : A poetician, yes. DB : So I struggle to imagine an adoption of these techniques in the US, and that may be my pessimism weighing in. But what words of hope do you have for the US, as we cope with COVID? AT : Well, as I mentioned, during SARS in Taiwan, nobody imagined we could have CECC and a cute spokesdog. Before the Sunflower movement, during a large protest, there was, I think, half a million people on the **street**, and many more. Nobody thought that we could have a collective intelligence system that puts open government data as a way to rebuild citizen participation. And so, never lose hope. As my favorite singer, Leonard Cohen – a poet, also – is fond of saying,"Ring the bells that still can ring and forget any perfect offering. There is a crack in everything and that is how the light gets in."WPR : Wow. That ' s so beautiful, and it feels like such a great message to, sort of, leave the audience with, and sharing the sentiment that everyone seems to be so grateful for what you ' ve shared, Audrey, and all the great information and insight into Taiwan ' s strategies. AT : Thank you. WPR : And David – DB : I was just going to say, thank you so much for that, thank you for that beautiful job description, and for all the wisdom you shared in rapid-fire fashion. I think it wasn ' t just one idea that you shared, but maybe, I don ' t know, 20, 30, 40? I lost count at some point. AT : Well, it ' s called Ideas Worth Spreading, it ' s a plural form. DB : Very true. Well, thank you so much for joining us. WPR : Thank you, Audrey. DB : And I wish you luck with everything. AT : Thank you, and have a good local time. Stay safe.

Text Sample 354: POS Dim 3 – 2018 – Score 14.00 – 2018/t000378.txt

Nearly 100 years ago, almost today, most women in the United States finally won the right to vote. Now, it would take decades more for women of color to earn that right, and we ' ve come a long way since, but I would argue not nearly far enough. I think what women want today, not just only in the United States but around the globe, is to no longer be an afterthought. We don ’ t want to continue to try to, like, look at the next 100 years and be granted, grudgingly, small legal rights and accommodations. We simply want true and full **equality**. I think that women are tired of retrofitting ourselves into institutions and governments that were built by men, for men, and we ’ d rather reshape the future on our own terms. I believe — I believe what we need is a women ’ s political revolution for full **equality** across race, across class, across gender identity, across **sexual** orientation, and yes, across political labels, because I believe what binds us together as women is so much more profound than what keeps up apart. And so I ’ ve given some thought about how to build this women ’ s political revolution and that ’ s what I want to talk to you about today. The good news is that one thing that hasn ’ t changed in the last century is women ’ s resilience and our commitment to build a better life not only for ourselves, but for generations to come, because I can ’ t think of a single woman who wants her daughter to have fewer rights or opportunities than she ’ s had. So we know we all stand on the shoulders of the women who came before us, and as for myself, I come from a long line of tough Texas women. My grandparents lived outside of Waco, Texas, in the country. And when my grandmother got pregnant, of course she was not going to go to the hospital to deliver, she was going to have that baby at home. But when she went into labor, she called the neighbor woman over to cook dinner for my grandfather, because... I mean, it was unthinkable that he was going to make supper for himself. Been there. The neighbor had no experience with killing a chicken, and that was what was planned for dinner that night. And so as the story goes, my grandmother, in the birthing bed, in labor, hoists herself up on one elbow and wrings that chicken ’ s neck, right? And that is how my mother came into this world. But the amazing thing is, even though my mother ’ s own grandmother could not vote in Texas, because under Texas law,”idiots, imbeciles, the insane and women”were prevented the franchise — just two generations later, my mother, Ann Richards, was elected the first woman governor in her own right in the state of Texas. But you see, when Mom was coming up in Texas, there weren ’ t a lot of opportunities for women, and frankly, she spent her entire life trying to change that. She used to like to say,”As women, if you just give us a chance, we can perform. After all, Ginger Rogers did everything Fred Astaire did, but she did it backwards and in high heels.”Right? And honestly, that ’ s kind of what women have been doing for this last century : despite having very, very little political power, we have made **enormous** progress. So today in the United States, 100 years after getting the right to vote, women are almost half the workforce. And in 40 percent of families with children, women are the major breadwinners. Economists even estimate that if every single paid working woman took just one day off of work, it would cost the United States 21 billion dollars in gross **domestic** product. Now, largely because of Title IX, which required educational **equity**, women are actually now half the college students in the United States. We ’ re half the medical students, we ’ re half the law students — Exactly. And a fact I absolutely love : One of the most recent classes of graduating NASA astronauts was... What? For the first time, 50 percent women. The point is that women are really changing industries, they ’ re changing business from the inside out. But when it comes to government, it ’ s another story, and I actually think a picture is worth 1000 words. This is a photograph from 2017 at the White House when congressional leaders were called over to put the final details into the healthcare reform bill that was to go to Congress. Now, one of the results of this meeting was that they got rid of maternity benefits, which may not be that surprising, since no one at that table actually would need maternity benefits. And unfortunately, that ’ s what we ’ ve learned the hard way in the US for women. If we ’ re not at the table, we ’ re on the menu, right? And we ’ re simply not at enough tables, because even though women are the vast majority of voters in the United States, we fall far behind the rest of the world in political representation. Recent research is that when they ranked all the countries, the United States is 104th in women ’ s representation in office. 104th... Right behind Indonesia. So is it any big surprise, then, considering who ’ s making decisions, we ’ re the only developed country with no paid family leave? And despite all the research and improvements we ’ ve made in medical care — and this is really horrifying to me — the United States now leads the developed world in maternal mortality rates. Now, when it comes to **equal** pay, we ’ re not doing a whole lot better. Women now, on average, in the United States, still only make 80 cents to the dollar that a man makes. Though if you ’ re an African American woman, it ’ s 63 cents to the dollar. And if you ’ re Latina, it ’ s 54 cents to the dollar. It ’ s an outrage. Now, women in the UK, the United Kingdom, just came up with something I thought was rather ingenious, in order to illustrate the impact of the pay gap. So, starting November 10 and going through the end of the year, they simply put an out-of-office memo on their email to indicate all the weeks they were working without pay. Right? I think it ’ s an idea that actually could catch on. But imagine if women actually had political power. Imagine if we were at the table, making decisions. Imagine if we had our own women ’ s political party that instead of putting our issues to the side as distractions, made them the top priority. Well, we know — research shows that when women are in office, they actually act differently than men. They collaborate more with their colleagues, they work across party lines, and women are much more likely to support legislation that improves **access** to health care, education, civil rights. And what we ’ ve seen in our research in the United States Congress is that women sponsor more legislation and they cosponsor more legislation. So all the evidence is that when women actually have the chance to serve, they make a huge difference and they get the job done. So how would it look in the United States if different people were making decisions? Well, I firmly believe if half of Congress could get pregnant, we would finally quit fighting about birth control and Planned Parenthood. That would be over. I also really believe that finally, businesses might quit treating pregnancy as a nuisance, and rather understand it as a primary medical issue for millions of American workers. And I think if more women were in office, our government would actually prioritize keeping families together rather than pulling them apart. But perhaps most importantly, I think all of these issues would no longer be seen as”women ’ s issues.”They would just be seen as basic issues of **fairness** and **equality** that everybody can get behind. So I think the question is, what would it take, actually, to build this women ’ s political revolution? The good news is, actually, it ’ s already started. Because women around the globe are demanding workplaces, they ’ re demanding educational institutions, they ’ re demanding governments where sexism and **sexual harassment** and **sexual assault** are neither accepted nor tolerated. Women around the world, as we know, are raising their hands and saying,”Me Too,”and it ’ s a movement that ’ s made so much more powerful by the fact that women are standing together across industries, from **domestic** workers to celebrities in Hollywood. Women are marching, we ’ re sitting in, we ’ re speaking up. Women are challenging the status quo, we ’ re busting old taboos and yes, we are proudly making trouble. So, women in Saudi Arabia are driving for the very first time. Women in Iraq are standing in **solidarity** with survivors of human trafficking. And women from El Salvador to Ireland are fighting for reproductive rights. And women in Myanmar are standing up for human rights. In short, I think the most profound leadership in the world isn ’ t coming from halls of government. It ’ s coming from women at the grassroots all across the globe. And here in the United States, women are on fire. So a recent Kaiser poll reported that since our last presidential election in 2016, one in five Americans have either marched or taken part in a protest, and the number one issue has been women ’ s rights. Women are starting new organizations, they are volunteering on campaigns, and they ’ re taking on every issue from gun-safety reform to public education. And women are running for office in record numbers, and they are winning. So — Women like Lucy McBath from Georgia. Lucy lost her son to gun **violence**, and it was because of her experience with the criminal justice system that she realized just how broken it is, and she decided to do something about that. So she ran for office, and this January, she ’ s going to Congress. OK? Or — Angie Craig from Minnesota. So her congressman had made such hateful comments about LGBTQ people that she decided to challenge him. And you know what? She did, and she won, and when she goes to Congress in January, she ’ ll be the first lesbian mother serving in the House of Representatives. Or — Or Lauren Underwood from Illinois. She ’ s a registered nurse, and she sees every day the impact that lack of health care **access** has on the community where she lives, and so she decided to run. She took on six men in her primary, she beat them all, she won the general election, and when she goes to Congress in January, she ’ s going to be the first African-American woman ever to serve her district in Washington, D. C. So women are recognizing — this is our moment. Don ’ t wait for permission, don ’ t wait for your turn. As the late, great Shirley Chisholm said — Shirley Chisholm, the first African-American woman ever to go to Congress and the first woman to run for president in the Democratic party — but Shirley Chisholm said,”If there ’ s no room for you at the table, just pull up a folding chair.”And that ’ s what women are doing, all across the country. I believe women are now the most important and powerful political force in the world, but how do we make sure that this is not just a moment? What we need is actually a global movement for women ’ s full **equality** that is intersectional and it ’ s intergenerational, where no one gets left behind. And so I have a few ideas about how we could do that. Number one : it ’ s not enough to resist. It ’ s not enough to say what we ’ re against. It ’ s time to be loud and proud about what we are for, because being for full **equality** is a mainstream value and something that we can get behind. Because actually, men support **equal** pay for women. Millennials, they support gender **equality**. And businesses are increasingly adopting family-friendly policies, not just because it ’ s the right thing to do, but because it ’ s good for their workers. It ’ s good for their business. Number two : We have to remember, in the words of Fannie Lou Hamer, that”nobody ’ s free ’ til everybody ’ s free.”So as I mentioned earlier, women of color in this country didn ’ t even get the right to vote until much further along than the rest of us. But since they did, they are the most reliable voters, and women of color are the most reliable voters for candidates who support women ’ s rights, and we need to follow their lead — Because their issues are our issues. And as white women, we have to do more, because racism and sexism and homophobia, these are issues that affect all of us. Number three : we ’ ve got to vote in every single election. Every election. And we ’ ve got to make it easier for folks to vote, and we ’ ve got to make sure that every single vote is counted, OK? Because the barriers that exist to voting in the United States, they fall disproportionately on women — women of color, women with low incomes, women who are working and trying to raise a family. So we need to make it easier for everyone to vote, and we can start by making Election Day a federal holiday in the United States of America. Number four : don ’ t wait for instructions. If you see a problem that needs fixing, I think you ’ re the one to do it, OK? So start a new organization, run for office. Or maybe it ' s as simple as standing up on the job in support of yourself or your coworkers. This is up to all of us. And number five : invest in women, all right? Invest in women as candidates, as changemakers, as leaders. Just as an example, in this last election cycle in the United States, women donated 100 million dollars more to candidates and campaigns than they had just two years ago, and a record number of women won. So just think about that. So look, sometimes I think that the challenges we face, they seem overwhelming and they seem like they almost can never be solved, but I think the problems that seem the most intractable are the ones that are most important to work on. And just because it hasn ' t been figured out yet doesn ' t mean you won ' t. After all, if women ' s work were easy, someone else would have already been doing it, right? But women around the globe, they ' re on the move, and they are taking strengths and inspiration from each other. They are doing things they never could have imagined. So if we could just take the progress we have made in joining the workforce, in joining business, in joining the educational system, and actually channel that into building true political power, we will reshape this century, because one of us can be ignored, two of us can be **dismissed**, but together, we ' re a movement, and we ' re unstoppable. Thank you. Thank you.

Text Sample 355: POS Dim 3 – 2018 – Score 14.00 – 2018/t000384.txt

When I was in the sixth grade, I got into a fight at school. It wasn ' t the first time I ' d been in a fight, but it was the first time one happened at school. It was with a boy who was about a foot taller than me, who was physically stronger than me and who ' d been taunting me for weeks. One day in PE, he stepped on my shoe and refused to **apologize**. So, filled with anger, I grabbed him and I threw him to the ground. I ' d had some previous judo training. Our fight lasted less than two minutes, but it was a perfect reflection of the hurricane that was building inside of me as a young survivor of **sexual assault** and as a girl who was grappling with abandonment and exposure to **violence** in other spaces in my life. I was fighting him, but I was also fighting the men and boys that had **assaulted** my body and the culture that told me I had to be silent about it. A teacher broke up the fight and my principal called me in her office. But she didn ' t say,"Monique, what ' s wrong with you?"She gave me a moment to collect my breath and asked,"What happened?"The educators working with me led with empathy. They knew me. They knew I loved to read, they knew I loved to draw, they knew I adored Prince. And they used that information to help me understand why my actions, and those of my classmate, were disruptive to the learning community they were leading. They didn ' t place me on suspension ; they didn ' t call the police. My fight didn ' t keep me from going to school the next day. It didn ' t keep me from graduating ; it didn ' t keep me from teaching. But unfortunately, that ' s not a story that ' s shared by many black girls in the US and around the world today. We ' re living through a crisis in which black girls are being disproportionately pushed away from schools — - not because of an imminent threat they pose to the **safety** of a school, but because they ' re often experiencing schools as locations for punishment and marginalization. That ' s something that I hear from black girls around the country. But it ' s not insurmountable. We can shift this narrative. Let ' s start with some data. According to a National Black Women ' s Justice Institute analysis of civil rights data collected by the US Department of Education, black girls are the only group of girls who are overrepresented along the entire continuum of discipline in schools. That doesn ' t mean that other girls aren ’ t experiencing exclusionary discipline and it doesn ’ t mean that other girls aren ’ t overrepresented at other parts along that continuum. But black girls are the only group of girls who are overrepresented all along the way. Black girls are seven times more likely than their white counterparts to experience one or more out-of-school suspensions and they ’ re nearly three times more likely than their white and Latinx counterparts to be referred to the juvenile court. A recent study by the Georgetown Center on Poverty and Inequality partially explained why this disparity is taking place when they confirmed that black girls experience a specific type of age compression, where they ’ re seen as more adult-like than their white peers. Among other things, the study found that people perceive black girls to need less nurturing, less protection, to know more about sex and to be more independent than their white peers. The study also found that the perception disparity begins when girls are as young as five years old. And that this perception and the disparity increases over time and peaks when girls are between the ages of 10 and 14. This is not without consequence. Believing that a girl is older than she is can lead to harsher treatment, immediate censure when she makes a mistake and **victim** blaming when she ’ s **harmed**. It can also lead a girl to think that something is wrong with her, rather than the conditions in which she finds herself. Black girls are routinely seen as too loud, too aggressive, too angry, too visible. Qualities that are often measured in relation to nonblack girls and which don ’ t take into consideration what ’ s going on in this girl ’ s life or her cultural norms. And it ’ s not just in the US. In South Africa, black girls at the Pretoria Girls High School were discouraged from attending school with their hair in its natural state, without chemical processing. What did those girls do? They protested. And it was a beautiful thing to see the global community for the most part wrap its arms around girls as they stood in their truths. But there were those who saw them as disruptive, largely because they dared to ask the question,”Where can we be black if we can ’ t be black in Africa?”It ’ s a good question. Around the world, black girls are grappling with this question. And around the world, black girls are struggling to be seen, working to be free and fighting to be included in the landscape of promise that a safe space to learn provides. In the US, little girls, just past their toddler years, are being arrested in classrooms for having a tantrum. Middle school girls are being turned away from school because of the way they wear their hair naturally or because of the way the clothes fit their bodies. High school girls are experiencing **violence** at the hands of police officers in schools. Where can black girls be black without reprimand or punishment? And it ’ s not just these incidents. In my work as a researcher and educator, I ’ ve had an opportunity to work with girls like Stacy, a girl who I profile in my book”Pushout,”who struggles with her participation in **violence**. She bypasses the neuroscientific and structural analyses that science has to offer about how her adverse childhood experiences inform why she ’ s participating in **violence** and goes straight to describing herself as a”problem child,”largely because that ’ s the language that educators were using as they routinely suspended her. But here ’ s the thing. Disconnection and the internalization of **harm** grow stronger in isolation. So when girls get in trouble, we shouldn ’ t be pushing them away, we should be bringing them in closer. Education is a critical protective factor against contact with the criminal legal system. So we should be building out policies and practices that keep girls connected to their learning, rather than pushing them away from it. It ’ s one of the reasons I like to say that education is freedom work. When girls feel safe, they can learn. When they don ’ t feel safe, they fight, they protest, they argue, they flee, they freeze. The human brain is wired to protect us when we feel a threat. And so long as school feels like a threat, or part of the tapestry of

harm in a girl ' s life, she ' ll be inclined to resist. But when schools become locations for healing, they can also become locations for learning. So what does this mean for a school to become a location for healing? Well, for one thing, it means that we have to immediately discontinue the policies and practices that target black girls for their hairstyles or dress. Let ' s focus on how and what a girl learns rather than policing her body in ways that facilitate rape culture or punish children for the conditions in which they were born. This is where parents and the community of concerned adults can enter this work. Start a conversation with the school and encourage them to address their dress code and other conduct-related policies as a collaborative project, with parents and students, so as to intentionally avoid bias and **discrimination**. Keep in mind, though, that some of the practices that **harm** black girls most are unwritten. So we have to continue to do the deep, internal work to address the biases that inform how, when and whether we see black girls for who they actually are, or what we ' ve been told they are. Volunteer at a school and establish culturally competent and gender responsive discussion groups with black girls, Latinas, **indigenous** girls and other students who experience marginalization in schools to give them a safe space to process their identities and experiences in schools. And if schools are to become locations for healing, we have to remove police officers and increase the number of counselors in schools. Education is freedom work. And whatever our point of entry is, we all have to be freedom fighters. The good news is that there are schools that are actively working to establish themselves as locations for girls to see themselves as sacred and loved. The Columbus City Prep School for Girls in Columbus, Ohio, is an example of this. They became an example the moment their principal **declared** that they were no longer going to punish girls for having"a bad **attitude**."In addition to building — Essentially, what they did is they built out a robust continuum of alternatives to suspension, expulsion and arrest. In addition to establishing a restorative justice program, they improved their student and teacher relationships by ensuring that every girl has at least one adult on campus that she can go to when she ' s in a moment of crisis. They built out spaces along the corridors of the school and in classrooms for girls to regroup, if they need a minute to do so. And they established an advisory program that provides girls with an opportunity to start every single day with the promotion of self-worth, communication skills and goal setting. At this school, they ' re trying to respond to a girl ' s adverse childhood experiences rather than ignore them. They bring them in closer ; they don ' t push them away. And as a result, their truancy and suspension rates have improved, and girls are arriving at school increasingly ready to learn because they know the teachers there care about them. That matters. Schools that integrate the arts and sports into their curriculum or that are building out tranformative programming, such as restorative justice, mindfulness and **meditation**, are providing an opportunity for girls to repair their relationships with others, but also with themselves. Responding to the lived, complex and historical **trauma** that our students face requires all of us who believe in the promise of children and adolescents to build relationships, learning materials, human and financial resources and other tools that provide children with an opportunity to **heal**, so that they can learn. Our schools should be places where we respond to our most vulnerable girls as essential to the creation of a positive school culture. Our ability to see her promise should be at its sharpest when she ' s in the throws of poverty and addiction ; when she ' s reeling from having been sex-trafficked or survived other forms of **violence** ; when she ' s at her loudest, or her quietest. We should be able to support her intellectual and social-emotional well-being whether her shorts reach her knees or stop mid-thigh or higher. It might seem like a tall order in a world so deeply entrenched in the politics of fear to radically imagine schools as locations where girls can **heal** and thrive, but we have to be bold enough to set this as our intention. If we commit to this notion of education as freedom work, we can shift educational conditions so that no girl, even the most vulnerable among us, will get pushed out of school. And that ' s a win for all of us. Thank you.

Throughout the United States, there is growing social awareness that **sexual violence** and **harassment** are far too common occurrences within our various institutions â occurrences often without any accountability. As a result, the Me Too movement is upon us, and survivors everywhere are speaking out to demand change. Students have rallied against **sexual assault** on campus. Service members have demanded Congress reform the military, and workers ranging from Hollywood stars to janitorial staff have called out **sexual harassment** in the workplace. This is a tipping point. This is when a social movement can create lasting legal change. But only if we switch tactics. Instead of going institution by institution, fighting for reform, it ' s time to go to the Constitution. As it stands, the US Constitution denies fundamental protections to **victims** of gender **violence** such as **sexual assault**, intimate partner **violence** and stalking. Specifically, the Fourteenth Amendment of the Constitution, which prohibits state governments from abusing its citizens, does not require state governments to intervene when private parties abuse its citizens. So what does that mean in real life? That means that when a woman calls the police from her home, afraid that an intruder may attack her, she is not entitled to the state ' s protection. Not only can the police fail to respond, but she will be left without any legal remedy if preventable **harm** occurs as a result. How can this be? It is because the state, theoretically, acts on behalf of all citizens collectively, not any one citizen individually. The resulting constitutional flaw directly contradicts international law, which requires nation-states to intervene and protect citizens against gender **violence** by private parties as a human right. Instead of requiring intervention, our Constitution leaves discretion â discretion that states have used to discriminate systemically to deny countless **victims** any remedy. Unlike what you may have seen on"Law & Order : SVU,"justice is rare for **victims** of gender **violence**. And even in those rare cases where law **enforcement** has chosen to act, **victims** have no rights during the resulting criminal process. You see, **victims** are not parties in a criminal case. Rather, they are witnesses ; their bodies, evidence. The prosecution does not represent the interests of a **victim**. Rather, the prosecution represents the interests of the state. And the state has the discretion to **dismiss** criminal charges, enter lax plea deals and otherwise remove a **victim** ' s voice from the process, because again, a state theoretically represents the interests of all citizens collectively and not any one citizen individually. Despite this constitutional flaw, some **victims** of gender **violence** have found protections under federal Civil Rights statutes, such as Title IX. Title IX is not just about sports. Rather, it prohibits all forms of sex **discrimination**, including **sexual violence** and **harassment** within educational programs that accept federal funding. While initially targeting sex **discrimination** within admissions, Title IX has actually evolved over time to require educational institutions to intervene and address gender **violence** when committed by certain parties, such as when teachers, students or campus visitors commit **sexual assault** or **harassment**. So what this means is that through Title IX, those who seek **access** to education are protected against gender **violence** in a way that otherwise does not exist under the law. It is Title IX that requires educational institutions to take reports of gender **violence** seriously, or to suffer liability. And through campus-level proceedings, Title IX goes so far as to give **victims equitable** rights during the campus process, which means that **victims** can represent their own interests during proceedings, rather than relying on educational institutions to do so. And that ' s really important, because educational institutions have historically swept gender **violence** under the rug, much like our criminal justice system does today. So while Civil Rights protects some **victims**, we should want to protect all **victims**. Rather than going institution by institution, fighting for reform on campus, in the military, in the workplace, it ' s time to go to the Constitution and pass the Equal Rights Amendment. Originally proposed in 1923, the Equal Rights Amendment would guarantee gender **equality** under the law, and much like Title IX on campus, that constitutional amendment could require states to intervene and address gender **violence** as a prohibitive form of sex **discrimination**. While the Equal Rights Amendment did not pass in the 1970s, it actually came within three states of doing so. And within the last year, at least one of those states has ratified the amendment, because we live in different political times. From the Women ' s March to the Me Too movement, we have the growing political will of the people necessary to create lasting, legal change. So as a **victims** ' rights attorney fighting to increase the prospect of justice for survivors across the country and as a survivor myself, I ' m not here to say,"Time ' s Up."I ' m here to say,"It ' s time."It ' s time for accountability to become the norm after gender **violence**. It ' s time to pass the Equal Rights Amendment, so that our legal system can become a system of justice, and #MeToo can finally become"no more."Thank you.

Whitney Pennington Rodgers : There is so much happening in the world right now. Our guest today spends her days and, in fact, her entire illustrious career tracking and reporting on the moment ' s biggest stories. She is CNN ' s chief international anchor and host of the network ' s award-winning flagship global affairs program, Amanpour on CNN International in London and Amanpour and Co. on PBS in the United States. I ' m so thrilled to have her here with us to offer context on some of the news stories that are impacting our world and our lives. And you can see her there right now, please welcome Christiane Amanpour. Hello, Christiane, how are you doing? Christiane Amanpour : Whitney, thank you so much for having me. I ' m so glad to be with you for a few minutes and your TED community on these really important issues. And yes, I am the chief international anchor, but before that, I was, you know, the main international correspondent. So the way I work is always informed by me being on the ground, in the field and having essentially walk the walk and talk the talk with the people who are at the coalface. WPR : I love that, and I feel like that ' s going to give us so much perspective during this conversation. Let ' s just dive right in. I think one place we ' d like to start with is in Iran. For those of you who are on the call who haven ' t been tracking, back in September, an Iranian woman, Mahsa Amini, died in the custody of Iranian morality police after being arrested for not wearing hijab. Amini ' s death sparked protests and a revolution around women ' s rights in Iran and beyond that is continuing into this very moment. And, Christiane, I know that you ' ve reported on Iran throughout your career and have spent a lot of time covering this story very closely. So how historically significant would you say this moment is in Iran?

And could you just give us some context on that? CA : Look, I think it is very significant. Exactly how and what will develop towards the end, I ’ m not sure. A little bit of my own history : I am half Iranian, and I grew up in Iran. And I spent essentially the first 20 years of my life in Iran, with a little bit of going back and forth to the UK for boarding school. But that ’ s where my home was and that ’ s where my parents lived, and my sisters, essentially, you know, I was there during the build up to the Islamic Revolution of 1979. And so I saw all that happening, and that ’ s what made me want to be a journalist, in fact, to tell those kinds of history-making stories to the world. And that ’ s what really focused me on the kind of career that I then pursued. Fast forward now some 43-odd years, and you can see that the women who actually were pretty upset at the beginning of the revolution, when they had demonstrated for Khomeini, believing that he would bring democracy as he promised back then to a country that was a monarchy. And then to quickly find out that actually that wasn ’ t his plan and to quickly find out that he was putting women under the veil, which he had not said earlier. So for the first year or so of the revolution, women did not have to wear the veil. And when they did, many, many women came out and demonstrated against it. And then for the decades since, there ’ s been a sort of a tug of war between how strictly to put on the veil and not. And clearly differences between conservative and religious women who want to wear the whole tight covering that covers their head very tightly, covers their body very loosely, known as a chador in Iran. And then those who just didn ’ t, the younger generation who felt, well, they better, you know, follow the law, but they were kind of treading their own path towards how they would wear the hijab. And you could see coats and body coverings were getting tighter and shorter, head scarves were getting more colorful and pushed further back. Women and girls were going to great lengths to make themselves look beautiful and stand out as women. They would do their hair, particularly the front of their hair, which stuck out of the scarf. They would, you know, bangs were not forbidden, you know, beautifully made up their eyes, you know, their skin, their lips were all just beautifully done. And Iranian women are incredibly beautiful women in spirit and in body. And that seemed to be kind of OK. But what happened towards the last sort of, ten years or so, you ’ ve had a slightly less draconian regime when it comes to enforcing hijab. You know, in the late ’ 90s, early 2000s, and then a much more draconian, which is the latest one. So these very hard liners, this mullah, you know, Ebrahim Raisi, who is the very hardline conservative president, actually came to the presidency by using as his political platform, among other things, a much tougher interpretation of what they believe, you know, the Islamic laws should be. And, of course, who paid the ultimate price? Women. Because it ’ s always, whether it ’ s in Iran, whether it ’ s in Afghanistan, whether it ’ s in the UAE or in Saudi Arabia, or whether it ’ s in parts of Africa, whether it ’ s in the United States, etc., women ’ s bodies, women ’ s personal space seem to be used, you know, for people ’ s political aims. And so the same happened in Iran. And this poor, poor woman, Mahsa Amini, at the age of 22, came with her family from the Kurdish region of Iran to visit relatives and was wearing a scarf and was wearing a body covering. But the police on the corner at that time didn ’ t think it was conservative enough. And that ’ s why there ’ s a backlash. WPR : Well, you know, in recent days, a story was circulating that some 15, 000 protesters were to be executed, and the veracity of the story has been challenged and disproven. As I understand it, it ’ s actually more like 15, 000 protesters have been detained and the parliament voted in support of the death penalty for protesters. But it ’ s not ultimately up to them. So I ’ m curious how real you think the possibility is that something like a mass execution might actually happen in the near future? How real a threat is that? CA : Well, you ’ re right that this story was chased down, including by us, and it turned out not to be as it was being broadcast. On the other hand, there are many, many, I mean, you know, hundreds, if not thousands of people who ’ ve been rounded up and put into prison, whether they are women, men, young girls, other young people. I recall hearing one of the top government officials saying several weeks ago that the average age of those who are being arrested, this is an actual government official there, the average age was 15 and 16. And I mean, just think about it for a moment. I mean, that ’ s just unheard of anywhere, that children, young girls, people so young are in the front lines of this protest, this uprising, this movement, and are being punished. And then the latest stories, particularly by my colleague Farnaz Fassihi of The New York Times, who ’ s an incredibly good reporter, has brought out, I mean, some of the most terrible stories of how young people are being dealt with in a very harsh way. And, you know, there was, over the weekend, there was the burial of a young boy, 10 or nine years old, who was, you know, a **victim** of all of this. And he was killed. And his funeral happened. There was another big protest there. And, you know, these things defy normal behavior. And even for, you know, an Islamic republic that ’ s been pretty draconian for the last 43 years. And this goes way beyond, you know, riot control or whatever you might want to call it. So the question again is, because I know those outside of Iran want to know, is this the beginning of the end, or is this the end of the beginning, or is this the end of the Islamic republic? And I ’ m just not ready to say one way or another, because you just don ’ t know to what lengths they will finally go to crush it. And so I ’ m waiting, as a journalist should, I ’ m watching, I ’ m waiting, I ’ m interviewing, I ’ m getting as much information as I possibly can. And I ’ m going to be doing it on my show today, which will air, as you said, on CNNi and on PBS. And I ’ ve done it many times with many Iranian interlocutors. And... This is a very brutal regime when it comes to staying in power. But the only thing that I think is interesting, well, there are many things that are interesting, but what ’ s somewhat different to before is that within the Islamic establishment, you have voices, actually male voices, who are questioning why they need to react this hard against girls just for the hijab and the headscarf. So we ’ ll wait to see where that conversation gets to, if at all. WPR : And as someone with such a close personal connection to Iran, that part of your heritage and then also just your close reporting of this story, what do you feel are the things that most of the world is missing or not seeing about what ’ s happening there? CA : Well, look, I think in general, foreign policy and stories from around the world are hard to get past the American public because they ’ re hard to get past our own editors. So if there was more reporting on a more regular basis of these kinds of stories, we would have a much better – and you all would have a much better idea of trends, of what ’ s actually happening. You know, don ’ t forget, Iran is a very important country to the United States and to the rest of the world, partly because of the sort of upheaval that the Islamic Republic and including backing terrorism etc., have caused to the world – and holding hostages as they continue to do. Iranian Americans, British Iranians, and a whole load of others who are in jail, used as political pawns. And this is, you know, a very, very unfortunate and tragic situation where human beings are being used as political weapons. So they ’ re weaponizing people who just happen to be half Iranian or they ’ ve left and they have become you know, they ’ ve taken on the nationality of the countries that have given them refuge. And when they go back to visit family or on personal visits, they have been dragged into this political turmoil. So that ’ s really bad. And many governments are having to deal with that. The other issue of why it ’ s important is because of the Iran nuclear deal. Now, I think that ’ s off the table for the moment. It was always going to be off the table pending the midterms, but now pending, you know, this crushing of this movement, the US has imposed more sanctions, Europe has imposed more sanctions on individuals who are **deemed** responsible for the harshest crackdown. So it ' s very important. Iran remains a very, very important country to the world. And don ' t forget, you know, it has a huge population, and such a huge majority of the Iranian population are under the age of 30 or, you know, they ' re in that young generation, which means they ' re incredibly well-educated, they are well-connected to the world. Even now, even though the regime is trying to cut them off from the West and cut the world off from them. They manage, you know, to play a very sophisticated technical game of cat and mouse to get their stories out and to get information from the world in. So you can never cut the Iranian people off. And they would benefit and I hope they are benefiting from the support that they know, the moral support that the world is giving them. On the other hand, I know there are others who call for more support to overthrow the regime. That ' s not my space because I ' m a reporter, and I report on what ' s going on there. And I personally don ' t believe that anybody, any foreign government is going to do that. And I also believe that the women and men, the male allies inside Iran... This is their movement. This is their movement. They don ' t want it to be sullied by any interference from abroad that could get them even more tarnished than the regime is trying to do at the moment. WPR : Christiane, we ' re getting a lot of questions from our members, and I ' m going start to bring some into our conversation. We have one from TED member, Don, which speaks to what you ' re suggesting around this idea of global support. They want to know how can we help from afar."I feel **helpless**, but would like to do what I can without putting more women in **harm** ' s way,"is what Don shares. CA : Well, it ' s very hard. I mean, definitely moral support, definitely spreading the word, spreading the word and supporting the Iranian women in whatever way you can. Some people ask, how can we send them material support, whether it ' s money or whatever it might be. But that ' s very, very difficult, and I do not have an answer for that. It ' s difficult because Iran is so heavily sanctioned. So it ' s quite often illegal, actually, you know, by American law or European law or others, to actually send money via various ways, as far as I know. Maybe there are ways that it ' s possible, but I don ' t know those ways. But it is quite difficult to provide, at the moment, more than material support. I would say, I do believe the world should be a lot more generous to those who are trying to flee this and any other kind of repressive regime. Right now I ' m in London, and as you know, over the last several, certainly months, there ' s been a crisis in the English Channel. And a huge number of Iranians are trying to get away from the danger zones and into the UK. A huge number of Afghans and potentially others fleeing wars and devastation. But they get turned back. And I think the world ' s asylum and refugee policies have become so draconian and have gone so far from being what they were envisaged as, to welcome those who are fleeing you know, terrible oppression and, of course, often starvation and disease you know, and natural disasters and the like. And I think that ' s a real **shame** that we ' re seeing in this time of maximum upheaval in these parts of the world, the rest of the world actually closing their doors. And I ' m about to do some interviews around a new film that ' s coming out called"The Swimmers."And just to say, it ' s about two Syrian girls who had to leave Syria at the height of the Arab Spring and during the Iran-supported crackdown by the Syrian regime on those who were demanding freedom. Anyway, they managed to get out, but they had to take a rickety boat to get to Europe, they had to walk for miles, then they had to wait for months, you know, for asylum. You know, people like you and me were dying in the Mediterranean. They ' re dying in the

English Channel. They ’ re dying, you know, coming across from Africa. This is 2022. It ’ s a scandal. And I do believe that that lack of asylum, that lack of refuge is a terrible **shame** and a blot on all of us who believe in human rights and democracy and the value of life. WPR : Well, I want to move to another part of the world, also experiencing a huge crisis, where you ’ ve been spending a lot of time, both reporting and actually physically being there. You just returned from Ukraine. And we ’ re now more than nine months into the war there. So could you tell us a little bit about your trip and what you saw as the people there are heading into the winter. What would you like for us to know about what you saw? CA : Because you just said winter, I think it ’ s really important to know that what Putin is doing now, because he ’ s been thwarted on the battlefield, is he is literally taking this war to civilians in a much more targeted and devastating way than he has been already, which has already been attacking civilians. But this **relentless** attack by cruise missiles and other really, really powerful – including Iranian-supplied kamikaze drones – this is attacking civilian energy infrastructure on a regular basis, it ’ s sometimes attacking civilian residential buildings and ordinary people are being killed and wounded. At the same time, what turned out to be a phenomenally resourceful Ukrainian population, whether civilians or experts, let ’ s just take now the engineers in the energy sector are working around the clock, day and night to try to put this, you know, back. And they ’ ve done managed, rolling blackouts and the like to try to make sure that they can save some of the energy infrastructure. And particularly, let ’ s not forget how tightly intertwined is electricity and water. Those two are yin and yang. You can ’ t really have water without electricity to pump it. And so if you lack water, fresh water just to drink, you ’ re in real big trouble. And so the Ukrainian engineers are working around the clock to try to make sure that people have at least, at least, even if it ’ s rationed, **access**. So that ’ s a big issue. I would say I ’ ve been completely and utterly overwhelmed and surprised – not surprised, delighted by the spirit of the Ukrainian people. You know, I ’ ve covered a lot of wars in which much more powerful, heavily-armed aggressors try to subjugate and force a less heavily-armed civilian population into surrender. And the Ukrainians are nowhere near that. They have so much heart, they have so much love for their country. They have so much respect, as the Iranians do, for the idea of independence, sovereignty and personal freedom and political freedom and democracy. That ’ s what they ’ re fighting for. And frankly, they are our frontline troops. The Ukrainian people right now, and to an extent, the Iranian people, are our frontline troops. In Ukraine, people are standing between freedom and totalitarianism. And if Putin succeeds in Ukraine, then he ’ s... I mean, not only do the brave Ukrainian people lose, but then he comes a country closer to the West and continues to threaten the ideas and the values and principles of democracy and freedom. And this idea that it was NATO ’ s fault and NATO expansion, I promise you that is fake news. It ’ s too difficult right now to go into it because we only have limited time. But it ’ s not that. It ’ s that Putin does not want to see a free and independent and democratic country, in this case Ukraine, on his borders, and then be asked why he can ’ t have that, why his people can ’ t have that. He doesn ’ t want that. He wants to create his own sort of greater Russia. I witnessed that covering Bosnia, where the Serbs, backed by Russia, wanted to create a greater Serbia on the backs of the Bosnian people. And in Iran, too. And you ’ ve seen the Afghan women and girls now saying,”If Iranians can stand up and demand their rights, it ’ s our turn next.”So these have huge roll-on effects and inspiration to people who believe in basic freedom, dignity and the right to live their lives. WPR : Well, I know while you were there, you sat down with Ukrainian President Volodymyr Zelensky and first lady Olena Zelenska. And I ’ m just curious what your thoughts were about their mindset at this point in the war and how you think that will impact their leadership? CA : Well, I think their leadership has been extraordinary. I mean, really, who would have thought it. This man Volodymyr Zelensky came from the entertainment space. He ran based on a program that he had been starring in, a TV series based on corruption at the highest level. And so he ran as a clean candidate. And then when he came into office, that ’ s what he tried to bring in, to increase infrastructure and to improve it and crack down on corruption, because Ukraine did have, and may still, after the war, have a corruption problem. But believe me, now, that is right on the back burner. And US senators of both parties have told me that everything that the Americans are sending and NATO is sending is accounted for, and they are not worried about it going into somebody ’ s pocket. Unlike in Russia, where it ’ s gone into, obviously, people ’ s pockets because they have barely a military machine that can operate in Ukraine, much less against NATO. Their leadership has been inspirational. The fact that the president did not leave when he could have done, he did not take his wife and children out when he could have done. And the fact that they keep”poking the bear,”and I asked him that. I said,”You know, a lot of people in the West are worried and elsewhere are worried that if you push Putin too much, you”put him in a corner”and he might do the unthinkable.”And he said,”You know what? We ’ ve lived in this **neighborhood** forever. If we ’ re not scared, you shouldn ’ t be scared.”And I was saying this because not only are they pushing him militarily back, but also if you look at the Ukrainian Defense ministry or any of the online space, they ’ re constantly trolling Putin. Constantly. And it ’ s done with incredible humor, and it ’ s very, very effective. And so they know something that we don ’ t know. And as Olena Zelensky told me,”This is our last stand. This is it. If we don ’ t stand up now, there is no other time when we can stand up. If we don ’ t do it now, when are we ever going to be able to do it?”So they ’ re very, very clear about that. As you know, there ’ s been some talk around the world, some talk in the US and Europe, elsewhere that maybe, you know, particularly after the liberation of Kherson by the Ukrainians, shouldn ’ t the Ukrainians sit down at the negotiating table? So I asked President Zelensky that, and he said,”Look, we ’ re happy to negotiate, but based on international principles, based on the Russians removing their troops from their illegally invaded, annexed and claimed territory. You know, and sham referendums and sham annexation. And by the way, we ’ re pushing them back.”So they don ’ t want to be pushed to a negotiation while they have the upper hand and one that would reward Russia for its aggression. And to be honest with you, we don ’ t want that either. We do not want Russia to get away with today what they did get away with in their first invasion of 2014, when the world did not stand up and did not challenge him. And this is the result. He thought the world was weak. And that ’ s his big surprise. He was very surprised that the Ukrainians would stand up, the West and NATO would stand up, and that this unity would last this long. And, you know, I come to it from, you know, having covered something similar in Bosnia for four years. I mean, this was an ethnic cleansing, which they ’ re trying to do in Ukraine, the Russians, along the east, and it was a genocide, which I believe that... maybe not genocide, but crimes against humanity will be placed legitimately at the feet of Russia after this war. WPR : Well in both Iran and Russia, and thinking about Ukraine, we see a suppression of free speech and **access** to information. How can we know that we ’ re receiving accurate updates on what ’ s happening in both of these places? CA : Well, I do think you and everybody have to take on a certain sense of responsibility because that is the challenge of our time. You know, people ask me : Where do we find the truth? And I ’ m like, well, you can watch CNN, you can watch PBS, you can watch BBC. You can read The Wall Street Journal or The New York Times The LA Times or any number, Financial Times, whatever. There are many, many organizations who are committed to the truth and who have reporters on the ground, including in Russia. The BBC, for instance, has a very, very accomplished and good reporter called Steve Rosenberg. I highly recommend you all to **access** his reports, because under the constraints that Russia has put on journalists, he is managing to tell the story in a very, very clever way. And also, I would, you know, just look at the Russian state media, Russian blogs and this and that, including the military bloggers who are traveling with Russian troops in Ukraine. There ' s a huge amount of information coming out that actually paints the accurate picture. And right now, they ' re very – which is not to say they want the war to end, but they ' re actually painting the story that the Russians are doing badly in Ukraine. So there are places and avenues to go. But I believe that it ' s really up to the consumer now. We can do as much as we can to bring you the truth, fact-checked, evidence-based news information. But you must not go to the fake news sites and believe that that ' s the truth. You must go to what I would call the news organizations that have earned the Good Housekeeping seal of authenticity and truth and, you know, approval. It ' s really on you all now to search for those. And it ' s not hard, they exist. WPR : As we get close to the end of our time, I just want to turn things to you, Christiane, and your thinking as a reporter, a journalist. How would you say reporting on conflict and crisis has changed the way you think about the world, your perspective on life? CA : I think it ' s changed my perspective in that I ' m very clear that I can ' t be a both-siderism, or"on the one hand / on the otherism."In other words, in certain instances, such as gross violations of international humanitarian law, which we ' re witnessing, in other words, you know, human rights atrocities, crimes against humanity, genocide and the like, you absolutely have to know where the truth is and what you ' re looking at so that you know that there are aggressors and there are **victims**. There ' s no two ways about that. So my mantra is and has been, and I ' ve developed that from Bosnia, which was one of my earliest experiences in the field, my mantra is"truthful, not neutral,"which doesn ' t mean to say I ' m not being objective. I am being objective because objective is our golden rule. And by that I mean you have to look at all sides of the story and report all sides of the story. But what you mustn ' t do is create any false equivalence, either factually or morally. And when you do do that, you are actually being untruthful and in some cases you ' re being an accessory to terrible atrocities. And I would say the same about climate. I mean, you can talk about any of these crises, these moral and existential crises that we find. You know, climate has been too long, for decades been treated as a both-siderism, that the deniers had **equal** factual or moral weight as the science. And it ' s just, as we know, not true, and so much time has been wasted to the point that we are on the brink of a global catastrophe. And that is something that I ' ve learned. That in order to be a trustworthy, credible journalist, I must, must call out the truth. WPR : Well, I want to end with a question from a member, which is basically,"If you were to interview yourself, what would be the last question you would ask?"So here ' s your last question, what is your last question for Christiane? CA : Oh, Lordy. My last question, I don ' t know, but I do know one thing. That I wish that I would be able to – I guess it would be, how can you get more **access** to the other side, you know? I want to say the bad actors, because they are. How do you get more **access** to them? You know, I would like to sit down with a Putin or a Kim Jong-un or whoever, Viktor Orban in Hungary or whoever is denying democracy in the United States and the like. I would like to sit and talk to them to try to understand. Not because I think that I would be, you know, I would suddenly become a neutral observer, but because I want them to spell it out so the people can see and I would question them rigorously, that they would see the bankruptcy of their positions. And I would like to keep doing that with fossil fuel executives and the like. I ’ ve done a few and with governments, you know, who have allowed politics, politics to endanger us all. I do believe those people need to be held accountable. So I would like to be able to ask those people more questions. WPR : Well, Christiane, thank you so much for taking the time to **chat** with us today, I think I speak for everyone, just appreciating everything that you ’ ve shared. and good luck with the rest of your day. CA : Thank you very much, I appreciate it. It was good to talk to you all, thanks Whitney. [Want to support TED?] [Become a TED Member!] [Learn more at ted. com / membership]

Bruno Giussani : We are at the end of day six of the war in Ukraine or, more correctly, of the Russian invasion of Ukraine, launched on February 24 by President Vladimir Putin. We are all shocked and saddened by the events and by the human **suffering** they are causing. And as we speak, really, a Russian military convoy is headed towards Kyiv, other Ukrainian cities are being bombarded, half a million Ukrainians have already fled to neighboring countries and much more. It ’ s still early days, and it ’ s difficult to predict how the situation will evolve even just in the next few hours. But this is a war that should concern everyone, everywhere. And so today, in this TED Membership conversation, we want to try to give it a broader context with our guest, historian and author, Yuval Noah Harari. Yuval, welcome. Yuval Noah Harari : Hello. Thank you for inviting me. BG : I want to start from Ukraine itself and its 42 million people and its particular place between the East and the West. What do we need to know about Ukraine to understand this war and what ’ s at stake? YNH : The most crucial thing to know is that Ukrainians are not Russians, and that Ukraine is an ancient, independent nation. Ukraine has a history of more than a thousand years. Kyiv was a major metropolis and cultural center when Moscow was not even a village. For most of these thousand years Kyiv was not ruled by Moscow. They were not part of the same political entity. For centuries, Kyiv was looking westwards and was a part of a union with Lithuania and Poland until it was eventually conquered and absorbed by the Russian Empire, by the czarist empire. But even after that, Ukrainians remained a separate people to a large extent, and it ’ s important to know that because this is really what is at stake in this war. The key issue of the war, at least for President Putin, is whether Ukraine is an independent nation, whether it is a nation at all. He has this fantasy that Ukraine isn ’ t a nation, that Ukraine is just a part of Russia, that Ukrainians are Russians. In his fantasy, Ukrainians are Russians that want to be back in the fold of Mother Russia, and that the only ones preventing it is a very small gang at the top, which he portrays as Nazis, even if the president is Jewish ; but OK, a Nazi Jew. And his belief was, at least, that he just needs to invade, Zelenskyy will flee, the government will collapse, the army would lay down its arms, and the Ukrainian people would welcome the Russian liberators, throwing flowers on them. And this fantasy has been shattered already. Zelenskyy hasn ’ t fled, the Ukrainian army is fighting. And the Ukrainian people is not throwing flowers on the Russian tanks, it ’ s throwing Molotov cocktails. BG : So let ’ s unpack that and maybe take the different pieces one way one. So Ukraine has a long history of being dominated and occupied. You mentioned the czar, but also the Soviet Union, Hitler ’ s armies. It also has a long

history of mistrust of authority and of resistance, which goes some way to explain the current strong resistance that the Russians are encountering. Anne Applebaum, the journalist, even suggests that this mistrust, this resistance to authority, is the very essence of Ukraine-ness, do you agree? YNH : We did see in the last 30 years Ukrainians twice rising in revolt when there was a danger of an **authoritarian** regime being established – once in 2004, once in 2013. And when I was in Kyiv a few years ago, what really struck me was this very strong feeling of the desire for independence and for democracy. And I remember walking around this museum of the Revolution of 2013-2014 and seeing these images, like these two elderly women who were bringing sandwiches to the demonstrators, to the fighters. They couldn ’ t throw stones and they couldn ’ t do anything else, so they prepared sandwiches and brought this huge tray full of sandwiches to the demonstrators. And this, yes, this is the kind of spirit that inspires not just the Ukrainians but everybody who is now watching what is happening there. BG : Help me understand the actual nature of the threat here in terms of Russia moving into Ukraine. So in your last book, when you write about Russia, you describe the Russian model as :"not a coherent political ideology, but rather a sort of practice of monopolizing power and wealth by a small group at the top."But then, in his actions against Ukraine, Putin in the last few weeks seems to move very much by an ideology, an ideology of empire, of denial of Ukraine ’ s right to exist, as you mention. What has changed in the four years since you wrote that book? YNH : The imperial dream was always there, but you know, empires are often the creation of a very small gang of people at the top. I don ’ t think the Russian people [are] interested in this war. I don ’ t think that the Russian people want to conquer Ukraine or to slaughter the citizens of Kyiv. It ’ s all coming from the top. So there is no change there. I mean, when you look at the Soviet Union, you can say that there was this mass ideology, which was shared by a large proportion, or some proportion, of the population. You don ’ t see this now. You know, Russia is a very rich country, rich in resources, but most people are very poor. Their standard of living is very, very low because all the wealth and power is kind of sucked by the people at the top, and very little is left for everybody else. So I don ’ t think it ’ s a society where the masses are part of this kind of ideological project. They ’ re being ruled from the top. And you have this classic imperial situation, when the emperor, which controls the largest country in the world, feels that,"Hey, this is not enough. I need more."And sends his army to capture, to extend the empire. BG : I said at the beginning that it ’ s difficult, of course, to make predictions. But yesterday, you published an article in"The Guardian"titled :"Why Putin has already lost this war."Please explain. YNH : Well, one thing should be very clear. I don ’ t mean to say that he ’ s going to suffer an immediate military defeat. He definitely has the military power to conquer Kyiv and perhaps the whole of Ukraine. Unfortunately, we might see this. But his long-term goal, the whole rationale of the war, is to deny the existence of the Ukrainian nation and to absorb it into Russia. And to do that, it ’ s not enough to conquer Ukraine. You also need to hold it. And it ’ s all based on this fantasy, on this gamble, that most of the population in Ukraine would agree to this, would even welcome this. And we already know that it ’ s not true. That the Ukrainians are a very real nation ; they are fiercely independent ; they don ’ t want to be part of Russia ; they will fight like hell. And in the long-run, again, you can conquer a country, But as the Russians learned in Afghanistan, as the Americans learned also in Afghanistan, also in Iraq, it ’ s much harder to hold a country. And again, the big question mark before the war was always this. Before the war started, many things were already known. Everybody knew that the Russian army is much stronger than the Ukrainian Army. Everybody knew that

NATO will not send **armed** forces into Ukraine, troops into Ukraine. Everybody knew that the West, the Europeans, would be hesitant about imposing too strict a sanction regime for fear of being hurt by it themselves. And this was the basis for Putin ' s war plan. But there was one big unknown. Nobody could say for sure how the Ukrainian people would react. And there was always the option that maybe Putin ' s fantasy would come true. Maybe the Russians will march in, Zelenskyy would flee, maybe the Ukrainian army will just capitulate and the population would not do much. This was always an option. And now we know this was just fantasy. Now we know that the Ukrainians are fighting, they will fight. And this derails the whole rationale of Putin ' s war. Because you can conquer the country, maybe, but you won ' t be able to absorb Ukraine back into Russia. The only thing he ' s accomplishing, he is planting seeds of **hatred** in the hearts of every Ukrainian. Every Ukrainian being killed, every day this war continues is more seeds of **hatred** that may last for generations. Ukrainians and Russians didn ' t hate each other before Putin. They ' re **siblings**. Now he ' s making them enemies. And if he continues, this will be his legacy. BG : We ' re going to talk a bit about that again later but, you know, at the same time, Putin needs a victory, right? The cost, the human, economic, political cost of this war, not even a week in, is already astronomical. So to justify it and also to remain, by the way, a viable leader at the head of Russia, Putin needs to win, and even win convincingly. So how do we square these things? YNH : I don ' t know. I mean, the fact that you need to win doesn ' t mean that you can win. Lots of political leaders need to win, and sometimes they lose. He could stop the war, **declare** that he won, and say that recognizing Luhansk and Donetsk by the Russians is what he really wanted all along, and he achieved this. Maybe they cobble this agreement, or I don ' t know. This is the job of politicians, I ' m not a politician. But I can tell you that I hope, for the sake of everybody – Ukrainians, Russians and the whole of humanity – that this war stops immediately. Because if it doesn ' t, it ' s not only the Ukrainians and the Russians that will suffer terribly. Everybody will suffer terribly if this war continues. BG : Explain why. YNH : Because of the shock waves destabilizing the whole world. Let ' s start with the bottom line : budgets. We have been living in an amazing era of peace in the last few decades. And it wasn ' t some kind of hippie fantasy. You saw it in the bottom line. You saw it in the budgets. In Europe, in the European Union, the average defense budget of EU members was around three percent of government budget. And that ' s a historical miracle, almost. For most of history, the budget of kings and emperors and sultans, like 50 percent, 80 percent goes to war, goes to the army. In Europe, it ' s just three percent. In the whole world, the average is about six percent, I think, fact-check me on this, but this is the figure that I know, six percent. What we saw already within a few days, Germany doubles its military budget in a day. And I ' m not against it. Given what they are facing, it ' s reasonable. For the Germans, for the Poles, for all of Europe to double their budgets. And you see other countries around the world doing the same thing. But this is, you know, a race to the bottom. When they double their budgets, other countries look and feel insecure and double their budgets, so they have to double them again and triple them. And the money that should go to health care, that should go to education, that should go to fight climate change, this money will now go to tanks, to missiles, to fighting wars. So there is less health care for everybody, and there is maybe no solution to climate change because the money goes to tanks. And in this way, even if you live in Australia, even if you live in Brazil, you will feel the repercussions of this war in less health care, in a deteriorating ecological crisis, in many other things. Again, another very central question is technology. We are on the verge, we are already in the middle, actually, of new technological arms races in fields like artificial intelligence. And we need global agreement about how to regulate AI and to prevent the worst scenarios. How can we get a global agreement on AI when you have a new cold war, a new hot war? So in this field, to all hopes of stopping the AI arms race will go up in smoke if this war continues. So again, everybody around the world will feel the consequences in many ways. This is much, much bigger than just another regional conflict. BG : If one of Putin ’ s goals here is to divide Europe, to weaken the transatlantic alliance and the global liberal order, he seems to kind of accidentally have revitalized all of them in a way. US-EU relations have never been so close in many years. And so how do you read that? YNH : Well, again, in this sense, he also lost the war. If his aim was to divide Europe, to divide NATO, he ’ s achieved exactly the opposite. I mean, I was amazed by how quick, how strong and how unanimous the European reaction was. I think the Europeans surprised themselves. You even see countries like Finland and Sweden sending arms to Ukraine and closing their airspace. They didn ’ t even do it in the Cold War. It ’ s really amazing to see it. I think another very important thing is what has been dividing the West over the several years now, it ’ s what people term the”culture war”. The culture war between left and right, between conservatives and liberals. And I think this war can be an opportunity to end the culture war within the West, to make peace in the culture war. First of all, because you suddenly realize we are all in this together. There are much bigger things in the world than these arguments between left and right within the Western democracies. And it ’ s a reminder that we need to stand united to protect Western liberal democracies. But it ’ s deeper than that. Much of the argument between left and right seemed to be in terms of a contradiction between liberalism and nationalism. Like, you need to choose. And the right goes with nationalism, and the left goes more liberalism. And Ukraine is a reminder that no, the two actually go together. Historically, nationalism and liberalism are not opposites. They are not enemies. They are friends, they go together. They meet around the central value of freedom, of liberty. And to see a nation fighting for its survival, fighting for its freedom, you see it on Fox News or you see it in CNN. And yes, they tell the story a little differently, but they suddenly see the same reality. And they find common ground. And the common ground is to understand that nationalism is not about hating minorities or hating foreigners, it ’ s about loving your compatriots, and reaching a peaceful agreement about how we want to run our country together. And I hope that seeing what is happening would help to end the culture war in the West. And if this happens, we don ’ t need to worry about anything. You know, when you look at the real power balance, if the Europeans stick together, if the Americans and the Europeans stick together and stop this culture war and stop tearing themselves apart, they have absolutely nothing to fear – the Russians or anybody else. BG : I ’ m going to ask you a question later about the stories the West tells itself, but let me zoom out for a second and get a larger perspective. You wrote another essay last week in”The Economist”, and you argue that what ’ s at stake in Ukraine is, and I quote you,”the direction of human history”because it puts at risk what you call the greatest political and moral achievement of modern civilization, which is the decline of war. So now we are back in a war and potentially afterwards into a new form of cold war or hot war, but hopefully not. Elaborate about that essay you wrote. YNH : Yeah, I mean, some people think that all this talk about the decline of war was always just a fantasy. But... Again, you look at the statistics. Since 1945, there has not been a single clash between superpowers, whereas previously in history, this was, you know, the basic stuff of history. Since 1945, not a single internationally recognized country was wiped off the map by external invasion. This was the common thing in history. Until then and then it stopped. This is an amazing achievement, which is the basis for everything we have, for our medical services, for education system, and this is all now in jeopardy. Because this era of peace, it wasn ’ t the result of some miracle. It wasn ’ t the result of a change in the laws of nature. It was humans making better decisions and building better institutions, which means also that there is no guarantee for the future. If humans, some humans, start making bad decisions and start destroying the institutions that kept the peace, then we will be back in the era of war with budgets, military budgets going to 20, 30, 40 percent. It can happen. It ’ s in our hands. And I ’ ll just say one more thing, When, not just me, but other scholars like Steven Pinker and others, talked about the era of peace, some people understood it as kind of encouraging complacency. That, oh, we don ’ t need to worry about anything. No, I mean, the message was really the opposite. It was a message of responsibility. If you think that there is no era of peace in history, it ’ s always war, it ’ s always the jungle, there is a constant level of **violence** in nature, then this basically means that there is no point struggling for peace and there is no responsibility on leaders like Putin because you can ’ t blame Putin for the war. It ’ s just a law of nature that there are wars. When you realize, no, humans are able to decrease the level of **violence**, then it should make us much more responsible. And it should also make us understand that the war in Ukraine now, it ’ s not a natural disaster. It ’ s a man-made disaster, and a single man. It ’ s not the Russian people who want this war. There ’ s really just a single person who, by his decisions, created this tragedy. BG : So one of the things that has come back in the last weeks and months is the nuclear threat. It ’ s moved back into the center of political and strategic considerations. Putin has talked about it several times, the other day he ordered Russia ’ s nuclear forces on a higher alert status. President Zelenskyy himself at the Munich Security Conference essentially said that Ukraine had made a mistake abandoning the nuclear weapons it had inherited from the Soviet Union. That ’ s a statement that I suspect many countries are pondering. What ’ s your thinking about the return of the nuclear threat? YNH : It ’ s extremely frightening. You know, it ’ s like it ’ s almost Freudian, it ’ s the return of the repressed. We thought that, oh, nuclear weapons, yes, there was something about that in the 1960s with the Cuban Missile Crisis and Dr. Strangelove. But no, it ’ s here. And, you know, it took just a few days of difficulties on the battlefield for suddenly – I mean, I ’ m watching television, like, the news and you have these experts explaining to people what different nuclear weapons will do to this city or to this country. It rushed back in. So, you know, nuclear weapons are – in a way they also, until now, preserved the peace of the world. I belong to the school of thought that if it was not for nuclear weapons, we would have had the Third World War between the Soviet Union and the United States and NATO sometime in the 1950s or ’ 60s. That nuclear weapons actually, until today, served a good function. It ’ s because of nuclear weapons that we did not have any more direct clashes between superpowers because it was obvious that this would be collective suicide. But the danger is still there, it ’ s always there. If there is miscalculation, then the results could, of course, be existential, catastrophic. BG : And at the same time, you know, in the ’ 70s after Cuba and Berlin, and so in the ’ 60s, but in the ’ 70s, we started building a sort of international institutional architecture that helped reduce the risk of military confrontation of nuclear weapons, we used, you know, anything from arms control agreements to measures designed to build trust or to communicate directly and so on. And then in the last decade or so, that has been progressively kind of scrapped, so we are even in a more dangerous situation than we were let ’ s say, at the end of the last century. YNH : Completely, I mean, we are now reaping the bad fruits of neglect that ' s been going on for several years, not just about nuclear weapons, but in general, about international institutions and global cooperation. We ' ve built, in the late 20th century, a house for humanity based on cooperation, based on collaboration, based on the understanding that our future depends on being able to cooperate, otherwise we will become extinct as a species. And we all live in this house. But in the last few years we stopped – we neglected it, we stopped repairing it. We allow it to deteriorate more and more. And, you know, eventually it will – It is collapsing now. So I hope that people will realize before it ' s too late that we need not just to stop this terrible war, we need to rebuild the institutions, we need to repair the global house in which we all live together. If it falls down, we all die. BG : So we have, among the audience listening, Rola from – I don ' t know where she ' s from, she grew up in Lebanon – and she said,"I lived the war, I slept on the ground, I breathed fear. All the reasons were explained to me that the only remaining learning came the war is absurd. We talk about strategy, power, budgets, opportunities, technologies. What about human **suffering** and psychological **trauma**?"Especially, I assume what she ' s asking is what about, what ' s going to remain, in terms of the human **suffering** and the psychological **trauma** going forward? YNH : Yeah, I mean, these are the seeds of **hatred** and fear and misery that are being planted right now in the minds and the bodies of tens of millions, hundreds of millions of people, really. Because it ' s not just the people in Ukraine, it ' s also in the countries around, all over the world. And these seeds will give a terrible harvest, terrible fruits in years, in decades to come. This is why it ' s so crucial to stop the war immediately. Every day this continues, plants more and more of these seeds. And, you know, like this war now, its seeds were, to a large extent, planted decades and even centuries ago. That part of the Russian fears that are motivating Putin and motivating people around him is memories of past invasions of Russia, especially, of course, in Second World War. And of course, it ' s a terrible mistake what they are doing with it. They are recreating again the same things that they should learn to avoid. But yes, these are still the terrible fruits of the seeds being planted in the 1940s. BG : It ' s what in same article you call the fact that nations are ultimately built on stories. So these seeds are the stories we are starting to create now. The war in Ukraine is starting to create the stories that are going to have an impact in the future, that ' s what you ' re saying. YNH : Some of the seeds of this war were planted in the siege of Leningrad. And now it gives fruit in the siege of Kyiv, which may give fruit in 40 or 50 years in more terrible... We need to cut this, we need to stop this. You know, as a historian, I feel sometimes ashamed or responsible, I don ' t know what, about what history, the knowledge of history is doing to people. In recent weeks, I have been watching all the world leaders talking with Putin, and very often he gave them lectures on history. I think that Macron had a discussion with him for five hours, and afterwards, said,"Most of the time he was lecturing me about history."And as a historian, I feel ashamed that this is what my profession in some way is doing. I know it for my own country. In Israel, we also suffer from too much history. I think people should be liberated from the past, not constantly repeating it again and again. You know, everybody should kind of free themselves from the memories of the Second World War. It ' s true of the Russians, it ' s also true of the Germans. You know, I look at Germany now, and what I really want to say, if there are Germans watching us, what I really want to say to the Germans : guys, we know you are not Nazis. You don ' t need to keep proving it again and again. What we need from Germany now is to stand up and be a leader, to be at the forefront of the struggle for freedom. And sometimes Germans are afraid that if they speak forcefully or pick up a gun, everybody will say,"Hey, you ' re Nazis again."No, we won ' t think that.

BG : That ’ s happening right now. I mean, lots of things that were inconceivable just 10 days ago have happened in the last few weeks. And one of the most striking, to me in any case, is Germany ’ s reaction and transformation. I mean, the new chancellor, Olaf Scholz, the other day announced that Germany will send arms to Ukraine, and will spend an extra 100 billion dollars in building up its army. That reverses completely the principles that have guided Germany ’ s foreign policy and security politics for decades. So that shift is happening exactly at this moment and very, very fast. YNH : Yeah. And I think it ’ s a good thing. We need the Germans to... I mean, they are now the leaders of Europe, certainly after Britain left in Brexit. And we need them to, in a way, let go of the past and be in the present. If there is really one country in the world that, as a Jew, as an Israeli, as a historian, that I trust it not to repeat the horrors of Nazism, that ’ s Germany. BG : Yuval, I want to touch quickly on three things that have to do with the fact that this feels like the first truly interconnected war in many ways. The first, of course, is the basics, which is, on one side, you have a very ancient war – we have tanks and we have trenches and we have bombed buildings – and on the other, we have real-time visibility of everything through cell phones and **Twitter** and TikTok and so on. And you have written a lot about this tension between old ways and new tech. What ’ s the impact here? YNH : First of all, we don ’ t know everything that is happening. I mean, surprisingly, with all this TikTok and phones and everything, so much is not known. So the fog of war is still there, and yes, there is much more information, but information isn ’ t truth. Lots of information is disinformation and fake news and so forth. And yes, it ’ s always like this ; the new and the old, they come together. You know, with all the talk about interconnectedness and living in cyberspace and all that, one of the most important technologies not just of this war, but of the last decade or two have been stone walls. It ’ s Neolithic. Everybody is now building stone walls in the era of Facebook and Google and all that. So the old and the new, they go together. And it ’ s... It is a new kind of war. People are sitting at home in California or Australia, and they actively participate in the war, not just by writing tweets, but by attacking websites or defending websites. You know, in Spain, in the Civil War, if you wanted to help fight fascism, then you had to go to Spain and join the international brigade. Now the international brigade is sitting at home in San Francisco and is still in some way part of the war. So this is definitely new. BG : So indeed, just two days ago, Ukraine ’ s deputy prime minister, I think, Fedorov, announced via Telegram that he wanted to create a sort of volunteer cyber army. He invited software developers and hackers and other people with IT skills to somehow help Ukraine fight on the cyber front. And according to”Wired”magazine, in less than two days, 175, 000 people signed up. So here is a defending nation that can kind of recruit almost overnight, 175, 000 volunteers to go to battle on his behalf. It ’ s a very different kind of war. YNH : Yeah. You know, every war brings it surprises. Sometimes it ’ s how everything is new, but sometimes it ’ s also how everything is old. BG : So a few people in the **chat** and in the Q and A, have mentioned China, which of course, is an important actor here, although for now is mostly an observer. But China has a stated policy of opposing any act that violates territorial integrity. So moving into Ukraine, of course, violates territorial integrity. And it also has a huge interest in a stable global economy and global system. But then it needs to square this with the recent closeness with Russia. Xi Jinping and Putin met in Beijing before the Olympics, for example, and kind of had this message of friendship that went out to the world. How do you read China ’ s position in this conflict? YNH : I don ’ t know, I mean, I ’ m not an expert on China, and I certainly can ’ t just... You know, just reading the news won ’ t get you into the mindset, into the real opinions and positions of the Chinese leadership. I hope that they take a responsible position. And act – because they are close to Russia, they are also close to Ukraine, but especially because they are close to Russia, they have a lot of influence on Russia, I hope that they will be the responsible adults that will put down the flames of this war. They have a lot to lose from a breakdown of the global order. And I think they have a lot to win from the return of peace, including in terms of the gratitude of the international community. Now, whether they do it or not, this is with them. I can ' t predict, but I hope so. BG : You have mentioned before the several European and Western leaders that have gone to Moscow in the weeks before the invasion. Varun in the **chat**, asks,"Is the Ukraine war a failure of diplomacy?"Could have... Something different happened? YNH : Oh, you can understand it in two questions. Did diplomacy fail to stop the war? Absolutely, everybody knows that. But is it a failure in the sense that a different diplomatic approach, some kind of other proposition, would have stopped the war? I don ' t know, but it doesn ' t seem like it. I mean, looking at the events of the last few weeks, it doesn ' t seem that Putin was really interested in a diplomatic solution. It seemed that he was really interested in the war, and I think, again, it goes back to this basic fantasy that if he really was concerned about the security situation of Russia, then there was no need to immediately invade Ukraine. There was no immediate threat to Russia. There was no discussion of right now, Ukraine joining NATO. There was no invasion army assembling in the Baltic states or in Poland. Nothing. Putin chose the moment to start this crisis. So this is why it doesn ' t seem that it ' s really about the security concerns. It seems more about this very deep fantasy of re-establishing the Russian Empire and of denying the very existence of the Ukrainian nation. BG : So you live in the Middle East. Someone else in the **chat** asks,"What makes the situation so unique compared to many other wars that are going on right now in the world?"I would say, aside from the nuclear threat from Russia, but what else? YNH : Several things. First of all, we have here, again, something we haven ' t seen since 1945, which is a dominant power trying to basically obliterate from the map an independent country. You know, when the US invaded Afghanistan or when the US invaded Iraq, you can say a lot of things about it and criticize it in many ways. There was no question of the US annexing Iraq or turning Iraq into the 51st state of the United States. This is what is happening in Ukraine under this pretext or this disguise, this is what ' s at stake. The real aim is to annex Ukraine. If this succeeds, again, it brings us back to the era of war. I was struck by what the Kenyan representative to the UN Security Council said when this erupted. The Kenyan representative spoke in the name of Kenya and other African countries. And he told the Russians : Look, we also are the product of a post-imperial order. The same way the Soviet empire collapsed into different independent nations, also, African nations came out of the collapse of European empires. And the basic principle of African politics ever since then was that no matter what your objections to the borders you have inherited, keep the borders. The borders are sacred because if we start invading neighboring countries because,"Hey, this is part of our countries, these people are part of our nation,"there will not be an end to it. And if this now happens in Ukraine, it will be a blueprint for copycats all over the world. The other thing which is different is that we are talking about superpowers. This is not a war between Israel and Hezbollah. This is potentially a war between Russia and NATO. And even leaving aside nuclear weapons, this completely destabilizes the peace of the entire world. And again, I go back again and again to the budgets. That if Germany doubles its defense budget, if Poland doubles its defense budget, this will spread to every country in the world, and this is terrible news. BG : So Yuval, I ' m jumping from topic to topic because I want to use the last few minutes to ask a few questions from the audience. A few people are asking about the link to the climate crisis, particularly when it relates to the energy flows. Like, Europe is very dependent, part of Europe, is very dependent on Russian oil and gas, which is, as far as we know, still flowing until today. But could this crisis, in a sort of paradoxical way, a bit like the pandemic, accelerate climate action, accelerate renewables and and so on? YNH : This is the hope. That Europe now realizes the danger and starts a green Manhattan Project that kind of accelerates what already has been happening, but accelerates it, the development of better energy sources, better energy infrastructure, which would release it from its dependence on oil and gas. And it will actually undercut the dependence of the whole world on oil and gas. And this would be the best way to undermine the Putin regime and the Putin war machine, because this is what Russia has, oil and gas. That ' s it. When was the last time you bought anything made in Russia? They have oil and gas, and we know, you know, the curse of oil. That oil is a source of riches, but it ' s also very often a support for dictatorships. Because to enjoy the benefits of oil, you don ' t need to share it with your citizens. You don ' t need an open society, you don ' t need education, you just need to drill. So we see in many places that oil and gas are actually the basis for dictatorships. If oil and gas, if the price drops, if they become irrelevant, it will not only undercut the finance, the power of the Russian military machine, it will also force Russia, force Putin or the Russians to change their regime. BG : OK, let me bring up a character that everybody here in the **chat** seems to find quite heroic, and that ' s the Ukrainian president. So Ukraine kind of finds itself with a comedian who turned almost accidental president, who turned now war president. But he has shown an impressive conduct in the last few weeks, especially in the last few days, which can be summarized in that response he gave to the US when they offered to kind of exfiltrate him so he could lead a government in exile, he said,"I need ammunition. I don ' t need a ride."How would you look at President Zelenskyy? YNH : His conduct has indeed been admirable, and he gives courage and inspiration not just to the Ukrainian people, but I think to everybody around the world. I think to a large extent the swift and united reaction of Europe with the sanctions and sending arms and so forth, to a large extent, this is also to the credit of Zelenskyy. That, you know, when politicians are also human beings. And his direct appeal to them, and you know, they met him many times in person and to see where he is now and the threat that not only him, but his family is also in. And you know, they talk with him, and he says, and they know, that this may be the last time they speak. He may be dead, murdered or bombed in an hour or in a day. It really changes something. So in this sense, I think he made a huge personal contribution, to not just the reaction in Ukraine, but around the world. BG : So Sam, who ' s listening, asked this question :"Can you provide some historical context for the force and the meaning of economic and trade sanctions at the level where they are currently imposed. How have previous would-be empires, would-be aggressors, or aggressors, been constrained by such isolations and such sanctions?"YNH : You know, what we need, again, to realize about Putin ' s Russia is that it ' s not the Soviet Union. It ' s a much smaller and weaker country. It ' s not like in the 1960s, that in addition to the Soviet Union, you had the entire Soviet bloc around it. So it ' s easier in this sense to isolate it. It ' s much more vulnerable. Again, does it mean that sanctions would work like a miracle and stop the tanks? No. It takes time. But I think that the West is in a position to impact Russia with these kinds of sanctions and isolation much more than, let ' s say, with the Soviet Union. And also the Russian people are different. The Russian people don ' t really want this war, even the people in the immediate circle around Putin. You know, again, I don ' t know them personally, from what it seems, it ’ s that these people, they like life. They have their yachts and they have their private airplanes and they have their house in London and they have their chateau in France. And they like the good life, and they want to keep enjoying it. So I think that the sanctions can be really effective. What ’ s the timetable? That ’ s ultimately in the hands of Putin. BG : So Gabriella asks :”I remember the war in former Yugoslavia and the atrocities there. Is there any possibility that this war would escalate into such a situation?”I think an extension to that is : Is this war kind of stirring dormant conflicts like in the Balkans, for example, or in the former Central Asian republic? YNH : Unfortunately, it can get to that level and even worse. If you want an analogy, go to Syria. You look at what happened in Homs. At what happened in Aleppo. And this was done by Putin and his airplanes and his minions in Syria. It ’ s the same person behind it. And to think that,”No, no, no, this happened in the Middle East. It can ’ t happen in Europe.”No. We could see Kyiv in the same situation as Homs, as the same situation as Aleppo, which would be catastrophic, and, again, would plant terrible seeds of **hatred** for years and decades. So far, we ’ ve seen hundreds of people being killed, Ukrainian citizens being killed. It could reach tens of thousands, hundreds of thousands. So in this sense, it ’ s extremely painful to contemplate. And this is why we need again and again to urge the leaders to stop this war, and especially, again and again, tell Putin,”You will not be able to absorb Ukraine into Russia. They don ’ t want it, they don ’ t want you. If you continue, the only thing you will achieve is to create terrible **hatred** between Ukrainians and Russians for generations. It doesn ’ t have to be like that.”BG : Yuval, let me finish with one question about your county. You are in Israel. Israel has close ties with both Russia and Ukraine. It ’ s actually home of many Russian-born and many Ukrainian-born Jews. How is the country reacting to this conflict, I ’ m talking about the government, but also about the population? YNH : Actually, I ’ m not the best person to ask. I ’ ve been so, kind of, following what ’ s happening around the world, I didn ’ t pay so much attention to what is happening right here. And even though I live here, I ’ m not an expert on Israeli society or Israeli politics. Definitely, the sentiment in the **street**, in the social media is with Ukraine. You see Ukrainian flags, you see on social media people putting Ukrainian flags on their accounts. And another thing, so many people in Israel, they came from the former Soviet Union. And until now, everybody was simply known as Russians. You know, even if you came from Azerbaijan or you came from Bukhara, you were a Russian. And suddenly,”No, no, no, no, no. I ’ m not Russian. I ’ m Ukrainian.”And again, these seeds of **hatred** that Putin is planting, it ’ s reaching also here. That suddenly people are saying no, Russian, Ukrainian, until a very short time ago, it ’ s the same thing. No, it ’ s not the same thing. So the shock waves are spreading. BG : Yuval, thank you for taking the time and being with us today and sharing your knowledge and your views on the situation. Thank you very much. YNH : Thank you and I hope for peace quickly. BG : We all do. Thank you. [Get **access** to **thought-provoking** events you won ’ t want to miss.] [Become a TED Member at ted. com / membership]

Marisa Franco : Now, as an expert on friendship, I ’ m up against a lot because of the hierarchy that a lot of our cultures place on love, right? With familial love at the top, with romantic love at the top, and with platonic love, friendship love, really at the bottom. And with so many countries, people feeling so lonely and so disconnected, I believe that if we leave friendship at the bottom of this hierarchy, it ’ s like there ’ s gold at our feet that we ’ re treating as concrete. And so why are friendships so key? Well, our bodies have always known that we need an entire community to feel whole. And just being around a spouse, for example, only surfaces one side of ourselves. So maybe the part of me that likes to garden or do yoga will begin to wither away if my spouse, for example, doesn ’ t like these activities. But then when I ’ m around a friend, I can garden and plant my pothos with them or around another friend that I can [do] downward facing dog with. And I feel my entire identity, accordion outward, unfold and fan out. And I experience the full richness and complexities of who I am when I have an entire community to bring that out in me. And so that ’ s one of the reasons why friendship is really important. But I think there ’ s two reasons why we tend to really devalue it. One reason is because we just don ’ t know how to make friends. So luckily, I am going to help you with that a little bit today. But the other reason has to do with something I like to call the”paradox of people.”That on the one hand we need people, they make us feel healthy, they make us feel connected, they make us feel like our very selves, right? But on the other hand, people are really scary. They can **dismiss** us, they can reject us, they can actively **harm** us. And so this sort of dilemma that we face, the sort of entity that we need the most is also the entity that can **harm** us the most. And how we walk across this tightrope handling this paradox of people says a lot about our ability to make and keep friends. Because if we find ourselves stuck in the place where we see people as – we mistrust people, or we see people as potentially rejecting us and **harming** us, it ’ s really hard to foster connection. And this really materialized for me one day when I had bought an apartment, and I was really excited to make friends with my neighbors because I ’ m like,”I ’ m going to be here for a while.”And I see a couple of my neighbors in the hallway, when I ’ m walking home into my apartment with my ex at the time who was living with me. And I walk right past them, right? Because paradox of people, I ’ m scared of them, they might reject me. They might see me as weird if I try to introduce myself. So I scurry into my apartment and my ex, he pushes me back into the hallway to talk to my neighbors and says to me, you know,”You ’ re writing this book on friends. What would you tell other people who are in your situation?”And so as I ’ m sort of stumbling back into the hallway, I ’ m thinking about a few things that I have learned through studying friendship so intensely. And so two observations that I have on friendship and two takeaways for what we can do to make and keep friends. First observation, friendship does not happen organically in adulthood, right? And in fact, one study found that people that think that it happens based on luck are actually lonelier five years later, whereas people that see it as happening based on effort are less lonely five years later. So what does that tell me? That if I was just there hoping that my neighbors would someday try to be my friends, it probably wouldn ’ t happen, right? And so I would need to make that effort in order to be able to make friends. But second observation that I have, based on reading all the research on friendship, is something called the”liking gap,”which is a phenomenon wherein when strangers interact and predict how likely the other person is to like them, they underestimate how much the other person likes them. So this research really suggests that we ’ re less likely to be rejected than we think. Which leads me to my first takeaway for making friends. If you want to make friends, you have to assume that people like you, right? The reason is, when researchers told people,”Hey, you ’ re going to go into this group, and based on your personality profile, we predict that you will be liked.”This was completely bogus, a total lie. But they found that when people went into this group of people, they became warmer, open, more friendly, because they made this assumption. And so indeed, it became this self-fulfilling prophecy called the”acceptance prophecy”. And when we assume we ’ ll be liked, we make it more likely that we actually will be liked. Whereas other research finds that people that tend to assume that they ’ re rejected, even when the circumstance is ambiguous, like, my friend, maybe they ’ re just, like, hungry or something, rather than that they hate me, right? Those people that go straight to”maybe they don ’ t like me,”they actually become cold, they actually become withdrawn and they reject people. And then they get rejected in return. So I ’ m thinking of these things in the hallway, you know, right by my neighbors. I ’ m thinking that, you know, I can ’ t wait for this to happen organically. OK, I ’ m afraid they ’ re going to reject me, but that ’ s less likely to happen than I actually think. I should assume that they ’ re going to like me. And then one last thing I have to remind myself of was to overcome something called”covert avoidance,”which is our tendency to show up around other people physically, but check out mentally, right? Like, you ’ re hanging out with people and you ’ re on your phone, or that would look like me just standing in the hallway hoping that my neighbors talk to me. And so to make friends, you have to overcome covert avoidance by not just showing up, I showed up in that hallway, right, but you also have to engage with people when you get there. So I ended up approaching my neighbors and saying,”Hi, I ’ m Marisa, I just moved into 103, It ’ s really great to meet you.”And we start **chatting**. And at some point, you know, I asked them, like,”Is there a group where we can keep in touch? I ’ d love to, you know, **chat** further.”And they tell me about their cat group that they have for cat parents in the Drew. And I don ’ t have a cat, but like, I ’ ll take connection when I can find it. So the cat group became half cat group, half social group. And I think sometimes we think that you know, a tiny act, something small like saying hello can have colossal consequences for our life. But when we can lean into the sort of positive side of the paradox of people, when we can initiate and assume people like us, right, it can have colossal consequences. Because since I said that”hello,”me and my neighbors, we met up and we hung out every Friday, socially distanced of the pandemic in the garden behind our apartment, right? And so I think that this experience really taught me the importance that while we all face this paradox of people, while we all face this dilemma, that, if we want to make friends, if we want to connect with people, we have to be able to move away from the part of ourselves that is fearful, that is mistrustful, that assumes people will **harm** or reject us and turn towards the part of ourselves that simply wants to love and connect with people and can ready ourselves to engage in these new connections with optimism and with hope. You know, my niece read my book”Platonic,”and one thing that she took away from it was that for friendship to happen, someone has to be brave. So be brave. Thank you. Whitney Pennington Rodgers : Thank you, Marisa. I loved all of that. And I could see in the **chat** that a lot of the members also really love some of the things you shared there. So thank you so much for that wonderful talk and for those tips which we will dive into in this conversation. And, you know, I think just to sort of start, your line of work is just so interesting. Friendship is, it seems such a unique area to research. And I actually want to read something back to you from your book to help us understand a little bit more about just the importance of this type of relationship. You say,”Friendship, in releasing the relationship pressure valve, infuses us with joy like no other relationship. Without needing to plan for retirement, fulfill each other ’ s **sexual** needs and work out who should be scrubbing the shower grime, we are free to make friendship territories of pleasure.”So can you talk a little bit more about this and just why friendship holds such an important role in all of our lives? MF : Yeah, yeah. Well, first of all, I ’ ll take a step back and say, like, clearly, connection is so central to all of us. You know, the research finds that, for example, loneliness is more toxic for your body than having a poor diet or not exercising. And these are things that we talk about in the public health conscious, but we don ’ t talk about social connection enough. Maybe for our UK folks, you all have a prime minister of loneliness. So it ’ s a little bit different, right? But when we talk about the impact of loneliness, there ’ s actually three different dimensions of loneliness. There is intimate loneliness, which is the desire for someone to be very intimate with. There ’ s also relational loneliness, which is the desire for someone that feels as close to us as a friend might. And then there ’ s collective loneliness, which means I desire to be part of a group working towards a common goal. And this research on loneliness really suggests that, just like I said, we really do need an entire community to feel whole. Because if we just focus on being very nuclear, you know, just having a spouse and that being the center of all of our connections, right, that ’ s maybe touching on our intimate loneliness, but not our relational, not our collective, right? And so I think a lot of us found this in the pandemic that, we may have been home with the spouse or partner that we really loved a lot, but we still ended up feeling lonely. And that ’ s because as social species, as social creatures, like, we just need an entire community to fulfill us. WPR : You touched on this a little bit in the talk, and in the book, you separate, sort of, the way you think about friendship to two categories. You talk about, you know, sort of a backward look at how we ’ ve traditionally experienced friendship, and then you look forward at how we could build better relationships, better platonic relationships. And so if we could just talk a little bit about sort of that first section, just diving into how we as a culture tend to think about friendship and how does this really impact the way that we actually approach it? MF : Yeah, so I ’ m reading all the research on friendship, and what sort of materializes before my eyes is that our personalities are fundamentally a reflection of our experiences of connection or disconnection, right? Like, in some ways our personalities are coping mechanisms from the experiences of connection or disconnection we ’ ve received. So whether you are friendly, open, warm, vulnerable, trusting, cynical, aggressive, even **violent**, all of this is predicted by what your history of connection or lack thereof looks like. So how we ’ ve connected really affects who we are. But not only that, who we are really affects how we connect, right? Those people that have that history of healthy relationships, they have an internal set of beliefs within them that allows them to continue to facilitate healthy relationships. This is, if people are familiar with”attachment theory,”securely attached people, who think others can be trusted, who think they can be vulnerable, who think they can turn to people for support, right? And they go into new relationships with this set of beliefs that allows them to continue to create these new relationships. Whereas people who have had difficult previous relationships, those can be internalized as a belief system that then can impede their ability to foster further connections, right? Because they may think”people are going to reject me,”that”I can ’ t be vulnerable,”that”I can never feel safe around anybody,”even when someone is safe, they ’ re still holding that assumption and that judgment, right? And so what I want”Platonic”to do, because I know some people hear this and they ’ re like,”Good for those people with healthy childhoods, you know, whatever. For me, I guess I ’ m doomed.”Absolutely not. WPR : Your work is focused specifically on adult friendships, which, for a lot of the reasons you ’ ve already outlined, seem like are just really challenging for us to develop. But I guess, can you talk about sort of, why this breakdown happens and really when we start to see that it becomes more difficult for people to make friends in the same way as you did when you were kids? MF : Yeah. So when I say friendship doesn ’ t happen organically in adulthood, I don ’ t mean that friendship doesn ’ t happen organically in childhood, because for children it often does. And they have certain ingredients in their environment that really foster friendship. So Rebecca G. Adams, she ' s a sociologist, and she says, you know, for friendship to be fostered organically, you need to have this repeated unplanned interaction and the **shared** vulnerability, right? And so in school we have that. We have that through our lunch period. We have that through our gym, we have that through our recess, right, we ' re seeing people every day, we ' re letting our guard down, we end up sort of just developing these friendships. But when you think about adults going into the working worlds, you may have repeated unplanned interaction with your colleagues, less so now that we ' re doing more hybrid and remote workplace, right? But we ' re often not as vulnerable in the workplace. And that ' s why one study, and again, this is caveat, US context, one study found that the more time people spend together at work, the less close that they feel. And so we need to recognize that as adults, we don ' t have the same infrastructure we had as kids. So we can ' t rely on the same set of assumptions that, oh, this is just going to happen, I don ' t have to try, I don ' t have to initiate. Because as I shared from that previous research study, if we think that way, for a lot of us, it won ' t happen. WPR : And I think also just in thinking about what friendship brings to the table for you, how it benefits you, you have this phrase in your book where you say,"Connecting to others makes us ourselves."And it ' s about much more than just the pleasure of connection there. Can you explain a little bit about that? MF : Yeah. So Harry Stack Sullivan, he ' s a psychiatrist, and he has this theory called the"theory of chums,"which is basically that our chums or our friends earlier in life, they provide us with the sort of relationship template that we take on into our future. So it allows us to continue to connect throughout life, right? And there is some research that finds that if we connect in childhood, we have good friends in childhood, we have higher self-esteem in adulthood, we ' re more empathic in adulthood, right? And so he kind of argues that the therapy experience is similar to the chumship experience, in that with your friends, you share things that you feel like you should be ashamed of, right? And when you are ashamed of something, you ' re not integrating it into your entire personality. You ' re trying to push it away and suppress it and not make it who you are. And the **shame** can really take over your whole personality because you ' re pushing away this part of who you are that you think is shameful. But then so much of your personality is spent focusing on making sure nobody finds out this thing, right? And so that ' s why **shame** can be so encompassing and enveloping. But what Stack Sullivan argues, is that when kids share this **shame** with their friends and their friends are like, you know, we still love you. You know, this isn ' t a big deal for us, right? And we still think you ' re amazing and we accept that about you, right? We begin to be able to accept it in ourselves and to bring whatever we felt **shame** about, to see it as just part of our personalities rather than antithetical to the personality that we want to have. And we are able to sort of relinquish all of the energies that we spend trying to push this thing away. And so in that way, the experience of experiencing that platonic love from our friends, especially at that time in childhood, teenagers, where we ' re very high in **shame**, we ' re like highest in **shame** than throughout our whole lifespan, right? That our friends are there at that time when we ' re so high in **shame**, to help us integrate that and to help us connect to all sides of ourselves so that we sort of begin to become who we fully are. WPR : It ' s just so interesting how much vulnerability and **shame** play into this. And in a way, it seems like on the one hand, as you get more confident, you start to lose some of the ability to make new friends, but also using that confidence, leaning into it to actually make the friends is what you need. So it ' s fascinating. Well, I want to dive into some of the member questions we ' re receiving because they ' re also really interesting. So TED member Arnoldo, they ask,"Married people often complain about lack of time to cultivate friendships outside of the marital circle. What insights have you gained in your research about the effects of outside friendships in a couple ' s relationship?"MF : Oh, I love this question. I think that having outside friendships is necessary for having a healthy marriage. I do. And this is where I ' m coming from with that. The research basically finds that if I make a friend, I ' m not only less depressed, but my spouse is too. It also finds that when you get into conflict with your spouse, it negatively impacts your release of a stress hormone cortisol, right? But if you have quality connection outside of that marriage, that doesn ' t happen. Your cortisol release is normal, right? Other research that finds that, particularly for women who tend to have more close intimate relationships, when they go through difficulties within that partnership, they are more resilient to it when they have this outside support, right? And so it ' s just like, if I can **access** this other person to center me during times of stress in my marriage, I can return to that marriage in a centered and grounded way. And that ' s a resource for me, and it ' s a resource for my spouse. Where we see that people that only have that close connection with their spouse, they have high rates of what ' s called concordance, which means that, however your spouse feels is kind of how you feel. Their, sort of, energy affects you a lot more when they ' re the only person that you ' re looking to for support. And so what happens is like, the natural ebbs and flows that can happen in a marriage, they ' re so much more impacted, and there ' s so much more devastated during those times of ebbs because they don ' t have that support outside of the relationship. So I think sometimes we see, we think of like,"Oh, are my friends a threat to my spouse? My spouse is spending time with their friends, they ' re not spending time with me."But if we understand more broadly the importance of friendship and how it makes every other relationship in our life better, we will see that there ' s actually synergy between these relationships. That my spouse having friends outside of this relationship is what makes them a better spouse for me. WPR : So, so much of it has to do with the way we just think about the role friendships play in our lives. We have lots of questions that are coming in about, sort of, the steps to actually making friends. And I think before we get into some of those specific questions, I know you, in the talk, sort of shared – you started with two tips, this idea of first, assuming that people like you and then overcoming what you call covert avoidance or that urge to sort of mentally check out when you ' re meeting someone new. What are some of the other ways that you recommend people try to use tools that people use to build new friendships? MF : So I can walk through my own experience of making a bunch of friends and share this in a story. I went to Mexico City alone and was there for 10 days and was like, OK, if I spend ten days here and don ' t make any friends, I ' m going to be very lonely. So how did I make friends when I was there? First I went to a coffee shop. I heard another American there and I knew, you know, he ' s less likely to reject me than I think. I also knew the research on transitioners, right? People that are in times of transition are most open to friendship. So people that are traveling, people that have just moved to the city, people that have just started school, people that have just retired, right? Those are the people to try to connect with versus, you know, someone who ' s been here for a while and already has an established network. So I knew this guy ' s a transitioner and he ' s less likely to reject me than I think. So I ' m going to engage with him. And I asked, you know, where are you from? Like, I ' m from the US too. We start **chatting** and I end up inviting him to a meetup that night, and it ' s like a language exchange meetup. And at that language exchange meetup, I meet someone else who ’ s cool, and I say, you know,”Do you want to come to this Lucha Libre wrestling match with me?”Then he said, yes, and I think... You know what I realized, too, from the research on friendship, I used to think that making friends was about being interesting, being smart, being insightful, being charismatic, being entertaining. But in fact, people report that this entertainment factor is the least important quality they look for in a friend. And the most important quality that they look for is someone who makes them feel like they matter. So for me, if I want to connect with someone, it ’ s not about me trying to impress them. It ’ s about me trying to make them feel valued and, you know, say hello to them and engage with them and tell them what I like about them and tell them what I appreciate about them, right? There ’ s this study that looked at friendship, budding friendship groups, for like 12 weeks, which of these pairs ended up becoming friends. And it was the ones that shared the most affirmation and affection towards each other, right? And so, just to go even deeper into the research rabbit hole, there ’ s a theory called”risk regulation theory,”which indicates that we decide how much to invest in a relationship based on our view of how likely we are to get rejected. So when we show people”I like you,”we ’ re telling them,”Hey, you ’ re not going to get rejected if you try to be friends with me.”And that makes people really feel safe connecting with us, right? So I was both engaging with these people and I was trying to make them feel loved and tell them how great I thought they were and how happy I am to meet them as I reached out to them. And then I went to my Spanish class, which, if you don ’ t have any friends, what I recommend is that you join something that ’ s repeated over time. And remember, I said repeated unplanned interaction and **shared** vulnerability is that infrastructure that kids have for friends that we lack as adults. So as adults, we really need to recreate that infrastructure. And so if you join like, a social group that ’ s repeated over time, turn your hobby into a community, right, that ’ s a really important way to make friends. So for me, it ’ s I want to take the Spanish class because I love learning languages. For you, it might be football team, improv team, hiking team, **meditation** group, but it ’ s just finding something, finding a group that meets around this hobby. Because when you find something that ’ s repeated over time, what happens is something called the”mere exposure effect”sets in. The mere exposure effect describes our tendency to unconsciously, completely unconsciously, like people just because they are familiar to us. So, for example, this researcher found that when he planted women into a large psychology lecture, at the end of the semester, none of the students remembered the woman, but they reported liking the woman who showed up to the most classes, 20 percent more than the woman that didn ’ t show up for any, right? Nobody remembered her, but they liked her a lot because they had seen her face, like this is our brain, right? And what I think the other implication of mere exposure effect is in the beginning, mere exposure hadn ’ t set in. So it ’ s going to be awkward, it ’ s going to be weary. You ’ re going to feel uncomfortable, right? Maybe a little distrusting. That ’ s not a sign that you need to stop showing up. That ’ s a sign you need to keep showing up because when you continue to show up, they ’ re going to like you more, you ’ re going to like them more, right? So I joined that Spanish class, that was repeated over time. Every day in Spanish class, I would ask people to go out to lunch with me. We ’ d go out to lunch together, then we went to Lucha Libre together. You know, of course, I was only there for 10 days, so I can only go so deep with folks. But in general, when you join this event that ’ s repeated over time, you want to start generating exclusivity with someone in that group. Exclusivity means you develop memories and you develop experiences with one person in the group that you don ’ t have with other people. So pick whoever in the group that you really liked and ask them,"Oh, would you be open to like, getting coffee, getting tea like, before or after our next group?"Like,"I love to hang out"and those are like, the budding stems of friendship. And luckily, if you ' re in this group, right, you don ' t have to put in as much effort, you had your tea, and now you ' re going to just continue to see them over time, and you have the wheel start moving for friendship and connection. WPR : So TED member Celia actually is curious about virtual friendships and sort of how all of this plays into it, especially to some of the points you were making earlier about the pandemic. You know, for people who have met on social media only as opposed to in real life, they ask,"Is it possible to have a strong virtual friendship? How important is in-person connection or getting together in real life?"MF : Yeah, so this is such a nuanced question in some ways, right? Because it ' s such a"both / and."We know from the research that in-person connections tend to be stronger than virtual connections, right? But I think that that research, it doesn ' t account for certain communities like people with disabilities, people with severe social anxiety, even older people that aren ' t as mobile, who tend to find connections online. And even though, you know, the online connections tend to not be as deep as in person, they can get deep if you ' re practicing the same skills that you can practice in offline connection to establish deeper relationships. So, for example, like, the research finds that if you ' re just passively scrolling on social media, doomscrolling, it makes you more lonely and negatively impacts your mental health and well-being. But if you are engaging actively on social media, I ' m posting, I ' m commenting on something that you shared, I ' m saying congratulations to you, that ' s actually linked to less loneliness and is something that actually makes us feel more satisfied in our relationships. So if we want to have deep virtual connections, it ' s certainly possible. But we have to bring those same principles that we use in offline connections to create more intimacy, things like being vulnerable with someone, being generous with them or showing affection towards them. That also works online. They feel like they like one another more. But when you ' re vulnerable with someone who ' s avoidantly attached, that doesn ' t necessarily happen. The avoidantly attached person doesn ' t like you more because you ' re vulnerable, because they have their own wounds around vulnerability, right? They ' ve learned that it ' s not good to be vulnerable,"I shouldn ' t be vulnerable."Like, that ' s the implicit message that they have that really inhibits their ability to connect. So the implications of this, I think, is that if you ' re vulnerable and it doesn ' t go well and it wasn ' t from a place of fear, remember that it ' s not always your fault. That other people have their own issues that they ' re dealing with which may lead them to respond to your vulnerability negatively. And that doesn ' t mean that you did anything wrong. I mean, I think if you continue to try to be vulnerable with this person who ' s shown you that they can ' t handle it, then I think you should try to pivot, right? But just because someone responded dismissively to your vulnerability, it might mean that they have their own issues to work out. WPR : I think, in sort of thinking about how to make friendships work well or to be really good at this process of doing this, you know, there ' s a popular excerpt from your book that you shared in"The Atlantic"where you talked about the concept of super friends. So what makes someone a super friend, and how can we all strive to be super friends? MF : Yeah, secure friends, aka super friends. These people are secure with themselves, which means that they don ' t have to try to use other people as a tool to fulfill their sense of self or to help them escape threatening emotions or feelings. So they ' re able to really humanize other people fully. And the research on securely attached people find, and again, these are the people that have a history of healthy relationships, but there ' s also earned-secure, which means you may not have had a history of healthy relationships, but you ' ve done the work on yourself to develop a sense of security, right? Remember, this isn ' t – nobody ' s doomed by their attachment style. But what qualities do we see in them? They ' re more likely to initiate friendships. They ' re more likely to maintain friendships. They ' re less likely to dissolve friendships. They ' re more generous towards other people because, again, they fully humanize other people. Insecurely attached people, they sometimes perceive other people through the lens of their own wounds, right? So anxiously attached people, it ' s like, you need to prove to me that you value me and you love me because I ' m so afraid that you ' re going to abandon me, and then I can try to control you and make you do things to show me that you really, really love me, right? And so they ' re not fully humanizing another person because they ' re almost seeing that person as a tool to fulfill their sense of self. Avoidantly attached people, they just think everybody ' s out to **harm** them and that everybody ' s untrustworthy. So they almost see other people as threats, so they don ' t fully humanize people for their beauty and the resources that connecting with another person can bring you. But these securely attached people, they tend to assume other people like them. I talked about something called pronoia, which is the opposite of paranoia. It ' s the idea that, you know, the universe is commiserating for your success and for your well-being and that you can trust people. They ' re comfortable with vulnerability, they ' re more empathic, they ' re comfortable sharing their needs, but also fulfilling the needs of other people. They ' re more responsive to the needs of other people. When they engage in conflict, it ' s all about perspective-taking. They ' re not like,"You do this, otherwise I ' m going to be pissed off."They ' re like,"These are my needs. What are your needs? Let ' s figure out a way to collaborate and figure out something that will work for both of us. So they tend to be quite **healing** friends. They tend to be – I talked about avoidant being low effort, low reward. Anxious is high effort, low reward. Secure is high effort, high reward when it comes to friendship. WPR : And then what about friendships where there ' s not necessarily a difference in values, but maybe a distance, whether that ' s a physical distance has been created or some sort of emotional distance because your life has changed in some way? How do you suggest people go about maintaining and nurturing those types of relationships? MF : So there ' s research on long-distance friends that finds that we are helped when we perceive our friendships as flexible, not fragile. So when we perceive that,"Oh, I haven ' t talked to this person in a few months, I ' m going to assume that friendship is asleep, not that it ' s dead, so that I can reconvene this friendship at any time."Right? So it ' s being able to recognize that our friendships ebb and flow. And when we ' re at an ebb, that doesn ' t mean,"OK, I ' m never going to contact this person again, because the friendship is officially over."We assume that this ebb is part of the normal process to flow again. So that facilitates us being able to re-engage in the friendship at any time. So basically, this all goes back to, I really think, this tip, right? It ' s such an all encompassing tip, right? Because what I ' m basically telling you is to assume people like you, right? Like, if you don ' t talk to your friend awhile, assume that they ' re still interested in being friends with you. Again, this isn ' t about, you know, being delusional. If someone ' s clearly indicating that they ' re not interested in a friendship with you, then move on. But if it ' s ambiguous and you ' re like,"I ' m not really sure, we haven ' t talked for a while, but they haven ' t necessarily rejected me or they still are responsive when I reach out to them,"you want to make that your running assumption in response to ambiguity, because again, having that assumption really facilitates continued connection. Let me begin with some **confessions**. I voted for Mitt Romney in 2012. And I voted for Hillary Clinton and Joe Biden, which is shocking, I know. I ’ m pro-choice, and I think the European laws are sensible ones. I ’ m a very proud supporter of Israel, even though I ’ m a critic of its current government. I think terrorists like Hamas and Hezbollah are evil, and there is a bright line between groups that aim to kill **innocents** and those that try to avoid doing so at all costs. I think that girls in Afghanistan shouldn ’ t be sold into child marriages, and that women in Iran should be free to show their hair in public without fear of imprisonment or worse. And that women in Somalia should not endure genital mutilation. I believe that all people are created **equal** and created in the image of God, but that all cultures are not **equal**. I believe in **gay** marriage, so much so that I ’ m actually in one myself. I believe that adults should make pretty much any decision they want about their bodies, but that children should not. I think the SAT is an imperfect but useful tool. I think defunding the police is a very bad idea. And that living in a safe **neighborhood** is among the truest forms of privilege. I think COVID probably came from a lab, and that, in retrospect, locking kids out of school for two years was a big mistake. I think we should hire people based on their merit, but cast as wide a net as possible. I don ’ t want to eat bugs, nor do I want to drink water full of microplastics, and I don ’ t think there ’ s anything coded right or left about either of those things. I believe that **equality** of opportunity and not **equality** of outcome is the true measure of **fairness**. I am repelled by ideologies that insist that our immutable characteristics are more important than our character. I don ’ t like riots, I don ’ t like mobs, and I hate lies. And I love America for all of its flaws. I believe, in part because Americans are free to debate those flaws and to strive for a more perfect union, that it really is the last best hope on Earth. The point in all of this is that I am really boring. Or at least I thought I was. I am, or at least until a few seconds ago in historical time, I used to be considered a standard-issue liberal. And yet somehow, in our most intellectual and prestigious spaces, many of the ideas I just outlined and others like them, have become provocative or controversial, which is really a polite way of saying unwelcome, beyond the pale. Even bigoted or racist. How? How did these relatively boring views come to be seen as off-limits? And how did that happen, at least it seems to me, in the span of under a few years? Now the convenient answer, of course, is the power of extreme activists. People who burn down businesses and police stations, people who shut down bridges and highways, people who harass their fellow students and shout down their professors. People who vandalize, who desecrate or tear down monuments of national heroes. But do a handful of extreme activists really have the power to dismantle the moral guardrails of a whole society, to radically shift the Overton window of what is politically and socially acceptable? I don ’ t think so. There has always been and always will be a fringe. The difference right now is that the fringe seems to be calling the shots. If you want to know why things have been turned upside down, why so many people are asking themselves if they ’ ve gone crazy, or if the world has, as they hear feminist groups justify rape as a tool of resistance ; as groups that call themselves anti-racist advocate for a new kind of segregation ; as young, highly educated people chant the slogans of jihadi terrorist groups ; well, I ultimately don ’ t think that ’ s because of a few maniacs that are throwing paint on masterpieces in our museums. It ’ s because they have been allowed to do so. And the question is why? Perhaps, to give the most generous read, it ’ s because the people shutting things down claim to be doing so in the name of justice, not in the name of nihilism. And because we believe them. Or perhaps it ’ s because we told ourselves,”It ’ s just a few nuts, I don ’ t need to get involved.”Or maybe it ’ s because people looked at their portfolio and decided that they were doing great by the numbers. And those torched stores? Ah, they probably had insurance anyway. Or because it was a headache. Or because they ’ re just kids. Or because, why die on that hill? Or maybe it was because we thought they had a point. That America and the West really were guilty of all of the terrible things that they said, or at least of some of them. And though we wouldn ’ t have torn down statues or shouted down speakers, we lacked the conviction or the ideas to stop the people doing it. Or because maybe in the end we prized comfort over complexity. I was going to say prized comfort over truth, but the thing is, truth isn ’ t something you pull out of the ground like gold or diamonds. It is a process sustained by a culture of questioning, including self-questioning. Which is why right now it can look like the absolutists are winning. My theory is that the reason we have a culture in crisis is because of the cowardice of people that know better. It is because the weakness of the silent, or rather the self-silencing majority. So why have we been silent? Simple. Because it ’ s easier. Because speaking up is hard, it is embarrassing, it makes you vulnerable. It exposes you as someone who is not chill, as someone who cares a lot, as someone who makes judgments, as someone who discerns between right and wrong, between better and worse. The reason Aristotle called courage the first virtue is because it is the one that makes all of the other virtues possible. Do you want to live in a world that values justice, wisdom, compassion, curiosity, rationality, **equality** and the pursuit of truth? I do. But fighting to make sure we live in such a world is going to take courage. That first virtue. I think one of the lessons of the past decade is that cowardice is perhaps more contagious than COVID. But so is courage, and a singular example can serve as a powerful means of transmission. So who are those examples? Each one of you, when I say the word courage, will have the ones that come to mind for you. But for me, for me, they are people like Salman Rushdie, sentenced to death by the Iranian ayatollahs in 1989 for the sin of writing a novel. He lived under the shadow of a fatwa until two years ago, on a stage like this one, he was viciously stabbed. But he survived and undaunted, this week, of course, he published a book about it. Courage for me is someone like Pennsylvania Senator John Fetterman, who insists that there is nothing contradictory about his progressive values and his belief that Hamas is a band of murderers that must be defeated. Now suffice it to say, this has not made him popular, but he doesn ’ t seem to care. While a lot of other people have moved on out of political expediency, his office in DC is the one that remains papered with photos of all of the hostages. Courage to me looks like Stanford medical professor Dr. Jay Bhattacharya. Jay studies the health and well-being of vulnerable populations for a living, and he foresaw the social and mental health crisis that would follow the COVID lockdowns. He said so, he explained it calmly. But for doing so, **Twitter** blacklisted him. YouTube censored him. The medical establishment ostracized and slandered him. He wrote,”I could not believe this was happening in a country that I so love.”And yet he did not tremble. He said,”The healing of the world starts by one person saying loudly, so the whole world can hear,”an important, true thing, that he knows he ’ s not supposed to say and that he knows will get him in trouble for saying it. I think about Roland Fryer, the economist who did just that. His colleagues at Harvard warned him against publishing research that he did into police **violence**.”You ’ ll ruin your career,”they told him. And that ’ s because his research found that while there was racial bias in low-level police force, there wasn ’ t when it came to police shootings. Now Roland himself was shocked by these findings. He knew it went against his own assumptions. He knew it would outrage people. But he published the research anyway. And it wasn ’ t simply that his reputation suffered. He had to hire an **armed** guard in Cambridge. His baby was seven days old, and he had to go to buy diapers with an **armed** guard. Where did he get the courage to do it?”Simple,”he told me.”I don ’ t covet what they covet.”He said,”Every day I have to look at myself in the mirror and say, ’ What are you here for? ’”Masih Alinejad knows what she is put on Earth for. With moxie and courage, she is leading the campaign for women ’ s rights in Iran. Her sister was forced to denounce her on state television. Her brother was thrown in jail for her dissent. And now Masih lives in exile in America but remains a hunted woman, moving from safe house to safe house. And yet she does not stop shouting for freedom. Nor does Jimmy Lai, the media mogul whose pro-democracy newspaper”Apple Daily”was shut down as China took over Hong Kong. Jimmy had more than the means to flee his country. He is a billionaire with a British passport. But he stayed.”Now is not the time for **safety**,”he said.”This is a time for sacrifice.”Today is his 1, 204 day in prison. His son Sebastian said this of his father :”Dad staying in Hong Kong is really proof that this intangible thing we call liberty is a thing people yearn for. You can call it Western values, but it ’ s not really. In the sense that it ’ s not something that only people in the West want or deserve.”Alexei Navalny was not born in the West, but he yearned for that kind of liberty. The opposition leader had refuge in Germany, but he flew back into Putin ’ s Russia, sacrificing his freedom and ultimately his life to oppose tyranny. He knew that his death would expose the truth about a totalitarian regime built on lies. Which it can, so long as we keep his memory alive. Navalny lived and died beneath the shadow of a tyranny that we are fighting to prevent in our still young but ever-darkening century. Ask yourself right now, should it take courage in the West to denounce the hateful ideology of the Islamic Republic of Iran, which pronounces death on individual writers and on entire countries, large and small? Should it take courage to oppose those chanting”death to America?”Should it take courage to say,”No, that ’ s wrong?”Should it take courage to say that those who praise the pristine subways of Russia are not journalists, but propagandists? Should it take courage to just say in public,”I disagree?”Right now it does. My friend Coleman Hughes, who spoke on this stage last year and who advocates for the colorblind ideal championed by Martin Luther King Jr, rather than give in to the race essentialism that ’ s become chic these days, he ’ ll debate anyone. He ’ ll disagree with anyone. But why is it that his angriest opponents prefer to call him hateful names and to lobby for his exclusion? The question, I think, is whether or not the people I ’ ve mentioned and those like them, whether their photos and their names and most importantly, their ideas will show up at conferences like this one. And that ’ s up to you. I ’ ve had enough people confess to me after lectures or in newsrooms or on college campuses or in corporations or cafes, really, everywhere I go, that they wish they could say what they believe. They tell me with some measure of **shame** that they ’ re closeted in our liberal democracies. It ’ s a really strange phenomenon. The freest people in the history of the world seem to have lost the hunger for liberty. Or maybe it ’ s really the will to defend it. And when they tell me this, it puts me in mind of my hero, Natan Sharansky, who spent a decade in the Soviet gulag before getting his freedom. He is the single bravest person that I have ever met in my life. And a few years ago, one afternoon in Jerusalem, I asked him a simple question.”Nathan,”I asked him,”is it possible to teach courage?”And he smiled in his impish way and said,”No. All you can do is show people how good it feels to be free.”Thank you. Thank you so much. Thank you. Thank you. Chris Anderson : Stay up, stay up a sec. Friends – Bari Weiss : Sorry I couldn ’ t memorize, you guys. CA : This session is going to run long. I ’ m sorry, but it matters. Thank you, that was a great talk. Saw people stand and cheer, other people didn ’ t stand. You ’ re in the middle of all these issues – BW : I was expecting hecklers, so I ’ m really happy. CA : But these issues are so important. And this is such an important conversation. I think I want to ask you something in the quest for common ground here. Is it possible that, as well as lack of courage, there ’ s something else big going on in the hearts of many of the”silent majority?”Which, for want of a better word is love. These are often debates between identity groups, and many of us don ’ t like the way that the battle is going. But we also feel deeply the pain that a lot of these groups have gone through, the injustices that they have suffered. And if you get involved, it can so easily be seen as you are against that group. And I guess I ’ m just wondering whether there ’ s common ground to be found in us all saying identity really matters. And I mean, you care about the past injustices of people in America and all the different groups you ’ ve talked about. But that there are some things that are upstream of identity that matter even more. You mentioned truth, the pursuit of truth. We have common ground on that. I believe that passionately. I believe that about ideas. You know that some people want to say that ideas are a property of one group and that, you know – but no, no, TED is all based on the notion that ideas can spread from any human to any human. BW : But the whole question is, sorry to interrupt, how do you get to truth, right? And the West has given us the most radical tools in human history. I think Sam Harris is probably in this room, and I ’ m stealing his line. But the radical departure is that here, in rooms like this one, in cultures like the ones that we are lucky enough to live in, we don ’ t solve our conflicts with blows and with **violence**. We solve them with words. And that is why it is so absolutely crucial, no matter how people who are really advocating to burn it all down or tear it all down. No, by tearing it all down, by tearing down the rule of law, by disallowing us to be able to have this kind of debate and discussion, you ’ re preventing the whole project itself. And that has nothing to do with identity, with claims of victimhood, with actual victimhood. The entire way that progress has been achieved is by **victim** groups using the tools that liberal democracies have provided them with. Without freedom, without freedom of speech, freedom of religion, without the rule of law, none of the progress that I know so many people in this room **celebrate** would be possible at all. And so it ’ s really about clinging to the tools rather than repudiating them. CA : I agree with that. But the tools of words in our current culture, which is sound-bite, fast stuff, it ’ s so often heard as an **assault**, it ’ s heard not as words and exploration of truth. It ’ s heard as **hatred** or criticism. And I just wonder whether there could be a coalition of the willing, or double down exactly on what you said, let ’ s pursue the truth. Let ’ s pursue the best ideas. Let ’ s not be fearful of sharing things that are difficult with each other, but do so in a spirit of love and respect, and so that everyone can know that at heart, they are respected. We ’ re all trying to make things better. BW : I don ’ t see anything to disagree with there, only that... you know... Respect – like... Love and compassion and all of that, again, it ’ s only possible if we agree to a certain set of rules that I think many of us took for granted in the way we take oxygen or gravity for granted. And one of the things that has driven me and my choices over the past years of my life is a profound sense that the line between civilization and barbarism, a word that maybe will provoke some people, but I believe is an accurate description, is paper thin. The things that allow for us to do this are so exceptional, and they have to be fought for. And the people that claim that words are **violence** are taking away the most fundamental tool we have for all of the virtues that I was trying to talk about on stage here this morning. CA

: Bari, thank you. You ’ ve ignited an incredibly important conversation here. Thank you for doing that. Please stay, please continue this conversation. And thank you for what you said. BW : Thanks for having me.

Text Sample 361: POS Dim 3 – 2024 – Score 17.00 – 2024/t003164.txt
Chris Anderson : Hello, welcome, TED members. It ’ s very, very, very good to see you. I ’ m the head of TED, Chris Anderson. I ’ m a TED head, apparently, and really excited to be here with you. We ’ re actually doing something we haven ’ t done before. We are going to watch together a smash hit TED Talk in the presence of the man who gave that talk, Scott Galloway. I ’ m going to introduce to you in a minute. While we ’ re watching that talk, you can comment away, ask questions, talk with each other, disagree, amplify, laugh, whatever strikes you as the right thing to do. And when the talk is over, we ’ ll be putting questions to Scott and seeing how he can possibly defend the outrageous claims that he makes in this talk. This talk is a very big deal. He ’ s outlining a giant problem making some big, bold solutions on what we might do about it. It ’ s a big wow. And it ’ s been seen by millions of people already. But we want to dig deeper into these questions. And there couldn ’ t be a better group of people to do it than you. So thank you for being part of this. You are awesome. I think, let ’ s see, yeah, there ’ s a live transcript of this event if you need it by clicking on the captions option. So I think that ’ s it. So I would like to welcome the – how do we describe Scott Galloway? Well I mean he ’ s a professor at NYU, business professor, he ’ s the host of an ungodly number of podcasts. Incredibly successful. He does all kinds of things. He ’ s been a successful entrepreneur and general troublemaker, and it ’ s a delight to welcome Scott Galloway here. Scott, hello, nice to have you. Scott Galloway : It ’ s good to be with you, Chris. Thanks for having me. And hello to all TED acolytes and Members. CA : Alrighty. So I don ’ t know if you ’ ve ever done this either. I don ’ t know whether it ’ d be at all uncomfortable to watch yourself in full glory giving this talk that was so well received. But let ’ s try it. Let us roll this video without further ado. My name is Scott Galloway, I teach at NYU and I appreciate your time. I have 44 slides and 720 seconds. Let ’ s light this candle. OK so for those of you who don ’ t know me, I ’ m actually a global television store. True story. I ’ ve had four TV series in the last three years. Two of them have been **canceled** before they were launched and two were **canceled** within six weeks. Let ’ s recap. If we want to juice this thing, if we want to put a cattle prod up the ass of the economy. Bloomberg. The most trusted name in financial news. Not for long. Andrew Yang : I ’ m going to do whatever I can for this country of ours. SG : Jesus, come on, dude, you ’ re 0 for two. Face for podcasting. So first insight of the day. I ’ d like to be the first person to welcome you to the last TED. OK. By the way, it ’ s clear – what ’ s it called? What are we here for?”The brave and the brilliant?”It ’ s clear that Chris is a frustrated soap **opera** producer. Essentially what we have here is a telenovela where, after a night of unbridled **passion** between Bill Gates and Malcolm Gladwell, they give birth to their bastard love child, Simon Sinek. OK, I start us with a question. Do we love our children? Sounds like an illegitimate question, right? Well, I ’ m going to try and convince you otherwise. Essentially, as we go down generations, we ’ re seeing that for the last two generations, people are making less money on an inflation-adjusted basis. In addition, the cost of buying a home, the cost of pursuing education, continues to skyrocket. So the purchasing power, the prosperity, is inversely correlated to age. Simply put, as we get younger, we ’ re taking away opportunity and prosperity from our youngest. The social con-

tract that is now no longer in place and for the first time in the US ' s history, a 30-year-old is no longer doing as well as his or her parents were at 30. This is a breakdown in the fundamental agreement we have with any society, and it creates rage and **shame**. As a result, people over the age of 55 feel pretty good about America, but less than one in five people under the age of 34 feel very good about America. This creates an incendiary. Righteous movements, cuts to our society end up becoming opportunistic infections because generally speaking, young people have a warranted envy, they ' re pissed off and they ' re angry that they don ' t enjoy the same spoils and prosperity that were provided to our generation. A decent proxy for how much we value youth labor is minimum wage, and we ' ve kept it purposely pretty low. If it had just kept pace with productivity, it ' d be at about 23 bucks a share. But we ' ve decided to purposely keep it low. Out of reach. Median home price has skyrocketed relative to median household income. As a result, pre-pandemic, the average mortgage payment was 1, 100 dollars, it ' s now 2, 300 dollars because of an acceleration in interest rates and the fact that the average home has gone from 290, 000 to 420. By the way, the most expensive homes in the world, based on this metric, are number three, Vancouver. Why? Because 60 percent of the cost of building a home goes to permits. Because guess what, the incumbents that own assets have weaponized government to make it very difficult for new entrants to ever get their own assets, thereby elevating their own net worth. This is the transfer I ' m going to be speaking about. This has resulted in an **enormous** transfer of wealth, where people over the age of 70 used to control 19 percent of household income, versus people under the age of 40, used to control 12. Their wealth has been cut in half. This isn ' t by accident, it ' s purposeful. This is me at UCLA in 1987. I know your first thought is I haven ' t changed a bit. This is also Mia Sevario, who is the analyst who put together these slides. By the way, Mia is 26. I did the math, just by virtue of her being in this audience, it brings the average age of the entire conference down 11 days. When I applied to UCLA, the admissions rate was 76 percent. Today, it ' s nine percent. I received a 2. 23 GPA from UCLA. I learned nothing but how to make bongs out of household items and every line from"Planet of the Apes."And the greatest public school in the world, Berkeley, decided to let me in with a 2. 27 GPA. And that ' s what higher ed is about. Higher ed is about taking unremarkable kids and giving them a shot at being remarkable. And every year it ' s gotten more expensive. Higher ed and homes and the ability, not only is higher ed incredibly expensive, it ' s not accessible. Because me and my colleagues are drunk on luxury and I ' ll come back to that. We ' ve embraced the ultimate strategy. Me and my colleagues in higher ed wake up every morning and ask ourselves the same question when we look in the mirror. How can I increase my compensation while reducing my accountability? And we have found the ultimate strategy. It ' s called an LVMH strategy, where we artificially constrain supply to create aspiration and scarcity such that we can raise tuition faster than inflation. And old people and wealthy people have done the same thing with housing. All of a sudden, once you own a home, you become very concerned with traffic and you make sure that there ' s no new housing permits. And here is a memo to my colleagues in higher ed : we ' re public servants, not fucking Chanel bags. Harvard is the best example of this. They ' ve increased their endowment in the last 40 years and have decided to expand their enrollment, their freshman class, by four percent. Any university that doesn ' t grow their freshman class faster than population that has over a billion dollars in endowment should lose their tax-free status because they ' re no longer in higher education. They ' re a hedge fund offering classes. My first recommendation, Biden should take some of that 750 billion earmarked to **bail** out the one third of people that got to go to college on the backs of the two thirds that didn ’ t and give a billion dollars to our 500 greatest public institutions, size-adjusted, in exchange for three things. One, they use technology and scale to reduce tuition by two percent a year, expand enrollments by six percent a year, and increase the number of vocational certifications and nontraditional four-year degrees by 20 percent. Where does that get us? In just 10 years, in just ten years, that doubles the freshman seats and cuts the cost in half. This isn ’ t radical. This is called college in the ’ 80s and ’ 90s. Another transfer of wealth. Look at what ’ s happened to wages. Oh, they ’ ve gone up? Not as much as corporate profits. There ’ s a healthy tension between capital and labor. But for the last 40 years, capital has been kicking the shit out of labor. Well, you think, what about wages, right? They ’ ve gone up. Well if you compare them to the S and P, they barely register. It ’ s been an amazing time to own assets. But your attempt to get the certification or the income such that you can acquire assets has gotten harder and harder. In my class of 300 kids, it ’ s never been easier to be a billionaire, it ’ s never been harder to be a millionaire. By the way, our job in higher ed isn ’ t to identify a top one percent of people who are freakishly remarkable or have rich parents and turn them into a super class of billionaires. It ’ s to give the bottom 90 a chance to be in the top ten. You know who doesn ’ t need me or higher education? The top 10 percent. The whole point of higher ed is to give the unremarkables, i. e. yours truly, who was raised by a single **immigrant** mother, a shot of being remarkable. The transfer has been purposeful. While the cohorts, corporations and the ultra wealthy continue to garner more and more of our wealth, we have decided,”I know, if they win the gold, let ’ s give them the silver and the bronze and let ’ s lower their taxes.”This transfer is purposeful. It ’ s not by accident and it works. Senior poverty is way down and we should **celebrate** that. Meanwhile, child poverty is flat to up. The third rail. I ’ m going to talk about Social Security. It would cost 11 billion dollars to expand the child tax credit. But that gets stripped out of the infrastructure bill. But the additional 135 billion dollars a year to Social Security, that flies right through Congress. And every year we transfer 1. 4 trillion dollars from a cohort that is increasingly doing less well to the cohort that is the wealthiest cohort in the history of this planet. I ’ m not against Social Security, but the criteria should be if you need it, not whether you have a catheter. Eighty percent of you, 80 percent of you have absolutely no reason to ever take Social Security. It is bankrupting our nation. And we have fallen under this mythology that somehow it ’ s this great social program. No it ’ s not. It ’ s the great transfer of wealth from young to old. How is this happening? Because our representatives are in fact, representative. Old people vote. Washington has become a cross between the”Land of the Dead”and”The Golden Girls.”Quite frankly, this is fucking ridiculous. And if I sound ageist – If I sound ageist, I am. And you know who else is ageist? Biology. When Speaker Pelosi had her first child, get this, two thirds of households didn ’ t have color televisions, and Castro had just **declared** martial law. But she ’ s supposed to understand the challenges of a 17-year-old girl who ’ s 5 ’ 9 ’ ’, 95 pounds, getting tips on dieting and extreme dieting from Facebook? She ’ s supposed to understand the challenges that a 27-year-old single mother faces? By the way, young and dreamy. Young and dreamy. The great intergenerational theft took place under the auspices of a virus. I know, let ’ s use the greatest health crisis in a century to really speed-ball the transfer. This is the Nasdaq from 2008 to 2012. We let the markets crash. And by the way, you need churn, you need disruption because it seeds and recalibrates advantage and wealth from the incumbents to the entrants. It ’ s a natural part of the cycle. But wait, lately, no, a million people dying would be bad. But what would be tragic is if we let the Nasdaq go down and guys like me lost wealth. So we pumped the economy, which again, increased the massive transfer of wealth. The best two years of my life? COVID – more time with my kids, more time with Netflix, and the value of my stocks absolutely exploded. And who has to pay for my prosperity? Not me. Future generations who will have to deal with an unprecedented level of debt. Why am I here and why do I get the prosperity I enjoy? Because in 2008 we **bailed** out the banks, but we didn ' t **bail** out the economy. We let the markets fall. So as I was coming into my prime income-earning years, I got to buy, no joke, these stocks at these prices. This is where those stocks are now. Where does a young person find disruption? When you **bail** out the baby-boomer owner of a restaurant, all you ' re doing is robbing opportunity from the 26-year-old graduate of a culinary academy that wants her shot. We need disruption. I just like this slide. It has no context or relevance. We ' re economically attacking the young, but I know, let ' s attack their emotional and mental well-being. Let ' s take advantage of the flaws in our species with medieval institutions, Paleolithic instincts, and godlike technology. I ' m just going to say, I think Mark Zuckerberg has done more damage to the young people in our nation while making more money than any person in history. Oh, but wait, it could be worse. It ' s as if we let an adversary implant a neural jack into our youth to raise a generation of civic, military, and business leaders that hate America. How can we be this stupid? This all adds up to a bunch of graphs all headed up into the right. And what are they? What ' s the first one? Oh, that ' s self-harm rates, which have exploded, especially among girls since my colleague Jonathan Haidt pointed out, it ' s really, really gone crazy since social went on mobile. What ' s the next one? **Teens** with depression. The next one, men and women not having sex. Biggest fear of my parents was that I was going to get in too much trouble. My biggest fear, honestly, is that my kids aren ' t going to get into enough trouble. My advice to every young person watching this program is go out, drink more and make a series of bad decisions, it might pay off. Next graph, cumulative gun deaths. You ' re more likely to be shot in the United States if you ' re a toddler or an infant than a cop. Next graph, obesity, way up. By the way, the industrial food complex wants to addict you to shitty, fatty foods so they can hand you over to the industrial diabetes complex. We should not romanticize obesity. You ' re not finding your fucking truth. You ' re finding diabetes. Overdose deaths, way up. Deaths of despair. When I was in high school, it was drunk driving, now it ' s kids killing themselves. Young people don ' t want to have kids anymore. Two thirds of people aged 30 to 34, able-bodied, used to decide to have at least one child. It ' s been cut in half. It ' s now less than a third, 27 percent. As a result, people over the age of 60 in the US, pretty happy. People under the age of 30, not so much. Some of the lowest in the free world. What can we do? Nothing wrong with America that can ' t be fixed with what ' s right with it. We got the hard stuff figured out. There are programs to address all of these issues, they cost a lot of money, that ' s the hard part. And we have figured this out. In just five minutes post an earnings call, we can add a quarter of a trillion dollars to the economy. We ' ve got the hard part figured out, the resources. We have the money, but we decide not to do it. This is per-capita spending on child care in the United States relative to other nations. This is housing permits. Things are doable. We increase minimum wage at 25 bucks an hour, it goes into the economy, the wonderful thing about low- and middle-income households is they spend all their money. We have to have a restore or a progressive tax structure with alternative minimum tax on corporations and wealthy individuals. We need to refund the IRS. We need to reform Social Security. It should be based on whether you need the money, not on how old you are. We need a negative income tax. My friend Andrew Yang screwed up a great idea, he branded it incorrectly. Instead of calling it UBI, he should got Republicans on board by calling it a negative income tax. We need to eliminate the capital gains tax deduction. When did we decide that the money that capital earns is more noble than the money that sweat earns? Shouldn ’ t it be flipped? We need to remove 230 protection for all algorithmically-elevated content. We need identity verification. The reason we can have identity verification is because we have a First Amendment. Break up Big Tech. We have monopolies that are incurring greater and greater costs on every small business and parents because again, see above, our representatives don ’ t understand these technologies. We need to age-gate social media. There ’ s absolutely no reason anyone under the age of 16 should ever be on social media. We need universal pre-K. We need to reinstate the expanded child-tax credit. We need term limits, see above, Andrew Yang. We need income-based affirmative action. Any visible signs of affirmative action make no sense at all. You would rather be born **gay** or non-white, in the United States today, than poor. And that ’ s a sign of our progress and our need to recalibrate who we give advantage to. Affirmative action, of which I ’ m a beneficiary, I got Pell Grants, I got unfair advantage. Affirmative action is a wonderful thing and it should be based on color. It should be based on green. How much money you have or don ’ t have. Expand college enrollment in vocational programs. Mental health, ban phones in schools, invest in third places, Big Brothers and Sisters programs, we need national service. We need to tell people in the United States and Canada that they live in the greatest countries in the world, and we need to remind them of that every day by exposing them to other great Americans where they feel connective tissue. We can do all of this. We can do all of it. We have the resources. The question is, do we have the will? This is my last slide. It is an emotionally manipulative slide to try and get you to like me more. But it does have a message. This is the whole shooting match. Anybody here without kids ask someone with kids. You have your world of work, you have your world of friends, you have your world of kids. Something happens here, your whole world shrinks to this. So I present, as I wrap here, with just a few questions. One, if you acknowledge that our kids are the most important thing in our lives, that everything else we do here is meaningful, but our kids ’ well-being and prosperity is profound. If you acknowledge that they ’ re doing more poorly than previous generations, if you believe there ’ s a chance that the illusion of complexity has done nothing but provide cloud cover for the unbelievable transfer of good will, of well-being and of prosperity from young to old, and if you believe we can actually fix these problems and we have the resources, then I present to you, I posit, I augur the question that I hope has more voracity than it did 17 minutes and 24 seconds ago. And that ’ s the following question. Do we love our children? My name is Scott Galloway, I teach at NYU and I appreciate your time. Thank you. CA : We cut off the standing O. That was a long, long standing O. It was as long as there was at TED this year, Scott. An amazing talk, honestly. I want to ask you a bit about just your style of speaking, because I think it ’ s remarkable. I ’ m going to start here. This thing ’ s been seen by five-plus million people around the world already and growing. It ’ s the biggest single hit coming out of the last TED. I ’ m curious what feedback you ’ ve had from it. I mean, you laid out some pretty savage criticisms of a lot of people there. Have some of them come back hard at you? Have you mainly been amplified and cheered on? Give us a sense of the feedback on this. SG : First off, thanks for having me, Chris, and thanks for creating such a powerful platform to let people like me have this type of opportunity. 97, 98-plus percent has been exceptionally positive. Not yesterday, but the day before yesterday, I was on a Zoom call where I spoke after Speaker Pelosi and before Senators Blumenthal and Blackburn, and talking specifically about my recommendations around Big Tech. I don ' t know if I ' ll be invited back because I did not hold back. But it ' s been, you know, let me talk about, it ' s been overwhelmingly positive. It ' s been everything from... Billionaires reaching out and saying,"I have a philanthropy, and I ' d like your help allocating some of our resources,"to someone sent me a screenshot of an account with 10 million dollars in it and said,"It ' s yours if you run for president in 2028."To which I responded,"I have no interest in that, but I ' d really enjoy spending the weekend in Vegas with you."It ' s been really positive. So the points of pushback that I think are interesting, and I want to be clear, I get it wrong all the time. You know, I ' d like to think that some or even most of this is directionally correct. But what I know for certain is some of it is wrong. I got pushback around Social Security from Representatives, from seniors, that this is the most successful social program in the world, and that I shouldn ' t be demonizing old people for taking out something they ' ve already contributed to. I ' ve got pushback for fat **shaming**. So I ' ve gotten, you know, points of pushback. But I think that ' s important. I think that if you ' re going to make provocative statements, you need to be subject to pushback. And I would say that my goal is not to be right, It ' s to catalyze a conversation such that we can craft better solutions. And the thing that ' s been really rewarding about this dialogue is that when people send me very long emails, including from Congress and the Senate and people who run companies and **nonprofits**, the dialogue ' s been very civil. And I would say that the thing that I really enjoy, you know, I recognize about the TED community, is I ' m in a variety of different communities, whether it ' s TikTok or whether it ' s different conferences where I say these things. And the dialogue this has inspired has been remarkably more civil. It ' s been more, you know,"I liked this, I didn ' t like this,"but I really appreciate that the medium is the message. You know, people are more civil on LinkedIn than they are on **Twitter**. And I have found so far people are much more civil on TED than other platforms. CA : Well, that ' s nice to hear. We definitely, though, don ' t want people to hold back. And I know that in the comments there are some people who ' ve pushed back on specific aspects of the talk. But which of the various proposals and things that we could actually do about this problem, do you think have most chance of actually moving forward? Because it ' s so wide ranging. You know, it ' s like, it ' s very hard for young people to get to college now, hard to get a house and then, you know, all the way up to Social Security and so forth. Where do you think there ' s most traction, Scott? Something that might actually shift. SG : I think there ' s already a movement underway to expand freshman class at elite colleges, to invest more in vocational programs, to reverse this vibe or gestalt of higher ed as a luxury brand and return it to being a public servant. I think that movement was already underway, and it feels like there ' s a lot of momentum there, and some of the stats have really freaked people out. There ' s 10 to one MIT employees for every person who teaches. So I ' ve heard from the president of ASU saying, and the presidents of Purdue saying,"Come here,"and they ' ve been circulating my talk and raising money around the fact that they have not embraced this strategy. I think we ' re seeing – I ' ve heard from quite a few people in the budget office and Congresspeople talking about things including eliminating capital gains tax or just having one income tax, similar to what we had under Reagan, instead of favoring the income that capital earns or wealthier people versus current income. I have heard a decent amount around the idea of just general, generally speaking, tax reform. How do we put more money in young people ' s pockets? And then from what I ' ll call the retail media, whether it ' s Morning Joe or The View, which I ' ve been on since this talk, it ' s we need to change the narrative and stop criticizing young people and saying that their depression, their anxiety, their obesity as a function of their entitlement and not a function of public policy that people of my age have implemented. That, OK, maybe there is some truth to some of their disappointment. CA : So let me, before we go into the other details on it, let me pick up that specific point, because there is, I ’ m sure that some people watching this, probably older people, would say, are you sure it ’ s really this intentional thing as opposed to a consequence of just cultural cycles? So there ’ s this quote that you all know by Michael Hopf that, you know, hard times create strong men, strong men create good times, good times create weak men, weak men create hard times. That there ’ s an argument that we ’ ve been through so much prosperity that, you know, baby boomers, raised, you know, a generation of kids who just grew up too comfortable and that that is where part of the problem is. You are halfly arguing a different case. Is there any truth to that argument? SG : I think in almost every generation before ours, I ’ ll call it Gen X and baby boomers, there was a concerted effort to elect people who would think long-term and make forward-leaning investments. If you think about Apple, Google, Nvidia, all of these companies, Moderna, that have added trillions of dollars in market cap, it ’ s really, they build a thick layer of innovation on top of investments that have been made by the most successful venture capitalists in history, and that ’ s the US government with its limited partners, its investors, the middle class. And that there ’ s a lack of that forward-leaning investment. Basically, the only thing that passes for bipartisan cooperation now is reckless spending. Republicans want more military spending and lower taxes. Democrats want more social spending and, you know, higher taxes. And they agree on lower taxes and more spending. So I just feel like we are being irresponsible, even reckless. The way I loosely describe it is seven trillion dollars in government spending which juices the economy, five trillion in receipts. I ’ m in the club partying with champagne and cocaine, and the closest the young people get to the club is they can throw their credit card at me from downstairs, and I ’ ll rack up more debt on their backs so I can continue this prosperity. Even the markets right now, we don ’ t want to talk about this. The markets are being supported right now by an additional two trillion dollars in stimulus every year, in the form of government spending that ’ s beyond our revenues. In past generations, unless it was wartime, never would have engaged or supported that type of government spending. So I do think there ’ s something different here. I think the financialization of everything, Chris, where, as they said in”Jerry Maguire,”more money used to be a bigger seat in business class, now it ’ s a better life. And the fact that we haven ’ t faced really any external threats to rally us together to create more comity of man or more patriotism, there just seems to be not the same sense of selflessness or investment mindset there ’ s been with past generations. CA : One of the most powerful aspects of the talk, and there were so many powerful aspects, was your juxtaposition of different stats. So Harvard, this explosive growth in the endowment and, you know, no more students being admitted. I mean, you immediately know, when you just put those numbers together that there ’ s something very, very wrong with that picture. So powerful. I thought your line about just showing, you know, minimum wage has just not remotely caught up with the way at which capital is growing. And I wonder whether one, you know, there ’ s almost like some political ideas that we could push out there that said things like that. A society is not operating justly if the rate, its minimum wage rate, is growing slower than the rate at which capital is appreciating. It shouldn ’ t be linked to inflation or even wages. It should be linked to the rate at which capital is appreciating you know, in that society. Otherwise, inequality is absolutely bound to increase. And I ’ m curious which others of those have landed, like with Social Security, for example. I understand why people have pushed back. Do you see any workable, kind of, middle ground here where you could say, look, Social Security is important, we ' re not going to take the whole thing away. But we have to make it more just, we can ' t have it sucking more and more of the next generation ' s time. Like, what is the right metric to think about how much Social Security could be trimmed to be fair to the generation coming through that? Feels like one of the biggest numbers. SG : So I ' ve had a bunch of calls with people, different people in Congress and different PACs about Social Security. So means-testing and moving the age back, right? I mean, the majority of people, just even 100 years ago, didn ' t participate in Social Security because they were dead by that time. Now they ' re living 20 and 30 years beyond that. People will say,"Well, I invested in it, I want it back."I ' d say first it ' s called a tax, not a pension fund, meaning that it might be distributed to other people. Two, people who will live to be 85 take out two to three times more than they put in. I ' m not saying we should do away with it. I ' m just saying it should be means-tested, the age should be pushed back to reflect that people are working much longer. Also just basics. The person who put together the slides, Mia, makes 160, 000 dollars a year, I ' m allowed to say that with her permission. She ' s 26, very talented young woman. She pays 9, 000 dollars a year, or six percent, in Social Security. This year, I ' ll make 100 times that, and I ' ll pay, wait for it, 9, 000 dollars in Social Security income tax. It ' s capped for anyone making over 160, 000 dollars. So if this generation is the wealthiest generation in history, why have we decided to cap Social Security for rich people? So I don ' t have a problem with stimulus. I don ' t have a problem with social programs. But Social Security is another example yet again, of we are really taxing – six percent is a real number for young people their whole life, but it ' s been de minimis for me because I ' m old and wealthy. So it ' s another example of how this transfer under the cover of dark, that wealthy people are in there saying,"We ' ll position this tax as onerous, but we ' re going to cap it like it ' s a good thing at six percent."Why is Jeff Bezos not paying six percent of his income into Social Security? It ' s an off-balance-sheet item, it doesn ' t impact the deficit, it ' s funded every year. But right now, 40 percent of all government spending is allocated for programs that go to seniors. It ' s about to be 50 percent in ten years at this rate, which means that crowds out investments and forward-leaning investments such as education and technology. And we also just need to acknowledge and this sounds ageist, and it is, old people are less productive and more expensive. And so unless we figure out a way to acknowledge that they spend a longer period of their lives being expensive and unproductive, our economy is basically just going to be an engine to kind of support the most expensive nursing home in the world. This is happening in Japan, it ' s happening in Italy, and it takes an economy into decline, because you can ' t make forward-leaning investments that encourage wealth or inspire wealth for young people, and they don ' t have kids. In terms of minimum wage, this is an easy one. I ' ve been positioned as anti-union. I ' m not, there should be one union. It should be in DC, and it should be federally-mandated minimum wage, 25 bucks an hour, except in certain areas where there ' s an exceptionally low cost of living. And the incumbents and corporations will start this bullshit narrative of it ' ll kill the economy. No, it won ' t. In Washington state and California, where they raised minimum wage, the economy actually grew because the wonderful thing about low- and middle-income people is they spend all of their money, meaning the multiplier effect is greater. If it had just kept pace with productivity and inflation, it ' d be 23 bucks. That ' s an easy one. Mandatory, federally-mandated, 25 bucks an hour. Would McDonald ' s and Walmart stock take a huge hit? Sure.

Would a bunch of small businesses go out of business? Yes. And it ' d be worth it. CA : So, as you say, you don ' t hold back. And there were definitely a few things in the talk that provoked comment. So Kyra Gaunt, I see in the **chat**, found your comment about diabetes a bit smug. She says there are epigenetics to consider. It ' s complicated for members of marginalized groups. And you say you ' ve heard from other people on that. Do you want to clarify your view on that at all? SG : It ' s a fair feedback. As someone who was born to parents who were both tall and thin, so easy for you to say, Scott. What I have said in the past and you know, if I sound offensive, I **apologize**, is I believe that we need bottom line to put more money in the pockets of lower-income people such that they can eat better. I think we need to tax the food industrial complex relative to its externalities. Obesity, morbid obesity has gone from five to nine percent in the last 30 years. Obesity has gone from, I believe it ' s gone from 30 to 45 percent. The only thing that Americans really share is it ' s 70 percent of us are overweight or obese. And if you look at McDonald ' s, Kraft, General Foods, PepsiCo, Coca-Cola, they ' re not companies as much as they are obesity indices. And their stocks have gone up 10 to 12x as obesity has gone up. And if you give those two, their stocks and obesity rates, to a statistician, they will tell you they are highly correlated. So as a result, because there ' s money in the diabetes industrial complex, we have Unilever **celebrating** obese women. We have people saying you ' re finding your truth. And this is from the same company that sells Ben and Jerry ' s and Axe, which basically encourages young men to fuck anything. So the notion that they are concerned about, are trying to liberate people or all of these apparel companies saying that you ' re finding your truth – I want to go back to the ' 60s, where Kennedy said it was American and patriotic to be in great shape. I used to train every year for the Presidential Fitness Awards, and that was seen as fat **shaming**, so they did away with it. I don ' t think there ' s anything wrong with **celebrating** fitness, but also at the same time recognizing some people are dealt a difficult hand genetically and providing them with money and resources so they can get out of food deserts. I also believe GLP-1 drugs are the most impressive technology of the last year, not AI, and we should be pushing them into low-income communities. I think they ' re an absolute game changer right now. Here ' s a crazy stat : the region of America that has the greatest penetration of GLP-1 prescriptions is also the thinnest. It ' s the Upper East Side. Because right now, GLP-1 drugs are being used for ladies of lunch who want to lose that last 10 pounds. I hope that more and more of it is imported illegally across the border, where it ' s 100 bucks a month versus 1, 000, and it gets to the people who really need it, which is low-income people who don ' t have the money for diabetes. Because the industrial food complex wants you to be obese so they can hand you over to the medical industrial complex of hip replacements, kidney dialysis, knee replacements, heart stents. That ' s an **enormous** industry. I want to put Coca-Cola, Kraft, McDonald ' s and some of these hospital systems absolutely out of business. There ' s too much incentive to convince you that being obese is some sort of personal liberation. It ' s not. CA : So this is so interesting. Like, somehow, and I feel this for TED as well, we have to figure out how to have conversations about difficult topics that are respectful of people. And, you know, everyone, as you say, has been dealt a different hand, but that don ' t ignore the basic facts of health or of science. And that is what is so hard to do in the current environment right now. We ' ve all got frightened, I think, of saying the kind of thing that you just said. And there probably are still, I don ' t know Kyra, how you felt about what he **replied** there, but I feel like we need to do both, you know, we need to be provocative and also respectful. And I heard that in you. So I think that ' s cool. And then again, actually not to pick on Kyra, but I noticed that she pushed back on your point about social media, that, you know, one of the fixes is to get our younger kids off of social media. Points out, and I ' ve felt this reading Jon Haidt ' s work myself, that those communities that people connect with on social media sometimes are incredibly beneficial. So you think of the kid who ' s queer or is struggling with something and doesn ' t find anyone in their community who they can connect with, finds a community online. I mean, there ' s presumably some benefit in that. Is there any way of making recommendations where there aren ' t swings and roundabouts? There aren ' t, you know, sort of downsides to what we recommend? SG : Look, one in five LGBTQ high schoolers is going to try and kill themselves. So I ' m involved with the Jed Foundation that works with high schools to try and identify or distinguish between kind of what is normal abnormal **teen** behavior and suicidal ideation. Because we really have an epidemic of self-harm at a **teen** level, and there ' s just no getting around it. Some trans and **gay** kids and other kids from special interest groups find other people like them on social media. I guess the question would be if banning social media under the age of 16 or age-gating it on the whole were demonstrated to be an absolute huge net positive – because I think a lot of those communities are actually the subjects of incredible bullying and **shaming** online, and are more prone to go down a rabbit hole of depression and end up in self-harm – are there other programs that could replace that incredible community some of them have found? But look, when you make huge government decisions, there is no decision where there ' s not going to be losers. I mean, the special-interest-group kid who finds people online at 14, when social media is age-gated, yeah, that person suffers. I guess the argument I would make is that if you were to look at any study about the general impact it ' s having on people under the age of 16, the benefits dramatically outweigh the soft tissue here. So the question is, could we do it? But at the same time recognize we still have an **enormous** self-harm problem among kids, especially in the LGBTQ community, and move in with other programs or other analog means of helping them find other people. But I want to acknowledge, there ' s just nothing I recommend that doesn ' t have a downside. CA : Some people are asking about practical things we can do. So Adrian Neubauer said,"As an elementary school teacher, what ' s your advice for helping Gen Alpha students? I don ' t want my students to grow up having such apathy towards learning and being successful. I definitely don ' t want my students ' highest aspirations to be TikTok influencers. How do I help them?"SG : Well, the first thing is, I think this is an easy one, I don ' t think there ' s any reason for anyone under the age of 16 to be on social media. I think we need a massive investment. I think we need to tax every person in a private school and use that capital to invest in after-school programs and third places. I went to public schools all the way through graduate school. I went back to my high school, university high school, and 93 percent are kids of color. It ' s got the unfortunate designation of having the greatest proportion of kids who are classified as **homeless** in LAUSD, and they just cut their drill team. They just cut their band, their drumline, because they don ' t have money. I just think so much of this, Chris, unfortunately, it ' s like households with a lot of anxiety. It sounds very crass, but I think a lot of it, a lot of problems are solved with money. Show me divorce and I ' m usually going to show you some sort of economic stress or poor alignment around economics. And when you can add a quarter of a trillion dollars in five minutes post the earnings call of Nvidia, and at the same time, you see corporations are paying their lowest taxes since 1939 and the top 25 wealthiest Americans are paying a tax rate of six percent, and five companies have added the value of the entire global auto industry in the last six weeks. We have the resources. So I think a lot of this comes down to funding, giving kids more third places such that they ' re not staring at their phones. And also demanding that parents and demanding that entire school systems go phone-free and that there ' s no social media. And on a more tactical level, I absolutely think we need to ban or divest TikTok. I think it makes absolutely no sense to be raising a generation of civic, military and **nonprofit** leaders who hate America, and it ' s all wrapped in cute dances. I just think it ' s insane that we would be this stupid. One of the wonderful things about America is our optimism. But one of the downsides of that is we ' re much easier to fool than convince we ' ve being fooled. I think every day we ' re being fooled by TikTok. I think this is the most unbelievable propaganda tool in history. Unfortunately, it ' s not ours. CA : You mentioned Nvidia there, which has exploded in value in the last couple of years, last year really. Isn ' t that to some extent a counterargument to your earlier comment about you had this unique opportunity to buy these cheap stocks like Netflix and Amazon at low prices. I mean, there are always... Is the market fundamentally changed, there aren ' t that kind of opportunity for smart people to identify trends and get the same kind of wealth? Was it just a timing thing? SG : No, what we ' ve decided is we want capitalism on the way up. We want low taxes, and the pioneer, the individual who earned the money and should pay a low tax rate because he or she is the most productive citizen. And then on the way down when there ' s a virus or some exogenous event, which happen a lot, whether it ' s war, famine, revolution or a virus, the CEO of Delta says,"We ' re all in this together,"and wants a massive bailout, despite the fact that 80 percent of the free cash flow of airlines the 10 years before were either used on dividend or stock buybacks or CEO compensation that juice their compensation. So look, capitalism on the way up and socialism on the way down is cronyism. And we ' ve gone full cronyist in the United States. And I understand the rationale for pumping the economy full of stimulus, because they said we needed to overdo it versus underdo it, but then no one suggested a special tax for the unbelievable champagne and cocaine disco party we ' ve had in the markets. Markets are touching all-time highs right now. And the myth that my generation is fomented across the economy, the young people take hook, line and sinker is the following. There are two phases of everyone ' s life. There ' s investing, and then there ' s the harvesting phase. Investing is when you do your best to make more than you spend, and save some money, so you can deploy an army of capital that grows in your sleep, such that you can have some security and some balance as you get older, and you begin harvesting. I ' m entering the harvesting stage of my life where I ' m no longer making as much as I spend. During the investment part of your life, in you ' re younger years, you want markets to crash. You want real estate that ' s inexpensive. You want to dollar-cost-averaging at the low price. The reason I get to roll with you in London and I get to go to the south of France tomorrow, Chris, is because we let the markets crash in ' 08, and I got to buy Netflix at 12 bucks, which is at 650 now. What we ' ve decided now purposefully, is that we aren ' t going to let the markets have a natural cycle of disruption, that anytime the markets are threatened, we ' re going to weigh in with the credit card of our young friends, of our daughters and our sons, and we ' re going to artificially inflate and support the markets. That is nothing but a transfer of wealth. You need disruption. You need churn. These are purposeful decisions to protect old on the credit card of the young. I don ' t have a problem with stimulus, but for God ' s sakes, those of us who have benefited from it should pay it back. CA : So there ' s a great question here from Brett McCall."During this talk, there are an overwhelming number of points that are all delivered in an easy-to-understand way."That ' s true, by the way. I don ' t know of a talk where there ' s been such density of points, of facts that connect, really remarkable. Anyway, he says,"It leaves me charged with the desire to join, ' the movement ' and make change. It ' s almost like a full semester-worth of issues that could be movements, but there isn ' t an explicit community or movement to join. Scott, where would you suggest a starting place for someone who becomes inspired by your talk?"SG : It ' s hard to do this without being political, but try and find Congresspeople or get involved in campaigns of people who are, one, talking about the deficit, talking about the war on young people, having difficult conversations. I mean, there ' s some very basics. And the speaker before me, Andrew Yang, final five and ranked choice voting. People who are going to be moderates, who are going to think long-term about society. I think we need absolutely more young people in Congress. So I would say political action, just being engaged. And then on a ground level, getting involved with local schools, getting involved in charities and efforts to help young people in special interest groups find third places, find places to find each other. I think all of this is somewhat couched in young people, in an epidemic of loneliness. So anything you can do to create resources and opportunities for young people to get out of the house. I think it ' s up to parents to get their kids off – I mean, I think it ' s not what to do, it ' s what not to do. In terms of a political movement, I ' m still waiting for a leader to come forward and say,"I ' m going to piss off everybody. Old people, you ' re going to hate me. Unions, you ' re going to hate me. Rich people, you ' re going to hate me."You know what we need? We need the biggest class traitor in history. Someone who shows up and says,"Are we going to decrease government spending, or are we going to raise taxes?"And the answer is yes. It ' s time to start acting like adults and paying it back to some of the incredible Americans who have made sacrifices such that we can enjoy this prosperity. I haven ' t seen that person yet. CA : Politicians assume that that ' s an unelectable slate. And maybe they ' re underestimating the intelligence of their citizens. SG : I think people are ready. Do you know one of the top three issues among young people is right now? People think it ' s Middle East, it ' s not. That ' s like number 17 because of the zombie apocalypse of useful idiots on campuses that has been highlighted in media and in TikTok to give you the sense that every student is protesting. 2, 300 arrests, 40 weren ' t students. I ' m at NYU, 99. 9 percent of the kids are just getting their shit done. The new undergraduate president of Columbia is an Israeli girl. You know, we need... anyways, one of the top, top issues for young people, one of the top three? The deficit. So I just think we need a pragmatist who says,"I am not going to ever insult anyone on the other side of the aisle personally to get on TikTok and raise money. I ' m going to talk about really boring shit. Tax policy, the deficit, **teen** depression, obesity. And I ' m going to make big sweeping changes. And guess what? All of you are going to suffer, all of you."Because there ' s just no getting around it. We need to make a fraction of the sacrifices that a lot of Americans made 80 years ago. I don ' t know about you, I was very moved by the D-Day commemorations. But every generation up until this one has made real sacrifice for forward generations, except this one. So we need to catch up. I think people are ready for that. CA : Scott, you ' ve spent a lot of time giving advice, especially for young men. Do you think that the problem has been especially bad for them for some reason or that a disproportionate share of the solution will be found by fixing the problems that young men are facing right now? SG : Well, all of these things are especially acute. So with young men – and this is really the thing, this is my **passion** project – four times as likely to kill themselves, three times as likely to be addicted, 12 times as likely to be incarcerated. There has been no group globally that ' s ascended faster than women. More women globally are pursuing tertiary education, which is remarkable when you think about – many nations don ' t allow women to pursue tertiary education, and twice as many women have been elected to parliament over the last 30 years around the world. Now domestically in the US, there has never been a cohort that has fallen further faster than young men. More women, single women own homes now than single men, which is fantastic. In urban areas, women are out-earning men. These things are wonderful. We don ' t have a **homeless** crisis. We have a male **homeless** crisis. We don ' t have an opioid addiction crisis. We have a male opioid addiction crisis. And unfortunately, something that gets in the way of programs, Chris, is that because of the benefit, the massive benefit, privilege and advantage that you and I received, we hold these young men accountable. We use words like accountability or pull yourself up by your bootstraps. If any special interest group is killing themselves at four times the rate of the control group, we ' d move in with programs. And I think there just generally needs to be a change in the narrative and the dialogue. And we need to recognize that empathy isn ' t a zero-sum game. **Gay** marriage didn ' t hurt heteronormative marriage, civil rights didn ' t hurt white people. And recognizing the problems that young men especially are facing – one in three men under the age of 30 hasn ' t had sex in the last year. Three million working-age men have given up looking for work. Fifty percent of millennial men are no longer even trying to date. And so you have this cohort that is doing so poorly, and if we don ' t have a vibrant middle class full of successful, economically and emotionally viable men, the nation is going to collapse. Because here ' s the thing about women, we don ' t want to have an open and honest conversation about mating. And this is the following. Women mate, socioeconomically, horizontally and up ; men, horizontally and down. And when the pool of men available horizontally and up keeps shrinking, we ' re going to have a lack of household formation. Sixty percent of people aged 30 to 34, 40 years ago, had at least one child. Now it ' s 27 percent. The whole shooting match, the whole shooting match, why we engage in all this shit, is so we can find someone we love and raise kids together. That is the most rewarding thing. Everything else is a means. That ' s the ends. And when a nation is failing to do that and just creating a generation of anxious, obese and depressed kids who don ' t like themselves, much less have the opportunity to like other people and get together and start having sex and fall in love and have kids and have economic prosperity, then what the fuck is any of this for? So I think this is a call for all hands on deck. If young people, and especially young men, aren ' t doing well, then we are not going to have a functioning nation or economy, full stop. And it ' s time to put the politically correct agenda away and say,"Well, you ' re being sexist."Yeah, I ' m sexist. I believe the genders are different. If you don ' t believe me, put a three-year-old girl and a three-year-old boy in a room with cars and dolls and see what happens. That doesn ' t mean we reduce empathy for either gender, but we can ' t even have an honest conversation about this stuff because someone sees an opportunity to virtue signal and get a Guardians of Gotcha pin rather than actually addressing the fucking problem. That was a rant. CA : Well, I will say that you rant better than anyone I know. I mean, I really, just as someone who ' s hosted a lot of TED Talks, I was stunned by how this one went. Like many, many speaker coaches looking at you would say, Oh, he ' s very monotone. It ' s very, you know, where ' s the – it just unwraps in a very, sort of flat voice initially. But every word is so carefully chosen and follows so consequentially to what ' s just gone before, that you tap into a different part of people ' s brains than most talks do. People go, yes, you know, that makes sense, that makes sense. And then it builds, and then your anger and frustration starts to come out and get dialed up. It ' s absolutely remarkable rhetoric. I don ' t know how you learned it or where you got it from, but it ' s really unique out there, I would say. And I think it ' s a super powerful weapon.

And I mean, I don ’ t know if people listening agree with this. This is really unusual... It ’ s not like everyone will agree with every single word, Scott, that you said, but it ’ s a really unusual and powerful piece of rhetoric about something that really matters. And for that, I feel, I think we all feel huge gratitude to you and wish you well on this continued journey. I mean, there just isn ’ t a more important issue. So bravo to you. Thank you. SG : Chris, I appreciate the generous words. And what I told my wife is that after 30 years of working my ass off, I ’ m an overnight success because of Chris Anderson and TED. So thank you. CA : You had visibility everywhere, and you do. It ’ s amazing how much your voice is out there. If people don ’ t know it, Scott has his own – Well, just talk about the two or three podcasts you ’ d most like people to do, because I think that ’ s the best way to get closer to you. SG : Yeah, to resist is futile, I ’ m like AOL in the ’ 90s. If you stick your hand in a cereal box, you ’ re going to find something from Scott Galloway. I have”Pivot,”I have”Prof G,”I have my newsletter,”No Mercy, No Malice”and a slew of books. So to resist is futile. Text Sample 362: POS Dim 3 – 2024 – Score 12.00 – 2024/t003268.txt
Susan Zimmerman : Welcome, Suleika. Suleika Jaouad : Hi, Susan. SZ : I ’ m going to dive right in with”American Symphony.”I would love to first say thank you for sharing your story with us in this gorgeous **documentary**. Can you share a little bit more how this project came to be? SJ : So the director of”American Symphony,”Matt Heineman, who is an extraordinarily brilliant filmmaker and a dear friend of ours, says that if you end up with a project that you started with, you ’ re not doing your job right because you weren ’ t listening along the way. And that proved to be true in ways that we couldn ’ t possibly imagine. I knew Matt through my own work. Jon had worked with him on his last film,”The First Wave,”that took place during the pandemic, and he and Jon started talking about the idea of a short process film that was going to follow Jon as he composed what he called”American Symphony,”which was his reimagination of what a symphony would look like if it were created in the 21st century. And Jon was committed to really upturning what we think of as a symphony. He wanted to travel all across the country to recruit jazz musicians and blues musicians and classical musicians and **Indigenous** musicians and musicians who don ’ t know how to read music and to figure out how to bring them all together. So initially, that was the film, and about a week after we decided to move forward with that project, on the very same day I began chemo and the same week I learned that after a decade-long remission, my leukemia was back, Jon was also nominated for a record historical number of Grammys. And so right from the beginning of the filming process, the initial conceit changed. And it was the kind of project and really a testament to Matt ’ s style, where we weren ’ t too worried about figuring out what the story was. Matt specializes in cinema verité, and so he followed us from sun up until we went to sleep every single day for about seven months. And at the end of that process, we had 1, 500 hours of footage, which, as you can imagine, is a lot of footage. But we knew that we wanted to document all of it, to document what it means to be living a life of contrasts, what is required of us when we ’ re in the belly of the beast and how creativity and our individual and joint, sort of, creative language inform that project. SZ : For two people, who are very much the directors of their own creative projects and worlds, how did you negotiate creative control in your work with Matt Heineman, especially in such vulner-

able and personal circumstances? SJ : You know, it wasn ' t easy for either of us because we are used to, you know, captaining our own creative ships. But I think, you know, surrendering to the process was really important. We didn ' t want to get in the way of the filming. But we were also very much creative partners with Matt. And I ' m not sure that a film like this would have been possible without deep trust with the filmmaker and ongoing conversations about what we were comfortable with and what we weren ' t, and we had those conversations daily. We had them weekly and monthly. And the truth is that when I decided to participate in this film, I had no idea if I was going to survive long enough to actually see the finished product. And what Jon would always say is : if nothing else comes out of this, we ' ll have the world ' s most beautifully shot home videos to share with our families and loved ones. So it was really, you know, a process that required trust. It required a leap of faith, and it required surrendering the kind of creative control that we ' re used to. SZ : You also shared, in a recent"Isolation Journal":"When the ceiling caves in, it ' s terrifying and disorienting. Yet those moments have also been the most fertile stretches of personal and creative growth for me. A couple of months after my second bone marrow transplant, I was rehospitalized due to complications, and I told one of my nurses that I get my best work done there, and I joked that it had become my favorite artist ' s residency."Can you share more about these creative periods during extremely challenging circumstances? SJ : Yeah, so I want to go on record and say that, you know, these moments when the ceiling caves in on you, when you can no longer assume structural stability... don ' t suddenly fill me with creative inspiration. It ' s the very opposite. I had so many plans, both professional and personal, before I learned of my relapse. I was getting ready to write a reported book that would require me to be on the road for long stretches of time. Jon and I were talking about getting married and starting a family, and I moved through my own version of the five stages of **grief**. And the first is shock, often mixed with fear. And then I get to a place of defeat. But something interesting happens when the possibility of productivity is taken away from you. And when I ' m able to move past that **grief** and that fear, and to start to get curious about the isolation and the sense of solitude that comes with, you know, having been brought to your knees on the floor by some kind of life event. Even though it doesn ' t feel like I ' m doing something, I ' m in the chrysalis. I ' m as larval and goopy and unformed as I ever feel. And what these periods of being extremely sick have done for me is that I ' ve had to get good with my own company. I ' ve had to get good with quiet, with having no plans. And of course, that ' s not a luxury that we ' re all able to carve out for ourselves. But when I ' m able to surrender to that not knowing, interesting things emerge. And I had, you know, the misfortune and privilege of having been through this once before. And I knew that to go into this treatment, to enter the hospital for many weeks and months with expectations of what I was going to do from my bed or trying to hold on to whatever plans I ' d made before, was going to be a recipe for frustration and defeat. And sure enough, pretty shortly after I entered the bone marrow transplant unit, I was on two medications that caused my vision to blur and double. And so the thing that I had always reached for in times of duress, which for me is writing, wasn ' t as easily accessible to me. It was frustrating, it was hard, it was halting. And instead of trying to keep doing that, I decided to be open to whatever felt good. And for the first time since I was a little kid, I picked up some watercolors and some brushes. I transformed the bedside table in my hospital room into my little palette of paints, and I began painting the nightmares I was having, the fever dreams I was having, and transcribing them onto the canvas without any expectation of doing anything with these paintings other than that they simply felt good. What I love about watercolor is that you don ’ t have much control. Watercolor is all about the beautiful, happy accidents. And so that felt like an apt medium, given the fact that my circumstances were very much mirroring that lack of control. I ’ ve come to believe that survival is its own kind of creative act. When you can ’ t speak because the chemo sores in your mouth make it too painful to speak, you have to find new ways to communicate. When you ’ re confined to a bed for many weeks and months, you have to find new ways of traveling in your imagination. And really, it requires complete surrender and an **openness** to whatever may emerge, and also a curiosity about the changes that are happening and trust that something will come out of it, even if it ’ s just in terms of my own personal growth and the reshuffling of the priorities. Though often, well, it doesn ’ t feel that way in the moment, it ’ s ended up being my most fertile creative stretches where I ’ m pushed to experiment and to create in new ways. Not in spite of my limitations, but because of them. And it becomes a process of finding purpose in that pain and trying to alchemize it into something interesting and **thought-provoking**, and maybe even useful and beautiful. SZ : This leads me to think about 22-year-old you, you know, with your first leukemia diagnosis and your”Life, Interrupted”column in The New York Times. How did that column come to be, because I feel like your journey now, you were pulling from these resources, but how then did you come to the conclusion of,”I need to write a column about this, and I need to share this with the world?”SJ : So I first got diagnosed with leukemia when I was 22, and overnight, I lost my job, I lost my apartment, I was working as a paralegal in Paris at the time, but hoping to become a foreign correspondent. And maybe worst of all, I lost my independence. And 22 is such a funny age where, you know, you ’ re no longer a kid, yet, you ’ re not a fully formed adult either. And so that sense of in-betweenness accompanied me from my very first day in the hospital. And I spent a really difficult first year of treatment, I spent about eight months, cumulatively, of that first year in isolation in the hospital where I wasn ’ t able to leave my room. And when I went into this, not knowing anything about what it means to be sick, I remember packing a suitcase full of books like”War and Peace”and cheerfully announcing to my parents that I was going to use that first summer in the hospital to read through the rest of the Western canon. And let me tell you, naivete has a short shelf life. And that was true for me. I didn ’ t read a single one of those books. And I felt really angry. My treatments were not working, my leukemia was becoming more aggressive. I was enrolled in a phase 2 clinical trial that hadn ’ t yet been proven to be safe or effective. And I was really struggling with a sense that my life had been interrupted. My life had been put on pause at a time when I was watching my friends begin their lives, you know, travel the world, start careers, get married and all the other big and small milestones of early adulthood. After I learned that the treatments weren ’ t working for me, that a friend of mine came up with the idea of a 100-day project, and the premise was really simple. We decided we were each going to do one creative act a day for 100 days. And for my project, I decided to keep the bar very low, knowing how unpredictable my energy was, and I decided to recommit to the thing that had been my companion from the time I could hold a pen, which was, keeping a journal. And it didn ’ t matter how much I wrote. Sometimes it was many pages, sometimes it was a sentence. Occasionally it was the F-word, which felt apt for that particular moment. But in the course of keeping that journal, something interesting began to happen. Prior to this project, I, you know, of course, was not in a place where I could become a foreign correspondent in the way that I dreamed of. But I realized, in keeping my journal, that I was using it as a kind of reporter ’ s notebook. I was writing about all the things that felt impossible to talk about with my loved ones. I was writing about the sense of guilt and being a burden, that can come with being sick. I was writing about navigating our health care system. I was writing about the patients I was befriending in the cancer unit. I was writing about the nurses and the various characters in my medical team. I was writing about **sexual** health, I was writing about **shame**, I was writing about what it feels like to fall in love while you ' re falling sick. And by the end of that project, I realized that, you know, while I couldn ' t travel the world and report on the stories of others, I did have a story to tell, and that I was reporting from a different kind of conflict zone. I was reporting from the front lines of my hospital bed. And so, like the good millennial that I am, I decided to start a blog. It was in the weeks leading up to a bone marrow transplant, and I knew that the odds were stacked against me. My doctors told me point blank I had a 35-percent chance of long-term survival, and I think it lit a kind of fire under me. Staring your mortality straight in the eye can be a great motivator. There ' s no longer this illusion of endless time. Time to eventually get to the things that you want to do, time to figure out what you want to contribute in whatever, you know, small or big way, to the world. And so I kept this blog for a couple of weeks and I took it really seriously. I would write every day, and through an old journalism professor of mine, it got sent to Tara Parker-Pope, my wonderful editor at The New York Times, and we had a couple of email exchanges, and she called me and invited me to contribute an essay. And I took a deep breath and I said,"Thank you, but I ' m not interested in writing an essay. What I ' m interested in writing is a weekly column, because so often illness stories are told from the vantage point of someone who survived. But I want to write from the trenches of that uncertainty."And I went on and on and on. And to my surprise, she said,"OK, we ' ll try it for a couple of installments and see how it goes."And I had never been published before, I ' d never had a byline, and this pitch that I had just performed would have seemed wildly presumptuous to pre-diagnosis 22-year-old me. I would have been grateful for a fact-checking position. But that ' s the thing about confronting your mortality, is that... it can make you brazen. And I knew that I didn ' t have time for internships and fact-checking positions. And so for the first time in my life, I said exactly what it was that I wanted to do without any expectation, but I knew I needed to try for it. SZ : The response to that column,"Life, Interrupted,"led to your subsequent road trip across the US to meet some of the people that wrote to you while you were in the hospital. You spoke about this journey in your 2019 TED Talk, and you wrote about it in your memoir,"Between Two Kingdoms,"your New York Times best selling book. Can you share first, a little bit more about the title of the book, and then how did the process of making this trip and writing it impact you and your readers? SJ : So I ended up spending four years in cancer treatment. And throughout those four years, the goal was always to eventually be cured. And I hadn ' t given much thought to what would happen after that, in part because it felt like such a tenuous, flimsy hope. And to my great surprise, when I did get the all-clear from my doctors, when the port was removed from my chest and I was sort of released from the medical bubble, instead of feeling great excitement, and instead of quickly and organically folding back into the world of the living, I found myself deeply stuck. And to my great surprise, the hardest part of my cancer experience, on a personal level, began once the cancer was gone. I very quickly realized, you know, of course, that I was no longer a patient, but that I couldn ' t go back to the person I ' d been pre-diagnosis. And I had no idea who I was and how to find my footing among the living. And I was struggling to figure out how to carry the imprints of this experience. Out of my group of 10 cancer comrades, as we called each other – young people who I ' d befriended during those years in treatment – only two of us were still alive. So I knew how lucky I was to be alive, I knew that... I didn ’ t just want to be someone who was surviving but living, because after all, you know, what was the point of having endured all that I ’ d endured if not to live a good life, a meaningful life, a beautiful one? But I didn ’ t have the tools to do that. And without, you know, a cavalry of doctors and nurses and friends checking up on me, I realized, you know, there was no road map for the way forward and that I was going to have to create one for myself. And so I spent this lost year trying and failing and trying and failing to move on, only to realize, you know, that we don ’ t get to move on from the painful parts of our past. As much as we want to, you know, we can ’ t compartmentalize them and stow them away because they always bob back up to the surface and often with a vengeance, and that instead I was going to have to figure out how to move forward with the imprints of my illness, both on my body and on my mind. And so one of the very first things I did, because I was still in a place of feeling afraid, feeling, you know, ironically, afraid of the outside world. I was comfortable in the hospital ecosystem to really, first of all, give myself the time to properly **heal** from that experience, but also to figure out what was on the other side of that fear. And so I learned how to drive, and I ended up returning to some of the letters I ’ d received from readers of”Life, Interrupted,”who had shared with me their own experiences of aftermath, of figuring out how to do the hard work of recovery and figuring out how to do that hard work of moving forward, with whatever had happened. And so I decided to sublet my apartment. I borrowed a friend ’ s car. I got a bunch of camping gear, and I embarked on a different kind of 100-day project. A 100-day, 15, 000-mile solo road trip with my dog Oscar as my co-pilot, and to visit some of these strangers who had been lifelines when I was at my sickest, and to talk to them about that experience of in-betweenness. So to wrap this up, the title of the book,”Between Two Kingdoms,”is a reference to Susan Sontag ’ s essay”Illness as Metaphor,”where she describes how we all have dual citizenship in the kingdom of the sick and in the kingdom of the well, and that it ’ s only a matter of time until we use that other passport. But what she didn ’ t talk about was that liminal space between the two, where maybe you ’ re not either sick or well. And that became the premise of that book. It ’ s figuring out how to exist in the messy middle. SZ : That book launched during COVID. Something else that was beginning at that time was the”Isolation Journals”in April of 2020. Can you share what was the inspiration for this project, especially at such a unique moment in time? SJ : In the early days of lockdown, as the world was shutting down, as we were all having to pivot and to put our plans on hold and to figure out how to live our lives within very, you know, major constraints. So much of that experience felt bizarrely familiar to me. Everything from wearing a face mask and, you know, walking around with gallons of hand sanitizer to being isolated at home. And, you know, isolation is its own epidemic, one that predated the pandemic and one that continues now. And I decided, on April 1, 2020, to share what has always helped me transform that sense of isolation into creative solitude and connection and even community. And I launched a newsletter called”The Isolation Journals.”It ’ s a free newsletter, and we invited our larger community to do their own 100-day project. And so every single day, for 100 days, we had a different guest contributor write an essay in a journaling prompt. We had artists and writers and musicians and community leaders. One of my very favorite essays and prompts came from Lou Sullivan, a seven-year-old, two-time brain cancer survivor who shared this game that he played in the hospital called”Inside Seeing,”which was essentially his take on **meditation**. And within 48 hours, we had over 40, 000 people who ’ d signed up. And it was extraordinary to see what can happen when we dare to share our most vulnerable, unvarnished stories. And the reverberation that that creates. And so that newsletter continues on to this day. We have over 150, 000 community members. And every Sunday we send out a newsletter with thoughts from me and then a new essay and journaling prompt. But what ' s surprised me so much is that people interpret journaling in all kinds of ways. Some people use the prompts as conversation prompts, others use them as thought prompts. Some people reinterpret the idea of journaling, not as old fashioned, you know, pen and paper, but they ' ll paint to the prompts, they ' ll do modern dances. And so it ' s really been such a nourishing, tender, life-giving space. And I ' m so proud of this thing we built. I know what it ' s like to feel alone, to feel like you ' re the only person **suffering** in a particular way. But we have so many extraordinary artists throughout time, from Frida Kahlo to Virginia Woolf to Audre Lorde, who have taken that space of confinement, who have reimagined their limitations as creative grist. SZ : We have a question from Celia."Our world tries to avoid having feelings, but in ' American Symphony, ' you said that you didn ' t want to develop a thick skin. You wanted to feel it all. Can you say more about how that approach impacts your spirit and how you experience life feeling it all and how others can do the same?"SJ : You know, as a culture, we resist discomfort. We resist confronting the fact that all of us are here on this Earth for a very short period of time. I ' m not special, I live a little closer to the veil, because of the nature of my illness. And as tempting as it can be, you know, to compartmentalize that discomfort, to plaster over it, to **numb** it, I think there ' s also so much to be gained when you unguard your heart. And it ' s the hardest thing in the world to do. I knew going into this that it wasn ' t going to be easy. I had no illusions, not only about the toll it would take on me and on my loved ones, but I also knew that there was a lot to be gained if I could resist that urge... to look away from the things that scared me most. And rather to engage in them directly. I wanted to be open to all of it. I wanted to be open to the beautiful things and to the painful things, and to really learn how to hold both of them in the same palm. Because in varying ways and for varying reasons, that ' s the work that we all have to do. There is no binary. Life isn ' t either good or bad. We ' re not either happy or sad or healthy or unhealthy. Most of us, you know, exist somewhere in the middle, and depending on the hour or depending on the day, we might shift from one to the other. Trying to do the opposite of having tough skin, trying to have tender skin, is not something that comes easily to me. It ' s something I have to work at every single day. But I know that for me, it ' s the only way I can shift out of that survival mode and in to fully living and feeling alive. SZ : We have a question here from Lauren."In your book, you shared how cancer impacted your relationship with your previous boyfriend. Have you carried these lessons and experienced with this return of your leukemia? Were you able to strike a better balance as a caregiver / patient? And how did art making and his music making affect your relationship this time around?"SJ : The most surprising toll isn ' t what happens to the body, it ' s what often happens to your relationships. And so at 22, I was pretty isolated. The friends that I had played beer pong with in college were not necessarily the ones who showed up to sit at my hospital bedside as my hair was falling out in clumps. But more important than realizing who my real friends were and weren ' t, I was so astounded by the people who came out of the woodwork and who showed up with such generosity and support and really made me understand the value of cultivating community and prioritizing that and investing your time and energy in that. And so luckily, by the time that I did have my recurrence, I had spent that decade building a community, because as much of a cliche as it sounds like, we all need a village and we especially need a village when the ceiling caves in. And so, when I learned of my recurrence, Jon was in the midst of perhaps his busiest professional season of life. And I ' ve known Jon from the time I was 13 years old. I have watched him work so hard to get to a place where he was getting the kind of recognition and invitations that he had, and it felt really important to me that he not put his life on pause. And so we had to get creative about how to stay connected to each other at this time where it felt like we were living on polar opposite planets. And so Jon came up with a beautiful idea of composing lullabies. He would compose a lullaby for me every single day, and send it off to me as a kind of counterpoint to the hospital ' s many noises, the beeping of monitors, the wheezing of respirators, the alarms that go off. And it was his way of enveloping me with his presence, even when he couldn ' t physically be there. And I, in turn, would text him photos of the little paintings that I would make. And so what that meant was that when we spoke on the phone, the conversation wasn ' t just centered around the latest biopsy results and blood tests and whatever else was happening. It was centered in our love language, which is a **shared** creative language, and gave us a way of expressing what we couldn ' t express. SZ : Joey writes,"What do you recommend to someone who is trying to get started with journaling but feeling a little overwhelmed by the blank page? Do you have any rituals or any starting places you can recommend?"SJ : Yes, in spite of the fact that I ' ve been a lifelong journaler, I go through many moments where I feel daunted by the blank page, and that was kind of the original premise of starting the"Isolation Journals."Sometimes we need to read something. Sometimes we need to prompt ourselves to get out of, you know, to twist our mind out of its usual rut. Come join us at"The Isolation Journals."We have an archive of hundreds of essays and prompts and journaling challenges. Or don ' t. But I ' ll offer you what helps me when I ' m feeling daunted by the blank page. And it ' s actually something I borrowed from my friend, the poet Marie Howe, and she told me that when she ' s feeling stuck, she writes with her non-dominant hand and a big scrawl across the page."I don ' t want to write about..."And then she writes into that. Another one of my favorite journaling prompts from"The Isolation Journals"is by the photographer Ash Parsons. During a period of time where she was in the NICU with a recently adopted baby who was having major health issues, she began what she calls"just 10 images,"which is listing just 10 snapshots from the last 24 hours, stream of consciousness, whatever comes to mind. And I love that prompt because it ' s in list form and it ' s so simple. But more than just recounting what happens in the last 24 hours, it ' s a prompt that ' s trained me to look and to look again and to notice my day differently. But the beautiful thing about journaling, and the thing that makes it so generative and inspiring for me is how low the barrier to entry is. You know, journaling is not beautiful writing. It doesn ' t have to be grammatically correct. It doesn ' t have to be in full sentences. It can be whatever it is that you want. It ' s such an expansive form that you can interpret and reinterpret however it best serves you. SZ : I have one last question from York. York says,"Thank you for sharing your experience and insights. One of the parts that resonated with me was your experience of using creativity while you were struggling with finding purpose. Were you always able to focus on creativity and if not, what helped you make that shift?"SJ : Liz Gilbert speaks so beautifully about the pressure of finding your"capital P"Purpose. And so, what she ' s always said is you have to be one percent more curious than afraid. Any time I come up with some big, ambitious creative project, I immediately get frozen in my fear and daunted by whatever it is. And so I think curiosity is such a gentler way in and such... And it ' s a more honest way into the creative process, where you don ' t hold to an expectation of how something should look or how something will come together. But you really give yourself the time and space to explore the threads of that curiosity. The work I ' m most proud of, the work that has surprised me and changed me as an artist, as a writer, are the projects I started without that sense of output or expectation, be it, you know, that 100-day project and keeping that journal or even the paintings that I started doing in the hospital. They were pure play and tapping into that sort of child space, of creating simply for the joy of creating without any regard for if it ’ s good or bad, but simply to explore. And so I try to trick myself back into that space all the time. SZ : Thank you for sharing so openly and vulnerably with us, as you frequently do. Bye for now. SJ : Thank you everyone, thank you Susan. [Want to support TED?] [Become a TED Member!] [Learn more at ted. com / membership]

Can you paint with all the colors of the wind? I love this song from the first time I heard it. I was 14, growing up in public housing in western Sydney. So maybe a little too old for this Disney classic from”Pocahontas.”But it spoke to me. I saw something of myself in it. At this stage, I think I knew I was queer. I mean, come on, I was rocking out to Disney. And look at those glasses. Seriously, what a queer kid. But I was also from a Pacific **Indigenous** heritage with conservative views and values. I didn ’ t feel like I could fit into any of the boxes that were being presented to me. Straight, **gay**, Fijian, Australian. I couldn ’ t pick just one color to paint with. Prior to colonization, **sexuality** amongst many of our Pacific islands across the region was fluid. Men would have sex with men without the stigma or **shame** afforded it today. **Sexual** intimacy was a way of being able to connect socially and relationally. Sex wasn ’ t just for procreation. Or in marriage. It wasn ’ t exclusively monogamous. Just because you had sex with a man didn ’ t define your **sexuality**. It didn ’ t make you an outcast. But as Europeans started to colonize the Pacific region, they brought Christian missionaries with them. They told us to cover up our beautiful bodies. We were taught **shame**. We were told to stop practicing Pacifica cultures and values that were seen as provocative. To a Western and white perspective, our non-binary **sexuality** was judged as tribal, outdated, sinful and impossible to practice alongside a Christian faith. Still today, those who are **Indigenous** to the Pacific are negatively impacted by whiteness. That”white is right, West is best.”I was brought up to espouse strong Christian beliefs, views and values which would shape my burgeoning identity as an adult. From these staunch conservative views, I was taught to fear the queer. Those people that were seen as unusual and fruity. And in essence, I grew to despise a part of myself. I sought to separate my queerness from my identity. I could never see myself as part of that world. Growing up, biracial and bisexual constantly challenged the way I saw the world around me. I was unsure about my thinking, feelings and behaviors around liking males and females. I was unsure about my thinking, feelings and behaviors when it came to whether I needed to be a white Australian or a Fijian person. And whether this needed to be framed within a binary to choose one over the other. In this way, I don ’ t think that my story is unique. There ’ s plenty of people in the queer world that have escaped conservative upbringings, religions and cultures. But this is only part of my story. Another common story in the queer community is the coming-out story. When did you tell your parents? How did they react? How it liberated you or ultimately separated you from your family. But this didn ’ t feel like an option for me either. I believe that embedded in these particular stories, these tropes, is a part of dominant queer culture that made it very hard for me to **access** the queer world. For example, when I started to go to **gay** clubs, I would be lining up at the front of the club and often I would get door staff come up to me and go,”Sorry, you do know this is a **gay** club, right?”From these lived experiences, I feel that there is a whiteness that pervades queer culture. And I didn ’ t want to give up my identity and my appearance as a Pacific **indigenous** person to be queer. Pacifica cultures really, really value and esteem the collective above the individual. For Pacifica people, our families are inextricably connected to our own sense of self-agency, self-determination, self-esteem, self-love and self-worth. Our own individual identities are meshed and intertwined with our family ’ s reputation and standing in the community. Our mind, body and souls are inextricably connected to the broader community, to our families, to ourselves and to others. I didn ’ t want to come out to potentially ostracize myself, to make a point to separate myself from my Pacific and faith communities. I couldn ’ t then see my authentic self in any of these spaces. And a quick shout out to my son on the left-hand side. Round of applause for my son. He said to me this morning,”Daddy, make sure you mention me.”So I was like,”OK, son. Alright.”So there you go for the recording, son. And the rest are my other family, that ’ s up there as well. Across queer cultures and the broader community, we have learned to embrace our gender and **sexual** differences. We encourage individuals to be allies for each other and to support safe spaces for those that are seen to not fit in. We empower and really encourage individuals to really develop and express their self-agency, their self-determination, their self love, their self-worth. We boldly go into spaces striving to bring others with us to ensure that we can create inclusive societies for everyone. However, the dominant Western view in queer cultures is still based on the individual. Me, myself and I. And my individual pursuits towards happiness. As a queer **Indigenous** Pacific person, I feel that there are parts of queer culture that is white, feels very white. We may fail to see the importance of bringing our families and our cultural communities along our journey as queer people. It ’ s either the queer way or the highway. It ’ s one or the other. Young or old. Rich or poor. Smart or stupid. Masculine or feminine. Fit or fat. These binaries create a sense of us and them, those people. A binary approach and position that we generally in Western white societies use to determine the norm. We create, conflate, perpetuate binaries that create divisions in our society. Saints or sinner, straight or **gay**. I see it like this. Binaries are a very white and Western way of thinking, feeling and behaving. As individuals today, we live within these binaries and create identities that then create these labels. We use these labels to then define and confine people and places. We are one or the other. But what we fail to see is that our identities are more than a set of binaries. Our own identities are comprised of intersecting identifiers that contributes to who you are, including our age, class, color, education, gender, size, spirituality, **sexuality**, and so, so much more. We need to decolonize queerness, to live beyond”white is right, West is best.”Because if we don ’ t, we ’ re going to continue to create silos and divisions in our societies that don ’ t create inclusive and safe spaces for everyone. For **Indigenous** queer people, they shape our connection to community and culture, our families. If we don ’ t include that within our understanding of who we are, even as queer people, then we ’ re not able to be, again, our true and authentic selves. We ’ re not able to then be our fabulous selves as part of the queer community. And it ’ s really, really interesting because I believe that we can learn so much from pre-colonial cultures like those that were practiced in the Pacific, that provide a different way of looking at a society. A queer way that pre-dates all the privileges that go into binary ways of thinking, feeling and behaving. Across many of our Pacifica languages we have a lot of key concepts that help solidify and support a shared understanding of the collective. For example, in Fijian,”solesolevaki”is all about reciprocal living, where my wellbeing is your wellbeing. I will actively seek to ensure that your well-being and every part of your life is catered for, knowing that you will do the same for me. We strive to enact"veiqaravi,"as tatted here on my hand, to serve others. We strive to also embed and embold and empower people to practice"veirokovi,"respect for self and others where we are relationally driven, where that is so important to our spaces and places. My sense of ability to actually put this into practice, my ability to actually understand these **Indigenous** perspectives has greatly helped shape and reconcile my queer identity today. But what ' s really interesting is that it ' s not just queer communities that need to decolonize itself. It ' s all of us as a broader society that needs to be part of a shared conversation to decolonize, deconstruct and disrupt binary ways of thinking, feeling and behaving. So how can we practically do that? Practice cultural humility, where you are constantly learning and embracing differences, where you get over yourselves and strive to learn about other people ' s differences and how that can be meaningfully included in the way in which you create safe spaces for everyone. I also believe it ' s possible to bring **Indigenous** perspectives into Western and white workplaces. For example, I ' ve introduced the concept of"talanoa"in all of my work meetings. Talanoa is all about being able to create a safe space where everyone is able to contribute to a collective, collegial and collaborative conversation. Where people are able to bring their authentic selves into these spaces. Literally, I will chair meetings where I have no firm set agenda items and I literally would just hold space for participants just to bring themselves. So you can tell I ' m a social worker, right? Safe space, safe space, safe space. It ' s OK, it ' s OK. But it ' s through these safe spaces that people can bring their multiple, intersecting identifiers, including their age, their class, color, education, gender, size, spirituality, **sexuality** and so, so much more. I invite queer communities to come talanoa with Pacific **Indigenous** Communities to create robust and resilient queer cultures. I have been able to greatly reconcile my queer and Pacifica identities, which has now really been embraced to help shape how I see the world around me today. And it ' s through these shared perspectives and approaches that we can truly embrace cultural diversity and its differences. And to know that people can live beyond those binaries and those labels we continue to perpetuate and perpetrate against others. It is a commitment from queer communities to decolonize queerness. It ' s a commitment from me, from you and all of us to decolonize Western and white societies and to live beyond the binary way of thinking, feeling and behaving. I genuinely believe that it ' s through this common goal that we can truly learn how to paint with all the colors of the wind."Vinaka vakalevu"and thank you.

Text Sample 364: POS Dim 3 – 2025 – Score 3.00 – 2025/t003002.txt

HW : Hi everyone, I am Helen Walters. I am head of Media and Curation here at TED. Welcome to another episode of TED Explains the World with the one and only, Ian Bremmer. It is Monday, February 24, a little more than a month since President Trump was inaugurated once more, and safe to say, a lot has been going on. So we figured we ' d check in with Ian to determine what we should really be paying attention to amid the extreme noise. Ian, hi. Ian Bremmer : Helen, great to be back with you. HW : So we asked the TED community to share their questions for you, and we wanted them to share what they ' re most curious to know. And we really got some amazing questions that I plan to pepper this conversation with. So let ' s start with one right now. Two months into 2025, where does the US stand? IB : Very powerfully, in the sense that the US economy, of course, is performing considerably better than any of the other G7 economies coming still out of the pandemic. Technologically, only close competitor is China, ahead of the US in some areas, behind the US and other critical areas. But compared to every other country in the world, the US is head and shoulders and neck or waist above them. Militarily, of course, the US is the only country with global ability to project power. No one else is close. And the US dollar is still the global reserve currency, no one is approximate challenger. I say all of those things because those are the things that haven ’ t really changed over the course of the last few months, but I suspect that isn ’ t what the questioner was asking. What they were really asking is what ’ s happening politically. And politically, the United States is unwinding its own global order. It is no longer particularly interested in promoting collective security or NATO. It ’ s no longer really interested in promoting involvement and leadership of multilateral institutions, of consistent rule of law and free trade that ’ s well regulated, certainly not very interested in promoting democracy around the world. I mean, this is an environment where other countries around the world have to figure out how to adapt to the United States, and that the US has become the principal driver of geopolitical risk and uncertainty in the world today, unlike any other time in my lifetime and yours, that ’ s perhaps the biggest change. HW : That is quite a statement. Alright, you are a geopolitical expert. Let ’ s talk about Europe. So Defense Secretary Pete Hegseth stated that America ’ s foreign policy focus no longer lies in Europe. Vice President JD Vance caused some raised eyebrows, dropped jaws and, I suspect, some choice expletives after his recent speech at the Munich Security Conference, in which he accused European leaders of suppressing free speech and warned of the threat from within. So you were in Munich. Was it as dramatic as the stories we read had it? And what happens next? IB : It was. I was in the room. I was maybe 30 feet away from him when he gave that speech. Standing right in the front, right next to me was the president of Czechia, the president of Finland, the prime minister of Sweden, watching all of them and their reactions. What he said, let ’ s keep in mind, this is the Munich Security Conference. It ’ s been going on now for something like 61 years. And he was the head of the US delegation. And every year the head of the US delegation gives a big speech on the state of the transatlantic alliance and on global security. And he didn ’ t do that. I mean, the people in the audience were expecting a challenging speech. They were expecting that the Americans would be less committed to the alignment with the Europeans on Ukraine. The US had just had that direct Trump phone call with Vladimir Putin, 90 minutes long. Hadn ’ t coordinated that with the Europeans, never mind the Ukrainians, in advance. So, I mean, they were definitely prepared for a very challenging plenary. But Vance did none of that. Vance said,”I ’ m not going to talk about Ukraine or Russia or China, because the biggest problem is actually what ’ s happening inside Europe. The biggest problem, essentially, are you guys sitting in front of me, that I ’ m speaking to, because you ’ re suppressing free speech. You ’ re suppressing the far right. You ’ ve been infected by the woke mind virus, and you aren ’ t real democracies as a consequence.”And specifically he said, and this is something that I think is underappreciated in the United States, he attacked the German firewall. And said that – And let me explain what the German firewall is. That is a principle by the leaders of all of the mainstream German parties and their supporters that they will not, under any circumstances, work with, enter into coalition with the Alternative for Deutschland party, the AfD. Because the AfD, under surveillance from German intelligence agencies, is considered to be a neo-Nazi party. And the United States, of course, after World War II, led de-nazification of Germany. The day before, Vance had actually gone to Dachau and visited a concentration camp, and then came to speak in Germany about the firewall needing to be ended. And at that point someone yelled out from the crowd,”This is unacceptable!”And it was right in the front. And people in the room, about 1, 500 people in the room, standing room only, couldn ’ t see who it was. They ’ d just see the back of his head. I saw who it was. It was the German Defense Minister, Pistorius. And in 15 years of me going to the Munich Security Conference, I have never seen anything remotely like that. And the reason I mention all of this, and of course, on the back of that, let me be clear, Vance refused to meet with the German chancellor because he ’ s basically, well, he ’ s not relevant. He ’ s only going to be there for a couple more months until a new government, so why should I bother? But does meet with the leader of this AfD, goes and meets with her directly, does a bilateral that evening. So that is a very important backdrop for this last weekend ’ s German elections, where the victor, Friedrich Mertz, who is going to be the next chancellor, actually referred specifically to America ’ s intervention in German democracy and support of the AfD being every bit as bad as what the Kremlin is doing inside Germany, and also said that the Europeans need to develop a defense policy which is independent of the United States, in other words, essentially saying that it will be the end of NATO. Again, staggering comments, unheard of, impossible to imagine even two weeks ago. And that ’ s why it ’ s very critical that you have the context of what happened between Vance, Elon Musk over the past couple of months, Trump, with the Germans, with the Europeans. So you can understand why the incoming German chancellor would make a statement like that. HW : What should we make of all of the conversation about the rise of Nazism, the return of Nazism? Obviously, the AfD just won 20 percent in the German election. We ’ ve also seen people allegedly giving Nazi salutes at various US conventions and speeches. Do you think this is overblown? Is this a fear that people have rationally? And what should we make of that? IB : In Germany, the Alternative for Deutschland, are winning all of former East Germany. This is a group that increasingly understands that they ’ re never going to really catch up to the rest of Germany. Remember, Germany hasn ’ t really grown in five years now. They ’ ve been in recession for the last two. And the average citizen, the average voter, living in former East Germany no longer are just angry about not catching up. They ’ re basically saying,”I ’ m done with this system.”So that ’ s why you ’ re getting this very strident, revanchist nationalism that is, you know, it ’ s not just taking a hard line on illegal **immigrants**. The AfD even supports removing citizens of Germany that they claim have not adequately integrated into German culture and nationality. And so, I mean, this is some very, very strong stuff, stuff that really does feel like what they were doing back in Nazi Germany. But in former East Germany, they win. They get the largest number of votes, where, in much of the wealthier part of West Germany, including, you know, where I was, in Munich, the AfD can ’ t break out of single digits. So it ’ s a very, very divided country. And also the AfD is doing very, very well among young men. There ’ s a clear gender divide here as well, just as there is in the United States. In the US, I mean, I, of course, saw Elon Musk and that, you know, sort of grabbing his heart, saying,”My heart goes out to you”and then doing what appeared to be mimicking a Nazi salute. And then Steve Bannon doing the same without the initial heartfelt comment. It clearly was trolling. Clearly was trying to get a reaction from folks. It ’ s very performative. And it ’ s meant to also, you know, attack and attach, make the left lose their minds on something that isn ’ t very critical to what the Trump administration is trying to do compared to the revolutionary changes inside the US government that they are very much prioritizing right now. So I ’ m very concerned about the rise of neo-Nazism in Germany. I am very much not concerned about that in the US. I ’ m concerned about other things I ’ m thinking is being used as gaslighting for those that can use distractions or can be distracted by them. And I would also say that this election in Germany wasn ' t surprising. It was exactly as the polls have expected for several months now. But the key elections in Germany and the key elections in Europe are the next cycle. I ' ve spoken with a lot of people around the Trump administration that believe that the Europeans are one electoral cycle behind the United States. So in other words, Trumpism is coming, just not quite yet. And so in the UK, you ' ve got Labour for a full term. But the Reform Party is increasingly the most popular. And just with a little nudge, maybe a little external money, and Elon said he ' s already thinking about giving them 100 million dollars, which is a massive amount in UK politics, not so much in the US, that the Conservatives would fragment, a rump group would join with Reform, and they could win the next elections. In France, you ' ve had all of these governments continue to collapse. Macron, very unpopular. Marine Le Pen and the National Rally party could easily win upcoming elections in 2027. In 2029, in Germany, if the Germans are incapable of turning their economy around, incapable of unwinding their debt break and spending some of the capital that ' s just sitting there and as their debt to GDP goes down, but their economy contracts at the same time, then AfD could easily win in 2029, and then the firewall is no more. And then, of course, in the European Union elections overall, in five years ' time, now four and a half, you could easily see the Patriots front, which is the equivalent to the far right grouping that these parties are a part of, they could all come together and be the dominant party. And then the EU as we know it is really a thing of the past. So these are existential changes that are happening not just for NATO right now, but also for the EU and quite plausibly, for the future of democracy as we know it. HW : Alright, let ' s turn to Ukraine. So President Trump accused President Zelenskyy of starting the war with Russia and called him"a dictator without elections."Last week, senior American and Russian officials met in Riyadh to discuss a potential cease-fire with no Ukrainians present. Now Zelenskyy has offered to step down in return for Ukrainian admission to NATO, although apparently he doesn ' t really mean this. So what happens to Ukraine now? What should we be paying attention to? IB : Well, I mean, I think he would mean it if NATO membership happened. I ' d love to see Trump call his bluff on that. But of course it ' s not going to. And he wasn ' t saying that six months or a year ago. He ' s saying it now that NATO is truly being pulled off the table. I think it ' s the right thing for him to do. It is, again, performative and helps to remind those around the world that Ukraine is fighting for self-determination. They ' re fighting for the ability to join their own alliance, as any country in the world should be able to do. But that is not Trump ' s belief. Trump believes that what you get to do is determined by how powerful you are, not by the fact that you happen to run a country. And indeed, the territorial integrity is something that is afforded to powerful countries, but not so much for weak countries. And that ' s the way he feels about Panama, and that ' s the way he feels about Denmark and Greenland. And that ' s certainly the way he feels about Ukraine. So right now, as you and I are speaking, the United States is putting forward a new UN resolution at the General Assembly that says that the war has to end as fast as possible but does not recognize Ukraine ' s territorial integrity, which has been a core precept of the international order that the United States has supported since creating the United Nations and since the end of World War II in 1945. The Americans are now throwing that out. And the Russians, of course, are fully supportive of that. America ' s allies in Europe are not. But the US has gotten the Saudis to agree, and they ' re getting a unified Arab block. The Americans have privately worked with a lot of poorer countries in Africa, in the Asia Pacific and others, smaller countries, and saying,"You ' re not going to get any aid from the US unless you vote in favor of this new resolution."I fully expect the resolution is going to pass. But of course, what that means is that the Americans are preparing to cut a deal on Ukraine over the heads of the Ukrainians. In other words, the US and Russia together will figure out what a ceasefire should and should not entail as part of a broader US-Russia rapprochement. This is obviously a disaster for the Ukrainians and the Ukrainians who initially refuse to accept this so-called deal, on Ukrainian natural resources that would grant the Americans $500 billion in **access** to such resources in return for"paying off"aid that the Americans had granted to the Ukrainians without conditions or strings, but apparently no longer. And so, you know, what does this all mean? Well it means it ' s yet another case of why people shouldn ' t trust the United States from one administration to the next, because foreign policy will change completely. And what you thought was an American commitment won ' t stand. It shows that there is a fundamental rift between the Americans and the Europeans and indeed, Emmanuel Macron in the United States right now, as you and I speak, hoping that he can do something that will keep Trump from, as Macron believes, essentially surrendering to, conceding to, the Russian position and maintaining some level of coordination with the Europeans. But he doesn ' t have a lot to offer. And the Ukrainians, you know, now in a position of desperation where maybe they will end up signing over a lot of their natural resources to the Americans. But what, if anything, will they get in return for that? And how empowered will the Russians be in any deal that is cut? And will an independent Ukraine even be able to survive, and what will the terms that will be required of them? Of course, Putin is saying things like, no European troops of any sort, whether in a NATO formulation or not, would be allowed as peacekeepers in Ukraine. Well, then, how would you guarantee, what kind of security commitments would you give to the Ukrainians? These are all open questions, but apparently questions that President Trump is prepared to largely resolve on Russia ' s terms. And again, this is such a dramatic change from where the United States and where the Western order was just a month or two ago. HW : So let ' s take some quick-fire questions from our community related to this topic. And I think the first one is particularly pertinent to what you just said, so it ' s simple. What does Putin have over Trump? IB : I don ' t think that Putin"has"anything over Trump. If he did, then why wouldn ' t Trump have granted Russia more in his first term? In his first term he gave the Ukrainians those javelin anti-tank missiles that Obama refused to give. And, you know, he thought they were too risky. He increased sanctions against Russia. Now that was his administration with a lot of hawkish in orientation advisors around him that he doesn ' t have this time around. They ' re all directly loyal to him. But, I mean, if it was a priority for him, he could have stopped it. And if the Russians had something over him, then why wouldn ' t they have used it in that case? It feels like a conspiracy theory. I don ' t buy it. I think very differently. We can explain what ' s happening because number one, Trump wants to end wars. It ' s very popular with his base. He ' s said this on Gaza. He ' s said this on Iran, where Israel wants him to support attacks on Iran ' s nuclear capabilities, and Trump has said no. And he ' s showing this on Ukraine. He doesn ' t want to spend money on the Ukrainians going forward after spending over 100 billion dollars under the last three years from the Biden administration. He doesn ' t want to spend that money going forward. And he also doesn ' t value a strong Europe. He actually thinks that a weak Europe is in America ' s interests, where you have more Brexits. He used to always talk to the French about that during his first term,"Why won ' t you do Brexit?"He wants all of these MAGA-type populist parties, including the AfD, to win in Europe because that legitimizes his own popularity. Just like he loves Milei in Argentina or Bukele in El Salvador. And so I think if you put those things together, you actually get to why Trump is doing what he ’ s doing with the Russians without needing to create a story about Trump somehow being threatened by some secret, shadowy information that the Russians have on Trump that they ’ ve let him know about but nobody else knows. I just don ’ t buy that. HW : Great. OK, another community question. If the US hands Ukraine to Russia, will Russia keep going? Will they attempt to take over Europe? IB : It ’ s interesting that Trump just met with the Polish president, President Duda. It was supposed to be an hour meeting, it was only 10 minutes. So he kind of embarrassed him at home in Poland. But he did say that the US is still committed to maintaining a troop presence on the ground in Poland. And so it ’ s very hard to imagine the Russians rolling through Ukraine and then into Poland, even though there ’ s been lots of asymmetric warfare, for example, and even there have been, you know, Russian missiles launched into Lviv, Ukrainian air defense, missile defense, and with Polish villagers getting killed because of the fighting. So, I mean, there ’ s been spillover. But America is still going to be in Poland. Why is that? They get along pretty well, and the Poles are heading towards five percent of GDP defense spend this year, which has been the high water mark of American demands of defense spend. So he ’ s, you know, been consistent on that over the past months. Baltic states. I mean, they ’ re all spending a lot more money on their defense. And so, I mean, in principle, you could imagine the United States maintaining these rotational deployments in the Baltics, which would prevent the Russians from invading. But might Trump say, as part of a deal,”Why do we have all those troops there?”You mentioned Pete Hegseth saying the Americans need to get troops out of Europe and get them to Asia, which is where their principal competitive, you know, sort of, strategy is going to be oriented. And the US hasn ’ t been pressing the Japanese or the Indians, the principal partners, allies in Asia vis-à-vis China, the way they ’ ve been pressing the French, the Brits, the Germans in Europe. So I think it is certainly plausible that the Russians will do more, especially with those countries that refuse to align with a Trump rapprochement towards Russia. The countries I would be most worried about are Moldova, are Georgia. I ’ d be most worried about the countries that are in the so-called”near abroad”that aren ’ t a part of NATO, and aren ’ t going to become a part of NATO, and therefore are much more vulnerable. But certainly in terms of Russia ’ s willingness to engage in espionage, to fund actors on the ground for arson attacks, assassinations, critical infrastructure attacks on fiber networks, on pipelines, I think all of those things are likely to increase against European states across the board, on the back of this US-Russia rapprochement. HW : OK, final community question for this segment. What happens if the US no longer supports NATO? IB : It ’ s possible that the United States is moving towards a similar posture in Europe that they presently have in Asia, which is strong individual bilateral deals with a number of countries : South Korea, Japan, Australia, but not a collective security agreement, where those countries together have more of a call on the United States and there ’ s a lot more free riding. So I could imagine that NATO falls apart and becomes that. The danger is that even though the Europeans now understand the nature of the threat, that it is very plausible and maybe even baseline, that the Americans are going to leave Europe collectively on its own. That that seriousness does not equate to the ability to increase spending adequately in the near term. The Germans did manage to pull together an electoral outcome that will allow for a so-called grand coalition, just barely. So you ’ ll have a two-party government in all likelihood instead of a three. But you also have a blocking capacity on the part of the far right and the far left that will prevent the Germans from really blowing out their spending, including their defense spending, unless they can pull something off before that new government is formed. Which is possible, but it ' s unlikely to be very big. The Brits are now talking about maybe moving the 2. 5 percent of GDP defense spend over years with a very challenging fiscal environment. The Spaniards, not even close, the Italians, not even close. So what does a European military capability really look like? And without the Americans, the answer is it ' s not there. It ' s not there. So I think that if NATO falls apart, the reality is that most of Europe will be incredibly vulnerable to external attack, especially Russian attack, And there won ' t be a way for them to defend themselves, and some of them will break and therefore want to work more directly and individually with the United States. And that could be the end, not only of NATO, but it could be the end of the European Union. I think this is, the stakes are incredibly high, this is an existential challenge for European governments that needed to take this seriously 30 years ago, 20 years ago, certainly in 2014, when the Russians invaded Ukraine, certainly, certainly in 2016 when Trump was elected, and certainly, certainly, certainly in 2022 when the Russians then invaded all of Ukraine. And at every point the Europeans were basically saying,"We ' re still fine with the Americans basically doing this."And now they are in very serious trouble. HW : No time like the present, I suppose. Alright, let ' s move on. So I mentioned the discussions in Saudi and obviously also on the agenda there with the discussions about Gaza and Trump ' s proposal to build a Gaza Riviera. What should we make of that? Or as one of our community members asked, what is the actual solution for Gaza? And surely it isn ' t what the US is proposing. IB : Well, look, here ' s what ' s interesting. You know, Trump says a lot of things, and when they don ' t work [out], he backs out fairly quickly. And you know, I thought – just stick with Ukraine for one second on this. It was interesting to me that Trump has said that he doesn ' t want to talk to Zelenskyy because he has no cards, he has no leverage. And so why should he let him at the table? And so Trump ' s going to cut the deal. Very interesting that if that is true, then why is it that the Secretary of Treasury brings this deal and says,"You ' ve got to sign this right now, Zelenskyy"And Zelenskyy refuses. And then a few days later, the Americans come back with a new deal with altered terms that are not quite as predatory vis-à-vis Ukraine. Why would the Americans change their tune for someone that has no leverage? Because, I don ' t think it ' s because Trump is a nice guy. He ' s not going soft at 78. I think it ' s because he overstated how little leverage Ukraine has. Ukraine is very popular among the GOP in the House and Senate, far more than Putin. Zelenskyy is far more popular in the United States among the voting population than Putin. And of course, he ' s also much more popular among the Europeans and even globally than Putin. And so it turns out that maybe there is a little bit of leverage that Zelenskyy has, and maybe Trump does have to give a little bit more. So this is relevant in the context of Gaza, because Trump was very annoyed that, you know, despite his ability to get a cease fire between Hamas and Israel over the goal line, that his friends in the Middle East were not coming up with a plan for Gaza. Where they were supposed to provide security and provide investment and lead reconstruction and deal with the Palestinian populations in the interim. And that wasn ' t happening. And so Trump then meeting with Prime Minister Netanyahu from Israel in Washington, then after that, summoning the Jordanian king, who was the ally that is most reliant on the United States and so, therefore, most needing to say yes to whatever Trump orders of him. Basically says, as you mentioned, Helen, that Gaza is going to be a Riviera, that the US is going to turn this into an incredible place. They ' re going to build wonderful homes for the Palestinians someplace else. And the Palestinians will all volunteer to leave Gaza and go to those homes, and Gaza will be depopulated and new people will come in and live there. That was the plan. And when he was asked, standing there with King Abdullah from Jordan, under whose authority? Trump ' s response was :"Under my authority."And that went over like a lead balloon among America ' s allies in the Middle East. They all said,"We ' re not up for this. We ' re not resettling Palestinian populations. They won ' t actually leave voluntarily. This will would actually be a huge problem for Israel ' s own national security long-term. And we ' re going to come up with another plan. And our plan will keep the Palestinians on the ground in Gaza."At which point Trump pivots to work with the new plan. And his advisers say that Trump was only trying to start the conversation. And what he said was his plan is not actually what he ' s going to do. So, what ' s sustainable? What would be sustainable would be a lot of Gulf money going in and maybe some European money too, though they ' re going to be really pressed, given everything you and I just talked about, to try to reconstruct a completely devastated Gaza that eventually some two million-plus Palestinians will be able to live normal lives in, and the governance will be provided by some technocratic group of a Palestinian Authority that will be working with, selected by, those that are involved in the reconstruction and the security. Namely the Egyptians, the Jordanians, the Saudis and the Emiratis. That is the best possible deal that they ' re going to get. But that ' s happening as Israel has just evacuated forcibly another 40, 000 Palestinians from refugee camps in the West Bank, sending tanks in for the first time in decades and probably precipitating more Israeli settlers taking more land on the ground in the West Bank. And so, as we are possibly taking a small step towards a sustainable solution in Gaza, we are taking a slightly larger step away from a sustainable solution for the Palestinians in the West Bank, twas ever thus over the past decades in this incredibly horrible problem and conflict. HW : And why is Israel doing that? I mean, are they feeling emboldened by the US, or why the incursions in the West Bank now? IB : Well, I think they ' re feeling emboldened by their own successes. They have shown that they are the dominant military power in the Middle East, and they have the ability to determine the level of escalation unilaterally, and their adversaries and enemies can ' t really do any damage to them. They proved that after October 7, in their response to Hamas. They proved that in decapitating and taking out the military capabilities of Hezbollah. And they ' ve proved that also with overturning – they didn ' t do it, but the fact that the Assad regime in Syria is gone, which means that the Iranians no longer have a land bridge to get additional weapons to what had been the strongest adversary of Israel militarily, Hezbollah. So all of that has shown that Israel can decide outcomes. They ' re the ones that have all the power here. And also that depopulation of Gaza is very popular among Israelis. There was a poll recently in the Jerusalem Post, which is pretty mainstream in Israel. 80 percent of Israeli respondents said that they wanted to depopulate Gaza of all Palestinians. Taking more land is very popular, especially in the West Bank, especially among Netanyahu ' s present right-wing coalition, that he would like to keep together, to continue to govern. And this is a sop to them as he is looking to potentially extend the ceasefire in Gaza and move from phase one to phase two, which is facing some delays and open questions right now. So, yes, certainly, the United States has been underpinning that military capability of Israel. And I think it is instructive to remember that not only does the US provide more military aid in peacetime to any country in the world, to Israel, but that unlike in Ukraine, where the Trump administration is saying,"No, I ' m not happy with the grants, you ' ve got to pay that back,"The billions and billions that the United States sends to Israel, nobody is suggesting that that should be alone or that the Americans should get technology rights or mineral rights or anything else from Israel, despite the fact that Trump ' s policy is America First. Israel is a very clear exception to America First in Trump ’ s visioning of it. HW : Alright, so we talked about the fact that the foreign policy focus of America is shifting to Asia. So what are you hearing about how China is feeling in all of this? And what should we be paying attention to on that front? IB : China has had a couple of good weeks economically and specifically on the back of that huge announcement of DeepSeek, which has, you know, far less money behind it than the comparable American chatbots but is performing at an extremely high level. And, you know, given the fact that there are all of these export controls on semiconductors and other parts of advanced technology, that this is giving people more of a belief that the Chinese really are capable of driving innovation even in that space. And they ’ re, of course, dominating the post-carbon energy space. We see that with electric vehicles and batteries. But we ’ re also seeing that with massive investment now in green hydrogen, for example, we ’ re seeing it in advanced nuclear capabilities, all of these things. And so there is more investment in that space that the Chinese are not only driving as a state, but that they ’ re also increasingly able to raise and move in their own private sector. So the story that you and I have been discussing for the last couple of years is the Chinese economy is radically underperforming. That is still true, but there is an emerging counter-narrative here that I would be remiss not to mention. Now more broadly, what the Chinese here are seeing is that Trump ’ s direct policies are going to hurt them economically. His tariffs that he ’ s already announced on China, the 10 percent, on a whole bunch of Chinese goods for export, the reciprocal tariffs that are global, that will clearly hurt China and that they ’ ll have a hard time negotiating out of, and also the willingness of the United States to expand their export controls, their sanctions on China, especially in areas that are considered relevant, even loosely relevant to American national security. All of that is going to constrain Chinese growth. All of that is going to negatively impact the Chinese economy. That ’ s the downside. And the Americans are doing that not only in bilateral relations with China but also pressuring other countries to get Chinese tech out of their supply chain. And you see that with Americans pushing other countries that produce semiconductors to take the Chinese out. They ’ re pushing American allies and trade partners to get China out of the export chain. So Mexico being pushed very hard by Trump to stop allowing China to pass goods through Mexico into the United States. India, same conversation. Vietnam, same conversation. A lot of that going on. So baseline, the US-China relationship is getting worse. But the Chinese see huge advantages in America ’ s reversion to unilateralism that we haven ’ t really seen since the original America First movement in the run up to World War II. Charles Lindbergh saying,”Don ’ t get into the war, don ’ t fight the Nazis. The US is far away. This isn ’ t our our problem.”And now you have the Americans not only doing that with Russia and Ukraine with the new America First, but you also see that happening with the Americans pulling out of the Paris Climate Accord, again, pulling out of the World Health Organization. You see it with the Americans shutting down USAID. And America has historically been responsible for about 40 percent of global humanitarian support and aid. And absolutely, some of that is corrupt. Absolutely, some of that is on woke programs that the vast majority of American taxpayers would never support. But the majority of that money is actually spent on programs that are really important in advancing American soft power and influence over countries in the Global South, all over the world. The Chinese know that. That ’ s why they ’ ve started humanitarian programs. It ’ s not out of some great love for, you know, providing foreign aid for these countries. It ’ s more because they see it creates influence. Now the Americans are leaving a vacuum that the Chinese can absolutely take advantage of. And we ’ ll see this across, you know, sort of, microstates in the Pacific. We ' ll see this across sub-Saharan Africa. We ' ll see this across South America. The Chinese see huge opportunities from the United States creating a leadership vacuum. And the place they ' re most capable of doing that is if the US stops paying dues in the United Nations, where China is number two, and they ' ll suddenly have the most influence over all the key positions, which will give them a role in global governance that they ' ve really been constrained from having over the past decades. HW : What do you think are the chances that the US stops paying its dues to the UN? IB : You know, if it were up to Congress and only Congress and Trump doesn ' t lean on them, I ' d say fairly low. I ' d say that they ' d probably, you know, cut back on some programs. But in terms of baseline dues, they ' d keep paying it. But Trump personally, I think increasingly sees the UN as hostile to the United States. That ' s particularly true in terms of Israel policy, which Trump is leaning in on. And, you know – let me put it this way. Tulsi Gabbard did not have the votes to get confirmed. There were Republican senators that were going to vote against her. And Elon called those individual senators and threatened them. And this was, you know, fully aligned with what Trump wanted Elon to do. And those votes went away. And the only person that ended up voting against Tulsi was McConnell. And as a consequence, it went through. So look, I think that we should not underestimate the level of power and control that Trump and Elon have over the Republican Party this time around, compared to 2017, where it was really the Republican Party that was much stronger than Trump, both in his administration creating a lot of guardrails, but also in Congress. This time around, Trump has all the chips and he ' s using them. So if he decides he wants to stop paying dues, I think that ' s what ' s going to happen. This is a much more revolutionary presidency, domestically, where last time around it was much more transactional. HW : Alright. Let ' s talk a little bit more about what ' s actually happening inside the US. You bring up Elon, who obviously with DOGE has been sending out emails and asking for information from people and kind of trying to do a lot very quickly. Some of these high-profile moves are – I think what ' s interesting is that no one would really argue that there isn ' t inefficiency in government, that that ' s an understood reality. But the way that some of these moves are being made are maybe going to cause irreparable damage. And that ' s to people from red states, that ' s to scientists, that ' s to veterans, that ' s to people who voted for Trump and that ' s to people around the world. You talk about soft power and the United States, but what about actually what ' s happening inside the United States? And why do you think that the administration is willing to go so quickly, to go so fast and to cause such damage? IB : Well, and you saw Trump this weekend saying that he wants Elon to move faster, to be more aggressive. And I don ' t think that was just a troll. I think that ' s true. Trump is 78 years old, and with his friends he talks about the fact that he doesn ' t have much time. That in two years ' time, the Democrats could take the House in four years ' time, you know, that ' s it. He ' s not talking privately of"I ' m going to be president for life."He also knows he was almost killed. He was shot in the head. And do I think that changes somebody? Absolutely. I think that he believes that he was saved by God, and that his level of confidence that what he is doing is fundamentally right and necessary now is so much higher than the insecurity that I frequently saw in him in his first presidency. So I think his willingness to push, push, push, and his view that Elon is a great activator and executor on that intention, and someone that he had nowhere close to someone with that kind of capability and energy and execution ability in his first term. And now he does. So first of all, I think that relationship between Trump and Elon isn ' t going anywhere. I think it ' s actually very stable. People that say it is are people that want it to go away. But hope is not a strategy. And I also think that the intention of revolutionary politics domestically is to shoot first and ask questions later. It ’ s to break things. It ’ s a view that the bureaucracy has been weaponized against Trump first and foremost, and also against the will of the American people. And therefore it must be broken. And you ’ re going to break eggs when you want to make that omelet. Now your point is that there are a lot of Republicans that work in government. There are a lot of Republicans and Trump voters that are losing their jobs and that are not being treated with a level of care and compassion as a result of what Trump and Elon are doing. And I think there will be a backlash. But I ’ m not so sure that a one-term, 78-year-old-Trump presidency cares all that much about that. And, you know, if that means that his popularity slips to like, the high 30s, frankly, you know, in a very, very polarized country, high 30s isn ’ t that bad. It still means 80, 90 percent of the people that voted for him still support him, and I think he ’ s probably more comfortable with that this time around. So I think a lot more has to happen before we can start talking about whether there ’ s really going to be significant pushback against what Trump is trying to accomplish at home. HW : Do you expect to see any of Congress standing up to Trump? We saw the governor of Maine recently kind of take him on. Do you expect to see more of that, or do you feel like for the next two years at least, people will just go where Trump takes them? IB : Well, sure, but, you know, in the case of Maine, that ’ s a Democrat. So I don ’ t know how much that means. I don ’ t expect to see a lot of Republicans standing up against him. And of course, since the Republicans control the House and the Senate, that ’ s the only thing that really matters. I mean, you know, you saw Kash Patel got through, Pete Hegseth got through. Now look, I actually think that a lot of the members of cabinet are very capable. I mean, they ’ ve been picked for their loyalty and they will be loyal to Trump, but they ’ re very capable. I think JD Vance is very capable. Mike Waltz, I know quite well. Marco Rubio, over the years. These are people that are very well respected, have been by their colleagues and could have served under any Republican administration. But there are some people that are completely incapable for the roles that they have been selected, completely incapable. They would not be selected in a role in any cabinet, in any democracy. And yet here they are, serving in critical roles in the most powerful country in the world. And yes, I ’ m talking about the Secretary of Defense. I ’ m talking about the Secretary of Health and Human Services. I ’ m talking about the Director of National Intelligence. I ’ m talking about the Director of FBI. These are important roles. And they were all confirmed. And if you ’ re a Republican senator – and senator – I ’ m not talking about the House here where, you know, it ’ s a lot more diffuse and there are a lot more wackos and it ’ s easier to get in. But Senate has always been like, responsible and more oriented towards bipartisanship and the rest, and they are utterly petrified of what it means if they publicly get crosswise with President Trump and number two, Elon. And they ’ re not willing to do it. So I think that there ’ s very little belief that you are going to see Congress step up. I think that you will see justices step up because those justices are independent. The problem is that many of those justices are progressive and have a known progressive lean. And so when cases come up and justices that have that political lean oppose something Trump wants, his willingness, his administration ’ s willingness to attack them and refuse to execute on that judicial decision, unconstitutionally, is real. Now the case will of course go then up to the Supreme Court eventually. And I don ’ t feel the same way about Trump refusing to listen to adhere to the rulings of the Supreme Court. But if there ’ s 100 rulings like that and you overwhelm the judicial process, you quickly see how you might erode a core check on executive power in the United States. And Trump and Elon clearly intend to every day test those checks and balances and break them if they can. I mean, that is the intent, that is the intent. HW : So you mentioned democracy. When we last spoke, you said very clearly that the US is not Hungary, meaning that democracy is not threatened and that the US is not in danger of turning into an autocracy. Do you stand by that? IB : Yes, I do. I mean, in the sense that I think in two years we ’ re going to have midterm elections, and they will be largely free and fair. And in four years we ’ ll have presidential elections. And US elections are held at the federal level, right? They ’ re held state by state. They make the rules. It ’ s very easy to make people believe that the election has been stolen. It ’ s extremely hard to actually rig an American election. And I don ’ t believe that that is very likely at all. It ’ s very unlikely. The American military, despite the firings that we ’ ve seen just last Friday, is still an independent and professional military that I believe will carry out its orders and its duties professionally. I see the judiciary in the United States as independent and a clear check on the executive power in the United States. Where I see a problem, is that the US is becoming more kleptocratic every day. And the US was already much more of a kleptocracy over the past 10 years under Democrats and Republicans than any other advanced industrial democracy in the world. Clearly, money buys power in America in a way that it doesn ’ t in any other major democracy, wealthy democracy. That is getting dramatically worse. I saw specifically that Elon Musk, who is a walking conflict of interest at the highest level, met with Narendra Modi, the Prime Minister of India, in Blair House, so part of the official White House complex, right after Trump met with him. And Trump was asked later in the day, was Modi meeting with Elon in Elon ’ s private-sector capacity to advance his business interests or his official capacity to advance the policies of the United States? And Trump answered honestly. He said,”I don ’ t know.”And how could he know, right? Because, I mean, those two things are completely intertwined. But that is not remotely acceptable for rule of law in a functional democracy, and yet nothing is being done about it. In fact, it ’ s getting more and more entrenched every day. So the single place where the United States was least functional as an advanced democracy is now getting far, far worse. And I don ’ t see any checks and balances on that. I think that ’ s a very, very serious problem. HW : Alright, Ian, thank you, as always for all of your insights. Let ’ s close out with a couple more questions from our community. And this one indeed relates to the kleptocratic conversation that you were just raising. So why are the billionaires enabling fascism? What do they get out of it? IB : Fascism is a very politically loaded argument. That ’ s a political system where the cruelty against a subgroup or a perceived subgroup in the society is the intention, the expressed intention of the policy. And I certainly wouldn ’ t define the United States as a fascist system today. But I do believe that billionaires in the United States, at least a significant subset of them, are really under-interested in the well-being of their fellow countrymen and women. And this is a country that really makes heroic the individual. And it undermines the community. We ’ ve seen a significant erosion of civic engagement in the United States and civic associations. The church is not what it was in the US. Fewer people go, fewer people trust the church. Public education is not what it was. And wealthy people increasingly opt out. The family is not what it was. It ’ s increasingly atomized and people spend much more, much more of their time being, you know, isolated and atomized and intermediated by algorithms. And you and I have spoken about that problem in the past. We are increasingly a society of individuals as opposed to a nation together. I will tell you that that is a real problem when you have large numbers of billionaires that believe that they built it themselves, that they ’ re not responsible to a collective whole for any of their success and therefore they

’ re not accountable for their fellow citizens. And that ’ s what I think we have. I think we have a lot of winners in the United States and not a lot of leaders. And when you have winners, you have losers. When you have winners, you don ’ t have a collectivity. I will say that in this anti-DEI thing, I have a lot of sympathy for the people that don ’ t like DEI. I thought it was rammed down the throats of a lot of people And I ’ ve said this before, it was well beyond what the average American was willing to tolerate, and also it came with a level of high-handedness that that basically said, if you ’ re not with us in supporting these programs, you ’ re evil, you ’ re stupid, you ’ re uneducated. That ’ s unacceptable, too. It was a completely, you know, sort of oppositional way to try to have what ’ s a very challenging conversation. But I ’ ve never been a champion of diversity for diversity ’ s sake. What ’ s amazing about the history of the United States is despite all of our diversity, we find commonalities with each other. We find connectedness. That ’ s what ’ s amazing, is the connectedness, is that, you know, on this world, we ’ ve got eight billion people. And despite how different we all are, we all actually connect as human beings. That is what we need to focus on, not the diversity, the connectedness. And I think that ’ s what the billionaires today in the United States are losing. They ’ re doing incredibly well themselves. They ’ ve got theirs, they ’ ve got **access** to power, they ’ re paying good money for it, they ’ re going to get even more. But they ’ re forgetting that for us to succeed as a society and as a planet, we have to be connected to each other. You can ’ t throw out diversity and forget connectedness, and that ’ s what we ’ re forgetting right now. That ’ s why the country feels so much **trauma** and pain right now. And I think why the United States has given up on a lot of its really aspirational values that made such a difference to the world, that almost lost World War II for many generations. And now we ’ re giving it all away. HW : I mean, I think that ’ s why you find that diversity and inclusion go hand in hand, that that ’ s actually speaking to that. But in some of the moves that are being made to kind of throw out any type of diversity, to scan documents, to find words in order to highlight programs that are wasteful, that we ’ re actually going to lose what many, many studies actually highlight as being the benefits of diversity and the fact that you need diversity in order to be actually successful. IB : Shooting first and asking questions later, you know, moving fast and breaking things, those things make sense in a turbocharged venture capital technology environment. They do not work in government. They don ’ t work in government at all. In government, we have something called checks and balances, and we need them. And moving fast and breaking things undermines those checks and balances. So we ’ re going to do a lot of damage unintentionally. A lot of people are going to get hurt. A lot of folks don ’ t care about that in power right now, but they should because it would be much, much better. I know people want to move fast, but actually to think a little bit, do a little bit of your own research before you decide to kill that program, before you decide to fire that person. We ’ d be in a lot better shape as a government right now. HW : OK, the final question that I have for you actually comes from my 10-year-old son, and it ’ s a bit of a miserable question. We have a very lovely house, I promise. But his question nonetheless is are we heading into World War III? So, Ian, what should I tell him? IB : No, no, I don ’ t think we ’ re heading into World War III but we are absolutely heading into a world of much greater conflict. I think it ’ s much more likely, for example, in the next five, 10 years, that we ’ ll have a nuclear weapon go off. And I thought that was pretty unlikely since the Cuban Missile Crisis. In other words, over the course of my life. I think we ’ re going to see a lot more terrorism at scale, because a lot more people are going to feel angry and disaffected, I think. You know, you saw that assassination of the CEO of

UnitedHealthcare just a few dozen blocks from my house. I think you ’ re going to see more things like that. And so, no, not World War III because the fact is that outside of the US and China, all the other countries know that they need to work with everybody. And there are even forces inside US-China that are trying to make sure that you don ’ t throw the baby out with the bathwater. But underneath that World War III risk, there ’ s an awful lot of damage that ’ s going to get done, an awful lot of crisis that I think we ’ re going to have to live through before we start to see what we create on the other side. A lot of defense as well, that we ’ re going to be playing in this environment. HW : Well, Ian, it is always a pleasure to talk to you, and we ’ re so glad that you are scanning the world to understand what is happening and then you come here and explain it to us all. Couldn ’ t be more grateful and thank you for everything. IB : Thank you.

A Love Letter to my Garden by Debbie Millman In the beginning of time, there was no time. The universe began with every bit of energy contained in a very tiny, incredibly dense point. It was even smaller than this point. The point exploded with an unimaginable force and created everything we know and are made of. Seeds are a bit like that too. They ’ re tiny and densely packed with their entire existence. Time feels different now, while we shelter at home. Time is scary and uncertain. So we decided to plant some mint. We actually started a little garden a while ago, but now we have more time. We thought that these flowers had died, but they miraculously came back to life. A hopeful sign about the future, perhaps? We planted foxglove and it thrived. And then we went a little crazy. We planted tomatoes, carrots, beans, corn, lettuce and cucumbers, strawberries, blueberries and limes. It ’ s such a strange time in the world. There is so much beauty amidst so much fear. It ’ s so hard to know what to do. In the meantime, we watch and wait and remain grateful we ’ re able to make things with our hands. A love letter to New York City by Debbie Millman I ’ m a native New Yorker. I ’ ve lived here my entire life, yet the city never ceases to surprise me. Everywhere you look, there ’ s something to see. There is Tom Otterness underground and Lawrence Weiner underfoot. There are so many of us. Everyone wants to be someone. Everyone seeks to be heard. Everyone has an opinion, A point of view. And seemingly something to sell. But life is different now as we shelter at home. Under the same sky, at the same moment, at the same time. I ’ m thinking about how tough New York can be, how rough and unrelenting. But maybe that intensity is what fuels our tenacity. As we navigate through this crisis, I am hopeful we will find some solace together. A Love Letter to Travel by Debbie Millman My work has taken me all over the world. There have been many early departures, and many evenings in the air. In all my travels, I ’ ve been struck by so many things. I ’ ve observed how people lived in some of the most ancient places on the planet. This is Machu Picchu. This is Easter Island. This is Samoa. This is Angkor Wat. This is Petra in Jordan. The ancient city contained a church, a theater and tombs for the dead. Families lived in two and three-bedroom apartments. We ’ ve come a long way. Some of the structures that remain are rather mysterious, some are otherworldly, some are glorious odes to love, some house the souls of the dead. Some have forced us to choose sides. Some have succumbed to the power of nature. And some have not. The view from the sky is so abstract. It reveals our connections, our continuity and our scale. Nevertheless, it ’ s hard to see the big picture right now. It ’ s such a difficult time in the world as we pause and dismantle and rebuild our culture. I think back to my travels. I ’ ve seen how different we are, how diverse and distinct. But I ’ ve also seen our commonalities. How much worship means in Tibet, in Pakistan, in Italy, in China, in Cambodia and in Peru. How much peace means to our future. How much we regret the mistakes of our past. And now, insisting on what matters no matter what. There is still so much beauty in the world. So much love. I ’ m hopeful for the next generation. For every creature, large and small. And for the planet we call home. A Love Letter to Storytelling by Debbie Millman”A need to tell and hear stories is essential to the species Homo Sapiens. The sound of story is the dominant sound of our lives.”- Joseph Campbell I ’ ve loved telling stories all of my life. I ’ ve loved writing them and drawing them, and I love teaching my students how to make them. Now I conduct visual storytelling workshops all over the world. Over the years, the students have invented many new ways of expressing their stories. They tell their truths. They reveal secrets. They bare their souls. They share stories of pain, of feeling seen, of not being smart enough. Stories of being scared, feeling pretty or not. No matter where I teach, I ’ ve come to realize how many of their stories are universal. They convey so many **shared** experiences : rejection, judgment, insecurity, **prejudice**, forgetting and remembering. But there are also stories of hope, strength, awareness, courage and realizations. Their stories reflect who they really are, how deeply they want to feel connected. And now, as they share their visions for a more optimistic future, their stories are becoming the stories of our times.

The world can be a toxic place. No one knows this more than women and girls, cis and trans, as well as nonbinary people. I am a journalist with 30 years ’ experience reporting on the injustices women and others face around the world. I ’ m a co-founder of the Man Up Campaign to energize youth activism against **sexual** and gender-based **violence**. I ’ m a father to two daughters, I ’ m a life partner to a woman and I ’ m a Black man in America. Holding these identities – and many more – I say this call to action to you with the deepest sincerity and utmost gravity. It is time for a gender reckoning, beginning with men authentically confronting our internal selves and each other through the toxicity within us. Against the backdrop of Black Lives Matter protest, cries for a racial reckoning have echoed throughout the world, at times seeming premature and largely misunderstood. I believe a true gender reckoning must be the center of any transformative movement for social justice and **equity**. But what is a reckoning? Dictionaries say it means to resolve a bill or a debt. In other words, to settle an account. In the case of women and girls, what is the debt owed to them? Who ’ s to pay it? And how? The consequences of male toxicity continue building the debt to which I refer, including, among others, a gender wealth gap most affecting women who care for their families as well as act as the primary income generators for their households. Today, in the United States and abroad, threats to reproductive justice endanger the lives and hard-fought rights of women in regards to their bodily, **sexual** and gender autonomy, impacting the most disenfranchised community in society. And **violence** against women, in all of its forms, still represents an existential challenge, as we ’ ve seen **domestic violence** rise in the pandemic, as people were confined to their homes, we ’ ve seen online and public **harassment** flourish, unabated. The **sexual** trafficking, prostitution, exploitation of women and girls thrives as ever before. From where does this toxicity come and why? Men are not endangered, we ’ re not under **assault**, we ’ re not being unfairly maligned. In fact, it

’ s men, or certain types of masculinity, that are the issue. To be clear, being a man does not make me or anyone else who identifies as a man inherently toxic. But masculinity, in certain forms, can **harm** women, girls, nonbinary people and men through **violence**, dominating power and control. So how do we address this? How can we men step up and better support our daughters, our sisters, our female partners, our colleagues, neighbors and friends? Through what means can men both instigate and lead a gender reckoning? First, we must tell the truth. We must tell the truth. Men grow into this world becoming who we ’ re expected to be or who we think we ’ re expected to be based on cultural expectations and inaccurate historical narratives. As a short, chubby Black kid wearing glasses growing up, I was repeatedly told I cried too much. I ’ m too emotional, too soft. It was ingrained in me that to prove my masculinity I had to display physical prowess – intimidation. Because of that indoctrination, as an adult, I refused to seek help facing escalating health challenges, including high blood pressure and mental **trauma**. The archetype of manhood nearly killed me. I say that as a survivor of two heart attacks, four years on dialysis and a kidney transplant... aside from the physical risk I put myself into covering wars around the world. The injury we do to ourselves and the women around us comes from fear of losing control, of lack of external affirmation and simply out of **shame**. Manhood is a spectrum of identities. There is no one way to be a man. And sometimes, discovering one ’ s true manhood is a lifelong journey. Secondly, we must be consistent. Men, especially men of color, cannot expect women to stand up for us, with us in the face of **systemic** oppressions when too often we do not do the same for them. The Black Lives Matter movement for example, founded, named and led by queer women of color, still centers Black men ’ s well-being in the face of unfair policing and criminal justice systems. And where ’ s the reciprocal support from those men, including myself, in addressing intercommunity **violence** against women of color, maternal health **inequity**, economic disparity? How and where do men show up for women? I wonder... how many men stood with women on the steps of the US Supreme Court as they fought for reproductive rights? How many men should have been there? Finally, there can be no reckoning without accountability. There can be no reckoning without accountability. Men who commit acts of **violence** against women must be held accountable by formal systems of justice as well as other men. **Silence** in the face of misogynistic behavior and language is complicity. We men need to break free from the pack, take concrete actions to stop **violence**, create **safety** and build **equity**. And most importantly, say something. To be sure, bold men around us are actively working to disrupt the narrative of male toxicity. After the 2010 earthquake in Haiti, a local organization, KOFAVIV, invited men to be defenders of women and girls in displacement camps, women and girls who were at risk of **sexual assault**. Scores of men answered the call and can continue to do so today. In New York City, CONNECT NYC, led by a Black man, actively engages community partners across civil society to address family **violence**. And in a profession not known generally for its advocacy against gender **violence**, a professional player for the Washington Football Team has become an unabashed advocate for men to learn and actively change behaviors regarding **sexual** and physical **violence**. There is hope ; there is light. Men around the world are putting in the work to catalyze a true gender reckoning. But far more are needed. What I want to say to you today is this. Too many of us – too many men – don ’ t understand that **equity**, justice, inclusivity, **safety** for women, girls and nonbinary people serves and saves us all. Broken masculinity **harms** societies, full stop. When we men reckon with that truth, we will finally find our **shared** humanity. Women, girls, nonbinary people, men standing together on **equal** footing with mutual respect in safe environments is the greatest gender reckoning we can create. Thank you.

Male, Female. Christian, Jew, Muslim, Atheist. White, Black, Asian, Caucasian, Arab. Liberal, Conservative, Libertarian, Progressive. Cisgender, Transgender, Heterosexual, Homosexual, Queer, Non-binary, Agender. All of these are labels, some of which I have, and some of that you yourselves may have. But what exactly are labels? Merriam-Webster defines the label as a descriptive or identifying word or phrase. Since the dawn of human language, we have come up with terms to categorize ourselves and each other, from simple things such as ’ us ’ and ’ them ’, ’ family ’, ’ tribe member ’, ’ citizen ’, ’ foreigner ’ and ’ enemy ’ to more complex labels describing political ideologies, religion, or even personal interests. ’ Geek ’, ’ jock ’, ’ soccer mom ’ and ’ workaholic ’ are in widespread use. Some labels that I use include ’ female ’, ’ Asian-American ’, ’ parent ’, ’ daughter ’, ’ sister ’, ’ transgender ’, ’ pansexual ’, ’ nerd ’, and ’ airman ’. Labels have a greater power than what a simple definition can describe. Looking at today ’ s world, labels have increasingly led to more division, marginalization, **hatred**. According to the FBI, hate crimes are at the highest level they ’ ve been in 10 years. People have been attacked for being Asian. **Victims** of misinformation spread during the rise of COVID-19, or used as a scapegoat for a young man ’ s inability to control his **sexual** urges in Georgia this past March. When I was six years old, I attended kindergarten, I was first exposed to a variety of racial slurs and bullying due to my mixed Asian-American ancestry. As I discovered computers and I did well on math tests. I was harassed because of stereotypes. To this day, I struggled to escape those that want to use this label for **harm**, simply because I was born with it. Others, like Jews, have been attacked for their religion. Anti-Semitism has existed for thousands of years, from the ancient Greeks and Romans to the expulsion of Jews, from multiple nations in the Middle Ages to more recently, the Holocaust - Nazi Germany ’ s final solution. The Pew Research Center has studies indicating a growing partisan divide in politics. The number of Democrats and Republicans willing to compromise and work together is at its lowest in modern history. The LGBTQ+ community has faced legislative attacks around the globe from so-called”LGBT-free zones”in Poland to over 80 anti-transgender bills introduced here in the United States. Those that are part of this community have been particularly vulnerable. Transgender military members such as myself have experienced the back and forth in policies - traded off like we ’ re a footballer trading card, and not human beings that want to serve our country. And, as we saw last year, despite the gains in legislative **equality** stemming from the 13th Amendment abolishing slavery, and the Civil Rights Act of 1964, we all have a long way to go in addressing **systemic** racism and centuries of **inequities** in the United States. From integral parts of identity such as our gender, gender identity, **sexual** orientation, race and **ethnicity**, to those groups that we choose to be a part of, such as political parties, political alignment or religion, peace labels, these groupings have divided us to an alarming degree. Labels can separate us. They can help foster an ’ us versus them ’ mentality, leading to unhealthy competition. They can lead to **harassment**, **discrimination**, bigotry, **assault**, and even murder. Labels used incorrectly can be dangerous. And yet, our labels are entirely without benefit. When I was seven years old, I discovered that my gender identity didn ’ t match what I was assigned at birth. While my birth certificate said Male, every part of my being said that this was wrong, that I was actually a girl. But when I made this realization all the way back in 1989, I had no idea what this feeling meant for me. I was confused. I was scared. I thought something was horribly wrong with me. I had no internet to search for clues. There was no representation in the media that I could turn to for inspiration and guidance. I was alone. I struggled with these feelings for almost 20 years before I found the word ' transgender '. Suddenly, what I was and who I was became clear for the first time in my life. In addition to that, I discovered that I was part of a community : the LGBTQ+ Community. I found mentors, friends, and people that I now consider to be family. I can go to any major city, and in many of the smaller ones, and with a quick search on the internet, I can find community centers and social places that are focused on making my community safe and welcome. This label, one that has become so controversial in our country, became a way for me to accept who I am and to feel a part of something larger than myself. So, too, can other labels. Members of a particular religion can find fellowship with each other. Street signs, social media pages, google searches can help anyone from evangelical Christians, Catholics, Baptists, Muslims to faiths like Rastafarianism, Zoroastrianism and Wicca find places of worship in new locations. Those that adhere to specific political parties or ideologies can more easily connect and find common ground. Places such as Reddit have communities for people that follow nearly every political system and ideology that has ever existed. Professions have their own labels. One that I earned in my life is Airman. I enlisted in the United States Air Force in 2004, and having that label has tied me to a group of individuals with many **shared** goals and common interests. I have been able to connect with currently serving service members and veterans, and we find support through those others People with **shared** cultures, shared histories can come together and **celebrate** that which makes them unique. Major cities host cultural days and weeks where all members of the local area can gather and enjoy music, food, clothing, dance, and other aspects of many different cultures. Labels, at their worst, can drive divisions between us when they foster an ' us versus them ' mentality, when they turn into a categorization of people like me are good, but people not like me are the enemy. Labels lead to negative, such as **harassment** and **discrimination**. They separate us and lead us to live lives that are empty of the good, that different perspectives spring, But at their best, labels describe those things that connect us to one another. When we work as a team, when we adopt the label teammate, we are capable of accomplishing things greater than we can when we ' re alone. My own transgender label has connected me to a community that has accepted me, given me mentorship, and helped me to acknowledge who I am. Being an Asian-American, and more specifically a Korean-American, ties me to a deep and rich culture that broadens my own perspectives, and allows me to teach my own children about their roots. Labels allow us to bind together in groups and communities that allow us to grow and become more knowledgeable about our histories, our cultures, and how to develop strategies on how to be more successful. Labels are not all good or bad. Like any tool, they can be used to build and create wonderful things, highlighting what I consider to be one of the greatest things that humanity has developed : community ties. But, misused, they ' re also capable of causing a great deal of destruction. If we, as individuals, choose to use labels responsibly, we can achieve greater things together than we ever could on our own.

Text Sample 368: POS Dim 3 – 2021 – Score 13.00 – 2021/t003773.txt

I was born during a war that still engulfs my country, Afghanistan. When I was growing up, **violence** was all around me. I remember sitting in my living room with my family when a distant thud would jerk us all out of our seats. As the sound of the rockets came closer and closer, our bodies would coil and freeze. My grandmother would take charge of her terrified flock and shepherd us into a room in the back of the house. No less exposed, but to us, it somehow felt safer. I ' d cling to my granny and clench my fists wondering why this was happening to us. I clearly remember my little brother ' s face wincing every time we heard a rocket fall. It was this **violence**, this war that still goes on today, which forced my family to leave our home. We left early one morning not knowing where we would end up. Along the way, there was more **violence**. We drove on roads with landmines, and everywhere we went, there was hostility. The overriding memory in my body of those years is of feeling **unsafe**. Feeling as though something terrible would happen to me or to my family. We worried about our friends and family back home. My grandmother was still in Kabul, and I missed her terribly. I ' d go to bed at night and say the **prayers** she taught me to pray for her **safety**. We wanted nothing more than to go back home. But when the Taliban took over the country in 1996, my parents realized that was no longer an option. So after four years of living in exile, we sought asylum in the UK and began a new life. I started going to school. And almost 25 years later, I ' m standing here with you. I ' m now working to help others overcome devastation by war. To overcome the **trauma** of being expendable. In my work, I see how living under constant threat of **violence** and feeling **unsafe** can affect people, even when they manage to get out. War leaves a physical legacy in our body, our mind and in our spirit. When I tell people about my life, they sometimes say it ' s a remarkable story. But this is not true. Millions of people are living through war and displacement, trying to survive. For these people, like my family, the dream isn ' t to get rich or to go on vacations or to buy that perfect house. They have a modest, yet somehow still extravagant dream of being safe. They dream of a day when they can go to the market without the fear of **violence**. Or send their kids to school without being afraid for their lives. War is dislocating. It gets inside your body and makes you into a thing, a corpse. It can dislodge empathy, hope and joy and replace them with fear. The fear that comes from living in the **violence** of war can break social bonds, disbanding the very communities we rely on for **safety**. Women and children I work with complain about pain in their body. Children as young as three or four talk about hurt in their bellies and not because they ' re hungry. It ' s a pain I know well. A constant, dull ache all over your body, and it feels as though nothing can alleviate it. People have nightmares and experience overwhelming emotions : **grief**, sadness and anger."Why did I deserve this,"they wonder. This is the situation facing 84 million forcibly displaced people. And according to UNHCR, more than half are women and children. What ' s even more startling is the number of people living in active conflict zones. According to Save the Children, 420 million children are growing up in places where **violence** is the norm. These are families and children subject to forces they cannot control. Yet war and **violence** don ' t become normal. The stress and **trauma** experienced by people who go through war is itself deadly. Illnesses like cancer, diabetes and heart disease have been linked to **trauma** and chronic stress. But it ' s the psychic pain that affects people the most. Depression, PTSD and other psychiatric disorders affect a significant percentage of people who go through war. I was shocked when I learned that since 9 / 11, four times more US soldiers have taken their own lives than died in combat. Reconciling to normal life after you ' ve seen life-shattering war can be the hardest of tasks for a human being. But mental health and healing are often overlooked when supporting people who have survived war. And that ' s why I set up Refugee **Trauma** Initiative, to help support the mental health of those affected by war and displacement. Our organization is one of several around the world that helps people so they can begin to feel safe again. When feeling safe is splintered and you feel **unsafe** and unseen, we work to help bring the internal safe system back online. We create spaces where people can convene and **heal** as a community. In our groups, men, women and children reconnect with their bodies, have the space to express what they are feeling, and most importantly, reconnect with others. We use art, mindfulness, dance and storytelling to help make sense of the dislocating experiences of **violence** and of being forced to leave your home. And everything that we do is underpinned by value-based practice. We practice understanding, curiosity and respect to everyone who comes through the door. We recognize and acknowledge their **trauma** without pathologizing or medicalizing their very normal human reaction to the reckless **violence** they ' ve experienced. And we recognize that these experiences are the result of **systemic** injustice and oppression that often have colonial roots, which has dehumanized and killed people for centuries. At the heart of our work is a simple yet fundamental notion that feelings of **safety** are inextricably tied to feeling connected to a community. A community where you feel worthy and seen. Where your **suffering** will be recognized and cared for, where you can experience belonging. Understanding how **violence** and conflict affects and changes people is more important than ever. Our world is embroiled in multiple chronic conflicts that seem to have no end in sight. Since 1945, there have been 150 conflicts around the world, and the overwhelming majority of casualties have been civilians. We can ' t talk about this human toll of war without talking about the war industry. The war on terror over the last 20 years unleashed a new kind of **violence**, displacing 38 million people. This is a war that made drone warfare the norm. Drones enable automated extermination. As we are moving closer and closer towards automation of war, what happens when we outsource **violence**, the extinguishing of a human life, to a computer? What happens to us as an interconnected global community when a machine and not a human decides whether a life is worth something? This is all bleak, but not hopeless. There ' s always room to adjust our trajectory to a better future. I ' m standing here in the most powerful country in the world, a citizen of the United Kingdom, two countries that have long held power over war and peace. And the first thing that we can do is demand that our governments stop investing in mass destruction. At a time when we need to invest in tackling climate change and in health care, our governments are financing weapons and drones. Every vote that we cast should be against weapons of mass destruction, against automation of war. And you can do something in your own community. Right now, there are literally millions of Afghans who are brutally forced to leave their home. Like them, there are Syrians, Iraqis, Burundians who all have to deal with the fallout of war and displacement. And the antidote to their **suffering** lies in the kindness and connection of the communities where they find themselves. If they can feel safe there, they can begin to **heal** and start a new life. It ' s sometimes hard for us to see that the answers to some of the most complicated problems in the world lie in the simplest of human actions. It may sound too easy that a good neighbor can help to **heal** the wounds of war. But in my experience, this is true. Before we landed in London, after months of hardship, we stopped in a poor **neighborhood** of a town in Central Asia. I was forlorn, **grief** stricken and not yet able to imagine a future without **violence**. One day, a **neighborhood** teacher knocked on our door. When we opened the door, we saw a kindly middle-aged woman carrying a box of pens, colored pencils, paper and children ' s books. She asked my parents if she could come in and spend time with us. They let her in, and from that day, she visited us most days after school. When I told her that I desperately wanted to go to school, she took me to her classroom, where the girls had prepared gifts. They taught me how to **sing** a song. It wasn ’ t long before we had to move on, and once we left, I never saw her again. But what she did made me feel valued and safe. The memory of that experience had left a blueprint of what it felt to inhabit my body, if only for a moment, without fear. A memory of joy and belonging. And to this day, when I feel the opposite, I can close my eyes and feel that connection. And it carries me through the dark days. Thank you.

Text Sample 369: POS Dim 3 – 2015 – Score 16.00 – 2015/t001602.txt

To be honest, by personality, I ’ m just not much of a crier. But I think in my career that ’ s been a good thing. I ’ m a civil rights lawyer, and I ’ ve seen some horrible things in the world. I began my career working police abuse cases in the United States. And then in 1994, I was sent to Rwanda to be the director of the U. N. ’ s genocide investigation. It turns out that tears just aren ’ t much help when you ’ re trying to investigate a genocide. The things I had to see, and feel and touch were pretty unspeakable. What I can tell you is this : that the Rwandan genocide was one of the world ’ s greatest failures of simple compassion. That word, compassion, actually comes from two Latin words : cum passio, which simply mean”to suffer with.”And the things that I saw and experienced in Rwanda as I got up close to human **suffering**, it did, in moments, move me to tears. But I just wish that I, and the rest of the world, had been moved earlier. And not just to tears, but to actually stop the genocide. Now by contrast, I ’ ve also been involved with one of the world ’ s greatest successes of compassion. And that ’ s the fight against global poverty. It ’ s a cause that probably has involved all of us here. I don ’ t know if your first introduction might have been choruses of”We Are the World,”or maybe the picture of a sponsored child on your refrigerator door, or maybe the birthday you donated for fresh water. I don ’ t really remember what my first introduction to poverty was but I do remember the most jarring. It was when I met Venus — she ’ s a mom from Zambia. She ’ s got three kids and she ’ s a widow. When I met her, she had walked about 12 miles in the only garments she owned, to come to the capital city and to share her story. She sat down with me for hours, just ushered me in to the world of poverty. She described what it was like when the coals on the cooking fire finally just went completely cold. When that last drop of cooking oil finally ran out. When the last of the food, despite her best efforts, ran out. She had to watch her youngest son, Peter, suffer from malnutrition, as his legs just slowly bowed into uselessness. As his eyes grew cloudy and dim. And then as Peter finally grew cold. For over 50 years, stories like this have been moving us to compassion. We whose kids have plenty to eat. And we ’ re moved not only to care about global poverty, but to actually try to do our part to stop the **suffering**. Now there ’ s plenty of room for critique that we haven ’ t done enough, and what it is that we ’ ve done hasn ’ t been effective enough, but the truth is this : The fight against global poverty is probably the broadest, longest running manifestation of the human phenomenon of compassion in the history of our species. And so I ’ d like to share a pretty shattering insight that might forever change the way you think about that struggle. But first, let me begin with what you probably already know. Thirty-five years ago, when I would have been graduating from high school, they told us that 40, 000 kids every day died because of poverty. That number, today, is now down to

17, 000. Way too many, of course, but it does mean that every year, there ' s eight million kids who don ' t have to die from poverty. Moreover, the number of people in our world who are living in extreme poverty, which is defined as living off about a dollar and a quarter a day, that has fallen from 50 percent, to only 15 percent. This is massive progress, and this **exceeds** everybody ' s expectations about what is possible. And I think you and I, I think, honestly, that we can feel proud and encouraged to see the way that compassion actually has the power to succeed in stopping the **suffering** of millions. But here ' s the part that you might not hear very much about. If you move that poverty mark just up to two dollars a day, it turns out that virtually the same two billion people who were stuck in that harsh poverty when I was in high school, are still stuck there, 35 years later. So why, why are so many billions still stuck in such harsh poverty? Well, let ' s think about Venus for a moment. Now for decades, my wife and I have been moved by common compassion to sponsor kids, to fund microloans, to support generous levels of foreign aid. But until I had actually talked to Venus, I would have had no idea that none of those approaches actually addressed why she had to watch her son die."We were doing fine,"Venus told me,"until Brutus started to cause trouble."Now, Brutus is Venus ' neighbor and"cause trouble"is what happened the day after Venus ' husband died, when Brutus just came and threw Venus and the kids out of the house, stole all their land, and robbed their market stall. You see, Venus was thrown into destitution by **violence**. And then it occurred to me, of course, that none of my child sponsorships, none of the microloans, none of the traditional anti-poverty programs were going to stop Brutus, because they weren ' t meant to. This became even more clear to me when I met Griselda. She ' s a marvelous young girl living in a very poor community in Guatemala. And one of the things we ' ve learned over the years is that perhaps the most powerful thing that Griselda and her family can do to get Griselda and her family out of poverty is to make sure that she goes to school. The experts call this the Girl Effect. But when we met Griselda, she wasn ' t going to school. In fact, she was rarely ever leaving her home. Days before we met her, while she was walking home from church with her family, in broad daylight, men from her community just snatched her off the **street**, and violently raped her. See, Griselda had every opportunity to go to school, it just wasn ' t safe for her to get there. And Griselda ' s not the only one. Around the world, poor women and girls between the ages of 15 and 44, they are — when **victims** of the everyday **violence** of **domestic** abuse and **sexual violence** — those two forms of **violence** account for more death and disability than malaria, than car accidents, than war combined. The truth is, the poor of our world are trapped in whole systems of **violence**. In South Asia, for instance, I could drive past this rice mill and see this man hoisting these 100-pound sacks of rice upon his thin back. But I would have no idea, until later, that he was actually a slave, held by **violence** in that rice mill since I was in high school. Decades of anti-poverty programs right in his community were never able to rescue him or any of the hundred other slaves from the beatings and the rapes and the torture of **violence** inside the rice mill. In fact, half a century of anti-poverty programs have left more poor people in slavery than in any other time in human history. Experts tell us that there ' s about 35 million people in slavery today. That ' s about the population of the entire nation of Canada, where we ' re sitting today. This is why, over time, I have come to call this epidemic of **violence** the Locust Effect. Because in the lives of the poor, it just descends like a plague and it destroys everything. In fact, now when you survey very, very poor communities, residents will tell you that their greatest fear is **violence**. But notice the **violence** that they fear is not the **violence** of genocide or the wars, it ' s everyday **violence**. So for me, as a lawyer, of course, my first reaction was to think, well, of course we ' ve got to change all the laws. We ' ve got to make all this **violence** against the poor illegal. But then I found out, it already is. The problem is not that the poor don ' t get laws, it ' s that they don ' t get law **enforcement**. In the developing world, basic law **enforcement** systems are so broken that recently the U. N. issued a report that found that"most poor people live outside the protection of the law."Now honestly, you and I have just about no idea of what that would mean because we have no first-hand experience of it. Functioning law **enforcement** for us is just a total assumption. In fact, nothing expresses that assumption more clearly than three simple numbers : 9-1-1, which, of course, is the number for the emergency police operator here in Canada and in the United States, where the average response time to a police 911 emergency call is about 10 minutes. So we take this just completely for granted. But what if there was no law **enforcement** to protect you? A woman in Oregon recently experienced what this would be like. She was home alone in her dark house on a Saturday night, when a man started to tear his way into her home. This was her worst nightmare, because this man had actually put her in the hospital from an **assault** just two weeks before. So terrified, she picks up that phone and does what any of us would do : She calls 911 — but only to learn that because of budget cuts in her county, law **enforcement** wasn ' t available on the weekends. Listen. Dispatcher : I don ' t have anybody to send out there. Woman : OK Dispatcher : Um, obviously if he comes inside the residence and **assaults** you, can you ask him to go away? Or do you know if he is intoxicated or anything? Woman : I ' ve already asked him. I ' ve already told him I was calling you. He ' s broken in before, busted down my door, **assaulted** me. Dispatcher : Uh- huh. Woman : Um, yeah, so... Dispatcher : Is there any way you could safely leave the residence? Woman : No, I can ' t, because he ' s blocking pretty much my only way out. Dispatcher : Well, the only thing I can do is give you some advice, and call the sheriff ' s office tomorrow. Obviously, if he comes in and unfortunately has a weapon or is trying to cause you physical **harm**, that ' s a different story. You know, the sheriff ' s office doesn ' t work up there. I don ' t have anybody to send."Gary Haugen : Tragically, the woman inside that house was violently **assaulted**, choked and raped because this is what it means to live outside the rule of law. And this is where billions of our poorest live. What does that look like? In Bolivia, for example, if a man sexually **assaults** a poor child, statistically, he ' s at greater risk of slipping in the shower and dying than he is of ever going to jail for that crime. In South Asia, if you enslave a poor person, you ' re at greater risk of being struck by lightning than ever being sent to jail for that crime. And so the epidemic of everyday **violence**, it just rages on. And it devastates our efforts to try to help billions of people out of their two-dollar-a-day hell. Because the data just doesn ' t lie. It turns out that you can give all manner of goods and services to the poor, but if you don ' t restrain the hands of the **violent** bullies from taking it all away, you ' re going to be very disappointed in the long-term impact of your efforts. So you would think that the disintegration of basic law **enforcement** in the developing world would be a huge priority for the global fight against poverty. But it ' s not. Auditors of international assistance recently couldn ' t find even one percent of aid going to protect the poor from the lawless chaos of everyday **violence**. And honestly, when we do talk about **violence** against the poor, sometimes it ' s in the weirdest of ways. A fresh water organization tells a heart-wrenching story of girls who are raped on the way to fetching water, and then **celebrates** the solution of a new well that drastically shortens their walk. End of story. But not a word about the rapists who are still right there in the community. If a young woman on one of our college campuses was raped on her walk to the library, we would never **celebrate** the solution of moving the library closer to the dorm. And yet, for some reason, this is okay for poor people. Now the truth is, the traditional experts in economic development and poverty alleviation, they don ’ t know how to fix this problem. And so what happens? They don ’ t talk about it. But the more fundamental reason that law **enforcement** for the poor in the developing world is so neglected, is because the people inside the developing world, with money, don ’ t need it. I was at the World Economic Forum not long ago talking to corporate executives who have massive businesses in the developing world and I was just asking them,”How do you guys protect all your people and property from all the **violence**?”And they looked at each other, and they said, practically in unison,”We buy it.”Indeed, private security forces in the developing world are now, four, five and seven times larger than the public police force. In Africa, the largest employer on the continent now is private security. But see, the rich can pay for **safety** and can keep getting richer, but the poor can ’ t pay for it and they ’ re left totally unprotected and they keep getting thrown to the ground. This is a massive and scandalous outrage. And it doesn ’ t have to be this way. Broken law **enforcement** can be fixed. **Violence** can be stopped. Almost all criminal justice systems, they start out broken and corrupt, but they can be transformed by fierce effort and commitment. The path forward is really pretty clear. Number one : We have to start making stopping **violence** indispensable to the fight against poverty. In fact, any conversation about global poverty that doesn ’ t include the problem of **violence** must be **deemed** not serious. And secondly, we have to begin to seriously invest resources and share expertise to support the developing world as they fashion new, public systems of justice, not private security, that give everybody a chance to be safe. These transformations are actually possible and they ’ re happening today. Recently, the Gates Foundation funded a project in the second largest city of the Philippines, where local advocates and local law **enforcement** were able to transform corrupt police and broken courts so drastically, that in just four short years, they were able to measurably reduce the commercial **sexual violence** against poor kids by 79 percent. You know, from the hindsight of history, what ’ s always most inexplicable and inexcusable are the simple failures of compassion. Because I think history convenes a tribunal of our grandchildren and they just ask us,”Grandma, Grandpa, where were you? Where were you, Grandpa, when the Jews were fleeing Nazi Germany and were being rejected from our shores? Where were you? And Grandma, where were you when they were marching our Japanese-American neighbors off to internment camps? And Grandpa, where were you when they were beating our African-American neighbors just because they were trying to register to vote?”Likewise, when our grandchildren ask us,”Grandma, Grandpa, where were you when two billion of the world ’ s poorest were drowning in a lawless chaos of everyday **violence**?”I hope we can say that we had compassion, that we raised our voice, and as a generation, we were moved to make the **violence** stop. Thank you very much. Chris Anderson : Really powerfully argued. Talk to us a bit about some of the things that have actually been happening to, for example, boost police training. How hard a process is that? GH : Well, one of the glorious things that ’ s starting to happen now is that the collapse of these systems and the consequences are becoming obvious. There ’ s actually, now, political will to do that. But it just requires now an investment of resources and transfer of expertise. There ’ s a political will struggle that ’ s going to take place as well, but those are winnable fights, because we ’ ve done some examples around the world at International Justice Mission that are very encouraging. CA : So just tell us in one country, how much it costs to make a material difference to police, for example — I know that ’ s only one piece of it.

GH : In Guatemala, for instance, we ’ ve started a project there with the local police and court system, prosecutors, to retrain them so that they can actually effectively bring these cases. And we ’ ve seen prosecutions against **perpetrators** of **sexual violence** increase by more than 1, 000 percent. This project has been very modestly funded at about a million dollars a year, and the kind of bang you can get for your buck in terms of leveraging a criminal justice system that could function if it were properly trained and motivated and led, and these countries, especially a middle class that is seeing that there ’ s really no future with this total instability and total privatization of security I think there ’ s an opportunity, a window for change. CA : But to make this happen, you have to look at each part in the chain — the police, who else? GH : So that ’ s the thing about law **enforcement**, it starts out with the police, they ’ re the front end of the pipeline of justice, but they hand if off to the prosecutors, and the prosecutors hand it off to the courts, and the survivors of **violence** have to be supported by social services all the way through that. So you have to do an approach that pulls that all together. In the past, there ’ s been a little bit of training of the courts, but they get crappy evidence from the police, or a little police intervention that has to do with narcotics or terrorism but nothing to do with treating the common poor person with excellent law **enforcement**, so it ’ s about pulling that all together, and you can actually have people in very poor communities experience law **enforcement** like us, which is imperfect in our own experience, for sure, but boy, is it a great thing to sense that you can call 911 and maybe someone will protect you. CA : Gary, I think you ’ ve done a spectacular job of bringing this to the world ’ s attention in your book and right here today. Thanks so much. Gary Haugen.

Why do we cheat? And why do happy people cheat? And when we say”infidelity,”what exactly do we mean? Is it a hookup, a love story, paid sex, a **chat** room, a massage with a happy ending? Why do we think that men cheat out of boredom and fear of intimacy, but women cheat out of loneliness and hunger for intimacy? And is an affair always the end of a relationship? For the past 10 years, I have traveled the globe and worked extensively with hundreds of couples who have been shattered by infidelity. There is one simple act of transgression that can rob a couple of their relationship, their happiness and their very identity : an affair. And yet, this extremely common act is so poorly understood. So this talk is for anyone who has ever loved. Adultery has existed since marriage was invented, and so, too, the taboo against it. In fact, infidelity has a tenacity that marriage can only envy, so much so, that this is the only commandment that is repeated twice in the Bible : once for doing it, and once just for thinking about it. So how do we reconcile what is universally forbidden, yet universally practiced? Now, throughout history, men practically had a license to cheat with little consequence, and supported by a host of biological and evolutionary theories that justified their need to roam, so the double standard is as old as adultery itself. But who knows what ’ s really going on under the sheets there, right? Because when it comes to sex, the pressure for men is to boast and to exaggerate, but the pressure for women is to hide, minimize and deny, which isn ’ t surprising when you consider that there are still nine countries where women can be killed for straying. Now, monogamy used to be one person for life. Today, monogamy is one person at a time. I mean, many of you probably have said,”I am monogamous in all my relationships.”We used to marry, and had sex for the first time. But now we marry, and we stop having sex with others. The fact is that monogamy had nothing to do with love. Men relied on women ' s fidelity in order to know whose children these are, and who gets the cows when I die. Now, everyone wants to know what percentage of people cheat. I ' ve been asked that question since I arrived at this conference. It applies to you. But the definition of infidelity keeps on expanding : sexting, watching porn, staying secretly active on dating apps. So because there is no universally agreed-upon definition of what even constitutes an infidelity, estimates vary widely, from 26 percent to 75 percent. But on top of it, we are walking contradictions. So 95 percent of us will say that it is terribly wrong for our partner to lie about having an affair, but just about the same amount of us will say that that ' s exactly what we would do if we were having one. Now, I like this definition of an affair — it brings together the three key elements : a secretive relationship, which is the core structure of an affair ; an emotional connection to one degree or another ; and a **sexual** alchemy. And alchemy is the key word here, because the erotic frisson is such that the kiss that you only imagine giving, can be as powerful and as enchanting as hours of actual lovemaking. As Marcel Proust said, it ' s our imagination that is responsible for love, not the other person. So it ' s never been easier to cheat, and it ' s never been more difficult to keep a secret. And never has infidelity exacted such a psychological toll. When marriage was an economic enterprise, infidelity threatened our economic security. But now that marriage is a romantic arrangement, infidelity threatens our emotional security. Ironically, we used to turn to adultery — that was the space where we sought pure love. But now that we seek love in marriage, adultery destroys it. Now, there are three ways that I think infidelity hurts differently today. We have a romantic ideal in which we turn to one person to fulfill an endless list of needs : to be my greatest lover, my best friend, the best parent, my trusted confidant, my emotional companion, my intellectual **equal**. And I am it : I ' m chosen, I ' m unique, I ' m indispensable, I ' m irreplaceable, I ' m the one. And infidelity tells me I ' m not. It is the ultimate betrayal. Infidelity shatters the grand ambition of love. But if throughout history, infidelity has always been painful, today it is often traumatic, because it threatens our sense of self. So my patient Fernando, he ' s plagued. He goes on :"I thought I knew my life. I thought I knew who you were, who we were as a couple, who I was. Now, I question everything."Infidelity — a violation of trust, a crisis of identity."Can I ever trust you again?"he asks."Can I ever trust anyone again?"And this is also what my patient Heather is telling me, when she ' s talking to me about her story with Nick. Married, two kids. Nick just left on a business trip, and Heather is playing on his iPad with the boys, when she sees a message appear on the screen :"Can ' t wait to see you."Strange, she thinks, we just saw each other. And then another message :"Can ' t wait to hold you in my arms."And Heather realizes these are not for her. She also tells me that her father had affairs, but her mother, she found one little receipt in the pocket, and a little bit of lipstick on the collar. Heather, she goes digging, and she finds hundreds of messages, and photos exchanged and desires expressed. The vivid details of Nick ' s two-year affair unfold in front of her in real time, And it made me think : Affairs in the digital age are death by a thousand cuts. But then we have another paradox that we ' re dealing with these days. Because of this romantic ideal, we are relying on our partner ' s fidelity with a unique fervor. But we also have never been more inclined to stray, and not because we have new desires today, but because we live in an era where we feel that we are entitled to pursue our desires, because this is the culture where I deserve to be happy. And if we used to divorce because we were unhappy, today we divorce because we could be happier. And if divorce carried all the **shame**, today, choosing to stay when you can leave is the new **shame**. So Heather, she can ' t talk to her friends because she ’ s afraid that they will judge her for still **loving** Nick, and everywhere she turns, she gets the same advice : Leave him. Throw the dog on the curb. And if the situation were reversed, Nick would be in the same situation. Staying is the new **shame**. So if we can divorce, why do we still have affairs? Now, the typical assumption is that if someone cheats, either there ’ s something wrong in your relationship or wrong with you. But millions of people can ’ t all be pathological. The logic goes like this : If you have everything you need at home, then there is no need to go looking elsewhere, assuming that there is such a thing as a perfect marriage that will inoculate us against wanderlust. But what if **passion** has a finite shelf life? What if there are things that even a good relationship can never provide? If even happy people cheat, what is it about? The vast majority of people that I actually work with are not at all chronic philanderers. They are often people who are deeply monogamous in their beliefs, and at least for their partner. But they find themselves in a conflict between their values and their behavior. They often are people who have actually been faithful for decades, but one day they cross a line that they never thought they would cross, and at the risk of losing everything. But for a glimmer of what? Affairs are an act of betrayal, and they are also an expression of longing and loss. At the heart of an affair, you will often find a longing and a yearning for an emotional connection, for novelty, for freedom, for autonomy, for **sexual** intensity, a wish to recapture lost parts of ourselves or an attempt to bring back vitality in the face of loss and tragedy. I ’ m thinking about another patient of mine, Priya, who is blissfully married, loves her husband, and would never want to hurt the man. But she also tells me that she ’ s always done what was expected of her : good girl, good wife, good mother, taking care of her **immigrant** parents. Priya, she fell for the arborist who removed the tree from her yard after Hurricane Sandy. And with his truck and his tattoos, he ’ s quite the opposite of her. But at 47, Priya ’ s affair is about the adolescence that she never had. And her story highlights for me that when we seek the gaze of another, it isn ’ t always our partner that we are turning away from, but the person that we have ourselves become. And it isn ’ t so much that we ’ re looking for another person, as much as we are looking for another self. Now, all over the world, there is one word that people who have affairs always tell me. They feel alive. And they often will tell me stories of recent losses — of a parent who died, and a friend that went too soon, and bad news at the doctor. Death and mortality often live in the shadow of an affair, because they raise these questions. Is this it? Is there more? Am I going on for another 25 years like this? Will I ever feel that thing again? And it has led me to think that perhaps these questions are the ones that propel people to cross the line, and that some affairs are an attempt to beat back deadness, in an antidote to death. And contrary to what you may think, affairs are way less about sex, and a lot more about desire : desire for attention, desire to feel special, desire to feel important. And the very structure of an affair, the fact that you can never have your lover, keeps you wanting. That in itself is a desire machine, because the incompleteness, the ambiguity, keeps you wanting that which you can ’ t have. Now some of you probably think that affairs don ’ t happen in open relationships, but they do. First of all, the conversation about monogamy is not the same as the conversation about infidelity. But the fact is that it seems that even when we have the freedom to have other **sexual** partners, we still seem to be lured by the power of the forbidden, that if we do that which we are not supposed to do, then we feel like we are really doing what we want to. And I ’ ve also told quite a few of my patients that if they could bring into their relationships one tenth of the boldness, the imagination and the verve that they put into their affairs, they probably would never need to see me. So how do we **heal** from an affair?

Desire runs deep. Betrayal runs deep. But it can be **healed**. And some affairs are death knells for relationships that were already dying on the vine. But others will jolt us into new possibilities. The fact is, the majority of couples who have experienced affairs stay together. But some of them will merely survive, and others will actually be able to turn a crisis into an opportunity. They ' ll be able to turn this into a generative experience. And I ' m actually thinking even more so for the deceived partner, who will often say,"You think I didn ' t want more? But I ' m not the one who did it."But now that the affair is exposed, they, too, get to claim more, and they no longer have to uphold the status quo that may not have been working for them that well, either. I ' ve noticed that a lot of couples, in the immediate aftermath of an affair, because of this new disorder that may actually lead to a new order, will have depths of conversations with honesty and **openness** that they haven ' t had in decades. And, partners who were sexually indifferent find themselves suddenly so lustfully voracious, they don ' t know where it ' s coming from. Something about the fear of loss will rekindle desire, and make way for an entirely new kind of truth. So when an affair is exposed, what are some of the specific things that couples can do? We know from **trauma** that healing begins when the **perpetrator** acknowledges their wrongdoing. So for the partner who had the affair, for Nick, one thing is to end the affair, but the other is the essential, important act of expressing guilt and remorse for hurting his wife. But the truth is that I have noticed that quite a lot of people who have affairs may feel terribly guilty for hurting their partner, but they don ' t feel guilty for the experience of the affair itself. And that distinction is important. And Nick, he needs to hold vigil for the relationship. He needs to become, for a while, the protector of the boundaries. It ' s his responsibility to bring it up, because if he thinks about it, he can relieve Heather from the obsession, and from having to make sure that the affair isn ' t forgotten, and that in itself begins to restore trust. But for Heather, or deceived partners, it is essential to do things that bring back a sense of self-worth, to surround oneself with love and with friends and activities that give back joy and meaning and identity. But even more important, is to curb the curiosity to mine for the sordid details — Where were you? Where did you do it? How often? Is she better than me in bed? — questions that only inflict more pain, and keep you awake at night. And instead, switch to what I call the investigative questions, the ones that mine the meaning and the motives — What did this affair mean for you? What were you able to express or experience there that you could no longer do with me? What was it like for you when you came home? What is it about us that you value? Are you pleased this is over? Every affair will redefine a relationship, and every couple will determine what the legacy of the affair will be. But affairs are here to stay, and they ' re not going away. And the dilemmas of love and desire, they don ' t yield just simple answers of black and white and good and bad, and **victim** and **perpetrator**. Betrayal in a relationship comes in many forms. There are many ways that we betray our partner : with contempt, with neglect, with indifference, with **violence**. **Sexual** betrayal is only one way to hurt a partner. In other words, the **victim** of an affair is not always the **victim** of the marriage. Now, you ' ve listened to me, and I know what you ' re thinking : She has a French accent, she must be pro-affair. So, you ' re wrong. I am not French. And I ' m not pro-affair. But because I think that good can come out of an affair, I have often been asked this very strange question : Would I ever recommend it? Now, I would no more recommend you have an affair than I would recommend you have cancer, and yet we know that people who have been **ill** often talk about how their illness has yielded them a new perspective. The main question that I ' ve been asked since I arrived at this conference when I said I would talk about infidelity is, for or against? I said,"Yes."I look at affairs from a dual perspective : hurt and betrayal on one side, growth and self-discovery on the other — what it did to you, and what it meant for me. And so when a couple comes to me in the aftermath of an affair that has been revealed, I will often tell them this : Today in the West, most of us are going to have two or three relationships or marriages, and some of us are going to do it with the same person. Your first marriage is over. Would you like to create a second one together? Thank you.

On the path that American children travel to adulthood, two institutions oversee the journey. The first is the one we hear a lot about : college. Some of you may remember the excitement that you felt when you first set off for college. Some of you may be in college right now and you ' re feeling this excitement at this very moment. College has some shortcomings. It ' s expensive ; it leaves young people in debt. But all in all, it ' s a pretty good path. Young people emerge from college with pride and with great friends and with a lot of knowledge about the world. And perhaps most importantly, a better chance in the labor market than they had before they got there. Today I want to talk about the second institution overseeing the journey from childhood to adulthood in the United States. And that institution is prison. Young people on this journey are meeting with probation officers instead of with teachers. They ' re going to court dates instead of to class. Their junior year abroad is instead a trip to a state correctional facility. And they ' re emerging from their 20s not with degrees in business and English, but with criminal records. This institution is also costing us a lot, about 40, 000 dollars a year to send a young person to prison in New Jersey. But here, taxpayers are footing the bill and what kids are getting is a cold prison cell and a permanent mark against them when they come home and apply for work. There are more and more kids on this journey to adulthood than ever before in the United States and that ' s because in the past 40 years, our incarceration rate has grown by 700 percent. I have one slide for this talk. Here it is. Here ' s our incarceration rate, about 716 people per 100, 000 in the population. Here ' s the OECD countries. What ' s more, it ' s poor kids that we ' re sending to prison, too many drawn from African-American and Latino communities so that prison now stands firmly between the young people trying to make it and the fulfillment of the American Dream. The problem ' s actually a bit worse than this ' cause we ' re not just sending poor kids to prison, we ' re saddling poor kids with court fees, with probation and parole restrictions, with low-level warrants, we ' re asking them to live in halfway houses and on house arrest, and we ' re asking them to negotiate a police force that is entering poor communities of color, not for the purposes of promoting public **safety**, but to make arrest counts, to line city coffers. This is the hidden underside to our historic experiment in punishment : young people worried that at any moment, they will be stopped, searched and seized. Not just in the **streets**, but in their homes, at school and at work. I got interested in this other path to adulthood when I was myself a college student attending the University of Pennsylvania in the early 2000s. Penn sits within a historic African-American **neighborhood**. So you ' ve got these two parallel journeys going on simultaneously : the kids attending this elite, private university, and the kids from the adjacent **neighborhood**, some of whom are making it to college, and many of whom are being shipped to prison. In my sophomore year, I started tutoring a young woman who was in high school who lived about 10 minutes away from the university. Soon, her cousin came home from a juvenile detention center. He was 15, a freshman in high school. I began to get to know him and his friends and family, and I asked him what he thought about me writing about his life for my senior thesis in college. This senior thesis became a dissertation at Princeton and now a book. By the end of my sophomore year, I moved into the **neighborhood** and I spent the next six years trying to understand what young people were facing as they came of age. The first week I spent in this **neighborhood**, I saw two boys, five and seven years old, play this game of chase, where the older boy ran after the other boy. He played the cop. When the cop caught up to the younger boy, he pushed him down, handcuffed him with imaginary handcuffs, took a quarter out of the other child ' s pocket, saying,"I ' m seizing that."He asked the child if he was carrying any drugs or if he had a warrant. Many times, I saw this game repeated, sometimes children would simply give up running, and stick their bodies flat against the ground with their hands above their heads, or flat up against a wall. Children would yell at each other,"I ' m going to lock you up, I ' m going to lock you up and you ' re never coming home!"Once I saw a six-year- old child pull another child ' s pants down and try to do a cavity search. In the first 18 months that I lived in this **neighborhood**, I wrote down every time I saw any contact between police and people that were my neighbors. So in the first 18 months, I watched the police stop pedestrians or people in cars, search people, run people ' s names, chase people through the **streets**, pull people in for questioning, or make an arrest every single day, with five exceptions. Fifty-two times, I watched the police break down doors, chase people through houses or make an arrest of someone in their home. Fourteen times in this first year and a half, I watched the police punch, choke, kick, stomp on or beat young men after they had caught them. Bit by bit, I got to know two brothers, Chuck and Tim. Chuck was 18 when we met, a senior in high school. He was playing on the basketball team and making C ' s and B ' s. His younger brother, Tim, was 10. And Tim loved Chuck ; he followed him around a lot, looked to Chuck to be a mentor. They lived with their mom and grandfather in a two-story row home with a front lawn and a back porch. Their mom was struggling with addiction all while the boys were growing up. She never really was able to hold down a job for very long. It was their grandfather ' s pension that supported the family, not really enough to pay for food and clothes and school supplies for growing boys. The family was really struggling. So when we met, Chuck was a senior in high school. He had just turned 18. That winter, a kid in the schoolyard called Chuck ' s mom a crack whore. Chuck pushed the kid ' s face into the snow and the school cops charged him with aggravated **assault**. The other kid was fine the next day, I think it was his pride that was injured more than anything. But anyway, since Chuck was 18, this agg. **assault** case sent him to adult county jail on State Road in northeast Philadelphia, where he sat, unable to pay the **bail** — he couldn ' t afford it — while the trial dates dragged on and on and on through almost his entire senior year. Finally, near the end of this season, the judge on this **assault** case threw out most of the charges and Chuck came home with only a few hundred dollars ' worth of court fees hanging over his head. Tim was pretty happy that day. The next fall, Chuck tried to re-enroll as a senior, but the school secretary told him that he was then 19 and too old to be readmitted. Then the judge on his **assault** case issued him a warrant for his arrest because he couldn ' t pay the 225 dollars in court fees that came due a few weeks after the case ended. Then he was a high school dropout living on the run. Tim ' s first arrest came later that year after he turned 11. Chuck had managed to get his warrant lifted and he was on a payment plan for the court fees and he was driving Tim to school in his girlfriend ' s car. So a cop pulls them over, runs the car, and the car comes up as stolen in California. Chuck had no idea where in the history of this car it had been stolen. His girlfriend ’ s uncle bought it from a used car auction in northeast Philly. Chuck and Tim had never been outside of the tri-state, let alone to California. But anyway, the cops down at the precinct charged Chuck with receiving stolen property. And then a juvenile judge, a few days later, charged Tim, age 11, with accessory to receiving a stolen property and then he was placed on three years of probation. With this probation sentence hanging over his head, Chuck sat his little brother down and began teaching him how to run from the police. They would sit side by side on their back porch looking out into the shared alleyway and Chuck would coach Tim how to spot undercover cars, how to negotiate a late-night police raid, how and where to hide. I want you to imagine for a second what Chuck and Tim ’ s lives would be like if they were living in a **neighborhood** where kids were going to college, not prison. A **neighborhood** like the one I got to grow up in. Okay, you might say. But Chuck and Tim, kids like them, they ’ re committing crimes! Don ’ t they deserve to be in prison? Don ’ t they deserve to be living in fear of arrest? Well, my answer would be no. They don ’ t. And certainly not for the same things that other young people with more privilege are doing with impunity. If Chuck had gone to my high school, that schoolyard fight would have ended there, as a schoolyard fight. It never would have become an aggravated **assault** case. Not a single kid that I went to college with has a criminal record right now. Not a single one. But can you imagine how many might have if the police had stopped those kids and searched their pockets for drugs as they walked to class? Or had raided their frat parties in the middle of the night? Okay, you might say. But doesn ’ t this high incarceration rate partly account for our really low crime rate? Crime is down. That ’ s a good thing. Totally, that is a good thing. Crime is down. It dropped precipitously in the ’ 90s and through the 2000s. But according to a committee of academics convened by the National Academy of Sciences last year, the relationship between our historically high incarceration rates and our low crime rate is pretty shaky. It turns out that the crime rate goes up and down irrespective of how many young people we send to prison. We tend to think about justice in a pretty narrow way : good and bad, **innocent** and guilty. Injustice is about being wrongfully **convicted**. So if you ’ re **convicted** of something you did do, you should be punished for it. There are **innocent** and guilty people, there are **victims** and there are **perpetrators**. Maybe we could think a little bit more broadly than that. Right now, we ’ re asking kids who live in the most disadvantaged **neighborhoods**, who have the least amount of family resources, who are attending the country ’ s worst schools, who are facing the toughest time in the labor market, who are living in **neighborhoods** where **violence** is an everyday problem, we ’ re asking these kids to walk the thinnest possible line — to basically never do anything wrong. Why are we not providing support to young kids facing these challenges? Why are we offering only handcuffs, jail time and this fugitive existence? Can we imagine something better? Can we imagine a criminal justice system that prioritizes recovery, prevention, civic inclusion, rather than punishment? A criminal justice system that acknowledges the legacy of exclusion that poor people of color in the U. S. have faced and that does not promote and perpetuate those exclusions. And finally, a criminal justice system that believes in black young people, rather than treating black young people as the enemy to be rounded up. The good news is that we already are. A few years ago, Michelle Alexander wrote”The New Jim Crow,”which got Americans to see incarceration as a civil rights issue of historic proportions in a way they had not seen it before. President Obama and Attorney General Eric Holder have come out very strongly on sentencing reform, on the need to address racial disparity in incarceration. We ’ re seeing states throw out Stop and Frisk as the civil rights violation that it is. We ’ re seeing cities and states decriminalize possession of marijuana. New York, New Jersey and California have been dropping their prison populations, closing prisons, while also seeing a big drop in crime. Texas has gotten into the game now, also closing prisons, investing in education. This curious coalition is building from the right and the left, made up of former prisoners and fiscal conservatives, of civil rights activists and libertarians, of young people taking to the **streets** to protest police **violence** against unarmed black teenagers, and older, wealthier people — some of you are here in the audience — pumping big money into decarceration **initiatives** In a deeply divided Congress, the work of reforming our criminal justice system is just about the only thing that the right and the left are coming together on. I did not think I would see this political moment in my lifetime. I think many of the people who have been working tirelessly to write about the causes and consequences of our historically high incarceration rates did not think we would see this moment in our lifetime. The question for us now is, how much can we make of it? How much can we change? I want to end with a call to young people, the young people attending college and the young people struggling to stay out of prison or to make it through prison and return home. It may seem like these paths to adulthood are worlds apart, but the young people participating in these two institutions conveying us to adulthood, they have one thing in common : Both can be leaders in the work of reforming our criminal justice system. Young people have always been leaders in the fight for **equal** rights, the fight for more people to be granted dignity and a fighting chance at freedom. The mission for the generation of young people coming of age in this, a sea-change moment, potentially, is to end mass incarceration and build a new criminal justice system, emphasis on the word justice. Thanks.

Election night 2008 was a night that tore me in half. It was the night that Barack Obama was elected. [One hundred and forty-three] years after the end of slavery, and [43] years after the passage of the Voting Rights Act, an African- American was elected president. Many of us never thought that this was possible until the moment that it happened. And in many ways, it was the climax of the black civil rights movement in the United States. I was in California that night, which was ground zero at the time for another movement : the marriage **equality** movement. **Gay** marriage was on the ballot in the form of Proposition 8, and as the election returns started to come in, it became clear that the right for same sex couples to marry, which had recently been granted by the California courts, was going to be taken away. So on the same night that Barack Obama won his historic presidency, the lesbian and **gay** community suffered one of our most painful defeats. And then it got even worse. Pretty much immediately, African-Americans started to be blamed for the passage of Proposition 8. This was largely due to an incorrect poll that said that blacks had voted for the measure by something like 70 percent. This turned out not to be true, but this idea of pervasive black homophobia set in, and was grabbed on by the media. I couldn ’ t tear myself away from the coverage. I listened to some **gay** commentator say that the African-American community was notoriously homophobic, and now that civil rights had been achieved for us, we wanted to take away other people ’ s rights. There were even reports of racist epithets being thrown at some of the participants of the **gay** rights rallies that took place after the election. And on the other side, some African-Americans **dismissed** or ignored homophobia that was indeed real in our community. And others resented this comparison between **gay** rights and civil rights, and once again, the sinking feeling that two minority groups of which I ’ m both a part of were competing with each other instead of supporting each other overwhelmed and, frankly, pissed me off. Now, I ’ m a **documentary** filmmaker, so after going through my pissed off stage and yelling at the television and radio, my next instinct was to make a movie. And what guided me in making this film was, how was this happening? How was it that the **gay** rights movement was being pitted against the civil rights movement? And this wasn ’ t just an abstract question. I ’ m a beneficiary of both movements, so this was actually personal. But then something else happened after that election in 2008. The march towards **gay equality** accelerated at a pace that surprised and shocked everyone, and is still reshaping our laws and our policies, our institutions and our entire country. And so it started to become increasingly clear to me that this pitting of the two movements against each other actually didn ’ t make sense, and that they were in fact much, much more interconnected, and that, in fact, some of the way that the **gay** rights movement has been able to make such incredible gains so quickly is that it ’ s used some of the same tactics and strategies that were first laid down by the civil rights movement. Let ’ s just look at a few of these strategies. First off, it ’ s really interesting to see, to actually visually see, how quick the **gay** rights movement has made its gains, if you look at a few of the major events on a timeline of both freedom movements. Now, there are tons of milestones in the civil rights movement, but the first one we ’ re going to start with is the 1955 Montgomery bus boycott. This was a protest campaign against Montgomery, Alabama ’ s segregation on their public transit system, and it began when a woman named Rosa Parks refused to give up her seat to a white person. The campaign lasted a year, and it galvanized the civil rights movement like nothing had before it. And I call this strategy the”I ’ m tired of your foot on my neck”strategy. So **gays** and lesbians have been in society since societies began, but up until the mid-20th century, homosexual acts were still illegal in most states. So just 14 years after the Montgomery bus boycott, a group of LGBT folks took that same strategy. It ’ s known as Stonewall, in 1969, and it ’ s where a group of LGBT patrons fought back against police beatings at a Greenwich Village bar that sparked three days of rioting. Incidentally, black and latino LGBT folks were at the forefront of this rebellion, and it ’ s a really interesting example of the intersection of our struggles against racism, homophobia, gender identity and police brutality. After Stonewall happened, **gay** liberation groups sprang up all over the country, and the modern **gay** rights movement as we know it took off. So the next moment to look at on the timeline is the 1963 March on Washington. This was a seminal event in the civil rights movement and it ’ s where African- Americans called for both civil and economic justice. And it ’ s of course where Martin Luther King delivered his famous”I have a dream”speech, but what ’ s actually less known is that this march was organized by a man named Bayard Rustin. Bayard was an out **gay** man, and he ’ s considered one of the most brilliant strategists of the civil rights movement. He later in his life became a fierce advocate of LGBT rights as well, and his life is testament to the intersection of the struggles. The March on Washington is one of the high points of the movement, and it ’ s where there was a fervent belief that African- Americans too could be a part of American democracy. I call this strategy the”We are visible and many in numbers”strategy. Some early **gay** activists were actually directly inspired by the march, and some had taken part. **Gay** pioneer Jack Nichols said,”We marched with Martin Luther King, seven of us from the Mattachine Society”— which was an early **gay** rights organization —”and from that moment on, we had our own dream about a **gay** rights march of similar proportions.”Several years later, a series of marches took place, each one gaining the momentum of the **gay** freedom struggle. The first one was in 1979, and the second one took place in 1987. The third one was held in 1993. Almost a million people showed up, and people were so energized and excited by what had taken place, they went back to their own communities and started their own political and social organizations, further increasing the visibility of the movement. The day of that march, October 11, was then **declared** National Coming Out Day, and is still **celebrated** all over the world. These marches set the groundwork for the historic changes that we see happening today in the United States. And lastly, the"Loving"strategy. The name speaks for itself. In 1967, the Supreme Court ruled in Loving v. Virginia, and invalidated all laws that prohibited interracial marriage. This is considered one of the Supreme Court ' s landmark civil rights cases. In 1996, President Clinton signed the Defense of Marriage Act, known as DOMA, and that made the federal government only have to recognize marriages between a man and a woman. In United States v. Windsor, a 79-year-old lesbian named Edith Windsor sued the federal government when she was forced to pay estate taxes on her deceased wife ' s property, something that heterosexual couples don ' t have to do. And as the case wound its way through the lower courts, the Loving case was repeatedly cited as precedent. When it got to the Supreme Court in 2013, the Supreme Court agreed, and DOMA was thrown out. It was incredible. But the **gay** marriage movement has been making gains for years now. To date, 17 states have passed laws allowing marriage **equality**. It ' s become the de facto battle for **gay equality**, and it seems like daily, laws prohibiting it are being challenged in the courts, even in places like Texas and Utah, which no one saw coming. So a lot has changed since that night in 2008 when I felt torn in half. I did go on to make that film. It ' s a **documentary** film, and it ' s called"The New Black,"and it looks at how the African-American community is grappling with the **gay** rights issue in light of the **gay** marriage movement and this fight over the meaning of civil rights. And I wanted to capture some of this incredible change that was happening, and as luck or politics would have it, another marriage battle started gearing up, this time in Maryland, where African- Americans make up 30 percent of the electorate. So this tension between **gay** rights and civil rights started to bubble up once again, and I was lucky enough to capture how some people were making the connection between the movements this time. This is a clip of Karess Taylor-Hughes and Samantha Masters, two characters in the film, as they hit the **streets** of Baltimore and try to convince potential voters. Samantha Masters : That ' s what ' s up, man, this is a righteous man over here. Okay, are you registered to vote? Man : No. Karess Taylor-Hughes : Okay. How old are you? Man : 21. KTH : 21? You gotta get registered to vote. We got to get you registered to vote. Man : I ain ' t voting on no **gay** shit. SM : Okay, why? What ' s up? Man : I ain ' t with that. SM : That ' s not cool. Man : What made you be **gay**? SM : So what made you be straight? So what made you be straight? Man 2 : You can ' t answer that question. KSM : I used to not have the same rights as you, but I know that because a black man like yourself stood up for a woman like me, I know that I ' ve got the same opportunities. So you, as a black man, have the opportunity to stand up for somebody else. Whether you ' re **gay** or not, these are your brothers and sisters out here, and they need you to represent. Man 2 : Who is you to tell somebody who they can ' t have sex with, who they can ' t be with? They ain ' t got that power. Nobody has that power to say, you can ' t marry that young lady. Who has that power? Nobody. SM : But you know what? Our state has put the power in your hands, and so what we need you to do is vote for, you gonna vote for 6. Man 2 : I got you. SM : Vote for 6, okay? Man 2 : I got you. KSM : All right, do y ' all need community service hours?

You do? All right, you can always volunteer with us to get community service hours. Y ' all want to do that? We feed you. We bring you pizza. Yoruba Richen : Thank you. What ' s amazing to me about that clip that we just captured as we were filming is, it really shows how Karess understands the history of the civil rights movement, but she ' s not restricted by it. She doesn ' t just limit it to black people. She sees it as a blueprint for expanding rights to **gays** and lesbians. Maybe because she ' s younger, she ' s like 25, she ' s able to do this a little bit more easily, but the fact is that Maryland voters did pass that marriage **equality** amendment, and in fact it was the first time that marriage **equality** was directly voted on and passed by the voters. African- Americans supported it at a higher level than had ever been recorded. It was a complete turnaround from that night in 2008 when Proposition 8 was passed. It was, and feels, monumental. We in the LGBT community have gone from being a pathologized and reviled and criminalized group to being seen as part of the great human quest for dignity and **equality**. We ' ve gone from having to hide our **sexuality** in order to maintain our jobs and our families to literally getting a place at the table with the president and a shout out at his second inauguration. I just want to read what he said at that inauguration :"We the people **declare** today that the most evident of truths, that all of us are created **equal**. It is the star that guides us still, just as it guided our forebears through Seneca Falls and Selma and Stonewall."Now we know that everything is not perfect, especially when you look at what ' s happening with the LGBT rights issue internationally, but it says something about how far we ' ve come when our president puts the **gay** freedom struggle in the context of the other great freedom struggles of our time : the women ' s rights movement and the civil rights movement. His statement demonstrates not only the interconnectedness of those movements, but how each one borrowed and was inspired by the other. So just as Martin Luther King learned from and borrowed from Gandhi ' s tactics of civil disobedience and nonviolence, which became a bedrock of the civil rights movement, the **gay** rights movement saw what worked in the civil rights movement, and they used some of those same strategies and tactics to make gains at an even quicker pace. Maybe one more other reason for the relative quick progress of the **gay** rights movement. Whereas a lot of us continue to still live in racially segregated spaces, LGBT folks, we are everywhere. We are in urban communities and rural communities, communities of color, **immigrant** communities, churches and **mosques** and synagogues. We are your mothers and brothers and sisters and sons. And when someone that you love or a family member comes out, it may be easier to support their quest for **equality**. And in fact, the **gay** rights movement asks us to support justice and **equality** from a space of love. That may be the biggest, greatest gift that the movement has given us. It calls on us to **access** that which is most universal and most intimate : a love of our brother and our sister and our neighbor. I just want to end with a quote by one of our greatest freedom fighters who ' s no longer with us, Nelson Mandela of South Africa. Nelson Mandela led South Africa after the dark and brutal days of Apartheid, and out of the ashes of that legalized racial **discrimination**, he led South Africa to become the first country in the world to ban **discrimination** based on **sexual** orientation within its constitution. Mandela said,"For to be free is not merely to cast off one ' s chains, but to live in a way that respects and enhances the freedom of others."So as these movements continue on, and as freedom struggles around the world continue on, let ' s remember that not only are they interconnected, but they must support and enhance each other for us to be truly victorious. Thank you.

Text Sample 373: POS Dim 3 – 2014 – Score 15.00 – 2014/t001790.txt

Could I protect my father from the Armed Islamic Group with a paring knife? That was the question I faced one Tuesday morning in June of 1993, when I was a law student. I woke up early that morning in Dad ' s apartment on the outskirts of Algiers, Algeria, to an unrelenting pounding on the front door. It was a season as described by a local paper when every Tuesday a scholar fell to the bullets of fundamentalist assassins. My father ' s university teaching of Darwin had already provoked a classroom visit from the head of the so-called Islamic Salvation Front, who denounced Dad as an advocate of biologism before Dad had ejected the man, and now whoever was outside would neither identify himself nor go away. So my father tried to get the police on the phone, but perhaps terrified by the rising tide of **armed** extremism that had already claimed the lives of so many Algerian officers, they didn ' t even answer. And that was when I went to the kitchen, got out a paring knife, and took up a position inside the entryway. It was a ridiculous thing to do, really, but I couldn ' t think of anything else, and so there I stood. When I look back now, I think that that was the moment that set me on the path was to writing a book called"Your Fatwa Does Not Apply Here : Untold Stories from the Fight Against Muslim Fundamentalism."The title comes from a Pakistani play. I think it was actually that moment that sent me on the journey to interview 300 people of Muslim heritage from nearly 30 countries, from Afghanistan to Mali, to find out how they fought fundamentalism peacefully like my father did, and how they coped with the attendant risks. Luckily, back in June of 1993, our unidentified visitor went away, but other families were so much less lucky, and that was the thought that motivated my research. In any case, someone would return a few months later and leave a note on Dad ' s kitchen table, which simply said,"Consider yourself dead."Subsequently, Algeria ' s fundamentalist **armed** groups would murder as many as 200, 000 civilians in what came to be known as the dark decade of the 1990s, including every single one of the women that you see here. In its harsh counterterrorist response, the state resorted to torture and to forced disappearances, and as terrible as all of these events became, the international community largely ignored them. Finally, my father, an Algerian peasant ' s son turned professor, was forced to stop teaching at the university and to flee his apartment, but what I will never forget about Mahfoud Bennoune, my dad, was that like so many other Algerian intellectuals, he refused to leave the country and he continued to publish pointed criticisms, both of the fundamentalists and sometimes of the government they battled. For example, in a November 1994 series in the newspaper El Watan entitled"How Fundamentalism Produced a Terrorism without Precedent,"he denounced what he called the terrorists ' radical break with the true Islam as it was lived by our ancestors. These were words that could get you killed. My father ' s country taught me in that dark decade of the 1990s that the popular struggle against Muslim fundamentalism is one of the most important and overlooked human rights struggles in the world. This remains true today, nearly 20 years later. You see, in every country where you hear about **armed** jihadis targeting civilians, there are also unarmed people defying those militants that you don ' t hear about, and those people need our support to succeed. In the West, it ' s often assumed that Muslims generally condone terrorism. Some on the right think this because they view Muslim culture as inherently **violent**, and some on the left imagine this because they view Muslim **violence**, fundamentalist **violence**, solely as a product of legitimate grievances. But both views are dead wrong. In fact, many people of Muslim heritage around the world are staunch opponents both of fundamentalism and of terrorism, and often for very good reason. You see, they ' re much more likely to be **victims** of this **violence** than its **perpetrators**. Let me just give you one example. According to a 2009 survey of Arabic language media resources, between 2004 and 2008, no more than 15 percent of al Qaeda ' s **victims** were Westerners. That ' s a terrible toll, but the vast majority were people of Muslim heritage, killed by Muslim fundamentalists. Now I ' ve been talking for the last five minutes about fundamentalism, and you have a right to know exactly what I mean. I cite the definition given by the Algerian sociologist Marieme Helie Lucas, and she says that fundamentalisms, note the"s,"so within all of the world ' s great religious traditions,"fundamentalisms are political movements of the extreme right which in a context of globalization manipulate religion in order to achieve their political aims."Sadia Abbas has called this the radical politicization of theology. Now I want to avoid projecting the notion that there ' s sort of a monolith out there called Muslim fundamentalism that is the same everywhere, because these movements also have their diversities. Some use and advocate **violence**. Some do not, though they ' re often interrelated. They take different forms. Some may be non-governmental organizations, even here in Britain like Cageprisoners. Some may become political parties, like the Muslim Brotherhood, and some may be openly armed groups like the Taliban. But in any case, these are all radical projects. They ' re not conservative or traditional approaches. They ' re most often about changing people ' s relationship with Islam rather than preserving it. What I am talking about is the Muslim extreme right, and the fact that its adherents are or purport to be Muslim makes them no less offensive than the extreme right anywhere else. So in my view, if we consider ourselves liberal or left-wing, human rights-loving or feminist, we must oppose these movements and support their grassroots opponents. Now let me be clear that I support an effective struggle against fundamentalism, but also a struggle that must itself respect international law, so nothing I am saying should be taken as a justification for refusals to democratize, and here I send out a shout-out of support to the pro-democracy movement in Algeria today, Barakat. Nor should anything I say be taken as a justification of violations of human rights, like the mass death sentences handed out in Egypt earlier this week. But what I am saying is that we must challenge these Muslim fundamentalist movements because they threaten human rights across Muslim-majority contexts, and they do this in a range of ways, most obviously with the direct attacks on civilians by the **armed** groups that carry those out. But that **violence** is just the tip of the iceberg. These movements as a whole purvey **discrimination** against religious minorities and **sexual** minorities. They seek to curtail the freedom of religion of everyone who either practices in a different way or chooses not to practice. And most definingly, they lead an all-out war on the rights of women. Now, faced with these movements in recent years, Western discourse has most often offered two flawed responses. The first that one sometimes finds on the right suggests that most Muslims are fundamentalist or something about Islam is inherently fundamentalist, and this is just offensive and wrong, but unfortunately on the left one sometimes encounters a discourse that is too politically correct to acknowledge the problem of Muslim fundamentalism at all or, even worse, **apologizes** for it, and this is unacceptable as well. So what I ' m seeking is a new way of talking about this all together, which is grounded in the lived experiences and the hope of the people on the front lines. I ' m painfully aware that there has been an increase in **discrimination** against Muslims in recent years in countries like the U. K. and the U. S., and that too is a matter of grave concern, but I firmly believe that telling these counter- stereotypical stories of people of Muslim heritage who have confronted the fundamentalists and been their primary **victims** is also a great way of countering that **discrimination**. So now let me introduce you to four people whose stories I had the great honor of telling. Faizan Peerzada and the Rafi Peer Theatre workshop named for his father have for years promoted the performing arts in Pakistan. With the rise of jihadist **violence**, they began to receive threats to call off their events, which they refused to heed. And so a bomber struck their 2008 eighth world performing arts festival in Lahore, producing rain of glass that fell into the venue injuring nine people, and later that same night, the Peerzadas made a very difficult decision : they announced that their festival would continue as planned the next day. As Faizan said at the time, if we bow down to the Islamists, we ’ ll just be sitting in a dark corner. But they didn ’ t know what would happen. Would anyone come? In fact, thousands of people came out the next day to support the performing arts in Lahore, and this simultaneously thrilled and terrified Faizan, and he ran up to a woman who had come in with her two small children, and he said,”You do know there was a bomb here yesterday, and you do know there ’ s a threat here today.”And she said,”I know that, but I came to your festival with my mother when I was their age, and I still have those images in my mind. We have to be here.”With stalwart audiences like this, the Peerzadas were able to conclude their festival on schedule. And then the next year, they lost all of their sponsors due to the security risk. So when I met them in 2010, they were in the middle of the first subsequent event that they were able to have in the same venue, and this was the ninth youth performing arts festival held in Lahore in a year when that city had already experienced 44 terror attacks. This was a time when the Pakistani Taliban had commenced their systematic targeting of girls ’ schools that would culminate in the attack on Malala Yousafzai. What did the Peerzadas do in that environment? They staged girls ’ school theater. So I had the privilege of watching”Naang Wal,”which was a musical in the Punjabi language, and the girls of Lahore Grammar School played all the parts. They **sang** and danced, they played the mice and the water buffalo, and I held my breath, wondering, would we get to the end of this amazing show? And when we did, the whole audience collectively exhaled, and a few people actually wept, and then they filled the auditorium with the peaceful boom of their applause. And I remember thinking in that moment that the bombers made headlines here two years before but this night and these people are as important a story. Maria Bashir is the first and only woman chief prosecutor in Afghanistan. She ’ s been in the post since 2008 and actually opened an office to investigate cases of **violence** against women, which she says is the most important area in her mandate. When I meet her in her office in Herat, she enters surrounded by four large men with four huge guns. In fact, she now has 23 bodyguards, because she has weathered bomb attacks that nearly killed her kids, and it took the leg off of one of her guards. Why does she continue? She says with a smile that that is the question that everyone asks — as she puts it,”Why you risk not living?”And it is simply that for her, a better future for all the Maria Bashirs to come is worth the risk, and she knows that if people like her do not take the risk, there will be no better future. Later on in our interview, Prosecutor Bashir tells me how worried she is about the possible outcome of government negotiations with the Taliban, the people who have been trying to kill her.”If we give them a place in the government,”she asks,”Who will protect women ’ s rights?”And she urges the international community not to forget its promise about women because now they want peace with Taliban. A few weeks after I leave Afghanistan, I see a headline on the Internet. An Afghan prosecutor has been assassinated. I google desperately, and thankfully that day I find out that Maria was not the **victim**, though sadly, another Afghan prosecutor was gunned down on his way to work. And when I hear headlines like that now, I think that as international troops leave Afghanistan this year and beyond, we must continue to care about what happens to people there, to all of the Maria Bashirs. Sometimes I still hear her voice in my head saying, with no bravado whatsoever,”The situation of the women of Afghanistan will be better someday. We should prepare the ground for this, even if we are killed.”There are no words adequate to denounce the al Shabaab terrorists who attacked the Westgate Mall in Nairobi on the same day as a children ’ s cooking competition in September of 2013. They killed 67, including poets and pregnant women. Far away in the American Midwest, I had the good fortune of meeting Somali-Americans who were working to counter the efforts of al Shabaab to recruit a small number of young people from their city of Minneapolis to take part in atrocities like Westgate. Abdirizak Bihi ’ s studious 17-year-old nephew Burhan Hassan was recruited here in 2008, spirited to Somalia, and then killed when he tried to come home. Since that time, Mr. Bihi, who directs the no- budget Somali Education and Advocacy Center, has been vocally denouncing the recruitment and the failures of government and Somali-American institutions like the Abubakar As-Saddique Islamic Center where he believes his nephew was radicalized during a youth program. But he doesn ’ t just criticize the **mosque**. He also takes on the government for its failure to do more to prevent poverty in his community. Given his own lack of financial resources, Mr. Bihi has had to be creative. To counter the efforts of al Shabaab to sway more disaffected youth, in the wake of the group ’ s 2010 attack on World Cup viewers in Uganda, he organized a Ramadan basketball tournament in Minneapolis in response. Scores of Somali-American kids came out to embrace sport despite the fatwa against it. They played basketball as Burhan Hassan never would again. For his efforts, Mr. Bihi has been ostracized by the leadership of the Abubakar As-Saddique Islamic Center, with which he used to have good relations. He told me,”One day we saw the imam on TV calling us infidels and saying, ’ These families are trying to destroy the **mosque**. ’”This is at complete odds with how Abdirizak Bihi understands what he is trying to do by exposing al Shabaab recruitment, which is to save the religion I love from a small number of extremists. Now I want to tell one last story, that of a 22-year-old law student in Algeria named Amel Zenoune-Zouani who had the same dreams of a legal career that I did back in the ’ 90s. She refused to give up her studies, despite the fact that the fundamentalists battling the Algerian state back then threatened all who continued their education. On January 26, 1997, Amel boarded the bus in Algiers where she was studying to go home and spend a Ramadan evening with her family, and would never finish law school. When the bus reached the outskirts of her hometown, it was stopped at a checkpoint manned by men from the Armed Islamic Group. Carrying her schoolbag, Amel was taken off the bus and killed in the **street**. The men who cut her throat then told everyone else,”If you go to university, the day will come when we will kill all of you just like this.”Amel died at exactly 5:17 p. m., which we know because when she fell in the **street**, her watch broke. Her mother showed me the watch with the second hand still aimed optimistically upward towards a 5:18 that would never come. Shortly before her death, Amel had said to her mother of herself and her sisters,”Nothing will happen to us, Inshallah, God willing, but if something happens, you must know that we are dead for knowledge. You and father must keep your heads held high.”The loss of such a young woman is unfathomable, and so as I did my research I found myself searching for Amel ’ s hope again and her name even means”hope”in Arabic. I think I found it in two places. The first is in the strength of her family and all the other families to continue telling their stories and to go on with their lives despite the terrorism. In fact, Amel ’ s sister Lamia overcame her **grief**, went to law school, and practices as a lawyer in Algiers today, something which is only possible because the **armed** fundamentalists were largely defeated in the country. And the second place I found Amel ’ s hope was everywhere that women and men continue to defy the jihadis. We must support all of those in honor of Amel who continue this human rights struggle today, like the Network of Women Living Under Muslim Laws. It is not enough, as the **victims** rights advocate Cherifa Kheddar told me in Algiers, it is not enough just to battle terrorism. We must also challenge fundamentalism, because fundamentalism is the ideology that makes the bed of this terrorism. Why is it that people like her, like all of them are not more well known? Why is it that everyone knows who Osama bin Laden was and so few know of all of those standing up to the bin Ladens in their own contexts. We must change that, and so I ask you to please help share these stories through your networks. Look again at Amel Zenoune ’ s watch, forever frozen, and now please look at your own watch and decide this is the moment that you commit to supporting people like Amel. We don ’ t have the right to be silent about them because it is easier or because Western policy is flawed as well, because 5:17 is still coming to too many Amel Zenounes in places like northern Nigeria, where jihadis still kill students. The time to speak up in support of all of those who peacefully challenge fundamentalism and terrorism in their own communities is now. Thank you.

As a student of adversity, I ’ ve been struck over the years by how some people with major challenges seem to draw strength from them. And I ’ ve heard the popular wisdom that that has to do with finding meaning. And for a long time, I thought the meaning was out there, some great truth waiting to be found. But over time, I ’ ve come to feel that the truth is irrelevant. We call it”finding meaning,”but we might better call it”forging meaning.”My last book was about how families manage to deal with various kinds of challenging or unusual offspring. And one of the mothers I interviewed, who had two children with multiple severe disabilities, said to me,”People always give us these little sayings like, ’ God doesn ’ t give you any more than you can handle. ’ But children like ours are not preordained as a gift. They ’ re a gift because that ’ s what we have chosen.”We make those choices all our lives. When I was in second grade, Bobby Finkel had a birthday party and invited everyone in our class but me. My mother assumed there had been some sort of error, and she called Mrs. Finkel, who said that Bobby didn ’ t like me and didn ’ t want me at his party. And that day, my mom took me to the zoo and out for a hot fudge sundae. When I was in seventh grade, one of the kids on my school bus nicknamed me”Percy,”as a shorthand for my demeanor. And sometimes, he and his cohort would chant that provocation the entire school bus ride, 45 minutes up, 45 minutes back :”Percy! Percy! Percy! Percy!”When I was in eighth grade, our science teacher told us that all male homosexuals develop fecal incontinence because of the **trauma** to their anal sphincter. And I graduated high school without ever going to the cafeteria, where I would have sat with the girls and been laughed at for doing so, or sat with the boys, and been laughed at for being a boy who should be sitting with the girls. I survived that childhood through a mix of avoidance and endurance. What I didn ’ t know then and do know now, is that avoidance and endurance can be the entryway to forging meaning. After you ’ ve forged meaning, you need to incorporate that meaning into a new identity. You need to take the **traumas** and make them part of who you ’ ve come to be, and you need to fold the worst events of your life into a narrative of triumph, evincing a better self in response to things that hurt. One of the other mothers I interviewed when I was working on my book had been raped as an adolescent, and had a child following that rape, which had thrown away her career plans

and damaged all of her emotional relationships. But when I met her, she was 50, and I said to her,”Do you often think about the man who raped you?”And she said,”I used to think about him with anger, but now only with **pity**.”And I thought she meant **pity** because he was so unevolved as to have done this terrible thing. And I said,”**Pity**?”And she said,”Yes, because he has a beautiful daughter and two beautiful grandchildren, and he doesn ’ t know that, and I do. So as it turns out, I ’ m the lucky one.”Some of our struggles are things we ’ re born to : our gender, our **sexuality**, our race, our disability. And some are things that happen to us : being a political prisoner, being a rape **victim**, being a Katrina survivor. Identity involves entering a community to draw strength from that community, and to give strength there, too. It involves substituting”and”for”but”— not”I am here but I have cancer,”but rather,”I have cancer and I am here.”When we ’ re ashamed, we can ’ t tell our stories, and stories are the foundation of identity. Forge meaning, build identity. Forge meaning and build identity. That became my mantra. Forging meaning is about changing yourself. Building identity is about changing the world. All of us with stigmatized identities face this question daily : How much to accommodate society by constraining ourselves, and how much to break the limits of what constitutes a valid life? Forging meaning and building identity does not make what was wrong right. It only makes what was wrong precious. In January of this year, I went to Myanmar to interview political prisoners, and I was surprised to find them less **bitter** than I ’ d anticipated. Most of them had knowingly committed the offenses that landed them in prison, and they had walked in with their heads held high, and they walked out with their heads still held high, many years later. Dr. Ma Thida, a leading human rights activist who had nearly died in prison and had spent many years in solitary confinement, told me she was grateful to her jailers for the time she had had to think, for the wisdom she had gained, for the chance to hone her **meditation** skills. She had sought meaning and made her travail into a crucial identity. But if the people I met were less **bitter** than I ’ d anticipated about being in prison, they were also less thrilled than I ’ d expected about the reform process going on in their country. Ma Thida said,”We Burmese are noted for our tremendous grace under pressure, but we also have grievance under glamour.”She said,”And the fact that there have been these shifts and changes doesn ’ t erase the continuing problems in our society that we learned to see so well while we were in prison.”I understood her to be saying that concessions confer only a little humanity where full humanity is due ; that crumbs are not the same as a place at the table. Which is to say, you can forge meaning and build identity and still be mad as hell. I ’ ve never been raped, and I ’ ve never been in anything remotely approaching a Burmese prison. But as a **gay** American, I ’ ve experienced **prejudice** and even **hatred**, and I ’ ve forged meaning and I ’ ve built identity, which is a move I learned from people who had experienced far worse privation than I ’ ve ever known. In my own adolescence, I went to extreme lengths to try to be straight. I enrolled myself in something called”**sexual** surrogacy therapy,”in which people I was encouraged to call doctors prescribed what I was encouraged to call exercises with women I was encouraged to call surrogates, who were not exactly prostitutes but who were also not exactly anything else. My particular favorite was a blonde woman from the Deep South who eventually admitted to me that she was really a necrophiliac, and had taken this job after she got in trouble down at the morgue. These experiences eventually allowed me to have some happy physical relationships with women, for which I ’ m grateful. But I was at war with myself, and I dug terrible wounds into my own psyche. We don ’ t seek the painful experiences that hew our identities, but we seek our identities in the wake of painful experiences. We cannot bear a pointless torment, but we can endure great pain if we believe that it ’ s purposeful. Ease makes less of an impression on us than struggle. We could have been ourselves without our delights, but not without the misfortunes that drive our search for meaning.”Therefore, I take pleasure in infirmities,”St. Paul wrote in Second Corinthians,”for when I am weak, then I am strong.”In 1988, I went to Moscow to interview artists of the Soviet underground. I expected their work to be dissident and political. But the radicalism in their work actually lay in reinserting humanity into a society that was annihilating humanity itself, as, in some senses, Russian society is now doing again. One of the artists I met said to me,”We were in training to be not artists but angels.”In 1991, I went back to see the artists I ’ d been writing about, and I was with them during the putsch that ended the Soviet Union. And they were among the chief organizers of the resistance to that putsch. And on the third day of the putsch, one of them suggested we walk up to Smolenskaya. And we went there, and we arranged ourselves in front of one of the barricades, and a little while later, a column of tanks rolled up. And the soldier on the front tank said,”We have unconditional orders to destroy this barricade. If you get out of the way, we don ’ t need to hurt you. But if you won ’ t move, we ’ ll have no choice but to run you down.”The artist I was with said,”Give us just a minute. Give us just a minute to tell you why we ’ re here.”And the soldier folded his arms, and the artist launched into a Jeffersonian panegyric to democracy such as those of us who live in a Jeffersonian democracy would be hard-pressed to present. And they went on and on, and the soldier watched. And then he sat there for a full minute after they were finished and looked at us, so bedraggled in the rain, and said,”What you have said is true, and we must bow to the will of the people. If you ’ ll clear enough space for us to turn around, we ’ ll go back the way we came.”And that ’ s what they did. Sometimes, forging meaning can give you the vocabulary you need to fight for your ultimate freedom. Russia awakened me to the lemonade notion that oppression breeds the power to oppose it. And I gradually understood that as the cornerstone of identity. It took identity to rescue me from sadness. The **gay** rights movement posits a world in which my aberrances are a victory. Identity politics always works on two fronts : to give pride to people who have a given condition or characteristic, and to cause the outside world to treat such people more gently and more kindly. Those are two totally separate enterprises, but progress in each sphere reverberates in the other. Identity politics can be narcissistic. People extol a difference only because it ’ s theirs. People narrow the world and function in discrete groups without empathy for one another. But properly understood and wisely practiced, identity politics should expand our idea of what it is to be human. Identity itself should be not a smug label or a gold medal, but a revolution. I would have had an easier life if I were straight, but I would not be me. And I now like being myself better than the idea of being someone else, someone who, to be honest, I have neither the option of being nor the ability fully to imagine. But if you banish the dragons, you banish the heroes, and we become attached to the heroic strain in our own lives. I ’ ve sometimes wondered whether I could have ceased to hate that part of myself without **gay** pride ’ s technicolor fiesta, of which this speech is one manifestation. I used to think I would know myself to be mature when I could simply be **gay** without emphasis. But the self-loathing of that period left a void, and celebration needs to fill and overflow it, and even if I repay my private debt of melancholy, there ’ s still an outer world of homophobia that it will take decades to address. Someday, being **gay** will be a simple fact, free of party hats and blame. But not yet. A friend of mine who thought **gay** pride was getting very carried away with itself, once suggested that we organize Gay Humility Week. It ’ s a great idea. But its time has not yet come. And neutrality, which seems to lie halfway between despair and celebration, is actually the endgame. In 29 states in the US, I could legally be fired or denied housing for being **gay**. In Russia, the anti-propaganda law has led to people being beaten in the **streets**. Twenty-seven African countries have passed laws against sodomy. And in Nigeria, **gay** people can legally be stoned to death, and lynchings have become common. In Saudi Arabia recently, two men who had been caught in carnal acts were sentenced to 7, 000 lashes each, and are now permanently **disabled** as a result. So who can forge meaning and build identity? **Gay** rights are not primarily marriage rights, and for the millions who live in unaccepting places with no resources, dignity remains elusive. I am lucky to have forged meaning and built identity, but that ' s still a rare privilege. And **gay** people deserve more, collectively, than the crumbs of justice. And yet, every step forward is so sweet. In 2007, six years after we met, my partner and I decided to get married. Meeting John had been the discovery of great happiness and also the elimination of great unhappiness. And sometimes, I was so occupied with the disappearance of all that pain, that I forgot about the joy, which was at first the less remarkable part of it to me. Marrying was a way to **declare** our love as more a presence than an absence. Marriage soon led us to children, and that meant new meanings and new identities — ours and theirs. I want my children to be happy, and I love them most achingly when they are sad. As a **gay** father, I can teach them to own what is wrong in their lives, but I believe that if I succeed in sheltering them from adversity, I will have failed as a parent. A Buddhist scholar I know once explained to me that Westerners mistakenly think that nirvana is what arrives when all your woe is behind you, and you have only bliss to look forward to. But he said that would not be nirvana, because your bliss in the present would always be shadowed by the joy from the past. Nirvana, he said, is what you arrive at when you have only bliss to look forward to and find in what looked like sorrows the seedlings of your joy. And I sometimes wonder whether I could have found such fulfillment in marriage and children if they ' d come more readily, if I ' d been straight in my youth or were young now, in either of which cases this might be easier. Perhaps I could. Perhaps all the complex imagining I ' ve done could have been applied to other topics. But if seeking meaning matters more than finding meaning, the question is not whether I ' d be happier for having been bullied, but whether assigning meaning to those experiences has made me a better father. I tend to find the ecstasy hidden in ordinary joys, because I did not expect those joys to be ordinary to me. I know many heterosexuals who have equally happy marriages and families, but **gay** marriage is so breathtakingly fresh, and **gay** families so exhilaratingly new, and I found meaning in that surprise. In October, it was my 50th birthday, and my family organized a party for me. And in the middle of it, my son said to my husband that he wanted to make a speech. And John said,"George, you can ' t make a speech. You ' re four.""Only Grandpa and Uncle David and I are going to make speeches tonight."But George insisted and insisted, and finally, John took him up to the microphone, and George said very loudly,"Ladies and gentlemen! May I have your attention, please?"And everyone turned around, startled. And George said,"I ' m glad it ' s daddy ' s birthday. I ' m glad we all get cake. And Daddy, if you were little, I ' d be your friend."And I thought — Thank you. I thought that I was indebted even to Bobby Finkel, because all those earlier experiences were what had propelled me to this moment, and I was finally unconditionally grateful for a life I ' d once have done anything to change. The **gay** activist Harvey Milk was once asked by a younger **gay** man what he could do to help the movement, and Harvey Milk said,"Go out and tell someone."There ' s always somebody who wants to confiscate our humanity. And there are always stories that restore it. If we live out loud, we can trounce the **hatred**, and expand everyone ’ s lives. Forge meaning. Build identity. Forge meaning. Build identity. And then invite the world to share your joy. Thank you. Thank you. Thank you. Thank you.

When you were a child, what did you want to be when you grew up? A footballer? An actress? A doctor? Well, when I was a little girl, whenever I was asked the question, my answer was pretty much always the same :”When I grow up, I want to become a man.”To my logic, that was the only way I could live a life free from the suffocating restrictions that women in my birth country of Iran were forced to endure. I ’ m not quite sure where this line of thinking started from, but a particularly hot summer ’ s afternoon comes to mind. I was nine years old and along with my family, as we did on every summer holiday, we had traveled to the north of Iran to a little seaside village called Chamkhaleh. For as long as I remember, some of my best childhood memories are of me swimming in the Caspian Sea, paddling in its waves and making sandcastles on its gorgeous beaches. All of those lovely memories, though, were about to be rewritten. In the Islamic Republic of Iran, when a girl turns nine years old, she has legally entered womanhood. And that means having to follow a series of restrictive rules written by men. The most symbolic of which is probably the mandatory wearing of the hijab. That year, my mom had to sit me down and sorrowfully explain that I was now too old to get into the water wearing a swimsuit. Now that I was nine years old, it was illegal. And if I wanted to get into the water like all the other women, I had to go in fully covered from head to toe. I had to go in wearing a pair of trousers, a long-sleeved top and a loose covering called the manto to cover it all. And of course, the headscarf. I still remember the lump in my throat as I set foot in the water. I could no longer feel the fresh coolness of the Caspian Sea against my skin. Instead, my now-wet layers felt itchy and weird. I can still remember feeling the watchful eyes of the morality police, the so-called morality police, making sure that me and the other girls were not showing too much hair or too much skin to, God forbid, arouse the men. It was as if my former freedoms were washing away with every tide and flow of the water. Next, I ’ m deep in the water. I was a good swimmer, but my layers were so heavy and restrictive. I tried to gasp for air, but my headscarf kept blocking my face. The tides were pulling me further and further out. I could see my mom and dad on the beach, I tried to call for help, but they couldn ’ t hear me. Perhaps my voice was drowned out by the roaring engines of the bikes that the morality police were patrolling the beaches. The tides continued, pulling me further and further out and hopelessness started creeping in. Next, I wake up on the beach, cold, wet, shivering. It turns out my father had just spotted my struggles in time and had rushed in to get me. That was the last time I ever set foot in my beloved Caspian Sea. Growing up in the Islamic Republic of Iran, every day it felt as though I was going through the same experience but in different ways. And looking at the women in my life, they seemed to be going through the same thing too, in different ways. And the older I grew, the further out the tides of oppression, injustice, inequality felt like they were pulling me in. Wherever I turned, **shame**, fear and especially hopelessness were ever-present. Women in Iran are second-class citizens. They have almost no **access** when it comes to some of the most basic rights like divorce, custody of children and even travel. They have no legal protection against **sexual harassment** and **domestic violence**. They are not allowed to **sing** in public or have sex outside of marriage, and they ’ re only allowed to show their face and hand in public. In the 20 years or so since I almost drowned, nothing has changed. Iranian women have been adrift in a vast sea of oppression. Their only way out, for those who could, is to leave themselves at the mercy of people smugglers, set out on dangerous journeys in hope of finding **safety** in a land far away. That ’ s what happened to me. Age 12, along with my mom and my baby sister, we escaped Iran. And after years of living in refugee camps across Europe, sleeping rough and being at the mercy of some very, very dodgy people smugglers, we finally found safe haven here, in the UK. For my friends and family who stayed behind, there was little hope for change. And so when in September last year, 22-year-old Mahsa Jina Amini stepped out of the metro onto the bustling **streets** of Tehran, there was little reason to expect a change to the status quo. The same way that it ’ s happened to my own mother and many other women I know, Mahsa was arrested by the so-called morality police because, in their opinion, she was showing more hair than they **deemed** acceptable. Three days later, Mahsa died in police custody. This time, though, something changed. Thanks to the power of social media and the brave journalists working hard on the ground, the news of Mahsa ’ s killing wasn ’ t drowned out in the regime ’ s **relentless** propaganda. In the same way that the unjust killing of George Floyd ignited the Black Lives Matter movement, the unjust killing of Mahsa Amini ignited the biggest anti-regime protests across Iran since the formation of the Islamic Republic in 1979. For the first time in decades, women in Iran are finally daring to defy the strict morality laws. In a fight for **equality** and dignity, they are taking off their headscarves, burning them in bonfires, and some are cutting off their hair. They ’ re chanting”Zan. Zendegi. Azadi.””Woman, Life, Freedom.”Furious crowds are calling for democracy, for freedom of speech, for freedom of expression, whilst many others are calling for the fall of the supreme leader, Ali Khamenei. Khamenei is Iran ’ s spiritual leader and has the final say over all government matters. For the first time in a very, very long time, there seems to be hope in the air. Hope that perhaps change in Iran is possible. And that ’ s exactly why the crackdown has been so brutal and deadly. These are the faces of the protesters who fought for freedom but will not live to see it. Since the protest began nearly five months ago, around 500 people have been killed. Nearly 80 of those children. Around 18, 000 protesters have been arrested. And there are reports of psychological, physical and **sexual** torture in prisons. There has been a series of hasty trials, forced **confessions** and public executions of the protesters. The **authoritarian** regime of Iran is clearly desperate to kill any and all hope because they know that for as long as we remain hopeless, we ’ ll resign to their oppression and injustice. But as history has shown over and over again, the light of hope emerges from the depth of **darkness**. Hope is angry. It ’ s defiant. Hope is dangerous. Hope is standing its ground on the **streets** of Iran, chanting”Woman, Life, Freedom.”Hope is in political prisons, biding its time, sustaining those in shackles. Hope has now spread to the four corners of my birth country. As a journalist, I can ’ t travel to Iran. But as my sisters in Tehran, Mashhad, Shiraz, Baluchistan, Kurdistan, shomal, jonoob, shargh, gharb, all over Iran have done, I, too, I ’ m going to cut my hair to show my **solidarity** with the movement. Thank you. Thank you. Audience : Freedom for women! SZ : This hair, for too long, has been intertwined with religion and politics. But I say with my sisters in Iran : no more. And I say with them : Women, to reclaim our rights. Life, for the lives unjustly taken. Freedom, for the liberation of my people. I stand here with my hair in my hand, in hope of a future where no little girl has to wish she were a man because she ’ s terrified that she might drown every day. Yes, the crackdown is brutal. And yes, there might not be a solution inside yet. But the only thing that can help create and sustain one is hope. Sorry. The only thing that can help create and sustain one is hope. And every single one of us can take a step and play our part. I ’ m standing here speaking to you now. Many non-Iranians and Iranians outside of Iran have been signing petitions, going to protest, putting pressure on their governments so that in turn, they put pressure on the Iranian regime and government. For the past few months, I ’ ve been speaking to protesters inside of Iran, and they tell me how much it matters to them that we on the outside stay informed and engaged. So let ’ s try our best to make certain that those of us on the shore let those at sea know that we see them, that we hear their cries. Thank you for taking a step towards a future where freedom is not just a dream, but a reality. Not just for women, but for everyone. And not just in Iran, but everywhere. Thank you.

Helen Walters : Hello, everybody. Two days ago, on October 7, the Palestinian Sunni-Islamic fundamentalist organization Hamas attacked Israel, overrunning two military bases, occupying territory, killing hundreds of Israeli citizens and taking dozens more as hostages. It was the most significant breach of Israel ’ s borders since the Yom Kippur War of 1973. The attacks were clearly long- and well-planned, and they sent shock waves of fear and panic through the region and the world. Obviously, it ’ s two days later. It is way too soon to understand all of the ramifications of these attacks. But we can try to understand how we got here and the implications of this awful moment. So we asked our community to share their questions and to answer them, I am joined by Ian Bremmer, president and founder of political risk research and consulting firm Eurasia Group. Hi Ian. Ian Bremmer : Helen, great to be with you. HW : Alright, so let ’ s get right to it. We ’ ve had a number of our community who really want you to explain the very simple question of how we got here. So can you share the historical context for this moment? And if you like, give us a bit of a Gaza 101. IB : Well, I mean, Gaza, we ’ ve got a population, a Palestinian population of just over two million, 2. 2 million, exceedingly poor. And, you know, without sovereignty, without statehood, and a part of the Palestinian occupied territories, also the West Bank, more people, 3. 5 million. The West Bank run not very well by the Palestinian Authority, which recognizes Israel ’ s right to exist. Gaza, run really badly, with very little resources, run by Hamas, which does not recognize Israel ’ s right to exist. Now we ’ ve been talking about a two-state solution for a very long time. For the idea that the only way you end up with stability between the Israelis and the Palestinians is if the Palestinians have some ability to govern themselves, have some control over their economic trajectory, over their foreign policy, over their borders. That is not where we stand right now. And indeed, the idea of a two-state solution has kind of lost the collective interest, imagination, traction, for two reasons. First, because the Middle East has moved on. A bunch of countries around the region have found that they are interested in developing direct relations, some formal, some informal, with Israel, and that they ’ re willing to do that irrespective of resolving the Palestinian question, the Palestinian problem. And we ’ ve seen that with the Abraham Accords under the Trump administration, where the UAE, the United Arab Emirates, Bahrain and Morocco all directly established diplomatic relations with Israel. If you go to Dubai or Abu Dhabi today, you will see Israeli tourists like you wouldn ’ t imagine. And they ’ re having a great time and they ’ re spending money and they ’ re taking in the sites and they ’ re very welcomed by the Emirates. Unimaginable that was going to happen 10 or 20 years ago. In fact, Saudi Arabia was very close, not within weeks, it wasn ’ t imminent, but certainly within months of signing a deal with Israel that would allow for them to open diplomatic relations. And there ’ s already been a number of high-level diplomatic relations informally between Mohammed bin Salman and Prime Minister Netanyahu. So, in other words, across the region, you had Israel, frankly, in the strongest geopolitical position that they ’ ve been in decades. They ’ ve been surrounded by enemies. Well, now they ’ re increasingly surrounded by countries they can do business with. In fact, just a couple of weeks ago, there was an announcement of a deal where the United Arab Emirates was investing massively into solar power for Jordan, which would then be given to Israel in return for desalinized water processed by Israel. Even five years ago, inconceivable a deal like that could happen. So the Israelis, technologically very sophisticated, an advanced industrial economy, are only standing to make more money by doing business with all of these countries. What ’ s been happening with the Palestinians? Nothing. The answer is nothing. They ’ re not benefiting economically. And all of these deals for Israel have happened without any consequences, any contingencies for the Palestinians. And indeed in Israel, you know, there have been a lot of headlines. Israel ’ s made a lot of news this year, but not because of the Palestinians. Israel has made news because of their own **domestic** constitutional crisis, an effort by the Prime Minister, Netanyahu, and his right-wing coalition to engage in judicial reform, an Israeli judiciary which is very independent, which has, in the context of democracies, a very surprising amount of authority over making but also interpretation of laws in Israel. What can and what cannot be considered a reasonable law to be executed. And for a country that doesn ’ t have a constitution, not surprising perhaps, the judiciary is so powerful. And Netanyahu facing corruption charges and with a very weak right-wing coalition relying on far right, extremist right party as part of that coalition, was pushing for these reforms. Now, why am I talking about that? Because for the last six months, there have been unprecedented demonstrations across Israel, peaceful demonstrations, but bringing out the entire country. Because they were concerned about a constitutional crisis. Kind of an irony for a country without a constitution. If Netanyahu persisted, went ahead with these reforms. No one was talking about the Palestinians. And indeed, large numbers of troops that had been in the south were moved to the West Bank as the Netanyahu government was expanding the settlements in that territory and responding to Palestinian reprisals against those settlements. So they weren ’ t focused on the issue. They took their eyes off the ball. Israel had other priorities, and the Palestinians were in a position not only to lose their friends around the region but also increasingly an afterthought for the Israeli government and the Israeli people. That is the backdrop for where we are today. HW : So let ’ s dig in a little bit into the idea that you bring up of the kind of the troubles that have been roiling Netanyahu and the Israeli government themselves. So I think one of the things that has been brought up is the massive failure of intelligence and defense systems in Israel that allowed this attack to happen. What happens next? Do you see Israel uniting around Netanyahu? Do you see this fracturing even worse with anger at what happened in the lapses in defense and intelligence insights? Or what happens next? IB : Well, the first point I should make is just for everyone to understand what has just happened to the Israeli consciousness. It is unimaginable that, you know, certainly someone in a developed country could have any understanding of what the Jewish people in Israel are presently going through. This feeling that, you know, after the Holocaust and, you know, the land being provided to them to have a safe haven to create an independent Israeli state. And the need to defend their borders, the historic fights they ’ ve had with their neighbors, the war in 1973, when a number of Arab nations decided to fight against them. And, you know, the continual sense of besiegement with missiles from Hezbollah, for example, terrorist operations. This is not like a bolt from the blue when the United States experienced 9 / 11. Israel ’ s 9 / 11 is both massively greater in the impact on Israel but also comes for a country that was supposed to be prepared for this. I mean, Israel represents the gold standard on border security around the world. Not like the United States, where you ’ ve got, you know, all sorts of people running across and”build the wall”becomes a clarion call precisely because nobody understands how to defend the border, no. And also, intelligence collection, surveillance, digital surveillance, human intelligence collection on the ground, especially in the occupied territories. This is what they do. And the fact is that right now, today, Netanyahu ’ s legacy will not be anything that he has done to date. It will be this failure and how he responds to it. Period, end of story. Nothing else is close. So what that means for Israel is that all of the issues that have roiled this country over the past year, all of the political polarization, and it ’ s not a two-party country, it ’ s a many, many-party country. You know, the joke is you get three people together in Israel and, you know, you form a new political party. And if you go to the coffeehouses and the rest, everybody ’ s talking politics. Everyone reads the newspapers. This is a highly politically literate and divided population. But as of right now, priority one, two and three for the entire Israeli people is to respond to these attacks, these terrorist attacks. And how are they going to respond to them? Well, number one, they ’ ve got to find a way to get their people back. There are 100-plus, and we don ’ t know the exact numbers right now, hostages that are being held in Gaza, most of whom are civilians. And they will do everything to get them back. And they may well have direct American support in trying to accomplish that. And then it will be to go into Gaza, to remove the leadership of Gaza, to disarm the militias in the territory of Gaza, and to do everything they can to try to ensure that this cannot happen again. And making that happen is a very, very tall order. It might be a taller order than the Israelis can accomplish, and certainly the knock-on consequences will be grave even for just Gaza. And that is before we talk about any potential expansion of the war. But for now, the Israeli people will stand together. And there ’ s already talk of a government of national emergency that would bring together Netanyahu with the leader of the Israeli opposition for the purposes of fighting this war so that everyone in Israel is together collectively, ensuring the national security of the people of Israel. And I think that for the course of the coming months, and let us remember, this is not just, you know, an attack against Israel and now they respond. It is very likely there are Hamas operatives on the ground inside Israel right now that the Israeli government has to find and neutralize. It is also true that, you know, you ’ re still actively expecting that there are going to be additional attacks, whether those are missile attacks or whether those are direct incursions, nobody knows, but given the level of planning that was required by Hamas to make these strikes over the weekend, which nobody in Israel thought was possible, no one expected it, right now, that level of concern would be higher than anything else on the political agenda. And again, that will not move for the foreseeable future. HW : So I want to talk more about all of that and expand this to obviously the broader geopolitical implications of this. But I want to just play out the 9 / 11 reference a little bit if you can, because obviously 9 / 11 happened some time ago with the attack on the United States. But we know with retrospect, with hindsight, that some of the decisions that were made after that were misguided, they were misjudged, they actually led to terrible **harm**. How and who is going to make sure that these types of decisions are not made? And how can Israel avoid making decisions that will be bad? IB : As someone who was in New York on 9 / 11 and saw the second tower go down and saw how the city rallied together, how the country rallied together, President Bush, over 90 percent approval in the country a couple of months after 9 / 11, how the world came together to support the United States, the coalition of the willing, well beyond NATO. I mean, poor countries that had no business caring about what the United States was up to providing troops on the ground and support for the Americans. Russia, Putin ' s Russia, calling up Bush and offering, you know, the former Soviet republics in Central Asia as bases to support for logistical operations for the war in Afghanistan. I mean, the level of support for the United States after 9 / 11 was singular. And there ' s no question that the outpouring of concern, I mean, when I saw in Berlin, shining on the Brandenburg Gate, the Israeli flag with the star of David in Germany, in Berlin, in Germany, and given the history and given what that means and given the Alternative für Deutschland doing well in East Germ – all of that, I mean, this is a singular moment in the relationship between Germany and Israel. The European Union suspending aid to the Palestinians, the support for Israel is extraordinary. Narendra Modi In India. It is not universal for every country, but it is absolutely wide-ranging. And I got a readout, I spoke to several of the folks involved in the Emergency Security Council meeting at the United Nations this weekend. The condemnation of these attacks, everyone but Russia. And again, so in that regard, this is very, very similar to 9 / 11. Now, the broader question that you ' re asking, Helen, which I ' m also very sensitive to, is in 2023, looking back on 9 / 11, the Americans made some horrible, horrible, long-lasting mistakes. And some of those mistakes were in the United States. I mean, if I think about how much money was spent and wasted in the Department of Homeland Security, on personal security and **safety** in the airlines, how much money was wasted, how much economic inefficiency as a consequence of overstating the terrorist threat in the US, everything else secondary to that. But also, the rights that were stripped back for, in some cases, all Americans in terms of surveillance and the Patriot Act. But also targeting Muslim Americans across the country and so much mistreatment of American citizens as a consequence of that. But that ' s nothing compared to the mistakes made internationally. A war of choice in Iraq, responding to 9 / 11 with trillions of dollars wasted and lives, millions of lives destroyed. Afghanistan, 20 years on, a failed war with the Taliban returning to power and a failed state. Yes, bin Laden was killed, and I think people around the world cheered that, not just in the United States, and Al Qaeda was destroyed at the highest levels and in many cases uprooted completely. But no one can look back on the 20-plus years since 9 / 11 and say that the American response with the war on terror was successful. You can ' t do that. And Israel is not the United States. The Americans have extraordinary strength and resilience in its national security capabilities and the size of its economy, also in where it ' s located geopolitically. Israel certainly has the military strength in the region, but the the country is small. The territory is small. And certainly it is not in a geopolitical space that is comfortable. And so I think the danger here is that as the Israelis respond against Hamas, as they should and as they must, and as they work to destroy the leadership of that terrorist organization and disarm the militants that are involved in the attacks against Israel and pose an ongoing threat. But that is certainly not the only knock-on consequences of Israel ' s decision making. And the potential for this to become a broader war that would envelop the Middle East in conflagration and that ultimately could even end Israel is real in a way that the war on terror could not have threatened the United States existentially. And I, as a consequence, I certainly believe that a unity government will make it less likely that the Israelis overreact in that way. I certainly believe that the United States, in providing very strong and committed support, but also notes of caution in what can be done and what should not be done, will hopefully restrain the worst impulses. And, you know, in the early moments, again, we all understand why Israel would feel the need to react in the harshest possible way. But I certainly worry when I see the Israeli defense minister refer to the attackers as inhuman animals and announce a siege on the entirety of Gaza, which means no food, no electricity, no water. And this is a territory that already has 50 percent poverty, already has fewer than half of its population with **access** to clean water. I worry about what that is going to mean for the Palestinian people as well as for Israel long-term. You know, I think it was Golda Meir who says,"I won ' t hate you for killing our children. I will hate you for making me kill your children."Ultimately, the Israeli population is most threatened by what the terrorists of Hamas unleash from Israel. HW : So do you think that was part of the incentive for Hamas in doing this? Because surely they knew that the response would be swift. And surely they knew that the world would rally around such atrocities. So what do you think was their motivation, and do you think that they underestimated what might happen? IB : Oh, I don ' t think they underestimated what might happen. But it ' s a compelling question. It ' s really hard to put yourself in the mindset of someone like a Hamas leader. But, you know, I had to do that just a few months ago when Yevgeny Prigozhin was marching with his Wagner forces on Moscow. And people were asking me,"What is going through this guy ' s mind?"Because it ' s clear he ' s going to get killed, right? I mean, you turn against the Kremlin and Putin, you ' re not walking away from that. And when he cut the"deal"and everyone said,"Oh you know, he cut a deal"– He ' s dead man walking. Like, literally, that was the reality. And as soon as the Hamas leaders decided that they were going to commit these atrocities against Israeli civilians, they ' re dead. There is no future for these people. So I think there are two different things going on. The first, and this is analogous to Prigozhin, is that Hamas felt themselves in an increasingly untenable environment, that they were losing their support in the region. And even the Saudis were about to normalize their relationship with Israel. They had no influence in ability to get anything done, no leverage with the Israeli government, which was only becoming harder and harder lined against them. And in that regard, they were increasingly in a corner. Their options were increasingly all bad. And, you know, we know that people that find themselves only with horrible options frequently do irrational things. And I would not underestimate that in driving the decision of Hamas to take that action. It ' s kind of like why would 77 percent of a Gaza population in the last elections they had, which was some time ago, why would they vote for an organization like Hamas? Well, I mean, they wouldn ' t if they had economic opportunities. They wouldn ' t, if they had education, they wouldn ' t if they could come and go from Gaza as they please. But the worse the situation gets, the more they are willing to vote for an organization that is prepared to burn it all down. And by the way, there ' s a lesson in that, even for those of us in very wealthy, very stable countries. So I think that ' s one set of motivations, but another set of motivations certainly is an ideological effort of Hamas to insert themselves as more dominant in the conversation, to radicalize the Israeli population, to undermine the Palestinian Authority in the West Bank. Because if this fight, you know, gets the Israelis to kill huge numbers of Palestinian civilians, and by the way, Hamas will facilitate that, right? I mean, Hamas is absolutely going to be engaged in operations, you know, in residential buildings. They do that intentionally. They ' re not going to make it easy for Israel to take them out. They want to make it bloody. They want to paint the Israelis as just as bad as Hamas, if not worse. They will take human shields. The IDF, the Israeli Defense Forces, usually gives warnings about when they ' re about to attack a building. They ask the civilians to leave. Well, Hamas tells those civilians that that ' s disinformation. They do everything they can to make the Israelis seem complicit with the kind of indiscriminate attacks against civilians that Hamas engages in themselves. They want to bring the Israelis to their level. And they also want to radicalize the Palestinians in response, not just in Gaza but also in the West Bank. And they want to radicalize the Arab **street**. They want people across the region to be, you know, in uproar against Israel and in **solidarity** with the Hamas cause and in **solidarity** with the destruction of Israel. They want Arab leaders to be saying what the Iranian supreme leader was posting on social media this weekend, calling essentially for a genocide against the Zionist regime. That is ideologically what Hamas is trying to accomplish. And again, Israel must do everything in its power not to allow Hamas to drag them there. HW : It ' s interesting, in your talk in Vancouver this year at TED2023, you were talking about the rise of different orders, and I do just get the sense that everything is connected. You have Russia, you have Ukraine, you have Iran. There are these ideological battles that are now becoming real-world wars. And so I wonder if you can, especially the mention of Iran, I don ' t think it ' s confirmed yet, the intervention of Iran in this, but certainly the"Journal"was reporting that Iran had been involved, deeply involved in setting up these attacks. What does this mean? What does this mean for the world at large? And then I also have a follow up question, which is, what do you think the US should do? IB : So let ' s talk in terms of the world at large and starting with Iran, certainly that"Wall Street Journal"piece over the weekend drove an **enormous** amount of news. It was saying, hey, the Iranians basically planned this. I will tell you, that was a very lightly sourced piece, relying on Hamas. And I would not have gone to print with that if I had been"The Journal."HW : Yeah, the US has not confirmed that at all. IB : In fact, the US has actually said that there is not hard evidence at this point that fingers Iran as having directly orchestrated or ordered these attacks. Now, let ' s be very clear. The Iranians have publicly expressed strongest possible support for Hamas. The Iranians have historically funded and provided military support directly for Hamas. So they clearly are not **innocents** in this. And I would be surprised to learn that the Iranians had no idea that this was going to happen. I suspect that they were aware. But awareness and orchestration are two very different things. Now, since the attacks occurred, Hezbollah, which of course, is also very much aligned with Iran and gets a lot of direct military support and training from the Iranians, they have, I say only, but in this context, is only, they ' ve only engaged in some missile strikes, some rocket strikes against an Israeli military – not base, but military outpost. A soldier ' s outpost. And the Israelis, in response, immediately engaged in strikes back against Hezbollah. That ' s it. If the Iranians were behind this and wanted to be seen as behind this, Hezbollah would be involved in these attacks. They are far more capable than Hamas. The Iranians have claimed that they have had no role, that this was an autonomous Hamas operation. And indeed, Iran has been doing better geopolitically of late. The Chinese facilitated a breakthrough in Iranian relations with the Saudis. The Iranians have engaged with the United States, and six billion dollars of Iranian assets are set to be unfrozen, have not been unfrozen yet, but are set to be transferred to Iran. Five American civilians that were held unjustly as hostages in Iranian jails have been released and sent to the United States. The Iranians have reduced the top level of uranium enrichment and some of their stockpiles, allowing inspectors in. Now, this is not a return to the Iranian nuclear deal, the JCPOA, but certainly on the basis of all of that and even some high-level discussion that the Iranians might be willing to engage directly with the United States diplomatically through the good offices of Oman, none of that seems aligned at all with the Iranians pulling the trigger on an attack against Israel that would almost certainly lead to massive retaliation once the Israelis found that out. So I am sitting here saying I would be surprised, not with a high level of confidence, and, you know, the Iranian regime has a very old supreme leader who is also dealing with internal instability and a transition that is coming. So never say never. But I would be quite surprised if we found out that the Iranians directly ordered this. Now, it is useful that the United States has both sent a fleet off of the Israeli coast to show stalwart support and will be providing a level of at least military coordination and operational intelligence, may well do much more than that. We can get to that when we talk about the United States, but is also very publicly saying"We do not yet have any evidence that the Iranians are involved."In other words, the message from the United States is very clear : do not expand this war into Iran, because the consequences of that are 150-dollar crude at a minimum. The consequences of that is the world goes back into global recession. The consequences of that are conflagration in the region. And I think, I do believe that the Israeli government is quite aligned with the United States in not wanting to go there. HW : I keep coming back to the human cost of this because the reality is that people are suffering, people are being killed, and many more people are likely to be killed. If, indeed Hamas has kind of hijacked this story with extremist action, I wonder what you see from the Palestinian side of kind of a more moderate type of push towards trying to get understanding, trying to get peace in this nation or trying to get peace in this area. IB : I mean, that ' s the most tragic piece of this, is the ability of Hamas to successfully hijack big pieces of the political spectrum for the Palestinians. I mean, there are so many people in the West right now that view the Palestinians as equivalent to Hamas, and nothing could be further from the truth. But that reality, that perception is going to make life so much worse for the people that have suffered the most. They are the powerless. The Palestinians are the stateless. They lack resources. They lack a proper military. They lack the capacity to defend their own territory and to defend themselves. And we ' ve already seen, even over this most tragic weekend for Israel, that the number of deaths and casualties for the Palestinians are almost as much as they were for the Israelis. And when you go back over the past 20 years, who ' ve had the most deaths, who ' ve had the most casualties, consistently, it ' s been the Palestinians. Who ' s going to suffer the most going forward? Consistently, it will be the Palestinians. Who suffered the most from the US war on terror? It was, of course, the Iraqis and all of the tribes in Afghanistan. This should not surprise anyone, but it is the unfortunate reality that of course, Hamas leadership will be destroyed. But the biggest damage that they will have done would have been to their own people. To the Palestinian people, who now will face almost unfathomable deprivation. And there ' s very little that the rest of the world is going to do about it. HW : Do you see a movement within Palestine to step up if Hamas is done? IB : I certainly believe that the Palestinian Authority will try to see this as an opportunity to push for more international engagement from the region to take seriously a cessation of illegal Israeli settlements in the West Bank, a rolling back of the territory that is presently occupied and a revival of peace talks that would bring about a two-state solution where the Palestinians, less land than perhaps they would have gotten in the days of, you know, Arafat and Rabin, but nonetheless, something that feels sustainable, a country that one might be able to raise children with a sense of hope. There is no one in the occupied territories of Palestine that could say that for themselves for their children today. So I think that is the hope. But, you know, clearly right now is not the time for that. Not because we don ' t want it, but because events will overtake it immediately and have already overtaken. Now, the hope is that the **violence** that will spread in the West Bank can be contained. That we do not see a war in Gaza become a war in the West Bank, that we do not see an occupation of Gaza become an occupation of the West Bank. That is, I think, the priority now. You have to know sometimes when you actually have a trajectory for peace, and when you have to do your best to avoid war expanding. We do not have a trajectory for peace right now. We are at war. There were plenty of opportunities over the past years to take off ramps, to engage more seriously. They were ignored. And it is precisely that reality that has brought us to a point where we now are on defense, where we are hoping that this does not get much, much worse. That is the story of the Middle East today. HW : Do you think Israel will annex Gaza? IB : I think the Israelis don ' t know. Again, don ' t underestimate the shock, the emotional shock that all of the Israelis are facing today. They are not making long-term strategic decisions right now. They are making immediate, short-term decisions. What can we do to make sure the country is still defended, our borders are still secure, that terrorists are not, you know, right now running around in our midst, planning further atrocities? That is priority number one. And very close to it is getting those hostages back and safe and I ' d say unharmed. They ' ve already experienced a lot of **harm**. That ' s beyond the realm of possibility right now. There will be, in the coming weeks, and there ' s also some shock and awe, you know, Netanyahu immediately posting, some buildings getting demolished in Gaza and saying we are, you know, at war. That is, I mean, they ' ve engaged in these sorts of airstrikes before, and we already know of families that have gotten killed, entire families in some cases of nine, of 13 people, lots of children, this sort of thing. We will see that. But in terms of what ' s the nature of the long-term objectives, the occupation, the Israelis are not close to making that decision. And I also think that other countries that Israel trusts and Israel needs will have some ability to have influence over Israel in making that decision. I ' m not just talking about the US now. I ' m also talking about countries in the region that Israel would like to maintain relations with. So there needs to be very active multilateral diplomacy behind the scenes, quietly, high-level, with the Israeli government in the coming days and weeks. HW : I want to talk a little bit about the media coverage of the attacks and of what is happening right now. A lot of the people who had written in with questions for you are really confused by the rhetoric that they ' re seeing. They ' re not sure what to trust, who to trust, what to believe. And I want to get your sense, you ' re a very online person. And so what is your take on this, and how can we think about how to understand what ' s happening, especially in such a kind of, real-time situation? IB : Well, first of all, there ' s always the fog of war. There ' s always disinformation from both sides actively trying to promote a narrative that is more effective for them, that they ' re doing better than they otherwise are, and that the other side is engaged in greater atrocities than they actually are. You see lots of that, lots of immediately fake videos putting out of buildings that are being destroyed, people that are being killed, you know, sort of, people that are providing, you know, sort of, support for, sort of,"kill all the Jews"and"kill all the Palestinians"that actually came from previous conflicts, not from the present one. There ' s plenty of that. This time around, there ' s also so much more **hatred**. There ' s, on social media especially, there ' s so much more willingness to promote, algorithmically, opinions that you would never hear in your family, that you would never hear in your community, in your school, but it ' s being bombarded. And this is very different from the so-called mainstream media, whether it ' s the BBC or the Deutsche Welle or it ' s Fox News or CNN. No, no. Social media has become a far more greatly polarized and hate-filled space. I ’ ve received at least 30 death threats over the last 48 hours from complete randos. A few people that I actually could track if I really needed to, most anonymous accounts. But clearly people that are writing me directly, some of whom are really, really pro-Israel, some of whom are really, really pro-Palestine and some of whom are probably just trolling for the lolz, as they like to say. It is increasingly very hard to navigate this space without becoming incensed and deranged. Having said that, as much as I find **Twitter** / X a space antithetical to civil society, I also know, as someone who does analysis, that some of the best real-time information from sources on the ground is being passed through on X and is not found in other places. It will not come through in mainstream media. So for the average person, you need to spend a lot more time filtering and figuring out where to go and who to follow. But it still is the one place that you can go. And you know, it really does, the whole thing profoundly worries me because when you ’ re in an environment that you can no longer know what is truth, what is real information, it is really hard to maintain a society that is human. When you have people that are saying that all Israelis are X and all Palestinians are Y, and that is where much of social media, I mean, a strong majority of social media is there right now, you cannot have dialogue, you cannot have solutions, and you can very easily tilt into war, into radicalism, into fascism. This is something we all need to be guarded against. And I truly believe that the social media companies need to be regulated on this. They are acting as if they have no responsibility for what ’ s on their sites. That, you know, it ’ s just like the phone company. That if you and I, Helen, are having a conversation about blowing something up, well, we ’ re responsible for that. But the phone company isn ’ t responsible, and I accept that. But, Helen, if you and I are having a conversation about blowing something up and then the phone company takes that conversation, identifies everyone else that might be interested in blowing something up or has considered it, and takes that conversation and promotes it to them, then you, the phone company, are responsible, you are liable, you should be taken down. And we are in a war right now, and the social media companies are actively fanning the flames. They are spraying fuel on the flames, and they ’ re doing it globally. Globally, so much so that countries like China that are **authoritarian** and control their media space actually have sort of an intrinsic political stability advantage in”information warfare”over open societies that should be the most resilient. That ’ s crazy, and we can ’ t keep going down that path. HW : The ironies are writ large. OK, so we are coming on our time, but I wonder if you can leave us with a sense of what should we be watching for next? What should we be looking for? IB : First, we need to look for Lebanon. This is the issue of Hezbollah, which so far has been the dog that has not barked. Is that going to continue? It is the place that you are most likely to see tipping point escalation if it were to occur. And you have Hezbollah operatives of many different stripes. They are loosely organized, they ’ re well-trained. But that doesn ’ t mean that they ’ re all following, you know, marching orders from one direct leader. The potential that this could – you could see escalation with some Israeli farmers getting killed, and then the Israelis respond. And before you know it, you ’ re in a much bigger firefight. Lebanon ’ s involved, Hezbollah is involved, and then it knocks on to Iran. That is sort of the gateway drug in the Middle East even if nobody wants that fight. That ’ s one thing to watch. Second thing to watch, of course, imminently is what happens with these hostages. Do the Israelis get them back? Historically, that has always been the top priority, and it is today. But Hamas has control over that. And, you know, if the Israelis are not prepared to negotiate with Hamas to release militants presently in Israel prisons, and it ’ s very hard for me to imagine in today ’ s environment they would be willing to do that, well, how exactly do they get them back and how many of them can they actually free? Again, you know, the Israelis and the Americans have far, far better tradecraft on the ability to get these hostages out than Hamas have to take them. But Hamas has **exceeded** expectations over the past 48 hours, and I would worry very much about that. That would be the second thing I ’ d watch most closely right now. And then finally, the nature of the Israeli government itself. Do we have success in putting together a unified national emergency government, in which case we will have more stability in governance and decision making that comes from Israel and also greater willingness to consider longer-term engagement with those Palestinians, particularly in the West Bank, to start, at least, that might be looking for a more constructive path now that they are back on the agenda. I don ’ t have a high amount of optimism that that ’ s going to happen. But you asked me for something hopeful, that would be something hopeful. HW : Ian Bremmer, we are so grateful for your time and for your insight. Thank you so much for joining us, stay well. IB : My pleasure Helen.

Text Sample 377: POS Dim 3 – 2023 – Score 11.00 – 2023/t003423.txt

So if you whack your thumb with a hammer, you think pain is in your thumb. Physicians have a more sophisticated understanding. We know that it ’ s an alarm that goes, on nerves, to your spine, where it is translated to your brain, and pain actually happens... somewhere. It ’ s a little vague. We actually only get two days of pain education throughout all of medical school, so... In fact, the only pain lecture I remember from the ’ 90s was in a dark room like this, after being awake for 30 hours and hungry, and finding out our noon lecture was sponsored by OxyContin. We got pens, we got great lasagna, and they had very cool slides that showed pain stopped by opioids. And we learned that home opioids aren ’ t addictive, and if you stay ahead of pain – you can keep your patients pain-free. And beyond the obviously egregious marketing, I think it was framing”pain-free”as the goal that has destroyed countless lives. My friend ’ s son Christopher started having severe abdominal pain during this”no-pain”era. Eventually, he was diagnosed with a colon disease and had surgery his senior year. They sent Christopher home with 90 OxyContin, and then 90 more, and then, as the pain started getting faster and faster... Uncontrolled pain is terrifying. So when his ran out and his friends ’ medicine cabinets ran out, Christopher tried heroin. And Christopher Wolf lost his battle with substance use at age 32. So did we misunderstand pain? What if pain isn ’ t an alarm to **silence** but a learning system for survival? TED pose. Pain is every organism ’ s primary learning system for survival. I mean, it ’ s like,”Ouch. Don ’ t touch that.”Or, to paraphrase”The Princess Bride,””Life is pain, Highness.””Pain-free”was marketing, and it made physicians think that one pill could solve pain. It still makes people feel like you can ’ t be happy if you have some pain, and we now know that if you want to move past pain, it takes work. Setting the bar at”pain-free”was too high. Plenty of people could have been more comfortable, but they gave up because pain-free was out of reach. We have really good new information that I ’ m going to share, and so from now on, I want you to think about pain as a Venn diagram, with physiology, fear and control. I ’ m going to tell you how each of these can give you power over pain. Right now, I ’ m translating these, in my research, into a low-back pain device to reduce opioid use. But 20 years ago, I just wanted to have a fast cure for needle pain, for IV **access** and my kids ’ shots. I was driving home one night after a graveyard shift, and my hands were vibrating on the steering wheel, because we needed to get the tires balanced. I was ignoring that to think about pain, and when I got home and reached for the door in my house, my hand was **numb**. Vibration. So I burst in, my Boy Scout husband grabbed some frozen peas, and we had ourselves a genuine eureka moment, where cold and vibration blocked pain. Over the next decade, I found the right frequency to block pain, I got a grant, and I created Buzzy, which is vibration plus ice... in a bee shape. And you put it on your arm when you ' re getting an injection. And to date, 45 million needle procedures had decreased pain, and over 80 randomized controlled trials, independently, all around the world, have been published. But... At about 30 randomized controlled trials in, one of my colleagues came to me and confided that he was in opioid recovery. And he asked whether or not Buzzy could let him get through a total knee replacement drug-free. I ' d never thought about it. It ' s the same pain nerve for knees as for needles, so I said maybe. And he did it. Vibration plus cold replaced OxyContin. So at that point, I went all in, to figure out why. And here is what we know. So the reason that vibration decreases pain is because the physiology of the nerves of light touch, pressure, stretching and motion all races pain to the spine. Now people have tried electricity to trigger the light-touch nerves, but we now know that motion, shown in green, is what ' s most effective at shutting the gate on sharp pain. This is called gate control, and the exact right frequency of vibration triggers the nerves that decrease pain. The physiology of ice is different. So the cold goes up to the brain, where the conductor goes,"Obnoxious, but not dangerous. I will decrease sensations coming from everywhere."And it decreases pain everywhere. If a child was so freaked out from previous experiences that even the swab hurt... physiology wasn ' t as helpful. So we added distraction, like a monkey poster. And what we discovered was combining counting plus making a decision cut pain in half. So, for example,"How many monkeys are actually touching the bed?"activates the decision switchboard. I know what you guys are doing. It ' s five. Here is your pain hack for the day, though. If you do not have monkeys on hand, then find any sentence and count how many of the letters have holes in them. Counting, deciding. So, like, you ' ve got a g-hole, o-hole, a... hole. I guarantee you and your family will use this. The biggest hack, though, is understanding why distraction works. And now, through functional MRI, we can actually see pain happen. And it ' s not one place. Pain is a symphony of connections, from the sensation area to the conductor, to the decision switchboard, and then to fear, memory, meaning, control. So if the decision switchboard is occupied sorting monkeys, it can ' t notify fear and meaning, and you feel less pain. What you feel is mostly what you expect to feel. Stay with me. If you ' re a kid, the same punch hurts more from a bully than from your buddy. And if you ' re an adult and you feel something, the second you think it ' s cancer, it hurts more and more, until you find out it ' s not. And those same kids who had horrible shot experiences can tolerate all kinds of needle pain... to look cool. Because it is a different context. These patterns, called connectomes, are very personal, because experiences lay down more of the same sensation. And we now know that people who have certain areas in the brain connected feel more pain than people with different areas connected. And more importantly, untreated pain or intense pain can lay down heavier connections, so that even when your body is **healed**, you will still feel more pain. It ' s this very plasticity and personalization which makes the physiology, fear, control matrix so useful. Because choosing physiologic options that you can layer, that work for you, decreases pain, like heat, cold, vibration, deep relaxation, acupuncture, capsaicin, exercise, **meditation**... There ' s more. Christopher probably had 10 of these around his house and just didn ' t know it. Having control over your options decreases pain. Deep breathing increases control. Choosing what to focus on increases control. Fear and control are the volume knobs for pain. Fear controls so many of our sensations, this shouldn ’ t be unusual, but we don ’ t practice it for pain. So if you ’ re home alone and you hear a clunk... your hearing becomes hypersensitive. But when you remember your kid ’ s home from college, your fear dials down and your brain overrides it and says,”Don ’ t worry about it.”Saint Augustine called pain the greatest of evil. But if it is a survival system, it cannot be all evil. So instead, think of pain as your nagging, safety-obsessed, exaggerating friend who ’ s sometimes wrong. And it ’ s OK to ignore or override your friend if you know that you ’ re safe. This takes practice. On a flight that was turbulent, I had an entire cup of scalding-hot coffee dumped straight on my ankle. Electric jolt through my scalp. I ripped off my sock ; it was already red. It was going to blister. There was no way I could get my foot into that little sink to get cold water on it. And then I remembered. Physiology hack. I had an unopened cold beer. Medical-grade cold beer went on my ankle, stat. I had a vibrator in my carry-on, because I would. On my ankle. And then – The pain kind. And then my fear hack. I ’ m like,”There ’ s a barf bag that has holy letters, but I ’ m going to put it in the pocket pouch and save it, because then, I have increased control.”And, pain, I was no longer that concerned. Although then, I realized I ’ m that guy, with my bare foot sticking out in the aisle on a plane, with a beer on it. Power over pain isn ’ t always pretty, but it is possible and it is absolutely critical. Because there ’ s one more misconception we have not talked about. I honestly thought that opioids turned off some pain switch. They turn on our reward system. So some people feel amazing, but most people just still feel pain, but don ’ t care. Now, this is a godsend for people with chronic pain diseases. We should not take them away. And in the **trauma** bay, the more morphine in the first 24 hours after a burn or a wound, the less post-traumatic stress, the less chronic pain later. But studies show that recovery after surgery is just as well accomplished with coaching and physiologic options. And if you ’ re one of the people who feel amazing with opioids, it ’ s too risky. A study in 2019 found that one in 15 young adults who got opioids for their wisdom tooth removal had substance-use disorder within a year. Ibuprofen works better. So what do we do? Well, in my dream world, we have health-care systems – paid-for options and coaching – for Christophers everywhere. And we quit giving double-digit prescriptions for opioids for home recovery. In the real world, 80, 000 people died in the US last year from opioid overdoses, and 80 percent of substance-use disorders start with a pill prescribed for pain... Usually taken from your friend ’ s medicine cabinet. People can ’ t afford options. Doctors, 20 years later, still don ’ t know them. But you do. You all now know to throw away the opioids in your medicine cabinet. You now know that there are options you can use to decrease pain, and you know that”pain-free”should be ditched for”more comfortable.”And whether you dump scalding coffee or pain wakes you and exhausts you every day... Options that are in your control... can allow you to reframe pain. Thank you. Whitney Pennington Rodgers : Amy, thank you, it ’ s amazing. So how do you think that pain scales have set us back from this work that you ’ re doing, and how is the NIH treating pain and addiction differently now? Amy Baxter : So in one of the 120 versions of this talk, I talked about how the thing is, in the ’ 90s, if we wanted to”disease-ify”pain, it meant we had to be able to measure it. So that was where the FACES scales come from, and they ’ re actually very useful in the emergency department to tell whether or not a medicine is working. In fact, we were one of the first ones that showed, with sickle cell, that the patient ’ s report, based on those scales, was what was most indicative of whether they needed to be admitted, rather than any biologic marker. But what we ’ re doing now is we ’ re using something called the PROMIS scales, so it ’ s how intense pain is on five-point scales, how much it interferes, so there ’ s pain interference, pain intensity. And the way we ’ re looking at pain is much more on the impact for the person, rather than trying to pretend there ’ s any kind of objective pain measurement. WPR : OK. And you mentioned that you ’ re working on some new applications for Buzzy, specifically for back pain. What are some of the possibilities that we have here for what this could do for us in the future? AB : On my tombstone, there ’ s going to be a vibrating bee. It ’ s actually called DuoTherm, not Buzzy. But what we ’ ve learned is that there are harmonics of interaction between the specific frequencies that **cancel** out the pain. So there ’ s one particular nerve called the Pacinian that has a very specific frequency range, and by causing them to interact, we ’ re starting to explore more about the pain that ’ s coming from the fascia between the skin and between the muscles, but that area is where we ’ re unexplored, and so by interacting with different frequencies and then layering heat or cold, pressure options, giving people the choice of so many different ways to do it, it ’ s really engaging all the different areas of the brain from which pain comes. WPR : Wow, OK. Well, thank you so much, Amy. AB : Welcome. Thank you, all.

As someone who has spent his entire career trying to be invisible standing in front of an audience is a cross between an out-of-body experience and a deer caught in the headlights, so please forgive me for violating one of the TED commandments by relying on words on paper, and I only hope I ’ m not struck by lightning bolts before I ’ m done. I ’ d like to begin by talking about some of the ideas that motivated me to become a **documentary** photographer. I was a student in the ’ 60s, a time of social upheaval and questioning, and on a personal level, an awakening sense of idealism. The war in Vietnam was raging ; the Civil Rights Movement was under way ; and pictures had a powerful influence on me. Our political and military leaders were telling us one thing, and photographers were telling us another. I believed the photographers, and so did millions of other Americans. Their images fueled resistance to the war and to racism. They not only recorded history ; they helped change the course of history. Their pictures became part of our collective consciousness and, as consciousness evolved into a shared sense of conscience, change became not only possible, but inevitable. I saw that the free flow of information represented by journalism, specifically visual journalism, can bring into focus both the benefits and the cost of political policies. It can give credit to sound decision-making, adding momentum to success. In the face of poor political judgment or political inaction, it becomes a kind of intervention, assessing the damage and asking us to reassess our behavior. It puts a human face on issues which from afar can appear abstract or ideological or monumental in their global impact. What happens at ground level, far from the halls of power, happens to ordinary citizens one by one. And I understood that **documentary** photography has the ability to interpret events from their point of view. It gives a voice to those who otherwise would not have a voice. And as a reaction, it stimulates public opinion and gives impetus to public debate, thereby preventing the interested parties from totally controlling the agenda, much as they would like to. Coming of age in those days made real the concept that the free flow of information is absolutely vital for a free and dynamic society to function properly. The press is certainly a business, and in order to survive it must be a successful business, but the right balance must be found between marketing considerations and journalistic responsibility. Society ' s problems can ' t be solved until they ' re identified. On a higher plane, the press is a service industry, and the service it provides is awareness. Every story does not have to sell something. There ' s also a time to give. That was a tradition I wanted to follow. Seeing the war created such incredibly high stakes for everyone involved and that visual journalism could actually become a factor in conflict resolution — I wanted to be a photographer in order to be a war photographer. But I was driven by an inherent sense that a picture that revealed the true face of war would almost by definition be an anti-war photograph. I ' d like to take you on a visual journey through some of the events and issues I ' ve been involved in over the past 25 years. In 1981, I went to Northern Ireland. 10 IRA prisoners were in the process of starving themselves to death in protest against conditions in jail. The reaction on the **streets** was **violent** confrontation. I saw that the front lines of contemporary wars are not on isolated battlefields, but right where people live. During the early ' 80s, I spent a lot of time in Central America, which was engulfed by civil wars that straddled the ideological divide of the Cold War. In Guatemala, the central government — controlled by a oligarchy of European decent — was waging a scorched Earth campaign against an **indigenous** rebellion, and I saw an image that reflected the history of Latin America : conquest through a combination of the Bible and the sword. An anti-Sandinista guerrilla was mortally wounded as Commander Zero attacked a town in Southern Nicaragua. A destroyed tank belonging to Somoza ' s national guard was left as a monument in a park in Managua, and was transformed by the energy and spirit of a child. At the same time, a civil war was taking place in El Salvador, and again, the civilian population was caught up in the conflict. I ' ve been covering the Palestinian-Israeli conflict since 1981. This is a moment from the beginning of the second intifada, in 2000, when it was still stones and Molotovs against an army. In 2001, the uprising escalated into an **armed** conflict, and one of the major incidents was the destruction of the Palestinian refugee camp in the West Bank town of Jenin. Without the political will to find common ground, the continual friction of tactic and counter-tactic only creates suspicion and **hatred** and vengeance, and perpetuates the cycle of **violence**. In the ' 90s, after the breakup of the Soviet Union, Yugoslavia fractured along ethnic fault lines, and civil war broke out between Bosnia, Croatia and Serbia. This is a scene of house-to-house fighting in Mostar, neighbor against neighbor. A bedroom, the place where people share intimacy, where life itself is conceived, became a battlefield. A **mosque** in northern Bosnia was destroyed by Serbian artillery and was used as a makeshift morgue. Dead Serbian soldiers were collected after a battle and used as barter for the return of prisoners or Bosnian soldiers killed in action. This was once a park. The Bosnian soldier who guided me told me that all of his friends were there now. At the same time in South Africa, after Nelson Mandela had been released from prison, the black population commenced the final phase of liberation from apartheid. One of the things I had to learn as a journalist was what to do with my anger. I had to use it, channel its energy, turn it into something that would clarify my vision, instead of clouding it. In Transkei, I witnessed a rite of passage into manhood, of the Xhosa tribe. Teenage boys lived in isolation, their bodies covered with white clay. After several weeks, they washed off the white and took on the full responsibilities of men. It was a very old ritual that seemed symbolic of the political struggle that was changing the face of South Africa. Children in Soweto playing on a trampoline. Elsewhere in Africa there was famine. In Somalia, the central government collapsed and clan warfare broke out. Farmers were driven off their land, and crops and livestock were destroyed or stolen. Starvation was being used as a weapon of mass destruction — primitive but extremely effective. Hundreds of thousands of people were exterminated, slowly and painfully. The international community responded with massive humanitarian relief, and hundreds of thousands of more lives were saved. American troops were sent to protect the relief shipments, but they were eventually drawn into the conflict, and after the tragic battle in Mogadishu, they were withdrawn. In southern Sudan, another civil war saw similar use of starvation as a means of genocide. Again, international NGOs, united under the umbrella of the U. N., staged a massive relief operation and thousands of lives were saved. I ’ m a witness, and I want my testimony to be honest and uncensored. I also want it to be powerful and eloquent, and to do as much justice as possible to the experience of the people I ’ m photographing. This man was in an NGO feeding center, being helped as much as he could be helped. He literally had nothing. He was a virtual skeleton, yet he could still summon the courage and the will to move. He had not given up, and if he didn ’ t give up, how could anyone in the outside world ever dream of losing hope? In 1994, after three months of covering the South African election, I saw the inauguration of Nelson Mandela, and it was the most uplifting thing I ’ ve ever seen. It exemplified the best that humanity has to offer. The next day I left for Rwanda, and it was like taking the express elevator to hell. This man had just been liberated from a Hutu death camp. He allowed me to photograph him for quite a long time, and he even turned his face toward the light, as if he wanted me to see him better. I think he knew what the scars on his face would say to the rest of the world. This time, maybe confused or discouraged by the military disaster in Somalia, the international community remained silent, and somewhere around 800, 000 people were slaughtered by their own countrymen — sometimes their own neighbors — using farm implements as weapons. Perhaps because a lesson had been learned by the weak response to the war in Bosnia and the failure in Rwanda, when Serbia attacked Kosovo, international action was taken much more decisively. NATO forces went in, and the Serbian army withdrew. Ethnic Albanians had been murdered, their farms destroyed and a huge number of people forcibly deported. They were received in refugee camps set up by NGOs in Albania and Macedonia. The imprint of a man who had been burned inside his own home. The image reminded me of a cave painting, and echoed how primitive we still are in so many ways. Between 1995 and ’ 96, I covered the first two wars in Chechnya from inside Grozny. This is a Chechen rebel on the front line against the Russian army. The Russians bombarded Grozny constantly for weeks, killing mainly the civilians who were still trapped inside. I found a boy from the local orphanage wandering around the front line. My work has evolved from being concerned mainly with war to a focus on critical social issues as well. After the fall of Ceausescu, I went to Romania and discovered a kind of gulag of children, where thousands of orphans were being kept in medieval conditions. Ceausescu had imposed a quota on the number of children to be produced by each family, thereby making women ’ s bodies an instrument of state economic policy. Children who couldn ’ t be supported by their families were raised in government orphanages. Children with birth defects were labeled incurables, and confined for life to inhuman conditions. As reports began to surface, again international aid went in. Going deeper into the legacy of the Eastern European regimes, I worked for several months on a story about the effects of industrial pollution, where there had been no regard for the environment or the health of either workers or the general population. An aluminum factory in Czechoslovakia was filled with carcinogenic smoke and dust, and four out of five workers came down with cancer. After the fall of Suharto in Indonesia, I began to explore conditions of poverty in a country that was on its way towards modernization. I spent a good deal of time with a man who lived with his family on a railway embankment and had lost an arm and a leg in a train accident. When the story was published, unsolicited donations poured in. A trust fund was established, and the family now lives in a house in the countryside and all their basic necessities are taken care of. It was a story that wasn ’ t trying to sell anything. Journalism had provided a channel for people ’ s natural sense of generosity, and the readers responded. I met a band of **homeless** children who ’ d come to Jakarta from the countryside, and ended up living in a train station. By the age of 12 or 14, they ’ d become beggars and drug addicts. The rural poor had become the urban poor, and in the process, they ’ d become invisible. These heroin addicts in detox in Pakistan reminded me of figures in a play by Beckett : isolated, waiting in the dark, but drawn to the light. Agent Orange was a defoliant used during the Vietnam War to deny cover to the Vietcong and the North Vietnamese army. The active ingredient was dioxin, an extremely toxic chemical that was sprayed in vast quantities, and whose effects passed through the genes to the next generation. In 2000, I began documenting global health issues, concentrating first on AIDS in Africa. I tried to tell the story through the work of caregivers. I thought it was important to emphasize that people were being helped, whether by international NGOs or by local grassroots organizations. So many children have been orphaned by the epidemic that grandmothers have taken the place of parents, and a lot of children had been born with HIV. A hospital in Zambia. I began documenting the close connection between HIV / AIDS and tuberculosis. This is an MSF hospital in Cambodia. My pictures can play a supporting role to the work of NGOs by shedding light on the critical social problems they ’ re trying to deal with. I went to Congo with MSF, and contributed to a book and an exhibition that focused attention on a forgotten war in which millions of people have died, and exposure to disease without treatment is used as a weapon. A malnourished child being measured as part of the supplemental feeding program. In the fall of 2004 I went to Darfur. This time I was on assignment for a magazine, but again worked closely with MSF. The international community still hasn ’ t found a way to create the pressure necessary to stop this genocide. An MSF hospital in a camp for displaced people. I ’ ve been working on a long project on crime and punishment in America. This is a scene from New Orleans. A prisoner on a chain gang in Alabama was punished by being handcuffed to a post in the midday sun. This experience raised a lot of questions, among them questions about race and **equality** and for whom in our country opportunities and options are available. In the yard of a chain gang in Alabama. I didn ’ t see either of the planes hit, and when I glanced out my window, I saw the first tower burning, and I thought it might have been an accident. A few minutes later when I looked again and saw the second tower burning, I knew we were at war. In the midst of the wreckage at Ground Zero, I had a realization. I ’ d been photographing in the Islamic world since 1981 — not only in the Middle East, but also in Africa, Asia and Europe. At the time I was photographing in these different places, I thought I was covering separate stories, but on 9 / 11 history crystallized, and I understood I ’ d actually been covering a single story for more than 20 years, and the attack on New York was its latest manifestation. The central commercial district of Kabul, Afghanistan at the end of the civil war, shortly before the city fell to the Taliban. Land mine **victims** being helped at the Red Cross rehab center being run by Alberto Cairo. A boy who lost a leg to a leftover mine. I ’ d witnessed immense **suffering** in the Islamic world from political oppression, civil war, foreign invasions, poverty, famine. I understood that in its **suffering**, the Islamic world had been crying out. Why weren ’ t we listening? A Taliban fighter shot during a battle as the Northern Alliance entered the city of Kunduz. When war with Iraq was imminent, I realized the

American troops would be very well covered, so I decided to cover the invasion from inside Baghdad. A marketplace was hit by a mortar shell that killed several members of a single family. A day after American forces entered Baghdad, a company of Marines began rounding up bank robbers and were cheered on by the crowds — a hopeful moment that was short lived. For the first time in years, Shi ' ites were allowed to make the pilgrimage to Karbala to observe Ashura, and I was amazed by the sheer number of people and how fervently they practiced their religion. A group of men march through the **streets** cutting themselves with knives. It was obvious that the Shi ' ites were a force to be reckoned with, and we would do well to understand them and learn how to deal with them. Last year I spent several months documenting our wounded troops, from the battlefield in Iraq all the way home. This is a helicopter medic giving CPR to a soldier who had been shot in the head. Military medicine has become so efficient that the percentage of troops who survive after being wounded is much higher in this war than in any other war in our history. The signature weapon of the war is the IED, and the signature wound is severe leg damage. After enduring extreme pain and **trauma**, the wounded face a grueling physical and psychological struggle in rehab. The spirit they displayed was absolutely remarkable. I tried to imagine myself in their place, and I was totally humbled by their courage and determination in the face of such catastrophic loss. Good people had been put in a very bad situation for questionable results. One day in rehab someone, started talking about surfing and all these guys who ' d never surfed before said,"Hey, let ' s go."And they went surfing. Photographers go to the extreme edges of human experience to show people what ' s going on. Sometimes they put their lives on the line, because they believe your opinions and your influence matter. They aim their pictures at your best instincts, generosity, a sense of right and wrong, the ability and the willingness to identify with others, the refusal to accept the unacceptable. My TED wish : there ' s a vital story that needs to be told, and I wish for TED to help me gain **access** to it and then to help me come up with innovative and exciting ways to use news photography in the digital era. Thank you very much.

Text Sample 379: POS Dim 3 – 2007 – Score 11.00 – 2007/t000357.txt

I ' ve actually been waiting by the phone for a call from TED for years. And in fact, in 2000, I was ready to talk about eBay, but no call. In 2003, I was ready to do a talk about the Skoll Foundation and social entrepreneurship. No call. In 2004, I started Participant Productions and we had a really good first year, and no call. And finally, I get a call last year, and then I have to go up after J. J. Abrams. You ' ve got a cruel sense of humor, TED. When I first moved to Hollywood from Silicon Valley, I had some misgivings. But I found that there were some advantages to being in Hollywood. And, in fact, some advantages to owning your own media company. And I also found that Hollywood and Silicon Valley have a lot more in common than I would have dreamed. Hollywood has its sex symbols, and the Valley has its sex symbols. Hollywood has its rivalries, and the Valley has its rivalries. Hollywood gathers around power tables, and the Valley gathers around power tables. So it turned out there was a lot more in common than I would have dreamed. But I ' m actually here today to tell a story. And part of it is a personal story. When Chris invited me to speak, he said, people think of you as a bit of an enigma, and they want to know what drives you a bit. And what really drives me is a vision of the future that I think we all share. It ' s a world of peace and prosperity and sustainability. And when we heard a lot of the presentations over the last couple of days, Ed Wilson and the pictures of James Nachtwey, I think we all realized how far we have to go to get to this new version of humanity that I like to call"Humanity 2. 0."And it ' s also something that resides in each of us, to close what I think are the two big calamities in the world today. One is the gap in opportunity — this gap that President Clinton last night called uneven, unfair and unsustainable — and, out of that, comes poverty and illiteracy and disease and all these evils that we see around us. But perhaps the other, bigger gap is what we call the hope gap. And someone, at some point, came up with this very bad idea that an ordinary individual couldn ' t make a difference in the world. And I think that ' s just a horrible thing. And so chapter one really begins today, with all of us, because within each of us is the power to **equal** those opportunity gaps and to close the hope gaps. And if the men and women of TED can ' t make a difference in the world, I don ' t know who can. And for me, a lot of this started when I was younger and my family used to go camping in upstate New York. And there really wasn ' t much to do there for the summer, except get beaten up by my sister or read books. And so I used to read authors like James Michener and James Clavell and Ayn Rand. And their stories made the world seem a very small and interconnected place. And it struck me that if I could write stories that were about this world as being small and interconnected, that maybe I could get people interested in the issues that affected us all, and maybe engage them to make a difference. I didn ' t think that was necessarily the best way to make a living, so I decided to go on a path to become financially independent, so I could write these stories as quickly as I could. I then had a bit of a wake-up call when I was 14. And my dad came home one day and announced that he had cancer, and it looked pretty bad. And what he said was, he wasn ' t so much afraid that he might die, but that he hadn ' t done the things that he wanted to with his life. And knock on wood, he ' s still alive today, many years later. But for a young man that made a real impression on me, that one never knows how much time one really has. So I set out in a hurry. I studied engineering. I started a couple of businesses that I thought would be the ticket to financial freedom. One of those businesses was a computer rental business called Micros on the Move, which is very well named, because people kept stealing the computers. So I figured I needed to learn a little bit more about business, so I went to Stanford Business School and studied there. And while I was there, I made friends with a fellow named Pierre Omidyar, who is here today. And Pierre, I **apologize** for this. This is a photo from the old days. And just after I ' d graduated, Pierre came to me with this idea to help people buy and sell things online with each other. And with the wisdom of my Stanford degree, I said,"Pierre, what a stupid idea."And needless to say, I was right. But right after that, Pierre — in ' 96, Pierre and I left our full-time jobs to build eBay as a company. And the rest of that story, you know. The company went public two years later and is today one of the best known companies in the world. Hundreds of millions of people use it in hundreds of countries, and so on. But for me, personally, it was a real change. I went from living in a house with five guys in Palo Alto and living off their leftovers, to all of a sudden having all kinds of resources. And I wanted to figure out how I could take the blessing of these resources and share it with the world. And around that time, I met John Gardner, who is a remarkable man. He was the architect of the Great Society programs under Lyndon Johnson in the 1960s. And I asked him what he felt was the best thing I could do, or anyone could do, to make a difference in the long-term issues facing humanity. And John said,"Bet on good people doing good things. Bet on good people doing good things."And that really resonated with me. I started a foundation to bet on these good people doing good things. These leading, innovative, **nonprofit** folks, who are using business skills in a very leveraged way to solve social problems. People today we call social entrepreneurs. And to put a face on it, people like Muhammad Yunus, who started the Grameen Bank, has lifted 100 million people plus out of poverty around the world, won the Nobel Peace Prize. But there ' s also a lot of people that you don ' t know. Folks like Ann Cotton, who started a group called CAMFED in Africa, because she felt girls ' education was lagging. And she started it about 10 years ago, and today, she educates over a quarter million African girls. And somebody like Dr. Victoria Hale, who started the world ' s first **nonprofit** pharmaceutical company, and whose first drug will be fighting visceral leishmaniasis, also known as black fever. And by 2010, she hopes to eliminate this disease, which is really a scourge in the developing world. And so this is one way to bet on good people doing good things. And a lot of this comes together in a philosophy of change that I find really is powerful. It ' s what we call,"Invest, connect and **celebrate**."And invest : if you see good people doing good things, invest in them. Invest in their organizations, or in business. Invest in these folks. Connecting them together through conferences — like a TED — brings so many powerful connections, or through the World Forum on Social Entrepreneurship that my foundation does at Oxford every year. And **celebrate** them : tell their stories, because not only are there good people doing good work, but their stories can help close these gaps of hope. And it was this last part of the mission, the **celebrate** part, that really got me back to thinking when I was a kid and wanted to tell stories to get people involved in the issues that affect us all. And a light bulb went off, which was, first, that I didn ' t actually have to do the writing myself, I could find writers. And then the next light bulb was, better than just writing, what about film and TV, to get out to people in a big way? And I thought about the films that inspired me, films like"Gandhi"and"Schindler ' s List."And I wondered who was doing these kinds of films today. And there really wasn ' t a specific company that was focused on the public interest. So, in 2003, I started to make my way around Los Angeles to talk about the idea of a pro-social media company and I was met with a lot of encouragement. One of the lines of encouragement that I heard over and over was,"The **streets** of Hollywood are littered with the carcasses of people like you, who think you ' re going to come to this town and make movies."And then of course, there was the other adage."The surest way to become a millionaire is to start by being a billionaire and go into the movie business."Undeterred, in January of 2004, I started Participant Productions with the vision to be a global media company focused on the public interest. And our mission is to produce entertainment that creates and inspires social change. And we don ' t just want people to see our movies and say, that was fun, and forget about it. We want them to actually get involved in the issues. In 2005, we launched our first slate of films,"Murder Ball,""North Country,""Syriana"and"Good Night and Good Luck."And much to my surprise, they were noticed. We ended up with 11 Oscar nominations for these films. And it turned out to be a pretty good year for this guy. Perhaps more importantly, tens of thousands of people joined the advocacy programs and the activism programs that we created to go around the movies. And we had an online component of that, our community sect called Participate. net. But with our social sector partners, like the ACLU and PBS and the Sierra Club and the NRDC, once people saw the film, there was actually something they could do to make a difference. One of these films in particular, called"North Country,"was actually kind of a box office disaster. But it was a film that starred Charlize Theron and it was about women ' s rights, women ' s empowerment, **domestic violence** and so on. And we released the film at the same time that the Congress was debating the renewal of the **Violence** Against Women Act. And with screenings on the Hill, and discussions, and with our social sector partners, like the National Organization of Women, the film was widely credited with influencing the successful renewal of the act. And that to me, spoke volumes, because it ’ s — the film started about a true-life story about a woman who was harassed, sued her employer, led to a landmark case that led to the Equal Opportunity Act, and the **Violence** Against Women Act and others. And then the movie about this person doing these things, then led to this greater renewal. And so again, it goes back to betting on good people doing good things. Speaking of which, our fellow TEDster, Al — I first saw Al do his slide show presentation on global warming in May of 2005. At that point, I thought I knew something about global warming. I thought it was a 30 to 50 year problem. And after we saw his slide show, it became clear that it was much more urgent. And so right afterwards, I met backstage with Al, and with Lawrence Bender, who was there, and Laurie David, and Davis Guggenheim, who was running **documentaries** for Participant at the time. And with Al ’ s blessing, we decided on the spot to turn it into a film, because we felt that we could get the message out there far more quickly than having Al go around the world, speaking to audiences of 100 or 200 at a time. And you know, there ’ s another adage in Hollywood, that nobody knows nothing about anything. And I really thought this was going to be a straight-to-PBS charitable **initiative**. And so it was a great shock to all of us when the film really captured the public interest, and today is mandatory viewing in schools in England and Scotland, and most of Scandinavia. We ’ ve sent 50, 000 DVDs to high school teachers in the U. S. and it ’ s really changed the debate on global warming. It was also a pretty good year for this guy. We now call Al the George Clooney of global warming. And for Participant, this is just the start. Everything we do looks at the major issues in the world. And we have 10 films in production right now, and dozens others in development. I ’ ll quickly talk about a few coming up. One is”Charlie Wilson ’ s War,”with Tom Hanks and Julia Roberts. And it ’ s the true story of Congressman Charlie Wilson, and how he funded the Taliban to fight the Russians in Afghanistan. And we ’ re also doing a movie called”The Kite Runner,”based on the book”The Kite Runner,”also about Afghanistan. And we think once people see these films, they ’ ll have a much better understanding of that part of the world and the Middle East in general. We premiered a film called”The Chicago 10”at Sundance this year. It ’ s based on the protesters at the Democratic Convention in 1968, Abby Hoffman and crew, and, again, a story about a small group of individuals who did make change in the world. And a **documentary** that we ’ re doing on Jimmy Carter and his Mid-East peace efforts over the years. And in particular, we ’ ve been following him on his recent book tour, which, as many of you know, has been very non- controversial — — which is really bad for getting people to come see a movie. In closing, I ’ d like to say that everybody has the opportunity to make change in their own way. And all the people in this room have done so through their business lives, or their philanthropic work, or their other interests. And one thing that I ’ ve learned is that there ’ s never one right way to make change. One can do it as a tech person, or as a finance person, or a **nonprofit** person, or as an entertainment person, but every one of us is all of those things and more. And I believe if we do these things, we can close the opportunity gaps, we can close the hope gaps. And I can imagine, if we do this, the headlines in 10 years might read something like these :”New AIDS Cases in Africa Fall to Zero,””U. S. Imports its Last Barrel of Oil”— —”Israelis and Palestinians **Celebrate** 10 Years of Peaceful Coexistence.”And I like this one,”Snow Has Returned to Kilimanjaro.”And finally, an eBay listing for one well-traveled slide show, now obsolete, museum piece. Please contact Al Gore. And I believe that, working together, we can make all of these things happen.

And I want to thank you all for having me here today. It ’ s been a real honor. Thank you. Oh, thank you.

Text Sample 380: POS Dim 3 – 2007 – Score 10.00 – 2007/t000355.txt

I really am honored to be here, and as Chris said, it ’ s been over 20 years since I started working in Africa. My first introduction was at the Abidjan airport on a sweaty, Ivory Coast morning. I had just left Wall Street, cut my hair to look like Margaret Mead, given away most everything that I owned, and arrived with all the essentials — some poetry, a few clothes, and, of course, a guitar — because I was going to save the world, and I thought I would just start with the African continent. But literally within days of arriving I was told, in no uncertain terms, by a number of West African women, that Africans didn ’ t want saving, thank you very much, least of all not by me. I was too young, unmarried, I had no children, didn ’ t really know Africa, and besides, my French was pitiful. And so, it was an incredibly painful time in my life, and yet it really started to give me the humility to start listening. I think that failure can be an incredibly motivating force as well, so I moved to Kenya and worked in Uganda, and I met a group of Rwandan women, who asked me, in 1986, to move to Kigali to help them start the first microfinance institution there. And I did, and we ended up naming it Duterimbere, meaning”to go forward with enthusiasm.”And while we were doing it, I realized that there weren ’ t a lot of businesses that were viable and started by women, and so maybe I should try to run a business, too. And so I started looking around, and I heard about a bakery that was run by 20 prostitutes. And, being a little intrigued, I went to go meet this group, and what I found was 20 unwed mothers who were trying to survive. And it was really the beginning of my understanding the power of language, and how what we call people so often distances us from them, and makes them little. I also found out that the bakery was nothing like a business, that, in fact, it was a classic charity run by a well-intentioned person, who essentially spent 600 dollars a month to keep these 20 women busy making little crafts and baked goods, and living on 50 cents a day, still in poverty. So, I made a deal with the women. I said,”Look, we get rid of the charity side, and we run this as a business and I ’ ll help you.”They nervously agreed. I nervously started, and, of course, things are always harder than you think they ’ re going to be. First of all, I thought, well, we need a sales team, and we clearly aren ’ t the A-Team here, so let ’ s — I did all this training. And the epitome was when I literally marched into the **streets** of Nyamirambo, which is the popular quarter of Kigali, with a bucket, and I sold all these little doughnuts to people, and I came back, and I was like,”You see?”And the women said,”You know, Jacqueline, who in Nyamirambo is not going to buy doughnuts out of an orange bucket from a tall American woman?”And like — — it ’ s a good point. So then I went the whole American way, with competitions, team and individual. Completely failed, but over time, the women learnt to sell on their own way. And they started listening to the marketplace, and they came back with ideas for cassava chips, and banana chips, and sorghum bread, and before you knew it, we had cornered the Kigali market, and the women were earning three to four times the national average. And with that confidence surge, I thought,”Well, it ’ s time to create a real bakery, so let ’ s paint it.”And the women said,”That ’ s a really great idea.”And I said,”Well, what color do you want to paint it?”And they said,”Well, you choose.”And I said,”No, no, I ’ m learning to listen. You choose. It ’ s your bakery, your **street**, your country — not mine.”But they wouldn ’ t give me an answer. So, one week, two weeks, three weeks went by, and finally I said,”Well, how about blue?”And they said,”Blue, blue, we love blue. Let ’ s do it blue.”So, I went to the store, I brought Gaudence, the recalcitrant one of all, and we brought all this paint and fabric to make curtains, and on painting day, we all gathered in Nyamirambo, and the idea was we would paint it white with blue as trim, like a little French bakery. But that was clearly not as satisfying as painting a wall of blue like a morning sky. So, blue, blue, everything became blue. The walls were blue, the windows were blue, the **sidewalk** out front was painted blue. And Aretha Franklin was shouting”R-E-S-P-E-C-T,”the women ’ s hips were swaying and little kids were trying to grab the paintbrushes, but it was their day. And at the end of it, we stood across the **street** and we looked at what we had done, and I said,”It is so beautiful.”And the women said,”It really is.”And I said,”And I think the color is perfect,”and they all nodded their head, except for Gaudence, and I said,”What?”And she said,”Nothing.”And I said,”What?”And she said,”Well, it is pretty, but, you know, our color, really, it is green.”And — — I learned then that listening isn ’ t just about patience, but that when you ’ ve lived on charity and dependent your whole life long, it ’ s really hard to say what you mean. And, mostly because people never really ask you, and when they do, you don ’ t really think they want to know the truth. And so then I learned that listening is not only about waiting, but it ’ s also learning how better to ask questions. And so, I lived in Kigali for about two and a half years, doing these two things, and it was an extraordinary time in my life. And it taught me three lessons that I think are so important for us today, and certainly in the work that I do. The first is that dignity is more important to the human spirit than wealth. As Eleni has said, when people gain income, they gain choice, and that is fundamental to dignity. But as human beings, we also want to see each other, and we want to be heard by each other, and we should never forget that. The second is that traditional charity and aid are never going to solve the problems of poverty. I think Andrew pretty well covered that, so I will move to the third point, which is that markets alone also are not going to solve the problems of poverty. Yes, we ran this as a business, but someone needed to pay the philanthropic support that came into the training, and the management support, the strategic advice and, maybe most important of all, the **access** to new contacts, networks and new markets. And so, on a micro level, there ’ s a real role for this combination of investment and philanthropy. And on a macro level — some of the speakers have inferred that even health should be privatized. But, having had a father with heart disease, and realizing that what our family could afford was not what he should have gotten, and having a good friend step in to help, I really believe that all people deserve **access** to health at prices they can afford. I think the market can help us figure that out, but there ’ s got to be a charitable component, or I don ’ t think we ’ re going to create the kind of societies we want to live in. And so, it was really those lessons that made me decide to build Acumen Fund about six years ago. It ’ s a **nonprofit**, venture capital fund for the poor, a few oxymorons in one sentence. It essentially raises charitable funds from individuals, foundations and corporations, and then we turn around and we invest **equity** and loans in both for-profit and **nonprofit** entities that deliver affordable health, housing, energy, clean water to low income people in South Asia and Africa, so that they can make their own choices. We ’ ve invested about 20 million dollars in 20 different enterprises, and have, in so doing, created nearly 20, 000 jobs, and delivered tens of millions of services to people who otherwise would not be able to afford them. I want to tell you two stories. Both of them are in Africa. Both of them are about investing in entrepreneurs who are committed to service, and who really know the markets. Both of them live at the confluence of public health and enterprise, and both of them, because they ’ re manufacturers, create jobs directly, and create incomes indirectly, because they ’ re in the malaria sector, and Africa loses about 13 billion dollars a year because of malaria. And so as people get healthier, they also get wealthier. The first one is called Advanced Bio-Extracts Limited. It ’ s a company built in Kenya about seven years ago by an incredible entrepreneur named Patrick Henfrey and his three colleagues. These are old-hand farmers who ’ ve gone through all the agricultural ups and downs in Kenya over the last 30 years. Now, this plant is an Artemisia plant ; it ’ s the basic component for artemisinin, which is the best-known treatment for malaria. It ’ s **indigenous** to China and the Far East, but given that the prevalence of malaria is here in Africa, Patrick and his colleagues said,”Let ’ s bring it here, because it ’ s a high value-add product.”The farmers get three to four times the yields that they would with maize. And so, using patient capital — money that they could raise early on, that actually got below market returns and was willing to go the long haul and be combined with management assistance, strategic assistance — they ’ ve now created a company where they purchase from 7, 500 farmers. So that ’ s about 50, 000 people affected. And I think some of you may have visited — these farmers are helped by KickStart and TechnoServe, who help them become more self-sufficient. They buy it, they dry it and they bring it to this factory, which was purchased in part by, again, patient capital from Novartis, who has a real interest in getting the powder so that they can make Coartem. Acumen ’ s been working with ABE for the past year, year and a half, both on looking at a new business plan, and what does expansion look like, helping with management support and helping to do term sheets and raise capital. And I really understood what patient capital meant emotionally in the last month or so. Because the company was literally 10 days away from proving that the product they produced was at the world-quality level needed to make Coartem, when they were in the biggest cash crisis of their history. And we called all of the social investors we know. Now, some of these same social investors are really interested in Africa and understand the importance of agriculture, and they even helped the farmers. And even when we explained that if ABE goes away, all those 7, 500 jobs go away too, we sometimes have this bifurcation between business and the social. And it ’ s really time we start thinking more creatively about how they can be fused. So Acumen made not one, but two bridge loans, and the good news is they did indeed meet world-quality classification and are now in the final stages of closing a 20-million-dollar round, to move it to the next level, and I think that this will be one of the more important companies in East Africa. This is Samuel. He ’ s a farmer. He was actually living in the Kibera slums when his father called him and told him about Artemisia and the value-add potential. So he moved back to the farm, and, long story short, they now have seven acres under cultivation. Samuel ’ s kids are in private school, and he ’ s starting to help other farmers in the area also go into Artemisia production — dignity being more important than wealth. The next one, many of you know. I talked about it a little at Oxford two years ago, and some of you visited A to Z manufacturing, which is one of the great, real companies in East Africa. It ’ s another one that lives at the confluence of health and enterprise. And this is really a story about a public-private solution that has really worked. It started in Japan. Sumitomo had developed a technology essentially to impregnate a polyethylene-based fiber with organic insecticide, so you could create a bed net, a malaria bed net, that would last five years and not need to be re-dipped. It could alter the vector, but like Artemisia, it had been produced only in East Asia. And as part of its social responsibility, Sumitomo said,”Why don ’ t we experiment with whether we can produce it in Africa, for Africans?”UNICEF came forward and said,”We ’ ll buy most of the nets, and then we ’ ll give them away, as part of the global fund ’ s and the U.

N. ’ s commitment to pregnant women and children, for free.”Acumen came in with the patient capital, and we also helped to identify the entrepreneur that we would all partner with here in Africa, and Exxon provided the initial resin. Well, in looking around for entrepreneurs, there was none better that we could find on earth than Anuj Shah, in A to Z manufacturing company. It ’ s a 40-year-old company, it understands manufacturing. It ’ s gone from socialist Tanzania into capitalist Tanzania, and continued to flourish. It had about 1, 000 employees when we first found it. And so, Anuj took the entrepreneurial risk here in Africa to produce a public good that was purchased by the aid establishment to work with malaria. And, long story short, again, they ’ ve been so successful. In our first year, the first net went off the line in October of 2003. We thought the hitting-it- out-of-the-box number was 150, 000 nets a year. This year, they are now producing eight million nets a year, and they employ 5, 000 people, 90 percent of whom are women, mostly unskilled. They ’ re in a joint venture with Sumitomo. And so, from an enterprise perspective for Africa, and from a public health perspective, these are real successes. But it ’ s only half the story if we ’ re really looking at solving problems of poverty, because it ’ s not long-term sustainable. It ’ s a company with one big customer. And if avian flu hits, or for any other reason the world decides that malaria is no longer as much of a priority, everybody loses. And so, Anuj and Acumen have been talking about testing the private sector, because the assumption that the aid establishment has made is that, look, in a country like Tanzania, 80 percent of the population makes less than two dollars a day. It costs, at manufacturing point, six dollars to produce these, and it costs the establishment another six dollars to distribute it, so the market price in a free market would be about 12 dollars per net. Most people can ’ t afford that, so let ’ s give it away free. And we said,”Well, there ’ s another option. Let ’ s use the market as the best listening device we have, and understand at what price people would pay for this, so they get the dignity of choice. We can start building local distribution, and actually, it can cost the public sector much less.”And so we came in with a second round of patient capital to A to Z, a loan as well as a grant, so that A to Z could play with pricing and listen to the marketplace, and found a number of things. One, that people will pay different prices, but the overwhelming number of people will come forth at one dollar per net and make a decision to buy it. And when you listen to them, they ’ ll also have a lot to say about what they like and what they don ’ t like. And that some of the channels we thought would work didn ’ t work. But because of this experimentation and iteration that was allowed because of the patient capital, we ’ ve now found that it costs about a dollar in the private sector to distribute, and a dollar to buy the net. So then, from a policy perspective, when you start with the market, we have a choice. We can continue going along at 12 dollars a net, and the customer pays zero, or we could at least experiment with some of it, to charge one dollar a net, costing the public sector another six dollars a net, give the people the dignity of choice, and have a distribution system that might, over time, start sustaining itself. We ’ ve got to start having conversations like this, and I don ’ t think there ’ s any better way to start than using the market, but also to bring other people to the table around it. Whenever I go to visit A to Z, I think of my grandmother, Stella. She was very much like those women sitting behind the sewing machines. She grew up on a farm in Austria, very poor, didn ’ t have very much education. She moved to the United States, where she met my grandfather, who was a cement hauler, and they had nine children. Three of them died as babies. My grandmother had tuberculosis, and she worked in a sewing machine shop, making shirts for about 10 cents an hour. She, like so many of the women I see at A to Z, worked hard every day, understood what **suffering** was, had a deep faith in God, loved her children and would never have accepted a handout. But because she had the opportunity of the marketplace, and she lived in a society that provided the **safety** of having **access** to affordable health and education, her children and their children were able to live lives of real purpose and follow real dreams. I look around at my **siblings** and my cousins — and as I said, there are a lot of us — and I see teachers and musicians, hedge fund managers, designers. One sister who makes other people ’ s wishes come true. And my wish, when I see those women, I meet those farmers, and I think about all the people across this continent who are working hard every day, is that they have that sense of opportunity and possibility, and that they also can believe and get **access** to services, so that their children, too, can live those lives of great purpose. It shouldn ’ t be that difficult. But what it takes is a commitment from all of us to essentially refuse trite assumptions, get out of our ideological boxes. It takes investing in those entrepreneurs that are committed to service as well as to success. It takes opening your arms, both, wide, and expecting very little love in return, but demanding accountability, and bringing the accountability to the table as well. And most of all, most of all, it requires that all of us have the courage and the patience, whether we are rich or poor, African or non-African, local or diaspora, left or right, to really start listening to each other. Thank you.

Text Sample 381: POS Dim 3 – 2012 – Score 15.00 – 2012/t002418.txt

Well this is a really extraordinary honor for me. I spend most of my time in jails, in prisons, on death row. I spend most of my time in very low-income communities in the projects and places where there ’ s a great deal of hopelessness. And being here at TED and seeing the stimulation, hearing it, has been very, very energizing to me. And one of the things that ’ s emerged in my short time here is that TED has an identity. And you can actually say things here that have impacts around the world. And sometimes when it comes through TED, it has meaning and power that it doesn ’ t have when it doesn ’ t. And I mention that because I think identity is really important. And we ’ ve had some fantastic presentations. And I think what we ’ ve learned is that, if you ’ re a teacher your words can be meaningful, but if you ’ re a compassionate teacher, they can be especially meaningful. If you ’ re a doctor you can do some good things, but if you ’ re a caring doctor you can do some other things. And so I want to talk about the power of identity. And I didn ’ t learn about this actually practicing law and doing the work that I do. I actually learned about this from my grandmother. I grew up in a house that was the traditional African-American home that was dominated by a matriarch, and that matriarch was my grandmother. She was tough, she was strong, she was powerful. She was the end of every argument in our family. She was the beginning of a lot of arguments in our family. She was the daughter of people who were actually enslaved. Her parents were born in slavery in Virginia in the 1840 ’ s. She was born in the 1880 ’ s and the experience of slavery very much shaped the way she saw the world. And my grandmother was tough, but she was also **loving**. When I would see her as a little boy, she ’ d come up to me and she ’ d give me these hugs. And she ’ d squeeze me so tight I could barely breathe and then she ’ d let me go. And an hour or two later, if I saw her, she ’ d come over to me and she ’ d say,”Bryan, do you still feel me hugging you?”And if I said,”No,”she ’ d **assault** me again, and if I said,”Yes,”she ’ d leave me alone. And she just had this quality that you always wanted to be near her. And the only challenge was that she had 10 children. My mom was the youngest of her 10 kids. And sometimes when I would go and spend time with her, it would be difficult to get her time and attention. My cousins would be running around everywhere. And I remember, when I was about eight or nine years old, waking up one morning, going into the living room, and all of my cousins were running around. And my grandmother was sitting across the room staring at me. And at first I thought we were playing a game. And I would look at her and I ’ d smile, but she was very serious. And after about 15 or 20 minutes of this, she got up and she came across the room and she took me by the hand and she said,”Come on, Bryan. You and I are going to have a talk.”And I remember this just like it happened yesterday. I never will forget it. She took me out back and she said,”Bryan, I ’ m going to tell you something, but you don ’ t tell anybody what I tell you.”I said,”Okay, Mama.”She said,”Now you make sure you don ’ t do that.”I said,”Sure.”Then she sat me down and she looked at me and she said,”I want you to know I ’ ve been watching you.”And she said,”I think you ’ re special.”She said,”I think you can do anything you want to do.”I will never forget it. And then she said,”I just need you to promise me three things, Bryan.”I said,”Okay, Mama.”She said,”The first thing I want you to promise me is that you ’ ll always love your mom.”She said,”That ’ s my baby girl, and you have to promise me now you ’ ll always take care of her.”Well I adored my mom, so I said,”Yes, Mama. I ’ ll do that.”Then she said,”The second thing I want you to promise me is that you ’ ll always do the right thing even when the right thing is the hard thing.”And I thought about it and I said,”Yes, Mama. I ’ ll do that.”Then finally she said,”The third thing I want you to promise me is that you ’ ll never drink alcohol.”Well I was nine years old, so I said,”Yes, Mama. I ’ ll do that.”I grew up in the country in the rural South, and I have a brother a year older than me and a sister a year younger. When I was about 14 or 15, one day my brother came home and he had this six-pack of beer — I don ’ t know where he got it — and he grabbed me and my sister and we went out in the woods. And we were kind of just out there doing the stuff we crazily did. And he had a sip of this beer and he gave some to my sister and she had some, and they offered it to me. I said,”No, no, no. That ’ s okay. You all go ahead. I ’ m not going to have any beer.”My brother said,”Come on. We ’ re doing this today ; you always do what we do. I had some, your sister had some. Have some beer.”I said,”No, I don ’ t feel right about that. Y ’ all go ahead. Y ’ all go ahead.”And then my brother started staring at me. He said,”What ’ s wrong with you? Have some beer.”Then he looked at me real hard and he said,”Oh, I hope you ’ re not still hung up on that conversation Mama had with you.”I said,”Well, what are you talking about?”He said,”Oh, Mama tells all the grandkids that they ’ re special.”I was devastated. And I ’ m going to admit something to you. I ’ m going to tell you something I probably shouldn ’ t. I know this might be broadcast broadly. But I ’ m 52 years old, and I ’ m going to admit to you that I ’ ve never had a drop of alcohol. I don ’ t say that because I think that ’ s virtuous ; I say that because there is power in identity. When we create the right kind of identity, we can say things to the world around us that they don ’ t actually believe makes sense. We can get them to do things that they don ’ t think they can do. When I thought about my grandmother, of course she would think all her grandkids were special. My grandfather was in prison during prohibition. My male uncles died of alcohol-related diseases. And these were the things she thought we needed to commit to. Well I ’ ve been trying to say something about our criminal justice system. This country is very different today than it was 40 years ago. In 1972, there were 300, 000 people in jails and prisons. Today, there are 2. 3 million. The United States now has the highest rate of incarceration in the world. We have seven million people on probation and parole. And mass incarceration, in my judgment, has fundamentally changed our world. In poor communities, in communities of color there is this despair, there is this hopelessness, that is being shaped by these outcomes. One out of three black men between the ages of 18 and 30 is in jail, in prison, on probation or parole. In urban communities across this country — Los Angeles, Philadelphia, Baltimore, Washington — 50 to 60 percent of all young men of color are in jail or prison or on probation or parole. Our system isn ' t just being shaped in these ways that seem to be distorting around race, they ' re also distorted by poverty. We have a system of justice in this country that treats you much better if you ' re rich and guilty than if you ' re poor and **innocent**. Wealth, not culpability, shapes outcomes. And yet, we seem to be very comfortable. The politics of fear and anger have made us believe that these are problems that are not our problems. We ' ve been disconnected. It ' s interesting to me. We ' re looking at some very interesting developments in our work. My state of Alabama, like a number of states, actually permanently disenfranchises you if you have a criminal conviction. Right now in Alabama 34 percent of the black male population has permanently lost the right to vote. We ' re actually projecting in another 10 years the level of disenfranchisement will be as high as it ' s been since prior to the passage of the Voting Rights Act. And there is this stunning **silence**. I represent children. A lot of my clients are very young. The United States is the only country in the world where we sentence 13-year-old children to die in prison. We have life imprisonment without parole for kids in this country. And we ' re actually doing some litigation. The only country in the world. I represent people on death row. It ' s interesting, this question of the death penalty. In many ways, we ' ve been taught to think that the real question is, do people deserve to die for the crimes they ' ve committed? And that ' s a very sensible question. But there ' s another way of thinking about where we are in our identity. The other way of thinking about it is not, do people deserve to die for the crimes they commit, but do we deserve to kill? I mean, it ' s fascinating. Death penalty in America is defined by error. For every nine people who have been executed, we ' ve actually identified one **innocent** person who ' s been exonerated and released from death row. A kind of astonishing error rate — one out of nine people **innocent**. I mean, it ' s fascinating. In aviation, we would never let people fly on airplanes if for every nine planes that took off one would crash. But somehow we can insulate ourselves from this problem. It ' s not our problem. It ' s not our burden. It ' s not our struggle. I talk a lot about these issues. I talk about race and this question of whether we deserve to kill. And it ' s interesting, when I teach my students about African-American history, I tell them about slavery. I tell them about terrorism, the era that began at the end of reconstruction that went on to World War II. We don ' t really know very much about it. But for African- Americans in this country, that was an era defined by terror. In many communities, people had to worry about being lynched. They had to worry about being bombed. It was the threat of terror that shaped their lives. And these older people come up to me now and they say,"Mr. Stevenson, you give talks, you make speeches, you tell people to stop saying we ' re dealing with terrorism for the first time in our nation ' s history after 9 / 11."They tell me to say,"No, tell them that we grew up with that."And that era of terrorism, of course, was followed by segregation and decades of racial subordination and apartheid. And yet, we have in this country this dynamic where we really don ' t like to talk about our problems. We don ' t like to talk about our history. And because of that, we really haven ' t understood what it ' s meant to do the things we ' ve done historically. We ' re constantly running into each other. We ' re constantly creating tensions and conflicts. We have a hard time talking about race, and I believe it ' s because we are unwilling to commit ourselves to a process of truth and reconciliation. In South Africa, people understood that we couldn ' t overcome apartheid without a commitment to truth and reconciliation. In Rwanda, even after the genocide, there was this commitment, but in this country we haven ' t done that. I was giving some lectures in Germany about the death penalty. It was fascinating because one of the scholars stood up after the presentation and said,"Well you know it ' s deeply troubling to hear what you ' re talking about."He said,"We don ' t have the death penalty in Germany. And of course, we can never have the death penalty in Germany."And the room got very quiet, and this woman said,"There ' s no way, with our history, we could ever engage in the systematic killing of human beings. It would be unconscionable for us to, in an intentional and deliberate way, set about executing people."And I thought about that. What would it feel like to be living in a world where the nation state of Germany was executing people, especially if they were disproportionately Jewish? I couldn ' t bear it. It would be unconscionable. And yet, in this country, in the states of the Old South, we execute people — where you ' re 11 times more likely to get the death penalty if the **victim** is white than if the **victim** is black, 22 times more likely to get it if the defendant is black and the **victim** is white — in the very states where there are buried in the ground the bodies of people who were lynched. And yet, there is this disconnect. Well I believe that our identity is at risk. That when we actually don ' t care about these difficult things, the positive and wonderful things are nonetheless implicated. We love innovation. We love technology. We love creativity. We love entertainment. But ultimately, those realities are shadowed by **suffering**, abuse, degradation, marginalization. And for me, it becomes necessary to integrate the two. Because ultimately we are talking about a need to be more hopeful, more committed, more dedicated to the basic challenges of living in a complex world. And for me that means spending time thinking and talking about the poor, the disadvantaged, those who will never get to TED. But thinking about them in a way that is integrated in our own lives. You know ultimately, we all have to believe things we haven ' t seen. We do. As rational as we are, as committed to intellect as we are. Innovation, creativity, development comes not from the ideas in our mind alone. They come from the ideas in our mind that are also fueled by some conviction in our heart. And it ' s that mind-heart connection that I believe compels us to not just be attentive to all the bright and dazzly things, but also the dark and difficult things. Vaclav Havel, the great Czech leader, talked about this. He said,"When we were in Eastern Europe and dealing with oppression, we wanted all kinds of things, but mostly what we needed was hope, an orientation of the spirit, a willingness to sometimes be in hopeless places and be a witness."Well that orientation of the spirit is very much at the core of what I believe even TED communities have to be engaged in. There is no disconnect around technology and design that will allow us to be fully human until we pay attention to **suffering**, to poverty, to exclusion, to unfairness, to injustice. Now I will warn you that this kind of identity is a much more challenging identity than ones that don ' t pay attention to this. It will get to you. I had the great privilege, when I was a young lawyer, of meeting Rosa Parks. And Ms. Parks used to come back to Montgomery every now and then, and she would get together with two of her dearest friends, these older women, Johnnie Carr who was the organizer of the Montgomery bus boycott — amazing African- American woman — and Virginia Durr, a white woman, whose husband, Clifford Durr, represented Dr. King. And these women would get together and just talk. And every now and then Ms. Carr would call me, and she ' d say,"Bryan, Ms. Parks is coming to town. We ' re going to get together and talk. Do you want to come over and listen?"And I ' d say,"Yes, Ma ' am, I do."And she ' d say,"Well what are you going to do when you get here?"I said,"I ' m going to listen."And I ' d go over there and I would, I would just listen. It would be so energizing and so empowering. And one time I was over there listening to these women talk, and after a couple of hours Ms. Parks turned to me and she said,”Now Bryan, tell me what the Equal Justice Initiative is. Tell me what you ’ re trying to do.”And I began giving her my rap. I said,”Well we ’ re trying to challenge injustice. We ’ re trying to help people who have been wrongly **convicted**. We ’ re trying to confront bias and **discrimination** in the administration of criminal justice. We ’ re trying to end life without parole sentences for children. We ’ re trying to do something about the death penalty. We ’ re trying to reduce the prison population. We ’ re trying to end mass incarceration.”I gave her my whole rap, and when I finished she looked at me and she said,”Mmm mmm mmm.”She said,”That ’ s going to make you tired, tired, tired.”And that ’ s when Ms. Carr leaned forward, she put her finger in my face, she said,”That ’ s why you ’ ve got to be brave, brave, brave.”And I actually believe that the TED community needs to be more courageous. We need to find ways to embrace these challenges, these problems, the **suffering**. Because ultimately, our humanity depends on everyone ’ s humanity. I ’ ve learned very simple things doing the work that I do. It ’ s just taught me very simple things. I ’ ve come to understand and to believe that each of us is more than the worst thing we ’ ve ever done. I believe that for every person on the planet. I think if somebody tells a lie, they ’ re not just a liar. I think if somebody takes something that doesn ’ t belong to them, they ’ re not just a thief. I think even if you kill someone, you ’ re not just a killer. And because of that there ’ s this basic human dignity that must be respected by law. I also believe that in many parts of this country, and certainly in many parts of this globe, that the opposite of poverty is not wealth. I don ’ t believe that. I actually think, in too many places, the opposite of poverty is justice. And finally, I believe that, despite the fact that it is so dramatic and so beautiful and so inspiring and so stimulating, we will ultimately not be judged by our technology, we won ’ t be judged by our design, we won ’ t be judged by our intellect and reason. Ultimately, you judge the character of a society, not by how they treat their rich and the powerful and the privileged, but by how they treat the poor, the condemned, the incarcerated. Because it ’ s in that nexus that we actually begin to understand truly profound things about who we are. I sometimes get out of balance. I ’ ll end with this story. I sometimes push too hard. I do get tired, as we all do. Sometimes those ideas get ahead of our thinking in ways that are important. And I ’ ve been representing these kids who have been sentenced to do these very harsh sentences. And I go to the jail and I see my client who ’ s 13 and 14, and he ’ s been certified to stand trial as an adult. I start thinking, well, how did that happen? How can a judge turn you into something that you ’ re not? And the judge has certified him as an adult, but I see this kid. And I was up too late one night and I starting thinking, well gosh, if the judge can turn you into something that you ’ re not, the judge must have magic power. Yeah, Bryan, the judge has some magic power. You should ask for some of that. And because I was up too late, wasn ’ t thinking real straight, I started working on a motion. And I had a client who was 14 years old, a young, poor black kid. And I started working on this motion, and the head of the motion was :”Motion to try my poor, 14-year-old black male client like a privileged, white 75-year-old corporate executive.”And I put in my motion that there was prosecutorial misconduct and police misconduct and judicial misconduct. There was a crazy line in there about how there ’ s no conduct in this county, it ’ s all misconduct. And the next morning, I woke up and I thought, now did I dream that crazy motion, or did I actually write it? And to my horror, not only had I written it, but I had sent it to court. A couple months went by, and I had just forgotten all about it. And I finally decided, oh gosh, I ’ ve got to go to the court and do this crazy case. And I got into my car and I was feeling really overwhelmed — overwhelmed. And I got in my car and I went to this courthouse. And I was thinking, this is going to be so difficult, so painful. And I finally got out of the car and I started walking up to the courthouse. And as I was walking up the steps of this courthouse, there was an older black man who was the janitor in this courthouse. When this man saw me, he came over to me and he said,"Who are you?"I said,"I ' m a lawyer."He said,"You ' re a lawyer?"I said,"Yes, sir."And this man came over to me and he hugged me. And he whispered in my ear. He said,"I ' m so proud of you."And I have to tell you, it was energizing. It connected deeply with something in me about identity, about the capacity of every person to contribute to a community, to a perspective that is hopeful. Well I went into the courtroom. And as soon as I walked inside, the judge saw me coming in. He said,"Mr. Stevenson, did you write this crazy motion?"I said,"Yes, sir. I did."And we started arguing. And people started coming in because they were just outraged. I had written these crazy things. And police officers were coming in and assistant prosecutors and clerk workers. And before I knew it, the courtroom was filled with people angry that we were talking about race, that we were talking about poverty, that we were talking about inequality. And out of the corner of my eye, I could see this janitor pacing back and forth. And he kept looking through the window, and he could hear all of this holler. He kept pacing back and forth. And finally, this older black man with this very worried look on his face came into the courtroom and sat down behind me, almost at counsel table. About 10 minutes later the judge said we would take a break. And during the break there was a deputy sheriff who was offended that the janitor had come into court. And this deputy jumped up and he ran over to this older black man. He said,"Jimmy, what are you doing in this courtroom?"And this older black man stood up and he looked at that deputy and he looked at me and he said,"I came into this courtroom to tell this young man, keep your eyes on the prize, hold on."I ' ve come to TED because I believe that many of you understand that the moral arc of the universe is long, but it bends toward justice. That we cannot be full evolved human beings until we care about human rights and basic dignity. That all of our survival is tied to the survival of everyone. That our visions of technology and design and entertainment and creativity have to be married with visions of humanity, compassion and justice. And more than anything, for those of you who share that, I ' ve simply come to tell you to keep your eyes on the prize, hold on. Thank you very much. Chris Anderson : So you heard and saw an obvious desire by this audience, this community, to help you on your way and to do something on this issue. Other than writing a check, what could we do? BS : Well there are opportunities all around us. If you live in the state of California, for example, there ' s a referendum coming up this spring where actually there ' s going to be an effort to redirect some of the money we spend on the politics of punishment. For example, here in California we ' re going to spend one billion dollars on the death penalty in the next five years — one billion dollars. And yet, 46 percent of all homicide cases don ' t result in arrest. 56 percent of all rape cases don ' t result. So there ' s an opportunity to change that. And this referendum would propose having those dollars go to law **enforcement** and **safety**. And I think that opportunity exists all around us. CA : There ' s been this huge decline in crime in America over the last three decades. And part of the narrative of that is sometimes that it ' s about increased incarceration rates. What would you say to someone who believed that? BS : Well actually the **violent** crime rate has remained relatively stable. The great increase in mass incarceration in this country wasn ' t really in **violent** crime categories. It was this misguided war on drugs. That ' s where the dramatic increases have come in our prison population. And we got carried away with the rhetoric of punishment. And so we have three strikes laws that put people in prison forever for stealing a bicycle, for low-level property crimes, rather than making them give those resources back to the people who they victimized. I believe we need to do more to help people who are victimized by crime, not do less. And I think our current punishment philosophy does nothing for no one. And I think that ’ s the orientation that we have to change. CA : Bryan, you ’ ve struck a massive chord here. You ’ re an inspiring person. Thank you so much for coming to TED. Thank you.

Thank you very much. Thank you. It ’ s a distinct privilege to be here. A few weeks ago, I saw a video on YouTube of Congresswoman Gabrielle Giffords at the early stages of her recovery from one of those awful bullets. This one entered her left hemisphere, and knocked out her Broca ’ s area, the speech center of her brain. And in this session, Gabby ’ s working with a speech therapist, and she ’ s struggling to produce some of the most basic words, and you can see her growing more and more devastated, until she ultimately breaks down into sobbing tears, and she starts sobbing wordlessly into the arms of her therapist. And after a few moments, her therapist tries a new tack, and they start **singing** together, and Gabby starts to **sing** through her tears, and you can hear her clearly able to enunciate the words to a song that describe the way she feels, and she **sings**, in one descending scale, she **sings**,”Let it shine, let it shine, let it shine.”And it ’ s a very powerful and poignant reminder of how the beauty of music has the ability to speak where words fail, in this case literally speak. Seeing this video of Gabby Giffords reminded me of the work of Dr. Gottfried Schlaug, one of the preeminent neuroscientists studying music and the brain at Harvard, and Schlaug is a proponent of a therapy called Melodic Intonation Therapy, which has become very popular in music therapy now. Schlaug found that his stroke **victims** who were aphasic, could not form sentences of three- or four-word sentences, but they could still **sing** the lyrics to a song, whether it was”Happy Birthday To You”or their favorite song by the Eagles or the Rolling Stones. And after 70 hours of intensive singing lessons, he found that the music was able to literally rewire the brains of his patients and create a homologous speech center in their right hemisphere to compensate for the left hemisphere ’ s damage. When I was 17, I visited Dr. Schlaug ’ s lab, and in one afternoon he walked me through some of the leading research on music and the brain — how musicians had fundamentally different brain structure than non-musicians, how music, and listening to music, could just light up the entire brain, from our prefrontal cortex all the way back to our cerebellum, how music was becoming a neuropsychiatric modality to help children with autism, to help people struggling with stress and anxiety and depression, how deeply Parkinsonian patients would find that their tremor and their gait would steady when they listened to music, and how late-stage Alzheimer ’ s patients, whose dementia was so far progressed that they could no longer recognize their family, could still pick out a tune by Chopin at the piano that they had learned when they were children. But I had an ulterior motive of visiting Gottfried Schlaug, and it was this : that I was at a crossroads in my life, trying to choose between music and medicine. I had just completed my undergraduate, and I was working as a research assistant at the lab of Dennis Selkoe, studying Parkinson ’ s disease at Harvard, and I had fallen in love with neuroscience. I wanted to become a surgeon. I wanted to become a doctor like Paul Farmer or Rick Hodes, these kind of fearless men who go into places like Haiti or Ethiopia and work with AIDS patients with multidrug-resistant tuberculosis, or with children with disfiguring cancers. I wanted to become that kind of Red Cross doctor, that doctor without borders. On the other hand, I had played the violin my entire life. Music for me was more than a **passion**. It was obsession. It was oxygen. I was lucky enough to have studied at the Juilliard School in Manhattan, and to have played my debut with Zubin Mehta and the Israeli philharmonic orchestra in Tel Aviv, and it turned out that Gottfried Schlaug had studied as an organist at the Vienna Conservatory, but had given up his love for music to pursue a career in medicine. And that afternoon, I had to ask him,"How was it for you making that decision?"And he said that there were still times when he wished he could go back and play the organ the way he used to, and that for me, medical school could wait, but that the violin simply would not. And after two more years of studying music, I decided to shoot for the impossible before taking the MCAT and applying to medical school like a good Indian son to become the next Dr. Gupta. And I decided to shoot for the impossible and I took an audition for the esteemed Los Angeles Philharmonic. It was my first audition, and after three days of playing behind a screen in a trial week, I was offered the position. And it was a dream. It was a wild dream to perform in an orchestra, to perform in the iconic Walt Disney Concert Hall in an orchestra conducted now by the famous Gustavo Dudamel, but much more importantly to me to be surrounded by musicians and mentors that became my new family, my new musical home. But a year later, I met another musician who had also studied at Juilliard, one who profoundly helped me find my voice and shaped my identity as a musician. Nathaniel Ayers was a double bassist at Juilliard, but he suffered a series of psychotic episodes in his early 20s, was treated with thorazine at Bellevue, and ended up living **homeless** on the **streets** of Skid Row in downtown Los Angeles 30 years later. Nathaniel ' s story has become a beacon for **homelessness** and mental health advocacy throughout the United States, as told through the book and the movie"The Soloist,"but I became his friend, and I became his violin teacher, and I told him that wherever he had his violin, and wherever I had mine, I would play a lesson with him. And on the many times I saw Nathaniel on Skid Row, I witnessed how music was able to bring him back from his very darkest moments, from what seemed to me in my untrained eye to be the beginnings of a schizophrenic episode. Playing for Nathaniel, the music took on a deeper meaning, because now it was about communication, a communication where words failed, a communication of a message that went deeper than words, that registered at a fundamentally primal level in Nathaniel ' s psyche, yet came as a true musical offering from me. I found myself growing outraged that someone like Nathaniel could have ever been **homeless** on Skid Row because of his mental illness, yet how many tens of thousands of others there were out there on Skid Row alone who had stories as tragic as his, but were never going to have a book or a movie made about them that got them off the **streets**? And at the very core of this crisis of mine, I felt somehow the life of music had chosen me, where somehow, perhaps possibly in a very naive sense, I felt what Skid Row really needed was somebody like Paul Farmer and not another classical musician playing on Bunker Hill. But in the end, it was Nathaniel who showed me that if I was truly passionate about change, if I wanted to make a difference, I already had the perfect instrument to do it, that music was the bridge that connected my world and his. There ' s a beautiful quote by the Romantic German composer Robert Schumann, who said,"To send light into the **darkness** of men ' s hearts, such is the duty of the artist."And this is a particularly poignant quote because Schumann himself suffered from schizophrenia and died in asylum. And inspired by what I learned from Nathaniel, I started an organization on Skid Row of musicians called Street Symphony, bringing the light of music into the very darkest places, performing for the **homeless** and mentally **ill** at shelters and clinics on Skid Row, performing for combat veterans with post-traumatic stress disorder, and for the incarcerated and those labeled as criminally insane. After one of our events at the Patton State Hospital in San Bernardino, a woman walked up to us and she had tears streaming down her face, and she had a palsy, she was shaking, and she had this gorgeous smile, and she said that she had never heard classical music before, she didn ’ t think she was going to like it, she had never heard a violin before, but that hearing this music was like hearing the sunshine, and that nobody ever came to visit them, and that for the first time in six years, when she heard us play, she stopped shaking without medication. Suddenly, what we ’ re finding with these concerts, away from the stage, away from the footlights, out of the tuxedo tails, the musicians become the conduit for delivering the tremendous therapeutic benefits of music on the brain to an audience that would never have **access** to this room, would never have **access** to the kind of music that we make. Just as medicine serves to **heal** more than the building blocks of the body alone, the power and beauty of music transcends the”E”in the middle of our beloved acronym. Music transcends the aesthetic beauty alone. The synchrony of emotions that we experience when we hear an **opera** by Wagner, or a symphony by Brahms, or chamber music by Beethoven, compels us to remember our **shared**, common humanity, the deeply communal connected consciousness, the empathic consciousness that neuropsychiatrist Iain McGilchrist says is hard-wired into our brain ’ s right hemisphere. And for those living in the most dehumanizing conditions of mental illness within **homelessness** and incarceration, the music and the beauty of music offers a chance for them to transcend the world around them, to remember that they still have the capacity to experience something beautiful and that humanity has not forgotten them. And the spark of that beauty, the spark of that humanity transforms into hope, and we know, whether we choose the path of music or of medicine, that ’ s the very first thing we must instill within our communities, within our audiences, if we want to inspire healing from within. I ’ d like to end with a quote by John Keats, the Romantic English poet, a very famous quote that I ’ m sure all of you know. Keats himself had also given up a career in medicine to pursue poetry, but he died when he was a year older than me. And Keats said,”Beauty is truth, and truth beauty. That is all ye know on Earth, and all ye need to know.”

Text Sample 383: POS Dim 3 – 2012 – Score 13.00 – 2012/t002040.txt

I ’ m going to share with you a paradigm-shifting perspective on the issues of gender **violence** : **sexual assault**, **domestic violence**, relationship abuse, **sexual harassment**, **sexual** abuse of children. That whole range of issues that I ’ ll refer to in shorthand as”gender **violence** issues,”they ’ ve been seen as women ’ s issues that some good men help out with, but I have a problem with that frame and I don ’ t accept it. I don ’ t see these as women ’ s issues that some good men help out with. In fact, I ’ m going to argue that these are men ’ s issues, first and foremost. Now obviously — Obviously, they ’ re also women ’ s issues, so I appreciate that, but calling gender **violence** a women ’ s issue is part of the problem, for a number of reasons. The first is that it gives men an excuse not to pay attention, right? A lot of men hear the term”women ’ s issues”and we tend to tune it out, and we think,”I ’ m a guy ; that ’ s for the girls,”or”that ’ s for the women.”And a lot of men literally don ’ t get beyond the first sentence as a result. It ’ s almost like a chip in our brain is activated, and the neural pathways take our attention in a different direction when we hear the term”women ' s issues.”This is also true, by the way, of the word”gender,”because a lot of people hear the word”gender”and they think it means”women.”So they think that gender issues is synonymous with women ' s issues. There ' s some confusion about the term gender. And let me illustrate that confusion by way of analogy. So let ' s talk for a moment about race. In the US, when we hear the word”race,”a lot of people think that means African-American, Latino, Asian-American, Native American, South Asian, Pacific Islander, on and on. A lot of people, when they hear the word”**sexual** orientation”think it means **gay**, lesbian, bisexual. And a lot of people, when they hear the word”gender,”think it means women. In each case, the dominant group doesn ' t get paid attention to. As if white people don ' t have some sort of racial identity or belong to some racial category or construct, as if heterosexual people don ' t have a **sexual** orientation, as if men don ' t have a gender. This is one of the ways that dominant systems maintain and reproduce themselves, which is to say the dominant group is rarely challenged to even think about its dominance, because that ' s one of the key characteristics of power and privilege, the ability to go unexamined, lacking introspection, in fact being rendered invisible, in large measure, in the discourse about issues that are primarily about us. And this is amazing how this works in **domestic** and **sexual violence**, how men have been largely erased from so much of the conversation about a subject that is centrally about men. And I ' m going to illustrate what I ' m talking about by using the old tech. I ' m old school on some fundamental regards. I make films and I work with high tech, but I ' m still old school as an educator, and I want to share with you this exercise that illustrates on the sentence-structure level how the way that we think, literally the way that we use language, conspires to keep our attention off of men. This is about **domestic violence** in particular, but you can plug in other analogues. This comes from the work of the feminist linguist Julia Penelope. It starts with a very basic English sentence :”John beat Mary.”That ' s a good English sentence. John is the subject, beat is the verb, Mary is the object, good sentence. Now we ' re going to move to the second sentence, which says the same thing in the passive voice.”Mary was beaten by John.”And now a whole lot has happened in one sentence. We ' ve gone from”John beat Mary”to”Mary was beaten by John.”We ' ve shifted our focus in one sentence from John to Mary, and you can see John is very close to the end of the sentence, well, close to dropping off the map of our psychic plain. The third sentence, John is dropped, and we have,”Mary was beaten,”and now it ' s all about Mary. We ' re not even thinking about John, it ' s totally focused on Mary. Over the past generation, the term we ' ve used synonymous with”beaten”is”battered,”so we have”Mary was battered.”And the final sentence in this sequence, flowing from the others, is,”Mary is a battered woman.”So now Mary ' s very identity — Mary is a battered woman — is what was done to her by John in the first instance. But we ' ve demonstrated that John has long ago left the conversation. Those of us who work in the **domestic** and **sexual violence** field know that victim-blaming is pervasive in this realm, which is to say, blaming the person to whom something was done rather than the person who did it. And we say : why do they go out with these men? Why are they attracted to them? Why do they keep going back? What was she wearing at that party? What a stupid thing to do. Why was she drinking with those guys in that hotel room? This is **victim** blaming, and there are many reasons for it, but one is that our cognitive structure is set up to blame **victims**. This is all unconscious. Our whole cognitive structure is set up to ask questions about women and women ' s choices and what they ' re doing, thinking, wearing. And I ' m not going to shout down people who ask questions about women. It ' s a legitimate thing to ask. But ' s let ’ s be clear : Asking questions about Mary is not going to get us anywhere in terms of preventing **violence**. We have to ask a different set of questions. The questions are not about Mary, they ’ re about John. They include things like, why does John beat Mary? Why is **domestic violence** still a big problem in the US and all over the world? What ’ s going on? Why do so many men abuse physically, emotionally, verbally, and other ways, the women and girls, and the men and boys, that they claim to love? What ’ s going on with men? Why do so many adult men sexually abuse little girls and boys? Why is that a common problem in our society and all over the world today? Why do we hear over and over again about new scandals erupting in major institutions like the Catholic Church or the Penn State football program or the Boy Scouts of America, on and on and on? And then local communities all over the country and all over the world. We hear about it all the time. The **sexual** abuse of children. What ’ s going on with men? Why do so many men rape women in our society and around the world? Why do so many men rape other men? What is going on with men? And then what is the role of the various institutions in our society that are helping to produce abusive men at pandemic rates? Because this isn ’ t about individual **perpetrators**. That ’ s a naive way to understanding what is a much deeper and more systematic social problem. The **perpetrators** aren ’ t these monsters who crawl out of the swamp and come into town and do their nasty business and then retreat into the **darkness**. That ’ s a very naive notion, right? **Perpetrators** are much more normal than that, and everyday than that. So the question is, what are we doing here in our society and in the world? What are the roles of various institutions in helping to produce abusive men? What ’ s the role of religious belief systems, the sports culture, the pornography culture, the family structure, economics, and how that intersects, and race and **ethnicity** and how that intersects? How does all this work? And then, once we start making those kinds of connections and asking those important and big questions, then we can talk about how we can be transformative, in other words, how can we do something differently? How can we change the practices? How can we change the socialization of boys and the definitions of manhood that lead to these current outcomes? These are the kind of questions that we need to be asking and the kind of work that we need to be doing, but if we ’ re endlessly focused on what women are doing and thinking in relationships or elsewhere, we ’ re not going to get to that piece. I understand that a lot of women who have been trying to speak out about these issues, today and yesterday and for years and years, often get shouted down for their efforts. They get called nasty names like”male-basher”and”man-hater,”and the disgusting and offensive”feminazi”, right? And you know what all this is about? It ’ s called kill the messenger. It ’ s because the women who are standing up and speaking out for themselves and for other women as well as for men and boys, it ’ s a statement to them to sit down and shut up, keep the current system in place, because we don ’ t like it when people rock the boat. We don ’ t like it when people challenge our power. You ’ d better sit down and shut up, basically. And thank goodness that women haven ’ t done that. Thank goodness that we live in a world where there ’ s so much women ’ s leadership that can counteract that. But one of the powerful roles that men can play in this work is that we can say some things that sometimes women can ’ t say, or, better yet, we can be heard saying some things that women often can ’ t be heard saying. Now, I appreciate that that ’ s a problem, it ’ s sexism, but it ’ s the truth. So one of the things that I say to men, and my colleagues and I always say this, is we need more men who have the courage and the strength to start standing up and saying some of this stuff, and standing with women and not against them and pretending that somehow this is a battle between the sexes and other kinds of nonsense. We live in the world together. And by the way, one of the things that really bothers me about some of the rhetoric against feminists and others who have built the battered women ' s and rape crisis movements around the world is that somehow, like I said, that they ' re anti-male. What about all the boys who are profoundly affected in a negative way by what some adult man is doing against their mother, themselves, their sisters? What about all those boys? What about all the young men and boys who have been traumatized by adult men ' s **violence**? You know what? The same system that produces men who abuse women, produces men who abuse other men. And if we want to talk about male **victims**, let ' s talk about male **victims**. Most male **victims** of **violence** are the **victims** of other men ' s **violence**. So that ' s something that both women and men have in common. We are both **victims** of men ' s **violence**. So we have it in our direct self-interest, not to mention the fact that most men that I know have women and girls that we care deeply about, in our families and our friendship circles and every other way. So there ' s so many reasons why we need men to speak out. It seems obvious saying it out loud, doesn ' t it? Now, the nature of the work that I do and my colleagues do in the sports culture and the US military, in schools, we pioneered this approach called the bystander approach to gender-violence prevention. And I just want to give you the highlights of the bystander approach, because it ' s a big thematic shift, although there ' s lots of particulars, but the heart of it is, instead of seeing men as **perpetrators** and women as **victims**, or women as **perpetrators**, men as **victims**, or any combination in there. I ' m using the gender binary. I know there ' s more than men and women, there ' s more than male and female. And there are women who are **perpetrators**, and of course there are men who are **victims**. There ' s a whole spectrum. But instead of seeing it in the binary fashion, we focus on all of us as what we call bystanders, and a bystander is defined as anybody who is not a **perpetrator** or a **victim** in a given situation, so in other words friends, teammates, colleagues, coworkers, family members, those of us who are not directly involved in a dyad of abuse, but we are embedded in social, family, work, school, and other peer culture relationships with people who might be in that situation. What do we do? How do we speak up? How do we challenge our friends? How do we support our friends? But how do we not remain silent in the face of abuse? Now, when it comes to men and male culture, the goal is to get men who are not abusive to challenge men who are. And when I say abusive, I don ' t mean just men who are beating women. We ' re not just saying a man whose friend is abusing his girlfriend needs to stop the guy at the moment of attack. That ' s a naive way of creating a social change. It ' s along a continuum, we ' re trying to get men to interrupt each other. So, for example, if you ' re a guy and you ' re in a group of guys playing poker, talking, hanging out, no women present, and another guy says something sexist or degrading or harassing about women, instead of laughing along or pretending you didn ' t hear it, we need men to say,"Hey, that ' s not funny. that could be my sister you ' re talking about, and could you joke about something else? Or could you talk about something else? I don ' t appreciate that kind of talk."Just like if you ' re a white person and another white person makes a racist comment, you ' d hope, I hope, that white people would interrupt that racist enactment by a fellow white person. Just like with heterosexism, if you ' re a heterosexual person and you yourself don ' t enact harassing or abusive behaviors towards people of varying **sexual** orientations, if you don ' t say something in the face of other heterosexual people doing that, then, in a sense, isn ' t your **silence** a form of consent and complicity? Well, the bystander approach is trying to give people tools to interrupt that process and to speak up and to create a peer culture climate where the abusive behavior will be seen as unacceptable, not just because it ’ s illegal, but because it ’ s wrong and unacceptable in the peer culture. And if we can get to the place where men who act out in sexist ways will lose status, young men and boys who act out in sexist and harassing ways towards girls and women, as well as towards other boys and men, will lose status as a result of it, guess what? We ’ ll see a radical diminution of the abuse. Because the typical **perpetrator** is not sick and twisted. He ’ s a normal guy in every other way, isn ’ t he? Now, among the many great things that Martin Luther King said in his short life was,”In the end, what will hurt the most is not the words of our enemies but the **silence** of our friends.”In the end, what will hurt the most is not the words of our enemies but the **silence** of our friends. There ’ s been an awful lot of **silence** in male culture about this ongoing tragedy of men ’ s **violence** against women and children, hasn ’ t there? There ’ s been an awful lot of **silence**. And all I ’ m saying is that we need to break that **silence**, and we need more men to do that. Now, it ’ s easier said than done, because I ’ m saying it now, but I ’ m telling you it ’ s not easy in male culture for guys to challenge each other, which is one of the reasons why part of the paradigm shift that has to happen is not just understanding these issues as men ’ s issues, but they ’ re also leadership issues for men. Because ultimately, the responsibility for taking a stand on these issues should not fall on the shoulders of little boys or teenage boys in high school or college men. It should be on adult men with power. Adult men with power are the ones we need to be holding accountable for being leaders on these issues, because when somebody speaks up in a peer culture and challenges and interrupts, he or she is being a leader, really. But on a big scale, we need more adult men with power to start prioritizing these issues, and we haven ’ t seen that yet, have we? Now, I was at a dinner a number of years ago, and I work extensively with the US military, all the services. And I was at this dinner and this woman said to me — I think she thought she was a little clever — she said,”So how long have you been doing sensitivity training with the Marines?”And I said,”With all due respect, I don ’ t do sensitivity training with the Marines. I run a leadership program in the Marine Corps.”Now, I know it ’ s a bit pompous, my response, but it ’ s an important distinction, because I don ’ t believe that what we need is sensitivity training. We need leadership training, because, for example, when a professional coach or a manager of a baseball team or a football team — and I work extensively in that realm as well — makes a sexist comment, makes a homophobic statement, makes a racist comment, there will be discussions on the sports blogs and in sports talk radio. And some people will say,”He needs sensitivity training.”Other people will say,”Well, get off it. That ’ s political correctness run amok, he made a stupid statement, move on.”My argument is, he doesn ’ t need sensitivity training. He needs leadership training, because he ’ s being a bad leader, because in a society with gender diversity and **sexual** diversity — and racial and ethnic diversity, you make those kind of comments, you ’ re failing at your leadership. If we can make this point that I ’ m making to powerful men and women in our society at all levels of institutional authority and power, it ’ s going to change the paradigm of people ’ s thinking. You know, for example, I work a lot in college and university athletics throughout North America. We know so much about how to prevent **domestic** and **sexual violence**, right? There ’ s no excuse for a college or university to not have **domestic** and **sexual violence** prevention training mandated for all student athletes, coaches, administrators, as part of their educational process. We know enough to know that we can easily do that. But you know what ’ s missing? The leadership. But it ’ s not the leadership of student athletes. It ’ s the leadership of the athletic director, the president of the university, the people in charge who make decisions about resources and who make decisions about priorities in the institutional settings. That ' s a failure, in most cases, of men ' s leadership. Look at Penn State. Penn State is the mother of all teachable moments for the bystander approach. You had so many situations in that realm where men in powerful positions failed to act to protect children, in this case, boys. It ' s unbelievable, really. But when you get into it, you realize there are pressures on men. There are constraints within peer cultures on men, which is why we need to encourage men to break through those pressures. And one of the ways to do that is to say there ' s an awful lot of men who care deeply about these issues. I know this, I work with men, and I ' ve been working with tens of thousands, hundreds of thousands of men for many decades now. It ' s scary, when you think about it, how many years. But there ' s so many men who care deeply about these issues, but caring deeply is not enough. We need more men with the guts, with the courage, with the strength, with the moral integrity to break our complicit **silence** and challenge each other and stand with women and not against them. By the way, we owe it to women. There ' s no question about it. But we also owe it to our sons. We also owe it to young men who are growing up all over the world in situations where they didn ' t make the choice to be a man in a culture that tells them that manhood is a certain way. They didn ' t make the choice. We that have a choice, have an opportunity and a responsibility to them as well. I hope that, going forward, men and women, working together, can begin the change and the transformation that will happen so that future generations won ' t have the level of tragedy that we deal with on a daily basis. I know we can do it, we can do better. Thank you very much.

I am a vicar in the Church of England. I ' ve been a priest in the Church for 20 years. For most of that time, I ' ve been struggling and grappling with questions about the nature of God. Who is God? And I ' m very aware that when you say the word"God,"many people will turn off immediately. And most people, both within and outside the organized church, still have a picture of a celestial controller, a rule maker, a policeman in the sky who orders everything, and causes everything to happen. He will protect his own people, and answer the **prayers** of the faithful. And in the worship of my church, the most frequently used adjective about God is"almighty."But I have a problem with that. I have become more and more uncomfortable with this perception of God over the years. Do we really believe that God is the kind of male boss that we ' ve been presenting in our worship and in our liturgies over all these years? Of course, there have been thinkers who have suggested different ways of looking at God. Exploring the feminine, nurturing side of divinity. Suggesting that God expresses Himself or Herself through powerlessness, rather than power. Acknowledging that God is unknown and unknowable by definition. Finding deep resonances with other religions and philosophies and ways of looking at life as part of what is a universal and global search for meaning. These ideas are well known in liberal academic circles, but clergy like myself have been reluctant to air them, for fear of creating tension and division in our church communities, for fear of upsetting the simple faith of more traditional believers. I have chosen not to rock the boat. Then, on December 26th last year, just two months ago, that underwater earthquake triggered the tsunami. And two weeks later, Sunday morning, 9th of January, I found myself standing in front of my congregation — intelligent, well meaning, mostly thoughtful Christian people — and I needed to express, on their behalf, our feelings and our questions. I had my own personal responses, but I also have a public role, and something needed to be said. And this is what I said. Shortly after the tsunami I read a newspaper article written by the Archbishop of Canterbury — fine title — about the tragedy in Southern Asia. The essence of what he said was this : the people most affected by the devastation and loss of life do not want intellectual theories about how God let this happen. He wrote,"If some religious genius did come up with an explanation of exactly why all these deaths made sense, would we feel happier, or safer, or more confident in God?"If the man in the photograph that appeared in the newspapers, holding the hand of his dead child was standing in front of us now, there are no words that we could say to him. A verbal response would not be appropriate. The only appropriate response would be a compassionate **silence** and some kind of practical help. It isn ' t a time for explanation, or preaching, or theology ; it ' s a time for tears. This is true. And yet here we are, my church in Oxford, semi-detached from events that happened a long way away, but with our faith bruised. And we want an explanation from God. We demand an explanation from God. Some have concluded that we can only believe in a God who shares our pain. In some way, God must feel the anguish, and **grief**, and physical pain that we feel. In some way the eternal God must be able to enter into the souls of human beings and experience the torment within. And if this is true, it must also be that God knows the joy and exaltation of the human spirit, as well. We want a God who can weep with those who weep, and rejoice with those who rejoice. This seems to me both a deeply moving and a convincing re-statement of Christian belief about God. For hundreds of years, the prevailing orthodoxy, the accepted truth, was that God the Father, the Creator, is unchanging and therefore by definition cannot feel pain or sadness. Now the unchanging God feels a bit cold and indifferent to me. And the devastating events of the 20th century have forced people to question the cold, unfeeling God. The slaughter of millions in the trenches and in the death camps have caused people to ask,"Where is God in all this? Who is God in all this?"And the answer was,"God is in this with us, or God doesn ' t deserve our allegiance anymore."If God is a bystander, observing but not involved, then God may well exist, but we don ' t want to know about Him. Many Jews and Christians now feel like this, I know. And I am among them. So we have a suffering God — a God who is intimately connected with this world and with every living soul. I very much relate to this idea of God. But it isn ' t enough. I need to ask some more questions, and I hope they are questions that you will want to ask, as well, some of you. Over the last few weeks I have been struck by the number of times that words in our worship have felt a bit inappropriate, a bit dodgy. We have a pram service on Tuesday mornings for mums and their pre-school children. And last week we **sang** with the children one of their favorite songs,"The Wise Man Built His House Upon the Rock."Perhaps some of you know it. Some of the words go like this :"The foolish man built his house upon the sand / And the floods came up / And the house on the sand went crash."Then in the same week, at a funeral, we **sang** the familiar hymn"We Plow the Fields and Scatter,"a very English hymn. In the second verse comes the line,"The wind and waves obey Him."Do they? I don ' t feel we can **sing** that song again in church, after what ' s happened. So the first big question is about control. Does God have a plan for each of us? Is God in control? Does God order each moment? Does the wind and the waves obey Him? From time to time, one hears Christians telling the story of how God organized things for them, so that everything worked out all right — some difficulty overcome, some illness cured, some trouble averted, a parking space found at a crucial time. I can remember someone saying this to me, with her eyes shining with enthusiasm at this wonderful confirmation of her faith and the goodness of God. But if God can or will do these things —

intervene to change the flow of events — then surely he could have stopped the tsunami. Do we have a local God who can do little things like parking spaces, but not big things like 500 mile-per-hour waves? That ' s just not acceptable to intelligent Christians, and we must acknowledge it. Either God is responsible for the tsunami, or God is not in control. After the tragedy, survival stories began to emerge. You probably heard some of them : the man who surfed the wave, the teenage girl who recognized the danger because she had just been learning about tsunamis at school. Then there was the congregation who had left their usual church building on the shore to hold a service in the hills. The preacher delivered an extra long sermon, so that they were still out of **harm** ' s way when the wave struck. Afterwards someone said that God must have been looking after them. So the next question is about partiality. Can we earn God ' s favor by worshipping Him or believing in Him? Does God demand loyalty, like any medieval tyrant? A God who looks after His own, so that Christians are OK, while everyone else perishes? A cosmic us and them, and a God who is guilty of the worst kind of favoritism? That would be appalling, and that would be the point at which I would hand in my membership. Such a God would be morally inferior to the highest ideals of humanity. So who is God, if not the great puppet-master or the tribal protector? Perhaps God allows or permits terrible things to happen, so that heroism and compassion can be shown. Perhaps God is testing us : testing our charity, or our faith. Perhaps there is a great, cosmic plan that allows for horrible **suffering** so that everything will work out OK in the end. Perhaps, but these ideas are all just variations on God controlling everything, the supreme commander toying with expendable units in a great campaign. We are still left with a God who can do the tsunami and allow Auschwitz. In his great novel,"The Brothers Karamazov,"Dostoevsky gives these words to Ivan, addressed to his naive and devout younger brother, Alyosha :"If the **sufferings** of children go to make up the sum of **sufferings** which is necessary for the purchase of truth, then I say beforehand that the entire truth is not worth such a price. We cannot afford to pay so much for admission. It is not God that I do not accept. I merely, most respectfully, return Him the ticket."Or perhaps God set the whole universe going at the beginning and then relinquished control forever, so that natural processes could occur, and evolution run its course. This seems more acceptable, but it still leaves God with the ultimate moral responsibility. Is God a cold, unfeeling spectator? Or a powerless lover, watching with infinite compassion things God is unable to control or change? Is God intimately involved in our **suffering**, so that He feels it in His own being? If we believe something like this, we must let go of the puppet-master completely, take our leave of the almighty controller, abandon traditional models. We must think again about God. Maybe God doesn ' t do things at all. Maybe God isn ' t an agent like all of us are agents. Early religious thought conceived God as a sort of superhuman person, doing things all over the place. Beating up the Egyptians, drowning them in the Red Sea, wasting cities, getting angry. The people knew their God by His mighty acts. But what if God doesn ' t act? What if God doesn ' t do things at all? What if God is in things? The **loving** soul of the universe. An in-dwelling compassionate presence, underpinning and sustaining all things. What if God is in things? In the infinitely complex network of relationships and connections that make up life. In the natural cycle of life and death, the creation and destruction that must happen continuously. In the process of evolution. In the incredible intricacy and magnificence of the natural world. In the collective unconscious, the soul of the human race. In you, in me, mind and body and spirit. In the tsunami, in the **victims**. In the depth of things. In presence and in absence. In simplicity and complexity. In change and development and growth. How does this in-ness, this innerness, this interiority of God work? It ’ s hard to conceive, and begs more questions. Is God just another name for the universe, with no independent existence at all? I don ’ t know. To what extent can we ascribe personality to God? I don ’ t know. In the end, we have to say,”I don ’ t know.”If we knew, God would not be God. To have faith in this God would be more like trusting an essential benevolence in the universe, and less like believing a system of doctrinal statements. Isn ’ t it **ironic** that Christians who claim to believe in an infinite, unknowable being then tie God down in closed systems and rigid doctrines? How could one practice such a faith? By seeking the God within. By cultivating my own inwardness. In **silence**, in **meditation**, in my inner space, in the me that remains when I gently put aside my passing emotions and ideas and preoccupations. In awareness of the inner conversation. And how would we live such a faith? How would I live such a faith? By seeking intimate connection with your inwardness. The kind of relationships when deep speaks to deep. If God is in all people, then there is a meeting place where my relationship with you becomes a three-way encounter. There is an Indian greeting, which I ’ m sure some of you know :”Namaste,”accompanied by a respectful bow, which, roughly translated means,”That which is of God in me greets that which of God is in you.”Namaste. And how would one deepen such a faith? By seeking the inwardness which is in all things. In music and poetry, in the natural world of beauty and in the small ordinary things of life, there is a deep, indwelling presence that makes them extraordinary. It needs a profound attentiveness and a patient waiting, a contemplative **attitude** and a generosity and **openness** to those whose experience is different from my own. When I stood up to speak to my people about God and the tsunami, I had no answers to offer them. No neat packages of faith, with Bible references to prove them. Only doubts and questioning and uncertainty. I had some suggestions to make — possible new ways of thinking about God. Ways that might allow us to go on, down a new and uncharted road. But in the end, the only thing I could say for sure was,”I don ’ t know,”and that just might be the most profoundly religious statement of all. Thank you.

I think it ’ ll be a relief to some people and a disappointment to others that I ’ m not going to talk about vaginas today. I began”The Vagina Monologues”because I was worried about vaginas. I ’ m very worried today about this notion, this world, this prevailing kind of force of security. I see this word, hear this word, feel this word everywhere. Real security, security checks, security watch, security clearance. Why has all this focus on security made me feel so much more insecure? What does anyone mean when they talk about real security? And why have we, as Americans particularly, become a nation that strives for security above all else? In fact, I think that security is elusive. It ’ s impossible. We all die. We all get old. We all get sick. People leave us. People change us. Nothing is secure. And that ’ s actually the good news. This is, of course, unless your whole life is about being secure. I think that when that is the focus of your life, these are the things that happen. You can ’ t travel very far or venture too far outside a certain circle. You can ’ t allow too many conflicting ideas into your mind at one time, as they might confuse you or challenge you. You can ’ t open yourself to new experiences, new people, new ways of doing things — they might take you off course. You can ’ t not know who you are, so you cling to hard-matter identity. You become a Christian, Muslim, Jew. You ’ re an Indian, Egyptian, Italian, American. You ’ re a heterosexual or a homosexual, or you never have sex. Or at least, that ' s what you say when you identify yourself. You become part of an"us."In order to be secure, you defend against"them."You cling to your land because it is your secure place. You must fight anyone who encroaches upon it. You become your nation. You become your religion. You become whatever it is that will freeze you, **numb** you and protect you from doubt or change. But all this does, actually, is shut down your mind. In reality, it does not really make you safer. I was in Sri Lanka, for example, three days after the tsunami, and I was standing on the beaches and it was absolutely clear that, in a matter of five minutes, a 30-foot wave could rise up and desecrate a people, a population and lives. All this striving for security, in fact, has made you much more insecure because now you have to watch out all the time. There are people not like you — people who you now call enemies. You have places you cannot go, thoughts you cannot think, worlds that you can no longer inhabit. And so you spend your days fighting things off, defending your territory and becoming more entrenched in your fundamental thinking. Your days become devoted to protecting yourself. This becomes your mission. That is all you do. Ideas get shorter. They become sound bytes. There are evildoers and saints, criminals and **victims**. There are those who, if they ' re not with us, are against us. It gets easier to hurt people because you do not feel what ' s inside them. It gets easier to lock them up, force them to be naked, humiliate them, occupy them, invade them and kill them, because they are only obstacles now to your security. In six years, I ' ve had the extraordinary privilege through V-Day, a global movement against [**violence** against] women, to travel probably to 60 countries, and spend a great deal of time in different portions. I ' ve met women and men all over this planet, who through various circumstances — war, poverty, racism, multiple forms of **violence** — have never known security, or have had their illusion of security forever devastated. I ' ve spent time with women in Afghanistan under the Taliban, who were essentially brutalized and censored. I ' ve been in Bosnian refugee camps. I was with women in Pakistan who have had their faces melted off with acid. I ' ve been with girls all across America who were date-raped, or raped by their best friends when they were drugged one night. One of the amazing things that I ' ve discovered in my travels is that there is this emerging species. I loved when he was talking about this other world that ' s right next to this world. I ' ve discovered these people, who, in V-Day world, we call Vagina Warriors. These particular people, rather than getting AK-47s, or weapons of mass destruction, or machetes, in the spirit of the warrior, have gone into the center, the heart of pain, of loss. They have grieved it, they have died into it, and allowed and encouraged poison to turn into medicine. They have used the fuel of their pain to begin to redirect that energy towards another mission and another trajectory. These warriors now devote themselves and their lives to making sure what happened to them doesn ' t happen to anyone else. There are thousands if not millions of them on the planet. I venture there are many in this room. They have a fierceness and a freedom that I believe is the bedrock of a new paradigm. They have broken out of the existing frame of **victim** and **perpetrator**. Their own personal security is not their end goal, and because of that, because, rather than worrying about security, because the transformation of **suffering** is their end goal, I actually believe they are creating real **safety** and a whole new idea of security. I want to talk about a few of these people that I ' ve met. Tomorrow, I am going to Cairo, and I ' m so moved that I will be with women in Cairo who are V-Day women, who are opening the first safe house for battered women in the Middle East. That will happen because women in Cairo made a decision to stand up and put themselves on the line, and talk about the degree of **violence** that is happening in Egypt, and were willing to be attacked and criticized. And through their work over the last years, this is not only happening that this house is opening, but it ' s being supported by many factions of the society who never would have supported it. Women in Uganda this year, who put on"The Vagina Monologues"during V-Day, actually evoked the wrath of the government. And, I love this story so much. There was a cabinet meeting and a meeting of the presidents to talk about whether"Vaginas"could come to Uganda. And in this meeting — it went on for weeks in the press, two weeks where there was huge discussion. The government finally made a decision that"The Vagina Monologues"could not be performed in Uganda. But the amazing news was that because they had stood up, these women, and because they had been willing to risk their security, it began a discussion that not only happened in Uganda, but all of Africa. As a result, this production, which had already sold out, every single person in that 800-seat audience, except for 10 people, made a decision to keep the money. They raised 10, 000 dollars on a production that never occurred. There ' s a young woman named Carrie Rethlefsen in Minnesota. She ' s a high school student. She had seen"The Vagina Monologues"and she was really moved. And as a result, she wore an"I heart my vagina"button to her high school in Minnesota. She was basically threatened to be expelled from school. They told her she couldn ' t love her vagina in high school, that it was not a legal thing, that it was not a moral thing, that it was not a good thing. So she really struggled with this, what to do, because she was a senior and she was doing well in her school and she was threatened expulsion. So what she did is she got all her friends together — I believe it was 100, 150 students all wore"I love my vagina"T-shirts, and the boys wore"I love her vagina"T-shirts to school. Now this seems like a fairly, you know, frivolous, but what happened as a result of that, is that that school now is forming a sex education class. It ' s beginning to talk about sex, it ' s beginning to look at why it would be wrong for a young high school girl to talk about her vagina publicly or to say that she loved her vagina publicly. I know I ' ve talked about Agnes here before, but I want to give you an update on Agnes. I met Agnes three years ago in the Rift Valley. When she was a young girl, she had been mutilated against her will. That mutilation of her clitoris had actually obviously impacted her life and changed it in a way that was devastating. She made a decision not to go and get a razor or a glass shard, but to devote her life to stopping that happening to other girls. For eight years, she walked through the Rift Valley. She had this amazing box that she carried and it had a torso of a woman ' s body in it, a half a torso, and she would teach people, everywhere she went, what a healthy vagina looked like and what a mutilated vagina looked like. In the years that she walked, she educated parents, mothers, fathers. She saved 1, 500 girls from being cut. When V-Day met her, we asked her how we could support her and she said,"Well, if you got me a Jeep, I could get around a lot faster."So, we bought her a Jeep. In the year she had the Jeep, she saved 4, 500 girls from being cut. So, we said, what else could we do? She said,"If you help me get money, I could open a house."Three years ago, Agnes opened a safe house in Africa to stop mutilation. When she began her mission eight years ago, she was reviled, she was detested, she was completely slandered in her community. I am proud to tell you that six months ago, she was elected the deputy mayor of Narok. I think what I ' m trying to say here is that if your end goal is security, and if that ' s all you ' re focusing on, what ends up happening is that you create not only more insecurity in other people, but you make yourself far more insecure. Real security is contemplating death, not pretending it doesn ' t exist. Not running from loss, but entering **grief**, surrendering to sorrow. Real security is not knowing something, when you don ' t know it. Real security is hungering for connection rather than power. It cannot be bought or arranged or made with bombs. It is deeper, it is a process, it is acute awareness that we are all utterly inter-bended, and one action by one being in one tiny town has consequences everywhere. Real security is not only being able to tolerate mystery, complexity, ambiguity, but hungering for them and only trusting a situation when they are present. Something happened when I began traveling in V-Day, eight years ago. I got lost. I remember being on a plane going from Kenya to South Africa, and I had no idea where I was. I didn ’ t know where I was going, where I ’ d come from, and I panicked. I had a total anxiety attack. And then I suddenly realized that it absolutely didn ’ t matter where I was going, or where I had come from because we are all essentially permanently displaced people. All of us are refugees. We come from somewhere and we are hopefully traveling all the time, moving towards a new place. Freedom means I may not be identified as any one group, but that I can visit and find myself in every group. It does not mean that I don ’ t have values or beliefs, but it does mean I am not hardened around them. I do not use them as weapons. In the **shared** future, it will be just that, shared. The end goal will [be] becoming vulnerable, realizing the place of our connection to one another, rather than becoming secure, in control and alone. Thank you very much. Chris Anderson : And how are you doing? Are you exhausted? On a typical day, do you wake up with hope or gloom? Eve Ensler : You know, I think Carl Jung once said that in order to survive the twentieth century, we have to live with two existing thoughts, opposite thoughts, at the same time. And I think part of what I ’ m learning in this process is that one must allow oneself to feel **grief**. And I think as long as I keep grieving, and weeping, and then moving on, I ’ m fine. When I start to pretend that what I ’ m seeing isn ’ t impacting me, and isn ’ t changing my heart, then I get in trouble. Because when you spend a lot of time going from place to place, country to country, and city to city, the degree to which women, for example, are violated, and the epidemic of it, and the kind of ordinariness of it, is so devastating to one ’ s soul that you have to take the time, or I have to take the time now, to process that. CA : There are a lot of causes out there in the world that have been talked about, you know, poverty, sickness and so on. You spent eight years on this one. Why this one? EE : I think that if you think about women, women are the primary resource of the planet. They give birth, we come from them, they are mothers, they are visionaries, they are the future. If you think that the U. N. now says that one out of three women on the planet will be raped or beaten in their lifetime, we ’ re talking about the desecration of the primary resource of the planet, we ’ re talking about the place where we come from, we ’ re talking about parenting. Imagine that you ’ ve been raped and you ’ re bringing up a boy child. How does it impact your ability to work, or envision a future, or thrive, as opposed to just survive? What I believe is if we could figure out how to make women safe and honor women, it would be parallel or **equal** to honoring life itself.

So my grandfather told me when I was a little girl,”If you say a word often enough, it becomes you.”And having grown up in a segregated city, Baltimore, Maryland, I sort of use that idea to go around America with a tape recorder â thank God for technology â to interview people, thinking that if I walked in their words â which is also why I don ’ t wear shoes when I perform â if I walked in their words, that I could sort of absorb America. I was also inspired by Walt Whitman, who wanted to absorb America and have it absorb him. So these four characters are going to be from that work that I ’ ve been doing for many years now, and well over, I don ’ t know, a couple of thousand people I ’ ve interviewed. Anybody out here old enough to know Studs Terkel, that old radio man? So I thought he would be the perfect person to go to to ask about a defining moment in American history. You know, he was”born in 1912, the year the Titanic sank, greatest ship every built. Hits the tip of an iceberg, and bam, it went down. It went down and I came up. Wow, some century.”So this is his answer about a defining moment in American history.”Defining moment in American history, I don ’ t think there ’ s one ; you can ’ t say Hiroshima, that ’ s a big one â I can ’ t think of any one moment I would say is a defining moment. The gradual slippage â ’ slippage ’ is the word used by the people in Watergate, moral slippage â it ’ s a gradual kind of thing, combination of things. You see, we also have the technology. I say, less and less the human touch.”Oh, let me kind of tell you a funny little play bit. The Atlanta airport is a modern airport, and they should leave the gate there. These trains that take you out to a concourse and on to a destination. And these trains are smooth, and they ’ re quiet and they ’ re efficient. And there ’ s a voice on the train, you know the voice was a human voice. You see in the old days we had robots, robots imitated humans. Now we have humans imitating robots. So we got this voice on this train : Concourse One : Omaha, Lincoln. Concourse Two : Dallas, Fort Worth. Same voice. Just as a train is about to go, a young couple rush in and they ’ re just about to close the pneumatic doors. And that voice, without losing a beat, says, ’ Because of late entry, we ’ re delayed 30 seconds. ’ Just then, everybody ’ s looking at this couple with hateful eyes and the couple ’ s going like this, you know, shrinking. Well, I ’ d happened to have had a couple of drinks before boarding â I do that to steel my nerves â and so I imitate a train call, holding my hand on my â ’ George Orwell, your time has come, ’ you see. Well, some of you are laughing. Everybody laughs when I say that, but not on this train. **Silence**. And so suddenly they ’ re looking at me. So here I am with the couple, the three of us shrinking at the foot of Calvary about to be up, you know.”Just then I see a baby, a little baby in the lap of a mother. I know it ’ s Hispanic because she ’ s speaking Spanish to her companion. So I ’ m going to talk to the baby. So I say to the baby, holding my hand over my mouth because my breath must be 100 proof, I say to the baby, ’ Sir or Madam, what is your considered opinion of the human species? ’ And the baby looks, you know, the way babies look at you clearly, starts laughing, starts busting out with this crazy little laugh. I say, ’ Thank God for a human reaction, we haven ’ t lost yet. ’”But you see, the human touch, you see, it ’ s disappearing. You know, you see, you ’ ve got to question the official truth. You know the thing that was so great about Mark Twain â you know we honor Mark Twain, but we don ’ t read him. We read ’ Huck Finn, ’ of course, we read ’ Huck Finn ’ of course. I mean, Huck, of course, was tremendous. Remember that great scene on the raft, remember what Huck did? You see, here ’ s Huck ; he ’ s an illiterate kid ; he ’ s had no schooling, but there ’ s something in him. And the official truth, the truth was, the law was, that a black man was a property, was a thing, you see. And Huck gets on the raft with a property named Jim, a slave, see. And he hears that Jim is going to go and take his wife and kids and steal them from the woman who owns them, and Huck says, ’ Ooh, oh my God, ooh, ooh â that woman, that woman never did anybody any **harm**. Ooh, he ’ s going to steal ; he ’ s going to steal ; he ’ s going to do a terrible thing. ’ Just then, two slavers caught up, guys chasing slaves, looking for Jim. ’ Anybody up on that raft with you? ’ Huck says, ’ Yeah. ’ ’ Is he black or white? ’ ’ White. ’ And they go off. And Huck said, ’ Oh my God, oh my God, I lied, I lied, ooh, I did a terrible thing, did a terrible thing â why do I feel so good? ’”But it ’ s the goodness of Huck, that stuff that Huck ’ s been made of, you see, all been buried ; it ’ s all been buried. So the human touch, you see, it ’ s disappearing. So you ask about a defining moment â ain ’ t no defining moment in American history for me. It ’ s an accretion of moments that add up to where we are now, where trivia becomes news. And more and more, less and less awareness of the pain of the other. Huh. You know, I don ’ t know if you could use this or not, but I was quoting Wright Morris, a writer from Nebraska, who says, ’ We ’ re more and more into communications and less and less into communication. ’ Okay, kids, I got to scram, got to go see my cardiologist.”And that ’ s Studs Terkel. So, talk about risk taking. I ’ m going to do somebody that nobody likes. You know, most actors want to do characters that are likeable â well, not always, but the notion, especially at a conference like this, I like to inspire people. But since this was called”risk taking,”I ’ m doing somebody who I never do, because she ’ s so unlikeable that one person actually came backstage and told me to take her out of the show she was in. And I ’ m doing her because I think we think of risk, at a conference like this, as a good thing. But there are certain other connotations to the word”risk,”and the same thing about the word”nature.”What is nature? Maxine Greene, who ’ s a wonderful philosopher who ’ s as old as Studs, and was the head of a philosophy â great, big philosophy kind of an organization â I went to her and asked her what are the two things that she doesn ’ t know, that she still wants to know. And she said,”Well, personally, I still feel like I have to curtsey when I see the president of my university. And I still feel as though I ’ ve got to get coffee for my male colleagues, even though I ’ ve outlived most of them.”And she said,”And then intellectually, I don ’ t know enough about the negative imagination. And September 11th certainly taught us that that ’ s a whole area we don ’ t investigate.”So this piece is about a negative imagination. It raises questions about what nature is, what Mother Nature is, and about what a risk can be. And I got this in the Maryland Correctional Institute for Women. Everything I do is word for word off a tape. And I title things because I think people speak in organic poems, and this is called”A Mirror to Her Mouth.”And this is an inmate named Paulette Jenkins.”I began to learn how to cover it up, because I didn ’ t want nobody to know that this was happening in my home. I want everybody to think we were a normal family. I mean we had all the materialistic things, but that didn ’ t make my children pain any less ; that didn ’ t make their fears subside. I ran out of excuses about how we got black eyes and busted lips and bruises. I didn ’ t had no more excuses. And he beat me too. But that didn ’ t change the fact that it was a nightmare for my family ; it was a nightmare. And I failed them dramatically, because I allowed it to go on and on and on.”But the night that Myesha got killed â and the intensity just grew and grew and grew, until one night we came home from getting drugs, and he got angry with Myesha, and he started beating her, and he put her in a bathtub. Oh, he would use a belt. He had a belt because he had this warped perverted thing that Myesha was having sex with her little brother and they was fondling each other â that would be his reason. I ’ m just talking about the particular night that she died. And so he put her in the bathtub, and I was in the bedroom with the baby.”And four months before this happened, four months before Myesha died, I thought I could really fix this man. So I had a baby by him â insane â thinking that if I gave him his own kid, he would leave mine alone. And it didn ’ t work, didn ’ t work. And I ended up with three children, Houston, Myesha and Dominic, who was four months old when I came to jail.”And I was in the bedroom. Like I said, he had her in the bathroom and he â he â every time he hit her, she would fall. And she would hit her head on the tub. It happened continuously, repeatedly. I could hear it, but I dared not to move. I didn ’ t move. I didn ’ t even go and see what was happening. I just sat there and listened. And then he put her in the hallway. He told her, just set there. And so she set there for about four or five hours. And then he told her, get up. And when she got up, she says she couldn ’ t see. Her face was bruised. She had a black eye. All around her head was just swollen ; her head was about two sizes of its own size. I told him, ’ Let her go to sleep. ’ He let her go to sleep.”The next morning she was dead. He went in to check on her for school, and he got very excited. He says, ’ She won ’ t breathe. ’ I knew immediately that she was dead. I didn ’ t even want to accept the fact that she was dead, so I went in and I put a mirror to her mouth â there was no thing, nothing, coming out of her mouth. He said, he said, he said, ’ We can ’ t, we can ’ t let nobody find out about this. ’ He say, ’ You ’ ve got to help me. ’ I agree. I agree.”I mean, I ’ ve been keeping a secret for years and years and years, so it just seemed like second hand to me, just to keep on keeping it a secret. So we went to the mall and we told a police that we had, like, lost her, that she was missing. We told a security guard that she was missing, though she wasn ’ t missing. And we told the security guard what we had put on her and we went home and we dressed her in exactly the same thing that we had told the security guard that we had put on her.”And then we got the baby and my other child, and we drove out to, like, I-95. I was so petrified and so **numb**, all I could look was in the rear-view mirror. And he just laid her right on the shoulder of the highway. My own child, I let that happen to.”So that ’ s an investigation of the negative imagination. When I started this project called”On the Road : A Search For an American Character”with my tape recorder, I thought that I was going to go around America and find it in all its aspects â bull riders, cowboys, pig farmers, drum majorettes â but I sort of got tripped on race relations, because my first big show was a show about a race riot. And so I went to both â two race riots, one of which was the Los Angeles riot. And this next piece is from that. Because this is what I would say I ’ ve learned the most about race relations, from this piece. It ’ s a kind of an aria, I would say, and in many tapes that I have. Everybody knows that the Los Angeles riots happened because four cops beat up a black man named Rodney King. It was captured on videotape â technology â and it was played all over the world. Everybody thought the four cops would go to jail. They did not, so there were riots. And what a lot of people forget, is there was a second trial, ordered by George Bush, Sr. And that trial came back with two cops going to jail and two cops **declared innocent**. I was at that trial. And I mean, the people just danced in the **streets** because they were afraid there was going to be another riot. Explosion of joy that this verdict had come back this way. So there was a community that didn ’ t â the Korean-Americans, whose stores had been burned to the ground. And so this woman, Mrs. Young-Soon Han, I suppose will have taught me the most that I have learned about race. And she asks also a question that Studs talks about : this notion of the”official truth,”to question the”official truth.”So what she ’ s questioning here, she ’ s taking a chance and questioning what justice is in society. And this is called,”Swallowing the Bitterness.””I used to believe America was the best. I watched in Korea many luxurious Hollywood lifestyle movie. I never saw any poor man, any black. Until 1992, I used to believe America was the best â I still do ; I don ’ t deny that because I am a **victim**. But at the end of ’ 92, when we were in such turmoil, and having all the financial problems, and all the mental problems, I began to really realize that Koreans are completely left out of this society and we are nothing. Why? Why do we have to be left out? We didn ’ t qualify for medical treatment, no food stamp, no GR, no welfare, anything. Many African-Americans who never work got minimum amount of money to survive. We didn ’ t get any because we have a car and a house. And we are high taxpayer. Where do I find justice?”OK. OK? OK. OK. Many African- Americans probably think that they won by the trial. I was sitting here watching them the morning after the verdict, and all the day they were having a party, they **celebrated**, all of South Central, all the churches. And they say, ' Well, finally justice has been done in this society. ' Well, what about **victims** ' rights? They got their rights by destroying **innocent** Korean merchants. They have a lot of respect, as I do, for Dr. Martin King. He is the only model for black community ; I don ' t care Jesse Jackson. He is the model of non- **violence**, non-violence â and they would all like to be in his spirit."But what about 1992? They destroyed **innocent** people. And I wonder if that is really justice for them, to get their rights in that way. I was swallowing the bitterness, sitting here alone and watching them. They became so hilarious, but I was happy for them. I was glad for them. At least they got something back, OK. Let ' s just forget about Korean **victims** and other **victims** who were destroyed by them. They fought for their rights for over two centuries, and maybe because they sacrifice other minorities, Hispanic, Asian, we would suffer more in the mainstream. That ' s why I understand ; that ' s why I have a mixed feeling about the verdict."But I wish that, I wish that, I wish that I could be part of the enjoyment. I wish that I could live together with black people. But after the riot, it ' s too much difference. The fire is still there. How do you say it? [Unclear]. Igniting, igniting, igniting fire. Igniting fire. It ' s still there ; it can burst out anytime."Mrs. Young-Soon Han. The other reason that I don ' t wear shoes is just in case I really feel like I have to cuddle up and get into the feet of somebody, walking really in somebody else ' s shoes. And I told you that in â you know, I didn ' t give you the year, but in ' 79 I thought that I was going to go around and find bull riders and pig farmers and people like that, and I got sidetracked on race relations. Finally, I did find a bull rider, two years ago. And I ' ve been going to the rodeos with him, and we ' ve bonded. And he ' s the lead in an op-ed I did about the Republican Convention. He ' s a Republican â I won ' t say anything about my party affiliation, but anyway â so this is my dear, dear Brent Williams, and this is on toughness, in case anybody needs to know about being tough for the work that you do. I think there ' s a real lesson in this. And this is called"Toughness.""Well, I ' m an optimist. I mean basically I ' m an optimist. I mean, you know, I mean, it ' s like my wife, Jolene, her family ' s always saying, you know, you ever think he ' s just a born loser? It seems like he has so much bad luck, you know. But then when that bull stepped on my kidney, you know, I didn ' t lose my kidney â I could have lost my kidney, I kept my kidney, so I don ' t think I ' m a born loser. I think that ' s good luck."And, I mean, funny things like this happen. I was in a doctor ' s office last CAT scan, and there was a Reader ' s Digest, October 2002. It was like, ' seven ways to get lucky. ' And it says if you want to get lucky, you know, you ' ve got to be around positive people. I mean, like even when I told my wife that you want to come out here and talk to me, she ' s like, ' She ' s just talking ; she ' s just being nice to you. She ' s not going to do that. '"And then you called me up and you said you wanted to come out here and interview me and she went and looked you up on the Internet. She said, ' Look who she is. You ' re not even going to be able to answer her questions. ' And she was saying you ' re going to make me look like an idiot because I ' ve never been to college, and I wouldn ' t be talking professional or anything. I said, ' Well look, the woman talked to me for four hours. You know, if I wasn ' t talking â you know, like, you know, she wanted me to talk, I don ' t think she would even come out here. '"Confidence? Well, I think I ride more out of determination than confidence. I mean, confidence is like, you know, you ' ve been on that bull before ; you know you can ride him. I mean, confidence is kind of like being cocky, but in a good way. But determination, you know, it ' s like just, you know, ' Fuck the form, get the horn. ' That ' s Tuff Hedeman, in the movie ’ 8 Seconds. ’ I mean, like, Pat O ’ Mealey always said when I was a boy, he say, ’ You know, you got more try than any kid I ever seen. ’ And try and determination is the same thing. Determination is, like, you ’ re going to hang on that bull, even if you ’ re riding upside down. Determination ’ s like, you ’ re going to ride till your head hits the back of the dirt.”Freedom? It would have to be the rodeo.”Beauty? I don ’ t think I know what beauty is. Well, you know, I guess that ’ d have to be the rodeo too. I mean, look how we are, the roughy family, palling around and shaking hands and wrestling around me. It ’ s like, you know, racking up our credit cards on entry fees and gas. We ride together, we, you know, we, we eat together and we sleep together. I mean, I can ’ t even imagine what it ’ s going to be like the last day I rodeo. I mean, I ’ ll be alright. I mean, I have my ranch and everything, but I actually don ’ t even want to think the day that comes. I mean, I guess it just be like â I guess it be like the day my brother died.”Toughness? Well, we was in West Jordan, Utah, and this bull shoved my face right through the metal shoots in a â you know, busted my face all up and had to go to the hospital. And they had to sew me up and straighten my nose out. And I had to go and ride in the rodeo that night, so I didn ’ t want them to put me under anesthesia, or whatever you call it. And so they sewed my face up. And then they had to straighten out my nose, and they took these rods and shoved them up my nose and went up through my brains and felt like it was coming out the top of my head, and everybody said that it should have killed me, but it didn ’ t, because I guess I have a high tolerance for pain. But the good thing was, once they shoved those rods up there and straightened my nose out, I could breathe, and I hadn ’ t been able to breathe since I broke my nose in the high school rodeo.”Thank you.

Text Sample 387: POS Dim 3 – 2013 – Score 17.00 – 2013/t000034.txt

About 18 months ago, I had a really bad week. I was on my way home from work one night, and it was one of those hot evenings where the traffic was at a standstill, and as I walked down the road, and the cars crawled next to me, some guys started shouting out of their car windows about my legs, about the things that they ’ d like to do to me. And I ignored them, and I carried on home, and I got on with it, like you do. Then a few nights later, I was on the way home, on the bus, quite late at night, and I was on the phone to my mom. I thought, at first, that the guy next to me just accidentally brushed my leg with his hand. And I carried on talking to my mom. Then I realized that, actually, he was grabbing and groping my leg and moving his hand up towards my crotch. I stood up to move away, but because I was on the phone, I vocalized it, in a way I don ’ t think I would have done otherwise. I said,”On the bus, this guy ’ s groping me.”Everybody on that bus looked out the window, or down at their feet, or at their phone. Certainly nobody stepped in, but more than that, there was a real sense of,”Why make a fuss about this, woman? This is your issue, deal with it ; don ’ t make us have to think about it.”That immediately made me feel ashamed. It made me feel like I ’ d done something wrong, or I shouldn ’ t have been out that late, or I shouldn ’ t have been wearing what I was wearing, and all of those thoughts that that reaction triggers. And again, I carried on. I went home, I didn ’ t mention it. I got on with it, like you do. Then a couple days later, I was walking down the **street** in broad daylight. There was a big truck being unloaded, scaffolding was coming off the back of it, and there were two guys working together. As I walked past, one of them turned to the other and said,”Look at the tits on that.”Not”her,””that.”They started discussing me as if I wasn ’ t there, even though I was one meter away, and I could really clearly hear them. The thing that really hit me about these three incidents was if they hadn ’ t happened in the same week, I never would have thought twice about any one of them. I started asking myself why that was : Why was this so normal? Why was I so used to them? I started thinking back about hundreds of incidents that had happened over the weeks and months and years that I ’ d never said anything about to anyone, because it was normal. I started talking to other women and asking - the women I knew, older women, younger women, women I met - saying,”Have you ever experienced anything like this?”And I honestly thought that one or two women would have a story. That one or two people would say,”Yes, a few years ago this happened,”or,”I once had a job where this happened.”But it wasn ’ t like that. It was every woman I spoke to. And it wasn ’ t a few years ago, this one incident. It was hundreds of things.”It was on my way here, this happened, yesterday this happened, most days this happens.”But just like me, until I asked them, they ’ d never told those stories to anyone. Because they were used to it, because it was normal. I started trying to speak up about this, because I was realizing there was this huge problem, and I started trying to talk about it, and again and again, I got the same response. People said,”Stop making a fuss. Women are **equal** now, more or less.”If women are **equal** now, then to talk about sexism, to complain about sexism, must be overreacting. Or maybe you don ’ t have a sense of humor, or maybe you need to learn to take a compliment, or maybe you ’ re a bit frigid or uptight and you need to learn to take a joke. I thought, maybe they were right, maybe women are **equal** now, more or less ; perhaps I was overreacting. I thought I ’ d look into it, I ’ d interrogate that claim and I did. These are some of the things that I found : Women are **equal** now, more or less. Except in our Houses of Parliament, where the policies that affect all of us are debated and defined, less than one in four MPs is a woman. Women make up one fifth of the membership of the House of Lords. The UK comes joint 57th in the world for gender **equality** in Parliament. Then I looked into the law, and I found that just four out of 35 Lord Justices of Appeal, and just 18 out of 108 High Court judges are women. I decided to look at the arts. I found that it was reported in 2010, that out of 2, 300 works, one of our most prestigious art institutions, the National Gallery, had paintings by just ten women. I found that at the Royal Opera House, it ’ s been over 13 years since a female choreographer was commissioned to create a piece for the main stage. And that out of 573 listed statues up and down the UK commemorating people of interest, just 15 per cent of them are of women. I found that fewer than one in ten of our engineers is female, less than half the proportion of France or Spain ; that our Royal Society, one of our most prestigious scientific institutions, has never had a female president, and just five per cent of the current fellowship are women. And that whilst women make up 50 per cent of chemistry undergraduates, there ’ re only six per cent of professors. I found that women write only one fifth of front page newspaper articles, but 84 per cent of those articles are dominated by male subjects or experts. That women directed just five per cent of the 250 major films of 2011, and that only one in five UK architects is female, yet 63 per cent of them report experiencing **sexual harassment** in the workplace during the course of their career. And then I looked into the crime statistics. Women are **equal** now, more or less. Except that in the UK over two women a week are killed by a current or former partner. There ’ s a phone call to the police every minute about **domestic violence**. Every six or seven minutes, a woman is raped, adding up to over 85, 000 rapes and 400, 000 **sexual assaults** every year. In the UK, a woman has a one in four chance of becoming a **victim** of **domestic violence**, and has a one in five chance of being a **victim** of a **sexual** offense. Worldwide, one in three women on the planet will be raped or beaten in her lifetime. I decided that that argument that women were **equal** now and we shouldn ’ t be making a fuss, really didn ’ t stand up to scrutiny. In fact, it seemed to me that it really was time to make a fuss. So I set up a simple website because I realized we couldn ’ t solve a problem if people refused even to acknowledge that it existed, and that what I really wanted people to have was that experience that I ’ d had of seeing these things kind of rolled out in front of them like a map, and realizing how much there was and how bad it still was. I set up a very simple website called”The Everyday Sexism Project,”and I asked women and men to add their experiences of gender imbalance on a daily basis ; anything from the tiny niggling normalized things, all the way up the scale. I didn ’ t have any funding or any way of publicizing it, so I thought that maybe 20 or 30 women would add their stories, and I hoped it would build a sense of **solidarity**, and help to raise awareness. But instead, things took off a little more than I expected. [75, 000 Women To Take A Stand Against Sexism] 50, 000 women from all over the world added their stories in 18 months. They were women and men from countries everywhere, people of all ages, races, **ethnicities**, **sexual** orientations, gender identities, religious and non-religious, **disabled** and non-disabled, employed and unemployed. We heard from a seven-year-old **disabled** girl in a wheelchair and a 74-year-old women in a mobility scooter who encountered almost identical experiences of screamed abuse about”female drivers.”A female Reverend in the Church of England was asked if there was a man available to perform the wedding or funeral service -”Nothing personal.”A man was congratulated for babysitting his own children. A woman working in the city was asked if she would sit on her bosses lap if she wanted her Christmas bonus. A woman who worked in a video store found that every time she went up the ladder to the storeroom, her boss would smack her on the bum, and when she came down he looked down her top and say :”You know why I hired you.”A waitress was told to make a choice between having an abortion or resigning when she fell pregnant. A 15-year-old girl wrote that she knew that she was clever and funny, and she could do anything she wanted to do, but really it didn ’ t matter if she became a doctor or a lawyer, because she knew from the world around her and from the media, that the only thing that really mattered was whether she was sexy, whether her breasts grew and her waist narrowed, and whether boys found her attractive. A 13-year-old girl wrote to say that she ’ d been showed a video of sex, at school on a boy ’ s mobile phone, a video of porn, and that now she ’ s scared to have sex, she cries every night, because she didn ’ t realize that what sex was was the woman hurting and crying. A woman in Pakistan talked about hiding abuse for the sake of family honor. A woman in Brazil tried to ignore three men who catcalled her only to find that they tried to drag her into their car. In Mexico a woman was told by her university professor :”Calladita te ves ms bonita”,”You look prettier when you shut up.”This is what happened when I gave a speech about politics - [I think Laura should just get her tits out so we can judge for ourselves.] [I ’ m not sexist or anything but she may be keeping a nice pair...] This was what I got on a daily basis. But not just once a day, up to 200 times a day, just for speaking out. Ironically these people sending messages because they wanted to shut the project down were showing how vital and needed it was. [fuck you stupid slut] The fact that it was so scary for some people, for somebody just to want to talk about **equality**, just to want to raise women ’ s voices and give their stories a platform, that they had to tell me exactly how they wanted to disembowel me, and with exactly which weapons and in what order, and not just that I should be raped, but exactly how I should be raped, and in which our orifices, and where and when. Then something else started to happen. After we ’ d received about ten thousand stories, we started getting some which had a very different tone. We started getting success stories. We started hearing from women like one who said that she was a keen runner, who often experienced **harassment**, but she thought it was just the way things were. Then after reading the stories on the website, she realized other women were standing up to this, and other people were acknowledging that this shouldn ’ t be normal, and it wasn ’ t okay. The next time she went running, a guy happened to call her over from his car and ask for directions. So she went over and helped him, and then he reached out of the car window and grabbed her breasts really hard, really hurt her. She said she felt all of the experiences, the feelings wash over her that she normally felt in that situation - terror, embarrassment, **shame**, the urge to run - but she also felt something she hadn ’ t felt before, and it was that feeling of those women behind her standing up, and it gave her the strength, just for a moment, to stop and take down the guy ’ s car number plate, and now he ’ s been charged with **assault**. We were able to take 2, 000 of the stories we collected that specifically described women ’ s experiences of **harassment** and **assault** on public transport to the British Transport Police when they decided to look at the way that they police **sexual** offences. We were able to break them down, to hear from women ’ s own voices why they haven ’ t felt able to report, and then work with the British Transport Police to send out the message to people everywhere that they were taking this seriously and they could report it. So far we know that that project - Project Guardian - has raised reports of **harassment** and **assault** on the tube by up to 20 per cent. We were able to start talking to girls at universities about the UK definition of **sexual assault**, which is very simple. Under UK law, if someone touches you anywhere on your body, and the touching is **sexual**, and you don ’ t consent, and they don ’ t have reason to believe that you consent, it ’ s a form of **sexual assault**. Girls came up to me saying,”That can ’ t be **sexual assault** because it ’ s normal.””That can ’ t be **sexual assault** because that happens when I go out with my friends.””It can ’ t be **sexual assault** because I won ’ t be able to call it that, people won ’ t take me seriously, I couldn ’ t go to the police.”We were able to start to change that **attitude** and able to start to get reports of people who ’ d reported things that previously, they ’ d had no idea they had the right to object to. We also started hearing people ’ s individual stories of standing up, and that was really fascinating and crucial, because these weren ’ t stories of waving banners or going on marches - as valuable as those are - they were stories of women and men around the world finding that own very unique and individual ways to stand up that worked for them and made a difference in their lives. We heard from a woman who was being sexually harassed in the office, who printed off a copy of her workplace **sexual harassment** policy and put it on every single person ’ s desk, and the **harassment** stopped. We heard from a woman who said that she was sick of cold callers ringing. She was a single mom and sick of them ringing and asking to speak to the man of the house. Now she puts them on to her six-year old son, and apparently he **sings** them,”I ’ m sexy and I know it.”We heard from a guy who was walking past a building site, when two builders screamed at two women across the road,”Get your tits out!”So he lifted up his T-shirt instead. We heard from a woman who said that every time someone screams”Nice tits!”at her in the **street**, she looks down at them, and screams as if she ’ d never seen them before. We heard from a man who said that he ’ d never really thought about **harassment** before, but after reading the stories it gave him new insight into what it actually felt like for women, and the next time he saw another guy in the **street** harassing two women, he ran after him, tapped him on the shoulder and said,”Sorry, can I just ask you, why did you do that?”And the other guy had no answer, because he ’ d never been asked that question before, because it was just normal, for him too. He ’ d grown up in a world where that was just normal and something that men did. That ’ s the really important thing here, because sadly and frustratingly, we can no longer point to one specific policy change or piece of legislation that we need to solve this problem. Particularly in the UK, we have excellent legislation now, a really good example is workplace **sexual harassment** law, which is fantastic. The single biggest category of entries that we receive is from women being harassed in the workplace, being **assaulted** in the workplace, being discriminated against in the workplace. What we need is a cultural and a social shift in our **attitudes** towards women, and towards **violence** against women. Because it ’ s people in the workplace that laugh along and call it”banter”and just joke around when someone grabs her breasts that make her feel unable to report. In a way that ’ s the exciting thing, because it means that we can all be part of the solution. If the Everyday Sexism Project has shown anything, it ’ s that this is a continuum. All of these things are connected. The same ideas and **attitudes** about women that underlie those more”minor”incidents of sexism and **harassment**, that we ’ re often told to brush off and not make a fuss about, are the same ideas and **attitudes** about women that underlie the more serious incidents of **assault** and rape. What that means is that by helping to contribute to a cultural shift in the way women are perceived - whether it ’ s in the media, in the professional sphere, in the social or economic sphere - we help to shift the way that they ’ re perceived and treated in the other spheres as well. So that does mean that every one of us can be part of the change. It ’ s not necessarily about targeting **perpetrators**, and it ’ s certainly not about telling **victims** that they should be behaving in a certain way or reacting in a certain way. It ’ s about the people in the office that made it difficult for that woman to feel able to speak out ; it ’ s about the people on that bus that day that looked out of the window. Be part of the change. Be the cool aunt or uncle who buys a chemistry set for their niece, or a play cooker for their nephew. Be the teenager that tells his friends that actually it ’ s not okay or funny to refer to women as sluts or whores. Be the person that lets somebody who ’ s been groped realize that it will be taken seriously, and they have the right to report it. Be the tabloid editor who commissions an article that isn ’ t illustrated with a picture of a pair of women ’ s tits. Be the person at the bus stop that steps in when they see a woman being harassed. Or be the person on the bus that stands up and says it isn ’ t okay. Because our voices are the loudest when we raise them together.

The day I left home for the first time to go to university was a bright day brimming with hope and optimism. I ’ d done well at school. Expectations for me were high, and I gleefully entered the student life of lectures, parties and traffic cone theft. Now appearances, of course, can be deceptive, and to an extent, this feisty, energetic persona of lecture-going and traffic cone stealing was a veneer, albeit a very well-crafted and convincing one. Underneath, I was actually deeply unhappy, insecure and fundamentally frightened — frightened of other people, of the future, of failure and of the emptiness that I felt was within me. But I was skilled at hiding it, and from the outside appeared to be someone with everything to hope for and aspire to. This fantasy of invulnerability was so complete that I even deceived myself, and as the first semester ended and the second began, there was no way that anyone could have predicted what was just about to happen. I was leaving a seminar when it started, humming to myself, fumbling with my bag just as I ’ d done a hundred times before, when suddenly I heard a voice calmly observe,”She is leaving the room.”I looked around, and there was no one there, but the clarity and decisiveness of the comment was unmistakable. Shaken, I left my books on the stairs and hurried home, and there it was again.”She is opening the door.”This was the beginning. The voice had arrived. And the voice persisted, days and then weeks of it, on and on, narrating everything I did in the third person.”She is going to the library.””She is going to a lecture.”It was neutral, impassive and even, after a while, strangely companionate and reassuring, although I did notice that its calm exterior sometimes slipped and that it occasionally mirrored my own unexpressed emotion. So, for example, if I was angry and had to hide it, which I often did, being very adept at concealing how I really felt, then the voice would sound frustrated. Otherwise, it was neither sinister nor disturbing, although even at that point it was clear that it had something to communicate to me about my emotions, particularly emotions which were remote and inaccessible. Now it was then that I made a fatal mistake, in that I told a friend about the voice, and she was horrified. A subtle conditioning process had begun, the implication that normal people don ’ t hear voices and the fact that I did meant that something was very seriously wrong. Such fear and mistrust was infectious. Suddenly the voice didn ’ t seem quite so benign anymore, and when she insisted that I seek medical attention, I duly complied, and which proved to be mistake number two. I spent some time telling the college G. P. about what I perceived to be the real problem : anxiety, low self-worth, fears about the future, and was met with bored indifference until I mentioned the voice, upon which he dropped his pen, swung round and began to question me with a show of real interest. And to be fair, I was desperate for interest and help, and I began to tell him about my strange commentator. And I always wish, at this point, the voice had said,”She is digging her own grave.”I was referred to a psychiatrist, who likewise took a grim view of the voice ’ s presence, subsequently interpreting everything I said through a lens of latent insanity. For example, I was part of a student TV station that broadcast news bulletins around the campus, and during an appointment which was running very late, I said,”I ’ m sorry, doctor, I ’ ve got to go. I ’ m reading the news at six.”Now it ’ s down on my medical records that Eleanor has delusions that she ’ s a television news broadcaster. It was at this point that events began to rapidly overtake me. A hospital admission followed, the first of many, a diagnosis of schizophrenia came next, and then, worst of all, a toxic, tormenting sense of hopelessness, humiliation and despair about myself and my prospects. But having been encouraged to see the voice not as an experience but as a symptom, my fear and resistance towards it intensified. Now essentially, this represented taking an aggressive stance towards my own mind, a kind of psychic civil war, and in turn this caused the number of voices to increase and grow progressively hostile and menacing. Helplessly and hopelessly, I began to retreat into this nightmarish inner world in which the voices were destined to become both my persecutors and my only perceived companions. They told me, for example, that if I proved myself worthy of their help, then they could change my life back to how it had been, and a series of increasingly bizarre tasks was set, a kind of labor of Hercules. It started off quite small, for example, pull out three strands of hair, but gradually it grew more extreme, culminating in commands to **harm** myself, and a particularly dramatic instruction :”You see that tutor over there? You see that glass of water? Well, you have to go over and pour it over him in front of the other students.”Which I actually did, and which needless to say did not endear me to the faculty. In effect, a vicious cycle of fear, avoidance, mistrust and misunderstanding had been established, and this was a battle in which I felt powerless and incapable of establishing any kind of peace or reconciliation. Two years later, and the deterioration was dramatic. By now, I had the whole frenzied repertoire : terrifying voices, grotesque visions, bizarre, intractable delusions. My mental health status had been a catalyst for **discrimination**, verbal abuse, and physical and **sexual assault**, and I ' d been told by my psychiatrist,"Eleanor, you ' d be better off with cancer, because cancer is easier to cure than schizophrenia."I ' d been diagnosed, drugged and discarded, and was by now so tormented by the voices that I attempted to drill a hole in my head in order to get them out. Now looking back on the wreckage and despair of those years, it seems to me now as if someone died in that place, and yet, someone else was saved. A broken and haunted person began that journey, but the person who emerged was a survivor and would ultimately grow into the person I was destined to be. Many people have **harmed** me in my life, and I remember them all, but the memories grow pale and faint in comparison with the people who ' ve helped me. The fellow survivors, the fellow voice-hearers, the comrades and collaborators ; the mother who never gave up on me, who knew that one day I would come back to her and was willing to wait for me for as long as it took ; the doctor who only worked with me for a brief time but who reinforced his belief that recovery was not only possible but inevitable, and during a devastating period of relapse told my terrified family,"Don ' t give up hope. I believe that Eleanor can get through this. Sometimes, you know, it snows as late as May, but summer always comes eventually."Fourteen minutes is not enough time to fully credit those good and generous people who fought with me and for me and who waited to welcome me back from that agonized, lonely place. But together, they forged a blend of courage, creativity, integrity, and an unshakeable belief that my shattered self could become **healed** and whole. I used to say that these people saved me, but what I now know is they did something even more important in that they empowered me to save myself, and crucially, they helped me to understand something which I ' d always suspected : that my voices were a meaningful response to traumatic life events, particularly childhood events, and as such were not my enemies but a source of insight into solvable emotional problems. Now, at first, this was very difficult to believe, not least because the voices appeared so hostile and menacing, so in this respect, a vital first step was learning to separate out a metaphorical meaning from what I ' d previously interpreted to be a literal truth. So for example, voices which threatened to attack my home I learned to interpret as my own sense of fear and insecurity in the world, rather than an actual, objective danger. Now at first, I would have believed them. I remember, for example, sitting up one night on guard outside my parents ' room to protect them from what I thought was a genuine threat from the voices. Because I ' d had such a bad problem with self-injury that most of the cutlery in the house had been hidden, so I ended up arming myself with a plastic fork, kind of like picnic ware, and sort of sat outside the room clutching it and waiting to spring into action should anything happen. It was like,"Don ' t mess with me. I ' ve got a plastic fork, don ' t you know?"Strategic. But a later response, and much more useful, would be to try and deconstruct the message behind the words, so when the voices warned me not to leave the house, then I would thank them for drawing my attention to how **unsafe** I felt — because if I was aware of it, then I could do something positive about it — but go on to reassure both them and myself that we were safe and didn ' t need to feel frightened anymore. I would set boundaries for the voices, and try to interact with them in a way that was assertive yet respectful, establishing a slow process of communication and collaboration in which we could learn to work together and support one another. Throughout all of this, what I would ultimately realize was that each voice was closely related to aspects of myself, and that each of them carried overwhelming emotions that I ' d never had an opportunity to process or resolve, memories of **sexual**

trauma and abuse, of anger, **shame**, guilt, low self-worth. The voices took the place of this pain and gave words to it, and possibly one of the greatest revelations was when I realized that the most hostile and aggressive voices actually represented the parts of me that had been hurt most profoundly, and as such, it was these voices that needed to be shown the greatest compassion and care. It was armed with this knowledge that ultimately I would gather together my shattered self, each fragment represented by a different voice, gradually withdraw from all my medication, and return to psychiatry, only this time from the other side. Ten years after the voice first came, I finally graduated, this time with the highest degree in psychology the university had ever given, and one year later, the highest masters, which shall we say isn ’ t bad for a madwoman. In fact, one of the voices actually dictated the answers during the exam, which technically possibly counts as cheating. And to be honest, sometimes I quite enjoyed their attention as well. As Oscar Wilde has said, the only thing worse than being talked about is not being talked about. It also makes you very good at eavesdropping, because you can listen to two conversations simultaneously. So it ’ s not all bad. I worked in mental health services, I spoke at conferences, I published book chapters and academic articles, and I argued, and continue to do so, the relevance of the following concept : that an important question in psychiatry shouldn ’ t be what ’ s wrong with you but rather what ’ s happened to you. And all the while, I listened to my voices, with whom I ’ d finally learned to live with peace and respect and which in turn reflected a growing sense of compassion, acceptance and respect towards myself. And I remember the most moving and extraordinary moment when supporting another young woman who was terrorized by her voices, and becoming fully aware, for the very first time, that I no longer felt that way myself but was finally able to help someone else who was. I ’ m now very proud to be a part of Intervoice, the organizational body of the International Hearing Voices Movement, an **initiative** inspired by the work of Professor Marius Romme and Dr. Sandra Escher, which locates voice hearing as a survival strategy, a sane reaction to insane circumstances, not as an aberrant symptom of schizophrenia to be endured, but a complex, significant and meaningful experience to be explored. Together, we envisage and enact a society that understands and respects voice hearing, supports the needs of individuals who hear voices, and which values them as full citizens. This type of society is not only possible, it ’ s already on its way. To paraphrase Chavez, once social change begins, it cannot be reversed. You cannot humiliate the person who feels pride. You cannot oppress the people who are not afraid anymore. For me, the achievements of the Hearing Voices Movement are a reminder that empathy, fellowship, justice and respect are more than words ; they are convictions and beliefs, and that beliefs can change the world. In the last 20 years, the Hearing Voices Movement has established hearing voices networks in 26 countries across five continents, working together to promote dignity, **solidarity** and empowerment for individuals in mental distress, to create a new language and practice of hope, which, at its very center, lies an unshakable belief in the power of the individual. As Peter Levine has said, the human animal is a unique being endowed with an instinctual capacity to **heal** and the intellectual spirit to harness this innate capacity. In this respect, for members of society, there is no greater honor or privilege than facilitating that process of healing for someone, to bear witness, to reach out a hand, to share the burden of someone ’ s **suffering**, and to hold the hope for their recovery. And likewise, for survivors of distress and adversity, that we remember we don ’ t have to live our lives forever defined by the damaging things that have happened to us. We are unique. We are irreplaceable. What lies within us can never be truly colonized, contorted, or taken away. The light never goes out.

As a very wonderful doctor once said to me,”Don ’ t tell me what other people have told you about yourself. Tell me about you.”Thank you.

”Even in purely non-religious terms, homosexuality represents a misuse of the **sexual** faculty. It is a pathetic little second-rate substitute for reality â a pitiable flight from life. As such, it deserves no compassion, it deserves no treatment as minority martyrdom, and it deserves not to be **deemed** anything but a pernicious sickness.”That ’ s from Time magazine in 1966, when I was three years old. And last year, the president of the United States came out in favor of **gay** marriage. And my question is, how did we get from there to here? How did an illness become an identity? When I was perhaps six years old, I went to a shoe store with my mother and my brother. And at the end of buying our shoes, the salesman said to us that we could each have a balloon to take home. My brother wanted a red balloon, and I wanted a pink balloon. My mother said that she thought I ’ d really rather have a blue balloon. But I said that I definitely wanted the pink one. And she reminded me that my favorite color was blue. The fact that my favorite color now is blue, but I ’ m still **gay** â â is evidence of both my mother ’ s influence and its limits. When I was little, my mother used to say,”The love you have for your children is like no other feeling in the world. And until you have children, you don ’ t know what it ’ s like.”And when I was little, I took it as the greatest compliment in the world that she would say that about parenting my brother and me. And when I was an adolescent, I thought that I ’ m **gay**, and so I probably can ’ t have a family. And when she said it, it made me anxious. And after I came out of the closet, when she continued to say it, it made me furious. I said,”I ’ m **gay**. That ’ s not the direction that I ’ m headed in. And I want you to stop saying that.”About 20 years ago, I was asked by my editors at The New York Times Magazine to write a piece about deaf culture. And I was rather taken aback. I had thought of deafness entirely as an illness. Those poor people, they couldn ’ t hear. They lacked hearing, and what could we do for them? And then I went out into the deaf world. I went to deaf clubs. I saw performances of deaf theater and of deaf poetry. I even went to the Miss Deaf America contest in Nashville, Tennessee where people complained about that slurry Southern signing. And as I plunged deeper and deeper into the deaf world, I become convinced that deafness was a culture and that the people in the deaf world who said,”We don ’ t lack hearing, we have membership in a culture,”were saying something that was viable. It wasn ’ t my culture, and I didn ’ t particularly want to rush off and join it, but I appreciated that it was a culture and that for the people who were members of it, it felt as valuable as Latino culture or **gay** culture or Jewish culture. It felt as valid perhaps even as American culture. Then a friend of a friend of mine had a daughter who was a dwarf. And when her daughter was born, she suddenly found herself confronting questions that now began to seem quite resonant to me. She was facing the question of what to do with this child. Should she say,”You ’ re just like everyone else but a little bit shorter?”Or should she try to construct some kind of dwarf identity, get involved in the Little People of America, become aware of what was happening for dwarfs? And I suddenly thought, most deaf children are born to hearing parents. Those hearing parents tend to try to cure them. Those deaf people discover community somehow in adolescence. Most **gay** people are born to straight parents. Those straight parents often want them to function in what they think of as the mainstream world, and those **gay** people have to discover identity later on. And here was this friend of mine looking at these questions of identity with her dwarf daughter. And I thought, there it is again : A family that perceives itself to be normal with a child who seems to be extraordinary. And I hatched the idea that there are really two kinds of identity. There are vertical identities, which are passed down generationally from parent to child. Those are things like **ethnicity**, frequently nationality, language, often religion. Those are things you have in common with your parents and with your children. And while some of them can be difficult, there ’ s no attempt to cure them. You can argue that it ’ s harder in the United States â our current presidency notwithstanding â to be a person of color. And yet, we have nobody who is trying to ensure that the next generation of children born to African- Americans and Asians come out with creamy skin and yellow hair. There are these other identities which you have to learn from a peer group. And I call them horizontal identities, because the peer group is the horizontal experience. These are identities that are alien to your parents and that you have to discover when you get to see them in peers. And those identities, those horizontal identities, people have almost always tried to cure. And I wanted to look at what the process is through which people who have those identities come to a good relationship with them. And it seemed to me that there were three levels of acceptance that needed to take place. There ’ s self- acceptance, there ’ s family acceptance, and there ’ s social acceptance. And they don ’ t always coincide. And a lot of the time, people who have these conditions are very angry because they feel as though their parents don ’ t love them, when what actually has happened is that their parents don ’ t accept them. Love is something that ideally is there unconditionally throughout the relationship between a parent and a child. But acceptance is something that takes time. It always takes time. One of the dwarfs I got to know was a guy named Clinton Brown. When he was born, he was diagnosed with diastrophic dwarfism, a very disabling condition, and his parents were told that he would never walk, he would never talk, he would have no intellectual capacity, and he would probably not even recognize them. And it was suggested to them that they leave him at the hospital so that he could die there quietly. And his mother said she wasn ’ t going to do it. And she took her son home. And even though she didn ’ t have a lot of educational or financial advantages, she found the best doctor in the country for dealing with diastrophic dwarfism, and she got Clinton enrolled with him. And in the course of his childhood, he had 30 major surgical procedures. And he spent all this time stuck in the hospital while he was having those procedures, as a result of which he now can walk. And while he was there, they sent tutors around to help him with his school work. And he worked very hard because there was nothing else to do. And he ended up achieving at a level that had never before been contemplated by any member of his family. He was the first one in his family, in fact, to go to college, where he lived on campus and drove a specially-fitted car that accommodated his unusual body. And his mother told me this story of coming home one day â and he went to college nearby â and she said,”I saw that car, which you can always recognize, in the parking lot of a bar,”she said.”And I thought to myself, they ’ re six feet tall, he ’ s three feet tall. Two beers for them is four beers for him.”She said,”I knew I couldn ’ t go in there and interrupt him, but I went home, and I left him eight messages on his cell phone.”She said,”And then I thought, if someone had said to me when he was born that my future worry would be that he ’ d go drinking and driving with his college buddies â”And I said to her,”What do you think you did that helped him to emerge as this charming, accomplished, wonderful person?”And she said,”What did I do? I loved him, that ’ s all. Clinton just always had that light in him. And his father and I were lucky enough to be the first to see it there.”I ’ m going to quote from another magazine of the ’ 60s. This one is from 1968 â The Atlantic Monthly, voice of liberal America â written by an important bioethicist. He said,”There is no reason to feel guilty about putting a Down syndrome child away, whether it is put away in the sense of hidden in a sanitarium or in a more responsible, lethal sense. It is sad, yes â dreadful. But it carries no guilt. True guilt arises only from an offense against a person, and a Down ’ s is not a person.”There ’ s been a lot of ink given to the **enormous** progress that we ’ ve made in the treatment of **gay** people. The fact that our **attitude** has changed is in the headlines every day. But we forget how we used to see people who had other differences, how we used to see people who were **disabled**, how inhuman we held people to be. And the change that ’ s been accomplished there, which is almost equally radical, is one that we pay not very much attention to. One of the families I interviewed, Tom and Karen Robards, were taken aback when, as young and successful New Yorkers, their first child was diagnosed with Down syndrome. They thought the educational opportunities for him were not what they should be, and so they decided they would build a little center â two classrooms that they started with a few other parents â to educate kids with D. S. And over the years, that center grew into something called the Cooke Center, where there are now thousands upon thousands of children with intellectual disabilities who are being taught. In the time since that Atlantic Monthly story ran, the life expectancy for people with Down syndrome has tripled. The experience of Down syndrome people includes those who are actors, those who are writers, some who are able to live fully independently in adulthood. The Robards had a lot to do with that. And I said,”Do you regret it? Do you wish your child didn ’ t have Down syndrome? Do you wish you ’ d never heard of it?”And interestingly his father said,”Well, for David, our son, I regret it, because for David, it ’ s a difficult way to be in the world, and I ’ d like to give David an easier life. But I think if we lost everyone with Down syndrome, it would be a catastrophic loss.”And Karen Robards said to me,”I ’ m with Tom. For David, I would cure it in an instant to give him an easier life. But speaking for myself â well, I would never have believed 23 years ago when he was born that I could come to such a point â speaking for myself, it ’ s made me so much better and so much kinder and so much more purposeful in my whole life, that speaking for myself, I wouldn ’ t give it up for anything in the world.”We live at a point when social acceptance for these and many other conditions is on the up and up. And yet we also live at the moment when our ability to eliminate those conditions has reached a height we never imagined before. Most deaf infants born in the United States now will receive Cochlear implants, which are put into the brain and connected to a receiver, and which allow them to acquire a facsimile of hearing and to use oral speech. A compound that has been tested in mice, BMN-111, is useful in preventing the action of the achondroplasia gene. Achondroplasia is the most common form of dwarfism, and mice who have been given that substance and who have the achondroplasia gene, grow to full size. Testing in humans is around the corner. There are blood tests which are making progress that would pick up Down syndrome more clearly and earlier in pregnancies than ever before, making it easier and easier for people to eliminate those pregnancies, or to terminate them. And so we have both social progress and medical progress. And I believe in both of them. I believe the social progress is fantastic and meaningful and wonderful, and I think the same thing about the medical progress. But I think it ’ s a tragedy when one of them doesn ’ t see the other. And when I see the way they ’ re intersecting in conditions like the three I ’ ve just described, I sometimes think it ’ s like those moments in grand **opera** when the hero realizes he loves the heroine at the exact moment that she lies expiring on a divan. We have to think about how we feel about cures altogether. And a lot of the time the question of parenthood is, what do we validate in our children, and what do we cure in them? Jim Sinclair, a prominent autism activist, said,"When parents say ' I wish my child did not have autism, ' what they ' re really saying is ' I wish the child I have did not exist and I had a different, non-autistic child instead. ' Read that again. This is what we hear when you mourn over our existence. This is what we hear when you pray for a cure â that your fondest wish for us is that someday we will cease to be and strangers you can love will move in behind our faces."It ' s a very extreme point of view, but it points to the reality that people engage with the life they have and they don ' t want to be cured or changed or eliminated. They want to be whoever it is that they ' ve come to be. One of the families I interviewed for this project was the family of Dylan Klebold who was one of the **perpetrators** of the Columbine massacre. It took a long time to persuade them to talk to me, and once they agreed, they were so full of their story that they couldn ' t stop telling it. And the first weekend I spent with them â the first of many â I recorded more than 20 hours of conversation. And on Sunday night, we were all exhausted. We were sitting in the kitchen. Sue Klebold was fixing dinner. And I said,"If Dylan were here now, do you have a sense of what you ' d want to ask him?"And his father said,"I sure do. I ' d want to ask him what the hell he thought he was doing."And Sue looked at the floor, and she thought for a minute. And then she looked back up and said,"I would ask him to forgive me for being his mother and never knowing what was going on inside his head."When I had dinner with her a couple of years later â one of many dinners that we had together â she said,"You know, when it first happened, I used to wish that I had never married, that I had never had children. If I hadn ' t gone to Ohio State and crossed paths with Tom, this child wouldn ' t have existed and this terrible thing wouldn ' t have happened. But I ' ve come to feel that I love the children I had so much that I don ' t want to imagine a life without them. I recognize the pain they caused to others, for which there can be no forgiveness, but the pain they caused to me, there is,"she said."So while I recognize that it would have been better for the world if Dylan had never been born, I ' ve decided that it would not have been better for me."I thought it was surprising how all of these families had all of these children with all of these problems, problems that they mostly would have done anything to avoid, and that they had all found so much meaning in that experience of parenting. And then I thought, all of us who have children love the children we have, with their flaws. If some glorious angel suddenly descended through my living room ceiling and offered to take away the children I have and give me other, better children â more polite, funnier, nicer, smarter â I would cling to the children I have and pray away that atrocious spectacle. And ultimately I feel that in the same way that we test flame-retardant pajamas in an inferno to ensure they won ' t catch fire when our child reaches across the stove, so these stories of families negotiating these extreme differences reflect on the universal experience of parenting, which is always that sometimes you look at your child and you think, where did you come from? It turns out that while each of these individual differences is siloed â there are only so many families dealing with schizophrenia, there are only so many families of children who are transgender, there are only so many families of prodigies â who also face similar challenges in many ways â there are only so many families in each of those categories â but if you start to think that the experience of negotiating difference within your family is what people are addressing, then you discover that it ' s a nearly universal phenomenon. Ironically, it turns out, that it ' s our differences, and our negotiation of difference, that unite us. I decided to have children while I was working on this project. And many people were astonished and said,"But how can you decide to have children in the midst of studying everything that can go wrong?”And I said,”I ’ m not studying everything that can go wrong. What I ’ m studying is how much love there can be, even when everything appears to be going wrong.”I thought a lot about the mother of one **disabled** child I had seen, a severely **disabled** child who died through caregiver neglect. And when his ashes were interred, his mother said,”I pray here for forgiveness for having been twice robbed, once of the child I wanted and once of the son I loved.”And I figured it was possible then for anyone to love any child if they had the effective will to do so. So my husband is the biological father of two children with some lesbian friends in Minneapolis. I had a close friend from college who ’ d gone through a divorce and wanted to have children. And so she and I have a daughter, and mother and daughter live in Texas. And my husband and I have a son who lives with us all the time of whom I am the biological father, and our surrogate for the pregnancy was Laura, the lesbian mother of Oliver and Lucy in Minneapolis. So the shorthand is five parents of four children in three states. And there are people who think that the existence of my family somehow undermines or weakens or damages their family. And there are people who think that families like mine shouldn ’ t be allowed to exist. And I don ’ t accept subtractive models of love, only additive ones. And I believe that in the same way that we need species diversity to ensure that the planet can go on, so we need this diversity of affection and diversity of family in order to strengthen the ecosphere of kindness. The day after our son was born, the pediatrician came into the hospital room and said she was concerned. He wasn ’ t extending his legs appropriately. She said that might mean that he had brain damage. In so far as he was extending them, he was doing so asymmetrically, which she thought could mean that there was a tumor of some kind in action. And he had a very large head, which she thought might indicate hydrocephalus. And as she told me all of these things, I felt the very center of my being pouring out onto the floor. And I thought, here I had been working for years on a book about how much meaning people had found in the experience of parenting children who are **disabled**, and I didn ’ t want to join their number. Because what I was encountering was an idea of illness. And like all parents since the dawn of time, I wanted to protect my child from illness. And I wanted also to protect myself from illness. And yet, I knew from the work I had done that if he had any of the things we were about to start testing for, that those would ultimately be his identity, and if they were his identity they would become my identity, that that illness was going to take a very different shape as it unfolded. We took him to the MRI machine, we took him to the CAT scanner, we took this day-old child and gave him over for an arterial blood draw. We felt **helpless**. And at the end of five hours, they said that his brain was completely clear and that he was by then extending his legs correctly. And when I asked the pediatrician what had been going on, she said she thought in the morning he had probably had a cramp. But I thought how my mother was right. I thought, the love you have for your children is unlike any other feeling in the world, and until you have children, you don ’ t know what it feels like. I think children had ensnared me the moment I connected fatherhood with loss. But I ’ m not sure I would have noticed that if I hadn ’ t been so in the thick of this research project of mine. I ’ d encountered so much strange love, and I fell very naturally into its bewitching patterns. And I saw how splendor can illuminate even the most abject vulnerabilities. During these 10 years, I had witnessed and learned the terrifying joy of unbearable responsibility, and I had come to see how it conquers everything else. And while I had sometimes thought the parents I was interviewing were fools, enslaving themselves to a lifetime ’ s journey with their thankless children and trying to breed identity out of misery, I realized that day that my research had built me a plank and that I was ready to join them on their ship. Thank you.

Salaam. Namaskar. Good morning. Given my TED profile, you might be expecting that I ’ m going to speak to you about the latest philanthropic trends â the one that ’ s currently got Wall Street and the World Bank buzzing â how to invest in women, how to empower them, how to save them. Not me. I am interested in how women are saving us. They ’ re saving us by redefining and re-imagining a future that defies and blurs accepted polarities, polarities we ’ ve taken for granted for a long time, like the ones between modernity and tradition, First World and Third World, oppression and opportunity. In the midst of the daunting challenges we face as a global community, there ’ s something about this third way raga that is making my heart **sing**. What intrigues me most is how women are doing this, despite a set of paradoxes that are both frustrating and fascinating. Why is it that women are, on the one hand, viciously oppressed by cultural practices, and yet at the same time, are the preservers of cultures in most societies? Is the hijab or the headscarf a symbol of submission or resistance? When so many women and girls are beaten, raped, maimed on a daily basis in the name of all kinds of causes â honor, religion, nationality â what allows women to replant trees, to rebuild societies, to lead radical, non-violent movements for social change? Is it different women who are doing the preserving and the radicalizing? Or are they one and the same? Are we guilty, as Chimamanda Adichie reminded us at the TED conference in Oxford, of assuming that there is a single story of women ’ s struggles for their rights while there are, in fact, many? And what, if anything, do men have to do with it? Much of my life has been a quest to get some answers to these questions. It ’ s taken me across the globe and introduced me to some amazing people. In the process, I ’ ve gathered a few fragments that help me shed some light on this puzzle. Among those who ’ ve helped open my eyes to a third way are : a devout Muslim in Afghanistan, a group of harmonizing lesbians in Croatia and a taboo breaker in Liberia. I ’ m indebted to them, as I am to my parents, who for some set of misdemeanors in their last life, were blessed with three daughters in this one. And for reasons equally unclear to me, seem to be inordinately proud of the three of us. I was born and raised here in India, and I learned from an early age to be deeply suspicious of the aunties and uncles who would bend down, pat us on the head and then say to my parents with no problem at all,”Poor things. You only have three daughters. But you ’ re young, you could still try again.”My sense of outrage about women ’ s rights was brought to a boil when I was about 11. My aunt, an incredibly articulate and brilliant woman, was widowed early. A flock of relatives descended on her. They took off her colorful sari. They made her wear a white one. They wiped her bindi off her forehead. They broke her bangles. Her daughter, Rani, a few years older than me, sat in her lap bewildered, not knowing what had happened to the confident woman she once knew as her mother. Late that night, I heard my mother begging my father,”Please do something Ramu. Can ’ t you intervene?”And my father, in a low voice, muttering,”I ’ m just the youngest brother, there ’ s nothing I can do. This is tradition.”That ’ s the night I learned the rules about what it means to be female in this world. Women don ’ t make those rules, but they define us, and they define our opportunities and our chances. And men are affected by those rules too. My father, who had fought in three wars, could not save his own sister from this **suffering**. By 18, under the excellent tutelage of my mother, I was therefore, as you might expect, defiantly feminist. On

the **streets** chanting,"[Hindi] [Hindi] We are the women of India. We are not flowers, we are sparks of change."By the time I got to Beijing in 1995, it was clear to me, the only way to achieve gender **equality** was to overturn centuries of oppressive tradition. Soon after I returned from Beijing, I leapt at the chance to work for this wonderful organization, founded by women, to support women ' s rights organizations around the globe. But barely six months into my new job, I met a woman who forced me to challenge all my assumptions. Her name is Sakena Yacoobi. She walked into my office at a time when no one knew where Afghanistan was in the United States. She said to me,"It is not about the burka."She was the most determined advocate for women ' s rights I had ever heard. She told me women were running underground schools in her communities inside Afghanistan, and that her organization, the Afghan Institute of Learning, had started a school in Pakistan. She said,"The first thing anyone who is a Muslim knows is that the Koran requires and strongly supports literacy. The prophet wanted every believer to be able to read the Koran for themselves."Had I heard right? Was a women ' s rights advocate invoking religion? But Sakena defies labels. She always wears a headscarf, but I ' ve walked alongside with her on a beach with her long hair flying in the breeze. She starts every lecture with a **prayer**, but she ' s a single, feisty, financially independent woman in a country where girls are married off at the age of 12. She is also immensely pragmatic."This headscarf and these clothes,"she says,"give me the freedom to do what I need to do to speak to those whose support and assistance are critical for this work. When I had to open the school in the refugee camp, I went to see the imam. I told him, ' I ' m a believer, and women and children in these terrible conditions need their faith to survive. '"She smiles slyly."He was flattered. He began to come twice a week to my center because women could not go to the **mosque**. And after he would leave, women and girls would stay behind. We began with a small literacy class to read the Koran, then a math class, then an English class, then computer classes. In a few weeks, everyone in the refugee camp was in our classes."Sakena is a teacher at a time when to educate women is a dangerous business in Afghanistan. She is on the Taliban ' s hit list. I worry about her every time she travels across that country. She shrugs when I ask her about **safety**."Kavita jaan, we cannot allow ourselves to be afraid. Look at those young girls who go back to school when acid is thrown in their face."And I smile, and I nod, realizing I ' m watching women and girls using their own religious traditions and practices, turning them into instruments of opposition and opportunity. Their path is their own and it looks towards an Afghanistan that will be different. Being different is something the women of Lesbor in Zagreb, Croatia know all too well. To be a lesbian, a dyke, a homosexual in most parts of the world, including right here in our country, India, is to occupy a place of immense discomfort and extreme **prejudice**. In post-conflict societies like Croatia, where a hyper-nationalism and religiosity have created an environment unbearable for anyone who might be considered a social outcast. So enter a group of out dykes, young women who love the old music that once spread across that region from Macedonia to Bosnia, from Serbia to Slovenia. These folk singers met at college at a gender studies program. Many are in their 20s, some are mothers. Many have struggled to come out to their communities, in families whose religious beliefs make it hard to accept that their daughters are not sick, just queer. As Leah, one of the founders of the group, says,"I like traditional music very much. I also like rock and roll. So Lesbor, we blend the two. I see traditional music like a kind of rebellion, in which people can really speak their voice, especially traditional songs from other parts of the former Yugoslav Republic. After the war, lots of these songs were lost, but they are a part of our childhood and our history, and we should not forget them.”Improbably, this LGBT singing **choir** has demonstrated how women are investing in tradition to create change, like alchemists turning discord into harmony. Their repertoire includes the Croatian national anthem, a Bosnian love song and Serbian duets. And, Leah adds with a grin,”Kavita, we especially are proud of our Christmas music, because it shows we are open to religious practices even though Catholic Church hates us LGBT.”Their concerts draw from their own communities, yes, but also from an older generation : a generation that might be suspicious of homosexuality, but is nostalgic for its own music and the past it represents. One father, who had initially balked at his daughter coming out in such a **choir**, now writes songs for them. In the Middle Ages, troubadours would travel across the land **singing** their tales and sharing their verses : Lesbor travels through the Balkans like this, singing, connecting people divided by religion, nationality and language. Bosnians, Croats and Serbs find a rare **shared** space of pride in their history, and Lesbor reminds them that the songs one group often claims as theirs alone really belong to them all. Yesterday, Mallika Sarabhai showed us that music can create a world more accepting of difference than the one we have been given. The world Leymah Gbowee was given was a world at war. Liberia had been torn apart by civil strife for decades. Leymah was not an activist, she was a mother of three. But she was sick with worry : She worried her son would be abducted and taken off to be a child soldier, she worried her daughters would be raped, she worried for their lives. One night, she had a dream. She dreamt she and thousands of other women ended the bloodshed. The next morning at church, she asked others how they felt. They were all tired of the fighting. We need peace, and we need our leaders to know we will not rest until there is peace. Among Leymah ’ s friends was a policewoman who was Muslim. She promised to raise the issue with her community. At the next Friday sermon, the women who were sitting in the side room of the **mosque** began to share their distress at the state of affairs.”What does it matter?”they said,”A bullet doesn ’ t distinguish between a Muslim and a Christian.”This small group of women, determined to bring an end to the war, and they chose to use their traditions to make a point : Liberian women usually wear lots of jewelry and colorful clothing. But no, for the protest, they dressed all in white, no makeup. As Leymah said,”We wore the white saying we were out for peace.”They stood on the side of the road on which Charles Taylor ’ s motorcade passed every day. They stood for weeks â first just 10, then 20, then 50, then hundreds of women â wearing white, singing, dancing, saying they were out for peace. Eventually, opposing forces in Liberia were pushed to hold peace talks in Ghana. The peace talks dragged on and on and on. Leymah and her sisters had had enough. With their remaining funds, they took a small group of women down to the venue of the peace talks and they surrounded the building. In a now famous CNN clip, you can see them sitting on the ground, their arms linked. We know this in India. It ’ s called a [Hindi]. Then things get tense. The police are called in to physically remove the women. As the senior officer approaches with a baton, Leymah stands up with deliberation, reaches her arms up over her head, and begins, very slowly, to untie her headdress that covers her hair. You can see the policeman ’ s face. He looks embarrassed. He backs away. And the next thing you know, the police have disappeared. Leymah said to me later,”It ’ s a taboo, you know, in West Africa. If an older woman undresses in front of a man because she wants to, the man ’ s family is cursed.”She said,”I don ’ t know if he did it because he believed, but he knew we were not going to leave. We were not going to leave until the peace accord was signed.”And the peace accord was signed. And the women of Liberia then mobilized in support of Ellen Johnson Sirleaf, a woman who broke a few taboos herself becoming the first elected woman head of state in Africa in years. When she made her presidential address, she acknowledged these brave women of Liberia who allowed her to win against a football star â that ' s soccer for you Americans â no less. Women like Sakena and Leah and Leymah have humbled me and changed me and made me realize that I should not be so quick to jump to assumptions of any kind. They ' ve also saved me from my righteous anger by offering insights into this third way. A Filipina activist once said to me,"How do you cook a rice cake? With heat from the bottom and heat from the top."The protests, the marches, the uncompromising position that women ' s rights are human rights, full stop. That ' s the heat from the bottom. That ' s Malcolm X and the suffragists and **gay** pride parades. But we also need the heat from the top. And in most parts of the world, that top is still controlled by men. So to paraphrase Marx : Women make change, but not in circumstances of their own choosing. They have to negotiate. They have to subvert tradition that once **silenced** them in order to give voice to new aspirations. And they need allies from their communities. Allies like the imam, allies like the father who now writes songs for a lesbian group in Croatia, allies like the policeman who honored a taboo and backed away, allies like my father, who couldn ' t help his sister but has helped three daughters pursue their dreams. Maybe this is because feminism, unlike almost every other social movement, is not a struggle against a distinct oppressor â it ' s not the ruling class or the occupiers or the colonizers â it ' s against a deeply held set of beliefs and assumptions that we women, far too often, hold ourselves. And perhaps this is the ultimate gift of feminism, that the personal is in fact the political. So that, as Eleanor Roosevelt said once of human rights, the same is true of gender **equality** : that it starts in small places, close to home. On the **streets**, yes, but also in negotiations at the kitchen table and in the marital bed and in relationships between lovers and parents and sisters and friends. And then you realize that by integrating aspects of tradition and community into their struggles, women like Sakena and Leah and Leymah â but also women like Sonia Gandhi here in India and Michelle Bachelet in Chile and Shirin Ebadi in Iran â are doing something else. They ' re challenging the very notion of Western models of development. They are saying, we don ' t have to be like you to make change. We can wear a sari or a hijab or pants or a boubou, and we can be party leaders and presidents and human rights lawyers. We can use our tradition to navigate change. We can demilitarize societies and pour resources, instead, into reservoirs of genuine security. It is in these little stories, these individual stories, that I see a radical epic being written by women around the world. It is in these threads that are being woven into a resilient fabric that will sustain communities, that I find hope. And if my heart is **singing**, it ' s because in these little fragments, every now and again, you catch a glimpse of a whole, of a whole new world. And she is definitely on her way. Thank you.

Text Sample 391: POS Dim 3 – 2009 – Score 11.00 – 2009/t002967.txt

Okay, so 90 percent of my photographic process is, in fact, not photographic. It involves a campaign of letter writing, research and phone calls to **access** my subjects, which can range from Hamas leaders in Gaza to a hibernating black bear in its cave in West Virginia. And oddly, the most notable letter of rejection I ever received came from Walt Disney World, a seemingly innocuous site. And it read — I ' m just going to read a key sentence :"Especially during these **violent** times, I personally believe that the magical spell cast upon guests who visit our theme parks is particularly important to protect and helps to provide them with an important fantasy they can escape to."Photography threatens fantasy.

They didn ’ t want to let my camera in because it confronts constructed realities, myths and beliefs, and provides what appears to be evidence of a truth. But there are multiple truths attached to every image, depending on the creator ’ s intention, the viewer and the context in which it is presented. Over a five year period following September 11th, when the American media and government were seeking hidden and unknown sites beyond its borders, most notably weapons of mass destruction, I chose to look inward at that which was integral to America ’ s foundation, mythology and daily functioning. I wanted to confront the boundaries of the citizen, self-imposed and real, and confront the divide between privileged and public **access** to knowledge. It was a critical moment in American history and global history where one felt they didn ’ t have **access** to accurate information. And I wanted to see the center with my own eyes, but what I came away with is a photograph. And it ’ s just another place from which to observe, and the understanding that there are no absolute, all-knowing insiders. And the outsider can never really reach the core. I ’ m going to run through some of the photographs in this series. It ’ s titled,”An American Index of the Hidden and Unfamiliar,”and it ’ s comprised of nearly 70 images. In this context I ’ ll just show you a few. This is a nuclear waste storage and encapsulation facility at Hanford site in Washington State, where there are over 1, 900 stainless steel capsules containing nuclear waste submerged in water. A human standing in front of an unprotected capsule would die instantly. And I found one section amongst all of these that actually resembled the outline of the United States of America, which you can see here. And a big part of the work that is sort of absent in this context is text. So I create these two poles. Every image is accompanied with a very detailed factual text. And what I ’ m most interested in is the invisible space between a text and its accompanying image, and how the image is transformed by the text and the text by the image. So, at best, the image is meant to float away into abstraction and multiple truths and fantasy. And then the text functions as this cruel anchor that kind of nails it to the ground. But in this context I ’ m just going to read an abridged version of those texts. This is a cryopreservation unit, and it holds the bodies of the wife and mother of cryonics pioneer Robert Ettinger, who hoped to be awoken one day to extended life in good health, with advancements in science and technology, all for the cost of 35 thousand dollars, for forever. This is a 21-year-old Palestinian woman undergoing hymenoplasty. Hymenoplasty is a surgical procedure which restores the virginal state, allowing her to adhere to certain cultural expectations regarding virginity and marriage. So it essentially reconstructs a ruptured hymen, allowing her to bleed upon having **sexual** intercourse, to simulate the loss of virginity. This is a jury simulation deliberation room, and you can see beyond that two- way mirror jury advisers standing in a room behind the mirror. And they observe deliberations after mock trial proceedings so that they can better advise their clients how to adjust their trial strategy to have the outcome that they ’ re hoping for. This process costs 60, 000 dollars. This is a U. S. Customs and Border Protection room, a contraband room, at John F. Kennedy International Airport. On that table you can see 48 hours ’ worth of seized goods from passengers entering in to the United States. There is a pig ’ s head and African cane rats. And part of my photographic work is I ’ m not just documenting what ’ s there. I do take certain liberties and intervene. And in this I really wanted it to resemble an early still-life painting, so I spent some time with the smells and items. This is the exhibited art on the walls of the CIA in Langley, Virginia, their original headquarters building. And the CIA has had a long history with both covert and public cultural diplomacy efforts. And it ’ s speculated that some of their interest in the arts was designed to counter Soviet communism and promote what it considered to be pro-American thoughts and aesthetics. And one of the art forms that elicited the interest of the agency, and had thus come under question, is abstract expressionism. This is the Forensic Anthropology Research Facility, and on a six acre plot there are approximately 75 cadavers at any given time that are being studied by forensic anthropologists and researchers who are interested in monitoring a rate of corpse decomposition. And in this particular photograph the body of a young boy has been used to reenact a crime scene. This is the only federally funded site where it is legal to cultivate cannabis for scientific research in the United States. It ' s a research crop marijuana grow room. And part of the work that I hope for is that there is a sort of disorienting entropy where you can ' t find any discernible **formula** in how these things — they sort of awkwardly jump from government to science to religion to security — and you can ' t completely understand how information is being distributed. These are transatlantic submarine communication cables that travel across the floor of the Atlantic Ocean, connecting North America to Europe. They carry over 60 million simultaneous voice conversations, and in a lot of the government and technology sites there was just this very apparent vulnerability. This one is almost humorous because it feels like I could just snip all of that conversation in one easy cut. But stuff did feel like it could have been taken 30 or 40 years ago, like it was locked in the Cold War era and hadn ' t necessarily progressed. This is a Braille edition of Playboy magazine. And this is... a division of the Library of Congress produces a free national library service for the blind and visually impaired, and the publications they choose to publish are based on reader popularity. And Playboy is always in the top few. But you ' d be surprised, they don ' t do the photographs. It ' s just the text. This is an avian quarantine facility where all imported birds coming into America are required to undergo a 30-day quarantine, where they are tested for diseases including Exotic Newcastle Disease and Avian Influenza. This film shows the testing of a new explosive fill on a warhead. And the Air Armament Center at Eglin Air Force Base in Florida is responsible for the deployment and testing of all air-delivered weaponry coming from the United States. And the film was shot on 72 millimeter, government-issue film. And that red dot is a marking on the government-issue film. All living white tigers in North America are the result of selective inbreeding — that would be mother to son, father to daughter, sister to brother — to allow for the genetic conditions that create a salable white tiger. Meaning white fur, ice blue eyes, a pink nose. And the majority of these white tigers are not born in a salable state and are killed at birth. It ' s a very **violent** process that is little known. And the white tiger is obviously celebrated in several forms of entertainment. Kenny was born. He actually made it to adulthood. He has since passed away, but was mentally retarded and suffers from severe bone abnormalities. This, on a lighter note, is at George Lucas ' personal archive. This is the Death Star. And it ' s shown here in its true orientation. In the context of"Star Wars : Return of the Jedi,"its mirror image is presented. They flip the negative. And you can see the photoetched brass detailing, and the painted acrylic facade. In the context of the film, this is a deep-space battle station of the Galactic Empire, capable of annihilating planets and civilizations, and in reality it measures about four feet by two feet. This is at Fort Campbell in Kentucky. It ' s a Military Operations on Urbanized Terrain site. Essentially they ' ve simulated a city for urban combat, and this is one of the structures that exists in that city. It ' s called the World Church of God. It ' s supposed to be a generic site of worship. And after I took this photograph, they constructed a wall around the World Church of God to mimic the set-up of **mosques** in Afghanistan or Iraq. And I worked with Mehta Vihar who creates virtual simulations for the army for tactical practice. And we put that wall around the World Church of God, and also used the characters and vehicles and explosions that are offered in the video games for the army. And I put them into my photograph. This is live HIV virus at Harvard Medical School, who is working with the U. S. Government to develop sterilizing immunity. And Alhurra is a U. S. Government- sponsored Arabic language television network that distributes news and information to over 22 countries in the Arab world. It runs 24 hours a day, commercial free. However, it ' s illegal to broadcast Alhurra within the United States. And in 2004, they developed a channel called Alhurra Iraq, which specifically deals with events occurring in Iraq and is broadcast to Iraq. Now I ' m going to move on to another project I did. It ' s titled"The **Innocents**."And for the men in these photographs, photography had been used to create a fantasy. Contradicting its function as evidence of a truth, in these instances it furthered the fabrication of a lie. I traveled across the United States photographing men and women who had been wrongfully **convicted** of crimes they did not commit, **violent** crimes. I investigate photography ' s ability to blur truth and fiction, and its influence on memory, which can lead to severe, even lethal consequences. For the men in these photographs, the primary cause of their wrongful conviction was mistaken identification. A **victim** or eyewitness identifies a suspected **perpetrator** through law **enforcement** ' s use of images. But through exposure to composite sketches, Polaroids, mug shots and line-ups, eyewitness testimony can change. I ' ll give you an example from a case. A woman was raped and presented with a series of photographs from which to identify her attacker. She saw some similarities in one of the photographs, but couldn ' t quite make a positive identification. Days later, she is presented with another photo array of all new photographs, except that one photograph that she had some draw to from the earlier array is repeated in the second array. And a positive identification is made because the photograph replaced the memory, if there ever was an actual memory. Photography offered the criminal justice system a tool that transformed **innocent** citizens into criminals, and the criminal justice system failed to recognize the limitations of relying on photographic identifications. Frederick Daye, who is photographed at his alibi location, where 13 witnesses placed him at the time of the crime. He was **convicted** by an all-white jury of rape, kidnapping and vehicle theft. And he served 10 years of a life sentence. Now DNA exonerated Frederick and it also implicated another man who was serving time in prison. But the **victim** refused to press charges because she claimed that law **enforcement** had permanently altered her memory through the use of Frederick ' s photograph. Charles Fain was **convicted** of kidnapping, rape and murder of a young girl walking to school. He served 18 years of a death sentence. I photographed him at the scene of the crime at the Snake River in Idaho. And I photographed all of the wrongfully **convicted** at sites that came to particular significance in the history of their wrongful conviction. The scene of arrest, the scene of misidentification, the alibi location. And here, the scene of the crime, it ' s this place to which he ' s never been, but changed his life forever. So photographing there, I was hoping to highlight the tenuous relationship between truth and fiction, in both his life and in photography. Calvin Washington was **convicted** of capital murder. He served 13 years of a life sentence in Waco, Texas. Larry Mayes, I photographed at the scene of arrest, where he hid between two mattresses in Gary, Indiana, in this very room to hide from the police. He ended up serving 18 and a half years of an 80 year sentence for rape and robbery. The **victim** failed to identify Larry in two live lineups and then made a positive identification, days later, from a photo array. Larry Youngblood served eight years of a 10 and half year sentence in Arizona for the abduction and repeated sodomizing of a 10 year old boy at a carnival. He is photographed at his alibi location. Ron Williamson. Ron was **convicted** of the rape and murder of a barmaid at a club, and served 11 years of a death sentence. I photographed Ron at a baseball field because he had been drafted to the Oakland A ' s to play professional baseball just before his conviction. And the state ' s key witness in Ron ' s case was, in the end, the actual **perpetrator**. Ronald Jones served eight years of a death sentence for rape and murder of a 28-year-old woman. I photographed him at the scene of arrest in Chicago. William Gregory was **convicted** of rape and burglary. He served seven years of a 70 year sentence in Kentucky. Timothy Durham, who I photographed at his alibi location where 11 witnesses placed him at the time of the crime, was **convicted** of 3. 5 years of a 3220 year sentence, for several charges of rape and robbery. He had been misidentified by an 11-year-old **victim**. Troy Webb is photographed here at the scene of the crime in Virginia. He was **convicted** of rape, kidnapping and robbery, and served seven years of a 47 year sentence. Troy ' s picture was in a photo array that the **victim** tentatively had some draw toward, but said he looked too old. The police went and found a photograph of Troy Webb from four years earlier, which they entered into a photo array days later, and he was positively identified. Now I ' m going to leave you with a self portrait. And it reiterates that distortion is a constant, and our eyes are easily deceived. That ' s it. Thank you.

Text Sample 392: POS Dim 3 – 2009 – Score 11.00 – 2009/t002939.txt

I ' m a storyteller. And I would like to tell you a few personal stories about what I like to call"the danger of the single story."I grew up on a university campus in eastern Nigeria. My mother says that I started reading at the age of two, although I think four is probably close to the truth. So I was an early reader, and what I read were British and American children ' s books. I was also an early writer, and when I began to write, at about the age of seven, stories in pencil with crayon illustrations that my poor mother was obligated to read, I wrote exactly the kinds of stories I was reading : All my characters were white and blue-eyed, they played in the snow, they ate apples, and they talked a lot about the weather, how lovely it was that the sun had come out. Now, this despite the fact that I lived in Nigeria. I had never been outside Nigeria. We didn ' t have snow, we ate mangoes, and we never talked about the weather, because there was no need to. My characters also drank a lot of ginger beer, because the characters in the British books I read drank ginger beer. Never mind that I had no idea what ginger beer was. And for many years afterwards, I would have a desperate desire to taste ginger beer. But that is another story. What this demonstrates, I think, is how impressionable and vulnerable we are in the face of a story, particularly as children. Because all I had read were books in which characters were foreign, I had become convinced that books by their very nature had to have foreigners in them and had to be about things with which I could not personally identify. Now, things changed when I discovered African books. There weren ' t many of them available, and they weren ' t quite as easy to find as the foreign books. But because of writers like Chinua Achebe and Camara Laye, I went through a mental shift in my perception of literature. I realized that people like me, girls with skin the color of chocolate, whose kinky hair could not form ponytails, could also exist in literature. I started to write about things I recognized. Now, I loved those American and British books I read. They stirred my imagination. They opened up new worlds for me. But the unintended consequence was that I did not know that people like me could exist in literature. So what the discovery of African writers did for me was this : It saved me from having a single story of what books are. I come from a conventional, middle-class Nigerian family. My father was a professor. My mother was an administrator. And so we had, as was the norm, live-in **domestic** help, who would often come from nearby rural villages. So, the year I turned eight, we got a new house boy. His name was Fide. The only thing my mother told us about him was that his family was very poor. My mother sent yams and rice, and our old clothes, to his family. And when I didn ’ t finish my dinner, my mother would say,”Finish your food! Don ’ t you know? People like Fide ’ s family have nothing.”So I felt **enormous pity** for Fide ’ s family. Then one Saturday, we went to his village to visit, and his mother showed us a beautifully patterned basket made of dyed raffia that his brother had made. I was startled. It had not occurred to me that anybody in his family could actually make something. All I had heard about them was how poor they were, so that it had become impossible for me to see them as anything else but poor. Their poverty was my single story of them. Years later, I thought about this when I left Nigeria to go to university in the United States. I was 19. My American roommate was shocked by me. She asked where I had learned to speak English so well, and was confused when I said that Nigeria happened to have English as its official language. She asked if she could listen to what she called my”tribal music,”and was consequently very disappointed when I produced my tape of Mariah Carey. She assumed that I did not know how to use a stove. What struck me was this : She had felt sorry for me even before she saw me. Her default position toward me, as an African, was a kind of patronizing, well- meaning **pity**. My roommate had a single story of Africa : a single story of catastrophe. In this single story, there was no possibility of Africans being similar to her in any way, no possibility of feelings more complex than **pity**, no possibility of a connection as human **equals**. I must say that before I went to the U. S., I didn ’ t consciously identify as African. But in the U. S., whenever Africa came up, people turned to me. Never mind that I knew nothing about places like Namibia. But I did come to embrace this new identity, and in many ways I think of myself now as African. Although I still get quite irritable when Africa is referred to as a country, the most recent example being my otherwise wonderful flight from Lagos two days ago, in which there was an announcement on the Virgin flight about the charity work in”India, Africa and other countries.”So, after I had spent some years in the U. S. as an African, I began to understand my roommate ’ s response to me. If I had not grown up in Nigeria, and if all I knew about Africa were from popular images, I too would think that Africa was a place of beautiful landscapes, beautiful animals, and incomprehensible people, fighting senseless wars, dying of poverty and AIDS, unable to speak for themselves and waiting to be saved by a kind, white foreigner. I would see Africans in the same way that I, as a child, had seen Fide ’ s family. This single story of Africa ultimately comes, I think, from Western literature. Now, here is a quote from the writing of a London merchant called John Lok, who sailed to west Africa in 1561 and kept a fascinating account of his voyage. After referring to the black Africans as”beasts who have no houses,”he writes,”They are also people without heads, having their mouth and eyes in their breasts.”Now, I ’ ve laughed every time I ’ ve read this. And one must admire the imagination of John Lok. But what is important about his writing is that it represents the beginning of a tradition of telling African stories in the West : A tradition of Sub-Saharan Africa as a place of negatives, of difference, of **darkness**, of people who, in the words of the wonderful poet Rudyard Kipling, are”half devil, half child.”And so, I began to realize that my American roommate must have throughout her life seen and heard different versions of this single story, as had a professor, who once told me that my novel was not”authentically African.”Now, I was quite willing to contend that there were a number of things wrong with the novel, that it had failed in a number of places, but I had not quite imagined that it had failed at achieving something called African authenticity. In fact, I did not know what African authenticity was. The professor told me that my characters were too much like him, an educated and middle-class man. My characters drove cars. They were not starving. Therefore they were not authentically African. But I must quickly add that I too am just as guilty in the question of the single story. A few years ago, I visited Mexico from the U. S. The political climate in the U. S. at the time was tense, and there were debates going on about **immigration**. And, as often happens in America, **immigration** became synonymous with Mexicans. There were endless stories of Mexicans as people who were fleecing the healthcare system, sneaking across the border, being arrested at the border, that sort of thing. I remember walking around on my first day in Guadalajara, watching the people going to work, rolling up tortillas in the marketplace, smoking, laughing. I remember first feeling slight surprise. And then, I was overwhelmed with **shame**. I realized that I had been so immersed in the media coverage of Mexicans that they had become one thing in my mind, the abject **immigrant**. I had bought into the single story of Mexicans and I could not have been more ashamed of myself. So that is how to create a single story, show a people as one thing, as only one thing, over and over again, and that is what they become. It is impossible to talk about the single story without talking about power. There is a word, an Igbo word, that I think about whenever I think about the power structures of the world, and it is"nkali."It ' s a noun that loosely translates to"to be greater than another."Like our economic and political worlds, stories too are defined by the principle of nkali : How they are told, who tells them, when they ' re told, how many stories are told, are really dependent on power. Power is the ability not just to tell the story of another person, but to make it the definitive story of that person. The Palestinian poet Mourid Barghouti writes that if you want to dispossess a people, the simplest way to do it is to tell their story and to start with,"secondly."Start the story with the arrows of the Native Americans, and not with the arrival of the British, and you have an entirely different story. Start the story with the failure of the African state, and not with the colonial creation of the African state, and you have an entirely different story. I recently spoke at a university where a student told me that it was such a **shame** that Nigerian men were physical abusers like the father character in my novel. I told him that I had just read a novel called"American Psycho"— — and that it was such a **shame** that young Americans were serial murderers. Now, obviously I said this in a fit of mild irritation. But it would never have occurred to me to think that just because I had read a novel in which a character was a serial killer that he was somehow representative of all Americans. This is not because I am a better person than that student, but because of America ' s cultural and economic power, I had many stories of America. I had read Tyler and Updike and Steinbeck and Gaitskill. I did not have a single story of America. When I learned, some years ago, that writers were expected to have had really unhappy childhoods to be successful, I began to think about how I could invent horrible things my parents had done to me. But the truth is that I had a very happy childhood, full of laughter and love, in a very close-knit family. But I also had grandfathers who died in refugee camps. My cousin Polle died because he could not get adequate healthcare. One of my closest friends, Okoloma, died in a plane crash because our fire trucks did not have water. I grew up under repressive military governments that devalued education, so that sometimes, my parents were not paid their salaries. And so, as a child, I saw jam disappear from the breakfast table, then margarine disappeared, then bread became too expensive, then milk became rationed. And most of all, a kind of normalized political fear invaded our lives. All of these stories make me who I am. But to insist on only these negative stories is to flatten my experience and to overlook the many other stories that formed me. The single story creates stereotypes, and the problem with stereotypes is not that they are untrue, but that they are incomplete. They make one story become the only story. Of course, Africa is a continent full of catastrophes : There are immense ones, such as the horrific rapes in Congo and depressing ones, such as the fact that 5, 000 people apply for one job vacancy in Nigeria. But there are other stories that are not about catastrophe, and it is very important, it is just as important, to talk about them. I ' ve always felt that it is impossible to engage properly with a place or a person without engaging with all of the stories of that place and that person. The consequence of the single story is this : It robs people of dignity. It makes our recognition of our **equal** humanity difficult. It emphasizes how we are different rather than how we are similar. So what if before my Mexican trip, I had followed the **immigration** debate from both sides, the U. S. and the Mexican? What if my mother had told us that Fide ' s family was poor and hardworking? What if we had an African television network that broadcast diverse African stories all over the world? What the Nigerian writer Chinua Achebe calls"a balance of stories."What if my roommate knew about my Nigerian publisher, Muhtar Bakare, a remarkable man who left his job in a bank to follow his dream and start a publishing house? Now, the conventional wisdom was that Nigerians don ' t read literature. He disagreed. He felt that people who could read, would read, if you made literature affordable and available to them. Shortly after he published my first novel, I went to a TV station in Lagos to do an interview, and a woman who worked there as a messenger came up to me and said,"I really liked your novel. I didn ' t like the ending. Now, you must write a sequel, and this is what will happen..."And she went on to tell me what to write in the sequel. I was not only charmed, I was very moved. Here was a woman, part of the ordinary masses of Nigerians, who were not supposed to be readers. She had not only read the book, but she had taken ownership of it and felt justified in telling me what to write in the sequel. Now, what if my roommate knew about my friend Funmi Iyanda, a fearless woman who hosts a TV show in Lagos, and is determined to tell the stories that we prefer to forget? What if my roommate knew about the heart procedure that was performed in the Lagos hospital last week? What if my roommate knew about contemporary Nigerian music, talented people **singing** in English and Pidgin, and Igbo and Yoruba and Ijo, mixing influences from Jay-Z to Fela to Bob Marley to their grandfathers. What if my roommate knew about the female lawyer who recently went to court in Nigeria to challenge a ridiculous law that required women to get their husband ' s consent before renewing their passports? What if my roommate knew about Nollywood, full of innovative people making films despite great technical odds, films so popular that they really are the best example of Nigerians consuming what they produce? What if my roommate knew about my wonderfully ambitious hair braider, who has just started her own business selling hair extensions? Or about the millions of other Nigerians who start businesses and sometimes fail, but continue to nurse ambition? Every time I am home I am confronted with the usual sources of irritation for most Nigerians : our failed infrastructure, our failed government, but also by the incredible resilience of people who thrive despite the government, rather than because of it. I teach writing workshops in Lagos every summer, and it is amazing to me how many people apply, how many people are eager to write, to tell stories. My Nigerian publisher and I have just started a non-profit called Farafina Trust, and we have big dreams of building libraries and refurbishing libraries that already exist and providing books for state schools that don ' t have anything in their libraries, and also of organizing lots and lots of workshops, in reading and writing, for all the people who are eager to tell our many stories. Stories matter. Many stories matter. Stories have been used to dispossess and to malign, but stories can also be used to empower and to humanize. Stories can break the dignity of a people, but stories can also repair that broken dignity. The American writer Alice Walker wrote this about her Southern relatives who had moved to the North. She introduced them to a book about the Southern life that they had left behind.”They sat around, reading the book themselves, listening to me read the book, and a kind of paradise was regained.”I would like to end with this thought : That when we reject the single story, when we realize that there is never a single story about any place, we regain a kind of paradise. Thank you.

Text Sample 393: POS Dim 3 – 2010 – Score 13.00 – 2010/t002671.txt

I ’ ve been spending a lot of time traveling around the world these days, talking to groups of students and professionals, and everywhere I ’ m finding that I hear similar themes. On the one hand, people say,”The time for change is now.”They want to be part of it. They talk about wanting lives of purpose and greater meaning. But on the other hand, I hear people talking about fear, a sense of risk-aversion. They say,”I really want to follow a life of purpose, but I don ’ t know where to start. I don ’ t want to disappoint my family or friends.”I work in global poverty. And they say,”I want to work in global poverty, but what will it mean about my career? Will I be marginalized? Will I not make enough money? Will I never get married or have children?”And as a woman who didn ’ t get married until I was a lot older — and I ’ m glad I waited — — and has no children, I look at these young people and I say,”Your job is not to be perfect. Your job is only to be human. And nothing important happens in life without a cost.”These conversations really reflect what ’ s happening at the national and international level. Our leaders and ourselves want everything, but we don ’ t talk about the costs. We don ’ t talk about the sacrifice. One of my favorite quotes from literature was written by Tillie Olsen, the great American writer from the South. In a short story called”Oh Yes,”she talks about a white woman in the 1950s who has a daughter who befriends a little African American girl, and she looks at her child with a sense of pride, but she also wonders, what price will she pay?”Better immersion than to live untouched.”But the real question is, what is the cost of not daring? What is the cost of not trying? I ’ ve been so privileged in my life to know extraordinary leaders who have chosen to live lives of immersion. One woman I knew who was a fellow at a program that I ran at the Rockefeller Foundation was named Ingrid Washinawatok. She was a leader of the Menominee tribe, a Native American peoples. And when we would gather as fellows, she would push us to think about how the elders in Native American culture make decisions. And she said they would literally visualize the faces of children for seven generations into the future, looking at them from the Earth, and they would look at them, holding them as stewards for that future. Ingrid understood that we are connected to each other, not only as human beings, but to every living thing on the planet. And tragically, in 1999, when she was in Colombia working with the U ’ wa people, focused on preserving their culture and language, she and two colleagues were abducted and tortured and killed by the FARC. And whenever we would gather the fellows after that, we would leave a chair empty for her spirit. And more than a decade later, when I talk to NGO fellows, whether in Trenton, New Jersey or the office of the White House, and we talk about Ingrid, they all say that they ’ re trying to integrate her wisdom and her spirit and really build on the unfulfilled work of her life ’ s mission.

And when we think about legacy, I can think of no more powerful one, despite how short her life was. And I ’ ve been touched by Cambodian women — beautiful women, women who held the tradition of the classical dance in Cambodia. And I met them in the early ’ 90s. In the 1970s, under the Pol Pot regime, the Khmer Rouge killed over a million people, and they focused and targeted the elites and the intellectuals, the artists, the dancers. And at the end of the war, there were only 30 of these classical dancers still living. And the women, who I was so privileged to meet when there were three survivors, told these stories about lying in their cots in the refugee camps. They said they would try so hard to remember the fragments of the dance, hoping that others were alive and doing the same. And one woman stood there with this perfect carriage, her hands at her side, and she talked about the reunion of the 30 after the war and how extraordinary it was. And these big tears fell down her face, but she never lifted her hands to move them. And the women decided that they would train not the next generation of girls, because they had grown too old already, but the next generation. And I sat there in the studio watching these women clapping their hands — beautiful rhythms — as these little fairy pixies were dancing around them, wearing these beautiful silk colors. And I thought, after all this atrocity, this is how human beings really pray. Because they ’ re focused on honoring what is most beautiful about our past and building it into the promise of our future. And what these women understood is sometimes the most important things that we do and that we spend our time on are those things that we cannot measure. I also have been touched by the dark side of power and leadership. And I have learned that power, particularly in its absolute form, is an **equal** opportunity provider. In 1986, I moved to Rwanda, and I worked with a very small group of Rwandan women to start that country ’ s first microfinance bank. And one of the women was Agnes — there on your extreme left — she was one of the first three women parliamentarians in Rwanda, and her legacy should have been to be one of the mothers of Rwanda. We built this institution based on social justice, gender **equity**, this idea of empowering women. But Agnes cared more about the trappings of power than she did principle at the end. And though she had been part of building a liberal party, a political party that was focused on diversity and tolerance, about three months before the genocide, she switched parties and joined the extremist party, Hutu Power, and she became the Minister of Justice under the genocide regime and was known for inciting men to kill faster and stop behaving like women. She was **convicted** of category one crimes of genocide. And I would visit her in the prisons, sitting side-by-side, knees touching, and I would have to admit to myself that monsters exist in all of us, but that maybe it ’ s not monsters so much, but the broken parts of ourselves, sadnesses, secret **shame**, and that ultimately it ’ s easy for demagogues to prey on those parts, those fragments, if you will, and to make us look at other beings, human beings, as lesser than ourselves — and in the extreme, to do terrible things. And there is no group more vulnerable to those kinds of manipulations than young men. I ’ ve heard it said that the most dangerous animal on the planet is the adolescent male. And so in a gathering where we ’ re focused on women, while it is so critical that we invest in our girls and we even the playing field and we find ways to honor them, we have to remember that the girls and the women are most isolated and violated and victimized and made invisible in those very societies where our men and our boys feel disempowered, unable to provide. And that, when they sit on those **street** corners and all they can think of in the future is no job, no education, no possibility, well then it ’ s easy to understand how the greatest source of status can come from a uniform and a gun. Sometimes very small investments can release **enormous**, infinite potential that exists in all of us. One of the Acumen Fund fellows at my organization, Suraj Sudhakar, has what we call moral imagination — the ability to put yourself in another person ' s shoes and lead from that perspective. And he ' s been working with this young group of men who come from the largest slum in the world, Kibera. And they ' re incredible guys. And together they started a book club for a hundred people in the slums, and they ' re reading many TED authors and liking it. And then they created a business plan competition. Then they decided that they would do TEDx ' s. And I have learned so much from Chris and Kevin and Alex and Herbert and all of these young men. Alex, in some ways, said it best. He said,"We used to feel like nobodies, but now we feel like somebodies."And I think we have it all wrong when we think that income is the link. What we really yearn for as human beings is to be visible to each other. And the reason these young guys told me that they ' re doing these TEDx ' s is because they were sick and tired of the only workshops coming to the slums being those workshops focused on HIV, or at best, microfinance. And they wanted to **celebrate** what ' s beautiful about Kibera and Mathare — the photojournalists and the creatives, the graffiti artists, the teachers and the entrepreneurs. And they ' re doing it. And my hat ' s off to you in Kibera. My own work focuses on making philanthropy more effective and capitalism more inclusive. At Acumen Fund, we take philanthropic resources and we invest what we call patient capital — money that will invest in entrepreneurs who see the poor not as passive recipients of charity, but as full-bodied agents of change who want to solve their own problems and make their own decisions. We leave our money for 10 to 15 years, and when we get it back, we invest in other innovations that focus on change. I know it works. We ' ve invested more than 50 million dollars in 50 companies, and those companies have brought another 200 million dollars into these forgotten markets. This year alone, they ' ve delivered 40 million services like maternal health care and housing, emergency services, solar energy, so that people can have more dignity in solving their problems. Patient capital is uncomfortable for people searching for simple solutions, easy categories, because we don ' t see profit as a blunt instrument. But we find those entrepreneurs who put people and the planet before profit. And ultimately, we want to be part of a movement that is about measuring impact, measuring what is most important to us. And my dream is we ' ll have a world one day where we don ' t just honor those who take money and make more money from it, but we find those individuals who take our resources and convert it into changing the world in the most positive ways. And it ' s only when we honor them and **celebrate** them and give them status that the world will really change. Last May I had this extraordinary 24-hour period where I saw two visions of the world living side-by-side — one based on **violence** and the other on transcendence. I happened to be in Lahore, Pakistan on the day that two **mosques** were attacked by suicide bombers. And the reason these **mosques** were attacked is because the people praying inside were from a particular sect of Islam who fundamentalists don ' t believe are fully Muslim. And not only did those suicide bombers take a hundred lives, but they did more, because they created more **hatred**, more rage, more fear and certainly despair. But less than 24 hours, I was 13 miles away from those **mosques**, visiting one of our Acumen investees, an incredible man, Jawad Aslam, who dares to live a life of immersion. Born and raised in Baltimore, he studied real estate, worked in commercial real estate, and after 9 / 11 decided he was going to Pakistan to make a difference. For two years, he hardly made any money, a tiny stipend, but he apprenticed with this incredible housing developer named Tasneem Saddiqui. And he had a dream that he would build a housing community on this barren piece of land using patient capital, but he continued to pay a price. He stood on moral ground and refused to pay bribes. It took almost two years just to register the land. But I saw how the level of moral standard can rise from one person ' s action. Today, 2, 000 people live in 300 houses in this beautiful community. And there ' s schools and clinics and shops. But there ' s only one **mosque**. And so I asked Jawad,"How do you guys navigate? This is a really diverse community. Who gets to use the **mosque** on Fridays?"He said,"Long story. It was hard, it was a difficult road, but ultimately the leaders of the community came together, realizing we only have each other. And we decided that we would elect the three most respected imams, and those imams would take turns, they would rotate who would say Friday **prayer**. But the whole community, all the different sects, including Shi ' a and Sunni, would sit together and pray."We need that kind of moral leadership and courage in our worlds. We face huge issues as a world — the financial crisis, global warming and this growing sense of fear and otherness. And every day we have a choice. We can take the easier road, the more cynical road, which is a road based on sometimes dreams of a past that never really was, a fear of each other, distancing and blame. Or we can take the much more difficult path of transformation, transcendence, compassion and love, but also accountability and justice. I had the great honor of working with the child psychologist Dr. Robert Coles, who stood up for change during the Civil Rights movement in the United States. And he tells this incredible story about working with a little six-year-old girl named Ruby Bridges, the first child to desegregate schools in the South — in this case, New Orleans. And he said that every day this six-year-old, dressed in her beautiful dress, would walk with real grace through a phalanx of white people screaming angrily, calling her a monster, threatening to poison her — distorted faces. And every day he would watch her, and it looked like she was talking to the people. And he would say,"Ruby, what are you saying?"And she ' d say,"I ' m not talking."And finally he said,"Ruby, I see that you ' re talking. What are you saying?"And she said,"Dr. Coles, I am not talking ; I ' m praying."And he said,"Well, what are you praying?"And she said,"I ' m praying, ' Father, forgive them, for they know not what they are doing. '"At age six, this child was living a life of immersion, and her family paid a price for it. But she became part of history and opened up this idea that all of us should have **access** to education. My final story is about a young, beautiful man named Josephat Byaruhanga, who was another Acumen Fund fellow, who hails from Uganda, a farming community. And we placed him in a company in Western Kenya, just 200 miles away. And he said to me at the end of his year,"Jacqueline, it was so humbling, because I thought as a farmer and as an African I would understand how to transcend culture. But especially when I was talking to the African women, I sometimes made these mistakes — it was so hard for me to learn how to listen."And he said,"So I conclude that, in many ways, leadership is like a panicle of rice. Because at the height of the season, at the height of its powers, it ' s beautiful, it ' s green, it nourishes the world, it reaches to the heavens."And he said,"But right before the harvest, it bends over with great gratitude and humility to touch the earth from where it came."We need leaders. We ourselves need to lead from a place that has the audacity to believe we can, ourselves, extend the fundamental assumption that all men are created **equal** to every man, woman and child on this planet. And we need to have the humility to recognize that we cannot do it alone. Robert Kennedy once said that"few of us have the greatness to bend history itself, but each of us can work to change a small portion of events."And it is in the total of all those acts that the history of this generation will be written. Our lives are so short, and our time on this planet is so precious, and all we have is each other. So may each of you live lives of immersion. They won ' t necessarily be easy lives, but in the end, it is all that will sustain us. Thank you.

Text Sample 394: POS Dim 3 – 2010 – Score 10.00 – 2010/t002767.txt

I am a cultural omnivore, one whose daily commute is made possible by attachment to an iPod â an iPod that contains Wagner and Mozart, pop diva Christina Aguilera, country singer Josh Turner, gangsta rap artist Kirk Franklin, concerti, symphonies and more and more. I ' m a voracious reader, a reader who deals with Ian McEwan down to Stephanie Meyer. I have read the Twilight tetralogy. And one who lives for my home theater, a home theater where I devour DVDs, video on demand and a lot of television. For me,"Law & Order : SVU,"Tina Fey and"30 Rock"and"Judge Judy"â"The people are real, the cases are real, the rulings are final."Now, I ' m convinced a lot of you probably share my **passions**, especially my **passion** for"Judge Judy,"and you ' d fight anybody who attempted to take her away from us, but I ' m a little less convinced that you share the central **passion** of my life, a **passion** for the live professional performing arts, performing arts that represent the orchestral repertoire, yes, but jazz as well, modern dance, **opera**, theater and more and more and more. Frankly, it ' s a sector that many of us who work in the field worry is being endangered and possibly dismantled by technology. While we initially heralded the Internet as the fantastic new marketing device that was going to solve all our problems, we now realize that the Internet is, if anything, too effective in that regard. Depending on who you read, an arts organization or an artist, who tries to attract the attention of a potential single ticket buyer, now competes with between three and 5, 000 different marketing messages a typical citizen sees every single day. We now know, in fact, that technology is our biggest competitor for leisure time. Five years ago, Gen Xers spent 20. 7 hours online and TV, the majority on TV. Gen Yers spent even more â 23. 8 hours, the majority online. And now, a typical university-entering student arrives at college already having spent 20, 000 hours online and an additional 10, 000 hours playing video games â a stark reminder that we operate in a cultural context where video games now outsell music and movie recordings combined. Moreover, we ' re afraid that technology has altered our very assumptions of cultural consumption. Thanks to the Internet, we believe we can get anything we want whenever we want it, delivered to our own doorstep. We can shop at three in the morning or eight at night, ordering jeans tailor-made for our unique body types. Expectations of personalization and customization that the live performing arts â which have set curtain times, set venues, attendant inconveniences of travel, parking and the like â simply cannot meet. And we ' re all acutely aware : what ' s it going to mean in the future when we ask someone to pay a hundred dollars for a symphony, **opera** or ballet ticket, when that cultural consumer is used to downloading on the internet 24 hours a day for 99 cents a song or for free? These are **enormous** questions for those of us that work in this terrain. But as particular as they feel to us, we know we ' re not alone. All of us are engaged in a seismic, fundamental realignment of culture and communications, a realignment that is shaking and decimating the newspaper industry, the magazine industry, the book and publishing industry and more. Saddled in the performing arts as we are, by antiquated union agreements that inhibit and often prohibit mechanical reproduction and streaming, locked into large facilities that were designed to ossify the ideal relationship between artist and audience most appropriate to the 19th century and locked into a business model dependent on high ticket revenues, where we charge exorbitant prices. Many of us shudder in the wake of the collapse of Tower Records and ask ourselves,"Are we next?"Everyone I talk to in performing arts resonates to the words of Adrienne Rich, who, in"Dreams of a

Common Language,”wrote,”We are out in a country that has no language, no laws. Whatever we do together is pure invention. The maps they gave us are out of date by years.”And for those of you who love the arts, aren ’ t you glad you invited me here to brighten your day? Now, rather than saying that we ’ re on the brink of our own annihilation, I prefer to believe that we are engaged in a fundamental reformation, a reformation like the religious Reformation of the 16th century. The arts reformation, like the religious Reformation, is spurred in part by technology, with indeed, the printing press really leading the charge on the religious Reformation. Both reformations were predicated on fractious discussion, internal self-doubt and massive realignment of antiquated business models. And at heart, both reformations, I think, were asking the questions : who ’ s entitled to practice? How are they entitled to practice? And indeed, do we need anyone to intermediate for us in order to have an experience with a spiritual divine? Chris Anderson, someone I trust you all know, editor in chief of Wired magazine and author of The Long Tail, really was the first, for me, to nail a lot of this. He wrote a long time ago, you know, thanks to the invention of the Internet, web technology, minicams and more, the means of artistic production have been democratized for the first time in all of human history. In the 1930s, if any of you wanted to make a movie, you had to work for Warner Brothers or RKO, because who could afford a movie set and lighting equipment and editing equipment and scoring, and more? And now who in this room doesn ’ t know a 14 year-old hard at work on her second, third, or fourth movie? Similarly, the means of artistic distribution have been democratized for the first time in human history. Again, in the ’ 30s, Warner Brothers, RKO did that for you. Now, go to YouTube, Facebook ; you have worldwide distribution without leaving the privacy of your own bedroom. This double impact is occasioning a massive redefinition of the cultural market, a time when anyone is a potential author. Frankly, what we ’ re seeing now in this environment is a massive time, when the entire world is changing as we move from a time when audience numbers are plummeting. But the number of arts participants, people who write poetry, who **sing** songs, who perform in church **choirs**, is exploding beyond our wildest imaginations. This group, others have called the pro-ams, amateur artists doing work at a professional level. You see them on YouTube, in dance competitions, film festivals and more. They are radically expanding our notions of the potential of an aesthetic vocabulary, while they are challenging and undermining the cultural autonomy of our traditional institutions. Ultimately, we now live in a world defined not by consumption, but by participation. But I want to be clear, just as the religious Reformation did not spell the end to the formal Church or to the priesthood ; I believe that our artistic institutions will continue to have importance. They currently are the best opportunities for artists to have lives of economic dignity â not opulence, of dignity. And they are the places where artists who deserve and want to work at a certain scale of resources will find a home. But to view them as synonymous with the entirety of the arts community is, by far, too shortsighted. And indeed, while we ’ ve tended to polarize the amateur from the professional, the single most exciting development in the last five to 10 years has been the rise of the professional hybrid artist, the professional artist who works, not primarily in the concert hall or on the stage ; but most frequently around women ’ s rights, or human rights, or on global warming issues or AIDS relief for more â not out of economic necessity, but out of a deep, organic conviction that the work that she or he is called to do cannot be accomplished in the traditional hermetic arts environment. Today ’ s dance world is not defined solely by the Royal Winnipeg Ballet or the National Ballet of Canada, but by Liz Lerman ’ s Dance Exchange â a multi- generational, professional dance company, whose dancers range in age from 18 to 82, and who work with genomic scientists to embody the DNA strand and with nuclear physicists at CERN. Today ’ s professional theater community is defined, not only the Shaw and Stratford Festivals, but by the Cornerstone Theater of Los Angeles â□□ a collective of artists that after 9 / 11, brought together 10 different religious communities â□□ the Baha ’ i, the Catholic, the Muslim, the Jewish, even the Native American and the **gay** and lesbian communities of faith, helping them create their own individual plays and one massive play, where they explored the differences in their faith and found commonality as an important first step toward cross-community healing. Today ’ s performers, like Rhodessa Jones, work in women ’ s prisons, helping women prisoners articulate the pain of incarceration, while today ’ s playwrights and directors work with youth gangs to find alternate channels to **violence** and more and more and more. And indeed, I think, rather than being annihilated, the performing arts are poised on the brink of a time when we will be more important than we have ever been. You know, we ’ ve said for a long time, we are critical to the health of the economic communities in your town. And absolutely â□□ I hope you know that every dollar spent on a performing arts ticket in a community generates five to seven additional dollars for the local economy, dollars spent in restaurants or on parking, at the fabric stores where we buy fabric for costumes, the piano tuner who tunes the instruments, and more. But the arts are going to be more important to economies as we go forward, especially in industries we can ’ t even imagine yet, just as they have been central to the iPod and the computer game industries, which few, if any of us, could have foreseen 10 to 15 years ago. Business leadership will depend more and more on emotional intelligence, the ability to listen deeply, to have empathy, to articulate change, to motivate others â□□ the very capacities that the arts cultivate with every encounter. Especially now, as we all must confront the fallacy of a market-only orientation, uninformed by social conscience ; we must seize and **celebrate** the power of the arts to shape our individual and national characters, and especially characters of the young people, who all too often are subjected to bombardment of sensation, rather than digested experience. Ultimately, especially now in this world, where we live in a context of regressive and onerous **immigration** laws, in reality TV that thrives on humiliation, and in a context of analysis, where the thing we hear most repeatedly, day in, day out in the United States, in every train station, every bus station, every plane station is,”Ladies and gentlemen, please report any suspicious behavior or suspicious individuals to the authorities nearest to you,”when all of these ways we are encouraged to view our fellow human being with hostility and fear and contempt and suspicion. The arts, whatever they do, whenever they call us together, invite us to look at our fellow human being with generosity and curiosity. God knows, if we ever needed that capacity in human history, we need it now. You know, we ’ re bound together, not, I think by technology, entertainment and design, but by common cause. We work to promote healthy vibrant societies, to ameliorate human **suffering**, to promote a more thoughtful, substantive, empathic world order. I salute all of you as activists in that quest and urge you to embrace and hold dear the arts in your work, whatever your purpose may be. I promise you the hand of the Doris Duke Charitable Foundation is stretched out in friendship for now and years to come. And I thank you for your kindness and your patience in listening to me this afternoon. Thank you, and Godspeed.

Our face is hugely important because it ’ s the external, visual part that everybody else sees. Let ’ s not forget it ’ s a functional entity. We have strong skull bones that protect the most important organ in our body : the brain. It ’ s where our senses are located, our special senses â our vision, our speech, our hearing, our smell, our taste. And this bone is peppered, as you can see, with the light shining through the skull with cavities, the sinuses, which warm and moisten the air we breathe. But also imagine if they were filled with solid bone â our head would be dead weight, we wouldn ’ t be able to hold it erect, we wouldn ’ t be able to look at the world around us. This woman is slowly dying because the benign tumors in her facial bones have completely obliterated her mouth and her nose so she can ’ t breathe and eat. Attached to the facial bones that define our face ’ s structure are the muscles that deliver our facial expression, our universal language of expression, our social-signaling system. And overlying this is the skin drape, which is a hugely complex three-dimensional structure â taking right-angled bends here and there, having thin areas like the eyelids, thick areas like the cheek, different colors. And then we have the sensual factor of the face. Where do we like to kiss people? On the lips. Nibble the ears maybe. It ’ s the face where we ’ re attracted to with that. But let ’ s not forget the hair. You ’ re looking at the image on your left-hand side â that ’ s my son with his eyebrows present. Look how odd he looks with the eyebrows missing. There ’ s a definite difference. And imagine if he had hair sprouting from the middle of his nose, he ’ d look even odder still. Dysmorphophobia is an extreme version of the fact that we don ’ t see ourselves as others see us. It ’ s a shocking truth that we only see mirror images of ourselves, and we only see ourselves in freeze-frame photographic images that capture a mere fraction of the time that we live. Dysmorphophobia is a perversion of this where people who may be very good looking regard themselves as hideously ugly and are constantly seeking surgery to correct their facial appearance. They don ’ t need this. They need psychiatric help. Max has kindly donated his photograph to me. He doesn ’ t have dysmorphophobia, but I ’ m using his photograph to illustrate the fact that he looks exactly like a dysmorphophobic. In other words, he looks entirely normal. Age is another thing when our **attitude** toward our appearance changes. So children judge themselves, learn to judge themselves, by the behavior of adults around them. Here ’ s a classic example : Rebecca has a benign blood vessel tumor that ’ s growing out through her skull, has obliterated her nose, and she ’ s having difficulty seeing. As you can see, it ’ s blocking her vision. She ’ s also in danger, when she damages this, of bleeding profusely. Our research has shown that the parents and close loved ones of these children adore them. They ’ ve grown used to their face ; they think they ’ re special. Actually, sometimes the parents argue about whether these children should have the lesion removed. And occasionally they suffer intense **grief** reactions because the child they ’ ve grown to love has changed so dramatically and they don ’ t recognize them. But other adults say incredibly painful things. They say,”How dare you take this child out of the house and terrify other people. Shouldn ’ t you be doing something about this? Why haven ’ t you had it removed?”And other children in curiosity come up and poke the lesion, because â a natural curiosity. And that obviously alerts the child to their unusual nature. After surgery, everything normalizes. The adults behave more naturally, and the children play more readily with other children. As teenagers â just think back to your teenage years â we ’ re going through a dramatic and often disproportionate change in our facial appearance. We ’ re trying to struggle to find our identity. We crave the approval of our peers. So our facial appearance is vital to us as we ’ re trying to project ourselves to the world. Just remember that single acne spot that crippled you for several days. How long did you spend looking in the mirror every day, practicing your sardonic look, practicing your serious look, trying to look like Sean Connery, as I did, trying to raise one eyebrow? It ’ s a crippling time. I ’ ve chosen to show this profile view of Sue because what it shows is her lower jaw jutting forward and her lower lip jutting forward. I ’ d like you all in the audience now to push your lower jaw forward. Turn to the person next to you, push your lower jaws forward. Turn to the person next to you and look at them â they look miserable. That ’ s exactly what people used to say to Sue. She wasn ’ t miserable at all. But people used to say to her,”Why are you so miserable?”People were making misjudgments all the time on her mood. Teachers and peers were underestimating her ; she was teased at school. So she chose to have facial surgery. After the facial surgery, she said,”My face now reflects my personality. People know now that I ’ m enthusiastic, that I ’ m a happy person.”And that ’ s the change that can be achieved for teenagers. Is this change, though, a real change, or is it a figment of the imagination of the patient themselves? Well we studied teenagers ’ **attitudes** to photographs of patients having this corrective facial surgery. And what we found was â we jumbled up the photographs so they couldn ’ t recognize the before and after â what we found was that the patients were regarded as being more attractive after the surgery. Well that ’ s not surprising, but we also asked them to judge them on honesty, intelligence, friendliness, **violence**. They were all perceived as being less than normal in all those characteristics â more **violent**, etc. â before the surgery. After the surgery, they were perceived as being more intelligent, more friendly, more honest, less **violent** â and yet we hadn ’ t operated on their intellect or their character. When people get older, they don ’ t necessarily choose to follow this kind of surgery. Their presence in the consultation suite is a result of the slings and arrows of outrageous fortune. What happens to them is that they may have suffered cancer or **trauma**. So this is a photograph of Henry, two weeks after he had a malignant cancer removed from the left side of his face â his cheekbone, his upper jaw, his eye-socket. He looks pretty good at this stage. But over the course of the next 15 years he had 14 more operations, as the disease ravaged his face and destroyed my reconstruction regularly. I learned a huge amount from Henry. Henry taught me that you can carry on working. He worked as an advocate. He continued to play cricket. He enjoyed life to the full, and this was probably because he had a successful, fulfilling job and a caring family and was able to participate socially. He maintained a calm insouciance. I don ’ t say he overcame this ; he didn ’ t overcome it. This was something more than that. He ignored it. He ignored the disfigurement that was happening in his life and carried on oblivious to it. And that ’ s what these people can do. Henriapi illustrates this phenomenon as well. This is a man in his 20s whose first visit out of Nigeria was with this malignant cancer that he came to the United Kingdom to have operated on. It was my longest operation. It took 23 hours. I did it with my neurosurgeon. We removed all the bones at the right side of his face â his eye, his nose, the skull bones, the facial skin â and reconstructed him with tissue from the back. He continued to work as a psychiatric nurse. He got married. He had a son called Jeremiah. And again, he said,”This painting of me with my son Jeremiah shows me as the successful man that I feel that I am.”His facial disfigurement did not affect him because he had the support of a family ; he had a successful, fulfilling job. So we ’ ve seen that we can change people ’ s faces. But when we change people ’ s faces, are we changing their identity â for better or for worse? For instance, there are two different types of facial surgery. We can categorize it like that. We can say there are patients who choose to have facial surgery â like Sue. When they have facial surgery, they feel their lives have changed because other people perceive them as better people. They don ’ t feel different. They feel that they ’ ve actually gained what they never had, that their face now reflects their personality. And actually that ’ s probably the difference between cosmetic surgery and this kind of surgery. Because you might say,”Well, this type of surgery might be regarded as cosmetic.”If you do cosmetic surgery, patients are often less happy. They ’ re trying to achieve difference in their lives. Sue wasn ’ t trying to achieve difference in her life. She was just trying to achieve the face that matched her personality. But then we have other people who don ’ t choose to have facial surgery. They ’ re people who have their face shot off. I ’ ll move it off, and we ’ ll have a blank slide for those who are squeamish amongst you. They have it forced upon them. And again, as I told you, if they have a caring family and good work life, then they can lead normal and fulfilled lives. Their identity doesn ’ t change. Is this business about appearance and preoccupation with it a Western phenomenon? Muzetta ’ s family give the lie to this. This is a little Bangladeshi girl from the east end of London who ’ s got a huge malignant tumor on the right side of her face, which has already made her blind and which is rapidly growing and is going to kill her shortly. After she had surgery to remove the tumor, her parents dressed her in this beautiful green velvet dress, a pink ribbon in her hair, and they wanted the painting to be shown around the world, despite the fact that they were orthodox Muslims and the mother wore a full burqa. So it ’ s not simply a Western phenomenon. We make judgments on people ’ s faces all the time. It ’ s been going on since we can think of Lombroso and the way he would define criminal faces. He said you could see criminal faces, judging them just on the photographs that were showed. Good-looking people are always judged as being more friendly. We look at O. J. â he ’ s a good-looking guy. We ’ d like to spend time with him. He looks friendly. Now we know that he ’ s a **convicted** wife-batterer, and actually he ’ s not the good guy. And beauty doesn ’ t equate to goodness, and certainly doesn ’ t equate to contentment. So we ’ ve talked about the static face and judging the static face, but actually, we ’ re more comfortable with judging the moving face. We think we can judge people on their expressions. U. K. jurors in the U. K. justice system like to see a live witness to see whether they can pick up the telltale signs of mendacity â the blink, the hesitation. And so they want to see live witnesses. Todorov tells us that, in a tenth of a second, we can make a judgment on somebody ’ s face. Are we uncomfortable with this image? Yes, we are. Would we be happy if our doctor ’ s face, our lawyer ’ s face, our financial adviser ’ s face was covered? We ’ d be pretty uncomfortable. But are we good at making the judgments on facial appearance and movement? The truth is that there ’ s a five-minute rule, not the tenth-of-a-second rule like Todorov, but a five-minute rule. If you spend five minutes with somebody, you start looking beyond their facial appearance, and the people who you ’ re initially attracted to may seem boring and you lose interest in them, and the people who you didn ’ t immediately seek out, because you didn ’ t find them particularly attractive, become attractive people because of their personality. So we ’ ve talked a lot about facial appearance. I now want to share a little bit of the surgery that we do â where we ’ re at and where we ’ re going. This is an image of Ann who ’ s had her right jaw removed and the base of her skull removed. And you can see in the images afterward, we ’ ve managed to reconstruct her successfully. But that ’ s not good enough. This is what Ann wants. She wants to be out kayaking, she wants to be out climbing mountains. And that ’ s what she achieved, and that ’ s what we have to get to. This is a horrific image, so I ’ m putting my hand up now. This is a photograph of Adi, a Nigerian bank manager who had his face shot off in an **armed** robbery. And he lost his lower jaw, his lip, his chin and his upper jaw and teeth.

This is the bar that he set for us.”I want to look like this. This is how I looked before.”So with modern technology, we used computers to make models. We made a model of the jaw without bone in it. We then bent a plate up to it. We put it in place so we knew it was an accurate position. We then put bone and tissue from the back. Here you can see the plate holding it, and you can see the implants being put in â so that in one operation we achieve this and this. So the patient ’ s life is restored. That ’ s the good news. However, his chin skin doesn ’ t look the same as it did before. It ’ s skin from his back. It ’ s thicker, it ’ s darker, it ’ s coarser, it doesn ’ t have the contours. And that ’ s where we ’ re failing, and that ’ s where we need the face transplant. The face transplant has a role probably in burns patients to replace the skin. We can replace the underlying skeletal structure, but we ’ re still not good at replacing the facial skin. So it ’ s very valuable to have that tool in our armamentarium. But the patients are going to have to take drugs that suppress their immune system for the rest of their lives. What does that mean? They have an increased risk of infection, an increased risk of malignancy. This is not a life-saving transplant â like a heart, or liver, or lung transplant â it is a quality-of-life transplant, and as a result, are the patients going to say, if they get a malignant cancer 10 or 15 years on,”I wish I ’ d had conventional reconstructive techniques rather than this because I ’ m now dying of a malignant cancer”? We don ’ t know yet. We also don ’ t know what they feel about recognition and identity. Bernard Devauchelle and Sylvie Testelin, who did the first operation, are studying that. Donors are going to be short on the ground, because how many people want to have their loved one ’ s face removed at the point of death? So there are going to be problems with face transplantation. So the better news is the future ’ s almost here â and the future is tissue engineering. Just imagine, I can make a biologically-degradable template. I can put it in place where it ’ s meant to be. I can sprinkle a few cells, stem cells from the patient ’ s own hip, a little bit of genetically engineered protein, and lo and behold, leave it for four months and the face is grown. This is a bit like a Julia Child recipe. But we ’ ve still got problems. We ’ ve got mouth cancer to solve. We ’ re still not curing enough patients â it ’ s the most disfiguring cancer. We ’ re still not reconstructing them well enough. In the U. K. we have an epidemic of facial injuries among young people. We still can ’ t get rid of scars. We need to do research. And the best news of all is that surgeons know that we need to do research. And we ’ ve set up charities that will help us fund the clinical research to determine the best treatment practice now and better treatment into the future, so we don ’ t just sit on our laurels and say,”Okay, we ’ re doing okay. Let ’ s leave it as it is.”Thank you very much indeed.

Text Sample 396: POS Dim 3 – 2011 – Score 9.00 – 2011/t002584.txt

Have you ever wondered why extremism seems to have been on the rise in Muslim- majority countries over the course of the last decade? Have you ever wondered how such a situation can be turned around? Have you ever looked at the Arab uprisings and thought,”How could we have predicted that?”or”How could we have better prepared for that?”Well my personal story, my personal journey, what brings me to the TED stage here today, is a demonstration of exactly what ’ s been happening in Muslim-majority countries over the course of the last decades, at least, and beyond. I want to share some of that story with you, but also some of my ideas around change and the role of social movements in creating change in Muslim-majority societies. So let me begin by first of all giving a very, very brief history of time, if I may indulge. In medieval societies there were defined allegiances. An identity was defined primarily by religion. And then we moved on into an era in the 19th century with the rise of a European nation-state where identities and allegiances were defined by **ethnicity**. So identity was primarily defined by **ethnicity**, and the nation-state reflected that. In the age of globalization, we moved on. I call it the era of citizenship — where people could be from multi-racial, multi-ethnic backgrounds, but all be **equal** as citizens in a state. You could be American-Italian ; you could be American-Irish ; you could be British-Pakistani. But I believe now that we ' re moving into a new age, and that age The New York Times dubbed recently as"the age of behavior."How I define the age of behavior is a period of transnational allegiances, where identity is defined more so by ideas and narratives. And these ideas and narratives that bump people across borders are increasingly beginning to affect the way in which people behave. Now this is not all necessarily good news, because it ' s also my belief that **hatred** has gone global just as much as love. But actually it ' s my belief that the people who ' ve been truly capitalizing on this age of behavior, up until now, up until recent times, up until the last six months, the people who have been capitalizing most on the age of behavior and the transnational allegiances, using digital activism and other sorts of borderless technologies, those who ' ve been benefiting from this have been extremists. And that ' s something which I ' d like to elaborate on. If we look at Islamists, if we look at the phenomenon of far-right fascists, one thing they ' ve been very good at, one thing that they ' ve actually been **exceeding** in, is communicating across borders, using technologies to organize themselves, to propagate their message and to create truly global phenomena. Now I should know, because for 13 years of my life, I was involved in an extreme Islamist organization. And I was actually a potent force in spreading ideas across borders, and I witnessed the rise of Islamist extremism as distinct from Islam the faith, and the way in which it influenced my co- religionists across the world. And my story, my personal story, is truly evidence for the age of behavior that I ' m attempting to elaborate upon here. I was, by the way — I ' m an Essex lad, born and raised in Essex in the U. K. Anyone who ' s from England knows the reputation we have from Essex. But having been born in Essex, at the age of 16, I joined an organization. At the age of 17, I was recruiting people from Cambridge University to this organization. At the age of 19, I was on the national leadership of this organization in the U. K. At the age of 21, I was co-founding this organization in Pakistan. At the age of 22, I was co-founding this organization in Denmark. By the age of 24, I found myself **convicted** in prison in Egypt, being blacklisted from three countries in the world for attempting to overthrow their governments, being subjected to torture in Egyptian jails and sentenced to five years as a prisoner of conscience. Now that journey, and what took me from Essex all the way across the world — by the way, we were laughing at democratic activists. We felt they were from the age of yesteryear. We felt that they were out of date. I learned how to use email from the extremist organization that I used. I learned how to effectively communicate across borders without being detected. Eventually I was detected, of course, in Egypt. But the way in which I learned to use technology to my advantage was because I was within an extremist organization that was forced to think beyond the confines of the nation-state. The age of behavior : where ideas and narratives were increasingly defining behavior and identity and allegiances. So as I said, we looked to the status quo and ridiculed it. And it ' s not just Islamist extremists that did this. But even if you look across the mood music in Europe of late, far-right fascism is also on the rise. A form of anti-Islam rhetoric is also on the rise and it ' s transnational. And the consequences that this is having is that it ' s affecting the political climate across Europe. What ' s actually happening is that what were previously localized parochialisms, individual or groupings of extremists who were isolated from one another, have become interconnected in a globalized way and have thus become, or are becoming, mainstream. Because the Internet and connection technologies are connecting them across the world. If you look at the rise of far-right fascism across Europe of late, you will see some things that are happening that are influencing **domestic** politics, yet the phenomenon is transnational. In certain countries, **mosque** minarets are being banned. In others, headscarves are being banned. In others, kosher and halal meat are being banned, as we speak. And on the flip side, we have transnational Islamist extremists doing the same thing across their own societies. And so they are pockets of parochialism that are being connected in a way that makes them feel like they are mainstream. Now that never would have been possible before. They would have felt isolated, until these sorts of technologies came around and connected them in a way that made them feel part of a larger phenomenon. Where does that leave democracy aspirants? Well I believe they ' re getting left far behind. And I ' ll give you an example here at this stage. If any of you remembers the Christmas Day bomb plot : there ' s a man called Anwar al-Awlaki. As an American citizen, ethnically a Yemeni, in hiding currently in Yemen, who inspired a Nigerian, son of the head of Nigeria ' s national bank. This Nigerian student studied in London, trained in Yemen, boarded a flight in Amsterdam to attack America. In the meanwhile, the Old mentality with a capital O, was represented by his father, the head of the Nigerian bank, warning the CIA that his own son was about to attack, and this warning fell on deaf ears. The Old mentality with a capital O, as represented by the nation-state, not yet fully into the age of behavior, not recognizing the power of transnational social movements, got left behind. And the Christmas Day bomber almost succeeded in attacking the United States of America. Again with the example of the far right : that we find, ironically, xenophobic nationalists are utilizing the benefits of globalization. So why are they succeeding? And why are democracy aspirants falling behind? Well we need to understand the power of the social movements who understand this. And a social movement is comprised, in my view, it ' s comprised of four main characteristics. It ' s comprised of ideas and narratives and symbols and leaders. I ' ll talk you through one example, and that ' s the example that everyone here will be aware of, and that ' s the example of Al-Qaeda. If I asked you to think of the ideas of Al-Qaeda, that ' s something that comes to your mind immediately. If I ask you to think of their narratives — the West being at war with Islam, the need to defend Islam against the West — these narratives, they come to your mind immediately. Incidentally, the difference between ideas and narratives : the idea is the cause that one believes in ; and the narrative is the way to sell that cause — the propaganda, if you like, of the cause. So the ideas and the narratives of Al-Qaeda come to your mind immediately. If I ask you to think of their symbols and their leaders, they come to your mind immediately. One of their leaders was killed in Pakistan recently. So these symbols and these leaders come to your mind immediately. And that ' s the power of social movements. They ' re transnational, and they bond around these ideas and narratives and these symbols and these leaders. However, if I ask your minds to focus currently on Pakistan, and I ask you to think of the symbols and the leaders for democracy in Pakistan today, you ' ll be hard pressed to think beyond perhaps the assassination of Benazir Bhutto. Which means, by definition, that particular leader no longer exists. One of the problems we ' re facing is, in my view, that there are no globalized, youth-led, grassroots social movements advocating for democratic culture across Muslim-majority societies. There is no equivalent of the Al-Qaeda, without the terrorism, for democracy across Muslim-majority societies. There are no ideas and narratives and leaders and symbols advocating the democratic culture on the ground. So that begs the next question. Why is it that extremist organizations, whether of the far-right or of the Islamist extremism — Islamism meaning those who wish to impose one version of Islam over the rest of society — why is it that they are succeeding in organizing in a globalized way, whereas those who aspire to democratic culture are falling behind? And I believe that ' s for four reasons. I believe, number one, it ' s complacency. Because those who aspire to democratic culture are in power, or have societies that are leading globalized, powerful societies, powerful countries. And that level of complacency means they don ' t feel the need to advocate for that culture. The second, I believe, is political correctness. That we have a hesitation in espousing the universality of democratic culture because we are associating that — we associate believing in the universality of our values — with extremists. Yet actually, whenever we talk about human rights, we do say that human rights are universal. But actually going out to propagate that view is associated with either neoconservativism or with Islamist extremism. To go around saying that I believe democratic culture is the best that we ' ve arrived at as a form of political organizing is associated with extremism. And the third, democratic choice in Muslim-majority societies has been relegated to a political choice, meaning political parties in many of these societies ask people to vote for them as the democratic party, but then the other parties ask them to vote for them as the military party — wanting to rule by military dictatorship. And then you have a third party saying,"Vote for us ; we ' ll establish a theocracy."So democracy has become merely one political choice among many other forms of political choices available in those societies. And what happens as a result of this is, when those parties are elected, and inevitably they fail, or inevitably they make political mistakes, democracy takes the blame for their political mistakes. And then people say,"We ' ve tried democracy. It doesn ' t really work. Let ' s bring the military back again."And the fourth reason, I believe, is what I ' ve labeled here on the slide as the ideology of resistance. What I mean by that is, if the world superpower today was a communist, it would be much easier for democracy activists to use democracy activism as a form of resistance against colonialism, than it is today with the world superpower being America, occupying certain lands and also espousing democratic ideals. So roughly these four reasons make it a lot more difficult for democratic culture to spread as a civilizational choice, not merely as a political choice. When talking about those reasons, let ' s break down certain preconceptions. Is it just about grievances? Is it just about a lack of education? Well statistically, the majority of those who join extremist organizations are highly educated. Statistically, they are educated, on average, above the education levels of Western society. Anecdotally, we can demonstrate that if poverty was the only factor, well Bin Laden is from one of the richest families in Saudi Arabia. His deputy, Ayman al-Zawahiri, was a pediatrician — not an ill-educated man. International aid and development has been going on for years, but extremism in those societies, in many of those societies, has been on the rise. And what I believe is missing is genuine grassroots activism on the ground, in addition to international aid, in addition to education, in addition to health. Not exclusive to these things, but in addition to them, is propagating a genuine demand for democracy on the ground. And this is where I believe neoconservatism had it upside-down. Neoconservatism had the philosophy that you go in with a supply-led approach to impose democratic values from the top down. Whereas Islamists and far-right organizations, for decades, have been building demand for their ideology on the grassroots. They ' ve been building civilizational demand for their values on the grassroots, and we ' ve been seeing those societies slowly transition to societies that are increasingly asking for a form of Islamism. Mass movements in Pakistan have been represented after the Arab uprisings mainly by organizations claiming for some form of theocracy, rather than for a democratic uprising. Because since pre-partition, they ’ ve been building demand for their ideology on the ground. And what ’ s needed is a genuine transnational youth-led movement that works to actively advocate for the democratic culture — which is necessarily more than just elections. But without freedom of speech, you can ’ t have free and fair elections. Without human rights, you don ’ t have the protection granted to you to campaign. Without freedom of belief, you don ’ t have the right to join organizations. So what ’ s needed is those organizations on the ground advocating for the democratic culture itself to create the demand on the ground for this culture. What that will do is avoid the problem I was talking about earlier, where currently we have political parties presenting democracy as merely a political choice in those societies alongside other choices such as military rule and theocracy. Whereas if we start building this demand on the ground on a civilizational level, rather than merely on a political level, a level above politics — movements that are not political parties, but are rather creating this civilizational demand for this democratic culture. What we ’ ll have in the end is this ideal that you see on the slide here — the ideal that people should vote in an existing democracy, not for a democracy. But to get to that stage, where democracy builds the fabric of society and the political choices within that fabric, but are certainly not theocratic and military dictatorship — i. e. you ’ re voting in a democracy, in an existing democracy, and that democracy is not merely one of the choices at the ballot box. To get to that stage, we genuinely need to start building demand in those societies on the ground. Now to conclude, how does that happen? Well, Egypt is a good starting point. The Arab uprisings have demonstrated that this is already beginning. But what happened in the Arab uprisings and what happened in Egypt was particularly cathartic for me. What happened there was a political coalition gathered together for a political goal, and that was to remove the leader. We need to move one step beyond that now. We need to see how we can help those societies move from political coalitions, loosely based political coalitions, to civilizational coalitions that are working for the ideals and narratives of the democratic culture on the ground. Because it ’ s not enough to remove a leader or ruler or dictator. That doesn ’ t guarantee that what comes next will be a society built on democratic values. But generally, the trends that start in Egypt have historically spread across the MENA region, the Middle East and North Africa region. So when Arab socialism started in Egypt, it spread across the region. In the ’ 80s and ’ 90s when Islamism started in the region, it spread across the MENA region as a whole. And the aspiration that we have at the moment — as young Arabs are proving today and instantly rebranding themselves as being prepared to die for more than just terrorism — is that there is a chance that democratic culture can start in the region and spread across to the rest of the countries that are surrounding that. But that will require helping these societies transition from having merely political coalitions to building genuinely grassroots-based social movements that advocate for the democratic culture. And we ’ ve made a start for that in Pakistan with a movement called Khudi, where we are working on the ground to encourage the youth to create genuine buy-in for the democratic culture. And it ’ s with that thought that I ’ ll end. And my time is up, and thank you for your time.

Text Sample 397: POS Dim 3 – 2011 – Score 9.00 – 2011/t002654.txt

Ten years ago exactly, I was in Afghanistan. I was covering the war in Afghanistan, and I witnessed, as a reporter for Al Jazeera, the amount of **suffering** and destruction that emerged out of a war like that. Then, two years later, I covered another war â the war in Iraq. I was placed at the center of that war because I was covering the war from the northern part of Iraq. And the war ended with a regime change, like the one in Afghanistan. And that regime that we got rid of was actually a dictatorship, an **authoritarian** regime, that for decades created a great sense of paralysis within the nation, within the people themselves. However, the change that came through foreign intervention created even worse circumstances for the people and deepened the sense of paralysis and inferiority in that part of the world. For decades, we have lived under **authoritarian** regimes â in the Arab world, in the Middle East. These regimes created something within us during this period. I ' m 43 years old right now. For the last 40 years, I have seen almost the same faces for kings and presidents ruling us â old, aged, **authoritarian**, corrupt situations â regimes that we have seen around us. And for a moment I was wondering, are we going to live in order to see real change happening on the ground, a change that does not come through foreign intervention, through the misery of occupation, through nations invading our land and deepening the sense of inferiority sometimes? The Iraqis : yes, they got rid of Saddam Hussein, but when they saw their land occupied by foreign forces they felt very sad, they felt that their dignity had suffered. And this is why they revolted. This is why they did not accept. And actually other regimes, they told their citizens,"Would you like to see the situation of Iraq? Would you like to see civil war, sectarian killing? Would you like to see destruction? Would you like to see foreign troops on your land?"And the people thought for themselves,"Maybe we should live with this kind of **authoritarian** situation that we find ourselves in, instead of having the second scenario."That was one of the worst nightmares that we have seen. For 10 years, unfortunately we have found ourselves reporting images of destruction, images of killing, of sectarian conflicts, images of **violence**, emerging from a magnificent piece of land, a region that one day was the source of civilizations and art and culture for thousands of years. Now I am here to tell you that the future that we were dreaming for has eventually arrived. A new generation, well-educated, connected, inspired by universal values and a global understanding, has created a new reality for us. We have found a new way to express our feelings and to express our dreams : these young people who have restored self-confidence in our nations in that part of the world, who have given us new meaning for freedom and empowered us to go down to the **streets**. Nothing happened. No **violence**. Nothing. Just step out of your house, raise your voice and say,"We would like to see the end of the regime."This is what happened in Tunisia. Over a few days, the Tunisian regime that invested billions of dollars in the security agencies, billions of dollars in maintaining, trying to maintain, its prisons, collapsed, disappeared, because of the voices of the public. People who were inspired to go down to the **streets** and to raise their voices, they tried to kill. The intelligence agencies wanted to arrest people. They found something called Facebook. They found something called **Twitter**. They were surprised by all of these kinds of issues. And they said,"These kids are misled."Therefore, they asked their parents to go down to the **streets** and collect them, bring them back home. This is what they were telling. This is their propaganda."Bring these kids home because they are misled."But yes, these youth who have been inspired by universal values, who are idealistic enough to imagine a magnificent future and, at the same time, realistic enough to balance this kind of imagination and the process leading to it â not using **violence**, not trying to create chaos â these young people, they did not go home. Parents actually went to the **streets** and they supported them. And this is how the revolution was born in Tunisia. We in Al Jazeera were banned from Tunisia for years, and the government did not allow any Al Jazeera reporter to be there. But we found that these people in the **street**, all of them are our reporters, feeding our newsroom with pictures, with videos and with news. And suddenly that newsroom in Doha became a center that received all this kind of input from ordinary people â people who are connected and people who have ambition and who have liberated themselves from the feeling of inferiority. And then we took that decision : We are unrolling the news. We are going to be the voice for these voiceless people. We are going to spread the message. Yes, some of these young people are connected to the Internet, but the connectivity in the Arab world is very little, is very small, because of many problems that we are suffering from. But Al Jazeera took the voice from these people and we amplified [it]. We put it in every sitting room in the Arab world â and internationally, globally, through our English channel. And then people started to feel that there ’ s something new happening. And then Zine al-Abidine Ben Ali decided to leave. And then Egypt started, and Hosni Mubarak decided to leave. And now Libya as you see it. And then you have Yemen. And you have many other countries trying to see and to rediscover that feeling of,”How do we imagine a future which is magnificent and peaceful and tolerant?”I want to tell you something, that the Internet and connectivity has created [a] new mindset. But this mindset has continued to be faithful to the soil and to the land that it emerged from. And while this was the major difference between many **initiatives** before to create change, before we thought, and governments told us â and even sometimes it was true â that change was imposed on us, and people rejected that, because they thought that it is alien to their culture. Always, we believed that change will spring from within, that change should be a reconciliation with culture, cultural diversity, with our faith in our tradition and in our history, but at the same time, open to universal values, connected with the world, tolerant to the outside. And this is the moment that is happening right now in the Arab world. This is the right moment, and this is the actual moment that we see all of these meanings meet together and then create the beginning of this magnificent era that will emerge from the region. How did the elite deal with that â the so-called political elite? In front of Facebook, they brought the camels in Tahrir Square. In front of Al Jazeera, they started creating tribalism. And then when they failed, they started speaking about conspiracies that emerged from Tel Aviv and Washington in order to divide the Arab world. They started telling the West,”Be aware of Al-Qaeda. Al-Qaeda is taking over our territories. These are Islamists trying to create new Imaras. Be aware of these people who [are] coming to you in order to ruin your great civilization.”Fortunately, people right now cannot be deceived. Because this corrupt elite in that region has lost even the power of deception. They could not, and they cannot, imagine how they could really deal with this reality. They have lost. They have been detached from their people, from the masses, and now we are seeing them collapsing one after the other. Al Jazeera is not a tool of revolution. We do not create revolutions. However, when something of that magnitude happens, we are at the center of the coverage. We were banned from Egypt, and our correspondents, some of them were arrested. But most of our camera people and our journalists, they went underground in Egypt â voluntarily â to report what happened in Tahrir Square. For 18 days, our cameras were broadcasting, live, the voices of the people in Tahrir Square. I remember one night when someone phoned me on my cellphone â ordinary person who I don ’ t know â from Tahrir Square. He told me,”We appeal to you not to switch off the cameras. If you switch off the cameras tonight, there will be a genocide. You are protecting us by showing what is happening at Tahrir Square.”I felt the responsibility to phone our correspondents there and to phone our newsroom and to tell them,”Make your best not to switch off the cameras at night, because the guys there really feel confident when someone is reporting their story â and they feel protected as well.”So we have a chance to create a new future in that part of the world. We have a chance to go and to think of the future as something which is open to the world. Let us not repeat the mistake of Iran, of [the] Mosaddeq revolution. Let us free ourselves â especially in the West â from thinking about that part of the world based on oil interest, or based on interests of the illusion of stability and security. The stability and security of **authoritarian** regimes cannot create but terrorism and **violence** and destruction. Let us accept the choice of the people. Let us not pick and choose who we would like to rule their future. The future should be ruled by people themselves, even sometimes if they are voices that might now scare us. But the values of democracy and the freedom of choice that is sweeping the Middle East at this moment in time is the best opportunity for the world, for the West and the East, to see stability and to see security and to see friendship and to see tolerance emerging from the Arab world, rather than the images of **violence** and terrorism. Let us support these people. Let us stand for them. And let us give up our narrow selfishness in order to embrace change, and in order to **celebrate** with the people of that region a great future and hope and tolerance. The future has arrived, and the future is now. I thank you very much. Thank you very much. Chris Anderson : I just have a couple of questions for you. Thank you for coming here. How would you characterize the historical significance of what ’ s happened? Is this a story-of-the-year, a story-of-the-decade or something more? Wadah Khanfar : Actually, this may be the biggest story that we have ever covered. We have covered many wars. We have covered a lot of tragedies, a lot of problems, a lot of conflict zones, a lot of hot spots in the region, because we were centered at the middle of it. But this is a story â it is a great story ; it is beautiful. It is not something that you only cover because you have to cover a great incident. You are witnessing change in history. You are witnessing the birth of a new era. And this is what the story ’ s all about. CA : There are a lot of people in the West who are still skeptical, or think this may just be an intermediate stage before much more alarming chaos. You really believe that if there are democratic elections in Egypt now, that a government could emerge that espouses some of the values you ’ ve spoken about so inspiringly? WK : And people actually, after the collapse of the Hosni Mubarak regime, the youth who have organized themselves in certain groups and councils, they are guarding the transformation and they are trying to put it on a track in order to satisfy the values of democracy, but at the same time also to make it reasonable and to make it rational, not to go out of order. In my opinion, these people are much more wiser than, not only the political elite, even the intellectual elite, even opposition leaders including political parties. At this moment in time, the youth in the Arab world are much more wiser and capable of creating the change than the old â including the political and cultural and ideological old regimes. CA : We are not to get involved politically and interfere in that way. What should people here at TED, here in the West, do if they want to connect or make a difference and they believe in what ’ s happening here? WK : I think we have discovered a very important issue in the Arab world â that people care, people care about this great transformation. Mohamed Nanabhay who ’ s sitting with us, the head of Aljazeera. net, he told me that a 2, 500 percent increase of **accessing** our website from various parts of the world. Fifty percent of it is coming from America. Because we discovered that people care, and people would like to know â they are receiving the stream through our Internet. Unfortunately in the United States, we are not covering but Washington D. C. at this moment in time for Al Jazeera English. But I can tell you, this is the moment to **celebrate** through connecting ourselves with those people in the **street** and expressing our support to them and expressing this kind of feeling, universal feeling, of supporting the weak and the oppressed to create a much better future for all of us. CA : Well Wadah, a group of members of the TED community, TEDxCairo, are meeting as we speak. They ’ ve had some speakers there. I believe they ’ ve heard your talk. Thank you for inspiring them and for inspiring all of us. Thank you so much.

Text Sample 398: POS Dim 3 – 2011 – Score 8.00 – 2011/t002368.txt

This is Shivdutt Yadav, and he ’ s from Uttar Pradesh, India. Now Shivdutt was visiting the local land registry office in Uttar Pradesh, and he discovered that official records were listing him as dead. His land was no longer registered in his name. His brothers, Chandrabhan and Phoolchand, were also listed as dead. Family members had bribed officials to interrupt the hereditary transfer of land by having the brothers **declared** dead, allowing them to inherit their father ’ s share of the ancestral farmland. Because of this, all three brothers and their families had to vacate their home. According to the Yadav family, the local court has been scheduling a case review since 2001, but a judge has never appeared. There are several instances in Uttar Pradesh of people dying before their case is given a proper review. Shivdutt ’ s father ’ s death and a want for his property led to this corruption. He was laid to rest in the Ganges River, where the dead are cremated along the banks of the river or tied to heavy stones and sunk in the water. Photographing these brothers was a disorienting exchange because on paper they don ’ t exist, and a photograph is so often used as an evidence of life. Yet, these men remain dead. This quandary led to the title of the project, which considers in many ways that we are all the living dead and that we in some ways represent ghosts of the past and the future. So this story is the first of 18 chapters in my new body of work titled”A Living Man **Declared** Dead and Other Chapters.”And for this work, I traveled around the world over a four-year period researching and recording bloodlines and their related stories. I was interested in ideas surrounding fate and whether our fate is determined by blood, chance or circumstance. The subjects I documented ranged from feuding families in Brazil to **victims** of genocide in Bosnia to the first woman to hijack an airplane and the living dead in India. In each chapter, you can see the external forces of governance, power and territory or religion colliding with the internal forces of psychological and physical inheritance. Each work that I make is comprised of three segments. On the left are one or more portrait panels in which I systematically order the members of a given bloodline. This is followed by a text panel, it ’ s designed in scroll form, in which I construct the narrative at stake. And then on the right is what I refer to as a footnote panel. It ’ s a space that ’ s more intuitive in which I present fragments of the story, beginnings of other stories, photographic evidence. And it ’ s meant to kind of reflect how we engage with histories or stories on the Internet, in a less linear form. So it ’ s more disordered. And this disorder is in direct contrast to the unalterable order of a bloodline. In my past projects I ’ ve often worked in serial form, documenting things that have the appearance of being comprehensive through a determined title and a determined presentation, but in fact, are fairly abstract. In this project I wanted to work in the opposite direction and find an absolute catalog, something that I couldn ’ t interrupt, curate or edit by choice. This led me to blood. A bloodline is determined and ordered. But the project centers on the collision of order and disorder — the order of blood butting up against the disorder represented in the often chaotic and **violent** stories that are the subjects of my chapters. In chapter two, I photograph the descendants of Arthur Ruppin. He was sent in 1907 to Palestine by the Zionist organization to look at areas for Jewish settlement and acquire land for Jewish settlement. He oversaw land acquisition on behalf of the Palestine Land Development Company whose work led to the establishment of a Jewish state. Through my research at the Zionist Archives in Jerusalem, I wanted to look at the early paperwork of the establishment of the Jewish state. And I found these maps which you see here. And these are studies commissioned by the Zionist organization for alternative areas for Jewish settlement. In this, I was interested in the consequences of geography and imagining how the world would be different if Israel were in Uganda, which is what these maps demonstrate. These archives in Jerusalem, they maintain a card index file of the earliest **immigrants** and applicants for **immigration** to Palestine, and later Israel, from 1919 to 1965. Chapter three : Joseph Nyamwanda Jura Ondijo treated patients outside of Kisumu, Kenya for AIDS, tuberculosis, infertility, mental illness, evil spirits. He ' s most often paid for his services in cash, cows or goats. But sometimes when his female patients can ' t afford his services, their families give the women to Jura in exchange for medical treatment. As a result of these transactions, Jura has nine wives, 32 children and 63 grandchildren. In his bloodline you see the children and grandchildren here. Two of his wives were brought to him suffering from infertility and he cured them, three for evil spirits, one for an asthmatic condition and severe chest pain and two wives Ondijo claims he took for love, paying their families a total of 16 cows. One wife deserted him and another passed away during treatment for evil spirits. Polygamy is widely practiced in Kenya. It ' s common among a privileged class capable of paying numerous dowries and keeping multiple homes. Instances of prominent social and political figures in polygamous relationships has led to the perception of polygamy as a symbol of wealth, status and power. You may notice in several of the chapters that I photographed there are empty portraits. These empty portraits represent individuals, living individuals, who couldn ' t be present. And the reasons for their absence are given in my text panel. They include dengue fever, imprisonment, army service, women not allowed to be photographed for religious and cultural reasons. And in this particular chapter, it ' s children whose mothers wouldn ' t allow them to travel to the photographic shoot for fear that their fathers would kidnap them during it. Twenty-four European rabbits were brought to Australia in 1859 by a British settler for sporting purposes, for hunting. And within a hundred years, that population of 24 had exploded to half a billion. The European rabbit has no natural predators in Australia, and it competes with native wildlife and damages native plants and degrades the land. Since the 1950s, Australia has been introducing lethal diseases into the wild rabbit population to control growth. These rabbits were bred at a government facility, Biosecurity Queensland, where they bred three bloodlines of rabbits and have infected them with a lethal disease and are monitoring their progress to see if it will effectively kill them. So they ' re testing its virulence. During the course of this trial, all of the rabbits died, except for a few, which were euthanized. Haigh ' s Chocolate, in collaboration with the Foundation for Rabbit-Free Australia, stopped all production of the Easter Bunny in chocolate and has replaced it with the Easter Bilby. Now this was done to counter the annual celebration of rabbits and presumably make the public more comfortable with the killing of rabbits and promote an animal that ' s native to Australia, and actually an animal that is threatened by the European rabbit. In chapter seven, I focus on the effects of a genocidal act on one bloodline. So over a two-day period, six individuals from this bloodline were killed in the Srebrenica massacre. This is the only work in which I visually represent the dead. But I only represent those that were killed in the Srebrenica massacre, which is recorded as the largest mass murder in Europe since the Second World War. And during this massacre, 8, 000 Bosnian Muslim men and boys were systematically executed. So when you look at a detail of this work, you can see, the man on the upper- left is the father of the woman sitting next to him. Her name is Zumra. She is followed by her four children, all of whom were killed in the Srebrenica massacre. Following those four children is Zumra ’ s younger sister who is then followed by her children who were killed as well. During the time I was in Bosnia, the mortal remains of Zumra ’ s eldest son were exhumed from a mass grave. And I was therefore able to photograph the fully assembled remains. However, the other individuals are represented by these blue slides, which show tooth and bone samples that were matched to DNA evidence collected from family members to prove they were the identities of those individuals. They ’ ve all been given a proper burial, so what remains are these blue slides at the International Commission for Missing Persons. These are personal effects dug up from a mass grave that are awaiting identification from family members and graffiti at the Potochari battery factory, which was where the Dutch U. N. soldiers were staying, and also the Serbian soldiers later during the times of the executions. This is video footage used at the Milosevic trial, which from top to bottom shows a Serbian scorpion unit being blessed by an Orthodox priest before rounding up the boys and men and killing them. Chapter 15 is more of a performance piece. I solicited China ’ s State Council Information Office in 2009 to select a multi-generational bloodline to represent China for this project. They chose a large family from Beijing for its size, and they declined to give me any further reasoning for their choice. This is one of the rare situations where I have no empty portraits. Everyone showed up. You can also see the evolution of the one-child-only policy as it travels through the bloodline. Previously known as the Department of Foreign Propaganda, the State Council Information Office is responsible for all of China ’ s external publicity operations. It controls all foreign media and image production outside of China from foreign media working within China. It also monitors the Internet and instructs local media on how to handle any potentially controversial issues, including Tibet, ethnic minorities, Human Rights, religion, democracy movements and terrorism. For the footnote panel in this work, this office instructed me to photograph their central television tower in Beijing. And I also photographed the gift bag they gave me when I left. These are the descendants of Hans Frank who was Hitler ’ s personal legal advisor and governor general of occupied Poland. Now this bloodline includes numerous empty portraits, highlighting a complex relationship to one ’ s family history. The reasons for these absences include people who declined participation. There ’ s also parents who participated who wouldn ’ t let their children participate because they thought they were too young to decide for themselves. Another section of the family presented their clothing, as opposed to their physical presence, because they didn ’ t want to be identified with the past that I was highlighting. And finally, another individual sat for me from behind and later rescinded his participation, so I had to pixelate him out so he ’ s unrecognizable. In the footnote panel that accompanies this work I photographed an official Adolph Hitler postage stamp and an imitation of that stamp produced by British Intelligence with Hans Frank ’ s image on it. It was released in Poland to create friction between Frank and Hitler, so that Hitler would imagine Frank was trying to usurp his power. Again, talking about fate, I was interested in the stories and fate of particular works of art. These paintings were taken by Hans Frank during the time of the Third Reich. And I ’ m interested in the impact of their absence and presence through time. They are Leonardo da Vinci ' s"Lady With an Ermine,"Rembrandt ' s"Landscape With Good Samaritan"and Raphael ' s"Portrait of a Youth,"which has never been found. Chapter 12 highlights people being born into a battle that is not of their making, but becomes their own. So this is the Ferraz family and the Novaes family. And they are in an active blood feud. This feud has been going on since 1991 in Northeast Brazil in Pernambuco, and it involved the deaths of 20 members of the families and 40 others associated with the feud, including hired hit men, **innocent** bystanders and friends. Tensions between these two families date back to 1913 when there was a dispute over local political power. But it got **violent** in the last two decades and includes decapitation and the death of two mayors. Installed into a protective wall surrounding the suburban home of Louis Novaes, who ' s the head of the Novaes family, are these turret holes, which were used for shooting and looking. Brazil ' s northeast state of Pernambuco is one of the nation ' s most **violent** regions. It ' s rooted in a principle of retributive justice, or an eye for an eye, so retaliatory killings have led to several deaths in the area. This story, like many of the stories in my chapters, reads almost as an archetypal episode, like something out of Shakespeare, that ' s happening now and will happen again in the future. I ' m interested in these ideas of repetition. So after I returned home, I received word that one member of the family had been shot 30 times in the face. Chapter 17 is an exploration of the absence of a bloodline and the absence of a history. Children at this Ukrainian orphanage are between the ages of six and 16. This piece is ordered by age because it can ' t be ordered by blood. In a 12- month period when I was at the orphanage, only one child had been adopted. Children have to leave the orphanage at age 16, despite the fact that there ' s often nowhere for them to go. It ' s commonly reported in Ukraine that children, when leaving the orphanage are targeted for human trafficking, child pornography and prostitution. Many have to turn to criminal activity for their survival, and high rates of suicide are recorded. This is a boys ' bedroom. There ' s an insufficient supply of beds at the orphanage and not enough warm clothing. Children bathe infrequently because the hot water isn ' t turned on until October. This is a girls ' bedroom. And the director listed the orphanage ' s most urgent needs as an industrial size washing machine and dryer, four vacuum cleaners, two computers, a video projector, a copy machine, winter shoes and a dentist ' s drill. This photograph, which I took at the orphanage of one of the classrooms, shows a sign which I had translated when I got home. And it reads :"Those who do not know their past are not worthy of their future."There are many more chapters in this project. This is just an abridged rendering of over a thousand images. And this mass pile of images and stories forms an archive. And within this accumulation of images and texts, I ' m struggling to find patterns and imagine that the narratives that surround the lives we lead are just as coded as blood itself. But archives exist because there ' s something that can ' t necessarily be articulated. Something is said in the gaps between all the information that ' s collected. And there ' s this **relentless** persistence of birth and death and an unending collection of stories in between. It ' s almost machine-like the way people are born and people die, and the stories keep coming and coming. And in this, I ' m considering, is this actual accumulation leading to some sort of evolution, or are we on repeat over and over again? Thank you.

Text Sample 399: POS Dim 3 – 2008 – Score 12.00 – 2008/t000239.txt
Philosophers, dramatists, theologians have grappled with this question for cen-

turies : what makes people go wrong? Interestingly, I asked this question when I was a little kid. I grew up in the South Bronx, inner-city ghetto in New York, and I was surrounded by evil, as all kids are who grew up in an inner city. And I had friends who were really good kids, who lived out the Dr. Jekyll Mr. Hyde scenario — Robert Louis Stevenson. That is, they took drugs, got in trouble, went to jail. Some got killed, and some did it without drug assistance. So when I read Robert Louis Stevenson, that wasn ’ t fiction. The only question is, what was in the juice? And more importantly, that line between good and evil — which privileged people like to think is fixed and impermeable, with them on the good side, the others on the bad side — I knew that line was movable, and it was permeable. Good people could be seduced across that line, and under good and some rare circumstances, bad kids could recover with help, with reform, with rehabilitation. So I want to begin with this wonderful illusion by [Dutch] artist M. C. Escher. If you look at it and focus on the white, what you see is a world full of angels. But let ’ s look more deeply, and as we do, what appears is the demons, the devils in the world. That tells us several things. One, the world is, was, will always be filled with good and evil, because good and evil is the yin and yang of the human condition. It tells me something else. If you remember, God ’ s favorite angel was Lucifer. Apparently, Lucifer means”the light.”It also means”the morning star,”in some scripture. And apparently, he disobeyed God, and that ’ s the ultimate disobedience to authority. And when he did, Michael, the archangel, was sent to kick him out of heaven along with the other fallen angels. And so Lucifer descends into hell, becomes Satan, becomes the devil, and the force of evil in the universe begins. Paradoxically, it was God who created hell as a place to store evil. He didn ’ t do a good job of keeping it there though. So, this arc of the cosmic transformation of God ’ s favorite angel into the Devil, for me, sets the context for understanding human beings who are transformed from good, ordinary people into **perpetrators** of evil. So the Lucifer effect, although it focuses on the negatives — the negatives that people can become, not the negatives that people are — leads me to a psychological definition. Evil is the exercise of power. And that ’ s the key : it ’ s about power. To intentionally **harm** people psychologically, to hurt people physically, to destroy people mortally, or ideas, and to commit crimes against humanity. If you Google”evil,”a word that should surely have withered by now, you come up with 136 million hits in a third of a second. A few years ago — I am sure all of you were shocked, as I was, with the revelation of American soldiers abusing prisoners in a strange place in a controversial war, Abu Ghraib in Iraq. And these were men and women who were putting prisoners through unbelievable humiliation. I was shocked, but I wasn ’ t surprised, because I had seen those same visual parallels when I was the prison superintendent of the Stanford Prison Study. Immediately the Bush administration military said what? What all administrations say when there ’ s a scandal :”Don ’ t blame us. It ’ s not the system. It ’ s the few bad apples, the few rogue soldiers.”My hypothesis is, American soldiers are good, usually. Maybe it was the barrel that was bad. But how am I going to deal with that hypothesis? I became an expert witness for one of the guards, Sergeant Chip Frederick, and in that position, I had **access** to the dozen investigative reports. I had **access** to him. I could study him, have him come to my home, get to know him, do psychological analysis to see, was he a good apple or bad apple. And thirdly, I had **access** to all of the 1, 000 pictures that these soldiers took. These pictures are of a **violent** or **sexual** nature. All of them come from the cameras of American soldiers. Because everybody has a digital camera or cell phone camera, they took pictures of everything, more than 1, 000. And what I ’ ve done is I organized them into various categories. But these are by United States military police, army reservists. They are not soldiers prepared for this mission at all. And it all happened in a single place, Tier 1-A, on the night shift. Why? Tier 1-A was the center for military intelligence. It was the interrogation hold. The CIA was there. Interrogators from Titan Corporation, all there, and they ' re getting no information about the insurgency. So they ' re going to put pressure on these soldiers, military police, to cross the line, give them permission to break the will of the enemy, to prepare them for interrogation, to soften them up, to take the gloves off. Those are the euphemisms, and this is how it was interpreted. Let ' s go down to that dungeon. [Abu Ghraib Iraq Prison Abuses 2008 Military Police Guards ' Photos] [The following images include nudity and graphic depictions of **violence**] So, pretty horrific. That ' s one of the visual illustrations of evil. And it should not have escaped you that the reason I paired the prisoner with his arms out with Leonardo da Vinci ' s ode to humanity is that that prisoner was mentally **ill**. That prisoner covered himself with shit every day, they had to roll him in dirt so he wouldn ' t stink. But the guards ended up calling him"Shit Boy."What was he doing in that prison rather than in some mental institution? In any event, here ' s former Secretary of Defense Rumsfeld. He comes down and says,"I want to know, who is responsible? Who are the bad apples?"Well, that ' s a bad question. You have to reframe it and ask,"What is responsible?""What"could be the who of people, but it could also be the what of the situation, and obviously that ' s wrongheaded. How do psychologists try to understand such transformations of human character, if you believe that they were good soldiers before they went down to that dungeon? There are three ways. The main way is called dispositional. We look at what ' s inside of the person, the bad apples. This is the foundation of all of social science, the foundation of religion, the foundation of war. Social psychologists like me come along and say,"Yeah, people are the actors on the stage, but you ' ll have to be aware of the situation. Who are the cast of characters? What ' s the costume? Is there a stage director?"And so we ' re interested in what are the external factors around the individual — the bad barrel? Social scientists stop there and they miss the big point that I discovered when I became an expert witness for Abu Ghraib. The power is in the system. The system creates the situation that corrupts the individuals, and the system is the legal, political, economic, cultural background. And this is where the power is of the bad-barrel makers. If you want to change a person, change the situation. And to change it, you ' ve got to know where the power is, in the system. So the Lucifer effect involves understanding human character transformations with these three factors. And it ' s a dynamic interplay. What do the people bring into the situation? What does the situation bring out of them? And what is the system that creates and maintains that situation? My recent book,"The Lucifer Effect,"is about, how do you understand how good people turn evil? And it has a lot of detail about what I ' m going to talk about today. So Dr. Z ' s"Lucifer Effect,"although it focuses on evil, really is a celebration of the human mind ' s infinite capacity to make any of us kind or cruel, caring or indifferent, creative or destructive, and it makes some of us villains. And the good news that I ' m going to hopefully come to at the end is that it makes some of us heroes. This wonderful cartoon in the New Yorker summarizes my whole talk :"I ' m neither a good cop nor a bad cop, Jerome. Like yourself, I ' m a complex amalgam of positive and negative personality traits that emerge or not, depending on the circumstances."There ' s a study some of you think you know about, but very few people have ever read the story. You watched the movie. This is Stanley Milgram, little Jewish kid from the Bronx, and he asked the question,"Could the Holocaust happen here, now?"People say,"No, that ' s Nazi Germany, Hitler, you know, that ' s 1939."He said,"Yeah, but suppose Hitler asked you, ' Would you electrocute a stranger? ' ' No way, I ' m a good person. '"He said,"Why don ' t we put you in a situation and give you a chance to see what you would do?"And so what he did was he tested 1, 000 ordinary people. 500 New Haven, Connecticut, 500 Bridgeport. And the ad said,"Psychologists want to understand memory. We want to improve people ' s memory, because it is the key to success."OK?"We ' re going to give you five bucks — four dollars for your time. We don ' t want college students. We want men between 20 and 50."In the later studies, they ran women. Ordinary people : barbers, clerks, white-collar people. So, you go down, one of you will be a learner, one will be a teacher. The learner ' s a genial, middle-aged guy. He gets tied up to the shock apparatus in another room. The learner could be middle-aged, could be as young as 20. And one of you is told by the authority, the guy in the lab coat,"Your job as teacher is to give him material to learn. Gets it right, reward. Gets it wrong, you press a button on the shock box. The first button is 15 volts. He doesn ' t even feel it."That ' s the key. All evil starts with 15 volts. And then the next step is another 15 volts. The problem is, at the end of the line, it ' s 450 volts. And as you go along, the guy is screaming,"I ' ve got a heart condition! I ' m out of here!"You ' re a good person. You complain."Sir, who will be responsible if something happens to him?"The experimenter says,"Don ' t worry, I will be responsible. Continue, teacher."And the question is, who would go all the way to 450 volts? You should notice here, when it gets up to 375, it says,"Danger. Severe Shock."When it gets up to here, there ' s"XXX"— the pornography of power. So Milgram asks 40 psychiatrists,"What percent of American citizens would go to the end?"They said only one percent. Because that ' s sadistic behavior, and we know, psychiatry knows, only one percent of Americans are sadistic. OK. Here ' s the data. They could not be more wrong. Two thirds go all the way to 450 volts. This was just one study. Milgram did more than 16 studies. And look at this. In study 16, where you see somebody like you go all the way, 90 percent go all the way. In study five, if you see people rebel, 90 percent rebel. What about women? Study 13 — no different than men. So Milgram is quantifying evil as the willingness of people to blindly obey authority, to go all the way to 450 volts. And it ' s like a dial on human nature. A dial in a sense that you can make almost everybody totally obedient, down to the majority, down to none. What are the external parallels? For all research is artificial. What ' s the validity in the real world? 912 American citizens committed suicide or were murdered by family and friends in Guyana jungle in 1978, because they were blindly obedient to this guy, their pastor — not their priest — their pastor, Reverend Jim Jones. He persuaded them to commit mass suicide. And so, he ' s the modern Lucifer effect, a man of God who becomes the Angel of Death. Milgram ' s study is all about individual authority to control people. Most of the time, we are in institutions, so the Stanford Prison Study is a study of the power of institutions to influence individual behavior. Interestingly, Stanley Milgram and I were in the same high school class in James Monroe in the Bronx, 1954. I did this study with my graduate students, especially Craig Haney — and it also began work with an ad. We had a cheap, little ad, but we wanted college students for a study of prison life. 75 people volunteered, took personality tests. We did interviews. Picked two dozen : the most normal, the most healthy. Randomly assigned them to be prisoner and guard. So on day one, we knew we had good apples. I ' m going to put them in a bad situation. And secondly, we know there ' s no difference between the boys who will be guards and those who will be prisoners. To the prisoners, we said,"Wait at home. The study will begin Sunday."We didn ' t tell them that the city police were going to come and do realistic arrests. [Day 1] Student : A police car pulls up in front, and a cop comes to the front door, and knocks, and says he ' s looking for me. So they, right there, you know, they took me out the door, they put my hands against the car. It was a real cop car, it was a real policeman, and there were real neighbors in the **street**, who didn ' t know that this was an experiment. And there was cameras all around and neighbors all around. They put me in the car, then they drove me around Palo Alto. They took me to the basement of the police station. Then they put me in a cell. I was the first one to be picked up, so they put me in a cell, which was just like a room with a door with bars on it. You could tell it wasn ' t a real jail. They locked me in there, in this degrading little outfit. They were taking this experiment too seriously. Here are the prisoners, who are going to be dehumanized, they ' ll become numbers. Here are the guards with the symbols of power and anonymity. Guards get prisoners to clean the toilet bowls out with their bare hands, to do other humiliating tasks. They strip them naked. They sexually taunt them. They begin to do degrading activities, like having them simulate sodomy. You saw simulating fellatio in soldiers in Abu Ghraib. My guards did it in five days. The stress reaction was so extreme that normal kids we picked because they were healthy had breakdowns within 36 hours. The study ended after six days, because it was out of control. Five kids had emotional breakdowns. Does it make a difference if warriors go to battle changing their appearance or not? If they ' re anonymous, how do they treat their **victims**? In some cultures, they go to war without changing their appearance. In others, they paint themselves like"Lord of the Flies."In some, they wear masks. In many, soldiers are anonymous in uniform. So this anthropologist, John Watson, found 23 cultures that had two bits of data. Do they change their appearance? 15. Do they kill, torture, mutilate? 13. If they don ' t change their appearance, only one of eight kills, tortures or mutilates. The key is in the red zone. If they change their appearance, 12 of 13 — that ' s 90 percent — kill, torture, mutilate. And that ' s the power of anonymity. So what are the seven social processes that grease the slippery slope of evil? Mindlessly taking the first small step. Dehumanization of others. De- individuation of self. Diffusion of personal responsibility. Blind obedience to authority. Uncritical conformity to group norms. Passive tolerance of evil through inaction, or indifference. And it happens when you ' re in a new or unfamiliar situation. Your habitual response patterns don ' t work. Your personality and morality are disengaged."Nothing is easier than to denounce the evildoer ; nothing more difficult than understanding him,"Dostoyevsky. Understanding is not excusing. Psychology is not excuse-ology. So social and psychological research reveals how ordinary, good people can be transformed without the drugs. You don ' t need it. You just need the social- psychological processes. Real world parallels? Compare this with this. James Schlesinger — I ' m going to end with this — says,"Psychologists have attempted to understand how and why individuals and groups who usually act humanely can sometimes act otherwise in certain circumstances."That ' s the Lucifer effect. And he goes on to say,"The landmark Stanford study provides a cautionary tale for all military operations."If you give people power without oversight, it ' s a prescription for abuse. They knew that, and let that happen. So another report, an investigative report by General Fay, says the system is guilty. In this report, he says it was the environment that created Abu Ghraib, by leadership failures that contributed to the occurrence of such abuse, and because it remained undiscovered by higher authorities for a long period of time. Those abuses went on for three months. Who was watching the store? The answer is nobody, I think on purpose. He gave the guards permission to do those things, and they knew nobody was ever going to come down to that dungeon. So you need a paradigm shift in all of these areas. The shift is away from the medical model that focuses only on the individual. The shift is toward a public health model that recognizes situational and **systemic** vectors of disease. Bullying is a disease. **Prejudice** is a disease. **Violence** is a disease. Since the Inquisition, we ’ ve been dealing with problems at the individual level. It doesn ’ t work. Aleksandr Solzhenitsyn says,”The line between good and evil cuts through the heart of every human being.”That means that line is not out there. That ’ s a decision that you have to make, a personal thing. So I want to end very quickly on a positive note. Heroism as the antidote to evil, by promoting the heroic imagination, especially in our kids, in our educational system. We want kids to think,”I ’ m a hero in waiting, waiting for the right situation to come along, and I will act heroically. My whole life, I ’ m now going to focus away from evil — that I ’ ve been in since I was a kid — to understanding heroes. Banality of heroism. It ’ s ordinary people who do heroic deeds. It ’ s the counterpoint to Hannah Arendt ’ s”Banality of Evil.”Our traditional societal heroes are wrong, because they are the exceptions. They organize their life around this. That ’ s why we know their names. Our kids ’ heroes are also wrong models for them, because they have supernatural talents. We want our kids to realize most heroes are everyday people, and the heroic act is unusual. This is Joe Darby. He was the one that stopped those abuses you saw, because when he saw those images, he turned them over to a senior investigating officer. He was a low-level private, and that stopped it. Was he a hero? No. They had to put him in hiding, because people wanted to kill him, and then his mother and his wife. For three years, they were in hiding. This is the woman who stopped the Stanford Prison Study. When I said it got out of control, I was the prison superintendent. I didn ’ t know it was out of control. I was totally indifferent. She saw that madhouse and said,”You know what, it ’ s terrible what you ’ re doing to those boys. They ’ re not prisoners nor guards, they ’ re boys, and you are responsible.”And I ended the study the next day. The good news is I married her the next year. I just came to my senses, obviously. So situations have the power to do [three things]. But the point is, this is the same situation that can inflame the hostile imagination in some of us, that makes us **perpetrators** of evil, can inspire the heroic imagination in others. It ’ s the same situation and you ’ re on one side or the other. Most people are guilty of the evil of inaction, because your mother said,”Don ’ t get involved. Mind your own business.”And you have to say,”Mama, humanity is my business.”So the psychology of heroism is — we ’ re going to end in a moment — how do we encourage children in new hero courses, that I ’ m working on with Matt Langdon — he has a hero workshop — to develop this heroic imagination, this self-labeling,”I am a hero in waiting,”and teach them skills. To be a hero, you have to learn to be a deviant, because you ’ re always going against the conformity of the group. Heroes are ordinary people whose social actions are extraordinary. Who act. The key to heroism is two things. You have to act when other people are passive. B : You have to act socio-centrically, not egocentrically. And I want to end with a known story about Wesley Autrey, New York subway hero. Fifty- year-old African-American construction worker standing on a subway. A white guy falls on the tracks. The subway train is coming. There ’ s 75 people there. You know what? They freeze. He ’ s got a reason not to get involved. He ’ s black, the guy ’ s white, and he ’ s got two kids. Instead, he gives his kids to a stranger, jumps on the tracks, puts the guy between the tracks, lays on him, the subway goes over him. Wesley and the guy — 20 and a half inches height. The train clearance is 21 inches. A half an inch would have taken his head off. And he said,”I did what anyone could do,”no big deal to jump on the tracks. And the moral imperative is”I did what everyone should do.”And so one day, you will be in a new situation. Take path one, you ’ re going to be a **perpetrator** of evil. Evil, meaning you ’ re going to be Arthur Andersen. You ’ re going to cheat, or you ’ re going to allow bullying. Path two, you become guilty of the evil of passive inaction. Path three, you become a hero. The point is, are we ready to take the path to **celebrating** ordinary heroes, waiting for the right situation to come along to put heroic imagination into action? Because it may only happen once in your life, and when you pass it by, you ’ ll always know, I could have been a hero and I let it pass me by. So the point is thinking it and then doing it. So I want to thank you. Thank you. Let ’ s oppose the power of evil systems at home and abroad, and let ’ s focus on the positive. Advocate for respect of personal dignity, for justice and peace, which sadly our administration has not been doing. Thanks so much.

Text Sample 400: POS Dim 3 – 2008 – Score 9.00 – 2008/t000226.txt
Suppose that two American friends are traveling together in Italy. They go to see Michelangelo ’ s”David,”and when they finally come face-to-face with the statue, they both freeze dead in their tracks. The first guy â we ’ ll call him Adam â is transfixed by the beauty of the perfect human form. The second guy â we ’ ll call him Bill â is transfixed by embarrassment, at staring at the thing there in the center. So here ’ s my question for you : Which one of these two guys was more likely to have voted for George Bush, which for Al Gore? I don ’ t need a show of hands, because we all have the same political stereotypes. We all know that it ’ s Bill. And in this case, the stereotype corresponds to reality. It really is a fact that liberals are much higher than conservatives on a major personality trait called **openness** to experience. People who are high in **openness** to experience just crave novelty, variety, diversity, new ideas, travel. People low on it like things that are familiar, that are safe and dependable. If you know about this trait, you can understand a lot of puzzles about human behavior, like why artists are so different from accountants. You can predict what kinds of books they like to read, what kinds of places they like to travel to and what kinds of food they like to eat. Once you understand this trait, you can understand why anybody would eat at Applebee ’ s, but not anybody that you know. This trait also tells us a lot about politics. The main researcher of this trait, Robert McCrae, says that”Open individuals have an affinity for liberal, progressive, left-wing political views...”They like a society which is open and changing,”... whereas closed individuals prefer conservative, traditional, right-wing views.”This trait also tells us a lot about the kinds of groups people join. Here ’ s the description of a group I found on the web. What kinds of people would join”a global community... welcoming people from every discipline and culture, who seek a deeper understanding of the world, and who hope to turn that understanding into a better future for us all”? This is from some guy named Ted. Well, let ’ s see now. If **openness** predicts who becomes liberal, and **openness** predicts who becomes a TEDster, then might we predict that most TEDsters are liberal? Let ’ s find out. I ’ ll ask you to raise your hand, whether you are liberal, left of center â on social issues, primarily â or conservative. And I ’ ll give a third option, because I know there are libertarians in the audience. So please raise your hand â in the simulcast rooms too. Let ’ s let everybody see who ’ s here. Please raise your hand if you ’ d say that you ’ re liberal or left of center. Please raise your hand high right now. OK. Please raise your hand if you ’ d say you ’ re libertarian. OK. About two dozen. And please raise your hand if you ’ d say you are right of center or conservative. One, two, three, four, five â about eight or 10. OK. This is a bit of a problem. Because if our goal is to seek a deeper understanding of the world, our general lack of moral diversity here is going to make it harder. Because when people all share values, when people all share morals, they become a team. And once you

engage the psychology of teams, it shuts down open-minded thinking. When the liberal team loses, [United States of Canada / Jesusland] as it did in 2004, and as it almost did in 2000, we comfort ourselves. We try to explain why half of America voted for the other team. We think they must be blinded by religion [Post-election US map : America / Dumbf*ckistan] or by simple stupidity. So if you think that half of America votes Republican because they are blinded in this way, then my message to you is that you ’ re trapped in a moral Matrix, in a particular moral Matrix. And by”the Matrix,”I mean literally the Matrix, like the movie”The Matrix.”But I ’ m here today to give you a choice. You can either take the blue pill and stick to your comforting delusions, or you can take the red pill, learn some moral psychology and step outside the moral Matrix. Now, because I know â I assume that answers my question. I was going to ask which one you picked, but no need. You ’ re all high in **openness** to experience, and it looks like it might even taste good, and you ’ re all epicures. Anyway, let ’ s go with the red pill, study some moral psychology and see where it takes us. Let ’ s start at the beginning : What is morality, where does it come from? The worst idea in all of psychology is the idea that the mind is a blank slate at birth. Developmental psychology has shown that kids come into the world already knowing so much about the physical and social worlds and programmed to make it really easy for them to learn certain things and hard to learn others. The best definition of innateness I ’ ve seen, which clarifies so many things for me, is from the brain scientist Gary Marcus. He says,”The initial organization of the brain does not depend that much on experience. Nature provides a first draft, which experience then revises. ’ Built-in ’ doesn ’ t mean unmalleable ; it means organized in advance of experience.”OK, so what ’ s on the first draft of the moral mind? To find out, my colleague Craig Joseph and I read through the literature on anthropology, on culture variation in morality and also on evolutionary psychology, looking for matches : What sorts of things do people talk about across disciplines that you find across cultures and even species? We found five best matches, which we call the five foundations of morality. The first one is **harm** / care. We ’ re all mammals here, we all have a lot of neural and hormonal programming that makes us really bond with others, care for others, feel compassion for others, especially the weak and vulnerable. It gives us very strong feelings about those who cause **harm**. This moral foundation underlies about 70 percent of the moral statements I ’ ve heard here at TED. The second foundation is **fairness** / reciprocity. There ’ s actually ambiguous evidence as to whether you find reciprocity in other animals, but the evidence for people could not be clearer. This Norman Rockwell painting is called”The Golden Rule”â as we heard from Karen Armstrong, it ’ s the foundation of many religions. That second foundation underlies the other 30 percent of the moral statements I ’ ve heard here at TED. The third foundation is in-group / loyalty. You do find cooperative groups in the animal kingdom, but these groups are always either very small or they ’ re all **siblings**. It ’ s only among humans that you find very large groups of people who are able to cooperate and join together into groups, but in this case, groups that are united to fight other groups. This probably comes from our long history of tribal living, of tribal psychology. And this tribal psychology is so deeply pleasurable that even when we don ’ t have tribes, we go ahead and make them, because it ’ s fun. Sports is to war as pornography is to sex. We get to exercise some ancient drives. The fourth foundation is authority / respect. Here you see submissive gestures from two members of very closely related species. But authority in humans is not so closely based on power and brutality as it is in other primates. It ’ s based on more voluntary deference and even elements of love, at times. The fifth foundation is purity / sanctity. This painting is called”The Allegory Of

Chastity,”but purity is not just about suppressing female **sexuality**. It ’ s about any kind of ideology, any kind of idea that tells you that you can attain virtue by controlling what you do with your body and what you put into your body. And while the political right may moralize sex much more, the political left is doing a lot of it with food. Food is becoming extremely moralized nowadays. A lot of it is ideas about purity, about what you ’ re willing to touch or put into your body. I believe these are the five best candidates for what ’ s written on the first draft of the moral mind. I think this is what we come with, a preparedness to learn all these things. But as my son Max grows up in a liberal college town, how is this first draft going to get revised? And how will it end up being different from a kid born 60 miles south of us, in Lynchburg, Virginia? To think about culture variation, let ’ s try a different metaphor. If there really are five systems at work in the mind, five sources of intuitions and emotions, then we can think of the moral mind as one of those audio equalizers that has five channels, where you can set it to a different setting on every channel. My colleagues Brian Nosek and Jesse Graham and I made a questionnaire, which we put up on the web at www. YourMorals. org. And so far, 30, 000 people have taken this questionnaire, and you can, too. Here are the results from about 23, 000 American citizens. On the left are the scores for liberals ; on the right, conservatives ; in the middle, moderates. The blue line shows people ’ s responses on the average of all the **harm** questions. So as you see, people care about **harm** and care issues. They highly endorse these sorts of statements all across the board, but as you also see, liberals care about it a little more than conservatives ; the line slopes down. Same story for **fairness**. But look at the other three lines. For liberals, the scores are very low. They ’ re basically saying,”This is not morality. In-group, authority, purity â this has nothing to do with morality. I reject it.”But as people get more conservative, the values rise. We can say liberals have a two-channel or two-foundation morality. Conservatives have more of a five- foundation, or five-channel morality. We find this in every country we look at. Here ’ s the data for 1, 100 Canadians. I ’ ll flip through a few other slides. The UK, Australia, New Zealand, Western Europe, Eastern Europe, Latin America, the Middle East, East Asia and South Asia. Notice also that on all of these graphs, the slope is steeper on in- group, authority, purity, which shows that, within any country, the disagreement isn ’ t over **harm** and **fairness**. I mean, we debate over what ’ s fair, but everybody agrees that **harm** and **fairness** matter. Moral arguments within cultures are especially about issues of in-group, authority, purity. This effect is so robust, we find it no matter how we ask the question. In a recent study, we asked people, suppose you ’ re about to get a dog, you picked a particular breed, learned about the breed. Suppose you learn that this particular breed is independent-minded and relates to its owner as a friend and an **equal**. If you ’ re a liberal, you say,”That ’ s great!”because liberals like to say,”Fetch! Please.”But if you ’ re a conservative, that ’ s not so attractive. If you ’ re conservative and learn that a dog ’ s extremely loyal to its home and family and doesn ’ t warm up to strangers, for conservatives, loyalty is good ; dogs ought to be loyal. But to a liberal, it sounds like this dog is running for the Republican nomination. You might say, OK, there are differences between liberals and conservatives, but what makes the three other foundations moral? Aren ’ t they the foundations of xenophobia, authoritarianism and puritanism? What makes them moral? The answer, I think, is contained in this incredible triptych from Hieronymus Bosch,”The Garden of Earthly Delights.”In the first panel, we see the moment of creation. All is ordered, all is beautiful, all the people and animals are doing what they ’ re supposed to be doing, are where they ’ re supposed to be. But then, given the way of the world, things change. We get every person doing whatever he wants, with every aperture of every other person and every other animal. Some of you might recognize this as the ’ 60s. But the ’ 60s inevitably gives way to the ’ 70s, where the cuttings of the apertures hurt a little bit more. Of course, Bosch called this hell. So this triptych, these three panels, portray the timeless truth that order tends to decay. The truth of social entropy. But lest you think this is just some part of the Christian imagination where Christians have this weird problem with pleasure, here ’ s the same story, the same progression, told in a paper that was published in”Nature”a few years ago, in which Ernst Fehr and Simon GĂ¤chter had people play a commons dilemma, a game in which you give people money, and then, on each round of the game, they can put money into a common pot, then the experimenter doubles what ’ s there, and then it ’ s all divided among the players. So it ’ s a nice analog for all sorts of environmental issues, where we ’ re asking people to make a sacrifice and they don ’ t really benefit from their own sacrifice. You really want everybody else to sacrifice, but everybody has a temptation to free ride. What happens is that, at first, people start off reasonably cooperative. This is all played anonymously. On the first round, people give about half of the money that they can. But they quickly see other people aren ’ t doing so much.”I don ’ t want to be a sucker. I won ’ t cooperate.”So cooperation quickly decays from reasonably good down to close to zero. But then â and here ’ s the trick â Fehr and GĂ¤chter, on the seventh round, told people,”You know what? New rule. If you want to give some of your own money to punish people who aren ’ t contributing, you can do that.”And as soon as people heard about the punishment issue going on, cooperation shoots up. It shoots up and it keeps going up. Lots of research shows that to solve cooperative problems, it really helps. It ’ s not enough to appeal to people ’ s good motives. It helps to have some sort of punishment. Even if it ’ s just **shame** or embarrassment or gossip, you need some sort of punishment to bring people, when they ’ re in large groups, to cooperate. There ’ s even some recent research suggesting that religion â priming God, making people think about God â often, in some situations, leads to more cooperative, more pro-social behavior. Some people think that religion is an adaptation evolved both by cultural and biological evolution to make groups to cohere, in part for the purpose of trusting each other and being more effective at competing with other groups. That ’ s probably right, although this is a controversial issue. But I ’ m particularly interested in religion and the origin of religion and in what it does to us and for us, because I think the greatest wonder in the world is not the Grand Canyon. The Grand Canyon is really simple â a lot of rock and a lot of water and wind and a lot of time, and you get the Grand Canyon. It ’ s not that complicated. This is what ’ s complicated : that people lived in places like the Grand Canyon, cooperating with each other, or on the savannahs of Africa or the frozen shores of Alaska. And some of these villages grew into the mighty cities of Babylon and Rome and Tenochtitlan. How did this happen? It ’ s an absolute miracle, much harder to explain than the Grand Canyon. The answer, I think, is that they used every tool in the toolbox. It took all of our moral psychology to create these cooperative groups. Yes, you need to be concerned about **harm**, you need a psychology of justice. But it helps to organize a group if you have subgroups, and if those subgroups have some internal structure, and if you have some ideology that tells people to suppress their carnality â to pursue higher, nobler ends. Now we get to the crux of the disagreement between liberals and conservatives : liberals reject three of these foundations. They say,”Let ’ s **celebrate** diversity, not common in-group membership,”and,”Let ’ s question authority,”and,”Keep your laws off my body.”Liberals have very noble motives for doing this. Traditional authority and morality can be quite repressive and restrictive to those at the bottom, to women, to people who don ’ t fit in. Liberals speak for the weak and oppressed. They want change and justice, even at the risk of chaos. This shirt says,”Stop bitching, start a revolution.”If you ’ re high in **openness** to experience, revolution is good ; it ’ s change, it ’ s fun. Conservatives, on the other hand, speak for institutions and traditions. They want order, even at some cost, to those at the bottom. The great conservative insight is that order is really hard to achieve. It ’ s precious, and it ’ s really easy to lose. So as Edmund Burke said,”The restraints on men, as well as their liberties, are to be reckoned among their rights.”This was after the chaos of the French Revolution. Once you see that liberals and conservatives both have something to contribute, that they form a balance on change versus stability, then I think the way is open to step outside the moral Matrix. This is the great insight that all the Asian religions have attained. Think about yin and yang. Yin and yang aren ’ t enemies ; they don ’ t hate each other. Yin and yang are both necessary, like night and day, for the functioning of the world. You find the same thing in Hinduism. There are many high gods in Hinduism. Two of them are Vishnu, the preserver, and Shiva, the destroyer. This image, actually, is both of those gods sharing the same body. You have the markings of Vishnu on the left, so we could think of Vishnu as the conservative god. You have the markings of Shiva on the right â Shiva ’ s the liberal god. And they work together. You find the same thing in Buddhism. These two stanzas contain, I think, the deepest insights that have ever been attained into moral psychology. From the Zen master SĂngcĂ n :”If you want the truth to stand clear before you, never be ’ for ’ or ’ against. ’ The struggle between ’ for ’ and ’ against ’ is the mind ’ s worst disease.”Unfortunately, it ’ s a disease that has been caught by many of the world ’ s leaders. But before you feel superior to George Bush, before you throw a stone, ask yourself : Do you accept this? Do you accept stepping out of the battle of good and evil? Can you be not for or against anything? So what ’ s the point? What should you do? Well, if you take the greatest insights from ancient Asian philosophies and religions and combine them with the latest research on moral psychology, I think you come to these conclusions : that our righteous minds were designed by evolution to unite us into teams, to divide us against other teams and then to blind us to the truth. So what should you do? Am I telling you to not strive? Am I telling you to embrace SĂngcĂ n and stop, stop with the struggle of for and against? No, absolutely not. I ’ m not saying that. This is an amazing group of people who are doing so much, using so much of their talent, their brilliance, their energy, their money, to make the world a better place, to fight wrongs, to solve problems. But as we learned from Samantha Power in her story about SĂŠrgio Vieira de Mello, you can ’ t just go charging in, saying,”You ’ re wrong, and I ’ m right,”because, as we just heard, everybody thinks they are right. A lot of the problems we have to solve are problems that require us to change other people. And if you want to change other people, a much better way to do it is to first understand who we are â understand our moral psychology, understand that we all think we ’ re right â and then step out, even if it ’ s just for a moment, step out â check in with SĂngcĂ n. Step out of the moral Matrix, just try to see it as a struggle playing out, in which everybody thinks they ’ re right, and even if you disagree with them, everybody has some reasons for what they ’ re doing. Step out. And if you do that, that ’ s the essential move to cultivate moral humility, to get yourself out of this self-righteousness, which is the normal human condition. Think about the Dalai Lama. Think about the **enormous** moral authority of the Dalai Lama. It comes from his moral humility. So I think the point â the point of my talk and, I think, the point of TED â is that this is a group that is passionately engaged in the pursuit of changing the world for the better. People here are passionately engaged in trying to make the world a better place. But there is also a passionate commitment to the truth. And so I think the answer is to use that passionate commitment to the truth to try to turn it into a better future for us all. Thank you.

Well, this is such an honor. And it ’ s wonderful to be in the presence of an organization that is really making a difference in the world. And I ’ m intensely grateful for the opportunity to speak to you today. And I ’ m also rather surprised, because when I look back on my life the last thing I ever wanted to do was write, or be in any way involved in religion. After I left my convent, I ’ d finished with religion, frankly. I thought that was it. And for 13 years I kept clear of it. I wanted to be an English literature professor. And I certainly didn ’ t even want to be a writer, particularly. But then I suffered a series of career catastrophes, one after the other, and finally found myself in television. I said that to Bill Moyers, and he said,”Oh, we take anybody.”And I was doing some rather controversial religious programs. This went down very well in the U. K., where religion is extremely unpopular. And so, for once, for the only time in my life, I was finally in the mainstream. But I got sent to Jerusalem to make a film about early Christianity. And there, for the first time, I encountered the other religious traditions : Judaism and Islam, the sister religions of Christianity. And while I found I knew nothing about these faiths at all — despite my own intensely religious background, I ’ d seen Judaism only as a kind of prelude to Christianity, and I knew nothing about Islam at all. But in that city, that tortured city, where you see the three faiths jostling so uneasily together, you also become aware of the profound connection between them. And it has been the study of other religious traditions that brought me back to a sense of what religion can be, and actually enabled me to look at my own faith in a different light. And I found some astonishing things in the course of my study that had never occurred to me. Frankly, in the days when I thought I ’ d had it with religion, I just found the whole thing absolutely incredible. These doctrines seemed unproven, abstract. And to my astonishment, when I began seriously studying other traditions, I began to realize that belief — which we make such a fuss about today — is only a very recent religious enthusiasm that surfaced only in the West, in about the 17th century. The word”belief”itself originally meant to love, to prize, to hold dear. In the 17th century, it narrowed its focus, for reasons that I ’ m exploring in a book I ’ m writing at the moment, to include — to mean an intellectual assent to a set of propositions, a credo.”I believe :”it did not mean,”I accept certain creedal articles of faith.”It meant :”I commit myself. I engage myself.”Indeed, some of the world traditions think very little of religious orthodoxy. In the Quran, religious opinion — religious orthodoxy — is **dismissed** as”zanna :”self-indulgent guesswork about matters that nobody can be certain of one way or the other, but which makes people quarrelsome and stupidly sectarian. So if religion is not about believing things, what is it about? What I ’ ve found, across the board, is that religion is about behaving differently. Instead of deciding whether or not you believe in God, first you do something. You behave in a committed way, and then you begin to understand the truths of religion. And religious doctrines are meant to be summons to action ; you only understand them when you put them into practice. Now, pride of place in this practice is given to compassion. And it is an arresting fact that right across the board, in every single one of the major world faiths, compassion — the ability to feel with the other in the way we ’ ve been thinking about this evening —

is not only the test of any true religiosity, it is also what will bring us into the presence of what Jews, Christians and Muslims call"God"or the"Divine."It is compassion, says the Buddha, which brings you to Nirvana. Why? Because in compassion, when we feel with the other, we dethrone ourselves from the center of our world and we put another person there. And once we get rid of ego, then we ' re ready to see the Divine. And in particular, every single one of the major world traditions has highlighted — has said — and put at the core of their tradition what ' s become known as the Golden Rule. First propounded by Confucius five centuries before Christ :"Do not do to others what you would not like them to do to you."That, he said, was the central thread which ran through all his teaching and that his disciples should put into practice all day and every day. And it was — the Golden Rule would bring them to the transcendent value that he called"ren,"human-heartedness, which was a transcendent experience in itself. And this is absolutely crucial to the monotheisms, too. There ' s a famous story about the great rabbi, Hillel, the older contemporary of Jesus. A pagan came to him and offered to convert to Judaism if the rabbi could recite the whole of Jewish teaching while he stood on one leg. Hillel stood on one leg and said,"That which is hateful to you, do not do to your neighbor. That is the Torah. The rest is commentary. Go and study it."And"go and study it"was what he meant. He said,"In your exegesis, you must make it clear that every single verse of the Torah is a commentary, a gloss upon the Golden Rule."The great Rabbi Meir said that any interpretation of Scripture which led to **hatred** and disdain, or contempt of other people — any people whatsoever — was illegitimate. Saint Augustine made exactly the same point. Scripture, he says,"teaches nothing but charity, and we must not leave an interpretation of Scripture until we have found a compassionate interpretation of it."And this struggle to find compassion in some of these rather rebarbative texts is a good dress rehearsal for doing the same in ordinary life. But now look at our world. And we are living in a world that is — where religion has been hijacked. Where terrorists cite Quranic verses to justify their atrocities. Where instead of taking Jesus ' words,"Love your enemies. Don ' t judge others,"we have the spectacle of Christians endlessly judging other people, endlessly using Scripture as a way of arguing with other people, putting other people down. Throughout the ages, religion has been used to oppress others, and this is because of human ego, human greed. We have a talent as a species for messing up wonderful things. So the traditions also insisted — and this is an important point, I think — that you could not and must not confine your compassion to your own group : your own nation, your own co-religionists, your own fellow countrymen. You must have what one of the Chinese sages called"jian ai": concern for everybody. Love your enemies. Honor the stranger. We formed you, says the Quran, into tribes and nations so that you may know one another. And this, again — this universal outreach — is getting subdued in the strident use of religion — abuse of religion — for nefarious gains. Now, I ' ve lost count of the number of taxi drivers who, when I say to them what I do for a living, inform me that religion has been the cause of all the major world wars in history. Wrong. The causes of our present woes are political. But, make no mistake about it, religion is a kind of fault line, and when a conflict gets ingrained in a region, religion can get sucked in and become part of the problem. Our modernity has been exceedingly **violent**. Between 1914 and 1945, 70 million people died in Europe alone as a result of **armed** conflict. And so many of our institutions, even football, which used to be a pleasant pastime, now causes riots where people even die. And it ' s not surprising that religion, too, has been affected by this **violent** ethos. There ' s also a great deal, I think, of religious illiteracy around. People seem to think, now equate religious faith with believing things. As though that

— we call religious people often believers, as though that were the main thing that they do. And very often, secondary goals get pushed into the first place, in place of compassion and the Golden Rule. Because the Golden Rule is difficult. I sometimes — when I ’ m speaking to congregations about compassion, I sometimes see a mutinous expression crossing some of their faces because a lot of religious people prefer to be right, rather than compassionate. Now — but that ’ s not the whole story. Since September the 11th, when my work on Islam suddenly propelled me into public life, in a way that I ’ d never imagined, I ’ ve been able to sort of go all over the world, and finding, everywhere I go, a yearning for change. I ’ ve just come back from Pakistan, where literally thousands of people came to my lectures, because they were yearning, first of all, to hear a friendly Western voice. And especially the young people were coming. And were asking me — the young people were saying,”What can we do? What can we do to change things?”And my hosts in Pakistan said,”Look, don ’ t be too polite to us. Tell us where we ’ re going wrong. Let ’ s talk together about where religion is failing.”Because it seems to me that with — our current situation is so serious at the moment that any ideology that doesn ’ t promote a sense of global understanding and global appreciation of each other is failing the test of the time. And religion, with its wide following... Here in the United States, people may be being religious in a different way, as a report has just shown — but they still want to be religious. It ’ s only Western Europe that has retained its secularism, which is now beginning to look rather endearingly old-fashioned. But people want to be religious, and religion should be made to be a force for harmony in the world, which it can and should be — because of the Golden Rule.”Do not do to others what you would not have them do to you”: an ethos that should now be applied globally. We should not treat other nations as we would not wish to be treated ourselves. And these — whatever our wretched beliefs — is a religious matter, it ’ s a spiritual matter. It ’ s a profound moral matter that engages and should engage us all. And as I say, there is a hunger for change out there. Here in the United States, I think you see it in this election campaign : a longing for change. And people in churches all over and **mosques** all over this continent after September the 11th, coming together locally to create networks of understanding. With the **mosque**, with the synagogue, saying,”We must start to speak to one another.”I think it ’ s time that we moved beyond the idea of toleration and move toward appreciation of the other. I ’ d — there ’ s one story I ’ d just like to mention. This comes from”The Iliad.”But it tells you what this spirituality should be. You know the story of”The Iliad,”the 10-year war between Greece and Troy. In one incident, Achilles, the famous warrior of Greece, takes his troops out of the war, and the whole war effort suffers. And in the course of the ensuing muddle, his beloved friend, Patroclus, is killed — and killed in single combat by one of the Trojan princes, Hector. And Achilles goes mad with **grief** and rage and revenge, and he mutilates the body. He kills Hector, he mutilates his body and then he refuses to give the body back for burial to the family, which means that, in Greek ethos, Hector ’ s soul will wander eternally, lost. And then one night, Priam, king of Troy, an old man, comes into the Greek camp incognito, makes his way to Achilles ’ tent to ask for the body of his son. And everybody is shocked when the old man takes off his head covering and shows himself. And Achilles looks at him and thinks of his father. And he starts to weep. And Priam looks at the man who has murdered so many of his sons, and he, too, starts to weep. And the sound of their weeping filled the house. The Greeks believed that weeping together created a bond between people. And then Achilles takes the body of Hector, he hands it very tenderly to the father, and the two men look at each other, and see each other as divine. That is the ethos found, too, in all the religions. It ’ s what is meant by overcoming the horror that we feel when we are under threat of our enemies, and beginning to appreciate the other. It ’ s of great importance that the word for”holy”in Hebrew, applied to God, is”Kadosh”: separate, other. And it is often, perhaps, the very otherness of our enemies which can give us intimations of that utterly mysterious transcendence which is God. And now, here ’ s my wish : I wish that you would help with the creation, launch and propagation of a Charter for Compassion, crafted by a group of inspirational thinkers from the three Abrahamic traditions of Judaism, Christianity and Islam, and based on the fundamental principle of the Golden Rule. We need to create a movement among all these people that I meet in my travels — you probably meet, too — who want to join up, in some way, and reclaim their faith, which they feel, as I say, has been hijacked. We need to empower people to remember the compassionate ethos, and to give guidelines. This Charter would not be a massive document. I ’ d like to see it — to give guidelines as to how to interpret the Scriptures, these texts that are being abused. Remember what the rabbis and what Augustine said about how Scripture should be governed by the principle of charity. Let ’ s get back to that. And the idea, too, of Jews, Christians and Muslims — these traditions now so often at loggerheads — working together to create a document which we hope will be signed by a thousand, at least, of major religious leaders from all the traditions of the world. And you are the people. I ’ m just a solitary scholar. Despite the idea that I love a good time, which I was rather amazed to see coming up on me — I actually spend a great deal of time alone, studying, and I ’ m not very — you ’ re the people with media knowledge to explain to me how we can get this to everybody, everybody on the planet. I ’ ve had some preliminary talks, and Archbishop Desmond Tutu, for example, is very happy to give his name to this, as is Imam Feisal Rauf, the Imam in New York City. Also, I would be working with the Alliance of Civilizations at the United Nations. I was part of that United Nations **initiative** called the Alliance of Civilizations, which was asked by Kofi Annan to diagnose the causes of extremism, and to give practical guidelines to member states about how to avoid the escalation of further extremism. And the Alliance has told me that they are very happy to work with it. The importance of this is that this is — I can see some of you starting to look worried, because you think it ’ s a slow and cumbersome body — but what the United Nations can do is give us some neutrality, so that this isn ’ t seen as a Western or a Christian **initiative**, but that it ’ s coming, as it were, from the United Nations, from the world — who would help with the sort of bureaucracy of this. And so I do urge you to join me in making — in this **charter** — to building this **charter**, launching it and propagating it so that it becomes — I ’ d like to see it in every college, every church, every **mosque**, every synagogue in the world, so that people can look at their tradition, reclaim it, and make religion a source of peace in the world, which it can and should be. Thank you very much.

I ’ m going to go right into the slides. And all I ’ m going to try and prove to you with these slides is that I do just very straight stuff. And my ideas are â in my head, anyway â they ’ re very logical and relate to what ’ s going on and problem solving for clients. I either convince clients at the end that I solve their problems, or I really do solve their problems, because usually they seem to like it. Let me go right into the slides. Can you turn off the light? Down. I like to be in the dark. I don ’ t want you to see what I ’ m doing up here. Anyway, I did this house in Santa Monica, and it got a lot of notoriety. In fact, it appeared in a porno comic book, which is the slide on the right. This is in Venice. I just show it because I want you to know I ’ m concerned about context. On the left-hand side, I had the context of those little houses, and I tried to build a building that fit into that context. When people take pictures of these buildings out of that context they look really weird, and my premise is that they make a lot more sense when they ’ re photographed or seen in that space. And then, once I deal with the context, I then try to make a place that ’ s comfortable and private and fairly serene, as I hope you ’ ll find that slide on the right. And then I did a law school for Loyola in downtown L. A. I was concerned about making a place for the study of law. And we continue to work with this client. The building on the right at the top is now under construction. The garage on the right â the gray structure â will be torn down, finally, and several small classrooms will be placed along this avenue that we ’ ve created, this campus. And it all related to the clients and the students from the very first meeting saying they felt denied a place. They wanted a sense of place. And so the whole idea here was to create that kind of space in downtown, in a **neighborhood** that was difficult to fit into. And it was my theory, or my point of view, that one didn ’ t upstage the **neighborhood** â one made accommodations. I tried to be inclusive, to include the buildings in the **neighborhood**, whether they were buildings I liked or not. In the ’ 60s I started working with paper furniture and made a bunch of stuff that was very successful in Bloomingdale ’ s. We even made flooring, walls and everything, out of cardboard. And the success of it threw me for a loop. I couldn ’ t deal with the success of furniture â I wasn ’ t secure enough as an architect â and so I closed it all up and made furniture that nobody would like. So, nobody would like this. And it was in this, preliminary to these pieces of furniture, that Ricky and I worked on furniture by the slice. And after we failed, I just kept failing. The piece on the left â and that ultimately led to the piece on the right â happened when the kid that was working on this took one of those long strings of stuff and folded it up to put it in the wastebasket. And I put a piece of tape around it, as you see there, and realized you could sit on it, and it had a lot of resilience and strength and so on. So, it was an accidental discovery. I got into fish. I mean, the story I tell is that I got mad at postmodernism â at po-mo â and said that fish were 500 million years earlier than man, and if you ’ re going to go back, we might as well go back to the beginning. And so I started making these funny things. And they started to have a life of their own and got bigger â as the one glass at the Walker. And then, I sliced off the head and the tail and everything and tried to translate what I was learning about the form of the fish and the movement. And a lot of my architectural ideas that came from it â accidental, again â it was an intuitive kind of thing, and I just kept going with it, and made this proposal for a building, which was only a proposal. I did this building in Japan. I was taken out to dinner after the contract for this little restaurant was signed. And I love sake and Kobe and all that stuff. And after I got â I was really drunk â I was asked to do some sketches on napkins. And I made some sketches on napkins â little boxes and Morandi-like things that I used to do. And the client said,”Why no fish?”And so I made a drawing with a fish, and I left Japan. Three weeks later, I received a complete set of drawings saying we ’ d won the competition. Now, it ’ s hard to do. It ’ s hard to translate a fish form, because they ’ re so beautiful â perfect â into a building or object like this. And Oldenburg, who I work with a little once in a while, told me I couldn ’ t do it, and so that made it even more exciting. But he was right â I couldn ’ t do the tail. I started to get the head OK, but the tail I couldn ’ t do. It was pretty hard. The thing on the right is a snake form, a ziggurat. And I put them together, and you walk between them. It was a dialog with the context again.

Now, if you saw a picture of this as it was published in Architectural Record â they didn ’ t show the context, so you would think,”God, what a pushy guy this is.”But a friend of mine spent four hours wandering around here looking for this restaurant. Couldn ’ t find it. So... As for craft and technology and all those things that you ’ ve all been talking about, I was thrown for a complete loop. This was built in six months. The way we sent drawings to Japan : we used the magic computer in Michigan that does carved models, and we used to make foam models, which that thing scanned. We made the drawings of the fish and the scales. And when I got there, everything was perfect â except the tail. So, I decided to cut off the head and the tail. And I made the object on the left for my show at the Walker. And it ’ s one of the nicest pieces I ’ ve ever made, I think. And then Jay Chiat, a friend and client, asked me to do his headquarters building in L. A. For reasons we don ’ t want to talk about, it got delayed. Toxic waste, I guess, is the key clue to that one. And so we built a temporary building â I ’ m getting good at temporary â and we put a conference room in that ’ s a fish. And, finally, Jay dragged me to my hometown, Toronto, Canada. And there is a story â it ’ s a real story â about my grandmother buying a carp on Thursday, bringing it home, putting it in the bathtub when I was a kid. I played with it in the evening. When I went to sleep, the next day it wasn ’ t there. And the next night, we had gefilte fish. And so I set up this interior for Jay ’ s offices and I made a pedestal for a sculpture. And he didn ’ t buy a sculpture, so I made one. I went around Toronto and found a bathtub like my grandmother ’ s, and I put the fish in. It was a joke. I play with funny people like [Claes] Oldenburg. We ’ ve been friends for a long time. And we ’ ve started to work on things. A few years ago, we did a performance piece in Venice, Italy, called”Il Corso del Coltello”â the Swiss Army knife. And most of the imagery is â Claes ’, but those two little boys are my sons, and they were Claes ’ assistants in the play. He was the Swiss Army knife. He was a souvenir salesman who always wanted to be a painter, and I was Frankie P. Toronto. P for Palladio. Dressed up like the AT&T building by Claes â with a fish hat. The highlight of the performance was at the end. This beautiful object, the Swiss Army knife, which I get credit for participating in. And I can tell you â it ’ s totally an Oldenburg. I had nothing to do with it. The only thing I did was, I made it possible for them to turn those blades so you could sail this thing in the canal, because I love sailing. We made it into a sailing craft. I ’ ve been known to mess with things like chain link fencing. I do it because it ’ s a curious thing in the culture, when things are made in such great quantities, absorbed in such great quantities, and there ’ s so much denial about them. People hate it. And I ’ m fascinated with that, which, like the paper furniture â it ’ s one of those materials. And I ’ m always drawn to that. And so I did a lot of dirty things with chain link, which nobody will forgive me for. But Claes made homage to it in the Loyola Law School. And that chain link is really expensive. It ’ s in perspective and everything. And then we did a camp together for children with cancer. And you can see, we started making a building together. Of course, the milk can is his. But we were trying to collide our ideas, to put objects next to each other. Like a Morandi â like the little bottles â composing them like a still life. And it seemed to work as a way to put he and I together. Then Jay Chiat asked me to do this building on this funny lot in Venice, and I started with this three-piece thing, and you entered in the middle. And Jay asked me what I was going to do with the piece in the middle. And he pushed that. And one day I had a â oh, well, the other way. I had the binoculars from Claes, and I put them there, and I could never get rid of them after that. Oldenburg made the binoculars incredible when he sent me the first model of the real proposal. It made my building look sick. And it was this interaction between that kind of, up-the-ante stuff that became pretty interesting. It led to the building on the left. And I still think the Time magazine picture will be of the binoculars, you know, leaving out the â what the hell. I use a lot of metal in my work, and I have a hard time connecting with the craft. The whole thing about my house, the whole use of rough carpentry and everything, was the frustration with the crafts available. I said,"If I can ' t get the craft that I want, I ' ll use the craft I can get."There were plenty of models for that, in Rauschenberg and Jasper Johns, and many artists who were making beautiful art and sculpture with junk materials. I went into the metal because it was a way of building a building that was a sculpture. And it was all of one material, and the metal could go on the roof as well as the walls. The metalworkers, for the most part, do ducts behind the ceilings and stuff. I was given an opportunity to design an exhibit for the metalworkers ' unions of America and Canada in Washington, and I did it on the condition that they become my partners in the future and help me with all future metal buildings, etc. etc. And it ' s working very well to have these people, these craftsmen, interested in it. I just tell the stories. It ' s a way of connecting, at least, with some of those people that are so important to the realization of architecture. The metal continued into a building â Herman Miller, in Sacramento. And it ' s just a complex of factory buildings. And Herman Miller has this philosophy of having a place â a people place. I mean, it ' s kind of a trite thing to say, but it is real that they wanted to have a central place where the cafeteria would be, where the people would come and where the people working would interact. So it ' s out in the middle of nowhere, and you approach it. It ' s copper and galvanize. I used the galvanize and copper in a very light gauge, so it would buckle. I spent a lot of time undoing Richard Meier ' s aesthetic. Everybody ' s trying to get the panels perfect, and I always try to get them sloppy and fuzzy. And they end up looking like stone. This is the central area. There ' s a ramp. And that little dome in there is a building by Stanley Tigerman. Stanley was instrumental in my getting this job. And when I was awarded the contract I, at the very beginning, asked the client if they would let Stanley do a cameo piece with me. Because these were ideas that we were talking about, building things next to each other, making â it ' s all about [a] metaphor for a city, maybe. And so Stanley did the little dome thing. And we did it over the phone and by fax. He would send me a fax and show me something. He ' d made a building with a dome and he had a little tower. I told him,"No, no, that ' s too ongepotchket. I don ' t want the tower."So he came back with a simpler building, but he put some funny details on it, and he moved it closer to my building. And so I decided to put him in a depression. I put him in a hole and made a kind of a hole that he sits in. And so then he put two bridges â this all happened on the fax, going back and forth over a couple of weeks ' period. And he put these two bridges with pink guardrails on it. And so then I put this big billboard behind it. And I call it,"David and Goliath."And that ' s my cafeteria. In Boston, we had that old building on the left. It was a very prominent building off the freeway, and we added a floor and cleaned it up and fixed it up and used the kind of â I thought â the language of the **neighborhood**, which had these cornices, projecting cornices. Mine got a little exuberant, but I used lead copper, which is a beautiful material, and it turns green in 100 years. Instead of, like, copper in 10 or 15. We redid the side of the building and re-proportioned the windows so it sort of fit into the space. And it surprised both Boston and myself that we got it approved, because they have very strict kind of design guideline, and they wouldn ' t normally think I would fit them. The detailing was very careful with the lead copper and making panels and fitting it tightly into the fabric of the existing building. In Barcelona, on Las Ramblas for some film festival, I did the Hollywood sign going and coming, made a building out of it, and they built it. I flew in one night and took this picture. But they made it a third smaller than my model without telling me. And then more metal and some chain link in Santa Monica â a little shopping center. And this is a laser laboratory at the University of Iowa, in which the fish comes back as an abstraction in the back. It ’ s the support labs, which, by some coincidence, required no windows. And the shape fit perfectly. I just joined the points. In the curved part there ’ s all the mechanical equipment. That solid wall behind it is a pipe chase â a pipe canyon â and so it was an opportunity that I seized, because I didn ’ t have to have any protruding ducts or vents or things in this form. It gave me an opportunity to make a sculpture out of it. This is a small house somewhere. They ’ ve been building it so long I don ’ t remember where it is. It ’ s in the West Valley. And we started with the stream and built the house along the stream â dammed it up to make a lake. These are the models. The reality, with the lake â the workmanship is pretty bad. And it reminded me why I play defensively in things like my house. When you have to do something really cheaply, it ’ s hard to get perfect corners and stuff. That big metal thing is a passage, and in it is â you go downstairs into the living room and then down into the bedroom, which is on the right. It ’ s kind of like a whole built town. I was asked to do a hospital for schizophrenic adolescents at Yale. I thought it was fitting for me to be doing that. This is a house next to a Philip Johnson house in Minnesota. The owners had a dilemma â they asked Philip to do it. He was too busy. He didn ’ t recommend me, by the way. We ended up having to make it a sculpture, because the dilemma was, how do you build a building that doesn ’ t look like the language? Is it going to look like this beautiful estate is sub-divided? Etc. etc. You ’ ve got the idea. And so we finally ended up making it. These people are art collectors. And we finally made it so it appears very sculptural from the main house and all the windows are on the other side. And the building is very sculptural as you walk around it. It ’ s made of metal and the brown stuff is Fin-Ply â it ’ s that formed lumber from Finland. We used it at Loyola on the chapel, and it didn ’ t work. I keep trying to make it work. In this case we learned how to detail it. In Cleveland, there ’ s Burnham Mall, on the left. It ’ s never been finished. Going out to the lake, you can see all those new buildings we built. And we had the opportunity to build a building on this site. There ’ s a railroad track. This is the city hall over here somewhere, and the courthouse. And the centerline of the mall goes out. Burnham had designed a railroad station that was never built, and so we followed. Sohio is on the axis here, and we followed the axis, and they ’ re two kind of goalposts. And this is our building, which is a corporate headquarters for an insurance company. We collaborated with Oldenburg and put the newspaper on top, folded. The health club is fastened to the garage with a C-clamp, for Cleveland. You drive down. So it ’ s about a 10-story C-clamp. And all this stuff at the bottom is a museum, and an idea for a very fancy automobile entry. This owner has a pet peeve about bad automobile entries. And this would be a hotel. So, the centerline of this thing â we ’ d preserve it, and it would start to work with the scale of the new buildings by Pelli and Kohn Pederson Fox, etc., that are underway. It ’ s hard to do high-rise. I feel much more comfortable down here. This is a piece of property in Brentwood. And a long time ago, about ’ 82 or something, after my house â I designed a house for myself that would be a village of several pavilions around a courtyard â and the owner of this lot worked for me and built that actual model on the left. And she came back, I guess wealthier or something â something happened â and asked me to design a house for her on this site. And following that basic idea of the village, we changed it as we got into it. I locked the house into the site by cutting the back end â here you see on the photographs of the site â slicing into it and putting all the bathrooms and dressing rooms like a retaining wall, creating a lower level zone for the master bedroom, which I designed like a kind of a barge, looking like a boat. And that ’ s it, built. The dome was a request from the client. She wanted a dome somewhere in the house. She didn ’ t care where. When you sleep in this bedroom, I hope â I mean, I haven ’ t slept in it yet. I ’ ve offered to marry her so I could sleep there, but she said I didn ’ t have to do that. But when you ’ re in that room, you feel like you ’ re on a kind of barge on some kind of lake. And it ’ s very private. The landscape is being built around to create a private garden. And then up above there ’ s a garden on this side of the living room, and one on the other side. These aren ’ t focused very well. I don ’ t know how to do it from here. Focus the one on the right. It ’ s up there. Left â it ’ s my right. Anyway, you enter into a garden with a beautiful grove of trees. That ’ s the living room. Servants ’ quarters. A guest bedroom, which has this dome with marble on it. And then you enter into the living room and then so on. This is the bedroom. You come down from this level along the stairway, and you enter the bedroom here, going into the lake. And the bed is back in this space, with windows looking out onto the lake. These Stonehenge things were designed to give foreground and to create a greater depth in this shallow lot. The material is lead copper, like in the building in Boston. And so it was an intent to make this small piece of land â it ’ s 100 by 250 â into a kind of an estate by separating these areas and making the living room and dining room into this pavilion with a high space in it. And this happened by accident that I got this right on axis with the dining room table. It looks like I got a Baldessari painting for free. But the idea is, the windows are all placed so you see pieces of the house outside. Eventually this will be screened â these trees will come up â and it will be very private. And you feel like you ’ re in your own kind of village. This is for Michael Eisner â Disney. We ’ re doing some work for him. And this is in Anaheim, California, and it ’ s a freeway building. You go under this bridge at about 65 miles an hour, and there ’ s another bridge here. And you ’ re through this room in a split second, and the building will sort of reflect that. On the backside, it ’ s much more humane â entrance, dining hall, etc. And then this thing here â I ’ m hoping as you drive by you ’ ll hear the picket fence effect of the sound hitting it. Kind of a fun thing to do. I ’ m doing a building in Switzerland, Basel, which is an office building for a furniture company. And we struggled with the image. These are the early studies, but they have to sell furniture to normal people, so if I did the building and it was too fancy, then people might say,”Well, the furniture looks OK in his thing, but no, it ain ’ t going to look good in my normal building.”So we ’ ve made a kind of pragmatic slab in the second phase here, and we ’ ve taken the conference facilities and made a villa out of them so that the communal space is very sculptural and separate. And you ’ re looking at it from the offices and you create a kind of interaction between these pieces. This is in Paris, along the Seine. Palais des Sports, the Gare de Lyon over here. The Minister of Finance â the guy that moved from the Louvre â goes in here. There ’ s a new library across the river. And back in here, in this already treed park, we ’ re doing a very dense building called the American Center, which has a theater, apartments, dance school, an art museum, restaurants and all kinds of â it ’ s a very dense program â bookstores, etc. In a very tight, small â this is the ground level. And the French have this extraordinary way of screwing things up by taking a beautiful site and cutting the corner off. They call it the plan coupe. And I struggled with that thing â how to get around the corner. These are the models for it. I showed you the other model, the one â this is the way I organized myself so I could make the drawing â so I understood the problem. I was trying to get around this plan coupe â how do you do it? Apartments, etc. And these are the kind of study models we did. And the one on the left is pretty awful. You can see why I was ready to commit suicide when this one was built. But out of it came finally this resolution, where the elevator piece worked frontally to this, parallel to this **street**, and also parallel to here. And then this kind of twist, with this balcony and the skirt, kind of like a ballerina lifting her skirt to let you into the foyer. The restaurants here â the apartments and the theater, etc. So it would all be built in stone, in French limestone, except for this metal piece. And it faces into a park. And the idea was to make this express the energy of this. On the side facing the **street** it ’ s much more normal, except I slipped a few mansards down, so that coming on the point, these housing units made a gesture to the corner. And this will be some kind of high-tech billboard. If any of you guys have any ideas for it, please contact me. I don ’ t know what to do. Jay Chiat is a glutton for punishment, and he hired me to do a house for him in the Hamptons. And it ’ s got a fish. And I keep thinking,”This is going to be the last fish.”It ’ s like a drug addict. I say,”I ’ m not going to do it anymore â I don ’ t want to do it anymore â I ’ m not going to do it.”And then I do it. There it is. But it ’ s the living room. And this piece here is â I don ’ t know what it is. I just added it so that we ’ d have enough money in the budget so we could take something out. This is Euro Disney, and I ’ ve worked with all of the guys that presented to you earlier. We ’ ve had a lot of fun working together. I think I ’ m from Mars for them, and they are for me, but somehow we all manage to work together, and I think, productively. So far. This is a shopping thing. You come into the Magic Kingdom and the hotel that Tony Baxter ’ s group is doing out here. And then this is a kind of a shopping mall, with a rodeo and restaurants. And another restaurant. What I did â because of the Paris skies being quite dull, I made a light grid that ’ s perpendicular to the train station, to the route of the train. It looks like it ’ s kind of been there, and then crashed all these simpler forms into it. The light grid will have a light, be lit up at night and give a kind of light ceiling. In Switzerland â Germany, actually â on the Rhine across from Basel, we did a furniture factory and a furniture museum. And I tried to â there ’ s a Nick Grimshaw building over here, there ’ s an Oldenburg sculpture over here â I tried to make a relationship urbanistically. And I don ’ t gave good slides to show â it ’ s just been completed â but this piece here is this building, and these pieces here and here. And as you pass by it ’ s always part â you see it as all of these pieces accrue and become part of an overall **neighborhood**. It ’ s plaster and just zinc. And you wonder, if this is a museum, what it ’ s going to be like inside? If it ’ s going to be so busy and crazy that you wouldn ’ t show anything, and just wait. I ’ m so cunning and clever â I made it quiet and wonderful. But on the outside it does scream out at you a bit. It ’ s actually basically three square rooms with a couple of skylights and stuff. And from the building in the back, you see it as an iceberg floating by in the hills. I know I ’ m over time. See, that skylight goes down and becomes that one. So it ’ s pretty quiet inside. This is the Disney Hall â the concert hall. It ’ s a complicated project. It has a chamber hall. It ’ s related to an existing Chandler Pavilion that was built with a lot of love and tears and caring. And it ’ s not a great building, but I approached it optimistically, that we would make a compositional relationship between us that would strengthen both of us. And the plan of this â it ’ s a concert hall. This is the foyer, which is kind of a garden structure. There ’ s commercial at the ground floor. These are offices, which, really, in the competition, we didn ’ t have to design. But finally, there ’ s a hotel there. These were the kind of relationships made to the Chandler, composing these elevations together and relating them to the buildings that existed â to MOCA, etc. The acoustician in the competition gave us criteria, which led to this compartmentalized scheme, which we found out after the competition would not work at all. But everybody liked these forms and liked the space, and so that ’ s one of the problems of a competition. You have to then try and get that back in some way. And we studied many models. This was our original model. These were the three buildings that were the ideal â the Concertgebouw, Boston and Berlin. Everybody liked the surround. Actually, this is the smallest hall in size, and it has more seats than any of these because it has double balconies. Our client doesn ’ t want balconies, so â and when we met our new acoustician, he told us this was the right shape or this was the right shape. And we tried many shapes, trying to get the energy of the original design within an acoustical, acceptable format. We finally settled on a shape that was the proportion of the Concertgebouw with the sloping outside walls, which the acoustician said were crucial to this and later decided they weren ’ t, but now we have them. And our idea is to make the seating carriage very sculptural and out of wood and like a big boat sitting in this plaster room. That ’ s the idea. And the corners would have skylights and these columns would be structural. And the nice thing about introducing columns is they give you a kind of sense of proscenium from wherever you sit, and create intimacy. Now, this is not a final design â these are just on the way to being â and so I wouldn ’ t take it literally, except the feeling of the space. We studied the acoustics with laser stuff, and they bounce them off this and see where it all works. But you get the sense of the hall in section. Most halls come straight down into a proscenium. In this case we ’ re opening it back up and getting skylights in the four corners. And so it will be quite a different shape. The original building, because it was frog-like, fit nicely on the site and cranked itself well. When you get into a box, it ’ s harder to do it â and here we are, struggling with how to put the hotel in. And this is a teapot I designed for Alessi. I just stuck it on there. But this is how I do work. I do take pieces and bits and look at it and struggle with it and cut it away. And of course it ’ s not going to look like that, but it is the crazy way I tend to work. And then finally, in L. A. I was asked to do a sculpture at the foot of Interstate Bank Tower, the highest building in L. A. Larry Halprin is doing the stairs. And I was asked to do a fish, and so I did a snake. It ’ s a public space, and I made it kind of a garden structure, and you can go in it. It ’ s a kiva, and Larry ’ s putting some water in there, and it works much better than a fish. In Barcelona I was asked to do a fish, and we ’ re working on that, at the foot of a Ritz-Carlton Tower being done by Skidmore, Owings and Merrill. And the Ritz-Carlton Tower is being designed with exposed steel, non-fire proof, much like those old gas tanks. And so we took the language of this exposed steel and used it, perverted it, into the form of the fish, and created a kind of a 19th- century contraption that looks like, that will sit â this is the beach and the harbor out in front, and this is really a shopping center with department stores. And we split these bridges. Originally, this was all solid with a hole in it. We cut them loose and made several bridges and created a kind of a foreground for this hotel. We showed this to the hotel people the other day, and they were terrified and said that nobody would come to the Ritz-Carlton anymore, because of this fish. And finally, I just threw these in â Lou Danziger. I didn ’ t expect Lou Danziger to be here, but this is a building I did for him in 1964, I think. A little studio â and it ’ s sadly for sale. Time goes on. And this is my son working with me on a small fast-food thing. He designed the robot as the cashier, and the head moves, and I did the rest of it. And the food wasn ’ t as good as the stuff, and so it failed. It should have been the other way around â the food should have been good first. It didn ’ t work. Thank you very much.

Text Sample 403: POS Dim 3 – 2006 – Score 8.00 – 2006/t000499.txt

If you ’ re here today â and I ’ m very happy that you are â you ’ ve all heard about how sustainable development will save us from ourselves. However, when we ’ re not at TED, we are often told that a real sustainability policy agenda is just not feasible, especially in large urban areas like New York City. And that ’ s because most people with decision-making powers, in both the public and the private sector, really don ’ t feel as though they ’ re in danger. The reason why I ’ m here today, in part, is because of a dog â an abandoned puppy I found back in the rain, back in 1998. She turned out to be a much bigger dog than I ’ d anticipated. When she came into my life, we were fighting against a huge waste facility planned for the East River waterfront despite the fact that our small part of New York City already handled more than 40 percent of the entire city ’ s commercial waste : a sewage treatment pelletizing plant, a sewage sludge plant, four power plants, the world ’ s largest food-distribution center, as well as other industries that bring more than 60, 000 diesel truck trips to the area each week. The area also has one of the lowest ratios of parks to people in the city. So when I was contacted by the Parks Department about a $10, 000 seed-grant **initiative** to help develop waterfront projects, I thought they were really well-meaning, but a bit naive. I ’ d lived in this area all my life, and you could not get to the river, because of all the lovely facilities that I mentioned earlier. Then, while jogging with my dog one morning, she pulled me into what I thought was just another illegal dump. There were weeds and piles of garbage and other stuff that I won ’ t mention here, but she kept dragging me, and lo and behold, at the end of that lot was the river. I knew that this forgotten little street-end, abandoned like the dog that brought me there, was worth saving. And I knew it would grow to become the proud beginnings of the community-led revitalization of the new South Bronx. And just like my new dog, it was an idea that got bigger than I ’ d imagined. We garnered much support along the way, and the Hunts Point Riverside Park became the first waterfront park that the South Bronx had had in more than 60 years. We leveraged that $10, 000 seed grant more than 300 times, into a $3 million park. And in the fall, I ’ m going to exchange marriage vows with my beloved. Thank you very much. That ’ s him pressing my buttons back there, which he does all the time. But those of us living in environmental justice communities are the canary in the coal mine. We feel the problems right now, and have for some time. Environmental justice, for those of you who may not be familiar with the term, goes something like this : no community should be saddled with more environmental burdens and less environmental benefits than any other. Unfortunately, race and class are extremely reliable indicators as to where one might find the good stuff, like parks and trees, and where one might find the bad stuff, like power plants and waste facilities. As a black person in America, I am twice as likely as a white person to live in an area where air pollution poses the greatest risk to my health. I am five times more likely to live within walking distance of a power plant or chemical facility, which I do. These land-use decisions created the hostile conditions that lead to problems like obesity, diabetes and asthma. Why would someone leave their home to go for a brisk walk in a toxic **neighborhood**? Our 27 percent obesity rate is high even for this country, and diabetes comes with it. One out of four South Bronx children has asthma. Our asthma hospitalization rate is seven times higher than the national average. These impacts are coming everyone ’ s way. And we all pay dearly for solid waste costs, health problems associated with pollution and more odiously, the cost of imprisoning our young black and Latino men, who possess untold amounts of untapped potential. Fifty percent of our residents live at or below the poverty line ; 25 percent of us are unemployed. Low-income citizens often use emergency-room visits as primary care. This comes at a high cost to taxpayers and produces no proportional benefits. Poor people are not only still poor, they are still unhealthy. Fortunately, there are many people like me who are striving for solutions that won ’ t compromise the lives of low-income communities of color in the short term, and won ’ t destroy us all in the long term. None of us want that, and we all have that in common. So what else do we have in common? Well, first of all, we ’ re all incredibly good-looking. Graduated high school, college, post-graduate degrees, traveled to interesting places, didn ’ t have kids in your early **teens**, financially stable, never been imprisoned. OK. Good. But, besides being a black woman, I am different from most of you in some other ways. I watched nearly half of the buildings in my **neighborhood** burn down. My big brother Lenny fought in Vietnam, only to be gunned down a few blocks from our home. Jesus. I grew up with a crack house across the **street**. Yeah, I ’ m a poor black child from the ghetto. These things make me different from you. But the things we have in common set me apart from most of the people in my community, and I am in between these two worlds with enough of my heart to fight for justice in the other. So how did things get so different for us? In the late ’ 40s, my dad â a Pullman porter, son of a slave â bought a house in the Hunts Point section of the South Bronx, and a few years later, he married my mom. At the time, the community was a mostly white, working-class **neighborhood**. My dad was not alone. And as others like him pursued their own version of the American dream, white flight became common in the South Bronx and in many cities around the country. Red-lining was used by banks, wherein certain sections of the city, including ours, were **deemed** off-limits to any sort of investment. Many landlords believed it was more profitable to torch their buildings and collect insurance money rather than to sell under those conditions â dead or injured former tenants notwithstanding. Hunts Point was formerly a walk-to-work community, but now residents had neither work nor home to walk to. A national highway construction boom was added to our problems. In New York State, Robert Moses spearheaded an aggressive highway-expansion campaign. One of its primary goals was to make it easier for residents of wealthy communities in Westchester County to go to Manhattan. The South Bronx, which lies in between, did not stand a chance. Residents were often given less than a month ’ s notice before their buildings were razed. 600, 000 people were displaced. The common perception was that only pimps and pushers and prostitutes were from the South Bronx. And if you are told from your earliest days that nothing good is going to come from your community, that it ’ s bad and ugly, how could it not reflect on you? So now, my family ’ s property was worthless, save for that it was our home, and all we had. And luckily for me, that home and the love inside of it, along with help from teachers, mentors and friends along the way, was enough. Now, why is this story important? Because from a planning perspective, economic degradation begets environmental degradation, which begets social degradation. The disinvestment that began in the 1960s set the stage for all the environmental injustices that were to come. Antiquated zoning and land-use regulations are still used to this day to continue putting polluting facilities in my **neighborhood**. Are these factors taken into consideration when land-use policy is decided? What costs are associated with these decisions? And who pays? Who profits? Does anything justify what the local community goes through? This was”planning”â in quotes â that did not have our best interests in mind. Once we realized that, we decided it was time to do our own planning. That small park I told you about earlier was the first stage of building a Greenway movement in the

South Bronx. I wrote a one-and-a-quarter-million dollar federal transportation grant to design the plan for a waterfront esplanade with dedicated on-street bike paths. Physical improvements help inform public policy regarding traffic **safety**, the placement of the waste and other facilities, which, if done properly, don ’ t compromise a community ’ s quality of life. They provide opportunities to be more physically active, as well as local economic development. Think bike shops, juice stands. We secured 20 million dollars to build first-phase projects. This is Lafayette Avenue â and that ’ s redesigned by Mathews Nielsen Landscape Architects. And once this path is constructed, it ’ ll connect the South Bronx with more than 400 acres of Randall ’ s Island Park. Right now we ’ re separated by about 25 feet of water, but this link will change that. As we nurture the natural environment, its abundance will give us back even more. We run a project called the Bronx [Environmental] Stewardship Training, which provides job training in the fields of ecological restoration, so that folks from our community have the skills to compete for these well-paying jobs. Little by little, we ’ re seeding the area with green-collar jobs â and with people that have both a financial and personal stake in their environment. The Sheridan Expressway is an underutilized relic of the Robert Moses era, built with no regard for the **neighborhoods** that were divided by it. Even during rush hour, it goes virtually unused. The community created an alternative transportation plan that allows for the removal of the highway. We have the opportunity now to bring together all the stakeholders to re-envision how this 28 acres can be better utilized for parkland, affordable housing and local economic development. We also built New York City ’ s first green and cool roof demonstration project on top of our offices. Cool roofs are highly-reflective surfaces that don ’ t absorb solar heat, and pass it on to the building or atmosphere. Green roofs are soil and living plants. Both can be used instead of petroleum-based roofing materials that absorb heat, contribute to urban”heat island”effect and degrade under the sun, which we in turn breathe. Green roofs also retain up to 75 percent of rainfall, so they reduce a city ’ s need to fund costly end-of-pipe solutions â which, incidentally, are often located in environmental justice communities like mine. And they provide habitats for our little friends! [Butterfly] So cool! Anyway, the demonstration project is a springboard for our own green roof installation business, bringing jobs and sustainable economic activity to the South Bronx. [Green is the new black...] I like that, too. Anyway, I know Chris told us not to do pitches up here, but since I have all of your attention : We need investors. End of pitch. It ’ s better to ask for forgiveness than permission. Anyway â OK. Katrina. Prior to Katrina, the South Bronx and New Orleans ’ Ninth Ward had a lot in common. Both were largely populated by poor people of color, both hotbeds of cultural innovation : think hip-hop and jazz. Both are waterfront communities that host both industries and residents in close proximity of one another. In the post-Katrina era, we have still more in common. We ’ re at best ignored, and maligned and abused, at worst, by negligent regulatory agencies, pernicious zoning and lax governmental accountability. Neither the destruction of the Ninth Ward nor the South Bronx was inevitable. But we have emerged with valuable lessons about how to dig ourselves out. We are more than simply national symbols of urban blight or problems to be solved by empty campaign promises of presidents come and gone. Now will we let the Gulf Coast languish for a decade or two, like the South Bronx did? Or will we take proactive steps and learn from the homegrown resource of grassroots activists that have been born of desperation in communities like mine? Now listen, I do not expect individuals, corporations or government to make the world a better place because it is right or moral. This presentation today only represents some of what I ’ ve been through. Like a tiny little bit. You ’ ve no clue.

But I ’ ll tell you later, if you want to know. But â I know it ’ s the bottom line, or one ’ s perception of it, that motivates people in the end. I ’ m interested in what I like to call the”triple bottom line”that sustainable development can produce. Developments that have the potential to create positive returns for all concerned : the developers, government and the community where these projects go up. At present, that ’ s not happening in New York City. And we are operating with a comprehensive urban-planning deficit. A parade of government subsidies is going to propose big-box and stadium developments in the South Bronx, but there is scant coordination between city agencies on how to deal with the cumulative effects of increased traffic, pollution, solid waste and the impacts on open space. And their approaches to local economic and job development are so lame it ’ s not even funny. Because on top of that, the world ’ s richest sports team is replacing the House That Ruth Built by destroying two well-loved community parks. Now, we ’ ll have even less than that stat I told you about earlier. And although less than 25 percent of South Bronx residents own cars, these projects include thousands of new parking spaces, yet zip in terms of mass public transit. Now, what ’ s missing from the larger debate is a comprehensive cost- benefit analysis between not fixing an unhealthy, environmentally-challenged community, versus incorporating structural, sustainable changes. My agency is working closely with Columbia University and others to shine a light on these issues. Now let ’ s get this straight : I am not anti-development. Ours is a city, not a wilderness preserve. And I ’ ve embraced my inner capitalist. And, but I don ’ t have â You probably all have, and if you haven ’ t, you need to. So I don ’ t have a problem with developers making money. There ’ s enough precedent out there to show that a sustainable, community-friendly development can still make a fortune. Fellow TEDsters Bill McDonough and Amory Lovins â both heroes of mine by the way â have shown that you can actually do that. I do have a problem with developments that hyper-exploit politically vulnerable communities for profit. That it continues is a **shame** upon us all, because we are all responsible for the future that we create. But one of the things I do to remind myself of greater possibilities, is to learn from visionaries in other cities. This is my version of globalization. Let ’ s take Bogota. Poor, Latino, surrounded by runaway gun **violence** and drug trafficking ; a reputation not unlike that of the South Bronx. However, this city was blessed in the late 1990s with a highly-influential mayor named Enrique PeĂąalosa. He looked at the demographics. Few Bogotanos own cars, yet a huge portion of the city ’ s resources was dedicated to serving them. If you ’ re a mayor, you can do something about that. His administration narrowed key municipal thoroughfares from five lanes to three, outlawed parking on those **streets**, expanded pedestrian walkways and bike lanes, created public plazas, created one of the most efficient bus mass-transit systems in the entire world. For his brilliant efforts, he was nearly impeached. But as people began to see that they were being put first on issues reflecting their day-to-day lives, incredible things happened. People stopped littering. Crime rates dropped, because the **streets** were alive with people. His administration attacked several typical urban problems at one time, and on a third-world budget, at that. We have no excuse in this country, I ’ m sorry. But the bottom line is : their people-first agenda was not meant to penalize those who could actually afford cars, but rather, to provide opportunities for all Bogotanos to participate in the city ’ s resurgence. That development should not come at the expense of the majority of the population is still considered a radical idea here in the U. S. But Bogota ’ s example has the power to change that. You, however, are blessed with the gift of influence. That ’ s why you ’ re here and why you value the information we exchange. Use your influence in support of comprehensive, sustainable change everywhere. Don ’ t just talk about it at TED. This is a nationwide policy agenda I ’ m trying to build, and as you all know, politics are personal. Help me make green the new black. Help me make sustainability sexy. Make it a part of your dinner and cocktail conversations. Help me fight for environmental and economic justice. Support investments with a triple-bottom-line return. Help me democratize sustainability by bringing everyone to the table, and insisting that comprehensive planning can be addressed everywhere. Oh good, glad I have a little more time! Listen â when I spoke to Mr. Gore the other day after breakfast, I asked him how environmental justice activists were going to be included in his new marketing strategy. His response was a grant program. I don ’ t think he understood that I wasn ’ t asking for funding. I was making him an offer. What troubled me was that this top-down approach is still around. Now, don ’ t get me wrong, we need money. But grassroots groups are needed at the table during the decision-making process. Of the 90 percent of the energy that Mr. Gore reminded us that we waste every day, don ’ t add wasting our energy, intelligence and hard-earned experience to that count. I have come from so far to meet you like this. Please don ’ t waste me. By working together, we can become one of those small, rapidly-growing groups of individuals who actually have the audacity and courage to believe that we actually can change the world. We might have come to this conference from very, very different stations in life, but believe me, we all share one incredibly powerful thing. We have nothing to lose and everything to gain. Ciao, bellos!

I can ’ t help but this wish : to think about when you ’ re a little kid, and all your friends ask you,”If a genie could give you one wish in the world, what would it be?”And I always answered,”Well, I ’ d want the wish to have the wisdom to know exactly what to wish for.”Well, then you ’ d be screwed, because you ’ d know what to wish for, and you ’ d use up your wish, and now, since we only have one wish — unlike last year they had three wishes — I ’ m not going to wish for that. So let ’ s get to what I would like, which is world peace. And I know what you ’ re thinking : You ’ re thinking,”The poor girl up there, she thinks she ’ s at a beauty pageant. She ’ s not. She ’ s at the TED Prize.”But I really do think it makes sense. And I think that the first step to world peace is for people to meet each other. I ’ ve met a lot of different people over the years, and I ’ ve filmed some of them, from a dotcom executive in New York who wanted to take over the world, to a military press officer in Qatar, who would rather not take over the world. If you ’ ve seen the film”Control Room”that was sent out, you ’ d understand a little bit why. Thank you. Wow! Some of you watched it. That ’ s great. That ’ s great. So basically what I ’ d like to talk about today is a way for people to travel, to meet people in a different way than — because you can ’ t travel all over the world at the same time. And a long time ago — well, about 40 years ago — my mom had an exchange student. And I ’ m going to show you slides of the exchange student. This is Donna. This is Donna at the Statue of Liberty. This is my mother and aunt teaching Donna how to ride a bike. This is Donna eating ice cream. And this is Donna teaching my aunt how to do a Filipino dance. I really think as the world is getting smaller, it becomes more and more important that we learn each other ’ s dance moves, that we meet each other, we get to know each other, we are able to figure out a way to cross borders, to understand each other, to understand people ’ s hopes and dreams, what makes them laugh and cry. And I know that we can ’ t all do exchange programs, and I can ’ t force everybody to travel ; I ’ ve already talked about that to Chris and Amy, and they said that there ’ s a problem with this : You can ’ t force people, free will. And I totally support that, so we ’ re not forcing people to travel. But I ’ d like to talk about another way to travel that doesn ’ t require a ship or an airplane, and just requires a movie camera, a projector and a screen. And that ’ s what I ’ m going to talk to you about today. I was asked that I speak a little bit about where I personally come from, and Cameron, I don ’ t know how you managed to get out of that one, but I think that building bridges is important to me because of where I come from. I ’ m the daughter of an American mother and an Egyptian-Lebanese-Syrian father. So I ’ m the living product of two cultures coming together. No pun intended. And I ’ ve also been called, as an Egyptian-Lebanese-Syrian American with a Persian name, the”Middle East Peace Crisis.”So maybe me starting to take pictures was some kind of way to bring both sides of my family together — a way to take the worlds with me, a way to tell stories visually. It all kind of started that way, but I think that I really realized the power of the image when I first went to the garbage-collecting village in Egypt, when I was about 16. My mother took me there. She ’ s somebody who believes strongly in community service, and decided that this was something that I needed to do. And so I went there and I met some amazing women there. There was a center there, where they were teaching people how to read and write, and get vaccinations against the many diseases you can get from sorting through garbage. And I began teaching there. I taught English, and I met some incredible women there. I met people that live seven people to a room, barely can afford their evening meal, yet lived with this strength of spirit and sense of humor and just incredible qualities. I got drawn into this community and I began to take pictures there. I took pictures of weddings and older family members — things that they wanted memories of. About two years after I started taking these pictures, the UN Conference on Population and Development asked me to show them at the conference. So I was 18 ; I was very excited. It was my first exhibit of photographs and they were all put up there, and after about two days, they all came down except for three. People were very upset, very angry that I was showing these dirty sides of Cairo, and why didn ’ t I cut the dead donkey out of the frame? And as I sat there, I got very depressed. I looked at this big empty wall with three lonely photographs that were, you know, very pretty photographs and I was like,”I failed at this.”But I was looking at this intense emotion and intense feeling that had come out of people just seeing these photographs. Here I was, this 18-year-old pipsqueak that nobody listened to, and all of a sudden, I put these photographs on the wall, and there were arguments, and they had to be taken down. And I saw the power of the image, and it was incredible. And I think the most important reaction that I saw there was actually from people that would never have gone to the garbage village themselves, that would never have seen that the human spirit could thrive in such difficult circumstances. And I think it was at that point that I decided I wanted to use photography and film to somehow bridge gaps, to bridge cultures, bring people together, cross borders. And so that ’ s what really kind of started me off. Did a stint at MTV, made a film called”Startup.com,”and I ’ ve done a couple of music films. But in 2003, when the war in Iraq was about to start, it was a very surreal feeling for me, because before the war started, there was kind of this media war that was going on. And I was watching television in New York, and there seemed to be just one point of view that was coming across, and the coverage went from the US State Department to embedded troops. And what was coming across on the news was that there was going to be this clean war and precision bombings, and the Iraqis would be greeting the Americans as liberators, and throwing flowers at their feet in the **streets** of Baghdad. And I knew that there was a completely other story that was taking place in the Middle East, where my parents were. I knew that there was a completely other story being told, and I was thinking,"How are people supposed to communicate with each other when they ' re getting completely different messages, and nobody knows what the other ' s being told? How are people supposed to have any kind of common understanding or know how to move together into the future? So I knew that I had to go there. I just wanted to be in the center. I had no plan. I had no funding. I didn ' t even have a camera at the time — I had somebody bring it there, because I wanted to get **access** to Al Jazeera, George Bush ' s favorite channel, and a place which I was very curious about because it ' s disliked by many governments across the Arab world, and also called the mouthpiece of Osama Bin Laden by some people in the US government. So I was thinking, this station that ' s hated by so many people has to be doing something right. I ' ve got to go see what this is all about. And I also wanted to go see Central Command, which was 10 minutes away. And that way, I could get **access** to how this news was being created — on the Arab side, reaching the Arab world, and on the US and Western side, reaching the US. And when I went there and sat there, and met these people that were in the center of it, and sat with these characters, I met some surprising, very complex people. And I ' d like to share with you a little bit of that experience of when you sit with somebody and you film them, and you listen to them, and you allow them more than a five-second sound bite. The amazing complexity of people emerges. Samir Khader : Business as usual. Iraq, and then Iraq, and then Iraq. But between us, if I ' m offered a job with Fox, I ' ll take it. To change the Arab nightmare into the American dream. I still have that dream. Maybe I will never be able to do it, but I have plans for my children. When they finish high school, I will send them to America to study there. I will pay for their study. And they will stay there. Josh Rushing : The night they showed the POWs and the dead soldiers — Al Jazeera showed them — it was powerful, because America doesn ' t show those kinds of images. Most of the news in America won ' t show really gory images and this showed American soldiers in uniform, strewn about a floor, a cold tile floor. And it was revolting. It was absolutely revolting. It made me sick at my stomach. And then what hit me was, the night before, there had been some kind of bombing in Basra, and Al Jazeera had shown images of the people. And they were equally, if not more, horrifying — the images were. And I remember having seen it in the Al Jazeera office, and thought to myself,"Wow, that ' s gross. That ' s bad."And then going away, and probably eating dinner or something. And it didn ' t affect me as much. So, the impact that had on me — me realizing that I just saw people on the other side, and those people in the Al Jazeera office must have felt the way I was feeling that night, and it upset me on a profound level that I wasn ' t as bothered as much the night before. It makes me hate war. But it doesn ' t make me believe that we ' re in a world that can live without war yet. Jehane Noujaim : I was overwhelmed by the response of the film. We didn ' t know whether it would be able to get out there. We had no funding for it. We were incredibly lucky that it got picked up. And when we showed the film in both the United States and the Arab world, we had such incredible reactions. It was amazing to see how people were moved by this film. In the Arab world — and it ' s not really by the film, it ' s by the characters — I mean, Josh Rushing was this incredibly complex person who was thinking about things. And when I showed the film in the Middle East, people wanted to meet Josh. He kind of redefined us as an American population. People started to ask me,"Where is this guy now?"Al Jazeera offered him a job. And Samir, on the other hand, was also quite an interesting character for the Arab world to see, because it brought out the complexities of this love-hate relationship that the Arab world has with the West. In the United States, I was blown away by the motivations, the positive motivations of the American people when they ’ d see this film. You know, we ’ re criticized abroad for believing we ’ re the saviors of the world in some way, but the flip side of it is that, actually, when people do see what is happening abroad and people ’ s reactions to some of our policy abroad, we feel this power, that we need to — we feel like we have to get the power to change things. And I saw this with audiences. This woman came up to me after the screening and said,”You know, I know this is crazy. I saw the bombs being loaded on the planes, I saw the military going out to war, but you don ’ t understand people ’ s anger towards us until you see the people in the hospitals and the **victims** of the war, and how do we get out of this bubble? How do we understand what the other person is thinking?”Now, I don ’ t know whether a film can change the world. But I know the power of it, I know that it starts people thinking about how to change the world. Now, I ’ m not a philosopher, so I feel like I shouldn ’ t go into great depth on this, but let film speak for itself and take you to this other world. Because I believe that film has the ability to take you across borders, I ’ d like you to just sit back and experience for a couple of minutes being taken into another world. And these couple clips take you inside of two of the most difficult conflicts that we ’ re faced with today. [The last 48 hours of two Palestinian suicide bombers.] [Paradise Now] [Man : As long as there is injustice, someone must make a sacrifice!] [Woman : That ’ s no sacrifice, that ’ s revenge!] [If you kill, there ’ s no difference between **victim** and occupier.] [Man : If we had airplanes, we wouldn ’ t need martyrs, that ’ s the difference.] [Woman : The difference is that the Israeli military is still stronger.] [Man : Then let us be **equal** in death.] [We still have Paradise.] [Woman : There is no Paradise! It only exists in your head!] [Man : God forbid!] [May God forgive you.] [If you were not Abu Azzam ’ s daughter...] [Anyway, I ’ d rather have Paradise in my head than live in this hell!] [In this life, we ’ re dead anyway.] [One only chooses bitterness when the alternative is even **bitterer**.] [Woman : And what about us? The ones who remain?] [Will we win that way?] [Don ’ t you see what you ’ re doing is destroying us?] [And that you give Israel an alibi to carry on?] [Man : So with no alibi, Israel will stop?] [Woman : Perhaps. We have to turn it into a moral war.] [Man : How, if Israel has no morals?] [Woman : Be careful!] [And the real people building peace through non-violence] [Encounter Point] Video : [Tel Aviv, Israel 1996] [Tzvika : My wife Ayelet called me and said,] [”There was a suicide bombing in Tel Aviv.”] [Ayelet : What do you know about the casualties?] [Tzvika off-screen : We ’ re looking for three girls.] [We have no information.] [Ayelet : One is wounded here, but we haven ’ t heard from the other three.] [Tzvika : I said,”OK, that ’ s Bat-Chen, that ’ s my daughter.] [Are you sure she is dead?”] [They said yes.] Video : [Bethlehem, Occupied Palestinian Territories, 2003] [George : On that day, at around 6:30] [I was driving with my wife and daughters to the supermarket.] [When we got to here...] [we saw three Israeli military jeeps parked on the side of the road.] [When we passed by the first jeep...] [they opened fire on us.] [And my 12-year-old daughter Christine] [was killed in the shooting.] [Bereaved Families Forum, Jerusalem] [Tzvika : I ’ m the headmaster for all parts.] [George : But there is a teacher that is in charge?] [Tzvika : Yes, I have assistants.] [I deal with children all the time.] [One year after their daughters ’ deaths both Tzvika and George join the forum] [George : At first, I thought it was a strange idea.] [But after thinking logically about it,] [I didn ’ t find any reason why not to meet them] [and let them know of our **suffering**.] [Tzvika : There were many things that touched me.] [We see that there are Palestinians who suffered a lot, who lost children,] [and still believe in the peace process and in reconciliation.]

[If we who lost what is most precious can talk to each other,] [and look forward to a better future,] [then everyone else must do so, too.] [From South Africa : A Revolution Through Music] [Amandla] Man : Song is something that we communicated with people who otherwise would not have understood where we ' re coming from. You could give them a long political speech, they would still not understand. But I tell you, when you finish that song, people will be like,"Damn, I know where you niggas are coming from. I know where you guys are coming from. Death unto apartheid!"Narrator : It ' s about the liberation struggle. It ' s about those children who took to the **streets** — fighting, screaming,"Free Nelson Mandela!"It ' s about those unions who put down their tools and demanded freedom. Yes. Yes! Freedom! Jehane Noujaim : I think everybody ' s had that feeling of sitting in a theater, in a dark room, with other strangers, watching a very powerful film, and they felt that feeling of transformation. And what I ' d like to talk about is how can we use that feeling to actually create a movement through film? I ' ve been listening to the talks in the conference, and Robert Wright said yesterday that if we have an appreciation for another person ' s humanity, then they will have an appreciation for ours. And that ' s what this is about. It ' s about connecting people through film, getting these independent voices out there. Now, Josh Rushing actually ended up leaving the military and taking a job with Al Jazeera. So his feeling is that he ' s at Al Jazeera International because he feels like he can actually use media to bridge the gap between East and West. And that ' s an amazing thing. But I ' ve been trying to think about ways to give power to these independent voices, to give power to the filmmakers, to give power to people who are trying to use film for change. And there are incredible organizations that are out there doing this already. There ' s Witness, that you heard from earlier. There ' s Just Vision, that are working with Palestinians and Israelis who are working together for peace, and documenting that process and getting interviews out there and using this film to take to Congress to show that it ' s a powerful tool, to show that this is a woman who ' s had her daughter killed in an attack, and she believes that there are peaceful ways to solve this. There ' s Working Films and there ' s Current TV, which is an incredible platform for people around the world to be able to put their — Yeah, it ' s amazing. I ' ve watched it and I ' m blown away by it and its potential to bring voices from around the world — independent voices from around the world — and create a truly democratic, global television. So what can we do to create a platform for these organizations, to create some momentum, to get everybody in the world involved in this movement? I ' d like for us to imagine for a second. Imagine a day when you have everyone coming together from around the world. You have towns and villages and theaters — all from around the world, getting together, and sitting in the dark, and sharing a communal experience of watching a film, or a couple of films, together. Watching a film which maybe highlights a character that is fighting to live, or just a character that defies stereotypes, makes a joke, **sings** a song. Comedies, **documentaries**, shorts. This amazing power can be used to change people and to bond people together ; to cross borders, and have people feel like they ' re having a communal experience. So if you imagine this day when all around the world, you have theaters and places where we project films. If you imagine projecting from Times Square to Tahrir Square in Cairo, the same film in Ramallah, the same film in Jerusalem. You know, we ' ve been talking to a friend of mine about using the side of the Great Pyramid and the Great Wall of China. It ' s endless what you can imagine, in terms of where you can project films and where you can have this communal experience. And I believe that this one day, if we can create it, this one day can create momentum for all of these independent voices. There isn ' t an organization which is connecting the independent voices of the world to get out there, and yet I ’ m hearing throughout this conference that the biggest challenge in our future is understanding the other, and having mutual respect for the other and crossing borders. And if film can do that, and if we can get all of these different locations in the world to watch these films together — this could be an incredible day. So we ’ ve already made a partnership, set up through somebody from the TED community, John Camen, who introduced me to Steven Apkon, from the Jacob Burns Film Center. And we started calling up everybody. And in the last week, there have been so many people that have responded to us, from as close as Palo Alto, to Mongolia and to India. There are people that want to be a part of this global day of film ; to be able to provide a platform for independent voices and independent films to get out there. Now, we ’ ve thought about a name for this day, and I ’ d like to share this with you. Now, the most amazing part of this whole process has been sharing ideas and wishes, and so I invite you to give brainstorms onto how does this day echo into the future? How do we use technology to make this day echo into the future, so that we can build community and have these communities working together, through the Internet? There was a time, many, many years ago, when all of the continents were stuck together. And we call that landmass Pangea. So what we ’ d like to call this day of film is Pangea Cinema Day. And if you just imagine that all of these people in these towns would be watching, then I think that we can actually really make a movement towards people understanding each other better. I know that it ’ s very intangible, touching people ’ s hearts and souls, but the only way that I know how to do it, the only way that I know how to reach out to somebody ’ s heart and soul all across the world, is by showing them a film. And I know that there are independent filmmakers and films out there that can really make this happen. And that ’ s my wish. I guess I ’ m supposed to give you my one-sentence wish, but we ’ re way out of time. Chris Anderson : That is an incredible wish. Pangea Cinema : The day the world comes together. JN : It ’ s more tangible than world peace, and it ’ s certainly more immediate. But it would be the day that the world comes together through film, the power of film. CA : Ladies and gentlemen, Jehane Noujaim.

Text Sample 405: POS Dim 3 – 2006 – Score 6.00 – 2006/t000492.txt

About 10 years ago, I took on the task to teach global development to Swedish undergraduate students. That was after having spent about 20 years, together with African institutions, studying hunger in Africa. So I was sort of expected to know a little about the world. And I started, in our medical university, Karolinska Institute, an undergraduate course called Global Health. But when you get that opportunity, you get a little nervous. I thought, these students coming to us actually have the highest grade you can get in the Swedish college system, so I thought, maybe they know everything I ’ m going to teach them about. So I did a pretest when they came. And one of the questions from which I learned a lot was this one :”Which country has the highest child mortality of these five pairs?”And I put them together so that in each pair of countries, one has twice the child mortality of the other. And this means that it ’ s much bigger, the difference, than the uncertainty of the data. I won ’ t put you at a test here, but it ’ s Turkey, which is highest there, Poland, Russia, Pakistan and South Africa. And these were the results of the Swedish students. I did it so I got the confidence interval, which is pretty narrow. And I got happy, of course — a 1. 8 right answer out of five possible. That means there was a place for a professor of international health and for my course. But one late night, when I was compiling the report, I really realized my discovery. I have shown that Swedish top students know, statistically, significantly less about the world than the chimpanzees. Because the chimpanzee would score half right if I gave them two bananas with Sri Lanka and Turkey. They would be right half of the cases. But the students are not there. The problem for me was not ignorance ; it was preconceived ideas. I did also an unethical study of the professors of the Karolinska Institute, which hands out the Nobel Prize in Medicine, and they are on par with the chimpanzee there. This is where I realized that there was really a need to communicate, because the data of what ' s happening in the world and the child health of every country is very well aware. So we did this software, which displays it like this. Every bubble here is a country. This country over here is China. This is India. The size of the bubble is the population, and on this axis here, I put fertility rate. Because my students, what they said when they looked upon the world, and I asked them,"What do you really think about the world?"Well, I first discovered that the textbook was Tintin, mainly. And they said,"The world is still ' we ' and ' them. ' And ' we ' is the Western world and ' them ' is the Third World.""And what do you mean with ' Western world? '"I said."Well, that ' s long life and small family. And ' Third World ' is short life and large family."So this is what I could display here. I put fertility rate here — number of children per woman : one, two, three, four, up to about eight children per woman. We have very good data since 1962, 1960, about, on the size of families in all countries. The error margin is narrow. Here, I put life expectancy at birth, from 30 years in some countries, up to about 70 years. And in 1962, there was really a group of countries here that were industrialized countries, and they had small families and long lives. And these were the developing countries. They had large families and they had relatively short lives. Now, what has happened since 1962? We want to see the change. Are the students right? It ' s still two types of countries? Or have these developing countries got smaller families and they live here? Or have they got longer lives and live up there? Let ' s see. We stopped the world then. This is all UN statistics that have been available. Here we go. Can you see there? It ' s China there, moving against better health there, improving there. All the green Latin American countries are moving towards smaller families. Your yellow ones here are the Arabic countries, and they get longer life, but not larger families. The Africans are the green here. They still remain here. This is India ; Indonesia is moving on pretty fast. In the ' 80s here, you have Bangladesh still among the African countries. But now, Bangladesh — it ' s a miracle that happens in the ' 80s — the imams start to promote family planning, and they move up into that corner. And in the ' 90s, we have the terrible HIV epidemic that takes down the life expectancy of the African countries. And the rest of them all move up into the corner, where we have long lives and small family, and we have a completely new world. Let me make a comparison directly between the United States of America and Vietnam. 1964 : America had small families and long life ; Vietnam had large families and short lives. And this is what happens. The data during the war indicate that even with all the death, there was an improvement of life expectancy. By the end of the year, family planning started in Vietnam, and they went for smaller families. And the United States up there is getting longer life, keeping family size. And in the ' 80s now, they give up Communist planning and they go for market economy, and it moves faster even than social life. And today, we have in Vietnam the same life expectancy and the same family size here in Vietnam, 2003, as in United States, 1974, by the end of the war. I think we all, if we don ' t look at the data, we underestimate the tremendous change in Asia, which was in social change before we saw the economic change. So let ' s move over to another way here in which we could display the distribution in the world of income. This is the world distribution of income of people. One dollar, 10 dollars or 100 dollars per day. There ' s no gap between rich and poor any longer. This is a myth. There ' s a little hump here. But there are people all the way. And if we look where the income ends up, this is 100 percent of the world ' s annual income. And the richest 20 percent, they take out of that about 74 percent. And the poorest 20 percent, they take about two percent. And this shows that the concept of developing countries is extremely doubtful. We think about aid, like these people here giving aid to these people here. But in the middle, we have most of the world population, and they have now 24 percent of the income. We heard it in other forms. And who are these? Where are the different countries? I can show you Africa. This is Africa. Ten percent of the world population, most in poverty. This is OECD — the rich countries, the country club of the UN. And they are over here on this side. Quite an overlap between Africa and OECD. And this is Latin America. It has everything on this earth, from the poorest to the richest in Latin America. And on top of that, we can put East Europe, we can put East Asia, and we put South Asia. And what did it look like if we go back in time, to about 1970? Then, there was more of a hump. And most who lived in absolute poverty were Asians. The problem in the world was the poverty in Asia. And if I now let the world move forward, you will see that while population increases, there are hundreds of millions in Asia getting out of poverty, and some others getting into poverty, and this is the pattern we have today. And the best projection from the World Bank is that this will happen, and we will not have a divided world. We ' ll have most people in the middle. Of course it ' s a logarithmic scale here, but our concept of economy is growth with percent. We look upon it as a possibility of percentile increase. If I change this and take GDP per capita instead of family income, and I turn these individual data into regional data of gross **domestic** product, and I take the regions down here, the size of the bubble is still the population. And you have the OECD there, and you have sub-Saharan Africa there, and we take off the Arab states there, coming both from Africa and from Asia, and we put them separately, and we can expand this axis, and I can give it a new dimension here, by adding the social values there, child survival. Now I have money on that axis, and I have the possibility of children to survive there. In some countries, 99. 7 % of children survive to five years of age ; others, only 70. And here, it seems, there is a gap between OECD, Latin America, East Europe, East Asia, Arab states, South Asia and sub-Saharan Africa. The linearity is very strong between child survival and money. But let me split sub-Saharan Africa. Health is there and better health is up there. I can go here, and I can split sub-Saharan Africa into its countries. And when it bursts, the size of each country bubble is the size of the population. Sierra Leone down there, Mauritius is up there. Mauritius was the first country to get away with trade barriers, and they could sell their sugar, they could sell their textiles, on **equal** terms as the people in Europe and North America. There ' s a huge difference [within] Africa. And Ghana is here in the middle. In Sierra Leone, humanitarian aid. Here in Uganda, development aid. Here, time to invest ; there, you can go for a holiday. There ' s tremendous variation within Africa, which we very often make that it ' s **equal** everything. I can split South Asia here. India ' s the big bubble in the middle. But there ' s a huge difference between Afghanistan and Sri Lanka. I can split Arab states. How are they? Same climate, same culture, same religion — huge difference. Even between neighbors — Yemen, civil war ; United Arab Emirates, money, which was quite equally and well-used. Not as the myth is. And that includes all the children of the foreign workers who are in the country. Data is often better than you think. Many people say data is bad. There is an uncertainty margin, but we can see the difference here :

Cambodia, Singapore. The differences are much bigger than the weakness of the data. East Europe : Soviet economy for a long time, but they come out after 10 years very, very differently. And there is Latin America. Today, we don ’ t have to go to Cuba to find a healthy country in Latin America. Chile will have a lower child mortality than Cuba within some few years from now. Here, we have high-income countries in the OECD. And we get the whole pattern here of the world, which is more or less like this. And if we look at it, how the world looks, in 1960, it starts to move. This is Mao Zedong. He brought health to China. And then he died. And then Deng Xiaoping came and brought money to China, and brought them into the mainstream again. And we have seen how countries move in different directions like this, so it ’ s sort of difficult to get an example country which shows the pattern of the world. But I would like to bring you back to about here, at 1960. I would like to compare South Korea, which is this one, with Brazil, which is this one. The label went away for me here. And I would like to compare Uganda, which is there. I can run it forward, like this. And you can see how South Korea is making a very, very fast advancement, whereas Brazil is much slower. And if we move back again, here, and we put trails on them, like this, you can see again that the speed of development is very, very different, and the countries are moving more or less at the same rate as money and health, but it seems you can move much faster if you are healthy first than if you are wealthy first. And to show that, you can put on the way of United Arab Emirates. They came from here, a mineral country. They cached all the oil ; they got all the money ; but health cannot be bought at the supermarket. You have to invest in health. You have to get kids into schooling. You have to train health staff. You have to educate the population. And Sheikh Zayed did that in a fairly good way. In spite of falling oil prices, he brought this country up here. So we ’ ve got a much more mainstream appearance of the world, where all countries tend to use their money better than they used it in the past. Now, this is, more or less, if you look at the average data of the countries — they are like this. That ’ s dangerous, to use average data, because there is such a lot of difference within countries. So if I go and look here, we can see that Uganda today is where South Korea was in 1960. If I split Uganda, there ’ s quite a difference within Uganda. These are the quintiles of Uganda. The richest 20 percent of Ugandans are there. The poorest are down there. If I split South Africa, it ’ s like this. And if I go down and look at Niger, where there was such a terrible famine [recently], it ’ s like this. The 20 percent poorest of Niger is out here, and the 20 percent richest of South Africa is there, and yet we tend to discuss what solutions there should be in Africa. Everything in this world exists in Africa. And you can ’ t discuss universal **access** to HIV [treatment] for that quintile up here with the same strategy as down here. The improvement of the world must be highly contextualized, and it ’ s not relevant to have it on a regional level. We must be much more detailed. We find that students get very excited when they can use this. And even more, policy makers and the corporate sectors would like to see how the world is changing. Now, why doesn ’ t this take place? Why are we not using the data we have? We have data in the United Nations, in the national statistical agencies and in universities and other nongovernmental organizations. Because the data is hidden down in the databases. And the public is there, and the internet is there, but we have still not used it effectively. All that information we saw changing in the world does not include publicly funded statistics. There are some web pages like this, you know, but they take some nourishment down from the databases, but people put prices on them, stupid passwords and boring statistics. And this won ’ t work. So what is needed? We have the databases. It ’ s not a new database that you need. We have wonderful design tools and more and more are added up here. So we started a **nonprofit** venture linking data to design, we called”Gapminder,”from the London Underground, where they warn you,”Mind the gap.”So we thought Gapminder was appropriate. And we started to write software which could link the data like this. And it wasn ’ t that difficult. It took some person years, and we have produced animations. You can take a data set and put it there. We are liberating UN data, some few UN organization. Some countries accept that their databases can go out on the world. But what we really need is, of course, a search function, a search function where we can copy the data up to a searchable format and get it out in the world. And what do we hear when we go around? I ’ ve done anthropology on the main statistical units. Everyone says,”It ’ s impossible. This can ’ t be done. Our information is so peculiar in detail, so that cannot be searched as others can be searched. We cannot give the data free to the students, free to the entrepreneurs of the world.”But this is what we would like to see, isn ’ t it? The publicly funded data is down here. And we would like flowers to grow out on the net. One of the crucial points is to make them searchable, and then people can use the different design tools to animate it there. And I have pretty good news for you. I have good news that the [current], new head of UN statistics doesn ’ t say it ’ s impossible. He only says,”We can ’ t do it.”And that ’ s a quite clever guy, huh? So we can see a lot happening in data in the coming years. We will be able to look at income distributions in completely new ways. This is the income distribution of China, 1970. This is the income distribution of the United States, 1970. Almost no overlap. Almost no overlap. And what has happened? What has happened is this : that China is growing, it ’ s not so **equal** any longer, and it ’ s appearing here, overlooking the United States, almost like a ghost, isn ’ t it? It ’ s pretty scary. But I think it ’ s very important to have all this information. We need really to see it. And instead of looking at this, I would like to end up by showing the internet users per 1, 000. In this software, we **access** about 500 variables from all the countries quite easily. It takes some time to change for this, but on the axes, you can quite easily get any variable you would like to have. And the thing would be to get up the databases free, to get them searchable, and with a second click, to get them into the graphic formats, where you can instantly understand them. Now, statisticians don ’ t like it, because they say that this will not show the reality ; we have to have statistical, analytical methods. But this is hypothesis-generating. I end now with the world. There, the internet is coming. The number of internet users are going up like this. This is the GDP per capita. And it ’ s a new technology coming in, but then amazingly, how well it fits to the economy of the countries. That ’ s why the $100 computer will be so important. But it ’ s a nice tendency. It ’ s as if the world is flattening off, isn ’ t it? These countries are lifting more than the economy, and it will be very interesting to follow this over the year, as I would like you to be able to do with all the publicly funded data. Thank you very much.

This session is on natural wonders, and the bigger conference is on the pursuit of happiness. I want to try to combine them all, because to me, healing is really the ultimate natural wonder. Your body has a remarkable capacity to begin **healing** itself, and much more quickly than people had once realized, if you simply stop doing what—s causing the problem. And so, really, so much of what we do in medicine and life in general is focused on mopping up the floor without also turning off the faucet. I love doing this work, because it really gives many people new hope and new choices that they didn—t have before, and it allows us to talk about things that — not just diet, but that happiness is not — we ’ re talking about the pursuit of happiness, but when you really look at all the spiritual traditions, what Aldous Huxley called the”perennial wisdom,”when you get past the named and forms and rituals that really divide people, it—s really about — our nature is to be happy ; our nature is to be peaceful, our nature is to be healthy. And so it—s not something — happiness is not something you get, health is generally not something that you get. But rather all of these different practices — you know, the ancient swamis and rabbis and priests and monks and nuns didn—t develop these techniques to just manage stress or lower your blood pressure, unclog your arteries, even though it can do all those things. They—re powerful tools for transformation, for quieting down our mind and bodies to allow us to experience what it feels like to be happy, to be peaceful, to be joyful and to realize that it—s not something that you pursue and get, but rather it—s something that you have already until you disturb it. I studied yoga for many years with a teacher named Swami Satchidananda and people would say,”What are you, a Hindu?”He—d say,”No, I—m an undo.”And it—s really about identifying what—s causing us to disturb our innate health and happiness, and then to allow that natural healing to occur. To me, that—s the real natural wonder. So, within that larger context, we can talk about diet, stress management — which are really these spiritual practices — moderate exercise, smoking cessation, support groups and community — which I—ll talk more about — and some vitamins and supplements. And it—s not a diet. You know, when most people think about the diet I recommend, they think it—s a really strict diet. For reversing disease, that—s what it takes, but if you—re just trying to be healthy, you have a spectrum of choices. And to the degree that you can move in a healthy direction, you—re going to live longer, you—re going to feel better, you—re going to lose weight, and so on. And in our studies, what we—ve been able to do is to use very expensive, high-tech, state-of-the-art measures to prove how powerful these very simple and low-tech and low-cost — and in many ways, ancient — interventions, can be. We first began by looking at heart disease, and when I began doing this work 26 or 27 years ago, it was thought that once you have heart disease it can only get worse. And what we found was that, instead of getting worse and worse, in many cases it could get better and better, and much more quickly than people had once realized. This is a representative patient who at the time was 73 — totally needed to have a bypass, decided to do this instead. We used quantitative arteriography, showing the narrowing. This is one of the arteries that feed the heart, one of the main arteries, and you can see the narrowing here. A year later, it—s not as clogged ; normally, it goes the other direction. These minor changes in blockages caused a 300 percent improvement in blood flow, and using cardiac positron emission tomography, or”PET,”scans, blue and black is no blood flow, orange and white is maximal. Huge differences can occur without drugs, without surgery. Clinically, he literally couldn—t walk across the **street** without getting severe chest pain ; within a month, like most people, was pain-free, and within a year, climbing more than 100 floors a day on a Stairmaster. This is not unusual, and it—s part of what enables people to maintain these kinds of changes, because it makes such a big difference in their quality of life. Overall, if you looked at all the arteries in all the patients, they got worse and worse, from one year to five years, in the comparison group. This is the natural history of heart disease, but it—s really not natural because we found it could get better and better, and much more quickly than people had once thought. We also found that the more people change, the better they got. It wasn—t a function of how old or how sick they were — it was mainly how much they changed, and the oldest patients improved as much as the young ones. I got this as a Christmas card a few years ago from two of the patients in one of our programs. The younger brother is 86, the older one—s 95 ; they wanted to show me how much more flexible they were. And the following year they sent me this one, which I thought was kind of funny. You just never know. And what we found was that 99 percent of the patients start to reverse the progression of their heart disease. Now I thought, you know, if we just did good science, that would change medical practice. But, that was a little naive. It—s important, but not enough. Because we doctors do what we get paid to do, and we get trained to do what we get paid to do, so if we change insurance, then we change medical practice and medical education. Insurance will cover the bypass, it—ll cover the angioplasty ; it won—t, until recently, cover diet and lifestyle. So, we began through our **nonprofit** institute ' s training hospitals around the country, and we found that most people could avoid surgery, and not only was it medically effective, it was also cost effective. And the insurance companies found that they began to save almost 30, 000 dollars per patient, and Medicare is now in the middle of doing a demonstration project where they—re paying for 1, 800 people to go through the program on the sites that we train. The fortuneteller says,"I give smokers a discount because there—s not as much to tell."I like this slide, because it—s a chance to talk about what really motivates people to change, and what doesn—t. And what doesn—t work is fear of dying, and that—s what—s normally used. Everybody who smokes knows it—s not good for you, and still 30 percent of Americans smoke — 80 percent in some parts of the world. Why do people do it? Well, because it helps them get through the day. And I—ll talk more about this, but the real epidemic isn—t just heart disease or obesity or smoking — it—s loneliness and depression. As one woman said,"I—ve got 20 friends in this package of cigarettes, and they—re always there for me and nobody else is. You—re going to take away my 20 friends? What are you going to give me?"Or they eat when they get depressed, or they use alcohol to **numb** the pain, or they work too hard, or watch too much TV. There are lots of ways we have of avoiding and **numbing** and bypassing pain, but the point of all of this is to deal with the cause of the problem. And the pain is not the problem : it—s the symptom. And telling people they—re going to die is too scary to think about, or, they—re going to get emphysema or heart attack is too scary, and so they don—t want to think about it, so they don—t. The most effective anti-smoking ad was this one. You—ll notice the limp cigarette hanging out of his mouth, and"impotence"— the headline is,"Impotent"— it—s not emphysema. What was the biggest selling drug of all time when it was introduced a few years ago? Viagra, right? Why? Because a lot of guys need it. It—s not like you say,"Hey Joe, I—m having erectile dysfunction, how about you?"And yet, look at the number of prescriptions that are being sold. It—s not so much psychological, it—s vascular, and nicotine makes your arteries constrict. So does cocaine, so does a high fat diet, so does emotional stress. So the very behaviors that we think of as being so sexy in our culture are the very ones that leave so many people feeling tired, lethargic, depressed and impotent, and that—s not much fun. But when you change those behaviors, your brain gets more blood, you think more clearly, you have more energy, your heart gets more blood in ways I—ve shown you. Your **sexual** function improves. And these things occur within hours. This is a study : a high fat meal, and within one or two hours blood-flow is measurably less — and you—ve all experienced this at Thanksgiving. When you eat a big fatty meal, how do you feel? You feel kind of sleepy afterwards. On a low-fat meal, the blood flow doesn—t go down — it even goes up. Many of you have kids, and you know that—s a big change in your lifestyle, and so people are not afraid to make big changes in lifestyle if they—re worth it.

And the paradox is that when you make big changes, you get big benefits, and you feel so much better so quickly. For many people, those are choices worth making — not to live longer, but to live better. I want to talk a little bit about the obesity epidemic, because it really is a problem. Two-thirds of adults are overweight or obese, and diabetes in kids and 30-year-olds has increased 70 percent in the last 10 years. It—s no joke : it—s real. And just to show you this, this is from the CDC. These are not election returns ; these are the percentage of people who are overweight. And if you see from ' 85 to ' 86 to ' 87, ' 88, ' 89, ' 90, ' 91 — you get a new category, 15 to 20 percent ; ' 92, ' 93, ' 94, ' 95, ' 96, ' 97 — you get a new category ; ' 98, ' 99, 2000, and 2001. Mississippi, more than 25 percent of people are overweight. Why is this? Well, this is one way to lose weight that works very well... but it doesn—t last, which is the problem. Now, there—s no mystery in how you lose weight ; you either burn more calories by exercise or you eat fewer calories. Now, one way to eat fewer calories is to eat less food, which is why you can lose weight on any diet if you eat less food, or if you restrict entire categories of foods. But the problem is, you get hungry, so it—s hard to keep it off. The other way is to change the type of food. And fat has nine calories per gram, whereas protein and carbs only have four. So, when you eat less fat, you eat fewer calories without having to eat less food. So you can eat the same amount of food, but you—ll be getting fewer calories because the food is less dense in calories. And it—s the volume of food that affects satiety, rather than the type of food. You know, I don—t like talking about the Atkins diet, but I get asked about it every day, and so I just thought I—d spend a few minutes on that. The myth that you hear about is, Americans have been told to eat less fat, the percent of calories from fat is down, Americans are fatter than ever, therefore fat doesn—t make you fat. It—s a half-truth. Actually, Americans are eating more fat than ever, and even more carbs. And so the percentage is lower, the actual amount is higher, and so the goal is to reduce both. Dr. Atkins and I debated each other many times before he died, and we agreed that Americans eat too many simple carbs, the"bad carbs,"and these are things like — — sugar, white flour, white rice, alcohol. And you get a double whammy : you get all these calories that don—t fill you up because you—ve removed the fiber, and they get absorbed quickly so your blood sugar zooms up. Your pancreas makes insulin to bring it back down, which is good. But insulin accelerates the conversion of calories into fat. So, the goal is not to go to pork rinds and bacon and sausages — these are not health foods — but to go from"bad carbs"to what are called"good carbs."And these are things like whole foods, or unrefined carbs : fruits, vegetables, whole wheat flour, brown rice, in their natural forms, are rich in fiber. And the fiber fills you up before you get too many calories, and it slows the absorption so you don—t get that rapid rise in blood sugar. So, and you get all the disease-protective substances. It—s not just what you exclude from your diet, but also what you include that—s protective. Just as all carbs are not bad for you, all fats are not bad for you. There are good fats. And these are predominantly what are called the Omega-3 fatty acids. You find these, for example, in fish oil. And the bad fats are things like trans-fatty acids and processed food and saturated fats, which we find in meat. If you don—t remember anything else from this talk, three grams a day of fish oil can reduce your risk of a heart attack and sudden death by 50 to 80 percent. Three grams a day. They come in one-gram capsules ; more than that just gives you extra fat you don—t need. It also helps reduce the risk of the most common cancers like breast, prostate and colon cancer. Now, the problem with the Atkins diet, everybody knows people who have lost weight on it, but you can lose weight on amphetamines, you know, and fen-phen. I mean, there are lots of ways of losing weight that aren—t good for you. You want to lose weight in a way that enhances your health rather than the one that **harms** it. And the problem is that it—s based on this half-truth, which is that Americans eat too many simple carbs, so if you eat fewer simple carbs you—re going to lose weight. You—ll lose even more weight if you go to whole foods and less fat, and you—ll enhance your health rather than **harming** it. He says,"I—ve got some good news. While your cholesterol level has remained the same, the research findings have changed."Now, what happens to your heart when you go on an Atkins diet? The red is good at the beginning, and a year later — this is from a study done in a peer- reviewed journal called Angiology — there—s more red after a year on a diet like I would recommend, there—s less red, less blood flow after a year on an Atkins-type diet. So, yes, you can lose weight, but your heart isn—t happy. Now, one of the studies funded by the Atkins Center found that 70 percent of the people were constipated, 65 percent had bad breath, 54 percent had headaches — this is not a healthy way to eat. And so, you might start to lose weight and start to attract people towards you, but when they get too close it—s going to be a problem. And more seriously, there are case reports now of 16-year-old girls who died after a few weeks on the Atkins diet — of bone disease, kidney disease, and so on. And that—s how your body excretes waste, is through your breath, your bowels and your perspiration. So when you go on these kinds of diet, they begin to smell bad. So, an optimal diet is low in fat, low in the bad carbs, high in the good carbs and enough of the good fats. And then, again, it—s a spectrum : when you move in this direction, you—re going to lose weight, you—re going to feel better and you—re going to gain health. Now, there are ecological reasons for eating lower on the food chain too, whether it—s the deforestation of the Amazon, or making more protein available, to the four billion people who live on a dollar a day — not to mention whatever ethical concerns people have. So, there are lots of reasons for eating this way that go beyond just your health. Now, we—re about to publish the first study looking at the effects of this program on prostate cancer, and, in collaboration with Sloane-Kettering and with UCSF. We took 90 men who had biopsy-proven prostate cancer and who had elected, for reasons unrelated to the study, not to have surgery. We could randomly divide them into two groups, and then we could have one group that is a non-intervention control group to compare to, which we can—t do with, say, breast cancer, because everyone gets treated. What we found was that, after a year, none of the experimental group patients who made these lifestyle changes needed treatment, whereas six of the control- group patients needed surgery or radiation. When we looked at their PSA levels — which is a marker for prostate cancer — they got worse in the control group, but they actually got better in the experimental group, and these differences were highly significant. And then I wondered : was there any relationship between how much people changed their diet and lifestyle — whichever group they were in — and the changes in PSA? And sure enough, we found a dose-response relationship, just like we found in the arterial blockages in our cardiac studies. And in order for the PSA to go down, they had to make pretty big changes. I then wondered, well, maybe they—re just changing their PSA, but it—s not really affecting the tumor growth. So we took some of their blood serum and sent it down to UCLA ; they added it to a standard line of prostate tumor cells growing in tissue culture, and it inhibited the growth seven times more in the experimental group than in the control group — 70 versus 9 percent. And finally, I said, I wonder if there—s any relationship between how much people change and how it inhibited their tumor growth, whichever group they happened to be in. And this really got me excited because again, we found the same pattern : the more people change, the more it affected the growth of their tumors. And finally, we did MRI and MR spectroscopy scans on some of these patients, and the tumor activity is shown in red in this patient, and you can see clearly it—s better a year later, along with the PSA going down. So, if it—s true for prostate cancer, it—ll almost certainly be true for breast cancer as well. And whether or not you have conventional treatment, in addition, if you make these changes, it may help reduce the risk of recurrence. The last thing I want to talk about, apropos of the issue of the pursuit of happiness, is that study after study have shown that people who are lonely and depressed — and depression is the other real epidemic in our culture — are many times more likely to get sick and die prematurely, in part because, as we talked about, they—re more likely to smoke and overeat and drink too much and work too hard and so on. But also, through mechanisms that we don—t fully understand, people who are lonely and depressed are many times — three to five to ten times, in some studies — more likely to get sick and die prematurely. And depression is treatable. We need to do something about that. Now, on the other hand, anything that promotes intimacy is **healing**. It can be **sexual** intimacy — I happen to think that healing energy and erotic energy are just different forms of the same thing. Friendship, altruism, compassion, service — all the perennial truths that we talked about that are part of all religion and all cultures — once you stop trying to see the differences, these are the things in our own self-interest, because they free us from our **suffering** and from disease. And it—s in a sense the most selfish thing that we can do. Just take a look at one study. This was done by David Spiegel at Stanford. He took women with metastatic breast cancer, randomly divided them into two groups. One group of people just met for an hour-and-a-half once a week in a support group. It was a nurturing, **loving** environment, where they were encouraged to let down their emotional defenses and talk about how awful it is to have breast cancer with people who understood, because they were going through it too. They just met once a week for a year. Five years later, those women lived twice as long, and you can see that the people — and that was the only difference between the groups. It was a randomized control study published in The Lancet. Other studies have shown this as well. So, these simple things that create intimacy are really **healing**, and even the word healing, it comes from the root"to make whole."The word yoga comes from the Sanskrit, meaning"union, to yoke, to bring together."And the last slide I want to show you is from — I was — again, this swami that I studied with for so many years, and I did a combined oncology and cardiology Grand Rounds at the University of Virginia medical school a couple of years ago. And at the end of it, somebody said,"Hey, Swami, what—s the difference between wellness and illness?"And so he went up on the board and he wrote the word"illness,"and circled the first letter, and then wrote the word"wellness,"and circled the first two letters... To me, it—s just shorthand for what we—re talking about : that anything that creates a sense of connection and community and love is really **healing**. And then we can enjoy our lives more fully without getting sick in the process. Thank you.

Text Sample 407: POS Dim 3 – 2004 – Score 8.00 – 2004/t000464.txt

I bet you ' re worried. I was worried. That ' s why I began this piece. I was worried about vaginas. I was worried what we think about vaginas and even more worried that we don ' t think about them. I was worried about my own vagina. It needed a context, a culture, a community of other vaginas. There is so much **darkness** and secrecy surrounding them. Like the Bermuda Triangle, nobody ever reports back from there. In the first place, it ' s not so easy to even find your vagina. Women go days, weeks, months, without looking at it. I interviewed a high-powered businesswoman ; she told me she didn ’ t have time.”Looking at your vagina,”she said,”is a full day ’ s work.””You ’ ve got to get down there on your back, in front of a mirror, full-length preferred. You ’ ve got to get in the perfect position with the perfect light, which then becomes shadowed by the angle you ’ re at. You ’ re twisting your head up, arching your back, it ’ s exhausting.”She was busy ; she didn ’ t have time. So I decided to talk to women about their vaginas. They began as casual vagina interviews, and they turned into vagina monologues. I talked with over 200 women. I talked to older women, younger women, married women, lesbians, single women. I talked to corporate professionals, college professors, actors, sex workers. I talked to African-American women, Asian-American women, Native- American women, Caucasian women, Jewish women. OK, at first women were a little shy, a little reluctant to talk. Once they got going, you couldn ’ t stop them. Women love to talk about their vaginas, they do. Mainly because no one ’ s ever asked them before. Let ’ s just start with the word”vagina”— vagina, vagina. It sounds like an infection, at best. Maybe a medical instrument.”Hurry, nurse, bring the vagina!”Vagina, vagina, vagina. It doesn ’ t matter how many times you say the word, it never sounds like a word you want to say. It ’ s a completely ridiculous, totally un-sexy word. If you use it during sex, trying to be politically correct,”Darling, would you stroke my vagina,”you kill the act right there. I ’ m worried what we call them and don ’ t call them. In Great Neck, New York, they call it a Pussycat. A woman told me there her mother used to tell her,”Don ’ t wear panties, dear, underneath your pajamas. You need to air out your Pussycat.”In Westchester, they call it a Pooki, in New Jersey, a twat. There ’ s Powderbox, derriere, a Pooky, a Poochi, a Poopi, a Poopelu, a Pooninana, a Padepachetchki, a Pal, and a Piche. There ’ s Toadie, Dee Dee, Nishi, Dignity, Coochi Snorcher, Cooter, Labbe, Gladys Seagelman, VA, Wee wee, Horsespot, Nappy Dugout, Mongo, Ghoulie, Powderbox, a Mimi in Miami, a Split Knish in Philadelphia... and a Schmende in the Bronx. I am worried about vaginas. This is how the”Vagina Monologues”begins. But it really didn ’ t begin there. It began with a conversation with a woman. We were having a conversation about menopause, and we got onto the subject of her vagina, which you ’ ll do if you ’ re talking about menopause. And she said things that really shocked me about her vagina — that it was dried-up and finished and dead — and I was kind of shocked. So I said to a friend casually,”Well, what do you think about your vagina?”And that woman said something more amazing, and then the next woman said something more amazing, and before I knew it, every woman was telling me I had to talk to somebody about their vagina because they had an amazing story, and I was sucked down the vagina trail. And I really haven ’ t gotten off of it. I think if you had told me when I was younger that I was going to grow up, and be in shoe stores, and people would scream out,”There she is, the Vagina Lady!”I don ’ t know that that would have been my life ambition. But I want to talk a little bit about happiness, and the relationship to this whole vagina journey, because it has been an extraordinary journey that began eight years ago. I think before I did the”Vagina Monologues,”I didn ’ t really believe in happiness. I thought that only idiots were happy, to be honest. I remember when I started practicing Buddhism 14 years ago, and I was told that the end of this practice was to be happy, I said,”How could you be happy and live in this world of **suffering** and live in this world of pain?”I mistook happiness for a lot of other things, like numbness or decadence or selfishness. And what happened through the course of the”Vagina Monologues”and this journey is, I think I have come to understand a little bit more about happiness. There are three qualities I want to talk about. One is seeing what ’ s right in front of you, and talking about it, and stating it. I think what I learned from talking about the vagina and speaking about the vagina, is it was the most obvious thing — it was right in the center of my body and the center of the world — and yet it was the one thing nobody talked about. The second thing is that what talking about the vagina did is it opened this door which allowed me to see that there was a way to serve the world to make it better. And that ' s where the deepest happiness has actually come from. And the third principle of happiness, which I ' ve realized recently : Eight years ago, this momentum and this energy, this"V-wave"started — and I can only describe it as a"V-wave"because, to be honest, I really don ' t understand it completely ; I feel at the service of it. But this wave started, and if I question the wave, or try to stop the wave or look back at the wave, I often have the experience of whiplash or the potential of my neck breaking. But if I go with the wave, and I trust the wave and I move with the wave, I go to the next place, and it happens logically and organically and truthfully. And I started this piece, particularly with stories and narratives, and I was talking to one woman and that led to another woman and that led to another woman. And then I wrote those stories down, and I put them out in front of other people. And every single time I did the show at the beginning, women would literally line up after the show, because they wanted to tell me their stories. And at first I thought,"Oh great, I ' ll hear about wonderful orgasms, and great sex lives, and how women love their vaginas."But in fact, that ' s not what women lined up to tell me. What women lined up to tell me was how they were raped, and how they were battered, and how they were beaten, and how they were gang-raped in parking lots, and how they were incested by their uncles. And I wanted to stop doing the"Vagina Monologues,"because it felt too daunting. I felt like a war photographer who takes pictures of terrible events, but doesn ' t intervene on their behalf. And so in 1997, I said,"Let ' s get women together. What could we do with this information that all these women are being violated?"And it turned out, after thinking and investigating, that I discovered — and the UN has actually said this recently — that one out of every three women on this planet will be beaten or raped in her lifetime. That ' s essentially a gender ; that ' s essentially the resource of the planet, which is women. So in 1997 we got all these incredible women together and we said,"How can we use the play, this energy, to stop **violence** against women?"And we put on one event in New York City, in the theater, and all these great actors came — from Susan Sarandon, to Glenn Close, to Whoopi Goldberg — and we did one performance on one evening, and that catalyzed this wave, this energy. And within five years, this extraordinary thing began to happen. One woman took that energy and she said,"I want to bring this wave, this energy, to college campuses,"and so she took the play and she said,"Let ' s use the play and have performances once a year, where we can raise money to stop **violence** against women in local communities all around the world."And in one year, it went to 50 colleges, and then it expanded. And over the course of the last six years, it ' s spread and it ' s spread and it ' s spread around the world. What I have learned is two things : one, that the epidemic of **violence** towards women is shocking ; it ' s global ; it is so profound and it is so devastating, and it is so in every little pocket of every little crater, of every little society that we don ' t even recognize it, because it ' s become ordinary. This journey has taken me to Afghanistan, where I had the extraordinary honor and privilege to go into parts of Afghanistan under the Taliban. I was dressed in a burqa and I went in with an extraordinary group, called the Revolutionary Association of the Women of Afghanistan. And I saw firsthand how women had been stripped of every single right that was possible to strip women of — from being educated, to being employed, to being actually allowed to eat ice cream. For those of you who don ' t know, it was illegal to eat ice cream under the Taliban. And I actually saw and met women who had been flogged for being caught eating vanilla ice cream. I was taken to the secret ice cream-eating place in a little town, where we went to a back room, and women were seated and a curtain was pulled around us, and they were served vanilla ice cream. And women lifted their burqas and ate this ice cream. And I don ’ t think I ever understood pleasure until that moment, and how women have found a way to keep their pleasure alive. It has taken me, this journey, to Islamabad, where I have witnessed and met women with their faces melted off. It has taken me to Juarez, Mexico, where I was a week ago, where I have literally been there in parking lots, where bones of women have washed up and been dumped next to Coca-Cola bottles. It has taken me to universities all over this country, where girls are date-raped and drugged. I have seen terrible, terrible, terrible **violence**. But I have also recognized, in the course of seeing that **violence**, that being in the face of things and seeing actually what ’ s in front of us is the antidote to depression, and to a feeling that one is worthless and has no value. Because before the”Vagina Monologues,”I will say that 80 percent of my consciousness was closed off to what was really going on in this reality, and that closing-off closed off my vitality and my life energy. What has also happened is in the course of these travels — and it ’ s been an extraordinary thing — is that every single place that I have gone to in the world, I have met a new species. And I really love hearing about all these species at the bottom of the sea. And I was thinking about how being with these extraordinary people on this particular panel, that it ’ s beneath, beyond and between, and the vagina kind of fits into all those categories. But one of the things I ’ ve seen is this species — and it is a species, and it is a new paradigm, and it doesn ’ t get reported in the press or in the media because I don ’ t think good news ever is news, and I don ’ t think people who are transforming the planet are what gets the ratings on TV shows. But every single country I have been to — and in the last six years, I ’ ve been to about 45 countries, and many tiny little villages and cities and towns — I have seen something what I ’ ve come to call”vagina warriors.”A”vagina warrior”is a woman, or a vagina-friendly man, who has witnessed incredible **violence** or suffered it, and rather than getting an AK-47 or a weapon of mass destruction or a machete, they hold the **violence** in their bodies ; they grieve it ; they experience it ; and then they go out and devote their lives to making sure it doesn ’ t happen to anybody else. I have met these women everywhere on the planet, and I want to tell a few stories, because I believe that stories are the way that we transmit information, where it goes into our bodies. And I think one of the things about being at TED that ’ s been very interesting is that I live in my body a lot, and I don ’ t live in my head very much anymore. And this is a very heady place. And it ’ s been really interesting to be in my head for the last two days ; I ’ ve been very disoriented — because I think the world, the V-world, is very much in your body. It ’ s a body world, and the species really exists in the body. And I think there ’ s a real significance in us attaching our bodies to our heads, that that separation has created a divide that is often separating purpose from intent. And the connection between body and head often brings those things into union. I want to talk about three particular people that I ’ ve met, vagina warriors, who really transformed my understanding of this whole principle and species, and one is a woman named Marsha Lopez. Marsha Lopez was a woman I met in Guatemala. She was 14 years old, and she was in a marriage and her husband was beating her on a regular basis. And she couldn ’ t get out, because she was addicted to the relationship, and she had no money. Her sister was younger than her, and she applied — we had a”Stop Rape”contest a few years ago in New York — and she applied, hoping that she would become a finalist and she could bring her sister. She did become a finalist ; she brought Marsha to New York. And at that time, we did this extraordinary V-Day at Madison Square Garden, where we sold out the entire testosterone-filled dome — 18, 000 people standing up to say"Yes"to vaginas, which was really a pretty incredible transformation. And she came, and she witnessed this, and she decided that she would go back and leave her husband, and that she would bring V-Day to Guatemala. She was 21 years old. I went to Guatemala and she had sold out the National Theater of Guatemala. And I watched her walk up on stage in her red short dress and high heels, and she stood there and said,"My name is Marsha. I was beaten by my husband for five years. He almost murdered me. I left and you can, too."And the entire 2, 000 people went absolutely crazy. There ' s a woman named Esther Chvez who I met in Juarez, Mexico. And Esther Chvez was a brilliant accountant in Mexico City. She was 72 years old and she was planning to retire. She went to Juarez to take care of an ailing aunt, and in the course of it, she began to discover what was happening to the murdered and disappeared women of Juarez. She gave up her life ; she moved to Juarez. She started to write the stories which documented the disappeared women. 300 women have disappeared in a border town because they ' re brown and poor. There has been no response to the disappearance, and not one person has been held accountable. She began to document it. She opened a center called Casa Amiga, and in six years, she has literally brought this to the consciousness of the world. We were there a week ago, when there were 7, 000 people in the **street**, and it was truly a miracle. And as we walked through the **streets**, the people of Juarez, who normally don ' t even come into the **streets**, because the **streets** are so dangerous, literally stood there and wept, to see that other people from the world had showed up for that particular community. There ' s another woman, named Agnes. And Agnes, for me, epitomizes what a vagina warrior is. I met her three years ago in Kenya. And Agnes was mutilated as a little girl ; she was circumcised against her will when she was 10 years old, and she really made a decision that she didn ' t want this practice to continue anymore in her community. So when she got older, she created this incredible thing : it ' s an anatomical sculpture of a woman ' s body, half a woman ' s body. And she walked through the Rift Valley, and she had vagina and vagina replacement parts, where she would teach girls and parents and boys and girls what a healthy vagina looks like, and what a mutilated vagina looks like. And in the course of her travel — she walked literally for eight years through the Rift Valley, through dust, through sleeping on the ground, because the Maasai are nomads, and she would have to find them, and they would move, and she would find them again — she saved 1, 500 girls from being cut. And in that time, she created an alternative ritual, which involved girls coming of age without the cut. When we met her three years ago, we said,"What could V-Day do for you?"And she said,"Well, if you got me a jeep, I could get around a lot faster."So we bought her a jeep. And in the year that she had the jeep, she saved 4, 500 girls from being cut. So we said to her,"What else could we do for you?"She said,"Well, Eve, if you gave me some money, I could open a house and girls could run away, and they could be saved."And I want to tell this little story about my own beginnings, because it ' s very interrelated to happiness and Agnes. When I was a little girl — I grew up in a wealthy community ; it was an upper- middle class white community, and it had all the trappings and the looks of a perfectly nice, wonderful, great life. And everyone was supposed to be happy in that community, and, in fact, my life was hell. I lived with an alcoholic father who beat me and molested me, and it was all inside that. And always as a child I had this fantasy that somebody would come and rescue me. And I actually made up a little character whose name was Mr.

Alligator. I would call him up when things got really bad, and say it was time to come and pick me up. And I would pack a little bag and wait for Mr. Alligator to come. Now, Mr. Alligator never did come, but the idea of Mr. Alligator coming actually saved my sanity and made it OK for me to keep going, because I believed, in the distance, there would be someone coming to rescue me. Cut to 40-some odd years later, we go to Kenya, and we ’ re walking, we arrive at the opening of this house. And Agnes hadn ’ t let me come to the house for days, because they were preparing this whole ritual. I want to tell you a great story. When Agnes first started fighting to stop female genital mutilation in her community, she had become an outcast, and she was exiled and slandered, and the whole community turned against her. But being a vagina warrior, she kept going, and she kept committing herself to transforming consciousness. And in the Maasai community, goats and cows are the most valued possession. They ’ re like the Mercedes-Benz of the Rift Valley. And she said two days before the house opened, two different people arrived to give her a goat each, and she said to me,”I knew then that female genital mutilation would end one day in Africa.”Anyway, we arrived, and when we arrived, there were hundreds of girls dressed in red homemade dresses — which is the color of the Maasai and the color of V-Day — and they greeted us. They had made up these songs that they were **singing**, about the end of **suffering** and the end of mutilation, and they walked us down the path. It was a gorgeous day in the African sun, and the dust was flying and the girls were dancing, and there was this house, and it said,”V- Day Safe House for the Girls.”And it hit me in that moment that it had taken 47 years, but that Mr. Alligator had finally shown up. And he had shown up, obviously, in a form that it took me a long time to understand, which is that when we give in the world what we want the most, we **heal** the broken part inside each of us. And I feel, in the last eight years, that this journey — this miraculous vagina journey — has taught me this really simple thing, which is that happiness exists in action ; it exists in telling the truth and saying what your truth is ; and it exists in giving away what you want the most. And I feel that knowledge and that journey has been an extraordinary privilege, and I feel really blessed to have been here today to communicate that to you. Thank you very much.

Text Sample 408: POS Dim 3 – 2004 – Score 7.00 – 2004/t000486.txt

You ’ ll be happy to know that I ’ ll be talking not about my own tragedy, but other people ’ s tragedy. It ’ s a lot easier to be lighthearted about other people ’ s tragedy than your own, and I want to keep it in the spirit of the conference. So, if you believe the media accounts, being a drug dealer in the height of the crack cocaine epidemic was a very glamorous life, in the words of Virginia Postrel. There was money, there was drugs, guns, women, you know, you name it — jewelry, bling-bling — it had it all. What I ’ m going to tell you today is that, in fact, based on 10 years of research, a unique opportunity to go inside a gang — to see the actual books, the financial records of the gang — that the answer turns out not to be that being in the gang was a glamorous life. But I think, more realistically, that being in a gang — selling drugs for a gang — is perhaps the worst job in all of America. And that ’ s what I ’ d like to convince you of today. So there are three things I want to do. First, I want to explain how and why crack cocaine had such a profound influence on inner-city gangs. Secondly, I want to tell you how somebody like me came to be able to see the inner workings of a gang — an interesting story, I think. And then third, I want to tell you, in a very superficial way, about some of the things we found when we actually got to look at the financial records, the books, of the gang. So before I do that, just one warning, which is that this presentation has been rated ' R ' by the Motion Picture Association of America. It contains adult themes, adult language. Given who is up on the stage, you ' ll be delighted to know that, in fact, there ' ll be no nudity — Unexpected wardrobe malfunctions aside. So let me start by talking about crack cocaine, and how it transformed the gang. To do that, you have to actually go back to a time before crack cocaine, in the early ' 80s, and look at it from the perspective of a gang leader. Being a gang leader in the inner city wasn ' t such a bad deal in the mid- ' 80s — the early ' 80s, let me say. Now, you had a lot of power, and you got to beat people up — you got a lot of prestige, a lot of respect. But the thing is, there was no money in it. The gang had no way to make money. You couldn ' t charge dues to the people in the gang, because the people in the gang didn ' t have any money. You couldn ' t really make any money selling marijuana — marijuana ' s too cheap, it turns out. You can ' t get rich selling marijuana. You couldn ' t sell cocaine ; cocaine ' s a great product — powdered cocaine — but you ' ve got to know rich white people. And most of the inner-city gang members didn ' t know any rich white people, so couldn ' t sell to that market. You couldn ' t really do petty crime, either. Turns out, petty crime ' s a terrible way to make a living. As a result, as a gang leader, you had, you know, power — it ' s a pretty good life — but the thing was, in the end, you were living at home with your mother. And so it wasn ' t really a career. There were limits to how powerful and important you could be if you had to live at home with your mother. Then along comes crack cocaine. And in the words of Malcolm Gladwell, crack cocaine was the extra-chunky version of tomato sauce for the inner city. Because crack cocaine was an unbelievable innovation. I don ' t have time to talk about it today, but if you think about it, I would say that in the last 25 years, of every invention or innovation that ' s occurred in this country, the biggest one in terms of impact on the well-being of people who live in the inner city, was crack cocaine. And for the worse — not for the better, but for the worse. It had a huge impact on life. So what was it about crack cocaine? It was a brilliant way of getting the brain high. Because you could smoke crack cocaine — you can ' t smoke powdered cocaine — and smoking is a much more efficient mechanism of delivering a high than snorting it. And it turned out there was this audience that didn ' t know it wanted crack cocaine, but when it came, it really did. And it was a perfect drug ; you could buy the cocaine that went into it for a dollar, sell it for five dollars. Highly addictive — the high was very short. So for fifteen minutes, you get this great high, and then when you come down, all you want to do is get high again. It created a wonderful market. And for the people who were there running the gang, it was a great way, seemingly, to make a lot of money. At least for the people on the top. So this is where we enter the picture. Not really me — I ' m really a bit player in all this. My co-author, Sudhir Venkatesh, is the main character. He was a math major in college who had a good heart, and decided he wanted to get a sociology PhD, came to the University of Chicago. Now, the three months before he came to Chicago, he had spent following the Grateful Dead. And in his own words, he"looked like a freak."He ' s a South Asian — very dark-skinned South Asian. Big man, and he had hair, in his words,"down to his ass."Defied all kinds of boundaries : Was he black or white? Was he man or woman? He was really a curious sight to be seen. So he showed up at the University of Chicago, and the famous sociologist William Julius Wilson was doing a book that involved surveying people all across Chicago. He took one look at Sudhir, who was going to go do some surveys for him, and decided he knew exactly the place to send him, which was to one of the toughest, most notorious housing projects not just in Chicago, but in the entire United States. So Sudhir, the suburban boy who had never really been in the inner city, dutifully took his clipboard and walked down to this housing project, gets to the first building. The first building? Well, there ’ s nobody there. But he hears some voices up in the stairwell, so he climbs up the stairwell, comes around the corner, and finds a group of young African-American men playing dice. This is about 1990, peak of the crack epidemic. This is a very dangerous job, being in a gang. You don ’ t like to be surprised. You don ’ t like to be surprised by people who come around the corner. And the mantra was : shoot first ; ask questions later. Now, Sudhir was lucky — he was such a freak, and that clipboard probably saved his life, because they figured no other rival gang member would be coming up to shoot at them with a clipboard. So his greeting was not particularly warm, but they did say, well, OK — let ’ s hear your questions on your survey. So — I kid you not — the first question on the survey that he was sent to ask was :”How do you feel about being poor and Black in America?”Makes you wonder about academics. So the choice of answers were : [A) Very Good B) Good C) Bad D) Very Bad] What Sudhir found out is, in fact, that the real answer was the following : [A) Very Good B) Good C) Bad D) Very Bad E) Fuck you] The survey was not, in the end, going to be what got Sudhir off the hook. He was held hostage overnight in the stairwell. There was a lot of gunfire, there were a lot of philosophical discussions he had with the gang members. By morning, the gang leader arrived, checked out Sudhir, decided he was no threat, and they let him go home. So Sudhir went home, took a shower, took a nap. And you and I, probably, faced with the situation, would think,”I guess I ’ m going to write my dissertation on The Grateful Dead, I ’ ve been following them for the last three months.”Sudhir, on the other hand, got right back, walked down to the housing project, went up to the second floor, and said :”Hey, guys, I had so much fun hanging out with you last night, I wonder if I could do it again tonight.”And that was the beginning of what turned out to be a beautiful relationship that involved Sudhir living in the housing project on and off for 10 years, hanging out in crack houses, going to jail with the gang members, having the windows shot out of his car, having the police break into his apartment and steal his computer disks — you name it. But ultimately, the story has a happy ending for Sudhir, who became one of the most respected sociologists in the country. And especially for me, as I sat in my office with my Excel spreadsheet open, waiting for Sudhir to come and deliver to me the latest load of data that he would get from the gang. It was one of the most unequal co-authoring relationships ever — But I was glad to be the beneficiary of it. So what did we find? What did we find in the gang? Well, let me say one thing : We really got **access** to everybody in the gang. We got an inside look at the gang, from the very bottom up to the very top. They trusted Sudhir, in ways that really no academic has ever — or really anybody, any outsider — has ever earned the trust of these gangs, to the point where they actually opened up what was most interesting for me — their books, the financial records they kept. They made them available to us, and we not only could study them, but we could ask them questions about what was in them. So if I have to kind of summarize very quickly in the short time I have what the bottom line of what I take away from the gang is, it ’ s that, if I had to draw a parallel between the gang and any other organization, it would be that the gang is just like McDonald ’ s, in a lot of different respects — the restaurant McDonald ’ s. So first, in one way, which isn ’ t maybe the most interesting way, but it ’ s a good way to start — is in the way it ’ s organized, the hierarchy of the gang, the way it looks. So here ’ s what the org chart of the gang looks like. I don ’ t know if you know much about org charts, but if you were to assign a stripped- down and simplified McDonald ’ s org chart, this is exactly what it would look like. It ’ s amazing, but the top level of the gang, they actually call themselves the”Board of Directors.”And Sudhir says it ’ s not like these guys had a very sophisticated view of what happened in American corporate life, but they had seen movies like”Wall Street,”and they had learned a little bit about what it was like to be in the real world. Now, below that board of directors, you ’ ve got essentially what are regional VPs — people who control, say, the South Side of Chicago, or the West Side of Chicago. Sudhir got to know very well the guy who had the unfortunate assignment of trying to take the Iowa franchise, which, it turned out, for this black gang, was not one of the more brilliant financial endeavors they undertook. But the thing that really makes the gang seem like McDonald ’ s is its franchisees. The guys who are running the local gangs — the four-square-block by four-square-block areas — they ’ re just like the guys, in some sense, who are running the McDonald ’ s. They are the entrepreneurs. They get the exclusive property rights to control the drug-selling. They get the name of the gang behind them, for merchandising and marketing. And they ’ re the ones who basically make the profit or lose a profit, depending on how good they are at running the business. Now, the group I really want you to think about, though, are the ones at the bottom — the foot soldiers. These are the teenagers, typically, who ’ d be standing out on the **street** corner, selling the drugs. Extremely dangerous work. And important to note is that almost all of the weight, all of the people in this organization are at the bottom — just like McDonald ’ s. So in some sense, the foot soldiers are a lot like the people who are taking your order at McDonald ’ s, and it ’ s not just by chance that they ’ re like them. In fact, in these **neighborhoods**, they ’ d be the same people. So the same kids who are working in the gang were actually, at the very same time, typically working part-time at a place like McDonald ’ s. Which already foreshadows the main result that I ’ ve talked about, about what a crappy job it was, being in the gang. Because obviously, if being in the gang were such a wonderful, lucrative job, why in the world would these guys moonlight at McDonald ’ s? So what do the wages look like? You might be surprised. But based on being able to talk to them and to see their records, this is what it looks like in terms of the wages. The hourly wage the foot soldiers were earning was $3. 50 an hour. It was below the minimum wage. And this is well-documented. It ’ s easy to see by the patterns of consumption they have. It really is not fiction — it ’ s fact. There was very little money in the gang, especially at the bottom. Now if you managed to rise up, say, and be that local leader, the guy who ’ s the equivalent of the McDonald ’ s franchisee, you ’ d be making 100, 000 dollars a year. And that, in some ways, was the best job you could hope to get if you were growing up in one of these **neighborhoods** as a young black male. If you managed to rise to the very top, 200, 000 or 400, 000 dollars a year is what you ’ d hope to make. Truly, you would be a great success story. And one of the sad parts of this is that, indeed, among the many other ramifications of crack cocaine is that the most talented individuals in these communities — this is what they were striving for. They weren ’ t trying to make it in legitimate ways, because there were no legitimate channels out. This was the best way out. And it actually was the right choice, probably, to try to make it out this way. You look at this, the relationship to McDonald ’ s breaks down here. The money looks about the same. Why is it such a bad job? Well, the reason it ’ s such a bad job is that there ’ s somebody shooting at you a lot of the time. So, with shooting at you, what are the death rates? We found, in our gang — and admittedly, this was not really a standard situation ; this was a time of intense **violence**, of a lot of gang wars, as this gang actually became quite successful. But there were costs. And so the death rate — not to mention the rate of being arrested, sent to prison, being wounded — the death rate in our sample was seven percent per person per year. You ’ re in the gang for four years, you expect to die with about a 25 percent likelihood. That is about as high as you can get. So for comparison ’ s purposes, let ’ s think about some other walk of life you may expect might be extremely risky. Let ’ s say that you were a murderer and you were **convicted** of murder, and you ’ re sent to death row. It turns out, the death rates on death row from all causes, including execution : two percent a year. So it ’ s a lot safer being on death row than it is selling drugs out on the **street**. That gives you some pause, for those of you who believe that a death penalty ’ s going to have an **enormous** deterrent effect on crime. To give you a sense of just how bad the inner city was during crack — and I ’ m not really focusing on the negatives, but really, there ’ s another story to tell you there — if you look at the death rates just of random, young black males growing up in the inner city in the United States, the death rates during crack were about one percent. That ’ s extremely high. And this is **violent** death — it ’ s unbelievable, in some sense. To put it into perspective : if you compare this to the soldiers in Iraq, for instance, right now fighting the war : 0. 5 percent. So in some very literal way, the young black men who were growing up in this country were living in a war zone, very much in the sense that the soldiers over in Iraq are fighting in a war. So why in the world, you might ask, would anybody be willing to stand out on a **street** corner selling drugs for $3. 50 an hour, with a 25 percent chance of dying over the next four years? Why would they do that? And I think there are a couple answers. I think the first one is that they got fooled by history. It used to be the gang was a rite of passage ; that the young people controlled the gang ; that as you got older, you dropped out of the gang. So what happened was, the people who happened to be in the right place at the right time — the people who happened to be leading the gang in the mid-to-late- ’ 80s — became very, very wealthy. And so the logical thing to think was that they are going to age out of the gang like everybody else has, and the next generation is going to take over and get the wealth. There are striking similarities, I think, to the Internet boom. The first set of people in Silicon Valley got very, very rich. And then all of my friends said,”Maybe I should go do that, too.”And they were willing to work very cheap for stock options that never came. In some sense, that ’ s what happened, exactly, to the set of people we were looking at. They were willing to start at the bottom, just like, say, a first-year lawyer at a law firm is willing to start at the bottom, work 80-hour weeks for not that much money, because they think they ’ re going to make partner. But the rules changed, and they never got to make partner. Indeed, the same people who were running all of the major gangs in the late 1980s are still running the major gangs in Chicago today. They never passed on any of the wealth, So everybody got stuck at that $3. 50-an-hour job, and it turned out to be a disaster. The other thing the gang was very good at was marketing and trickery. And so for instance, one thing the gang would do is — the gang leaders would have big entourages, and they ’ d drive fancy cars and have fancy jewelry. So what Sudhir eventually realized as he hung out with them more, is that, really, they didn ’ t own those cars — they just leased them, because they couldn ’ t afford to own the fancy cars. And they didn ’ t really have gold jewelry, they had gold- plated jewelry. It goes back to, you know, the real-real versus the fake-real. And really, they did all sorts of things to trick the young people into thinking what a great deal the gang was going to be. So for instance, they would give a 14-year-old kid a whole roll of bills to hold. That 14-year-old kid would say to his friends,”Hey, look at all the money I got in the gang.”It wasn ’ t his money — until he spent it, and then he was in debt to the gang, and was sort of an indentured servant for a while. So I have a couple minutes. Let me do one last thing I hadn ’ t thought I ’ d have time to do, which is to talk about what we learned more generally about economics, from the study of the gang. So, economists tend to talk in technical words. Often, our theories fail quite miserably when we over the data, but what ’ s kind of interesting is that in this setting, it turned out that some of the economic theories that worked not so well in the real economy worked very well in the drug economy, in some sense, because it ’ s unfettered capitalism. Here ’ s an economic principle. This is one of the basic ideas in labor economics, called a”compensating differential.”It ’ s the idea that the increment to wages that a worker requires to leave him indifferent between performing two tasks, one which is more unpleasant than the other. Compensating differential — it ’ s why we think garbagemen might be paid more than people who work in parks. The words of one of the members of the gang, I think, make this clear. So it turns out — I ’ m sort of getting ahead of myself — it turns out, in the gang, when there ’ s a war going on, they actually pay the foot soldiers twice as much money. It ’ s exactly this concept. Because they ’ re not willing to be at risk. And the words of a gang member capture it quite nicely, he says :”Would you stand around here when all this shit...”— the shooting —”... if all this shit ’ s going on? No, right? So if I gonna be asked to put my life on the line, then front me the cash, man.”I think the gang member says it much more articulately than the economist, about what ’ s going on. Here ’ s another one. Economists talk about game theory, that every two-person game has a Nash equilibrium. Here ’ s the translation you get from the gang member. They ’ re talking about the decision of why they don ’ t go shoot — One thing that turns out to be a great business tactic in the gang : if you go and just shoot guns in the air in the other gang ’ s territory — people are afraid to go buy drugs there, they ’ re going to come into your **neighborhood**. Here ’ s what he says about why they don ’ t do that :”If we start shooting around there, the other gang ’ s territory, nobody, I mean, you dig it, nobody gonna step on their turf. But we gotta be careful, ’ cause they can shoot around here too and then we all fucked.”So that ’ s the same concept. Then again, sometimes economists get it wrong. One thing we observed in the data is that it looked like — the gang leader always got paid. No matter how bad it was economically, he always got himself paid. We had some theories related to cash flow, and lack of **access** to capital markets, and things like that. Then we asked the gang member,”Why is it you always get paid and your workers don ’ t always get paid?”His response is,”You got all these niggers below you who want your job, you dig? If you start taking losses, they see you as weak and shit.”And I thought about it and said,”CEOs often pay themselves million-dollar bonuses, even when companies are losing a lot of money. And it never would really occur to an economist that this idea of ’ weak and shit ’ could really be important.”Maybe”weak and shit”is an important hypothesis that needs more analysis. Thank you very much.

Text Sample 409: POS Dim 3 – 2003 – Score 10.00 – 2003/t000244.txt

A year ago, I spoke to you about a book that I was just in the process of completing, that has come out in the interim, and I would like to talk to you today about some of the controversies that that book inspired. The book is called”The Blank Slate,”based on the popular idea that the human mind is a blank slate, and that all of its structure comes from socialization, culture, parenting, experience. The”blank slate”was an influential idea in the 20th century. Here are a few quotes indicating that :”Man has no nature,”from the historian Jose Ortega y Gasset ;”Man has no instincts,”from the anthropologist Ashley Montagu ;”The human brain is capable of a full range of behaviors and predisposed to none,”from the late scientist Stephen Jay Gould. There are a number of reasons to doubt that the human mind is a blank slate, and some of them just come from common sense. As many people have told me over the years, anyone who ' s had more than one child knows that kids come into the world with certain temperaments and talents ; it doesn ' t all come from the outside. Oh, and anyone who has both a child and a house pet has surely noticed that the child, exposed to speech, will acquire a human language, whereas the house pet won ' t, presumably because of some innate different between them. And anyone who ' s ever been in a heterosexual relationship knows that the minds of men and the minds of women are not indistinguishable. There are also, I think, increasing results from the scientific study of humans that, indeed, we ' re not born blank slates. One of them, from anthropology, is the study of human universals. If you ' ve ever taken anthropology, you know that it ' s a — kind of an occupational pleasure of anthropologists to show how exotic other cultures can be, and that there are places out there where, supposedly, everything is the opposite to the way it is here. But if you instead look at what is common to the world ' s cultures, you find that there is an enormously rich set of behaviors and emotions and ways of construing the world that can be found in all of the world ' s 6, 000-odd cultures. The anthropologist Donald Brown has tried to list them all, and they range from aesthetics, affection and age statuses all the way down to weaning, weapons, weather, attempts to control, the color white and a worldview. Also, genetics and neuroscience are increasingly showing that the brain is intricately structured. This is a recent study by the neurobiologist Paul Thompson and his colleagues in which they — using MRI — measured the distribution of gray matter — that is, the outer layer of the cortex — in a large sample of pairs of people. They coded correlations in the thickness of gray matter in different parts of the brain using a false color scheme, in which no difference is coded as purple, and any color other than purple indicates a statistically significant correlation. Well, this is what happens when you pair people up at random. By definition, two people picked at random can ' t have correlations in the distribution of gray matter in the cortex. This is what happens in people who share half of their DNA — fraternal twins. And as you can see, large amounts of the brain are not purple, showing that if one person has a thicker bit of cortex in that region, so does his fraternal twin. And here ' s what happens if you get a pair of people who share all their DNA — namely, clones or identical twins. And you can see huge areas of cortex where there are massive correlations in the distribution of gray matter. Now, these aren ' t just differences in anatomy, like the shape of your ear lobes, but they have consequences in thought and behavior that are well illustrated in this famous cartoon by Charles Addams :"Separated at birth, the Mallifert twins meet accidentally."As you can see, there are two inventors with identical contraptions in their lap, meeting in the waiting room of a patent attorney. Now, the cartoon is not such an exaggeration, because studies of identical twins who were separated at birth and then tested in adulthood show that they have astonishing similarities. And this happens in every pair of identical twins separated at birth ever studied — but much less so with fraternal twins separated at birth. My favorite example is a pair of twins, one of whom was brought up as a Catholic in a Nazi family in Germany, the other brought up in a Jewish family in Trinidad. When they walked into the lab in Minnesota, they were wearing identical navy blue shirts with epaulettes ; both of them liked to dip buttered toast in coffee, both of them kept rubber bands around their wrists, both of them flushed the toilet before using it as well as after, and both of them liked to surprise people by sneezing in crowded elevators to watch them jump. Now — the story might seem to good to be true, but when you administer batteries of psychological tests, you get the same results — namely, identical twins separated at birth show quite astonishing similarities. Now, given both the common sense and scientific data calling the doctrine of the blank slate into question, why should it have been such an appealing notion? Well, there are a number of political reasons why people have found it congenial. The foremost is that if we ’ re blank slates, then, by definition, we are **equal**, because zero **equals** zero **equals** zero. But if something is written on the slate, then some people could have more of it than others, and according to this line of thinking, that would justify **discrimination** and inequality. Another political fear of human nature is that if we are blank slates, we can perfect mankind — the age-old dream of the perfectibility of our species through social engineering. Whereas, if we ’ re born with certain instincts, then perhaps some of them might condemn us to selfishness, **prejudice** and **violence**. Well, in the book, I argue that these are, in fact, non sequiturs. And just to make a long story short : first of all, the concept of **fairness** is not the same as the concept of sameness. And so when Thomas Jefferson wrote in the Declaration of Independence,”We hold these truths to be self-evident, that all men are created **equal**,”he did not mean”We hold these truths to be self- evident, that all men are clones.”Rather, that all men are **equal** in terms of their rights, and that every person ought to be treated as an individual, and not prejudged by the statistics of particular groups that they may belong to. Also, even if we were born with certain ignoble motives, they don ’ t automatically lead to ignoble behavior. That is because the human mind is a complex system with many parts, and some of them can inhibit others. For example, there ’ s excellent reason to believe that virtually all humans are born with a moral sense, and that we have cognitive abilities that allow us to profit from the lessons of history. So even if people did have impulses towards selfishness or greed, that ’ s not the only thing in the skull, and there are other parts of the mind that can counteract them. In the book, I go over controversies such as this one, and a number of other hot buttons, hot zones, Chernobyls, third rails, and so on — including the arts, cloning, crime, free will, education, evolution, gender differences, God, homosexuality, infanticide, inequality, Marxism, morality, Nazism, parenting, politics, race, rape, religion, resource depletion, social engineering, technological risk and war. And needless to say, there were certain risks in taking on these subjects. When I wrote a first draft of the book, I circulated it to a number of colleagues for comments, and here are some of the reactions that I got :”Better get a security camera for your house.””Don ’ t expect to get any more awards, job offers or positions in scholarly societies.””Tell your publisher not to list your hometown in your author bio.””Do you have tenure?”Well, the book came out in October, and nothing terrible has happened. I — I like — There was indeed reason to be nervous, and there were moments in which I did feel nervous, knowing the history of what has happened to people who ’ ve taken controversial stands or discovered disquieting findings in the behavioral sciences. There are many cases, some of which I talk about in the book, of people who have been slandered, called Nazis, physically **assaulted**, threatened with criminal prosecution for stumbling across or arguing about controversial findings. And you never know when you ’ re going to come across one of these booby traps. My favorite example is a pair of psychologists who did research on left-handers, and published some data showing that left-handers are, on average, more susceptible to disease, more prone to accidents and have a shorter lifespan. It ’ s not clear, by the way, since then, whether that is an accurate generalization, but the data at the time seemed to support that. Well, pretty soon they were barraged with enraged letters, death threats, ban on the topic in a number of scientific journals, coming from irate left-handers and their advocates, and they were literally afraid to open their mail because of the venom and vituperation that they had inadvertently inspired. Well, the night is young, but the book has been out for half a year, and nothing terrible has happened. None of the dire professional consequences has taken place — I haven ' t been exiled from the city of Cambridge. But what I wanted to talk about are two of these hot buttons that have aroused the strongest response in the 80-odd reviews that The Blank Slate has received. I ' ll just put that list up for a few seconds, and see if you can guess which two — I would estimate that probably two of these topics inspired probably 90 percent of the reaction in the various reviews and radio interviews. It ' s not **violence** and war, it ' s not race, it ' s not gender, it ' s not Marxism, it ' s not Nazism. They are : the arts and parenting. So let me tell you what aroused such irate responses, and I ' ll let you decide if whether they — the claims are really that outrageous. Let me start with the arts. I note that among the long list of human universals that I presented a few slides ago are art. There is no society ever discovered in the remotest corner of the world that has not had something that we would consider the arts. Visual arts — decoration of surfaces and bodies — appears to be a human universal. The telling of stories, music, dance, poetry — found in all cultures, and many of the motifs and themes that give us pleasure in the arts can be found in all human societies : a preference for symmetrical forms, the use of repetition and variation, even things as specific as the fact that in poetry all over the world, you have lines that are very close to three seconds long, separated by pauses. Now, on the other hand, in the second half of the 20th century, the arts are frequently said to be in decline. And I have a collection, probably 10 or 15 headlines, from highbrow magazines deploring the fact that the arts are in decline in our time. I ' ll give you a couple of representative quotes :"We can assert with some confidence that our own period is one of decline, that the standards of culture are lower than they were 50 years ago, and that the evidences of this decline are visible in every department of human activity."That ' s a quote from T. S. Eliot, a little more than 50 years ago. And a more recent one :"The possibility of sustaining high culture in our time is becoming increasing problematical. Serious book stores are losing their franchise, **nonprofit** theaters are surviving primarily by commercializing their repertory, symphony orchestras are diluting their programs, public television is increasing its dependence on reruns of British sitcoms, classical radio stations are dwindling, museums are resorting to blockbuster shows, dance is dying."That ' s from Robert Brustein, the famous drama critic and director, in The New Republic about five years ago. Well, in fact, the arts are not in decline. I don ' t think this will as a surprise to anyone in this room, but by any standard they have never been flourishing to a greater extent. There are, of course, entirely new art forms and new media, many of which you ' ve heard over these few days. By any economic standard, the demand for art of all forms is skyrocketing, as you can tell from the price of **opera** tickets, by the number of books sold, by the number of books published, the number of musical titles released, the number of new albums and so on. The only grain of truth to this complaint that the arts are in decline come from three spheres. One of them is in elite art since the 1930s — say, the kinds of works performed by major symphony orchestras, where most of the repertory is before 1930, or the works shown in major galleries and prestigious museums. In literary criticism and analysis, probably 40 or 50 years ago, literary critics were a kind of cultural hero ; now they ' re kind of a national joke. And the humanities and arts programs in the universities, which by many measures, indeed are in decline. Students are staying away in droves, universities are disinvesting in the arts and humanities. Well, here ' s a diagnosis. They didn ' t ask me, but by their own admission, they need all the help that they can get. And I would like to suggest that it ' s not a coincidence that this supposed decline in the elite arts and criticism occurred in the same point in history in which there was a widespread denial of human nature. A famous quotation can be found — if you look on the web, you can find it in literally scores of English core syllabuses —"In or about December 1910, human nature changed."A paraphrase of a quote by Virginia Woolf, and there ' s some debate as to what she actually meant by that. But it ' s very clear, looking at these syllabuses, that — it ' s used now as a way of saying that all forms of appreciation of art that were in place for centuries, or millennia, in the 20th century were discarded. The beauty and pleasure in art — probably a human universal — were — began to be considered saccharine, or kitsch, or commercial. Barnett Newman had a famous quote that"the impulse of modern art is the desire to destroy beauty"— which was considered bourgeois or tacky. And here ' s just one example. I mean, this is perhaps a representative example of the visual depiction of the female form in the 15th century ; here is a representative example of the depiction of the female form in the 20th century. And, as you can see, there — something has changed in the way the elite arts appeal to the senses. Indeed, in movements of modernism and post-modernism, there was visual art without beauty, literature without narrative and plot, poetry without meter and rhyme, architecture and planning without ornament, human scale, green space and natural light, music without melody and rhythm, and criticism without clarity, attention to aesthetics and insight into the human condition. Let me give just you an example to back up that last statement. But here, there — one of the most famous literary English scholars of our time is the Berkeley professor, Judith Butler. And here is an example of one of her analyses :"The move from a structuralist account in which capital is understood to structure social relations in relatively homologous ways to a view of hegemony in which power relations are subject to repetition, convergence and rearticulation brought the question of temporality into the thinking of structure, and marked a shift from the form of Althusserian theory that takes structural totalities as theoretical objects..."Well, you get the idea. By the way, this is one sentence — you can actually parse it. Well, the argument in"The Blank Slate"was that elite art and criticism in the 20th century, although not the arts in general, have disdained beauty, pleasure, clarity, insight and style. People are staying away from elite art and criticism. What a puzzle — I wonder why. Well, this turned out to be probably the most controversial claim in the book. Someone asked me whether I stuck it in in order to deflect ire from discussions of gender and Nazism and race and so on. I won ' t comment on that. But it certainly inspired an energetic reaction from many university professors. Well, the other hot button is parenting. And the starting point is the — for that discussion was the fact that we have all been subject to the advice of the parenting industrial complex. Now, here is — here is a representative quote from a besieged mother :"I ' m overwhelmed with parenting advice. I ' m supposed to do lots of physical activity with my kids so I can instill in them a physical fitness habit so they ' ll grow up to be healthy adults. And I ' m supposed to do all kinds of intellectual play so they ' ll grow up smart. And there are all kinds of play — clay for finger dexterity, word games for reading success, large motor play, small motor play. I feel like I could devote my life to figuring out what to play with my kids."I think anyone who ' s recently been a parent can sympathize with this mother. Well, here ' s some sobering facts about parenting. Most studies of parenting on which this advice is based are useless. They ' re useless because they don ' t control for heritability. They measure some correlation between what the parents do, how the children turn out and assume a causal relation : that the parenting shaped the child. Parents who talk a lot to their kids have kids who grow up to be articulate, parents who spank their kids have kids who grow up to be **violent** and so on. And very few of them control for the possibility that parents pass on genes for — that increase the chances a child will be articulate or **violent** and so on. Until the studies are redone with adoptive children, who provide an environment but not genes to their kids, we have no way of knowing whether these conclusions are valid. The genetically controlled studies have some sobering results. Remember the Mallifert twins : separated at birth, then they meet in the patent office — remarkably similar. Well, what would have happened if the Mallifert twins had grown up together? You might think, well, then they ' d be even more similar, because not only would they share their genes, but they would also share their environment. That would make them super-similar, right? Wrong. Identical twins, or any **siblings**, who are separated at birth are no less similar than if they had grown up together. Everything that happens to you in a given home over all of those years appears to leave no permanent stamp on your personality or intellect. A complementary finding, from a completely different methodology, is that adopted **siblings** reared together — the mirror image of identical twins reared apart, they share their parents, their home, their **neighborhood**, don ' t share their genes — end up not similar at all. OK — two different bodies of research with a similar finding. What it suggests is that children are shaped not by their parents over the long run, but in part — only in part — by their genes, in part by their culture — the culture of the country at large and the children ' s own culture, namely their peer group — as we heard from Jill Sobule earlier today, that ' s what kids care about — and, to a very large extent, larger than most people are prepared to acknowledge, by chance : chance events in the wiring of the brain in utero ; chance events as you live your life. So let me conclude with just a remark to bring it back to the theme of choices. I think that the sciences of human nature — behavioral genetics, evolutionary psychology, neuroscience, cognitive science — are going to, increasingly in the years to come, upset various dogmas, careers and deeply-held political belief systems. And that presents us with a choice. The choice is whether certain facts about humans, or topics, are to be considered taboos, forbidden knowledge, where we shouldn ' t go there because no good can come from it, or whether we should explore them honestly. I have my own answer to that question, which comes from a great artist of the 19th century, Anton Chekhov, who said,"Man will become better when you show him what he is like."And I think that the argument can ' t be put any more eloquently than that. Thank you very much.

Text Sample 410: POS Dim 3 – 2003 – Score 9.00 – 2003/t000451.txt

You know, one of the intense pleasures of travel and one of the delights of ethnographic research is the opportunity to live amongst those who have not forgotten the old ways, who still feel their past in the wind, touch it in stones polished by rain, taste it in the **bitter** leaves of plants. Just to know that Jaguar shamans still journey beyond the Milky Way, or the myths of the Inuit elders still resonate with meaning, or that in the Himalaya, the Buddhists still pursue the breath of the Dharma, is to really remember the central revelation of anthropology, and that is the idea that the world in which we live does not exist in some absolute sense, but is just one model of reality, the consequence of one particular set of adaptive choices that our lineage made, albeit successfully, many generations ago. And of course, we all share the same adaptive imperatives. We ' re all born. We all bring our children into the world. We go through initiation rites. We have to deal with the inexorable separation of death, so it shouldn ' t surprise us that we all **sing**, we all dance, we all have art. But what

’ s interesting is the unique cadence of the song, the rhythm of the dance in every culture. And whether it is the Penan in the forests of Borneo, or the Voodoo acolytes in Haiti, or the warriors in the Kaisut desert of Northern Kenya, the Curandero in the mountains of the Andes, or a caravanserai in the middle of the Sahara — this is incidentally the fellow that I traveled into the desert with a month ago — or indeed a yak herder in the slopes of Qomolangma, Everest, the goddess mother of the world. All of these peoples teach us that there are other ways of being, other ways of thinking, other ways of orienting yourself in the Earth. And this is an idea, if you think about it, can only fill you with hope. Now, together the myriad cultures of the world make up a web of spiritual life and cultural life that envelops the planet, and is as important to the well-being of the planet as indeed is the biological web of life that you know as a biosphere. And you might think of this cultural web of life as being an ethnosphere, and you might define the ethnosphere as being the sum total of all thoughts and dreams, myths, ideas, inspirations, intuitions brought into being by the human imagination since the dawn of consciousness. The ethnosphere is humanity ’ s great legacy. It ’ s the symbol of all that we are and all that we can be as an astonishingly inquisitive species. And just as the biosphere has been severely eroded, so too is the ethnosphere — and, if anything, at a far greater rate. No biologists, for example, would dare suggest that 50 percent of all species or more have been or are on the brink of extinction because it simply is not true, and yet that — the most apocalyptic scenario in the realm of biological diversity — scarcely approaches what we know to be the most optimistic scenario in the realm of cultural diversity. And the great indicator of that, of course, is language loss. When each of you in this room were born, there were 6, 000 languages spoken on the planet. Now, a language is not just a body of vocabulary or a set of grammatical rules. A language is a flash of the human spirit. It ’ s a vehicle through which the soul of each particular culture comes into the material world. Every language is an old-growth forest of the mind, a watershed, a thought, an ecosystem of spiritual possibilities. And of those 6, 000 languages, as we sit here today in Monterey, fully half are no longer being whispered into the ears of children. They ’ re no longer being taught to babies, which means, effectively, unless something changes, they ’ re already dead. What could be more lonely than to be enveloped in **silence**, to be the last of your people to speak your language, to have no way to pass on the wisdom of the ancestors or anticipate the promise of the children? And yet, that dreadful fate is indeed the plight of somebody somewhere on Earth roughly every two weeks, because every two weeks, some elder dies and carries with him into the grave the last syllables of an ancient tongue. And I know there ’ s some of you who say,”Well, wouldn ’ t it be better, wouldn ’ t the world be a better place if we all just spoke one language?”And I say,”Great, let ’ s make that language Yoruba. Let ’ s make it Cantonese. Let ’ s make it Kogi.”And you ’ ll suddenly discover what it would be like to be unable to speak your own language. And so, what I ’ d like to do with you today is sort of take you on a journey through the ethnosphere, a brief journey through the ethnosphere, to try to begin to give you a sense of what in fact is being lost. Now, there are many of us who sort of forget that when I say”different ways of being,”I really do mean different ways of being. Take, for example, this child of a Barasana in the Northwest Amazon, the people of the anaconda who believe that mythologically they came up the milk river from the east in the belly of sacred snakes. Now, this is a people who cognitively do not distinguish the color blue from the color green because the canopy of the heavens is equated to the canopy of the forest upon which the people depend. They have a curious language and marriage rule which is called”linguistic exogamy :”you must marry someone who speaks a different language. And this is all rooted in the mythological past, yet the curious thing is in these long houses, where there are six or seven languages spoken because of intermarriage, you never hear anyone practicing a language. They simply listen and then begin to speak. Or, one of the most fascinating tribes I ever lived with, the Waorani of northeastern Ecuador, an astonishing people first contacted peacefully in 1958. In 1957, five missionaries attempted contact and made a critical mistake. They dropped from the air 8 x 10 glossy photographs of themselves in what we would say to be friendly gestures, forgetting that these people of the rainforest had never seen anything two-dimensional in their lives. They picked up these photographs from the forest floor, tried to look behind the face to find the form or the figure, found nothing, and concluded that these were calling cards from the devil, so they speared the five missionaries to death. But the Waorani didn ’ t just spear outsiders. They speared each other. 54 percent of their mortality was due to them spearing each other. We traced genealogies back eight generations, and we found two instances of natural death and when we pressured the people a little bit about it, they admitted that one of the fellows had gotten so old that he died getting old, so we speared him anyway. But at the same time they had a perspicacious knowledge of the forest that was astonishing. Their hunters could smell animal urine at 40 paces and tell you what species left it behind. In the early ’ 80s, I had a really astonishing assignment when I was asked by my professor at Harvard if I was interested in going down to Haiti, infiltrating the secret societies which were the foundation of Duvalier ’ s strength and Tonton Macoutes, and securing the poison used to make zombies. In order to make sense out of sensation, of course, I had to understand something about this remarkable faith of Vodoun. And Voodoo is not a black magic cult. On the contrary, it ’ s a complex metaphysical worldview. It ’ s interesting. If I asked you to name the great religions of the world, what would you say? Christianity, Islam, Buddhism, Judaism, whatever. There ’ s always one continent left out, the assumption being that sub-Saharan Africa had no religious beliefs. Well, of course, they did and Voodoo is simply the distillation of these very profound religious ideas that came over during the tragic Diaspora of the slavery era. But, what makes Voodoo so interesting is that it ’ s this living relationship between the living and the dead. So, the living give birth to the spirits. The spirits can be invoked from beneath the Great Water, responding to the rhythm of the dance to momentarily displace the soul of the living, so that for that brief shining moment, the acolyte becomes the god. That ’ s why the Voodooists like to say that”You white people go to church and speak about God. We dance in the temple and become God.”And because you are possessed, you are taken by the spirit — how can you be **harmed**? So you see these astonishing demonstrations : Voodoo acolytes in a state of trance handling burning embers with impunity, a rather astonishing demonstration of the ability of the mind to affect the body that bears it when catalyzed in the state of extreme excitation. Now, of all the peoples that I ’ ve ever been with, the most extraordinary are the Kogi of the Sierra Nevada de Santa Marta in northern Colombia. Descendants of the ancient Tairona civilization which once carpeted the Caribbean coastal plain of Colombia, in the wake of the conquest, these people retreated into an isolated volcanic massif that soars above the Caribbean coastal plain. In a bloodstained continent, these people alone were never conquered by the Spanish. To this day, they remain ruled by a ritual priesthood but the training for the priesthood is rather extraordinary. The young acolytes are taken away from their families at the age of three and four, sequestered in a shadowy world of **darkness** in stone huts at the base of glaciers for 18 years : two nine-year periods deliberately chosen to mimic the nine months of gestation they spend in their natural mother ’ s womb ; now they are metaphorically in the womb of the great mother. And for this entire time, they are inculturated into the values of their society, values that maintain the proposition that their **prayers** and their **prayers** alone maintain the cosmic — or we might say the ecological — balance. And at the end of this amazing initiation, one day they ' re suddenly taken out and for the first time in their lives, at the age of 18, they see a sunrise. And in that crystal moment of awareness of first light as the Sun begins to bathe the slopes of the stunningly beautiful landscape, suddenly everything they have learned in the abstract is affirmed in stunning glory. And the priest steps back and says,"You see? It ' s really as I ' ve told you. It is that beautiful. It is yours to protect."They call themselves the"elder brothers"and they say we, who are the younger brothers, are the ones responsible for destroying the world. Now, this level of intuition becomes very important. Whenever we think of **indigenous** people and landscape, we either invoke Rousseau and the old canard of the"noble savage,"which is an idea racist in its simplicity, or alternatively, we invoke Thoreau and say these people are closer to the Earth than we are. Well, **indigenous** people are neither sentimental nor weakened by nostalgia. There ' s not a lot of room for either in the malarial swamps of the Asmat or in the chilling winds of Tibet, but they have, nevertheless, through time and ritual, forged a traditional mystique of the Earth that is based not on the idea of being self-consciously close to it, but on a far subtler intuition : the idea that the Earth itself can only exist because it is breathed into being by human consciousness. Now, what does that mean? It means that a young kid from the Andes who ' s raised to believe that that mountain is an Apu spirit that will direct his or her destiny will be a profoundly different human being and have a different relationship to that resource or that place than a young kid from Montana raised to believe that a mountain is a pile of rock ready to be mined. Whether it ' s the abode of a spirit or a pile of ore is irrelevant. What ' s interesting is the metaphor that defines the relationship between the individual and the natural world. I was raised in the forests of British Columbia to believe those forests existed to be cut. That made me a different human being than my friends amongst the Kwagiulth who believe that those forests were the abode of Huxwhukw and the Crooked Beak of Heaven and the cannibal spirits that dwelled at the north end of the world, spirits they would have to engage during their Hamatsa initiation. Now, if you begin to look at the idea that these cultures could create different realities, you could begin to understand some of their extraordinary discoveries. Take this plant here. It ' s a photograph I took in the Northwest Amazon just last April. This is ayahuasca, which many of you have heard about, the most powerful psychoactive preparation of the shaman ' s repertoire. What makes ayahuasca fascinating is not the sheer pharmacological potential of this preparation, but the elaboration of it. It ' s made really of two different sources : on the one hand, this woody liana which has in it a series of beta- carbolines, harmine, harmaline, mildly hallucinogenic — to take the vine alone is rather to have sort of blue hazy smoke drift across your consciousness — but it ' s mixed with the leaves of a shrub in the coffee family called Psychotria viridis. This plant had in it some very powerful tryptamines, very close to brain serotonin, dimethyltryptamine, 5-methoxydimethyltryptamine. If you ' ve ever seen the Yanomami blowing that snuff up their noses, that substance they make from a different set of species also contains methoxydimethyltryptamine. To have that powder blown up your nose is rather like being shot out of a rifle barrel lined with baroque paintings and landing on a sea of electricity. It doesn ' t create the distortion of reality ; it creates the dissolution of reality. In fact, I used to argue with my professor, Richard Evan Shultes — who is a man who sparked the psychedelic era with his discovery of the magic mushrooms in Mexico in the 1930s — I used to argue that you couldn ’ t classify these tryptamines as hallucinogenic because by the time you ’ re under the effects there ’ s no one home anymore to experience a hallucination. But the thing about tryptamines is they cannot be taken orally because they ’ re denatured by an enzyme found naturally in the human gut called monoamine oxidase. They can only be taken orally if taken in conjunction with some other chemical that denatures the MAO. Now, the fascinating things are that the beta- carbolines found within that liana are MAO inhibitors of the precise sort necessary to potentiate the tryptamine. So you ask yourself a question. How, in a flora of 80, 000 species of vascular plants, do these people find these two morphologically unrelated plants that when combined in this way, created a kind of biochemical version of the whole being greater than the sum of the parts? Well, we use that great euphemism,”trial and error,”which is exposed to be meaningless. But you ask the Indians, and they say,”The plants talk to us.”Well, what does that mean? This tribe, the Cofan, has 17 varieties of ayahuasca, all of which they distinguish a great distance in the forest, all of which are referable to our eye as one species. And then you ask them how they establish their taxonomy and they say,”I thought you knew something about plants. I mean, don ’ t you know anything?”And I said,”No.”Well, it turns out you take each of the 17 varieties in the night of a full moon, and it **sings** to you in a different key. Now, that ’ s not going to get you a Ph. D. at Harvard, but it ’ s a lot more interesting than counting stamens. Now — — the problem — the problem is that even those of us sympathetic with the plight of **indigenous** people view them as quaint and colorful but somehow reduced to the margins of history as the real world, meaning our world, moves on. Well, the truth is the 20th century, 300 years from now, is not going to be remembered for its wars or its technological innovations, but rather as the era in which we stood by and either actively endorsed or passively accepted the massive destruction of both biological and cultural diversity on the planet. Now, the problem isn ’ t change. All cultures through all time have constantly been engaged in a dance with new possibilities of life. And the problem is not technology itself. The Sioux Indians did not stop being Sioux when they gave up the bow and arrow any more than an American stopped being an American when he gave up the horse and buggy. It ’ s not change or technology that threatens the integrity of the ethnosphere. It is power, the crude face of domination. Wherever you look around the world, you discover that these are not cultures destined to fade away ; these are dynamic living peoples being driven out of existence by identifiable forces that are beyond their capacity to adapt to : whether it ’ s the egregious deforestation in the homeland of the Penan — a nomadic people from Southeast Asia, from Sarawak — a people who lived free in the forest until a generation ago, and now have all been reduced to servitude and prostitution on the banks of the rivers, where you can see the river itself is soiled with the silt that seems to be carrying half of Borneo away to the South China Sea, where the Japanese freighters hang light in the horizon ready to fill their holds with raw logs ripped from the forest — or, in the case of the Yanomami, it ’ s the disease entities that have come in, in the wake of the discovery of gold. Or if we go into the mountains of Tibet, where I ’ m doing a lot of research recently, you ’ ll see it ’ s a crude face of political domination. You know, genocide, the physical extinction of a people is universally condemned, but ethnocide, the destruction of people ’ s way of life, is not only not condemned, it ’ s universally, in many quarters, **celebrated** as part of a development strategy. And you cannot understand the pain of Tibet until you move through it at the ground level. I once travelled 6, 000 miles from Chengdu in Western China overland through southeastern Tibet to Lhasa with a young colleague, and it was only when I got to Lhasa that I understood the face behind the statistics you hear about : 6, 000 sacred monuments torn apart to dust and ashes, 1. 2 million people killed by the cadres during the Cultural Revolution. This young man ' s father had been ascribed to the Panchen Lama. That meant he was instantly killed at the time of the Chinese invasion. His uncle fled with His Holiness in the Diaspora that took the people to Nepal. His mother was incarcerated for the crime of being wealthy. He was smuggled into the jail at the age of two to hide beneath her skirt tails because she couldn ' t bear to be without him. The sister who had done that brave deed was put into an education camp. One day she inadvertently stepped on an armband of Mao, and for that transgression, she was given seven years of hard labor. The pain of Tibet can be impossible to bear, but the redemptive spirit of the people is something to behold. And in the end, then, it really comes down to a choice : do we want to live in a monochromatic world of monotony or do we want to embrace a polychromatic world of diversity? Margaret Mead, the great anthropologist, said, before she died, that her greatest fear was that as we drifted towards this blandly amorphous generic world view not only would we see the entire range of the human imagination reduced to a more narrow modality of thought, but that we would wake from a dream one day having forgotten there were even other possibilities. And it ' s humbling to remember that our species has, perhaps, been around for [150, 000] years. The Neolithic Revolution — which gave us agriculture, at which time we succumbed to the cult of the seed ; the poetry of the shaman was displaced by the prose of the priesthood ; we created hierarchy specialization surplus — is only 10, 000 years ago. The modern industrial world as we know it is barely 300 years old. Now, that shallow history doesn ' t suggest to me that we have all the answers for all of the challenges that will confront us in the ensuing millennia. When these myriad cultures of the world are asked the meaning of being human, they respond with 10, 000 different voices. And it ' s within that song that we will all rediscover the possibility of being what we are : a fully conscious species, fully aware of ensuring that all peoples and all gardens find a way to flourish. And there are great moments of optimism. This is a photograph I took at the northern tip of Baffin Island when I went narwhal hunting with some Inuit people, and this man, Olayuk, told me a marvelous story of his grandfather. The Canadian government has not always been kind to the Inuit people, and during the 1950s, to establish our sovereignty, we forced them into settlements. This old man ' s grandfather refused to go. The family, fearful for his life, took away all of his weapons, all of his tools. Now, you must understand that the Inuit did not fear the cold ; they took advantage of it. The runners of their sleds were originally made of fish wrapped in caribou hide. So, this man ' s grandfather was not intimidated by the Arctic night or the blizzard that was blowing. He simply slipped outside, pulled down his sealskin trousers and defecated into his hand. And as the feces began to freeze, he shaped it into the form of a blade. He put a spray of saliva on the edge of the shit knife and as it finally froze solid, he butchered a dog with it. He skinned the dog and improvised a harness, took the ribcage of the dog and improvised a sled, harnessed up an adjacent dog, and disappeared over the ice floes, shit knife in belt. Talk about getting by with nothing. And this, in many ways — — is a symbol of the resilience of the Inuit people and of all **indigenous** people around the world. The Canadian government in April of 1999 gave back to total control of the Inuit an area of land larger than California and Texas put together. It ' s our new homeland. It ' s called Nunavut. It ' s an independent territory. They control all mineral resources. An amazing example of how a nation-state can seek restitution with its people. And finally, in the end, I think it ' s pretty obvious at least to all of all us who ' ve traveled in these remote reaches of the planet, to realize that they ' re not remote at all. They ’ re homelands of somebody. They represent branches of the human imagination that go back to the dawn of time. And for all of us, the dreams of these children, like the dreams of our own children, become part of the naked geography of hope. So, what we ’ re trying to do at the National Geographic, finally, is, we believe that politicians will never accomplish anything. We think that polemics — — we think that polemics are not persuasive, but we think that storytelling can change the world, and so we are probably the best storytelling institution in the world. We get 35 million hits on our website every month. 156 nations carry our television channel. Our magazines are read by millions. And what we ’ re doing is a series of journeys to the ethnosphere where we ’ re going to take our audience to places of such cultural wonder that they cannot help but come away dazzled by what they have seen, and hopefully, therefore, embrace gradually, one by one, the central revelation of anthropology : that this world deserves to exist in a diverse way, that we can find a way to live in a truly multicultural, pluralistic world where all of the wisdom of all peoples can contribute to our collective well-being. Thank you very much.

Text Sample 411: POS Dim 3 – 2003 – Score 7.00 – 2003/t000434.txt

Good morning everyone. First of all, it ’ s been fantastic being here over these past few days. And secondly, I feel it ’ s a great honor to kind of wind up this extraordinary gathering of people, these amazing talks that we ’ ve had. I feel that I ’ ve fitted in, in many ways, to some of the things that I ’ ve heard. I came directly here from the deep, deep tropical rainforest in Ecuador, where I was out — you could only get there by a plane — with **indigenous** people with paint on their faces and parrot feathers on their headdresses, where these people are fighting to try and keep the oil companies, and keep the roads, out of their forests. They ’ re fighting to develop their own way of living within the forest in a world that ’ s clean, a world that isn ’ t contaminated, a world that isn ’ t polluted. And what was so amazing to me, and what fits right in with what we ’ re all talking about here at TED, is that there, right in the middle of this rainforest, was some solar panels — the first in that part of Ecuador — and that was mainly to bring water up by pump so that the women wouldn ’ t have to go down. The water was cleaned, but because they got a lot of batteries, they were able to store a lot of electricity. So every house — and there were, I think, eight houses in this little community — could have light for, I think it was about half an hour each evening. And there is the Chief, in all his regal finery, with a laptop computer. And this man, he has been outside, but he ’ s gone back, and he was saying,”You know, we have suddenly jumped into a whole new era, and we didn ’ t even know about the white man 50 years ago, and now here we are with laptop computers, and there are some things we want to learn from the modern world. We want to know about health care. We want to know about what other people do — we ’ re interested in it. And we want to learn other languages. We want to know English and French and perhaps Chinese, and we ’ re good at languages.”So there he is with his little laptop computer, but fighting against the might of the pressures — because of the debt, the foreign debt of Ecuador — fighting the pressure of World Bank, IMF, and of course the people who want to exploit the forests and take out the oil. And so, coming directly from there to here. But, of course, my real field of expertise lies in an even different kind of civilization — I can ’ t really call it a civilization. A different way of life, a different being. We ’ ve talked earlier — this wonderful talk by Wade Davis about the different cultures of the humans around the world — but the world is not composed only of human beings ; there are also other animal beings. And I propose to bring into this TED conference, as I always do around the world, the voice of the animal kingdom. Too often we just see a few slides, or a bit of film, but these beings have voices that mean something. And so, I want to give you a greeting, as from a chimpanzee in the forests of Tanzania — Ooh, ooh, ooh, ooh, ooh, ooh, ooh, ooh, ooh, ooh, ooh, ooh, ooh, ooh, ooh! I ' ve been studying chimpanzees in Tanzania since 1960. During that time, there have been modern technologies that have really transformed the way that field biologists do their work. For example, for the first time, a few years ago, by simply collecting little fecal samples we were able to have them analyzed — to have DNA profiling done — so for the first time, we actually know which male chimps are the fathers of each individual infant. Because the chimps have a very promiscuous mating society. So this opens up a whole new avenue of research. And we use GSI — geographic whatever it is, GSI — to determine the range of the chimps. And we ' re using — you can see that I ' m not really into this kind of stuff — but we ' re using satellite imagery to look at the deforestation in the area. And of course, there ' s developments in infrared, so you can watch animals at night, and equipment for recording by video, and tape recording is getting lighter and better. So in many, many ways, we can do things today that we couldn ' t do when I began in 1960. Especially when chimpanzees, and other animals with large brains, are studied in captivity, modern technology is helping us to search for the upper levels of cognition in some of these non-human animals. So that we know today, they ' re capable of performances that would have been thought absolutely impossible by science when I began. I think the chimpanzee in captivity who is the most skilled in intellectual performance is one called Ai in Japan — her name means love — and she has a wonderfully sensitive partner working with her. She loves her computer — she ' ll leave her big group, and her running water, and her trees and everything. And she ' ll come in to sit at this computer — it ' s like a video game for a kid ; she ' s hooked. She ' s 28, by the way, and she does things with her computer screen and a touch pad that she can do faster than most humans. She does very complex tasks, and I haven ' t got time to go into them, but the amazing thing about this female is she doesn ' t like making mistakes. If she has a bad run, and her score isn ' t good, she ' ll come and reach up and tap on the glass — because she can ' t see the experimenter — which is asking to have another go. And her concentration — she ' s already concentrated hard for 20 minutes or so, and now she wants to do it all over again, just for the satisfaction of having done it better. And the food is not important — she does get a tiny reward, like one raisin for a correct response — but she will do it for nothing, if you tell her beforehand. So here we are, a chimpanzee using a computer. Chimpanzees, gorillas, orangutans also learn human sign language. But the point is that when I was first in Gombe in 1960 — I remember so well, so vividly, as though it was yesterday — the first time, when I was going through the vegetation, the chimpanzees were still running away from me, for the most part, although some were a little bit acclimatized — and I saw this dark shape, hunched over a termite mound, and I peered with my binoculars. It was, fortunately, one adult male whom I ' d named David Greybeard — and by the way, science at that time was telling me that I shouldn ' t name the chimps ; they should all have numbers ; that was more scientific. Anyway, David Greybeard — and I saw that he was picking little pieces of grass and using them to fish termites from their underground nest. And not only that — he would sometimes pick a leafy twig and strip the leaves — modifying an object to make it suitable for a specific purpose — the beginning of tool-making. The reason this was so exciting and such a breakthrough is at that time, it was thought that humans, and only humans, used and made tools. When I was at school, we were defined as man, the toolmaker. So that when

Louis Leakey, my mentor, heard this news, he said,”Ah, we must now redefine ’ man, ’ redefine ’ tool, ’ or accept chimpanzees as humans.”We now know that at Gombe alone, there are nine different ways in which chimpanzees use different objects for different purposes. Moreover, we know that in different parts of Africa, wherever chimps have been studied, there are completely different tool-using behaviors. And because it seems that these patterns are passed from one generation to the next, through observation, imitation and practice — that is a definition of human culture. What we find is that over these 40-odd years that I and others have been studying chimpanzees and the other great apes, and, as I say, other mammals with complex brains and social systems, we have found that after all, there isn ’ t a sharp line dividing humans from the rest of the animal kingdom. It ’ s a very wuzzy line. It ’ s getting wuzzier all the time as we find animals doing things that we, in our arrogance, used to think was just human. The chimps — there ’ s no time to discuss their fascinating lives — but they have this long childhood, five years of suckling and sleeping with the mother, and then another three, four or five years of emotional dependence on her, even when the next child is born. The importance of learning in that time, when behavior is flexible — and there ’ s an awful lot to learn in chimpanzee society. The long-term affectionate supportive bonds that develop throughout this long childhood with the mother, with the brothers and sisters, and which can last through a lifetime, which may be up to 60 years. They can actually live longer than 60 in captivity, so we ’ ve only done 40 years in the wild so far. And we find chimps are capable of true compassion and altruism. We find in their non-verbal communication — this is very rich — they have a lot of sounds, which they use in different circumstances, but they also use touch, posture, gesture, and what do they do? They kiss ; they embrace ; they hold hands. They pat one another on the back ; they swagger ; they shake their fist — the kind of things that we do, and they do them in the same kind of context. They have very sophisticated cooperation. Sometimes they hunt — not that often, but when they hunt, they show sophisticated cooperation, and they share the prey. We find that they show emotions, similar to — maybe sometimes the same — as those that we describe in ourselves as happiness, sadness, fear, despair. They know mental as well as physical **suffering**. And I don ’ t have time to go into the information that will prove some of these things to you, save to say that there are very bright students, in the best universities, studying emotions in animals, studying personalities in animals. We know that chimpanzees and some other creatures can recognize themselves in mirrors —”self”as opposed to”other.”They have a sense of humor, and these are the kind of things which traditionally have been thought of as human prerogatives. But this teaches us a new respect — and it ’ s a new respect not only for the chimpanzees, I suggest, but some of the other amazing animals with whom we share this planet. Once we ’ re prepared to admit that after all, we ’ re not the only beings with personalities, minds and above all feelings, and then we start to think about ways we use and abuse so many other sentient, sapient creatures on this planet, it really gives cause for deep **shame**, at least for me. So, the sad thing is that these chimpanzees — who ’ ve perhaps taught us, more than any other creature, a little humility — are in the wild, disappearing very fast. They ’ re disappearing for the reasons that all of you in this room know only too well. The deforestation, the growth of human populations, needing more land. They ’ re disappearing because some timber companies go in with clear-cutting. They ’ re disappearing in the heart of their range in Africa because the big multinational logging companies have come in and made roads — as they want to do in Ecuador and other parts where the forests remain untouched — to take out oil or timber. And this has led in Congo basin, and other parts of the world, to what is known as the bush- meat trade. This means that although for hundreds, perhaps thousands of years, people have lived in those forests, or whatever habitat it is, in harmony with their world, just killing the animals they need for themselves and their families — now, suddenly, because of the roads, the hunters can go in from the towns. They shoot everything, every single thing that moves that ' s bigger than a small rat ; they sun-dry it or smoke it. And now they ' ve got transport ; they take it on the logging trucks or the mining trucks into the towns where they sell it. And people will pay more for bush-meat, as it ' s called, than for **domestic** meat — it ' s culturally preferred. And it ' s not sustainable, and the huge logging camps in the forest are now demanding meat, so the Pygmy hunters in the Congo basin who ' ve lived there with their wonderful way of living for so many hundreds of years are now corrupted. They ' re given weapons ; they shoot for the logging camps ; they get money. Their culture is being destroyed, along with the animals upon whom they depend. So, when the logging camp moves, there ' s nothing left. We talked already about the loss of human cultural diversity, and I ' ve seen it happening with my own eyes. And the grim picture in Africa — I love Africa, and what do we see in Africa? We see deforestation ; we see the desert spreading ; we see massive hunger ; we see disease and we see population growth in areas where there are more people living on a certain piece of land than the land can possibly support, and they ' re too poor to buy food from elsewhere. Were the people that we heard about yesterday, on the Easter Island, who cut down their last tree — were they stupid? Didn ' t they know what was happening? Of course, but if you ' ve seen the crippling poverty in some of these parts of the world it isn ' t a question of"Let ' s leave the tree for tomorrow.""How am I going to feed my family today? Maybe I can get just a few dollars from this last tree which will keep us going a little bit longer, and then we ' ll pray that something will happen to save us from the inevitable end."So, this is a pretty grim picture. The one thing we have, which makes us so different from chimpanzees or other living creatures, is this sophisticated spoken language — a language with which we can tell children about things that aren ' t here. We can talk about the distant past, plan for the distant future, discuss ideas with each other, so that the ideas can grow from the accumulated wisdom of a group. We can do it by talking to each other ; we can do it through video ; we can do it through the written word. And we are abusing this great power we have to be wise stewards, and we ' re destroying the world. In the developed world, in a way, it ' s worse, because we have so much **access** to knowledge of the stupidity of what we ' re doing. Do you know, we ' re bringing little babies into a world where, in many places, the water is poisoning them? And the air is **harming** them, and the food that ' s grown from the contaminated land is poisoning them. And that ' s not just in the far-away developing world ; that ' s everywhere. Do you know we all have about 50 chemicals in our bodies we didn ' t have about 50 years ago? And so many of these diseases, like asthma and certain kinds of cancers, are on the increase around places where our filthy toxic waste is dumped. We ' re **harming** ourselves around the world, as well as **harming** the animals, as well as **harming** nature herself — Mother Nature, that brought us into being ; Mother Nature, where I believe we need to spend time, where there ' s trees and flowers and birds for our good psychological development. And yet, there are hundreds and hundreds of children in the developed world who never see nature, because they ' re growing up in concrete and all they know is virtual reality, with no opportunity to go and lie in the sun, or in the forest, with the dappled sun-specks coming down from the canopy above. As I was traveling around the world, you know, I had to leave the forest — that ' s where I love to be. I had to leave these fascinating chimpanzees for my students and field staff to continue studying because, finding they dwindled from about two million 100 years ago to about 150, 000 now, I knew I had to leave the forest to do what I could to raise awareness around the world. And the more I talked about the chimpanzees ' plight, the more I realized the fact that everything ' s interconnected, and the problems of the developing world so often stem from the greed of the developed world, and everything was joining together, and making — not sense, hope lies in sense, you said — it ' s making a nonsense. How can we do it? Somebody said that yesterday. And as I was traveling around, I kept meeting young people who ' d lost hope. They were feeling despair, they were feeling,"Well, it doesn ' t matter what we do ; eat, drink and be merry, for tomorrow we die. Everything is hopeless — we ' re always being told so by the media."And then I met some who were angry, and anger that can turn to **violence**, and we ' re all familiar with that. And I have three little grandchildren, and when some of these students would say to me at high school or university, they ' d say,"We ' re angry,"or"We ' re filled with despair, because we feel you ' ve compromised our future, and there ' s nothing we can do about it."And I looked in the eyes of my little grandchildren, and think how much we ' ve **harmed** this planet since I was their age. I feel this deep **shame**, and that ' s why in 1991 in Tanzania, I started a program that ' s called Roots and Shoots. There ' s little brochures all around outside, and if any of you have anything to do with children and care about their future, I beg that you pick up that brochure. And Roots and Shoots is a program for hope. Roots make a firm foundation. Shoots seem tiny, but to reach the sun they can break through brick walls. See the brick walls as all the problems that we ' ve inflicted on this planet. Then, you see, it is a message of hope. Hundreds and thousands of young people around the world can break through, and can make this a better world. And the most important message of Roots and Shoots is that every single individual makes a difference. Every individual has a role to play. Every one of us impacts the world around us everyday, and you scientists know that you can ' t actually — even if you stay in bed all day, you ' re breathing oxygen and giving out CO2, and probably going to the loo, and things like that — you ' re making a difference in the world. So, the Roots and Shoots program involves youth in three kinds of projects. And these are projects to make the world around them a better place. One project to show care and concern for your own human community. One for animals, including **domestic** animals — and I have to say, I learned everything I know about animal behavior even before I got to Gombe and the chimps from my dog, Rusty, who was my childhood companion. And the third kind of project : something for the local environment. So what the kids do depends first of all, how old are they — and we go now from pre-school right through university. It ' s going to depend whether they ' re inner-city or rural. It ' s going to depend if they ' re wealthy or impoverished. It ' s going to depend which part, say, of America they ' re in. We ' re in every state now, and the problems in Florida are different from the problems in New York. It ' s going to depend on which country they ' re in — and we ' re already in 60-plus countries, with about 5, 000 active groups — and there are groups all over the place that I keep hearing about that I ' ve never even heard of, because the kids are taking the program and spreading it themselves. Why? Because they ' re buying into it, and they ' re the ones who get to decide what they ' re going to do. It isn ' t something that their parents tell them, or their teachers tell them. That ' s effective, but if they decide themselves,"We want to clean this river and put the fish back that used to be there. We want to clear away the toxic soil from this area and have an organic garden. We want to go and spend time with the old people and hear their stories and record their oral histories. We want to go and work in a dog shelter. We want to learn about animals. We want..."You know, it goes on and on, and this is very hopeful for me. As I travel around the world 300 days a year, everywhere there ’ s a group of Roots and Shoots of different ages. Everywhere there are children with shining eyes saying,”Look at the difference we ’ ve made.”And now comes the technology into it, because with this new way of communicating electronically these kids can communicate with each other around the world. And if anyone is interested to help us, we ’ ve got so many ideas but we need help — we need help to create the right kind of system that will help these young people to communicate their excitement. But also — and this is so important — to communicate their despair, to say,”We ’ ve tried this and it doesn ’ t work, and what shall we do?”And then, lo and behold, there ’ s another group answering these kids who may be in America, or maybe this is a group in Israel, saying,”Yeah, you did it a little bit wrong. This is how you should do it.”The philosophy is very simple. We do not believe in **violence**. No **violence**, no bombs, no guns. That ’ s not the way to solve problems. **Violence** leads to **violence**, at least in my view. So how do we solve? The tools for solving the problems are knowledge and understanding. Know the facts, but see how they fit in the big picture. Hard work and persistence — don ’ t give up — and love and compassion leading to respect for all life. How many more minutes? Two, one? Chris Anderson : One — one to two. Jane Goodall : Two, two, I ’ m going to take two. Are you going to come and drag me off? Anyway — so basically, Roots and Shoots is beginning to change young people ’ s lives. It ’ s what I ’ m devoting most of my energy to. And I believe that a group like this can have a very major impact, not just because you can share technology with us, but because so many of you have children. And if you take this program out, and give it to your children, they have such a good opportunity to go out and do good, because they ’ ve got parents like you. And it ’ s been so clear how much you all care about trying to make this world a better place. It ’ s very encouraging. But the kids do ask me — and this won ’ t take more than two minutes, I promise — the kids say,”Dr. Jane, do you really have hope for the future? You travel, you see all these horrible things happening.”Firstly, the human brain — I don ’ t need to say anything about that. Now that we know what the problems are around the world, human brains like yours are rising to solve those problems. And we ’ ve talked a lot about that. Secondly, the resilience of nature. We can destroy a river, and we can bring it back to life. We can see a whole area desolated, and it can be brought back to bloom again, with time or a little help. And thirdly, the last speaker talked about — or the speaker before last, talked about the indomitable human spirit. We are surrounded by the most amazing people who do things that seem to be absolutely impossible. Nelson Mandela — I take a little piece of limestone from Robben Island Prison, where he labored for 27 years, and came out with so little bitterness, he could lead his people from the horror of apartheid without a bloodbath. Even after the 11th of September — and I was in New York and I felt the fear — nevertheless, there was so much human courage, so much love and so much compassion. And then as I went around the country after that and felt the fear — the fear that was leading to people feeling they couldn ’ t worry about the environment any more, in case they seemed not to be patriotic — and I was trying to encourage them, somebody came up with a little quotation from Mahatma Gandhi,”If you look back through human history, you see that every evil regime has been overcome by good.”And just after that a woman brought me this little bell, and I want to end on this note. She said,”If you ’ re talking about hope and peace, ring this. This bell is made from metal from a defused landmine, from the killing fields of Pol Pot — one of the most evil regimes in human history — where people are now beginning to put their lives back together after the regime has crumbled. So, yes, there is hope, and where is the hope? Is it out there with the politicians? It ’ s in our hands. It ’ s in your hands and my hands and those of our children. It ’ s really up to us. We ’ re the ones who can make a difference. If we lead lives where we consciously leave the lightest possible ecological footprints, if we buy the things that are ethical for us to buy and don ’ t buy the things that are not, we can change the world overnight. Thank you.

I am going to talk about myself, which I rarely do, because I â well for one thing, I prefer to talk about things I know nothing about. And secondly, I ’ m a recovering narcissist. I didn ’ t know I was a narcissist actually. I thought narcissism meant you loved yourself. And then someone told me there is a flip side to it. So it ’ s actually drearier than self-love ; it ’ s unrequited self-love. I don ’ t feel I can afford a relapse. But I want to, though, explain how I came to design my own particular brand of comedy because I ’ ve been through so many different forms of it. I started with improvisation, in a particular form of improvisation called theater games, which had one rule, which I always thought was a great rule for an ethic for a society. And the rule was, you couldn ’ t deny the other person ’ s reality, you could only build on it. And of course we live in a society that ’ s all about contradicting other peoples ’ reality. It ’ s all about contradiction, which I think is why I ’ m so sensitive to contradiction in general. I see it everywhere. Like polls. You know, it ’ s always curious to me that in public opinion polls the percentage of Americans who don ’ t know the answer to any given question is always two percent. 75 percent of Americans think Alaska is part of Canada. But only two percent don ’ t know the effect that the debacle in Argentina will have on the IMF ’ s monetary policy â seems a contradiction. Or this ad that I read in the New York Times :”Wearing a fine watch speaks loudly of your rank in society. Buying it from us screams good taste.”Or this that I found in a magazine called California Lawyer, in an article that is surely meant for the lawyers at Enron.”Surviving the Slammer : Do ’ s and Don ’ ts.””Don ’ t use big words.””Learn the lingua franca.”Yeah.”Lingua this, Frankie.”And I suppose it ’ s a contradiction that I talk about science when I don ’ t know math. You know, because â and by the way to I was so grateful to Dean Kamen for pointing out that one of the reasons, that there are cultural reasons that women and minorities don ’ t enter the fields of science and technology â because for instance, the reason I don ’ t do math is, I was taught to do math and read at the same time. So you ’ re six years old, you ’ re reading Snow White and the Seven Dwarves, and it becomes rapidly obvious that there are only two kinds of men in the world : dwarves and Prince Charmings. And the odds are seven to one against your finding the prince. That ’ s why little girls don ’ t do math. It ’ s too depressing. Of course, by talking about science I also may, as I did the other night, incur the **violent** wrath of some scientists who were very upset with me. I used the word postmodern as if it were OK. And they got very upset. One of them, to his credit, I think really just wanted to engage me in a serious argument. But I don ’ t engage in serious arguments. I don ’ t approve of them because arguments, of course, are all about contradiction, and they ’ re shaped by the values that I have questions with. I have questions with the values of Newtonian science, like rationality. You ’ re supposed to be rational in an argument. Well rationality is constructed by what Christie Hefner was talking about today, that mind-body split, you know? The head is good, body bad. Head is ego, body id. When we say”I,”â as when Rene Descartes said,”I think therefore I am,”â we mean the head. And as David Lee Roth **sang**

in”Just a Gigolo,””I ain ’ t got no body.”That ’ s how you get rationality. And that ’ s why so much of humor is the body asserting itself against the head. That ’ s why you have toilet humor and **sexual** humor. That ’ s why you have the Raspyni Brothers whacking Richard in the genital area. And we ’ re laughing doubly then because he ’ s the body, but it ’ s also â Voice offstage : Richard. Emily Levine : Richard. What did I say? Richard. Yes but it ’ s also the head, the head of the conference. That ’ s the other way that humor â like Art Buchwald takes shots at the heads of state. It doesn ’ t make quite as much money as body humor I ’ m sure â but nevertheless, what makes us treasure you and adore you. There ’ s also a contradiction in rationality in this country though, which is, as much as we revere the head, we are very anti-intellectual. I know this because I read in the New York Times, the Ayn Rand foundation took out a full- page ad after September 11, in which they said,”The problem is not Iraq or Iran, the problem in this country, facing this country is the university professors and their spawn.”So I went back and re-read”The Fountainhead.”I don ’ t know how many of you have read it. And I ’ m not an expert on sadomasochism. But let me just read you a couple of random passages from page 217.”The act of a master taking painful contemptuous possession of her, was the kind of rapture she wanted. When they lay together in bed it was, as it had to be, as the nature of the act demanded, an act of **violence**. It was an act of clenched teeth and **hatred**. It was the unendurable. Not a caress, but a wave of pain. The agony as an act of **passion**.”So you can imagine my surprise on reading in The New Yorker that Alan Greenspan, Chairman of the Federal Reserve, claims Ayn Rand as his intellectual mentor. It ’ s like finding out your nanny is a dominatrix. Bad enough we had to see J. Edgar Hoover in a dress. Now we have to picture Alan Greenspan in a black leather corset, with a butt tattoo that says,”Whip inflation now.”And Ayn Rand of course, Ayn Rand is famous for a philosophy called Objectivism, which reflects another value of Newtonian physics, which is objectivity. Objectivity basically is constructed in that same S&M way. It ’ s the subject subjugating the object. That ’ s how you assert yourself. You make yourself the active voice. And the object is the passive no-voice. I was so fascinated by that Oxygen commercial. I don ’ t know if you know this but â maybe it ’ s different now, or maybe you were making a statement â but in many hospital nurseries across the country, until very recently anyway, according to a book by Jessica Benjamin, the signs over the little boys cribs read,”I ’ m a boy,”and the signs over the little girls cribs read,”It ’ s a girl.”Yeah. So the passivity was culturally projected onto the little girls. And this still goes on as I think I told you last year. There ’ s a poll that proves â there was a poll that was given by Time magazine, in which only men were asked,”Have you ever had sex with a woman you actively disliked?”And well, yeah. Well, 58 percent said yes, which I think is overinflated though because so many men if you just say,”Have you ever had sex...””Yes!”They don ’ t even wait for the rest of it. And of course two percent did not know whether they ’ d had â That ’ s the first callback, of my attempted quadruple. So this subject-object thing, is part of something I ’ m very interested in because this is why, frankly, I believe in political correctness. I do. I think it can go too far. I think Ringling Brothers may have gone too far with an ad they took out in the New York Times Magazine.”We have a lifelong emotional and financial commitment to our Asian Elephant partners.”Maybe too far. But you know â I don ’ t think that a person of color making fun of white people is the same thing as a white person making fun of people of color. Or women making fun of men is the same as men making fun of women. Or poor people making fun of rich people, the same as rich people. I think you can make fun of the have but not the have-nots, which is why you don ’ t see me making fun of Kenneth Lay and his charming wife. What ' s funny about being down to four houses? And I really learned this lesson during the sex scandals of the Clinton administration or, Or as I call them, the good ol ' days. When people I knew, you know, people who considered themselves liberal, and everything else, were making fun of Jennifer Flowers and Paula Jones. Basically, they were making fun of them for being trailer trash or white trash. It seems, I suppose, a harmless **prejudice** and that you ' re not really hurting anybody. Until you read, as I did, an ad in the Los Angeles Times."For sale : White trash compactor."So this whole subject-object thing has relevance to humor in this way. I read a book by a woman named Amy Richlin, who is the chair of the Classics department at USC. And the book is called"The Garden of Priapus."And she says that Roman humor mirrors the construction of Roman society. So that Roman society was very top / bottom, as ours is to some degree. And so was humor. There always had to be the butt of a joke. So it was always the satirist, like Juvenal or Martial, represented the audience, and he was going to make fun of the outsider, the person who didn ' t share that subject status. And in stand-up of course, the stand-up comedian is supposed to dominate the audience. A lot of heckling is the tension of trying to make sure that the comedian is going to be able to dominate, and overcome the heckler. And I got good at that when I was in stand up. But I always hated it because they were dictating the terms of the interaction, in the same way that engaging in a serious argument determines the content, to some degree, of what you ' re talking about. And I was looking for a form that didn ' t have that. And so I wanted something that was more interactive. I know that word is so debased now by the use of it by Internet marketers. I really miss the old telemarketers now, I ' ll tell you that. I do, because at least there you stood a chance. You know? I used to actually hang up on them. But then I read in"Dear Abby"that that was rude. So the next time that one called I let him get halfway through his spiel and then I said,"You sound sexy."He hung up on me! But the interactivity allows the audience to shape what you ' re going to do as much as you shape their experience of the world. And that ' s really what I ' m looking for. And I was sort of, as I was starting to analyze what exactly it is that I do, I read a book called"Trickster Makes This World,"by Lewis Hyde. And it was like being psychoanalyzed. I mean he had laid it all out. And then coming to this conference, I realized that most everybody here shared those same qualities because really what trickster is is an agent of change. Trickster is a change agent. And the qualities that I ' m about to describe are the qualities that make it possible to make change happen. And one of these is boundary crossing. I think this is what so, in fact, infuriated the scientists. But I like to cross boundaries. I like to, as I said, talk about things I know nothing about. I hope that ' s my agent, because you aren ' t paying me anything. And I think it ' s good to talk about things I know nothing about because I bring a fresh viewpoint to it, you know? I ' m able to see the contradiction that you may not be able to see. Like for instance a mime once â or a meme as he called himself. He was a very selfish meme. And he said that I had to show more respect because it took up to 18 years to learn how to do mime properly. And I said,"Well, that ' s how you know only stupid people go into it."It only takes two years to learn how to talk. And you know people, this is the problem with quote, objectivity, unquote. When you ' re only surrounded by people who speak the same vocabulary as you, or share the same set of assumptions as you, you start to think that that ' s reality. Like economists, you know, their definition of rational, that we all act out of our own economic self-interest. Well, look at Michael Hawley, or look at Dean Kamen, or look at my grandmother. My grandmother always acted in other people ' s interests, whether they wanted her to or not. If they had had an Olympics in martyrdom, my grandmother would have lost on purpose.”No, you take the prize. You ’ re young. I ’ m old. Who ’ s going to see it? Where am I going? I ’ m going to die soon.”So that ’ s one â this boundary crossing, this go-between which â Fritz Lanting, is that his name, actually said that he was a go-between. That ’ s an actual quality of the trickster. And another is, non-oppositional strategies. And this is instead of contradiction. Where you deny the other person ’ s reality, you have paradox where you allow more than one reality to coexist, I think there ’ s another philosophical construction. I ’ m not sure what it ’ s called. But my example of it is a sign that I saw in a jewelry store. It said,”Ears pierced while you wait.”There the alternative just boggles the imagination.”Oh no. Thanks though, I ’ ll leave them here. Thanks very much. I have some errands to run. So I ’ ll be back to pick them up around five, if that ’ s OK with you. Huh? Huh? What? Can ’ t hear you.”And another attribute of the trickster is smart luck. That accidents, that Louis Kahn, who talked about accidents, this is another quality of the trickster. The trickster has a mind that is prepared for the unprepared. That, and I will say this to the scientists, that the trickster has the ability to hold his ideas lightly so that he can let room in for new ideas or to see the contradictions or the hidden problems with his ideas. I had no joke for that. I just wanted to put the scientists in their place. But here ’ s how I think I like to make change, and that is in making connections. This is what I tend to see almost more than contradictions. Like the, what do you call those toes of the gecko? You know, the toes of the gecko, curling and uncurling like the fingers of Michael Moschen. I love connections. Like I ’ ll read that one of the two attributes of matter in the Newtonian universe â there are two attributes of matter in the Newtonian universe â one is space occupancy. Matter takes up space. I guess the more you matter the more space you take up, which explains the whole SUV phenomenon. And the other one though is impenetrability. Well, in ancient Rome, impenetrability was the criterion of masculinity. Masculinity depended on you being the active penetrator. And then, in economics, there ’ s an active producer and a passive consumer, which explains why business always has to penetrate new markets. Well yeah, I mean why we forced China to open her markets. And didn ’ t that feel good? And now we ’ re being penetrated. You know the biotech companies are actually going inside us and planting their little flags on our genes. You know we ’ re being penetrated. And I suspect, by someone who actively dislikes us. That ’ s the second of the quadruple. Yes of course you got that. Thank you very much. I still have a way to go. And what I hope to do, when I make these connections, is short circuit people ’ s thinking. You know, make you not follow your usual train of association, but make you rewire. It literally â when people say about the shock of recognition, it ’ s literally re-cognition, rewiring how you think â I had a joke to go with this and I forgot it. I ’ m so sorry. I ’ m getting like the woman in that joke about â have you heard this joke about the woman driving with her mother? And the mother is elderly. And the mother goes right through a red light. And the daughter doesn ’ t want to say anything. She doesn ’ t want to be like,”You ’ re too old to drive.”And the mother goes through a second red light. And the daughter says, as tactfully as possible,”Mom, are you aware that you just went through two red lights?”And the mother says,”Oh! Am I driving?”And that ’ s the shock of recognition at the shock of recognition. That completes the quadruple. I just want to say two more things. One is, another characteristic of trickster is that the trickster has to walk this fine line. He has to have poise. And you know the biggest hurdle for me, in doing what I do, is constructing my performance so that it ’ s prepared and unprepared. Finding the balance between those things is always dangerous because you might tip off too much in the direction of unprepared. But being too prepared doesn ’ t leave room for the accidents to happen. I was thinking about what Moshe Safdie said yesterday about beauty because in his book, Hyde says that sometimes trickster can tip over into beauty. But to do that you have to lose all the other qualities because once you ’ re into beauty you ’ re into a finished thing. You ’ re into something that occupies space and inhabits time. It ’ s an actual thing. And it is always extraordinary to see a thing of beauty. But if you don ’ t do that, if you allow for the accident to keep on happening, you have the possibility of getting on a wavelength. I like to think of what I do as a probability wave. When you go into beauty the probability wave collapses into one possibility. And I like to explore all the possibilities in the hope that you ’ ll be on the wavelength of your audience. And the one final quality I want to say about trickster is that he doesn ’ t have a home. He ’ s always on the road. I want to say to you Richard, in closing, that in TED you ’ ve created a home. And thank you for inviting me into it. Thank you very much.

Text Sample 413: POS Dim 3 – 2002 – Score 6.00 – 2002/t000428.txt

As you pointed out, every time you come here, you learn something. This morning, the world ’ s experts from I guess three or four different companies on building seats, I think concluded that ultimately, the solution is, people shouldn ’ t sit down. I could have told them that. Yesterday, the automotive guys gave us some new insights. They pointed out that, I believe it was between 30 and 50 years from today, they will be steering cars by wire, without all that mechanical stuff. That ’ s reassuring. They then pointed out that there ’ d be, sort of, the other controls by wire, to get rid of all that mechanical stuff. That ’ s pretty good, but why not get rid of the wires? Then you don ’ t need anything to control the car, except thinking about it. I would love to talk about the technology, and sometime, in what ’ s past the 15 minutes, I ’ ll be happy to talk to all the techno-geeks around here about what ’ s in here. But if I had one thing to say about this, before we get to first, it would be that from the time we started building this, the big idea wasn ’ t the technology. It really was a big idea in technology when we started applying it in the iBOT for the **disabled** community. The big idea here is, I think, a new piece of a solution to a fairly big problem in transportation. And maybe to put that in perspective : there ’ s so much data on this, I ’ ll be happy to give it to you in different forms. You never know what strikes the fancy of whom, but everybody is perfectly willing to believe the car changed the world. And Henry Ford, just about 100 years ago, started cranking out Model Ts. What I don ’ t think most people think about is the context of how technology is applied. For instance, in that time, 91 percent of America lived either on farms or in small towns. So, the car — the horseless carriage that replaced the horse and carriage — was a big deal ; it went twice as fast as a horse and carriage. It was half as long. And it was an environmental improvement, because, for instance, in 1903 they outlawed horses and buggies in downtown Manhattan, because you can imagine what the roads look like when you have a million horses, and a million of them urinating and doing other things, and the typhoid and other problems created were almost unimaginable. So the car was the clean environmental alternative to a horse and buggy. It also was a way for people to get from their farm to a farm, or their farm to a town, or from a town to a city. It all made sense, with 91 percent of the people living there. By the 1950s, we started connecting all the towns together with what a lot of people claim is the eighth wonder of the world, the highway system. And it is certainly a wonder. And by the way, as I take shots at old technologies, I want to assure everybody, and particularly the automotive industry — who ’ s been very supportive of us — that I don ’ t think this in any way competes with airplanes, or cars. But think about where the world is today. 50 percent of the global population now lives in cities. That ’ s 3. 2 billion people. We ’ ve solved all the transportation problems that have changed the world to get it to where we are today. 500 years ago, sailing ships started getting reliable enough ; we found a new continent. 150 years ago, locomotives got efficient enough, steam power, that we turned the continent into a country. Over the last hundred years, we started building cars, and then over the 50 years we ’ ve connected every city to every other city in an extraordinarily efficient way, and we have a very high standard of living as a consequence of that. But during that entire process, more and more people have been born, and more and more people are moving to cities. China alone is going to move four to six hundred million people into cities in the next decade and a half. And so, nobody, I think, would argue that airplanes, in the last 50 years, have turned the continent and the country now into a **neighborhood**. And if you just look at how technology has been applied, we ’ ve solved all the long-range, high-speed, high-volume, large- weight problems of moving things around. Nobody would want to give them up. And I certainly wouldn ’ t want to give up my airplane, or my helicopter, or my Humvee, or my Porsche. I love them all. I don ’ t keep any of them in my living room. The fact is, the last mile is the problem, and half the world now lives in dense cities. And people spend, depending on who they are, between 90 and 95 percent of their energy getting around on foot. I think there ’ s — I don ’ t know what data would impress you, but how about, 43 percent of the refined fuel produced in the world is consumed by cars in metropolitan areas in the United States. Three million people die every year in cities due to bad air, and almost all particulate pollution on this planet is produced by transportation devices, particularly sitting in cities. And again, I say that not to attack any industry, I think — I really do — I love my airplane, and cars on highways moving 60 miles an hour are extraordinarily efficient, both from an engineering point of view, an energy consumption point of view, and a utility point of view. And we all love our cars, and I do. The problem is, you get into the city and you want to go four blocks, it ’ s neither fun nor efficient nor productive. It ’ s not sustainable. If — in China, in the year 1998, 417 million people used bicycles ; 1. 7 million people used cars. If five percent of that population became, quote, middle class, and wanted to go the way we ’ ve gone in the last hundred years at the same time that 50 percent of their population are moving into cities of the size and density of Manhattan, every six weeks — it isn ’ t sustainable environmentally ; it isn ’ t sustainable economically — there just ain ’ t enough oil — and it ’ s not sustainable politically. I mean, what are we fighting over right now? We can make it complicated, but what ’ s the world fighting over right now? So it seemed to me that somebody had to work on that last mile, and it was dumb luck. We were working on iBOTs, but once we made this, we instantly decided it could be a great alternative to jet skis. You don ’ t need the water. Or snowmobiles. You don ’ t need the snow. Or skiing. It ’ s just fun, and people love to move around doing fun things. And every one of those industries, by the way — just golf carts alone is a multi-billion-dollar industry. But rather than go license this off, which is what we normally do, it seemed to me that if we put all our effort not into the technology, but into an understanding of a world that ’ s solved all its other problems, but has somehow come to accept that cities — which, right back from ancient Greece on, were meant to walk around, cities that were architected and built for people — now have a footprint that, while we ’ ve solved every other transportation problem — and it ’ s like Moore ’ s law. I mean, look at the time it took to cross a continent in a Conestoga wagon, then on a railroad, then an airplane. Every other form of transportation ’ s been improved. In 5, 000 years, we ’ ve gone backwards in getting around cities. They ’ ve gotten bigger ; they ’ re spread out. The most expensive real estate on this planet in every city — Wilshire Boulevard, or Fifth Avenue, or Tokyo, or Paris — the most expensive real estate is their downtowns. 65 percent of the landmass of our cities are parked cars. The 20 largest cities in the world. So you wonder, what if cities could give to their pedestrians what we take for granted as we now go between cities? What if you could make them fun, attractive, clean, environmentally friendly? What if it would make it a little bit more palatable to have **access** via this, as that last link to mass transit, to get out to your cars so we can all live in the suburbs and use our cars the way we want, and then have our cities energized again? We thought it would be really neat to do that, and one of the problems we really were worried about is : how do we get legal on the **sidewalk**? Because technically I ’ ve got motors ; I ’ ve got wheels — I ’ m a motor vehicle. I don ’ t look like a motor vehicle. I have the same footprint as a pedestrian ; I have the same unique capability to deal with other pedestrians in a crowded space. I took this down to Ground Zero, and knocked my way through crowds for an hour. I ’ m a pedestrian. But the law typically lags technology by a generation or two, and if we get told we don ’ t belong on the **sidewalk**, we have two choices. We ’ re a recreational vehicle that doesn ’ t really matter, and I don ’ t spend my time doing that kind of stuff. Or maybe we should be out in the **street** in front of a Greyhound bus or a vehicle. We ’ ve been so concerned about that, we went to the Postmaster General of the United States, as the first person we ever showed on the outside, and said,”Put your people on it. Everybody trusts their postman. And they belong on the **sidewalks**, and they ’ ll use it seriously.”He agreed. We went to a number of police departments that want their police officers back in the **neighborhood** on the beat, carrying 70 pounds of stuff. They love it. And I can ’ t believe a policeman is going to give themselves a ticket. So we ’ ve been working really, really hard, but we knew that the technology would not be as hard to develop as an **attitude** about what ’ s important, and how to apply the technology. We went out and we found some visionary people with enough money to let us design and build these things, and in hopefully enough time to get them accepted. So, I ’ m happy, really, I am happy to talk about this technology as much as you want. And yes, it ’ s really fun, and yes, you should all go out and try it. But if I could ask you to do one thing, it ’ s not to think about it as a piece of technology, but just imagine that, although we all understand somehow that it ’ s reasonable that we use our 4, 000-pound machine, which can go 60 miles an hour, that can bring you everywhere you want to go, and somehow it ’ s also what we used for the last mile, and it ’ s broken, and it doesn ’ t work. One of the more exciting things that occurred to us about why it might get accepted, happened out here in California. A few weeks ago, after we launched it, we were here with a news crew on Venice Beach, zipping up and back, and he ’ s marveling at the technology, and meanwhile bicycles are zipping by, and skateboarders are zipping by, and a little old lady — I mean, if you looked in the dictionary, a little old lady — came by me — and now that I ’ m on this, I ’ m the height of a normal adult now — and she just stops, and the camera is there, and she looks up at me and says,”Can I try that?”And what was I — you know, how are you going to say anything? And so I said,”Sure.”So I get off, and she gets on, and with a little bit of the usual, ah, then she turns around, and she goes about 20 feet, and she turns back around, and she ’ s all smiles. And she comes back to me and she stops, and she says,”Finally, they made something for us.”And the camera is looking down at her. I ’ m thinking,”Wow, that was great — — please lady, don ’ t say another word.”And the camera is down at her, and this guy has to put the microphone in her face, said,”What do you mean by that?”And I figured,”It ’ s all over now,”and she looks up and she says,”Well,”she ’ s still watching these guys go ; she says,”I can ’ t ride a bike,”no, she says,”I can ’ t use a skateboard, and I ’ ve never used roller blades,”she knew them by name ; she says,”And it ’ s been 50 years since I rode a bicycle.”Then she looks up, she ’ s looking up, and she says,”And I ’ m 81 years old, and I don ’ t drive a car anymore. I still have to get to the store, and I can ’ t carry a lot of things.”And it suddenly occurred to me, that among my many fears, were not just that the bureaucracy and the regulators and the legislators might not get it — it was that, fundamentally, you believe there ’ s pressure among the people not to invade the most precious little bit of space left, the **sidewalks** in these cities. When you look at the 36 inches of legal requirement for **sidewalk**, then the eight foot for the parked car, then the three lanes, and then the other eight feet — it ’ s — that little piece is all that ’ s there. But she looks up and says this, and it occurs to me, well, kids aren ’ t going to mind these things, and they don ’ t vote, and business people and then young adults aren ’ t going to mind these things — they ’ re pretty cool — so I guess subliminally I was worried that it ’ s the older population that ’ s going to worry. So, having seen this, and having worried about it for eight years, the first thing I do is pick up my phone and ask our marketing and regulatory guys, call AARP, get an appointment right away. We ’ ve got to show them this thing. And they took it to Washington ; they showed them ; and they ’ re going to be involved now, watching how these things get absorbed in a number of cities, like Atlanta, where we ’ re doing trials to see if it really can, in fact, help re-energize their downtown. The bottom line is, whether you believe the United Nations, or any of the other think tanks — in the next 20 years, all human population growth on this planet will be in cities. In Asia alone, it will be over a billion people. They learned to start with cell phones. They didn ’ t have to take the 100-year trip we took. They start at the top of the technology food chain. We ’ ve got to start building cities and human environments where a 150-pound person can go a couple of miles in a dense, rich, green-space environment, without being in a 4, 000-pound machine to do it. Cars were not meant for parallel parking ; they ’ re wonderful machines to go between cities, but just think about it : we ’ ve solved all the long-range, high-speed problems. The Greeks went from the theater of Dionysus to the Parthenon in their sandals. You do it in your sneakers. Not much has changed. If this thing goes only three times as fast as walking — three times — a 30-minute walk becomes 10 minutes. Your choice, when living in a city, if it ’ s now 10 minutes — because at 30 minutes you want an alternative, whether it ’ s a bus, a train — we ’ ve got to build an infrastructure — a light rail — or you ’ re going to keep parking those cars. But if you could put a pin in most cities, and imagine how far you could, if you had the time, walk in one half-hour, it ’ s the city. If you could make it fun, and make it eight or 10 minutes, you can ’ t find your car, un-park your car, move your car, re-park your car and go somewhere ; you can ’ t get to a cab or a subway. We could change the way people allocate their resources, the way this planet uses its energy, make it more fun. And we ’ re hoping to some extent history will say we were right. That ’ s Segway. This is a Stirling cycle engine ; this had been confused by a lot of things we ’ re doing. This little beast, right now, is producing a few hundred watts of electricity. Yes, it could be attached to this, and yes, on a kilogram of propane, you could drive from New York to Boston if you so choose. Perhaps more interesting about this little engine is it ’ ll burn any fuel, because some of you might be skeptical about the capability of this to have an impact, where most of the world you can ’ t simply plug into your 120-volt outlet. We ’ ve been working on this, actually, as an alternative energy source, starting way back with Johnson & Johnson, to run an iBOT, because the best batteries you could get — 10 watt-hours per kilogram in lead, 20 watt-hours per kilogram nickel- cadmium, 40 watt-hours per kilogram in nickel-metal hydride, 60 watt-hours per kilogram in lithium, 8, 750 watt-hours of energy in every kilogram of propane or gasoline — which is why nobody drives electric cars. But, in any event, if you can burn it with the same efficiency — because it ' s external combustion — as your kitchen stove, if you can burn any fuel, it turns out to be pretty neat. It makes just enough electricity to, for instance, do this, which at night is enough electricity, in the rest of the world, as Mr. Holly — Dr. Holly — pointed out, can run computers and a light bulb. But more interestingly, the thermodynamics of this say, you ' re never going to get more than 20 percent efficiency. It doesn ' t matter much — it says if you get 200 watts of electricity, you ' ll get 700 or 800 watts of heat. If you wanted to boil water and re-condense it at a rate of 10 gallons an hour, it takes about 25, a little over 25. 3 kilowatt — 25, 000 watts of continuous power — to do it. That ' s so much energy, you couldn ' t afford to desalinate or clean water in this country that way. Certainly, in the rest of the world, your choice is to devastate the place, turning everything that will burn into heat, or drink the water that ' s available. The number one cause of death on this planet among humans is bad water. Depending on whose numbers you believe, it ' s between 60 and 85, 000 people per day. We don ' t need sophisticated heart transplants around the world. We need water. And women shouldn ' t have to spend four hours a day looking for it, or watching their kids die. We figured out how to put a vapor- compression distiller on this thing, with a counter-flow heat exchanger to take the waste heat, then using a little bit of the electricity control that process, and for 450 watts, which is a little more than half of its waste heat, it will make 10 gallons an hour of distilled water from anything that comes into it to cool it. So if we put this box on here in a few years, could we have a solution to transportation, electricity, and communication, and maybe drinkable water in a sustainable package that weighs 60 pounds? I don ' t know, but we ' ll try it. I better shut up.

Text Sample 414: POS Dim 3 – 2002 – Score 6.00 – 2002/t000410.txt

That splendid music, the coming-in music,"The Elephant March"from"Aida,"is the music I ' ve chosen for my funeral. And you can see why. It ' s triumphal. I won ' t feel anything, but if I could, I would feel triumphal at having lived at all, and at having lived on this splendid planet, and having been given the opportunity to understand something about why I was here in the first place, before not being here. Can you understand my quaint English accent? Like everybody else, I was entranced yesterday by the animal session. Robert Full and Frans Lanting and others ; the beauty of the things that they showed. The only slight jarring note was when Jeffrey Katzenberg said of the mustang,"the most splendid creatures that God put on this earth."Now of course, we know that he didn ' t really mean that, but in this country at the moment, you can ' t be too careful. I ' m a biologist, and the central theorem of our subject : the theory of design, Darwin ' s theory of evolution by natural selection. In professional circles everywhere, it ' s of course universally accepted. In non-professional circles outside America, it ' s largely ignored. But in non-professional circles within America, it arouses so much hostility — it ' s fair to say that American biologists are in a state of war. The war is so worrying at present, with court cases coming up in one state after another, that I felt I had to say something about it. If you want to know what I have to say about Darwinism itself, I ' m afraid you ' re going to have to look at my books, which you won ' t find in the bookstore outside. Contemporary court cases often concern an allegedly new version of creationism, called”Intelligent Design,”or ID. Don ’ t be fooled. There ’ s nothing new about ID. It ’ s just creationism under another name, rechristened — I choose the word advisedly — for tactical, political reasons. The arguments of so-called ID theorists are the same old arguments that had been refuted again and again, since Darwin down to the present day. There is an effective evolution lobby coordinating the fight on behalf of science, and I try to do all I can to help them, but they get quite upset when people like me dare to mention that we happen to be atheists as well as evolutionists. They see us as rocking the boat, and you can understand why. Creationists, lacking any coherent scientific argument for their case, fall back on the popular phobia against atheism : Teach your children evolution in biology class, and they ’ ll soon move on to drugs, grand larceny and **sexual**”pre-version.”In fact, of course, educated theologians from the Pope down are firm in their support of evolution. This book,”Finding Darwin ’ s God,”by Kenneth Miller, is one of the most effective attacks on Intelligent Design that I know and it ’ s all the more effective because it ’ s written by a devout Christian. People like Kenneth Miller could be called a”godsend”to the evolution lobby, because they expose the lie that evolutionism is, as a matter of fact, tantamount to atheism. People like me, on the other hand, rock the boat. But here, I want to say something nice about creationists. It ’ s not a thing I often do, so listen carefully. I think they ’ re right about one thing. I think they ’ re right that evolution is fundamentally hostile to religion. I ’ ve already said that many individual evolutionists, like the Pope, are also religious, but I think they ’ re deluding themselves. I believe a true understanding of Darwinism is deeply corrosive to religious faith. Now, it may sound as though I ’ m about to preach atheism, and I want to reassure you that that ’ s not what I ’ m going to do. In an audience as sophisticated as this one, that would be preaching to the **choir**. No, what I want to urge upon you — Instead, what I want to urge upon you is militant atheism. But that ’ s putting it too negatively. If I was a person who were interested in preserving religious faith, I would be very afraid of the positive power of evolutionary science, and indeed science generally, but evolution in particular, to inspire and enthrall, precisely because it is atheistic. Now, the difficult problem for any theory of biological design is to explain the massive statistical improbability of living things. Statistical improbability in the direction of good design —”complexity”is another word for this. The standard creationist argument — there is only one ; they ’ re all reduced to this one — takes off from a statistical improbability. Living creatures are too complex to have come about by chance ; therefore, they must have had a designer. This argument of course, shoots itself in the foot. Any designer capable of designing something really complex has to be even more complex himself, and that ’ s before we even start on the other things he ’ s expected to do, like forgive sins, bless marriages, listen to **prayers** — favor our side in a war — disapprove of our sex lives, and so on. Complexity is the problem that any theory of biology has to solve, and you can ’ t solve it by postulating an agent that is even more complex, thereby simply compounding the problem. Darwinian natural selection is so stunningly elegant because it solves the problem of explaining complexity in terms of nothing but simplicity. Essentially, it does it by providing a smooth ramp of gradual, step-by-step increment. But here, I only want to make the point that the elegance of Darwinism is corrosive to religion, precisely because it is so elegant, so parsimonious, so powerful, so economically powerful. It has the sinewy economy of a beautiful suspension bridge. The God theory is not just a bad theory. It turns out to be — in principle — incapable of doing the job required of it. So, returning to tactics and the evolution lobby, I want to argue that rocking the boat may be just the right thing to do. My approach to attacking creationism is — unlike the evolution lobby — my approach to attacking creationism is to attack religion as a whole. And at this point I need to acknowledge the remarkable taboo against speaking **ill** of religion, and I ’ m going to do so in the words of the late Douglas Adams, a dear friend who, if he never came to TED, certainly should have been invited. Richard Dawkins : He was. Good. I thought he must have been. He begins this speech, which was tape recorded in Cambridge shortly before he died — he begins by explaining how science works through the testing of hypotheses that are framed to be vulnerable to disproof, and then he goes on. I quote,”Religion doesn ’ t seem to work like that. It has certain ideas at the heart of it, which we call ’ sacred ’ or ’ holy. ’ What it means is : here is an idea or a notion that you ’ re not allowed to say anything bad about. You ’ re just not. Why not? Because you ’ re not.””Why should it be that it ’ s perfectly legitimate to support the Republicans or Democrats, this model of economics versus that, Macintosh instead of Windows, but to have an opinion about how the universe began, about who created the universe — no, that ’ s holy. So, we ’ re used to not challenging religious ideas, and it ’ s very interesting how much of a furor Richard creates when he does it.”— He meant me, not that one.”Everybody gets absolutely frantic about it, because you ’ re not allowed to say these things. Yet when you look at it rationally, there ’ s no reason why those ideas shouldn ’ t be as open to debate as any other, except that we ’ ve agreed somehow between us that they shouldn ’ t be.”And that ’ s the end of the quote from Douglas. In my view, not only is science corrosive to religion ; religion is corrosive to science. It teaches people to be satisfied with trivial, supernatural non- explanations, and blinds them to the wonderful, real explanations that we have within our grasp. It teaches them to accept authority, revelation and faith, instead of always insisting on evidence. There ’ s Douglas Adams, magnificent picture from his book,”Last Chance to See.”Now, there ’ s a typical scientific journal, The Quarterly Review of Biology. And I ’ m going to put together, as guest editor, a special issue on the question,”Did an asteroid kill the dinosaurs?”And the first paper is a standard scientific paper, presenting evidence,”Iridium layer at the K-T boundary, and potassium argon dated crater in Yucatan, indicate that an asteroid killed the dinosaurs.”Perfectly ordinary scientific paper. Now, the next one.”The President of the Royal Society has been vouchsafed a strong inner conviction that an asteroid killed the dinosaurs.””It has been privately revealed to Professor Huxtane that an asteroid killed the dinosaurs.””Professor Hordley was brought up to have total and unquestioning faith”— —”that an asteroid killed the dinosaurs.””Professor Hawkins has promulgated an official dogma binding on all loyal Hawkinsians that an asteroid killed the dinosaurs.”That ’ s inconceivable, of course. But suppose — [Supporters of the Asteroid Theory cannot be patriotic citizens] In 1987, a reporter asked George Bush, Sr. whether he recognized the **equal** citizenship and patriotism of Americans who are atheists. Mr. Bush ’ s **reply** has become infamous.”No, I don ’ t know that atheists should be considered citizens, nor should they be considered patriots. This is one nation under God.”Bush ’ s bigotry was not an isolated mistake, blurted out in the heat of the moment and later retracted. He stood by it in the face of repeated calls for clarification or withdrawal. He really meant it. More to the point, he knew it posed no threat to his election — quite the contrary. Democrats as well as Republicans parade their religiousness if they want to get elected. Both parties invoke”one nation under God.”What would Thomas Jefferson have said? [In every country and in every age, the priest has been hostile to liberty] Incidentally, I ’ m not usually very proud of being British, but you can ’ t help making the comparison. In practice, what is an atheist? An atheist is just somebody who feels about Yahweh the way any decent Christian feels about Thor or Baal or the golden calf. As has been said before, we are all atheists about most of the gods that humanity has ever believed in. Some of us just go one god further. And however we define atheism, it ’ s surely the kind of academic belief that a person is entitled to hold without being vilified as an unpatriotic, unelectable non-citizen. Nevertheless, it ’ s an undeniable fact that to own up to being an atheist is tantamount to introducing yourself as Mr. Hitler or Miss Beelzebub. And that all stems from the perception of atheists as some kind of weird, way-out minority. Natalie Angier wrote a rather sad piece in the New Yorker, saying how lonely she felt as an atheist. She clearly feels in a beleaguered minority. But actually, how do American atheists stack up numerically? The latest survey makes surprisingly encouraging reading. Christianity, of course, takes a massive lion ’ s share of the population, with nearly 160 million. But what would you think was the second largest group, convincingly outnumbering Jews with 2. 8 million, Muslims at 1. 1 million, Hindus, Buddhists and all other religions put together? The second largest group, with nearly 30 million, is the one described as non-religious or secular. You can ’ t help wondering why vote-seeking politicians are so proverbially overawed by the power of, for example, the Jewish lobby — the state of Israel seems to owe its very existence to the American Jewish vote — while at the same time, consigning the non-religious to political oblivion. This secular non-religious vote, if properly mobilized, is nine times as numerous as the Jewish vote. Why does this far more substantial minority not make a move to exercise its political muscle? Well, so much for quantity. How about quality? Is there any correlation, positive or negative, between intelligence and tendency to be religious? [Them folks misunderestimated me] The survey that I quoted, which is the ARIS survey, didn ’ t break down its data by socio-economic class or education, IQ or anything else. But a recent article by Paul G. Bell in the Mensa magazine provides some straws in the wind. Mensa, as you know, is an international organization for people with very high IQ. And from a meta-analysis of the literature, Bell concludes that, I quote —”Of 43 studies carried out since 1927 on the relationship between religious belief, and one ’ s intelligence or educational level, all but four found an inverse connection. That is, the higher one ’ s intelligence or educational level, the less one is likely to be religious.”Well, I haven ’ t seen the original 42 studies, and I can ’ t comment on that meta-analysis, but I would like to see more studies done along those lines. And I know that there are — if I could put a little plug here — there are people in this audience easily capable of financing a massive research survey to settle the question, and I put the suggestion up, for what it ’ s worth. But let me know show you some data that have been properly published and analyzed, on one special group — namely, top scientists. In 1998, Larson and Witham polled the cream of American scientists, those who ’ d been honored by election to the National Academy of Sciences, and among this select group, belief in a personal God dropped to a shattering seven percent. About 20 percent are agnostic ; the rest could fairly be called atheists. Similar figures obtained for belief in personal immortality. Among biological scientists, the figure is even lower : 5. 5 percent, only, believe in God. Physical scientists, it ’ s 7. 5 percent. I ’ ve not seen corresponding figures for elite scholars in other fields, such as history or philosophy, but I ’ d be surprised if they were different. So, we ’ ve reached a truly remarkable situation, a grotesque mismatch between the American intelligentsia and the American electorate. A philosophical opinion about the nature of the universe, which is held by the vast majority of top American scientists and probably the majority of the intelligentsia generally, is so abhorrent to the American electorate that no candidate for popular election dare affirm it in public. If I ’ m right, this means that high office in the greatest country in the world is barred to the very people best qualified to hold it — the intelligentsia — unless they are prepared to lie about their beliefs. To put it bluntly : American political opportunities are heavily loaded against those who are simultaneously intelligent and honest. I ' m not a citizen of this country, so I hope it won ' t be thought unbecoming if I suggest that something needs to be done. And I ' ve already hinted what that something is. From what I ' ve seen of TED, I think this may be the ideal place to launch it. Again, I fear it will cost money. We need a consciousness-raising, coming-out campaign for American atheists. This could be similar to the campaign organized by homosexuals a few years ago, although heaven forbid that we should stoop to public outing of people against their will. In most cases, people who out themselves will help to destroy the myth that there is something wrong with atheists. On the contrary, they ' ll demonstrate that atheists are often the kinds of people who could serve as decent role models for your children, the kinds of people an advertising agent could use to recommend a product, the kinds of people who are sitting in this room. There should be a snowball effect, a positive feedback, such that the more names we have, the more we get. There could be non-linearities, threshold effects. When a critical mass has been obtained, there ' s an abrupt acceleration in recruitment. And again, it will need money. I suspect that the word"atheist"itself contains or remains a stumbling block far out of proportion to what it actually means, and a stumbling block to people who otherwise might be happy to out themselves. So, what other words might be used to smooth the path, oil the wheels, sugar the pill? Darwin himself preferred"agnostic"— and not only out of loyalty to his friend Huxley, who coined the term. Darwin said,"I have never been an atheist in the same sense of denying the existence of a God. I think that generally an ' agnostic ' would be the most correct description of my state of mind."He even became uncharacteristically tetchy with Edward Aveling. Aveling was a militant atheist who failed to persuade Darwin to accept the dedication of his book on atheism — incidentally, giving rise to a fascinating myth that Karl Marx tried to dedicate"Das Kapital"to Darwin, which he didn ' t, it was actually Edward Aveling. What happened was that Aveling ' s mistress was Marx ' s daughter, and when both Darwin and Marx were dead, Marx ' s papers became muddled up with Aveling ' s papers, and a letter from Darwin saying,"My dear sir, thank you very much but I don ' t want you to dedicate your book to me,"was mistakenly supposed to be addressed to Marx, and that gave rise to this whole myth, which you ' ve probably heard. It ' s a sort of urban myth, that Marx tried to dedicate"Kapital"to Darwin. Anyway, it was Aveling, and when they met, Darwin challenged Aveling."Why do you call yourselves atheists?""' Agnostic, '"retorted Aveling,"was simply ' atheist ' writ respectable, and ' atheist ' was simply ' agnostic ' writ aggressive."Darwin complained,"But why should you be so aggressive?"Darwin thought that atheism might be well and good for the intelligentsia, but that ordinary people were not, quote,"ripe for it."Which is, of course, our old friend, the"don ' t rock the boat"argument. It ' s not recorded whether Aveling told Darwin to come down off his high horse. But in any case, that was more than 100 years ago. You ' d think we might have grown up since then. Now, a friend, an intelligent lapsed Jew, who, incidentally, observes the Sabbath for reasons of cultural **solidarity**, describes himself as a"tooth-fairy agnostic."He won ' t call himself an atheist because it ' s, in principle, impossible to prove a negative, but"agnostic"on its own might suggest that God ' s existence was therefore on **equal** terms of likelihood as his non-existence. So, my friend is strictly agnostic about the tooth fairy, but it isn ' t very likely, is it? Like God. Hence the phrase,"tooth-fairy agnostic."Bertrand Russell made the same point using a hypothetical teapot in orbit about Mars.

You would strictly have to be agnostic about whether there is a teapot in orbit about Mars, but that doesn ' t mean you treat the likelihood of its existence as on all fours with its non-existence. The list of things which we strictly have to be agnostic about doesn ' t stop at tooth fairies and teapots ; it ' s infinite. If you want to believe one particular one of them — unicorns or tooth fairies or teapots or Yahweh — the onus is on you to say why. The onus is not on the rest of us to say why not. We, who are atheists, are also a-fairyists and a-teapotists. But we don ' t bother to say so. And this is why my friend uses"tooth-fairy agnostic"as a label for what most people would call atheist. Nonetheless, if we want to attract deep-down atheists to come out publicly, we ' re going to have find something better to stick on our banner than"tooth-fairy"or"teapot agnostic."So, how about"humanist"? This has the advantage of a worldwide network of well-organized associations and journals and things already in place. My problem with it is only its apparent anthropocentrism. One of the things we ' ve learned from Darwin is that the human species is only one among millions of cousins, some close, some distant. And there are other possibilities, like"naturalist,"but that also has problems of confusion, because Darwin would have thought naturalist —"Naturalist"means, of course, as opposed to"supernaturalist"— and it is used sometimes — Darwin would have been confused by the other sense of"naturalist,"which he was, of course, and I suppose there might be others who would confuse it with"nudism". Such people might be those belonging to the British lynch mob, which last year attacked a pediatrician in mistake for a pedophile. I think the best of the available alternatives for"atheist"is simply"non- theist."It lacks the strong connotation that there ' s definitely no God, and it could therefore easily be embraced by teapot or tooth-fairy agnostics. It ' s completely compatible with the God of the physicists. When atheists like Stephen Hawking and Albert Einstein use the word"God,"they use it of course as a metaphorical shorthand for that deep, mysterious part of physics which we don ' t yet understand."Non-theist"will do for all that, yet unlike"atheist,"it doesn ' t have the same phobic, hysterical responses. But I think, actually, the alternative is to grasp the nettle of the word"atheism"itself, precisely because it is a taboo word, carrying frissons of hysterical phobia. Critical mass may be harder to achieve with the word"atheist"than with the word"non- theist,"or some other non-confrontational word. But if we did achieve it with that dread word"atheist"itself, the political impact would be even greater. Now, I said that if I were religious, I ' d be very afraid of evolution — I ' d go further : I would fear science in general, if properly understood. And this is because the scientific worldview is so much more exciting, more poetic, more filled with sheer wonder than anything in the poverty-stricken arsenals of the religious imagination. As Carl Sagan, another recently dead hero, put it,"How is it that hardly any major religion has looked at science and concluded, ' This is better than we thought! The universe is much bigger than our prophet said, grander, more subtle, more elegant '? Instead they say, ' No, no, no! My god is a little god, and I want him to stay that way. ' A religion, old or new, that stressed the magnificence of the universe as revealed by modern science, might be able to draw forth reserves of reverence and awe hardly tapped by the conventional faiths."Now, this is an elite audience, and I would therefore expect about 10 percent of you to be religious. Many of you probably subscribe to our polite cultural belief that we should respect religion. But I also suspect that a fair number of those secretly despise religion as much as I do. If you ' re one of them, and of course many of you may not be, but if you are one of them, I ' m asking you to stop being polite, come out, and say so. And if you happen to be rich, give some thought to ways in which you might make a difference. The religious lobby in this country is massively financed by foundations — to say nothing of all the tax benefits — by foundations, such as the Templeton Foundation and the Discovery Institute. We need an anti- Templeton to step forward. If my books sold as well as Stephen Hawking ’ s books, instead of only as well as Richard Dawkins ’ books, I ’ d do it myself. People are always going on about,”How did September the 11th change you?”Well, here ’ s how it changed me. Let ’ s all stop being so damned respectful. Thank you very much.

Text Sample 415: POS Dim 3 – 1984 – Score 1.00 – 1984/t000297.txt

In this rather long sort of marathon presentation, I ’ ve tried to break it up into three parts : the first being a whole lot of examples on how it can be a little bit more pleasurable to deal with a computer and really address the qualities of the human interface. And these will be some simple design qualities and they will also be some qualities of, if you will, the intelligence of interaction. Then the second part will really just be examples of new technologies — new media falling very much into that mold. Again, I will go through them as fast as possible. And then the last one will be some examples I ’ ve been able to collect, which I think illustrate this at least as best I can, in the world of entertainment. People have this belief — and I share most of it — that we will be using the TV screens or their equivalents for electronic books of the future. But then you think,”My God! What a terrible image you get when you look at still pictures on TV.”Well, it doesn ’ t have to be terrible. And that is a slide taken from a TV set and it was pre- processed to be very sympathetic to the TV medium, and it absolutely looks beautiful. Well, what ’ s happened? How did people get into this mess? Where you are now, all of a sudden, sitting in front of personal computers and video text — teletext systems, and somewhat horrified by what you see on the screen? Well, you have to remember that TV was designed to be looked at eight times the distance of the diagonal. So you get a 13-inch, 19-inch, whatever, TV, and then you should multiply that by eight and that ’ s the distance you should sit away from the TV set. Now we ’ ve put people 18 inches in front of a TV, and all the artifacts that none of the original designers expected to be seen, all of a sudden, are staring you in the face : the shadow mask, the scan lines, all of that. And they can be treated very easily ; there are actually ways of getting rid of them, there are actually ways of just making absolutely beautiful pictures. I ’ m talking here a little bit about display technologies. Let me talk about how you might input information. And my favorite example is always fingers. I ’ m very interested in touch-sensitive displays. High-tech, high-touch. Isn ’ t that what some of you said? It ’ s certainly a very important medium for input, and a lot of people think that fingers are a very low- resolution sort of stylus for inputting to a display. In fact, they ’ re not : it ’ s really a very, very high-resolution input medium — you have to just do it twice, you have to touch the screen and then rotate your finger slightly — and you can move a cursor with great accuracy. And so when you see on the market these systems that have just a few light emitting diodes on the side and are very low resolution, it ’ s nice that they exist because it still is better than nothing. But it, in some sense, misses the point : namely, that fingers are a very, very high-resolution input medium. Now, what are some of the other advantages? Well, the one advantage is that you don ’ t have to pick them up, and people don ’ t realize how important that is — not having to pick up your fingers to use them. When you think for a second of the mouse on Macintosh — and I will not criticize the mouse too much — when you ’ re typing — what you have — you want to now put something — first of all, you ’ ve got to find the mouse. You have to probably stop. Maybe not come to a grinding halt, but you ’ ve got to sort of find that mouse. Then you find the mouse, and you ' re going to have to wiggle it a little bit to see where the cursor is on the screen. And then when you finally see where it is, then you ' ve got to move it to get the cursor over there, and then —"Bang"— you ' ve got to hit a button or do whatever. That ' s four separate steps versus typing and then touching and typing and just doing it all in one motion — or one-and-a-half, depending on how you want to count. Again, what I ' m trying to do is just illustrate the kinds of problems that I think face the designers of new computer systems and entertainment systems and educational systems from the perspective of the quality of that interface. And another advantage, of course, of using fingers is you have 10 of them. And we have never known how to do this technically, so this slide is a fake slide. We never succeeded in using ten fingers, but there are certain things you can do, obviously, with more than one-finger input, which is rather fascinating. What we did stumble across was something... Again, which is typical of the computer field, is when you have a bug that you can ' t get rid of you turn it into a feature. And maybe... maybe a mouse is a new kind of bug. But the bug in our case was in touch-sensitive displays : we wanted to be able to draw — you know, rub your finger across the screen to input continuous points — and there was just too much friction created between your finger and the glass — if glass was the substrate, which it usually is. So we found that that actually was a feature in the sense you could build a pressure-sensitive display. And when you touch it with your finger, you can actually, then, introduce all the forces on the face of that screen, and that actually has a certain amount of value. Let me see if I can load another disc and show you, quickly, an example. Now, imagine a screen, which is not only touch-sensitive now, it ' s pressure-sensitive. And it ' s pressure-sensitive to the forces both in the plane of the screen — X, Y, and Z at least in one direction ; we couldn ' t figure out how to come in the other direction. But let me get rid of the slide, and let ' s see if this comes on. OK. So there is the pressure-sensitive display in operation. The person ' s just, if you will, pushing on the screen to make a curve. But this is the interesting part. I want to stop it for a second because the movie is very badly made. And the particular display was built about six years ago, and when we moved from one room to another room, a rather large person sat on it and it got destroyed. So all we have is this record. But imagine that screen having lots of objects on it and the person has touched an object — one of N — like he did there, and then pushed on it. Now, imagine a program where some of those objects are physically heavy and some are light : one is an anvil on a fuzzy rug and the other one is a ping-pong ball on a sheet of glass. And when you touch it, you have to really push very hard to move that anvil across the screen, and yet you touch the ping-pong ball very lightly and it just scoots across the screen. And what you can do — oops, I didn ' t mean to do that — what you can do is actually feed back to the user the feeling of the physical properties. So again, they don ' t have to be weight ; they could be a general trying to move troops, and he ' s got to move an aircraft carrier versus a little boat. In fact, they funded it for that very reason. The whole notion, then, is one that at the interface there are physical properties in that transducer — in this case it ' s pressure and touches — that allow you to present things to the user that you could never present before. So it ' s not simply looking at the quality or, if you will, the luxury of that interface, but it ' s actually looking at the idea of presenting things that previously couldn ' t be presented before. I want to move on to another example, which is one of a different sort, where we ' re trying to use computer and video disc technology now to come up with a new kind of book. Here, the idea is that you ' re going to take this book, if you will, and it ' s going to come alive. You ' re going to sort of breathe life into it. We are so used to doing monologues. Filmmakers, for example, are the experts in monologue making : you make a film and it has a well-formed beginning, middle and end, and in some sense the art of it is that. And you then say,”There ’ s an opportunity for making conversational movies.”Well, what does that mean? And it sort of nibbles at the core of the whole profession and all the assumptions of that medium. So, book writing is the same thing. What I ’ ll show you very quickly is a new kind of book where it is mixed now with... all sorts of things live in there, but you have to keep a few things in mind. One is that this book knows about itself. Each frame of the movie has information about itself. So it knows, or at least there is computer-readable information in the medium itself. It ’ s just not a static movie frame. That ’ s one thing. The other is that you have to realize that it is a random **access** medium, and you can, in fact, branch and expand and elaborate and shrink. And here — again, my favorite example — is the cookbook, the”Larousse Gastronomique.”And I think I use the example all too often, but it ’ s a great one because there is a classic ending in that little encyclopedia-style cookbook that tells you how to do something like penguin, and you get to the end of the recipe and it says,”Cook until done.”Now, that would be, if you will, the top green track, which doesn ’ t mean too much. But you might have to elaborate for me or for somebody who isn ’ t an expert, and say,”Cook at 380 degrees for 45 minutes.”And then for a real beginner, you would go down even further and elaborate more — say,”Open the oven, preheat, wait for the light to go out, open the door, don ’ t leave it open too long, put the penguin in and shut the door...”whatever. And that ’ s a much more elaborate one than you dribble back. That ’ s one kind of use of random **access**. And the other is where you want to explain the same thing in different ways. If you ’ re in a classroom situation and somebody asks a question, the last thing you do is repeat what you just said. You try and think of a different way of saying the same thing, or if you know the particular student and that student ’ s cognitive style, then you might say it in a way that you think would have a good impedance match with that student. There are all sorts of techniques you will use — and again, this is a different kind of branching. So, what I will show you is... it ’ s a rather boring book, but I ’ m afraid sometimes you have to do boring books because your sponsors aren ’ t necessarily interested in fiction and entertainment. And this is a book on how to repair a transmission. Now, I don ’ t even know what vintage the transmission is, but let me just show you very quickly some of it, and we ’ ll move on. Narrator : And continue to get descriptions for each of these chapters. Nicholas Negroponte : Now, this is his table of contents. Just a picture of the transmission, and as you rub your finger across the transmission it highlights the various parts. Narrator : When I find a chapter that I want to see, I just touch the text and the system will format pages for me to read. The words or phrases that are lit up in red are glossary words, so I can get a different definition by just touching the word, and the definition appears, superimposed over the illustration. NN : This is about the oil pan, or the oil filter and all that. This is relatively important because it sets the page... Narrator : This is another example of a page with glossary words highlighted in red. I can get a definition of these words just by touching them, and the definition will appear in the illustration corner. I can get back to the illustration, but in this case it ’ s not a single frame, but it ’ s actually a movie of someone coming into the frame and doing the repair that ’ s described in the text. The two-headed slider is a speed control that allows me to watch the movie at various speeds, in forward or reverse. And the movie is displayed as a full frame movie. I can go back to the beginning... and play the movie at full speed. Here ’ s another step-by-step procedure, only in this case — NN : Okay, this movie is... Everybody ’ s heard of sound-sync movies — this is text-sync movies, so as the movie plays, the text gets highlighted. We highlight the text as we go through the movie. Repairman :... Not too far out. Front poles, preferably. Don ’ t loosen them too far. If you loosen them too far, you ’ ll have a big mess. NN : I suspect that some of you might not even understand that language. OK. I ’ m at the third and last part of this, which I said I would make an attempt to at least give you some examples that may be more directly related to the world of entertainment. And of course, good education has got to be good entertainment, so my first example will be drawn from a very recent experiment that we ’ ve been doing — in this case, in Senegal — where we have tried to use personal computers as a pedagogical medium. But not as teaching machines at all ; the whole notion is to use this as an instrument where there is a complete reversal of roles — the child is, if you will, the teacher and the machine is the student — and the art of computer programming is a vehicle that sort of approximates thinking about thinking. But teaching kids programming per se is utterly irrelevant. And there are just a few slides I want to go through, but there ’ s a story I ’ d like to tell. And that was when, before we did this in any developing countries — we ’ re doing it, in fact, in three developing countries right now : Pakistan, Colombia and Senegal — we did it in some pretty rough areas of New York City. And one child, whose name I ’ ve forgotten, was about seven or eight years old, absolutely considered mentally handicapped — couldn ’ t read, didn ’ t even make it in the lowest section of the school ’ s classes — and was pretty much not in school, though physically there. But did hang around the, quote,”computer room,”where there were quite a few computers, and learned this particular language called Logo — and learned it with great ease and found it a lot of fun, it was very interesting. And one day, by chance, some visitors from the NIE came by in their double-breasted suits looking at this setup, and none of the children who were normally there, except for this one child, were there. He was, and he said,”Let me show you how this works,”and they got an absolutely ingenuous, wonderful description of Logo. And the child was just zipping right through it, showing them all sorts of things until they asked him how to do something which he couldn ’ t explain and so he flipped through the manual, found the explanation and typed the command and got it to do what they asked. They were delighted, and by the time it was time to go see the principal, whom they ’ d actually come to see — not the computer room — they went upstairs and they said,”This is absolutely remarkable! That child was very articulate and showed us and even dealt with the things he couldn ’ t do automatically with that manual. It was just absolutely fantastic.”The principal said,”There ’ s a dreadful mistake, because that child can ’ t read. And you obviously have been hoodwinked or you ’ ve talked about somebody else.”And they all got up and they all went downstairs and the child was still there. And they did something very intelligent : they asked the child,”Can you read?”And the child said,”No, I can ’ t.”And then they said,”But wait a minute. You just looked through that manual and you found...”and he said,”Oh, but that ’ s not reading.”And so they said,”Well, what ’ s reading then?”He says,”Well, reading is this junk they give me in little books to read. It ’ s absolutely irrelevant, and I get nothing for it. But here, with a little bit of effort I get a lot of return.”And it really meant something to the child. The child read beautifully, it turned out, and was really very competent. So it actually meant something. And that story has many other anecdotes that are similar, but wow. The key to the future of computers in education is right there, and it is : when does it mean something to a child? There is a myth, and it truly is a myth : we believe — and I ’ m sure a lot of you believe in this room — that it is harder to read and write than it is to learn how to speak. And it ’ s not, but we think speech —”My God, little children pick it up somehow, and by the age of two they ’ re doing a mediocre job, and by three and four they ’ re speaking reasonably well. And yet you ’ ve got to go to school to learn how to read, and you have to sit in a classroom and somebody has to teach you. Hence, it must be harder.”Well, it ’ s not harder. What the truth is is that speaking has great value to a child ; the child can get a great deal by talking to you. Reading and writing is utterly useless. There is no reason for a child to read and write except blind faith, and that it ’ s going to help you. So what happens is you go to school and people say,”Just believe me, you ’ re going to like it. You ’ re going to like reading,”and just read and read. On the other hand, you give a kid — a three-year-old kid — a computer and they type a little command and — Poof! — something happens. And all of a sudden... You may not call that reading and writing, but a certain bit of typing and reading stuff on the screen has a huge payoff, and it ’ s a lot of fun. And in fact, it ’ s a powerful educational instrument. Well, in Senegal we found that this was the traditional classroom : 120 kids — three per desk — one teacher, a little bit of chalk. This student was one of our first students, and it ’ s the girl on the left leaning with her chalkboard, and she came... within two days — I want to show you the program she wrote, and remember her hairstyle. And that is the program she made. That ’ s what meant something to her, is doing the hair pattern, and actually did it within two days — an hour each day — and found it was, to her, absolutely the most meaningful piece... But rooted in that, little did she know how much knowledge she was acquiring about geometry and just math and logic and all the rest. And again, I could talk for three hours about this subject. I will come to my last example and then quit. And my last example — as some of my former colleagues, whom I see in the room, can imagine what it will be. Yes, it is. It ’ s our work — that was a while ago, and it still is my favorite project — of teleconferencing. And the reason it remains a favorite project is that we were asked to do a teleconferencing system where you had the following situation : you had five people at five different sites — they were known people — and you had to have these people in teleconference, such that each one was utterly convinced that the other four were physically present. Now, that is sufficiently zany that we would, obviously, jump to the bait, and we did. And the fact that we knew the people — we had to take a page out of the history of Walt Disney — we actually went so far as to build CRTs in the shapes of the people ’ s faces. So if I wanted to call my friend Peter Sprague on the phone, my secretary would get his head out and bring it and set it on the desk, and that would be the TV used for the occasion. And it ’ s uncanny : there ’ s no way I can explain to you the amount of eye contact you get with that physical face projected on a 3D CRT of that sort. The next thing that we had to do is to persuade them that there needed to be spatial correspondence, which is straightforward, but again, it ’ s something that didn ’ t fall naturally out of a telecommunications or computing style of thinking ; it was a very, if you will, architectural or spatial concept. And that was to recognize that when you sit around the table, the actual location of the people becomes rather important. And when somebody gets up, in fact, to go answer a phone or use a bathroom or something, the empty seat becomes, if you will, that person. And you point frequently to the empty seat and you say,”He or she wouldn ’ t agree,”and the empty chair is that person and the spatiality is crucial. So we said,”Well, these will be on round tables and the order around the table had to be the same, so that at my site, I would be, if you will, real and then at each other ’ s site you ’ d have these plastic heads. And the plastic heads, sometimes you want to project them. And there are a number of schemes, which I don ’ t want to dwell on, but this is the one that we finally used where we projected onto rear screen material that was molded in the face — literally in the face of the person. And I ’ ll show you one more slide, where this is actually made from something called a solid photograph and is the screen. Now, we track, on the person ’ s head, the head motions — so we transmit with a video the head positions — and so this head moves in about two axes. So if I, all of a sudden, turn to the person to my left and start talking to that person, then at the person to my right ’ s site, he ’ ll see these two plastic heads talking to each other. And then if that person interrupts, then those two heads may turn. And it really is reconstructing, quite accurately, teleconferencing.

As a clergyman, you can imagine how out of place I feel. I feel like a fish out of water, or maybe an owl out of the air. I was preaching in San Jose some time ago, and my friend Mark Kvamme, who helped introduce me to this conference, brought several CEOs and leaders of some of the companies here in the Silicon Valley to have breakfast with me, or I with them. And I was so stimulated. And had such — it was an eye-opening experience to hear them talk about the world that is yet to come through technology and science. I know that we ’ re near the end of this conference, and some of you may be wondering why they have a speaker from the field of religion. Richard can answer that, because he made that decision. But some years ago I was on an elevator in Philadelphia, coming down. I was to address a conference at a hotel. And on that elevator a man said,”I hear Billy Graham is staying in this hotel.”And another man looked in my direction and said,”Yes, there he is. He ’ s on this elevator with us.”And this man looked me up and down for about 10 seconds, and he said,”My, what an anticlimax!”I hope that you won ’ t feel that these few moments with me is not a — is an anticlimax, after all these tremendous talks that you ’ ve heard, and addresses, which I intend to listen to every one of them. But I was on an airplane in the east some years ago, and the man sitting across the aisle from me was the mayor of Charlotte, North Carolina. His name was John Belk. Some of you will probably know him. And there was a drunk man on there, and he got up out of his seat two or three times, and he was making everybody upset by what he was trying to do. And he was slapping the stewardess and pinching her as she went by, and everybody was upset with him. And finally, John Belk said,”Do you know who ’ s sitting here?”And the man said,”No, who?”He said,”It ’ s Billy Graham, the preacher.”He said,”You don ’ t say!”And he turned to me, and he said,”Put her there!”He said,”Your sermons have certainly helped me.”And I suppose that that ’ s true with thousands of people. I know that as you have been peering into the future, and as we ’ ve heard some of it here tonight, I would like to live in that age and see what is going to be. But I won ’ t, because I ’ m 80 years old. This is my eightieth year, and I know that my time is brief. I have phlebitis at the moment, in both legs, and that ’ s the reason that I had to have a little help in getting up here, because I have Parkinson ’ s disease in addition to that, and some other problems that I won ’ t talk about. But this is not the first time that we ’ ve had a technological revolution. We ’ ve had others. And there ’ s one that I want to talk about. In one generation, the nation of the people of Israel had a tremendous and dramatic change that made them a great power in the Near East. A man by the name of David came to the throne, and King David became one of the great leaders of his generation. He was a man of tremendous leadership. He had the favor of God with him. He was a brilliant poet, philosopher, writer, soldier — with strategies in battle and conflict that people study even today. But about two centuries before David, the Hittites had discovered the secret of smelting and processing of iron, and, slowly, that skill spread. But they wouldn ’ t allow the Israelis to look into it, or to have any. But David changed all of that, and he introduced the Iron Age to Israel. And the Bible says that David laid up great stores of iron, and which archaeologists have found, that in present-day Palestine, there are evidences of that generation. Now, instead of crude tools made of sticks and stones, Israel now had iron plows, and sickles, and hoes and military weapons. And in the course of one generation, Israel was completely changed. The introduction of iron, in some ways, had an impact a little bit like the microchip has had on our generation. And David found that there were many problems that technology could not solve. There were many problems still left. And they ’ re still with us, and you haven ’ t solved them, and I haven ’ t heard anybody here speak to that. How do we solve these three problems that I ’ d like to mention? The first one that David saw was human evil. Where does it come from? How do we solve it? Over again and again in the Psalms, which Gladstone said was the greatest book in the world, David describes the evils of the human race. And yet he says,”He restores my soul.”Have you ever thought about what a contradiction we are? On one hand, we can probe the deepest secrets of the universe and dramatically push back the frontiers of technology, as this conference vividly demonstrates. We ’ ve seen under the sea, three miles down, or galaxies hundreds of billions of years out in the future. But on the other hand, something is wrong. Our battleships, our soldiers, are on a frontier now, almost ready to go to war with Iraq. Now, what causes this? Why do we have these wars in every generation, and in every part of the world? And revolutions? We can ’ t get along with other people, even in our own families. We find ourselves in the paralyzing grip of self-destructive habits we can ’ t break. Racism and injustice and **violence** sweep our world, bringing a tragic harvest of heartache and death. Even the most sophisticated among us seem powerless to break this cycle. I would like to see Oracle take up that, or some other technological geniuses work on this. How do we change man, so that he doesn ’ t lie and cheat, and our newspapers are not filled with stories of fraud in business or labor or athletics or wherever? The Bible says the problem is within us, within our hearts and our souls. Our problem is that we are separated from our Creator, which we call God, and we need to have our souls restored, something only God can do. Jesus said,”For out of the heart come evil thoughts : murders, **sexual** immorality, theft, false testimonies, slander.”The British philosopher Bertrand Russell was not a religious man, but he said,”It ’ s in our hearts that the evil lies, and it ’ s from our hearts that it must be plucked out.”Albert Einstein — I was just talking to someone, when I was speaking at Princeton, and I met Mr. Einstein. He didn ’ t have a doctor ’ s degree, because he said nobody was qualified to give him one. But he made this statement. He said,”It ’ s easier to denature plutonium than to denature the evil spirit of man.”And many of you, I ’ m sure, have thought about that and puzzled over it. You ’ ve seen people take beneficial technological advances, such as the Internet we ’ ve heard about tonight, and twist them into something corrupting. You ’ ve seen brilliant people devise computer viruses that bring down whole systems. The Oklahoma City bombing was simple technology, horribly used. The problem is not technology. The problem is the person or persons using it. King David said that he knew the depths of his own soul. He couldn ’ t free himself from personal problems and personal evils that included murder and adultery. Yet King David sought God ’ s forgiveness, and said,”You can restore my soul.”You see, the Bible teaches that we ’ re more than a body and a mind. We are a soul. And there ’ s something inside of us that is beyond our understanding. That ’ s the part of us that yearns for God, or something more than we find in technology. Your soul is that part of you that yearns for meaning in life, and which seeks for something beyond this life. It ’ s the part of you that yearns, really, for God. I find [that] young people all over the world are searching for something. They don ' t know what it is. I speak at many universities, and I have many questions and answer periods, and whether it ' s Cambridge, or Harvard, or Oxford — I ' ve spoken at all of those universities. I ' m going to Harvard in about three or four — no, it ' s about two months from now — to give a lecture. And I ' ll be asked the same questions that I was asked the last few times I ' ve been there. And it ' ll be on these questions : where did I come from? Why am I here? Where am I going? What ' s life all about? Why am I here? Even if you have no religious belief, there are times when you wonder that there ' s something else. Thomas Edison also said,"When you see everything that happens in the world of science, and in the working of the universe, you cannot deny that there ' s a captain on the bridge."I remember once, I sat beside Mrs. Gorbachev at a White House dinner. I went to Ambassador Dobrynin, whom I knew very well. And I ' d been to Russia several times under the Communists, and they ' d given me marvelous freedom that I didn ' t expect. And I knew Mr. Dobrynin very well, and I said,"I ' m going to sit beside Mrs. Gorbachev tonight. What shall I talk to her about?"And he surprised me with the answer. He said,"Talk to her about religion and philosophy. That ' s what she ' s really interested in."I was a little bit surprised, but that evening that ' s what we talked about, and it was a stimulating conversation. And afterward, she said,"You know, I ' m an atheist, but I know that there ' s something up there higher than we are."The second problem that King David realized he could not solve was the problem of human **suffering**. Writing the oldest book in the world was Job, and he said,"Man is born unto trouble as the sparks fly upward."Yes, to be sure, science has done much to push back certain types of human **suffering**. But I ' m — in a few months, I ' ll be 80 years of age. I admit that I ' m very grateful for all the medical advances that have kept me in relatively good health all these years. My doctors at the Mayo Clinic urged me not to take this trip out here to this — to be here. I haven ' t given a talk in nearly four months. And when you speak as much as I do, three or four times a day, you get rusty. That ' s the reason I ' m using this podium and using these notes. Every time you ever hear me on the television or somewhere, I ' m ad-libbing. I ' m not reading. I never read an address. I never read a speech or a talk or a lecture. I talk ad lib. But tonight, I ' ve got some notes here so that if I begin to forget, which I do sometimes, I ' ve got something I can turn to. But even here among us, most — in the most advanced society in the world, we have poverty. We have families that self-destruct, friends that betray us. Unbearable psychological pressures bear down on us. I ' ve never met a person in the world that didn ' t have a problem or a worry. Why do we suffer? It ' s an age- old question that we haven ' t answered. Yet David again and again said that he would turn to God. He said,"The Lord is my shepherd."The final problem that David knew he could not solve was death. Many commentators have said that death is the forbidden subject of our generation. Most people live as if they ' re never going to die. Technology projects the myth of control over our mortality. We see people on our screens. Marilyn Monroe is just as beautiful on the screen as she was in person, and our — many young people think she ' s still alive. They don ' t know that she ' s dead. Or Clark Gable, or whoever it is. The old stars, they come to life. And they ' re — they ' re just as great on that screen as they were in person. But death is inevitable. I spoke some time ago to a joint session of Congress, last year. And we were meeting in that room, the statue room. About 300 of them were there. And I said,"There ' s one thing that we have in common in this room, all of us together, whether Republican or Democrat, or whoever."I said,"We ' re all going to die. And we have that in common with all these great men of the past that are staring down at us."And it ' s often difficult for young people to understand that. It ’ s difficult for them to understand that they ’ re going to die. As the ancient writer of Ecclesiastes wrote, he said, there ’ s every activity under heaven. There ’ s a time to be born, and there ’ s a time to die. I ’ ve stood at the deathbed of several famous people, whom you would know. I ’ ve talked to them. I ’ ve seen them in those agonizing moments when they were scared to death. And yet, a few years earlier, death never crossed their mind. I talked to a woman this past week whose father was a famous doctor. She said he never thought of God, never talked about God, didn ’ t believe in God. He was an atheist. But she said, as he came to die, he sat up on the side of the bed one day, and he asked the nurse if he could see the chaplain. And he said, for the first time in his life he ’ d thought about the inevitable, and about God. Was there a God? A few years ago, a university student asked me,”What is the greatest surprise in your life?”And I said,”The greatest surprise in my life is the brevity of life. It passes so fast.”But it does not need to have to be that way. Wernher von Braun, in the aftermath of World War II concluded, quote :”science and religion are not antagonists. On the contrary, they ’ re sisters.”He put it on a personal basis. I knew Dr. von Braun very well. And he said,”Speaking for myself, I can only say that the grandeur of the cosmos serves only to confirm a belief in the certainty of a creator.”He also said,”In our search to know God, I ’ ve come to believe that the life of Jesus Christ should be the focus of our efforts and inspiration. The reality of this life and His resurrection is the hope of mankind.”I ’ ve done a lot of speaking in Germany and in France, and in different parts of the world — 105 countries it ’ s been my privilege to speak in. And I was invited one day to visit Chancellor Adenauer, who was looked upon as sort of the founder of modern Germany, since the war. And he once — and he said to me, he said,”Young man.”He said,”Do you believe in the resurrection of Jesus Christ?”And I said,”Sir, I do.”He said,”So do I.”He said,”When I leave office, I ’ m going to spend my time writing a book on why Jesus Christ rose again, and why it ’ s so important to believe that.”In one of his plays, Alexander Solzhenitsyn depicts a man dying, who says to those gathered around his bed,”The moment when it ’ s terrible to feel regret is when one is dying.”How should one live in order not to feel regret when one is dying? Blaise Pascal asked exactly that question in seventeenth-century France. Pascal has been called the architect of modern civilization. He was a brilliant scientist at the frontiers of mathematics, even as a teenager. He is viewed by many as the founder of the probability theory, and a creator of the first model of a computer. And of course, you are all familiar with the computer language named for him. Pascal explored in depth our human dilemmas of evil, **suffering** and death. He was astounded at the phenomenon we ’ ve been considering : that people can achieve extraordinary heights in science, the arts and human enterprise, yet they also are full of anger, hypocrisy and have — and self- **hatreds**. Pascal saw us as a remarkable mixture of genius and self-delusion. On November 23, 1654, Pascal had a profound religious experience. He wrote in his journal these words :”I submit myself, absolutely, to Jesus Christ, my redeemer.”A French historian said, two centuries later,”Seldom has so mighty an intellect submitted with such humility to the authority of Jesus Christ.”Pascal came to believe not only the love and the grace of God could bring us back into harmony, but he believed that his own sins and failures could be forgiven, and that when he died he would go to a place called heaven. He experienced it in a way that went beyond scientific observation and reason. It was he who penned the well-known words,”The heart has its reasons, which reason knows not of.”Equally well known is Pascal ’ s Wager. Essentially, he said this :”if you bet on God, and open yourself to his love, you lose nothing, even if you ’ re wrong. But if instead you bet that there is no God, then you can lose it all, in this life and the life to come."For Pascal, scientific knowledge paled beside the knowledge of God. The knowledge of God was far beyond anything that ever crossed his mind. He was ready to face him when he died at the age of 39. King David lived to be 70, a long time in his era. Yet he too had to face death, and he wrote these words :"even though I walk through the valley of the shadow of death, I will fear no evil, for you are with me."This was David ' s answer to three dilemmas of evil, **suffering** and death. It can be yours, as well, as you seek the living God and allow him to fill your life and give you hope for the future. When I was 17 years of age, I was born and reared on a farm in North Carolina. I milked cows every morning, and I had to milk the same cows every evening when I came home from school. And there were 20 of them that I had — that I was responsible for, and I worked on the farm and tried to keep up with my studies. I didn ' t make good grades in high school. I didn ' t make them in college, until something happened in my heart. One day, I was faced face-to-face with Christ. He said,"I am the way, the truth and the life."Can you imagine that?"I am the truth. I ' m the embodiment of all truth."He was a liar. Or he was insane. Or he was what he claimed to be. Which was he? I had to make that decision. I couldn ' t prove it. I couldn ' t take it to a laboratory and experiment with it. But by faith I said, I believe him, and he came into my heart and changed my life. And now I ' m ready, when I hear that call, to go into the presence of God. Thank you, and God bless all of you. Thank you for the privilege. It was great. Richard Wurman : You did it. Thanks.

' Theme and variations ' is one of those forms that require a certain kind of intellectual activity, because you are always comparing the variation with the theme that you hold in your mind. You might say that the theme is nature and everything that follows is a variation on the subject. I was asked, I guess about six years ago, to do a series of paintings that in some way would **celebrate** the birth of Piero della Francesca. And it was very difficult for me to imagine how to paint pictures that were based on Piero until I realized that I could look at Piero as nature — that I would have the same **attitude** towards looking at Piero della Francesca as I would if I were looking out a window at a tree. And that was enormously liberating to me. Perhaps it ' s not a very insightful observation, but that really started me on a path to be able to do a kind of theme and variations based on a work by Piero, in this case that remarkable painting that ' s in the Uffizi,"The Duke of Montefeltro,"who faces his consort, Battista. Once I realized that I could take some liberties with the subject, I did the following series of drawings. That ' s the real Piero della Francesca — one of the greatest portraits in human history. And these, I ' ll just show these without comment. It ' s just a series of variations on the head of the Duke of Montefeltro, who ' s a great, great figure in the Renaissance, and probably the basis for Machiavelli ' s"The Prince."He apparently lost an eye in battle, which is why he is always shown in profile. And this is Battista. And then I decided I could move them around a little bit — so that for the first time in history, they ' re facing the same direction. Whoops! Passed each other. And then a visitor from another painting by Piero, this is from"The Resurrection of Christ"— as though the cast had just gotten of the set to have a **chat**. And now, four large panels : this is upper left ; upper right ; lower left ; lower right. Incidentally, I ' ve never understood the conflict between abstraction and naturalism. Since all paintings are inherently abstract to begin with there doesn ' t seem to be an argument there. On another subject — — I was driving in the country one day with my wife, and I saw this sign, and I said,”That is a fabulous piece of design.”And she said,”What are you talking about?”I said,”Well, it ’ s so persuasive, because the purpose of that sign is to get you into the garage, and since most people are so suspicious of garages, and know that they ’ re going to be ripped off, they use the word ’ reliable. ’ But everybody says they ’ re reliable. But, reliable Dutchman”— —”Fantastic!”Because as soon as you hear the word Dutchman — which is an archaic word, nobody calls Dutch people”Dutchmen”anymore — but as soon as you hear Dutchman, you get this picture of the kid with his finger in the dike, preventing the thing from falling and flooding Holland, and so on. And so the entire issue is detoxified by the use of”Dutchman.”Now, if you think I ’ m exaggerating at all in this, all you have to do is substitute something else, like”Indonesian.”Or even”French.”Now,”Swiss”works, but you know it ’ s going to cost a lot of money. I ’ m going to take you quickly through the actual process of doing a poster. I do a lot of work for the School of Visual Arts, where I teach, and the director of this school — a remarkable man named Silas Rhodes — often gives you a piece of text and he says,”Do something with this.”And so he did. And this was the text —”In words as fashion the same rule will hold / Alike fantastic if too new or old / Be not the first by whom the new are tried / Nor yet the last to lay the old aside.”I could make nothing of that. And I really struggled with this one. And the first thing I did, which was sort of in the absence of another idea, was say I ’ ll sort of write it out and make some words big, and I ’ ll have some kind of design on the back somehow, and I was hoping — as one often does — to stumble into something. So I took another crack at it — you ’ ve got to keep it moving — and I Xeroxed some words on pieces of colored paper and I pasted them down on an ugly board. I thought that something would come out of it, like”Words rule fantastic new old first last Pope”because it ’ s by Alexander Pope, but I sort of made a mess out of it, and then I thought I ’ d repeat it in some way so it was legible. So, it was going nowhere. Sometimes, in the middle of a resistant problem, I write down things that I know about it. But you can see the beginning of an idea there, because you can see the word”new”emerging from the”old.”That ’ s what happens. There ’ s a relationship between the old and the new ; the new emerges from the context of the old. And then I did some variations of it, but it still wasn ’ t coalescing graphically at all. I had this other version which had something interesting about it in terms of being able to put it together in your mind from clues. The W was clearly a W, the N was clearly an N, even though they were very fragmentary and there wasn ’ t a lot of information in it. Then I got the words”new”and”old”and now I had regressed back to a point where there seemed to be no return. I was really desperate at this point. And so, I do something I ’ m truthfully ashamed of, which is that I took two drawings I had made for another purpose and I put them together. It says”dreams”at the top. And I was going to do a thing, I say,”Well, change the copy. Let it say something about dreams, and come to SVA and you ’ ll sort of fulfill your dreams.”But, to my credit, I was so embarrassed about doing that that I never submitted this sketch. And, finally, I arrived at the following solution. Now, it doesn ’ t look terribly interesting, but it does have something that distinguishes it from a lot of other posters. For one thing, it transgresses the idea of what a poster ’ s supposed to be, which is to be understood and seen immediately, and not explained. I remember hearing all of you in the graphic arts —”If you have to explain it, it ain ’ t working.”And one day I woke up and I said,”Well, suppose that ’ s not true?”So here ’ s what it says in my explanation at the bottom left. It says,”Thoughts : This poem is impossible. Silas usually has a better touch with his choice of quotations. This one generates no imagery at all.”I am now exposing myself to my audience, right? Which is something you never want to do professionally.”Maybe the words can make the image without anything else happening. What ’ s the heart of this poem? Don ’ t be trendy if you want to be serious. Is doing the poster this way trendy in itself? I guess one could reduce the idea further by suggesting that the new emerges behind and through the old, like this.”And then I show you a little drawing — you see, you remember that old thing I discarded? Well, I found a way to use it. So, there ’ s that little alternative over there, and I say,”Not bad,”— criticizing myself —”but more didactic than visual. Maybe what wants to be said is that old and the new are locked in a dialectical embrace, a kind of dance where each defines the other.”And then more self-questioning —”Am I being simple-minded? Is this the kind of simple that looks obvious, or the kind that looks profound? There ’ s a significant difference. This could be embarrassing. Actually, I realize fear of embarrassment drives me as much as any ambition. Do you think this sort of thing could really attract a student to the school?”Well, I think there are two fresh things here — two fresh things. One is the sort of willingness to expose myself to a critical audience, and not to suggest that I am confident about what I ’ m doing. And as you know, you have to have a front. I mean — you ’ ve got to be confident ; if you don ’ t believe in your work, who else is going to believe in it? So that ’ s one thing, to introduce the idea of doubt into graphics. That can be a big contribution. The other thing is to actually give you two solutions for the price of one ; you get the big one and if you don ’ t like that, how about the little one? And that too is a relatively new idea. And here ’ s just a series of experiments where I ask the question of — does a poster have to be square? Now, this is a little illusion. That poster is not folded. It ’ s not folded, that ’ s a photograph and it ’ s cut on the diagonal. Same cheap trick in the upper left- hand corner. And here, a very peculiar poster because, simply because of using the isometric perspective in the computer, it won ’ t sit still in the space. At times, it seems to be wider at the back than the front, and then it shifts. And if you sit here long enough, it ’ ll float off the page into the audience. But, we don ’ t have time. And then an experiment — a little bit about the nature of perspective, where the outside shape is determined by the peculiarity of perspective, but the shape of the bottle — which is identical to the outside shape — is seen frontally. And another piece for the art directors ’ club is”Anna Rees”casting long shadows. This is another poster from the School of Visual Arts. There were 10 artists invited to participate in it, and it was one of those things where it was extremely competitive and I didn ’ t want to be embarrassed, so I worked very hard on this. The idea was — and it was a brilliant idea — was to have 10 posters distributed throughout the city ’ s subway system so every time you got on the subway you ’ d be passing a different poster, all of which had a different idea of what art is. But I was absolutely stuck on the idea of”art is”and trying to determine what art was. But then I gave up and I said,”Well, art is whatever.”And as soon as I said that, I discovered that the word”hat”was hidden in the word”whatever,”and that led me to the inevitable conclusion. But then again, it ’ s on my list of didactic posters. My intent is to have a literary accompaniment that explains the poster, in case you don ’ t get it. Now this says,”Note to the viewer : I thought I might use a visual cliche of our time — Magritte ’ s everyman — to express the idea that art is mystery, continuity and history. I ’ m also convinced that, in an age of computer manipulation, surrealism has become banal, a shadow of its former self. The phrase ’ Art is whatever ’ expresses the current inclusiveness that surrounds art-making — a sort of ’ it ain ’ t what you do, it ’ s the way that you do it ’ notion. The shadow of Magritte falls across the central part of the poster a poetic event that occurs as the shadow man isolates the word ’ hat, ’ hidden in the word ’ whatever. ’ The four hats shown in the poster suggests how art might be defined : as a thing itself, the worth of the thing, the shadow of the thing, and the shape of the thing. Whatever.”OK. And the one that I did not submit, which I still like, I wanted to use the same phrase. There were wonderful experiments by Bruno Munari on letterforms some years ago — sort of, see how far you could go and still be able to read them. And that idea stuck in my head. But then I took the pieces that I had taken off and put them at the bottom. And, of course those are the remains, and they ’ re so labeled. But what really happens is that you read it as :”Art is whatever remains.”Thank you.

Text Sample 418: POS Dim 3 – 1998 – Score 2.00 – 1998/t000113.txt

Sheryl Shade : Hi, Aimee. Aimee Mullins : Hi. SS : Aimee and I thought we ’ d just talk a little bit, and I wanted her to tell all of you what makes her a distinctive athlete. AM : Well, for those of you who have seen the picture in the little bio â it might have given it away â I ’ m a double amputee, and I was born without fibulas in both legs. I was amputated at age one, and I ’ ve been running like hell ever since, all over the place. SS : Well, why don ’ t you tell them how you got to Georgetown â why don ’ t we start there? Why don ’ t we start there? AM : I ’ m a senior in Georgetown in the Foreign Service program. I won a full academic scholarship out of high school. They pick three students out of the nation every year to get involved in international affairs, and so I won a full ride to Georgetown and I ’ ve been there for four years. Love it. SS : When Aimee got there, she decided that she ’ s, kind of, curious about track and field, so she decided to call someone and start asking about it. So, why don ’ t you tell that story? AM : Yeah. Well, I guess I ’ ve always been involved in sports. I played softball for five years growing up. I skied competitively throughout high school, and I got a little restless in college because I wasn ’ t doing anything for about a year or two sports-wise. And I ’ d never competed on a **disabled** level, you know â I ’ d always competed against other able-bodied athletes. That ’ s all I ’ d ever known. In fact, I ’ d never even met another amputee until I was 17. And I heard that they do these track meets with all **disabled** runners, and I figured,”Oh, I don ’ t know about this, but before I judge it, let me go see what it ’ s all about.”So, I booked myself a flight to Boston in ’ 95, 19 years old and definitely the dark horse candidate at this race. I ’ d never done it before. I went out on a gravel track a couple of weeks before this meet to see how far I could run, and about 50 meters was enough for me, panting and heaving. And I had these legs that were made of a wood and plastic compound, attached with Velcro straps â big, thick, five-ply wool socks on â you know, not the most comfortable things, but all I ’ d ever known. And I ’ m up there in Boston against people wearing legs made of all things â carbon graphite and, you know, shock absorbers in them and all sorts of things â and they ’ re all looking at me like, OK, we know who ’ s not going to win this race. And, I mean, I went up there expecting â I don ’ t know what I was expecting â but, you know, when I saw a man who was missing an entire leg go up to the high jump, hop on one leg to the high jump and clear it at six feet, two inches... Dan O ’ Brien jumped 5 ’ 11”in ’ 96 in Atlanta, I mean, if it just gives you a comparison of â these are truly accomplished athletes, without qualifying that word”athlete.”And so I decided to give this a shot : heart pounding, I ran my first race and I beat the national record-holder by three hundredths of a second, and became the new national record-holder on my first try out. And, you know, people said,”Aimee, you know, you ’ ve got speed â you ’ ve got natural speed â but you don ’ t have any skill or finesse going down that track. You were all over the place. We all saw how hard you were working.”And so I decided to call the track coach at Georgetown. And I thank god I didn ’ t know just how huge this man is in the track and field world. He ’ s coached five Olympians, and the man ’ s office is lined from floor to ceiling with All America certificates of all these athletes he ’ s coached. He ’ s just a rather intimidating figure. And I called him up and said,”Listen, I ran one race and I won...””I want to see if I can, you know â I need to just see if I can sit in on some of your practices, see what drills you do and whatever.”That ’ s all I wanted â just two practices.”Can I just sit in and see what you do?”And he said,”Well, we should meet first, before we decide anything.”You know, he ’ s thinking,”What am I getting myself into?”So, I met the man, walked in his office, and saw these posters and magazine covers of people he has coached. And we got to talking, and it turned out to be a great partnership because he ’ d never coached a **disabled** athlete, so therefore he had no preconceived notions of what I was or wasn ’ t capable of, and I ’ d never been coached before. So this was like,”Here we go â let ’ s start on this trip.”So he started giving me four days a week of his lunch break, his free time, and I would come up to the track and train with him. So that ’ s how I met Frank. That was fall of ’ 95. But then, by the time that winter was rolling around, he said,”You know, you ’ re good enough. You can run on our women ’ s track team here.”And I said,”No, come on.”And he said,”No, no, really. You can. You can run with our women ’ s track team.”In the spring of 1996, with my goal of making the U. S. Paralympic team that May coming up full speed, I joined the women ’ s track team. And no **disabled** person had ever done that â run at a collegiate level. So I don ’ t know, it started to become an interesting mix. SS : Well, on your way to the Olympics, a couple of memorable events happened at Georgetown. Why don ’ t you just tell them? AM : Yes, well, you know, I ’ d won everything as far as the **disabled** meets â everything I competed in â and, you know, training in Georgetown and knowing that I was going to have to get used to seeing the backs of all these women ’ s shirts â you know, I ’ m running against the next Flo-Jo â and they ’ re all looking at me like,”Hmm, what ’ s, you know, what ’ s going on here?”And putting on my Georgetown uniform and going out there and knowing that, you know, in order to become better â and I ’ m already the best in the country â you know, you have to train with people who are inherently better than you. And I went out there and made it to the Big East, which was sort of the championship race at the end of the season. It was really, really hot. And it ’ s the first â I had just gotten these new sprinting legs that you see in that bio, and I didn ’ t realize at that time that the amount of sweating I would be doing in the sock â it actually acted like a lubricant and I ’ d be, kind of, pistoning in the socket. And at about 85 meters of my 100 meters sprint, in all my glory, I came out of my leg. Like, I almost came out of it, in front of, like, 5, 000 people. And I, I mean, was just mortified â because I was signed up for the 200, you know, which went off in a half hour. I went to my coach :”Please, don ’ t make me do this.”I can ’ t do this in front of all those people. My legs will come off. And if it came off at 85 there ’ s no way I ’ m going 200 meters. And he just sat there like this. My pleas fell on deaf ears, thank god. Because you know, the man is from Brooklyn ; he ’ s a big man. He says,”Aimee, so what if your leg falls off? You pick it up, you put the damn thing back on, and finish the goddamn race!”And I did. So, he kept me in line. He kept me on the right track. SS : So, then Aimee makes it to the 1996 Paralympics, and she ’ s all excited. Her family ’ s coming down â it ’ s a big deal. It ’ s now two years that you ’ ve been running? AM : No, a year. SS : A year. And why don ’ t you tell them what happened right before you go run your race? AM : Okay, well, Atlanta. The Paralympics, just for a little bit of clarification, are the Olympics for people with physical disabilities â amputees, persons with cerebral palsy, and wheelchair athletes â as opposed to the Special Olympics, which deals with people with mental disabilities. So, here we are, a week after the Olympics and down at Atlanta, and I ’ m just blown away by the fact that just a year ago, I got out on a gravel track and couldn ’ t run 50 meters. And so, here I am â never lost. I set new records at the U. S. Nationals â the Olympic trials â that May, and was sure that I was coming home with the gold. I was also the only, what they call”bilateral BK”â below the knee. I was the only woman who would be doing the long jump. I had just done the long jump, and a guy who was missing two legs came up to me and says,”How do you do that? You know, we ’ re supposed to have a planar foot, so we can ’ t get off on the springboard.”I said,”Well, I just did it. No one told me that.”So, it ’ s funny â I ’ m three inches within the world record â and kept on from that point, you know, so I ’ m signed up in the long jump â signed up? No, I made it for the long jump and the 100-meter. And I ’ m sure of it, you know? I made the front page of my hometown paper that I delivered for six years, you know? It was, like, this is my time for shine. And we ’ re at the trainee warm-up track, which is a few blocks away from the Olympic stadium. These legs that I was on, which I ’ ll take out right now â I was the first person in the world on these legs. I was the guinea pig., I ’ m telling you, this was, like â talk about a tourist attraction. Everyone was taking pictures â”What is this girl running on?”And I ’ m always looking around, like, where is my competition? It ’ s my first international meet. I tried to get it out of anybody I could, you know,”Who am I running against here?””Oh, Aimee, we ’ ll have to get back to you on that one.”I wanted to find out times.”Don ’ t worry, you ’ re doing great.”This is 20 minutes before my race in the Olympic stadium, and they post the heat sheets. And I go over and look. And my fastest time, which was the world record, was 15. 77. Then I ’ m looking : the next lane, lane two, is 12. 8. Lane three is 12. 5. Lane four is 12. 2. I said,”What ’ s going on?”And they shove us all into the shuttle bus, and all the women there are missing a hand. So, I ’ m just, like â they ’ re all looking at me like ’ which one of these is not like the other, ’ you know? I ’ m sitting there, like,”Oh, my god. Oh, my god.”You know, I ’ d never lost anything, like, whether it would be the scholarship or, you know, I ’ d won five golds when I skied. In everything, I came in first. And Georgetown â that was great. I was losing, but it was the best training because this was Atlanta. Here we are, like, crĂ¨me de la crĂ¨me, and there is no doubt about it, that I ’ m going to lose big. And, you know, I ’ m just thinking,”Oh, my god, my whole family got in a van and drove down here from Pennsylvania.”And, you know, I was the only female U. S. sprinter. So they call us out and, you know â”Ladies, you have one minute.”And I remember putting my blocks in and just feeling horrified because there was just this murmur coming over the crowd, like, the ones who are close enough to the starting line to see. And I ’ m like,”I know! Look! This isn ’ t right.”And I ’ m thinking that ’ s my last card to play here ; if I ’ m not going to beat these girls, I ’ m going to mess their heads a little, you know? I mean, it was definitely the”Rocky IV”sensation of me versus Germany, and everyone else â Estonia and Poland â was in this heat. And the gun went off, and all I remember was finishing last and fighting back tears of frustration and incredible â incredible â this feeling of just being overwhelmed. And I had to think,”Why did I do this?”If I had won everything â but it was like, what was the point? All this training â I had transformed my life. I became a collegiate athlete, you know. I became an Olympic athlete. And it made me really think about how the achievement was getting there. I mean, the fact that I set my sights, just a year and three months before, on becoming an Olympic athlete and saying,”Here ’ s my life going in this direction â and I want to take it here for a while, and just seeing how far I could push it."And the fact that I asked for help â how many people jumped on board? How many people gave of their time and their expertise, and their patience, to deal with me? And that was this collective glory â that there was, you know, 50 people behind me that had joined in this incredible experience of going to Atlanta. So, I apply this sort of philosophy now to everything I do : sitting back and realizing the progression, how far you ’ ve come at this day to this goal, you know. It ’ s important to focus on a goal, I think, but also recognize the progression on the way there and how you ’ ve grown as a person. That ’ s the achievement, I think. That ’ s the real achievement. SS : Why don ’ t you show them your legs? AM : Oh, sure. SS : You know, show us more than one set of legs. AM : Well, these are my pretty legs. No, these are my cosmetic legs, actually, and they ’ re absolutely beautiful. You ’ ve got to come up and see them. There are hair follicles on them, and I can paint my toenails. And, seriously, like, I can wear heels. Like, you guys don ’ t understand what that ’ s like to be able to just go into a shoe store and buy whatever you want. SS : You got to pick your height? AM : I got to pick my height, exactly. Patrick Ewing, who played for Georgetown in the ’ 80s, comes back every summer. And I had incessant fun making fun of him in the training room because he ’ d come in with foot injuries. I ’ m like,"Get it off! Don ’ t worry about it, you know. You can be eight feet tall. Just take them off."He didn ’ t find it as humorous as I did, anyway. OK, now, these are my sprinting legs, made of carbon graphite, like I said, and I ’ ve got to make sure I ’ ve got the right socket. No, I ’ ve got so many legs in here. These are â do you want to hold that actually? That ’ s another leg I have for, like, tennis and softball. It has a shock absorber in it so it, like,"Shhhh,"makes this neat sound when you jump around on it. All right. And then this is the silicon sheath I roll over, to keep it on. Which, when I sweat, you know, I ’ m pistoning out of it. SS : Are you a different height? AM : In these? SS : In these. AM : I don ’ t know. I don ’ t think so. I may be a little taller. I actually can put both of them on. SS : She can ’ t really stand on these legs. She has to be moving, so... AM : Yeah, I definitely have to be moving, and balance is a little bit of an art in them. But without having the silicon sock, I ’ m just going to try slip in it. And so, I run on these, and have shocked half the world on these. These are supposed to simulate the actual form of a sprinter when they run. If you ever watch a sprinter, the ball of their foot is the only thing that ever hits the track. So when I stand in these legs, my hamstring and my glutes are contracted, as they would be had I had feet and were standing on the ball of my feet. AM : It ’ s a company in San Diego called Flex-Foot. And I was a guinea pig, as I hope to continue to be in every new form of prosthetic limbs that come out. But actually these, like I said, are still the actual prototype. I need to get some new ones because the last meet I was at, they were everywhere. You know, it ’ s like a big â it ’ s come full circle. Moderator : Aimee and the designer of them will be at TEDMED 2, and we ’ ll talk about the design of them. AM : Yes, we ’ ll do that. SS : Yes, there you go. AM : So, these are the sprint legs, and I can put my other... SS : Can you tell about who designed your other legs? AM : Yes. These I got in a place called Bournemouth, England, about two hours south of London, and I ’ m the only person in the United States with these, which is a crime because they are so beautiful. And I don ’ t even mean, like, because of the toes and everything. For me, while I ’ m such a serious athlete on the track, I want to be feminine off the track, and I think it ’ s so important not to be limited in any capacity, whether it ’ s, you know, your mobility or even fashion. I mean, I love the fact that I can go in anywhere and pick out what I want â the shoes I want, the skirts I want â and I ’ m hoping to try to bring these over here and make them accessible to a lot of people. They ’ re also silicon. This is a really basic, basic prosthetic limb under here. It ’ s like a Barbie foot under this. It is. It ’ s just stuck in this position, so I have to wear a two-inch heel. And, I mean, it ’ s really â let me take this off so you can see it. I don ’ t know how good you can see it, but, like, it really is. There ’ re veins on the feet, and then my heel is pink, and my Achilles ’ tendon â that moves a little bit. And it ’ s really an amazing store. I got them a year and two weeks ago. And this is just a silicon piece of skin. I mean, what happened was, two years ago this man in Belgium was saying,”God, if I can go to Madame Tussauds ’ wax museum and see Jerry Hall replicated down to the color of her eyes, looking so real as if she breathed, why can ’ t they build a limb for someone that looks like a leg, or an arm, or a hand?”I mean, they make ears for burn **victims**. They do amazing stuff with silicon. SS : Two weeks ago, Aimee was up for the Arthur Ashe award at the ESPYs. And she came into town and she rushed around and she said,”I have to buy some new shoes!”We ’ re an hour before the ESPYs, and she thought she ’ d gotten a two-inch heel but she ’ d actually bought a three-inch heel. AM : And this poses a problem for me, because it means I ’ m walking like that all night long. SS : For 45 minutes. Luckily, the hotel was terrific. They got someone to come in and saw off the shoes. AM : I said to the receptionist â I mean, I am just harried, and Sheryl ’ s at my side â I said,”Look, do you have anybody here who could help me? Because I have this problem...”You know, at first they were just going to write me off, like,”If you don ’ t like your shoes, sorry. It ’ s too late.””No, no, no, no. I ’ ve got these special feet that need a two-inch heel. I have a three-inch heel. I need a little bit off.”They didn ’ t even want to go there. They didn ’ t even want to touch that one. They just did it. No, these legs are great. I ’ m actually going back in a couple of weeks to get some improvements. I want to get legs like these made for flat feet so I can wear sneakers, because I can ’ t with these ones. So... Moderator : That ’ s it. SS : That ’ s Aimee Mullins.

Text Sample 419: POS Dim 3 – 1994 – Score -29.00 – 1994/t002458.txt

Because I usually take the role of trying to explain to people how wonderful the new technologies that are coming along are going to be, and I thought that, since I was among friends here, I would tell you what I really think and try to look back and try to understand what is really going on here with these amazing jumps in technology that seem so fast that we can barely keep on top of it. So I ’ m going to start out by showing just one very boring technology slide. And then, so if you can just turn on the slide that ’ s on. This is just a random slide that I picked out of my file. What I want to show you is not so much the details of the slide, but the general form of it. This happens to be a slide of some analysis that we were doing about the power of RISC microprocessors versus the power of local area networks. And the interesting thing about it is that this slide, like so many technology slides that we ’ re used to, is a sort of a straight line on a semi-log curve. In other words, every step here represents an order of magnitude in performance scale. And this is a new thing that we talk about technology on semi-log curves. Something really weird is going on here. And that ’ s basically what I ’ m going to be talking about. So, if you could bring up the lights. If you could bring up the lights higher, because I ’ m just going to use a piece of paper here. Now why do we draw technology curves in semi-log curves? Well the answer is, if I drew it on a normal curve where, let ’ s say, this is years, this is time of some sort, and this is whatever measure of the technology that I ’ m trying to graph, the graphs look sort of silly. They sort of go like this. And they don ’ t tell us much. Now if I graph, for instance, some other technology, say transportation technology, on a semi-log curve, it would look very stupid, it would look like a flat line. But when something like this happens, things are qualitatively changing. So if transportation technology was moving along as fast as microprocessor technology, then the day after tomorrow, I would be able to get in a taxi cab and be in Tokyo in 30 seconds. It ’ s not moving like that. And there ’ s nothing precedented in the history of technology development of this kind of self- feeding growth where you go by orders of magnitude every few years. Now the question that I ’ d like to ask is, if you look at these exponential curves, they don ’ t go on forever. Things just can ’ t possibly keep changing as fast as they are. One of two things is going to happen. Either it ’ s going to turn into a sort of classical S-curve like this, until something totally different comes along, or maybe it ’ s going to do this. That ’ s about all it can do. Now I ’ m an optimist, so I sort of think it ’ s probably going to do something like that. If so, that means that what we ’ re in the middle of right now is a transition. We ’ re sort of on this line in a transition from the way the world used to be to some new way that the world is. And so what I ’ m trying to ask, what I ’ ve been asking myself, is what ’ s this new way that the world is? What ’ s that new state that the world is heading toward? Because the transition seems very, very confusing when we ’ re right in the middle of it. Now when I was a kid growing up, the future was kind of the year 2000, and people used to talk about what would happen in the year 2000. Now here ’ s a conference in which people talk about the future, and you notice that the future is still at about the year 2000. It ’ s about as far as we go out. So in other words, the future has kind of been shrinking one year per year for my whole lifetime. Now I think that the reason is because we all feel that something ’ s happening there. That transition is happening. We can all sense it. And we know that it just doesn ’ t make too much sense to think out 30, 50 years because everything ’ s going to be so different that a simple extrapolation of what we ’ re doing just doesn ’ t make any sense at all. So what I would like to talk about is what that could be, what that transition could be that we ’ re going through. Now in order to do that I ’ m going to have to talk about a bunch of stuff that really has nothing to do with technology and computers. Because I think the only way to understand this is to really step back and take a long time scale look at things. So the time scale that I would like to look at this on is the time scale of life on Earth. So I think this picture makes sense if you look at it a few billion years at a time. So if you go back about two and a half billion years, the Earth was this big, sterile hunk of rock with a lot of chemicals floating around on it. And if you look at the way that the chemicals got organized, we begin to get a pretty good idea of how they do it. And I think that there ’ s theories that are beginning to understand about how it started with RNA, but I ’ m going to tell a sort of simple story of it, which is that, at that time, there were little drops of oil floating around with all kinds of different recipes of chemicals in them. And some of those drops of oil had a particular combination of chemicals in them which caused them to incorporate chemicals from the outside and grow the drops of oil. And those that were like that started to split and divide. And those were the most primitive forms of cells in a sense, those little drops of oil. But now those drops of oil weren ’ t really alive, as we say it now, because every one of them was a little random recipe of chemicals. And every time it divided, they got sort of unequal division of the chemicals within them. And so every drop was a little bit different. In fact, the drops that were different in a way that caused them to be better at incorporating chemicals around them, grew more and incorporated more chemicals and divided more. So those tended to live longer, get expressed more. Now that ’ s sort of just a very simple chemical form of life, but when things got interesting was when these drops learned a trick about abstraction. Somehow by ways that we don ’ t quite understand, these little drops learned to write down information. They learned to record the information that was the recipe of the cell onto a particular kind of chemical called DNA. So in other words, they worked out, in this mindless sort of evolutionary way, a form of writing that let them write down what they were, so that that way of writing it down could get copied. The amazing thing is that that way of writing seems to have stayed steady since it evolved two and a half billion years ago. In fact the recipe for us, our genes, is exactly that same code and that same way of writing. In fact, every living creature is written in exactly the same set of letters and the same code. In fact, one of the things that I did just for amusement purposes is we can now write things in this code. And I ’ ve got here a little 100 micrograms of white powder, which I try not to let the security people see at airports. But this has in it — what I did is I took this code — the code has standard letters that we use for symbolizing it — and I wrote my business card onto a piece of DNA and amplified it 10 to the 22 times. So if anyone would like a hundred million copies of my business card, I have plenty for everyone in the room, and, in fact, everyone in the world, and it ’ s right here. If I had really been a egotist, I would have put it into a virus and released it in the room. So what was the next step? Writing down the DNA was an interesting step. And that caused these cells — that kept them happy for another billion years. But then there was another really interesting step where things became completely different, which is these cells started exchanging and communicating information, so that they began to get communities of cells. I don ’ t know if you know this, but bacteria can actually exchange DNA. Now that ’ s why, for instance, antibiotic resistance has evolved. Some bacteria figured out how to stay away from penicillin, and it went around sort of creating its little DNA information with other bacteria, and now we have a lot of bacteria that are resistant to penicillin, because bacteria communicate. Now what this communication allowed was communities to form that, in some sense, were in the same boat together ; they were synergistic. So they survived or they failed together, which means that if a community was very successful, all the individuals in that community were repeated more and they were favored by evolution. Now the transition point happened when these communities got so close that, in fact, they got together and decided to write down the whole recipe for the community together on one string of DNA. And so the next stage that ’ s interesting in life took about another billion years. And at that stage, we have multi-cellular communities, communities of lots of different types of cells, working together as a single organism. And in fact, we ’ re such a multi- cellular community. We have lots of cells that are not out for themselves anymore. Your skin cell is really useless without a heart cell, muscle cell, a brain cell and so on. So these communities began to evolve so that the interesting level on which evolution was taking place was no longer a cell, but a community which we call an organism. Now the next step that happened is within these communities. These communities of cells, again, began to abstract information. And they began building very special structures that did nothing but process information within the community. And those are the neural structures. So neurons are the information processing apparatus that those communities of cells built up. And in fact, they began to get specialists in the community and special structures that were responsible for recording, understanding, learning information. And that was the brains and the nervous system of those communities. And that gave them an evolutionary advantage. Because at that point, an individual — learning could happen within the time span of a single organism, instead of over this evolutionary time span. So an organism could, for instance, learn not to eat a certain kind of fruit because it tasted bad and it got sick last time it ate it. That could happen within the lifetime of a single organism, whereas before they ’ d built these special information processing structures, that would have had to be learned evolutionarily over hundreds of thousands of years by the individuals dying off that ate that kind of fruit. So that nervous system, the fact that they built these special information structures, tremendously sped up the whole process of evolution. Because evolution could now happen within an individual. It could happen in learning time scales. But then what happened was the individuals worked out, of course, tricks of communicating. And for example, the most sophisticated version that we ’ re aware of is human language. It ’ s really a pretty amazing invention if you think about it. Here I have a very complicated, messy, confused idea in my head. I ’ m sitting here making grunting sounds basically, and hopefully constructing a similar messy, confused idea in your head that bears some analogy to it. But we ’ re taking something very complicated, turning it into sound, sequences of sounds, and producing something very complicated in your brain. So this allows us now to begin to start functioning as a single organism. And so, in fact, what we ’ ve done is we, humanity, have started abstracting out. We ’ re going through the same levels that multi-cellular organisms have gone through — abstracting out our methods of recording, presenting, processing information. So for example, the invention of language was a tiny step in that direction. Telephony, computers, videotapes, CD-ROMs and so on are all our specialized mechanisms that we ’ ve now built within our society for handling that information. And it all connects us together into something that is much bigger and much faster and able to evolve than what we were before. So now, evolution can take place on a scale of microseconds. And you saw Ty ’ s little evolutionary example where he sort of did a little bit of evolution on the Convolution program right before your eyes. So now we ’ ve speeded up the time scales once again. So the first steps of the story that I told you about took a billion years a piece. And the next steps, like nervous systems and brains, took a few hundred million years. Then the next steps, like language and so on, took less than a million years. And these next steps, like electronics, seem to be taking only a few decades. The process is feeding on itself and becoming, I guess, autocatalytic is the word for it — when something reinforces its rate of change. The more it changes, the faster it changes. And I think that that ’ s what we ’ re seeing here in this explosion of curve. We ’ re seeing this process feeding back on itself. Now I design computers for a living, and I know that the mechanisms that I use to design computers would be impossible without recent advances in computers. So right now, what I do is I design objects at such complexity that it ’ s really impossible for me to design them in the traditional sense. I don ’ t know what every transistor in the connection machine does. There are billions of them. Instead, what I do and what the designers at Thinking Machines do is we think at some level of abstraction and then we hand it to the machine and the machine takes it beyond what we could ever do, much farther and faster than we could ever do. And in fact, sometimes it takes it by methods that we don ’ t quite even understand. One method that ’ s particularly interesting that I ’ ve been using a lot lately is evolution itself. So what we do is we put inside the machine a process of evolution that takes place on the microsecond time scale. So for example, in the most extreme cases, we can actually evolve a program by starting out with random sequences of instructions. Say,”Computer, would you please make a hundred million random sequences of instructions. Now would you please run all of those random sequences of instructions, run all of those programs, and pick out the ones that came closest to doing what I wanted.”So in other words, I define what I wanted. Let ’ s say I want to sort numbers, as a simple example I ’ ve done it with. So find the programs that come closest to sorting numbers. So of course, random sequences of instructions are very unlikely to sort numbers, so none of them will really do it. But one of them, by luck, may put two numbers in the right order. And I say,”Computer, would you please now take the 10 percent of those random sequences that did the best job. Save those. Kill off the rest. And now let ’ s reproduce the ones that sorted numbers the best. And let ’ s reproduce them by a process of recombination analogous to sex.”Take two programs and they produce children by exchanging their subroutines, and the children inherit the traits of the subroutines of the two programs. So I ’ ve got now a new generation of programs that are produced by combinations of the programs that did a little bit better job. Say,”Please repeat that process.”Score them again. Introduce some mutations perhaps. And try that again and do that for another generation. Well every one of those generations just takes a few milliseconds. So I can do the equivalent of millions of years of evolution on that within the computer in a few minutes, or in the complicated cases, in a few hours. At the end of that, I end up with programs that are absolutely perfect at sorting numbers. In fact, they are programs that are much more efficient than programs I could have ever written by hand. Now if I look at those programs, I can ’ t tell you how they work. I ’ ve tried looking at them and telling you how they work. They ’ re obscure, weird programs. But they do the job. And in fact, I know, I ’ m very confident that they do the job because they come from a line of hundreds of thousands of programs that did the job. In fact, their life depended on doing the job. I was riding in a 747 with Marvin Minsky once, and he pulls out this card and says,”Oh look. Look at this. It says, ’ This plane has hundreds of thousands of tiny parts working together to make you a safe flight. ’ Doesn ’ t that make you feel confident?”In fact, we know that the engineering process doesn ’ t work very well when it gets complicated. So we ’ re beginning to depend on computers to do a process that ’ s very different than engineering. And it lets us produce things of much more complexity than normal engineering lets us produce. And yet, we don ’ t quite understand the options of it. So in a sense, it ’ s getting ahead of us. We ’ re now using those programs to make much faster computers so that we ’ ll be able to run this process much faster. So it ’ s feeding back on itself. The thing is becoming faster and that ’ s why I think it seems so confusing. Because all of these technologies are feeding back on themselves. We ’ re taking off. And what we are is we ’ re at a point in time which is analogous to when single- celled organisms were turning into multi-celled organisms. So we ’ re the amoebas and we can ’ t quite figure out what the hell this thing is we ’ re creating. We ’ re right at that point of transition. But I think that there really is something coming along after us. I think it ’ s very haughty of us to think that we ’ re the end product of evolution. And I think all of us here are a part of producing whatever that next thing is. So lunch is coming along, and I think I will stop at that point, before I get selected out.

Because I usually take the role of trying to explain to people how wonderful the new technologies that are coming along are going to be, and I thought that, since I was among friends here, I would tell you what I really think and try to look back and try to understand what is really going on here with these amazing jumps in technology that seem so fast that we can barely keep on top of it. So I ’ m going to start out by showing just one very boring technology slide. And then, so if you can just turn on the slide that ’ s on. This is just a random slide that I picked out of my file. What I want to show you is not so much the details of the slide, but the general form of it. This happens to be a slide of some analysis that we were doing about the power of RISC **microprocessors** versus the power of local area networks. And the interesting thing about it is that this slide, like so many technology slides that we ’ re used to, is a sort of a straight line on a semi-log curve. In other words, every step here represents an order of magnitude in performance scale. And this is a new thing that we talk about technology on semi-log curves. Something really weird is going on here. And that ’ s basically what I ’ m going to be talking about. So, if you could bring up the lights. If you could bring up the lights higher, because I ’ m just going to use a piece of paper here. Now why do we draw technology curves in semi-log curves? Well the answer is, if I drew it on a normal curve where, let ’ s say, this is years, this is time of some sort, and this is whatever measure of the technology that I ’ m trying to graph, the graphs look sort of silly. They sort of go like this. And they don ’ t tell us much. Now if I graph, for instance, some other technology, say transportation technology, on a semi-log curve, it would look very stupid, it would look like a flat line. But when something like this happens, things are qualitatively changing. So if transportation technology was moving along as fast as **microprocessor** technology, then the day after tomorrow, I would be able to get in a taxi cab and be in Tokyo in 30 seconds. It ’ s not moving like that. And there ’ s nothing precedented in the history of technology development of this kind of self- feeding growth where you go by orders of magnitude every few years. Now the question that I ’ d like to ask is, if you look at these exponential curves, they don ’ t go on forever. Things just can ’ t possibly keep changing as fast as they are. One of two things is going to happen. Either it ’ s going to turn into a sort of classical S-curve like this, until something totally different comes along, or maybe it ’ s going to do this. That ’ s about all it can do. Now I ’ m an optimist, so I sort of think it ’ s probably going to do something like that. If so, that means that what we ’ re in the middle of right now is a transition. We ’ re sort of on this line in a transition from the way the world used to be to some new way that the world is. And so what I ’ m trying to ask, what I ’ ve been asking myself, is what ’ s this new way that the world is? What ’ s that new state that the world is heading toward? Because the transition seems very, very confusing when we ’ re right in the middle of it. Now when I was a kid growing up, the future was kind of the year 2000, and people used to talk about what would happen in the year 2000. Now here ’ s a conference in which people talk about the future, and you notice that the future is still at about the year 2000. It ’ s about as far as we go out. So in other words, the future has kind of been shrinking one year per year for my whole lifetime. Now I think that the reason is because we all feel that something ’ s happening there. That transition is happening. We can all sense it. And we know that it just doesn ’ t make too much sense to think out 30, 50 years because everything ’ s going to be so different that a simple **extrapolation** of what we ’ re doing just doesn ’ t make any sense at all. So what I would like to talk about is what that could be, what that transition could be that we ’ re going through. Now in order to do that I ’ m going to have to talk about a bunch of stuff that really has nothing to do with technology and computers. Because I think the only way to understand this is to really step back and take a long time scale look at things. So the time scale that I would like to look at this on is the time scale of life on Earth. So I think this picture makes sense if you look at it a few billion years at a time. Text Sample 421: NEG Dim 3 – 1998 – Score -10.00 – 1998/t000200.txt

You hear that this is the era of environment â or biology, or information technology... Well, it ’ s the era of a lot of different things that we ’ re in right now. But one thing for sure : it ’ s the era of change. There ’ s more change going on than ever has occurred in the history of human life on earth. And you all sort of know it, but it ’ s hard to get it so that you really understand it. And I ’ ve tried to put together something that ’ s a good start for this. I ’ ve tried to show in this â though the color doesn ’ t come out â that what I ’ m concerned with is the little 50-year time bubble that you are in. You tend to be interested in a generation past, a generation future â your parents, your kids, things you can change over the next few decades â and this 50-year time bubble you kind of move along in. And in that 50 years, if you look at the population curve, you find the population of humans on the earth more than doubles and we ’ re up three-and-a-half times since I was born. When you have a new baby, by the time that kid gets out of high school more people will be added than existed on earth when I was born. This is unprecedented, and it ’ s big. Where it goes in the future is questioned. So that ’ s the human part. Now, the human part related to animals : look at the left side of that. What I call the human portion â humans and their livestock and pets â versus the natural portion â all the other wild animals and just â these are vertebrates and all the birds, etc., in the land and air, not in the water. How does it balance? Certainly, 10, 000 years ago, the civilization ’ s beginning, the human portion was less than one tenth of one percent. Let ’ s look at it now. You follow this curve and you see the whiter spot in the middle â that ’ s your 50- year time bubble. Humans, livestock and pets are now 97 percent of that integrated total mass on earth and all wild nature is three percent. We have won. The next generation doesn ’ t even have to worry about this game â it is over. And the biggest problem came in the last 25 years : it went from 25 percent up to that 97 percent. And this really is a sobering picture upon realizing that we, humans, are in charge of life on earth ; we ’ re like the capricious Gods of old Greek myths, kind of playing with life â and not a great deal of wisdom injected into it. Now, the third curve is information technology. This is Moore ’ s Law plotted here, which relates to density of information, but it has been pretty good for showing a lot of other things about information technology â computers, their use, Internet, etc. And what ’ s important is it just goes straight up through the top of the curve, and has no real limits to it. Now try and contrast these. This is the size of the earth going through that same â â frame. And to make it really clear, I ’ ve put all four on one graph. There ’ s no need to see the little detailed words on it. That first one is humans-versus-nature ; we ’ ve won, there ’ s no more gain. Human population. And so if you ’ re looking for growth industries to get into, that ’ s not a good one â protecting natural creatures. Human population is going up ; it ’ s going to continue for quite a while. Good business in obstetricians, morticians, and farming, housing, etc. â they all deal with human bodies, which require being fed, transported, housed and so on. And the information technology, which connects to our brains, has no limit â now, that is a wonderful field to be in. You ’ re looking for growth opportunity? It ’ s just going up through the roof. And then, the size of the Earth. Somehow making these all compatible with the Earth looks like a pretty bad industry to be involved with. So, that ’ s the stage out of all this. I find, for reasons I don ’ t understand, I really do have a goal. And the goal is that the world be desirable and sustainable when my kids reach my age â and I think that ’ s â in other words, the next generation. I think that ’ s a goal that we probably all share. I think it ’ s a hopeless goal. Technologically, it ’ s achievable ; economically, it ’ s achievable ; politically, it means sort of the habits, institutions of people â it ’ s impossible. The institutions of the past with all their inertia are just irrelevant for the future, except they ’ re there and we have to deal with them. I spend about 15 percent of my time trying to save the world, the other 85 percent, the usual â and whatever else we devote ourselves to. And in that 15 percent, the main focus is on human mind, thinking skills, somehow trying to unleash kids from the **straightjacket** of school, which is putting information and dogma into them, get them so they really think, ask tough questions, argue about serious subjects, don ’ t believe everything that ’ s in the book, think broadly or creative. They can be. Our school systems are very flawed and do not reward you for the things that are important in life or for the survival of civilization ; they reward you for a lot of learning and sopping up stuff. We can ’ t go into that today because there isn ’ t time â it ’ s a broad subject. One thing for sure, in the future there is an essential feature â necessary, but not sufficient â which is doing more with less. We ’ ve got to be doing things with more efficiency using less energy, less material. Your great-great grandparents got by on muscle power, and yet we all think there ’ s this huge power that ’ s essential for our lifestyle. And with all the wonderful technology we have we can do things that are much more efficient : conserve, recycle, etc. Let me just rush very quickly through things that we ’ ve done. Human-powered airplane â **Gossamer** Condor sort of started me in this direction in 1976 and 77, winning the Kremer prize in aviation history, followed by the Albatross. And we began making various odd planes and creatures. Here ’ s a giant flying replica of a pterosaur that has no tail. Trying to have it fly straight is like trying to shoot an arrow with the feathered end forward. It was a tough job, and boy it made me have a lot of respect for nature. This was the full size of the original creature. We did things on land, in the air, on water â vehicles of all different kinds, usually with some electronics or electric power systems in them. I find they ’ re all the same, whether its land, air or water. I ’ ll be focusing on the air here. This is a solar-powered airplane â 165 miles carrying a person from France to England as a symbol that solar power is going to be an important part of our future. Then we did the solar car for General Motors â the Sunracer â that won the race in Australia. We got a lot of people thinking about electric cars, what you could do with them. A few years later, when we suggested to GM that now is the time and we could do a thing called the Impact, they sponsored it, and here ’ s the Impact that we developed with them on their programs. This is the demonstrator. And they put huge effort into turning it into a commercial product. With that preamble, let ’ s show the first two-minute **videotape**, which shows a little airplane for surveillance and moving to a giant airplane. Narrator : A tiny airplane, the AV Pointer serves for surveillance â in effect, a pair of roving eyeglasses. A cutting-edge example of where miniaturization can lead if the operator is remote from the vehicle. It is convenient to carry, assemble and launch by hand. Battery-powered, it is silent and rarely noticed. It sends high-resolution video pictures back to the operator. With onboard GPS, it can navigate autonomously, and it is rugged enough to self-land without damage. The modern **sailplane** is superbly efficient. Some can glide as flat as 60 feet forward for every foot of descent. They are powered only by the energy they can extract from the atmosphere â an atmosphere nature stirs up by solar energy. Humans and soaring birds have found nature to be generous in providing replenishable energy. **Sailplanes** have flown over 1, 000 miles, and the altitude record is over 50, 000 feet. The Solar Challenger was made to serve as a symbol that photovoltaic cells can produce real power and will be part of the world ' s energy future. In 1981, it flew 163 miles from Paris to England, solely on the power of sunbeams, and established a basis for the Pathfinder. The message from all these vehicles is that ideas and technology can be harnessed to produce remarkable gains in doing more with less â gains that can help us attain a desirable balance between technology and nature. The stakes are high as we speed toward a challenging future. Buckminster Fuller said it clearly :"there are no passengers on spaceship Earth, only crew. We, the crew, can and must do more with less â much less."Paul MacCready : If we could have the second video, the one-minute, put in as quickly as you can, which â this will show the Pathfinder airplane in some flights this past year in Hawaii, and will show a sequence of some of the beauty behind it after it had just flown to 71, 530 feet â higher than any propeller airplane has ever flown. It ' s amazing : just on the puny power of the sun â by having a super lightweight plane, you ' re able to get it up there. It ' s part of a long-term program NASA sponsored. And we worked very closely with the whole thing being a team effort, and with wonderful results like that flight. And we ' re working on a bigger plane â 220-foot span â and an intermediate-size, one with a regenerative fuel cell that can store excess energy during the day, feed it back at night, and stay up 65, 000 feet for months at a time. Ray Morgan ' s voice will come in here. There he ' s the project manager. Anything they do is certainly a team effort. He ran this program. Here ' s... some things he showed as a celebration at the very end. Ray Morgan : We ' d just ended a seven-month deployment of Hawaii. For those who live on the mainland, it was tough being away from home. The friendly support, the quiet confidence, **congenial** hospitality shown by our Hawaiian and military hosts â this is starting â made the experience enjoyable and unforgettable. PM : We have real-time IR scans going out through the Internet while the plane is flying. And it ' s exploring without polluting the stratosphere. That ' s its goal : the stratosphere, the blanket that really controls the radiation of the earth and permits life on earth to be the success that it is â probing that is very important. And also we consider it as a sort of poor man ' s stationary satellite, because it can stay right overhead for months at a time, 2, 000 times closer than the real GFC synchronous satellite. We couldn ' t bring one here to fly it and show you. But now let ' s look at the other end. In the video you saw that nine-pound or eight-pound Pointer airplane surveillance drone that Keenan has developed and just done a remarkable job. Where some have servos that have gotten down to, oh, 18 or 25 grams, his weigh one-third of a gram. And what he ' s going to bring out here is a surveillance drone that weighs about 2 ounces â that includes the video camera, the batteries that run it, the telemetry, the receiver and so on. And we ' ll fly it, we hope, with the same success that we had last night when we did the practice. So Matt Keenan, just any time you ' re â all right â ready to let her go. But first, we ' re going to make sure that it ' s appearing on the screen, so you see what it sees. You can imagine yourself being a mouse or fly inside of it, looking out of its camera. Matt Keenan : It ' s switched on. PM : But now we ' re trying to get the video. There we go. MK : Can you bring up the house lights? PM : Yeah, the house lights and we ' ll see you all better and be able to fly the plane better. MK : All right, we ’ ll try to do a few laps around and bring it back in. Here we go. PM : The video worked right for the first few and I don ’ t know why it â there it goes. Oh, that was only a minute, but I think you ’ d be safe to have that near the end of the flight, perhaps. We get to do the classic. All right. If this hits you, it will not hurt you. OK. Thank you very much. Thank you. But now, as they say in **infomercials**, we have something much better for you, which we ’ re working on : planes that are only six inches â 15 centimeters â in size. And Matt ’ s plane was on the cover of Popular Science last month, showing what this can lead to. And in a while, something this size will have GPS and a video camera in it. We ’ ve had one of these fly nine miles through the air at 35 miles an hour with just a little battery in it. But there ’ s a lot of technology going. There are just milestones along the way of some remarkable things. This one doesn ’ t have the video in it, but you get a little feel from what it can do. OK, here we go. MK : Sorry. OK. PM : If you can pass it down when you ’ re done. Yeah, I think â I lost a little orientation ; I looked up into this light. It hit the building. And the building was poorly placed, actually. But you ’ re beginning to see what can be done. We ’ re working on projects now â even wing-flapping things the size of hawk moths â DARPA contracts, working with Caltech, UCLA. Where all this leads, I don ’ t know. Is it practical? I don ’ t know. But like any basic research, when you ’ re really forced to do things that are way beyond existing technology, you can get there with micro-technology, nanotechnology. You can do amazing things when you realize what nature has been doing all along. As you get to these small scales, you realize we have a lot to learn from nature â not with 747s â but when you get down to the nature ’ s realm, nature has 200 million years of experience. It never makes a mistake. Because if you make a mistake, you don ’ t leave any progeny. We should have nothing but success stories from nature, for you or for birds, and we ’ re learning a lot from its fascinating subjects. In concluding, I want to get back to the big picture and I have just two final slides to try and put it in perspective. The first I ’ ll just read. At last, I put in three sentences and had it say what I wanted. Over billions of years on a unique sphere, chance has painted a thin covering of life â complex, improbable, wonderful and fragile. Suddenly, we humans â a recently arrived species, no longer subject to the checks and balances inherent in nature â have grown in population, technology and intelligence to a position of terrible power. We now wield the paintbrush. And that ’ s serious : we ’ re not very bright. We ’ re short on wisdom ; we ’ re high on technology. Where ’ s it going to lead? Well, inspired by the sentences, I decided to wield the paintbrush. Every 25 years I do a picture. Here ’ s the one â tries to show that the world isn ’ t getting any bigger. Sort of a timeline, very non-linear scale, nature rates and trilobites and dinosaurs, and eventually we saw some humans with caves... Birds were flying overhead, after pterosaurs. And then we get to the civilization above the little TV set with a gun on it. Then traffic jams, and power systems, and some dots for digital. Where it ’ s going to lead â I have no idea. And so I just put robotic and natural cockroaches out there, but you can fill in whatever you want. This is not a forecast. This is a warning, and we have to think seriously about it. And that time when this is happening is not 100 years or 500 years. Things are going on this decade, next decade ; it ’ s a very short time that we have to decide what we are going to do. And if we can get some agreement on where we want the world to be â desirable, sustainable when your kids reach your age â I think we actually can reach it. Now, I said this was a warning, not a forecast. That was before â I painted this before we started in on making robotic versions of hawk moths and cockroaches, and now I ’ m beginning to wonder seriously â was this more of a forecast than

I wanted? I personally think the surviving intelligent life form on earth is not going to be carbon-based ; it ’ s going to be silicon-based. And so where it all goes, I don ’ t know. The one final bit of sparkle we ’ ll put in at the very end here is an utterly impractical flight vehicle, which is a little **ornithopter** wing-flapping device that â rubber-band powered â that we ’ ll show you. MK : 32 gram. Sorry, one gram. PM : Last night we gave it a few too many turns and it tried to bash the roof out also. It ’ s about a gram. The tube there ’ s hollow, about paper-thin. And if this lands on you, I assure you it will not hurt you. But if you reach out to grab it or hold it, you will destroy it. So, be gentle, just act like a wooden Indian or something. And when it comes down â and we ’ ll see how it goes. We consider this to be sort of the spirit of TED. And you wonder, is it practical? And it turns out if I had not been â Unfortunately, we have some light bulb changes. We can probably get it down, but it ’ s possible it ’ s gone up to a greater destiny up there â â than it ever had. And I wanted to make â just â But I want to make just two points. One is, you think it ’ s frivolous ; there ’ s nothing to it. And yet if I had not been making **ornithopters** like that, a little bit cruder, in 1939 â a long, long time ago â there wouldn ’ t have been a **Gossamer** Condor, there wouldn ’ t have been an Albatross, a Solar Challenger, there wouldn ’ t be an Impact car, there wouldn ’ t be a mandate on zero-emission vehicles in California. A lot of these things â or similar â would have happened some time, probably a decade later. I didn ’ t realize at the time I was doing inquiry-based, hands-on things with teams, like they ’ re trying to get in education systems. So I think that, as a symbol, it ’ s important. And I believe that also is important. You can think of it as a sort of a symbol for learning and TED that somehow gets you thinking of technology and nature, and puts it all together in things that are â that make this conference, I think, more important than any that ’ s taken place in this country in this decade. Thank you.

Text Sample 422: NEG Dim 3 – 1998 – Score -4.00 – 1998/t000216.txt

David Gallo : This is Bill Lange. I ’ m Dave Gallo. And we ’ re going to tell you some stories from the sea here in video. We ’ ve got some of the most incredible video of Titanic that ’ s ever been seen, and we ’ re not going to show you any of it. The truth of the matter is that the Titanic — even though it ’ s breaking all sorts of box office records — it ’ s not the most exciting story from the sea. And the problem, I think, is that we take the ocean for granted. When you think about it, the oceans are 75 percent of the planet. Most of the planet is ocean water. The average depth is about two miles. Part of the problem, I think, is we stand at the beach, or we see images like this of the ocean, and you look out at this great big blue expanse, and it ’ s shimmering and it ’ s moving and there ’ s waves and there ’ s surf and there ’ s tides, but you have no idea for what lies in there. And in the oceans, there are the longest mountain ranges on the planet. Most of the animals are in the oceans. Most of the earthquakes and volcanoes are in the sea, at the bottom of the sea. The biodiversity and the biodensity in the ocean is higher, in places, than it is in the rainforests. It ’ s mostly unexplored, and yet there are beautiful sights like this that captivate us and make us become familiar with it. But when you ’ re standing at the beach, I want you to think that you ’ re standing at the edge of a very unfamiliar world. We have to have a very special technology to get into that unfamiliar world. We use the submarine Alvin and we use cameras, and the cameras are something that Bill Lange has developed with the help of Sony. Marcel Proust said,”The true voyage of discovery is not so much in seeking new landscapes as in having new eyes.”People that have partnered with us have given us new eyes, not only on what exists — the new landscapes at the bottom of the sea — but also how we think about life on the planet itself. Here ’ s a jelly. It ’ s one of my favorites, because it ’ s got all sorts of working parts. This turns out to be the longest creature in the oceans. It gets up to about 150 feet long. But see all those different working things? I love that kind of stuff. It ’ s got these fishing lures on the bottom. They ’ re going up and down. It ’ s got tentacles dangling, swirling around like that. It ’ s a colonial animal. These are all individual animals banding together to make this one creature. And it ’ s got these jet thrusters up in front that it ’ ll use in a moment, and a little light. If you take all the big fish and schooling fish and all that, put them on one side of the scale, put all the jelly-type of animals on the other side, those guys win hands down. Most of the biomass in the ocean is made out of creatures like this. Here ’ s the X-wing death jelly. The bioluminescence — they use the lights for attracting mates and attracting prey and communicating. We couldn ’ t begin to show you our archival stuff from the jellies. They come in all different sizes and shapes. Bill Lange : We tend to forget about the fact that the ocean is miles deep on average, and that we ’ re real familiar with the animals that are in the first 200 or 300 feet, but we ’ re not familiar with what exists from there all the way down to the bottom. And these are the types of animals that live in that three- dimensional space, that micro-gravity environment that we really haven ’ t explored. You hear about giant squid and things like that, but some of these animals get up to be approximately 140, 160 feet long. They ’ re very little understood. DG : This is one of them, another one of our favorites, because it ’ s a little octopod. You can actually see through his head. And here he is, flapping with his ears and very gracefully going up. We see those at all depths and even at the greatest depths. They go from a couple of inches to a couple of feet. They come right up to the submarine — they ’ ll put their eyes right up to the window and peek inside the sub. This is really a world within a world, and we ’ re going to show you two. In this case, we ’ re passing down through the mid-ocean and we see creatures like this. This is kind of like an undersea rooster. This guy, that looks incredibly formal, in a way. And then one of my favorites. What a face! This is basically scientific data that you ’ re looking at. It ’ s footage that we ’ ve collected for scientific purposes. And that ’ s one of the things that Bill ’ s been doing, is providing scientists with this first view of animals like this, in the world where they belong. They don ’ t catch them in a net. They ’ re actually looking at them down in that world. We ’ re going to take a joystick, sit in front of our computer, on the Earth, and press the joystick forward, and fly around the planet. We ’ re going to look at the mid-ocean ridge, a 40, 000-mile long mountain range. The average depth at the top of it is about a mile and a half. And we ’ re over the Atlantic — that ’ s the ridge right there — but we ’ re going to go across the Caribbean, Central America, and end up against the Pacific, nine degrees north. We make maps of these mountain ranges with sound, with sonar, and this is one of those mountain ranges. We ’ re coming around a cliff here on the right. The height of these mountains on either side of this valley is greater than the Alps in most cases. And there ’ s tens of thousands of those mountains out there that haven ’ t been mapped yet. This is a volcanic ridge. We ’ re getting down further and further in scale. And eventually, we can come up with something like this. This is an icon of our robot, Jason, it ’ s called. And you can sit in a room like this, with a joystick and a headset, and drive a robot like that around the bottom of the ocean in real time. One of the things we ’ re trying to do at Woods Hole with our partners is to bring this virtual world — this world, this unexplored region — back to the laboratory. Because we see it in bits and pieces right now.

We see it either as sound, or we see it as video, or we see it as photographs, or we see it as chemical sensors, but we never have yet put it all together into one interesting picture. Here ' s where Bill ' s cameras really do shine. This is what ' s called a hydrothermal vent. And what you ' re seeing here is a cloud of densely packed, hydrogen-sulfide-rich water coming out of a volcanic axis on the sea floor. Gets up to 600, 700 degrees F, somewhere in that range. So that ' s all water under the sea — a mile and a half, two miles, three miles down. And we knew it was volcanic back in the ' 60s, ' 70s. And then we had some hint that these things existed all along the axis of it, because if you ' ve got **volcanism**, water ' s going to get down from the sea into cracks in the sea floor, come in contact with magma, and come shooting out hot. We weren ' t really aware that it would be so rich with sulfides, hydrogen sulfides. We didn ' t have any idea about these things, which we call chimneys. This is one of these hydrothermal vents. Six hundred degree F water coming out of the Earth. On either side of us are mountain ranges that are higher than the Alps, so the setting here is very dramatic. BL : The white material is a type of bacteria that thrives at 180 degrees C. DG : I think that ' s one of the greatest stories right now that we ' re seeing from the bottom of the sea, is that the first thing we see coming out of the sea floor after a volcanic eruption is bacteria. And we started to wonder for a long time, how did it all get down there? What we find out now is that it ' s probably coming from inside the Earth. Not only is it coming out of the Earth — so, biogenesis made from volcanic activity — but that bacteria supports these colonies of life. The pressure here is 4, 000 pounds per square inch. A mile and a half from the surface to two miles to three miles — no sun has ever gotten down here. All the energy to support these life forms is coming from inside the Earth — so, chemosynthesis. And you can see how dense the population is. These are called tube worms. BL : These worms have no digestive system. They have no mouth. But they have two types of gill structures. One for extracting oxygen out of the deep-sea water, another one which houses this chemosynthetic bacteria, which takes the hydrothermal fluid — that hot water that you saw coming out of the bottom — and converts that into simple sugars that the tube worm can digest. DG : You can see, here ' s a crab that lives down there. He ' s managed to grab a tip of these worms. Now, they normally retract as soon as a crab touches them. Oh! Good going. So, as soon as a crab touches them, they retract down into their shells, just like your fingernails. There ' s a whole story being played out here that we ' re just now beginning to have some idea of because of this new camera technology. BL : These worms live in a real temperature extreme. Their foot is at about 200 degrees C and their head is out at three degrees C, so it ' s like having your hand in boiling water and your foot in freezing water. That ' s how they like to live. DG : This is a female of this kind of worm. And here ' s a male. You watch. It doesn ' t take long before two guys here — this one and one that will show up over here — start to fight. Everything you see is played out in the pitch black of the deep sea. There are never any lights there, except the lights that we bring. Here they go. On one of the last dive series, we counted 200 species in these areas — 198 were new, new species. BL : One of the big problems is that for the biologists working at these sites, it ' s rather difficult to collect these animals. And they disintegrate on the way up, so the imagery is critical for the science. DG : Two octopods at about two miles depth. This pressure thing really amazes me — that these animals can exist there at a depth with pressure enough to crush the Titanic like an empty Pepsi can. What we saw up till now was from the Pacific. This is from the Atlantic. Even greater depth. You can see this shrimp is harassing this poor little guy here, and he ' ll bat it away with his claw. Whack! And the same thing ' s going on over here. What they ' re getting at is that — on the back of this crab — the foodstuff here is this very strange bacteria that lives on the backs of all these animals. And what these shrimp are trying to do is actually harvest the bacteria from the backs of these animals. And the crabs don ’ t like it at all. These long filaments that you see on the back of the crab are actually created by the product of that bacteria. So, the bacteria grows hair on the crab. On the back, you see this again. The red dot is the laser light of the submarine Alvin to give us an idea about how far away we are from the vents. Those are all shrimp. You see the hot water over here, here and here, coming out. They ’ re clinging to a rock face and actually scraping bacteria off that rock face. Here ’ s a tiny, little vent that ’ s come out of the side of that pillar. Those pillars get up to several stories. So here, you ’ ve got this valley with this incredible alien landscape of pillars and hot springs and volcanic eruptions and earthquakes, inhabited by these very strange animals that live only on chemical energy coming out of the ground. They don ’ t need the sun at all. BL : You see this white V-shaped mark on the back of the shrimp? It ’ s actually a light-sensing organ. It ’ s how they find the hydrothermal vents. The vents are emitting a black body radiation — an IR signature — and so they ’ re able to find these vents at considerable distances. DG : All this stuff is happening along that 40, 000-mile long mountain range that we ’ re calling the ribbon of life, because just even today, as we speak, there ’ s life being generated there from volcanic activity. This is the first time we ’ ve ever tried this any place. We ’ re going to try to show you high definition from the Pacific. We ’ re moving up one of these pillars. This one ’ s several stories tall. In it, you ’ ll see that it ’ s a habitat for a lot of different animals. There ’ s a funny kind of hot plate here, with vent water coming out of it. So all of these are individual homes for worms. Now here ’ s a closer view of that community. Here ’ s crabs here, worms here. There are smaller animals crawling around. Here ’ s pagoda structures. I think this is the neatest-looking thing. I just can ’ t get over this — that you ’ ve got these little chimneys sitting here smoking away. This stuff is toxic as hell, by the way. You could never get a permit to dump this in the ocean, and it ’ s coming out all from it. It ’ s unbelievable. It ’ s basically sulfuric acid, and it ’ s being just dumped out, at incredible rates. And animals are thriving — and we probably came from here. That ’ s probably where we evolved from. BL : This bacteria that we ’ ve been talking about turns out to be the most simplest form of life found. There are a number of groups that are proposing that life evolved at these vent sites. Although the vent sites are short-lived — an individual site may last only 10 years or so — as an ecosystem they ’ ve been stable for millions — well, billions — of years. DG : It works too well. You see there ’ re some fish inside here as well. There ’ s a fish sitting here. Here ’ s a crab with his claw right at the end of that tube worm, waiting for that worm to stick his head out. BL : The biologists right now cannot explain why these animals are so active. The worms are growing inches per week! DG : I already said that this site, from a human perspective, is toxic as hell. Not only that, but on top — the lifeblood — that plumbing system turns off every year or so. Their plumbing system turns off, so the sites have to move. And then there ’ s earthquakes, and then volcanic eruptions, on the order of one every five years, that completely wipes the area out. Despite that, these animals grow back in about a year ’ s time. You ’ re talking about biodensities and biodiversity, again, higher than the rainforest that just springs back to life. Is it sensitive? Yes. Is it fragile? No, it ’ s not really very fragile. I ’ ll end up with saying one thing. There ’ s a story in the sea, in the waters of the sea, in the sediments and the rocks of the sea floor. It ’ s an incredible story. What we see when we look back in time, in those sediments and rocks, is a record of Earth history. Everything on this planet — everything — works by cycles and rhythms. The continents move apart. They come back together. Oceans come and go. Mountains come and go. Glaciers come and go. El Nino comes and goes. It ’ s not a disaster, it ’ s rhythmic. What we ’ re learning now, it ’ s almost like a symphony. It ’ s just like music — it really is just like music. And what we ’ re learning now is that you can ’ t listen to a five-billion-year long symphony, get to today and say,”Stop! We want tomorrow ’ s note to be the same as it was today.”It ’ s absurd. It ’ s just absurd. So, what we ’ ve got to learn now is to find out where this planet ’ s going at all these different scales and work with it. Learn to manage it. The concept of preservation is futile. Conservation ’ s tougher, but we can probably get there. Thank you very much. Thank you.

Text Sample 423: NEG Dim 3 – 1998 – Score -2.00 – 1998/t000118.txt

Back in 1992, I started working for a company called Interval Research, which was just then being founded by David Lidell and Paul Allen as a for-profit research enterprise in Silicon Valley. I met with David to talk about what I might do in his company. I was just coming out of a failed virtual reality business and supporting myself by being on the speaking circuit and writing books — after twenty years or so in the computer game industry having ideas that people didn ’ t think they could sell. And David and I discovered that we had a question in common, that we really wanted the answer to, and that was,”Why hasn ’ t anybody built any computer games for little girls?”Why is that? It can ’ t just be a giant sexist conspiracy. These people aren ’ t that smart. There ’ s six billion dollars on the table. They would go for it if they could figure out how. So, what is the deal here? And as we thought about our goals — I should say that Interval is really a humanistic institution, in the classical sense that humanism, at its best, finds a way to combine clear-eyed empirical research with a set of core values that fundamentally love and respect people. The basic idea of humanism is the improvable quality of life ; that we can do good things, that there are things worth doing because they ’ re good things to do, and that clear-eyed **empiricism** can help us figure out how to do them. So, contrary to popular belief, there is not a conflict of interest between **empiricism** and values. And Interval Research is kind of the living example of how that can be true. So David and I decided to go find out, through the best research we could muster, what it would take to get a little girl to put her hands on a computer, to achieve the level of comfort and ease with the technology that little boys have because they play video games. We spent two and a half years conducting research ; we spent another year and a half in advance development. Then we formed a spin-off company. In the research phase of the project at Interval, we partnered with a company called Cheskin Research, and these people — Davis Masten and Christopher Ireland — changed my mind entirely about what market research was and what it could be. They taught me how to look and see, and they did not do the incredibly stupid thing of saying to a child,”Of all these things we already make you, which do you like best?”— which gives you zero answers that are usable. So, what we did for the first two and a half years was four things : We did an extensive review of the literature in related fields, like cognitive psychology, spatial cognition, gender studies, play theory, sociology, primatology. Thank you Frans de Waal, wherever you are, I love you and I ’ d give anything to meet you. After we had done that with a pretty large team of people and discovered what we thought the salient issues were with girls and boys and playing — because, after all, that ’ s really what this is about — we moved to the second phase of our work, where we interviewed adult experts in academia, some of the people who ’ d produced the literature that we found relevant. Also, we did focus groups with people who were on the ground with kids every day, like playground supervisors. We talked to them, confirmed some hypotheses and identified some serious questions about gender difference and play. Then we did what I consider to be the heart of the work : interviewed 1, 100 children, boys and girls, ages seven to 12, all over the United States — except for Silicon Valley, Boston and Austin because we knew that their little families would have millions of computers in them and they wouldn ’ t be a representative sample. And at the end of those remarkable conversations with kids and their best friends across the United States, after two years, we pulled together some survey data from another 10, 000 children, drew up a set up of what we thought were the key findings of our research, and spent another year transforming them into design heuristics, for designing computer-based products — and, in fact, any kind of products — for little girls, ages eight to 12. And we spent that time designing interactive prototypes for computer software and testing them with little girls. In 1996, in November, we formed the company Purple Moon which was a spinoff of Interval Research, and our chief investors were Interval Research, Vulcan Northwest, Institutional Venture Partners and Allen and Company. We launched a website on September 2nd that has now served 25 million pages, and has 42, 000 registered young girl users. They visit an average of one and a half times a day, spend an average of 35 minutes a visit, and look at 50 pages a visit. So we feel that we ’ ve formed a successful online community with girls. We launched two titles in October —”Rockett ’ s New School”— the first of a series of products — is about a character called Rockett beginning her first day of school in eighth grade at a brand new place, with a blank slate, which allows girls to play with the question of,”What will I be like when I ’ m older?””What ’ s it going to be like to be in high school or junior high school? Who are my friends?”; to exercise the love of social complexity and the narrative intelligence that drives most of their play behavior ; and which embeds in it values about noticing that we have lots of choices in our lives and the ways that we conduct ourselves. The other title that we launched is called”Secret Paths in the Forest,”which addresses the more fantasy-oriented, inner lives of girls. These two titles both showed up in the top 50 entertainment titles in PC Data — entertainment titles in PC Data in December, right up there with”John Madden Football,”which thrills me to death. So, we ’ re real, and we ’ ve touched several hundreds of thousands of little girls. We ’ ve made half-a-billion impressions with marketing and PR for this brand, Purple Moon. Ninety-six percent of them, roughly, have been positive ; four percent of them have been”other.”I want to talk about the other, because the politics of this enterprise, in a way, have been the most fascinating part of it, for me. There are really two kinds of negative reviews that we ’ ve received. One kind of reviewer is a male gamer who thinks he knows what games ought to be, and won ’ t show the product to little girls. The other kind of reviewer is a certain flavor of feminist who thinks they know what little girls ought to be. And so it ’ s funny to me that these interesting, odd bedfellows have one thing in common : they don ’ t listen to little girls. They haven ’ t looked at children and they ’ re certainly not demonstrating any love for them. I ’ d like to play you some voices of little girls from the two-and-a-half years of research that we did — actually, some of the voices are more recent. And these voices will be accompanied by photographs that they took for us of their lives, of the things that they value and care about. These are pictures the girls themselves never saw, but they gave to us This is the stuff those reviewers don ’ t know about and aren ’ t listening to and this is the kind of research I recommend to those who want to do humanistic work. Girl 1 : Yeah, my character is usually a tomboy. Hers is more into boys. Girl 2 : Uh, yeah. Girl 1 : We have — in the very beginning of the whole game, always we do this : we each have a piece of paper ; we write down our name, our age — are we rich, very rich, not rich, poor, medium, wealthy, boyfriends, dogs, pets — what else — sisters, brothers, and all those. Girl 2 : Divorced — parents divorced, maybe. Girl 3 : This is my pretend [unclear] one. Girl 4 : We make a school newspaper on the computer. Girl 5 : For a girl ' s game also usually they ' ll have really pretty scenery with clouds and flowers. Girl 6 : Like, if you were a girl and you were really adventurous and a real big tomboy, you would think that girls ' games were kinda sissy. Girl 7 : I run track, I played soccer, I play basketball, and I love a lot of things to do. And sometimes I feel like I can ' t really enjoy myself unless it ' s like a vacation, like when I get Mondays and all those days off. Girl 8 : Well, sometimes there is a lot of stuff going on because I have music lessons and I ' m on swim team — all this different stuff that I have to do, and sometimes it gets overwhelming. Girl 9 : My friend Justine kinda took my friend Kelly, and now they ' re being mean to me. Girl 10 : Well, sometimes it gets annoying when your brothers and sisters, or brother or sister, when they copy you and you get your idea first and they take your idea and they do it themselves. Girl 11 : Because my older sister, she gets everything and, like, when I ask my mom for something, she ' ll say,"No"— all the time. But she gives my sister everything. Brenda Laurel : I want to show you, real quickly, just a minute of"Rockett ' s Tricky Decision,"which went gold two days ago. Let ' s hope it ' s really stable. This is the second day in Rockett ' s life. The reason I ' m showing you this is I ' m hoping that the scene that I ' m going to show you will look familiar and sound familiar, now that you ' ve listened to some girls ' voices. And you can see how we ' ve tried to incorporate the issues that matter to them in the game that we ' ve created. Miko : Hey Rockett! C ' mere! Rockett : Hi Miko! What ' s going on? Miko : Did you hear about Nakilia ' s big Halloween party this weekend? She asked me to make sure you knew about it. Nakilia invited Reuben too, but — Rockett : But what? Isn ' t he coming? Miko : I don ' t think so. I mean, I heard his band is playing at another party the same night. Rockett : Really? What other party? Girl : Max ' s party is going to be so cool, Whitney. He ' s invited all the best people. BL : I ' m going to fast-forward to the decision point because I know I don ' t have a lot of time. After this awful event occurs, Rocket gets to decide how she feels about it. Rockett : Who ' d want to show up at that party anyway? I could get invited to that party any day if I wanted to. Gee, I doubt I ' ll make Max ' s best people list. BL : OK, so we ' re going to emotionally navigate. If we were playing the game, that ' s what we ' d do. If at any time during the game we want to learn more about the characters, we can go into this hidden hallway, and I ' ll quickly just show you the interface. We can, for example, go find Miko ' s locker and get some more information about her. Oops, I turned the wrong way. But you get the general idea of the product. I wanted to show you the ways, innocuous as they seem, in which we ' re incorporating what we ' ve learned about girls — their desires to experience greater emotional flexibility, and to play around with the social complexity of their lives. I want to make the point that what we ' re giving girls, I think, through this effort, is a kind of validation, a sense of being seen. And a sense of the choices that are available in their lives. We love them. We see them. We ' re not trying to tell them who they ought to be. But we ' re really, really happy about who they are. It turns out they ' re really great. I want to close by showing you a **videotape** that ' s a version of a future game in the Rockett series that our graphic artists and design people put together, that we feel would please that four percent of reviewers."Rockett 28!"Rockett : It ' s like I ' m just waking up, you know? BL : Thanks.

Text Sample 424: NEG Dim 3 – 1984 – Score 1.00 – 1984/t000297.txt

In this rather long sort of marathon presentation, I ’ ve tried to break it up into three parts : the first being a whole lot of examples on how it can be a little bit more pleasurable to deal with a computer and really address the qualities of the human interface. And these will be some simple design qualities and they will also be some qualities of, if you will, the intelligence of interaction. Then the second part will really just be examples of new technologies — new media falling very much into that mold. Again, I will go through them as fast as possible. And then the last one will be some examples I ’ ve been able to collect, which I think illustrate this at least as best I can, in the world of entertainment. People have this belief — and I share most of it — that we will be using the TV screens or their equivalents for electronic books of the future. But then you think,”My God! What a terrible image you get when you look at still pictures on TV.”Well, it doesn ’ t have to be terrible. And that is a slide taken from a TV set and it was pre- processed to be very sympathetic to the TV medium, and it absolutely looks beautiful. Well, what ’ s happened? How did people get into this mess? Where you are now, all of a sudden, sitting in front of personal computers and video text — teletext systems, and somewhat horrified by what you see on the screen? Well, you have to remember that TV was designed to be looked at eight times the distance of the diagonal. So you get a 13-inch, 19-inch, whatever, TV, and then you should multiply that by eight and that ’ s the distance you should sit away from the TV set. Now we ’ ve put people 18 inches in front of a TV, and all the artifacts that none of the original designers expected to be seen, all of a sudden, are staring you in the face : the shadow mask, the scan lines, all of that. And they can be treated very easily ; there are actually ways of getting rid of them, there are actually ways of just making absolutely beautiful pictures. I ’ m talking here a little bit about display technologies. Let me talk about how you might input information. And my favorite example is always fingers. I ’ m very interested in touch-sensitive displays. High-tech, high-touch. Isn ’ t that what some of you said? It ’ s certainly a very important medium for input, and a lot of people think that fingers are a very low- resolution sort of stylus for inputting to a display. In fact, they ’ re not : it ’ s really a very, very high-resolution input medium — you have to just do it twice, you have to touch the screen and then rotate your finger slightly — and you can move a cursor with great accuracy. And so when you see on the market these systems that have just a few light emitting diodes on the side and are very low resolution, it ’ s nice that they exist because it still is better than nothing. But it, in some sense, misses the point : namely, that fingers are a very, very high-resolution input medium. Now, what are some of the other advantages? Well, the one advantage is that you don ’ t have to pick them up, and people don ’ t realize how important that is — not having to pick up your fingers to use them. When you think for a second of the mouse on Macintosh — and I will not criticize the mouse too much — when you ’ re typing — what you have — you want to now put something — first of all, you ’ ve got to find the mouse. You have to probably stop. Maybe not come to a grinding halt, but you ’ ve got to sort of find that mouse. Then you find the mouse, and you ’ re going to have to wiggle it a little bit to see where the cursor is on the screen. And then when you finally see where it is, then you ’ ve got to move it to get the cursor over there, and then —”Bang”— you ’ ve got to hit a button or do whatever. That ’ s four separate steps versus typing and then touching and typing and just doing it all in one motion — or one-and-a-half, depending on how you want to count. Again, what I ’ m trying to do is just illustrate the kinds of problems that I think face the designers of new computer systems and entertainment systems and educational systems from the perspective of the quality of that interface. And another advantage, of course, of using fingers is you have 10 of them. And we have never known how to do this technically, so this slide is a fake slide. We never succeeded in using ten fingers, but there are certain things you can do, obviously, with more than one-finger input, which is rather fascinating. What we did stumble across was something... Again, which is typical of the computer field, is when you have a bug that you can ' t get rid of you turn it into a feature. And maybe... maybe a mouse is a new kind of bug. But the bug in our case was in touch-sensitive displays : we wanted to be able to draw — you know, rub your finger across the screen to input continuous points — and there was just too much friction created between your finger and the glass — if glass was the substrate, which it usually is. So we found that that actually was a feature in the sense you could build a pressure-sensitive display. And when you touch it with your finger, you can actually, then, introduce all the forces on the face of that screen, and that actually has a certain amount of value. Let me see if I can load another disc and show you, quickly, an example. Now, imagine a screen, which is not only touch-sensitive now, it ' s pressure-sensitive. And it ' s pressure-sensitive to the forces both in the plane of the screen — X, Y, and Z at least in one direction ; we couldn ' t figure out how to come in the other direction. But let me get rid of the slide, and let ' s see if this comes on. OK. So there is the pressure-sensitive display in operation. The person ' s just, if you will, pushing on the screen to make a curve. But this is the interesting part. I want to stop it for a second because the movie is very badly made. And the particular display was built about six years ago, and when we moved from one room to another room, a rather large person sat on it and it got destroyed. So all we have is this record. But imagine that screen having lots of objects on it and the person has touched an object — one of N — like he did there, and then pushed on it. Now, imagine a program where some of those objects are physically heavy and some are light : one is an anvil on a fuzzy rug and the other one is a ping-pong ball on a sheet of glass. And when you touch it, you have to really push very hard to move that anvil across the screen, and yet you touch the ping-pong ball very lightly and it just scoots across the screen. And what you can do — oops, I didn ' t mean to do that — what you can do is actually feed back to the user the feeling of the physical properties. So again, they don ' t have to be weight ; they could be a general trying to move troops, and he ' s got to move an aircraft carrier versus a little boat. In fact, they funded it for that very reason. The whole notion, then, is one that at the interface there are physical properties in that transducer — in this case it ' s pressure and touches — that allow you to present things to the user that you could never present before. So it ' s not simply looking at the quality or, if you will, the luxury of that interface, but it ' s actually looking at the idea of presenting things that previously couldn ' t be presented before. I want to move on to another example, which is one of a different sort, where we ' re trying to use computer and video disc technology now to come up with a new kind of book. Here, the idea is that you ' re going to take this book, if you will, and it ' s going to come alive. You ' re going to sort of breathe life into it. We are so used to doing monologues. Filmmakers, for example, are the experts in monologue making : you make a film and it has a well-formed beginning, middle and end, and in some sense the art of it is that. And you then say,"There ' s an opportunity for making conversational movies."Well, what does that mean? And it sort of nibbles at the core of the whole profession and all the assumptions of that medium. So, book writing is the same thing. What I ' ll show you very quickly is a new kind of book where it is mixed now with... all sorts of things live in there, but you have to keep a few things in mind. One is that this book knows about itself. Each frame of the movie has information about itself. So it knows, or at least there is computer-readable information in the medium itself. It ’ s just not a static movie frame. That ’ s one thing. The other is that you have to realize that it is a random access medium, and you can, in fact, branch and expand and elaborate and shrink. And here — again, my favorite example — is the cookbook, the”Larousse Gastronomique.”And I think I use the example all too often, but it ’ s a great one because there is a classic ending in that little encyclopedia-style cookbook that tells you how to do something like penguin, and you get to the end of the recipe and it says,”Cook until done.”Now, that would be, if you will, the top green track, which doesn ’ t mean too much. But you might have to elaborate for me or for somebody who isn ’ t an expert, and say,”Cook at 380 degrees for 45 minutes.”And then for a real beginner, you would go down even further and elaborate more — say,”Open the oven, preheat, wait for the light to go out, open the door, don ’ t leave it open too long, put the penguin in and shut the door...”whatever. And that ’ s a much more elaborate one than you dribble back. That ’ s one kind of use of random access. And the other is where you want to explain the same thing in different ways. If you ’ re in a classroom situation and somebody asks a question, the last thing you do is repeat what you just said. You try and think of a different way of saying the same thing, or if you know the particular student and that student ’ s cognitive style, then you might say it in a way that you think would have a good impedance match with that student. There are all sorts of techniques you will use — and again, this is a different kind of branching. So, what I will show you is... it ’ s a rather boring book, but I ’ m afraid sometimes you have to do boring books because your sponsors aren ’ t necessarily interested in fiction and entertainment. And this is a book on how to repair a transmission. Now, I don ’ t even know what vintage the transmission is, but let me just show you very quickly some of it, and we ’ ll move on. Narrator : And continue to get descriptions for each of these chapters. Nicholas Negroponte : Now, this is his table of contents. Just a picture of the transmission, and as you rub your finger across the transmission it highlights the various parts. Narrator : When I find a chapter that I want to see, I just touch the text and the system will format pages for me to read. The words or phrases that are lit up in red are glossary words, so I can get a different definition by just touching the word, and the definition appears, superimposed over the illustration. NN : This is about the oil pan, or the oil filter and all that. This is relatively important because it sets the page... Narrator : This is another example of a page with glossary words highlighted in red. I can get a definition of these words just by touching them, and the definition will appear in the illustration corner. I can get back to the illustration, but in this case it ’ s not a single frame, but it ’ s actually a movie of someone coming into the frame and doing the repair that ’ s described in the text. The two-headed slider is a speed control that allows me to watch the movie at various speeds, in forward or reverse. And the movie is displayed as a full frame movie. I can go back to the beginning... and play the movie at full speed. Here ’ s another step-by-step procedure, only in this case — NN : Okay, this movie is... Everybody ’ s heard of sound-sync movies — this is text-sync movies, so as the movie plays, the text gets highlighted. We highlight the text as we go through the movie. Repairman :... Not too far out. Front poles, preferably. Don ’ t loosen them too far. If you loosen them too far, you ’ ll have a big mess. NN : I suspect that some of you might not even understand that language. OK. I ’ m at the third and last part of this, which I said I would make an attempt to at least give you some examples that may be more directly related to the world of entertainment. And of course, good education has got to be good entertainment, so my first example will be drawn from a very recent experiment that we ’ ve been doing — in this case, in Senegal — where we have tried to use personal computers as a pedagogical medium. But not as teaching machines at all ; the whole notion is to use this as an instrument where there is a complete reversal of roles — the child is, if you will, the teacher and the machine is the student — and the art of computer programming is a vehicle that sort of approximates thinking about thinking. But teaching kids programming per se is utterly irrelevant. And there are just a few slides I want to go through, but there ’ s a story I ’ d like to tell. And that was when, before we did this in any developing countries — we ’ re doing it, in fact, in three developing countries right now : Pakistan, Colombia and Senegal — we did it in some pretty rough areas of New York City. And one child, whose name I ’ ve forgotten, was about seven or eight years old, absolutely considered mentally handicapped — couldn ’ t read, didn ’ t even make it in the lowest section of the school ’ s classes — and was pretty much not in school, though physically there. But did hang around the, quote,”computer room,”where there were quite a few computers, and learned this particular language called Logo — and learned it with great ease and found it a lot of fun, it was very interesting. And one day, by chance, some visitors from the NIE came by in their double-breasted suits looking at this setup, and none of the children who were normally there, except for this one child, were there. He was, and he said,”Let me show you how this works,”and they got an absolutely ingenuous, wonderful description of Logo. And the child was just zipping right through it, showing them all sorts of things until they asked him how to do something which he couldn ’ t explain and so he flipped through the manual, found the explanation and typed the command and got it to do what they asked. They were delighted, and by the time it was time to go see the principal, whom they ’ d actually come to see — not the computer room — they went upstairs and they said,”This is absolutely remarkable! That child was very articulate and showed us and even dealt with the things he couldn ’ t do automatically with that manual. It was just absolutely fantastic.”The principal said,”There ’ s a dreadful mistake, because that child can ’ t read. And you obviously have been hoodwinked or you ’ ve talked about somebody else.”And they all got up and they all went downstairs and the child was still there. And they did something very intelligent : they asked the child,”Can you read?”And the child said,”No, I can ’ t.”And then they said,”But wait a minute. You just looked through that manual and you found...”and he said,”Oh, but that ’ s not reading.”And so they said,”Well, what ’ s reading then?”He says,”Well, reading is this junk they give me in little books to read. It ’ s absolutely irrelevant, and I get nothing for it. But here, with a little bit of effort I get a lot of return.”And it really meant something to the child. The child read beautifully, it turned out, and was really very competent. So it actually meant something. And that story has many other anecdotes that are similar, but wow. The key to the future of computers in education is right there, and it is : when does it mean something to a child? There is a myth, and it truly is a myth : we believe — and I ’ m sure a lot of you believe in this room — that it is harder to read and write than it is to learn how to speak. And it ’ s not, but we think speech —”My God, little children pick it up somehow, and by the age of two they ’ re doing a mediocre job, and by three and four they ’ re speaking reasonably well. And yet you ’ ve got to go to school to learn how to read, and you have to sit in a classroom and somebody has to teach you. Hence, it must be harder.”Well, it ’ s not harder. What the truth is is that speaking has great value to a child ; the child can get a great deal by talking to you. Reading and writing is utterly useless. There is no reason for a child to read and write except blind faith, and that it ’ s going to help you. So what happens is you go to school and people say,”Just believe me, you ’ re going to like it. You ’ re going to like reading,”and just read and read. On the other hand, you give a kid — a three-year-old kid — a computer and they type a little command and — Poof! — something happens. And all of a sudden... You may not call that reading and writing, but a certain bit of typing and reading stuff on the screen has a huge payoff, and it ’ s a lot of fun. And in fact, it ’ s a powerful educational instrument. Well, in Senegal we found that this was the traditional classroom : 120 kids — three per desk — one teacher, a little bit of chalk. This student was one of our first students, and it ’ s the girl on the left leaning with her chalkboard, and she came... within two days — I want to show you the program she wrote, and remember her hairstyle. And that is the program she made. That ’ s what meant something to her, is doing the hair pattern, and actually did it within two days — an hour each day — and found it was, to her, absolutely the most meaningful piece... But rooted in that, little did she know how much knowledge she was acquiring about geometry and just math and logic and all the rest. And again, I could talk for three hours about this subject. I will come to my last example and then quit. And my last example — as some of my former colleagues, whom I see in the room, can imagine what it will be. Yes, it is. It ’ s our work — that was a while ago, and it still is my favorite project — of teleconferencing. And the reason it remains a favorite project is that we were asked to do a teleconferencing system where you had the following situation : you had five people at five different sites — they were known people — and you had to have these people in teleconference, such that each one was utterly convinced that the other four were physically present. Now, that is sufficiently zany that we would, obviously, jump to the bait, and we did. And the fact that we knew the people — we had to take a page out of the history of Walt Disney — we actually went so far as to build CRTs in the shapes of the people ’ s faces. So if I wanted to call my friend Peter Sprague on the phone, my secretary would get his head out and bring it and set it on the desk, and that would be the TV used for the occasion. And it ’ s uncanny : there ’ s no way I can explain to you the amount of eye contact you get with that physical face projected on a 3D CRT of that sort. The next thing that we had to do is to persuade them that there needed to be spatial correspondence, which is straightforward, but again, it ’ s something that didn ’ t fall naturally out of a telecommunications or computing style of thinking ; it was a very, if you will, architectural or spatial concept. And that was to recognize that when you sit around the table, the actual location of the people becomes rather important. And when somebody gets up, in fact, to go answer a phone or use a bathroom or something, the empty seat becomes, if you will, that person. And you point frequently to the empty seat and you say,”He or she wouldn ’ t agree,”and the empty chair is that person and the spatiality is crucial. So we said,”Well, these will be on round tables and the order around the table had to be the same, so that at my site, I would be, if you will, real and then at each other ’ s site you ’ d have these plastic heads. And the plastic heads, sometimes you want to project them. And there are a number of schemes, which I don ’ t want to dwell on, but this is the one that we finally used where we projected onto rear screen material that was molded in the face — literally in the face of the person. And I ’ ll show you one more slide, where this is actually made from something called a solid photograph and is the screen. Now, we track, on the person ’ s head, the head motions — so we transmit with a video the head positions — and so this head moves in about two axes. So if I, all of a sudden, turn to the person to my left and start talking to that person, then at the person to my right ’ s site, he ’ ll see these two plastic heads talking to each other. And then if that person interrupts, then those two heads may turn. And it really is reconstructing, quite accurately, teleconferencing.

Text Sample 425: NEG Dim 3 – 2002 – Score -3.00 – 2002/t000321.txt

I ’ m a historian. Steve told us about the future of little technology ; I ’ m going to show you some of the past of big technology. This was a project to build a 4, 000-ton nuclear bomb-propelled spaceship and go to Saturn and Jupiter. This took place in my childhood, 1957-65. It was deeply classified. I ’ m going to show you some stuff that not only has not been declassified, but has now been reclassified. If all goes well, next year I ’ ll be back, and I ’ ll have a lot more to show you, and if all doesn ’ t go well, I ’ ll be in jail, like Wen Ho Lee. So, this ship was basically the size of the Marriott Hotel, a little taller and a little bigger. And one of the people who worked on it at the beginning was my father, Freeman, there in the middle. That ’ s me and my sister, Esther, who ’ s a frequent TEDster. I didn ’ t like nuclear bomb-propelled spaceships. I mean, I thought it was a great idea, but I started building kayaks. So we had a few kayaks. Just so you know that I am not Dr. Strangelove. But all the time I was out there doing these strange kayak voyages in odd, beautiful parts of this planet, I always thought in the back of my mind about Project Orion, and how my father and his friends were going to build these big ships. They were actually going to go — Ted Taylor, who led the project, was going to take his children. My father was not going to take his children, that was one of the reasons we sort of had a falling out for a few years. The project began in ’ 57 at General Atomics there, that ’ s right on the coast at La Jolla. Look at that central building right in the middle of the picture. That ’ s the 130-foot diameter library. That is exactly the size of the base of the spaceship. So put that library at the bottom of that ship — that ’ s how big the thing was going to be. It would take two or three thousand bombs. The people who worked on it were a lot of the Los Alamos people who had done the hydrogen bomb work. It was the first project funded by ARPA. That ’ s the contract where ARPA gave the first million dollars to get this thing started.”Spaceship project officially begun. Job waiting for you. Dyson.”That ’ s July ’ 58. Two days later, the space traveler ’ s manifesto explaining why — just like we heard yesterday — why we need to go into space :”... trips to satellites of the outer planets. August 20, 1958.”These are the statistics of what would be the good places to go and stop. Some of the sizes of the ships, ranging all the way up to ship mass of 8 million tons. So that was the outer extreme. Here was version two : 2, 000 bombs. These are five-kiloton yield bombs, about the size of small Volkswagens ; it would take 800 to get into orbit. Here we see a 10, 000-ton ship will deliver 1, 300 tons to Saturn and back — essentially, a five-year trip. Possible departure dates : October 1960 to February 1967. These are trajectories going to Mars. All this was done by hand, with slide rules. The little Orion ship, and what it would take to do what Orion does with chemicals : you have a ship the size of the Empire State Building. NASA had no interest ; they tried to kill the project. The people who supported it were the Air Force, which meant that it was all secret. And that ’ s why when you get something declassified, that ’ s what it looks like. Military weapon versions that carried hydrogen bombs that could destroy half the planet. There ’ s another version there that sends retaliatory strikes at the Soviet Union. This is the really secret stuff : how to get directed energy explosions. So you ’ re sending the energy of a nuclear explosion — not like just a stick of dynamite, but you ’ re directing it at the ship. And this is still a very active subject. It ’ s quite dangerous, but I believe it ’ s better to have dangerous things in the open than think you ’ re going to keep them secret. This is what happened at 600 **microseconds**. The Air Force started to build smaller models and actually started doing this. The guys in La

Jolla said,”We ’ ve got to get started now.”They built a high-explosive propelled model. These are stills from film footage that was saved by someone who was supposed to destroy it but didn ’ t, and kept it in their basement for the last 40 years. So, these are three-pound charges of C4 ; that ’ s about 10 times what the guy had in his shoes. This is Ed Day putting — So each of these coffee cans has three pounds of C4 in it. They ’ re building a system that ejects these at quarter-second intervals. That ’ s my dad in the sport coat there, holding the briefcase. So, they had a lot of fun doing this. But no children were allowed ; my dad could tell me he was building a spaceship and going to go to Saturn, but he could not say anything more about it. So all my life I have wanted to find this stuff out, and spent the last four years tracking these old guys down. These are stills from the video. Jeff Bezos kindly, yesterday, said he ’ ll put this video up on the Amazon site — some little clip of it. So, thanks to him. They got quite serious about the engineering of this. The size of that mass, for us, is really large technology in a way we ’ re never going to go back to. If you saw the 1959 — this is what it would feel like in the passenger compartment ; that ’ s acceleration profile. And pulse-system yield : we ’ re looking at 20-kiloton yield for an effective thrust of 10 million newtons. Well, here we have a little problem, the radiation doses at the crew station : 700 **rads** per shot. Fission yields during development : they were hoping to get clean bombs ; they didn ’ t. Eyeburn : this is what happens to the people in Miami who are looking up. Personnel compartment noise : that ’ s not too bad ; it ’ s very low frequencies, it ’ s basically like these sub-woofers. And now we have ground-hazard assessments when you have a blow-up on the pad. Finally, at the very end in 1964, NASA steps in and says,”OK, we ’ ll support a feasibility study for a small version that could be launched with Saturn Vs in sections and pieced together.”So this is what NASA did, getting an eight-man version that would go to Mars. They liked it because the guys could kind of live there and be like,”It ’ s like living in a submarine.”This is crew compartment. It switches, so what ’ s upside down is right side up when you go to artificial gravity mode. The scientists were still going to go along ; they would take seven astronauts and seven scientists. This is a 20-man version for going to Jupiter : bunks, storm cellars, exercise room. You know, it was going to be a nice, long trip. The Air Force version : here we have a military version. This is the kind of stuff that ’ s not been declassified, just that people managed to sneak home and after, you know, on their deathbed, basically, gave me that. The sort of artist conceptions. These are basically PowerPoint presentations given to the Air Force 40 years ago. Look at the little guys there outside the vehicle. And one part of NASA was interested in it, but the headquarters in NASA, they killed the project. So finally, at the end, we can see the thing followed its sort of design path right up to 1965, and then all those paths came to a halt. Results : none. This project is hereby terminated. So that ’ s the end. All I can say in closing is : we heard yesterday that one of the 10 bad things that could happen to us is an asteroid with our name on it. And one of the bad things that could happen to NASA is if that asteroid shows up with our name on it nine months out, and everybody says,”Well, what are we going to do?”And Orion is really one of the only, if not the only, off-the-shelf technologies that could do something. So I ’ m going to tell you the good news and the bad news. The good news is that NASA has a small, secret contingency-plan division that is looking at this, trying to keep knowledge of Orion preserved in the event of such a misfortune. Maybe keep a few little bombs of plutonium on the side. That ’ s the good news. The bad news is, when I got in contact with these people to try and get some documents from them, they went crazy because I had all this stuff that they don ’ t have, and NASA purchased 1, 759 pages of this stuff from me. So that ’ s the state we ’ re at ; it ’ s not very good.

Welcome. If I could have the first slide, please? Contrary to calculations made by some engineers, bees can fly, dolphins can swim, and geckos can even climb up the smoothest surfaces. Now, what I want to do, in the short time I have, is to try to allow each of you to experience the thrill of revealing nature ’ s design. I get to do this all the time, and it ’ s just incredible. I want to try to share just a little bit of that with you in this presentation. The challenge of looking at nature ’ s designs — and I ’ ll tell you the way that we perceive it, and the way we ’ ve used it. The challenge, of course, is to answer this question : what permits this extraordinary performance of animals that allows them basically to go anywhere? And if we could figure that out, how can we implement those designs? Well, many biologists will tell engineers, and others, organisms have millions of years to get it right ; they ’ re spectacular ; they can do everything wonderfully well. So, the answer is **bio-mimicry** : just copy nature directly. We know from working on animals that the truth is that ’ s exactly what you don ’ t want to do — because evolution works on the just-good-enough principle, not on a perfecting principle. And the constraints in building any organism, when you look at it, are really severe. Natural technologies have incredible constraints. Think about it. If you were an engineer and I told you that you had to build an automobile, but it had to start off to be this big, then it had to grow to be full size and had to work every step along the way. Or think about the fact that if you build an automobile, I ’ ll tell you that you also — inside it — have to put a factory that allows you to make another automobile. And you can absolutely never, absolutely never, because of history and the inherited plan, start with a clean slate. So, organisms have this important history. Really evolution works more like a tinkerer than an engineer. And this is really important when you begin to look at animals. Instead, we believe you need to be inspired by biology. You need to discover the general principles of nature, and then use these analogies when they ’ re advantageous. This is a real challenge to do this, because animals, when you start to really look inside them — how they work — appear hopelessly complex. There ’ s no detailed history of the design plans, you can ’ t go look it up anywhere. They have way too many motions for their joints, too many muscles. Even the simplest animal we think of, something like an insect, and they have more neurons and connections than you can imagine. How can you make sense of this? Well, we believed — and we hypothesized — that one way animals could work simply, is if the control of their movements tended to be built into their bodies themselves. What we discovered was that two-, four-, six- and eight-legged animals all produce the same forces on the ground when they move. They all work like this kangaroo, they bounce. And they can be modeled by a spring-mass system that we call the spring mass system because we ’ re biomechanists. It ’ s actually a pogo stick. They all produce the pattern of a pogo stick. How is that true? Well, a human, one of your legs works like two legs of a trotting dog, or works like three legs, together as one, of a trotting insect, or four legs as one of a trotting crab. And then they alternate in their propulsion, but the patterns are all the same. Almost every organism we ’ ve looked at this way — you ’ ll see next week, I ’ ll give you a hint, there ’ ll be an article coming out that says that really big things like T. rex probably couldn ’ t do this, but you ’ ll see that next week. Now, what ’ s interesting is the animals, then — we said — bounce along the vertical plane this way, and in our collaborations with Pixar, in”A Bug ’ s Life,”we discussed the bipedal nature of the characters of the ants. And we told them, of course, they move in another plane as well. And they asked us this question. They say,"Why model just in the sagittal plane or the vertical plane, when you ' re telling us these animals are moving in the horizontal plane?"This is a good question. Nobody in biology ever modeled it this way. We took their advice and we modeled the animals moving in the horizontal plane as well. We took their three legs, we collapsed them down as one. We got some of the best mathematicians in the world from Princeton to work on this problem. And we were able to create a model where animals are not only bouncing up and down, but they ' re also bouncing side to side at the same time. And many organisms fit this kind of pattern. Now, why is this important to have this model? Because it ' s very interesting. When you take this model and you perturb it, you give it a push, as it bumps into something, it self-stabilizes, with no brain or no reflexes, just by the structure alone. It ' s a beautiful model. Let ' s look at the mathematics. That ' s enough! The animals, when you look at them running, appear to be self-stabilizing like this, using basically springy legs. That is, the legs can do computations on their own ; the control algorithms, in a sense, are embedded in the form of the animal itself. Why haven ' t we been more inspired by nature and these kinds of discoveries? Well, I would argue that human technologies are really different from natural technologies, at least they have been so far. Think about the typical kind of robot that you see. Human technologies have tended to be large, flat, with right angles, stiff, made of metal. They have rolling devices and axles. There are very few motors, very few sensors. Whereas nature tends to be small, and curved, and it bends and twists, and has legs instead, and appendages, and has many muscles and many, many sensors. So it ' s a very different design. However, what ' s changing, what ' s really exciting — and I ' ll show you some of that next — is that as human technology takes on more of the characteristics of nature, then nature really can become a much more useful teacher. And here ' s one example that ' s really exciting. This is a collaboration we have with Stanford. And they developed this new technique, called Shape Deposition Manufacturing. It ' s a technique where they can mix materials together and mold any shape that they like, and put in the material properties. They can embed sensors and actuators right in the form itself. For example, here ' s a leg : the clear part is stiff, the white part is compliant, and you don ' t need any axles there or anything. It just bends by itself beautifully. So, you can put those properties in. It inspired them to show off this design by producing a little robot they named Sprawl. Our work has also inspired another robot, a biologically inspired bouncing robot, from the University of Michigan and McGill named RHex, for robot hexapod, and this one ' s autonomous. Let ' s go to the video, and let me show you some of these animals moving and then some of the simple robots that have been inspired by our discoveries. Here ' s what some of you did this morning, although you did it outside, not on a treadmill. Here ' s what we do. This is a death ' s head cockroach. This is an American cockroach you think you don ' t have in your kitchen. This is an eight-legged scorpion, six-legged ant, forty-four-legged centipede. Now, I said all these animals are sort of working like pogo sticks — they ' re bouncing along as they move. And you can see that in this ghost crab, from the beaches of Panama and North Carolina. It goes up to four meters per second when it runs. It actually leaps into the air, and has aerial phases when it does it, like a horse, and you ' ll see it ' s bouncing here. What we discovered is whether you look at the leg of a human like Richard, or a cockroach, or a crab, or a kangaroo, the relative leg stiffness of that spring is the same for everything we ' ve seen so far. Now, what good are springy legs then? What can they do? Well, we wanted to see if they allowed the animals to have greater stability and maneuverability. So, we built a terrain that had obstacles three times the hip height of the animals that we ' re looking at. And we were certain they couldn ' t do this. And here ' s what they did. The animal ran over it and it didn ' t even slow down! It didn ' t decrease its preferred speed at all. We couldn ' t believe that it could do this. It said to us that if you could build a robot with very simple, springy legs, you could make it as maneuverable as any that ' s ever been built. Here ' s the first example of that. This is the Stanford Shape Deposition Manufactured robot, named Sprawl. It has six legs — there are the tuned, springy legs. It moves in a gait that an insect uses, and here it is going on the treadmill. Now, what ' s important about this robot, compared to other robots, is that it can ' t see anything, it can ' t feel anything, it doesn ' t have a brain, yet it can maneuver over these obstacles without any difficulty whatsoever. It ' s this technique of building the properties into the form. This is a graduate student. This is what he ' s doing to his thesis project — very robust, if a graduate student does that to his thesis project. This is from McGill and University of Michigan. This is the RHex, making its first outing in a demo. Same principle : it only has six moving parts, six motors, but it has springy, tuned legs. It moves in the gait of the insect. It has the middle leg moving in synchrony with the front, and the hind leg on the other side. Sort of an alternating tripod, and they can negotiate obstacles just like the animal. Robert Full : It ' ll go on different surfaces — here ' s sand — although we haven ' t perfected the feet yet, but I ' ll talk about that later. Here ' s RHex entering the woods. Again, this robot can ' t see anything, it can ' t feel anything, it has no brain. It ' s just working with a tuned mechanical system, with very simple parts, but inspired from the fundamental dynamics of the animal. RF : Here ' s it going down a pathway. I presented this to the jet propulsion lab at NASA, and they said that they had no ability to go down craters to look for ice, and life, ultimately, on Mars. And he said — especially with legged-robots, because they ' re way too complicated. Nothing can do that. And I talk next. I showed them this video with the simple design of RHex here. And just to convince them we should go to Mars in 2011, I tinted the video orange just to give them the sense of being on Mars. Another reason why animals have extraordinary performance, and can go anywhere, is because they have an effective interaction with the environment. The animal I ' m going to show you, that we studied to look at this, is the gecko. We have one here and notice its position. It ' s holding on. Now I ' m going to challenge you. I ' m going show you a video. One of the animals is going to be running on the level, and the other one ' s going to be running up a wall. Which one ' s which? They ' re going at a meter a second. How many think the one on the left is running up the wall? Okay. The point is it ' s really hard to tell, isn ' t it? It ' s incredible, we looked at students do this and they couldn ' t tell. They can run up a wall at a meter a second, 15 steps per second, and they look like they ' re running on the level. How do they do this? It ' s just phenomenal. The one on the right was going up the hill. How do they do this? They have bizarre toes. They have toes that uncurl like party favors when you blow them out, and then peel off the surface, like tape. Like if we had a piece of tape now, we ' d peel it this way. They do this with their toes. It ' s bizarre! This peeling inspired iRobot — that we work with — to build Mecho-Geckos. Here ' s a legged version and a tractor version, or a bulldozer version. Let ' s see some of the geckos move with some video, and then I ' ll show you a little bit of a clip of the robots. Here ' s the gecko running up a vertical surface. There it goes, in real time. There it goes again. Obviously, we have to slow this down a little bit. You can ' t use regular cameras. You have to take 1, 000 pictures per second to see this. And here ' s some video at 1, 000 frames per second. Now, I want you to look at the animal ' s back. Do you see how much it ' s bending like that? We can ' t figure that out

— that ’ s an unsolved mystery. We don ’ t know how it works. If you have a son or a daughter that wants to come to Berkeley, come to my lab and we ’ ll figure this out. Okay, send them to Berkeley because that ’ s the next thing I want to do. Here ’ s the gecko mill. It ’ s a see-through treadmill with a see-through treadmill belt, so we can watch the animal ’ s feet, and **videotape** them through the treadmill belt, to see how they move. Here ’ s the animal that we have here, running on a vertical surface. Pick a foot and try to watch a toe, and see if you can see what the animal ’ s doing. See it uncurl and then peel these toes. It can do this in 14 **milliseconds**. It ’ s unbelievable. Here are the robots that they inspire, the Mecho-Geckos from iRobot. First we ’ ll see the animals toes peeling — look at that. And here ’ s the peeling action of the Mecho-Gecko. It uses a pressure- sensitive adhesive to do it. Peeling in the animal. Peeling in the Mecho-Gecko — that allows them climb autonomously. Can go on the flat surface, transition to a wall, and then go onto a ceiling. There ’ s the bulldozer version. Now, it doesn ’ t use pressure-sensitive glue. The animal does not use that. But that ’ s what we ’ re limited to, at the moment. What does the animal do? The animal has weird toes. And if you look at the toes, they have these little leaves there, and if you blow them up and zoom in, you ’ ll see that ’ s there ’ s little striations in these leaves. And if you zoom in 270 times, you ’ ll see it looks like a rug. And if you blow that up, and zoom in 900 times, you see there are hairs there, tiny hairs. And if you look carefully, those tiny hairs have striations. And if you zoom in on those 30, 000 times, you ’ ll see each hair has split ends. And if you blow those up, they have these little structures on the end. The smallest branch of the hairs looks like spatulae, and an animal like that has one billion of these nano-size split ends, to get very close to the surface. In fact, there ’ s the diameter of your hair — a gecko has two million of these, and each hair has 100 to 1, 000 split ends. Think of the contact of that that ’ s possible. We were fortunate to work with another group at Stanford that built us a special manned sensor, that we were able to measure the force of an individual hair. Here ’ s an individual hair with a little split end there. When we measured the forces, they were enormous. They were so large that a patch of hairs about this size — the gecko ’ s foot could support the weight of a small child, about 40 pounds, easily. Now, how do they do it? We ’ ve recently discovered this. Do they do it by friction? No, force is too low. Do they do it by electrostatics? No, you can change the charge — they still hold on. Do they do it by interlocking? That ’ s kind of a like a Velcro-like thing. No, you can put them on molecular smooth surfaces — they don ’ t do it. How about suction? They stick on in a vacuum. How about wet adhesion? Or capillary adhesion? They don ’ t have any glue, and they even stick under water just fine. If you put their foot under water, they grab on. How do they do it then? Believe it or not, they grab on by intermolecular forces, by Van der Waals forces. You know, you probably had this a long time ago in chemistry, where you had these two atoms, they ’ re close together, and the electrons are moving around. That tiny force is sufficient to allow them to do that because it ’ s added up so many times with these small structures. What we ’ re doing is, we ’ re taking that inspiration of the hairs, and with another colleague at Berkeley, we ’ re manufacturing them. And just recently we ’ ve made a breakthrough, where we now believe we ’ re going to be able to create the first synthetic, self-cleaning, dry adhesive. Many companies are interested in this. We also presented to Nike even. We ’ ll see where this goes. We were so excited about this that we realized that that small-size scale — and where everything gets sticky, and gravity doesn ’ t matter anymore — we needed to look at ants and their feet, because one of my other colleagues at Berkeley has built a six-millimeter silicone robot with legs. But it gets stuck. It doesn ’ t move very well. But the ants do, and we ’ ll figure out why, so that ultimately we ’ ll make this move. And imagine : you ’ re going to be able to have swarms of these six-millimeter robots available to run around. Where ’ s this going? I think you can see it already. Clearly, the Internet is already having eyes and ears, you have web cams and so forth. But it ’ s going to also have legs and hands. You ’ re going to be able to do programmable work through these kinds of robots, so that you can run, fly and swim anywhere. We saw David Kelly is at the beginning of that with his fish. So, in conclusion, I think the message is clear. If you need a message, if nature ’ s not enough, if you care about search and rescue, or mine clearance, or medicine, or the various things we ’ re working on, we must preserve nature ’ s designs, otherwise these secrets will be lost forever. Thank you.

Text Sample 427: NEG Dim 3 – 2002 – Score -2.00 – 2002/t000341.txt

Dan Holzman : Please throw out the beanbag chairs. Here we go. Barry Friedman : There are all kinds of high-tech chairs here today, but this is really, I think, when it reached its peak as far as ergonomics, comfort, design, flexibility... DH : Now obviously, this is not something we do on our regular show ; it ’ s something we just kind of learned for this, so we ’ re going to try. But can we have some inspirational music for the beanbag chairs? BF : Nice show, Daniel, nice show. You are the man! Nice show. Man, that was good! DH : Thank you. BF : You know, sometimes when people do those, they go all the way down. You actually just did that. That ’ s the kind of extra effort that ’ s gotten us where we are today... DH : All right, let ’ s show them something special. BF :... without a MacArthur grant. Yeah, look at this. You know, all kinds of different... TED is about invention, let ’ s be honest. Right? DH : Yeah, it is. BF : Last night, Michael Moschen showed some **juggling** props he has invented and working on. Right now, Dan ’ s going to show something he actually invented. DH : A type of juggling I actually invented, right after I saw another **juggler** do it. BF : Shut up. DH : And this is a small excerpt from a longer piece. Folks, this is shaker cup **juggling**. It ’ s not a showstopper but it certainly slows it down. BF : Oh yeah, it does. BF : Oh, Daniel. DH : One more? Perfect. Perfect. BF : OK. DH : Oh! All right. I ’ m now pushing my luck : I ’ m skipping right to six cups. In order to do six cups, I must have perfect control over three with my right hand. BF : Also three with his left. DH : Perfect. And now, all six cups. Should I do it on the first try or should I miss once on purpose? BF : First try? Once on purpose? DH : How about if I try first and then decide? BF : Good idea. Let ’ s leave that. We ’ ll leave that door open. DH : He ’ s looking at me. BF : That ’ s all right, he does that. All right. DH : Oh! It ’ s time for Richard ’ s help. Oh, good. All right. BF : You know, over the years, every year at the conference, it ’ s kind of become a tradition for us to do something dangerous with Richard. And we ’ ve always done something with the bullwhips in our act. It ’ s funny, for years I did it with Daniel holding balloons. And then we thought,”How stupid.”DH : Excuse me, could we work on the design of the microphone? BF : I think that ’ s the next session. DH : Next session? BF : Yeah. And so we ’ ve actually found a way to incorporate Richard in this. He actually assumes more of the danger in this. DH : Please stand up, Richard. Oh, sorry. DH : Now Richard, please... BF : OK, sorry. DH : Jesus Christ. Richard, please stand in front of me. Richard Wurman : Can I say something? BF : Sure. RW : In all past years I ’ ve rehearsed with them, the things that have happened to me — I have no idea what ’ s going to happen and that ’ s the truth. DH : All right, please stand here in front... God, I hate that. Put your hands out like this, please. BF : No, come stay up with him. Dan used to actually hold them but now he ’ s got you for protection. It ’ s kind of neat. OK. DH : Wow, you ’ ve been working out. BF : No, shut up! Having a little bit of Richard time. That ’ s nice, that ’ s good. OK, here we go. Have him hold your wrist so I can... DH : Please hold my wrist, will you. BF : Yeah, hold this a minute. There you go. OK. OK, hold on. RW : Hmmm. DH : First one. BF : All those mid-year phone calls are coming back to me now, Richard. DH : So Richard, what were we on the list? Like 1, 020? What happened there? BF : I think we were just outside. DH : I don ’ t get it. DH : Sorry. BF : Having some bad flashbacks. RW : Do you want me to hold you or not? DH : Don ’ t hold me that hard. BF : Here we go, I ’ m taking it. DH : One more, one more. BF : We ’ ve got one more we ’ re going to do. RW : Do I get to hold them? BF : You don ’ t want to hold these, trust me. DH : Could you spread your legs a little bit? BF : Gloria, you want to do it? It ’ s very cool. One more try. Man, I don ’ t want to get too close. Could you just push that? DH : Wow! Boy! BF : That ’ s cool. I always wanted to try that. DH : Let ’ s jump this way, though. Now, we risked Richard ’ s life, it ’ s only fair we risk our own lives. So to do that, I will juggle these three razor-sharp sickles. And if that wasn ’ t enough, and judging by your response, it ’ s not... DH : Wow! BF : Hoping for a little more build. DH : True. Barry... BF : I ’ m going to run up behind him. DH : Leap over my shoulder. BF : Up and over his shoulders. DH : Grab the blades in mid-air, land right there in a pool of blood... Still juggling. Impossible, you say? BF : Incredible, you say? DH : Why bother, you say? BF : Here we go. DH : Just do it **juggler** boys, you say? BF : This guy, this guy invented air. DH : I think so, that ’ s right. Even the pencil. BF : He invented the pencil. DH : All right, we ’ ll do this trick, but please remember it took us over 10 years to perfect. BF : Ten years to perfect, which you ’ re about to see. DH : It ’ s not that difficult, we just don ’ t like to practice that much. BF : No, it ’ s a hassle. Traveling too much. Actually, we will take a second to prove — this could be fake — that the blades are indeed razor-sharp. DH : Will someone please throw a small farm animal up onto the stage? Or a virgin for a sacrifice? BF : Anything? DH : Where ’ s Gloria? BF : No, she ’ s got... farm animal. DH : Do you have a small farm animal? Just trying to play the odds. All right, here we go. BF : Over the top, over the top. DH : How you feeling, Barry? You feeling all right? BF : Yeah, it ’ s all right. DH : Do you feel everything ’ s OK? The atmosphere, the... BF : Yeah, a little sketchy. DH : Everything up here ’ s OK? BF : Yeah. DH : Then here we go. BF : This one ’ s a little... Who ’ s doing the lights? Could you point that a little more directly into my eyeballs? Is that possible? I can still see a little. DH : And turn up the intensity ; we ’ re still pink in the middle. We went too far. BF : Yeah, it ’ s too far. It ’ s too much of a visual. The design of the body is a whole different thing. DH : Ready, Barry? BF : Over the top. DH : May we have our jumping music please? May we have it a bit louder? BF : They ’ re a good crew! Whoa! DH : Whoa, sorry. All right. BF : We ’ re going on. DH : All right, we ’ ll try again. BF : All right? Oh my gosh. Oh. DH : All right, here we go. Sorry about that. BF : I thought I had the hard part. OK. DH : Whenever you ’ re ready. BF : There we go! All right, get up! Come on and dance! DH : Dance, come on. BF : Come on and dance! Somebody dance! Come on! Wow, wow, OK, stop. Weird, no one dances. We ’ re two guys doing this. I think that ’ s uncomfortable for everyone. DH : The French judge... BF : One more quick thing. DH : The French judge gives it a 5. 2. BF : Well, you know... DH : There you go... BF : Oh, yeah. Another one coming in. DH : Tell them about our bio and stuff. BF : Yeah. In our bio, some of you may have read that we ’ ve won two world **juggling** championships. And believe it or not, you don ’ t win juggling champions for doing things with bullwhips or shaker cups. We ’ re going to show you right now an excerpt from a routine that we used to wipe out the other **juggling** team competition. DH : That ' s right. BF : Good. DH : I know what you ' re thinking : other **juggling** teams must really suck. BF : **Juggling** ' s got a bad rap. DH : But wait, Barry, there ' s still one more club lying there by my foot. And look, it has a twin! BF : Shut up. DH : There ' s still one more by my foot. What do you want me to do with it? BF : Richard you tell him, it ' s your last year. DH : That ' s a pretty good setup, Richard. BF : Yeah, it ' s a good setup. That ' s a big setup. DH : You can ' t get any better than that. All right. What I will do : I will use my panther-like reflexes. BF : Nice. DH : I got that — to reach down and grab that club in my grip of steel. BF : Nice. DH : I touched it, Barry. That should be enough. BF : It ' s progress, that ' s the thing. DH : How about that? I ' ll do it again. Oh wait, it ' s on your side, Barry. And it ' s awfully windy over there. BF : It is, it ' s weird. You wouldn ' t think it would affect half the stage, but it is. It ' s weird. Watch this : what I ' m going to do is slide the seventh one onto my foot. DH : Wow! What a great trick, Barry! Oh, look how it lies there. Oh, Barry, is there nothing you can ' t do? You are my hero. You ' re my Jim Shea, Jr. Too much Olympics. BF : From my foot, I ' ll attempt to kick the seventh club. Here we go. DH : Where, Barry? Where? Tell us, Barry. [Unclear] eagerly awaits your next syllable. What will it be? What gem of knowledge? What pearl of wisdom? Do you want to buy a vowel, Barry? Is that your final answer? BF : All right! You have to turn off the TV from time to time. DH : I do, I do. BF : From my foot, the kick up in the seven. DH : We will juggle seven. BF : From six to seven. DH : That ' s a world ' s record. BF : Really? DH : For us. BF : Yes. DH : Whenever you ' re ready there, big guy. Put your tongue away, Barry. BF : Oh, oh, whoa. DH : Please, please stay seated. Stay seated. Thank you. Because now, to make this twice as difficult, we ' ll juggle the seven clubs back... BF : Seven-club **juggling**. DH :... to back. BF : Thank you, that ' s it. BF : Thank you guys! DH : Thank you very much!

Last year, I told you the story, in seven minutes, of Project Orion, which was this very implausible technology that technically could have worked, but it had this one-year political window where it could have happened. So it didn ' t happen. It was a dream that did not happen. This year I ' m going to tell you the story of the birth of digital computing. This was a perfect introduction. And it ' s a story that did work. It did happen, and the machines are all around us. And it was a technology that was inevitable. If the people I ' m going to tell you the story about, if they hadn ' t done it, somebody else would have. So, it was sort of the right idea at the right time. This is Barricelli ' s universe. This is the universe we live in now. It ' s the universe in which these machines are now doing all these things, including changing biology. I ' m starting the story with the first atomic bomb at Trinity, which was the Manhattan Project. It was a little bit like TED : it brought a whole lot of very smart people together. And three of the smartest people were Stan Ulam, Richard Feynman and John von Neumann. And it was Von Neumann who said, after the bomb, he was working on something much more important than bombs : he ' s thinking about computers. So, he wasn ' t only thinking about them ; he built one. This is the machine he built. He built this machine, and we had a beautiful demonstration of how this thing really works, with these little bits. And it ' s an idea that goes way back. The first person to really explain that was Thomas Hobbes, who, in 1651, explained how arithmetic and logic are the same thing, and if you want to do artificial thinking and artificial logic, you can do it all with arithmetic. He said you needed addition and subtraction. Leibniz, who came a little bit later — this is 1679 — showed that you didn ' t even need subtraction. You could do the whole thing with addition. Here, we have all the binary arithmetic and logic that drove the computer revolution. And Leibniz was the first person to really talk about building such a machine. He talked about doing it with marbles, having gates and what we now call shift registers, where you shift the gates, drop the marbles down the tracks. And that ' s what all these machines are doing, except, instead of doing it with marbles, they ' re doing it with electrons. And then we jump to Von Neumann, 1945, when he sort of reinvents the whole same thing. And 1945, after the war, the electronics existed to actually try and build such a machine. So June 1945 — actually, the bomb hasn ' t even been dropped yet — and Von Neumann is putting together all the theory to actually build this thing, which also goes back to Turing, who, before that, gave the idea that you could do all this with a very brainless, little, finite state machine, just reading a tape in and reading a tape out. The other sort of genesis of what Von Neumann did was the difficulty of how you would predict the weather. Lewis Richardson saw how you could do this with a cellular array of people, giving them each a little chunk, and putting it together. Here, we have an electrical model illustrating a mind having a will, but capable of only two ideas. And that ' s really the simplest computer. It ' s basically why you need the qubit, because it only has two ideas. And you put lots of those together, you get the essentials of the modern computer : the arithmetic unit, the central control, the memory, the recording medium, the input and the output. But, there ' s one catch. This is the fatal — you know, we saw it in starting these programs up. The instructions which govern this operation must be given in absolutely exhaustive detail. So, the programming has to be perfect, or it won ' t work. If you look at the origins of this, the classic history sort of takes it all back to the ENIAC here. But actually, the machine I ' m going to tell you about, the Institute for Advanced Study machine, which is way up there, really should be down there. So, I ' m trying to revise history, and give some of these guys more credit than they ' ve had. Such a computer would open up universes, which are, at the present, outside the range of any instruments. So it opens up a whole new world, and these people saw it. The guy who was supposed to build this machine was the guy in the middle, Vladimir Zworykin, from RCA. RCA, in probably one of the lousiest business decisions of all time, decided not to go into computers. But the first meetings, November 1945, were at RCA ' s offices. RCA started this whole thing off, and said, you know, televisions are the future, not computers. The essentials were all there — all the things that make these machines run. Von Neumann, and a logician, and a mathematician from the army put this together. Then, they needed a place to build it. When RCA said no, that ' s when they decided to build it in Princeton, where Freeman works at the Institute. That ' s where I grew up as a kid. That ' s me, that ' s my sister Esther, who ' s talked to you before, so we both go back to the birth of this thing. That ' s Freeman, a long time ago, and that was me. And this is Von Neumann and Morgenstern, who wrote the"Theory of Games."All these forces came together there, in Princeton. Oppenheimer, who had built the bomb. The machine was actually used mainly for doing bomb calculations. And Julian Bigelow, who took Zworkykin ' s place as the engineer, to actually figure out, using electronics, how you would build this thing. The whole gang of people who came to work on this, and women in front, who actually did most of the coding, were the first programmers. These were the prototype geeks, the nerds. They didn ' t fit in at the Institute. This is a letter from the director, concerned about —"especially unfair on the matter of sugar."You can read the text. This is hackers getting in trouble for the first time.. These were not theoretical physicists. They were real soldering-gun type guys, and they actually built this thing. And we take it for granted now, that each of these machines has billions of **transistors**, doing billions of cycles per second without failing. They were using vacuum tubes, very narrow, sloppy techniques to get actually binary behavior out of these radio vacuum tubes. They actually used 6J6, the common radio tube, because they found they were more reliable than the more expensive tubes. And what they did at the Institute was publish every step of the way. Reports were issued, so that this machine was cloned at 15 other places around the world. And it really was. It was the original **microprocessor**. All the computers now are copies of that machine. The memory was in cathode ray tubes — a whole bunch of spots on the face of the tube — very, very sensitive to electromagnetic disturbances. So, there ' s 40 of these tubes, like a V-40 engine running the memory. The input and the output was by teletype tape at first. This is a wire drive, using bicycle wheels. This is the archetype of the hard disk that ' s in your machine now. Then they switched to a magnetic drum. This is modifying IBM equipment, which is the origins of the whole data-processing industry, later at IBM. And this is the beginning of computer graphics. The"Graph ' g-Beam Turn On."This next slide, that ' s the — as far as I know — the first digital bitmap display, 1954. So, Von Neumann was already off in a theoretical cloud, doing abstract sorts of studies of how you could build reliable machines out of unreliable components. Those guys drinking all the tea with sugar in it were writing in their logbooks, trying to get this thing to work, with all these 2, 600 vacuum tubes that failed half the time. And that ' s what I ' ve been doing, this last six months, is going through the logs."Running time : two minutes. Input, output : 90 minutes."This includes a large amount of human error. So they are always trying to figure out, what ' s machine error? What ' s human error? What ' s code, what ' s hardware? That ' s an engineer gazing at tube number 36, trying to figure out why the memory ' s not in focus. He had to focus the memory — seems OK. So, he had to focus each tube just to get the memory up and running, let alone having, you know, software problems."No use, went home.""Impossible to follow the damn thing, where ' s a directory?"So, already, they ' re complaining about the manuals :"before closing down in disgust...""The General Arithmetic : Operating Logs."Burning lots of midnight oil."MANIAC,"which became the acronym for the machine, Mathematical and Numerical Integrator and Calculator,"lost its memory.""MANIAC regained its memory, when the power went off.""Machine or human?""Aha!"So, they figured out it ' s a code problem."Found trouble in code, I hope.""Code error, machine not guilty.""Damn it, I can be just as stubborn as this thing.""And the dawn came."So they ran all night. Twenty-four hours a day, this thing was running, mainly running bomb calculations."Everything up to this point is wasted time.""What ' s the use? Good night.""Master control off. The hell with it. Way off.""Something ' s wrong with the air conditioner — smell of burning V-belts in the air.""A short — do not turn the machine on.""IBM machine putting a tar-like substance on the cards. The tar is from the roof."So they really were working under tough conditions. Here,"A mouse has climbed into the blower behind the regulator rack, set blower to vibrating. Result : no more mouse.""Here lies mouse. Born :?. Died : 4:50 a. m., May 1953."There ' s an inside joke someone has penciled in :"Here lies Marston Mouse."If you ' re a mathematician, you get that, because Marston was a mathematician who objected to the computer being there."Picked a lightning bug off the drum.""Running at two kilocycles."That ' s two thousand cycles per second —"yes, I ' m chicken"— so two kilocycles was slow speed. The high speed was 16 kilocycles. I don ' t know if you remember a Mac that was 16 **Megahertz**, that ' s slow speed."I have now duplicated both results. How will I know which is right, assuming one result is correct? This now is the third different output. I know when I ’ m licked.””We ’ ve duplicated errors before.””Machine run, fine. Code isn ’ t.””Only happens when the machine is running.”And sometimes things are okay.”Machine a thing of beauty, and a joy forever.””Perfect running.””Parting thought : when there ’ s bigger and better errors, we ’ ll have them.”So, nobody was supposed to know they were actually designing bombs. They ’ re designing hydrogen bombs. But someone in the logbook, late one night, finally drew a bomb. So, that was the result. It was Mike, the first thermonuclear bomb, in 1952. That was designed on that machine, in the woods behind the Institute. So Von Neumann invited a whole gang of weirdos from all over the world to work on all these problems. Barricelli, he came to do what we now call, really, artificial life, trying to see if, in this artificial universe — he was a viral-geneticist, way, way, way ahead of his time. He ’ s still ahead of some of the stuff that ’ s being done now. Trying to start an artificial genetic system running in the computer. Began — his universe started March 3, ’ 53. So it ’ s almost exactly — it ’ s 50 years ago next Tuesday, I guess. And he saw everything in terms of — he could read the binary code straight off the machine. He had a wonderful rapport. Other people couldn ’ t get the machine running. It always worked for him. Even errors were duplicated.”Dr. Barricelli claims machine is wrong, code is right.”So he designed this universe, and ran it. When the bomb people went home, he was allowed in there. He would run that thing all night long, running these things, if anybody remembers Stephen Wolfram, who reinvented this stuff. And he published it. It wasn ’ t locked up and disappeared. It was published in the literature.”If it ’ s that easy to create living organisms, why not create a few yourself?”So, he decided to give it a try, to start this artificial biology going in the machines. And he found all these, sort of — it was like a naturalist coming in and looking at this tiny, 5, 000-byte universe, and seeing all these things happening that we see in the outside world, in biology. This is some of the generations of his universe. But they ’ re just going to stay numbers ; they ’ re not going to become organisms. They have to have something. You have a genotype and you have to have a phenotype. They have to go out and do something. And he started doing that, started giving these little numerical organisms things they could play with — playing chess with other machines and so on. And they did start to evolve. And he went around the country after that. Every time there was a new, fast machine, he started using it, and saw exactly what ’ s happening now. That the programs, instead of being turned off — when you quit the program, you ’ d keep running and, basically, all the sorts of things like Windows is doing, running as a **multicellular** organism on many machines, he envisioned all that happening. And he saw that evolution itself was an intelligent process. It wasn ’ t any sort of creator intelligence, but the thing itself was a giant parallel computation that would have some intelligence. And he went out of his way to say that he was not saying this was lifelike, or a new kind of life. It just was another version of the same thing happening. And there ’ s really no difference between what he was doing in the computer and what nature did billions of years ago. And could you do it again now? So, when I went into these archives looking at this stuff, lo and behold, the archivist came up one day, saying,”I think we found another box that had been thrown out.”And it was his universe on punch cards. So there it is, 50 years later, sitting there — sort of suspended animation. That ’ s the instructions for running — this is actually the source code for one of those universes, with a note from the engineers saying they ’ re having some problems.”There must be something about this code that you haven ’ t explained yet.”And I think that ’ s really the truth. We still don ’ t understand how these very simple instructions can lead to increasing complexity. What ’ s the dividing line between when that is lifelike and when it really is alive? These cards, now, thanks to me showing up, are being saved. And the question is, should we run them or not? You know, could we get them running? Do you want to let it loose on the Internet? These machines would think they — these organisms, if they came back to life now — whether they ’ ve died and gone to heaven, there ’ s a universe. My laptop is 10 thousand million times the size of the universe that they lived in when Barricelli quit the project. He was thinking far ahead, to how this would really grow into a new kind of life. And that ’ s what ’ s happening! When Juan Enriquez told us about these 12 trillion bits being transferred back and forth, of all this genomics data going to the proteomics lab, that ’ s what Barricelli imagined : that this digital code in these machines is actually starting to code — it already is coding from nucleic acids. We ’ ve been doing that since, you know, since we started PCR and synthesizing small strings of DNA. And real soon, we ’ re actually going to be synthesizing the proteins, and, like Steve showed us, that just opens an entirely new world. It ’ s a world that Von Neumann himself envisioned. This was published after he died : his sort of unfinished notes on self-reproducing machines, what it takes to get the machines sort of jump-started to where they begin to reproduce. It took really three people : Barricelli had the concept of the code as a living thing ; Von Neumann saw how you could build the machines — that now, last count, four million of these Von Neumann machines is built every 24 hours ; and Julian Bigelow, who died 10 days ago — this is John Markoff ’ s obituary for him — he was the important missing link, the engineer who came in and knew how to put those vacuum tubes together and make it work. And all our computers have, inside them, the copies of the architecture that he had to just design one day, sort of on pencil and paper. And we owe a tremendous credit to that. And he explained, in a very generous way, the spirit that brought all these different people to the Institute for Advanced Study in the ’ 40s to do this project, and make it freely available with no patents, no restrictions, no intellectual property disputes to the rest of the world. That ’ s the last entry in the logbook when the machine was shut down, July 1958. And it ’ s Julian Bigelow who was running it until midnight when the machine was officially turned off. And that ’ s the end. Thank you very much.

Text Sample 429: NEG Dim 3 – 2003 – Score -5.00 – 2003/t000364.txt

I am known best for human-powered flight, but that was just one thing that got me going in the sort of things that I ’ m working in now. As a youngster, I was very interested in model airplanes, **ornithopters**, autogyros, helicopters, gliders, power planes, indoor models, outdoor models, everything, which I just thought was a lot of fun, and wondered why most other people didn ’ t share my same enthusiasm with them. And then, navy pilot training, and, after college, I got into **sailplane** flying, power plane flying, and considered the **sailplanes** as a sort of hobby and fun, but got tangled up with some great professor types, who convinced me and everybody else in the field that this was a good way to get into really deep science. While this was all going on, I was in the field of weather modification, although getting a Ph. D. in aeronautics. The weather modification subject was getting started, and as a graduate student, I could go around to the various talks that were being given, on a hitchhiker ride to the East Coast, and so on. And everybody would talk to me, but all the professionals in the field hated each other, and they wouldn ’ t communicate. And as a result, I got the absolutely unique background in that field, and started a company, which did more research in weather modification than anybody, and there are a lot of things that I just can ' t go into. But then, 1971 started AeroVironment, with no employees — then one or two, three, and sort of fumbled along on trying to get interesting projects. We had AirDynamisis, who, like I, did not want to work for aerospace companies on some big, many year project, and so we did our small projects, and the company slowly grew. The thing that is exciting was, in 1976, I suddenly got interested in the human-powered airplane because I ' d made a made a loan to a friend of 100, 000 dollars, or I guaranteed the money at the bank. He needed them — he needed the money for starting a company. The company did not succeed, and he couldn ' t pay the money back, and I was the guarantor of the note. So, I had a $100, 000 debt, and I noticed that the Kramer prize for human-powered flight, which had then been around for — — 17 years at the time, was 50, 000 pounds, which, at the exchange rate, was just about 100, 000 dollars. So suddenly, I was interested in human-powered flight — — and did not — the way I approached it, first, thinking about ways to make the planes, was just like they ' d been doing in England, and not succeeding, and I gave it up. I figured, nah, there isn ' t any simple, easy way. But then, got off on a vacation trip, and was studying bird flight, just for the fun of it, and you can watch a bird soaring around in circles, and measure the time, and estimate the bank angle, and immediately, figure out its speed, and the turning radius, and so on, which I could do in the car, as we ' re driving along on a vacation trip — — with my three sons, young sons, helping me, but ridiculing the whole thing very much. But that began thinking about how birds went around, and then how airplanes would, how hang gliders would fly, and then other planes, and the idea of the Gossamer-Condor-type airplane quickly emerged, was so logical, one should have thought of it in the first place, but one didn ' t. And it was just, keep the weight down — 70 pounds was all it weighed — but let the size swell up, like a hang glider, but three times the span, three times the cord. You ' re down to a third of the speed, a third of the power, and a good bicyclist can put out that power, and that worked, and we won the prize a year later. We didn ' t — a lot of flying, a lot of experiments, a lot of things that didn ' t work, and ones that did work, and the plane kept getting a little better, a little better. Got a good pilot, Brian Allen, to operate it, and finally, succeeded. But unfortunately, about 65, 000 dollars was spent on the project. And there was only about 30 to help retire the debt. But fortunately, Henry Kramer, who put up the prize for — that was a one-mile flight — put up a new prize for flying the English Channel, 21 miles. And he thought it would take another 18 years for somebody to win that. We realized that if you just cleaned up our **Gossamer** Condor a little bit, the power to fly would be decreased a little bit, and if you decrease the power required a little, the pilot can fly a much longer period of time. And Brian Allen was able, in a miraculous flight, to get the **Gossamer** Albatross across the English Channel, and we won the 100, 000-pound, 200, 000-dollar prize for that. And when all expenses were paid, the debt was handled, and everything was fine. It turned out that giving the planes to the museum was worth much more than the debt, so for five years, six years, I only had to pay one third income tax. So, there were good economic reasons for the project, but — — that ' s not, well, the project was done entirely for economic reasons, and we have not been involved in any human-powered flight since then — — because the prizes are all over. But that sure started me thinking about various things, and immediately, we began making a solar-powered plane because we felt solar power was going to be so important for the country and the world, we didn ' t want the small funding in the government to be decreased, which is what the government was trying to do with it. And we thought a solar-powered plane wouldn ' t really make sense, but you could do it and it would get a lot of publicity for solar power and maybe help that field. And that project continued, did succeed, and we then got into other projects in aviation and mechanical things and ground devices. But while this was going on, in 1982, I got a prize from the Lindbergh Foundation — their annual prize — and I had to prepare a paper on it, which collected all my varied thoughts and varied interests over the years. This was the one chance that I had to focus on what I, really, was after, and what was important. And to my surprise, I realized the importance of environmental issues, which Charles Lindbergh devoted the last third of his life to, and preparing that paper did me a lot of good. I thought back about if I was a space traveler, and came and visited Earth every 5, 000 years. And for a few thousand visits, I would see the same thing every time, the little differences in the Earth. But this last time, just coming round, right now, suddenly, there ’ d be huge changes in the environment, in the concentration of people, and it was just unbelievable, the amount of — all the change in it. I wanted to — well, one of the biggest changes is, 200 years ago, we began using coal from underground, which has a lot of pollution, and 100 years ago, began getting gasoline from underground, with a lot of pollution. And gasoline consumption, or production, will reach its limit in about ten years, and then go down, and we wonder what ’ s going to happen with transportation. I wanted to show the slide — this slide, I think, is the most important one any of you will see, ever, because — — it shows nature versus humans, and goes from 1850 to 2050. And so, the year 2000, you see there. And this is the weight of all air and land vertebrates. Humans and muskrats and giraffes and birds and so on, are — the red line goes up. That ’ s the humans and livestock and pets portion. The green line goes down. That ’ s the wild nature portion. Humans, livestock and pets are, now, 98 percent of the total world ’ s mass of vertebrates on land and air. And you don ’ t know what the future will hold, but it ’ s not going to get a lower percentage. Ten thousand years ago, the humans and livestock and pets were not even one tenth of one percent and wouldn ’ t even have been visible on such a curve. Now they are 98 percent, and it, I think, shows human domination of the Earth. I give a talk to some remarkable high school students each summer, and ask them, after they ’ ve asked me questions, and I give them a talk and so on. Then I ask them questions. What ’ s the population of the Earth? What ’ s the population of the Earth going to be when you ’ re the age of your parents? Which I ’ d never, really — they had never, really, thought about but, now, they think about it. And then, what population of the Earth would be an equilibrium that could continue on, and be for 2050, 2100, 2150? And they form little groups, all fighting with each other, and when I leave, two hours later, most of them are saying about 2 billion people, and they don ’ t have any clue about how to get down to 2 billion, nor do I, but I think they ’ re right and this is a serious problem. Rachel Carson was thinking of these, and came out with”Silent Spring,”way back.”Solar Manifesto”by Hermann Scheer, in Germany, claims all energy on Earth can be derived, for every country, from solar energy and water, and so on. You don ’ t need to dig down for these chemicals, and we can do things much more efficiently. Let ’ s have the next slide. So this just summarizes it.”Over billions of years, on a unique sphere, chance has painted a thin covering of life — complex and probable, wonderful and fragile. Suddenly, we humans, a recently arrived species, no longer subject to the checks and balances inherent in nature, have grown in population, technology and intelligence to a position of terrible power. We, now, wield the paintbrush.”We ’ re in charge. It ’ s frightening. And I do a painting every 20 or 25 years. This is the last one. And [it] shows the Earth in a time flag : on the right, in trilobites and dinosaurs and so on ; and over the triangle, we now get to civilization and TV and traffic jams and so on. I have no idea of what comes next, so I just used robotic and natural cockroaches as the future, as a little warning. And two weeks after this drawing was done, we actually had our first project contract, at AeroVironment, on robotic cockroaches, which was very frightening to me. Well, that ' ll be all the slides. As time went on, we stopped our environmental programs. We focused more on the really serious energy problems of the future, and we produced products for the company. And we developed the impact car that General Motors made, the EV1, out of — and got the Air Resources Board to have the regulations that stimulated the electric cars, but they ' ve since come apart. And we ' ve done a lot of things, small drone airplanes and so on. I have a Helios. We have the first video. Narrator : With a wingspan of 247 feet, this makes her larger than a Boeing 747. Her designers ' attention to detail and her construction gives Helios ' structure the flexibility and strength to deal with the turbulence encountered in the atmosphere. This enables her to easily ride through the air currents as if she ' s sliding along on the ocean waves. Paul MacCready : The wings could touch together on top and not break. We think. Narrator : And Helios now begins the process of turning her back to the sun, to maximize the power from her solar array. As the sky gets darker, and the outside air temperatures drop below minus 100 degrees Fahrenheit, the most environmentally hostile segment of Helios ' s journey has gone by without notice, except for being recorded by specially designed data acquisition systems and their associated sensors. Approaching a peak radar altitude of 96, 863 feet, at 4:12 p. m., Helios is standing on top of 98 percent of the Earth ' s atmosphere. This is more than 10, 000 feet higher than the previous world ' s altitude record held by the SR-71 Blackbird. PM : That plane has many purposes, but it ' s aimed for communications, and it can fly so slowly that it ' ll just stay up at 65, 000 feet. Eventually, it will be able to have to stay up day, night, day, night, for six months at a time, acting like the synchronous satellite, but only ten miles above the Earth. Let ' s have the next video. This shows the other end of the spectrum. Narrator : A tiny airplane, the AV Pointer serves for surveillance. In effect a pair of roving eyeglasses, a cutting-edge example of where miniaturization can lead if the operator is remote from the vehicle. It is convenient to carry, assemble, and launch by hand. Battery-powered, it is silent and rarely noticed. It sends high-resolution video pictures back to the operator. With **on-board** GPS, it can navigate autonomously, and it is rugged enough to self-land without damage. PM : Okay, and let ' s have the next. That plane is widely used by the military, now, in all their operations. Let ' s have the next video. Alan Alda : He ' s got it, he ' s got it, he ' s got it on his head. We ' re going to end our visit with Paul MacCready ' s flying circus by meeting his son, Tyler, who, with his two brothers, helped build the **Gossamer** Condor, 25 years ago. Tyler MacCready : You can chase it, like this, for hours. AA : When they got bored with their father ' s project, they invented an extraordinary little plane of their own. TM : And I can control it by putting the lift on one side of the wing, or on the other. AA : They called it their Walkalong Glider. I ' ve never seen anything like that. How old were you when you invented that? TM : Oh, 10, 11. TM : 12, something like that. PM : And Tyler ' s here to show you the Walkalong. TM : All right. You all got a couple of these in your gift bags, and one of the first things, the production version seemed to dive a little bit, and so I would just suggest you bend the wing tips up a little bit before you try flying it. I ' ll give you a demonstration of how it works. The idea is that it soars on the lift over your body, like a seagull soaring on a cliff. As the wind comes up, it has to go over the cliff, so as you walk through the air, it goes around your body, some has to go over you. And so you just keep the glider positioned in that up current. The launch is the difficult part : you ' ve got to hold it high up, over your head, and you start walking forward, and just let go of it, and you can control it like that. And then also, like it said in the video, you can turn it left or right just by putting the lift under one wing or another. So I can do it — oops, that was going to be a right turn. Okay, this one will be a left turn. Here, but — — anyway. And that ’ s it, so you can just control it, wherever you want, and it ’ s just hours of fun. And these are no longer in production, so you have real collector ’ s items. And this, we just wanted to show you — if we can get the video running on this, yeah — just an example of a little video surveillance. This was flying around in the party last night, and — — you can see how it just can fly around, and you can spy on anybody you want. And that ’ s it. I was going to bring an airplane, but I was worried about hitting people in here, so I thought this would be a little bit more gentle. And that ’ s it, yeah, just a few inventions. All right.

This is a sculpture I made, which is a way of, kind of, freeing a form into an object that has different degrees of freedom. So, it can balance on a point. This is a bronze ball, an aluminum arm here, and then this wooden disk. And the wooden disk was really thought about as something that you ’ d want to hold on to, and that would glide easily through your hands. The aluminum is because it ’ s very light. The bronze is nice hard, durable material that could roll on the ground. Inside of the bronze ball there ’ s a lead weight that is free-swinging on an axle that ’ s on two bearings that pass in between, across it, like this, that counterbalance this weight. So it allows it to roll. And the sphere has that balance property that it always sort of stays still and looks the same from every direction. But if you put something on top of it, it disbalances it. And so it would tip over. But in this case because the interior is free-swinging in relation to the sphere, it can stand up on one point. And then there was a second level to this object, which is that it — I wanted it to convey some proportions that I was interested in, which is the diameter of the Moon and the diameter of the Earth in proportion to each other. I was exploring, really early on, wanting to make things float in the air. And I thought up a lot of ideas. This is sculpture that I made that — it ’ s magnetically levitated. The thing is, is that it ’ s slightly dangerous. Normally it ’ s sort of cordoned off when it ’ s in a museum. But it ’ s uh — let ’ s see if I can manipulate it a little bit without, um — oops. So this is just floating, floating on a permanent magnetic field, which stabilizes it in all directions. Except there is a slight tether here, which keeps it from going over the top of its field. It ’ s sort of surfing on a magnetic field at the crest of a wave. And that ’ s what supports the object and keeps it stable. I think we could roll the tape, admin. I have a sort of a collection of videos that I took of different installations, which I could narrate. This is a sculpture of the Sun and the Earth, in proportion. Representing that eight and a half minutes that it takes light and gravity to connect the two. So here is the Earth. It ’ s a little less than a millimeter that was turned of solid bronze. And here is a similar sculpture. That ’ s the Sun at that end. And then in a series of 55 balls, it reduces, proportionately — each ball and the spaces between them reduce proportionately, until they get down to this little Earth. This is in a sculpture park in Taejon. This one is about the Moon and then the distance to the Earth, in proportion also. This is a little stone ball, floating. As you can see the little tether, that it ’ s also magnetically levitated. And then this is the first part of — this is 109 spheres, since the Sun is 109 times the diameter of the Earth. And so this is the size of the Sun. And then each of these little spheres is the size of the Earth in proportion to the Sun. It ’ s made up of 16 concentric shells. Each one has 92 spheres. This is in the courtyard of a twelfth-century alchemist. I was thinking that the Sun is kind of the ultimate alchemist. So this, again, is on the subject — a slice from the equator of the Earth. And then the Moon in the center, and it ' s floating. And this is in France. This is in Sapporo. It ' s balancing on a shaft and a ball, right at the center of gravity, or just slightly above the center of gravity, which means that the lower half of the object is just a little bit more weighty. So you can see it rotating here. It weighs about a ton or over a ton. It ' s made of stainless steel, quite thick. But it ' s being balanced like that in equilibrium. It ' s susceptible to motion by the air currents. This is another species of work that I do. These are these arrays. These spheres are all suspended, but they have magnets horizontally in them that make them all like compasses. So all the red sides, for example, face one direction : south. And the blue side, the compliment, faces the other way. So as you turn around you ' re seeing different colors. This is based on the structure of a diamond. It was a diamond cell structure was the point of departure. And then there were kind of large spaces in the hollows between the atoms. And so I placed one more element of each one of them. These were white spheres. Then I had video projectors that were projecting intermittently onto the spheres. So they would catch parts of the images, and make sort of three-dimensional color volumes, as you walk through it, through the object. This is something I did of a tactile communication system. It was the idea of isolating the tactile component of sculpture, and then putting it into a communication system. This is an idea of moving a sculpture, a ball, that would be directed around the room by a computer. This is a clock I designed. It has Buckminster Fuller ' s Dymaxion Map edited here. It turns once per day in synchrony with the Earth. And then, this is like projects that are harder to build. This has a diamond-bottomed lake. So it ' s a floating island with water, fresh water, that can fly from place to place. This would be grown, I suppose, with nanotechnology in the future sometime. In the course of doing my work I sort of have a broad range of interests. And some of it is just the idea of creating media — media as a sculpture, something that would keep the sculpture fresh and ever-changing, by just creating the media that the sculpture is made of. And I had a lot of — always interested in the concept of a crystal ball. And the idea that you could see things inside of a crystal ball and predict the future — or a television set, where it ' s sort of like a magic box where anything can appear. I had thought about, a long time ago, in the late ' 60s — when I was just starting out, I was under the influence of thinking about Buckminster Fuller ' s grand project for an electric globe across from the United Nations — and other things that were happening, the space program at that time, and Whole Earth Catalog, things like that. I was thinking about mass produced spherical television sets that could be linked to orbiting camera satellites. So if we could roll the next film here. This has evolved over the years in a lot of different iterations. But this the current version of it, is a flying airship that is about 35 meters in diameter, about 110 feet in diameter. The whole surface of it is covered with 60 million diodes, red, blue, and green, that allow you to have a high-resolution picture, visible in daylight. I came with a plan. I brought it to Paul MacCready ' s company AeroVironment to do a feasibility study, and they analyzed it, and came up with a lot of innovative ideas about how to propel it. So we have a physical plan of how to make this actually happen. This is the control room inside of the ship. The idea of this air genie is, it ' s something that can just transform and become anything. It ' s like a traveling show. It has speakers on it. And it has cameras over the surface of it. So it can see its environment, and then it can mimic its environment and disappear. Here the legs are retracting. The cabin is open or closed, as you like. It weighs about 20 tons. It has **on-board** generators. It can generate about a million kilowatts, in order to be bright enough to be visible in daylight. The idea of it is to make a kind of a traveling show. It really would be dedicated to the arts and to interacting. There would be on board a crew of artists, musicians, that would allow the thing to become actually kind of a conscious object that would respond to the moment, and to interact as an entity that was aware, that could communicate. It ’ s completely silent and nonpolluting. It has electric motors with a novel propulsion system. It could be interacted with large crowds in different ways. Primarily I would be interested in how it would interact with, say, going to a college campus, and then being used as a way of talking about the earth sciences, the world, the situation of the globe. The default image on the object would probably be a high-resolution Earth image. But then one could interact with that and show plate tectonics or global warming issues, or migrations — all of the things that we ’ re concerned with today. And then at night the idea is that it would be used as kind of a rave situation, where the people could cut loose, and the music and the lights, and everything. So it could land in a park, for example. Or this could represent a college green. And then it would have a corresponding website that would show the itinerary of this. And so interacting with the same kind of imagery. It would also be able to be an open code, so people could interact with it. It would be forum for people ’ s ideas about what they would like to see on a giant screen of this type. So that ’ s pretty much it. Okay. Thank you.

If you ’ d like to learn how to play the lobster, we have some here. And that ’ s not a joke, we really do. So come up afterwards and I ’ ll show you how to play a lobster. So, actually, I started working on what ’ s called the mantis shrimp a few years ago because they make sound. This is a recording I made of a mantis shrimp that ’ s found off the coast of California. And while that ’ s an absolutely fascinating sound, it actually turns out to be a very difficult project. And while I was struggling to figure out how and why mantis shrimp, or stomatopods, make sound, I started to think about their appendages. And mantis shrimp are called”mantis shrimp”after the praying mantises, which also have a fast feeding appendage. And I started to think, well, maybe it will be interesting, while listening to their sounds, to figure out how these animals generate very fast feeding strikes. And so today I ’ ll talk about the extreme stomatopod strike, work that I ’ ve done in collaboration with Wyatt Korff and Roy Caldwell. So, mantis shrimp come in two varieties : there are spearers and smashers. And this is a spearing mantis shrimp, or stomatopod. And he lives in the sand, and he catches things that go by overhead. So, a quick strike like that. And if we slow it down a bit, this is the mantis shrimp — the same species — recorded at 1, 000 frames a second, played back at 15 frames per second. And you can see it ’ s just a really spectacular extension of the limbs, exploding upward to actually just catch a dead piece of shrimp that I had offered it. Now, the other type of mantis shrimp is the smasher stomatopod, and these guys open up snails for a living. And so this guy gets the snail all set up and gives it a good whack. So, I ’ ll play it one more time. He wiggles it in place, tugs it with his nose, and smash. And a few smashes later, the snail is broken open, and he ’ s got a good dinner. So, the smasher raptorial appendage can stab with a point at the end, or it can smash with the heel. And today I ’ ll talk about the smashing type of strike. And so the first question that came to mind was, well, how fast does this limb move? Because it ’ s moving pretty darn fast on that video. And I immediately came upon a problem. Every single high-speed video system in the biology department at Berkeley wasn ’ t fast enough to catch this movement. We simply couldn ’ t capture it on video. And so this had me stymied for quite a long period of time. And then a BBC crew came cruising through the biology department, looking for a story to do about new technologies in biology. And so we struck up a deal. I said,”Well, if you guys rent the high-speed video system that could capture these movements, you guys can film us collecting the data.”And believe it or not, they went for it. So we got this incredible video system. It ’ s very new technology — it just came out about a year ago — that allows you to film at extremely high speeds in low light. And low light is a critical issue with filming animals, because if it ’ s too high, you fry them. So this is a mantis shrimp. There are the eyes up here, and there ’ s that raptorial appendage, and there ’ s the heel. And that thing ’ s going to swing around and smash the snail. And the snail ’ s wired to a stick, so he ’ s a little bit easier to set up the shot. And — yeah. I hope there aren ’ t any snail rights activists around here. So this was filmed at 5, 000 frames per second, and I ’ m playing it back at 15. And so this is slowed down 333 times. And as you ’ ll notice, it ’ s still pretty gosh darn fast slowed down 333 times. It ’ s an incredibly powerful movement. The whole limb extends out. The body flexes backwards — just a spectacular movement. And so what we did is, we took a look at these videos, and we measured how fast the limb was moving to get back to that original question. And we were in for our first surprise. So what we calculated was that the limbs were moving at the peak speed ranging from 10 meters per second all the way up to 23 meters per second. And for those of you who prefer miles per hour, that ’ s over 45 miles per hour in water. And this is really darn fast. In fact, it ’ s so fast we were able to add a new point on the extreme animal movement spectrum. And mantis shrimp are officially the fastest measured feeding strike of any animal system. So our first surprise. So that was really cool and very unexpected. So, you might be wondering, well, how do they do it? And actually, this work was done in the 1960s by a famous biologist named Malcolm Burrows. And what he showed in mantis shrimp is that they use what ’ s called a”catch mechanism,”or”click mechanism.”And what this basically consists of is a large muscle that takes a good long time to contract, and a latch that prevents anything from moving. So the muscle contracts, and nothing happens. And once the muscle ’ s contracted completely, everything ’ s stored up — the latch flies upward, and you ’ ve got the movement. And that ’ s basically what ’ s called a”power amplification system.”It takes a long time for the muscle to contract, and a very short time for the limb to fly out. And so I thought that this was sort of the end of the story. This was how mantis shrimps make these very fast strikes. But then I took a trip to the National Museum of Natural History. And if any of you ever have a chance, backstage of the National Museum of Natural History is one of the world ’ s best collections of preserved mantis shrimp. And what — this is serious business for me. So, this — what I saw, on every single mantis shrimp limb, whether it ’ s a spearer or a smasher, is a beautiful saddle-shaped structure right on the top surface of the limb. And you can see it right here. It just looks like a saddle you ’ d put on a horse. It ’ s a very beautiful structure. And it ’ s surrounded by membranous areas. And those membranous areas suggested to me that maybe this is some kind of dynamically flexible structure. And this really sort of had me scratching my head for a while. And then we did a series of calculations, and what we were able to show is that these mantis shrimp have to have a spring. There needs to be some kind of spring-loaded mechanism in order to generate the amount of force that we observe, and the speed that we observe, and the output of the system. So we thought, OK, this must be a spring — the saddle could very well be a spring. And we went back to those high-speed videos again, and we could actually visualize the saddle compressing and extending. And I ' ll just do that one more time. And then if you take a look at the video — it ' s a little bit hard to see — it ' s outlined in yellow. The saddle is outlined in yellow. You can actually see it extending over the course of the strike, and actually hyperextending. So, we ' ve had very solid evidence showing that that saddle-shaped structure actually compresses and extends, and does, in fact, function as a spring. The saddle-shaped structure is also known as a"hyperbolic paraboloid surface,"or an"anticlastic surface."And this is very well known to engineers and architects, because it ' s a very strong surface in compression. It has curves in two directions, one curve upward and opposite transverse curve down the other, so any kind of perturbation spreads the forces over the surface of this type of shape. So it ' s very well known to engineers, not as well known to biologists. It ' s also known to quite a few people who make jewelry, because it requires very little material to build this type of surface, and it ' s very strong. So if you ' re going to build a thin gold structure, it ' s very nice to have it in a shape that ' s strong. Now, it ' s also known to architects. One of the most famous architects is Eduardo Catalano, who popularized this structure. And what ' s shown here is a saddle-shaped roof that he built that ' s 87 and a half feet spanwise. It ' s two and a half inches thick, and supported at two points. And one of the reasons why he designed roofs this way is because it ' s — he found it fascinating that you could build such a strong structure that ' s made of so few materials and can be supported by so few points. And all of these are the same principles that apply to the saddle-shaped spring in stomatopods. In biological systems it ' s important not to have a whole lot of extra material requirements for building it. So, very interesting parallels between the biological and the engineering worlds. And interestingly, this turns out — the stomatopod saddle turns out to be the first described biological hyperbolic paraboloid spring. That ' s a bit long, but it is sort of interesting. So the next and final question was, well, how much force does a mantis shrimp produce if they ' re able to break open snails? And so I wired up what ' s called a load cell. A load cell measures forces, and this is actually a piezoelectronic load cell that has a little crystal in it. And when this crystal is squeezed, the electrical properties change and it — which — in proportion to the forces that go in. So these animals are wonderfully aggressive, and are really hungry all the time. And so all I had to do was actually put a little shrimp paste on the front of the load cell, and they ' d smash away at it. And so this is just a regular video of the animal just smashing the heck out of this load cell. And we were able to get some force measurements out. And again, we were in for a surprise. I purchased a 100-pound load cell, thinking, no animal could produce more than 100 pounds at this size of an animal. And what do you know? They immediately overloaded the load cell. So these are actually some old data where I had to find the smallest animals in the lab, and we were able to measure forces of well over 100 pounds generated by an animal about this big. And actually, just last week I got a 300-pound load cell up and running, and I ' ve clocked these animals generating well over 200 pounds of force. And again, I think this will be a world record. I have to do a little bit more background reading, but I think this will be the largest amount of force produced by an animal of a given — per body mass. So, really incredible forces. And again, that brings us back to the importance of that spring in storing up and releasing so much energy in this system. But that was not the end of the story. Now, things — I ' m making this sound very easy, this is actually a lot of work. And I got all these force measurements, and then I went and looked at the force output of the system. And this is just very simple — time is on the X-axis and the force is on the Y-axis. And you can see two peaks. And that was what really got me puzzled. The first peak, obviously, is the limb hitting the load cell. But there ’ s a really large second peak half a **millisecond** later, and I didn ’ t know what that was. So now, you ’ d expect a second peak for other reasons, but not half a **millisecond** later. Again, going back to those high-speed videos, there ’ s a pretty good hint of what might be going on. Here ’ s that same orientation that we saw earlier. There ’ s that raptorial appendage — there ’ s the heel, and it ’ s going to swing around and hit the load cell. And what I ’ d like you to do in this shot is keep your eye on this, on the surface of the load cell, as the limb comes flying through. And I hope what you are able to see is actually a flash of light. Audience : Wow. Sheila Patek : And so if we just take that one frame, what you can actually see there at the end of that yellow arrow is a vapor bubble. And what that is, is cavitation. And cavitation is an extremely potent fluid dynamic phenomenon which occurs when you have areas of water moving at extremely different speeds. And when this happens, it can cause areas of very low pressure, which results in the water literally vaporizing. And when that vapor bubble collapses, it emits sound, light and heat, and it ’ s a very destructive process. And so here it is in the stomatopod. And again, this is a situation where engineers are very familiar with this phenomenon, because it destroys boat propellers. People have been struggling for years to try and design a very fast rotating boat propeller that doesn ’ t cavitate and literally wear away the metal and put holes in it, just like these pictures show. So this is a potent force in fluid systems, and just to sort of take it one step further, I ’ m going to show you the mantis shrimp approaching the snail. This is taken at 20, 000 frames per second, and I have to give full credit to the BBC cameraman, Tim Green, for setting this shot up, because I could never have done this in a million years — one of the benefits of working with professional cameramen. You can see it coming in, and an incredible flash of light, and all this cavitation spreading over the surface of the snail. So really, just an amazing image, slowed down extremely, to extremely slow speeds. And again, we can see it in slightly different form there, with the bubble forming and collapsing between those two surfaces. In fact, you might have even seen some cavitation going up the edge of the limb. So to solve this quandary of the two force peaks : what I think was going on is : that first impact is actually the limb hitting the load cell, and the second impact is actually the collapse of the cavitation bubble. And these animals may very well be making use of not only the force and the energy stored with that specialized spring, but the extremes of the fluid dynamics. And they might actually be making use of fluid dynamics as a second force for breaking the snail. So, really fascinating double whammy, so to speak, from these animals. So, one question I often get after this talk — so I figured I ’ d answer it now — is, well, what happens to the animal? Because obviously, if it ’ s breaking snails, the poor limb must be disintegrating. And indeed it does. That ’ s the smashing part of the heel on both these images, and it gets worn away. In fact, I ’ ve seen them wear away their heel all the way to the flesh. But one of the convenient things about being an arthropod is that you have to molt. And every three months or so these animals molt, and they build a new limb and it ’ s no problem. Very, very convenient solution to that particular problem. So, I ’ d like to end on sort of a wacky note. Maybe this is all wacky to folks like you, I don ’ t know. So, the saddles — that saddle-shaped spring — has actually been well known to biologists for a long time, not as a spring but as a visual signal. And there ’ s actually a spectacular colored dot in the center of the saddles of many species of stomatopods. And this is quite interesting, to find evolutionary origins of visual signals on what ’ s really, in all species, their spring. And I think one explanation for this could be going back to the molting phenomenon. So these animals go into a molting period where they ’ re unable to strike — their bodies become very soft. And they ’ re literally unable to strike or they will self-destruct. This is for real. And what they do is, up until that time period when they can ’ t strike, they become really obnoxious and awful, and they strike everything in sight ; it doesn ’ t matter who or what. And the second they get into that time point when they can ’ t strike any more, they just signal. They wave their legs around. And it ’ s one of the classic examples in animal behavior of bluffing. It ’ s a well-established fact of these animals that they actually bluff. They can ’ t actually strike, but they pretend to. And so I ’ m very curious about whether those colored dots in the center of the saddles are conveying some kind of information about their ability to strike, or their strike force, and something about the time period in the molting cycle. So sort of an interesting strange fact to find a visual structure right in the middle of their spring. So to conclude, I mostly want to acknowledge my two collaborators, Wyatt Korff and Roy Caldwell, who worked closely with me on this. And also the Miller Institute for Basic Research in Science, which gave me three years of funding to just do science all the time, and for that I ’ m very grateful. Thank you very much.

We ’ re going to talk — my — a new lecture, just for TED — and I ’ m going show you some illusions that we ’ ve created for TED, and I ’ m going to try to relate this to happiness. What I was thinking about with happiness is, what gives happiness — or happiness, which I equate with joy in my particular area, and I think there ’ s something very fundamental. And I was thinking about this. And it ’ s in terms of both illusions and movies that we go see and jokes and magic shows is that there ’ s something about these things where our expectations are violated in some sort of pleasing way. You go see a movie. And it has an unexpected twist — something that you didn ’ t expect — and you find a joyful experience. You look at those sort of illusions in my book and it ’ s not as what you ’ d expect. And there ’ s something joyful about it. And it ’ s the same thing with jokes and all these sorts of things. So, what I ’ m going to try and do in my lecture is go a little bit further and see if I can violate your expectations in a pleasing way. I mean, sometimes expectations that are violated are not pleasant, but I ’ m going to try to do it in a pleasant way, in a very primal way, so I can make the audience here happy. So I ’ m going to show you some ways that we can violate your expectations. First of all, I want to show you the particular illusion here. I want you first of all when it pops up on the screen to notice that the two holes are perpendicular to each other. These are all perceptual tricks. These are real objects that I ’ m going to show you. Now I ’ m going to show you how it is done. I ’ ve looped the film here so you can get a very interesting experience. I want you to see how this illusion is constructed, and it ’ s going to rotate so you see that it ’ s inside out. Now watch, as it rotates back, how quickly your perception snaps. OK now. Watch it as it rotates back again. And this is a very bright audience, all right? See if you can stop it from happening, even though you know 100 percent it ’ s true that — bam! You can ’ t undo it. What does that tell you about yourselves? We ’ re going to do it again. No doubt about it. See if you can stop it from happening. No. It ’ s difficult. And we can violate your expectations in a whole variety of ways about representation, about shape, about color and so forth and it ’ s very primal. And it ’ s an interesting question to ponder, why these things — we find these things joyful. Why would we find them joyful? So, here ’ s something that Lionel did a while ago. I like these sort of little things like this. Again, this is not an optical trick.

This is what you would see. In other words, it ’ s not a camera cut. It ’ s a perceptual trick. OK. We can violate your expectations about shape. We can violate your expectations on representation — what an image represents. What do you see here? How many of you here see dolphins? Raise your hand if you see dolphins. OK, those people who raised their hands, afterwards, the rest of the audience, go talk to them, all right? Actually, this is the best example of priming by experience that I know. If you are a child under the age of 10 who haven ’ t been ruined yet, you will look at this image and see dolphins. Now, some of you adults here are saying,”What dolphins? What dolphins?”But in fact, if you reversed the figure ground — in other words, the dark areas here — I forgot to ask for a pointer — but if you reverse it, you ’ ll see a whole series of little dolphins. By the way, if you ’ re also a student at CalTech — they also tend to just see the dolphins. It ’ s based on experience. Now, something like this can be used because this is after all talk about design, too. This was done by Saatchi and Saatchi, and they actually got away with this ad in Australia. So, if you look at this ad for beer, all those people are in sort of provocative positions. But they got it passed, and actually won the Clio awards, so it ’ s funny how you can do these things. Remember that sort of, um. This is the joke I did when the Florida ballot was going around. You know, count the dots for Gore ; count the dots for Bush ; count ’ em again... You can violate your expectations about experience. Here is an outside water fountain that I created with some friends of mine, but you can stop the water in drops and — actually make all the drops levitate. This is something we ’ re building for, you know, **amusement** parks and that kind of stuff. Now let ’ s take a static image. Can you see this? Do you see the middle section moving down and the outer sections moving up? It ’ s completely static. It ’ s a static image. How many people see this illusion? It ’ s completely static. Right. Now, when — it ’ s interesting that when we look at an image we see, you know, color, depth, texture. And you can look at this whole scene and analyze it. You can see the woman is in closer than the wall and so forth. But the whole thing is actually flat. It ’ s painted. It ’ s trompe l ’ oeil. And it was such a good trompe l ’ oeil that people got irritated when they tried to talk to the woman and she wouldn ’ t respond. Now, you can make design mistakes. Like this building in New York. So that when you see it from this side, it looks like the balconies tilt up, and when you walk around to the other side it looks like the balconies go down. So there are cases where you have mistakes in design that incorporate illusions. Or, you take this particular un-retouched photograph. Now, interestingly enough, I get a lot of emails from people who say,”Is there any perceptual difference between males and females?”And I really say,”No.”I mean, women can navigate through the world just as well as males can — and why wouldn ’ t they? However, this is the one illusion that women can consistently do better than males : in matching which head because they rely on fashion cues. They can match the hat. Okay, now getting to a part — I want to show design in illusions. I believe that the first example of illusions being used purposely was by da Vinci in this anamorphic image of an eye. So that when you saw from one little angle was like this. And this little technique got popular in the 16th century and the 17th century to disguise hidden meanings, where you could flip the image and see it from one little point of view like this. But these are early incorporations of illusions brought to — sort of high point with Hans Holbein ’ s”Ambassadors.”And Hans Holbein worked for Henry VIII. This was hung on a wall where you could walk down from the stair and you can see this hidden skull. All right, now I ’ m going to show you some designers who work with illusions to give that element of surprise. One of my favorites is Scott Kim. I worked with Scott to create some illusions for TED that I hope you will enjoy. We have one here on TED and happiness. OK now.

Arthur [Ganson] hasn ’ t talked yet, but his is going to be a delightful talk and he has some of his really fantastic machines outside. And so, we — Scott created this wonderful tribute to Arthur Ganson. Well, there ’ s analog and digital. Thought that was appropriate here. And figure goes to ground. And for the musicians. And of course, since happiness — we want”joy to the world.”Now, another great designer — he ’ s very well known in Japan — Shigeo Fukuda. And he just builds some fantastic things. This is simply amazing. This is a pile of junk that when you view it from one particular angle, you see its reflection in the mirror as a perfect piano. Pianist transforms to violinist. This is really wild. This assemblage of forks, knives and spoons and various cutlery, welded together. It gives a shadow of a motorcycle. You learn something in the sort of thing that I do, which is there are people out there with a lot of time on their hands. Ken Knowlton does wonderful composite images, like creating Jacques Cousteau out of seashells — un-retouched seashells, but just by rearranging them. He did Einstein out of dice because, after all, Einstein said,”God does not play dice with the universe.”Bert Herzog out of un-retouched keyboards. Will Shortz, crossword puzzle. John Cederquist does these wonderful trompe l ’ oeil cabinets. Now, I ’ m going to skip ahead since I ’ m sort of running [behind]. I want to show you quickly what I ’ ve created, some new type of illusions. I ’ ve done something with taking the Pixar-type illusions. So you see these kids the same size here, running down the hall. The two table tops of the same size. They ’ re looking out two directions at once. You have a larger piece fitting in with a smaller. And that ’ s something for you to think about, all right? So you see larger pieces fitting in within smaller pieces here. Does everyone see that? Which is impossible. You can see the two kids are looking out simultaneously out of two different directions at once. Now can you believe these two table tops are the same size and shape? They are. So, if you measured them, they would be. And as I say, those two figures are identical in size and shape. And it ’ s interesting, by doing this in this sort of rendered fashion, how much stronger the illusions are. Any case, I hope this has brought you a little joy and happiness, and if you ’ re interested in seeing more cool effects, see me outside. I ’ d be happy to show you lots of things.

Text Sample 433: NEG Dim 3 – 2004 – Score -1.00 – 2004/t000468.txt

Thank you! Thank you very much. Like the speaker before me â I am a TED virgin, I guess. I ’ m also the first time here, and... I don ’ t know what to say! I ’ m really happy that Mr. Anderson invited me. I ’ m really grateful that I get a chance to play for everyone. And the song that I just played was by Josef Hofmann. It ’ s called”Kaleidoscope.”And Hofmann is a Polish pianist and composer of the late 19th century, and he ’ s widely considered one of the greatest pianists of all time. I have another piece that I ’ d like to play for you. It ’ s called”Abegg Variations,”by Robert Schumann, a German 19th-century composer. The name”Abegg”is actually A-B-E-G-G, and that ’ s the main theme in the melody. That comes from the last name of one of Schumann ’ s female friends. But he wrote that for his wife. So actually, if you listen carefully, there are supposed to be five variations on this Abegg theme. It ’ s written around 1834, so even though it ’ s old, I hope you ’ ll like it. Now comes the part that I hate. Well, because Mr. Anderson told me that this session is called”Sync and Flow,”I was wondering,”What do I know that these geniuses don ’ t?”So, I ’ ll talk about musical composition, even though I don ’ t know where to start. How do I compose? I think Yamaha does a really good job of teaching us how to compose. What I do first is, I make a lot of little musical ideas you can just improvise here at the piano â and I choose one of those to become my main theme, my main melody, like the Abegg that you just heard. And once I choose my main theme, I have to decide : Out of all the styles in music, what kind of style do I want? And this year, I composed a Romantic style. So for inspiration, I listened to Liszt and Tchaikovsky and all the great Romantic composers. Next, I make the structure of the entire piece with my teachers. They help me plan out the whole piece. And then the hard part is filling it in with musical ideas, because then you have to think. And then, when the piece takes somewhat of a solified form â solidified, excuse me â solidified form, you ' re supposed to actually polish the piece, polish the details, and then polish the overall performance of the composition. And another thing that I enjoy doing is drawing. Drawing, because I like to draw, you know, Japanese anime art. I think that ' s a craze among teens right now. And once I realized it, there ' s a parallel between creating music and creating art, because for your motive, or your little initial idea for your drawing, it ' s your character â you want to decide who you want to draw, or if you want to draw an original character. And then you want to decide : How are you going to draw the character? Like, am I going to use one page? Am I going to draw it on the computer? Am I going to use a two-page spread like a comic book? For a more grandiose effect, I guess. And then you have to do the initial sketch of the character, which is like your structure of a piece, and then you add pen and pencil, and whatever details that you need â that ' s polishing the drawing. And another thing that both of these have in common is your state of mind, because I know I ' m one of those teenagers that are really easily distracted. So if I ' m trying to do homework and I don ' t feel like it, I ' ll try to draw or, you know, waste my time. And then what happens is, sometimes I absolutely can ' t draw or I can ' t compose at all, and then it ' s like there ' s too much on your mind. You can ' t focus on what you ' re supposed to do. And sometimes, if you manage to use your time wisely and work on it, you ' ll get something out of it, but it doesn ' t come naturally. What happens is, if something magical happens, if something natural happens to you, you ' re able to produce all this beautiful stuff instantly, and then that ' s what I consider"flow,"because that ' s when everything clicks and you ' re able to do anything. You feel like you ' re on top of your game and you can do anything you want. I ' m not going to play my own composition today because, although I did finish it, it ' s way too long. Instead, I ' d like to try something called"improvisation."I have here seven note cards, one with each note of the musical alphabet. And I ' d like someone to come up here and choose five â anyone to come up here and choose five â and then I can make it into some sort of melody, and I ' ll improvise it. Wow. A volunteer, yay! Jennifer Lin : Nice to meet you. Goldie Hawn : Thank you. Choose five? JL : Yes, five cards. Any five cards. GH : OK, one. JL : OK. GH : Two. JL : Yes. GH : Three. GH : Oh, D and F â too familiar. JL : One more. GH : OK."E"for"effort."JL : Would you mind reading them out in the order that you chose them? GH : OK â C, G, B, A and E. JL : Thank you very much! GH : You ' re welcome. And what about these? JL : I won ' t use them. Thank you! Now, she chose C, G, B, A, E. I ' m going to try to put that in some sort of order. OK, that ' s nice. So, I ' m going to have a moment to think, and I ' ll try to make something out of it. The next song, or the encore that I ' m going to play is called"Bumble Boogie,"by Jack Fina.

Text Sample 434: NEG Dim 3 – 1990 – Score 2.00 – 1990/t000287.txt

I ' m going to go right into the slides. And all I ' m going to try and prove to you with these slides is that I do just very straight stuff. And my ideas are â in my head, anyway â they ’ re very logical and relate to what ’ s going on and problem solving for clients. I either convince clients at the end that I solve their problems, or I really do solve their problems, because usually they seem to like it. Let me go right into the slides. Can you turn off the light? Down. I like to be in the dark. I don ’ t want you to see what I ’ m doing up here. Anyway, I did this house in Santa Monica, and it got a lot of notoriety. In fact, it appeared in a porno comic book, which is the slide on the right. This is in Venice. I just show it because I want you to know I ’ m concerned about context. On the left-hand side, I had the context of those little houses, and I tried to build a building that fit into that context. When people take pictures of these buildings out of that context they look really weird, and my premise is that they make a lot more sense when they ’ re photographed or seen in that space. And then, once I deal with the context, I then try to make a place that ’ s comfortable and private and fairly serene, as I hope you ’ ll find that slide on the right. And then I did a law school for Loyola in downtown L. A. I was concerned about making a place for the study of law. And we continue to work with this client. The building on the right at the top is now under construction. The garage on the right â the gray structure â will be torn down, finally, and several small classrooms will be placed along this avenue that we ’ ve created, this campus. And it all related to the clients and the students from the very first meeting saying they felt denied a place. They wanted a sense of place. And so the whole idea here was to create that kind of space in downtown, in a neighborhood that was difficult to fit into. And it was my theory, or my point of view, that one didn ’ t upstage the neighborhood â one made accommodations. I tried to be inclusive, to include the buildings in the neighborhood, whether they were buildings I liked or not. In the ’ 60s I started working with paper furniture and made a bunch of stuff that was very successful in Bloomingdale ’ s. We even made flooring, walls and everything, out of cardboard. And the success of it threw me for a loop. I couldn ’ t deal with the success of furniture â I wasn ’ t secure enough as an architect â and so I closed it all up and made furniture that nobody would like. So, nobody would like this. And it was in this, preliminary to these pieces of furniture, that Ricky and I worked on furniture by the slice. And after we failed, I just kept failing. The piece on the left â and that ultimately led to the piece on the right â happened when the kid that was working on this took one of those long strings of stuff and folded it up to put it in the wastebasket. And I put a piece of tape around it, as you see there, and realized you could sit on it, and it had a lot of resilience and strength and so on. So, it was an accidental discovery. I got into fish. I mean, the story I tell is that I got mad at postmodernism â at po-mo â and said that fish were 500 million years earlier than man, and if you ’ re going to go back, we might as well go back to the beginning. And so I started making these funny things. And they started to have a life of their own and got bigger â as the one glass at the Walker. And then, I sliced off the head and the tail and everything and tried to translate what I was learning about the form of the fish and the movement. And a lot of my architectural ideas that came from it â accidental, again â it was an intuitive kind of thing, and I just kept going with it, and made this proposal for a building, which was only a proposal. I did this building in Japan. I was taken out to dinner after the contract for this little restaurant was signed. And I love sake and Kobe and all that stuff. And after I got â I was really drunk â I was asked to do some sketches on napkins. And I made some sketches on napkins â little boxes and Morandi-like things that I used to do. And the client said,”Why no fish?”And so I made a drawing with a fish, and I left Japan. Three weeks later, I received a complete set of drawings saying we ’ d won the competition. Now, it ’ s hard to do. It ’ s hard to translate a fish form, because they ’ re so beautiful â perfect â into a building or object like this. And Oldenburg, who I work with a little once in a while, told me I couldn ’ t do it, and so that made it even more exciting. But he was right â I couldn ’ t do the tail. I started to get the head OK, but the tail I couldn ’ t do. It was pretty hard. The thing on the right is a snake form, a ziggurat. And I put them together, and you walk between them. It was a dialog with the context again. Now, if you saw a picture of this as it was published in Architectural Record â they didn ’ t show the context, so you would think,”God, what a pushy guy this is.”But a friend of mine spent four hours wandering around here looking for this restaurant. Couldn ’ t find it. So... As for craft and technology and all those things that you ’ ve all been talking about, I was thrown for a complete loop. This was built in six months. The way we sent drawings to Japan : we used the magic computer in Michigan that does carved models, and we used to make foam models, which that thing scanned. We made the drawings of the fish and the scales. And when I got there, everything was perfect â except the tail. So, I decided to cut off the head and the tail. And I made the object on the left for my show at the Walker. And it ’ s one of the nicest pieces I ’ ve ever made, I think. And then Jay Chiat, a friend and client, asked me to do his headquarters building in L. A. For reasons we don ’ t want to talk about, it got delayed. Toxic waste, I guess, is the key clue to that one. And so we built a temporary building â I ’ m getting good at temporary â and we put a conference room in that ’ s a fish. And, finally, Jay dragged me to my hometown, Toronto, Canada. And there is a story â it ’ s a real story â about my grandmother buying a carp on Thursday, bringing it home, putting it in the bathtub when I was a kid. I played with it in the evening. When I went to sleep, the next day it wasn ’ t there. And the next night, we had gefilte fish. And so I set up this interior for Jay ’ s offices and I made a pedestal for a sculpture. And he didn ’ t buy a sculpture, so I made one. I went around Toronto and found a bathtub like my grandmother ’ s, and I put the fish in. It was a joke. I play with funny people like [Claes] Oldenburg. We ’ ve been friends for a long time. And we ’ ve started to work on things. A few years ago, we did a performance piece in Venice, Italy, called”Il Corso del Coltello”â the Swiss Army knife. And most of the imagery is â Claes ’, but those two little boys are my sons, and they were Claes ’ assistants in the play. He was the Swiss Army knife. He was a souvenir salesman who always wanted to be a painter, and I was Frankie P. Toronto. P for Palladio. Dressed up like the AT&T building by Claes â with a fish hat. The highlight of the performance was at the end. This beautiful object, the Swiss Army knife, which I get credit for participating in. And I can tell you â it ’ s totally an Oldenburg. I had nothing to do with it. The only thing I did was, I made it possible for them to turn those blades so you could sail this thing in the canal, because I love sailing. We made it into a sailing craft. I ’ ve been known to mess with things like chain link fencing. I do it because it ’ s a curious thing in the culture, when things are made in such great quantities, absorbed in such great quantities, and there ’ s so much denial about them. People hate it. And I ’ m fascinated with that, which, like the paper furniture â it ’ s one of those materials. And I ’ m always drawn to that. And so I did a lot of dirty things with chain link, which nobody will forgive me for. But Claes made homage to it in the Loyola Law School. And that chain link is really expensive. It ’ s in perspective and everything. And then we did a camp together for children with cancer. And you can see, we started making a building together. Of course, the milk can is his. But we were trying to collide our ideas, to put objects next to each other. Like a Morandi â like the little bottles â composing them like a still life. And it seemed to work as a way to put he and I together. Then Jay Chiat asked me to do this building on this funny lot in Venice, and I started with this three-piece thing, and you entered in the middle. And Jay asked me what I was going to do with the piece in the middle. And he pushed that. And one day I had a â oh, well, the other way. I had the binoculars from Claes, and I put them there, and I could never get rid of them after that. Oldenburg made the binoculars incredible when he sent me the first model of the real proposal. It made my building look sick. And it was this interaction between that kind of, up-the-ante stuff that became pretty interesting. It led to the building on the left. And I still think the Time magazine picture will be of the binoculars, you know, leaving out the â what the hell. I use a lot of metal in my work, and I have a hard time connecting with the craft. The whole thing about my house, the whole use of rough carpentry and everything, was the frustration with the crafts available. I said,"If I can ' t get the craft that I want, I ' ll use the craft I can get."There were plenty of models for that, in Rauschenberg and Jasper Johns, and many artists who were making beautiful art and sculpture with junk materials. I went into the metal because it was a way of building a building that was a sculpture. And it was all of one material, and the metal could go on the roof as well as the walls. The metalworkers, for the most part, do ducts behind the ceilings and stuff. I was given an opportunity to design an exhibit for the metalworkers ' unions of America and Canada in Washington, and I did it on the condition that they become my partners in the future and help me with all future metal buildings, etc. etc. And it ' s working very well to have these people, these craftsmen, interested in it. I just tell the stories. It ' s a way of connecting, at least, with some of those people that are so important to the realization of architecture. The metal continued into a building â Herman Miller, in Sacramento. And it ' s just a complex of factory buildings. And Herman Miller has this philosophy of having a place â a people place. I mean, it ' s kind of a trite thing to say, but it is real that they wanted to have a central place where the cafeteria would be, where the people would come and where the people working would interact. So it ' s out in the middle of nowhere, and you approach it. It ' s copper and galvanize. I used the galvanize and copper in a very light gauge, so it would buckle. I spent a lot of time undoing Richard Meier ' s aesthetic. Everybody ' s trying to get the panels perfect, and I always try to get them sloppy and fuzzy. And they end up looking like stone. This is the central area. There ' s a ramp. And that little dome in there is a building by Stanley Tigerman. Stanley was instrumental in my getting this job. And when I was awarded the contract I, at the very beginning, asked the client if they would let Stanley do a cameo piece with me. Because these were ideas that we were talking about, building things next to each other, making â it ' s all about [a] metaphor for a city, maybe. And so Stanley did the little dome thing. And we did it over the phone and by fax. He would send me a fax and show me something. He ' d made a building with a dome and he had a little tower. I told him,"No, no, that ' s too ongepotchket. I don ' t want the tower."So he came back with a simpler building, but he put some funny details on it, and he moved it closer to my building. And so I decided to put him in a depression. I put him in a hole and made a kind of a hole that he sits in. And so then he put two bridges â this all happened on the fax, going back and forth over a couple of weeks ' period. And he put these two bridges with pink guardrails on it. And so then I put this big billboard behind it. And I call it,"David and Goliath."And that ' s my cafeteria. In Boston, we had that old building on the left. It was a very prominent building off the freeway, and we added a floor and cleaned it up and fixed it up and used the kind of â I thought â the language of the neighborhood, which had these cornices, projecting cornices. Mine got a little exuberant, but I used lead copper, which is a beautiful material, and it turns green in 100 years. Instead of, like, copper in 10 or 15. We redid the side of the building and re-proportioned the windows so it sort of fit into the space. And it surprised both Boston and myself that we got it approved, because they have very strict kind of design guideline, and they wouldn ’ t normally think I would fit them. The detailing was very careful with the lead copper and making panels and fitting it tightly into the fabric of the existing building. In Barcelona, on Las Ramblas for some film festival, I did the Hollywood sign going and coming, made a building out of it, and they built it. I flew in one night and took this picture. But they made it a third smaller than my model without telling me. And then more metal and some chain link in Santa Monica â□□ a little shopping center. And this is a laser laboratory at the University of Iowa, in which the fish comes back as an abstraction in the back. It ’ s the support labs, which, by some coincidence, required no windows. And the shape fit perfectly. I just joined the points. In the curved part there ’ s all the mechanical equipment. That solid wall behind it is a pipe chase â□□ a pipe canyon â□□ and so it was an opportunity that I seized, because I didn ’ t have to have any protruding ducts or vents or things in this form. It gave me an opportunity to make a sculpture out of it. This is a small house somewhere. They ’ ve been building it so long I don ’ t remember where it is. It ’ s in the West Valley. And we started with the stream and built the house along the stream â□□ dammed it up to make a lake. These are the models. The reality, with the lake â□□ the workmanship is pretty bad. And it reminded me why I play defensively in things like my house. When you have to do something really cheaply, it ’ s hard to get perfect corners and stuff. That big metal thing is a passage, and in it is â□□ you go downstairs into the living room and then down into the bedroom, which is on the right. It ’ s kind of like a whole built town. I was asked to do a hospital for schizophrenic adolescents at Yale. I thought it was fitting for me to be doing that. This is a house next to a Philip Johnson house in Minnesota. The owners had a dilemma â□□ they asked Philip to do it. He was too busy. He didn ’ t recommend me, by the way. We ended up having to make it a sculpture, because the dilemma was, how do you build a building that doesn ’ t look like the language? Is it going to look like this beautiful estate is sub-divided? Etc. etc. You ’ ve got the idea. And so we finally ended up making it. These people are art collectors. And we finally made it so it appears very sculptural from the main house and all the windows are on the other side. And the building is very sculptural as you walk around it. It ’ s made of metal and the brown stuff is Fin-Ply â□□ it ’ s that formed lumber from Finland. We used it at Loyola on the chapel, and it didn ’ t work. I keep trying to make it work. In this case we learned how to detail it. In Cleveland, there ’ s Burnham Mall, on the left. It ’ s never been finished. Going out to the lake, you can see all those new buildings we built. And we had the opportunity to build a building on this site. There ’ s a railroad track. This is the city hall over here somewhere, and the courthouse. And the centerline of the mall goes out. Burnham had designed a railroad station that was never built, and so we followed. Sohio is on the axis here, and we followed the axis, and they ’ re two kind of goalposts. And this is our building, which is a corporate headquarters for an insurance company. We collaborated with Oldenburg and put the newspaper on top, folded. The health club is fastened to the garage with a C-clamp, for Cleveland. You drive down. So it ’ s about a 10-story C-clamp. And all this stuff at the bottom is a museum, and an idea for a very fancy automobile entry. This owner has a pet peeve about bad automobile entries. And this would be a hotel. So, the centerline of this thing â□□ we ’ d preserve it, and it would start to work with the scale of the new buildings by Pelli and Kohn Pederson Fox, etc., that are underway. It ’ s hard to do high-rise. I feel much more comfortable down here. This is a piece of property in Brentwood. And a long time ago, about ’ 82 or something, after my house â I designed a house for myself that would be a village of several pavilions around a courtyard â and the owner of this lot worked for me and built that actual model on the left. And she came back, I guess wealthier or something â something happened â and asked me to design a house for her on this site. And following that basic idea of the village, we changed it as we got into it. I locked the house into the site by cutting the back end â here you see on the photographs of the site â slicing into it and putting all the bathrooms and dressing rooms like a retaining wall, creating a lower level zone for the master bedroom, which I designed like a kind of a barge, looking like a boat. And that ’ s it, built. The dome was a request from the client. She wanted a dome somewhere in the house. She didn ’ t care where. When you sleep in this bedroom, I hope â I mean, I haven ’ t slept in it yet. I ’ ve offered to marry her so I could sleep there, but she said I didn ’ t have to do that. But when you ’ re in that room, you feel like you ’ re on a kind of barge on some kind of lake. And it ’ s very private. The landscape is being built around to create a private garden. And then up above there ’ s a garden on this side of the living room, and one on the other side. These aren ’ t focused very well. I don ’ t know how to do it from here. Focus the one on the right. It ’ s up there. Left â it ’ s my right. Anyway, you enter into a garden with a beautiful grove of trees. That ’ s the living room. Servants ’ quarters. A guest bedroom, which has this dome with marble on it. And then you enter into the living room and then so on. This is the bedroom. You come down from this level along the stairway, and you enter the bedroom here, going into the lake. And the bed is back in this space, with windows looking out onto the lake. These Stonehenge things were designed to give foreground and to create a greater depth in this shallow lot. The material is lead copper, like in the building in Boston. And so it was an intent to make this small piece of land â it ’ s 100 by 250 â into a kind of an estate by separating these areas and making the living room and dining room into this pavilion with a high space in it. And this happened by accident that I got this right on axis with the dining room table. It looks like I got a Baldessari painting for free. But the idea is, the windows are all placed so you see pieces of the house outside. Eventually this will be screened â these trees will come up â and it will be very private. And you feel like you ’ re in your own kind of village. This is for Michael Eisner â Disney. We ’ re doing some work for him. And this is in Anaheim, California, and it ’ s a freeway building. You go under this bridge at about 65 miles an hour, and there ’ s another bridge here. And you ’ re through this room in a split second, and the building will sort of reflect that. On the backside, it ’ s much more humane â entrance, dining hall, etc. And then this thing here â I ’ m hoping as you drive by you ’ ll hear the picket fence effect of the sound hitting it. Kind of a fun thing to do. I ’ m doing a building in Switzerland, Basel, which is an office building for a furniture company. And we struggled with the image. These are the early studies, but they have to sell furniture to normal people, so if I did the building and it was too fancy, then people might say,”Well, the furniture looks OK in his thing, but no, it ain ’ t going to look good in my normal building.”So we ’ ve made a kind of pragmatic slab in the second phase here, and we ’ ve taken the conference facilities and made a villa out of them so that the communal space is very sculptural and separate. And you ’ re looking at it from the offices and you create a kind of interaction between these pieces. This is in Paris, along the Seine. Palais des Sports, the Gare de Lyon over here. The Minister of Finance â the guy that moved from the Louvre â goes in here. There ’ s a new library across the river. And back in here, in this already treed park, we ’ re doing a very dense building called the American Center, which has a theater, apartments, dance school, an art museum, restaurants and all kinds of â it ' s a very dense program â bookstores, etc. In a very tight, small â this is the ground level. And the French have this extraordinary way of screwing things up by taking a beautiful site and cutting the corner off. They call it the plan coupe. And I struggled with that thing â how to get around the corner. These are the models for it. I showed you the other model, the one â this is the way I organized myself so I could make the drawing â so I understood the problem. I was trying to get around this plan coupe â how do you do it? Apartments, etc. And these are the kind of study models we did. And the one on the left is pretty awful. You can see why I was ready to commit suicide when this one was built. But out of it came finally this resolution, where the elevator piece worked frontally to this, parallel to this street, and also parallel to here. And then this kind of twist, with this balcony and the skirt, kind of like a ballerina lifting her skirt to let you into the foyer. The restaurants here â the apartments and the theater, etc. So it would all be built in stone, in French limestone, except for this metal piece. And it faces into a park. And the idea was to make this express the energy of this. On the side facing the street it ' s much more normal, except I slipped a few mansards down, so that coming on the point, these housing units made a gesture to the corner. And this will be some kind of high-tech billboard. If any of you guys have any ideas for it, please contact me. I don ' t know what to do. Jay Chiat is a glutton for punishment, and he hired me to do a house for him in the Hamptons. And it ' s got a fish. And I keep thinking,"This is going to be the last fish."It ' s like a drug addict. I say,"I ' m not going to do it anymore â I don ' t want to do it anymore â I ' m not going to do it."And then I do it. There it is. But it ' s the living room. And this piece here is â I don ' t know what it is. I just added it so that we ' d have enough money in the budget so we could take something out. This is Euro Disney, and I ' ve worked with all of the guys that presented to you earlier. We ' ve had a lot of fun working together. I think I ' m from Mars for them, and they are for me, but somehow we all manage to work together, and I think, productively. So far. This is a shopping thing. You come into the Magic Kingdom and the hotel that Tony Baxter ' s group is doing out here. And then this is a kind of a shopping mall, with a rodeo and restaurants. And another restaurant. What I did â because of the Paris skies being quite dull, I made a light grid that ' s perpendicular to the train station, to the route of the train. It looks like it ' s kind of been there, and then crashed all these simpler forms into it. The light grid will have a light, be lit up at night and give a kind of light ceiling. In Switzerland â Germany, actually â on the Rhine across from Basel, we did a furniture factory and a furniture museum. And I tried to â there ' s a Nick Grimshaw building over here, there ' s an Oldenburg sculpture over here â I tried to make a relationship urbanistically. And I don ' t gave good slides to show â it ' s just been completed â but this piece here is this building, and these pieces here and here. And as you pass by it ' s always part â you see it as all of these pieces accrue and become part of an overall neighborhood. It ' s plaster and just zinc. And you wonder, if this is a museum, what it ' s going to be like inside? If it ' s going to be so busy and crazy that you wouldn ' t show anything, and just wait. I ' m so cunning and clever â I made it quiet and wonderful. But on the outside it does scream out at you a bit. It ' s actually basically three square rooms with a couple of skylights and stuff. And from the building in the back, you see it as an iceberg floating by in the hills. I know I ' m over time. See, that skylight goes down and becomes that one. So it ' s pretty quiet inside. This is the Disney Hall â the concert hall. It ' s a complicated project. It has a chamber hall. It ' s related to an existing Chandler Pavilion that was built with a lot of love and tears and caring. And it ' s not a great building, but I approached it optimistically, that we would make a compositional relationship between us that would strengthen both of us. And the plan of this â it ’ s a concert hall. This is the foyer, which is kind of a garden structure. There ’ s commercial at the ground floor. These are offices, which, really, in the competition, we didn ’ t have to design. But finally, there ’ s a hotel there. These were the kind of relationships made to the Chandler, composing these elevations together and relating them to the buildings that existed â to MOCA, etc. The acoustician in the competition gave us criteria, which led to this compartmentalized scheme, which we found out after the competition would not work at all. But everybody liked these forms and liked the space, and so that ’ s one of the problems of a competition. You have to then try and get that back in some way. And we studied many models. This was our original model. These were the three buildings that were the ideal â the Concertgebouw, Boston and Berlin. Everybody liked the surround. Actually, this is the smallest hall in size, and it has more seats than any of these because it has double balconies. Our client doesn ’ t want balconies, so â and when we met our new acoustician, he told us this was the right shape or this was the right shape. And we tried many shapes, trying to get the energy of the original design within an acoustical, acceptable format. We finally settled on a shape that was the proportion of the Concertgebouw with the sloping outside walls, which the acoustician said were crucial to this and later decided they weren ’ t, but now we have them. And our idea is to make the seating carriage very sculptural and out of wood and like a big boat sitting in this plaster room. That ’ s the idea. And the corners would have skylights and these columns would be structural. And the nice thing about introducing columns is they give you a kind of sense of proscenium from wherever you sit, and create intimacy. Now, this is not a final design â these are just on the way to being â and so I wouldn ’ t take it literally, except the feeling of the space. We studied the acoustics with laser stuff, and they bounce them off this and see where it all works. But you get the sense of the hall in section. Most halls come straight down into a proscenium. In this case we ’ re opening it back up and getting skylights in the four corners. And so it will be quite a different shape. The original building, because it was frog-like, fit nicely on the site and cranked itself well. When you get into a box, it ’ s harder to do it â and here we are, struggling with how to put the hotel in. And this is a teapot I designed for Alessi. I just stuck it on there. But this is how I do work. I do take pieces and bits and look at it and struggle with it and cut it away. And of course it ’ s not going to look like that, but it is the crazy way I tend to work. And then finally, in L. A. I was asked to do a sculpture at the foot of Interstate Bank Tower, the highest building in L. A. Larry Halprin is doing the stairs. And I was asked to do a fish, and so I did a snake. It ’ s a public space, and I made it kind of a garden structure, and you can go in it. It ’ s a kiva, and Larry ’ s putting some water in there, and it works much better than a fish. In Barcelona I was asked to do a fish, and we ’ re working on that, at the foot of a Ritz-Carlton Tower being done by Skidmore, Owings and Merrill. And the Ritz-Carlton Tower is being designed with exposed steel, non-fire proof, much like those old gas tanks. And so we took the language of this exposed steel and used it, perverted it, into the form of the fish, and created a kind of a 19th- century contraption that looks like, that will sit â this is the beach and the harbor out in front, and this is really a shopping center with department stores. And we split these bridges. Originally, this was all solid with a hole in it. We cut them loose and made several bridges and created a kind of a foreground for this hotel. We showed this to the hotel people the other day, and they were terrified and said that nobody would come to the Ritz-Carlton anymore, because of this fish. And finally, I just threw these in â Lou Danziger. I didn ’ t expect Lou Danziger to be here, but this is a building I did for him in 1964, I think. A little studio â and it ’ s sadly for sale. Time goes on. And this is my son working with me on a small fast-food thing. He designed the robot as the cashier, and the head moves, and I did the rest of it. And the food wasn ’ t as good as the stuff, and so it failed. It should have been the other way around â the food should have been good first. It didn ’ t work. Thank you very much.

Text Sample 435: NEG Dim 3 – 2006 – Score -4.00 – 2006/t000417.txt

I just want to say, over the last few years I ’ ve been â had the opportunity to do this closing conference. And I ’ ve had some incredible warm-up acts. About eight years ago, Billy Graham opened for me. And I thought that there was â I thought that there was absolutely no way in hell to top that. But I just wanted to say â and I mean this without irony â I think I can speak for everybody in the audience when I say that I wish to God that you were the President of the United States. OK, this is the title of my talk today. I just want to give you a quick overview. First of all, please remember I ’ m completely politically correct, and I mean everything with great affection. If any of you have sensitive stomachs or are feeling queasy, now is the time to check your Blackberry. Just to review, this is my TEDTalk. We ’ re going to do some jokes, some gags, some little skits â and then we ’ re going to talk about the L1 point. So, one of the questions I ask myself is, was this the most distressing TED ever? Let ’ s try and sum things up, shall we? Images of limb regeneration and faces filled with smallpox : 21 percent of the conference. Mentions of polar bears drowning : four percent. Images of the earth being wiped out by flood or bird flu : 64 percent. And David Pogue singing show tunes. Because this is the most distressing TED ever, I ’ ve been working with Neil Gershenfeld on next year ’ s TED Bag. And if the â if the conference is anywhere near this distressing, then we ’ re going to have a scream bag next year. It ’ s going to be a **cradle-to-cradle** scream bag, of course. So you ’ re going to be able to go like this. Bring it over here and open it up. Aaaah! Meanwhile, back at TED University, this wonderful woman is teaching you how to chop Sun Chips. So Robert Wright â I don ’ t know, I felt like if there was anyone that Helen needed to give antidepressants to, it might have been him. I want to deliberately interfere with his dopamine levels. He was talking about morality. Economy class morality is, we want to bomb you back to the Stone Age. Business class morality is, don ’ t bomb Japan â they built my car. And first-class morality is, don ’ t bomb Mexico â they clean my house. Yes, it is politically incorrect. All right, now I want to do a little bit of a thing for you... All right, now these are the wha â I ’ d say, [mumble, mumble â mumble, mumble, mumble, mumble, mumble] â ahh! So I wanted to show you guys â I wanted to talk about a revolutionary new computer interface that lets you work with images just as easily as you â as a completely natural user interface. And you can â you can use really natural hand gestures to like, go like this. Now we had a Harvard professor here â she was from Harvard, I just wanted to mention and â and she was actually a professor from Harvard. And she was talking about seven-dimensional, inverted universes. With, you know, of course, there ’ s the gravity brain. There ’ s the weak brain. And then there ’ s my weak brain, which is too â too â absolutely too weak to understand what the fuck she was talking about. Now â one of the things that is very important to me is to try and figure out what on Earth am I here for. And that ’ s why I went out and I picked up a best-selling business book.

You know, it basically uses as its central premise Greek mythology. And it ' s by a guy named Pastor Rick Warren, and it ' s called"The Porpoise Driven Life."And Rick is as a pagan god, which I thought was kind of appropriate, in a certain way. And now we ' re going to have kind of a little more visualization about Rick Warren. OK. All right. Now, red is Rick Warren, and green is Daniel Dennett, OK? The scales here are religiosity from zero percent, or atheist, to 100 percent, Bible literally true. And then this is books sold â the logarithmic scale. 30, 000, 300, 000, three million, 30 million, 300 million. OK, now they ' re duking it out. Now they ' re duking it out. And Rick Warren ' s kind of pulling ahead, kind of pulling ahead. Yup, and his installed base is getting a little bigger. But Darwin ' s dangerous idea is coming back. It ' s coming back. Let me turn the trails on, so you can see that a little bit better. Now, one of the things that ' s very important is, Nicholas Negroponte talked to us about one lap dance per â I ' m sorry â about One Laptop Per Child. Now let ' s talk about some of the characteristics that are important for this revolutionary device. I ' ll tell you a little bit about the design parameters, and then I ' ll show it to you in person. First of all, it needs to be small. It needs to be flat, so it ' s transportable. Lightweight. Portable. Uses very, very little power. Very, very high resolution. Has to be visible in bright daylight. Will work anywhere. And broadly applicable across many platforms. Now, we ' ve actually done some research â Neil Gershenfeld and the Fab Labs went out into the market. They did some research ; we came back ; and we think we have the perfect prototype of what the students in the field are actually asking for. And here it is, the $100 computer. OK, OK, OK, OK â excellent, excellent. Now, I bought this device from Clifford Stoll for about 900 bucks. And he and his team of junior-high school students were doing real science. So we ' re trying to check and trying to douse here, and see who uses marijuana. See who uses marijuana. Are we going to be able to find any marijuana, Jim Young? Only if we open enough locker doors. OK, now smallpox is an extremely distressing illness. We had Dr. Larry Brilliant talking about how we eradicated smallpox. I wanted to show you the stages of smallpox. We start. This is day one. Day two. Day three, she gets a massively big pox on her shoulder. Day three. Day four. Day five and day six. Now the good news is, because I ' m a trained medical professional, I know that even though she ' ll be scarred for life, she ' s going to make a full recovery. Now the good news about Architects for Humanity is they ' re really kind of the most amazing group. They ' ve been sponsoring a design competition to come up with innovative medical housing solutions, clinic solutions, in Africa, and they ' ve had a design competition. Now the wonderful thing is, Larry Brilliant was just appointed the head of the Google Foundation, and so he decided that he would support â he would support Cameron ' s work. And the way he decided to support that work was by shipping over 50, 000 shipping containers of Google snacks. So I want to show you some prototypes. The U. N. â you know, they took 20 years just to add a flap to a tent, but I think we have some more exciting things. This is a home made entirely out of Fruit Roll-Ups. And those roll-up cookies coated with white chocolate. And the really wonderful thing about this is, when you ' re done, well â you can eat it. But the thing that I ' m really, really excited about is this incredible granola house. And the granola house has a special Sun Chip roof to collect water and recycle it. And it ' s â well, on this side it has regular Sour Patch Kids and Gummy Bears to let in the light. But on this side, it has sugary Gummy Bears, to diffuse the light more slightly. And we â we wanted just to show you what this might look like in situ. So, Einstein â Einstein, tell me â what ' s your favorite song? No, I said what ' s your favorite song? No, I said what ' s your favorite song?"Free Bird."OK, so, Einstein, what ' s your favorite singing group? Could you say that again? What ’ s your favorite singing group? OK, one more time â I ’ m just going to give you a little help. Your favorite singing group â it ’ s Diana Ross and the â Audience : Supremes! Tom Reilly : Exactly. Could we have the sound up on the laptop, please?”Free Bird”kind of reminds me that if you â if you listen to”Free Bird”backwards, this is what you might hear. Computer : Satan. Satan. Satan. Satan. Satan. Satan. Satan. TR : Now it ’ s a little hard to hear the whole message, so I wanted to â so I wanted to help you a little bit. Computer : My sweet Satan. Dan Dennett worships Satan. Buy”The Purpose-Driven Life,”or Satan will take your soul. TR : So, we ’ ve talked a lot about global warming, but, you know, as Jill said, it sounds kind of nice â good weather in the wintertime, and New York City. And as Jay Walker pointed out, that is just not scary enough. So Al, I actually think I ’ m rather good at branding. So I ’ ve tried to figure out a good design process to come up with a new term to replace”global warming.”So we started with Babel Fish. We put in global warming. And then we decided that we ’ d change it from English to Dutch â into”Het globale Verwarmen.”From Dutch to [Korean], into”Hordahordaneecheewa.”[Korean] to Portuguese : Aquecer-se Global. Then Portuguese to Pig Latin. Aquecer-se ucked-fay. And then finally back into the English, which is, we ’ re totally fucked. Now I don ’ t know about you, but Michael Shermer talked about the willingness for human beings â evolutionarily, they ’ re designed to see patterns in things. For example, in cheese sandwiches. Now can you look at that carefully and see if you see the Virgin Mary? I tried to make it a little bit clearer. Is it the Virgin Mary? Or is it Mena Trott? So, I talked to Josh Prince-Ramus about the convention center and the conferences. It ’ s getting awfully big. It ’ s getting just a little bit too big. It ’ s bursting at the seams here a little bit. So we tried to come up with a program â how we could remake this structure to better accommodate TED. So first of all we decided â that we needed about one-third bookstore, one-third Google cafe, about 20 percent registration, 80 percent luxury hotel, about five percent for restrooms. And then of course, we wanted to have the simulcast lounge, the lobby and the Steinbeck forum. Now let me show you how that literally translated into the design program. So first, one of the problems with Monterey is that if there is global warming and Greenland melts as you say, the ocean level is going to rise 20 feet and flood the hell out of the convention center. So we ’ re going to build this new building on stilts. So we build this building on stilts, then up here â is where we ’ re going to put the new Steinbeck auditorium. And the wonderful thing about the new bookstore is, it ’ s going to be shaped in a spiral that ’ s organized by the Dewey Decimal System. Then we ’ re going to make an escalator that helps you get up there. And finally, we ’ re going to put the Marriott Hotel and the Portola Plaza on the top. Now I don ’ t know about you, but sometimes I have these images in my head of separated at birth. I don ’ t know about you, but when I see Aubrey de Grey, I immediately go to Gandalf the Grey. OK. Now, we ’ ve heard, of course, that we ’ re all soldiers here. So what I ’ d really, really like you to do now is, pick up your white piece of paper. Does everybody have their white piece of paper? And I want you to get out a pen, and I want you to write a terrorist note. If we put up the ELMO for a moment â if we put up the ELMO, then we ’ ll get, you know, I ’ ll give you a model that you can work from, OK? And then I want you to fold that note into a paper airplane. And once you ’ ve folded it into a paper airplane, I want you to take some anthrax â and I want you to put that in the paper airplane. And then I want you to throw it on Jim Young. Luckily, I was the recipient of the TED Prize this year. And I wanted to see â I want to dedicate this film to my father, Homer. OK. Now this film isn ’ t really hard enough, so I wanted to make it a little bit harder. So I ’ m going to try and do this while reciting pi. 3. 1415, 2657, 753, 8567, 24972 â□□ â□□ 85871, 25871, 3928, 5657, 2592, 5624. Can we cue the music please? Now I wanted to use this talk to talk about global warming a little bit. Back in 1968, you can see that the mountain range of Brokeback Mountain was covered in 151 inches of snow pack. Parenthetically, over there on the slopes, I did want to show you that black men ski. But over the years, 10 years later, the snow packs eroded, and, if you notice, the trees have started turning yellow. The water level of the lake has started drying up. A few years later, there ’ s no snow left at all. And all the trees have turned brown. This year, unfortunately the lakebed ’ s turned into an absolute cracked dry bed. And I fear, if we do nothing for our planet, in 20 years, it ’ s going to look like this. Mr. Vice President, I wish I knew how to quit you. Thank you very much.

Text Sample 436: NEG Dim 3 – 2006 – Score -1.00 – 2006/t000129.txt
How can we investigate this flora of viruses that surround us, and aid medicine? How can we turn our cumulative knowledge of virology into a simple, hand-held, single diagnostic assay? I want to turn everything we know right now about detecting viruses and the spectrum of viruses that are out there into, let ’ s say, a small chip. When we started thinking about this project — how we would make a single diagnostic assay to screen for all pathogens simultaneously — well, there ’ s some problems with this idea. First of all, viruses are pretty complex, but they ’ re also evolving very fast. This is a picornavirus. Picornaviruses — these are things that include the common cold and polio, things like this. You ’ re looking at the outside shell of the virus, and the yellow color here are those parts of the virus that are evolving very, very fast, and the blue parts are not evolving very fast. When people think about making pan-viral detection reagents, usually it ’ s the fast-evolving problem that ’ s an issue, because how can we detect things if they ’ re always changing? But evolution is a balance : where you have fast change, you also have ultra-conservation — things that almost never change. And so we looked into this a little more carefully, and I ’ m going to show you data now. This is just some stuff you can do on the computer from the desktop. I took a bunch of these small picornaviruses, like the common cold, like polio and so on, and I just broke them down into small segments. And so took this first example, which is called coxsackievirus, and just break it into small windows. And I ’ m coloring these small windows blue if another virus shares an identical sequence in its genome to that virus. These sequences right up here — which don ’ t even code for protein, by the way — are almost absolutely identical across all of these, so I could use this sequence as a marker to detect a wide spectrum of viruses, without having to make something individual. Now, over here there ’ s great diversity : that ’ s where things are evolving fast. Down here you can see slower evolution : less diversity. Now, by the time we get out here to, let ’ s say, acute bee paralysis virus — probably a bad one to have if you ’ re a bee — - this virus shares almost no similarity to coxsackievirus, but I can guarantee you that the sequences that are most conserved among these viruses on the right-hand of the screen are in identical regions right up here. And so we can encapsulate these regions of ultra-conservation through evolution — how these viruses evolved — by just choosing DNA elements or RNA elements in these regions to represent on our chip as detection reagents. OK, so that ’ s what we did, but how are we going to do that? Well, for a long time, since I was in graduate school, I ’ ve been messing around making DNA chips — that is, printing DNA on glass. And that ’ s what you see here : These little salt spots are just DNA tacked onto glass, and

so I can put thousands of these on our glass chip and use them as a detection reagent. We took our chip over to Hewlett-Packard and used their atomic force microscope on one of these spots, and this is what you see : you can actually see the strands of DNA lying flat on the glass here. So, what we ’ re doing is just printing DNA on glass — little flat things — and these are going to be markers for pathogens. OK, I make little robots in lab to make these chips, and I ’ m really big on disseminating technology. If you ’ ve got enough money to buy just a Camry, you can build one of these too, and so we put a deep how-to guide on the Web, totally free, with basically order-off-the-shelf parts. You can build a DNA array machine in your garage. Here ’ s the section on the all-important emergency stop switch. Every important machine ’ s got to have a big red button. But really, it ’ s pretty robust. You can actually be making DNA chips in your garage and decoding some genetic programs pretty rapidly. It ’ s a lot of fun. And so what we did — and this is a really cool project — we just started by making a respiratory virus chip. I talked about that — you know, that situation where you go into the clinic and you don ’ t get diagnosed? Well, we just put basically all the human respiratory viruses on one chip, and we threw in herpes virus for good measure — I mean, why not? The first thing you do as a scientist is, you make sure stuff works. And so what we did is, we take tissue culture cells and infect them with various viruses, and we take the stuff and fluorescently label the nucleic acid, the genetic material that comes out of these tissue culture cells — mostly viral stuff — and stick it on the array to see where it sticks. Now, if the DNA sequences match, they ’ ll stick together, and so we can look at spots. And if spots light up, we know there ’ s a certain virus in there. That ’ s what one of these chips really looks like, and these red spots are, in fact, signals coming from the virus. And each spot represents a different family of virus or species of virus. And so, that ’ s a hard way to look at things, so I ’ m just going to encode things as a little barcode, grouped by family, so you can see the results in a very intuitive way. What we did is, we took tissue culture cells and infected them with adenovirus, and you can see this little yellow barcode next to adenovirus. And, likewise, we infected them with parainfluenza-3 — that ’ s a paramyxovirus — and you see a little barcode here. And then we did respiratory syncytial virus. That ’ s the scourge of daycare centers everywhere — it ’ s like boogeremia, basically. You can see that this barcode is the same family, but it ’ s distinct from parainfluenza-3, which gives you a very bad cold. And so we ’ re getting unique signatures, a fingerprint for each virus. Polio and rhino : they ’ re in the same family, very close to each other. Rhino ’ s the common cold, and you all know what polio is, and you can see that these signatures are distinct. And Kaposi ’ s sarcoma-associated herpes virus gives a nice signature down here. And so it is not any one stripe or something that tells me I have a virus of a particular type here ; it ’ s the barcode that in bulk represents the whole thing. All right, I can see a rhinovirus — and here ’ s the blow-up of the rhinovirus ’ s little barcode — but what about different rhinoviruses? How do I know which rhinovirus I have? There ’ re 102 known variants of the common cold, and there ’ re only 102 because people got bored collecting them : there are just new ones every year. And so, here are four different rhinoviruses, and you can see, even with your eye, without any fancy computer pattern-matching recognition software algorithms, that you can distinguish each one of these barcodes from each other. Now, this is kind of a cheap shot, because I know what the genetic sequence of all these rhinoviruses is, and I in fact designed the chip expressly to be able to tell them apart, but what about rhinoviruses that have never seen a genetic sequencer? We don ’ t know what the sequence is ; just pull them out of the field. So, here are four rhinoviruses we never knew anything about — no one ’ s ever sequenced them — and you can also see that you get unique and distinguishable patterns. You can imagine building up some library, whether real or virtual, of fingerprints of essentially every virus. But that ' s, again, shooting fish in a barrel, you know, right? You have tissue culture cells. There are a ton of viruses. What about real people? You can ' t control real people, as you probably know. You have no idea what someone ' s going to cough into a cup, and it ' s probably really complex, right? It could have lots of bacteria, it could have more than one virus, and it certainly has host genetic material. So how do we deal with this? And how do we do the positive control here? Well, it ' s pretty simple. That ' s me, getting a nasal lavage. And the idea is, let ' s experimentally inoculate people with virus. This is all IRB-approved, by the way ; they got paid. And basically we experimentally inoculate people with the common cold virus. Or, even better, let ' s just take people right out of the emergency room — undefined, community-acquired respiratory tract infections. You have no idea what walks in through the door. So, let ' s start off with the positive control first, where we know the person was healthy. They got a shot of virus up the nose, let ' s see what happens. Day zero : nothing happening. They ' re healthy ; they ' re clean — it ' s amazing. Actually, we thought the nasal tract might be full of viruses even when you ' re walking around healthy. It ' s pretty clean. If you ' re healthy, you ' re pretty healthy. Day two : we get a very robust rhinovirus pattern, and it ' s very similar to what we get in the lab doing our tissue culture experiment. So that ' s great, but again, cheap shot, right? We put a ton of virus up this guy ' s nose. So — — I mean, we wanted it to work. He really had a cold. So, how about the people who walk in off the street? Here are two individuals represented by their anonymous ID codes. They both have rhinoviruses ; we ' ve never seen this pattern in lab. We sequenced part of their viruses ; they ' re new rhinoviruses no one ' s actually even seen. Remember, our evolutionary-conserved sequences we ' re using on this array allow us to detect even novel or uncharacterized viruses, because we pick what is conserved throughout evolution. Here ' s another guy. You can play the diagnosis game yourself here. These different blocks represent the different viruses in this paramyxovirus family, so you can kind of go down the blocks and see where the signal is. Well, doesn ' t have canine distemper ; that ' s probably good. But by the time you get to block nine, you see that respiratory syncytial virus. Maybe they have kids. And then you can see, also, the family member that ' s related : RSVB is showing up here. So, that ' s great. Here ' s another individual, sampled on two separate days — repeat visits to the clinic. This individual has parainfluenza-1, and you can see that there ' s a little stripe over here for Sendai virus : that ' s mouse parainfluenza. The genetic relationships are very close there. That ' s a lot of fun. So, we built out the chip. We made a chip that has every known virus ever discovered on it. Why not? Every plant virus, every insect virus, every marine virus. Everything that we could get out of GenBank — that is, the national repository of sequences. Now we ' re using this chip. And what are we using it for? Well, first of all, when you have a big chip like this, you need a little bit more informatics, so we designed the system to do automatic diagnosis. And the idea is that we simply have virtual patterns, because we ' re never going to get samples of every virus — it would be virtually impossible. But we can get virtual patterns, and compare them to our observed result — which is a very complex mixture — and come up with some sort of score of how likely it is this is a rhinovirus or something. And this is what this looks like. If, for example, you used a cell culture that ' s chronically infected with papilloma, you get a little computer readout here, and our algorithm says it ' s probably papilloma type 18. And that is, in fact, what these particular cell cultures are chronically infected with. So let ' s do something a little bit harder. We put the beeper in the clinic. When somebody shows up, and the hospital doesn ’ t know what to do because they can ’ t diagnose it, they call us. That ’ s the idea, and we ’ re setting this up in the Bay Area. And so, this case report happened three weeks ago. We have a 28- year-old healthy woman, no travel history, [unclear], doesn ’ t smoke, doesn ’ t drink. 10-day history of fevers, night sweats, bloody sputum — she ’ s coughing up blood — muscle pain. She went to the clinic, and they gave her antibiotics and then sent her home. She came back after ten days of fever, right? Still has the fever, and she ’ s hypoxic — she doesn ’ t have much oxygen in her lungs. They did a CT scan. A normal lung is all sort of dark and black here. All this white stuff — it ’ s not good. This sort of tree and bud formation indicates there ’ s inflammation ; there ’ s likely to be infection. OK. So, the patient was treated then with a third-generation cephalosporin antibiotic and doxycycline, and on day three, it didn ’ t help : she had progressed to acute failure. They had to intubate her, so they put a tube down her throat and they began to mechanically ventilate her. She could no longer breathe for herself. What to do next? Don ’ t know. Switch antibiotics : so they switched to another antibiotic, Tamiflu. It ’ s not clear why they thought she had the flu, but they switched to Tamiflu. And on day six, they basically threw in the towel. You do an open lung biopsy when you ’ ve got no other options. There ’ s an eight percent mortality rate with just doing this procedure, and so basically — and what do they learn from it? You ’ re looking at her open lung biopsy. And I ’ m no pathologist, but you can ’ t tell much from this. All you can tell is, there ’ s a lot of swelling : bronchiolitis. It was”unrevealing”: that ’ s the pathologist ’ s report. And so, what did they test her for? They have their own tests, of course, and so they tested her for over 70 different assays, for every sort of bacteria and fungus and viral assay you can buy off the shelf : SARS, metapneumovirus, HIV, RSV — all these. Everything came back negative, over 100, 000 dollars worth of tests. I mean, they went to the max for this woman. And basically on hospital day eight, that ’ s when they called us. They gave us endotracheal aspirate — you know, a little fluid from the throat, from this tube that they got down there — and they gave us this. We put it on the chip ; what do we see? Well, we saw parainfluenza-4. Well, what the hell ’ s parainfluenza-4? No one tests for parainfluenza-4. No one cares about it. In fact, it ’ s not even really sequenced that much. There ’ s just a little bit of it sequenced. There ’ s almost no epidemiology or studies on it. No one would even consider it, because no one had a clue that it could cause respiratory failure. And why is that? Just lore. There ’ s no data — no data to support whether it causes severe or mild disease. Clearly, we have a case of a healthy person that ’ s going down. OK, that ’ s one case report. I ’ m going to tell you one last thing in the last two minutes that ’ s unpublished — it ’ s going to come out tomorrow — and it ’ s an interesting case of how you might use this chip to find something new and open a new door. Prostate cancer. I don ’ t need to give you many statistics about prostate cancer. Most of you already know it : third leading cause of cancer deaths in the U. S. Lots of risk factors, but there is a genetic predisposition to prostate cancer. For maybe about 10 percent of prostate cancer, there are folks that are predisposed to it. And the first gene that was mapped in association studies for this, **early-onset** prostate cancer, was this gene called RNASEL. What is that? It ’ s an antiviral defense enzyme. So, we ’ re sitting around and thinking,”Why would men who have the mutation — a defect in an antiviral defense system — get prostate cancer? It doesn ’ t make sense — unless, maybe, there ’ s a virus?”So, we put tumors — - and now we have over 100 tumors — on our array. And we know who ’ s got defects in RNASEL and who doesn ’ t. And I ’ m showing you the signal from the chip here, and I ’ m showing you for the block of retroviral oligos. And what I ’ m telling you here from the signal, is that men who have a mutation in this antiviral defense enzyme, and have a tumor, often have — 40 percent of the time — a signature which reveals a new retrovirus. OK, that ’ s pretty wild. What is it? So, we clone the whole virus. First of all, I ’ ll tell you that a little automated prediction told us it was very similar to a mouse virus. But that doesn ’ t tell us too much, so we actually clone the whole thing. And the viral genome I ’ m showing you right here? It ’ s a classic gamma retrovirus, but it ’ s totally new ; no one ’ s ever seen it before. Its closest relative is, in fact, from mice, and so we would call this a xenotropic retrovirus, because it ’ s infecting a species other than mice. And this is a little phylogenetic tree to see how it ’ s related to other viruses. We ’ ve done it for many patients now, and we can say that they ’ re all independent infections. They all have the same virus, but they ’ re different enough that there ’ s reason to believe that they ’ ve been independently acquired. Is it really in the tissue? And I ’ ll end up with this : yes. We take slices of these biopsies of tumor tissue and use material to actually locate the virus, and we find cells here with viral particles in them. These guys really do have this virus. Does this virus cause prostate cancer? Nothing I ’ m saying here implies causality. I don ’ t know. Is it a link to oncogenesis? I don ’ t know. Is it the case that these guys are just more susceptible to viruses? Could be. And it might have nothing to do with cancer. But now it ’ s a door. We have a strong association between the presence of this virus and a genetic mutation that ’ s been linked to cancer. That ’ s where we ’ re at. So, it opens up more questions than it answers, I ’ m afraid, but that ’ s what, you know, science is really good at. This was all done by folks in the lab — I cannot take credit for most of this. This is a collaboration between myself and Don. This is the guy who started the project in my lab, and this is the guy who ’ s been doing prostate stuff. Thank you very much.

It ’ s wonderful to be back. I love this wonderful gathering. And you must be wondering,”What on earth? Have they put up the wrong slide?”No, no. Look at this magnificent beast, and ask the question : Who designed it? This is TED ; this is Technology, Entertainment, Design, and there ’ s a dairy cow. It ’ s a quite wonderfully designed animal. And I was thinking, how do I introduce this? And I thought, well, maybe that old doggerel by Joyce Kilmer, you know :”Poems are made by fools like me, but only God can make a tree.”And you might say,”Well, God designed the cow.”But, of course, God got a lot of help. This is the ancestor of cattle. This is the aurochs. And it was designed by natural selection, the process of natural selection, over many millions of years. And then it became domesticated, thousands of years ago. And human beings became its stewards, and, without even knowing what they were doing, they gradually redesigned it and redesigned it and redesigned it. And then more recently, they really began to do reverse engineering on this beast and figure out just what the parts were, how they worked and how they might be optimized — how they might be made better. Now, why am I talking about cows? Because I want to say that much the same thing is true of religions. Religions are natural phenomena — they ’ re just as natural as cows. They have evolved over millennia. They have a biological base, just like the aurochs. They have become domesticated, and human beings have been redesigning their religions for thousands of years. This is TED, and I want to talk about design. Because what I ’ ve been doing for the last four years — really since the first time you saw me — some of you saw me at TED when I was talking about religion — and in the last four years, I ’ ve been working just about non-stop on this topic. And you might say it ’ s about the reverse engineering of religions. Now that very idea, I think, strikes terror in many people, or anger, or anxiety of one sort or another. And that is the spell that I want to break. I want to say, no, religions are an important natural phenomenon. We should study them with the same intensity that we study all the other important natural phenomena, like global warming, as we heard so eloquently last night from Al Gore. Today ’ s religions are brilliantly designed — brilliantly designed. They are immensely powerful social institutions and many of their features can be traced back to earlier features that we can really make sense of by reverse engineering. And, as with the cow, there ’ s a mixture of evolutionary design — designed by natural selection itself — and intelligent design — more or less intelligent design — and redesigned by human beings who are trying to redesign their religions. You don ’ t do book talks at TED, but I ’ m going to have just one slide about my book, because there is one message in it which I think this group really needs to hear. And I would be very interested to get your responses to this. It ’ s the one policy proposal that I make in the book, at this time, when I claim not to know enough about religion to know what other policy proposals to make. And it ’ s one that echoes remarks that you ’ ve heard already today. Here ’ s my proposal, I ’ m going to just take a couple of minutes to explain it : Education on world religions for all of our children — in primary school, in high school, in public schools, in private schools and in home schooling. So what I ’ m proposing is, just as we require reading, writing, arithmetic, American history, so we should have a curriculum on facts about all the religions of the world — about their history, about their creeds, about their texts, their music, their symbolisms, their prohibitions, their requirements. And this should be presented factually, straightforwardly, with no particular spin, to all of the children in the country. And as long as you teach them that, you can teach them anything else you like. That, I think, is maximal tolerance for religious freedom. As long as you inform your children about other religions, then you may — and as early as you like and whatever you like — teach them whatever creed you want them to learn. But also let them know about other religions. Now, why do I say that? Because democracy depends on an informed citizenship. Informed consent is the very bedrock of our understanding of democracy. Misinformed consent is not worth it. It ’ s like a coin flip ; it doesn ’ t count, really. Democracy depends on informed consent. This is the way we treat people as responsible adults. Now, children below the age of consent are a special case. Parents — I ’ m going to use a word that Pastor Rick just used — parents are stewards of their children. They don ’ t own them. You can ’ t own your children. You have a responsibility to the world, to the state, to them, to take care of them right. You may teach them whatever creed you think is most important, but I say you have a responsibility to let them be informed about all the other creeds in the world, too. The reason I ’ ve taken this time is I ’ ve been fascinated to hear some of the reactions to this. One reviewer for a Roman Catholic newspaper called it”totalitarian.”It strikes me as practically libertarian. Is it totalitarian to require reading, writing and arithmetic? I don ’ t think so. All I ’ m saying is — and facts, facts only ; no values, just facts — about all the world ’ s religions. Another reviewer called it”hilarious.”Well, I ’ m really bothered by the fact that anybody would think that was hilarious. It seems to me to be such a plausible, natural extension of the democratic principles we already have that I ’ m shocked to think anybody would find that just ridiculous. I know many religions are so anxious about preserving the purity of their faith among their children that they are intent on keeping their children ignorant of other faiths. I don ’ t think that ’ s defensible. But I ’ d really be pleased to get your answers on that — any reactions to that

— later. But now I ’ m going to move on. Back to the cow. This picture, which I pulled off the web — the fellow on the left is really an important part of this picture. That ’ s the steward. Cows couldn ’ t live without human stewards — they ’ re domesticated. They ’ re a sort of ectosymbiont. They depend on us for their survival. And Pastor Rick was just talking about sheep. I ’ m going to talk about sheep, too. There ’ s a lot of serendipitous convergence here. How clever it was of sheep to acquire shepherds! Think of what this got them. They could outsource all their problems : protection from predators, food-finding...... health maintenance. The only cost in most flocks — not even this — a loss of free mating. What a deal!”How clever of sheep!”you might say. Except, of course, it wasn ’ t the sheep ’ s cleverness. We all know sheep are not exactly rocket scientists — they ’ re not very smart. It wasn ’ t the cleverness of the sheep at all. They were clueless. But it was a very clever move. Whose clever move was it? It was the clever move of natural selection itself. Francis Crick, the co-discoverer of the structure of DNA with Jim Watson, once joked about what he called Orgel ’ s Second Rule. Leslie Orgel is a molecular biologist, brilliant guy, and Orgel ’ s Second Rule is : Evolution is cleverer than you are. Now, that is not Intelligent Design — not from Francis Crick. Evolution is cleverer than you are. If you understand Orgel ’ s Second Rule, then you understand why the Intelligent Design movement is basically a hoax. The designs discovered by the process of natural selection are brilliant, unbelievably brilliant. Again and again biologists are fascinated with the brilliance of what ’ s discovered. But the process itself is without purpose, without foresight, without design. When I was here four years ago, I told the story about an ant climbing a blade of grass. And why the ant was doing it was because its brain had been infected with a lancet fluke that was needed to get into the belly of a sheep or a cow in order to reproduce. So it was sort of a spooky story. And I think some people may have misunderstood. Lancet flukes aren ’ t smart. I submit that the intelligence of a lancet fluke is down there, somewhere between petunia and carrot. They ’ re not really bright. They don ’ t have to be. The lesson we learn from this is : you don ’ t have to have a mind to be a beneficiary. The design is there in nature, but it ’ s not in anybody ’ s head. It doesn ’ t have to be. That ’ s the way evolution works. Question : Was domestication good for sheep? It was great for their genetic fitness. And here I want to remind you of a wonderful point that Paul MacCready made at TED three years ago. Here ’ s what he said :”Ten thousand years ago, at the dawn of agriculture, human population, plus livestock and pets, was approximately a tenth of one percent of the terrestrial vertebrate landmass.”That was just 10, 000 years ago. Yesterday, in biological terms. What is it today? Does anybody remember what he told us? 98 percent. That is what we have done on this planet. Now, I talked to Paul afterwards — I wanted to check to find out how he ’ d calculated this, and get the sources and so forth — and he also gave me a paper that he had written on this. And there was a passage in it which he did not present here and I think it is so good, I ’ m going to read it to you :”Over billions of years on a unique sphere, chance has painted a thin covering of life : complex, improbable, wonderful and fragile. Suddenly, we humans — a recently arrived species no longer subject to the checks and balances inherent in nature — have grown in population, technology and intelligence to a position of terrible power. We now wield the paintbrush.”We heard about the atmosphere as a thin layer of varnish. Life itself is just a thin coat of paint on this planet. And we ’ re the ones that hold the paintbrush. And how can we do that? The key to our domination of the planet is culture. And the key to culture is religion. Suppose Martian scientists came to Earth. They would be puzzled by many things. Anybody know what this is? I ’ ll tell you what it is. This is a million people gathering on the banks of the Ganges in 2001, perhaps the largest single gathering of human beings ever, as seen from satellite photograph. Here ’ s a big crowd. Here ’ s another crowd in Mecca. Martians would be amazed by this. They ’ d want to know how it originated, what it was for and how it perpetuates itself. Actually, I ’ m going to pass over this. The ant isn ’ t alone. There ’ s all sorts of wonderful cases of species which — in that case — A parasite gets into a mouse and needs to get into the belly of a cat. And it turns the mouse into Mighty Mouse, makes it fearless, so it runs out in the open, where it ’ ll be eaten by a cat. True story. In other words, we have these hijackers — you ’ ve seen this slide before, from four years ago — a parasite that infects the brain and induces even suicidal behavior, on behalf of a cause other than one ’ s own genetic fitness. Does that ever happen to us? Yes, it does — quite wonderfully. The Arabic word”Islam”means”submission.”It means”surrender of self-interest to the will of Allah.”But I ’ m not just talking about Islam. I ’ m talking also about Christianity. This is a parchment music page that I found in a Paris bookstall 50 years ago. And on it, it says, in Latin :”Semen est verbum Dei. Sator autem Christus.”The word of God is the seed and the sower of the seed is Christ. Same idea. Well, not quite. But in fact, Christians, too... glory in the fact that they have surrendered to God. I ’ ll give you a few quotes.”The heart of worship is surrender. Surrendered people obey God ’ s words, even if it doesn ’ t make sense.”Those words are by Rick Warren. Those are from”The Purpose Driven Life.”And I want to turn now, briefly, to talk about that book, which I ’ ve read. You ’ ve all got a copy, and you ’ ve just heard the man. And what I want to do now is say a bit about this book from the design standpoint, because I think it ’ s actually a brilliant book. First of all, the goal — and you heard just now what the goal is — it ’ s to bring purpose to the lives of millions, and he has succeeded. Is it a good goal? In itself, I ’ m sure we all agree, it is a wonderful goal. He ’ s absolutely right. There are lots of people out there who don ’ t have purpose in their life, and bringing purpose to their life is a wonderful goal. I give him an A+ on this. Is the goal achieved? Yes. Thirty million copies of this book. Al Gore, eat your heart out. Just exactly what Al is trying to do, Rick is doing. This is a fantastic achievement. And the means — how does he do it? It ’ s a brilliant redesign of traditional religious themes — updating them, quietly dropping obsolete features, putting new interpretations on other features. This is the evolution of religion that ’ s been going on for thousands of years, and he ’ s just the latest brilliant practitioner of it. I don ’ t have to tell you this ; you just heard the man. Excellent insights into human psychology, wise advice on every page. Moreover, he invites us to look under the hood. I really appreciated that. For instance, he has an appendix where he explains his choice of translations of different Bible verses. The book is clear, vivid, accessible, beautifully formatted. Just enough repetition. That ’ s really important. Every time you read it or say it, you make another copy in your brain. Every time you read it or say it, you make another copy in your brain. With me, everybody — Every time you read it or say it, you make another copy in your brain. Thank you. And now we come to my problem. Because I ’ m absolutely sincere in my appreciation of all that I said about this book. But I wish it were better. I have some problems with the book. And it would just be insincere of me not to address those problems. I wish he could do this with a revision, a Mark 2 version of his book.”The truth will set you free.”That ’ s what it says in the Bible, and it ’ s something that I want to live by, too. My problem is, some of the bits in it I don ’ t think are true. Now some of this is a difference of opinion. And that ’ s not my main complaint, that ’ s worth mentioning. Here ’ s a passage — it ’ s very much what he said, anyway :”If there was no God we would all be accidents, the result of astronomical random chance in the Universe. You could stop reading this book because life would have no purpose or meaning or significance. There would be no right or wrong and no hope beyond your brief years on Earth.”Now, I just do not believe that. By the way, I find — Homer Groening ’ s film presented a beautiful alternative to that very claim. Yes, there is meaning and a reason for right or wrong. We don ’ t need a belief in God to be good or to have meaning in us. But that, as I said, is just a difference of opinion. That ’ s not what I ’ m really worried about. How about this :”God designed this planet ’ s environment just so we could live in it.”I ’ m afraid that a lot of people take that sentiment to mean that we don ’ t have to do the sorts of things that Al Gore is trying so hard to get us to do. I am not happy with that sentiment at all. And then I find this :”All the evidence available in the biological sciences supports the core proposition that the cosmos is a specially designed whole with life and mankind as its fundamental goal and purpose, a whole in which all facets of reality have their meaning and explanation in this central fact.”Well, that ’ s Michael Denton. He ’ s a creationist. And here, I think,”Wait a minute.”I read this again. I read it three or four times and I think,”Is he really endorsing Intelligent Design? Is he endorsing creationism here?”And you can ’ t tell. So I ’ m sort of thinking,”Well, I don ’ t know, I don ’ t know if I want to get upset with this yet.”But then I read on, and I read this :”First, Noah had never seen rain, because prior to the Flood, God irrigated the earth from the ground up.”I wish that sentence weren ’ t in there, because I think it is false. And I think that thinking this way about the history of the planet, after we ’ ve just been hearing about the history of the planet over millions of years, discourages people from scientific understanding. Now, Rick Warren uses scientific terms and scientific factoids and information in a very interesting way. Here ’ s one :”God deliberately shaped and formed you to serve him in a way that makes your ministry unique. He carefully mixed the DNA cocktail that created you.”I think that ’ s false. Now, maybe we want to treat it as metaphorical. Here ’ s another one :”For instance, your brain can store 100 trillion facts. Your mind can handle 15, 000 decisions a second.”Well, it would be interesting to find the interpretation where I would accept that. There might be some way of treating that as true.”Anthropologists have noted that worship is a universal urge, hardwired by God into the very fiber of our being — an inbuilt need to connect with God.”Well, the sense of which I agree with him, except I think it has an evolutionary explanation. And what I find deeply troubling in this book is that he seems to be arguing that if you want to be moral, if you want to have meaning in your life, you have to be an Intelligent Designer, you have to deny the theory of evolution by natural selection. And I think, on the contrary, that it is very important to solving the world ’ s problems that we take evolutionary biology seriously. Whose truth are we going to listen to? Well, this is from”The Purpose Driven Life”:”The Bible must become the authoritative standard for my life : the compass I rely on for direction, the counsel I listen to for making wise decisions, and the benchmark I use for evaluating everything.”Well maybe, OK, but what ’ s going to follow from this? And here ’ s one that does concern me. Remember I quoted him before with this line :”Surrendered people obey God ’ s word, even if it doesn ’ t make sense.”And that ’ s a problem.”Don ’ t ever argue with the Devil. He ’ s better at arguing than you are, having had thousands of years to practice.”Now, Rick Warren didn ’ t invent this clever move. It ’ s an old move. It ’ s a very clever adaptation of religions. It ’ s a wild card for disarming any reasonable criticism.”You don ’ t like my interpretation? You ’ ve got a reasonable objection to it? Don ’ t listen, don ’ t listen! That ’ s the Devil speaking.”This discourages the sort of reasoning citizenship it seems to me that we want to have. I ’ ve got one more problem, then I ’ m through. And I ’ d really like to get a response if Rick is able to do it.”In the Great Commission, Jesus said, ' Go to all people of all nations and make them my disciples. Baptize them in the name of the Father, the Son and the Holy Spirit, and teach them to do everything I ' ve told you. '"The Bible says Jesus is the only one who can save the world. We ' ve seen many wonderful maps of the world in the last day or so. Here ' s one, not as beautiful as the others ; it simply shows the religions of the world. Here ' s one that shows the sort of current breakdown of the different religions. Do we really want to commit ourselves to engulfing all the other religions, when their holy books are telling them,"Don ' t listen to the other side, that ' s just Satan talking!"? It seems to me that that ' s a very problematic ship to get on for the future. I found this sign as I was driving to Maine recently, in front of a church :"Good without God becomes zero."Sort of cute. A very clever little meme. I don ' t believe it and I think this idea, popular as it is — not in this guise, but in general — is itself one of the main problems that we face. If you are like me, you know many wonderful, committed, engaged atheists, agnostics, who are being very good without God. And you also know many religious people who hide behind their sanctity instead of doing good works. So, I wish we could drop this meme. I wish this meme would go extinct. Thanks very much for your attention.

Text Sample 438: NEG Dim 3 – 2008 – Score -2.00 – 2008/t000236.txt

So, people argue vigorously about the definition of life. They ask if it should have reproduction in it, or metabolism, or evolution. And I don ' t know the answer to that, so I ' m not going to tell you. I will say that life involves computation. So this is a computer program. Booted up in a cell, the program would execute, and it could result in this person ; or with a small change, it could result in this person ; or another small change, this person ; or with a larger change, this dog, or this tree, or this whale. So now, if you take this metaphor [of] genome as program seriously, you have to consider that Chris Anderson is a computer-fabricated artifact, as is Jim Watson, Craig Venter, as are all of us. And in convincing yourself that this metaphor is true, there are lots of similarities between genetic programs and computer programs that could help to convince you. But one, to me, that ' s most compelling is the peculiar sensitivity to small changes that can make large changes in biological development — the output. A small mutation can take a two-wing fly and make it a four-wing fly. Or it could take a fly and put legs where its antennae should be. Or if you ' re familiar with"The Princess Bride,"it could create a six-fingered man. Now, a hallmark of computer programs is just this kind of sensitivity to small changes. If your bank account ' s one dollar, and you flip a single bit, you could end up with a thousand dollars. So these small changes are things that I think that — they indicate to us that a complicated computation in development is underlying these amplified, large changes. So now, all of this indicates that there are molecular programs underlying biology, and it shows the power of molecular programs — biology does. And what I want to do is write molecular programs, potentially to build technology. And there are a lot of people doing this, a lot of synthetic biologists doing this, like Craig Venter. And they concentrate on using cells. They ' re cell- oriented. So my friends, molecular programmers, and I have a sort of biomolecule-centric approach. We ' re interested in using DNA, RNA and protein, and building new languages for building things from the bottom up, using biomolecules, potentially having nothing to do with biology. So, these are all the machines in a cell. There ' s a camera. There ' s the solar panels of the cell, some switches that turn your genes on and off, the girders of the cell, motors that move your muscles. My little group of molecular programmers are trying to refashion all of these parts from DNA. We ’ re not DNA zealots, but DNA is the cheapest, easiest to understand and easy to program material to do this. And as other things become easier to use — maybe protein — we ’ ll work with those. If we succeed, what will molecular programming look like? You ’ re going to sit in front of your computer. You ’ re going to design something like a cell phone, and in a high-level language, you ’ ll describe that cell phone. Then you ’ re going to have a compiler that ’ s going to take that description and it ’ s going to turn it into actual molecules that can be sent to a synthesizer and that synthesizer will pack those molecules into a seed. And what happens if you water and feed that seed appropriately, is it will do a developmental computation, a molecular computation, and it ’ ll build an electronic computer. And if I haven ’ t revealed my prejudices already, I think that life has been about molecular computers building electrochemical computers, building electronic computers, which together with electrochemical computers will build new molecular computers, which will build new electronic computers, and so forth. And if you buy all of this, and you think life is about computation, as I do, then you look at big questions through the eyes of a computer scientist. So one big question is, how does a baby know when to stop growing? And for molecular programming, the question is how does your cell phone know when to stop growing? Or how does a computer program know when to stop running? Or more to the point, how do you know if a program will ever stop? There are other questions like this, too. One of them is Craig Venter ’ s question. Turns out I think he ’ s actually a computer scientist. He asked, how big is the minimal genome that will give me a functioning microorganism? How few genes can I use? This is exactly **analogous** to the question, what ’ s the smallest program I can write that will act exactly like Microsoft Word? And just as he ’ s writing, you know, bacteria that will be smaller, he ’ s writing genomes that will work, we could write smaller programs that would do what Microsoft Word does. But for molecular programming, our question is, how many molecules do we need to put in that seed to get a cell phone? What ’ s the smallest number we can get away with? Now, these are big questions in computer science. These are all complexity questions, and computer science tells us that these are very hard questions. Almost — many of them are impossible. But for some tasks, we can start to answer them. So, I ’ m going to start asking those questions for the DNA structures I ’ m going to talk about next. So, this is normal DNA, what you think of as normal DNA. It ’ s double-stranded, it ’ s a double helix, has the As, Ts, Cs and Gs that pair to hold the strands together. And I ’ m going to draw it like this sometimes, just so I don ’ t scare you. We want to look at individual strands and not think about the double helix. When we synthesize it, it comes single-stranded, so we can take the blue strand in one tube and make an orange strand in the other tube, and they ’ re floppy when they ’ re single-stranded. You mix them together and they make a rigid double helix. Now for the last 25 years, Ned Seeman and a bunch of his descendants have worked very hard and made beautiful three-dimensional structures using this kind of reaction of DNA strands coming together. But a lot of their approaches, though elegant, take a long time. They can take a couple of years, or it can be difficult to design. So I came up with a new method a couple of years ago I call DNA origami that ’ s so easy you could do it at home in your kitchen and design the stuff on a laptop. But to do it, you need a long, single strand of DNA, which is technically very difficult to get. So, you can go to a natural source. You can look in this computer-fabricated artifact, and he ’ s got a double-stranded genome — that ’ s no good. You look in his intestines. There are billions of bacteria. They ’ re no good either. Double strand again, but inside them, they ’ re infected with a virus that has a nice, long, single-stranded genome that we can fold like a piece of paper. And here ’ s how we do it. This is part of that genome. We add a bunch of short, synthetic DNAs that I call staples. Each one has a left half that binds the long strand in one place, and a right half that binds it in a different place, and brings the long strand together like this. The net action of many of these on that long strand is to fold it into something like a rectangle. Now, we can ’ t actually take a movie of this process, but Shawn Douglas at Harvard has made a nice visualization for us that begins with a long strand and has some short strands in it. And what happens is that we mix these strands together. We heat them up, we add a little bit of salt, we heat them up to almost boiling and cool them down, and as we cool them down, the short strands bind the long strands and start to form structure. And you can see a little bit of double helix forming there. When you look at DNA origami, you can see that what it really is, even though you think it ’ s complicated, is a bunch of double helices that are parallel to each other, and they ’ re held together by places where short strands go along one helix and then jump to another one. So there ’ s a strand that goes like this, goes along one helix and binds — it jumps to another helix and comes back. That holds the long strand like this. Now, to show that we could make any shape or pattern that we wanted, I tried to make this shape. I wanted to fold DNA into something that goes up over the eye, down the nose, up the nose, around the forehead, back down and end in a little loop like this. And so, I thought, if this could work, anything could work. So I had the computer program design the short staples to do this. I ordered them ; they came by FedEx. I mixed them up, heated them, cooled them down, and I got 50 billion little smiley faces floating around in a single drop of water. And each one of these is just one-thousandth the width of a human hair, OK? So, they ’ re all floating around in solution, and to look at them, you have to get them on a surface where they stick. So, you pour them out onto a surface and they start to stick to that surface, and we take a picture using an atomic- force microscope. It ’ s got a needle, like a record needle, that goes back and forth over the surface, bumps up and down, and feels the height of the first surface. It feels the DNA origami. There ’ s the atomic-force microscope working and you can see that the landing ’ s a little rough. When you zoom in, they ’ ve got, you know, weak jaws that flip over their heads and some of their noses get punched out, but it ’ s pretty good. You can zoom in and even see the extra little loop, this little nano-goatee. Now, what ’ s great about this is anybody can do this. And so, I got this in the mail about a year after I did this, unsolicited. Anyone know what this is? What is it? It ’ s China, right? So, what happened is, a graduate student in China, Lulu Qian, did a great job. She wrote all her own software to design and built this DNA origami, a beautiful rendition of China, which even has Taiwan, and you can see it ’ s sort of on the world ’ s shortest leash, right? So, this works really well and you can make patterns as well as shapes, OK? And you can make a map of the Americas and spell DNA with DNA. And what ’ s really neat about it — well, actually, this all looks like nano- artwork, but it turns out that nano-artwork is just what you need to make nano- circuits. So, you can put circuit components on the staples, like a light bulb and a light switch. Let the thing assemble, and you ’ ll get some kind of a circuit. And then you can maybe wash the DNA away and have the circuit left over. So, this is what some colleagues of mine at Caltech did. They took a DNA origami, organized some carbon nano-tubes, made a little switch, you see here, wired it up, tested it and showed that it is indeed a switch. Now, this is just a single switch and you need half a billion for a computer, so we have a long way to go. But this is very promising because the origami can organize parts just one-tenth the size of those in a normal computer. So it ’ s very promising for making small computers. Now, I want to get back to that compiler.

The DNA origami is a proof that that compiler actually works. So, you start with something in the computer. You get a high-level description of the computer program, a high-level description of the origami. You can compile it to molecules, send it to a synthesizer, and it actually works. And it turns out that a company has made a nice program that ' s much better than my code, which was kind of ugly, and will allow us to do this in a nice, visual, computer-aided design way. So, now you can say, all right, why isn ' t DNA origami the end of the story? You have your molecular compiler, you can do whatever you want. The fact is that it does not scale. So if you want to build a human from DNA origami, the problem is, you need a long strand that ' s 10 trillion trillion bases long. That ' s three light years ' worth of DNA, so we ' re not going to do this. We ' re going to turn to another technology, called algorithmic self-assembly of tiles. It was started by Erik Winfree, and what it does, it has tiles that are a hundredth the size of a DNA origami. You zoom in, there are just four DNA strands and they have little single-stranded bits on them that can bind to other tiles, if they match. And we like to draw these tiles as little squares. And if you look at their sticky ends, these little DNA bits, you can see that they actually form a checkerboard pattern. So, these tiles would make a complicated, self-assembling checkerboard. And the point of this, if you didn ' t catch that, is that tiles are a kind of molecular program and they can output patterns. And a really amazing part of this is that any computer program can be translated into one of these tile programs — specifically, counting. So, you can come up with a set of tiles that when they come together, form a little binary counter rather than a checkerboard. So you can read off binary numbers five, six and seven. And in order to get these kinds of computations started right, you need some kind of input, a kind of seed. You can use DNA origami for that. You can encode the number 32 in the right-hand side of a DNA origami, and when you add those tiles that count, they will start to count — they will read that 32 and they ' ll stop at 32. So, what we ' ve done is we ' ve figured out a way to have a molecular program know when to stop going. It knows when to stop growing because it can count. It knows how big it is. So, that answers that sort of first question I was talking about. It doesn ' t tell us how babies do it, however. So now, we can use this counting to try and get at much bigger things than DNA origami could otherwise. Here ' s the DNA origami, and what we can do is we can write 32 on both edges of the DNA origami, and we can now use our watering can and water with tiles, and we can start growing tiles off of that and create a square. The counter serves as a template to fill in a square in the middle of this thing. So, what we ' ve done is we ' ve succeeded in making something much bigger than a DNA origami by combining DNA origami with tiles. And the neat thing about it is, is that it ' s also reprogrammable. You can just change a couple of the DNA strands in this binary representation and you ' ll get 96 rather than 32. And if you do that, the origami ' s the same size, but the resulting square that you get is three times bigger. So, this sort of recapitulates what I was telling you about development. You have a very sensitive computer program where small changes — single, tiny, little mutations — can take something that made one size square and make something very much bigger. Now, this — using counting to compute and build these kinds of things by this kind of developmental process is something that also has bearing on Craig Venter ' s question. So, you can ask, how many DNA strands are required to build a square of a given size? If we wanted to make a square of size 10, 100 or 1, 000, if we used DNA origami alone, we would require a number of DNA strands that ' s the square of the size of that square ; so we ' d need 100, 10, 000 or a million DNA strands. That ' s really not affordable. But if we use a little computation — we use origami, plus some tiles that count — then we can get away with using 100, 200 or 300 DNA strands. And so we can exponentially reduce the number of DNA strands we use, if we use counting, if we use a little bit of computation. And so computation is some very powerful way to reduce the number of molecules you need to build something, to reduce the size of the genome that you ’ re building. And finally, I ’ m going to get back to that sort of crazy idea about computers building computers. If you look at the square that you build with the origami and some counters growing off it, the pattern that it has is exactly the pattern that you need to make a memory. So if you affix some wires and switches to those tiles — rather than to the staple strands, you affix them to the tiles — then they ’ ll self-assemble the somewhat complicated circuits, the demultiplexer circuits, that you need to address this memory. So you can actually make a complicated circuit using a little bit of computation. It ’ s a molecular computer building an electronic computer. Now, you ask me, how far have we gotten down this path? Experimentally, this is what we ’ ve done in the last year. Here is a DNA origami rectangle, and here are some tiles growing from it. And you can see how they count. One, two, three, four, five, six, nine, 10, 11, 12, 17. So it ’ s got some errors, but at least it counts up. So, it turns out we actually had this idea nine years ago, and that ’ s about the time constant for how long it takes to do these kinds of things, so I think we made a lot of progress. We ’ ve got ideas about how to fix these errors. And I think in the next five or 10 years, we ’ ll make the kind of squares that I described and maybe even get to some of those self-assembled circuits. So now, what do I want you to take away from this talk? I want you to remember that to create life ’ s very diverse and complex forms, life uses computation to do that. And the computations that it uses, they ’ re molecular computations, and in order to understand this and get a better handle on it, as Feynman said, you know, we need to build something to understand it. And so we are going to use molecules and refashion this thing, rebuild everything from the bottom up, using DNA in ways that nature never intended, using DNA origami, and DNA origami to seed this algorithmic self-assembly. You know, so this is all very cool, but what I ’ d like you to take from the talk, hopefully from some of those big questions, is that this molecular programming isn ’ t just about making gadgets. It ’ s not just making about — it ’ s making self-assembled cell phones and circuits. What it ’ s really about is taking computer science and looking at big questions in a new light, asking new versions of those big questions and trying to understand how biology can make such amazing things. Thank you.

Text Sample 439: NEG Dim 3 – 2008 – Score -2.00 – 2008/t000283.txt

You know, I ’ ve talked about some of these projects before â about the human genome and what that might mean, and discovering new sets of genes. We ’ re actually starting at a new point : we ’ ve been digitizing biology, and now we ’ re trying to go from that digital code into a new phase of biology with designing and synthesizing life. So, we ’ ve always been trying to ask big questions.”What is life?”is something that I think many biologists have been trying to understand at various levels. We ’ ve tried various approaches, paring it down to minimal components. We ’ ve been digitizing it now for almost 20 years ; when we sequenced the human genome, it was going from the analog world of biology into the digital world of the computer. Now we ’ re trying to ask,”Can we regenerate life or can we create new life out of this digital universe?”This is the map of a small organism, Mycoplasma genitalium, that has the smallest genome for a species that can self-replicate in the laboratory, and we ’ ve been trying to just see if we can come up with an even smaller genome. We ’ re able to knock out on the order of 100 genes out of the 500 or so that are here. When we look at its metabolic map, it ’ s relatively simple compared to ours â trust me, this is simple â but when we look at all the genes that we can knock out one at a time, it ’ s very unlikely that this would yield a living cell. So we decided the only way forward was to actually synthesize this chromosome so we could vary the components to ask some of these most fundamental questions. And so we started down the road of : can we synthesize a chromosome? Can chemistry permit making these really large molecules where we ’ ve never been before? And if we do, can we boot up a chromosome? A chromosome, by the way, is just a piece of inert chemical material. So, our pace of digitizing life has been increasing at an exponential pace. Our ability to write the genetic code has been moving pretty slowly but has been increasing, and our latest point would put it on, now, an exponential curve. We started this over 15 years ago. It took several stages, in fact, starting with a bioethical review before we did the first experiments. But it turns out synthesizing DNA is very difficult. There are tens of thousands of machines around the world that make small pieces of DNA â 30 to 50 letters in length â and it ’ s a degenerate process, so the longer you make the piece, the more errors there are. So we had to create a new method for putting these little pieces together and correct all the errors. And this was our first attempt, starting with the digital information of the genome of phi X174. It ’ s a small virus that kills bacteria. We designed the pieces, went through our error correction and had a DNA molecule of about 5, 000 letters. The exciting phase came when we took this piece of inert chemical and put it in the bacteria, and the bacteria started to read this genetic code, made the viral particles. The viral particles then were released from the cells and came back and killed the E. coli. I was talking to the oil industry recently and I said they clearly understood that model. They laughed more than you guys are. And so, we think this is a situation where the software can actually build its own hardware in a biological system. But we wanted to go much larger : we wanted to build the entire bacterial chromosome â it ’ s over 580, 000 letters of genetic code â so we thought we ’ d build them in cassettes the size of the viruses so we could actually vary the cassettes to understand what the actual components of a living cell are. Design is critical, and if you ’ re starting with digital information in the computer, that digital information has to be really accurate. When we first sequenced this genome in 1995, the standard of accuracy was one error per 10, 000 base pairs. We actually found, on resequencing it, 30 errors ; had we used that original sequence, it never would have been able to be booted up. Part of the design is designing pieces that are 50 letters long that have to overlap with all the other 50-letter pieces to build smaller subunits we have to design so they can go together. We design unique elements into this. You may have read that we put watermarks in. Think of this : we have a four- letter genetic code â A, C, G and T. Triplets of those letters code for roughly 20 amino acids, such that there ’ s a single letter designation for each of the amino acids. So we can use the genetic code to write out words, sentences, thoughts. Initially, all we did was autograph it. Some people were disappointed there was not poetry. We designed these pieces so we can just chew back with enzymes ; there are enzymes that repair them and put them together. And we started making pieces, starting with pieces that were 5, 000 to 7, 000 letters, put those together to make 24, 000-letter pieces, then put sets of those going up to 72, 000. At each stage, we grew up these pieces in abundance so we could sequence them because we ’ re trying to create a process that ’ s extremely robust that you can see in a minute. We ’ re trying to get to the point of automation. So, this looks like a basketball playoff. When we get into these really large pieces over 100, 000 base pairs, they won ’ t any longer grow readily in E. coli â it exhausts all the modern tools of molecular biology â and so we turned to other mechanisms. We knew there ’ s a mechanism called homologous **recombination** that biology uses to repair DNA that can put pieces together. Here ’ s an example of it : there ’ s an organism called Deinococcus radiodurans that can take three millions **rads** of radiation. You can see in the top panel, its chromosome just gets blown apart. Twelve to 24 hours later, it put it back together exactly as it was before. We have thousands of organisms that can do this. These organisms can be totally desiccated ; they can live in a vacuum. I am absolutely certain that life can exist in outer space, move around, find a new aqueous environment. In fact, NASA has shown a lot of this is out there. Here ’ s an actual micrograph of the molecule we built using these processes, actually just using yeast mechanisms with the right design of the pieces we put them in ; yeast puts them together automatically. This is not an electron micrograph ; this is just a regular photomicrograph. It ’ s such a large molecule we can see it with a light microscope. These are pictures over about a six- second period. So, this is the publication we had just a short while ago. This is over 580, 000 letters of genetic code ; it ’ s the largest molecule ever made by humans of a defined structure. It ’ s over 300 million molecular weight. If we printed it out at a 10 font with no spacing, it takes 142 pages just to print this genetic code. Well, how do we boot up a chromosome? How do we activate this? Obviously, with a virus it ’ s pretty simple ; it ’ s much more complicated dealing with bacteria. It ’ s also simpler when you go into eukaryotes like ourselves : you can just pop out the nucleus and pop in another one, and that ’ s what you ’ ve all heard about with cloning. With bacteria and Archaea, the chromosome is integrated into the cell, but we recently showed that we can do a complete transplant of a chromosome from one cell to another and activate it. We purified a chromosome from one microbial species â roughly, these two are as distant as human and mice â we added a few extra genes so we could select for this chromosome, we digested it with enzymes to kill all the proteins, and it was pretty stunning when we put this in the cell â and you ’ ll appreciate our very sophisticated graphics here. The new chromosome went into the cell. In fact, we thought this might be as far as it went, but we tried to design the process a little bit further. This is a major mechanism of evolution right here. We find all kinds of species that have taken up a second chromosome or a third one from somewhere, adding thousands of new traits in a second to that species. So, people who think of evolution as just one gene changing at a time have missed much of biology. There are enzymes called restriction enzymes that actually digest DNA. The chromosome that was in the cell doesn ’ t have one ; the chromosome we put in does. It got expressed and it recognized the other chromosome as foreign material, chewed it up, and so we ended up just with a cell with the new chromosome. It turned blue because of the genes we put in it. And with a very short period of time, all the characteristics of one species were lost and it converted totally into the new species based on the new software that we put in the cell. All the proteins changed, the membranes changed ; when we read the genetic code, it ’ s exactly what we had transferred in. So, this may sound like genomic alchemy, but we can, by moving the software of DNA around, change things quite dramatically. Now I ’ ve argued, this is not genesis ; this is building on three and a half billion years of evolution. And I ’ ve argued that we ’ re about to perhaps create a new version of the Cambrian explosion, where there ’ s massive new speciation based on this digital design. Why do this? I think this is pretty obvious in terms of some of the needs. We ’ re about to go from six and a half to nine billion people over the next 40 years. To put it in context for myself : I was born in 1946. There are now three people on the planet for every one of us that existed in 1946 ; within 40 years, there ’ ll be four. We have trouble feeding, providing fresh, clean water, medicines, fuel for the six and a half billion. It ’ s going to be a stretch to do it for nine. We use over five billion tons of coal, 30 billion-plus barrels of oil â that ’ s a hundred million barrels a day. When we try to think of biological processes or any process to replace that, it ’ s going to be a huge challenge. Then of course, there ’ s all that CO2 from this material that ends up in the atmosphere. We now, from our discovery around the world, have a database with about 20 million genes, and I like to think of these as the design components of the future. The electronics industry only had a dozen or so components, and look at the diversity that came out of that. We ’ re limited here primarily by a biological reality and our imagination. We now have techniques, because of these rapid methods of synthesis, to do what we ’ re calling combinatorial genomics. We have the ability now to build a large robot that can make a million chromosomes a day. When you think of processing these 20 million different genes or trying to optimize processes to produce octane or to produce pharmaceuticals, new vaccines, we can just with a small team, do more molecular biology than the last 20 years of all science. And it ’ s just standard selection : we can select for viability, chemical or fuel production, vaccine production, etc. This is a screen snapshot of some true design software that we ’ re working on to actually be able to sit down and design species in the computer. You know, we don ’ t know necessarily what it ’ ll look like : we know exactly what their genetic code looks like. We ’ re focusing on now fourth-generation fuels. You ’ ve seen recently, corn to ethanol is just a bad experiment. We have second- and third- generation fuels that will be coming out relatively soon that are sugar, to much higher-value fuels like octane or different types of butanol. But the only way we think that biology can have a major impact without further increasing the cost of food and limiting its availability is if we start with CO2 as its feedstock, and so we ’ re working with designing cells to go down this road. And we think we ’ ll have the first fourth-generation fuels in about 18 months. Sunlight and CO2 is one method... but in our discovery around the world, we have all kinds of other methods. This is an organism we described in 1996. It lives in the deep ocean, about a mile and a half deep, almost at boiling-water temperatures. It takes CO2 to methane using molecular hydrogen as its energy source. We ’ re looking to see if we can take captured CO2, which can easily be piped to sites, convert that CO2 back into fuel to drive this process. So, in a short period of time, we think that we might be able to increase what the basic question is of”What is life?”We truly, you know, have modest goals of replacing the whole petrol-chemical industry â Yeah. If you can ’ t do that at TED, where can you? â become a major source of energy... But also, we ’ re now working on using these same tools to come up with instant sets of vaccines. You ’ ve seen this year with flu ; we ’ re always a year behind and a dollar short when it comes to the right vaccine. I think that can be changed by building combinatorial vaccines in advance. Here ’ s what the future may begin to look like with changing, now, the evolutionary tree, speeding up evolution with synthetic bacteria, Archaea and, eventually, eukaryotes. We ’ re a ways away from improving people : our goal is just to make sure that we have a chance to survive long enough to maybe do that. Thank you very much.

Text Sample 440: NEG Dim 3 – 2008 – Score -1.00 – 2008/t000173.txt

The north coast of California has rainforests â temperate rainforests â where it can rain more than 100 inches a year. This is the realm of the Coast Redwood tree. Its species name is Sequoia sempervirens. Sequoia sempervirens is the tallest living organism on Earth. The range of the species goes up to as much as 380 feet tall. That ’ s 38 stories tall. These are trees that would stand out in midtown Manhattan. Nobody knows how old the oldest living Coast Redwoods are because nobody has ever drilled into any of them to count their annual growth rings, and, in any case, the centers of the oldest individuals appear to be hollow. But it ’ s believed that the oldest living Redwoods are perhaps 2, 500 years old â roughly the age of the Parthenon â although it ’ s also suspected that there may be individual trees that are older than that. You can see the range of the Coast Redwoods. It ’ s here, in red. The largest individuals of this species, the dreadnoughts of their kind, live just on the north coast of California, where the rain is really intense. In recent historic times, about 96 percent of the Coast Redwood forest was cut down, especially in a series of bursts of intense liquidation logging, clear-cutting that took place in the 1970s through the early 1990s. Even so, about four percent of the primeval Redwood rainforest remains intact, wild and now protected â entirely protected â in a chain of small parks strung out like pearls along the north coast of California, including Redwood National Park. But curiously, Redwood rainforests, the fragments that we have left, to this day remain underexplored. Redwood rainforest is incredibly difficult to move through, and even today, individual trees are being discovered that have never been seen before, including, in the summer of 2006, Hyperion, the world ’ s tallest tree. I ’ m going to do a little Gedanken experiment. I ’ m going to ask you to imagine what a Redwood really is as a living organism. And, Chris, if I could have you up here? I have a tape measure. It ’ s a kind loaner from TED. And Chris, if you could take the end of that tape measure? We ’ re going to show you what the diameter at breast height of a big Redwood is. Unfortunately, this tape isn ’ t long enough â it ’ s only a 25-foot tape. Chris, could you extend your arm out that way? There we go. OK. And maybe about here, about 30 feet, is the diameter of a big Redwood. Now, let your imagination go upward into space. Think about this tree, rising upward into Redwood space, 325 feet, 32 stories, an individual living organism articulating its forms upward into space over long periods of time. The Redwood species seems to exist in another kind of time : not human time, but what we might call Redwood time. Redwood time moves at a more stately pace than human time. To us, when we look at a Redwood tree, it seems to be motionless and still, and yet Redwoods are constantly in motion, moving upward into space, articulating themselves and filling Redwood space over Redwood time, over thousands of years. Plant this small seed, wait 2, 000 years, and you get this : the Lost Monarch. It dwells in the Grove of Titans on the north coast, and was discovered in 1998. And yet, when you look at the base of a Redwood tree, you ’ re not seeing the organism. You ’ re like a mouse looking at the foot of an elephant, and most of the organism is overhead, unseen. I became very interested, and I wrote about a couple. Steve Sillett and Marie Antoine are the principal explorers of the Redwood forest canopy. They ’ re world-class athletes, and they also are world-class forest ecology scientists. Steve Sillett, when he was a 19-year-old college student at Reed College, had heard that the Redwood forest canopy is considered to be a so-called Redwood desert. That is to say, at that time it was believed that there was nothing up there except the branches of Redwood trees. And with a friend of his, he took it upon himself to free-climb a Redwood without ropes or any equipment to see what was up there. He climbed up a small tree next to this giant Redwood, and then he leaped through space and grabbed a branch with his hands, and ended up hanging, like catching a bar of a trapeze. And then, from there, he climbed directly up the bark until he got to the top of the tree. His friend, a guy named Marwood Harris, was following behind. Neither one of them had noticed that there was a Yellow Jacket wasp ’ s nest the size of a bowling ball hanging from the branch that Steve had jumped into. And when Marwood made the jump, he was covered with wasps stinging him in the face and eyes. He nearly let go. He would have fallen to his death, being 75 feet above the ground. But they made it to the top, and what they found was not a Redwood desert, but a lost world â a kind of three-dimensional labyrinth in the air, filled with unknown life. Now, I had been working on other topics : the emergence of infectious diseases, which come out of the natural ecosystems of the Earth, make a trans-species jump, and get into humans. After three books on this, it got to be a bit much, in a way. My wife and I adore our children. And I began climbing trees with my kids as just something to do with them, using the so-called arborist climbing technique, with ropes. You use ropes to get yourself up into the crown of a tree. Children are incredibly adept at climbing trees. That ’ s my son, Oliver. They don ’ t seem to suffer from the same fear of heights that humans do. If ontogeny recapitulates phylogeny, then children are somewhat closer to our roots as primates in the arboreal forest. Humans appear to be the only primates that I know of that are afraid of heights. All other primates, when they ’ re scared, they run up a tree, where they feel safe. We camped overnight in the trees, in tree boats. This is my daughter Laura, then 15, looking out of a tree boat. She ’ s, by the way, tied in with a rope so she can ’ t fall. Looking out of a tree boat in the morning and hearing birdsong coming in three dimensions around us. We had been visited in the night by flying squirrels, who don ’ t seem to recognize humans for what they are because they ’ ve never seen them in the canopy before. And we practiced advanced techniques like sky-walking, where you can move from tree to tree through space, rather like Spiderman. It became a writing project. When Steve Sillett gets up into a big Redwood, he fires an arrow, which trails a fishing line, which gets over a branch in the tree, and then you ascend up a rope which has been dragged into the tree by the line. You ascend 30 stories. There are two people climbing this tree, Gaya, which is thought to be one of the oldest Redwoods. There they are. They are only one-seventh of the way up that tree. You do feel a sense of exposure. There is a small person right down there on the ground. You feel like you ’ re climbing a wall of wood. But then you enter the Redwood canopy, and it ’ s like coming through a layer of clouds. And all of a sudden, you lose sight of the ground, and you also lose sight of the sky, and you ’ re in a three-dimensional labyrinth in the air filled with hanging gardens of ferns growing out of soil, which is populated with all kinds of small organisms. There are epiphytes, plants that grow on trees. These are huckleberry bushes. Many species of mosses, and then all sorts of lichens just plastering the tree. When you get near the top of the tree, you feel like you can ’ t fall â in fact, it ’ s difficult to move. You ’ re worming your way through branches which are crowded with living things that don ’ t occur near the ground. It ’ s like scuba diving into a coral reef, except you ’ re going upward instead of downward. And then the trees tend to flare out into platform-like areas at the top. Maria ’ s sitting on one of them. These limbs could be five to six hundred years old. Redwoods grow very slowly in their tops. They also have a feature : thickets of huckleberry bushes that grow out of the tops of Redwood trees that are technically known as huckleberry afros, and you can sit there and snack on the berries while you ’ re resting. Redwoods have an enormous surface area that extends upward into space because they have a propensity to do something called reiteration. A Redwood is a fractal. And as they put out limbs, the limbs burst into small trees, copies of the Redwood. Now, here we see a reiteration in Chronos, one of the older Redwoods. This reiteration is a huge flying buttress that comes out the tree itself. This buttress is less than halfway up the tree. And then it bursts into a forest of Redwoods.

This particular extra trunk is a meter across at the base and extends upward for 150 feet. It ’ s as big as any of the biggest trees east of the Mississippi River, and yet it ’ s only a minor feature on Chronos. This three-dimensional map of the crown structure of a Redwood named Iluvatar, made by Steve Sillett, Marie Antoine and their colleagues, gives you an idea. What you ’ re seeing here is a hierarchical **schematic** development of the trunks of this tree as it has elaborated itself over time into six layers of fractal, of trunks springing from trunks springing from trunks. I asked Steve to put a human being in this to give a sense of scale. There ’ s the person, right there. The person is waving to us. I ’ ve wanted to ask Craig Venter if it would be possible to insert a synthetic chromosome into a human so that we could reiterate ourselves if we wanted to. And if we were able to reiterate, then the fingers of our hand would be people who looked like us, and they would have people on their hands and so on. And if we had Redwood-like biology, we would have six layers of people on our hands, as it were. And it would be a lovely thing to be able to wave to someone and have all our reiterations wave at the same time. To reiterate the point, let ’ s go closer into Iluvatar. We ’ re looking at that yellow box. And this hallucinatory drawing shows you â□□ everything you see in this drawing is Iluvatar. These are millennial structures â□□ portions of the tree that are believed to be more than 1, 000 years old. There are four humans in this shot â□□ one, two, three, four. And there ’ s also something that I want to show you. This is a flying buttress. Redwoods grow back into themselves as they expand into space, and this flying buttress is a limb shot out of that small trunk, going back into the main trunk and fusing with it. Flying buttresses, just as in a cathedral, help strengthen the crown of the tree and help the tree exist longer through time. The scientists are doing all kinds of experiments in these trees. They ’ ve wired them like patients in an ICU. They ’ re finding out that Redwoods can move moisture out of the air and down into their trunks, possibly all the way into their root systems. They also have the ability to put roots anywhere in the tree itself. If a portion of a Redwood is rotting, the Redwood will send roots into its own form and draw nutrients out of itself as it falls apart. If we had Redwood-like biology, if we got a touch of gangrene in our arm then we could just, you know, extract the nutrients extract the nutrients and the moisture out of it until it fell off. Canopy soil can occur up to a meter deep, hundreds of feet above the ground, and there are organisms in this soil that have, as yet, no names. This is an unnamed species of copepod. A copepod is a crustacean. These copepods are a major constituent of the oceans, and they are a major part of the diet of grazing baleen whales. What they ’ re doing in the Redwood forest canopy soil hundreds of feet above the ocean, or how they got there, is completely unknown. There are some interesting theories that, if I had time, I would tell you about. But as you go and you look closer at a tree, what you see is, you see increasing complexity. We ’ re looking at the very top of Gaya, which is thought to be the oldest Redwood. Gaya may be 3, 000 to 5, 000 years old, no one really knows, but its top has broken off and it ’ s been rotting back now. This little Japanese garden-like creation probably took 700 years to form in its complexity that we see right now. As you look at a tree, it takes a magnifying glass to see a giant tree. I have to show you something unfortunately very sad at the conclusion of this talk. The Eastern Hemlock tree has often been described as the Redwood of the East. And we ’ re moving in a full circle now. In the 1950s, a small organism appeared in Richmond, Virginia, called the Hemlock woolly adelgid. It made a trans-species jump out of some other organism in Asia, where it was living on Hemlock trees in Asia. When it moved into its new host, the Eastern Hemlock tree, it escaped its predators, and the new tree had no resistance to it. The Eastern Hemlock forest is being considered in some ways the last fragments of primeval rainforest east of the Mississippi River. I hadn ’ t even known that there were rainforests in the east, but in Great Smoky Mountains National Park it can rain up to 100 inches of rain a year. And in the last two to three summers, these invasive organisms, this kind of Ebola of the trees, as it were, has swept through the primeval Hemlock forest of the east, and has absolutely wiped it out. I climbed there this past summer. This is Great Smoky Mountains National Park, and the Hemlocks are dead as far as the eye can see. And what we ’ re seeing is not just the potential death of the Eastern Hemlock species â that is to say, its extinction from nature due to this invading parasite â but we ’ re also seeing the death of an incredibly complex ecosystem for which these trees are merely the substrate for the aerial labyrinth of the sky that exists in their crowns. It ’ s absolutely heartbreaking to see. One of the things that is just â I almost can ’ t conceive it â is the idea that the national news media hasn ’ t picked this up at all, and this is the devastation of one of the most important ecosystems in North America. What can the Redwoods tell us about ourselves? Well, I think they can tell us something about human time. The flickering, transitory quality of human time and the brevity of human life â the necessity to love. But we ’ re different from trees, and they can also teach us something about ourselves in the differences that we have. We are human, and we have the capacity to love, we have the capacity to wonder, and we have a sort of boundless curiosity, a restless inquisitiveness that so suits us as primates, I think. And at least for me, personally, the trees have taught me an entirely new way of loving my children. Exploring with them the forest canopy has been one of the most lovely things of my existence on Earth. And I think that one of the happiest things is the sense that with my children I ’ ve been able to introduce them into the very small circle of humans who are lucky enough, or possibly stupid enough, to still climb trees. Thank you very much. Chris Anderson : I think at a previous TED, I think it was Nathan Myhrvold who told me that it was thought that because these trees are like, 2, 000 years and older, on many of them there are ecosystems where there are species that are not found anywhere on the Earth except on that one tree. Is that correct? Richard Preston : Yes, that is correct. I mentioned Hyperion, the world ’ s tallest tree. And I was a member of a climbing team that made the first climb of it, in 2006. And while we were climbing Hyperion, Marie Antoine spotted an unknown species of golden-brown ant about halfway up the trunk. Ants are not known to occur in Redwood trees, curiously enough, and we wondered whether this ant, this species of ant, was only endemic to that one tree, or possibly to that grove. And in subsequent climbs they could never find that ant again, and so no specimens have ever been collected. We don ’ t know what it is â we just know it ’ s there. CA : So, you have to wonder when, you know, if some other species than us was recording the stories that mattered on Earth, you know, our stories are about Iraq and war and politics and celebrity gossip. You ’ ve just told us a different story of this tragic arms race that ’ s happening, and maybe whole ecosystems gone forever. It ’ s an amazing sense of wonder you ’ ve given me, and a sense of just how fragile this whole thing is. RP : It is fragile, and you know, I think about emerging human diseases â parasites that move into the human species. But that ’ s just a very small facet of a much greater problem of invasions of species worldwide, all through the ecosystems, and you know, the Earth itself â CA : Partly caused by us, inadvertently. RP : Caused by humans. Caused by the movement of humans. You can think of the Earth ’ s biosphere as a palace, and the continents are rooms in the palace, and the islands are small rooms. But lately, the doors of the palace have been flung open, and the walls are coming down. CA : Richard Preston, thank you very much, I think. RP : Thank you.

I thought I ’ d talk a little bit about how nature makes materials. I brought along with me an abalone shell. This abalone shell is a biocomposite material that ’ s 98 percent by mass calcium carbonate and two percent by mass protein. Yet, it ’ s 3, 000 times tougher than its geological counterpart. And a lot of people might use structures like abalone shells, like chalk. I ’ ve been fascinated by how nature makes materials, and there ’ s a lot of secrets to how they do such an exquisite job. Part of it is that these materials are macroscopic in structure, but they ’ re formed at the nano scale. They ’ re formed at the nano scale, and they use proteins that are coded by the genetic level that allow them to build these really exquisite structures. So something I think is very fascinating is : What if you could give life to non-living structures, like batteries and like solar cells? What if they had some of the same capabilities that an abalone shell did, in terms of being able to build really exquisite structures at room temperature and room pressure, using nontoxic chemicals and adding no toxic materials back into the environment? So that ’ s kind of the vision that I ’ ve been thinking about. And so what if you could grow a battery in a Petri dish? Or what if you could give genetic information to a battery so that it could actually become better as a function of time, and do so in an environmentally friendly way? And so, going back to this abalone shell, besides being nanostructured, one thing that ’ s fascinating is, when a male and female abalone get together, they pass on the genetic information that says,”This is how to build an exquisite material. Here ’ s how to do it at room temperature and pressure, using nontoxic materials.”Same with diatoms, which are shown right here, which are glasseous structures. Every time the diatoms replicate, they give the genetic information that says,”Here ’ s how to build glass in the ocean that ’ s perfectly nanostructured.”And you can do it the same, over and over again.”So what if you could do the same thing with a solar cell or a battery? I like to say my favorite biomaterial is my four year old. But anyone who ’ s ever had or knows small children knows, they ’ re incredibly complex organisms. If you wanted to convince them to do something they don ’ t want to do, it ’ s very difficult. So when we think about future technologies, we actually think of using bacteria and viruses — simple organisms. Can you convince them to work with a new toolbox, so they can build a structure that will be important to me? Also, when we think about future technologies, we start with the beginning of Earth. Basically, it took a billion years to have life on Earth. And very rapidly, they became **multi-cellular**, they could replicate, they could use photosynthesis as a way of getting their energy source. But it wasn ’ t until about 500 million years ago — during the Cambrian geologic time period — that organisms in the ocean started making hard materials. Before that, they were all soft, fluffy structures. It was during this time that there was increased calcium, iron and silicon in the environment, and organisms learned how to make hard materials. So that ’ s what I would like to be able to do, convince biology to work with the rest of the periodic table. Now, if you look at biology, there ’ s many structures like DNA, antibodies, proteins and ribosomes you ’ ve heard about, that are nanostructured — nature already gives us really exquisite structures on the nano scale. What if we could harness them and convince them to not be an antibody that does something like HIV? What if we could convince them to build a solar cell for us? Here are some examples. Natural shells, natural biological materials. The abalone shell here. If you fracture it, you can look at the fact that it ’ s nanostructured. There ’ s diatoms made out of SiO2, and there are magnetotactic bacteria that make small, single-domain magnets used for navigation. What all these have in common is these materials are structured at the nano scale, and they have a DNA sequence that codes for a protein sequence that gives them the blueprint to be able to build these really wonderful structures. Now, going back to the abalone shell, the abalone makes this shell by having these proteins. These proteins are very negatively charged. They can pull calcium out of the environment, and put down a layer of calcium and then carbonate, calcium and carbonate. It has the chemical sequences of amino acids which says,"This is how to build the structure. Here ' s the DNA sequence, here ' s the protein sequence in order to do it."So an interesting idea is, what if you could take any material you wanted, or any element on the periodic table, and find its corresponding DNA sequence, then code it for a corresponding protein sequence to build a structure, but not build an abalone shell — build something that nature has never had the opportunity to work with yet. And so here ' s the periodic table. I absolutely love the periodic table. Every year for the incoming freshman class at MIT, I have a periodic table made that says,"Welcome to MIT. Now you ' re in your element."And you flip it over, and it ' s the amino acids with the pH at which they have different charges. And so I give this out to thousands of people. And I know it says MIT and this is Caltech, but I have a couple extra if people want it. I was really fortunate to have President Obama visit my lab this year on his visit to MIT, and I really wanted to give him a periodic table. So I stayed up at night and talked to my husband,"How do I give President Obama a periodic table? What if he says, ' Oh, I already have one, ' or, ' I ' ve already memorized it? '"So he came to visit my lab and looked around — it was a great visit. And then afterward, I said,"Sir, I want to give you the periodic table, in case you ' re ever in a bind and need to calculate molecular weight."I thought"molecular weight"sounded much less nerdy than"molar mass."And he looked at it and said,"Thank you. I ' ll look at it periodically."Later in a lecture that he gave on clean energy, he pulled it out and said,"And people at MIT, they give out periodic tables."So... So basically what I didn ' t tell you is that about 500 million years ago, the organisms started making materials, but it took them about 50 million years to get good at it — 50 million years to learn how to perfect how to make that abalone shell. And that ' s a hard sell to a graduate student :"I have this great project... 50 million years..."So we had to develop a way of trying to do this more rapidly. And so we use a nontoxic virus called M13 bacteriophage, whose job is to infect bacteria. Well, it has a simple DNA structure that you can go in and cut and paste additional DNA sequences into it, and by doing that, it allows the virus to express random protein sequences. This is pretty easy biotechnology, and you could basically do this a billion times. So you can have a billion different viruses that are all genetically identical, but they differ from each other based on their tips, on one sequence, that codes for one protein. Now if you take all billion viruses, and put them in one drop of liquid, you can force them to interact with anything you want on the periodic table. And through a process of selection evolution, you can pull one of a billion that does something you ' d like it to do, like grow a battery or a solar cell. Basically, viruses can ' t replicate themselves ; they need a host. Once you find that one out of a billion, you infect it into a bacteria, and make millions and billions of copies of that particular sequence. The other thing that ' s beautiful about biology is that biology gives you really exquisite structures with nice link scales. These viruses are long and skinny, and we can get them to express the ability to grow something like semiconductors or materials for batteries. Now, this is a high-powered battery that we grew in my lab. We engineered a virus to pick up carbon **nanotubes**. One part of the virus grabs a carbon nanotube, the other part of the virus has a sequence that can grow an electrode material for a battery, and then it wires itself to the current collector. And so through a process of selection evolution, we went from being able to have a virus that made a crummy battery to a virus that made a good battery to a virus that made a record-breaking, high-powered battery that ’ s all made at room temperature, basically at the benchtop. That battery went to the White House for a press conference, and I brought it here. You can see it in this case that ’ s lighting this LED. Now if we could scale this, you could actually use it to run your Prius, which is kind of my dream — to be able to drive a virus- powered car. But basically you can pull one out of a billion, and make lots of amplifications to it. Basically, you make an amplification in the lab, and then you get it to self-assemble into a structure like a battery. We ’ re able to do this also with catalysis. This is the example of a photocatalytic splitting of water. And what we ’ ve been able to do is engineer a virus to basically take dye-absorbing molecules and line them up on the surface of the virus so it acts as an antenna, and you get an energy transfer across the virus. And then we give it a second gene to grow an inorganic material that can be used to split water into oxygen and hydrogen, that can be used for clean fuels. I brought an example of that with me today. My students promised me it would work. These are virus-assembled nanowires. When you shine light on them, you can see them bubbling. In this case, you ’ re seeing oxygen bubbles come out. Basically, by controlling the genes, you can control multiple materials to improve your device performance. The last example are solar cells. You can also do this with solar cells. We ’ ve been able to engineer viruses to pick up carbon **nanotubes** and then grow titanium dioxide around them, and use it as a way of getting electrons through the device. And what we ’ ve found is through genetic engineering, we can actually increase the efficiencies of these solar cells to record numbers for these types of dye-sensitized systems. And I brought one of those as well, that you can play around with outside afterward. So this is a virus-based solar cell. Through evolution and selection, we took it from an eight percent efficiency solar cell to an 11 percent efficiency solar cell. So I hope that I ’ ve convinced you that there ’ s a lot of great, interesting things to be learned about how nature makes materials, and about taking it the next step, to see if you can force or take advantage of how nature makes materials, to make things that nature hasn ’ t yet dreamed of making. Thank you.

Text Sample 442: NEG Dim 3 – 2011 – Score -2.00 – 2011/t002540.txt

When I was little â and by the way, I was little once â my father told me a story about an 18th century watchmaker. And what this guy had done : he used to produce these fabulously beautiful watches. And one day, one of his customers came into his workshop and asked him to clean the watch that he ’ d bought. And the guy took it apart, and one of the things he pulled out was one of the balance wheels. And as he did so, his customer noticed that on the back side of the balance wheel was an engraving, were words. And he said to the guy,”Why have you put stuff on the back that no one will ever see?”And the watchmaker turned around and said,”God can see it.”Now I ’ m not in the least bit religious, neither was my father, but at that point, I noticed something happening here. I felt something in this plexus of blood vessels and nerves, and there must be some muscles in there as well somewhere, I guess. But I felt something. And it was a physiological response. And from that point on, from my age at the time, I began to think of things in a different way. And as I took on my career as a designer, I began to ask myself the simple question : Do we actually think beauty, or do we feel it? Now you probably know the answer to this already. You probably think, well, I don ’ t know which one you think it is, but I think it ’ s about feeling beauty. And so I then moved on into my design career and began to find some exciting things. One of the most early work was done in automotive design â some very exciting work was done there. And during a lot of this work, we found something, or I found something, that really fascinated me, and maybe you can remember it. Do you remember when lights used to just go on and off, click click, when you closed the door in a car? And then somebody, I think it was BMW, introduced a light that went out slowly. Remember that? I remember it clearly. Do you remember the first time you were in a car and it did that? I remember sitting there thinking, this is fantastic. In fact, I ’ ve never found anybody that doesn ’ t like the light that goes out slowly. I thought, well what the hell ’ s that about? So I started to ask myself questions about it. And the first was, I ’ d ask other people :”Do you like it?””Yes.””Why?”And they ’ d say,”Oh, it feels so natural,”or,”It ’ s nice.”I thought, well that ’ s not good enough. Can we cut down a little bit further, because, as a designer, I need the vocabulary, I need the keyboard, of how this actually works. And so I did some experiments. And I suddenly realized that there was something that did exactly that â light to dark in six seconds â exactly that. Do you know what it is? Anyone? You see, using this bit, the thinky bit, the slow bit of the brain â using that. And this isn ’ t a think, it ’ s a feel. And would you do me a favor? For the next 14 minutes or whatever it is, will you feel stuff? I don ’ t need you to think so much as I want you to feel it. I felt a sense of relaxation tempered with anticipation. And that thing that I found was the cinema or the theater. It ’ s actually just happened here â light to dark in six seconds. And when that happens, are you sitting there going,”No, the movie ’ s about to start,”or are you going,”That ’ s fantastic. I ’ m looking forward to it. I get a sense of anticipation”? Now I ’ m not a neuroscientist. I don ’ t know even if there is something called a conditioned reflex. But it might be. Because the people I speak to in the northern hemisphere that used to go in the cinema get this. And some of the people I speak to that have never seen a movie or been to the theater don ’ t get it in the same way. Everybody likes it, but some like it more than others. So this leads me to think of this in a different way. We ’ re not feeling it. We ’ re thinking beauty is in the limbic system â if that ’ s not an outmoded idea. These are the bits, the pleasure centers, and maybe what I ’ m seeing and sensing and feeling is bypassing my thinking. The wiring from your sensory **apparatus** to those bits is shorter than the bits that have to pass through the thinky bit, the cortex. They arrive first. So how do we make that actually work? And how much of that reactive side of it is due to what we already know, or what we ’ re going to learn, about something? This is one of the most beautiful things I know. It ’ s a plastic bag. And when I looked at it first, I thought, no, there ’ s no beauty in that. Then I found out, post exposure, that this plastic bag if I put it into a filthy puddle or a stream filled with coliforms and all sorts of disgusting stuff, that that filthy water will migrate through the wall of the bag by osmosis and end up inside it as pure, potable drinking water. And all of a sudden, this plastic bag was extremely beautiful to me. Now I ’ m going to ask you again to switch on the emotional bit. Would you mind taking the brain out, and I just want you to feel something. Look at that. What are you feeling about it? Is it beautiful? Is it exciting? I ’ m watching your faces very carefully. There ’ s some rather bored-looking gentlemen and some slightly engaged-looking ladies who are picking up something off that. Maybe there ’ s an innocence to it. Now I ’ m going to tell you what it is. Are you ready? This is the last act on this Earth of a little girl called Heidi, five years old, before she died of cancer to the spine. It ’ s the last thing she did, the last physical act. Look at that picture. Look at the innocence. Look at the beauty in it. Is it beautiful now? Stop. Stop. How do you feel? Where are you feeling this? I

’ m feeling it here. I feel it here. And I ’ m watching your faces, because your faces are telling me something. The lady over there is actually crying, by the way. But what are you doing? I watch what people do. I watch faces. I watch reactions. Because I have to know how people react to things. And one of the most common faces on something faced with beauty, something stupefyingly delicious, is what I call the OMG. And by the way, there ’ s no pleasure in that face. It ’ s not a”this is wonderful!”The eyebrows are doing this, the eyes are defocused, and the mouth is hanging open. That ’ s not the expression of joy. There ’ s something else in that. There ’ s something weird happening. So pleasure seems to be tempered by a whole series of different things coming in. Poignancy is a word I love as a designer. It means something triggering a big emotional response, often quite a sad emotional response, but it ’ s part of what we do. It isn ’ t just about nice. And this is the dilemma, this is the paradox, of beauty. Sensorily, we ’ re taking in all sorts of things â mixtures of things that are good, bad, exciting, frightening â to come up with that sensorial exposure, that sensation of what ’ s going on. Pathos appears obviously as part of what you just saw in that little girl ’ s drawing. And also triumph, this sense of transcendence, this”I never knew that. Ah, this is something new.”And that ’ s packed in there as well. And as we assemble these tools, from a design point of view, I get terribly excited about it, because these are things, as we ’ ve already said, they ’ re arriving at the brain, it would seem, before cognition, before we can manipulate them â electrochemical party tricks. Now what I ’ m also interested in is : Is it possible to separate intrinsic and extrinsic beauty? By that, I mean intrinsically beautiful things, just something that ’ s exquisitely beautiful, that ’ s universally beautiful. Very hard to find. Maybe you ’ ve got some examples of it. Very hard to find something that, to everybody, is a very beautiful thing, without a certain amount of information packed in there before. So a lot of it tends to be extrinsic. It ’ s mediated by information before the comprehension. Or the information ’ s added on at the back, like that little girl ’ s drawing that I showed you. Now when talking about beauty you can ’ t get away from the fact that a lot experiments have been done in this way with faces and what have you. And one of the most tedious ones, I think, was saying that beauty was about symmetry. Well it obviously isn ’ t. This is a more interesting one where half faces were shown to some people, and then to add them into a list of most beautiful to least beautiful and then exposing a full face. And they found that it was almost exact coincidence. So it wasn ’ t about symmetry. In fact, this lady has a particularly asymmetrical face, of which both sides are beautiful. But they ’ re both different. And as a designer, I can ’ t help meddling with this, so I pulled it to bits and sort of did stuff like this, and tried to understand what the individual elements were, but feeling it as I go. Now I can feel a sensation of delight and beauty if I look at that eye. I ’ m not getting it off the eyebrow. And the earhole isn ’ t doing it to me at all. So I don ’ t know how much this is helping me, but it ’ s helping to guide me to the places where the signals are coming off. And as I say, I ’ m not a neuroscientist, but to understand how I can start to assemble things that will very quickly bypass this thinking part and get me to the enjoyable precognitive elements. Anais Nin and the Talmud have told us time and time again that we see things not as they are, but as we are. So I ’ m going to shamelessly expose something to you, which is beautiful to me. And this is the F1 MV Agusta. Ahhhh. It is really â I mean, I can ’ t express to you how exquisite this object is. But I also know why it ’ s exquisite to me, because it ’ s a palimpsest of things. It ’ s masses and masses of layers. This is just the bit that protrudes into our physical dimension. It ’ s something much bigger. Layer after layer of legend, sport, details that resonate. I mean, if I just go through some of them now â I know about laminar flow when it comes to air-piercing objects, and that does it consummately well, you can see it can. So that ' s getting me excited. And I feel that here. This bit, the big secret of automotive design â reflection management. It ' s not about the shapes, it ' s how the shapes reflect light. Now that thing, light flickers across it as you move, so it becomes a kinetic object, even though it ' s standing still â managed by how brilliantly that ' s done on the reflection. This little relief on the footplate, by the way, to a rider means there ' s something going on underneath it â in this case, a drive chain running at 300 miles and hour probably, taking the power from the engine. I ' m getting terribly excited as my mind and my eyes flick across these things. Titanium lacquer on this. I can ' t tell you how wonderful this is. That ' s how you stop the nuts coming off at high speed on the wheel. I ' m really getting into this now. And of course, a racing bike doesn ' t have a prop stand, but this one, because it ' s a road bike, it all goes away and it folds into this little gap. So it disappears. And then I can ' t tell you how hard it is to do that radiator, which is curved. Why would you do that? Because I know we need to bring the wheel farther into the aerodynamics. So it ' s more expensive, but it ' s wonderful. And to cap it all, brand royalty â Agusta, Count Agusta, from the great histories of this stuff. The bit that you can ' t see is the genius that created this. Massimo Tamburini. They call him"The Plumber"in Italy, as well as"Maestro,"because he actually is engineer and craftsman and sculptor at the same time. There ' s so little compromise on this, you can ' t see it. But unfortunately, the likes of me and people that are like me have to deal with compromise all the time with beauty. We have to deal with it. So I have to work with a supply chain, and I ' ve got to work with the technologies, and I ' ve got to work with everything else all the time, and so compromises start to fit into it. And so look at her. I ' ve had to make a bit of a compromise there. I ' ve had to move that part across, but only a millimeter. No one ' s noticed, have they yet? Did you see what I did? I moved three things by a millimeter. Pretty? Yes. Beautiful? Maybe lesser. But then, of course, the consumer says that doesn ' t really matter. So that ' s okay, isn ' t it? Another millimeter? No one ' s going to notice those split lines and changes. It ' s that easy to lose beauty, because beauty ' s incredibly difficult to do. And only a few people can do it. And a focus group cannot do it. And a team rarely can do it. It takes a central cortex, if you like, to be able to orchestrate all those elements at the same time. This is a beautiful water bottle â some of you know of it â done by Ross Lovegrove, the designer. This is pretty close to intrinsic beauty. This one, as long as you know what water is like then you can experience this. It ' s lovely because it is an embodiment of something refreshing and delicious. I might like it more than you like it, because I know how bloody hard it is to do it. It ' s stupefyingly difficult to make something that refracts light like that, that comes out of the tool correctly, that goes down the line without falling over. Underneath this, like the story of the swan, is a million things very difficult to do. So all hail to that. It ' s a fantastic example, a simple object. And the one I showed you before was, of course, a massively complex one. And they ' re working in beauty in slightly different ways because of it. You all, I guess, like me, enjoy watching a ballet dancer dance. And part of the joy of it is, you know the difficulty. You also may be taking into account the fact that it ' s incredibly painful. Anybody seen a ballet dancer ' s toes when they come out of the points? While she ' s doing these graceful arabesques and plies and what have you, something horrible ' s going on down here. The comprehension of it leads us to a greater and heightened sense of the beauty of what ' s actually going on. Now I ' m using **microseconds** wrongly here, so please ignore me. But what I have to do now, feeling again, what I ' ve got to do is to be able to supply enough of these enzymes, of these triggers into something early on in the process, that you pick it up, not through your thinking, but through your feeling. So we ’ re going to have a little experiment. Right, are you ready? I ’ m going to show you something for a very, very brief moment. Are you ready? Okay. Did you think that was a bicycle when I showed it to you at the first flash? It ’ s not. Tell me something, did you think it was quick when you first saw it? Yes you did. Did you think it was modern? Yes you did. That blip, that information, shot into you before that. And because your brain starter motor began there, now it ’ s got to deal with it. And the great thing is, this motorcycle has been styled this way specifically to engender a sense that it ’ s green technology and it ’ s good for you and it ’ s light and it ’ s all part of the future. So is that wrong? Well in this case it isn ’ t, because it ’ s a very, very ecologically-sound piece of technology. But you ’ re a slave of that first flash. We are slaves to the first few fractions of a second â and that ’ s where much of my work has to win or lose, on a shelf in a shop. It wins or loses at that point. You may see 50, 100, 200 things on a shelf as you walk down it, but I have to work within that domain, to ensure that it gets you there first. And finally, the layer that I love, of knowledge. Some of you, I ’ m sure, will be familiar with this. What ’ s incredible about this, and the way I love to come back to it, is this is taking something that you hate or bores you, folding clothes, and if you can actually do this â who can actually do this? Anybody try to do this? Yeah? It ’ s fantastic, isn ’ t it? Look at that. Do you want to see it again? No time. It says I have two minutes left, so we can ’ t do this. But just go to the Web, YouTube, pull it down,”folding T-shirt.”That ’ s how underpaid younger-aged people have to fold your T-shirt. You didn ’ t maybe know it. But how do you feel about it? It feels fantastic when you do it, you look forward to doing it, and when you tell somebody else about it â like you probably have â you look really smart. The knowledge bubble that sits around the outside, the stuff that costs nothing, because that knowledge is free â bundle that together and where do we come out? Form follows function? Only sometimes. Only sometimes. Form is function. Form is function. It informs, it tells us, it supplies us answers before we ’ ve even thought about it. And so I ’ ve stopped using words like”form,”and I ’ ve stopped using words like”function”as a designer. What I try to pursue now is the emotional functionality of things. Because if I can get that right, I can make them wonderful, and I can make them repeatedly wonderful. And you know what those products and services are, because you own some of them. They ’ re the things that you ’ d snatch if the house was on fire. Forming the emotional bond between this thing and you is an electrochemical party trick that happens before you even think about it. Thank you very much.

So historically there has been a huge divide between what people consider to be non-living systems on one side, and living systems on the other side. So we go from, say, this beautiful and complex crystal as non-life, and this rather beautiful and complex cat on the other side. Over the last hundred and fifty years or so, science has kind of blurred this distinction between non-living and living systems, and now we consider that there may be a kind of continuum that exists between the two. We ’ ll just take one example here : a virus is a natural system, right? But it ’ s very simple. It ’ s very simplistic. It doesn ’ t really satisfy all the requirements, it doesn ’ t have all the characteristics of living systems and is in fact a parasite on other living systems in order to, say, reproduce and evolve. But what we ’ re going to be talking about here tonight are experiments done on this sort of non-living end of this spectrum — so actually doing chemical experiments in the laboratory, mixing together nonliving ingredients to make new structures, and that these new structures might have some of the characteristics of living systems. Really what I ' m talking about here is trying to create a kind of artificial life. So what are these characteristics that I ' m talking about? These are them. We consider first that life has a body. Now this is necessary to distinguish the self from the environment. Life also has a metabolism. Now this is a process by which life can convert resources from the environment into building blocks so it can maintain and build itself. Life also has a kind of inheritable information. Now we, as humans, we store our information as DNA in our genomes and we pass this information on to our offspring. If we couple the first two — the body and the metabolism — we can come up with a system that could perhaps move and replicate, and if we coupled these now to inheritable information, we can come up with a system that would be more lifelike, and would perhaps evolve. And so these are the things we will try to do in the lab, make some experiments that have one or more of these characteristics of life. So how do we do this? Well, we use a model system that we term a protocell. You might think of this as kind of like a primitive cell. It is a simple chemical model of a living cell, and if you consider for example a cell in your body may have on the order of millions of different types of molecules that need to come together, play together in a complex network to produce something that we call alive. In the laboratory what we want to do is much the same, but with on the order of tens of different types of molecules — so a drastic reduction in complexity, but still trying to produce something that looks lifelike. And so what we do is, we start simple and we work our way up to living systems. Consider for a moment this quote by Leduc, a hundred years ago, considering a kind of synthetic biology :"The synthesis of life, should it ever occur, will not be the sensational discovery which we usually associate with the idea."That ' s his first statement. So if we actually create life in the laboratories, it ' s probably not going to impact our lives at all."If we accept the theory of evolution, then the first dawn of synthesis of life must consist in the production of forms intermediate between the inorganic and the organic world, or between the non-living and living world, forms which possess only some of the rudimentary attributes of life"— so, the ones I just discussed —"to which other attributes will be slowly added in the course of development by the evolutionary actions of the environment."So we start simple, we make some structures that may have some of these characteristics of life, and then we try to develop that to become more lifelike. This is how we can start to make a protocell. We use this idea called self-assembly. What that means is, I can mix some chemicals together in a test tube in my lab, and these chemicals will start to self-associate to form larger and larger structures. So say on the order of tens of thousands, hundreds of thousands of molecules will come together to form a large structure that didn ' t exist before. And in this particular example, what I took is some membrane molecules, mixed those together in the right environment, and within seconds it forms these rather complex and beautiful structures here. These membranes are also quite similar, morphologically and functionally, to the membranes in your body, and we can use these, as they say, to form the body of our protocell. Likewise, we can work with oil and water systems. As you know, when you put oil and water together, they don ' t mix, but through self-assembly we can get a nice oil droplet to form, and we can actually use this as a body for our artificial organism or for our protocell, as you will see later. So that ' s just forming some body stuff, right? Some architectures. What about the other aspects of living systems? So we came up with this protocell model here that I ' m showing. We started with a natural occurring clay called montmorillonite. This is natural from the environment, this clay. It forms a surface that is, say, chemically active. It could run a metabolism on it. Certain kind of molecules like to associate with the clay. For example, in this case, RNA, shown in red — this is a relative of DNA, it ' s an informational molecule — it can come along and it starts to associate with the surface of this clay. This structure, then, can organize the formation of a membrane boundary around itself, so it can make a body of liquid molecules around itself, and that ' s shown in green here on this micrograph. So just through self-assembly, mixing things together in the lab, we can come up with, say, a metabolic surface with some informational molecules attached inside of this membrane body, right? So we ' re on a road towards living systems. But if you saw this protocell, you would not confuse this with something that was actually alive. It ' s actually quite lifeless. Once it forms, it doesn ' t really do anything. So, something is missing. Some things are missing. So some things that are missing is, for example, if you had a flow of energy through a system, what we ' d want is a protocell that can harvest some of that energy in order to maintain itself, much like living systems do. So we came up with a different protocell model, and this is actually simpler than the previous one. In this protocell model, it ' s just an oil droplet, but a chemical metabolism inside that allows this protocell to use energy to do something, to actually become dynamic, as we ' ll see here. You add the droplet to the system. It ' s a pool of water, and the protocell starts moving itself around in the system. Okay? Oil droplet forms through self-assembly, has a chemical metabolism inside so it can use energy, and it uses that energy to move itself around in its environment. As we heard earlier, movement is very important in these kinds of living systems. It is moving around, exploring its environment, and remodeling its environment, as you see, by these chemical waves that are forming by the protocell. So it ' s acting, in a sense, like a living system trying to preserve itself. We take this same moving protocell here, and we put it in another experiment, get it moving. Then I ' m going to add some food to the system, and you ' ll see that in blue here, right? So I add some food source to the system. The protocell moves. It encounters the food. It reconfigures itself and actually then is able to climb to the highest concentration of food in that system and stop there. Alright? So not only do we have this system that has a body, it has a metabolism, it can use energy, it moves around. It can sense its local environment and actually find resources in the environment to sustain itself. Now, this doesn ' t have a brain, it doesn ' t have a neural system. This is just a sack of chemicals that is able to have this interesting and complex lifelike behavior. If we count the number of chemicals in that system, actually, including the water that ' s in the dish, we have five chemicals that can do this. So then we put these protocells together in a single experiment to see what they would do, and depending on the conditions, we have some protocells on the left that are moving around and it likes to touch the other structures in its environment. On the other hand we have two moving protocells that like to circle each other, and they form a kind of a dance, a complex dance with each other. Right? So not only do individual protocells have behavior, what we ' ve interpreted as behavior in this system, but we also have basically population- level behavior similar to what organisms have. So now that you ' re all experts on protocells, we ' re going to play a game with these protocells. We ' re going to make two different kinds. Protocell A has a certain kind of chemistry inside that, when activated, the protocell starts to vibrate around, just dancing. So remember, these are primitive things, so dancing protocells, that ' s very interesting to us. The second protocell has a different chemistry inside, and when activated, the protocells all come together and they fuse into one big one. Right? And we just put these two together in the same system. So there ' s population A, there ' s population B, and then we activate the system, and protocell Bs, they ’ re the blue ones, they all come together. They fuse together to form one big blob, and the other protocell just dances around. And this just happens until all of the energy in the system is basically used up, and then, game over. So then I repeated this experiment a bunch of times, and one time something very interesting happened. So, I added these protocells together to the system, and protocell A and protocell B fused together to form a hybrid protocell AB. That didn ’ t happen before. There it goes. There ’ s a protocell AB now in this system. Protocell AB likes to dance around for a bit, while protocell B does the fusing, okay? But then something even more interesting happens. Watch when these two large protocells, the hybrid ones, fuse together. Now we have a dancing protocell and a self-replication event. Right. Just with blobs of chemicals, again. So the way this works is, you have a simple system of five chemicals here, a simple system here. When they hybridize, you then form something that ’ s different than before, it ’ s more complex than before, and you get the emergence of another kind of lifelike behavior which in this case is replication. So since we can make some interesting protocells that we like, interesting colors and interesting behaviors, and they ’ re very easy to make, and they have interesting lifelike properties, perhaps these protocells have something to tell us about the origin of life on the Earth. Perhaps these represent an easily accessible step, one of the first steps by which life got started on the early Earth. Certainly, there were molecules present on the early Earth, but they wouldn ’ t have been these pure compounds that we worked with in the lab and I showed in these experiments. Rather, they ’ d be a real complex mixture of all kinds of stuff, because uncontrolled chemical reactions produce a diverse mixture of organic compounds. Think of it like a primordial ooze, okay? And it ’ s a pool that ’ s too difficult to fully characterize, even by modern methods, and the product looks brown, like this tar here on the left. A pure compound is shown on the right, for contrast. So this is similar to what happens when you take pure sugar crystals in your kitchen, you put them in a pan, and you apply energy. You turn up the heat, you start making or breaking chemical bonds in the sugar, forming a brownish caramel, right? If you let that go unregulated, you ’ ll continue to make and break chemical bonds, forming an even more diverse mixture of molecules that then forms this kind of black tarry stuff in your pan, right, that ’ s difficult to wash out. So that ’ s what the origin of life would have looked like. You needed to get life out of this junk that is present on the early Earth, four, 4. 5 billion years ago. So the challenge then is, throw away all your pure chemicals in the lab, and try to make some protocells with lifelike properties from this kind of primordial ooze. So we ’ re able to then see the self-assembly of these oil droplet bodies again that we ’ ve seen previously, and the black spots inside of there represent this kind of black tar — this diverse, very complex, organic black tar. And we put them into one of these experiments, as you ’ ve seen earlier, and then we watch lively movement that comes out. They look really good, very nice movement, and also they appear to have some kind of behavior where they kind of circle around each other and follow each other, similar to what we ’ ve seen before — but again, working with just primordial conditions, no pure chemicals. These are also, these tar-fueled protocells, are also able to locate resources in their environment. I ’ m going to add some resource from the left, here, that defuses into the system, and you can see, they really like that. They become very energetic, and able to find the resource in the environment, similar to what we saw before. But again, these are done in these primordial conditions, really messy conditions, not sort of **sterile** laboratory conditions. These are very dirty little protocells, as a matter of fact. But they have lifelike properties, is the point. So, doing these artificial life experiments helps us define a potential path between non-living and living systems. And not only that, but it helps us broaden our view of what life is and what possible life there could be out there — life that could be very different from life that we find here on Earth. And that leads me to the next term, which is”weird life.”This is a term by Steve Benner. This is used in reference to a report in 2007 by the National Research Council in the United States, wherein they tried to understand how we can look for life elsewhere in the universe, okay, especially if that life is very different from life on Earth. If we went to another planet and we thought there might be life there, how could we even recognize it as life? Well, they came up with three very general criteria. First is — and they ’ re listed here. The first is, the system has to be in non-equilibrium. That means the system cannot be dead, in a matter of fact. Basically what that means is, you have an input of energy into the system that life can use and exploit to maintain itself. This is similar to having the Sun shining on the Earth, driving photosynthesis, driving the ecosystem. Without the Sun, there ’ s likely to be no life on this planet. Secondly, life needs to be in liquid form, so that means even if we had some interesting structures, interesting molecules together but they were frozen solid, then this is not a good place for life. And thirdly, we need to be able to make and break chemical bonds. And again this is important because life transforms resources from the environment into building blocks so it can maintain itself. Now today, I told you about very strange and weird protocells — some that contain clay, some that have primordial ooze in them, some that have basically oil instead of water inside of them. Most of these don ’ t contain DNA, but yet they have lifelike properties. But these protocells satisfy these general requirements of living systems. So by making these chemical, artificial life experiments, we hope not only to understand something fundamental about the origin of life and the existence of life on this planet, but also what possible life there could be out there in the universe. Thank you.

Most of the talks that you ’ ve heard in the last several fabulous days have been from people who have the characteristic that they have thought about something, they are experts, they know what ’ s going on. All of you know about the topic that I ’ m supposed to talk about. That is, you know what simplicity is, you know what complexity is. The trouble is, I don ’ t. And what I ’ m going to do is share with you my ignorance on this subject. I want you to read this, because we ’ re going to come back to it in a moment. The quote is from the fabled Potter Stewart opinion on pornography. And let me just read it, the important details here :”Shorthand description, [’ hardcore pornography ’] ; and perhaps I could never succeed in intelligibly defining it. But I know it when I see it.”I ’ m going to come back to that in a moment. So, what is simplicity? It ’ s good to start with some examples. A coffee cup — we don ’ t think about coffee cups, but it ’ s much more interesting than one might think — a coffee cup is a device, which has a container and a handle. The handle enables you to hold it when the container is filled with hot liquid. Why is that important? Well, it enables you to drink coffee. But also, by the way, the coffee is hot, the liquid is **sterile** ; you ’ re not likely to get cholera that way. So the coffee cup, or the cup with a handle, is one of the tools used by society to maintain public health. Scissors are your clothes, glasses enable you to see things and keep you from being eaten by cheetahs or run down by automobiles, and books are, after all, your education. But there ’ s another class of simple things, which are also very important. Simple in function, but not at all simple in how they ’ re constructed. And the two here are just examples. One is the cellphone, which we use every day. And it rests on a complexity, which has some characteristics very different from those that my friend Benoit Mandelbrot discussed, but are very interesting. And the other, of course, is a birth control pill, which, in a very simple way, fundamentally changed the structure of society by changing the role of women in it by providing to them the opportunity to make reproductive choices. So, there are two ways of thinking about this word, I think. And here I ’ ve corrupted the Potter Stewart quotation by saying that we can think about something — which spans all the way from scissors to the cell phone, Internet and birth control pills — by saying that they ’ re simple, the functions are simple, and we recognize what that simplicity is when we see it. Or there may be another way of doing it, which is to think about the problem in terms of what — if you associate with moral philosophers — is called the teapot problem. The teapot problem I ’ ll pose this way. Suppose you see a teapot, and the teapot is filled with hot water. And you then ask the question : Why is the water hot? And that ’ s a simple question. It ’ s like, what is simplicity? One answer would be : because the kinetic energy of the water molecules is high and they bounce against things rapidly — that ’ s a kind of physical science argument. A second argument would be : because it was sitting on a stove with the flame on — that ’ s an historical argument. A third is that I wanted hot water for tea — that ’ s an intentional argument. And, since this is coming from a moral philosopher, the fourth would be that it ’ s part of God ’ s plan for the universe. All of these are possibilities. The point is that you get into trouble when you ask a single question with a single box for an answer, in which that single question actually is many questions with quite different meanings, but with the same words. Asking,”What is simplicity?”I think falls in that category. What is the state of science? And, interestingly, complexity is very highly evolved. We have a lot of interesting information about what complexity is. Simplicity, for reasons that are a little bit obscure, is almost not pursued, at least in the academic world. We academics — I am an academic — we love complexity. You can write papers about complexity, and the nice thing about complexity is it ’ s fundamentally intractable in many ways, so you ’ re not responsible for outcomes. Simplicity — all of you really would like your Waring Blender in the morning to make whatever a Waring Blender does, but not explode or play Beethoven. You ’ re not interested in the limits of these things. So what one is interested in has a lot to do with the rewards of the system. And there ’ s a lot of rewards in thinking about complexity and emergence, not so much in thinking about simplicity. One of the things I want to do is to help you with a very important task — which you may not know that you have very often — which is to understand how to sit next to a physicist at a dinner party and have a conversation. And the words that I would like you to focus on are complexity and emergence, because these will enable you to start the conversation and then daydream about other things. All right, what is complexity in this view of things, and what is emergence? We have, actually, a pretty good working definition of complexity. It is a system, like traffic, which has components. The components interact with one another. These are cars and drivers. They dissipate energy. It turns out that, whenever you have that system, weird stuff happens, and you in Los Angeles probably know this better than anyone. Here ’ s another example, which I put up because it ’ s an example of really important current science. You can ’ t possibly read that. It ’ s not intended that you read it, but that ’ s a tiny part of the chemical reactions going on in each of your cells at any given moment. And it ’ s like the traffic that you see. The amazing thing about the cell is that it actually does maintain a fairly stable working relationship with other cells, but we don ’ t know why. Anyone who tells you that we understand life, walk away. And let me reduce this to the simplest level. We ’ ve heard from Bill Gates recently. All of us, to some extent, study this thing called a Bill Gates. Terrific. You learn everything you can about that. And then there ’ s another kind of thing that you might study, and you study that hard. That ’ s a Bono, this is a Bono. But then, if you know everything you can know about those two things, and you put them together, what can you say about this combination? The answer is, not a lot. And that ’ s complexity. Now, imagine building that up to a city, or to a society, and you ’ ve got, obviously, an interesting problem. All right, so let me give you an example of simplicity of a particular kind. And I want to introduce a word that I think is very useful, which is stacking. And I ’ m going to use stacking for a kind of simplicity that has the characteristic that it is so simple and so reliable that I can build things with it. Or I ’ m going to use simple to mean reliable, predictable, repeatable. And I ’ m going to use as an example the Internet, because it ’ s a particularly good example of stacked simplicity. We call it a complex system, which it is, but it ’ s also something else. The Internet starts with mathematics, it starts with binary. And if you look at the list of things on the bottom, we are familiar with the Arabic numbers one to 10 and so on. In binary, one is 0001, seven is 0111. The question is : Why is binary simpler than Arabic? And the answer is, simply, that if I hold up three fingers, you can count that easily, but if I hold up this, it ’ s sort of hard to say that I just did seven. The virtue of binary is that it ’ s the simplest possible way of representing numbers. Anything else is more complicated. You can catch errors with it, it ’ s unambiguous in its reading, there are lots of good things about binary. So it is very, very simple once you learn how to read it. Now, if you like to represent this zero and one of binary, you need a device. And think of things in your life that are binary, one of them is light switches. They can be on and off. That ’ s binary. Now wall switches, we all know, fail. But our friends who are condensed matter physicists managed to come up, some 50 years ago, with a very nice device, shown under that bell jar, which is a **transistor**. A **transistor** is nothing more than a wall switch. It turns things on and off, but it does so without moving parts and it doesn ’ t fail, basically, for a very long period of time. So the second layer of simplicity was the **transistor** in the Internet. So, since the **transistor** is so simple, you can put lots of them together. And you put lots of them together and you come with something called integrated circuits. And a current integrated circuit might have in each one of these chips something like a billion **transistors**, all of which have to work perfectly every time. So that ’ s the next layer of simplicity, and, in fact, integrated circuits are really simple in the sense that they, in general, work really well. With integrated circuits, you can build cellphones. You all are accustomed to having your cellphones work the large majority of the time. In Boston... Boston is a little bit like Namibia in its cell phone coverage, so that we ’ re not accustomed to that all the time, but some of the time. But, in fact, if you have cell phones, you can now go to this nice lady who ’ s somewhere like Namibia, and who is extremely happy with the fact that although she does not have an master ’ s degree in electrical engineering from MIT, she ’ s nonetheless able to hack her cell phone to get power in some funny way. And from that comes the Internet. And this is a map of bitflows across the continent. The two blobs that are light in the middle there are the United States and Europe. And then back to simplicity again. So here we have what I think is one of the great ideas, which is Google. Which, in this simple portal makes the claim that it makes accessible all of the world ’ s information. But the point is that that extraordinary simple idea rests on layers of simplicity each compounded into a complexity that is itself simple, in the sense that it is completely reliable. All right, let me then finish off with four general statements, an example and two

aphorisms. The characteristics, which I think are useful to think about for simple things : First, they are predictable. Their behavior is predictable. Now, one of the nice characteristics of simple things is you know what it ’ s going to do, in general. So simplicity and predictability are characteristics of simple things. The second is, and this is a real world statement, they ’ re cheap. If you have things that are cheap enough, people will find uses for them, even if they seem very primitive. So, for example, stones. You can build cathedrals out of stones, you just have to know what it does. You carve them in blocks and then you pile them on top of one another, and they support weight. So there has to be function, the function has to be predictable and the cost has to be low. What that means is that you have to have a high performance or value for cost. And then I would propose as this last component that they serve, or have the potential to serve, as building blocks. That is, you can stack them. And stack can mean this way, or it can mean this way, or it can mean in some arbitrary n-dimensional space. But if you have something that has a function, and it ’ s really cheap, people will find new ways of putting it together to make new things. Cheap, functional, reliable things unleash the creativity of people who then build stuff that you could not imagine. There ’ s no way of predicting the Internet based on the first **transistor**. It just is not possible. So these are the components. Now, the example is something that I want to give you from the work that we ourselves do. We are very interested in delivering health care in the developing world, and one of the things that we wish to do in this particular business is to find a way of doing medical diagnosis at as close to zero cost as we can manage. So, how does one do that? This is a world in which there ’ s no electricity, there ’ s no money, there ’ s no medical competence. And I don ’ t want to spend your time in going through the details, but in the lower right-hand corner, you see an example of the kind of thing that we have. It ’ s a little paper chip. It has a few things printed on it using the same technology that you use for making comic books, which was the inspiration for this particular idea. And you put a drop, in this case, of urine at the bottom. It wicks its way up into these little branches. You know, no power required. It turns colors. In this particular case, you ’ re reading kidney function. And, since the health care worker of much of this part of the world is an 18 year-old with an AK-47, who happens to be out of work and is willing to go around and do this sort of thing, he can take a picture of it with his cellphone, send the picture back to where there is a doctor, and the doctor can look at it. So what you ’ ve done is to take a technology, which is available everywhere, make a device, which is extremely cheap, and make it in such a fashion that it is very, very reliable. If we can pull this off, if we can build more function, it will be stackable. That is to say, if we can make the basic technology of one or two things work, it will be applicable to a very, very large variety of human conditions, and hence, extendable in both vertical and horizontal directions. Part of my interest in this, I have to say, is that I would like to — how do I put this politely? — change the way, or maybe eviscerate, the capital structure of the U. S. health care system, which I think is fundamentally broken. So, let me close — Let me close with my two **aphorisms**. One of them is from Mr. Einstein, and he says,”Everything should be made as simple as possible, but not simpler.”And I think that ’ s a very good way of thinking about the problem. If you take too much out of something that ’ s simple, you lose function. You have to have low cost, but you also have to have a function. So you can ’ t make it too simple. And the second is a design issue, and it ’ s not directly relevant, but it ’ s a nice statement. This is by de Saint-Exupery. And he says,”You know you ’ ve achieved perfection in design, not when you have nothing more to add, but when you have nothing more to take away.”And that certainly is going in the right direction. So, what I think one can begin to do with this kind of cut at the word simplicity, which doesn ’ t cover Brancusi, it doesn ’ t answer the question of why Mondrian is better or worse or simpler or less simpler than Van Gogh, and certainly doesn ’ t address the question of whether Mozart is simpler than Bach. But it does make a point — which is one which, in a sense, differentiates the real world of people who make things, and the world of people who think about things, which is, there is an intellectual merit to asking : How do we make things as simple as we can, as cheap as we can, as functional as we can and as freely interconnectable as we can? If we make that kind of simplicity in our technology and then give it to you guys, you can go off and do all kinds of fabulous things with it. Thank you very much. Chris Anderson : Quick question. So can you picture that a science of simplicity might get to the point where you could look out at various systems — say a financial system or a legal system, health system — and say,”That has got to the point of danger or dysfunctionality for the following reasons, and this is how we might simplify it”? George Whitesides : Yes, I think you could. Because if you look at the components from which the system is made and examine their fragility, or their stability, you can probably build a kind of risk assessment based on that basis. CA : Have you started to do that? I mean, with the health system, you got a sort of radical solution on the cost side, but in terms of the system itself? GW : Well, no. How do I put that simply? No. CA : That was a simple, powerful answer. GW : Yes. CA : So, in terms of that diagnostic technology that you ’ ve got, where is that, and when do you see that maybe getting rolled out to scale. GW : That ’ s coming out soon. I mean, the systems work, and we have to find out how to manufacture them and do things of this kind, but the basic technology works. CA : You ’ ve got a company set up to... GW : A foundation, a foundation. Not-for- profit. CA : All right. Well, thank you so much for your talk. Thank you.

So, I ’ d like to spend a few minutes with you folks today imagining what our planet might look like in a thousand years. But before I do that, I need to talk to you about synthetic materials like plastics, which require huge amounts of energy to create and, because of their disposal issues, are slowly poisoning our planet. I also want to tell you and share with you how my team and I have been using mushrooms over the last three years. Not like that. We ’ re using mushrooms to create an entirely new class of materials, which perform a lot like plastics during their use, but are made from crop waste and are totally compostable at the end of their lives. But first, I need to talk to you about what I consider one of the most egregious offenders in the disposable plastics category. This is a material you all know is Styrofoam, but I like to think of it as toxic white stuff. In a single cubic foot of this material — about what would come around your computer or large television — you have the same energy content of about a liter and a half of petrol. Yet, after just a few weeks of use, you ’ ll throw this material in the trash. And this isn ’ t just found in packaging. 20 billion dollars of this material is produced every year, in everything from building materials to surfboards to coffee cups to table tops. And that ’ s not the only place it ’ s found. The EPA estimates, in the United States, by volume, this material occupies 25 percent of our landfills. Even worse is when it finds its way into our natural environment — on the side of the road or next to a river. If it ’ s not picked up by a human, like me and you, it ’ ll stay there for thousands and thousands of years. Perhaps even worse is when it finds its way into our oceans, like in the great plastic gyre, where these materials are being mechanically broken into smaller and smaller bits, but they ’ re not really going away. They ’ re not biologically compatible. They ’ re basically fouling up Earth ’ s respiratory and circulatory systems. And because these materials are so prolific, because they ’ re found in so many places, there ’ s one other place you ’ ll find this material, styrene, which is made from benzene, a known carcinogen. You ’ ll find it inside of you. So, for all these reasons, I think we need better materials, and there are three key principles we can use to guide these materials. The first is feedstocks. Today, we use a single feedstock, petroleum, to heat our homes, power our cars and make most of the materials you see around you. We recognize this is a finite resource, and it ’ s simply crazy to do this, to put a liter and a half of petrol in the trash every time you get a package. Second of all, we should really strive to use far less energy in creating these materials. I say far less, because 10 percent isn ’ t going to cut it. We should be talking about half, a quarter, one-tenth the energy content. And lastly, and I think perhaps most importantly, we should be creating materials that fit into what I call nature ’ s recycling system. This recycling system has been in place for the last billion years. I fit into it, you fit into it, and a hundred years tops, my body can return to the Earth with no preprocessing. Yet that packaging I got in the mail yesterday is going to last for thousands of years. This is crazy. But nature provides us with a really good model here. When a tree ’ s done using its leaves — its solar collectors, these amazing molecular photon capturing devices — at the end of a season, it doesn ’ t pack them up, take them to the leaf reprocessing center and have them melted down to form new leaves. It just drops them, the shortest distance possible, to the forest floor, where they ’ re actually upcycled into next year ’ s topsoil. And this gets us back to the mushrooms. Because in nature, mushrooms are the recycling system. And what we ’ ve discovered is, by using a part of the mushroom you ’ ve probably never seen — **analogous** to its root structure ; it ’ s called mycelium — we can actually grow materials with many of the same properties of conventional synthetics. Now, mycelium is an amazing material, because it ’ s a self-assembling material. It actually takes things we would consider waste — things like seed husks or woody biomass — and can transform them into a chitinous polymer, which you can form into almost any shape. In our process, we basically use it as a glue. And by using mycelium as a glue, you can mold things just like you do in the plastic industry, and you can create materials with many different properties, materials that are insulating, fire-resistant, moisture-resistant, vapor- resistant — materials that can absorb impacts, that can absorb acoustical impacts. But these materials are grown from agricultural byproducts, not petroleum. And because they ’ re made of natural materials, they are 100 percent compostable in you own backyard. So I ’ d like to share with you the four basic steps required to make these materials. The first is selecting a feedstock, preferably something that ’ s regional, that ’ s in your area, right — local manufacturing. The next is actually taking this feedstock and putting in a tool, physically filling an enclosure, a mold, in whatever shape you want to get. Then you actually grow the mycelium through these particles, and that ’ s where the magic happens, because the organism is doing the work in this process, not the equipment. The final step is, of course, the product, whether it ’ s a packaging material, a table top, or building block. Our vision is local manufacturing, like the local food movement, for production. So we ’ ve created formulations for all around the world using regional byproducts. If you ’ re in China, you might use a rice husk or a cottonseed hull. If you ’ re in Northern Europe or North America, you can use things like buckwheat husks or oat hulls. We then process these husks with some basic equipment. And I want to share with you a quick video from our facility that gives you a sense of how this looks at scale. So what you ’ re seeing here is actually cotton hulls from Texas, in this case. It ’ s a waste product. And what they ’ re doing in our equipment is going through a continuous system, which cleans, cooks, cools and pasteurizes these materials, while also continuously inoculating them with our mycelium. This gives us a continuous stream of material that we can put into almost any shape, though today we ’ re making corner blocks. And it ’ s when this lid goes on the part, that the magic really starts. Because the manufacturing process is our organism. It ’ ll actually begin to digest these wastes and, over the next five days, assemble them into biocomposites. Our entire facility is comprised of thousands and thousands and thousands of these tools sitting indoors in the dark, quietly self-assembling materials — and everything from building materials to, in this case, a packaging corner block. So I ’ ve said a number of times that we grow materials. And it ’ s kind of hard to picture how that happens. So my team has taken five days-worth of growth, a typical growth cycle for us, and condensed it into a 15-second time lapse. And I want you to really watch closely these little white dots on the screen, because, over the five-day period, what they do is extend out and through this material, using the energy that ’ s contained in these seed husks to build this chitinous polymer matrix. This matrix self-assembles, growing through and around the particles, making millions and millions of tiny fibers. And what parts of the seed husk we don ’ t digest, actually become part of the final, physical composite. So in front of your eyes, this part just self-assembled. It actually takes a little longer. It takes five days. But it ’ s much faster than conventional farming. The last step, of course, is application. In this case, we ’ ve grown a corner block. A major Fortune 500 furniture maker uses these corner blocks to protect their tables in shipment. They used to use a plastic packaging buffer, but we were able to give them the exact same physical performance with our grown material. Best of all, when it gets to the customer, it ’ s not trash. They can actually put this in their natural ecosystem without any processing, and it ’ s going to improve the local soil. So, why mycelium? The first reason is local open feedstocks. You want to be able to do this anywhere in the world and not worry about peak rice hull or peak cottonseed hulls, because you have multiple choices. The next is self- assembly, because the organism is actually doing most of the work in this process. You don ’ t need a lot of equipment to set up a production facility. So you can have lots of small facilities spread all across the world. Biological yield is really important. And because 100 percent of what we put in the tool become the final product, even the parts that aren ’ t digested become part of the structure, we ’ re getting incredible yield rates. Natural polymers, well... I think that ’ s what ’ s most important, because these polymers have been tried and tested in our ecosystem for the last billion years, in everything from mushrooms to crustaceans. They ’ re not going to clog up Earth ’ s ecosystems. They work great. And while, today, we can practically guarantee that yesterday ’ s packaging is going to be here in 10, 000 years, what I want to guarantee is that in 10, 000 years, our descendants, our children ’ s children, will be living happily and in harmony with a healthy Earth. And I think that can be some really good news. Thank you.

I admit that I ’ m a little bit nervous here because I ’ m going to say some radical things, about how we should think about cancer differently, to an audience that contains a lot of people who know a lot more about cancer than I do. But I will also contest that I ’ m not as nervous as I should be because I ’ m pretty sure I ’ m right about this. And that this, in fact, will be the way that we treat cancer in the future. In order to talk about cancer, I ' m going to actually have to — let me get the big slide here. First, I ' m going to try to give you a different perspective of genomics. I want to put it in perspective of the bigger picture of all the other things that are going on — and then talk about something you haven ' t heard so much about, which is proteomics. Having explained those, that will set up for what I think will be a different idea about how to go about treating cancer. So let me start with genomics. It is the hot topic. It is the place where we ' re learning the most. This is the great frontier. But it has its limitations. And in particular, you ' ve probably all heard the analogy that the genome is like the blueprint of your body, and if that were only true, it would be great, but it ' s not. It ' s like the parts list of your body. It doesn ' t say how things are connected, what causes what and so on. So if I can make an analogy, let ' s say that you were trying to tell the difference between a good restaurant, a healthy restaurant and a sick restaurant, and all you had was the list of ingredients that they had in their larder. So it might be that, if you went to a French restaurant and you looked through it and you found they only had margarine and they didn ' t have butter, you could say,"Ah, I see what ' s wrong with them. I can make them healthy."And there probably are special cases of that. You could certainly tell the difference between a Chinese restaurant and a French restaurant by what they had in a larder. So the list of ingredients does tell you something, and sometimes it tells you something that ' s wrong. If they have tons of salt, you might guess they ' re using too much salt, or something like that. But it ' s limited, because really to know if it ' s a healthy restaurant, you need to taste the food, you need to know what goes on in the kitchen, you need the product of all of those ingredients. So if I look at a person and I look at a person ' s genome, it ' s the same thing. The part of the genome that we can read is the list of ingredients. And so indeed, there are times when we can find ingredients that [are] bad. Cystic fibrosis is an example of a disease where you just have a bad ingredient and you have a disease, and we can actually make a direct correspondence between the ingredient and the disease. But most things, you really have to know what ' s going on in the kitchen, because, mostly, sick people used to be healthy people — they have the same genome. So the genome really tells you much more about predisposition. So what you can tell is you can tell the difference between an Asian person and a European person by looking at their ingredients list. But you really for the most part can ' t tell the difference between a healthy person and a sick person — except in some of these special cases. So why all the big deal about genetics? Well first of all, it ' s because we can read it, which is fantastic. It is very useful in certain circumstances. It ' s also the great theoretical triumph of biology. It ' s the one theory that the biologists ever really got right. It ' s fundamental to Darwin and Mendel and so on. And so it ' s the one thing where they predicted a theoretical construct. So Mendel had this idea of a gene as an abstract thing, and Darwin built a whole theory that depended on them existing, and then Watson and Crick actually looked and found one. So this happens in physics all the time. You predict a black hole, and you look out the telescope and there it is, just like you said. But it rarely happens in biology. So this great triumph — it ' s so good, there ' s almost a religious experience in biology. And Darwinian evolution is really the core theory. So the other reason it ' s been very popular is because we can measure it, it ' s digital. And in fact, thanks to Kary Mullis, you can basically measure your genome in your kitchen with a few extra ingredients. So for instance, by measuring the genome, we ' ve learned a lot about how we ' re related to other kinds of animals by the closeness of our genome, or how we ' re related to each other — the family tree, or the tree of life. There ' s a huge amount of information about the genetics just by comparing the genetic similarity. Now of course, in medical application, that is very useful because it ’ s the same kind of information that the doctor gets from your family medical history — except probably, your genome knows much more about your medical history than you do. And so by reading the genome, we can find out much more about your family than you probably know. And so we can discover things that probably you could have found by looking at enough of your relatives, but they may be surprising. I did the 23andMe thing and was very surprised to discover that I am fat and bald. But sometimes you can learn much more useful things about that. But mostly what you need to know, to find out if you ’ re sick, is not your predispositions, but it ’ s actually what ’ s going on in your body right now. So to do that, what you really need to do, you need to look at the things that the genes are producing and what ’ s happening after the genetics, and that ’ s what proteomics is about. Just like genome mixes the study of all the genes, proteomics is the study of all the proteins. And the proteins are all of the little things in your body that are signaling between the cells — actually, the machines that are operating — that ’ s where the action is. Basically, a human body is a conversation going on, both within the cells and between the cells, and they ’ re telling each other to grow and to die, and when you ’ re sick, something ’ s gone wrong with that conversation. And so the trick is — unfortunately, we don ’ t have an easy way to measure these like we can measure the genome. So the problem is that measuring — if you try to measure all the proteins, it ’ s a very elaborate process. It requires hundreds of steps, and it takes a long, long time. And it matters how much of the protein it is. It could be very significant that a protein changed by 10 percent, so it ’ s not a nice digital thing like DNA. And basically our problem is somebody ’ s in the middle of this very long stage, they pause for just a moment, and they leave something in an enzyme for a second, and all of a sudden all the measurements from then on don ’ t work. And so then people get very inconsistent results when they do it this way. People have tried very hard to do this. I tried this a couple of times and looked at this problem and gave up on it. I kept getting this call from this oncologist named David Agus. And Applied Minds gets a lot of calls from people who want help with their problems, and I didn ’ t think this was a very likely one to call back, so I kept on giving him to the delay list. And then one day, I get a call from John Doerr, Bill Berkman and Al Gore on the same day saying return David Agus ’ s phone call. So I was like,”Okay. This guy ’ s at least resourceful.”So we started talking, and he said,”I really need a better way to measure proteins.”I ’ m like,”Looked at that. Been there. Not going to be easy.”He ’ s like,”No, no. I really need it. I mean, I see patients dying every day because we don ’ t know what ’ s going on inside of them. We have to have a window into this.”And he took me through specific examples of when he really needed it. And I realized, wow, this would really make a big difference, if we could do it, and so I said,”Well, let ’ s look at it.”Applied Minds has enough play money that we can go and just work on something without getting anybody ’ s funding or permission or anything. So we started playing around with this. And as we did it, we realized this was the basic problem — that taking the sip of coffee — that there were humans doing this complicated process and that what really needed to be done was to automate this process like an assembly line and build robots that would measure proteomics. And so we did that, and working with David, we made a little company called Applied Proteomics eventually, which makes this robotic assembly line, which, in a very consistent way, measures the protein. And I ’ ll show you what that protein measurement looks like. Basically, what we do is we take a drop of blood out of a patient, and we sort out the proteins in the drop of blood according to how much they weigh, how slippery they are, and we arrange them in an image.

And so we can look at literally hundreds of thousands of features at once out of that drop of blood. And we can take a different one tomorrow, and you will see your proteins tomorrow will be different — they ' ll be different after you eat or after you sleep. They really tell us what ' s going on there. And so this picture, which looks like a big smudge to you, is actually the thing that got me really thrilled about this and made me feel like we were on the right track. So if I zoom into that picture, I can just show you what it means. We sort out the proteins — from left to right is the weight of the fragments that we ' re getting, and from top to bottom is how slippery they are. So we ' re zooming in here just to show you a little bit of it. And so each of these lines represents some signal that we ' re getting out of a piece of a protein. And you can see how the lines occur in these little groups of bump, bump, bump, bump, bump. And that ' s because we ' re measuring the weight so precisely that — carbon comes in different isotopes, so if it has an extra neutron on it, we actually measure it as a different chemical. So we ' re actually measuring each isotope as a different one. And so that gives you an idea of how exquisitely sensitive this is. So seeing this picture is sort of like getting to be Galileo and looking at the stars and looking through the telescope for the first time, and suddenly you say,"Wow, it ' s way more complicated than we thought it was."But we can see that stuff out there and actually see features of it. So this is the signature out of which we ' re trying to get patterns. So what we do with this is, for example, we can look at two patients, one that responded to a drug and one that didn ' t respond to a drug, and ask,"What ' s going on differently inside of them?"And so we can make these measurements precisely enough that we can overlay two patients and look at the differences. So here we have Alice in green and Bob in red. We overlay them. This is actual data. And you can see, mostly it overlaps and it ' s yellow, but there ' s some things that just Alice has and some things that just Bob has. And if we find a pattern of things of the responders to the drug, we see that in the blood, they have the condition that allows them to respond to this drug. We might not even know what this protein is, but we can see it ' s a marker for the response to the disease. So this already, I think, is tremendously useful in all kinds of medicine. But I think this is actually just the beginning of how we ' re going to treat cancer. So let me move to cancer. The thing about cancer — when I got into this, I really knew nothing about it, but working with David Agus, I started watching how cancer was actually being treated and went to operations where it was being cut out. And as I looked at it, to me it didn ' t make sense how we were approaching cancer, and in order to make sense of it, I had to learn where did this come from. We ' re treating cancer almost like it ' s an infectious disease. We ' re treating it as something that got inside of you that we have to kill. So this is the great paradigm. This is another case where a theoretical paradigm in biology really worked — was the germ theory of disease. So what doctors are mostly trained to do is diagnose — that is, put you into a category and apply a scientifically proven treatment for that diagnosis — and that works great for infectious diseases. So if we put you in the category of you ' ve got syphilis, we can give you **penicillin**. We know that that works. If you ' ve got malaria, we give you quinine or some derivative of it. And so that ' s the basic thing doctors are trained to do, and it ' s miraculous in the case of infectious disease — how well it works. And many people in this audience probably wouldn ' t be alive if doctors didn ' t do this. But now let ' s apply that to systems diseases like cancer. The problem is that, in cancer, there isn ' t something else that ' s inside of you. It ' s you ; you ' re broken. That conversation inside of you got mixed up in some way. So how do we diagnose that conversation? Well, right now what we do is we divide it by part of the body — you know, where did it appear? — and we put you in different categories according to the part of the body. And then we do a clinical trial for a drug for lung cancer and one for prostate cancer and one for breast cancer, and we treat these as if they ’ re separate diseases and that this way of dividing them had something to do with what actually went wrong. And of course, it really doesn ’ t have that much to do with what went wrong because cancer is a failure of the system. And in fact, I think we ’ re even wrong when we talk about cancer as a thing. I think this is the big mistake. I think cancer should not be a noun. We should talk about cancering as something we do, not something we have. And so those tumors, those are symptoms of cancer. And so your body is probably cancering all the time, but there are lots of systems in your body that keep it under control. And so to give you an idea of an analogy of what I mean by thinking of cancering as a verb, imagine we didn ’ t know anything about plumbing, and the way that we talked about it, we ’ d come home and we ’ d find a leak in our kitchen and we ’ d say,”Oh, my house has water.”We might divide it — the plumber would say,”Well, where ’ s the water?””Well, it ’ s in the kitchen.””Oh, you must have kitchen water.”That ’ s kind of the level at which it is.”Kitchen water, well, first of all, we ’ ll go in there and we ’ ll mop out a lot of it. And then we know that if we sprinkle Drano around the kitchen, that helps. Whereas living room water, it ’ s better to do tar on the roof.”And it sounds silly, but that ’ s basically what we do. And I ’ m not saying you shouldn ’ t mop up your water if you have cancer, but I ’ m saying that ’ s not really the problem ; that ’ s the symptom of the problem. What we really need to get at is the process that ’ s going on, and that ’ s happening at the level of the proteonomic actions, happening at the level of why is your body not healing itself in the way that it normally does? Because normally, your body is dealing with this problem all the time. So your house is dealing with leaks all the time, but it ’ s fixing them. It ’ s draining them out and so on. So what we need is to have a causative model of what ’ s actually going on, and proteomics actually gives us the ability to build a model like that. David got me invited to give a talk at National Cancer Institute and Anna Barker was there. And so I gave this talk and said,”Why don ’ t you guys do this?”And Anna said,”Because nobody within cancer would look at it this way. But what we ’ re going to do, is we ’ re going to create a program for people outside the field of cancer to get together with doctors who really know about cancer and work out different programs of research.”So David and I applied to this program and created a consortium at USC where we ’ ve got some of the best oncologists in the world and some of the best biologists in the world, from Cold Spring Harbor, Stanford, Austin — I won ’ t even go through and name all the places — to have a research project that will last for five years where we ’ re really going to try to build a model of cancer like this. We ’ re doing it in mice first, and we will kill a lot of mice in the process of doing this, but they will die for a good cause. And we will actually try to get to the point where we have a predictive model where we can understand, when cancer happens, what ’ s actually happening in there and which treatment will treat that cancer. So let me just end with giving you a little picture of what I think cancer treatment will be like in the future. So I think eventually, once we have one of these models for people, which we ’ ll get eventually — I mean, our group won ’ t get all the way there — but eventually we ’ ll have a very good computer model — sort of like a global climate model for weather. It has lots of different information about what ’ s the process going on in this proteomic conversation on many different scales. And so we will simulate in that model for your particular cancer — and this also will be for ALS, or any kind of system neurodegenerative diseases, things like that — we will simulate specifically you, not just a generic person, but what ’ s actually going on inside you. And in that simulation, what we could do is design for you specifically a sequence of treatments, and it might be very gentle treatments, very small amounts of drugs. It might be things like, don ’ t eat that day, or give them a little chemotherapy, maybe a little radiation. Of course, we ’ ll do surgery sometimes and so on. But design a program of treatments specifically for you and help your body guide back to health — guide your body back to health. Because your body will do most of the work of fixing it if we just sort of prop it up in the ways that are wrong. We put it in the equivalent of splints. And so your body basically has lots and lots of mechanisms for fixing cancer, and we just have to prop those up in the right way and get them to do the job. And so I believe that this will be the way that cancer will be treated in the future. It ’ s going to require a lot of work, a lot of research. There will be many teams like our team that work on this. But I think eventually, we will design for everybody a custom treatment for cancer. So thank you very much.

Text Sample 447: NEG Dim 3 – 2009 – Score -2.00 – 2009/t002907.txt

John Hockenberry : It ’ s great to be here with you, Tom. And I want to start with a question that has just been consuming me since I first became familiar with your work. In you work there ’ s always this kind of hybrid quality of a natural force in some sort of interplay with creative force. Are they ever in equilibrium in the way that you see your work? Tom Shannon : Yeah, the subject matter that I ’ m looking for, it ’ s usually to solve a question. I had the question popped into my head : What does the cone that connects the sun and the Earth look like if you could connect the two spheres? And in proportion, what would the size of the sphere and the length, and what would the taper be to the Earth? And so I went about and made that sculpture, turning it out of solid bronze. And I did one that was about 35 feet long. The sun end was about four inches in diameter, and then it tapered over about 35 feet to about a millimeter at the Earth end. And so for me, it was really exciting just to see what it looks like if you could step outside and into a larger context, as though you were an astronaut, and see these two things as an object, because they are so intimately bound, and one is meaningless without the other. JH : Is there a relief in playing with these forces? And I ’ m wondering how much of a sense of discovery there is in playing with these forces. TS : Well, like the magnetically levitated objects — like that silver one there, that was the result of hundreds of experiments with magnets, trying to find a way to make something float with the least possible connection to the ground. So I got it down to just one tether to be able to support that. JH : Now is this electromagnetic here, or are these static? TS : Those are permanent magnets, yeah. JH : Because if the power went out, there would just be a big noise. TS : Yeah. It ’ s really unsatisfactory having plug-in art. JH : I agree. TS : The magnetic works are a combination of gravity and magnetism, so it ’ s a kind of mixture of these ambient forces that influence everything. The sun has a tremendous field that extends way beyond the planets and the Earth ’ s magnetic field protects us from the sun. So there ’ s this huge invisible shape structures that magnetism takes in the universe. But with the pendulum, it allows me to manifest these invisible forces that are holding the magnets up. My sculptures are normally very simplified. I try to refine them down to very simple forms. But the paintings become very complex, because I think the fields that are supporting them, they ’ re billowing, and they ’ re interpenetrating, and they ’ re interference patterns. JH : And they ’ re non-deterministic. I mean, you don ’ t know necessarily where you ’ re headed when you begin, even though the forces can be calculated. So the evolution of this — I gather this isn ’ t your first pendulum. TS : No. TS : The first one I did was in the late 70 ’ s, and I just had a simple cone with a spigot at the bottom of it. I threw it into an orbit, and it only had one color, and when it got to the center, the paint kept running out, so I had to run in there, didn ’ t have any control over the spigot remotely. So that told me right away : I need a remote control device. But then I started dreaming of having six colors. I sort of think about it as the DNA — these colors, the red, blue, yellow, the primary colors and white and black. And if you put them together in different combinations — just like printing in a sense, like how a magazine color is printed — and put them under certain forces, which is orbiting them or passing them back and forth or drawing with them, these amazing things started appearing. JH : It looks like we ’ re loaded for bear here. TS : Yeah, well let ’ s put a couple of canvases. I ’ ll ask a couple of my sons to set up the canvases here. I want to just say — so this is Jack, Nick and Louie. JH : Thanks guys. TS : So here are the — JH : All right, I ’ ll get out of the way here. TS : I ’ m just going to throw this into an orbit and see if I can paint everybody ’ s shoes in the front. JH : Whoa. That is... ooh, nice. TS : So something like this. I ’ m doing this as a demo, and it ’ s more playful, but inevitably, all of this can be used. I can redeem this painting, just continuing on, doing layers upon layers. And I keep it around for a couple of weeks, and I ’ m contemplating it, and I ’ ll do another session with it and bring it up to another level, where all of this becomes the background, the depth of it. JH : That ’ s fantastic. So the valves at the bottom of those tubes there are like radio-controlled airplane valves. TS : Yes, they ’ re servos with cams that pinch these rubber tubes. And they can pinch them very tight and stop it, or you can have them wide open. And all of the colors come out one central port at the bottom. You can always be changing colors, put aluminum paint, or I could put anything into this. It could be tomato sauce, or anything could be dispensed — sand, powders or anything like that. JH : So many forces there. You ’ ve got gravity, you ’ ve got the centrifugal force, you ’ ve got the fluid dynamics. Each of these beautiful paintings, are they images in and of themselves, or are they records of a physical event called the pendulum approaching the canvas? TS : Well, this painting here, I wanted to do something very simple, a simple, iconic image of two ripples interfering. So the one on the right was done first, and then the one on the left was done over it. And then I left gaps so you could see the one that was done before. And then when I did the second one, it really disturbed the piece — these big blue lines crashing through the center of it — and so it created a kind of tension and an overlap. There are lines in front of the one on the right, and there are lines behind the one on the left, and so it takes it into different planes. What it ’ s also about, just the little events, the events of the interpenetration of — JH : Two stars, or — TS : Two things that happened — there ’ s an interference pattern, and then a third thing happens. There are shapes that come about just by the marriage of two events that are happening, and I ’ m very interested in that. Like the occurrence of moire patterns. Like this green one, this is a painting I did about 10 years ago, but it has some — see, in the upper third — there are these moires and interference patterns that are radio kind of imagery. And that ’ s something that in painting I ’ ve never seen done. I ’ ve never seen a representation of a kind of radio interference patterns, which are so ubiquitous and such an important part of our lives. JH : Is that a literal part of the image, or is my eye making that interference pattern — is my eye completing that interference pattern? TS : It is the paint actually, makes it real. It ’ s really manifested there. If I throw a very concentric circle, or concentric ellipse, it just dutifully makes these evenly spaced lines, which get closer and closer together, which describes how gravity works. There ’ s something very appealing about the exactitude of science that I really enjoy. And I love the shapes that I see in scientific observations and **apparatus**, especially astronomical forms and the idea of the vastness of it, the scale, is very interesting to me. My focus in recent years has kind of shifted more toward biology. Some of these paintings, when you look at them very close, odd things appear that really look like horses or birds or crocodiles, elephants. There are lots of things that appear. When you look into it, it ’ s sort of like looking at cloud patterns, but sometimes they ’ re very modeled and highly rendered. And then there are all these forms that we don ’ t know what they are, but they ’ re equally well-resolved and complex. So I think, conceivably, those could be predictive. Because since it has the ability to make forms that look like forms that we ’ re familiar with in biology, it ’ s also making other forms that we ’ re not familiar with. And maybe it ’ s the kind of forms we ’ ll discover underneath the surface of Mars, where there are probably lakes with fish swimming under the surface. JH : Oh, let ’ s hope so. Oh, my God, let ’ s. Oh, please, yes. Oh, I ’ m so there. You know, it seems at this stage in your life, you also very personally are in this state of confrontation with a sort of dissonant — I suppose it ’ s an electromagnetic force that somehow governs your Parkinson ’ s and this creative force that is both the artist who is in the here and now and this sort of arc of your whole life. Is that relevant to your work? TS : As it turns out, this device kind of comes in handy, because I don ’ t have to have the fine motor skills to do, that I can operate slides, which is more of a mental process. I ’ m looking at it and making decisions : It needs more red, it needs more blue, it needs a different shape. And so I make these creative decisions and can execute them in a much, much simpler way. I mean, I ’ ve got the symptoms. I guess Parkinson ’ s kind of creeps up over the years, but at a certain point you start seeing the symptoms. In my case, my left hand has a significant tremor and my left leg also. I ’ m left-handed, and so I draw. All my creations really start on small drawings, which I have thousands of, and it ’ s my way of just thinking. I draw with a simple pencil, and at first, the Parkinson ’ s was really upsetting, because I couldn ’ t get the pencil to stand still. JH : So you ’ re not a gatekeeper for these forces. You don ’ t think of yourself as the master of these forces. You think of yourself as the servant. TS : Nature is — well, it ’ s a godsend. It just has so much in it. And I think nature wants to express itself in the sense that we are nature, humans are of the universe. The universe is in our mind, and our minds are in the universe. And we are expressions of the universe, basically. As humans, ultimately being part of the universe, we ’ re kind of the spokespeople or the observer part of the constituency of the universe. And to interface with it, with a device that lets these forces that are everywhere act and show what they can do, giving them pigment and paint just like an artist, it ’ s a good ally. It ’ s a terrific studio assistant. JH : Well, I love the idea that somewhere within this idea of fine motion and control with the traditional skills that you have with your hand, some sort of more elemental force gets revealed, and that ’ s the beauty here. Tom, thank you so much. It ’ s been really, really great. TS : Thank you, John.

There ’ s a great big elephant in the room called the economy. So let ’ s start talking about that. I wanted to give you a current picture of the economy. That ’ s what I have behind myself. But of course what we have to remember is this. And what you have to think about is, when you ’ re dancing in the flames, what ’ s next? So what I ’ m going to try to do in the next 17 and a half minutes is I ’ m going to talk first about the flames — where we are in the economy — and then I ’ m going to take three trends that have taken place at TED over the last 25 years and that will take place in this conference and I will try and bring them together. And I will try and give you a sense of what the ultimate reboot looks like. Those three trends are the ability to engineer cells, the ability to engineer tissues, and robots. And somehow it will all make sense. But anyway, let ' s start with the economy. There ' s a couple of really big problems that are still sitting there. One is leverage. And the problem with leverage is it makes the U. S. financial system look like this. So, a normal commercial bank has nine to 10 times leverage. That means for every dollar you deposit, it loans out about nine or 10. A normal investment bank is not a deposit bank, it ' s an investment bank ; it has 15 to 20 times. It turns out that B of A in September had 32 times. And your friendly Citibank had 47 times. Oops. That means every bad loan goes bad 47 times over. And that, of course, is the reason why all of you are making such generous and wonderful donations to these nice folks. And as you think about that, you ' ve got to wonder : so what do banks have in store for you now? It ain ' t pretty. The government, meanwhile, has been acting like Santa Claus. We all love Santa Claus, right? But the problem with Santa Clause is, if you look at the mandatory spending of what these folks have been doing and promising folks, it turned out that in 1967, 38 percent was mandatory spending on what we call"entitlements."And then by 2007 it was 68 percent. And we weren ' t supposed to run into 100 percent until about 2030. Except we ' ve been so busy giving away a trillion here, a trillion there, that we ' ve brought that date of reckoning forward to about 2017. And we thought we were going to be able to lay these debts off on our kids, but, guess what? We ' re going to start to pay them. And the problem with this stuff is, now that the bill ' s come due, it turns out Santa isn ' t quite as cute when it ' s summertime. Right? Here ' s some advice from one of the largest investors in the United States. This guy runs the China Investment Corporation. He is the main buyer of U. S. Treasury bonds. And he gave an interview in December. Here ' s his first bit of advice. And here ' s his second bit of advice. And, by the way, the Chinese Prime Minister reiterated this at Davos last Sunday. This stuff is getting serious enough that if we don ' t start paying attention to the deficit, we ' re going to end up losing the dollar. And then all bets are off. Let me show you what it looks like. I think I can safely say that I ' m the only trillionaire in this room. This is an actual bill. And it ' s 10 triliion dollars. The only problem with this bill is it ' s not really worth very much. That was eight bucks last week, four bucks this week, a buck next week. And that ' s what happens to currencies when you don ' t stand behind them. So the next time somebody as cute as this shows up on your doorstep, and sometimes this creature ' s called Chrysler and sometimes Ford and sometimes... whatever you want — you ' ve just got to say no. And you ' ve got to start banishing a word that ' s called"entitlement."And the reason we have to do that in the short term is because we have just run out of cash. If you look at the federal budget, this is what it looks like. The orange slice is what ' s discretionary. Everything else is mandated. It makes no difference if we cut out the bridges to Alaska in the overall scheme of things. So what we have to start thinking about doing is capping our medical spending because that ' s a monster that ' s simply going to eat the entire budget. We ' ve got to start thinking about asking people to retire a little bit later. If you ' re 60 to 65 you retire on time. Your 401 just got nailed. If you ' re 50 to 60 we want you to work two years more. If you ' re under 50 we want you to work four more years. The reason why that ' s reasonable is, when your grandparents were given Social Security, they got it at 65 and were expected to check out at 68. Sixty-eight is young today. We ' ve also got to cut the military about three percent a year. We ' ve got to limit other mandatory spending. We ' ve got to quit borrowing as much, because otherwise the interest is going to eat that whole pie. And we

’ ve got to end up with a smaller government. And if we don ’ t start changing this trend line, we are going to lose the dollar and start to look like Iceland. I got what you ’ re thinking. This is going to happen when hell freezes over. But let me remind you this December it did snow in Vegas. Here ’ s what happens if you don ’ t address this stuff. So, Japan had a fiscal real estate crisis back in the late ’ 80s. And its 225 largest companies today are worth one quarter of what they were 18 years ago. We don ’ t fix this now, how would you like to see a Dow 3, 500 in 2026? Because that ’ s the consequence of not dealing with this stuff. And unless you want this person to not just become the CFO of Florida, but the United States, we ’ d better deal with this stuff. That ’ s the short term. That ’ s the flame part. That ’ s the financial crisis. Now, right behind the financial crisis there ’ s a second and bigger wave that we need to talk about. That wave is much larger, much more powerful, and that ’ s of course the wave of technology. And what ’ s really important in this stuff is, as we cut, we also have to grow. Among other things, because startup companies are. 02 percent of U. S. GDP investmentm and they ’ re about 17. 8 percent of output. It ’ s groups like that in this room that generate the future of the U. S. economy. And that ’ s what we ’ ve got to keep growing. We don ’ t have to keep growing these bridges to nowhere. So let ’ s bring a romance novelist into this conversation. And that ’ s where these three trends come together. That ’ s where the ability to engineer microbes, the ability to engineer tissues, and the ability to engineer robots begin to lead to a reboot. And let me recap some of the stuff you ’ ve seen. Craig Venter showed up last year and showed you the first fully programmable cell that acts like hardware where you can insert DNA and have it boot up as a different species. In parallel, the folks at MIT have been building a standard registry of biological parts. So think of it as a Radio Shack for biology. You can go out and get your proteins, your RNA, your DNA, whatever. And start building stuff. In 2006 they brought together high school students and college students and started to build these little odd creatures. They just happened to be alive instead of circuit boards. Here was one of the first things they built. So, cells have this cycle. First they don ’ t grow. Then they grow exponentially. Then they stop growing. Graduate students wanted a way of telling which stage they were in. So they engineered these cells so that when they ’ re growing in the exponential phase, they would smell like wintergreen. And when they stopped growing they would smell like bananas. And you could tell very easily when your experiment was working and wasn ’ t, and where it was in the phase. This got a bit more complicated two years later. Twenty-one countries came together. Dozens of teams. They started competing. The team from Rice University started to engineer the substance in red wine that makes red wine good for you into beer. So you take resveratrol and you put it into beer. Of course, one of the judges is wandering by, and he goes,”Wow! Cancer-fighting beer! There is a God.”The team from Taiwan was a little bit more ambitious. They tried to engineer bacterias in such a way that they would act as your kidneys. Four years ago, I showed you this picture. And people oohed and ahhed, because Cliff Tabin had been able to grow an extra wing on a chicken. And that was very cool stuff back then. But now moving from bacterial engineering to tissue engineering, let me show you what ’ s happened in that period of time. Two years ago, you saw this creature. An almost-extinct animal from Xochimilco, Mexico called an axolotl that can re-generate its limbs. You can freeze half its heart. It regrows. You can freeze half the brain. It regrows. It ’ s almost like leaving Congress. But now, you don ’ t have to have the animal itself to regenerate, because you can build cloned mice molars in Petri dishes. And, of course if you can build mice molars in Petri dishes, you can grow human molars in Petri dishes. This should not surprise you, right?

I mean, you ’ re born with no teeth. You give away all your teeth to the tooth fairy. You re- grow a set of teeth. But then if you lose one of those second set of teeth, they don ’ t regrow, unless, if you ’ re a lawyer. But, of course, for most of us, we know how to grow teeth, and therefore we can take adult stem teeth, put them on a biodegradable mold, re-grow a tooth, and simply implant it. And we can do it with other things. So, a Spanish woman who was dying of T. B. had a donor trachea, they took all the cells off the trachea, they spraypainted her stem cells onto that cartilage. She regrew her own trachea, and 72 hours later it was implanted. She ’ s now running around with her kids. This is going on in Tony Atala ’ s lab in Wake Forest where he is re- growing ears for injured soldiers, and he ’ s also re-growing bladders. So there are now nine women walking around Boston with re-grown bladders, which is much more pleasant than walking around with a whole bunch of plastic bags for the rest of your life. This is kind of getting boring, right? I mean, you understand where this story ’ s going. But, I mean it gets more interesting. Last year, this group was able to take all the cells off a heart, leaving just the cartilage. Then, they sprayed stem cells onto that heart, from a mouse. Those stem cells self- organized, and that heart started to beat. Life happens. This may be one of the ultimate papers. This was done in Japan and in the U. S., published at the same time, and it rebooted skin cells into stem cells, last year. That meant that you can take the stuff right here, and turn it into almost anything in your body. And this is becoming common, it ’ s moving very quickly, it ’ s moving in a whole series of places. Third trend : robots. Those of us of a certain age grew up expecting that by now we would have Rosie the Robot from”The Jetsons”in our house. And all we ’ ve **got** is a Roomba. We also thought we ’ d have this robot to warn us of danger. Didn ’ t happen. And these were robots engineered for a flat world, right? So, Rosie runs around on skates and the other one ran on flat threads. If you don ’ t have a flat world, that ’ s not good, which is why the robot ’ s we ’ re designing today are a little different. This is Boston Dynamics ’”BigDog.”And this is about as close as you can get to a physical Turing test. O. K., so let me remind you, a Turing test is where you ’ ve got a wall, you ’ re talking to somebody on the other side of the wall, and when you don ’ t know if that thing is human or animal — that ’ s when computers have reached human intelligence. This is not an intelligence Turing rest, but this is as close as you can get to a physical Turing test. And this stuff is moving very quickly, and by the way, that thing can carry about 350 pounds of weight. These are not the only interesting robots. You ’ ve also got flies, the size of flies, that are being made by Robert Wood at Harvard. You ’ ve got Stickybots that are being made at Stanford. And as you bring these things together, as you bring cells, biological tissue engineering and mechanics together, you begin to get some really odd questions. In the last Olympics, this gentleman, who had several world records in the Special Olympics, tried to run in the normal Olympics. The only issue with Oscar Pistorius is he was born without bones in the lower part of his legs. He came within about a second of qualifying. He sued to be allowed to run, and he won the suit, but didn ’ t qualify by time. Next Olympics, you can bet that Oscar, or one of Oscar ’ s successors, is going to make the time. And two or three Olympics after that, they are going to be unbeatable. And as you bring these trends together, and as you think of what it means to take people who are profoundly deaf, who can now begin to hear — I mean, remember the evolution of hearing aids, right? I mean, your grandparents had these great big cones, and then your parents had these odd boxes that would squawk at odd times during dinner, and now we have these little buds that nobody sees. And now you have cochlear implants that go into people ’ s heads and allow the deaf to begin to hear. Now, they can ’ t hear as well as you and I can. But, in 10 or 15 machine generations they will, and these are machine generations, not human generations. And about two or three years after they can hear as well as you and I can, they ’ ll be able to hear maybe how bats sing, or how whales talk, or how dogs talk, and other types of tonal scales. They ’ ll be able to focus their hearing, they ’ ll be able to increase the sensitivity, decrease the sensitivity, do a series of things that we can ’ t do. And the same thing is happening in eyes. This is a group in Germany that ’ s beginning to engineer eyes so that people who are blind can begin to see light and dark. Very primitive. And then they ’ ll be able to see shape. And then they ’ ll be able to see color, and then they ’ ll be able to see in definition, and one day, they ’ ll see as well as you and I can. And a couple of years after that, they ’ ll be able to see in ultraviolet, they ’ ll be able to see in infrared, they ’ ll be able to focus their eyes, they ’ ll be able to come into a microfocus. They ’ ll do stuff you and I can ’ t do. All of these things are coming together, and it ’ s a particularly important thing to understand, as we worry about the flames of the present, to keep an eye on the future. And, of course, the future is looking back 200 years, because next week is the 200th anniversary of Darwin ’ s birth. And it ’ s the 150th anniversary of the publication of”The Origin of Species.”And Darwin, of course, argued that evolution is a natural state. It is a natural state in everything that is alive, including hominids. There have actually been 22 species of hominids that have been around, have evolved, have wandered in different places, have gone extinct. It is common for hominids to evolve. And that ’ s the reason why, as you look at the hominid fossil record, erectus, and heidelbergensis, and floresiensis, and Neanderthals, and Homo sapiens, all overlap. The common state of affairs is to have overlapping versions of hominids, not one. And as you think of the implications of that, here ’ s a brief history of the universe. The universe was created 13. 7 billion years ago, and then you created all the stars, and all the planets, and all the galaxies, and all the Milky Ways. And then you created Earth about 4. 5 billion years ago, and then you got life about four billion years ago, and then you got hominids about 0. 006 billion years ago, and then you got our version of hominids about 0. 0015 billion years ago. Ta-dah! Maybe the reason for thr creation of the universe, and all the galaxies, and all the planets, and all the energy, and all the dark energy, and all the rest of stuff is to create what ’ s in this room. Maybe not. That would be a mildly arrogant viewpoint. So, if that ’ s not the purpose of the universe, then what ’ s next? I think what we ’ re going to see is we ’ re going to see a different species of hominid. I think we ’ re going to move from a Homo sapiens into a Homo evolutis. And I think this isn ’ t 1, 000 years out. I think most of us are going to glance at it, and our grandchildren are going to begin to live it. And a Homo evolutis brings together these three trends into a hominid that takes direct and deliberate control over the evolution of his species, her species and other species. And that, of course, would be the ultimate reboot. Thank you very much.

I have a studio in Berlin â let me cue on here â which is down there in this snow, just last weekend. In the studio we do a lot of experiments. I would consider the studio more like a laboratory. I have occasional meetings with scientists. And I have an academy, a part of the University of Fine Arts in Berlin. We have an annual gathering of people, and that is called Life in Space. Life in Space is really not necessarily about how we do things, but why we do things. Do you mind looking, with me, at that little cross in the center there? So just keep looking. Don ’ t mind me. So you will have a yellow circle, and we will do an after-image experiment. When the circle goes away you will have another color, the complementary color. I am saying something. And your eyes and your brain are saying something back. This whole idea of sharing, the idea of constituting reality by overlapping what I say and what you say â think of a movie. Since two years now, with some stipends from the science ministry in Berlin, I ’ ve been working on these films where we produce the film together. I don ’ t necessarily think the film is so interesting. Obviously this is not interesting at all in the sense of the narrative. But nevertheless, what the potential is â and just keep looking there â what the potential is, obviously, is to kind of move the border of who is the author, and who is the receiver. Who is the consumer, if you want, and who has responsibility for what one sees? I think there is a socializing dimension in, kind of, moving that border. Who decides what reality is? This is the Tate Modern in London. The show was, in a sense, about that. It was about a space in which I put half a semi-circular yellow disk. I also put a mirror in the ceiling, and some fog, some haze. And my idea was to make the space tangible. With such a big space, the problem is obviously that there is a discrepancy between what your body can embrace, and what the space, in that sense, is. So here I had the hope that by inserting some natural elements, if you want â some fog â I could make the space tangible. And what happens is that people, they start to see themselves in this space. So look at this. Look at the girl. Of course they have to look through a bloody camera in a museum. Right? That ’ s how museums are working today. But look at her face there, as she ’ s checking out, looking at herself in the mirror.”Oh! That was my foot there!”She wasn ’ t really sure whether she was seeing herself or not. And in that whole idea, how do we configure the relationship between our body and the space? How do we reconfigure it? How do we know that being in a space makes a difference? Do you see when I said in the beginning, it ’ s about why, rather than how? The why meant really,”What consequences does it have when I take a step?””What does it matter?””Does it matter if I am in the world or not?””And does it matter whether the kind of actions I take filter into a sense of responsibility?”Is art about that? I would say yes. It is obviously about not just about decorating the world, and making it look even better, or even worse, if you ask me. It ’ s obviously also about taking responsibility, like I did here when throwing some green dye in the river in L. A., Stockholm, Norway and Tokyo, among other places. The green dye is not environmentally dangerous, but it obviously looks really rather frightening. And it ’ s on the other side also, I think, quite beautiful, as it somehow shows the turbulence in these kind of downtown areas, in these different places of the world. The”Green river,”as a kind of activist idea, not a part of an exhibition, it was really about showing people, in this city, as they walk by, that space has dimensions. A space has time. And the water flows through the city with time. The water has an ability to make the city negotiable, tangible. Negotiable meaning that it makes a difference whether you do something or not. It makes a difference whether you say,”I ’ m a part of this city. And if I vote it makes a difference. If I take a stand, it makes a difference.”This whole idea of a city not being a picture is, I think, something that art, in a sense, always was working with. The idea that art can actually evaluate the relationship between what it means to be in a picture, and what it means to be in a space. What is the difference? The difference between thinking and doing. So these are different experiments with that. I won ’ t go into them. Iceland, lower right corner, my favorite place. These kinds of experiments, they filter into architectural models. These are ongoing experiments. One is an experiment I did for BMW, an attempt to make a car. It ’ s made out of ice. A **crystalline** stackable principle in the center on the top, which I am trying to turn into a concert hall in Iceland. A sort of a run track, or a walk track, on the top of a museum in Denmark, which is made of colored glass, going all around. So the movement with your legs will change the color of your horizon. And two summers ago at the Hyde Park in London, with the Serpentine Gallery : a kind of a temporal pavilion where moving was the only way you could see the pavilion. This summer, in New York : there is one thing about falling water which is very much about the time it takes for water to fall. It ’ s quite simple and fundamental. I ’ ve walked a lot in the mountains in Iceland. And as you come to a new valley, as you come to a new landscape, you have a certain view. If you stand still, the landscape doesn ’ t necessarily tell you how big it is. It doesn ’ t really tell you what you ’ re looking at. The moment you start to move, the mountain starts to move. The big mountains far away, they move less. The small mountains in the foreground, they move more. And if you stop again, you wonder,”Is that a one-hour valley? Or is that a three-hour hike, or is that a whole day I ’ m looking at?”If you have a waterfall in there, right out there at the horizon ; you look at the waterfall and you go,”Oh, the water is falling really slowly.”And you go,”My god it ’ s really far away and it ’ s a giant waterfall.”If a waterfall is falling faster, it ’ s a smaller waterfall which is closer by â because the speed of falling water is pretty constant everywhere. And your body somehow knows that. So this means a waterfall is a way of measuring space. Of course being an iconic city like New York, that has had an interest in somehow playing around with the sense of space, you could say that New York wants to seem as big as possible. Adding a measurement to that is interesting : the falling water suddenly gives you a sense of,”Oh, Brooklyn is exactly this much â the distance between Brooklyn and Manhattan, in this case the lower East River is this big.”So it was not just necessarily about putting nature into the cities. It was also about giving the city a sense of dimension. And why would we want to do that? Because I think it makes a difference whether you have a body that feels a part of a space, rather than having a body which is just in front of a picture. And”Ha-ha, there is a picture and here is I. And what does it matter?”Is there a sense of consequences? So if I have a sense of the space, if I feel that the space is tangible, if I feel there is time, if there is a dimension I could call time, I also feel that I can change the space. And suddenly it makes a difference in terms of making space accessible. One could say this is about community, collectivity. It ’ s about being together. How do we create public space? What does the word”public”mean today anyway? So, asked in that way, I think it raises great things about parliamentary ideas, democracy, public space, being together, being individual. How do we create an idea which is both tolerant to individuality, and also to collectivity, without polarizing the two into two different opposites? Of course the political agendas in the world has been very obsessed, polarizing the two against each other into different, very normative ideas. I would claim that art and culture, and this is why art and culture are so incredibly interesting in the times we ’ re living in now, have proven that one can create a kind of a space which is both sensitive to individuality and to collectivity. It ’ s very much about this causality, consequences. It ’ s very much about the way we link thinking and doing. So what is between thinking and doing? And right in-between thinking and doing, I would say, there is experience. And experience is not just a kind of entertainment in a non-casual way. Experience is about responsibility. Having an experience is taking part in the world. Taking part in the world is really about sharing responsibility. So art, in that sense, I think holds an incredible relevance in the world in which we ’ re moving into, particularly right now. That ’ s all I have. Thank you very much.

I ’ m going to talk about the strategizing brain. We ’ re going to use an unusual combination of tools from game theory and neuroscience to understand how people interact socially when value is on the line. So game theory is a branch of, originally, applied mathematics, used mostly in economics and political science, a little bit in biology, that gives us a mathematical taxonomy of social life and it predicts what people are likely to do and believe others will do in cases where everyone ’ s actions affect everyone else. That ’ s a lot of things : competition, cooperation, bargaining, games like hide-and-seek, and poker. Here ’ s a simple game to get us started. Everyone chooses a number from zero to 100, we ’ re going to compute the average of those numbers, and whoever ’ s closest to two-thirds of the average wins a fixed prize. So you want to be a little bit below the average number, but not too far below, and everyone else wants to be a little bit below the average number as well. Think about what you might pick. As you ’ re thinking, this is a toy model of something like selling in the stock market during a rising market. Right? You don ’ t want to sell too early, because you miss out on profits, but you don ’ t want to wait too late to when everyone else sells, triggering a crash. You want to be a little bit ahead of the competition, but not too far ahead. Okay, here ’ s two theories about how people might think about this, and then we ’ ll see some data. Some of these will sound familiar because you probably are thinking that way. I ’ m using my brain theory to see. A lot of people say,”I really don ’ t know what people are going to pick, so I think the average will be 50.”They ’ re not being really strategic at all.”And I ’ ll pick two-thirds of 50. That ’ s 33.”That ’ s a start. Other people who are a little more sophisticated, using more working memory, say,”I think people will pick 33 because they ’ re going to pick a response to 50, and so I ’ ll pick 22, which is two-thirds of 33.”They ’ re doing one extra step of thinking, two steps. That ’ s better. And of course, in principle, you could do three, four or more, but it starts to get very difficult. Just like in language and other domains, we know that it ’ s hard for people to parse very complex sentences with a kind of recursive structure. This is called a cognitive hierarchy theory, by the way. It ’ s something that I ’ ve worked on and a few other people, and it indicates a kind of hierarchy along with some assumptions about how many people stop at different steps and how the steps of thinking are affected by lots of interesting variables and variant people, as we ’ ll see in a minute. A very different theory, a much more popular one, and an older one, due largely to John Nash of”A Beautiful Mind”fame, is what ’ s called equilibrium analysis. So if you ’ ve ever taken a game theory course at any level, you will have learned a little bit about this. An equilibrium is a mathematical state in which everybody has figured out exactly what everyone else will do. It is a very useful concept, but behaviorally, it may not exactly explain what people do the first time they play these types of economic games or in situations in the outside world. In this case, the equilibrium makes a very bold prediction, which is everyone wants to be below everyone else, therefore they ’ ll play zero. Let ’ s see what happens. This experiment ’ s been done many, many times. Some of the earliest ones were done in the ’ 90s by me and Rosemarie Nagel and others. This is a beautiful data set of 9, 000 people who wrote in to three newspapers and magazines that had a contest. The contest said, send in your numbers and whoever is close to two-thirds of the average will win a big prize. And as you can see, there ’ s so much data here, you can see the spikes very visibly. There ’ s a spike at 33. Those are people doing one step. There is another spike visible at 22. And notice, by the way, that most people pick numbers right around there. They don ’ t necessarily pick exactly 33 and 22. There ’ s something a little bit noisy around it. But you can see those spikes, and they ’ re there. There ’ s another group of people who seem to have a firm grip on equilibrium analysis, because they ' re picking zero or one. But they lose, right? Because picking a number that low is actually a bad choice if other people aren ' t doing equilibrium analysis as well. So they ' re smart, but poor. Where are these things happening in the brain? One study by Coricelli and Nagel gives a really sharp, interesting answer. So they had people play this game while they were being scanned in an fMRI, and two conditions : in some trials, they ' re told you ' re playing another person who ' s playing right now and we ' re going to match up your behavior at the end and pay you if you win. In the other trials, they ' re told, you ' re playing a computer. They ' re just choosing randomly. So what you see here is a subtraction of areas in which there ' s more brain activity when you ' re playing people compared to playing the computer. And you see activity in some regions we ' ve seen today, medial prefrontal cortex, dorsomedial, however, up here, ventromedial prefrontal cortex, anterior cingulate, an area that ' s involved in lots of types of conflict resolution, like if you ' re playing"Simon Says,"and also the right and left temporoparietal junction. And these are all areas which are fairly reliably known to be part of what ' s called a"theory of mind"circuit, or"mentalizing circuit."That is, it ' s a circuit that ' s used to imagine what other people might do. So these were some of the first studies to see this tied in to game theory. What happens with these one- and two-step types? So we classify people by what they picked, and then we look at the difference between playing humans versus playing computers, which brain areas are differentially active. On the top you see the one-step players. There ' s almost no difference. The reason is, they ' re treating other people like a computer, and the brain is too. The bottom players, you see all the activity in dorsomedial PFC. So we know that those two-step players are doing something differently. Now if you were to step back and say,"What can we do with this information?"you might be able to look at brain activity and say,"This person ' s going to be a good poker player,"or,"This person ' s socially naive,"and we might also be able to study things like development of adolescent brains once we have an idea of where this circuitry exists. Okay. Get ready. I ' m saving you some brain activity, because you don ' t need to use your hair detector cells. You should use those cells to think carefully about this game. This is a bargaining game. Two players who are being scanned using EEG electrodes are going to bargain over one to six dollars. If they can do it in 10 seconds, they ' re going to actually earn that money. If 10 seconds goes by and they haven ' t made a deal, they get nothing. That ' s kind of a mistake together. The twist is that one player, on the left, is informed about how much on each trial there is. They play lots of trials with different amounts each time. In this case, they know there ' s four dollars. The uninformed player doesn ' t know, but they know that the informed player knows. So the uninformed player ' s challenge is to say,"Is this guy really being fair or are they giving me a very low offer in order to get me to think that there ' s only one or two dollars available to split?"in which case they might reject it and not come to a deal. So there ' s some tension here between trying to get the most money but trying to goad the other player into giving you more. And the way they bargain is to point on a number line that goes from zero to six dollars, and they ' re bargaining over how much the uninformed player gets, and the informed player ' s going to get the rest. So this is like a management-labor negotiation in which the workers don ' t know how much profits the privately held company has, right, and they want to maybe hold out for more money, but the company might want to create the impression that there ' s very little to split :"I ' m giving you the most that I can."First some behavior. So a bunch of the subject pairs, they play face to face. We have some other data where they play across computers. That ' s an interesting difference, as you might imagine. But a bunch of the face-to-face pairs agree to divide the money evenly every single time. Boring. It ' s just not interesting neurally. It ' s good for them. They make a lot of money. But we ' re interested in, can we say something about when disagreements occur versus don ' t occur? So this is the other group of subjects who often disagree. So they have a chance of — they bicker and disagree and end up with less money. They might be eligible to be on"Real Housewives,"the TV show. You see on the left, when the amount to divide is one, two or three dollars, they disagree about half the time, and when the amount is four, five, six, they agree quite often. This turns out to be something that ' s predicted by a very complicated type of game theory you should come to graduate school at CalTech and learn about. It ' s a little too complicated to explain right now, but the theory tells you that this shape kind of should occur. Your intuition might tell you that too. Now I ' m going to show you the results from the EEG recording. Very complicated. The right brain **schematic** is the uninformed person, and the left is the informed. Remember that we scanned both brains at the same time, so we can ask about time-synced activity in similar or different areas simultaneously, just like if you wanted to study a conversation and you were scanning two people talking to each other and you ' d expect common activity in language regions when they ' re actually kind of listening and communicating. So the arrows connect regions that are active at the same time, and the direction of the arrows flows from the region that ' s active first in time, and the arrowhead goes to the region that ' s active later. So in this case, if you look carefully, most of the arrows flow from right to left. That is, it looks as if the uninformed brain activity is happening first, and then it ' s followed by activity in the informed brain. And by the way, these were trials where their deals were made. This is from the first two seconds. We haven ' t finished analyzing this data, so we ' re still peeking in, but the hope is that we can say something in the first couple of seconds about whether they ' ll make a deal or not, which could be very useful in thinking about avoiding litigation and ugly divorces and things like that. Those are all cases in which a lot of value is lost by delay and strikes. Here ' s the case where the disagreements occur. You can see it looks different than the one before. There ' s a lot more arrows. That means that the brains are synced up more closely in terms of simultaneous activity, and the arrows flow clearly from left to right. That is, the informed brain seems to be deciding,"We ' re probably not going to make a deal here."And then later there ' s activity in the uninformed brain. Next I ' m going to introduce you to some relatives. They ' re hairy, smelly, fast and strong. You might be thinking back to your last Thanksgiving. Maybe if you had a chimpanzee with you. Charles Darwin and I and you broke off from the family tree from chimpanzees about five million years ago. They ' re still our closest genetic kin. We share 98. 8 percent of the genes. We share more genes with them than zebras do with horses. And we ' re also their closest cousin. They have more genetic relation to us than to gorillas. So how humans and chimpanzees behave differently might tell us a lot about brain evolution. So this is an amazing memory test from Nagoya, Japan, Primate Research Institute, where they ' ve done a lot of this research. This goes back quite a ways. They ' re interested in working memory. The chimp is going to see, watch carefully, they ' re going to see 200 **milliseconds** ' exposure — that ' s fast, that ' s eight movie frames — of numbers one, two, three, four, five. Then they disappear and they ' re replaced by squares, and they have to press the squares that correspond to the numbers from low to high to get an apple reward. Let ' s see how they can do it. This is a young chimp. The young ones are better than the old ones, just like humans. And they ' re highly experienced, so they ' ve done this thousands and thousands of time. Obviously there ' s a big training effect, as you can imagine. You can see they ' re very blas and kind of effortless. Not only can they do it very well, they do it in a sort of lazy way. Right? Who thinks you could beat the chimps? Wrong. We can try. We ’ ll try. Maybe we ’ ll try. Okay, so the next part of this study I ’ m going to go quickly through is based on an idea of Tetsuro Matsuzawa. He had a bold idea that — what he called the cognitive trade-off hypothesis. We know chimps are faster and stronger. They ’ re also very obsessed with status. His thought was, maybe they ’ ve preserved brain activities and they practice them in development that are really, really important to them to negotiate status and to win, which is something like strategic thinking during competition. So we ’ re going to check that out by having the chimps actually play a game by touching two touch screens. The chimps are actually interacting with each other through the computers. They ’ re going to press left or right. One chimp is called a matcher. They win if they press left, left, like a seeker finding someone in hide-and-seek, or right, right. The mismatcher wants to mismatch. They want to press the opposite screen of the chimp. And the rewards are apple cube rewards. So here ’ s how game theorists look at these data. This is a graph of the percentage of times the matcher picked right on the x-axis, and the percentage of times they predicted right by the mismatcher on the y-axis. So a point here is the behavior by a pair of players, one trying to match, one trying to mismatch. The NE square in the middle — actually NE, CH and QRE — those are three different theories of Nash equilibrium, and others, tells you what the theory predicts, which is that they should match 50-50, because if you play left too much, for example, I can exploit that if I ’ m the mismatcher by then playing right. And as you can see, the chimps, each chimp is one triangle, are circled around, hovering around that prediction. Now we move the payoffs. We ’ re actually going to make the left, left payoff for the matcher a little bit higher. Now they get three apple cubes. Game theoretically, that should actually make the mismatcher ’ s behavior shift, because what happens is, the mismatcher will think, oh, this guy ’ s going to go for the big reward, and so I ’ m going to go to the right, make sure he doesn ’ t get it. And as you can see, their behavior moves up in the direction of this change in the Nash equilibrium. Finally, we changed the payoffs one more time. Now it ’ s four apple cubes, and their behavior again moves towards the Nash equilibrium. It ’ s sprinkled around, but if you average the chimps out, they ’ re really, really close, within. 01. They ’ re actually closer than any species we ’ ve observed. What about humans? You think you ’ re smarter than a chimpanzee? Here ’ s two human groups in green and blue. They ’ re closer to 50-50. They ’ re not responding to payoffs as closely, and also if you study their learning in the game, they aren ’ t as sensitive to previous rewards. The chimps are playing better than the humans, better in the sense of adhering to game theory. And these are two different groups of humans from Japan and Africa. They replicate quite nicely. None of them are close to where the chimps are. So here are some things we learned today. People seem to do a limited amount of strategic thinking using theory of mind. We have some preliminary evidence from bargaining that early warning signs in the brain might be used to predict whether there will be a bad disagreement that costs money, and chimps are better competitors than humans, as judged by game theory. Thank you.

Have you ever experienced a moment in your life that was so painful and confusing, that all you wanted to do was learn as much as you could to make sense of it all? When I was 13, a close family friend who was like an uncle to me passed away from pancreatic cancer. When the disease hit so close to home, I knew I needed to learn more. So I went online to find answers. Using the Internet, I found a variety of statistics on pancreatic cancer, and what I had found shocked me. Over 85 percent of all pancreatic cancers are diagnosed late, when someone has less than a two percent chance of survival. Why are we so bad at detecting pancreatic cancer? The reason? Today ' s current"modern"medicine is a 60-year-old technique. That ' s older than my dad. But also, it ' s extremely expensive, costing 800 dollars per test, and it ' s grossly inaccurate, missing 30 percent of all pancreatic cancers. Your doctor would have to be ridiculously suspicious that you have the cancer in order to give you this test. Learning this, I knew there had to be a better way. So, I set up scientific criteria as to what a sensor would have to look like in order to effectively diagnose pancreatic cancer. The sensor would have to be : inexpensive, rapid, simple, sensitive, selective, and minimally invasive. Now, there ' s a reason why this test hasn ' t been updated in over six decades. And that ' s because when we ' re looking for pancreatic cancer, we ' re looking at your bloodstream, which is already abundant in all these tons and tons of protein, and you ' re looking for this miniscule difference in this tiny amount of protein. Just this one protein. That ' s next to impossible. However, undeterred due to my teenage optimism — I went online to a teenager ' s two best friends, Google and Wikipedia. I got everything for my homework from those two sources. And what I had found was an article that listed a database of over 8, 000 different proteins that are found when you have pancreatic cancer. So, I decided to go and make it my new mission to go through all these proteins, and see which ones could serve as a bio-marker for pancreatic cancer. And to make it a bit simpler for myself, I decided to map out scientific criteria, and here it is. Essentially, first, the protein would have to be found in all pancreatic cancers, at high levels in the bloodstream, in the earliest stages, but also only in cancer. And so I ' m just plugging and chugging through this gargantuan task, and finally, on the 4, 000th try, when I ' m close to losing my sanity, I find the protein. And the name of the protein I ' d located was called mesothelin, and it ' s just your ordinary, run-of-the-mill type protein, unless, of course, you have pancreatic, ovarian or lung cancer, in which case it ' s found at these very high levels in your bloodstream. But also, the key is that it ' s found in the earliest stages of the disease, when someone has close to 100 percent chance of survival. So now that I ' d found a reliable protein I could detect, I then shifted my focus to actually detecting that protein, and thus, pancreatic cancer. Now, my breakthrough came in a very unlikely place, possibly the most unlikely place for innovation — my high school biology class, the absolute stifler of innovation. And I had snuck in this article on these things called carbon **nanotubes**, and that ' s just a long, thin pipe of carbon that ' s an atom thick, and one 50, 000th the diameter of your hair. And despite their extremely small sizes, they have these incredible properties. They ' re kind of like the superheroes of material science. And while I was sneakily reading this article under my desk in my biology class, we were supposed to be paying attention to these other kind of cool molecules, called antibodies. And these are pretty cool because they only react with one specific protein, but they ' re not nearly as interesting as carbon **nanotubes**. And so then, I was sitting in class, and suddenly it hit me : I could combine what I was reading about, carbon **nanotubes**, with what I was supposed to be thinking about, antibodies. Essentially, I could weave a bunch of these antibodies into a network of carbon **nanotubes**, such that you have a network that only reacts with one protein, but also, due to the properties of these **nanotubes**, it will change its electrical properties, based on the amount of protein present. However, there ' s a catch. These networks of carbon **nanotubes** are extremely flimsy. And since they ' re so delicate, they need to be supported. So that ' s why I chose to use paper. Making a cancer sensor out of paper is about as simple as making chocolate chip cookies, which I love. You start with some water, pour in some **nanotubes**, add antibodies, mix it up, take some paper, dip it, dry it, and you can detect cancer. Then, suddenly, a thought occurred that kind of put a blemish on my amazing plan here. I can ' t really do cancer research on my kitchen countertop. My mom wouldn ' t really like that. So instead, I decided to go for a lab. So I typed up a budget, a materials list, a timeline, and a procedure, and I emailed it to 200 different professors at Johns Hopkins University and the National Institutes of Health — essentially, anyone that had anything to do with pancreatic cancer. I sat back waiting for these positive emails to be pouring in, saying,"You ' re a genius! You ' re going to save us all!"And — Then reality took hold, and over the course of a month, I got 199 rejections out of those 200 emails. One professor even went through my entire procedure, painstakingly — I ' m not really sure where he got all this time — and he went through and said why each and every step was like the worst mistake I could ever make. Clearly, the professors did not have as high of an opinion of my work as I did. However, there is a silver lining. One professor said,"Maybe I might be able to help you, kid."So, I went in that direction. As you can never say no to a kid. And so then, three months later, I finally nailed down a harsh deadline with this guy, and I get into his lab, I get all excited, and then I sit down, I start opening my mouth and talking, and five seconds later, he calls in another Ph. D. Ph. D. s just flock into this little room, and they ' re just firing these questions at me, and by the end, I kind of felt like I was in a clown car. There were 20 Ph. D. s, plus me and the professor crammed into this tiny office space, with them firing these rapid-fire questions at me, trying to sink my procedure. How unlikely is that? I mean, pshhh. However, subjecting myself to that interrogation — I answered all their questions, and I guessed on quite a few but I got them right — and I finally landed the lab space I needed. But it was shortly afterwards that I discovered my once brilliant procedure had something like a million holes in it, and over the course of seven months, I painstakingly filled each and every one of those holes. The result? One small paper sensor that costs three cents and takes five minutes to run. This makes it 168 times faster, over 26, 000 times less expensive, and over 400 times more sensitive than our current standard for pancreatic cancer detection. One of the best parts of the sensor, though, is that it has close to 100 percent accuracy, and can detect the cancer in the earliest stages, when someone has close to 100 percent chance of survival. And so in the next two to five years, this sensor could potentially lift the pancreatic cancer survival rates from a dismal 5. 5 percent to close to 100 percent, and it would do similar for ovarian and lung cancer. But it wouldn ' t stop there. By switching out that antibody, you can look at a different protein, thus, a different disease — potentially any disease in the entire world. So that ranges from heart disease, to malaria, HIV, AIDS, as well as other forms of cancer — anything. And so, hopefully one day, we can all have that one extra uncle, that one mother, that one brother, sister, we can have that one more family member to love. And that our hearts will be rid of that one disease burden that comes from pancreatic, ovarian and lung cancer, and potentially any disease. But through the Internet, anything is possible. Theories can be shared, and you don ' t have to be a professor with multiple degrees to have your ideas valued. It ' s a neutral space, where what you look like, age or gender — it doesn ' t matter. It ' s just your ideas that count. For me, it ' s all about looking at the Internet in an entirely new way, to realize that there ' s so much more to it than just posting duck-face pictures of yourself online. You could be changing the world. So if a 15 year- old who didn ' t even know what a pancreas was could find a new way to detect pancreatic cancer — just imagine what you could do. Thank you.

Eric Berlow : I ’ m an ecologist, and Sean ’ s a physicist, and we both study complex networks. And we met a couple years ago when we discovered that we had both given a short TED Talk about the ecology of war, and we realized that we were connected by the ideas we shared before we ever met. And then we thought, you know, there are thousands of other talks out there, especially TEDx Talks, that are popping up all over the world. How are they connected, and what does that global conversation look like? So Sean ’ s going to tell you a little bit about how we did that. Sean Gourley : Exactly. So we took 24, 000 TEDx Talks from around the world, 147 different countries, and we took these talks and we wanted to find the mathematical structures that underly the ideas behind them. And we wanted to do that so we could see how they connected with each other. And so, of course, if you ’ re going to do this kind of stuff, you need a lot of data. So the data that you ’ ve **got** is a great thing called YouTube, and we can go down and basically pull all the open information from YouTube, all the comments, all the views, who ’ s watching it, where are they watching it, what are they saying in the comments. But we can also pull up, using speech-to-text translation, we can pull the entire transcript, and that works even for people with kind of funny accents like myself. So we can take their transcript and actually do some pretty cool things. We can take natural language processing algorithms to kind of read through with a computer, line by line, extracting key concepts from this. And we take those key concepts and they sort of form this mathematical structure of an idea. And we call that the meme-ome. And the meme-ome, you know, quite simply, is the mathematics that underlies an idea, and we can do some pretty interesting analysis with it, which I want to share with you now. So each idea has its own meme-ome, and each idea is unique with that, but of course, ideas, they borrow from each other, they kind of steal sometimes, and they certainly build on each other, and we can go through mathematically and take the meme-ome from one talk and compare it to the meme-ome from every other talk, and if there ’ s a similarity between the two of them, we can create a link and represent that as a graph, just like Eric and I are connected. So that ’ s theory, that ’ s great. Let ’ s see how it works in actual practice. So what we ’ ve got here now is the global footprint of all the TEDx Talks over the last four years exploding out around the world from New York all the way down to little old New Zealand in the corner. And what we did on this is we analyzed the top 25 percent of these, and we started to see where the connections occurred, where they connected with each other. Cameron Russell talking about image and beauty connected over into Europe. We ’ ve got a bigger conversation about Israel and Palestine radiating outwards from the Middle East. And we ’ ve got something a little broader like big data with a truly global footprint reminiscent of a conversation that is happening everywhere. So from this, we kind of run up against the limits of what we can actually do with a geographic projection, but luckily, computer technology allows us to go out into multidimensional space. So we can take in our network projection and apply a physics engine to this, and the similar talks kind of smash together, and the different ones fly apart, and what we ’ re left with is something quite beautiful. EB : So I want to just point out here that every node is a talk, they ’ re linked if they share similar ideas, and that comes from a machine reading of entire talk transcripts, and then all these topics that pop out, they ’ re not from tags and keywords. They come from

the network structure of interconnected ideas. Keep going. SG : Absolutely. So I got a little quick on that, but he ' s going to slow me down. We ' ve got education connected to storytelling triangulated next to social media. You ' ve got, of course, the human brain right next to healthcare, which you might expect, but also you ' ve got video games, which is sort of adjacent, as those two spaces interface with each other. But I want to take you into one cluster that ' s particularly important to me, and that ' s the environment. And I want to kind of zoom in on that and see if we can get a little more resolution. So as we go in here, what we start to see, apply the physics engine again, we see what ' s one conversation is actually composed of many smaller ones. The structure starts to emerge where we see a kind of fractal behavior of the words and the language that we use to describe the things that are important to us all around this world. So you ' ve got food economy and local food at the top, you ' ve got greenhouse gases, solar and nuclear waste. What you ' re getting is a range of smaller conversations, each connected to each other through the ideas and the language they share, creating a broader concept of the environment. And of course, from here, we can go and zoom in and see, well, what are young people looking at? And they ' re looking at energy technology and nuclear fusion. This is their kind of resonance for the conversation around the environment. If we split along gender lines, we can see females resonating heavily with food economy, but also out there in hope and optimism. And so there ' s a lot of exciting stuff we can do here, and I ' ll throw to Eric for the next part. EB : Yeah, I mean, just to point out here, you cannot get this kind of perspective from a simple tag search on YouTube. Let ' s now zoom back out to the entire global conversation out of environment, and look at all the talks together. Now often, when we ' re faced with this amount of content, we do a couple of things to simplify it. We might just say, well, what are the most popular talks out there? And a few rise to the surface. There ' s a talk about gratitude. There ' s another one about personal health and nutrition. And of course, there ' s got to be one about porn, right? And so then we might say, well, gratitude, that was last year. What ' s trending now? What ' s the popular talk now? And we can see that the new, emerging, top trending topic is about digital privacy. So this is great. It simplifies things. But there ' s so much creative content that ' s just buried at the bottom. And I hate that. How do we bubble stuff up to the surface that ' s maybe really creative and interesting? Well, we can go back to the network structure of ideas to do that. Remember, it ' s that network structure that is creating these emergent topics, and let ' s say we could take two of them, like cities and genetics, and say, well, are there any talks that creatively bridge these two really different disciplines. And that ' s — Essentially, this kind of creative remix is one of the hallmarks of innovation. Well here ' s one by Jessica Green about the microbial ecology of buildings. It ' s literally defining a new field. And we could go back to those topics and say, well, what talks are central to those conversations? In the cities cluster, one of the most central was one by Mitch Joachim about ecological cities, and in the genetics cluster, we have a talk about synthetic biology by Craig Venter. These are talks that are linking many talks within their discipline. We could go the other direction and say, well, what are talks that are broadly synthesizing a lot of different kinds of fields. We used a measure of ecological diversity to get this. Like, a talk by Steven Pinker on the history of violence, very synthetic. And then, of course, there are talks that are so unique they ' re kind of out in the stratosphere, in their own special place, and we call that the Colleen Flanagan index. And if you don ' t know Colleen, she ' s an artist, and I asked her,"Well, what ' s it like out there in the stratosphere of our idea space?"And apparently it smells like bacon. I wouldn ' t know. So we ' re using these network motifs to find talks that are unique, ones that are creatively synthesizing a lot of different fields, ones that are central to their topic, and ones that are really creatively bridging disparate fields. Okay? We never would have found those with our obsession with what ’ s trending now. And all of this comes from the architecture of complexity, or the patterns of how things are connected. SG : So that ’ s exactly right. We ’ ve got ourselves in a world that ’ s massively complex, and we ’ ve been using algorithms to kind of filter it down so we can navigate through it. And those algorithms, whilst being kind of useful, are also very, very narrow, and we can do better than that, because we can realize that their complexity is not random. It has mathematical structure, and we can use that mathematical structure to go and explore things like the world of ideas to see what ’ s being said, to see what ’ s not being said, and to be a little bit more human and, hopefully, a little smarter. Thank you.

Text Sample 453: NEG Dim 3 – 2005 – Score -3.00 – 2005/t000427.txt

At the break, I was asked by several people about my comments about the aging debate. And this will be my only comment on it. And that is, I understand that optimists greatly outlive pessimists. What I ’ m going to tell you about in my 18 minutes is how we ’ re about to switch from reading the genetic code to the first stages of beginning to write the code ourselves. It ’ s only 10 years ago this month when we published the first sequence of a free-living organism, that of haemophilus influenzae. That took a genome project from 13 years down to four months. We can now do that same genome project in the order of two to eight hours. So in the last decade, a large number of genomes have been added : most human pathogens, a couple of plants, several insects and several mammals, including the human genome. Genomics at this stage of the thinking from a little over 10 years ago was, by the end of this year, we might have between three and five genomes sequenced ; it ’ s on the order of several hundred. We just got a grant from the Gordon and Betty Moore Foundation to sequence 130 genomes this year, as a side project from environmental organisms. So the rate of reading the genetic code has changed. But as we look, what ’ s out there, we ’ ve barely scratched the surface on what is available on this planet. Most people don ’ t realize it, because they ’ re invisible, but microbes make up about a half of the Earth ’ s biomass, whereas all animals only make up about one one-thousandth of all the biomass. And maybe it ’ s something that people in Oxford don ’ t do very often, but if you ever make it to the sea, and you swallow a mouthful of seawater, keep in mind that each milliliter has about a million bacteria and on the order of 10 million viruses. Less than 5, 000 microbial species have been characterized as of two years ago, and so we decided to do something about it. And we started the Sorcerer II Expedition, where we were, as with great oceanographic expeditions, trying to sample the ocean every 200 miles. We started in Bermuda for our test project, then moved up to Halifax, working down the U. S. East Coast, the Caribbean Sea, the Panama Canal, through to the Galapagos, then across the Pacific, and we ’ re in the process now of working our way across the Indian Ocean. It ’ s very tough duty ; we ’ re doing this on a sailing vessel, in part to help excite young people about going into science. The experiments are incredibly simple. We just take seawater and we filter it, and we collect different size organisms on different filters, and then take their DNA back to our lab in Rockville, where we can sequence a hundred million letters of the genetic code every 24 hours. And with doing this, we ’ ve made some amazing discoveries. For example, it was thought that the visual pigments that are in our eyes — there was only one or two organisms in the environment that had these same pigments. It turns out, almost every species in the upper parts of the ocean in warm parts of the world have these same photoreceptors, and use sunlight as the source of their energy and communication. From one site, from one barrel of seawater, we discovered 1. 3 million new genes and as many as 50, 000 new species. We ' ve extended this to the air now with a grant from the Sloan Foundation. We ' re measuring how many viruses and bacteria all of us are breathing in and out every day, particularly on airplanes or closed auditoriums. We filter through some simple **apparatuses** ; we collect on the order of a billion microbes from just a day filtering on top of a building in New York City. And we ' re in the process of sequencing all that at the present time. Just on the data collection side, just where we are through the Galapagos, we ' re finding that almost every 200 miles, we see tremendous diversity in the samples in the ocean. Some of these make logical sense, in terms of different temperature gradients. So this is a satellite photograph based on temperatures — red being warm, blue being cold — and we found there ' s a tremendous difference between the warm water samples and the cold water samples, in terms of abundant species. The other thing that surprised us quite a bit is these photoreceptors detect different wavelengths of light, and we can predict that based on their amino acid sequence. And these vary tremendously from region to region. Maybe not surprisingly, in the deep ocean, where it ' s mostly blue, the photoreceptors tend to see blue light. When there ' s a lot of chlorophyll around, they see a lot of green light. But they vary even more, possibly moving towards infrared and ultraviolet in the extremes. Just to try and get an assessment of what our gene repertoire was, we assembled all the data — including all of ours thus far from the expedition, which represents more than half of all the gene data on the planet — and it totaled around 29 million genes. And we tried to put these into gene families to see what these discoveries are : Are we just discovering new members of known families, or are we discovering new families? And it turns out we have about 50, 000 major gene families, but every new sample we take in the environment adds in a linear fashion to these new families. So we ' re at the earliest stages of discovery about basic genes, components and life on this planet. When we look at the so-called evolutionary tree, we ' re up on the upper right- hand corner with the animals. Of those roughly 29 million genes, we only have around 24, 000 in our genome. And if you take all animals together, we probably share less than 30, 000 and probably maybe a dozen or more thousand different gene families. I view that these genes are now not only the design components of evolution. And we think in a gene-centric view — maybe going back to Richard Dawkins ' ideas — than in a genome-centric view, which are different constructs of these gene components. Synthetic DNA, the ability to synthesize DNA, has changed at sort of the same pace that DNA sequencing has over the last decade or two, and is getting very rapid and very cheap. Our first thought about synthetic genomics came when we sequenced the second genome back in 1995, and that from mycoplasma genitalium. And we have really nice T-shirts that say, you know,"I heart my genitalium."This is actually just a microorganism. But it has roughly 500 genes. Haemophilus had 1, 800 genes. And we simply asked the question, if one species needs 800, another 500, is there a smaller set of genes that might comprise a minimal operating system? So we started doing transposon mutagenesis. Transposons are just small pieces of DNA that randomly insert in the genetic code. And if they insert in the middle of the gene, they disrupt its function. So we made a map of all the genes that could take transposon insertions and we called those"non-essential genes."But it turns out the environment is very critical for this, and you can only define an essential or non-essential gene based on exactly what ' s in the environment. We also tried to take a more directly intellectual approach with the genomes of 13 related organisms, and we tried to compare all of those, to see what they had in common. And we got these overlapping circles. And we found only 173 genes common to all 13 organisms. The pool expanded a little bit if we ignored one intracellular parasite ; it expanded even more when we looked at core sets of genes of around 310 or so. So we think that we can expand or contract genomes, depending on your point of view here, to maybe 300 to 400 genes from the minimal of 500. The only way to prove these ideas was to construct an artificial chromosome with those genes in them, and we had to do this in a cassette-based fashion. We found that synthesizing accurate DNA in large pieces was extremely difficult. Ham Smith and Clyde Hutchison, my colleagues on this, developed an exciting new method that allowed us to synthesize a 5, 000-base pair virus in only a two-week period that was 100 percent accurate, in terms of its sequence and its biology. It was a quite exciting experiment — when we just took the synthetic piece of DNA, injected it in the bacteria and all of a sudden, that DNA started driving the production of the virus particles that turned around and then killed the bacteria. This was not the first synthetic virus — a polio virus had been made a year before — but it was only one ten-thousandth as active and it took three years to do. This is a cartoon of the structure of phi X 174. This is a case where the software now builds its own hardware, and that ' s the notions that we have with biology. People immediately jump to concerns about biological warfare, and I had recent testimony before a Senate committee, and a special committee the U. S. government has set up to review this area. And I think it ' s important to keep reality in mind, versus what happens with people ' s imaginations. Basically, any virus that ' s been sequenced today — that genome can be made. And people immediately freak out about things about Ebola or smallpox, but the DNA from this organism is not infective. So even if somebody made the smallpox genome, that DNA itself would not cause infections. The real concern that security departments have is designer viruses. And there ' s only two countries, the U. S. and the former Soviet Union, that had major efforts on trying to create biological warfare agents. If that research is truly discontinued, there should be very little activity on the know-how to make designer viruses in the future. I think single-cell organisms are possible within two years. And possibly eukaryotic cells, those that we have, are possible within a decade. So we ' re now making several dozen different constructs, because we can vary the cassettes and the genes that go into this artificial chromosome. The key is, how do you put all of the others? We start with these fragments, and then we have a homologous **recombination** system that reassembles those into a chromosome. This is derived from an organism, deinococcus radiodurans, that can take three million **rads** of radiation and not be killed. It reassembles its genome after this radiation burst in about 12 to 24 hours, after its chromosomes are literally blown apart. This organism is ubiquitous on the planet, and exists perhaps now in outer space due to all our travel there. This is a glass beaker after about half a million **rads** of radiation. The glass started to burn and crack, while the microbes sitting in the bottom just got happier and happier. Here ' s an actual picture of what happens : the top of this shows the genome after 1. 7 million **rads** of radiation. The chromosome is literally blown apart. And here ' s that same DNA automatically reassembled 24 hours later. It ' s truly stunning that these organisms can do that, and we probably have thousands, if not tens of thousands, of different species on this planet that are capable of doing that. After these genomes are synthesized, the first step is just transplanting them into a cell without a genome. So we think synthetic cells are going to have tremendous potential, not only for understanding the basis of biology but for hopefully environmental and society issues. For example, from the third organism we sequenced, Methanococcus jannaschii — it lives in boiling water temperatures ; its energy source is hydrogen and all its carbon comes from CO2 it captures back from the environment. So we know lots of different pathways, thousands of different organisms now that live off of CO2, and can capture that back. So instead of using carbon from oil for synthetic processes, we have the chance of using carbon and capturing it back from the atmosphere, converting that into biopolymers or other products. We have one organism that lives off of carbon monoxide, and we use as a reducing power to split water to produce hydrogen and oxygen. Also, there ’ s numerous pathways that can be engineered metabolizing methane. And DuPont has a major program with Statoil in Norway to capture and convert the methane from the gas fields there into useful products. Within a short while, I think there ’ s going to be a new field called”Combinatorial Genomics,”because with these new synthesis capabilities, these vast gene array repertoires and the homologous **recombination**, we think we can design a robot to make maybe a million different chromosomes a day. And therefore, as with all biology, you get selection through screening, whether you ’ re screening for hydrogen production, or chemical production, or just viability. To understand the role of these genes is going to be well within reach. We ’ re trying to modify photosynthesis to produce hydrogen directly from sunlight. Photosynthesis is modulated by oxygen, and we have an oxygen- insensitive hydrogenase that we think will totally change this process. We ’ re also combining cellulases, the enzymes that break down complex sugars into simple sugars and fermentation in the same cell for producing ethanol. Pharmaceutical production is already under way in major laboratories using microbes. The chemistry from compounds in the environment is orders of magnitude more complex than our best chemists can produce. I think future engineered species could be the source of food, hopefully a source of energy, environmental remediation and perhaps replacing the petrochemical industry. Let me just close with ethical and policy studies. We delayed the start of our experiments in 1999 until we completed a year-and-a-half bioethical review as to whether we should try and make an artificial species. Every major religion participated in this. It was actually a very strange study, because the various religious leaders were using their scriptures as law books, and they couldn ’ t find anything in them prohibiting making life, so it must be OK. The only ultimate concerns were biological warfare aspects of this, but gave us the go ahead to start these experiments for the reasons we were doing them. Right now the Sloan Foundation has just funded a multi-institutional study on this, to work out what the risk and benefits to society are, and the rules that scientific teams such as my own should be using in this area, and we ’ re trying to set good examples as we go forward. These are complex issues. Except for the threat of bio-terrorism, they ’ re very simple issues in terms of, can we design things to produce clean energy, perhaps revolutionizing what developing countries can do and provide through various simple processes. Thank you very much.

Well, I thought there would be a podium, so I ’ m a bit scared. Chris asked me to tell again how we found the structure of DNA. And since, you know, I follow his orders, I ’ ll do it. But it slightly bores me. And, you know, I wrote a book. So I ’ ll say something â â I ’ ll say a little about, you know, how the discovery was made, and why Francis and I found it. And then, I hope maybe I have at least five minutes to say what makes me tick now. In back of me is a picture of me when I was 17. I was at the University of Chicago, in my third year, and I was in my third year because the University of Chicago let you in after two years of high school. So you â it was fun to get away from high school â â because I was very small, and I was no good in sports, or anything like that. But I should say that my background â my father was, you know, raised to be an Episcopalian and Republican, but after one year of college, he became an atheist and a Democrat. And my mother was Irish Catholic, and â but she didn ’ t take religion too seriously. And by the age of 11, I was no longer going to Sunday Mass, and going on birdwatching walks with my father. So early on, I heard of Charles Darwin. I guess, you know, he was the big hero. And, you know, you understand life as it now exists through evolution. And at the University of Chicago I was a zoology major, and thought I would end up, you know, if I was bright enough, maybe getting a Ph. D. from Cornell in ornithology. Then, in the Chicago paper, there was a review of a book called”What is Life?”by the great physicist, Schrodinger. And that, of course, had been a question I wanted to know. You know, Darwin explained life after it got started, but what was the essence of life? And Schrodinger said the essence was information present in our chromosomes, and it had to be present on a molecule. I ’ d never really thought of molecules before. You know chromosomes, but this was a molecule, and somehow all the information was probably present in some digital form. And there was the big question of, how did you copy the information? So that was the book. And so, from that moment on, I wanted to be a geneticist â understand the gene and, through that, understand life. So I had, you know, a hero at a distance. It wasn ’ t a baseball player ; it was Linus Pauling. And so I applied to Caltech and they turned me down. So I went to Indiana, which was actually as good as Caltech in genetics, and besides, they had a really good basketball team. So I had a really quite happy life at Indiana. And it was at Indiana I got the impression that, you know, the gene was likely to be DNA. And so when I got my Ph. D., I should go and search for DNA. So I first went to Copenhagen because I thought, well, maybe I could become a biochemist, but I discovered biochemistry was very boring. It wasn ’ t going anywhere toward, you know, saying what the gene was ; it was just nuclear science. And oh, that ’ s the book, little book. You can read it in about two hours. And â but then I went to a meeting in Italy. And there was an unexpected speaker who wasn ’ t on the program, and he talked about DNA. And this was Maurice Wilkins. He was trained as a physicist, and after the war he wanted to do biophysics, and he picked DNA because DNA had been determined at the Rockefeller Institute to possibly be the genetic molecules on the chromosomes. Most people believed it was proteins. But Wilkins, you know, thought DNA was the best bet, and he showed this x-ray photograph. Sort of **crystalline**. So DNA had a structure, even though it owed it to probably different molecules carrying different sets of instructions. So there was something universal about the DNA molecule. So I wanted to work with him, but he didn ’ t want a former birdwatcher, and I ended up in Cambridge, England. So I went to Cambridge, because it was really the best place in the world then for x-ray crystallography. And x-ray crystallography is now a subject in, you know, chemistry departments. I mean, in those days it was the domain of the physicists. So the best place for x-ray crystallography was at the Cavendish Laboratory at Cambridge. And there I met Francis Crick. I went there without knowing him. He was 35. I was 23. And within a day, we had decided that maybe we could take a shortcut to finding the structure of DNA. Not solve it like, you know, in rigorous fashion, but build a model, an electro-model, using some coordinates of, you know, length, all that sort of stuff from x-ray photographs. But just ask what the molecule â how should it fold up? And the reason for doing so, at the center of this photograph, is Linus Pauling. About six months before, he proposed the alpha helical structure for proteins. And in doing so, he banished the man out on the right, Sir Lawrence Bragg, who was the Cavendish professor. This is a photograph several years later, when Bragg had cause to smile. He certainly wasn ’ t smiling when I got there, because he was somewhat humiliated by Pauling getting the alpha helix, and the Cambridge people failing because they weren ’ t chemists. And certainly, neither Crick or I were chemists, so we tried to build a model. And he knew, Francis knew Wilkins. So Wilkins said he thought it was the helix. X-ray diagram, he thought was comparable with the helix. So we built a three-stranded model. The people from London came up. Wilkins and this collaborator, or possible collaborator, Rosalind Franklin, came up and sort of laughed at our model. They said it was lousy, and it was. So we were told to build no more models ; we were incompetent. And so we didn ’ t build any models, and Francis sort of continued to work on proteins. And basically, I did nothing. And â except read. You know, basically, reading is a good thing ; you get facts. And we kept telling the people in London that Linus Pauling ’ s going to move on to DNA. If DNA is that important, Linus will know it. He ’ ll build a model, and then we ’ re going to be scooped. And, in fact, he ’ d written the people in London : Could he see their x-ray photograph? And they had the wisdom to say”no.”So he didn ’ t have it. But there was ones in the literature. Actually, Linus didn ’ t look at them that carefully. But about, oh, 15 months after I got to Cambridge, a rumor began to appear from Linus Pauling ’ s son, who was in Cambridge, that his father was now working on DNA. And so, one day Peter came in and he said he was Peter Pauling, and he gave me a copy of his father ’ s manuscripts. And boy, I was scared because I thought, you know, we may be scooped. I have nothing to do, no qualifications for anything. And so there was the paper, and he proposed a three-stranded structure. And I read it, and it was just â it was crap. So this was, you know, unexpected from the world ’ s â â and so, it was held together by hydrogen bonds between phosphate groups. Well, if the peak pH that cells have is around seven, those hydrogen bonds couldn ’ t exist. We rushed over to the chemistry department and said,”Could Pauling be right?”And Alex Hust said,”No.”So we were happy. And, you know, we were still in the game, but we were frightened that somebody at Caltech would tell Linus that he was wrong. And so Bragg said,”Build models.”And a month after we got the Pauling manuscript â I should say I took the manuscript to London, and showed the people. Well, I said, Linus was wrong and that we ’ re still in the game and that they should immediately start building models. But Wilkins said”no.”Rosalind Franklin was leaving in about two months, and after she left he would start building models. And so I came back with that news to Cambridge, and Bragg said,”Build models.”Well, of course, I wanted to build models. And there ’ s a picture of Rosalind. She really, you know, in one sense she was a chemist, but really she would have been trained â she didn ’ t know any organic chemistry or quantum chemistry. She was a crystallographer. And I think part of the reason she didn ’ t want to build models was, she wasn ’ t a chemist, whereas Pauling was a chemist. And so Crick and I, you know, started building models, and I ’ d learned a little chemistry, but not enough. Well, we got the answer on the 28th February ’ 53. And it was because of a rule, which, to me, is a very good rule : Never be the brightest person in a room, and we weren ’ t. We weren ’ t the best chemists in the room. I went in and showed them a pairing I ’ d done, and Jerry Donohue â he was a chemist â he said, it ’ s wrong. You ’ ve got â the hydrogen atoms are in the wrong place. I just put them down like they were in the books. He said they were wrong. So the next day, you know, after I thought,”Well, he might be right.”So I changed the locations, and then we found the base pairing, and

Francis immediately said the chains run in absolute directions. And we knew we were right. So it was a pretty, you know, it all happened in about two hours. From nothing to thing. And we knew it was big because, you know, if you just put A next to T and G next to C, you have a copying mechanism. So we saw how genetic information is carried. It ’ s the order of the four bases. So in a sense, it is a sort of digital-type information. And you copy it by going from strand- separating. So, you know, if it didn ’ t work this way, you might as well believe it, because you didn ’ t have any other scheme. But that ’ s not the way most scientists think. Most scientists are really rather dull. They said, we won ’ t think about it until we know it ’ s right. But, you know, we thought, well, it ’ s at least 95 percent right or 99 percent right. So think about it. The next five years, there were essentially something like five references to our work in”Nature”â none. And so we were left by ourselves, and trying to do the last part of the trio : how do you â what does this genetic information do? It was pretty obvious that it provided the information to an RNA molecule, and then how do you go from RNA to protein? For about three years we just â I tried to solve the structure of RNA. It didn ’ t yield. It didn ’ t give good x-ray photographs. I was decidedly unhappy ; a girl didn ’ t marry me. It was really, you know, sort of a shitty time. So there ’ s a picture of Francis and I before I met the girl, so I ’ m still looking happy. But there is what we did when we didn ’ t know where to go forward : we formed a club and called it the RNA Tie Club. George Gamow, also a great physicist, he designed the tie. He was one of the members. The question was : How do you go from a four-letter code to the 20-letter code of proteins? Feynman was a member, and Teller, and friends of Gamow. But that ’ s the only â no, we were only photographed twice. And on both occasions, you know, one of us was missing the tie. There ’ s Francis up on the upper right, and Alex Rich â the M. D. -turned-crystallographer â is next to me. This was taken in Cambridge in September of 1955. And I ’ m smiling, sort of forced, I think, because the girl I had, boy, she was gone. And so I didn ’ t really get happy until 1960, because then we found out, basically, you know, that there are three forms of RNA. And we knew, basically, DNA provides the information for RNA. RNA provides the information for protein. And that let Marshall Nirenberg, you know, take RNA â synthetic RNA â put it in a system making protein. He made polyphenylalanine, polyphenylalanine. So that ’ s the first cracking of the genetic code, and it was all over by 1966. So there, that ’ s what Chris wanted me to do, it was â so what happened since then? Well, at that time â I should go back. When we found the structure of DNA, I gave my first talk at Cold Spring Harbor. The physicist, Leo Szilard, he looked at me and said,”Are you going to patent this?”And â but he knew patent law, and that we couldn ’ t patent it, because you couldn ’ t. No use for it. And so DNA didn ’ t become a useful molecule, and the lawyers didn ’ t enter into the equation until 1973, 20 years later, when Boyer and Cohen in San Francisco and Stanford came up with their method of recombinant DNA, and Stanford patented it and made a lot of money. At least they patented something which, you know, could do useful things. And then, they learned how to read the letters for the code. And, boom, we ’ ve, you know, had a biotech industry. And, but we were still a long ways from, you know, answering a question which sort of dominated my childhood, which is : How do you nature-nurture? And so I ’ ll go on. I ’ m already out of time, but this is Michael Wigler, a very, very clever mathematician turned physicist. And he developed a technique which essentially will let us look at sample DNA and, eventually, a million spots along it. There ’ s a chip there, a conventional one. Then there ’ s one made by a photolithography by a company in Madison called NimbleGen, which is way ahead of Affymetrix. And we use their technique. And what you can do is sort of compare DNA of normal segs versus cancer. And you can see on the top that cancers which are bad show insertions or deletions. So the DNA is really badly mucked up, whereas if you have a chance of surviving, the DNA isn ’ t so mucked up. So we think that this will eventually lead to what we call”DNA biopsies.”Before you get treated for cancer, you should really look at this technique, and get a feeling of the face of the enemy. It ’ s not a â it ’ s only a partial look, but it ’ s a â I think it ’ s going to be very, very useful. So, we started with breast cancer because there ’ s lots of money for it, no government money. And now I have a sort of vested interest : I want to do it for prostate cancer. So, you know, you aren ’ t treated if it ’ s not dangerous. But Wigler, besides looking at cancer cells, looked at normal cells, and made a really sort of surprising observation. Which is, all of us have about 10 places in our genome where we ’ ve lost a gene or gained another one. So we ’ re sort of all imperfect. And the question is well, if we ’ re around here, you know, these little losses or gains might not be too bad. But if these deletions or amplifications occurred in the wrong gene, maybe we ’ ll feel sick. So the first disease he looked at is autism. And the reason we looked at autism is we had the money to do it. Looking at an individual is about 3, 000 dollars. And the parent of a child with Asperger ’ s disease, the high-intelligence autism, had sent his thing to a conventional company ; they didn ’ t do it. Couldn ’ t do it by conventional genetics, but just scanning it we began to find genes for autism. And you can see here, there are a lot of them. So a lot of autistic kids are autistic because they just lost a big piece of DNA. I mean, big piece at the molecular level. We saw one autistic kid, about five million bases just missing from one of his chromosomes. We haven ’ t yet looked at the parents, but the parents probably don ’ t have that loss, or they wouldn ’ t be parents. Now, so, our autism study is just beginning. We got three million dollars. I think it will cost at least 10 to 20 before you ’ d be in a position to help parents who ’ ve had an autistic child, or think they may have an autistic child, and can we spot the difference? So this same technique should probably look at all. It ’ s a wonderful way to find genes. And so, I ’ ll conclude by saying we ’ ve looked at 20 people with schizophrenia. And we thought we ’ d probably have to look at several hundred before we got the picture. But as you can see, there ’ s seven out of 20 had a change which was very high. And yet, in the controls there were three. So what ’ s the meaning of the controls? Were they crazy also, and we didn ’ t know it? Or, you know, were they normal? I would guess they ’ re normal. And what we think in schizophrenia is there are genes of predisposure, and whether this is one that predisposes â and then there ’ s only a sub-segment of the population that ’ s capable of being schizophrenic. Now, we don ’ t have really any evidence of it, but I think, to give you a hypothesis, the best guess is that if you ’ re left-handed, you ’ re prone to schizophrenia. 30 percent of schizophrenic people are left-handed, and schizophrenia has a very funny genetics, which means 60 percent of the people are genetically left-handed, but only half of it showed. I don ’ t have the time to say. Now, some people who think they ’ re right-handed are genetically left- handed. OK. I ’ m just saying that, if you think, oh, I don ’ t carry a left-handed gene so therefore my, you know, children won ’ t be at risk of schizophrenia. You might. OK? So it ’ s, to me, an extraordinarily exciting time. We ought to be able to find the gene for bipolar ; there ’ s a relationship. And if I had enough money, we ’ d find them all this year. I thank you.

Text Sample 455: NEG Dim 3 – 2005 – Score -2.00 – 2005/t000437.txt
If you take 10, 000 people at random, 9, 999 have something in common : their

interests in business lie on or near the Earth ' s surface. The odd one out is an astronomer, and I am one of that strange breed. My talk will be in two parts. I ' ll talk first as an astronomer, and then as a worried member of the human race. But let ' s start off by remembering that Darwin showed how we ' re the outcome of four billion years of evolution. And what we try to do in astronomy and cosmology is to go back before Darwin ' s simple beginning, to set our Earth in a cosmic context. And let me just run through a few slides. This was the impact that happened last week on a comet. If they ' d sent a nuke, it would have been rather more spectacular than what actually happened last Monday. So that ' s another project for NASA. That ' s Mars from the European Mars Express, and at New Year. This artist ' s impression turned into reality when a parachute landed on Titan, Saturn ' s giant moon. It landed on the surface. This is pictures taken on the way down. That looks like a coastline. It is indeed, but the ocean is liquid methane — the temperature minus 170 degrees centigrade. If we go beyond our solar system, we ' ve learned that the stars aren ' t twinkly points of light. Each one is like a sun with a retinue of planets orbiting around it. And we can see places where stars are forming, like the Eagle Nebula. We see stars dying. In six billion years, the sun will look like that. And some stars die spectacularly in a supernova explosion, leaving remnants like that. On a still bigger scale, we see entire galaxies of stars. We see entire ecosystems where gas is being recycled. And to the cosmologist, these galaxies are just the atoms, as it were, of the large-scale universe. This picture shows a patch of sky so small that it would take about 100 patches like it to cover the full moon in the sky. Through a small telescope, this would look quite blank, but you see here hundreds of little, faint smudges. Each is a galaxy, fully like ours or Andromeda, which looks so small and faint because its light has taken 10 billion light-years to get to us. The stars in those galaxies probably don ' t have planets around them. There ' s scant chance of life there — that ' s because there ' s been no time for the nuclear fusion in stars to make silicon and carbon and iron, the building blocks of planets and of life. We believe that all of this emerged from a Big Bang — a hot, dense state. So how did that amorphous Big Bang turn into our complex cosmos? I ' m going to show you a movie simulation 16 powers of 10 faster than real time, which shows a patch of the universe where the expansions have subtracted out. But you see, as time goes on in gigayears at the bottom, you will see structures evolve as gravity feeds on small, dense irregularities, and structures develop. And we ' ll end up after 13 billion years with something looking rather like our own universe. And we compare simulated universes like that — I ' ll show you a better simulation at the end of my talk — with what we actually see in the sky. Well, we can trace things back to the earlier stages of the Big Bang, but we still don ' t know what banged and why it banged. That ' s a challenge for 21st-century science. If my research group had a logo, it would be this picture here : an ouroboros, where you see the micro-world on the left — the world of the quantum — and on the right the large-scale universe of planets, stars and galaxies. We know our universes are united though — links between left and right. The everyday world is determined by atoms, how they stick together to make molecules. Stars are fueled by how the nuclei in those atoms react together. And, as we ' ve learned in the last few years, galaxies are held together by the gravitational pull of so-called dark matter : particles in huge swarms, far smaller even than atomic nuclei. But we ' d like to know the synthesis **symbolized** at the very top. The micro-world of the quantum is understood. On the right hand side, gravity holds sway. Einstein explained that. But the unfinished business for 21st-century science is to link together cosmos and micro-world with a unified theory — **symbolized**, as it were, gastronomically at the top of that picture.

And until we have that synthesis, we won ’ t be able to understand the very beginning of our universe because when our universe was itself the size of an atom, quantum effects could shake everything. And so we need a theory that unifies the very large and the very small, which we don ’ t yet have. One idea, incidentally — and I had this hazard sign to say I ’ m going to speculate from now on — is that our Big Bang was not the only one. One idea is that our three-dimensional universe may be embedded in a high- dimensional space, just as you can imagine on these sheets of paper. You can imagine ants on one of them thinking it ’ s a two-dimensional universe, not being aware of another population of ants on the other. So there could be another universe just a millimeter away from ours, but we ’ re not aware of it because that millimeter is measured in some fourth spatial dimension, and we ’ re imprisoned in our three. And so we believe that there may be a lot more to physical reality than what we ’ ve normally called our universe — the aftermath of our Big Bang. And here ’ s another picture. Bottom right depicts our universe, which on the horizon is not beyond that, but even that is just one bubble, as it were, in some vaster reality. Many people suspect that just as we ’ ve gone from believing in one solar system to zillions of solar systems, one galaxy to many galaxies, we have to go to many Big Bangs from one Big Bang, perhaps these many Big Bangs displaying an immense variety of properties. Well, let ’ s go back to this picture. There ’ s one challenge **symbolized** at the top, but there ’ s another challenge to science **symbolized** at the bottom. You want to not only synthesize the very large and the very small, but we want to understand the very complex. And the most complex things are ourselves, midway between atoms and stars. We depend on stars to make the atoms we ’ re made of. We depend on chemistry to determine our complex structure. We clearly have to be large, compared to atoms, to have layer upon layer of complex structure. We clearly have to be small, compared to stars and planets — otherwise we ’ d be crushed by gravity. And in fact, we are midway. It would take as many human bodies to make up the sun as there are atoms in each of us. The geometric mean of the mass of a proton and the mass of the sun is 50 kilograms, within a factor of two of the mass of each person here. Well, most of you anyway. The science of complexity is probably the greatest challenge of all, greater than that of the very small on the left and the very large on the right. And it ’ s this science, which is not only enlightening our understanding of the biological world, but also transforming our world faster than ever. And more than that, it ’ s engendering new kinds of change. And I now move on to the second part of my talk, and the book”Our Final Century”was mentioned. If I was not a self-effacing Brit, I would mention the book myself, and I would add that it ’ s available in paperback. And in America it was called”Our Final Hour”because Americans like instant gratification. But my theme is that in this century, not only has science changed the world faster than ever, but in new and different ways. Targeted drugs, genetic modification, artificial intelligence, perhaps even implants into our brains, may change human beings themselves. And human beings, their physique and character, has not changed for thousands of years. It may change this century. It ’ s new in our history. And the human impact on the global environment — greenhouse warming, mass extinctions and so forth — is unprecedented, too. And so, this makes this coming century a challenge. Bio- and cybertechnologies are environmentally benign in that they offer marvelous prospects, while, nonetheless, reducing pressure on energy and resources. But they will have a dark side. In our interconnected world, novel technology could empower just one fanatic, or some weirdo with a mindset of those who now design computer viruses, to trigger some kind on disaster. Indeed, catastrophe could arise simply from technical misadventure — error rather than terror. And even a tiny probability of catastrophe is unacceptable when the downside could be of global consequence. In fact, some years ago, Bill Joy wrote an article expressing tremendous concern about robots taking us over, etc. I don ' t go along with all that, but it ' s interesting that he had a simple solution. It was what he called"fine-grained relinquishment."He wanted to give up the dangerous kind of science and keep the good bits. Now, that ' s absurdly naive for two reasons. First, any scientific discovery has benign consequences as well as dangerous ones. And also, when a scientist makes a discovery, he or she normally has no clue what the applications are going to be. And so what this means is that we have to accept the risks if we are going to enjoy the benefits of science. We have to accept that there will be hazards. And I think we have to go back to what happened in the post-War era, post-World War II, when the nuclear scientists who ' d been involved in making the atomic bomb, in many cases were concerned that they should do all they could to alert the world to the dangers. And they were inspired not by the young Einstein, who did the great work in relativity, but by the old Einstein, the icon of poster and t-shirt, who failed in his scientific efforts to unify the physical laws. He was premature. But he was a moral compass — an inspiration to scientists who were concerned with arms control. And perhaps the greatest living person is someone I ' m privileged to know, Joe Rothblatt. Equally untidy office there, as you can see. He ' s 96 years old, and he founded the Pugwash movement. He persuaded Einstein, as his last act, to sign the famous memorandum of Bertrand Russell. And he sets an example of the concerned scientist. And I think to harness science optimally, to choose which doors to open and which to leave closed, we need latter-day counterparts of people like Joseph Rothblatt. We need not just campaigning physicists, but we need biologists, computer experts and environmentalists as well. And I think academics and independent entrepreneurs have a special obligation because they have more freedom than those in government service, or company employees subject to commercial pressure. I wrote my book,"Our Final Century,"as a scientist, just a general scientist. But there ' s one respect, I think, in which being a cosmologist offered a special perspective, and that ' s that it offers an awareness of the immense future. The stupendous time spans of the evolutionary past are now part of common culture — outside the American Bible Belt, anyway — but most people, even those who are familiar with evolution, aren ' t mindful that even more time lies ahead. The sun has been shining for four and a half billion years, but it ' ll be another six billion years before its fuel runs out. On that **schematic** picture, a sort of time-lapse picture, we ' re halfway. And it ' ll be another six billion before that happens, and any remaining life on Earth is vaporized. There ' s an unthinking tendency to imagine that humans will be there, experiencing the sun ' s demise, but any life and intelligence that exists then will be as different from us as we are from bacteria. The unfolding of intelligence and complexity still has immensely far to go, here on Earth and probably far beyond. So we are still at the beginning of the emergence of complexity in our Earth and beyond. If you represent the Earth ' s lifetime by a single year, say from January when it was made to December, the 21st-century would be a quarter of a second in June — a tiny fraction of the year. But even in this concertinaed cosmic perspective, our century is very, very special, the first when humans can change themselves and their home planet. As I should have shown this earlier, it will not be humans who witness the end point of the sun ; it will be creatures as different from us as we are from bacteria. When Einstein died in 1955, one striking tribute to his global status was this cartoon by Herblock in the Washington Post. The plaque reads,"Albert Einstein lived here."And I ' d like to end with a vignette, as it were, inspired by this image. We ' ve been familiar for 40 years with this image : the fragile beauty of land, ocean and clouds, contrasted with the **sterile** moonscape on which the astronauts left their footprints. But let ’ s suppose some aliens had been watching our pale blue dot in the cosmos from afar, not just for 40 years, but for the entire 4. 5 billion-year history of our Earth. What would they have seen? Over nearly all that immense time, Earth ’ s appearance would have changed very gradually. The only abrupt worldwide change would have been major asteroid impacts or volcanic super-eruptions. Apart from those brief traumas, nothing happens suddenly. The continental landmasses drifted around. Ice cover waxed and waned. Successions of new species emerged, evolved and became extinct. But in just a tiny sliver of the Earth ’ s history, the last one-millionth part, a few thousand years, the patterns of vegetation altered much faster than before. This signaled the start of agriculture. Change has accelerated as human populations rose. Then other things happened even more abruptly. Within just 50 years — that ’ s one hundredth of one millionth of the Earth ’ s age — the amount of carbon dioxide in the atmosphere started to rise, and ominously fast. The planet became an intense emitter of radio waves — the total output from all TV and cell phones and radar transmissions. And something else happened. Metallic objects — albeit very small ones, a few tons at most — escaped into orbit around the Earth. Some journeyed to the moons and planets. A race of advanced extraterrestrials watching our solar system from afar could confidently predict Earth ’ s final doom in another six billion years. But could they have predicted this unprecedented spike less than halfway through the Earth ’ s life? These human-induced alterations occupying overall less than a millionth of the elapsed lifetime and seemingly occurring with runaway speed? If they continued their vigil, what might these hypothetical aliens witness in the next hundred years? Will some spasm foreclose Earth ’ s future? Or will the biosphere stabilize? Or will some of the metallic objects launched from the Earth spawn new oases, a post-human life elsewhere? The science done by the young Einstein will continue as long as our civilization, but for civilization to survive, we ’ ll need the wisdom of the old Einstein — humane, global and farseeing. And whatever happens in this uniquely crucial century will resonate into the remote future and perhaps far beyond the Earth, far beyond the Earth as depicted here. Thank you very much.

Text Sample 456: NEG Dim 3 – 2012 – Score -1.00 – 2012/t002202.txt

I ’ d like to show you a video of some of the models I work with. They ’ re all the perfect size, and they don ’ t have an ounce of fat. Did I mention they ’ re gorgeous? And they ’ re scientific models? As you might have guessed, I ’ m a tissue engineer, and this is a video of some of the beating heart that I ’ ve engineered in the lab. And one day we hope that these tissues can serve as replacement parts for the human body. But what I ’ m going to tell you about today is how these tissues make awesome models. Well, let ’ s think about the drug screening process for a moment. You go from drug formulation, lab testing, animal testing, and then clinical trials, which you might call human testing, before the drugs get to market. It costs a lot of money, a lot of time, and sometimes, even when a drug hits the market, it acts in an unpredictable way and actually hurts people. And the later it fails, the worse the consequences. It all boils down to two issues. One, humans are not rats, and two, despite our incredible similarities to one another, actually those tiny differences between you and I have huge impacts with how we metabolize drugs and how those drugs affect us. So what if we had better models in the lab that could not only mimic us better than rats but also reflect our diversity? Let ’ s see how we can do it with tissue engineering. One of the key technologies that ’ s really important is what ’ s called induced pluripotent stem cells. They were developed in Japan pretty recently. Okay, induced pluripotent stem cells. They ’ re a lot like embryonic stem cells except without the controversy. We induce cells, okay, say, skin cells, by adding a few genes to them, culturing them, and then harvesting them. So they ’ re skin cells that can be tricked, kind of like cellular amnesia, into an embryonic state. So without the controversy, that ’ s cool thing number one. Cool thing number two, you can grow any type of tissue out of them : brain, heart, liver, you get the picture, but out of your cells. So we can make a model of your heart, your brain on a chip. Generating tissues of predictable density and behavior is the second piece, and will be really key towards getting these models to be adopted for drug discovery. And this is a **schematic** of a bioreactor we ’ re developing in our lab to help engineer tissues in a more modular, scalable way. Going forward, imagine a massively parallel version of this with thousands of pieces of human tissue. It would be like having a clinical trial on a chip. But another thing about these induced pluripotent stem cells is that if we take some skin cells, let ’ s say, from people with a genetic disease and we engineer tissues out of them, we can actually use tissue-engineering techniques to generate models of those diseases in the lab. Here ’ s an example from Kevin Eggan ’ s lab at Harvard. He generated neurons from these induced pluripotent stem cells from patients who have Lou Gehrig ’ s Disease, and he differentiated them into neurons, and what ’ s amazing is that these neurons also show symptoms of the disease. So with disease models like these, we can fight back faster than ever before and understand the disease better than ever before, and maybe discover drugs even faster. This is another example of patient-specific stem cells that were engineered from someone with retinitis pigmentosa. This is a degeneration of the retina. It ’ s a disease that runs in my family, and we really hope that cells like these will help us find a cure. So some people think that these models sound well and good, but ask,”Well, are these really as good as the rat?”The rat is an entire organism, after all, with interacting networks of organs. A drug for the heart can get metabolized in the liver, and some of the byproducts may be stored in the fat. Don ’ t you miss all that with these tissue-engineered models? Well, this is another trend in the field. By combining tissue engineering techniques with microfluidics, the field is actually evolving towards just that, a model of the entire ecosystem of the body, complete with multiple organ systems to be able to test how a drug you might take for your blood pressure might affect your liver or an antidepressant might affect your heart. These systems are really hard to build, but we ’ re just starting to be able to get there, and so, watch out. But that ’ s not even all of it, because once a drug is approved, tissue engineering techniques can actually help us develop more personalized treatments. This is an example that you might care about someday, and I hope you never do, because imagine if you ever get that call that gives you that bad news that you might have cancer. Wouldn ’ t you rather test to see if those cancer drugs you ’ re going to take are going to work on your cancer? This is an example from Karen Burg ’ s lab, where they ’ re using inkjet technologies to print breast cancer cells and study its progressions and treatments. And some of our colleagues at Tufts are mixing models like these with tissue-engineered bone to see how cancer might spread from one part of the body to the next, and you can imagine those kinds of multi-tissue chips to be the next generation of these kinds of studies. And so thinking about the models that we ’ ve just discussed, you can see, going forward, that tissue engineering is actually poised to help revolutionize drug screening at every single step of the path : disease models making for better drug formulations, massively parallel human tissue models helping to revolutionize lab testing, reduce animal testing and human testing in clinical trials, and individualized therapies that disrupt what we even consider to be a market at all. Essentially, we ’ re dramatically speeding up that feedback between developing a molecule and learning about how it acts in the human body. Our process for doing this is essentially transforming biotechnology and pharmacology into an information technology, helping us discover and evaluate drugs faster, more cheaply and more effectively. It gives new meaning to models against animal testing, doesn ’ t it? Thank you.

This is a thousand-year-old drawing of the brain. It ’ s a diagram of the visual system. And some things look very familiar today. Two eyes at the bottom, optic nerve flowing out from the back. There ’ s a very large nose that doesn ’ t seem to be connected to anything in particular. And if we compare this to more recent representations of the visual system, you ’ ll see that things have gotten substantially more complicated over the intervening thousand years. And that ’ s because today we can see what ’ s inside of the brain, rather than just looking at its overall shape. Imagine you wanted to understand how a computer works and all you could see was a keyboard, a mouse, a screen. You really would be kind of out of luck. You want to be able to open it up, crack it open, look at the wiring inside. And up until a little more than a century ago, nobody was able to do that with the brain. Nobody had had a glimpse of the brain ’ s wiring. And that ’ s because if you take a brain out of the skull and you cut a thin slice of it, put it under even a very powerful microscope, there ’ s nothing there. It ’ s gray, formless. There ’ s no structure. It won ’ t tell you anything. And this all changed in the late 19th century. Suddenly, new chemical stains for brain tissue were developed and they gave us our first glimpses at brain wiring. The computer was cracked open. So what really launched modern neuroscience was a stain called the Golgi stain. And it works in a very particular way. Instead of staining all of the cells inside of a tissue, it somehow only stains about one percent of them. It clears the forest, reveals the trees inside. If everything had been labeled, nothing would have been visible. So somehow it shows what ’ s there. Spanish neuroanatomist Santiago Ramon y Cajal, who ’ s widely considered the father of modern neuroscience, applied this Golgi stain, which yields data which looks like this, and really gave us the modern notion of the nerve cell, the neuron. And if you ’ re thinking of the brain as a computer, this is the **transistor**. And very quickly Cajal realized that neurons don ’ t operate alone, but rather make connections with others that form circuits just like in a computer. Today, a century later, when researchers want to visualize neurons, they light them up from the inside rather than darkening them. And there ’ s several ways of doing this. But one of the most popular ones involves green fluorescent protein. Now green fluorescent protein, which oddly enough comes from a bioluminescent jellyfish, is very useful. Because if you can get the gene for green fluorescent protein and deliver it to a cell, that cell will glow green — or any of the many variants now of green fluorescent protein, you get a cell to glow many different colors. And so coming back to the brain, this is from a genetically engineered mouse called”Brainbow.”And it ’ s so called, of course, because all of these neurons are glowing different colors. Now sometimes neuroscientists need to identify individual molecular components of neurons, molecules, rather than the entire cell. And there ’ s several ways of doing this, but one of the most popular ones involves using antibodies. And you ’ re familiar, of course, with antibodies as the henchmen

of the immune system. But it turns out that they ’ re so useful to the immune system because they can recognize specific molecules, like, for example, the coat protein of a virus that ’ s invading the body. And researchers have used this fact in order to recognize specific molecules inside of the brain, recognize specific substructures of the cell and identify them individually. And a lot of the images I ’ ve been showing you here are very beautiful, but they ’ re also very powerful. They have great explanatory power. This, for example, is an antibody staining against serotonin transporters in a slice of mouse brain. And you ’ ve heard of serotonin, of course, in the context of diseases like depression and anxiety. You ’ ve heard of SSRIs, which are drugs that are used to treat these diseases. And in order to understand how serotonin works, it ’ s critical to understand where the serontonin machinery is. And antibody stainings like this one can be used to understand that sort of question. I ’ d like to leave you with the following thought : Green fluorescent protein and antibodies are both totally natural products at the get-go. They were evolved by nature in order to get a jellyfish to glow green for whatever reason, or in order to detect the coat protein of an invading virus, for example. And only much later did scientists come onto the scene and say,”Hey, these are tools, these are functions that we could use in our own research tool palette.”And instead of applying feeble human minds to designing these tools from scratch, there were these ready-made solutions right out there in nature developed and refined steadily for millions of years by the greatest engineer of all. Thank you.

Text Sample 458: NEG Dim 3 – 2012 – Score -1.00 – 2012/t002449.txt

Good morning. I ’ m here today to talk about autonomous flying beach balls. No, agile aerial robots like this one. I ’ d like to tell you a little bit about the challenges in building these, and some of the terrific opportunities for applying this technology. So these robots are related to unmanned aerial vehicles. However, the vehicles you see here are big. They weigh thousands of pounds, are not by any means agile. They ’ re not even autonomous. In fact, many of these vehicles are operated by flight crews that can include multiple pilots, operators of sensors, and mission coordinators. What we ’ re interested in is developing robots like this — and here are two other pictures — of robots that you can buy off the shelf. So these are helicopters with four rotors, and they ’ re roughly a meter or so in scale, and weigh several pounds. And so we retrofit these with sensors and processors, and these robots can fly indoors. Without GPS. The robot I ’ m holding in my hand is this one, and it ’ s been created by two students, Alex and Daniel. So this weighs a little more than a tenth of a pound. It consumes about 15 watts of power. And as you can see, it ’ s about eight inches in diameter. So let me give you just a very quick tutorial on how these robots work. So it has four rotors. If you spin these rotors at the same speed, the robot hovers. If you increase the speed of each of these rotors, then the robot flies up, it accelerates up. Of course, if the robot were tilted, inclined to the horizontal, then it would accelerate in this direction. So to get it to tilt, there ’ s one of two ways of doing it. So in this picture, you see that rotor four is spinning faster and rotor two is spinning slower. And when that happens, there ’ s a moment that causes this robot to roll. And the other way around, if you increase the speed of rotor three and decrease the speed of rotor one, then the robot pitches forward. And then finally, if you spin opposite pairs of rotors faster than the other pair, then the robot yaws about the vertical axis. So an **on-board** processor essentially looks at what motions need to be executed and combines these motions, and figures out what commands to send to the motors — 600 times a second. That ’ s basically how this thing operates. So one of the advantages of this design is when you scale things down, the robot naturally becomes agile. So here, R is the characteristic length of the robot. It ’ s actually half the diameter. And there are lots of physical parameters that change as you reduce R. The one that ’ s most important is the inertia, or the resistance to motion. So it turns out the inertia, which governs angular motion, scales as a fifth power of R. So the smaller you make R, the more dramatically the inertia reduces. So as a result, the angular acceleration, denoted by the Greek letter alpha here, goes as 1 over R. It ’ s inversely proportional to R. The smaller you make it, the more quickly you can turn. So this should be clear in these videos. On the bottom right, you see a robot performing a 360-degree flip in less than half a second. Multiple flips, a little more time. So here the processes on board are getting feedback from accelerometers and gyros on board, and calculating, like I said before, commands at 600 times a second, to stabilize this robot. So on the left, you see Daniel throwing this robot up into the air, and it shows you how robust the control is. No matter how you throw it, the robot recovers and comes back to him. So why build robots like this? Well, robots like this have many applications. You can send them inside buildings like this, as first responders to look for intruders, maybe look for biochemical leaks, gaseous leaks. You can also use them for applications like construction. So here are robots carrying beams, columns and assembling cube-like structures. I ’ ll tell you a little bit more about this. The robots can be used for transporting cargo. So one of the problems with these small robots is their payload-carrying capacity. So you might want to have multiple robots carry payloads. This is a picture of a recent experiment we did — actually not so recent anymore — in Sendai, shortly after the earthquake. So robots like this could be sent into collapsed buildings, to assess the damage after natural disasters, or sent into reactor buildings, to map radiation levels. So one fundamental problem that the robots have to solve if they are to be autonomous, is essentially figuring out how to get from point A to point B. So this gets a little challenging, because the dynamics of this robot are quite complicated. In fact, they live in a 12-dimensional space. So we use a little trick. We take this curved 12-dimensional space, and transform it into a flat, four-dimensional space. And that four-dimensional space consists of X, Y, Z, and then the yaw angle. And so what the robot does, is it plans what we call a minimum-snap trajectory. So to remind you of physics : You have position, derivative, velocity ; then acceleration ; and then comes jerk, and then comes snap. So this robot minimizes snap. So what that effectively does, is produce a smooth and graceful motion. And it does that avoiding obstacles. So these minimum-snap trajectories in this flat space are then transformed back into this complicated 12-dimensional space, which the robot must do for control and then execution. So let me show you some examples of what these minimum-snap trajectories look like. And in the first video, you ’ ll see the robot going from point A to point B, through an intermediate point. So the robot is obviously capable of executing any curve trajectory. So these are circular trajectories, where the robot pulls about two G ’ s. Here you have overhead motion capture cameras on the top that tell the robot where it is 100 times a second. It also tells the robot where these obstacles are. And the obstacles can be moving. And here, you ’ ll see Daniel throw this hoop into the air, while the robot is calculating the position of the hoop, and trying to figure out how to best go through the hoop. So as an academic, we ’ re always trained to be able to jump through hoops to raise funding for our labs, and we get our robots to do that. So another thing the robot can do is it remembers pieces of trajectory that it learns or is pre-programmed. So here, you see the robot combining a motion that builds up momentum, and then changes its orientation and then recovers. So it has to do this because this gap in the window is only slightly larger than the width of the robot. So just like a diver stands on a springboard and then jumps off it to gain momentum, and then does this pirouette, this two and a half somersault through and then gracefully recovers, this robot is basically doing that. So it knows how to combine little bits and pieces of trajectories to do these fairly difficult tasks. So I want change gears. So one of the disadvantages of these small robots is its size. And I told you earlier that we may want to employ lots and lots of robots to overcome the limitations of size. So one difficulty is : How do you coordinate lots of these robots? And so here, we looked to nature. So I want to show you a clip of Aphaenogaster desert ants, in Professor Stephen Pratt ' s lab, carrying an object. So this is actually a piece of fig. Actually you take any object coated with fig juice, and the ants will carry it back to the nest. So these ants don ' t have any central coordinator. They sense their neighbors. There ' s no explicit communication. But because they sense the neighbors and because they sense the object, they have implicit coordination across the group. So this is the kind of coordination we want our robots to have. So when we have a robot which is surrounded by neighbors — and let ' s look at robot I and robot J — what we want the robots to do, is to monitor the separation between them, as they fly in formation. And then you want to make sure that this separation is within acceptable levels. So again, the robots monitor this error and calculate the control commands 100 times a second, which then translates into motor commands, 600 times a second. So this also has to be done in a decentralized way. Again, if you have lots and lots of robots, it ' s impossible to coordinate all this information centrally fast enough in order for the robots to accomplish the task. Plus, the robots have to base their actions only on local information — what they sense from their neighbors. And then finally, we insist that the robots be agnostic to who their neighbors are. So this is what we call anonymity. So what I want to show you next is a video of 20 of these little robots, flying in formation. They ' re monitoring their neighbors ' positions. They ' re maintaining formation. The formations can change. They can be planar formations, they can be three-dimensional formations. As you can see here, they collapse from a three-dimensional formation into planar formation. And to fly through obstacles, they can adapt the formations on the fly. So again, these robots come really close together. As you can see in this figure-eight flight, they come within inches of each other. And despite the aerodynamic interactions with these propeller blades, they ' re able to maintain stable flight. So once you know how to fly in formation, you can actually pick up objects cooperatively. So this just shows that we can double, triple, quadruple the robots ' strength, by just getting them to team with neighbors, as you can see here. One of the disadvantages of doing that is, as you scale things up — so if you have lots of robots carrying the same thing, you ' re essentially increasing the inertia, and therefore you pay a price ; they ' re not as agile. But you do gain in terms of payload-carrying capacity. Another application I want to show you — again, this is in our lab. This is work done by Quentin Lindsey, who ' s a graduate student. So his algorithm essentially tells these robots how to autonomously build cubic structures from truss-like elements. So his algorithm tells the robot what part to pick up, when, and where to place it. So in this video you see — and it ' s sped up 10, 14 times — you see three different structures being built by these robots. And again, everything is autonomous, and all Quentin has to do is to give them a blueprint of the design that he wants to build. So all these experiments you ' ve seen thus far, all these demonstrations, have been done with the help of motion-capture systems. So what happens when you leave your lab, and you go outside into the real world? And what if there ' s no GPS? So this robot is actually equipped with a camera, and a laser rangefinder, laser scanner. And it uses these sensors to build a map of the environment. What that map consists of are features — like doorways, windows, people, furniture — and it then figures out where its position is, with respect to the features. So there is no global coordinate system. The coordinate system is defined based on the robot, where it is and what it ’ s looking at. And it navigates with respect to those features. So I want to show you a clip of algorithms developed by Frank Shen and Professor Nathan Michael, that shows this robot entering a building for the very first time, and creating this map on the fly. So the robot then figures out what the features are, it builds the map, it figures out where it is with respect to the features, and then estimates its position 100 times a second, allowing us to use the control algorithms that I described to you earlier. So this robot is actually being commanded remotely by Frank, but the robot can also figure out where to go on its own. So suppose I were to send this into a building, and I had no idea what this building looked like. I can ask this robot to go in, create a map, and then come back and tell me what the building looks like. So here, the robot is not only solving the problem of how to go from point A to point B in this map, but it ’ s figuring out what the best point B is at every time. So essentially it knows where to go to look for places that have the least information, and that ’ s how it populates this map. So I want to leave you with one last application. And there are many applications of this technology. I ’ m a professor, and we ’ re passionate about education. Robots like this can really change the way we do K-12 education. But we ’ re in Southern California, close to Los Angeles, so I have to conclude with something focused on entertainment. I want to conclude with a music video. I want to introduce the creators, Alex and Daniel, who created this video. So before I play this video, I want to tell you that they created it in the last three days, after getting a call from Chris. And the robots that play in the video are completely autonomous. You will see nine robots play six different instruments. And of course, it ’ s made exclusively for TED 2012. Let ’ s watch.

Text Sample 459: NEG Dim 3 – 2007 – Score -2.00 – 2007/t000230.txt

I got my first computer when I was a teenager growing up in Accra, and it was a really cool device. You could play games with it. You could program it in BASIC. And I was fascinated. So I went into the library to figure out how did this thing work. I read about how the CPU is constantly shuffling data back and forth between the memory, the RAM and the ALU, the arithmetic and logic unit. And I thought to myself, this CPU really has to work like crazy just to keep all this data moving through the system. But nobody was really worried about this. When computers were first introduced, they were said to be a million times faster than neurons. People were really excited. They thought they would soon outstrip the capacity of the brain. This is a quote, actually, from Alan Turing :”In 30 years, it will be as easy to ask a computer a question as to ask a person.”This was in 1946. And now, in 2007, it ’ s still not true. And so, the question is, why aren ’ t we really seeing this kind of power in computers that we see in the brain? What people didn ’ t realize, and I ’ m just beginning to realize right now, is that we pay a huge price for the speed that we claim is a big advantage of these computers. Let ’ s take a look at some numbers. This is Blue Gene, the fastest computer in the world. It ’ s got 120, 000 processors ; they can basically process 10 quadrillion bits of information per second. That ’ s 10 to the sixteenth. And they consume one and a half megawatts of power. So that would be really great, if you could add that to the production capacity in Tanzania. It would really boost the economy. Just to go back to the States, if you translate the amount of power or electricity this computer uses to the amount of households in the States, you get 1, 200 households in the U. S. That ’ s how much power this computer uses. Now, let ’ s compare this with the brain. This is a picture of, actually Rory Sayres ’ girlfriend ’ s brain. Rory is a graduate student at Stanford. He studies the brain using MRI, and he claims that this is the most beautiful brain that he has ever scanned. So that ’ s true love, right there. Now, how much computation does the brain do? I estimate 10 to the 16 bits per second, which is actually about very similar to what Blue Gene does. So that ’ s the question. The question is, how much — they are doing a similar amount of processing, similar amount of data — the question is how much energy or electricity does the brain use? And it ’ s actually as much as your laptop computer : it ’ s just 10 watts. So what we are doing right now with computers with the energy consumed by 1, 200 houses, the brain is doing with the energy consumed by your laptop. So the question is, how is the brain able to achieve this kind of efficiency? And let me just summarize. So the bottom line : the brain processes information using 100, 000 times less energy than we do right now with this computer technology that we have. How is the brain able to do this? Let ’ s just take a look about how the brain works, and then I ’ ll compare that with how computers work. So, this clip is from the PBS series,”The Secret Life of the Brain.”It shows you these cells that process information. They are called neurons. They send little pulses of electricity down their processes to each other, and where they contact each other, those little pulses of electricity can jump from one neuron to the other. That process is called a synapse. You ’ ve got this huge network of cells interacting with each other — about 100 million of them, sending about 10 quadrillion of these pulses around every second. And that ’ s basically what ’ s going on in your brain right now as you ’ re watching this. How does that compare with the way computers work? In the computer, you have all the data going through the central processing unit, and any piece of data basically has to go through that bottleneck, whereas in the brain, what you have is these neurons, and the data just really flows through a network of connections among the neurons. There ’ s no bottleneck here. It ’ s really a network in the literal sense of the word. The net is doing the work in the brain. If you just look at these two pictures, these kind of words pop into your mind. This is serial and it ’ s rigid — it ’ s like cars on a freeway, everything has to happen in lockstep — whereas this is parallel and it ’ s fluid. Information processing is very dynamic and adaptive. So I ’ m not the first to figure this out. This is a quote from Brian Eno :”the problem with computers is that there is not enough Africa in them.”Brian actually said this in 1995. And nobody was listening then, but now people are beginning to listen because there ’ s a pressing, technological problem that we face. And I ’ ll just take you through that a little bit in the next few slides. This is — it ’ s actually really this remarkable convergence between the devices that we use to compute in computers, and the devices that our brains use to compute. The devices that computers use are what ’ s called a **transistor**. This electrode here, called the gate, controls the flow of current from the source to the drain — these two electrodes. And that current, electrical current, is carried by electrons, just like in your house and so on. And what you have here is, when you actually turn on the gate, you get an increase in the amount of current, and you get a steady flow of current. And when you turn off the gate, there ’ s no current flowing through the device. Your computer uses this presence of current to represent a one, and the absence of current to represent a zero. Now, what ’ s happening is that as **transistors** are getting smaller and smaller and smaller, they no longer behave like this. In fact, they are starting to behave like the device that neurons use to compute, which is called an ion channel. And this is a little protein molecule. I mean, neurons have thousands of these. And it sits in the membrane of the cell and it ’ s got a pore in it. And these are individual **potassium** ions that are flowing through that pore. Now, this pore can open and close. But, when it ’ s open, because these ions have to line up and flow through, one at a time, you get a kind of sporadic, not steady — it ’ s a sporadic flow of current. And even when you close the pore — which neurons can do, they can open and close these pores to generate electrical activity — even when it ’ s closed, because these ions are so small, they can actually sneak through, a few can sneak through at a time. So, what you have is that when the pore is open, you get some current sometimes. These are your ones, but you ’ ve got a few zeros thrown in. And when it ’ s closed, you have a zero, but you have a few ones thrown in. Now, this is starting to happen in **transistors**. And the reason why that ’ s happening is that, right now, in 2007 — the technology that we are using — a **transistor** is big enough that several electrons can flow through the channel simultaneously, side by side. In fact, there ’ s about 12 electrons can all be flowing this way. And that means that a **transistor** corresponds to about 12 ion channels in parallel. Now, in a few years time, by 2015, we will shrink **transistors** so much. This is what Intel does to keep adding more cores onto the chip. Or your memory sticks that you have now can carry one gigabyte of stuff on them — before, it was 256. **Transistors** are getting smaller to allow this to happen, and technology has really benefitted from that. But what ’ s happening now is that in 2015, the **transistor** is going to become so small, that it corresponds to only one electron at a time can flow through that channel, and that corresponds to a single ion channel. And you start having the same kind of traffic jams that you have in the ion channel. The current will turn on and off at random, even when it ’ s supposed to be on. And that means your computer is going to get its ones and zeros mixed up, and that ’ s going to crash your machine. So, we are at the stage where we don ’ t really know how to compute with these kinds of devices. And the only kind of thing — the only thing we know right now that can compute with these kinds of devices are the brain. OK, so a computer picks a specific item of data from memory, it sends it into the processor or the ALU, and then it puts the result back into memory. That ’ s the red path that ’ s highlighted. The way brains work, I told you all, you have got all these neurons. And the way they represent information is they break up that data into little pieces that are represented by pulses and different neurons. So you have all these pieces of data distributed throughout the network. And then the way that you process that data to get a result is that you translate this pattern of activity into a new pattern of activity, just by it flowing through the network. So you set up these connections such that the input pattern just flows and generates the output pattern. What you see here is that there ’ s these redundant connections. So if this piece of data or this piece of the data gets clobbered, it doesn ’ t show up over here, these two pieces can activate the missing part with these redundant connections. So even when you go to these crappy devices where sometimes you want a one and you get a zero, and it doesn ’ t show up, there ’ s redundancy in the network that can actually recover the missing information. It makes the brain inherently robust. What you have here is a system where you store data locally. And it ’ s brittle, because each of these steps has to be flawless, otherwise you lose that data, whereas in the brain, you have a system that stores data in a distributed way, and it ’ s robust. What I want to basically talk about is my dream, which is to build a computer that works like the brain. This is something that we ’ ve been working on for the last couple of years. And I ’ m going to show you a system that we designed to model the retina, which is a piece of brain that lines the inside of your eyeball. We didn ’ t do this by actually writing code, like you do in a computer. In fact, the processing that happens in that little piece of brain is very similar to the kind of processing that computers do when they stream video over the Internet. They want to compress the information — they just want to send the changes, what ’ s new in the image, and so on — and that is how your eyeball is able to squeeze all that information down to your optic nerve, to send to the rest of the brain. Instead of doing this in software, or doing those kinds of algorithms, we went and talked to neurobiologists who have actually reverse engineered that piece of brain that ’ s called the retina. And they figured out all the different cells, and they figured out the network, and we just took that network and we used it as the blueprint for the design of a silicon chip. So now the neurons are represented by little nodes or circuits on the chip, and the connections among the neurons are represented, actually modeled by **transistors**. And these **transistors** are behaving essentially just like ion channels behave in the brain. It will give you the same kind of robust architecture that I described. Here is actually what our artificial eye looks like. The retina chip that we designed sits behind this lens here. And the chip — I ’ m going to show you a video that the silicon retina put out of its output when it was looking at Kareem Zaghloul, who ’ s the student who designed this chip. Let me explain what you ’ re going to see, OK, because it ’ s putting out different kinds of information, it ’ s not as straightforward as a camera. The retina chip extracts four different kinds of information. It extracts regions with dark contrast, which will show up on the video as red. And it extracts regions with white or light contrast, which will show up on the video as green. This is Kareem ’ s dark eyes and that ’ s the white background that you see here. And then it also extracts movement. When Kareem moves his head to the right, you will see this blue activity there ; it represents regions where the contrast is increasing in the image, that ’ s where it ’ s going from dark to light. And you also see this yellow activity, which represents regions where contrast is decreasing ; it ’ s going from light to dark. And these four types of information — your optic nerve has about a million fibers in it, and 900, 000 of those fibers send these four types of information. So we are really duplicating the kind of signals that you have on the optic nerve. What you notice here is that these snapshots taken from the output of the retina chip are very sparse, right? It doesn ’ t light up green everywhere in the background, only on the edges, and then in the hair, and so on. And this is the same thing you see when people compress video to send : they want to make it very sparse, because that file is smaller. And this is what the retina is doing, and it ’ s doing it just with the circuitry, and how this network of neurons that are interacting in there, which we ’ ve captured on the chip. But the point that I want to make — I ’ ll show you up here. So this image here is going to look like these ones, but here I ’ ll show you that we can reconstruct the image, so, you know, you can almost recognize Kareem in that top part there. And so, here you go. Yes, so that ’ s the idea. When you stand still, you just see the light and dark contrasts. But when it ’ s moving back and forth, the retina picks up these changes. And that ’ s why, you know, when you ’ re sitting here and something happens in your background, you merely move your eyes to it. There are these cells that detect change and you move your attention to it. So those are very important for catching somebody who ’ s trying to sneak up on you. Let me just end by saying that this is what happens when you put Africa in a piano, OK. This is a steel drum here that has been modified, and that ’ s what happens when you put Africa in a piano. And what I would like us to do is put Africa in the computer, and come up with a new kind of computer that will generate thought, imagination, be creative and things like that. Thank you. Chris Anderson : Question for you, Kwabena. Do you put together in your mind the work you ’ re doing, the future of Africa, this conference — what connections can we make, if any, between them? Kwabena Boahen : Yes, like I said at the beginning, I got my first computer when I was a teenager, growing up in Accra. And I had this gut reaction that this was the wrong way to do it. It was very brute force ; it was very inelegant. I don ’ t think that I would ’ ve had that reaction, if I ’ d grown up reading all this science fiction, hearing about RD2D2, whatever it was called, and just — you know, buying into this hype about computers. I was coming at it from a different perspective, where I was bringing that different perspective to bear on the problem. And I think a lot of people in Africa have this different perspective, and I think that ’ s going to impact technology. And that ’ s going to impact how it ’ s going to evolve. And I think you ’ re going to be able to see, use that infusion, to come up with new things, because you ’ re coming from a different perspective. I think we can contribute. We can dream like everybody else. CA : Thanks Kwabena, that was really interesting. Thank you.

Text Sample 460: NEG Dim 3 – 2007 – Score -1.00 – 2007/t000229.txt

The Internet, the Web as we know it, the kind of Web â the things we ’ re all talking about â is already less than 5, 000 days old. So all of the things that we ’ ve seen come about, starting, say, with satellite images of the whole Earth, which we couldn ’ t even imagine happening before, all these things rolling into our lives, just this abundance of things that are right before us, sitting in front of our laptop, or our desktop. This kind of cornucopia of stuff just coming and never ending is amazing, and we ’ re not amazed. It ’ s really amazing that all this stuff is here. It ’ s in 5, 000 days, all this stuff has come. And I know that 10 years ago, if I had told you that this was all coming, you would have said that that ’ s impossible. There ’ s simply no economic model that that would be possible. And if I told you it was all coming for free, you would say, this is simply â you ’ re dreaming. You ’ re a Californian utopian. You ’ re a wild-eyed optimist. And yet it ’ s here. The other thing that we know about it was that 10 years ago, as I looked at what even Wired was talking about, we thought it was going to be TV, but better. That was the model. That was what everybody was suggesting was going to be coming. And it turns out that that ’ s not what it was. First of all, it was impossible, and it ’ s not what it was. And so one of the things that I think we ’ re learning â if you think about, like, Wikipedia, it ’ s something that was simply impossible. It ’ s impossible in theory, but possible in practice. And if you take all these things that are impossible, I think one of the things that we ’ re learning from this era, from this last decade, is that we have to get good at believing in the impossible, because we ’ re unprepared for it. So, I ’ m curious about what ’ s going to happen in the next 5, 000 days. But if that ’ s happened in the last 5, 000 days, what ’ s going to happen in the next 5, 000 days? So, I have a kind of a simple story, and it suggests that what we want to think about is this thing that we ’ re making, this thing that has happened in 5, 000 days â that ’ s all these computers, all these handhelds, all these cell phones, all these laptops, all these servers â basically what we ’ re getting out of all these connections is we ’ re getting one machine. If there is only one machine, and our little handhelds and devices are actually just little windows into those machines, but that we ’ re basically constructing a single, global machine. And so I began to think about that. And it turned out that this machine happens to be the most reliable machine that we ’ ve ever made. It has not crashed ; it ’ s running uninterrupted. And there ’ s almost no other machine that we ’ ve ever made that runs the number of hours, the number of days. 5, 000 days without interruption â that ’ s just unbelievable. And of course, the Internet is longer than just 5, 000 days ; the Web is only 5, 000 days. So, I was trying to basically make measurements. What are the dimensions of this machine? And I started off by calculating how many billions of clicks there are all around the globe on all the computers. And there is a 100 billion clicks per day. And there ’ s 55 trillion links between all the Web pages of the world. And so I began thinking more about other kinds of dimensions, and I made a quick list. Was it Chris Jordan, the photographer, talking about numbers being so large that they ’ re meaningless? Well, here ’ s a list of them. They ’ re hard to tell, but there ’ s one billion PC chips on the Internet, if you count all the chips in all the computers on the Internet. There ’ s two million emails per second. So it ’ s a very big number. It ’ s just a huge machine, and it uses five percent of the global electricity on the planet. So here ’ s the specifications, just as if you were to make up a spec sheet for it : 170 quadrillion **transistors**, 55 trillion links, emails running at two **megahertz** itself, 31 kilohertz text messaging, 246 exabyte storage. That ’ s a big disk. That ’ s a lot of storage, memory. Nine exabyte RAM. And the total traffic on this is running at seven terabytes per second. Brewster was saying the Library of Congress is about twenty terabytes. So every second, half of the Library of Congress is swooshing around in this machine. It ’ s a big machine. So I did something else. I figured out 100 billion clicks per day, 55 trillion links is almost the same as the number of synapses in your brain. A quadrillion **transistors** is almost the same as the number of neurons in your brain. So to a first approximation, we have these things â twenty petahertz synapse firings. Of course, the memory is really huge. But to a first approximation, the size of this machine is the size â and its complexity, kind of â to your brain. Because in fact, that ’ s how your brain works â in kind of the same way that the Web works. However, your brain isn ’ t doubling every two years. So if we say this machine right now that we ’ ve made is about one HB, one human brain, if we look at the rate that this is increasing, 30 years from now, there ’ ll be six billion HBs. So by the year 2040, the total processing of this machine will exceed a total processing power of humanity, in raw bits and stuff. And this is, I think, where Ray Kurzweil and others get this little chart saying that we ’ re going to cross. So, what about that? Well, here ’ s a couple of things. I have three kind of general things I would like to say, three consequences of this. First, that basically what this machine is doing is embodying. We ’ re giving it a body. And that ’ s what we ’ re going to do in the next 5, 000 days â we ’ re going to give this machine a body. And the second thing is, we ’ re going to restructure its architecture. And thirdly, we ’ re going to become completely codependent upon it. So let me go through those three things. First of all, we have all these things in our hands. We think they ’ re all separate devices, but in fact, every screen in the world is looking into the one machine. These are all basically portals into that one machine. The second thing is that â some people call this the cloud, and you ’ re kind of touching the cloud with this. And so in some ways, all you really need is a cloudbook. And the cloudbook doesn ’ t have any storage. It ’ s wireless. It ’ s always connected. There ’ s many things about it. It becomes very simple, and basically what you ’ re doing is you ’ re just touching the machine, you ’ re touching the cloud and you ’ re going to compute that way. So the machine is computing. And in some ways, it ’ s sort of back to the kind of old idea of centralized computing. But everything, all the cameras, and the microphones, and the sensors in cars and everything is connected to this machine. And everything will go through the Web. And we ’ re seeing that already with, say, phones. Right now, phones don ’ t go through the Web, but they are beginning to, and they will. And if you imagine what, say, just as an example, what Google Labs has in terms of experiments with Google Docs, Google Spreadsheets, blah, blah, blah â all these things are going to become Web based. They ’ re going through the machine. And I am suggesting that every bit will be owned by the Web. Right now, it ’ s not. If you do spreadsheets and things at work, a Word document, they aren ’ t on the Web, but they are going to be. They ’ re going to be part of this machine. They ’ re going to speak the Web language. They ’ re going to talk to the machine. The Web, in some sense, is kind of like a black hole that ’ s sucking up everything into it. And so every thing will be part of the Web. So every item, every artifact that we make, will have embedded in it some little sliver of Web-ness and connection, and it will be part of this machine, so that our environment â kind of in that ubiquitous computing sense â our environment becomes the Web. Everything is connected. Now, with RFIDs and other things â whatever technology it is, it doesn ’ t really matter. The point is that everything will have embedded in it some sensor connecting it to the machine, and so we have, basically, an Internet of things. So you begin to think of a shoe as a chip with heels, and a car as a chip with wheels, because basically most of the cost of manufacturing cars is the embedded intelligence and electronics in it, and not the materials. A lot of people think about the new economy as something that was going to be a disembodied, alternative, virtual existence, and that we would have the old economy of atoms. But in fact, what the new economy really is is the marriage of those two, where we embed the information, and the digital nature of things into the material world. That ’ s what we ’ re looking forward to. That is where we ’ re going â this union, this convergence of the atomic and the digital. And so one of the consequences of that, I believe, is that where we have this sort of spectrum of media right now â TV, film, video â that basically becomes one media platform. And while there ’ s many differences in some senses, they will share more and more in common with each other. So that the laws of media, such as the fact that copies have no value, the value ’ s in the uncopiable things, the immediacy, the authentication, the personalization. The media wants to be liquid. The reason why things are free is so that you can manipulate them, not so that they are”free”as in”beer,”but”free”as in”freedom.”And the network effects rule, meaning that the more you have, the more you get. The first fax machine â the person who bought the first fax machine was an idiot, because there was nobody to fax to. But here she became an evangelist, recruiting others to get the fax machines because it made their purchase more valuable. Those are the effects that we ’ re going to see. Attention is the currency. So those laws are going to kind of spread throughout all media. And the other thing about this embodiment is that there ’ s kind of what I call the McLuhan reversal. McLuhan was saying,”Machines are the extensions of the human senses.”And I ’ m saying,”Humans are now going to be the extended senses of the machine,”in a certain sense. So we have a trillion eyes, and ears, and touches, through all our digital photographs and cameras. And we see that in things like Flickr, or Photosynth, this program from Microsoft that will allow you to assemble a view of a touristy place from the thousands of tourist snapshots of it. In a certain sense, the machine is seeing through the pixels of individual cameras. Now, the second thing that I want to talk about was this idea of restructuring, that what the Web is doing is restructuring. And I have to warn you, that what we ’ ll talk about is â I ’ m going to give my explanation of a term you ’ re hearing, which is a”semantic Web.”So first of all, the first stage that we ’ ve seen of the Internet was that it was going to link computers. And that ’ s what we called the Net ; that was the Internet of nets. And we saw that, where you have all the computers of the world. And if you remember, it was a kind of green screen with cursors, and there was really not much to do, and if you wanted to connect it, you connected it from one computer to another computer. And what you had to do was â if you wanted to participate in this, you had to share packets of information. So you were forwarding on. You didn ’ t have control. It wasn ’ t like a telephone system where you had control of a line : you had to share packets. The second stage that we ’ re in now is the idea of linking pages. So in the old one, if I wanted to go on to an airline Web page, I went from my computer, to an FTP site, to another airline computer. Now we have pages â the unit has been resolved into pages, so one page links to another page. And if I want to go in to book a flight, I go into the airline ’ s flight page, the website of the airline, and I ’ m linking to that page. And what we ’ re sharing were links, so you had to be kind of open with links. You couldn ’ t deny â if someone wanted to link to you, you couldn ’ t stop them. You had to participate in this idea of opening up your pages to be linked by anybody. So that ’ s what we were doing. We ’ re now entering to the third stage, which is what I ’ m talking about, and that is where we link the data. So, I don ’ t know what the name of this thing is. I ’ m calling it the one machine. But we ’ re linking data. So we ’ re going from machine to machine, from page to page, and now data to data. So the difference is, is that rather than linking from page to page, we ’ re actually going to link from one idea on a page to another idea, rather than to the other page. So every idea is basically being supported â or every item, or every noun â is being supported by the entire Web. It ’ s being resolved at the level of items, or ideas, or words, if you want. So besides physically coming out again into this idea that it ’ s not just virtual, it ’ s actually going out to things. So something will resolve down to the information about a particular person, so every person will have a unique ID. Every person, every item will have a something that will be very specific, and will link to a specific representation of that idea or item. So now, in this new one, when I link to it, I would link to my particular flight, my particular seat. And so, giving an example of this thing, I live in Pacifica, rather than â right now Pacifica is just sort of a name on the Web somewhere. The Web doesn ’ t know that that is actually a town, and that it ’ s a specific town that I live in, but that ’ s what we ’ re going to be talking about. It ’ s going to link directly to â it will know, the Web will be able to read itself and know that that actually is a place, and that whenever it sees that word,”Pacifica,”it knows that it actually has a place, latitude, longitude, a certain population. So here are some of the technical terms, all three-letter things, that you ’ ll see a lot more of. All these things are about enabling this idea of linking to the data. So I ’ ll give you one kind of an example. There ’ s like a billion social sites on the Web. Each time you go into there, you have to tell it again who you are and all your friends are. Why should you be doing that? You should just do that once, and it should know who all your friends are. So that ’ s what you want, is all your friends are identified, and you should just carry these relationships around. All this data about you should just be conveyed, and you should do it once and that ’ s all that should happen. And you should have all the networks of all the relationships between those pieces of data. That ’ s what we ’ re moving into â where it sort of knows these things down to that level. A semantic Web, Web 3. 0, giant global graph â we ’ re kind of trying out what we want to call this thing. But what ’ s it ’ s doing is sharing data. So you have to be open to having your data shared, which is a much bigger step than just sharing your Web page, or your computer. And all these things that are going to be on this are not just pages, they are things. Everything we ’ ve described, every artifact or place, will be a specific representation, will have a specific character that can be linked to directly. So we have this database of things. And so there ’ s actually a fourth thing that we have not get to, that we won ’ t see in the next 10 years, or 5, 000 days, but I think that ’ s where we ’ re going to. And as the Internet of things â where I ’ m linking directly to the particular things of my seat on the plane â that that physical thing becomes part of the Web. And so we are in the middle of this thing that ’ s completely linked, down to every object in the little sliver of a connection that it has. So, the last thing I want to talk about is this idea that we ’ re going to be codependent. It ’ s always going to be there, and the closer it is, the better. If you allow Google to, it will tell you your search history. And I found out by looking at it that I search most at 11 o ’ clock in the morning. So I am open, and being transparent to that. And I think total personalization in this new world will require total transparency. That is going to be the price. If you want to have total personalization, you have to be totally transparent. Google. I can ’ t remember my phone number, I ’ ll just ask Google. We ’ re so dependent on this that I have now gotten to the point where I don ’ t even try to remember things â I ’ ll just Google it. It ’ s easier to do that. And we kind of object at first, saying,”Oh, that ’ s awful.”But if we think about the dependency that we have on this other technology, called the alphabet, and writing, we ’ re totally dependent on it, and it ’ s transformed culture. We cannot imagine ourselves without the alphabet and writing. And so in the same way, we ’ re going to not imagine ourselves without this other machine being there. And what is happening with this is some kind of AI, but it ’ s not the AI in conscious AI, as being an expert, Larry Page told me that that ’ s what they ’ re trying to do, and that ’ s what they ’ re trying to do. But when six billion humans are Googling, who ’ s searching who? It goes both ways. So we are the Web, that ’ s what this thing is. We are going to be the machine. So the next 5, 000 days, it ’ s not going to be the Web and only better. Just like it wasn ’ t TV and only better. The next 5, 000 days, it ’ s not just going to be the Web but only better â it ’ s going to be something different. And I think it ’ s going to be smarter. It ’ ll have an intelligence in there, that ’ s not, again, conscious. But it ’ ll anticipate what we ’ re doing, in a good sense. Secondly, it ’ s become much more personalized. It will know us, and that ’ s good. And again, the price of that will be transparency. And thirdly, it ’ s going to become more ubiquitous in terms of filling your entire environment, and we will be in the middle of it. And all these devices will be portals into that. So the single idea that I wanted to leave with you is that we have to begin to think about this as not just”the Web, only better,”but a new kind of stage in this development. It looks more global. If you take this whole thing, it is a very big machine, very reliable machine, more reliable than its parts. But we can also think about it as kind of a large organism. So we might respond to it more as if this was a whole system, more as if this wasn ’ t a large organism that we are going to be interacting with. It ’ s a”One.”And I don ’ t know what else to call it, than the One. We ’ ll have a better word for it. But there ’ s a unity of some sort that ’ s starting to emerge. And again, I don ’ t want to talk about consciousness, I want to talk about it just as if it was a little bacteria, or a volvox, which is what that organism is. So, to do, action, take-away. So, here ’ s what I would say : there ’ s only one machine, and the Web is its OS. All screens look into the One. No bits will live outside the Web. To share is to gain. Let the One read it. It ’ s going to be machine-readable. You want to make something that the machine can read. And the One is us. We are in the One. I appreciate your time.

I ’ ve always wanted to be a cyborg. One of my favorite shows as a kid was”The Six Million Dollar Man,”and this is a little bit closer to the 240-dollar man or so, but â At any rate, I would normally feel very self-conscious and geeky wearing this around, but a few days ago I saw one world-renowned statistician swallowing swords on stage here, so I figure it ' s OK amongst this group. But that ' s not what I want to talk about today. I want to talk about toys, and the power that I see inherent in them. When I was a kid, I attended Montessori school up to sixth grade in Atlanta, Georgia. And at the time I didn ' t think much about it, but then later, I realized that that was the high point of my education. From that point on, everything else was pretty much downhill. And it wasn ' t until later, as I started making games, that â I really actually think of them more as toys. People call me a game designer, but I really think of these things more as toys. I started getting very interested in Maria Montessori and her methods, and the way she went about things, and the way she thought it very valuable for kids to discover things on their own rather than being taught these things overtly. And she would design these toys, where kids in playing with the toys would come to understand these deep principles of life and nature through play. And since they discovered this, it stuck with them so much more, and also they would experience their own failures. There was a failure-based aspect to learning there. It was very important. And so, the games that I do, I think of really more as modern Montessori toys. And I really kind of want them to be presented in a way to where kids can kind of explore and discover their own principles. So a few years ago, I started getting very interested in the SETI program. And that ' s the way I work. I get interested in different subjects, I dive in, research them, and then try to figure out how to craft a toy around that, so that other people can experience the same sense of discovery that I did as I was learning that subject. And it led me to astrobiology, the study of possible life in the universe. And then Drake ' s equation, looking at the probability of life arising on planets, how long it might last, how many planets are out there. And I started looking at how interesting Drake ' s equation was, because it spanned all these different subjects â physics, chemistry, sociology, economics, astronomy. And another thing that really impressed me a long time ago was"Powers of Ten,"Charles and Ray Eames ' film. And I started putting those two together and wondering, could I build a toy where kids would trip across all these interesting principles of life, as it exists and as it might go in the future. Things where you might trip across things like the Copernican principle, the Fermi paradox, the anthropic principle, the origin of life. And so I ' m going to show you a toy today that I ' ve been working on, that I think of more as kind of a philosophy toy. Playing this toy will bring up philosophical questions in you. The game is"Spore."I ' ve been working on it for several years. It ' s getting pretty close to finished now. It occurs at all these different scales, from very small to very large. I ' m going to pop in at the start of the game. And you actually start this game in a drop of water, as a very, very small single-cell creature, and right off the bat you basically just have to live, survive, reproduce. So here we are, at a very microscopic scale, swimming around. And I actually realize that cells don ' t have eyes, but it helps to make it cute. The players are going to play through every generation of this species, and as you play the game, the creature is actually growing bit by bit. And as we start growing, the camera will actually start zooming out, and things that you see in the background there will start slowly pulling into the foreground, showing you a little bit of what you ' ll be interacting with as you grow. So as we eat, the camera starts pulling out, and then we start interacting with larger and larger organisms. We actually play through many generations here, at the cellular scale. I ' m going to skip ahead here. At some point we get larger, and we actually get to a macroevolution scale. Now, at this point we ' re leaving the water, and one thing that ' s kind of important about this game is that, at every level, the player is designing their creature, and that ’ s a fundamental aspect of this. Now, in the evolution game here, the creature scale, basically you have to eat, survive, and then reproduce. You know, very Darwinian. One thing we noticed with”The Sims,”a game I did earlier, is that players love making stuff. When they were able to make stuff in the game, they had a lot of empathy in connection to it. Even if it wasn ’ t as pretty as a professional artist would make for games, it really stuck with them and they really cared about what would happen to it. At this point, we ’ ve left the water, and now with this little creature â we could bring up the volume a little bit â and now we might try to eat. We might sneak up on this little guy over here maybe, and try and eat him. OK, well, we fight. OK, we got him. Now we get a meal. So really, at this part of the game, what we ’ re doing is we ’ re running around and surviving, and also getting to the next generation, because we ’ re going to play through every generation of this creature. We can mate, so I ’ m going to see if one of these creatures wants to mate with me. Yeah. We didn ’ t want to replay actual evolution with humans and all that, because it ’ s almost more interesting to look at alternate possibilities in evolution. Evolution is usually presented as this one path that we took through, but really it represents this huge set of possibilities. Now, once we mate, we click on the egg. And this is where the game starts getting interesting, because one of the things we really focused on here was giving the players very high-leverage tools, so that for very little effort, the player can make something very cool. And it involves a lot of intelligence on the tool side. But basically, this is the editor where we ’ re going to design the next generation. So it has a little spine. I can move around, I can extend. I can also inflate or deflate it with the mouse wheel, so you sculpt it like clay. We have parts here that I can put on or pull off. The idea is that the player can basically design anything they can think of in this editor, and we ’ ll basically bring it to life. So I might put some limbs on the character here. I ’ ll inflate them kind of large. And in this case I might decide I ’ m going to put â I ’ ll put mouths on the limbs. So pretty much players are encouraged to be very creative in the game. Here, I ’ ll give it one eye in the middle, maybe scale it up a bit. Point it down. And I ’ ll also give it a few legs. So in some sense we want this to feel like an amplifier for the player ’ s imagination, so that with a very small number of clicks a player can create something that they didn ’ t really think was possible before. This is almost like designing something like Maya â that an eight- year-old can use. But really the goal here was, within about a minute, I wanted somebody to replicate what typically takes a pictorial artist several weeks to create. OK, now I ’ ll put some hands on it. OK, so here I ’ ve basically thrown together a little creature. Let me give it a little weapon on the tail here, so it can fight. OK, so that ’ s the complete model. Now we can actually go to the painting phase. At this phase, the program has some understanding of the topology of this creature. It knows where the backbone is, where the spine, the limbs are, how stripes should run, how it should be shaded. And so we ’ re procedurally generating the texture map, something a texture artist would take many days to work on. And then we can test it out, and see how it would move around. And so at this point the computer is procedurally animating this creature. It ’ s looking at whatever I ’ ve designed. It will actually bring it to life. And I can see how it might dance. How it might show emotions, how it might fight. So it ’ s acting with its two mouths there. I can even have it pose for a photo. Snap a little photo of it. So then I bring this back into the game. It ’ s born, and I play the next generation of my creature through evolution. Now again, the empathy that the players have when they create the content is tremendous. When players create content in this game, it ’ s automatically sent up to a server and then redistributed to all the other players transparently. So in fact, as I ' m interacting in this world with other creatures, these creatures are transparently coming from other players as they play. So the process of playing the game is a process of building up this huge database of content. And pretty much everything you ' re going to see in this game, there ' s an editor for that the player can create, up through civilization. This is my baby. When I eat, I ' ll actually start growing. This is the next generation. But I ' m going to skip ahead here. Normally what would happen is these creatures would work their way up, eventually become intelligent. I ' d start dealing with tribes, cities and civilizations of them over time. I ' m going to skip way ahead to the space phase. Eventually they would go out into space, and start colonizing and exploring the universe. Now, really, in some sense, I want the players to be building this world in their imagination, and then extracting it from them with the least amount of pain. So that ' s kind of what these tools are about. How do we make the gameplay, you know, basically the player ' s imagination amplifier? And how do we make these tools, these editors, something that are just as fun as the game itself? So this is the planet that we ' ve been playing on up to this point in the game. So far the entire game has been played on the surface of this little world here. At this point we ' re actually dealing with a very little toy planet. Almost, again, like the Montessori toy idea. What happens if you give somebody a toy planet, and let them play with a lot of dynamics on it? What could they discover? What might they learn on this? This world was actually extracted from the player ' s imagination. So, this is the planet that the player evolved on. Things like the buildings, the vehicles, the architecture, civilizations were all designed by the player up to this point. So here ' s a little city with some of our guys walking around in it. And most games put the player in the role of Luke Skywalker, this protagonist playing through this story. This is more about putting the player in the role of George Lucas. I want them, after they ' ve played this game, to have extracted an entire world that they ' re now interacting with. As we pull down here, we still have a whole set of creatures living on the surface of the planet. All these different dynamics going on here. I can look over here, and this is a little simplified food web that ' s going on with the creatures. I can open this up and then scan what exists on the surface. You get some sense of the diversity of creatures that were brought in. Some of these were created by the player, others by other players, automatically sent over here. But there ' s a very simple calculation of what ' s required, how many plants are required for the herbivores to live, how many herbivores for the carnivores to eat, etc., that you have to balance actively. Also with this phase, we ' re getting more and more God-like powers for the player, and you can experiment with this planet as a toy. So I can come in and I can do things, and just treat this planet as a lump of clay. We have very simple weather systems, simple geology. For instance, I could open one of my tools here and then carve out rivers. So this whole thing is kind of like a big lump of clay, a sculpture. I can also play with the dynamics in this world over time. So one of the things I can do is start pumping more CO2 gases into the atmosphere, and so that ' s what I ' m doing here. There ' s actually a little readout down there of our planetary atmosphere, pressure and temperature. So as I start pumping in more atmosphere, we ' re going to start pushing up the greenhouse gases here and if you ' ll start noticing, we start seeing the ocean levels rise over time. And our cities are going to be at risk too, because a lot of these are coastal cities. You can see the ocean levels are rising now and as they encroach upon the cities, I ' ll start losing cities here. So basically, I want the players to be able to experiment and explore a huge amount of failure space. So there goes one city. Now, over time, this is going to heat up the planet. So at first what we ' re going to see is a global ocean rise here on this little toy planet, but then over time â I can speed it up â we ’ ll see the heat impact of that as well. Not only will it get hotter, but at some point it ’ s going to get so hot the oceans will evaporate. They ’ ll go up, and then they ’ ll evaporate, and that ’ ll be my planet. So basically, what we ’ re getting here is the sequel to”An Inconvenient Truth,”in about two minutes, and that actually brings up an interesting point about games. Now here, our entire oceans are evaporating off the surface, and as it keeps getting hotter, at some point the entire planet is going to melt down. Here it goes. So we ’ re not only simulating biological dynamics â food webs and all that â but also geologic, you know, on a very simple core scale. And what ’ s interesting to me about games is that I think we can take a lot of long-term dynamics and compress them into very short-term experiences. Because it ’ s so hard for people to think 50 or 100 years out, but when you can give them a toy, and they can experience these long-term dynamics in just a few minutes, I think it ’ s an entirely different point of view, where we ’ re actually using the game to remap our intuition. It ’ s almost in the same way that a telescope or microscope recalibrates your eyesight ; I think computer simulations can recalibrate your instinct across vast scales of both space and time. So here ’ s our little solar system, as we pull away from our melted planet here. We actually have a couple of other planets in this solar system. Let ’ s fly to another one. We ’ re going to have this unlimited number of worlds you can explore here. As we move into the future, and we start going out into space and doing stuff, we ’ re drawing a lot from things like science fiction. And all my favorite science fiction movies I want to play out here as different dynamics. This planet actually has some life on it. Here it is, some indigenous life down here. One of the tools I can eventually earn for my UFO is a monolith that I can drop down. Now, as you can see, these guys are actually starting to go up and bow to it, and over time, once they touch it, they will become intelligent. So I can actually pick a species on a planet and then make them sentient. Now they ’ ve actually gone to tribal dynamics. And now, because I ’ m actually the one here, I can get out of the UFO and walk up, and they should be worshipping me at this point as a god. At first they ’ re a little freaked out. OK, well maybe they ’ re not worshipping me. I think I ’ ll leave before they get hostile. But we basically want a diversity of activities the players can play through this. I want to be able to play”The Day the Earth Stood Still,””2001 : A Space Odyssey,””Star Trek,””War Of the Worlds.”Now, as we pull away from this world â we ’ re going to keep pulling away from the star now. One of the things that always frustrated me about astronomy when I was a kid is how it was always presented so two-dimensionally and so static. As we pull away from the star here, we ’ re actually going now out into interstellar space, and we ’ re getting a sense of the space around our home star. What I really wanted to do is to present this, basically, as wonderfully 3D as it is actually is. And also show the dynamics, and a lot of the interesting objects that you might find, like, in the Hubble, at pretty much realistic frequencies and scales. So most people have no idea of the difference between an emission nebula and a planetary nebula. But these are the things that we can put in this little galaxy here. So we ’ re flying over here to what looks like a black hole. I want to basically have the entire zoo of Hubble objects that people can interact with and play with, again, as toys. So here ’ s a little black hole that we probably don ’ t want to get too close to. But we also have stars and things as well. If we pull all the way back, we start seeing the entire galaxy here, kind of slowly in motion. Typically, when people present galaxies, it ’ s always beautiful photos, but they ’ re always static. And when you bring it forward in time and start animating it, it ’ s amazing what a galaxy would look like fast forwarded. This would be about a million years a second, because you have about one supernova every century. And so you ’ d have this wonderful sparkling thing, with the disk slowly rotating, and this is roughly what it would look like. Part of this is about bringing the beauty of the natural world to somebody in a very imaginative way, so that they can start calibrating their instinct across these vast scales of space and time. Chris was wondering what kind of gods the players would become. Because if you think about it, you ’ re going to have 15-year-olds, 20-year-olds flying around this universe. They might be a nurturing god. They might be bootstrapping life on planets, trying to terraform and spread civilization. You might be a vengeful god, conquesting, because you actually can do that, you can attack other intelligent races. You might be a networking god, building alliances, or just curious, going around and wanting to explore as much as you possibly can. But basically, the reason why I make toys like this is because I think if there ’ s one difference I could possibly make in the world, that I would choose to make, it ’ s that I would like to somehow give people just a little bit better calibration on long-term thinking. Because I think most of the problems that our world is facing right now are the result of short-term thinking, and the fact that it is so hard for us to think 50, 100, or 1, 000 years out. And I think by giving kids toys like this and letting them replay dynamics, very long-term dynamics over the short term, and getting some sense of what we ’ re doing now, what it ’ s going to be like in 100 years, I think probably is the most effective thing I can be doing to help the world. And so that ’ s why I think that toys can change the world. Thank you.

I ’ m here to tell you that what we sense, meaning what we see, smell, hear, taste and touch, can impact how long we live. Now this may seem extraordinary, but it really isn ’ t. Let ’ s say that you wake up one morning and are trying to decide whether to go to an **amusement** park. One of the very first things you might do is to step outside and check the weather. When you do, you see that the sky is blue, that the sun is out. You hear that the birds are chirping. You feel how warm it is on your skin. Based on all of this information, you decide it is a perfect day for going to the park. You have used your senses to impact your decision. Now gathering this information does more than simply impact your behavior. It also can affect your emotions as well as how your body physically responds. To demonstrate, let ’ s say you ’ ve arrived at that **amusement** park, and one of the very first things that you see is a roller coaster. You see the speed with which it moves. You see the twists and turns it takes. You see the terrified look on the riders ’ faces. You hear their screams. Even right here, right now, this sensory event may be causing you to feel anxious or even excited, feelings that are associated with butterflies in your stomach, a racing heartbeat, even sweating palms. Your senses have caused your body to change. This is an example of how a very short sensory perceptive event can impact you. What do you imagine a much longer sensory event might do to you? This is the question that I am interested in addressing. And what scientists like me have discovered is that prolonged sensory events can impact the lifespan of an animal. This has been shown with worms, flies, mice. When you expose them to pheromones, it impacts how long they live. Now at this point, you might be asking yourself, um, what does a worm, a fly or a mouse have to do with me? I would argue more than you realize. The genes or genetic material that you find within a worm or within a fly, that is approximately 60 to 75 percent similar to our own. This increases to 85 percent if we compare ourselves to a mouse. Furthermore, the fact that three very different animals all respond in terms of changing their lifespan when exposed to a specific environmental cue, this suggests that those underlying biological processes that drive those changes are similar. Therefore, there is every reason to believe that environmental cues impact our own very human aging process. In order to study environmental cues and how they impact lifespan, our lab has decided to focus on the nervous system. Now why the nervous system? Well, we can think of the nervous system as a communication hub. It ’ s responsible for gathering that sensory information, for processing it and then for causing those bodily changes that occur. Furthermore, to do this research, we need to control the environment that an animal is in for its entire life. This is something that would be pretty difficult at best, and unethical at worst to do using humans. I therefore use this little guy, Drosophila melanogaster, also known as the fruit fly or the pest that came home on your bananas from the grocery store, in order to understand the things that we share in common that impact lifespan. Now fruit flies are amazing for this type of research. They live a short amount of time. They only live two or three months. They have a brain and a central nervous system. And we can easily activate or inhibit specific neuron cells or even the activities of specific molecules in order to see how these changes impact how long the animal lives. Now I am the first to admit that my belief of how great it is to work with fruit flies is biased. But that ’ s because I ’ m a fly girl. So our lab has studied how very many different environmental cues have impacted the lifespan of this animal. I ’ m going to highlight one in particular, and that is death perception. Yes, I said death. So why are we interested in whether a fly can recognize other dead flies? We ’ re interested in this so that we can develop therapies for people who find themselves developing negative health consequences as a result of stressful situations surrounding death. If you think about this, this could impact soldiers and first responders. You ’ re thinking,”What? A fly can actually recognize another dead fly?”The answer is yes. If I take a vial of flies and I put dead in there, they send out a signal to other flies to stay away. We can measure this. You know those flies in the vial with the dead? They lose weight and they die sooner. Now that we know that there ’ s all these effects, we wanted to make sure this was real. So, you know, the first thing that you might imagine is that, well, those flies with the dead, they ’ re getting an infection. They ’ re getting sick, and that ’ s what ’ s causing them to die. But we know this isn ’ t the case, because if I do the experiment under **sterile** or infection-free conditions, the live flies, they still die when they ’ re with the dead. But if you take that vial of flies and you put them in complete darkness for 24 hours, all the time, they never see the light, those flies live just as long as flies that never had dead in their vial to begin with. This indicates that it is the sight of the dead that is causing all those biological changes, which impacts their lifespan. So now that we know that flies can sense other dead, we turned our attention toward trying to understand a little bit more about those biological processes that are happening. What are the changes? And what we discovered was that molecules found in our own bodies, including serotonin and insulin, had a role. Furthermore, we discovered parts of the fly brain that played a role in how long they live when exposed to dead that have similarities with regions of our own brains. This is what we know about just one type of environmental cue. There are many different environmental cues that impact the lifespan of animals. These include the temperature that the animal is kept in. These include the smell of food, the wavelength of light they are exposed to, even the perception of pain. In order for us to develop therapies that promote healthy aging, we must understand the basic biology of all of these cues, because after all, we don ’ t live in a world where we receive one cue at a time. So what does this all mean? I would love nothing more than to be able to tell you that you should expose yourself to this environmental cue, you should avoid that one in order to live your longest, healthiest life. But I simply can ’ t do that yet. We ’ re just not there. But we ’ re pushing hard towards this type of understanding, and we ’ re going to do it with these little guys. After all, six Nobel Prizes have been won based on work with Drosophila that impacts the biology and helps us all, including worms, flies, mice, and yes, humans. And on that note, I ’ d like to leave you with a happy perceptive experience in the hopes that this positively impacts your life. Thank you.

I want you to envision a single piece of artwork generated by artificial intelligence. When most of us think of AI art, I bet we ’ re imagining something like this. We ’ re all probably picturing something totally different. Today, with machine learning models like DALL-E, Stable Diffusion and Midjourney, we ’ ve seen AI produce everything from strange life forms to imaginary influencers to entirely foreign, curious kinds of imagery. AI as a technology is fascinating to us because we ’ re inherently drawn to things we cannot understand. And with neural networks processing data from thousands of other images made by people from every possible generation, every art movement, millions of images in one simple scan, they can produce visuals that are so familiar yet strikingly unfamiliar. More poetically, AI mirrors us. The world is beginning to change right before our very eyes, and it ’ s basically divided into two schools of thought. There are pessimists who think AI poses a great threat to human creativity. And then optimists who see it as an extension of our creativity. So is it even possible to be truly original as an artist anymore? How do we begin to critically engage with artworks made by machines? We can start by looking at some metaphors, narratives and insights from artists who are truly pushing the boundaries of AI. Let ’ s look to these moments of delight, surprise, confusion and wonder that give us just one small glimpse into the possibilities of encounter with this technology. Because as we ’ ve seen, this is a very moral and ethical encounter as much as an aesthetic one. Mario Klingemann sold this piece on auction in 2019. It is running an AI model trained on thousands of portraits from the 17th to 19th centuries. The model constantly reveals uncanny interpretations of the human face. Each one is unique, generated in real time as the machine reads its own output. For the viewer, it ’ s almost like peering into the machine ’ s hallucinations as it conjures each new portrait. Sofia Crespo ’ s series”Neural Zoo”uses neural network interpretations of the real world to generate unreal sea creatures and diverse biological forms. Frogs look like flowers. Translucent jellyfish have vivid internal organs. There ’ s no one real creature in these images, but AI allows us to envision otherworldly lifeforms in impossible detail. This abstract piece by Sara Ludy began as a digital painting. It was augmented to fit a 16-by-9 ratio, using a prompt for”torn edges”in DALL-E 2 ’ s Outpainting. Outpainting allows artists to extend their creativity beyond the frame using simple language prompts like”torn edges.”This piece by Ivona Tau might read as a photograph, but it is also the work of AI. It ’ s the result of GAN training on thousands of images from the artist ’ s personal photo collection. Tau curates from her own photographs, carefully choosing the inputs and outputs for the model. In many ways, AI art is a form of curation. It becomes the process of selecting from hundreds of images at a time. This video pulls from models trained on a massive data set of Tau ’ s photos, resulting in a kind of algorithmic memory. But she also created a destructed data set for the model to **symbolize** forgetting or fleeting memory. And finally, we have Claire Silver.

Silver has called herself a”collaborative AI artist”in that she works intentionally with the machine to produce her art. Her process is constantly evolving as the tools evolve. She often works with inpainting techniques, masking and transforming just one small piece of an image. For this portrait, she shifted the opacity of various sections with an Apple pencil, transforming it bit by bit. She likens this technique to her version of glazing in oil painting. Silver feeds AI-generated images from one model into another, effectively creating new forms of language and understanding for the machine itself. Her work is half master painting, half digital art. Both old and new. This piece pulls inspiration from famed artists like John Singer Sargent, Evelyn De Morgan and Gustav Klimt, almost as an homage. Because different AI models are trained on different sets of information, it ’ s almost like they ’ re all speaking different languages. AI is everywhere now. We are all now collectively co-creating with AI, whether we ’ re aware of it or not. If we want to be a part of these worlds, we cannot design alone. If we want to be culturally literate in these new kinds of images and predictions and forms, then looking to the work of artists is a very productive place to start. We need to brace ourselves for an increasingly technological future, which is only going to multiply all the creative possibilities at our fingertips now. Thank you.

Text Sample 464: NEG Dim 3 – 2023 – Score -1.00 – 2023/t003429.txt

Twenty-five hundred years ago, Heraclitus said,”The world bubbles forth.”Here ’ s bubbling. What is actual now enables what is next possible, the adjacent possible. The biosphere has been bubbling forth for four billion years, creating new possibilities in the universe in that bubbling. It ’ s critical that physics cannot talk at all about bubbling new bubbles. Life on Earth started four billion years ago. For the first 2. 5 billion years were single-celled organisms co-evolving. Even by existing, organisms create new possibilities. If I ’ m a bacterium and you ’ re a bacterium and I have a flat surface, I ’ m a possible highway you can walk over to get food. That ’ s bubbling forth. So 2. 5 billion years after life started, six times multicell organisms emerged. A billion years after that, 3. 5 billion years after life started, is the extraordinary Cambrian explosion. 540 million years ago, for 50 million years, there was just this burst of creativity, making all of the phyla that exist now. And now we have this guy. I ’ m scared of having him in bed, I really am. So I don ’ t know what to call him. It ’ s a vote afterwards. So here ’ s a gentler guy and I ’ m in love with him. Look at his eyes looking at you, you know.”You ’ re doing what?”In order to talk about how the biosphere has been creative, I have to talk about the functions of parts of an organ. You all know your heart keeps you alive, but in particular, your heart pumps blood. It ’ s not by making heart sounds. So this means something fundamental. The function of a part is that subset of its causal properties that sustain the whole. Your heart pumping blood and you. But doing that is jury-rigging, finding subsets of causal features of use. Some years ago, my daughter dropped her purse in a shallow well. I took a wire coat hanger, slid it over a mop handle, and I fished out her purse. Anything can be used for more than one thing. For example, a screwdriver can be used to screw in a screw, but it ’ s great for scraping putty off the wall. An engine block can have eight holes drilled and you make an engine out of it. It ’ s actually a superb paperweight, and much research done only by scientists demonstrates that the corners are sharp and can crack open a coconut. I was very proud of that. So. But if you ’ re using an engine block as a paperweight, can you deduce, oh, I can use this thing to crack open coconuts. You can ’ t. It might be a banana peel. But that means also something fundamental. Finding new uses for things, jury-rigging is not a computation. It ’ s not a deduction. Jury-rigging is not a computation at all. Computers are. The biosphere is forever innovating in this kind of way that ’ s not a deduction. For example, there are things called Darwinian preadaptations. Dinosaurs had scales that were evolved for thermoregulation that were jury-rigged into flight feathers. Your eyes have clear crystallins that were perfectly normal-colored enzymes. And this, too, means something fundamental. We cannot deduce what is in the adjacent possible that the evolving biosphere will create, then become. We do not even know what can happen. In fact, we can use no mathematics based on set theory, which is all of mathematics, to deduce what the biosphere is going to become, or the economy. This means we are at a fantastic third-phase transition in science, we ’ re beyond Newton, we ’ re beyond quantum mechanics. We ’ re beyond the exquisite view that Copernicus had 480 years ago, that the world is a clockwork. The biosphere is not a clockwork. The paper that just published, it came out three days ago, and I ’ m pretty proud of it, it ’ s actually worth reading. We can ’ t deduce what is in the biosphere and will become, but we can make a mathematical theory of the statistics of the process. I call it the Theory of the Adjacent Possible or TAP. It ’ s really based on one idea. Things can be combined to make new things. So there is the equation. Mt is the number of things in the economy at some time now, say 10 things. So how many things will be in the economy in the next period? Well, if the 10 things work, we ’ ll keep them, but we could actually try to jury-rig something new out of any single thing among the 10 or out of pair of things among the 10. The printing press is a **recombination** between movable type and a wine press or any three things or four things. Watch what happens to the number of things, pairs of things, when the number of things goes up. If there ’ s 10 things, there ’ s 45 pairs of things that we might fiddle with. If there ’ s 100 things, there ’ s 4, 500 things we might jury-rig with. And if there ’ s 1, 000 things, there ’ s a half a million things we might fiddle with. Therefore, this process, the TAP process, has the property that for a long time the number of things increases very, very, very slowly, then something stunning happens. There ’ s a hockey-stick explosion and the number of things reaches infinity in a finite time. There ’ s a singularity and a brief burst explosion for 40 million years of the Cambrian explosion. The same pattern is showing up in our own evolution. Australopithecus flourished – I ’ d never know what flourishing means, I guess they had a good lunch – in Africa, 3. 3 million years ago. A million and a half years later, Homo erectus had about 20 crude stone tools. Watch how slowly things change. A mere 30, 000 years ago, Cro-Magnon in the south of France had about 100 or 150 of these exquisite pressure flake tools. A mere 28, 000 years after that is Mesopotamia with needles and chariots. There ’ s something interesting about the fact – of course, we invented writing, which is a wonderful story – once you have a clay tablet, it calls forth the tool that ’ s its complement. You need a stylus. So tools make niches for new tools and for new jobs. Scribes earned a living for quite a while. This is us in the late Middle Ages to now, and this is us now. We have billions of tools ranging from knitting needles to the space station. There ’ s always an adjacent possible. Once you ’ ve made a bow, a crossbow is in the adjacent possible. The pattern that we saw in the Cambrian, of a long period nothing happening and then a burst, is here right now. This is the size of human habitats in the last 300, 000 years. The horizontal line is time before present, and the vertical line as the logarithm of sizes of settlements. Nothing happened for 290, 000 years then it burst upward. Watch this, the same thing is true of GDP. GDP was flat since the time of Christ. In fact, for the last 100, 000 years. GDP burst up in the last two centuries. It ’ s going up vertically now. It ’ s wonderful. We ’ re lifting millions from poverty. And the theory explains it. It ’ s the same delay and burst, and there it is. We start making more complex things, selling them, and we make a profit. There ’ s another feature of all of this that I ’ ve lived in my lifetime, I ’ m 83. I was born in 1939. Just like the Cambrian explosion, watch the number of things that have come into existence in my lifetime. We didn ’ t have any helicopters, we didn ’ t have television. I listened to”The Lone Ranger,”which maybe you know, on radio, six o ’ clock at night. We didn ’ t have... computers, we didn ’ t have plastics, which are now all over the planet. We didn ’ t have microwaves, we didn ’ t have lasers. Look at the number of things that came into existence in one lifetime of 83 years. Not much happened 50, 000 years ago in 83 years. So what ’ s going on? The TAP process has the following property. Every time you make something new, the waiting time for the next new thing is cut in half. A thousand years, 500 years, 250, a year, six months, three months, we ’ re going to get a great acceleration. We are. So this is TAP. And watch that thing explode upward. That ’ s it. That explosion is the Cambrian, and it ’ s where we are now. And the signatures of the Anthropocene are exploding upward, now all over the place. This ends 25 years ago. We need to find a better adjacent possible. We ’ re rampaging over the planet, and the hope is in soils. So I ’ m going to talk briefly about compost. There are very fine compost, this is now terribly important. A very good compost is the Johnson-Su compost. Less land use, fewer degradations of... of our forests, fewer extinction events, fewer pandemics. Well, let ’ s get rid of fertilizer. And the most important point I ’ m going to take is – This is really bad news and good news. Last year we emitted 40. 5 billion tons of carbon dioxide. We have to find a way of solving it, and we can. We can take this Johnson-Su compost and get it out across the landscape. But more fundamentally, we can find good fungal bacterial communities and we can coat seeds with it and sell the seeds around the planet, or we can fill biochar and we can use biochar to get her across the planet. Most usefully, we can take a really good fungal bacterial community, put it into biochar or some other matrix, mix it into fertilizer, and get that fertilizer out across the planet. I ’ m going to just end with the following. Fungal bacterial communities are precisely something that can create novel adjacent possibles, that can bubble forth with solutions to soil problems. The good news is we can do it now. The planet ’ s on fire. We are of nature, ladies and gentlemen, we ’ re not above nature. Thank you.

I study ants in the desert, in the tropical forest and in my kitchen, and in the hills around Silicon Valley where I live. I ’ ve recently realized that ants are using interactions differently in different environments, and that got me thinking that we could learn from this about other systems, like brains and data networks that we engineer, and even cancer. So what all these systems have in common is that there ’ s no central control. An ant colony consists of **sterile** female workers — those are the ants you see walking around — and then one or more reproductive females who just lay the eggs. They don ’ t give any instructions. Even though they ’ re called queens, they don ’ t tell anybody what to do. So in an ant colony, there ’ s no one in charge, and all systems like this without central control are regulated using very simple interactions. Ants interact using smell. They smell with their antennae, and they interact with their antennae, so when one ant touches another with its antennae, it can tell, for example, if the other ant is a nestmate and what task that other ant has been doing. So here you see a lot of ants moving around and interacting in a lab arena that ’ s connected by tubes to two other arenas. So when one ant meets another, it doesn ’ t matter which ant it meets, and they ’ re actually not transmitting any kind of complicated signal or message. All that matters to the ant is the rate at which it meets other ants. And all of these interactions, taken together, produce a network. So this is the network of the ants that you just saw moving around in the arena, and it ’ s this constantly shifting network that produces the behavior of the colony, like whether all the ants are hiding inside the nest, or how many are going out to forage. A brain actually works in the same way, but what ’ s great about ants is that you can see the whole network as it happens. There are more than 12, 000 species of ants, in every conceivable environment, and they ’ re using interactions differently to meet different environmental challenges. So one important environmental challenge that every system has to deal with is operating costs, just what it takes to run the system. And another environmental challenge is resources, finding them and collecting them. In the desert, operating costs are high because water is scarce, and the seed-eating ants that I study in the desert have to spend water to get water. So an ant outside foraging, searching for seeds in the hot sun, just loses water into the air. But the colony gets its water by metabolizing the fats out of the seeds that they eat. So in this environment, interactions are used to activate foraging. An outgoing forager doesn ’ t go out unless it gets enough interactions with returning foragers, and what you see are the returning foragers going into the tunnel, into the nest, and meeting outgoing foragers on their way out. This makes sense for the ant colony, because the more food there is out there, the more quickly the foragers find it, the faster they come back, and the more foragers they send out. The system works to stay stopped, unless something positive happens. So interactions function to activate foragers. And we ’ ve been studying the evolution of this system. First of all, there ’ s variation. It turns out that colonies are different. On dry days, some colonies forage less, so colonies are different in how they manage this trade-off between spending water to search for seeds and getting water back in the form of seeds. And we ’ re trying to understand why some colonies forage less than others by thinking about ants as neurons, using models from neuroscience. So just as a neuron adds up its stimulation from other neurons to decide whether to fire, an ant adds up its stimulation from other ants to decide whether to forage. And what we ’ re looking for is whether there might be small differences among colonies in how many interactions each ant needs before it ’ s willing to go out and forage, because a colony like that would forage less. And this raises an **analogous** question about brains. We talk about the brain, but of course every brain is slightly different, and maybe there are some individuals or some conditions in which the electrical properties of neurons are such that they require more stimulus to fire, and that would lead to differences in brain function. So in order to ask evolutionary questions, we need to know about reproductive success. This is a map of the study site where I have been tracking this population of harvester ant colonies for 28 years, which is about as long as a colony lives. Each symbol is a colony, and the size of the symbol is how many offspring it had, because we were able to use genetic variation to match up parent and offspring colonies, that is, to figure out which colonies were founded by a daughter queen produced by which parent colony. And this was amazing for me, after all these years, to find out, for example, that colony 154, whom I ’ ve known well for many years, is a great-grandmother. Here ’ s her daughter colony, here ’ s her granddaughter colony, and these are her great- granddaughter colonies. And by doing this, I was able to learn that offspring colonies resemble parent colonies in their decisions about which days are so hot that they don ’ t forage, and the offspring of parent colonies live so far from each other that the ants never meet, so the ants of the offspring colony can ’ t be learning this from the parent colony. And so our next step is to look for the genetic variation underlying this resemblance. So then I was able to ask, okay, who ’ s doing better? Over the time of the study, and especially in the past 10 years, there ’ s been a very severe and deepening drought in the Southwestern U. S., and it turns out that the colonies that conserve water, that stay in when it ’ s really hot outside, and thus sacrifice getting as much food as possible, are the ones more likely to have offspring colonies. So all this time, I thought that colony 154 was a loser, because on really dry days, there ’ d be just this trickle of foraging, while the other colonies were out foraging, getting lots of food, but in fact, colony 154 is a huge success. She ’ s a matriarch. She ’ s one of the rare great-grandmothers on the site. To my knowledge, this is the first time that we ’ ve been able to track the ongoing evolution of collective behavior in a natural population of animals and find out what ’ s actually working best. Now, the Internet uses an algorithm to regulate the flow of data that ’ s very similar to the one that the harvester ants are using to regulate the flow of foragers. And guess what we call this analogy? The anternet is coming. So data doesn ’ t leave the source computer unless it gets a signal that there ’ s enough bandwidth for it to travel on. In the early days of the Internet, when operating costs were really high and it was really important not to lose any data, then the system was set up for interactions to activate the flow of data. It ’ s interesting that the ants are using an algorithm that ’ s so similar to the one that we recently invented, but this is only one of a handful of ant algorithms that we know about, and ants have had 130 million years to evolve a lot of good ones, and I think it ’ s very likely that some of the other 12, 000 species are going to have interesting algorithms for data networks that we haven ’ t even thought of yet. So what happens when operating costs are low? Operating costs are low in the tropics, because it ’ s very humid, and it ’ s easy for the ants to be outside walking around. But the ants are so abundant and diverse in the tropics that there ’ s a lot of competition. Whatever resource one species is using, another species is likely to be using that at the same time. So in this environment, interactions are used in the opposite way. The system keeps going unless something negative happens, and one species that I study makes circuits in the trees of foraging ants going from the nest to a food source and back, just round and round, unless something negative happens, like an interaction with ants of another species. So here ’ s an example of ant security. In the middle, there ’ s an ant plugging the nest entrance with its head in response to interactions with another species. Those are the little ones running around with their abdomens up in the air. But as soon as the threat is passed, the entrance is open again, and maybe there are situations in computer security where operating costs are low enough that we could just block access temporarily in response to an immediate threat, and then open it again, instead of trying to build a permanent firewall or fortress. So another environmental challenge that all systems have to deal with is resources, finding and collecting them. And to do this, ants solve the problem of collective search, and this is a problem that ’ s of great interest right now in robotics, because we ’ ve understood that, rather than sending a single, sophisticated, expensive robot out to explore another planet or to search a burning building, that instead, it may be more effective to get a group of cheaper robots exchanging only minimal information, and that ’ s the way that ants do it. So the invasive Argentine ant makes expandable search networks. They ’ re good at dealing with the main problem of collective search, which is the trade-off between searching very thoroughly and covering a lot of ground. And what they do is, when there are many ants in a small space, then each one can search very thoroughly because there will be another ant nearby searching over there, but when there are a few ants in a large space, then they need to stretch out their paths to cover more ground. I think they use interactions to assess density, so when they ’ re really crowded, they meet more often, and they search more thoroughly. Different ant species must use different algorithms, because they ’ ve evolved to deal with different resources, and it could be really useful to know about this, and so we recently asked ants to solve the collective search problem in the extreme environment of microgravity in the International Space Station. When I first saw this picture, I thought, Oh no, they ’ ve mounted the habitat vertically, but then I realized that, of course, it doesn ’ t matter. So the idea here is that the ants are working so hard to hang on to the wall or the floor or whatever you call it that they ’ re less likely to interact, and so the relationship between how crowded they are and how often they meet would be messed up. We ’ re still analyzing the data. I don ’ t have the results yet. But it would be interesting to know how other species solve this problem in different environments on Earth, and so we ’ re setting up a program to encourage kids around the world to try this experiment with different species. It ’ s very simple. It can be done with cheap materials. And that way, we could make a global map of ant collective search algorithms. And I think it ’ s pretty likely that the invasive species, the ones that come into our buildings, are going to be really good at this, because they ’ re in your kitchen because they ’ re really good at finding food and water. So the most familiar resource for ants is a picnic, and this is a clustered resource. When there ’ s one piece of fruit, there ’ s likely to be another piece of fruit nearby, and the ants that specialize on clustered resources use interactions for recruitment. So when one ant meets another, or when it meets a chemical deposited on the ground by another, then it changes direction to follow in the direction of the interaction, and that ’ s how you get the trail of ants sharing your picnic. Now this is a place where I think we might be able to learn something from ants about cancer. I mean, first, it ’ s obvious that we could do a lot to prevent cancer by not allowing people to spread around or sell the toxins that promote the evolution of cancer in our bodies, but I don ’ t think the ants can help us much with this because ants never poison their own colonies. But we might be able to learn something from ants about treating cancer. There are many different kinds of cancer. Each one originates in a particular part of the body, and then some kinds of cancer will spread or metastasize to particular other tissues where they must be getting resources that they need. So if you think from the perspective of early metastatic cancer cells as they ’ re out searching around for the resources that they need, if those resources are clustered, they ’ re likely to use interactions for recruitment, and if we can figure out how cancer cells are recruiting, then maybe we could set traps to catch them before they become established. So ants are using interactions in different ways in a huge variety of environments, and we could learn from this about other systems that operate without central control. Using only simple interactions, ant colonies have been performing amazing feats for more than 130 million years. We have a lot to learn from them. Thank you.

I was born in Taiwan. I grew up surrounded by different types of hardware stores, and I like going to night markets. I love the energy of the night markets, the colors, the lights, the toys, and all the unexpected things I find every time I go, things like watermelon with straw antennas or puppies with mohawks. When I was growing up, I liked taking toys apart, any kind of toys I ’ d find around the house, like my brother ’ s BB gun when he ’ s not home. I also liked to make environments for people to explore and play. In these early installations, I would take plastic sheets, plastic bags, and things I would find in the hardware store or around the house. I would take things like highlighter pen, mix it with water, pump it through plastic tubing, creating these glowing circulatory systems for people to walk through and enjoy. I like these materials because of the way they look, the way they feel, and they ’ re very affordable. I also liked to make devices that work with body parts. I would take camera LED lights and a bungee cord and strap it on my waist and I would **videotape** my belly button, get a different perspective, and see what it does. I also like to modify household appliances. This is an automatic night light. Some of you might have them at home. I would cut out the light sensor, add an extension line, and use modeling clay, stick it onto the television, and then I would **videotape** my eye, and using the dark part of my eye tricking the sensor into thinking it ’ s night time, so you turn on the lightbulb. The white of the eye and the eyelid will trick the sensor into thinking it ’ s daytime, and it will shut off the light. I wanted to collect more different types of eyes, so I built this device using bicycle helmets, some lightbulbs and television sets. It would be easier for other people to wear the helmet and record their eyes. This device allows me to symbolically extract other people ’ s eyes, so I have a diversity of eyes to use for my other sculptures. This sculpture has four eyes. Each eye is controlling a different device. This eye is turning itself around in a television. This eye is inflating a plastic tube. This eye is watching a video of another piece being made. And these two eyes are activating glowing water. Many of these pieces are later on shown in museums, biennials, triennial exhibitions around the world. I love science and biology. In 2007, I was doing a research fellowship at the Smithsonian Natural History Museum looking at bioluminous organisms in the oean. I love these creatures. I love the way they look, the way they feel. They ’ re soft, they ’ re slimy, and I was fascinated by the way they use light in their environment, either to attract mates, for self-defense, or to attract food. This research inspired my work in many different ways, things like movement or different light patterns. So I started gathering a lot of different types of material in my studio and just experimenting and trying this out, trying that out, and seeing what types of creatures I can come up with. I used a lot of computer cooling fans and just kind of put them together and see what happens. This is an 8, 000-square-foot installation composed of many different creatures, some hanging from the ceiling and some resting on the floor. From afar, they look alien-like, but when you look closer, they ’ re all made out of black garbage bags or Tupperware containers. I ’ d like to share with you how ordinary things can become something magical and wondrous. Thank you.

Nicholas Negroponte : Can we switch to the video disc, which is in play mode? I ’ m really interested in how you put people and computers together. We will be using the TV screens or their equivalents for electronic books of the future. Very interested in touch-sensitive displays, high-tech, high-touch, not having to pick up your fingers to use them. There is another way where computers touch people : wearing, physically wearing. Suddenly on September 11th, the world got bigger. NN : Thank you. Thank you. When I was asked to do this, I was also asked to look at all 14 TED Talks that I had given, chronologically. The first one was actually two hours. The second one was an hour, and then they became half hours, and all I noticed was my bald spot getting bigger. Imagine seeing your life, 30 years of it, go by, and it was, to say the least, for me, quite a shocking experience. So what I ’ m going to do in my time is try and share with you what happened during the 30 years, and then also make a prediction, and then tell you a little bit about what I ’ m doing next. And I put on a slide where TED 1 happened in my life. And it ’ s rather important because I had done 15 years of research before it, so I had a backlog, so it was easy. It ’ s not that I was Fidel Castro and I could talk for two hours, or Bucky Fuller. I had 15 years of stuff, and the Media Lab was about to start. So that was easy. But there are a couple of things about that period and about what happened that are really quite important. One is that it was a period when computers weren ’ t yet for people. And the other thing that sort of happened during that time is that we were considered sissy computer scientists. We weren ’ t considered the real thing. So what I ’ m going to show you is, in retrospect, a lot more interesting and a lot more accepted than it was at the time. So I ’ m going to characterize the years and I ’ m even going to go back to some very early work of mine, and this was the kind of stuff I was doing in the ’ 60s : very direct manipulation, very influenced as I studied architecture by the architect Moshe Safdie, and you can see that we even built robotic things that could build habitat-like structures. And this for me was not yet the Media Lab, but was the beginning of what I ’ ll call sensory computing, and I pick fingers partly because everybody thought it was ridiculous. Papers were published about how stupid it was to use fingers. Three reasons : One was they were low-resolution. The other is your hand would occlude what you wanted to see, and the third, which was the winner, was that your fingers would get the screen dirty, and hence, fingers would never be a device that you ’ d use. And this was a device we built in the ’ 70s, which has never even been picked up. It ’ s not just touch sensitive, it ’ s pressure sensitive. Voice : Put a yellow circle there. NN : Later work, and again this was before TED 1 — Voice : Move that west of the diamond. Create a large green circle there. Man : Aw, shit. NN : — was to sort of do interface concurrently, so when you talked and you pointed and you had, if you will, multiple channels. Entebbe happened. 1976, Air France was hijacked, taken to Entebbe, and the Israelis not only did an extraordinary rescue, they did it partly because they had practiced on a physical model of the airport, because they had built the airport, so they built a model in the desert, and when they arrived at Entebbe, they knew where to go because they had actually been there. The U. S. government asked some of us, ’ 76, if we could replicate that computationally, and of course somebody like myself says yes. Immediately, you get a contract, Department of Defense, and we built this truck and this rig. We did sort of a simulation, because you had video discs, and again, this is ’ 76. And then many years later, you get this truck, and so you have Google Maps. Still people thought, no, that was not serious computer science, and it was a man named Jerry Wiesner, who happened to be the president of MIT, who did think it was computer science. And one of the keys for anybody who wants to start something in life : Make sure your president is part of it. So when I was doing the Media Lab, it was like having a gorilla in the front seat. If you were stopped for speeding and the officer looked in the window and saw who was in the passenger seat, then,”Oh, continue on, sir.”And so we were able, and this is a cute, actually, device, parenthetically. This was a lenticular photograph of Jerry Wiesner where the only thing that changed in the photograph were the lips. So when you oscillated that little piece of lenticular sheet with his photograph, it would be in lip sync with zero bandwidth. It was a zero- bandwidth teleconferencing system at the time. So this was the Media Lab ’ s — this is what we said we ’ d do, that the world of computers, publishing, and so on would come together. Again, not generally accepted, but very much part of

TED in the early days. And this is really where we were headed. And that created the Media Lab. One of the things about age is that I can tell you with great confidence, I ' ve been to the future. I ' ve been there, actually, many times. And the reason I say that is, how many times in my life have I said,"Oh, in 10 years, this will happen,"and then 10 years comes. And then you say,"Oh, in five years, this will happen."And then five years comes. So I say this a little bit with having felt that I ' d been there a number of times, and one of the things that is most quoted that I ' ve ever said is that computing is not about computers, and that didn ' t quite get enough traction, and then it started to. It started to because people caught on that the medium wasn ' t the message. And the reason I show this car in actually a rather ugly slide is just again to tell you the kind of story that characterized a little bit of my life. This is a student of mine who had done a Ph. D. called"Backseat Driver."It was in the early days of GPS, the car knew where it was, and it would give audio instructions to the driver, when to turn right, when to turn left and so on. Turns out, there are a lot of things in those instructions that back in that period were pretty challenging, like what does it mean, take the next right? Well, if you ' re coming up on a street, the next right ' s probably the one after, and there are lots of issues, and the student did a wonderful thesis, and the MIT patent office said"Don ' t patent it. It ' ll never be accepted. The liabilities are too large. There will be insurance issues. Don ' t patent it."So we didn ' t, but it shows you how people, again, at times, don ' t really look at what ' s happening. Some work, and I ' ll just go through these very quickly, a lot of sensory stuff. You might recognize a young Yo-Yo Ma and tracking his body for playing the cello or the hypercello. These fellows literally walked around like that at the time. It ' s now a little bit more discreet and more commonplace. And then there are at least three heroes I want to quickly mention. Marvin Minsky, who taught me a lot about common sense, and I will talk briefly about Muriel Cooper, who was very important to Ricky Wurman and to TED, and in fact, when she got onstage, she said, the first thing she said was,"I introduced Ricky to Nicky."And nobody calls me Nicky and nobody calls Richard Ricky, so nobody knew who she was talking about. And then, of course, Seymour Papert, who is the person who said,"You can ' t think about thinking unless you think about thinking about something."And that ' s actually — you can unpack that later. It ' s a pretty profound statement. I ' m showing some slides that were from TED 2, a little silly as slides, perhaps. Then I felt television really was about displays. Again, now we ' re past TED 1, but just around the time of TED 2, and what I ' d like to mention here is, even though you could imagine intelligence in the device, I look today at some of the work being done about the Internet of Things, and I think it ' s kind of tragically pathetic, because what has happened is people take the oven panel and put it on your cell phone, or the door key onto your cell phone, just taking it and bringing it to you, and in fact that ' s actually what you don ' t want. You want to put a chicken in the oven, and the oven says,"Aha, it ' s a chicken,"and it cooks the chicken."Oh, it ' s cooking the chicken for Nicholas, and he likes it this way and that way."So the intelligence, instead of being in the device, we have started today to move it back onto the cell phone or closer to the user, not a particularly enlightened view of the Internet of Things. Television, again, television what I said today, that was back in 1990, and the television of tomorrow would look something like that. Again, people, but they laughed cynically, they didn ' t laugh with much appreciation. Telecommunications in the 1990s, George Gilder decided that he would call this diagram the Negroponte switch. I ' m probably much less famous than George, so when he called it the Negroponte switch, it stuck, but the idea of things that came in the ground would go in the air and stuff in the air would go into the ground has played itself out. That is the original slide from that year, and it has worked in lockstep obedience. We started Wired magazine. Some people, I remember we shared the reception desk periodically, and some parent called up irate that his son had given up Sports Illustrated to subscribe for Wired, and he said,”Are you some porno magazine or something?”and couldn ’ t understand why his son would be interested in Wired, at any rate. I will go through this a little quicker. This is my favorite, 1995, back page of Newsweek magazine. Okay. Read it. [”Nicholas Negroponte, director of the MIT Media Lab, predicts that we ’ ll soon buy books and newspapers straight over the Internet. Uh, sure.”— Clifford Stoll, Newsweek, 1995] You must admit that gives you, at least it gives me pleasure when somebody says how dead wrong you are.”Being Digital”came out. For me, it gave me an opportunity to be more in the trade press and get this out to the public, and it also allowed us to build the new Media Lab, which if you haven ’ t been to, visit, because it ’ s a beautiful piece of architecture aside from being a wonderful place to work. So these are the things we were saying in those TEDs. [Today, multimedia is a desktop or living room experience, because the **apparatus** is so clunky. This will change dramatically with small, bright, thin, high-resolution displays. — 1995] We came to them. I looked forward to it every year. It was the party that Ricky Wurman never had in the sense that he invited many of his old friends, including myself. And then something for me changed pretty profoundly. I became more involved with computers and learning and influenced by Seymour, but particularly looking at learning as something that is best approximated by computer programming. When you write a computer program, you ’ ve got to not just list things out and sort of take an algorithm and translate it into a set of instructions, but when there ’ s a bug, and all programs have bugs, you ’ ve got to de-bug it. You ’ ve got to go in, change it, and then re-execute, and you iterate, and that iteration is really a very, very good approximation of learning. So that led to my own work with Seymour in places like Cambodia and the starting of One Laptop per Child. Enough TED Talks on One Laptop per Child, so I ’ ll go through it very fast, but it did give us the chance to do something at a relatively large scale in the area of learning, development and computing. Very few people know that One Laptop per Child was a $1 billion project, and it was, at least over the seven years I ran it, but even more important, the World Bank contributed zero, USAID zero. It was mostly the countries using their own treasuries, which is very interesting, at least to me it was very interesting in terms of what I plan to do next. So these are the various places it happened. I then tried an experiment, and the experiment happened in Ethiopia. And here ’ s the experiment. The experiment is, can learning happen where there are no schools. And we dropped off tablets with no instructions and let the children figure it out. And in a short period of time, they not only turned them on and were using 50 apps per child within five days, they were singing”ABC”songs within two weeks, but they hacked Android within six months. And so that seemed sufficiently interesting. This is perhaps the best picture I have. The kid on your right has sort of nominated himself as teacher. Look at the kid on the left, and so on. There are no adults involved in this at all. So I said, well can we do this at a larger scale? And what is it that ’ s missing? The kids are giving a press conference at this point, and sort of writing in the dirt. And the answer is, what is missing? And I ’ m going to skip over my prediction, actually, because I ’ m running out of time, and here ’ s the question, is what ’ s going to happen? I think the challenge is to connect the last billion people, and connecting the last billion is very different than connecting the next billion, and the reason it ’ s different is that the next billion are sort of low-hanging fruit, but the last billion are rural. Being rural and being poor are very different. Poverty tends to be created by our society, and the people in that community are not poor in the same way at all. They may be primitive, but the way to approach it and to connect them, the history of One Laptop per Child, and the experiment in Ethiopia, lead me to believe that we can in fact do this in a very short period of time. And so my plan, and unfortunately I haven ’ t been able to get my partners at this point to let me announce them, but is to do this with a stationary satellite. There are many reasons that stationary satellites aren ’ t the best things, but there are a lot of reasons why they are, and for two billion dollars, you can connect a lot more than 100 million people, but the reason I picked two, and I will leave this as my last slide, is two billion dollars is what we were spending in Afghanistan every week. So surely if we can connect Africa and the last billion people for numbers like that, we should be doing it. Thank you very much. Chris Anderson : Stay up there. Stay up there. NN : You ’ re going to give me extra time? CA : No. That was wickedly clever, wickedly clever. You gamed it beautifully. Nicholas, what is your prediction? NN : Thank you for asking. I ’ ll tell you what my prediction is, and my prediction, and this is a prediction, because it ’ ll be 30 years. I won ’ t be here. But one of the things about learning how to read, we have been doing a lot of consuming of information going through our eyes, and so that may be a very inefficient channel. So my prediction is that we are going to ingest information You ’ re going to swallow a pill and know English. You ’ re going to swallow a pill and know Shakespeare. And the way to do it is through the bloodstream. So once it ’ s in your bloodstream, it basically goes through it and gets into the brain, and when it knows that it ’ s in the brain in the different pieces, it deposits it in the right places. So it ’ s ingesting. CA : Have you been hanging out with Ray Kurzweil by any chance? NN : No, but I ’ ve been hanging around with Ed Boyden and hanging around with one of the speakers who is here, Hugh Herr, and there are a number of people. This isn ’ t quite as far-fetched, so 30 years from now. CA : We will check it out. We ’ re going to be back and we ’ re going to play this clip 30 years from now, and then all eat the red pill. Well thank you for that. Nicholas Negroponte. NN : Thank you.
