Lizet Ocampo : I have a team meeting with my team. It ’ s Monday morning, so we kind of miss each other.”Let ’ s turn our cameras on.”Adam Grant : For Lizet Ocampo, it seemed like a regular day in quarantine. But when they turned on their cameras, something was off. Her face was a potato, a flat image of a potato, with Lizet ’ s eyes and lips moving on it. LO : And I just remember thinking,”Why am I a potato?”and of all things, why a potato? Like, I couldn ’ t go back to a regular camera, so I just essentially was a potato for the meeting. AG : The previous week, Lizet had been in a virtual happy hour for Latino leaders. LO : And I wanted to make them laugh, and so I thought,”You know what? Next week, I ’ m going to try to do some funny filters,”and so I download these Snap filters, but it didn ’ t really download all the way. There was an error message that kept popping up, so I kind of gave up on it and forgot about it. AG : Turns out the filters had worked a little too well and a little too late. Now Lizet was stuck as a potato. Her colleagues laughed and went on with the meeting. Lizet didn ’ t think much of it until she got a text. LO : Someone that ’ s on my staff took a **picture** of it and posted it on her personal Twitter account, so I had no idea. AG : She wrote,”My boss turned herself into a potato and can ’ t figure out how to turn the setting off.”LO : And then my colleagues ’ faces are hilarious because it looks like they ’ re trying to be serious, but they ’ re trying not to laugh at the same time. AG : It is amazing because you see her, you see the guy, and then there ’ s just a potato. LO : Yes. AG : Yeah, this poor potato is like,”How do I stop being a potato?”LO : Forty million people have seen it, and it ’ s become sort of a cultural moment in this quarantine world that we ’ re in right now. AG : You have a new identity now, don ’ t you, though? LO : That ’ s true. I ’ m known to the world as”potato boss.”I have potato appearances requests – AG : LO : and so I ’ ve showed up as a potato to some meetings for friends at other organizations and things like that. AG : The coronavirus pandemic has thrown many of us into the deep end of working remotely. While some people have found creative ways to swim, many others are struggling just to stay afloat. The good news is that remote work is not uncharted waters. We ’ ve actually been doing it and studying it for a long time, and with those lessons in hand, you might actually be more prepared than you think to make remote work work. AG : I ’ m Adam Grant, and this is”WorkLife,”my podcast with TED. I ’ m an organizational psychologist. I study how to make work not suck. In this show, I ’ m inviting myself inside the minds of some truly unusual people, because they ’ ve mastered something I wish everyone knew about work. Today : remote work, how we can communicate better with and without a camera, no potatoes required, and how, even during this unprecedented pandemic, we can stay resilient. This episode is sponsored by Hilton. As the world has gone into lockdown, many of us have experienced the challenges of working from home. But some jobs are hard to do remotely. If you work in health care or public safety, you need to be on the front lines. If you ’ re in manufacturing, production or distribution, you have to be on-site at a farm, factory or warehouse. We ’ re all depending on the people who are risking their health and safety to go to work. Yet, in the knowledge and service industries, many jobs can be done with online tools. And that ' s not as new as it seems. Half a century ago, futurists started predicting the rise of remote work. In 1993, management guru Peter Drucker wrote that commuting to an office is obsolete. But a quarter-century later, nearly half of global companies still weren ' t allowing remote work at all. Not anymore. Around the world, many companies are now requiring remote work. This forced remote work has amplified many of the challenges we had when we worked face-to-face. And even in that hard-to-imagine future beyond the pandemic, at least some of this shift to remote work is probably here to stay. So, how do we do it well? As teams, we need to figure out how to stay connected and collaborative. As individuals, we ' re all seeking guidance on how to stay sane when we ' re working alone. Recorded caller 1 : So, I ' m incredibly vulnerable and scared of losing some of the relationships that have taken a long time to build and not having the edge of my personality and my ability to communicate clearly face-to-face. Recorded caller 2 : Working from home has been a nightmare. AG : Interruptions have become a fact of life. We ' re all"BBC Dad"now, with kids or pets dancing right into our video conferences. Recorded caller 3 : We get on a Zoom call with our region, and in runs my four-year-old, completely naked, and I was speaking, so I wasn ' t on mute, and all you hear is me screaming,"No!"Recorded caller 4 : I finally made a rule that said,"If you interrupt a Zoom meeting, you ' ll have to stay for the whole thing."The first offender was my 10-year-old daughter. She ended up sitting there for 45 minutes with nothing to play with, and I can remember her telling all the other kids,"Wow, don ' t go down there, because you ' re going to have to stay for one of those boring meetings."Recorded caller 5 : On one Zoom call where I was pleading with government officials to please listen to the plight of small business owners, my five-year-old daughter walked behind me and said,"Mom, if you die of the virus, I ' ll run your company,"and everyone went silent. Try to come back from that when you ' re campaigning. Martine Haas : I think in some ways, we are adapting very, very fast right now. We are the experiment that will create the data. AG : Martine Haas is my colleague at Wharton and a renowned expert on how teams collaborate at a distance. Now she isn ' t just studying it. She ' s living it. MH : I ' ve been working to kind of get my setup really functional, and I invested in a screen to separate my workspace from the rest of the room that I ' m in. I open the screen ceremoniously in the morning, and then I close it ceremoniously. I literally move it so that it kind of covers the desk just as a way to kind of switch off. AG : One of my favorite insights about teams is that they ' re kind of like amplifiers : whatever you put in comes out louder. When we go remote, that ' s even more true. All of our microphones are blasting at once, and that can cause problems. MH : I sometimes think about it as kind of like an iceberg, right? At the top of the iceberg, the stuff that ' s more obvious – you know, it ' s just difficult to communicate, partly because of the technology, right? AG : Think about how much time you ' ve wasted on tech problems. First man : Hey, Paul. Can you hear me? Paul : Hey, guys. Hey, Tyler. Tyler : Sorry I ' m late. Having a hard time connecting. FM : One second. Paul ' s having a sound issue. P : I can ' t hear you. T : Try adjusting your output settings. P : Can you hear me? T : It ' s the gear icon. P : Never mind. I got it. I just had to change a few settings. FM : Great. Great. I think we can get started then started then then. Oh, great. Oh, great. AG : Another obvious issue is power. MH : And it ' s very easy to fall into a very hierarchical form of communication. AG : You know, where the person with the most authority or status hijacks the conversation. In a classic study of airline crews, it was possible to predict a flight ' s timeliness and fuel efficiency just by watching the first 15 minutes of a captain

’ s meeting with the crew. The ineffective captains tended to monopolize the conversation. The effective ones did more two-way communication. They spent more time engaging their crews and listening to them. They also encouraged their crews to talk to one another about the task. Creating open channels of communication is even more important in virtual teams. You ’ ve probably had video calls that were dominated by one talking head, but that ’ s only the tip of the iceberg. MH : So the less obvious things, there are two big buckets of things called”shared identity”problems and”shared understanding”problems. AG : Shared identity and shared understanding. Beneath the everyday communication challenges you ’ ve seen, these are probably the bigger issues at play. In fact, these are the key ingredients that Martine has found for making remote teams effective. But how do you build them among teammates who can only see the dimly lit, poorly framed video conference versions of each other? Let ’ s start with shared identity. It ’ s the sense that we ’ re all in this together. When teams lose that sense of unity... MH :... it ’ s really easy to get an us-versus-them kind of dynamic going.”Here in Philadelphia, we work really hard, but that part of the team that ’ s over there in Belgium, they really don ’ t work so hard, they don ’ t come in on time. We don ’ t know what they ’ re up to.”So it ’ s very easy to get those kind of psychological distancing dynamics that come into play, and it ’ s a basic psychological process. AG : In the study of airline crews, the effective captains created a shared identity. They talked about everyone as”we,”not just the flight attendants, but also the maintenance crew, the gate agents and even the air traffic controllers communicating remotely with them. They saw themselves as leading one team that was responsible for the safety of the flight. The ineffective captains reinforced fault lines between subgroups. They called the pilots”we”but everyone else”you.”This lack of shared identity hurts the work of face-to-face colleagues but creates an even bigger problem for remote teams. MH : It reduces trust. It reduces psychological safety, that sense that it ’ s safe to kind of speak up in the group. It can lead to people withholding information rather than sharing what they know, it can increase conflict. And so it ’ s really important of the team leader to articulate for an overarching goal. AG : Goal-setting isn ’ t usually the first thing that comes to mind when thinking about team identity. What most people try instead is team-building activities. I ’ m guessing you ’ ve suffered through Zoom calls where you ’ re asked to name your favorite pizza topping or to share highlights from your totally boring weekend in quarantine. Those superficial strategies overlook that we bond best when our individual actions contribute to a common purpose. Research reveals that it ’ s critical to establish team goals and clarify roles, especially in big teams. Having team goals creates a sense of shared identity. Having clear roles prevents social loafing and free-riding, helping people feel that their individual responsibilities matter. The other key challenge of virtual teams is shared understanding, being able to get on the same page, not just about what you ’ re doing, but also about who you are and what you value. MH : It ’ s basically the problem that you kind of have incomplete information. You don ’ t have a good understanding of each other ’ s contexts, right? So this is actually why it ’ s really valuable to ask members of your remote team,”What does your workplace look like? Who else is there? Do you have a dog? Are you watching your kid? What else is going on?”AG : You know you ’ ve reached shared understanding when a colleague does something that would be puzzling to most people but you get it right away. The project manager who cc ’ s the boss isn ’ t trying to make everyone look bad. She ’ s anxious about your team ’ s work being overlooked. The guy in accounts payable isn ’ t signing off at 3pm because he ’ s a slacker. He ’ s taking care of his mom, who ’ s ill. MH : Because if you don ’ t understand people ’ s contexts, you can make attributions

– and they ’ re often negative attributions – about what other people are doing or whether they ’ re working hard enough or whether they ’ re distracted that are not really fair, right? Because you don ’ t really get what their situation is in the same way as you would if you were working face-to-face. AG : Think about your virtual team. Shared identity and shared understanding are pivotal for trust. How do you make that happen when you ’ re not in the same physical space? You might strengthen shared identity by circulating feedback from customers on why your team ’ s work is more important than ever. And you could get to some shared understanding by talking about your favorite video conference bloopers. Some of you have been experimenting with other strategies. Woman to baby : Hey, bud, can you say”welcome”? Baby : Welcome. Woman : To. Baby : To. Woman : Principles. Baby : Woman : Of. Baby : Of. Woman : Management! Baby : Man : My little sister, she had found a sign that said”Wall Street”on it. She put the Wall Street sign behind me so that when I get on my Zoom calls, my colleagues can see it, and she said,”Look, now you ’ re on Wall Street. Stop complaining. Act like it.”Woman : Can you say”my”? Baby : My Woman : Mama. Baby : Mama. Woman : Misses. Baby : Misses. Woman : All. Baby : All. Woman : Of. Baby : Of. Woman : You. Baby : You. Man : I love asking folks to give me a quick tour of their makeshift home office if they ’ re comfortable with it. I ’ ve found it often leads to a conversation about hobbies or life outside of work, which has been really, really cool for building closer relationships and kind of humanizing the other folks on the team. Woman : OK, one more thing. If you ’ re happy and you know it shout”hooray”! Baby : Hooray! Woman : All right! AG : I ’ ve been doing the majority of my work remotely for the past 15 years. Some of the key members of our”WorkLife”team have never even met face-to-face, so reaching shared understanding has been key in our collaborations. If you work with me, we have a shared understanding that my biggest vice is being chronically late. I have a hard time disengaging from a task before it ’ s done, and I try to squeeze too much into each day, but I often have calls with people who don ’ t have that context. Eventually, I had to start managing expectations. Now my calendar invite automatically notifies people that I ’ m usually running five to 10 minutes late. It helps them understand my schedule. But there ’ s something that helps even more. Alex Cornell : Well, I ’ ve been sittin ’ here all day / I ’ ve been sittin ’ in this waiting room. AG : Hold music. But not just any hold music. AC : Waitin ’ on my friends / Yes, I ’ m waitin ’ on this conference call / All alone. AG : Now when I jump on the line late, people aren ’ t disappointed or frustrated. They ’ re often amused. AC : Guess I ’ m on hold / I hope it ’ s not all day. AG : So when I scheduled a call with the guy who wrote this song, for once, I was deliberately late. I let him call in first, so he could hear his own hold music. AC : Here ’ s my voice. Y ’ all sing along. AG : Alex Cornell wrote this song for UberConference, because he hates hold music. AC : Whenever I call into an airline or anything like that, and you hear the same song over and over and over again, you ’ re now sort of already in this like, low-level tortured state of just been listening to this terrible song over and over again. AG : So he decided to make something better. AC : Tell me where can they be... AC : If you could imagine being on hold, and while you ’ re on hold, there ’ s just actually a person there that ’ s sort of like a doorman, so to speak. I ’ m just smiling as I ’ m saying it because it ’ s such a weird thing to **picture**, this, like, virtual doorman saying like,”Oh, hey, like, here you are, too, calling into this conference call,”but then also, it acts as a great icebreaker. AG : Alex, didn ’ t just write the hold music for UberConference. He cofounded the company, and then went on to be the lead product designer of Facebook Live. So he ’ s spent a lot of time working on virtual communication and has a lot of experience building shared identity and shared understanding. Alex ’ s new start-up, Cocoon, has developed an app for communicating privately with our closest friends and families. Before the pandemic, the team was six people in the same physical space while one person was remote. Now they ' re all remote. AC : We have brought on at Cocoon two new team members since this began, and they need to be onboarded to the company, to the product and to what we do and what we believe in. AG : He ' s instinctively put into place some of the core strategies that Martine Haas recommends. To strengthen shared identity, Alex has created written memos to share the company ' s history and values. Spelling it out forced him to get clear on the team ' s goals and culture and helped newcomers get up to speed from a distance. It ' s something they can all revisit occasionally to remember their common purpose and norms. And to foster shared understanding, Alex has found that it helps to open up a little more about his home life. AC : I ' ve found that it can be pretty helpful for this situation too, even just for our coworkers, to have a little bit more awareness of what we ' re all doing day to day. I wouldn ' t normally have shared with them that I am building a gigantic LEGO with my stepson, and that ' s something that they know, and I think we ' re actually, in some ways, more in touch with one another than we ever have been. AG : There ' s evidence that when we gain this kind of personal knowledge about our colleagues ' lives outside work, it humanizes them. We trust them more and feel more similar to them. If we only talk about work, we miss out on that information. So Alex has been experimenting with unstructured interaction to create shared understanding. AC : We ' ve definitely done virtual lunches. I think one of the things that is missing most instantly when you go full remote is the sort of just camaraderie associated with being able to just kind of have a conversation about nothing around the lunch table, and it ' s weird to set a meeting and say,"The agenda is we ' re not going to talk about work, and everybody please have **fun**."It ' s like that is, that ' s a weird agenda. It ' s hard to do. I think there ' s all kinds of these new norms that are being established just as we go. AG : When you communicate virtually, what norms have you been setting to facilitate shared understanding? Maybe you ' ve been encouraging people to use the chat function so the quieter voices get heard. Or you might be turning off your self-view so you ' re not distracted by all your weird facial expressions. But if you ' re like most people, you want to keep seeing your team members ' videos. You prefer that to audio-only because you value having the rich visual cues of facial expressions and body language. That ' s how you read their emotions, right? Wrong. It turns out that if you want to know what someone is feeling, you might be better off just hearing their voice. In one experiment, people read another person ' s emotions more accurately when the lights were turned off. In another experiment, they were more accurate when the video feed was turned off. Follow-up studies showed that when we don ' t have visual cues, we pay more attention to the content and tone of voice. AC : I think that there is definitely something that is pure about when all you can hear somebody ' s voice. Then when you switch to audio only, it ' s like that actually is something that we ' re all familiar with and are somewhat used to, and there ' s no sort of missing piece. AG : Plus, if you ' re on video all day, you could be losing contributions from one group of colleagues in particular : introverts. Why? Because of screen-out. AC : Even though I really want to see my friends, if I ' ve been on Zoom all day, I don ' t really want to spend another couple hours on Zoom just because, socially, I ' m tired of interacting, but I ' m a bit of an introvert, I suppose, so my energy is just depleted, usually, by the end of the day so. AG : Introverts are more sensitive to stimulation than extroverts, not just bright lights and loud noises, but also eye contact, and video calls seem to be magnifying that overload. AC : And you ' re staring at somebody ' s eyes for, in some cases, like an hour, and I don ' t know about you, but when I talk to somebody else, I ’ m very rarely staring at their face for all 60 minutes. AG : There ’ s a **fun** study that tracked people ’ s reactions to seeing a large virtual face on their screen. The most common response was to flinch. AG : We know face-to-face interaction is critical for establishing trust, for building that shared understanding that Martine Haas has found is so important. But once trust exists, I think we should all have the license to turn off our video feeds from time to time. That ’ s what I ’ ve been doing. When people ask what video conference platform I prefer, I often tell them”audio.”After all, if you know what I look like, and you trust me, you don ’ t need to see my face every minute. But for times when you don ’ t have that option, Alex recently created a video conference version of his hold song. AC : My version of this on video conferencing is to have a looping version of myself who ’ s sitting there – AG : AC :... seemingly paying attention. Technically – I ’ m not saying I would do this – but you could have the looping version of yourself just on the call the whole time. This video one, it actually is me, so it ’ s sort of like a”Westworld”-type version of it. AG : If we were robots, it would be easy to be resilient. Just turn your emotions off until this crisis is over. Since we can ’ t do that, the next best thing is to learn from someone who ’ s done more remote work than almost anyone in human history. After the break. OK, this is going to be a different kind of ad. I ’ ve played a personal role in selecting the sponsors for this podcast because they all have interesting cultures of their own. Today, we ’ re going inside the workplace at Hilton. We had recorded a story back in February. Then the world changed, so we decided to do something different, to speak to the moment we ’ re living in. Charles Hill : I was in denial. We weren ’ t going to be impacted. We ’ re making it out of this. And it was that moment, it was 4:30 on a Friday, March 6. I knew that we were in for something else. AG : Meet Charles Hill. He ’ s the General Manager of DoubleTree by Hilton in Crystal City, Virginia, just outside Washington, DC. That Friday, his hotel was hit with a wave of cancellations. As the reality of how severely the coronavirus would affect them set in, he was called into nonstop meetings to answer an impossible question : How do you manage a hotel in the middle of a pandemic? CH : What is it that ’ s happening around us? How big is this? And what do we need to do? There was nothing coming in. It was all going out. But we still had these hotel rooms. AG : That ’ s when Hilton came up with a plan. They would do what they do best : offer hospitality. CH : Hospitality is caring for others and spreading light and warmth. AG : In partnership with American Express and its hotel owners, Hilton donated a million rooms across the US to frontline healthcare professionals. CH : For us to be able to provide accommodations for people who are literally working on the front lines to take care of those in need, it ’ s such a great way to impact our community. AG : They took in nurses, doctors, EMTs – the people working tireless hours who needed a safe and **clean** place to stay. When they arrived, Charles was there to welcome them at the front desk. CH : I think there ’ s a sense of surprise that they don ’ t have to pay. There isn ’ t a fee. We ’ re not going to charge you. It ’ s OK. We want you here. We ’ re thankful for what you ’ re doing. AG : For Charles and his staff, it felt good to be able to do something, and they were inspired to bring more light and warmth – literally. CH : The lights in our north tower have this warm glow, and we came up with the idea of putting messages in that north tower so that anybody who passes would be able to see something from us. AG : With no one staying in the north tower of the hotel, the dark windows were like a blank canvas. They could turn on the lights inside certain rooms to beam shapes to the outside. CH : The first message that we put up was this big heart. Think about these warm bulbs in 52 rooms that just emanates from the building to create this kind of glow outside. AG : A few days later, they changed the lights to form another message. This time, they beamed out one word. CH : We did”hope,”we put H-O-P-E, so you can see very clearly”hope”glowing in the night. AG : Because the hotel is so close to DC, anyone going in or out of the city could see the lights. That night, Charles got a message from a police officer who works at the Pentagon. CH : He had just finished his shift. He was walking back. He saw it, and he just wanted to say,”Thanks.”He said,”This was the first positive thing I ’ ve seen in a while.”AG : Their community started to take notice. Other hotels followed suit. The local news picked up the story, and people started calling the hotel, hoping for a sneak preview of what shape the lights would take next. CH : It turned into this moment where we all had something to be happy about again and something to celebrate, and it was small, but it was a win, and it brought joy. AG : Psychologists have discovered an alternative to post-traumatic stress. It ’ s called”post-traumatic growth.”It ’ s the experience of not just bouncing back, but bouncing forward from adversity. Often, it takes the form of a greater sense of strength. CH : This may be the toughest crisis any of us have seen in our lifetimes, but if we can make it through, anything else is a piece of cake. We ’ re going to be stronger for making our way through this. AG : COVID-19 has created unprecedented challenges for the travel industry. In times like these, hospitality is needed more than ever. Hilton hotels all around the world are coming together to be the bright light for those who need it most. Read more inspiring stories of Hilton hospitality at newsroom. hilton. com / actsofhospitality. JaBarie Anderson : We ’ re going to make magic today. OK, so – JA : This is”WorkLife ’ s”first live virtual haircut, and we ’ re here with”You Probably Need a Haircut”on webcam, because this is the new normal. You ’ re going to need a mirror, a comb and scissors. Coco : I have scissors, they ’ re the dog scissors. AG : Since I don ’ t have hair, our producer Coco volunteered to be a guinea pig. JA : So cut straight across, a little bit higher. Coco : A little bit higher? OK. AG : Before the pandemic, JaBarie Anderson was a freelance stylist. So when he tried doing virtual haircuts from home about a month ago, he wasn ’ t sure what to expect. JA : I ’ ve literally been in so many bathrooms and showers with people now, and people turn on their camera, and it ’ s just like people in their boxes getting their hair cut. I ’ m like,”Oh, OK. This is happening.”AG : Wait. That happens? JA : Yes, people are shirtless, or the whole family is in there watching, talking like,”This is crazy. I want to see how this is going to turn out.”I ’ m like,”Turn your head this way. Turn your head that way,”and you ’ re trying to get the hand positions right. Coco : OK, cutting. JA : OK. Now I ’ ll ask you to go in and point-cut it. Coco : Got it. OK, so now I ’ m point-cutting this. So basically... Ohhhh. JA : People being so willing and trusting – that was one thing that shocked me the most. Coco : A little bit higher? OK. JA : Right there. Coco : So, like, here? JA : Yep. Coco : OK. Cutting. JA : OK, now I want you to... AG : So far, there haven ’ t been any major hair disasters, and by moving his job online, JaBarie ’ s been able to get clients in San Francisco, Texas and Germany. JA : This is absolutely amazing now. It gives me a platform to really showcase my talent. AG : Wait. Did you just say this is amazing? JA : Yes, it allows you to interact with your clients in a different way, and it builds trust, and it builds a bond amongst people in your household. So, say your wife is cutting your hair. That ’ s another level of trust because it ’ s your hair, you know? AG : Wow, I would not have expected that. So it ’ s gotta be harder, though, to do your job in some ways, because you can ’ t touch the person or even control the scissors or the clippers. JA : Well, that ’ s where the education comes in. It ’ s truly amazing to see what people can do from a video chat call and their home tools. That line is kind of shattered. Coco : OK, I think I am shattering that line. It ’ s still, like, a little – JA : Shattering like broken glass! AG : JaBarie ’ s enthusiasm for this new platform has helped him maintain his livelihood during the pandemic. This kind of ingenuity is visible in many service jobs. Some physical therapists are doing virtual appointments. So are plumbers. Plumber : You know, as far as your toilet, what have you been flushing down there? Did you use a plunger for this, because you really don ' t want to. Oh, I told him what tools he needed, and I stayed on the video with him while he fixed it himself. It ended up being a very simple fix. AG : And people doing more independent work have found creative ways to stay engaged while working from home. Woman : I fake my commute, which means I get on my stationary bike and listen to a podcast in the same way I do when I drive to work for roughly 30 minutes before going to actually sit at my desk. Man : To stay productive, I could only use my phone in the living room, so pretty much my cell phone never leaves that area, and if I have to pick up a call, I ' ll have to go to the living room. If I want to check Facebook, I have to go to the living room in order to do so. Scott Kelly : I have a little bit of a mission control setup, so I got an iPad, a second iPad. I have a little TV next, over my right shoulder, so I can monitor the situation. AG : You might have your own personal mission control center as you navigate working remotely. But"mission control"has an entirely different meaning to Scott Kelly, because he ' s an astronaut. SK : So, five years ago today, I launched into space for my mission that wound up being 340 days on the ISS. AG : Three-hundred and forty consecutive days in space. It ' s an American record for a single mission. The rest of us weren ' t schooled in how to stay at home that long in sustained isolation, so I turned to Scott for ideas on building **resilience**. Other than the few fellow space travelers in isolation with him, communication with his family, friends and coworkers was entirely through video, e-mail and radio calls. He couldn ' t go outside without the right equipment, and he didn ' t even know when his mission was going to end. Sound familiar? SK : I knew I was going to come home about a year later. I didn ' t know exactly when. I had to make this mental kind of change to my whole reference system with regards to my life. AG : He ' d been to space three times before, but he ' d never been out there for so long away from everyone he loved. SK : And I felt like I needed to pace myself, as you can wind up working too much when you go to sleep in your office, and you wake up, and you ' re still in your office. The walls could be closing in a little bit, and I definitely felt that on my six-month flight. AG : Under normal circumstances, conventional wisdom is to be in the present, live in the moment, seize the day. But in isolation, sometimes the day sucks, especially in outer space. SK : I also missed nature, going outside, sun, rain, wind, fresh air. People become depressed without that sun. AG : I ' m imagining it ' s something like wake up in the morning and then wait for the Earth to rise? SK : Yeah, so – Yeah,"earthrise."Never heard it that way, put it that way, but yeah, that ' s a good way to put it. AG : For Scott, every day started feeling like"Groundhog Day."SK : I would generally wake up at around 6:15, have breakfast, work for a few hours, take time for lunch, schedule time for exercise, schedule time to connect with people. AG : It sounds a lot like what many of us are experiencing now. Time becomes meaningless. You ' ve probably already heard the most popular tips for coping with that :"Make a daily schedule.""Wear different clothes for different parts of the day.""Have Zoom calls with family and friends."But one of the lesser-known ways to give this time meaning is to master the art of time travel. More specifically, mental time travel. In psychology, it ' s a skill. Rewinding to think about the past and fast-forwarding to imagine the future. It ' s a distinctively human skill, and if we use it thoughtfully, it gives us the capacity to find meaning in the mundane and happiness in the midst of sadness, and make time pass faster or slower at will. The first destination for your mental time machine is the future. That ' s where Scott started. Months before he set **foot** in the rocket to leave Earth, Scott started imagining how he wanted his trip to end. He didn ’ t just focus on what he wanted to accomplish. He imagined how he wanted to feel when his mission was wrapping up. SK : My goal was to get to the end of this with the same enthusiasm and ability and energy as I had in the beginning, and I always wanted to convince myself that this is just my life. I ’ m here for a purpose, and my purpose was to be an astronaut and complete our mission objectives. AG : It helped Scott stay focused, and made the days pass faster. Psychologists find that a mental trip to the future can help us think less about the monotonous how of our days and more on the meaningful why. We ’ re able to get out of the dull weeds of the process and shift our attention to an exciting purpose. The farther ahead we look, the easier it becomes to tell a coherent story about our experience. One of the challenges of the current pandemic is that we don ’ t know when our mission will end, but we do know it isn ’ t endless. It will end. So think about how you want to feel on the day this crisis is over. How will you want to have gone through it? You might still find yourself worrying about what will happen in between. It ’ s inevitable. But here ’ s the thing : worrying isn ’ t necessarily a bad thing. SK : One of the things that NASA does very well is, and how we operate in space is, we ’ re always having to think about,”OK, what is the next worst thing that can happen to us right now? And how do we react and respond to that?”You know, in some ways that can cause stress and anxiety. AG : There ’ s a distinction that we often make in psychology between worrying and rumination, where worrying is basically an attempt at problem-solving and trying to figure out,”OK, what could go wrong? What ’ s that next worst thing? How do I avoid it?”And rumination is when you get stuck in a loop, just worrying about the situation, but not trying to act in the face of it. Did you have strategies for making sure that the stuff you were worried about didn ’ t cause you to ruminate? SK : Oh yeah, I think so, and I think that ’ s part of our nature as astronauts is to understand that bad things can happen. We don ’ t have control over them, but we still have to be prepared for them. AG : Some psychologists recommend a simple strategy for preventing rumination : adding worry time to your daily schedule. SK : Schedule time for your rumination, 15 minutes, maybe. Doing that will make the days go by so much quicker rather than just sitting there thinking about what you ’ re going to do next and bingeing on Netflix all day. AG : When I went through this exercise, I started thinking about silver linings, aspects of being fully remote that I ’ ll miss, like having more family time and flex time, not having to travel or commute, not having to change out of pajamas or at least pajama **bottoms**. Psychologists find that imagining these silver linings fading in the future makes them feel scarce. That helps us appreciate them more in the present. Next, you can direct your mental DeLorean to the past. This is something Scott has been doing during the current crisis : thinking about memories from his days in space. SK : When people ask me,”Well, what do you miss about space?”It ’ s not launching in the rocket. It ’ s not doing a space walk. It ’ s not floating around. It ’ s not the view. It is the people I was there with and also the sense of purpose. AG : What I heard there was nostalgia. The Greek roots of nostalgia translate to”return”and”pain.”The literal definition is : the pain of being unable to return to the past. But here ’ s the strange thing : that ’ s not how it feels. After people are randomly assigned to reflect on a nostalgic event in their lives, they end up feeling happier. They have a stronger sense of connection to others and become more willing to give and seek help. They gain a deeper sense of meaning and purpose in life. Think about a nostalgic event in your life, something you had before the pandemic but no longer do, like celebrating a holiday with your extended family, going on vacation, even going to a restaurant. Reminiscing about those moments might seem bittersweet, but the aftertaste is mostly sweet. It motivates you to make the most of the present. But it doesn ’ t just help to remember pleasant memories from the past. There are also benefits to reflecting on painful ones, too. SK : It was the worst day of my 520 days in space by far and probably one of the worst days of my life was January 8, 2011. I was on the space station about halfway through my six-month mission, and I get a call from the control center in Houston, and then they say,”Scott, I don ’ t know how to tell you this, so I ’ m just going to tell you. Your sister-in-law Gabby was shot in Tucson, Arizona.”And I quickly got on the phone with my brother. He was packing his bags to head to Tucson. You know, I ’ m on the space station now, and I can ’ t be there physically to be supportive to my family. Couple hours later, the CAPCOM called up on the privatized channel, and they told me Gabby had passed away because that ’ s what the news was reporting. Later, I found out she was still alive, thankfully. AG : That experience taught Scott a powerful lesson. SK : Oh absolutely. I mean, I always realize things could be worse. AG : This brings us to a third destination to transport yourself to alternative time lines, things that could have happened but didn ’ t. It ’ s called”counterfactual thinking.”Psychologists have shown that imagining how things could be worse helps us find gratitude. There ’ s evidence, for example, that people who graduate from college during a recession end up being happier with their jobs a decade later. They can easily imagine a world in which they ’ re unemployed, so they don ’ t take it for granted that they have jobs. Counterfactual thinking has come in handy for Scott over the past month. As bad as the coronavirus situation is, he ’ s been reflecting on how things could be worse. SK : You know, if given the choice of spending a year in my apartment or a year in space, the apartment wins hands-down every time. AG : Even if you ’ ve never been to space, you know the current circumstances could be a lot worse. My wife and I have been talking with our kids about how lucky we are that grocery stores are still open and utilities are still on. We feel deep appreciation for the people who are hard at work keeping those services going. I ’ ve been thinking about how much harder it would be to do my job without the internet or a phone. Recording this podcast would be pretty much impossible. As it does with many astronauts, being in space broadened Scott ’ s idea of who his neighbors were. SK : When we ’ re in space, and you look down at planet Earth, the planet is incredibly beautiful. During the daytime, you don ’ t see political borders, and it makes it look like humanity is all part of one big team, and when you ’ re part of a team, you need to work together to solve our problems. And I think this virus has shown us that we ’ re really, for better or worse, more interconnected than I really realized. If you consider the last pandemic, which was like 100 years ago, and if you consider what we have been able to accomplish as a species in a hundred years, it ’ s mind-blowing. I am absolutely confident that we will get through this, but it ’ s going to take all of us working together, making the right decisions, doing the right things. Teamwork is absolutely critical when you ’ re trying to do something like this. We ’ re really fighting, right now, the greatest battle for our lives that we ’ ve ever had to fight.”WorkLife”is hosted by me, Adam Grant. The show is produced by TED with Transmitter Media. Our team includes Colin Helms, Gretta Cohn, Dan O ’ Donnell, Jessica Glazer, Grace Rubenstein, Michelle Quint, Angela Cheng and Anna Phelan. This episode was produced by Constanza Gallardo. Our show is mixed by Rick Kwan. Original music by Hahnsdale Hsu and Allison Leyton-Brown. Ad stories produced by Pineapple Street Studios. Special thanks to our sponsors, Accenture, BetterUp, Hilton and SAP. For the conference call in real life, thanks to Tripp Crosby. For the snippets of what it ’ s like to work from home, thanks to Jason Gates, Ryan Smith, Amanda Monday, Danielle Tussing, Erin Kahana, Tiffany Chang, John Mi, Aaron Guo, Next Plumbing and everyone else who called in to share their stories with us. For their research, thanks to Bob Ginnett on airline crews, Cameron Klein and colleagues on team building, Ashley Hardin on personal knowledge, Jeremy Bailenson on giant virtual heads, Yaacov Trope and Nira Liberman on mental time travel, Kate Sweeny and Michael Dooley on worrying versus rumination, Constantine Sedikides and colleagues on nostalgia, Laura Kray and colleagues on counterfactual thinking, Emily Bianchi on starting your career in a recession, and my late advisor, Richard Hackman, on teams as amplifiers. For all their help this season, we thank Nicole Bode, Valentina Bojanini, Sammy Case, Micah Eames, Will Hennessy, Dian Lofton, Jen Michalski, Sarah Jane Souther and Emma Taubner. That ' s a wrap for season three of"WorkLife."Thank you so much for joining us. If you like what you heard, please rate and review the show. It helps people find us. And are you still a potato? LO : I ' m sorry – am I still a potato? AG : Yeah, I mean, you ' re potato boss now. You have to be a potato, right? LO : The funny thing is, the first time I got the request to be a potato, I couldn ' t figure out how to be a potato. It took me – it was like the opposite problem. It took me hours to get the potato back up and running again.

Text Sample 727: POS Dim 5 – 2020 – Score 8.00 – 2020/t004063.txt
Mm hmm. This is Design Matters with Debbie Millman, you could say that Cheryl Strayed is very adaptable. Her memoir, Wild, was adapted into a movie starring Reese Witherspoon. Another book, Tiny, Beautiful Things, was adapted for the stage by Nia Vardalos and Thomas Kael. Tiny, Beautiful Things itself was adapted from an advice column she once wrote called Dear Sugar. And that advice column has ultimately been adapted into a New York Times podcast called Sugar Calling. I ' m joined by Cheryl Strayed, who is recording herself in her home in Portland, Oregon. Cheryl Strayed, welcome to Design Matters. Hi, Debbie. I am so thrilled to be here. I ' m a fan of the podcast and I ' ve been dying to talk to you for ages. Oh, I ' m so glad. I ' m so excited. I listen to a recent podcast where you said that this pandemic has made it clear to you that the first thing you are is a writer. Was that ever really in doubt? No, no. It was never in doubt inside myself. But what I meant by that is one of the things that happened after a while became a bestseller, is suddenly I had so many opportunities that were not writing. They were writing adjacent. For example, I now have a really active career as a as a paid public speaker. I never I mean, I do unpaid public talks, too. But what I mean is I never in my wildest dreams imagined that I would be, you know, traveling the world, giving talks. And I and I am like I actually have a whole career of that in addition to my writing. And that was born out of a combination of, you know, wild success. And then also my you know, much to my surprise, I ' m good at it and I enjoy it. I understand that you ' re a huge planner, as am I. And it ' s been hard for you not to know what you ' re doing next month or July or August. How are you managing your schedule? And I ' m mostly asking this for my own sake to really get a sense of how you ' re managing. It ' s really interesting, isn ' t I mean, for me, I realized that planning has always made me feel safe and it ' s always been for me the vehicle of my ambitions. What I mean by that is that setting intentions has always been really important for me in terms of like if I ' m in a place, whether it be emotionally or professionally or financially, that that that it ' s not a good place, I think, OK, my intention is to go there and I make a plan and I see it on the horizon and I think about the steps I need to take to get there. And so on the deepest level, planning has been actually an incredibly healing act for me. It ' s also been just I get pleasure from knowing the logistics of everything. I '

m a detail person. I love maybe that sense of control that I have when I look at my calendar, I go, OK, we ’ re going to do this in June and that in July and that and August. And this time next year will be here, you know, and I love that. It gives me a kind of. Pleasure. I mean, I even joke with my husband, our long running argument, so let ’ s see, we ’ ve met we met in 1995, so I guess it ’ ll be 25 years since we met this fall, this September. My running joke with him, you know, we ’ ve been fighting for for decades about him not putting things on the calendar and not being a planner. And then every once in a while, he ’ ll do it like he ’ ll put something on the calendar. And I ’ m like, that is the sexiest thing you ever did for me. Yeah. Yeah. I totally lost my love language. Yeah. What about you? Well, I. I know that you ’ re a list maker and you ’ re not only a list speaker, but you make sublist hear lists. And I do the same thing and I am so I don ’ t know what the word would be attached to my calendar. I have a paper calendar, I ’ ve had a paper calendar for decades, and my dad used to send me the American Express book calendar, which I used to use, and then he passed away. So I needed another vehicle. And so I just have this little paper calendar. It ’ s actually little, but it ’ s two year calendar and I am attached to this thing. It goes with me everywhere. So I didn ’ t even answer your question. So how am I dealing with it? The first thing I was kind of in denial. Like a lot of people, what I decided is the pandemic would last about eight weeks at least. Its impact on my life would be, you know, that was the first thing like, OK, everything is canceled in March and April and maybe May, but June and July and August are totally on. Right. And then as the weeks passed and I realized, oh, my gosh, you know, and I finally, you know, I had to do. The thing I have many times advise others to do when they feel powerless is to surrender and to accept that ’ s about accepting what ’ s true, accepting what ’ s true. Really one of the most radical acts of my life. And I think any life, even if what ’ s true isn ’ t what you want to be true. Right. Because then you can work from a place of reality rather than delusion. And so I ’ m trying to accept it and let go of. The future, or at least my sense of knowing what ’ s going to happen in the future, let ’ s go into the past a little bit. I ’ d love to talk to you a little bit about how you have navigated the arc of your life. You were born Cheryl Niland in Spangler, Pennsylvania. Yeah. And moved to Chaska, Minnesota, when you were six years old. Shortly thereafter, your parents got divorced. And in addition to the time after your mother died, it seems as if those years were some of the darkest years of your life. Mm hmm. Did you realize that at the time? Gosh, that ’ s such a great question. I did I did realize it to the extent that a child can, which is somewhat limited. I was born into a house of really extremes. On one hand, I had this mother who was very loving and very kind hearted and warm and optimistic and in so many ways communicated to me and my my older. I have an older sister who ’ s three years older and a younger brother who ’ s about three years younger. And she always communicated to us that sense of of wonder and love and light and the beautiful things. But we were living in a house that was, you know, frankly, terrifying. My father was violent and abusive. He was emotionally abusive to all of us. He was physically violent to my mother to an extreme degree. And we were terrified of him. And also, you know, we witnessed I witnessed my brother and sister and I all witnessed horrifying things, things that I that I never witnessed beyond that, you know, as an adult. I mean, I saw as a little child my first some of the first things I saw were really, you know, my mother being beaten by my father, my mother almost being killed before my eyes and my father my mother being raped by my father. And so my memory, my perception of what I understood in those years. It ’ s definitely one of fear and and sorrow and terror and darkness. But because that was my life, it wasn ’ t really until my mother finally escaped my dad that I realized, oh, this is what happiness is, this is how it should be. So, yeah, I mean, I really think I had these kind of two childhoods, really three childhoods. But the first one was terror and darkness and violence and abuse. And the second one was my mom is a single mom and we were very poor. We were poor with my dad too, but really living in poverty with a single mom and three kids and a lot of chaos and disarray, but but also a lot of light and joy and **fun** and no longer being under the the sort of weight of that fear that you have when you live with somebody who ' s abusive. I completely understand in many ways. I had a lot of similar experiences so that a lot of the questions I ' m going to ask you are really not only for my listeners benefit, but also for my own in terms of really being so curious about how somebody can emerge from that kind of darkness to be able to. Say, this is happiness, you know, this is happiness. Mm hmm. You ' ve written this about what a father ' s role is in his children ' s life. The father ' s job is to teach his children how to be warriors, to give them the confidence to get on the horse, to ride into battle when it ' s necessary to do so. If you don ' t get that from your father, you have to teach yourself. Well, that ' s so resonated with me. What do you think you had to teach yourself? Like, what is the biggest thing you think you had to teach yourself? Oh, you don ' t ask little questions, do you? You asked me questions. Big questions, sorry. Big questions. You know, I think that the biggest thing is that I ' m OK in this world. I have the strength and the courage and the **resilience** and the heart to be OK, to be safe within myself. And I think that that ' s what I mean. When I said to be a warrior, I mean, I think we are very often think of this in terms of battle. And years ago I wrote I wrote about this in a while, too. But so right after my mom died, I was living in Minneapolis. I was twenty two and a friend of mine gave me a gift certificate to see an astrologer. And I was like, OK, well, I don ' t know, like what says astrology stuff, you know? And but I thought, OK, I ' ll go. And I went and I talked to this woman, Pat Kaluza, and she had this like hippie sort of place in Minneapolis, and she read my birth chart. And it was astounding and amazing. And one of the things she said to me, she kept going to the father. She kept saying, your father, he ' s a Vietnam vet or he ' s troubled or he ' s you know. And I kept saying, like, oh, yeah, my father is not in my life. He ' s nothing. He ' s nothing. He ' s not anything. And she said to me, well, you were wounded. Your father was wounded. And when you have a parent who ' s wounded and who hasn ' t healed his or her wounds, you you as the child, you ' re wounded in the same place. And so you ' re going to have to heal that wounds. And the way she talked to me about it is that there will be times in your life that you need to ride into battle for yourself and you need to teach yourself how to do that. And, you know, I would say that that extends beyond necessarily the father. I think that, you know, if we didn ' t get that essential sense of self-worth from both parents, we need to reckon with that in our adult lives. And so with my father, I had to heal many things. But but the most the biggest one you ask what the most important one I think it was that sense is that. That I ' m secure and safe in the world and that I ' m strong enough to face anything really and to really step into that knowledge, not that you ' ll be like always brave or always do the right thing or always accept what ' s happening in in a sort of graceful way or courageous way. But that at my deepest, deepest, deepest place within me, I believe in the power of my own **resilience** and ability to survive and persist. And I think that ' s what the parents give us if they love us well and they love us. Right. And if we don ' t get that, we have to find it ourselves and the world. I think that as I was rereading Wilde and as I watch the movie again, too, which was really wonderful. I also got the sense that that your journey was one of finding out if you could rely on yourself, if you could take care of yourself, pretty extreme way. Yeah. Testing yourself. But but I got the sense that that ability to do that was was also underneath everything else that you were doing. I think so, too. And, you know, I think I want to say to like I think though we all need to do that. You know, obviously somebody like me who had a father who was abusive and not, you know, not the father that any one wants. And then and then a mother who died, I was really an orphan. And, you know, I had to go and find those things, as you say. And yet I think part of maybe the human journey is that like that I even think of my own kids, teenagers right now who are loved and secure and living in a very happy home and have wonderful lives. And yet what I know about them is that that part of their journey is going to be finding their way and finding their strength and finding their courage and and also finding their path, you know, and all of those things are made more difficult when we have difficult parents or dead parents or abusive parents. But they ’ re all it ’ s part of what we have to do as humans. And and that ’ s why, you know, I think so often it wasn ’ t until after I actually wrote Wild that I understood what I had done on that hike is that I had given myself my own rite of passage. And, you know, I said, like, you have to go test yourself to see who you are. And that ’ s those rituals of rites of passage are what what we ’ ve done as humans throughout all time, across every culture and, you know, continents and so on and so forth. We don ’ t do that so much anymore. And I think it ’ s a loss. I think most of us would benefit from being asked to find out who we really are by being put in uncomfortable circumstances or challenging circumstances. When I was doing my research on your childhood and adolescence, they came across a couple of little facts that really were wonderfully surprising. I know that when you were 13, you moved to Aitkin County. It was very narrowly lived in a house with your mom and your stepfather. They built the house and for many years the house didn ’ t have electricity or running water, didn ’ t have indoor plumbing until after you went to college. But despite all of this, Cheryl Strayed, you were a high school cheerleader and the homecoming queen. And so you you were an overachiever from day one. Aha. I was. I was. So let me explain. My stepfather, who was a carpenter, he was seven years younger than my mom. They they married when I was like 11 and he was working under the table for this roofing contractor. And it was the middle of the winter in Minnesota. There was ice on the **roof**. He slid off the **roof** and broke his back. And as I said, we were always flat broke and he was injured and out of work for more than a year. And my mom at the time was working as an administrative assistant for the like the small town attorney in Chaska, Minnesota. And he said, you know, I ’ ll represent you pro bono. It ’ s not fair because my stepfather was working under the table. His boss said, oh, no, I don ’ t need to pay you anything. So by the end of the year, they got a twelve thousand dollar check. That was the payment for a broken back back in 1980 or so. And my mom said, you know, this is our only chance we ’ ll ever have our own home that we own and let ’ s not buy a home. Let ’ s buy land. So they went to northern Minnesota. Yeah. And we moved to 40 acres of land. We lived really in a tarpaper shack, one room tarpaper shack for the first six months. And we built the house ourselves. And it was a lot of work and it was incredibly difficult. And I was a teenager and I wanted to be pretty and popular and not associated with going to the bathroom in an outhouse or taking a bath in a pond, which is what I did. Or taking a bath in a bucket, which is what I did. So, yeah, my my rebellion in my teen years was to seem to be a version of myself that thought that I wanted to project a sense of success and grace and togetherness. And I you know, I wanted to be popular because to be popular is to be loved. I wanted people to love me. Now, let ’ s talk a little bit about books, because you ’ ve written about how, as you were growing up, books were your religion and you cited the experience of reading Dalton Trumbo novel Johnny Got His Gun is a book that first exposed you to the power of inhabiting the life of another human. Yeah. What was that like for you? How did how did that infuse who you were? Johnny got his gun. Dalton Trumbo, really, really powerfully important book. I think I was about 14 when I read it. And it ’ s just, you know, you ’ re inside the mind of a man who ’ s had, you know, been deeply injured in the war and lost his limbs. And he ’ s, you know, you ’ re just living in his head and and having his memories and his delusions and his his sorrows and his rages. And you ’ re right there inside of him. And I think it was this maybe the first book that the material was so utterly dark and painful and true that it was the it was the first time that I understood what war was, what grief was. You know, I ’ d learned about things from a distance. And what that novel taught me is how you can inhabit an experience that is so not your own. And and, you know, I loved books long before that, but that was the first time I stepped into one and thought, this is a kind of magic, if you will. This is a kind of portal that that I guess I ’ ve been longing to enter for a long time. Another piece of this that goes way back is always as a young child, I always wanted to know what was happening inside of other people ’ s minds. Like really like what did they really feel? What did they really think? What was their actual experience of being human? And so in this book, I was like, wow, I ’ ve finally been let in to that to that secret. You also started working at 13. You had a variety of jobs. You were a janitor ’ s assistant at your high school waxing floors. You were a waitress at the Dairy Queen. And I understand you can put a on on the top of a soft serve ice cream cone like a pro. Of course, I worked there. So, yeah. I mean, that ’ s the thing growing up poor. What you quickly realize is if you ever want anything, you have to earn the money yourself. Because even though my mom provided for us to the best of her abilities, you know, I wanted things like brand name shoes or Levi jeans, like we would go to Kmart and at the beginning the school year, and we ’ d each get like a certain amount of money we could spend. And then that was it. And I was like, I don ’ t want to, but I want to wear the brands, you know? And my mom would say, I can ’ t afford it. So as soon as I could, you know, I babysat before that. But but honestly, as soon as I could, I got myself a job and I was like thirteen and a half. I sort of fudged my age. I think you had to be 14 to actually work. But by 13, I worked as a full time job as a janitor ’ s assistant and in my school, **cleaning** the books that the shelves and the drawers and the desk getting gum off of things and painting. It was through this program for low income kids. You know, I worked and I earned my money and I bought my stuff. That ’ s that was part of the whole plan, you know, that I would get it myself if it couldn ’ t be provided for me. Sometimes I. I talk to my peers who were like going to camp or going to Paris or whatever, and I envy them. And yet I also think, wow, the best education I ever had was being a janitor in my high school and then going from that job straight to my job at the Dairy Queen. And I did that all summer and they were minimum wage jobs. But but they were the first lesson I had and really how to be self-sufficient and making it happen, like not expecting others to make it happen for you. And I treasure that. Like, I think I learned more doing that than I would have going to a lovely summer camp. But, you know, we all learned we all find our way. I read that it never occurred to you to attend college outside of Minnesota and you only applied to one school, the University of St. Thomas in St. Paul. How come how come it didn ’ t occur to you that you could go out outside of Minnesota? It never occurred to me. It absolutely never occurred to me that it was possible to leave my state to go to college. Like to me, the furthest even going to college seemed like going a very far. Our way and the reason I didn ’ t know to apply to more than one is because nobody told me. I wasn ’ t folded into anyone ’ s arms when it came to like, well, let ’ s talk about college, let ’ s talk about your options, let ’ s talk about the process. I figured out by reading something that I had to take the ACT test. Nobody talked to me about it. I paid for it myself. I drove myself there. I took the test. I didn ’ t study for it because I was told, you can ’ t study for that test. You just go. And it ’ s like an aptitude test. I don ’ t know what score I got because it didn ’ t even matter to me. I just took the test, did my best, and I went to I put in my application to one school and and I applied to this one school because it was a small school. I was overwhelmed of thinking, like going to like the University of Minnesota. It just seemed too big. So, yeah, you know, I look back at it and think, what was I thinking? And all I can say is I just didn ’ t have that information available. And I think we think this is so unique. But it ’ s not I mean, it ’ s the reality for a lot of kids living in poverty that they don ’ t know the way to college. For your sophomore year, you transferred to the University of Minnesota in Minneapolis and you studied English and women ’ s studies. What did you think you wanted to do professionally at that point as a poor kid getting an education? The first goal and really at first the only goal was like, you get a job so you can make money. And I first thought that the only path to that would be journalism. So when I was a freshman, I majored in journalism. And when I transferred to the University of Minnesota, I was like journalism, but I quit. I took a class really in that first year or so with Michael Dennis Browne, the poet Michael Dennis Browne and my eyes, I just everything, oh, you know, absolutely exploded. And I thought. I have to trust this, I have to you know, I thought that I could sort of funnel my my desire to write into the channel of journalism because it ’ s the job, you know, that you can actually get paid to write. But I don ’ t want to do that. Like, I want to really put all of my heart and my faith in and creative writing. So I switched majors and became an English major. And what I thought I ’ d do with that is become a great American writer. That ’ s what I thought I ’ d do with that I was absolutely relentlessly, ruthlessly committed to following through and being, you know, just really, really, you know, holding hard onto that thread. That was my writing and doing it and doing it and doing it until I succeeded. And you know, it ’ s funny, as I say, these words, you know, the female in me, the woman who was raised as a girl, is like, Oh, don ’ t say that. Don ’ t say you want to be a great American writer because that seems cocky or that you ’ re bragging or but I ’ ll tell you, like, that ’ s the thing that got me through. Is that that like, again, the intention, the plan, the ambition, if I sort of dithered around and said, well, you know, I hope that this turns out and I hope I can, you know, publish a story like I would never, ever, ever be talking to you right now. Yeah. And it reminds me of that little mantra you had while you were on your hike. I ’ m not afraid. I ’ m not afraid. I will not be afraid. Yeah, well, and of course. And of course, when did I say I ’ m not afraid? And I was. Yeah. And, you know, even to this day, like, writing is so hard for me. It ’ s so hard for me. I still have to say, Cheryl, you can do this. You ’ re going to do this and you are not going to give up. You ’ re not going to be second. You ’ re going to go you ’ re going to, you know, go all the way to the finish line. In March of 1991, when your mom was 45, you were 22, your mom died of cancer. And you ’ ve said that your mother ’ s death was in many ways your Genesis story and the start of what you called your wild years. And you said that for you, using drugs or having a lot of sex or any sort of reckless behavior was about love, was about trying to find love in this weird way, trying to show the world this woman ’ s life meant so much that I ’ m going to ruin mine to honor her. Mm hmm. And I wanted to ask you about that destructive thing that we do. Why do you think we hurt ourselves when we ’ re hurt? Mm. Well, again, you you with the big questions, Debbie, I kind of want to say I ’ m sorry, but I ’ m sorry. It ’ s so it ’ s so it ’ s so deep and so big that it layered the answers. Why do we hurt ourselves when we ’ re suffering? Why do we self-destruct when. Yeah, when we feel like we ’ ve been ruined? I think it ’ s a couple of things. I think one of the things is it ’ s a signal. It ’ s a signal to the people around us that we ’ re saying help me. Even if we with our words are saying like, oh, no, I ’ m fine, just leave me alone. And in so many ways, that ’ s, you know, when you turn to drugs, for example, you know, that ’ s a way of of pushing others away from you. Right. And yet what I was so clearly trying to do, I can see, is to be like, help me, help me, help me. And it ’ s also a kind of test. So it ’ s a signal. I need help. It ’ s a test. Is there anyone out there who loves me enough to help me? I also think in my case, there was this sort of division within me or this polarity that was the that ’ s almost like it ’ s almost like mythic in it ’ s you know, when I think about it and I interpret it this way is like the mother, the good mother who ’ s been taken from me and the and the bad father. The dark father who abandoned me. You know, if I can ’ t be the woman my mother raised me to be that ambitious, generous life, you know, light filled person, maybe I can be the junk, the pile of shit, the darkness that my father nurtured in me. There was something that I had to figure out about those primal relationships. That I had to rage against and he ’ ll. And understand and revise, and I think that a lot of us have to do that, you know, I think that a lot of people who are suffering and certainly people who have written to me as sugar, you know, they have a problem. They write with the problem right there. Like, this is my question. This is my thing. But really, the problem is, is that deep, deep river that ’ s flowing beneath all the troubles that that subterranean channel, that that is your parents, that is those early stories you received, your losses and your gains and your wounds and your sorrows that you have to you have to heal them. And sometimes, you know, healing is an ugly thing. Sometimes healing is destruction. Sometimes healing is turning away. Sometimes healing is a kind of rage and anger, you know? And I think that for me, it was just like I had to pass through. Everything so the image that always comes to mind to me is one of total destruction, when I saw that I was going to lose everything after my mom died and I did, my family also really fell apart and was lost when I understood that that was what was going to happen and that I couldn ’ t make it not happen. That ’ s when I really turned to heroin. That ’ s when I was like, OK, if if the house is going to burn down, I ’ m going to go like the the piece of this that I in some ways I can have control over is I ’ m going to actually burn the whole the whole, you know, the whole land, like the whole homestead. The hard thing about that is, of course, some people stay there, they get lost there. They ’ re walking through the ashes forever and luck. And I ’ m so grateful that that wasn ’ t my fate, you know, that that I had to do that stuff in order to realize that. That I wasn ’ t the person my father raised me to be, my father didn ’ t raise me, I was the person my mother raised me to be. And the best thing I could do, and this is why I said that so much of that stuff was about love, as I realized, like I was trying to show the world, listen, this amazing woman is gone and I am suffering. I wanted to, you know, with my own life, demonstrate how how how gigantic that loss was. And what I realized is the only way I could do that, the absolute only way I could do that was to make good on my intentions, to make good on my ambitions, to be the woman my mother raised me to be, as I said, and wild to become, to become. It ’ s interesting you brought her to life through your words and, you know, she brought you to life through her life. It ’ s a really nice symmetry there, it ’ s crazy, you know, I lost her, I was the same age when she died as she was when she was pregnant with me. So I lost her at the same age that I that I came into her life. Right. You know, I wish that I wish that I didn ’ t have to go into the darkness. But, you know, I was always trying to move in the direction of love.

And I felt so alone in my grief. And then when I wrote about it and told the truth about it, how savage it was, I felt like, OK, everyone ' s going to think I ' m crazy. But instead, what everyone thought was me too to this day, you know, so this day, really now, you know, hundreds of people, hundreds of thousands of people around the world, maybe millions of people around the world are saying, I know how you feel because I felt that way, too. And and I ' m suddenly not alone in my grief. Yeah. And I ' m always shocked by that. I am very grateful looking back on my life. And maybe this is synthesized happiness, I ' m not entirely sure in in terms of what it has given me in terms of my ambition or my creativity or even just my sense of the world. But I also deeply, deeply regret the pain that I caused others with my own self destructiveness. And one of the biggest regrets that I have. You know what what I put other people through in that journey to be who I am and where I am now. But I also know that I couldn ' t have survived in many ways without that destructiveness and that testing of of who I was as I revised myself, so to speak. Yeah. Do you think that part of that revision for you was to change your name? Oh, absolutely. Mm hmm. Yeah. So I was born Cheryl Milind, as you said, and then I got married young. I was Cheryl Milind Littig. We we both hyphenated our names. And because we were trying to be radical feminist and cool, which it was a weird thing to do back then. And so, yeah, when I got divorced right before I went to hike on the Pacific Crest Trail in 1995, I was getting divorced like 94, 95. I realized that. Yeah. So. I had to set my life on a new course, which was really the old course, which was the course, you know, way back, you know, when I was like hiding Jane Eyre in 10th grade or whatever. I think now those plans for myself, I took a little detour, did some other things, and then I was like, OK, this is, you know, life. My mother ' s dead. My first marriage is over. This man I loved but got married too young and I ' m an orphan and I need to make my life I ' m going to make my life. And part of that, obviously, for a writer is about language. And Cheryl Niland just didn ' t feel like me. And so I came up with my own last name, Cheryl Strayed. What ' s so funny to me now? So I ' ve been Cheryl strayed longer than I was anything else. Now I ' m 51. People still say like, oh, but Cheryl Strayed is not your real name. And I ' m like, Cheryl Strayed is the realest name I ever had. So you talked about your hike along the Pacific Crest Trail. You were 26 when you embarked on this solo three month, eleven hundred mile hike. If you knew that there were people listening who are considering taking the same hike, what would you share with them? What would you tell them? What advice might you give them? Well, absolutely go if you have any, whether it ' s the same hike as mine or any long hike. If you have any desire to do this, do it because it is walking, especially walking along way for many days on end day after day. It ' s it ' s it ' s a deeply, deeply challenging thing. So you get you you gain your sense of your own strength and your own ability to endure difficulty, monotony, pain. And of course, what happens on the outside, one **foot** in front of the other in front of the other, also happens on the inside that, you know, turns out for me, you know, the way to heal. Anything is to keep going. And to keep going with humility and faith and a sense of optimism, even when it looks and feels really hard and, you know, I just I love this idea of the body teaching us what what the soul and the spirit and the heart needs to know. And that ' s what happens on a long walk. That ' s exactly what happens on a long walk. I mean, I can ' t say enough what a powerfully humbling and healing act that was. And it seems unimaginable to me to consider hiking 11 hundred miles in near solitude without a phone on the Internet. Well, the phone off the entire time, I mean, it ' s just not even comprehensible. What would people say? Well, that ' s really this was 1995. And I didn ' t realize until, you know, I was sort of midway through wild that I realized, oh, I ' m I ' m actually writing a kind of historical. Memoir about a world that is no longer that, a world that is now past, that our experience of the wilderness is now one where, first of all, we can just research everything online, you know, where does that trail begin and end? Where is the water? Where ’ s the you know, I had this right, you know, and that was one of one of the things and of course, and wild, I did make comic of like unpreparedness or whatever. But the other piece of this I want to say is that I prepared to the extent that I could that there wasn ’ t the Internet. You know, I went to the Minneapolis Public Library and said, you know, what books do you have on the Pacific Crest Trail? And they had one. And it was the book I already purchased at. It wasn ’ t it wasn ’ t like things were available. You know, you just had to go and see how it was. Yeah, I was absolutely alone. I was the first eight days of my hike. I didn ’ t even see another person. What I learned is that that would be, you know, a regular thing like that. I would many, many times go three, four or five days without another seeing another person. There was no way to contact anyone except if I came upon a payphone or if I sent them a letter. Right. I ’ m so grateful for that world. I mean, I ’ m so grateful that I took my hike during that time because I think had I not done that, I would have spent a lot of time. Tweeting at people in town, right, connecting great **pictures**, the fox, I mean, yeah, and getting feedback from people. Right. And not just sitting in my solitude. I mean, that ’ s the thing about that. That kind of deep solitude is it ’ s just like it ’ s just you and there ’ s nothing to do but reckon with yourself. There ’ s nothing to do but have that conversation with yourself in your head. There ’ s nothing to do but allow those memories to emerge. By the time I was finished with my hike, I honestly felt like I had thought about everything I remembered in my whole life, every relationship, every person. What a therapeutic experience. Monster was the name of your backpack, which at its heaviest weighed nearly 70 pounds, even if even at its lightest it was 50 pounds. And making yourself suffer in a physical way kind of feels like the opposite of **fun**. And I read that you said that the act of remembering your suffering can become pleasure afterwards. And I wanted to know, like, how so? How does that become pleasure? I ’ m such a believer. I call it retrospective **fun**. OK, and this is the advice too. I ’ d give someone wanted to take a long hike is you just have to or really any kind of journey. You just have to acknowledge that, that very often the best things we do are painful and complicated and difficult and exhausting and require us to be out of our comfort zone and to accept difficult things. Right. If the journeys we take are just like exactly how we imagined they ’ d be and plan they ’ d be and and everything was idyllic and blissful. And there was no there was no sort of difficulty. We would be like, yeah, that that was that was **fun**. But, you know, there ’ s there ’ s nothing about it. Right. There ’ s no texture to it. Yeah. No, no. Great. And I think that the the grittier an experience is, the more it teaches us, we never, ever, ever forget the lessons we learned the hard way. I began on a backpacking novice. I became a backpacking expert. I thought that I couldn ’ t do that. And I did. I over and over and over again said to myself, I can ’ t go on. I can ’ t. And I always did. And then that becomes part of who you are. It becomes part of the story you tell yourself. So then, you know, 10 years later, you ’ re in labor. As I was trying to give birth to my eleven pound baby boy and I was thinking, I can ’ t do this. And I want what the deepest voice in me said, you know, you can you know, you can. Nine days after your hike and a few days after your 27th birthday, you met your husband through someone who came to the yard sale you had selling your hiking gear to raise a little bit of money to live on. Several years later, you married him, you had two children. Do you think that this sort of new life, big quotes was the gift you got at the end of a long struggle? Do you think it was just luck? Tell me about how you view that sort of moment in time where you come back and everything changes? Well, you know, I think it ’ s it ’ s a combination of things, right? Like luck is always luck is always a factor in everything. You know, how how do we ever know that we ’ re going to be standing there when that person walks up and you say hello and then something that ’ s born of that? Right. How I think of Brian ’ s life in my life and thinking about how how did our paths ever get to cross? And and of course, a lot of it is that by the time I met Brian, I was OK. You know, I was in a place that I was able to see more clearly again and be more kind to myself and to be truer to my nature and truer to my ambition and my vision. I was doing, again, what I ’ m here to do. And when you ’ re doing that and then you meet somebody else who ’ s doing that, it ’ s like really good timing, you know. So in so many ways, it is the gift. You know, getting, Brian, is the gift of. Doing all of that laundry and searching and finding and it ’ s not the end of the story, of course, it ’ s like it wasn ’ t like, well, now I ’ m just like all great and everything. And and then, you know, 25 years later, we ’ re just here we are in the same place. I mean, we both struggled and grown and gone through all kinds of things. Right. But, you know, to make yourself ready for that kind of relationship, I wasn ’ t walking the trail to do that. But that was one of the outcomes of it. Yeah. You moved to Portland, you got a job waiting tables. You started working full time, writing your first novel, Torch, and you then went to graduate school to Syracuse University and got a master of fine arts in fiction writing so you could actually finish the book. Why? What made you decide to do that? What made you feel like that would help you get to that moment that were where the book would be finished? Yeah, it was it was mostly financial. And some also just like the logistics of of giving myself real time to write. So all through my 20s, I was a waitress, I was a youth advocate. I was a vegetable picker in an organic farm. I like I was an EMT. I did all kinds of things. But what I was really doing was writing. That was my real work. And it was I had this big student loan to pay off. It was exhausting always to be just living hand-to-mouth and struggling financially while trying to write. And and I sort of always thought like. OK, my my first novel will, of course, be published and done and everything by the time I ’ m 30, but I, I just said, OK, as I was approaching 30, I was like, OK, this hasn ’ t been done yet. And here are the reasons why. One is I ’ m always having to work full time to pay the bills and to you know, it ’ s hard to have that kind of time and focus when you ’ re working full time. So graduate school kind of solve that problem for me. And I only looked into I only applied to graduate schools that, you know, with the idea that I would only go if I were offered a full a full fellowship or scholarship and tuition remission and that it wouldn ’ t put me further in student loan debt Torch was published in 2006. At that time, you had two children under the age of two, 18 months apart. You started writing Wild in 2008, 13 years after you completed the hike. Initially, you thought it would be a collection of essays. Your second book, What? What Changed? Yeah, well, you know, the reason I thought it would be a collection of essays is I thought there is no way in **hell** that I can write a book while having two little babies and being in financial stress. And, you know, all of this. I just thought, I can ’ t write another book. And what happened is I started writing and then it went on and on and on and on. And I was like, oh, I have a bigger story to tell. And it really I didn ’ t know that until I was doing the writing because I found the bigger story when I was writing and buy the bigger story. I mean, the story that exceeds the kind of like, oh, here ’ s you know, here ’ s my interesting journey or here ’ s the big loss I suffered, you know, that that I knew that I needed to find a universal thread that the my journey and my loss and my experience would be had the potential to be expressed in a way that other people would see themselves in it. And it took some writing for me to to figure out how to do that or to figure out that that was there. You said that being a memoirist is about learning how to re-enter previous versions of yourself. Yeah. How do you go back into that previous version while still maintaining who you are? Well, you know, you enter the magic of writing, that ' s that ' s what ' s so cool about it is so what I mean by that is this is the only way for me to write. About my real heartbreak over the decision to end my first marriage is to abandon the woman I am now who says, oh my gosh, I was too young to get married and he was great and everything, but it ' s a good thing we broke up because now we ' re both married to other people and we ' re happy, you know, so leave that person at the door and and start writing your way into the person who was in love with this man. Truly. And who also felt like she could not stay with him, who had to break his heart and her own in order to live the life that she, for whatever inexplicable reason that was still kind of, you know, beyond her explanation, had to trust herself to do that. And so I went in and reinhabited that and and as I was writing, for example, that scene in Wild, where my husband and I are decided to get divorced and then we get divorced and we ' re saying goodbye to each other. You know, I was just sobbing as I was writing it. And even though it ' s actually not sad, like it ' s actually not sad to me now. It ' s a memory of sadness that I that I reinhabited, this was really made a life to me. I was on the set a lot when we were making the movie. So I was there like every day and, you know, really involved in everything. And there ' s this scene in the movie and in the book where me and my ex-husband, we ' ve just mailed off, you know, our divorce papers and we ' re standing on the street and we ' re talking to each other and crying and embracing for the last time. And it ' s very emotional in the book. I ' m crying, you know, I ' m like, it ' s sad. And then, you know, I ' m standing there with Reese Witherspoon right before she ' s going to walk into the street with Thomas Sadowski, who plays my ex-husband. And they ' re going to begin shooting the scene. And she suddenly looks at me and she just just starts sobbing. She was getting ready for that scene and they go into the street and they shoot this, and I ' m standing next to the director, I ' m watching this on the camera. And I noticed that some people on the crew were kind of gathered around me and a couple of them sort of put their hand on my back and put their hand on my shoulder to comfort me. Wow. And I thought, oh, OK. I, I it was so clear, crystal clear to me because I was watching that scene and I wasn ' t crying because it ' s not sad anymore. But when I watch the scene of my mom dying. I cried, Oh, that ' s so sad, and it doesn ' t mean that one thing isn ' t sad and one thing is it means that there are different kinds of sorrow and some of them are sorrow. Our sad in the moment and others are sad forever. And, you know, so I think that ' s a really important thing that I try to remember still in my life, that it ' s like, is this a sorrow that I ' m going to carry with me forever, or is it a sorrow that is like a crucible and I have to endure it and then I will be better for it that I you know, that ' s what I when I wrote as sugar, you ' ve got to be brave enough to break your own heart. I was talking about exactly that thing where, you know, I had to make a decision that caused me and another person pain, but I ' m better for it. And it ' s not sad anymore. It was it was actually the the golden key that opened the door to to my liberation. And there was loss in that. But but there was more gain. You know, it became a gift in the end. Like, very often I think how memoir writing is almost like the process of therapy, right. Where you go back there and you say, well, who was that person and why did she do this and think this and love these people and leave these people. And there ' s always an answer if you ' re willing to dig for it. While you were working on Wilde, you also started writing your column, Dear Sugar for the Rumpus. You were mentoring students at the Attic Institute in Portland. You were teaching workshops at universities, writing for magazines. But you and Brian, your husband, who ' s a documentary filmmaker, were, as you put it, epically broke. You were, as they say, the classic starving artists. Yes. And I also thought it was interesting that, well, you were writing Dear Sugar, you were giving people advice and in wild you weren ' t. But people have read it that way. And I ' m wondering how you feel about that, that whole sort of notion of advice giving. I know you ' ve referred to self-help work as intellectually mushy and and I think I think that, too. But I do think that people look for that in work even when it ' s not there for their own needs. Yeah. When I was writing, while it never occurred to me that anyone would be experienced as inspiring, you know, I was really just trying to write the truest Rozz realist. Story about that experience, about my grief, about my finding my way on this long walk, about the experience I had in the wilderness, and so, yeah, people do experience that in a in a like, well, what ' s the message of wild? I ' m like, oh, you know, the message is whatever you think, whatever truth you find in yourself when you read it. That ' s what I meant when books were my religion as I felt saved by them, like I felt seen by them. So, you know, to me, I ' ve always said, like in airports, there are many of these kind of little convenience stores and airports will have these little turnstiles that are there, like inspirational or self-help like that. And there are never books. There ' s never like novels there. There ' s never, you know, tiny, beautiful things there. It ' s all these very specific things that are very instructive, like, here ' s your problem. Here ' s what you need to do. And I find that the most helpful literature when it comes to like what real self-help is, is things like, I don ' t know, Jane Eyre, you know, Alice Munro. Short stories. There I am. And Alice Munro, short stories. There I am. And Toni Morrison ' s beloved. There I am. And you know, Mary Oliver ' s poem. So, yeah, you know, I didn ' t intend for those things to be self-help and frankly, even sugar when when terrible, beautiful things came out, I was like it was in the self-help section of many books or so I was like, what? What? So I think of myself as an accidental self-help writer because of course, of course, dear sugar columns are self-help. And yet what they also are is literature. Yes, I understand you ' ve been at a sort of crossroads now is different opportunities have come your way weighing the reasons to do it, weighing the reasons not to do it. And you ' ve stated it ' s not about the number of things on the list. It ' s about the weight of those things. And almost always you think that the things that mean and matter the most really come down to one question. And that question is, what do you really want to do? And I wanted to see if you can help me understand how to know when something is the thing you really want to do. Archives again, with the heart of the system. So for me, that Deep is wanting, it ' s not that it ' s the easiest thing to do. It ' s the thing about which you feel like I can make I can create something that feels larger than me if I decide to do this. So if I if I write a book and not only is it a deep and true expression of some deep and true things, I want to put into the world, if it ' s not only that and that, it becomes also something that is meaningful to others, that ' s a big thing to contribute to the world. And I think that for me. That sense of like rightness or a sense of like if this mission is fulfilled, will it extend beyond my small little life? Like I feel that I feel that as a sort of powerful call. Cheryl, I have to ask questions for you. OK. The first is something that I was really heartened to read about. I understand that sandwiches are problematic. Of course they are. Sandwiches are just like chaos. You know, machines, right? They ' re just like willy nilly. See, I know you ' re my sister. I know you that I know you also feel this way like I to the orderly. Absolutely. Everybody has to be perfect. Not only do they have to be orderly. Yes. That ' s the whole goal of a sandwich for me is to make every bit as much like the previous bite as possible. OK, consistency. So you put the you know, whatever whatever you ’ re putting on it, it has to be uniformly applied everywhere. Burritos also sometimes have this problem. If people don ’ t do the burrito correctly, it ’ s just tacos. Yeah, absolutely. Yeah. So this is my last question, Cheryl. What is the thing you want to do most next? Finish my next book, I really am ready to do that. So wild and tiny, beautiful things were published within four months of each other in 2012, and basically my life was just an absolute you don ’ t like it was just like a volcano. And I was, you know, I movies. I was a little girly and. Yeah, and the play and I was involved in the podcast and the public speaking career and also the kids. You know, during all this time I got your mom these, you know, little records, you know, and who now are 14 and 16. And I just feel like, wow, OK, I really now I ’ m ready to go back. Go back to that basic go back to that sit there and write your next book. And so that ’ s what I ’ m doing. And I really want to do it and I ’ m really excited about it. I ’ m also afraid and doubtful as scared at all the things I am when I ’ m writing, which means I ’ m writing my next book. I can ’ t wait to read it, cannot wait to read it. Thank you, Cheryl Strayed. Thank you so much for joining me today. And design matters. Such an open for so many wonderful things to say. Thank you, Debbie. You are. You are a woman after my own heart, I swear. We have to meet in real life someday. Have sandwiches. Absolutely. I would love that. I would love that. Thank you, my dear. This is the 16th year broadcasting design matters. And I ’ d like to thank you for listening. And remember, we can talk about making a difference. We could make a difference. Well, we can do both. I ’ m Debbie Millman and I look forward to talking with you again soon. Special thanks to the sponsor of this episode. Hoffler and Co Design Matters is produced by Curtis Fox Productions and on Pandemic Times. The show was recorded at the School of Visual Arts Masters in Branding Program in New York City, the first and longest running branding program in the world. The editor in chief of Design Matters is Zachary Petitt, and the art director is Emily Weiland.

Text Sample 728: POS Dim 5 – 2018 – Score 7.00 – 2018/t000514.txt

It was my first year as an atmospheric science professor at Texas Tech University. We had just moved to Lubbock, Texas, which had recently been named the second most conservative city in the entire United States. A colleague asked me to **guest** teach his undergraduate geology class. I said,”Sure.”But when I showed up, the lecture hall was cavernous and dark. As I tracked the history of the carbon cycle through geologic time to present day, most of the students were slumped over, dozing or looking at their phones. I ended my talk with a hopeful request for any questions. And one hand shot up right away. I looked encouraging, he stood up, and in a loud voice, he said,”You ’ re a democrat, aren ’ t you?””No,”I said,”I ’ m Canadian.”That was my baptism by fire into what has now become a sad fact of life here in the United States and increasingly across Canada as well. The fact that the number one predictor of whether we agree that climate is changing, humans are responsible and the impacts are increasingly serious and even dangerous, has nothing to do with how much we know about science or even how smart we are but simply where we fall on the political spectrum. Does the thermometer give us a different answer depending on if we ’ re liberal or conservative? Of course not. But if that thermometer tells us that the planet is warming, that humans are responsible and that to fix this thing, we have to wean ourselves off fossil fuels as soon as possible — well, some people would rather cut off their arm than give the government any further excuse to disrupt their comfortable lives and tell them what to do. But saying,”Yes, it ’ s a real problem, but I don ’ t want to fix it,”that makes us the bad guy, and nobody wants to be the bad guy. So instead, we use arguments like,"It ' s just a natural cycle.""It ' s the sun."Or my favorite,"Those climate scientists are just in it for the money."I get that at least once a week. But these are just sciencey-sounding smoke screens, that are designed to hide the real reason for our objections, which have nothing to do with the science and everything to do with our ideology and our identity. So when we turn on the TV these days, it seems like pundit X is saying,"It ' s cold outside. Where is global warming now?"And politician Y is saying,"For every scientist who says this thing is real, I can find one who says it isn ' t."So it ' s no surprise that sometimes we feel like everybody is saying these myths. But when we look at the data — and the Yale Program on Climate [Change] Communication has done public opinion polling across the country now for a number of years — the data shows that actually 70 percent of people in the United States agree that the climate is changing. And 70 percent also agree that it will harm plants and animals, and it will harm future generations. But then when we dig down a bit deeper, the rubber starts to hit the road. Only about 60 percent of people think it will affect people in the United States. Only 40 percent of people think it will affect us personally. And then when you ask people,"Do you ever talk about this?"two-thirds of people in the entire United States say,"Never."And even worse, when you say,"Do you hear the media talk about this?"Over three-quarters of people say no. So it ' s a vicious cycle. The planet warms. Heat waves get stronger. Heavy precipitation gets more frequent. Hurricanes get more intense. Scientists release yet another doom-filled report. Politicians push back even more strongly, repeating the same sciencey-sounding myths. What can we do to break this vicious cycle? The number one thing we can do is the exact thing that we ' re not doing : talk about it. But you might say,"I ' m not a scientist. How am I supposed to talk about radiative forcing or cloud parametrization in climate models?"We don ' t need to be talking about more science ; we ' ve been talking about the science for over 150 years. Did you know that it ' s been 150 years or more since the 1850s, when climate scientists first discovered that digging up and burning coal and **gas** and oil is producing heat- trapping **gases** that is wrapping an extra blanket around the planet? That ' s how long we ' ve known. It ' s been 50 years since scientists first formally warned a US president of the dangers of a changing climate, and that president was Lyndon B. Johnson. And what ' s more, the social science has taught us that if people have built their identity on rejecting a certain set of facts, then arguing over those facts is a personal attack. It causes them to dig in deeper, and it digs a trench, rather than building a bridge. So if we aren ' t supposed to talk about more science, or if we don ' t need to talk about more science, then what should we be talking about? The most important thing to do is, instead of starting up with your head, with all the data and facts in our head, to start from the heart, to start by talking about why it matters to us, to begin with genuinely shared values. Are we both parents? Do we live in the same community? Do we enjoy the same outdoor activities : hiking, biking, fishing, even hunting? Do we care about the economy or national security? For me, one of the most foundational ways I found to connect with people is through my faith. As a Christian, I believe that God created this incredible planet that we live on and gave us responsibility over every living thing on it. And I furthermore believe that we are to care for and love the least fortunate among us, those who are already suffering the impacts of poverty, hunger, disease and more. If you don ' t know what the values are that someone has, have a conversation, get to know them, figure out what makes them tick. And then once we have, all we have to do is connect the dots between the values they already have and why they would care about a changing climate. I truly believe, after thousands of conversations that I ' ve had over the past decade and more, that just about every single person in the world already has the values they need to care about a changing climate. They just haven ' t connected the dots. And that ' s what we can do through our conversation with them. The only reason why I care about a changing climate is because of who I already am. I ' m a mother, so I care about the future of my child. I live in West Texas, where water is already scarce, and climate change is impacting the availability of that water. I ' m a Christian, I care about a changing climate because it is, as the military calls it, a"threat multiplier."It takes those issues, like poverty and hunger and disease and lack of access to **clean** water and even political crises that lead to refugee crises — it takes all of these issues and it exacerbates them, it makes them worse. I ' m not a Rotarian. But when I gave my first talk at a Rotary Club, I walked in and they had this giant banner that had the Four-Way Test on it. Is it the truth? Absolutely. Is it fair? Heck, no, that ' s why I care most about climate change, because it is absolutely unfair. Those who have contributed the least to the problem are bearing the brunt of the impacts. It went on to ask : Would it be beneficial to all, would it build goodwill? Well, to fix it certainly would. So I took my talk, and I reorganized it into the Four-Way Test, and then I gave it to this group of conservative businesspeople in West Texas. And I will never forget at the end, a local bank owner came up to me with the most bemused look on his face. And he said,"You know, I wasn ' t sure about this whole global warming thing, but it passed the Four-Way Test."These values, though — they have to be genuine. I was giving a talk at a Christian college a number of years ago, and after my talk, a fellow scientist came up and he said,"I need some help. I ' ve been really trying hard to get my **foot** in the door with our local churches, but I can ' t seem to get any traction. I want to talk to them about why climate change matters."So I said,"Well, the best thing to do is to start with the denomination that you ' re part of, because you share the most values with those people. What type of church do you attend?""Oh, I don ' t attend any church, I ' m an atheist,"he said. I said,"Well, in that case, starting with a faith community is probably not the best idea. Let ' s talk about what you do enjoy doing, what you are involved in."And we were able to identify a community group that he was part of, that he could start with. The **bottom** line is, we don ' t have to be a liberal tree hugger to care about a changing climate. All we have to be is a human living on this planet. Because no matter where we live, climate change is already affecting us today. If we live along the coasts, in many places, we ' re already seeing"sunny-day flooding."If we live in western North America, we ' re seeing much greater area being burned by wildfires. If we live in many coastal locations, from the Gulf of Mexico to the South Pacific, we are seeing stronger hurricanes, typhoons and cyclones, powered by a warming ocean. If we live in Texas or if we live in Syria, we ' re seeing climate change supersize our droughts, making them more frequent and more severe. Wherever we live, we ' re already being affected by a changing climate. So you might say,"OK, that ' s good. We can talk impacts. We can scare the pants off people, because this thing is serious."And it is, believe me. I ' m a scientist, I know. But fear is not what is going to motivate us for the long-term, sustained change that we need to fix this thing. Fear is designed to help us run away from the bear. Or just run faster than the person beside us. What we need to fix this thing is rational hope. Yes, we absolutely do need to recognize what ' s at stake. Of course we do. But we need a vision of a better future — a future with abundant energy, with a stable economy, with resources available to all, where our lives are not worse but better than they are today. There are solutions. And that ' s why the second important thing that we have to talk about is solutions — practical, viable, accessible, attractive solutions. Like what? Well, there ' s no silver bullet, as they say, but there ' s plenty of silver buckshot. There ' s simple solutions that save us money and reduce our carbon footprint at the same time. Yes, light bulbs. I love my plug-in car. I ' d like some solar shingles. But imagine if every home came with a switch beside the front door, that when you left the house, you could turn off everything except your fridge. And maybe the DVR. Lifestyle choices : eating local, eating lower down the food chain and reducing food waste, which at the global scale, is one of the most important things that we can do to fix this problem. I ' m a climate scientist, so the irony of traveling around to talk to people about a changing climate is not lost on me. The biggest part of my personal carbon footprint is my travel. And that ' s why I carefully collect my invitations. I usually don ' t go anywhere unless I have a critical mass of invitations in one place — anywhere from three to four to sometimes even as many as 10 or 15 talks in a given place — so I can minimize the impact of my carbon footprint as much as possible. And I ' ve transitioned nearly three-quarters of the talks I give to video. Often, people will say,"Well, we ' ve never done that before."But I say,"Well, let ' s give it a try, I think it could work."Most of all, though, we need to talk about what ' s already happening today around the world and what could happen in the future. Now, I live in Texas, and Texas has the highest carbon emissions of any state in the United States. You might say,"Well, what can you talk about in Texas?"The answer is : a lot. Did you know that in Texas there ' s over 25, 000 jobs in the wind energy industry? We are almost up to 20 percent of our electricity from **clean**, renewable sources, most of that wind, though solar is growing quickly. The largest army base in the United States, Fort Hood, is, of course, in Texas. And they ' ve been powered by wind and solar energy now, because it ' s saving taxpayers over 150 million dollars. Yes. What about those who don ' t have the resources that we have? In sub-Saharan Africa, there are hundreds of millions of people who don ' t have access to any type of energy except kerosine, and it ' s very expensive. Around the entire world, the fastest-growing type of new energy today is solar. And they have plenty of solar. So social impact investors, nonprofits, even corporations are going in and using innovative new microfinancing schemes, like, pay-as-you-go solar, so that people can buy the power they need in increments, sometimes even on their cell phone. One company, Azuri, has distributed tens of thousands of units across 11 countries, from Rwanda to Uganda. They estimate that they ' ve powered over 30 million hours of electricity and over 10 million hours of cell phone charging. What about the giant growing economies of China and India? Well, climate impacts might seem a little further down the road, but air quality impacts are right here today. And they know that **clean** energy is essential to powering their future. So China is investing hundreds of billions of dollars in **clean** energy. They ' re flooding coal mines, and they ' re putting floating solar **panels** on the surface. They also have a panda-shaped solar farm. Yes, they ' re still burning coal. But they ' ve shut down all the coal plants around Beijing. And in India, they ' re looking to replace a quarter of a billion incandescent light bulbs with LEDs, which will save them seven billion dollars in energy costs. They ' re investing in green jobs, and they ' re looking to decarbonize their entire vehicle fleet. India may be the first country to industrialize without relying primarily on fossil fuels. The world is changing. But it just isn ' t changing fast enough. Too often, we **picture** this problem as a giant boulder sitting at the **bottom** of a hill, with only a few hands on it, trying to roll it up the hill. But in reality, that boulder is already at the top of the hill. And it ' s got hundreds of millions of hands, maybe even billions on it, pushing it down. It just isn ' t going fast enough. So how do we speed up that giant boulder so we can fix climate change in time? You guessed it. The number one way is by talking about it. The **bottom** line is this : climate change is affecting you and me right here, right now, in the places where we live. But by working together, we can fix it. Sure, it ’ s a daunting problem. Nobody knows that more than us climate scientists. But we can ’ t give in to despair. We have to go out and actively look for the hope that we need, that will inspire us to act. And that hope begins with a conversation today. Thank you.

At this very moment, with every breath we take, major delta cities across the globe are sinking, including New York, London, Tokyo, Shanghai, New Orleans, and as well as my city, Bangkok. Here is the usual version of climate change. This is mine. Nothing much, just a crocodile on the street. This is an urgent impact of climate change : over sinking cities. Here, you can see the urbanization of Bangkok, growing in every direction, shifting from porous, agricultural land — the land that can breathe and absorb water — to a concrete jungle. This is what parts of it look like after 30 minutes of rainfall. And every time it rains, I wish my car could turn into a boat. This land has no room for water. It has lost its absorbent capacity. The reality of Bangkok ’ s metropolitan region is a city of 15 million people living, working and commuting on top of a shifting, muddy river delta. Bangkok is sinking more than one centimeter per year, which is four times faster than the rate of predicted sea level rise. And we could be below sea level by 2030, which will be here too soon. There is no coincidence that I am here as a landscape **architect**. As a child, I grew up in a row house next to the busy road always filled with traffic. In front of my house, there was a concrete parking lot, and that was my playground. The only living creature I would find, and had **fun** with, were these sneaky little plants trying to grow through the crack of the concrete pavement. My favorite game with friends was to dig a bigger and bigger hole through this crack to let this little plant creep out — sneak out more and more. And yes, landscape architecture gives me the opportunity to continue my cracking ambition — to connect this concrete land back to nature. Before, Thais — my people — we were adapted to the cycle of the wet and dry season, and you could call us amphibious. We lived both on land and on water. We were adapted to both. And flooding was a happy event, when the water fertilized our land. But now, flooding means... disaster. In 2011, Thailand was hit by the most damaging and the most expensive flood disaster in our history. Flooding has turned central Thailand into an enormous lake. Here, you can see the scale of the flood in the center of the image, to the scale of Bangkok, outlined in yellow. The water was overflowing from the north, making its way across several provinces. Millions of my people, including me and my family, were displaced and homeless. Some had to escape the city. Many were terrified of losing their home and their belongings, so they stayed back in the flood with no electricity and **clean** water. For me, this flood reflects clearly that our modern infrastructure, and especially our notion of fighting flood with concrete, had made us so extremely vulnerable to the climate uncertainty. But in the heart of this disaster, I found my calling. I cannot just sit and wait as my city continues to sink. The city needed me, and I had the ability to fix this problem. Six years ago, I started my project. My teams and I won the design competition for Chulalongkorn Centenary Park. This was the big, bold mission of the first university in Thailand for celebrating its hundredth anniversary by giving this piece of land as a public **park** to our city. Having a **park** sounds very normal to many other cities, but not in Bangkok, which has one of the lowest public green space per capita among megacities in Asia. Our project ’ s become the first new public **park** in almost 30 years. The

11-acre **park** — a big green crack at the heart of Bangkok — opened just last year. Thank you. For four years, we have pushed through countless meetings to convince and never give up to convincing that this **park** isn ’ t just for beautification or recreation : it must help the city deal with water, it must help the city confront climate change. And here is how it works. Bangkok is a flat city, so we harnessed the power of gravity by inclining the whole **park** to collect every drop of rain. The gravity force pulls down the runoff from the highest point to the lowest point. This **park** has three main elements that work as one system. The first — the green **roof**. This is the biggest green **roof** in Thailand, with the rainwater tanks and **museum** underneath. In the dry season, the collected rain can be used to water the **park** for up to a month. The runoff on the green **roof** then falls through wetlands with the native water plants that can help filter and help **clean** water. And at the lower end, the retention pond collects all of the water. At this pond, there are water bikes. People can pedal and help **clean** water. Their exercise becomes an active part of the **park** water system. When life gives you a flood, you have **fun** with the water. Centenary Park gives room for people and room for water, which is exactly what we and our cities need. This is an amphibious design. This **park** is not about getting rid of flood. It ’ s about creating a way to live with it. And not a single drop of rain is wasted in this **park**. This **park** can hold and collect a million gallons of water. Thank you. Every given project, for me, is an opportunity to create more green cracks through this concrete jungle by using landscape architecture as a solution, like turning this concrete **roof** into an urban farm, which can help absorb rain ; reduce urban heat island and grow food in the middle of the city ; reuse the abandoned concrete structure to become a green pedestrian bridge ; and another flood-proof **park** at Thammasat University, which nearly completes the biggest green **roof** on an academic campus yet in Southeast Asia. Severe flooding is our new normal, putting the southeast Asian region — the region with the most coastline — at extreme risk. Creating a **park** is just one solution. The awareness of climate change means we, in every profession we are involved, are increasingly obligated to understand the climate risk and put whatever we are working on as part of the solution. Because if our cities continue the way they are now, a similar catastrophe will happen again... and again. Creating a solution in these sinking cities is like making the impossible possible. And for that, I would like to share one word that I always keep in mind, that is,”tangjai.”The literal translation for”tang”is”to firmly stand,”and”jai”means”heart.”Firmly stand your heart at your goal. In Thai language, when you commit to do something, you put tangjai in front of your word, so your heart will be in your action. No matter how rough the path, how big the crack, you push through to your goal, because that ’ s where your heart is. And yes, Thailand is home. This land is my only home, and that ’ s where I firmly stand my heart. Where do you stand yours? Thank you. Thank you. Kp kun ka.

Text Sample 730: POS Dim 5 – 2018 – Score 6.00 – 2018/t000502.txt

It ’ s 4am, you ’ ve been awake for forty hours, when you unlock a puzzle containing this video of some kind of dance-off between a chicken and a roller- skating beaver. The confusion and delight you ’ re experiencing is a typical moment at the MIT Mystery Hunt, which is basically the Olympics meets Burning Man for a specific type of nerd. Today, I ’ m going to take you inside this strange, intellectually masochistic and incredibly joyful world. But first, I have to explain what I mean when I say”puzzle.”A puzzle-hunt- style puzzle is a data set.

It can be a grid of letters, a sudoku, a video, an audio — it can be anything that contains hidden information that can eventually resolve into an answer that is a word or a phrase. So, to give you an example, this is a puzzle called”Master Pieces.”It consists of 10 images of LEGO people looking at piles of LEGOs. And to save us some time, I ’ m going to explain what ’ s going on here. Each of the piles of LEGOs is a deconstructed work of art in the style of a famous artist. So, does anybody recognize the artist on the left? They used a lot of red. I heard”Rothko,”yeah. The second one? Mondrian. Alex Rosenthal : Yeah, well done. And the third one? This is the hardest one — Yeah, Klimt, I heard it. Well done, the color is the biggest clue there. So the puzzle has various clues that tell you what matters here are the artists, not the specific works of art. And what you need to do is then look at what you haven ’ t used yet, which is the number of LEGO people in each painting. And you can count them and then count into the artists ’ last names by the same number of letters. So there ’ s three people in front of the Rothko on the left, so you take the third letter, which is a T. There ’ s only one in front of the Mondrian, so you take the first letter, M. And there ’ s three again in front of Klimt, so you take the third letter, I. You do that for all 10 of the original artists and put them in the order, and you get the answer, which is”illuminate.”Puzzles like this are about communicating an idea. But where I ’ m trying to be as clear as possible for you now, puzzles have to navigate the line between **abstraction** and clarity. They have to be obtuse enough to make you work for it, but elegant enough so you can get to the aha moment, where everything clicks into place. Puzzle solvers are junkies for this aha moment — it feels like a brief high and an instant of pristine clarity. And there ’ s also a deeper fulfillment at play here, which is that humans are innate problem-solvers. That ’ s why we love crosswords and escape rooms and figuring out how to explore the **bottom** of the ocean. Solving deviously difficult puzzles expands our minds in new directions, and it also helps us come at problems from diverse perspectives. These puzzles come in various puzzle hunts, which come in various shapes and sizes. There ’ s one-hour ones designed for novices, 24-hour road rallies, and the puzzle hunt of puzzle hunts, the MIT Mystery Hunt. This is an event that takes place once a year and has around 2, 000 people descending on MIT ’ s campus and solving puzzles in teams that range from a single person to over 100. My team has 60 people on it — that includes a national crossword puzzle tournament champion, a particle physicist, a composer, an actual deep-sea explorer, and me, feeling like”Mr. Bean goes to Bletchley Park.”That ’ s actually an apt comparison, because one year involved a puzzle where you had to construct a working Enigma machine out of pieces of cardboard. Each Mystery Hunt has a theme. Past ones have included”The Matrix”and”Alice in Wonderland.”It ’ s often pop culture- and literary-based themes. And the goal is to find the coin that ’ s been hidden somewhere on MIT ’ s campus. And in order to get there, you have to solve around 150 puzzles and do various events and challenges. I had done this for about 10 years without ever dreaming of winning, until January of 2016, where 53 hours into a hunt whose theme is the movie”Inception,”we haven ’ t slept in days, so everything is hilarious... The tables are covered in piles of papers, of our notes and completed puzzles. The whiteboards are an unintelligible mess of three days ’ worth of insights. And we ’ re stuck on two puzzles. If we could crack them, we would get into the endgame, and after hours of work, in a magical moment, they both fall within 10 seconds of each other, and soon, we ’ re on the final runaround, a series of clues that will lead us to the coin, and we ’ re racing through the halls of MIT, trying not to knock over or terrify tour groups, when we realize we ’ re not alone, there ’ s another team on the runaround as well, and we don ’ t know who ’ s ahead. So, we ’ re a mess of anxiety, anticipation, exhilaration and sleep deprivation, when we arrive at the Alchemist, a sculpture in which we find... this coin. Yeah. And in claiming it, we win the MIT Mystery Hunt by a tiny margin of five minutes. What I didn ’ t mention before is that the prize for winning is that you get to construct the whole hunt for the following year. The punishment for winning is that you have to construct the whole hunt for the following year. At the beginning of 2016, I had never constructed a puzzle before — I had solved plenty of puzzles, but constructing and solving are entirely different beasts. But once again, I was lucky to be on a team full of brilliant mentors and collaborators. So, from a constructor ’ s point of view, a puzzle is where I have an idea, and instead of telling you what it is, I ’ m going to leave a trail of breadcrumbs so you can figure it out for yourself, and have the joy and experience of the aha moment. This is another way of looking at the aha moment. And what ’ s incredible to me is that this experience, which is very emotional and kind of almost physical, is something that can be carefully designed. So, to show you what I mean, this is a puzzle I co-constructed with my friend Matt Gruskin. It ’ s a text adventure, which is the old-school adventure game format, where you ’ re exploring, going north, east, south and west, picking up items and using them. And you could get to the end of the game part, but you won ’ t have solved the puzzle. In order to do so, you have to recognize a hidden layer of information, and the easiest way of seeing it is by mapping the game out. That looks something like this. Does anybody recognize what this is? Yeah, exactly. This text adventure takes place within”Settlers of Catan.”Who here knows what”Settlers”is? Nerds. If you don ’ t know,”Settlers”is a board game where you ’ re competing against other people to collect resources and use them to build structures. And within the text adventure, we hid information in various ways, with which you could reconstruct an entire game. You could figure out the roads, the cities, the towns, the resources, the numbers on the tiles, even the dice rolls. You put all that information together and you could extract an answer in a way that ’ s too complicated to explain right now. But find me afterwards if you really want to know. But what this puzzle emphasized for me is the value of perspective shifts in inspiring an aha. So, in this puzzle, you go from experiencing the world on the ground, as a character, to looking down on it from above as if you ’ re playing a board game, and in that shift, you completely reframe all the information you ’ ve been given. The hardest part of construction for me is coming up with a great idea for an aha. Fortunately, the world is a torrent of ideas and information. I ’ ve seen fantastic puzzles constructed out of the waggle dances of bees, and the remarkable coincidence that the 88 keys of a piano can be perfectly mapped to the 88 constellations in the sky. Once you find that out, you can ’ t not construct the puzzle, and it ’ s going to be about having the solvers make that connection in their own minds. Whether you give them stars on a keyboard or play the celestial music of the cosmos, you ’ re getting them there, one way or another. Before long, you find yourself staring at a turtle, and asking yourself,”Is this a puzzle?”And also, staring at a turtle and saying,”I never appreciated what multitudes this contains in its shell alone.”This might be a familiar experience to you, if you ’ ve ever been watching a TED Talk and asked yourself,”Is this a puzzle?”I ’ m not telling. But what I will say is that puzzles can be found in the most unexpected of places. That brings us back to one of my favorite puzzles of all time, which was constructed by Trip Payne. And this time, I ’ m going to play it for you with the sound on, so get ready to name that tune. Who knows what that is? Yeah,”You Make Me Feel Like a Natural Woman.”So you can identify that and seven other songs and clips, and then look at the videos themselves for clues, where the way that they are **filmed** and edited together plus things like the cutaways to the **panel** of five people sitting at a table, which is reminiscent of a **panel** of judges, all of this can suggest”reality competition show.”And either through internet research, or from just recognizing this, you can get to the aha, which is that these clips are shot- for-shot recreations of lip-synch battles from”RuPaul ’ s Drag Race.”So, why do we do this? You tell me, I don ’ t know. So, first of all, it ’ s really **fun**. But I think it also improves our lives in various ways. Being able to solve puzzles, when I ’ m confronted with a challenge, has allowed me to explore it from multiple perspectives before I lock in an approach. Also, the process of solving is great training for working with a team, knowing when to listen, when to share, and how to recognize and celebrate insight and being able to construct ahas is a very powerful tool. Think of how powerful and exciting and convincing an idea is that comes from your own mind, where you make all the connections yourself. So in January of 2017, after tens of thousands of hours of work, we finally run our Mystery Hunt. And it ’ s a different sort of satisfaction than the quick high of an aha moment. Instead, it ’ s the slow burn of saying something through perplexing **abstraction**, yet being understood. And when it was all over, in our exhaustion, we turned to each other and the world, and we said,”We ’ re never doing this again. It ’ s too much work. It ’ s really **fun**, but no more winning.”One year later, in January of 2018, we won the MIT Mystery Hunt again. So, we ’ re currently I don ’ t know how many tens of thousands of hours of work in, and we ’ re two months out from the 2019 Hunt. So, thank you for listening, I have to go write a puzzle.

Text Sample 731: POS Dim 5 – 2024 – Score 7.00 – 2024/t003231.txt

Auntie 1 : Why are you still single? Auntie 2 : How much do you earn? Auntie 3 : You look fat. Niceaunties : I just love aunties. Some of my aunties, I only see during Chinese New Year. I used to brace myself for inquisition prior to family gatherings. They call you fat but present you with platters of delicious food, made with love and great skill. This is exasperating and endearing. I ’ m not alone in this. This behavior and line of questioning is so common we even have memes for it. I grew up in a big family, where the women, my late grandmother, my mother and some of my 11 aunties, were expected to take care of children. They were big influences in my life, and I witnessed great personalities, strength, eccentricity and humor. They held back from fully expressing themselves because of societal pressures, family expectations and lack of support. My grandma spent most of her life at home. She did not travel and had little contact with the outside world. In the last 20 years of her life, she had dementia and was bedridden. I often imagined her in an alternate reality, where she ’ s out and about, having **fun**, laughing, chatting, enjoying life. But aunties are not just about family. Anyone of any age, of any culture, can be labelled an auntie. It is not something you really want to be associated with. As it could mean you ’ re old-fashioned, rigid in your thinking or naggy. So it is rather negative to be called one. Women of my generation live in fear of being labeled an auntie. But what if you could change this perception, turning it from dread to something **fun** and positive? Thank you. I ’ m a designer from Singapore, and in the last year, also an artist. I came across some intriguing and beautiful images on social media and then found out they were made with AI. Curious about what AI could do, I found a program, I signed up, I keyed in some words, and within seconds, images appeared. I was amazed and mesmerized. Never before have I found a medium that felt like the shortest path between my ideas and the visual. It became addictive. Rather than just making images, I wanted to do more with this tool, to tell stories about auntie culture. My mother engages in many social activities. She is very active, a result of her mother ’ s immobility and limited life. She dances and performs just like the aunties do in Singapore ’ s **parks** every day. This was a huge inspiration for me. So”Niceaunties”was born, a project about freedom, exuberance, self-expression and **fun**. It is a lighthearted perspective on the joyful side of auntie life. Also a surreal narrative, loosely based on the women in my family, their social lives, their relationships, their quirks, humor, and, of course, food. In the last 20 years, I worked in architecture, a profession of discipline, rules and clients. I always worked in a team. It was about fulfilling the client ’ s brief and budgets. With AI, it ’ s just me. It ’ s a breath of fresh air. This lack of restraint has transported me to an imaginary world, where my aunties can live freely as themselves, where anything **fun** can and does happen. For instance, aunties in public places, taking photos with sculptures in absurd ways. This is a common sight. A typical holiday photo becomes aunties trying to kiss the moon, but failing badly. Over the course of a year – instead of designing buildings, I developed”Niceaunties”into a world-building project : the”Auntieverse.”Just like in any world, there are cities, citizens, their lives and their culture. Auntieverse is partly inspired by Singapore, where acronyms are used for everything. A sentence would typically sound like :”I ’ m going to take the MRT to the NTUC near my mom ’ s HDB to avoid the ERP.”In the Auntieverse, we have Tofu-Engineered Sushi Luxury Autos, aka TESLA. It ’ s a transportation factory – where aunties assemble food and legs to create vehicles running on leg power. It ’ s very sustainable. In Chinese dialects,”legs”have the same sound as”cars,”so a common joke would be to say,”Let ’ s get around on our own cars.”Meaning we can move around on our own legs, implying self-reliance. So I imagine at TESLA, we have the usual car assembly, a car wash and, of course, a car junkyard. But legs don ’ t just move cars around in the Auntieverse. Buildings use them too, as do animals and vegetables. Another destination in the Auntieverse is MoMA, the Museum of Modern Aunties... Where modern auntie culture is celebrated. This is a social space where aunties gather, hang out, eat, chitchat, have **fun**, chillax. So one day, I said to my mother that she should show others how to make, and then sell, her delicious food. She said”No lah, too tired.”So I imagined NASA, Nice Auntie Sushi Academy – A culinary school on the moon, where aunties share their cooking skills. Here, amazing food is made available for all, 24-7. Aunties in training learn how to forage fresh ingredients on the moon, how to slice fish, and the cat will ensure all lessons go according to plan. But food isn ’ t just used for eating – In the Auntieverse. It ’ s used for all kinds of relaxing activities. I would love to soak in this ramen hot tub with my aunties. Well, sushi is used extensively in Auntie Spa for all kinds of beauty treatments and relaxing body wraps, a reference to many aunties ’ beauty tips, like putting cucumbers and other foods on their faces and bodies. Personally, I have been rubbed down in coffee grounds, and then wrapped in cling **film**. It ’ s very unsettling. Along with many beauty treatments, like **lasers** and acupuncture, I felt like I had to try, under the promise of youth and beauty. So many women undergo the pain of these beauty treatments to maintain body **ideals** and notions of beauty standards. Sometimes, it feels like having construction sites on our faces and bodies. Does it actually work? I don ’ t know. On the lighter end of the spectrum, Aunties ’ Nail Spa provides many beautiful options for our fingers, including very useful tools for everyday life. Cute and practical. Meanwhile, on Auntlantis, a parallel world inspired by Plato and the Great Pacific Garbage Patch, my aunties take a break on the beach, after a day ’ s work **cleaning** out the ocean floor, in a world filled with plastic waste as we know it. My Auntieverse is an ever-expanding narrative of food, culture, family, relationships and the world we live in. I could not have imagined having created this without the help of AI. Before AI, I have never edited a video. This technology lowered the barrier to learning and allowed me to bring my imagination to life in only 12 months. But this isn ’ t just about AI. The Auntieverse is about honoring the memory of extraordinary women who nurtured one another and their families. It is about celebrating personalities and bringing into the spotlight the mundane and the bizarre, like some aunties ’ big permed hair.”The taller the hair, the closer to God,”some said. [Auntie ’ s Hair Spray] [smells nice] [holds shape] [animal testing] [long lasting] [while stocks last!] Thank you.

So have you ever walked in front of a glass facade and see yourself in the reflection and try to check yourself out? Oh wait, wait, I forgot – the glass facade is there not for you, but it ’ s for the people on the inside to get a great view out. And they ’ re probably looking at you picking the spinach from your teeth. Have you ever walked in a city, come upon a very large commercial building, and in the very hot heat of the summer, the doors fly open, you feel that air-conditioned air come out and blast you, and you just sit there and wallow in that cool air? Oh wait, I forgot, that cool air is for the people on the inside. It ’ s a private building. They won ’ t even let you in to use a bathroom. Have you ever wondered why cities get hotter and hotter every year? Oh, wait, I forgot. In order to cool these buildings, the air conditioning systems have to give off air and emit it to the atmosphere, making it hotter and hotter every year, contributing to the heat island effect. So I ’ m an **architect**, a building tech innovator, and a 10, 000-step-a-day pedestrian. And I want to talk about how buildings can not only benefit the people on the inside, but they can actually improve life for those on the outside. So if you go back into history, things were different, right? In the cave, humans had to only worry about the interior, the outside facade was designed by nature. Once leaving the cave, humans then started to stack rocks to make shelter and in doing so inadvertently made some the earliest facades. From there, culture refined, building construction techniques refined, they discovered that the outside facade that ’ s very public-facing can actually tell stories and narratives. It could be used for public service. So they can tell stories about the family, the histories, the conquests, the wealth, the status, all these types of things appeared on facades, and facades became a thing. So fast forward, we have new technologies, new materials. We ’ re able to thin out the building so it ’ s transparent, the facade itself. But the problem is, glass is a very poor insulator. And that glass then can let the heat in, the cool in, and we had to develop big air-conditioning systems, heating systems to make the interiors even tolerable to stay in. And more recently, we want to keep that transparency. We want the glass, the view. But in order to do that and make the systems efficient, we had to expand that facade system again. So it ’ s highly engineered now to keep out the heat, the cold, the moisture and glare. So all these systems, in order to make it happen, even have four panes of glass to do it. It ’ s comfortable, it works. But what do we do next? So I would like to propose that that thickness of the facade still be used to make people on the inside comfortable. But can we think about the outside portion of the facade benefiting people on the outside? Can we actually think about those thousands of square **feet** of surface area? No, millions of square **feet** of surface area inside the city and use it for the public? Can we use it for infrastructure and for public good? So I ’ m going to show you a few technologies of other people that do that. Here, we can make habitats for animals, ecosystems like these for bees, birds, bats, all kinds of animals are even important to cities. This is a habitat for microorganisms. They ’ re invisible, but they ’ re essential to our livelihood, just like the microbiomes inside your gut. Think about the probiotic qualities of it. The same thing has to happen to cities. Water is an important resource. And so in this system it not only collects water, but it also can purify it as well as store it in a hyperlocalized way. So that places where water security is an issue starts to eliminate and reduce. Think about areas that have drought. And we can also modulate the surfaces, perforate the different types of materials in order to reduce the amount of noise pollution in streets. So think about garbage trucks, sirens, honking horns. That type of stuff can actually diminish with new technologies. In my own work, I look at architecture as something that can contribute positively to sustainability, to equity and to wellness. I ' m going to show you two technologies at different levels of development that I use and apply to public health issues. So the first one is a smog-eating **panel** for architecture. And in this case, it actually starts to filter particulate matter and noxious waste in cities in urban-canyon areas. So an urban canyon is when a street is lined by two very tall buildings on both sides, right, forming a canyon-like scenario. And what happens is in these areas, the air movement is very predictable. It comes from prevailing winds, from thermal convection, from the movement of vehicles in there. And it moves in a circular pattern where it makes it very difficult for the heavy particulate matter to escape. So therefore it just keeps going through and accumulates in the **bottom** over time, more and more. So what we ' re trying to do is modulate the surface so the surface can allow those prevailing winds to flow into these tubes, to filter that smog and move out as fresh air. So you can see here we use models and wind tunnels that we build as well as simulation modeling to test it. We pack the tubes together so that we can maximize the efficacy of it, as well as minimize the material it takes to make it. And we put them in such a position of where that wind flow is actually going, and so that it would have an easy time going into the tubes, **cleaning** the air and coming out as fresh air. We also use the thermal convection model, where in the case the pavement is heating the air, that hot air wants to rise up the face of the building. They can go into these tubes also to filter and then send out fresh air. So it ' s done in a very passive way. And not only do we try to apply this to building facades so that the facades are doing the cleaning, we want to actually design these bus shelters that can use this kind of technology, bringing the freshest pockets of air to the people who spend the most amount of time on the streets breathing the worst air. Another technology that I ' m working on is a self-shading window system. Here you can see it. Basically what it does is it shades the interior automatically so that you can use less energy on air conditioning. The idea came from using these thermo bimetal material, which is a material that curls when heated. And we make these very low-tech robots that we do for **fun** in our office. I know, everybody chuckles when they see it, and it ' s important that you know that because what happens is people get connected to them as if they ' re little pets, as if they are alive. And even we name them. This one ' s actually called Roly Poly. So from there, the idea was that we use this thermo bimetal on the facade of a building so that it actually can react to the outdoor environment. And through the course of a day, through the course of a year, as the temperature changes all the time, the building would also change to follow that. And if we can animate a building, then possibly we can get people to also feel more connected to the building, like their pets. And if we do that, we can make people smile more, they can cherish their buildings and they can even feel protective of their cities. So therefore the happiness level of the city can go up as well as mental health. So we embrace this idea of putting bimetal in the facade. In this case, it ' s actually in the cavity of a double-glazed standard window system. And we allow these little critters, again like butterflies, to flutter around and flip. So when the heat comes in... You can see simulated like the sun, these pieces will flip over and respond to any changes outside. What happens, too, is when they flip, you can still see pretty well through the system, it doesn ’ t block your view so that it turns like into a blackout situation. And then when the sun goes away, they go back to their original position. So you know, what happens, too, is because it ’ s a pixilated system, we can put graphics on it. It opens and closes whenever it wants to so that you can start to see the graphics. The result is awe-inspiring. It ’ s biophilic, and it ’ s magical. And I ’ m happy to say that it ’ s also safe for birds, right? Birds on the outside. So it ’ s actually a great thing. We ’ re hoping to put this technology onto buildings as soon as the end of this year, so stay tuned for that. So how can we get a lot of these cool technologies on buildings? This is the big question. I have three suggestions. The first one is change policy. Can we require owners and and contractors and real estate developers to spend a percentage of their construction cost on public-centric technologies for facades? Can we do that? Two, think entrepreneurially. Can owners actually rent, lease, sell this facade to others for infrastructure? Can it be to agriculture? Can it be to even not-for-profit situations? Can it be for utility companies? There ’ s a lot of possibilities that can happen. And three, advocate for change. Renters inside the buildings must start to demand that their building facades are much more magnanimous. Because think about it : everybody in these buildings must come out to the streets, too. And together we can actually enjoy the improvements to our society and public health. So next time you go out into a city and you ’ re walking around, look carefully at the buildings. They don ’ t have to be just a pretty face. They can serve a bigger purpose. Thank you.

You ’ ve probably all heard that solar modules are cheap, but I ’ m not sure you appreciate just how cheap. You can buy a solar module for the price of about eight cups of the posh coffee you get here in Brussels. You can make solar **panels** into a fence, and it ’ s not significantly more expensive than ordinary **fencing** material. But this isn ’ t just great news for rich Europeans who drink posh coffee. Solar power is starting to displace fossil fuels in the countries that most need cheap and **clean** electricity. Now, I have been an analyst of this sector for nearly 20 years and the growth is really impressive. This chart shows new solar built every year, and last year, 444 gigawatts of solar modules got installed worldwide. More than half of that was in China, actually. Four hundred and forty-four gigawatts is quite a lot. It ’ s more than the power capacity of Japan. And even more is being installed this year. It ’ s probably just under 600 gigawatts. But I have to take you off on a diversion now to complain about how hard my job is. Back in 2007, there were about 12 countries installing solar, and the official data coming out of them was good. Now my team is trying to cover 146 solar markets, and some of the data is really bad. Even Germany and Spain are installing more solar than is in their official data. So what hope is there for good data about countries in Africa or Southeast Asia? Take, for example, Pakistan. Now this chart shows the exports of solar modules from China to Pakistan according to China Customs. It reports in dollars, but we convert to gigawatts using average prices. So the official data on how much solar is installed in Pakistan is that there ’ s less than three gigawatts in the country. But more solar modules left China for Pakistan in 2022 alone. Now, we did think that substantial amounts of those were being re-exported to Afghanistan to run irrigation pumps, to grow poppies, to make heroin. And there ’ s also a money laundering scheme which distorts the data. But these don ’ t seem to be that big. And in 2024, things got ridiculous. Sixteen gigawatts of solar modules have left China for Pakistan in the first eight months of this year. What is going on here? I worked with a machine-learning and satellite data firm called Atlas Maps to detect the solar modules in Pakistan. Now, the great thing about detecting solar modules using satellite data is you can ’ t really hide solar modules. The bad thing is that they are distributed, they ’ re quite small installations, and sometimes they look a lot like greenhouses or skylights. But Atlas Maps found 443 installations in Pakistan, many of which we had no idea existed, and looking a lot like the ones on the right of this map, that ’ s some rooftop solar. It also missed some, like, you can see some on the left of this map that the machine-learning algorithm just did not detect. But you can see them. You would see them better if the **picture** was better, but they ’ re there. What the satellite data did confirm is that solar modules in Pakistan are installed near the industrial clusters of Lahore, Karachi and Islamabad. And actually, if you go on Google Earth and just look at a random spot somewhere in Pakistan, in these cities, you can see that loads of the **roofs** have solar **panels** on them. It ’ s really incredible. So the solar boom in Pakistan is really happening. It ’ s not just an artifact of China customs data. So why? So unfortunately, Pakistan is vulnerable to extreme temperatures. In 2024, 500 people have died in Pakistan in heat waves and temperatures reached 52 degrees Celsius So this is a country where people really need fans and air conditioning to survive. But power is expensive in Pakistan, increasingly expensive, and the total power capacity per person in Pakistan is 1 / 18 as much as it is in the United States. This is a country that really needs power. Now, the good thing about solar **panels** is that they generate in the daytime. So if you want to run air conditioning and fans, they ’ re generating at the right time to do that. And we ’ re pretty sure that this is what businesses and homes in Pakistan are doing. They ’ re installing solar **panels** to reduce how much they have to pay the grid and to run their cooling systems, as well as the other stuff that they do. But this is a problem for the largely coal-fired grid in Pakistan because it ’ s losing its best customers, which means it has to put up the prices for its remaining customers to fund the continuing operation of its coal plants. Which means that those remaining customers have higher prices and even more reason to go solar. And the power demand in Pakistan fell nine percent in 2023 as tracked by the grid. And this is probably partly because power is expensive, but also because of all these solar **panels** that are not being seen by the grid. So... As analysts – obviously, this is complicated, but we feel generally glad that Pakistanis are getting their power from cheap and **clean** sources. It seems in general a good thing. But you can ’ t always expect solar build to just go steadily up. Solar markets are more like a roller coaster. Actually, we call it the solar coaster. Take, for example, South Africa. This is data on rooftop solar new build by month from state utility Eskom, which has a really interesting way of tracking this data. It estimates rooftop solar build by the power demand it doesn ’ t see on the grid at particular times. There was a boom in solar installations in South Africa because it was a really bad blackout season, and people literally built solar, so they had power. And as analysts, we got really excited about this. A gigawatt of rooftop solar was built in two months. A gigawatt is the size of a medium-sized coal-fired power plant. OK, it only runs in the daytime, but it works. So we got really excited. We thought that South Africans would copy their neighbors, and the South African solar market would keep going up and up and up. We were wrong about that. The solar market has fallen back actually in South Africa in 2024, and this is because there were fewer blackouts. And this is partly because Eskom fixed its coal-fired power plants. Yay! But also because the solar is helping to support the grid. So it ’ s not always simple, but cheaper solar power is helping poorer countries to meet their power demand without increasing fossil fuel use. And this is what makes my job interesting. But what we need is to stop burning fossil fuels. And it ’ s most obvious that solar is helping there in markets with less unmet need for power. Take California, for example. This is an average day of power supply on each year from 2012 to 2023. In 2012, California got 43 percent of its power from **gas** burned in state, and it imported 29 percent. By 2015, you can see the little yellow bit in this chart, that ’ s large-scale solar eating into power imports in the middle of the day. And by 2023, on an average day, there is so much solar that the state is exporting power around noon. So this is having an impact. What ’ s next? Well, do you see the little pink bit in 2022 and 2023. That ’ s batteries. Batteries are doing exactly what they ’ re meant to do. They ’ re charging on solar in the daytime, and they ’ re discharging in the evening so that the gas-fired power plants don ’ t have to be ramped up. And thanks to all these trends, California carbon emissions per unit of electricity generation have fallen over 30 percent since 2012. So solar power is pushing out fossil fuels in both richer and poorer countries. And the next step is probably batteries working with solar and working with wind and other renewables to continue to push out fossil fuels. This is actually working. And that is why I have hope that we can beat climate change. Thank you.

Text Sample 734: POS Dim 5 – 2023 – Score 9.00 – 2023/t003333.txt

Christiana Figueres : There ’ s no doubt that we are facing exponential impacts of climate change. There is also, however, no doubt that that is being met with exponential progress of the technologies that can help to address climate change. So what we have here is, frankly, a race between two exponential **curves**. By 2030, we collectively will have chosen between door number one. And door number two. Julio Friedmann : The question I am most commonly asked about climate change is :”Should I be optimistic or pessimistic?”Cynthia Williams : Here ’ s what we need to do to make sure that we ’ re ready for an all-electric future. Anika Goss : Being financially secure and climate resilient should be the most important priority. Faustine Delasalle : It ’ s really easy when you look at where we are today and where we ought to be by 2030, to feel like there ’ s a huge gap that will never be filled. But we have good reasons to say that that gap is actually fixable. Nigel Topping : If you ’ re not worried or anxious, you ’ re probably not paying attention. But we should also not be defeatist. We shouldn ’ t say,”We ’ ve done nothing, we ’ re failing.”We ’ ve really started 20 years too late, but it takes a long time to get the flywheel of momentum going. Kingsmill Bond : The tide of change is coming. The costs keep falling. The political pressure keeps increasing. JF : We ’ re going to build a thriving, exciting world. AG : We can do this. JF : Full of potential. AG : We have to do this. [TED Explores A New Climate Vision] Manoush Zamorodi : When it comes to climate change, are you an optimist or a pessimist? News about the climate can be overwhelming and emotional, to the point that many of us just feel numb. I ’ m Manoush Zomorodi, a longtime public media journalist and host of the TED Radio Hour. And today, we want to bring you something special : an hour of nuance, of real people and clarity about what is happening to our planet and what we ’ re doing about it. Because we all know there ’ s plenty of bad news when it comes to the climate crisis. But guess what? There ’ s also some really good news. That ’ s why we ’ re here in Detroit at the TED Countdown Summit, where a cross-section of people who know the most and who are doing the most have gathered to share their ideas and plans with each other and with you. You ’ re going to hear from some incredible speakers about their personal stories and tested solutions. But first, let ’ s get a quick reminder on the basics : climate change in a minute or so. [Prologue : What is Climate Change?] David Biello : The air we breathe has changed. The mix of **gases** is shifting, with more and more greenhouse **gases** like carbon dioxide. And the shift is happening faster each year. In just a few hundred years, fossil fuels formed over eons have been burned as coal, oil and **gas**. The exhaust has transformed the entire atmosphere and ocean. It ’ s like a pollution blanket. And the result we know as climate change. The planet has already warmed more than one degree Celsius and is on a path to heat up even more. That may not seem like a lot, but it ’ s already caused major destruction across the globe. To give us some room to breathe, the world must reduce greenhouse **gas** pollution by more than seven percent each year, every year of this decade. There are a number of ways to do that. Let ’ s start by looking at the greenhouse **gases** themselves. CO2 makes up nearly 75 percent of the pollution emitted each year. And then there ’ s methane or natural **gas**, which makes up 17 percent. Finally, there ’ s nitrous oxide, making up six percent of the problem. There are other greenhouse **gases**, but these three make up the bulk of the climate challenge. Where do they come from? There are several ways to break down the sources of greenhouse **gas** emissions. Here we ’ re using the public Climate Watch data. Start with energy. The majority of modern energy comes from burning fossil fuels, which makes the energy sector 76 percent of the climate challenge, including the fuels used for transportation, industrial processes and agricultural production. Farming and animal raising also have to change, as agriculture accounts for 12 percent of greenhouse **gas** pollution. The remaining 12 percent comes from a grab bag of human activities like industrial heating, clearing forests and more. This is the climate challenge we face : going from adding billions of metric tons of greenhouse **gases** to the air each year to adding zero. Will it be easy? No. Can we do it? Yes, if we choose to. MZ : OK, so that ’ s the situation. Where do we go from here? Well, we ’ ve all heard of a tipping point, that moment when an idea or concept finally takes hold and then changes the world. Well, the UN ’ s climate chief, Simon Stiell, believes we are almost at a tipping point for massive action on climate change. And to get you ready, he wants to take you back to the early ’ 90s, when he was an executive at Nokia, and the world wasn ’ t sending text messages yet. [Chapter 1 : Exponential Change] Simon Stiell : I want you to imagine it ’ s 1992, and you ’ re talking to a telecoms expert. She tells you that mobile phone text messaging is going to fundamentally change the way we communicate. You think, why on Earth am I going to go from this to tapping on a screen with my fingers and my thumbs? But then, after a slow start, text-based services exploded. Today, over 23 billion messages are sent every single day. This paved the way for the smartphone revolution. I know how much we struggle to comprehend and predict what exponential change means, because I was at Nokia in 1993 when that technological revolution started. And now, as head of UN climate change, I ’ m here to tell you that what was true for mobile phones is also true for climate action today. We ’ re here in Detroit, the heart of car manufacturing. Take a look at this graph. Electric vehicle sales are expected to increase to become 70 percent by 2030. Another example, solar energy. Between 2010 and 2020, we moved from 20 gigawatts of solar energy installed to 150 gigawatts. And by 2030, that number is expected to increase again, to 1, 000 gigawatts per year. Change can come fast. FD : So exponential change means that change happens very slowly at first and then comes a tipping point. And suddenly things accelerate and accelerate and accelerate. NT : It ’ s a mathematical term, but it means basically stuff happens very slowly and then it goes really fast. Tessa Kahn : Governments and experts have consistently underestimated the pace and scale at which we can deploy renewable energy and how quickly renewable energy and associated technologies become affordable. Ramez Naam : I predicted in 2011 that we ' d have solar as cheap as coal in some parts of the world by 2015 and half the cost of coal by 2020, and everyone thought I was crazy, I ' ve got to say, almost. And in fact, I was wrong. The actual decline in the cost of solar happened twice as fast as I thought it would. Solar prices today are a century ahead of where the world ' s leading energy experts thought they ' d be in 2010. KB : It ' s now spreading from solar, so it ' s happening also in the wind sector, it ' s happening in the battery sector, it ' s happening in the electric vehicle sector. CF : I don ' t think that we do a good job at communicating the fact that we are progressing more than is commonly known. Nili Gilbert : The human brain is trained best at thinking about linear change. But when you think about an exponential **curve**, next to a line, at first the exponential **curve** is below the line, and so it ' s moving more slowly than you would think. And then it crosses the line and it ' s moving faster than you would think. Habiba Daggash : We call it cautious optimism. We ' re very hopeful about the trajectories that we ' ve seen. But we shouldn ' t let up yet. KB : So we can make this change happen slow or we can make it happen fast. The key point to say is we have agency. MZ : This idea of exponential growth sounds awesome. It sounds amazing, but is it actually happening? Well, I ' m headed into a workshop with industry and climate leaders to find out. The moderators of the workshop challenged us to hold two competing ideas in our minds at the same time. NT : What we ' re really going to explore today is two apparently opposing realities, and they ' re often two opposing narratives. The one which is true, right, is that in terms of the Paris goals, we ' re way off track. We ' re deep into the emergency. But what we ' re going to explore today is the other reality that we know what to do. Exponential change is happening, but it doesn ' t happen by magic. MZ : So what are we seeing in different industries? Well, let ' s start with one that ' s known to be really difficult to decarbonize : cement. Vicente Saiso Alva : I think everything converges into making climate a huge urgent matter for society. We started to feel the pressure from all different types of stakeholders, and in one year of running this program, we realized how fast we could move and how fast we were going in reducing CO2 emissions, which means now to go from 40 to close to 50 percent reduction by 2030. MZ : Encouraging, but to tackle that remaining 50 percent may require technologies that don ' t exist at scale yet. OK, what about shipping? Narin Phol : In Maersk, a few years back, we came out with a net-zero ambition by 2050, and in a few years later, based on the data that we have got, we ' ve really seen a path that we can really accelerate that one. That ' s why the revised target of 2040 came in. MZ : The news in offshore wind was quite dramatic. Jennie Dodson : So my moment of mindset shift was in 2019. The government put out a request to bid for offshore wind permits. And that year the price that came in was two thirds less than just four years before. And really critically, it was the same price as the mainstream market. And that was transformative. Nobody expected that when they started. MZ : The conversation got pretty technical and a bit wonky. NP : So to drive exponential growth, you focus on a reinforcing loop to make sure it works and you slow down on the balancing loop. MZ : But the takeaway is that certain sectors, like EVs and renewables, are being upended, while others, like cement and heavy industry are further behind. But generally across every industry – JD : It ' s amazing stuff. MZ : There ' s an understanding that they all need to work together. And the message? Big change can happen. It ' s going to be hard, but some of us are already doing it, so learn from us. [Chapter 2 : The Electric Vehicle Revolution] OK, we are in an exponential mindset. And as you heard, one example of exponential growth might be sitting in your driveway right now. Electric vehicles are finally really happening, which means that people here in Detroit are rethinking the auto industry. They ’ re rethinking their jobs, their identity. Take Cynthia Williams, head of sustainability at Ford. I sat down with her at Lucky Detroit, a local coffee and barber shop, where she told me that there are three things that need to happen for electric vehicles to go to the next level, from this tipping point to exponential growth. CW : The three things for me are change, collaboration and capacity. So the change piece of it is changing the way folks think about the vehicle, making sure that they understand we ’ re bringing a better vehicle to the customers. MZ : So you don ’ t have to make a sacrifice. CW : I think one of the things we need to do is actually get people in the cars and show them how **fun** it is. And it ’ s no different, it ’ s just powered by a battery. We are at a tipping point. We ’ re at a point of acceleration of electric vehicles. Many are calling it the electric vehicle revolution. Now with that comes unprecedented change that will require us to build new capacity and collaborate in ways that we ’ ve never seen before. To make things happen faster, you have to think differently. You can ’ t just collaborate with the same people because you get the same answer, right? You need to broaden your collaboration space. Go outside of your industry, understand what worked in Norway, for example, to get them to where they are. MZ : Where ’ s the weak link, Cynthia? What ’ s the thing that you ’ re like, that if we don ’ t push through that, we may not get to this full adoption? CW : The critical things that we hear from the consumers is they need infrastructure. That ’ s what it ’ s taking for us to work with governments to make sure that we bring more charging to everyone, whether it ’ s rural, urban, wealthy, low-income, we all need chargers. And I ’ m not saying we need one on every corner, but we do need many, many more. When we start building out the charging infrastructure, we need lighting. We need, you know, security, shelter, we need restrooms. We need other amenities so that people know where to go, where to charge. Next comes capacity. We have to invest in new facilities and talent. Now, that ’ s true for any industry transitioning to greener goals and strategies. And we ’ re investing in talent, we ’ re investing in education and training, and we ’ re also listening to the communities where we live and operate. MZ : So a young Cynthia Williams, now, your counterpart who ’ s studying engineering, will she be learning something very different if she wants to go and work in the automotive industry in Detroit? CW : There will be different options, right. And so, I ’ m a **mechanical** engineer by trade, but I think there will be opportunities for electrical engineering, software engineering. And there ’ s even certificates that students can get instead of going through a four-year college. It ’ s the proper training to get them right, to be dedicated, to build the vehicles that we need for the future. At the end of this year, globally, we ’ ll have the ability to produce 600, 000 electric vehicles. And in 2026, we ’ ll have a global goal to produce two million electric vehicles. And it just goes up from there. MZ : What is this going to look like, this growth for me in the next couple of years, in five years, in 20 years? CW : **Clean** air. That ’ s what I look at. If you think about when we were, during the pandemic, when everybody stopped driving and they were at home, clear skies and moving to zero tailpipe emission vehicles. And if you chose an electric vehicle, that ’ s you participating and you contributing to a better world, to a better future. We have come a long way. It ’ s so gratifying to see electric vehicles on the road, to move from aspiration to reality. To see plants dedicated to building electric vehicles. We have the technology, we have the leadership, we have the ingenuity to respond to the environmental crisis with courage. And I ’ ll tell you, as a person who ’ s dedicated my entire career to sustainability, the road ahead is paved with promise. TED-Ed : If you were buying a car in 1899, you would have had three major options to choose from. You could buy a steam-powered car, typically relying on gas-powered boilers. These could drive as far as you wanted, provided you also wanted to lug around extra water to refuel and didn ’ t mind waiting 30 minutes for your engine to heat up. Alternatively, you could buy a car powered by gasoline. However, the internal combustion engines in these models required dangerous hand cranking to start and emitted loud noises and foul smelling exhaust while driving. So your best bet was probably option number three : a battery-powered electric vehicle. These cars were quick to start, **clean** and quiet to run, and if you lived somewhere with access to electricity, easy to refuel overnight. If this seems like an easy choice, you ’ re not alone. By the end of the 19th century, nearly 40 percent of American cars were electric. In cities with early electric systems, battery-powered cars were a popular and reliable alternative to their occasionally explosive competitors. But electric vehicles had one major problem. Batteries. MZ : Flash forward to the present and batteries are still on everyone ’ s mind. So I visited Mujeeb Ijaz, the founder of the energy storage company One, who also happens to be an electric vehicle history buff. Mujeeb Ijaz : So this is a 1922 Detroit Electric. MZ : OK, so 100-year-old vehicle. MI : That ’ s right, electric vehicle. And then this was Walter Baker. He developed the Baker Electric. And he made the range run 201 miles on a single charge. He also felt strongly that you should be able to wear your top hat, you know, so he has a taller carriage. These had lead acid batteries to begin with. And then Thomas Edison introduced the nickel-iron battery. So this is the battery compartment, one of the battery compartments. And this is where you would charge. MZ : Right there? MI : And we ’ re building on what these original pioneers did. And I think it ’ s important to not think about us starting from scratch now. But go backwards, think about how they solved the problem, what disrupted their ability to advance this to the market, and then pick those problems up and make sure we don ’ t get stuck again. MZ : So we ’ ve been here before, a moment when electric vehicles could have taken off but didn ’ t. So what do we need to do differently this time? MI : Electric vehicles were able to deal with mobility in urban areas, but there were charging deserts where rural driving resulted in no way to get back because you couldn ’ t find electric charging everywhere. And that was a problem. MZ : And that ’ s what people are worried about right now. We ’ re at the same thing. We ’ re worried about range, we ’ re worried about accessibility. All of the things are the same. But the key difference being that we now know that our planet can ’ t keep going like this. MI : That ’ s right. Had the vision of the Model T assembly line and mass manufacturing been applied to electric car, the electric car would have also dropped in price, but range and charging deserts would have still been the obstruction. MZ : OK. We didn ’ t have the technology, but we do now. MI : We do now. MZ : In the US, there hasn ’ t been a mass move to electric vehicles... yet. Mujeeb ’ s company is one of many who want to change that by building batteries that give drivers longer range. And these batteries aren ’ t just for cars. MI : So we produce battery packs for transportation, but we ’ ve also started developing the same battery products into grid batteries. So micro-grids are those technologies that combine solar and storage and replace a coal plant or a natural **gas** plant for generating electricity. So buildings and industry and transportation all working together. And that ’ s an exciting future, is all these industries working together, that makes me more confident that we ’ re at the time in history where this transition will take place. MZ : How many years till we get to that? MI : I think it ’ s within 10 years. MZ : No way, 10 years? MI : We ’ re in a place where that transition is going to be much more visible, and then we just need technologies to drive it up to the mass markets. MZ : I am so excited. Like, genuinely so excited. Everyone everywhere driving electric sounds great, but that also means that the power to charge all those vehicles needs to be green. And that brings us to the energy sector, which is also changing at an incredible pace, even though renewable energy has been years in the making. [Chapter 3 : Renewables] TED-Ed : In the spring of 1954, the press excitedly gathered around Bell Laboratories ' latest invention : a silicon-based solar cell that could efficiently convert the sun ' s energy into electrical current. The creation was celebrated as the dawn of a new era, as reporters touted that civilization would soon run on the sun ' s limitless energy. But the dream had a catch. As this first commercially sold solar cell cost around 300 dollars per watt, meaning at its current rate it would cost well over a million dollars to buy a unit large enough to power a single home. But today, in many countries, solar is the cheapest form of energy to produce, surpassing fossil fuel alternatives like coal and natural **gas**. Millions of homes are equipped with rooftop solar, with most units paying for themselves in their first seven to 12 years and then generating further savings. So how did solar become so affordable? A turning point in solar ' s price history occurred on the floor of Germany ' s parliament, where in 2000, Hermann Scheer introduced the Renewable Energy Sources Act. This legislation laid out a vision for the country ' s energy future in solar and wind. It incentivized citizens to personally invest in rooftop solar **panels** by guaranteeing payment to homeowners for the renewable energy they generated and sold to the grid. The pay rate for this electricity was highly subsidized, at times reaching four times the market price. Several other countries soon followed Germany ' s example, implementing similar policies and incentives to drive their country ' s solar use. This created unprecedented demand for solar **panels** worldwide. Manufacturers were able to scale up production and innovate in ways that cut costs. As a result, solar **panel** prices dropped while efficiency grew. HD : We see the cost reduction in solar and other renewable energy technologies has been so steep, but a lot of it is because of the enabling regulatory and policy environments created in places like the European Union and the US. Akil Callender : We cannot divert catastrophic climate change without addressing emissions coming from our energy systems. Currently, emissions from the energy system account for around two thirds of global greenhouse **gas** emissions. So the good news is, yes, we are seeing tremendous progress across the globe in renewable energy. It ' s rolling out faster than ever before. Luisa Neubauer : The brilliant thing about energy supply in the world is that we have alternatives. So we don ' t need fossil fuels to provide safe and equitable access to energy systems. Ramón Méndez Galain : Almost 90 percent of the total new installed capacity all over the world is just renewable. This is a tremendous change. AC : There ' s more finance than ever before going into **clean** energy. In many countries, it is the largest contributor to their electricity system for the first time ever. KB : And also because China is the leading manufacturing nation in the world, change is happening there much faster. And those innovations are then spreading around the world. Hongquiao Liu : China ' s coal demand might not have peaked, and China will continue to consume quite a lot of coal in the next few years. But the decarbonization is happening. It ' s happening faster than anyone has expected, and China is adding an astonishing amount of wind and solar to its grid every year. Eduarda Zoghbi : I think one of the biggest obstacles today are natural resources, in the sense that we ' re talking more and more about critical minerals and the role that they have. And batteries are demanding a lot of critical minerals that are present in most of the developing countries. So I think that even though costs are decreasing, we have to be more and more creative when it comes to recycling the batteries. We also have to think of how they ’ re impacting local communities. KB : So to give you the numbers, we extract, at the moment, 15, 000 million tons of fossil fuels every year. The International Energy Agency says that we will need about 43 million tons of critical materials in order to build out the **clean** energy economy. So that ’ s 300 times less stuff that is required. It ’ s worth saying that the impact of extracting 300 times less stuff upon nature is dramatically lower. And I know that it ’ s often argued that the renewable economy may be damaging for nature. Again, this is a completely false statement. It ’ s in fact, our only chance of reducing the pressure upon our natural resources, because there ’ s far less of it. MZ : Of course, transitioning to using **clean** energy, upending industries, it has to happen across the world, not just here in the US. And it can be hard to even imagine what life will be like. But carbon scientist and futurist Julio Friedmann can help us. Julio Friedmann : I think we need a compelling vision of the future that gets people excited about the energy transition and solving climate change. Right now, it ’ s like we ’ re at a restaurant and there ’ s two options : burnt toast, unflavored oatmeal. And people are not excited about either, right? The burnt toast option for me is what I call the big switch. Everything ’ s the same, it ’ s just **clean**, but it costs a lot of money and it ’ s super hard to do. The other vision is kind of like,”Thou shalt not.”That vision is a narrower sort of,”eat your peas,”hair shirt kind of vision of the future. And a lot of people don ’ t want that either. And there ’ s nothing in the physics, chemistry or biology that says we can ’ t have a super interesting, exciting, vibrant world. And that is compelling in a way that we have not heard yet. MZ : Help me out here, what does that even look like? JF : So, for lack of a better word, like, I like the Marvel cinematic universe. MZ : OK, I ’ ll go with you. JF : So a place like Wakanda, right? It ’ s got flying cars, it ’ s got maglev trains, and it ’ s a totally fabulous place to live. Like, they ’ ve got lots of food. That is built on abundant, sustainable, cheap energy. MZ : OK, so like, we ’ re not Wakanda, we ’ re not in the Marvel universe. This is real life, sort of. How do we make this possible? JF : So what can you actually do here on Earth, constrained by economics and engineering and all the rest of it, right? And the answer is we can do an incredible amount. Abundant, available where you want it, when you want it. Everybody should have energy, including the three billion people who use less electricity than my refrigerator uses. Well, the good news is, every day, the Earth receives 163, 000 terawatts of energy from the sun. About half of that bounces back to space, but about 80, 000 terawatts arrive at the Earth in a form we can use. For reference, today, the world uses about 26 terawatts of energy, and we got more than solar and wind. We have geothermal, we have hydro, we have nuclear. There ’ s other kinds of **clean** energies. And some of the best resources are, in fact, in the Global South. These places are not simply future climate victims. These places are latent energy superpowers. My favorite example of this is Chile. Almost eight years ago now their government said, wait a second, we can make the cheapest green electricity on Earth. We have hydropower, we have solar power, we have wind power and the best resources anywhere in the world. So let ’ s start by making a lot of green electricity. And then they said, because of that, we can also make green hydrogen cheaper than anywhere else. And then Japan was like, hello, we want your green hydrogen. Can you ship it to us? MZ : Is that possible? JF : Totally. And Japan is like, we will also give you money to pay for these projects. We ’ ll loan you money to pay for these projects. Could you please use Japanese technology? So they ’ re using Japanese turbines, electrolyzers, they ’ re using Japanese ships to haul the ammonia around. So Japan gets rich on this, Chile gets rich on this. MZ : Win-win. JF : Totally win-win. MZ : Win-win-win, planet, too. JF : And that model, other countries are looking at that, going, I want some of that. And that ’ s why I like this vision of abundance. 15 years ago, solar was the most expensive power. Now it is the cheapest form of electricity, right? Which is astonishing, it ’ s totally amazing. And a whole bunch of people are like, now we ’ re done. And I ’ m like, no, we can do that with everything. We can do that with wind. We can do that with nuclear, we can do that with geothermal. But these projects take time, money and people. We need to develop the human capital as part of these investment projects for decades. And innovation, we need much more energy in many places, much cheaper. That ’ s an innovation agenda. For solar, that was the United States, Germany, China and others acting together. Well, if that ’ s the recipe, we can do that again. We ’ re already doing it with electric vehicles and **clean** hydrogen production. We can certainly do it by turning electricity into fuels. MZ : It sounds like the climate discussion needs to be kind of like improv, that it ’ s a”yes and”sort of thing. JF : I ’ m so glad you said that. So many people don ’ t understand my love of improv comedy. Yes, it is a”yes and”circumstance. Because mostly it is about room for agreement. Where do you find the point where everybody is like, I can agree on that? One of the things I love about the infrastructure bill, one of the things I love about the Inflation Reduction Act, neither of them had the word climate in it. They were both massive climate bills, right? That was a way to get everybody on the same page. Nationwide, they basically tripled the **clean** energy research budget. That ’ s a good start. But that made it all of one percent of GDP. And for comparison, we spend twice that on pharmaceuticals. So I think it ’ s fair to say we should get going. We should spend a lot more money. We ’ ve done stuff like this before. We ’ ve done World War II, we ’ ve done the Marshall Plan, like, we ’ ve done the space shot, like we actually know how to move really quickly as a nation. We did this for COVID. Collective action, building together is what makes the difficult possible and nourishes the soul through mission and purpose. We know what to do and we can act, not out of anger or fear, but out of generosity and common purpose, bringing aspiration and humility together. We ’ re going to build a thriving, vibrant, exciting world full of potential that ’ s going to be built on the back of infrastructure, innovation and investment that will harness the abundant, sustainable, cheap energy that is our planet ’ s endowment. Thank you. [Chapter 4 : A Just Transition] FD : There is a high risk that when those exponential kick in, we see businesses running after those opportunities. But then the distribution of the benefits being very unequal. EZ : Many people like discussing the importance of the just energy transition. And a lot of people don ’ t understand what justice really means. If we are to reach a revolution, a renewable energy future has to be inclusive. AC : We have this push for what we ’ re calling a just and equitable energy transition. We need to make sure that we are not exacerbating inequality, but rather we are ensuring that that gap is closed and that the groups that have been historically marginalized are not once again being marginalized in a new way. NT : Most of emissions come from wealthy, energy-guzzling citizens, but a lot of the economic benefit and human development benefit will come not from decarbonizing high-carbon lives and lifestyles, but from providing **clean**, distributed energy and tools and solutions to those who don ’ t have access to any of them. LN : When we speak of countries in need of economic development, we mostly speak of countries that are hit by the climate crisis the hardest right now. It should be the biggest wish and job and task for all those countries who have burned so much fossil fuel already to support any other country in the so-called Global South, to get an economy running without fossil fuels, to not repeat all the mistakes that we have made. HD : To ensure that the solar revolution that has been seen around the world comes to places like Africa, we need to be really conscious that the history and the lived experience when it comes to energy is very different for poor countries. Rebekah Shirley : We love to remind Global South communities, especially Africa, about the vast renewable energy potential that they have, which is true. But the finance flows to deliver on that potential remain very scarce. Africa, despite being 90 percent of those across the entire globe that still do not have access to electricity and being 17 percent of the global population, we ' re actually two percent of international finance. Money doesn ' t actually flow to these spaces naturally, and we need to do a lot of work to get global finance to these spaces. MZ : A world of abundant **clean** energy for everyone. That is the goal. But what about in the short term? Take Detroit. This once-wealthy city has been through some seriously hard times. How is it rebuilding itself so that everyone here can thrive while dealing with extreme heat, flooding, and other climate problems? Anika Goss is looking to Detroit ' s past to plan its future. AG : I am a third-generation Detroiter. My grandmother moved to Detroit in 1936 during the Great Migration and brought all of her southern ways with her. She owned a home and knew that home ownership would create wealth and opportunity for her growing family. Up until the late 1950s, Detroit was a haven for middle-class families living in neighborhoods where there was green space and community connectivity and opportunity. My grandmother, she had this amazing garden, and it was just abundant. There were all kinds of flowers and food. You know, she grew vegetables back there, and it was just a magical place for a little girl. MZ : I mean, what you ' re describing is a Detroit that, yes, has huge problems, segregation. But at the same time, a woman, she can have a job, she can own a house, she can raise her family, she can have fresh fruits and vegetables. AG : It was certainly a place where you could gain economic opportunity faster than you can now. My grandmother ' s Detroit is not the Detroit that I live in today. All of those sites where there was manufacturing and industrial sites that led to our economic boom, many stand vacant and abandoned. These industrial sites have led to dangerous contamination to our land and our water and our air. MZ : So, just lay it out for us. For people who maybe don ' t see, like, how is there a link between economic inequality and climate change? AG : You know, I ' m so surprised that it feels like separate problems. But I ' m also really glad that people are asking. Because if you ' re living around and working in a community that is low-income, where there are fewer jobs, the housing is deteriorated, this is a neighborhood that ' s also more likely to be closer to a factory that ' s emitting pollutants, likely to have water that ' s contaminated, probably has fewer **parks** and fewer intentional green spaces. The people who are living in those communities are at risk for climate impacts first. So we have to do something in those neighborhoods right away. MZ : So what can this healthier future look like? Anika showed me some of the work she ' s done in partnership with different neighborhoods in Detroit, to make them both more enjoyable and more resilient. First, she took me to the Circle Forest. It ' s an oasis right in the middle of the city. AG : This is six lots that were vacant, and we all worked together with this community to build a forest. MZ : Beautiful and a great example of how nonprofits can work with communities to transform them into sustainable, welcoming places. AG : We might have a good idea about gardens and tree planting, but this is where people live. And so you ask first. This is a new effort, of this idea of a resilient neighborhood or calling it that. So these are large tracts of vacancy that can be used to provide environmental sustainability, community **resilience** and beauty. Watch for the poison ivy. It ' s not pretend. MZ : Next we met up with Katrina Watkins, the founder and CEO of the Bailey Park Neighborhood Development Corporation, a group revitalizing this historic area by turning vacant lots into **parks** that can stand up to extreme weather. Katrina Watkins : My family has been in this neighborhood since 1946. I grew up hearing the stories from my dad, him telling me about how people thought it was a ghetto, but it wasn ' t. Those were families, and people worked and had businesses, and people looked out for each other. And it was those type of stories that made me say, wow, we just really need to bring that back. MZ : So then briefly fill us in about how things changed. KW : Things deteriorated in this neighborhood. The homes got torn down, left just a lot of vacant lots, a lot of overgrowth. It wasn ' t safe. I would see my little nieces and nephews. They would just be on their little skateboards, you know, not paying attention, the stop sign is covered. And me and my dad was like, we just have to do something. So we started out as Bailey Park Project, focusing on the **park** and green infrastructure and trees and flowers. And then over the course of the years, we started doing more community development. MZ : I wonder, like, how do you describe it to people when you explain what ' s happening, what you ' re trying to do for your neighborhood, the changes that you ' re making and how it relates to climate change? KW : One really great example, when people come to the **park**, like right now, this is like, literally a heat island because our trees haven ' t grown. So it is very hot. So sometimes it ' s so hot that the kids don ' t come out and play until the evening. That education of knowing the benefit of trees and cooling down an environment, how it makes the air cleaner. There ' s a lot of people that suffer from asthma. So trees can make a difference. And if you go to places like Grosse Pointe, you will see this beautiful tree canopy down. Like their homes are probably 20 degrees cooler you know, than our homes, AG : Having a lot of green space actually contributes to the climate resiliency for this neighborhood. So all of this grass actually can manage stormwater better. The idea of leading new development in this neighborhood with green, what it says to me is that the residents are really envisioning the neighborhood that they want to live in. And that I just – I ' m really excited about that. MZ : Turning great loss and upheaval into even greater opportunities. These Detroiters are creating a blueprint for an urban future that every city can learn from. [Chapter 5 : Agriculture] TED-Ed : About 10, 000 years ago, humans began to farm. This agricultural revolution was a turning point in our history that enabled people to settle, build and create. In short, agriculture enabled the existence of civilization. Today, approximately 40 percent of our planet is farmland. Spread all over the world, these agricultural lands are the pieces to a global puzzle we are all facing. In the future, how can we feed every member of a growing population a healthy diet? Meeting this goal will require nothing short of a second agricultural revolution. The first agricultural revolution was characterized by expansion and exploitation, feeding people at the expense of forests, wildlife and water, and destabilizing the climate in the process. That ' s not an option the next time around. Agriculture depends on a stable climate with predictable seasons and weather patterns. This means we can ' t keep expanding our agricultural lands, because doing so will undermine the environmental conditions that make agriculture possible in the first place. Instead, the next agricultural revolution will have to increase the output of our existing farmland for the long term while protecting biodiversity, conserving water, and reducing pollution and greenhouse **gas** emissions. So what will the future farms look like? In Bangladesh, Cambodia and Nepal, new approaches to rice production may dramatically decrease greenhouse **gas** emissions in the future. Rice is a staple food for three billion people and the main source of livelihood for millions of households. More than 90 percent of rice is grown in flooded paddies, which use a lot of water and release 11 percent of annual methane emissions, which accounts for one to two percent of total annual greenhouse **gas** emissions globally. By experimenting with new strains of rice, irrigating less and adopting less labor-intensive ways of planting seeds, farmers in these countries have already increased their incomes and crop yields while cutting down on greenhouse **gas** emissions. MZ : Related technologies are also taking root in the US. Father and daughter farmers, Jim and Jessica Whitaker, have come up with their own strategies to reduce methane that are working on their farm in Arkansas. But convincing everyone else to change is their next big challenge. So let ' s go back to how you got to be such a big supplier of rice in this country. You tell a story about how you were 22 and you were like, I ' m going to start my own farm, but – not that easy. Jim Whitaker : No, it ' s not. Let me tell you something about renting a farm when you ' re 22 years old. No one rents you a farm unless no one else wants to rent it. It was a big piece of land, it was cash rent, I mean, the stakes were set. We were doomed to fail. And we weren ' t focused on environmental sustainability back then. We were focused on economic sustainability. How do we make higher yield? How do we use less fertilizer? How do we get to the next year and feed our family? It happens that economic and environmental sustainability go hand in hand along with social sustainability. As we used less fertilizer, used less water, our yield started going up. MZ : Can you spell out for me what the problem is with rice when it comes to the environment? JW : Soil is full of microbes. And what they ' re doing in the soil on a basic level is they ' re down there chewing away, eating up the biomass that ' s left over from the crop before. And out of that comes methane, the same way it happens in cattle operations or whatever. MZ : But you decided to do it a different way. JW : We do it a little bit differently. Arkansas is a very water-rich state, but we have a dry season, right in the middle of summer is a dry season. So when we dry the soil, that anaerobic microbial that ' s living in that soup, that mushy soil, either dies or goes dormant. So we break his life cycle. MZ : Oh! JW : And then it stops emitting methane. But it doesn ' t hurt the rice. That actually helps rice, when you use less water. We have less runoff, less erosion, less nutrients leaving our field. Nothing leaves our field unless we want it to. Jessica Whitaker Allen : We started tracking this. We saw that our water use was down and we thought, OK, well, we need to add to that, let ' s add more data points to that. Let ' s add our fertilizer, let ' s add our fuel usage. And so we really started recording all this stuff by hand in just an Excel spreadsheet. We didn ' t know what we were doing. MZ : But you knew you were on to something. JWA : Yes, so we started recording everything. MZ : Do you remember if there was a moment when the two of you thought, like, what we ' re doing, it shouldn ' t be special to us. Why aren ' t more people – JW : To collect the data, have the equipment and the cloud-based technology and the stuff in the field to record it, it ' s just massively time-consuming, and consumers don ' t pay for it. JWA : Well and people like us, why would you want to do it? I mean, take a walk through your supermarket. Everything ' s sustainable, everything ' s greenwashed. You can put whatever you want to on a package, there ' s no rules, there ' s no standards. So we ' re trying to make that standard. We live and work in southeast Arkansas. Our town has 4, 000 residents and one stoplight. The nearest airport, Starbucks shopping mall, Whole Foods, is two hours away in any direction. Without places like this and farmers like us, you ' d be hungry, naked and sober. I ' m a farmer, but not in the way you might think. I don ' t drive the tractors, and I don ' t plant the rice. But I know how to take what my dad has learned and what he is doing and share that with others. We are going to work with farmers in southeast Arkansas to educate them about the benefits of growing sustainable rice. JW : Let me tell you why that ' s important. There are 400 million acres of rice grown globally. And our methods, if used, can reduce greenhouse **gas** by 50 percent, reduce water use by 50 percent, increase yields to feed a hungry world. MZ : We hear a lot about how weather has gotten more extreme, flooding, heat. What ' s it been like in Arkansas? JW : So in 2016, we had a 500-year flood. We were... We get a **picture** of our place flooded. 14 inches of rain. That was a 500-year flood. Hurt a lot of people. And then we had a 1, 000-year flood. And we lost so many acres. And you know, when houses get flooded in rural communities, they don ' t come back. I mean, when you have whole neighborhoods get flooded, they don ' t rebuild them, they don ' t come back. JWA : I feel like almost every day I ' m getting a notification from the weather Channel of an excessive heat warning or thunderstorm warning or hail threat. You know, you don ' t really know what you ' re going to expect. MZ : When you think about what it will be like, I don ' t know, five years, 10 years, for someone to go into the supermarket and think, oh, right, I need to get rice off my grocery list. What ideally would you like to see on the shelf there? JW : So I think it ' s going to change, because I like to study what companies want. I mean, if you figure out what they want, then you know what to give them. And when you read their sustainability goals, they ' re all saying they ' re going to be net zero. The only way they can be net zero is they bring the farmer into the loop. So if we ' re able to do this, in five years, everybody ' s doing these practices, the US rice industry will be the most sustainable industry in the world. MZ : Can you do it? JW : Oh, yeah. It ' s about to happen. MZ : You ' ve just heard a lot of ideas, a lot of stories and a lot of big plans. So we want to wrap things up by asking our experts : What if we actually achieved our climate goals? What would that future even look like? They, of course, had a lot of thoughts. We ' ll let you pick your favorites. Thanks for watching. NT : If we are successful in addressing the climate crisis, we massively reduce the vulnerability and improve the economic and the creative prospects of billions of people around the world who currently are basically excluded from all of the opportunities which we have, which come from having abundant material and energy all around us. That ' s the real prize. FD : A world where we have had that exponential would be a world in which we have **clean**, cheap energy for all. KB : At the end of this decade, the International Energy Agency believes that we will have enough capacity to be producing 10 billion, 10 billion batteries a year. It ' s enough for every person on the planet to have their own battery. AC : I ' m constantly surrounded by young people just like me who are really, really, really passionate about the world that we live in. For obvious reasons. It ' s the world that we will inherit. EZ : Women are very important for the energy transition. So if we ' re talking about a world where we have, you know, where we tackle climate change, all I want to see is, you know, women in power. I want to see more solutions being driven by young people. And I want our politicians to be truly and meaningfully engaged in making change. NG : We always tend to underestimate the pace of ultimate adoption and change. Today, there are more than 150 pathways, scientific pathways that we could take to limit global warming. Al Gore : If we get to true net zero, astonishingly, global temperatures will stop going up with a lag time of as little as three to five years. Colin Averill : We ' ve been able to accelerate tree growth and carbon capture and tree stems by 30 to 70 percent. Dan Jørgensen : Offshore wind has the potential to cover the current electricity demand of the entire world not once, not twice, 18 times. NG : We need to decarbonize the old economy that we have and invest to create the new economy that we need Paul Hawken : Regenerative farming is fairly simple in concept. It means creating the conditions for more life. Josephine Phillips : We need to buy less stuff, and we need to look after what we buy. Valuing the things that we own is a climate solution. Vishaan Chakrabarti : We can all live in this transit-rich, carbon-negative, affordable way and leave the vast majority of the planet for nature, for agriculture, for **clean** oceans. We can do this. Susan Ruffo : The ocean is a powerful source of solutions that we ’ ve overlooked for far too long. Al Roker : You have to be engaged. Let your elected officials know that this is important to you. You have to vote, you have to go out there and support politicians who are going to support our planet. Peggy Shepard : We can create a legacy of environmental quality and climate **resilience** for all. Fehinti Balogun : You are not powerless that the”oh, there ’ s nothing we can do, just keep going”is symptom, not cure. But you are needed. Avinash Persaud : The power of what we can do when it matters to us is unlimited. CF : It ’ s not that we ’ re simply going to avoid the worst impacts of climate change. It ’ s that we ’ re going to improve the quality of life for humans, both in the urban and in the rural sector, and for non-humans.

The construction industry accounts for 30 to 40 percent of the world ’ s total energy and resources. It also accounts for 40 percent of the world ’ s total carbon emissions. A man who lived long before us gave us a very simple solution. And he is Mahatma Gandhi, the father of our nation, India. He said that the **ideal** house should be built with materials found in a five-mile radius around the house. So you think, OK, what is that material? And it is right below our **feet**. It ’ s mud. Now imagine, if we can build a house with mud, there would be nothing more sustainable or eco-friendly than that. But then, you might ask, how strong is mud? This compressed five percent cement-added mud block, made by my alma mater, Auroville Earth Institute, is twice as strong as a country fired brick. In fact, it has a dry compressive strength of 6. 5 megapascal, as compared to a normal fired-brick, which just has 3 to 3. 5 megapascal. But then you may again ask, what about water? Wouldn ’ t water destroy mud brick? This is a brick from the same institute kept in water since 1995, a little less than 30 years, and you can see that it can still hold a significant amount of load. So what does this tell us? Can we change our perception of construction? Can we imagine a new way of building? Or can we bring beauty to dirt? I demoted myself from being an architecture graduate to being that of a mason. Or maybe I promoted myself, I don ’ t know. I joined hands with local workers and started teaching them mud techniques. Very soon we started to change every aspect of our construction. Our foundations became poured earth or rammed earth, our walls became mud blocks or compressed earth bricks. Why, even our **roofs** became domes and vaults made of mud bricks. This is a brick wall residence called Pirouette House, which we made in a very crowded community. So it goes in a zigzag pattern in need of natural ventilation. Now, please remember that this wonderful parametric form, or **curves**, were made not with any computational technology, AI or robotic arms. These were actually made with coconut twigs, thread and the masons ’ bear arms. At a time when the building industry is fast moving towards a future that exceeds mankind, we brought the value of human resources back into it. But way back in 2012, I was posed with a very life-altering question. I was asked to build a residence, a low-budget, eco-friendly residence for a primary school teacher called Biju Mathew. And when I reached the site, this was what I saw. A mountain of waste and debris dumped by the neighbors after they finished their construction. And because there was no other empty plot. So what do I do? Do I stand back and allow this waste to be dumped elsewhere? Or do I reimagine the philosophy of building with materials found in my vicinity? Neither me nor the future generations can unsee the waste that is getting piled in our vicinity. Therefore, we decided to use this waste as a part of our construction technique. We hand-pulverized this material, added a bit of soil and again, five-percent cement. And using the techniques we learned so far, we kind of poured it in between two meshes and poured the entire mixture into it. The resultant product was not just a formidable partition. It was load-bearing, means these walls took the load of the entire **roof** as well. But this came at a price. I was nicknamed"scrap engineer"by locals who found it amusing to see an engineer search through scrap in the junkyard. But what I found in the junkyard was pure gold : this is discarded electric meter boxes, washing machine wheels, decaying wood, all became part of a new philosophy that included more and more waste. Thank you. Now, emboldened by this, our new aim was to build multi-storied mud and waste construction. Is that possible? Yes. This is Shikhara, a three-storeyed multi-story, mud and waste construction. We decided to further modify what we did in the Biju Mathew residence. So instead of using two meshes, we put two wooden shutters and poured the same mixture which we did in the earlier project. And the resultant product was as strong as before and economical too. This wall had a dry compressive strength of 4. 5 megapascal. And mind you, this building, this residence, we completed in a meager budget of 90, 000 dollars as compared to a general budget of 200, 000 dollars or more. Very soon – Very soon, many practices in the country started adopting this technique, not just because of its eco-friendly part, but also because it was cost-effective. For us Indians, born to traditional societies, very often, our dreams culminate in lavish weddings and festivals. This, by the way, is a wedding stage. But the very next day, this too, is a common scene. India discards 3. 6 million tons of plastic every year. Therefore, we decided to utilize plastic bottles as a part of our construction for a new project called Chuzhi. It ' s a housing project. And in this project, we started to build circular beams using plastic bottles and reinforced concrete and of course, mud. We started to build it in circles. To be honest, we didn ' t know how this would eventually look, but we still kept on building the circles. We made it stable and put a **roof** on top of it. You can see how weird this looks. Chuzhi is a project that resides in a rocky terrain. And it ' s populated by a lot of trees and shrubs. Now, generally, these two factors are attributed as very bad things for construction. People generally cut trees or clear them to make spaces for their rooms or buildings or whatever. But in here, the trees not only form shelter but also cool the building in a tropical climate. And as far as the terrain was concerned, generally, people would fill it up, level it, clear it and build on top of it. But here, the building is perfectly camouflaged in the rocky terrain, that 10 metres away from this project, you will not see it. That is how good it is camouflaged. In this project – We managed to use 4, 300 plastic bottles which would have otherwise ended up as a landfill or even worse, in the ocean. One day, we all got sick working at the site. We had breathing difficulty and we kind of went to the doctor. And the doctor very calmly said,"Ah, it must be the burning tires used in road construction. Stay away."And we were shocked. There are hundreds of kids who travel these roads every day to their schools. There are thousands of families who traverse these roads every day to their jobs, why some of us even stay on these roads. And the answer is stay away. Upon further investigation, adding to our worst nightmare, we found out that our country discards half a million tires in a day. No, no, I ' m not done yet. And the rest of the world discards another half a million tires to India on the same day. Yeah. This is an aerial pic of a tire dump, seen from space. This is in a GCC country, that collects the tires from all of you guys, and eventually, dumps it in countries like India. Now you should remember, all of these tires, most of them at least, eventually end up either in the road tarring illegal process or we end up burning it to make again fuel oil, because this is a petroleum product. Now, one way to neutralize this huge toxic threat is to use it as part of construction. Now inspired from **architects** like Michael Reynolds, we introduced mud and tire to form a new building construction technique. And now we are building residences, we are building **museums**, schools. And this is the best way to neutralize this threat and create beautiful construction. We believe that tomorrow this may also be the alternative for the housing crisis that is a big reality for many of our underdeveloped countries. The heart of every project of ours lies with the problems that we created amongst us. Discarded tires, plastic bottles, construction debris. None of these things should be dumped thoughtlessly or carelessly. The world can not just find a solution, but we can even find beauty in this disaster that we created for ourselves. I remember a single line by the poet of my native language, Ulloor, and it goes like this. And it translates to this : It is our choice whether to build heaven or **hell** on Earth. Thank you, thank you.

So my wife and I have two young children. And like many of you, we are terrified about what the worst impacts of the climate crisis are going to be for them in their lives. Do we honestly have a plan that ' s specific that ' s achievable, that ' s actionable, that ' s going to allow us to reduce emissions at scale with the speed that ' s necessary to respond to the catastrophe in time to improve the quality of life for our kids? We ' ve decided to focus and devote our time and attention to the challenge of greening buildings in America. And I ' ll tell you a little bit about why. There are 125 million buildings in America, coast to coast. These buildings are where we cook and eat and work and pray and raise our kids. A lot of us spend almost 90 percent of our time indoors in buildings, and these buildings are powered by fossil fuels. We burn coal and **gas** at power plants, we burn oil and **gas** in buildings. This is a furnace that produces hot water and heating. This is in an apartment complex in Harlem that we visited back in 2014. And I remember visiting it, I was a little worried because we could smell **gas** kind of, leaking. And a few blocks away, a few weeks before this visit, an apartment building had a **gas** furnace that exploded. It collapsed the entire apartment building, it collapsed the apartment building next door, and eight people died. So I remember looking at this boiler and taking a **picture** and thinking,"Get me the heck out of here."So because fossil fuels power our 125 million buildings, it ' s 30 percent of emissions, 30 percent of American emissions are tied to our buildings. And there is no actionable path to responding to the climate crisis without going building by building and greening all of the existing buildings in America. So I ' m Donnel Baird, I ' m the CEO of BlocPower. We are a technology company that focuses on moving buildings off of fossil fuels. We want to make buildings smarter, healthier, greener, and we want to do that by making buildings 100-percent electric. We ' re here in Detroit. Detroit is learning how to rip fossil fuel engines out of vehicles and replacing them with smarter, all-electric engines. We want to do the same thing for buildings. We want to rip out all the fossil fuel equipment and replace it with smart, green, all-electric equipment. And we want that equipment to be powered by electricity that ' s **clean**. Stanford professor Mark Jacobson has written a plan for all 50 states to be powered by wind, by hydroelectric power, by solar, state by state, so that our entire grid can be **clean**. I got focused on the dangers, the perils of fossil fuel systems. Growing up as a kid with my family in a one-bedroom apartment in Brooklyn, we didn ' t have a heating system that worked in our apartment building in Brooklyn. So when it got really cold in the winters, my parents, sometimes they worked nights, they would tell me,”Look, if it gets too cold, light a match, turn on the **gas** oven, open up the oven door, and don ’ t forget to open up a window because heat ’ s going to come into the apartment, but so is carbon monoxide, and we don ’ t want you to suffocate.”Then they ’ d go to work. And millions of Americans across the country heat their buildings this way in the winter and worse. But it ’ s not just the low-income buildings that are super dangerous with fossil fuel infrastructure. Recent studies indicate that **gas** ovens, **gas** heating systems in our home leak benzene, they leak methane, they leak nitrogen dioxide. There ’ s so much nitrogen dioxide emitted into American homes that it causes about 13 percent of chronic childhood asthma. There ’ s so much methane leaked into our homes that it ’ s equal to the emissions of 500, 000 gas-powered vehicles. And benzene, benzene is a carcinogen. And the latest studies from Stanford indicate that benzene is emitted into our homes, it spreads throughout the home, it lingers, we breathe it in. And it actually can be worse than breathing in secondhand cigarette smoke. And so for any parent, the thought of our children sleeping and breathing all this stuff in, it ’ s horrific. But good news, it ’ s 2023. We don ’ t live in ancient Mesopotamia. We no longer have to dig up dead dinosaurs from the ground and burn them in our buildings for energy. We ’ ve got options. This is an electric induction oven that uses electricity and induction power of magnets. It ’ s hyper-efficient, it ’ s safe. The finest chefs in the world are starting to use these ovens and systems. They can boil hot water in less than 60 seconds. Pretty awesome. And one of the new technologies that I ’ m really excited about is the cold climate heat pump. Cold climate heat pumps are like a silver bullet for reducing emissions in buildings. We can now do things that we could not do five years ago because of this technology. They use electricity and refrigerant and compressors to pump hot air into your home in the winter, to pump hot air out of your home during the summer, to heat up hot water. But most importantly, it allows us to fundamentally unhook buildings from fossil fuels. We can unplug all of our buildings and homes from fossil fuels entirely due to these systems. So let ’ s go back to my building in Brooklyn. We now have a mix of technologies that we can install in our building : solar **panels** on the **roof**, high-efficiency lighting, electric hot water heating systems, electric heat pumps for heating and cooling, the electric oven. We can make these buildings all electric. If we ’ re in Detroit or LA or in Houston, one of the cities where people love their cars, we ’ ll of course, install some electric-vehicle charging stations. We ’ ll have some backup battery systems because all three electricity and energy grids are collapsing under the weight of heat waves and the climate crisis. But we can electrify buildings. Now, is it simple? Is it easy to electrify buildings? No, there ’ s challenges and opportunities. We have to solve the finance problem, we have to solve a workforce problem, we have to solve a data problem. Electrification can cost 10, 20, 30, 000 dollars per building. And that ’ s not affordable for the average American. But what we can do is most Americans can afford to buy a home on their own. And so we have a mortgage. And so we studied the mortgage market and found ways to amortize and spread out the upfront cost of building electrification over 15 years so that the monthly payment is affordable and lower in some instances than what families pay for fossil fuels. We have a workforce problem in that, like Europe, there ’ s a shortage of skilled electricians and technicians across America to deliver on these projects. Mayor Eric Adams in New York City has asked us to train and hire 3, 000 vulnerable and low-income individuals, ex-offenders, gang members, military veterans with PTSD, formerly homeless folks, to train them in building electrification. We had a gang, a street gang kind of come to us and say,”Look, if you guys hire us and give us jobs, we will shut down our street gang.”We had a crew of workers who had been locked up in Rikers Island, our

New York City jail, and we trained them, we hired them, we took them back to Rikers Island, They installed solar **panels** in the parking lot. We have a data problem. Every building is unique, like a snowflake. So in order to make sure we have the right size of the electrification equipment for that building, to unhook it from fossil fuels, we have to collect data and make sure we specify and recommend the right equipment. We ’ ve been working with the Bezos Earth Fund to aggregate all of the data on all 125 million buildings across America so that families can search for their address, get an electrification work plan, hand it to a local, well-trained electrician who we ’ ve trained and hired. These are good jobs that can ’ t be outsourced, so that every family has access to the data that they need. We ’ ve recently started working with Ithaca, New York, where Cornell is located, and San Jose and Menlo Park. These are cities that have committed to decarbonize 100 percent by the year 2030, in six and a half years. So we ’ re going to go building to building and move each building off of fossil fuels and make them all-electric. So we ’ ve got six and a half years, but there ’ s dozens of cities across the country where we ’ re working with partners : Portland, Oregon, Denver, Atlanta, Chicago to electrify buildings at scale. Electrification is possible. It ’ s not simple, it ’ s not easy, but it is possible. And what that means is if we can electrify one building, it means that we can electrify a whole block of buildings. If we can electrify a block of buildings, it means that we can electrify a neighborhood. If we can electrify a neighborhood, it means that we can electrify a city. And if we can electrify a city, that means we can electrify a country. There ’ s a saying : you have to be the change that you wish to see in the world. By doing this, we ’ re going to create great jobs. There ’ s going to be massive economic and public health outcomes. But we also are going to inspire cities and countries around the world to electrify. And we ’ ll be able to look our children in the eyes when they ask us and say that we ’ re doing everything we can to reduce emissions at speed and scale, to fight the most damaging impacts of the climate catastrophe. Thank you.

Hey, work lifers, this is J. J. Abrams, we ’ re trying something new on the podcast today, I am going to be conducting an interview on the show and my **guest** is Adam Grant. We ’ re going be talking about his new book, Think Again Automatical. Oh, JJ, it ’ s great to hear your voice, but this is my show. I don ’ t know if it is. I can ’ t just let you take my job and ask all the questions. I ’ m insisting on asking you some questions. Can you promise me that I can ask one Star Wars question? Yes, you can ask anything you want. You can ask. Fantastic. Jumping in here as host of my show in the off chance. You don ’ t know who J. J. Abrams is. You absolutely know his work. He ’ s directed, produced and written some of the most beloved **films** and shows of the last 30 years. If you love Lost alias Felicity, the more recent incarnations of Star Wars or Star Trek, you have to think as a bonus episode. While we ’ re hard at work on Season four, J. J. kindly agreed to turn the microphone around and host me for a chat about my new book, Think Again The Power of Knowing What You Don ’ t Know. It ’ s a book about the science of rethinking our opinions, opening other people ’ s minds and creating cultures of learning. It officially launches February 2nd, but I wanted to give you a sneak preview. So I sent JJ an early copy and told him he was in charge of our interview. Thanks to Viking Penguin, my publisher, for Think Again for supporting this episode. I have read this book and I just truly think again, your new book available now is so compelling and I just I ’ m thrilled to get to talk to you about it. I feel like you ’ re my book fairy godfather.

That ’ s such a thing. That ’ s my dream. Thank you. I ’ ve got to say that I had so many moments of kind of gasping when I read Think again, because you provided the kind of optimism that there is a way to find common ground, to find, to embrace nuance, to reexamine how we, you know, we go through the world. What motivated you to write the book? Well, there ’ s a part of me that that thinks I was probably motivated to write this book by one of my best friends from growing up, Khan, who I remember this was in seventh grade here. We ’ re in the middle of an argument, I think, during a commercial on Seinfeld. And he he hung up on me and I called him back and he said, Shut up, Adam, I won ’ t talk to you until you admit you ’ re wrong. And that was sort of a it really it was a moment that stuck with me. I didn ’ t have the language for it at the time, but I spent a lot of time afterward thinking, why is it so important to me to be right? And, you know, why do I have such a hard time admitting when I ’ m not? And that, you know, I think I was I was sort of a defining moment. And then, you know, much later I feel like my job as an organizational psychologist is, you know, is to really think again about how we work, how we lead, how we live, and to motivate other people to do that, too. And my most frustrating experiences as an author, as a speaker, as a researcher, as a teacher, as a consultant are always when people are not willing to rethink assumptions that I think they ought to be questioning. And so, you know, just over the past few years, the number of conversations I ’ ve had with with founders and CEOs where I you know, I give them the best evidence I have available. And they say, well, that ’ s that ’ s not how we do things around here or that ’ s not the way I ’ ve always done things. All right. And I just I just want to come back to them and say, you know, Blockbuster, BlackBerry, Kodak, Sears, you know what? You should definitely not rethink anything in your vision, strategy or business model. And so I guess, J. J., when you know, when I have both personal and professional experiences that drive me insane on the same topic, I feel like there might be a problem with tackling or a question worth writing about. Hmm. That ’ s great. Answered in reading the book. It made me wonder if people ’ s not bandwidth, but their comfort level is so low that there are people finding comfort in belief systems. And that ’ s the thing that they can rely on because there ’ s so little to rely on. And and so rethinking is a threat to one of the few comforts left. That ’ s such an interesting question, I don ’ t know is my first thought, my second thought is it reminds me of some research that I loved by sociologists that started in the 70s. They did. This study is where they were interested in the effects of being micromanaged at work and not just how we thought about our jobs, but how we behaved in the rest of our lives. And they found that if you had a really controlling boss, that you actually became more authoritarian as a parent with your children, which was just kind of a stunning spillover for me to, you know, to think that the way you get treated at work might affect the way that you raise your children who just never would have occurred to me. And I think that body of research and a whole bunch of other studies that followed kind of that they made me start to think about this basic truth, that when we lack control in one domain of our lives, we become motivated to seek it and try to regain it in other parts of our lives. And I think, you know, especially in the wake of this pandemic and a global recession where we ’ re facing a lot of threats to control right now. And I wonder if if part of what people are doing is they ’ re grasping at the things they do have control over. And one of the things we all have control over is what we believe. And so, you know, holding fast to the things that I think are true, they make that sort of makes the world feel more predictable, less uncertain. It also gives me a sense of belonging with whoever my tribe is. Right. It validates my worldview. And I ’ ve even wondered if, you know, if that ’ s part of why the the George Floyd protests, you know, really rose up when they did. I feel like before the pandemic, people felt like, you know, there ' s nothing that I personally can do to fight systemic racism, whereas, you know, juxtaposed against a global disease like covid, which I really can ' t fight. Well, you know what? I could I could show up in protest. And so I guess there ' s there ' s something about both holding fast to your beliefs that helps render an uncontrollable world more controllable. But also, there ' s something about being in an extremely uncontrollable world that can lead you to think again about where you do have some control areas where you can make a difference. And so I wonder if that cuts both ways. Hmmm, that ' s interesting, I wanted to ask you about the value of humility, because it seems like. Humility is also at the center of what allows for someone to. Pursue a truth or information or a point of view that might not be theirs, but I think so many of us take a more defensive posture and our are more closed off and declarative about things that we think we know. And I just wanted to ask you kind of what role you feel humility plays and why it might not be such a given that the actual value of it is the truth and is enlightenment and is wisdom and why that doesn ' t seem so appealing in the moment. Yeah, interesting. So if pride is what fuels overconfidence, I think humility is what gives us the freedom and the flexibility to rethink the opinions and assumptions we should be questioning. And I think that part of the problem is that we live in a culture where people are rewarded for being the smartest person in the room and they learn to wield their knowledge and expertise like a weapon, as opposed to treating it as a resource to share. And so, you know, I think in most workplaces, in many schools and frankly, in too many families and communities, too, you know, the currency of status is knowing more than everybody else. And so knowing that, you know, admitting what you don ' t know, questioning yourself, showing, you know, any hint of uncertainty is like admitting weakness and setting yourself up for defeat in battle. And obviously, I think that ' s a problem. And I think that maybe the first way to get people past that fear is we need people in positions of power to model it. Right. We know that if you ' ve been validated by your power or your status or your authority, that people are much more comfortable letting you say you don ' t know. There ' s evidence, for example, that when experts say, I ' m not sure or I don ' t know, they actually become more persuasive, in part because we respect their humility and in part because we ' re surprised that we actually pay more attention to the substance of their argument, which, you know, is likely to be persuasive if they are knowledgeable. So I guess what I want to do is I want to let people know that humility is a potential source of strength, not just a sign of weakness. And I don ' t I don ' t entirely know how to get people there. And I want to turn this around on you because I feel like this is one of the the themes that that really cuts through a lot of your work is every time I watch a show or a movie that was directed or produced by you, I know it ' s going to lead me to question an assumption. And it might be an assumption I ' ve held for a long time. And I ' m curious about is this something you do intentionally and how do you get your audiences to confront that kind of humility? Well, thanks for saying so. I feel like the the way into a story for me is usually finding a character who is vulnerable, who is in a place where they ' re out of their depth and they ' re desperate for something. And I think that desperation is like the greatest motivator. And it also it forces you as a storyteller to know what a character ' s desperate for and therefore what you are either afraid of or hopeful for and ideally both the idea of desperation as a motivator. I think that ' s incredibly powerful. And it ' s something that that not only strikes me as relevant to, you know, to thinking about characters in a story, but also to understanding the people that I work with and the people that I love. And I ' m wondering is, is that a lens that you apply? And I guess if you turn it inward a little bit, when you ’ ve achieved the level of success that you have, how do you stay desperate to rethink some of the stories that you tell? Well, I have to do is go on Twitter. I feel like, you know, I ’ m always desperate to do something, to tell a story that that moves people. And sometimes I ’ m more successful than others. And, you know, I never go into anything with a kind of template for what it should or shouldn ’ t be. I feel like I ’ ve learned a ton of lessons along the way. And by the way, I always feel like we ’ re carrying, you know, whatever a thousand lessons with us that we all need to, you know, remember at all times. But we can only really carry 900 of them. And we ’ re constantly dropping lessons and picking up the ones that we ’ ve dropped in by picking those up. We ’ ve dropped some other ones and we keep relearning the same thing. So I think, you know, rethinking is really important and relearning is a weird Sisyphean inevitability that I don ’ t think we can avoid. But I feel like, you know, the drive to do. What I do like I ’ m guessing the drive for you to do what you do, you do it because you feel compelled to share a point of view, an idea, a feeling, an insight, a question, something you might not even understand the answer to. And you just feel compelled to do it. And I think I start everything desperately, and I think they probably all end that way, too. I love that. I want to ask you, because your book is all about rethinking. I was just curious, do you feel like there is a fundamental barrier to rethinking and if so, what it is and I do have a follow up. Yeah, I think so. So, yeah, I feel like one of the things that I ’ ve rethought twice now as I ’ ve been writing books is, you know, I wrote my first book, Give and Take with with a whole framework to organize the world in terms of givers, takers and matters. And then I didn ’ t want to be constrained by a framework like that when I wrote originals and I felt like I overcorrected and there wasn ’ t enough connective tissue between the different chapters. I felt like I had a lot of interesting trees, but the forest was not clear enough. And so I decided when I was writing Think again that I was going to be open to finding an overarching framework, but I was not going to be attached to it. And that that felt like the sweet spot. And about halfway through the writing, it hit me and I had to rewrite the book from scratch. The framework was my my colleague, Phil Tetlock, where he observed that whatever your job or career is, that you spend a disproportionate amount of your time thinking like certain professions. He said, look, you know, there are moments when we think like preachers, prosecutors and politicians. And I think that that all three of these mindsets can stand in the way of rethinking, because when you ’ re preaching, you ’ re already convinced that you found the truth. And so you don ’ t need to question any of your assumptions when you ’ re prosecuting. You are trying to win your case. That means the other side is wrong. And so you ’ ve got to get them to do all the rethinking, but you get to stand still. And when you ’ re thinking more like a politician, you ’ re basically trying to cater to your audience and campaign for their approval or get their likes or their votes. And so you may be doing a little bit of flexing in the way that you present, but you ’ re not rethinking your underlying beliefs. Right. You ’ re just you ’ re just trying to appease your constituents. And I think we spend way too much time thinking in these modes. I know, you know, as somebody who ’ s been called a logic bully once or twice, maybe seven times at this point, by my count, I spend too much time in prosecutor mode. And when I think that somebody is selling snake oil or trying to, you know, indoctrinate their followers into some kind of idea cult, I feel like it ’ s my job to debunk those myths and bring the better evidence to the table. And the problem is then that I get too close minded. And so I ’ m trying to get out of prosecutor mode and spend more time thinking like a scientist, which is something I think we could all learn to do better. It ’ s funny, in the book, you say how I think the first time you were called The Logic Bully, it actually was something that you liked, that at first it appealed to you. I was proud. I thought, yeah, that ’ s my job as a social scientist. I want to decimate your bad arguments with rigorous evidence and airtight logic. And I ’ m good. And then, yeah, I didn ’ t like the bully part so much as I thought about it more. Given that, what are some of your favorite practices for questioning your own assumptions and for rethinking yourself? I think the first one for me is just the basic idea of thinking like a scientist to say that, you know, what scientists do is instead of forming beliefs, they actually form hypotheses. And so instead of having an opinion that set in stone, that means, OK, this is a hunch, how would I go and tested? And, you know, I don ’ t think that we have to always operate like we ’ re in a lab. Right, with a bunch of test tubes. But I do think that we should all be running experiments in our lives. So during the pandemic, for example, I have instead of assuming there ’ s a routine that ’ s going to work for me, I ’ ve run experiments to say, OK, what if I shift my creative brainstorming from the morning to the night? What does that do, you know, to to the number of original ideas that I generate? What if I turn my camera off during a zoo meeting? Do I actually have, you know, a more a more reflective, more thoughtful discussion? And all of those you know, there ’ s those little changes and adjustments that we make. We could think about them as experiments and then we could say, OK, well, you know what what information what data do I need in order to find out if that was a successful or failed experiment? And I I think that ’ s a huge step. And I guess the other thing I would I would just put on the table is when I was writing the book again, I made a list of all the things that I know I ’ m completely ignorant about. And my goal was was actually not to reduce the list, it was to expand the list. Mm hmm. Because I feel like the more I know about what I don ’ t know, the more curious I am and the more I ’ m going to learn from people who are actually are knowledgeable in those areas. So, you know, my list, I think it started out I immediately said I know nothing about music. I don ’ t understand financial markets. I ’ m clueless about chemistry. And, you know, the list just kept growing from there. And I ’ ve actually been just keeping that list. I have a file on my desktop and my goal is to add something new to it every week. And if I stay clear about what I don ’ t know, then I hope I ’ m going to stay more humble, more curious mindset. That ’ s great. When I was reading, I think, again, it was occurring to me, you know, that you tell such great stories, including like the story of the BlackBerry company and, you know, Mike ’ s inability to rethink the way perhaps he could have and what might have been. And I, too, was a huge fan of that keyboard. The question I had is, how do you find partnerships where there is a thinker and then a thinker, or is it always or typically whether it ’ s one or two or more people that are able to rethink and think, oh, that ’ s such a cool question. I think my **ideal** partnership is one where. There are clear norms that make sure rethinking happens. The question of where it comes from is something that I don ’ t have good data on, which really mildly annoys me right now and I need to go gather some. So stay tuned. But I mean, I can think of examples of both. One of the examples that that I ’ ve spent probably too much time thinking about now. Is the, you know, the Jerry Seinfeld Larry David example from Seinfeld. And one of the most interesting things that I learned from studying that collaboration was that they were both ruthless free thinkers, but they applied it to their own work, probably even more so than they did to each other ’ s work. And so one would not even bring a script or a joke to the other until he had thought it was, you know, really good. Mm hmm. And I can see how those kinds of norms could be really effective in partnerships. I ’ ve also seen examples, though, where, you know, one person is basically the kind of a creative dreamer and the other person is the really critical evaluator. And so, you know, the first person does the thinking, the second does the rethinking, and then it ends up being kind of this beautiful symphony. Mm hmm. I imagine, J. J., you ’ ve seen a lot of this in in the world of Hollywood. Is there is there one or the other that you think is more common or more effective? And are there are there are people who do more of the thinking versus rethinking in your collaborations? Well, obviously, I think, you know, everyone is different. And I know I have worked with people who who go to a place and not that they ’ re stubborn about where they go, but they arrive at an answer very, very quickly. And that ’ s sort of their thing and that they ’ re perhaps a bit reluctant to be as flexible or rethink things. Then, you know, I ’ ve worked people like, for example, with Matt Reeves, with whom I did Felicity, and we did the Cloverfield movie together. And he ’ s someone who you know, and I ’ ve known him since we were kids. And he ’ s always rethinking. And I find that I ’ m maybe more, you know, someone who would want to try something and put it out there and sort of commit to it for now and sort of see where it goes. And Matt. To his great credit, and it ’ s one of the reasons I love working with him, is he ’ s someone who really wants to stop and examine and consider and reconsider it and look at it from all sides and see if there ’ s a better way. And can it go deeper and can it be, you know, can it be more emotional? And I think that that, you know, part of that is probably, you know, less about thinking and rethinking and more about my being more impatient. And when we work together, we had our offices right next to each other. And in fact, our offices were in the location where they actually **filmed** the office, the show, the pilot for the American Office Show. Oh, and weirdly, his office in my office were Matt ’ s office with Michael Scott ’ s office. And my office was the the conference room, which years later, when I went and directed an episode of The Office, I was like, why do I know this place? And then I realized, oh, my God, it ’ s literally based on our old offices. But Matt, we had a little little sign in between is a **picture** of the two of us in between both of our offices. And someone had put up sticky notes over each of us and overmatch it, said, how do we make it more emotional and undermines lives, how to make it funnier? And there is a sort of like, you know, clearly everyone brings their whatever their interest is, whatever their their point of view is to the table. And even though sometimes it can be frustrating when someone says, well, wait a minute, let ’ s reconsider this, you know, it ’ s almost always a better thing because there ’ s nothing wrong with kicking the tires and interrogating something. But the best thing and this is what I found, you know, recently I co-wrote a pilot with a writer named Latoya Morgan, and she ’ s a wonderful writer. She ’ s a black woman who brings a point of view that is clearly going to be a life experience, very different from mine. And when I bring up an idea and she says, you know, hold on, let ’ s talk about this or that or vice versa, I feel like we almost invariably end up in a place where there ’ s something that we are both, like, beaming about that we wouldn ’ t have arrived at had it just been one of us in that room. And in all likelihood, you know, someone who looked like us, you know, either just me or just her. So I feel like there ’ s a lot of talk of how diversity is good and how you say in your book, diversity is good but hard. But, you know, I have personally felt like, you know, working with people who don ’ t look like you, especially when they are, you know, smart and freethinkers. It ’ s incredible how much better the conversation is, how much richer it is, and I think how much better the work ends up being. And I ’ m grateful for any time I work with someone, whether it ’ s Matt, Latoya, I can name a huge list of people who are really willing to rethink things that I might just assume need to stay. And the only caveat I would say here is that I can also think of times when there were paths we were on and the ability to switch it up and rethink something might not have been for the best. Yeah, this is one of the hardest questions that

I really wrestled with while writing the book and I ' m still grappling with now, which is how much rethinking is too much and how do I know whether when I ' ve started rethinking something, I should actually change my mind or go back to my original first answer and the only coherent place that I ' ve landed on this so far as to say, well, if this is a **curve** and there ' s an optimal amount of rethinking, I think most of us don ' t do enough of it. Agree or disagree? You ' re asking me, yeah, yeah, it ' s a question, do you agree or disagree? You know, my guess is I would agree. Got it. I have to take a sidebar here, JJ, because you mentioned the office. This is work life. I read once that you did not like the office when it premiered in the U. S. and that you weren ' t even a fan of the entire first season. Is it true? And what led you to rethink that view? I think that what I felt was when I first watched it, because I became a huge fan, which is why I reached out to them, essentially begging them to hire me as a director. I was such a fan of the original and in fact, to a degree that I reached out to Ricky Gervais and wrote a part for him in Alias. And I was such a fan of that show and the specificity of it that it felt. For me, I remember when I first saw it, I thought, oh, no, like it didn ' t matter how good everyone was because they were great. It felt like it was somehow sacrilege that it was redoing exactly the same thing in essentially the same time period, you know, putting it through the American TV mill. And then you realize, oh, they ' re doing it perfectly. And it ' s it ' s exactly what it should be. And it ' s its own thing. It was the quality of the show that that won me over. OK, next question. I ' m sure you hate getting asked about Star Wars in particular, because it might what might be the most beloved universe ever created a minimum. It ' s got a lot of passionate fans. And yeah, I loved The Force Awakens. I love the rise of Skywalker. I especially love the points where you rethought some moments and characters. And I wanted to ask you about one specific one, which is I think my biggest moment of shock in the new trilogy was when Emperor Palpatine came back to life because I thought he ' d been dead since 1983. And so I was wondering how you went about rethinking his demise. Well, that was something that came in and out and then back in again. But that idea was something that that felt like it was sitting there, set up in the prequels. And when we were looking at the story, the idea of a character who is desperate to find immortality and it felt like it was sitting there and that it was a set up potential set up. And I kept imagining it as something that could work. You know, if I ' m a kid watching all nine movies years from now, it felt like something that was a possible setup to be examined later. I will say that it ' s something that I loved the possibility of it and the promise of it. And it was one of, you know, so many things that we were rethinking and trying to find ways to sort of fit the pieces of the puzzle together. And I know that for some people, it they clicked in and it worked and was **fun** and surprising. And for other people it was, you know, understandably infuriating and sacrilege and stupid and wrong. The reactions were were vast, but it was also something that was, you know, in various moments felt like it was the right move. I imagine that happens a lot to that. You you rethink a classic world or story, whether it ' s Star Wars or Star Trek or even characters that we ' ve fallen in love with. Right. I still feel like, you know, with Lost in particular, I still feel like, you know, Sawyer and Sayid and Kate and some of the others are long lost friends. How often do you rethink the stories you ' ve told versus once you put it out into the world, you ' re you ' re happy with the creative choices you ' ve made, regardless of the feedback? Well, all I see when I work on something is the thing that we could have and should have done to make this better or that different. The rethinking doesn ' t stop because it ' s it ' s out there. And I do think that one of the enemies of certainly movies and in some cases TV is the sort of, you know, the announced release date where the time that one normally should have to rethink doesn ' t exist. And it ' s very difficult to be. In a healthy way, rethinking when you are under the gun, impractical material and often very expensive ways. For example, when Damon and I started working on Lost, it was a very particular, you know, crazy ticking clock where the head of ABC at the time, Lloyd Braun, wanted a show about people who survived a plane crash. And so in Damini, who had never met, we wrote that outline. It was in a week based on just pure instinct. And we went off and we shot this to our pilot that we were, you know, writing, casting, shooting, doing post and everything in nine weeks. And it was a crazy crunched period. Wow. And it ended up working as a pilot. And then Damon and Carlton Cuse wrote the series. But I, I feel like it ' s one of those lessons that not having an ending, it just makes it harder. I know it sounds so obvious and so easy, but when you take that leap of faith, when Stephen King starts writing a novel, he gets to finish that novel and decide, does anyone need to see this? And I ' m sure he ' s got drawers full of things that people have not read because he feels like it ' s not the thing. And one of the crazy things that this, you know, pandemic quarantine time has done for TV and for movies is it ' s given people time to write, not just a pilot or a rough outline, but write entire seasons of a series before it even goes, which, you know, you want to be flexible and you want to be able to cast a role and realize, oh, my God, we ' ve got to do this with this character because we didn ' t realize it or this thing isn ' t working the way I thought it would. But this time has allowed writers to, you know, write without the pressure of we have to be casting this thing right now. We have to be location scouting. We have to be, you know, getting the all these episodes edited and posted and ready for broadcast. And I think that it in no way do I feel like, oh, great, we had this time to do this. You know, I ' d much rather life be normal and covid not exist. But I will say that if there is any kind of creative benefit to this time, it ' s that suddenly release dates and broadcast dates are not being, you know, as aggressively announced. And time is available for some writers to be able to actually work on the stories in a more, you know, I think human pace. And that is no small thing. Is there creative practice that you ' ve rethought during the past year? If you had said to me that we could be breaking stories without ever being in the same room together, I would have thought it was probably impossible, if not wildly unlikely. And I think that online, not just the Zoom ' s, but also the sort of online whiteboard apps that exist that allow people to collaborate remotely has, I think, probably profoundly changed the way stories, at least on television and writers rooms, will be broken. Wow. Does that does that mean in writers rooms won ' t always be physical even after the pandemic? They definitely will. But I think the that someone can now be part of it who might not be in town. I think that that the norm will always seem to be better to be together. But there ' s something great about the focus and the, you know, the access that you have from anywhere. So I just think that that that ' s something that, you know, clearly there will be infinitely fewer business trips to have meetings that could now clearly be done on Zoome. Will people go back to it? You know, the way we were before? More than not, I believe they will, but. This is now accelerated the evidence that this is a valid and really productive way to work. I ' ve never said those words. I ' ve never said this before. We ' re not going to hold you accountable. Thank you. Next question from one magician to another. How does all the time you ' ve spent learning magic tricks and performing them affect your job? Has it spilled over into your work life in any way? I think the thing about magic, as much as some might see it as the geekiest sort of, you know, silliest thing to me, it ' s incredibly powerful. We had a magician in our office and this was like two years ago, and he was in my office, just the two of us. And he did a few tricks and he did one that literally made me, as a 50 year old man, think to myself in my head, he might be magical, like, you know, because I know how magic tricks are done. I know how a lot of I know bunch of gimmicks. I know a bunch of tricks. He did something where I was like, I wonder if he ' s maybe magical. Does he have? And my whole point is the fact that someone who ' s a half a century old can still have a moment of thinking. There might be powers beyond that, which I know is so profound. And the the wow and the gasping and the amazement that any audience has, big or small, it ' s there ' s something about the the sense of possibility that the world is more than it seems and that we want to see things that we can ' t imagine and that we don ' t expect. And so I feel like that is a natural. Aspect to telling a story, and I just think that whether it ' s writing a a book or making a show or a movie, it ' s all a bit of a magic trick. You are so much more comfortable not knowing than I am. I immediately want to answer. I have to figure out the secret, but then you can never see the trick again. You can admire the the skills and the genius of the performer who executed it, right? Yes. OK, next favorite character from the office. It has to be Michael Scott, not because just because I think he is the hub of the wheel. And so everyone is kind of it feels like they ' re all kind of in his orbit, to mix **metaphors**. So interesting. He wasn ' t even in my top five. I love that. And then can I ask you the same question about Star Wars? I think my favorite my favorite character in in Star Wars was Han. Just because I mean, it ' s very hard to think of a better scene in a movie ever than when you meet Han Solo and then in Empire Strikes Back. I mean, like there ' s just there are some of the greatest, truest larger than life, but completely relatable and grounded moments. And, you know, when we got to shoot in Force Awakens, you know, Harrison and Chewie coming into the, you know, the Falcon and saying, you know, we ' re home because it just there was something so crazy about it. And I feel super lucky to have, you know, been part of that. I had tears in my eyes when when Nonintuitive had their reunion. It just felt like we just couldn ' t wait to show it to people because it just felt like, oh, my God, you should see this. It ' s just so cool having them back on the ship. It was a beautiful moment. I ' d love to talk to you about as a Red Sox fan, the Red Sox versus Yankees. And you have this great chapter about just how far fans of these teams are willing to go to torture the opposing team. And what you tried, what didn ' t work and what finally seemed to break the ice of having them sort of find the humanity in each other. So my question to you is, what was what surprised you in your attempts to build those bridges between those two fan bases? And what were your findings? In summary, I ' m so glad that resonated. You know, I was I was when thinking about the prejudice that so many people hold toward other groups, I was looking for a context where we could study it, where the actual stakes are minimal, but the emotional stakes feel very high. And sports fan allegiances, it just it felt like the perfect place to go. I mean, a few years ago, I got to know an amazing woman in her 70s who helps Holocaust survivors. And one day she mentioned that she went to Ohio State. And my first reaction was, yuck. Yeah, I ' m a Michigan Wolverine. We ' re rivals, but who cares where she went to school half a century ago? Yeah, it just bothered me at a fundamental level. And so I decided, you know, like any self respecting social scientist, I should study that. And so Tim and I and all these experiments with the Yankees and Red Sox fans, which was such an easy rivalry to choose. And I think my my biggest surprise was that two of the steps that were supposed to work based on all the existing science, didn ' t you know one of those was was just creating a common identity as baseball fans? And, you know, people would say, yeah, you know, I would help a Yankees fan if they were in an emergency. But otherwise, you know, they ' re rooting for an evil team. So no, thank you. And then the other one was to to try to humanize the individual fan, where basically what happened was people said, all right, you know what? There ’ s this one Yankees fan who ’ s OK, but he ’ s not like the other ones. And I still hate all the rest of them. So what ultimately ended up working and in a way that I was I was surprised by the power of it actually was saying, look, you know, maybe we just need to get people to rethink how they became fans in the first place. So imagine if you had grown up in New York. Would you possibly root for the now you ’ re probably root for the Mets. But the point is, you might not be a Red Sox fan. I ’ m not crazy. Exactly. I ’ m joking. I ’ m joking. All my Mets fans, friends, I ’ m joking. I don ’ t know if you are, but go on. I ’ m joking anyway. I know I keep going, please. Well, no. So I thought this idea of just, you know, considering the possibility that we could hold different views all of a sudden, it it just destabilizes a lot of the stereotypes and prejudices that people hold. And so, as you know, we ran these really entertaining experiments where we gave people a chance to to punish fans of the opposing team by giving them extra spicy hot sauce or by giving them really difficult math problems, which were actually going to hurt their payment for participating in the study. And we found that, lo and behold, after we just got fans to think about how they might root for a different team if they had been born in a different city, that was enough to get them to show less animosity toward fans of the opposing team, which I thought was amazing. And this did not make it into the book. But we just finished a couple of experiments with with gun control and gun rights advocates where we found that the same process worked for them. That if we got somebody who is extremely concerned about about gun safety, to imagine having been born in a hunting family, they actually were less nasty than to somebody on the other side of the aisle. So I think there might be something to this. Fantastic. So I can ’ t thank you enough for talking to me on your show about you, you should do the the goodbye because it ’ s your show. But I just I wanted to thank you for the the honor and opportunity. Well, I can ’ t thank you enough for coming. I ’ m so grateful that you read the book. You liked it that you ’ re willing to talk about it. It ’ s a huge gift to me and our listeners. And I loved getting a little bit inside of your mind and your work life. And most importantly, the work you do has has always been just a huge source of inspiration to me. But over the past year, you have been a source of light and hope and entertainment and creative inspiration. And I just want to thank you for for everything that you do to entertain us and to get us to rethink so many of the things that we think we know. Holy crap. That was unbelievable. Way too generous, but your your words are incredibly appreciated. And and again, thank you for this amazing book and your kind words. WorkLife is hosted by me, Adam Grant. Our team includes Colin Helmes, Greg Achen, Dan O ’ Donnell, Constanza Guardo, Joanne DeLuna, Grace Rubenstein, Michelle Quint, Angela Chang and Anna Felin. This episode was produced by Jessica Glaser and supported by Viking Penguin. Think again. The power of knowing what you don ’ t know is available in whatever format you like print, electronic stone, tablet or audio narrated by me.

Text Sample 738: POS Dim 5 – 2021 – Score 7.00 – 2021/t004052.txt

Have you ever in your life met someone who felt like everything at their job and in their industry just worked perfectly, no room for improvement? I definitely have not. In fact, if I was talking to someone and they started to express anything even remotely similar to that view, I would be like, OK, take up the disguise. You ’ re my boss. Undercover. I caught you ripping. My point is, whatever you do for work, there is clearly room for improvement, whether it ’ s making hiring practices more inclusive or limiting the plastic waste and packaging materials work, stopping the spread of misinformation. We all have a role to play in today ’ s episode is all about how to catalyze change. How do you get people to try something new when they ’ re already very familiar and very comfortable with these well-worn paths? Well, Franklin Leonard managed to do just that in Hollywood. He created The Blacklist. It ’ s a list of the unproduced screenplays that Hollywood insiders love the most. And in doing so, he changed the way that Hollywood worked. Once a script made that list, it made the blacklist. And then powerful people started to see that there was consensus that the script was actually amazing. Well, then, these previously unsellable projects, they started getting sold and getting made and winning awards. And here ’ s how Franklin describes the importance of that in his talk at Ted Venice Beach. Simply put, the conventional wisdom about screenwriting merit where it was and where it could be found was wrong. And this is notable because, as I mentioned before, in the triage of finding movies to make and making them, there ’ s a lot of relying on conventional wisdom and that conventional wisdom maybe, just maybe might be wrong to even greater consequence. **Films** about black people don ’ t sell overseas. Female driven action movies don ’ t work because women will see themselves in men, but men won ’ t see themselves and women that no one wants to see. Movies about women over 40 that are on screen heroes have to conform to a very narrow idea about beauty that we consider conventional. What does that mean when those images are projected thirty **feet** high and the lights go down for a kid that looks like me in Columbus, Georgia, or Muslim girl in Cardiff, Wales, or a gay kid in Chennai. What does it mean for how we see ourselves and how we see the world and for how the world sees us? We live in very strange times, but I think for the most part, we all live in a state of constant rage. There ’ s just too much information, too much stuff to contend with. And so as a rule, we tend to default to conventional wisdom. I think it ’ s important that we ask ourselves constantly how much of that conventional wisdom is all convention and no wisdom and at what cost. As a writer myself, I think that there is something really amazing here. Normally what makes a script hot is if there ’ s a huge celebrity attached or if it ’ s a remake of something beloved, or if your last movie won six Academy Awards and grossed a billion dollars, you know, and not that those will stop getting scripts attention, I ’ m sure those guys will keep getting sold. But what ’ s really amazing about what Franklin did is he managed to find another way to get scripts attention. If enough of the people who read scripts all day say that this one, this one deserves attention. Well, now all of a sudden, people actually read it and people would take it seriously. And whatever industry you work in, whatever you do. The question that Franklin ’ s experience with the blacklist raises is, I think central to all progress. How can you challenge conventional wisdom today on how to be a better human? We ’ ve got Franklin here to answer that question and so many more. This is Franklin Leonard, founder of The Blacklist. The blacklist has gone from being just a list of the most beloved scripts to so much more than that. So I ’ m wondering, just in your own words, how do you now think of it and describe what the blacklist is? Yeah, I mean, I think of our North Star as being in identifying and celebrating great screenwriting and the people who do it. And that can take many forms. It ’ s everything from giving folks who are trying to become better screenwriters reasonably priced feedback that from reputable sources. It is when that feedback returns good telling people in the industry that can help their careers and help their movies get made. Hey, this is a really good script. It ’ s providing workshops for the best among those writers, oftentimes in collaboration with other organizations. It ’ s the annual survey of the industry ’ s most liked screenplays. It ’ s the partnered list that we do with GLADD, IMPAC and other sort of affinity groups, you know, for the Muslim community, the Asian Pacific Islander community, etc., all the way up to and including making some of those scripts and movies. So we ’ re producing a lot of these things now. It ’ s more about how can we be supportive of the Hollywood community at large and especially screenwriters within it. And I think that that as a general guide would sort of be the guiding principle for for everything we do. What ’ s so cool about the blacklist is you basically found a way to give people an excuse to trust their actual taste and to say like this thing that we really love, we actually can make. And I think that ’ s a really powerful thing across industries, not even just in Hollywood. I think that ’ s right. Look, and I don ’ t think that it ’ s that Hollywood lacks imagination. I mean, I can say concretely, having worked in the business for now, for coming up on 18 years, the people that work in Hollywood are wildly imaginative and wildly talented. And it is a joy to be able to work with them. I think that the the difficulty and the frustration is that the industry, you know, people are running scared at all times. And the decisions that are made about the economics of the business are made based on a set of conventional wisdom. That is all conventional wisdom that has been passed down through generations. And implicit in that sort of passed down, conventional wisdom is a ton of bias, some of which is, you know, sort of innocuous. And a lot of it is is terribly dangerous. Right. So it can be something as simple as, you know, certain kinds of action sequences don ’ t work right now. Does it really matter about like, you know, a certain kind of car chases work or don ’ t work in movies? Probably not really. Doesn ’ t matter when we decide, as the industry had for years, that female driven action movies don ’ t work commercially. And the consequences of that we see in our gender relationships, in our daily lives when people assume, oh, well, you can ’ t sell black actors abroad outside of the US, the consequences of that are apocalyptic in terms of like the actual valuing of black lives in America and around the world. Because we make fewer black movies, we don ’ t market those movies abroad, you know, and it ’ s just fundamentally not true. Stacy Smith, a professor at USC, ran the numbers and found that basically when you support movies with diversity in at the same level, that you support movies that don ’ t have that diversity, guess what? They make the same amount of money. People don ’ t have a problem seeing diverse actors on screen or seeing diverse stories. What they want more than anything is for those movies to be good. And what ’ s the blacklist, I hope has done is created more of a true meritocracy where the focus is not who ’ s in the movie, what ’ s the movie about it simply is this a good script? And probably one of the most gratifying things about the sort of 15 year history of the blacklist and. Up on 16 years is that last year, the Harvard Business School did a study on the economics of the Black List and found that movies on the black list, when controlling for every other factor, movies made from scripts on the Black List made 90 percent more in revenue than movies made from scripts, not on the black list. And I want to say it again, because I think that it can ’ t be emphasized enough that movies on the planet that were made from scripts on the Black List made 90 percent more than movies that were made from scripts not on the Blacklist. And there ’ s one reason why, which is if you start with a great screenplay, you have a better chance of making a great movie. And if you make a great movie, you have a better chance of making a profitable one. And so, you know, I think that that ’ s a lesson that everybody instinctively knows. But it ’ s not one that has been the guiding principle of the **film** industry for a very long time, if ever. So they ’ ve kind of worked both artistically and profitably. What lessons do you think you ’ ve learned that apply to people who don ’ t work in entertainment or maybe even in a creative field at all? Because it seems like so much of what you ’ ve learned here is that challenging the conventional wisdom is not just good for diversity and equity and inclusion. It ’ s also good for the **bottom** line. That ’ s exactly right. And I think that ’ s probably a number one. Increasing diversity is good for the **bottom** line, like it ’ s good morally and ethically, but it ’ s also good capitalistically. If we can use that probably neologism. No, look, I think the other the other thing that I ’ ve learned. Is that conventional wisdom is more often than not convention and not wisdom? You know, I think that in a world, especially over the last, let ’ s say, 20, 25 years or the amount of information that we ’ re expected to sort of keep in our brain and the analytics that we have to do on a daily basis to do our job and to process the world and to interact with other people, we are inclined to create these rustics that we just take for granted. And a lot of those critics are deeply, deeply, deeply flawed. And we as individuals and as organizations have to do a better job of aggressively interrogating them both for the good of the world, but also for our own individual self-interest. That means that I have to do that as well. Right. Like, this is not just me giving advice to other people and saying, why aren ’ t you doing better? It ’ s me looking in the mirror every day and saying, are you doing better? When you look at your business, are you just saying, well, I ’ m a black guy from the south, so I ’ m sure I ’ m doing fine? Or am I saying, you know, are we good on gender or are we making sure that everybody has a seat at the table? Are we making sure that we ’ re deconstructing the table and deconstructing the house and allowing everybody to rebuild it? And if we ’ re not, then I have to make changes. And I think that ’ s probably the biggest thing is trying to build a mirror for myself that actually presents an image of me as I am and not as I want to imagine myself. If that makes sense, that totally makes sense. So for everyone listening who may not know, last year the Academy issued some new rules for **films** to be considered for an Oscar. The rules had minimum requirements for diversity and inclusion, and there ’ s been a mixed response as to what the effects of those rules might be. Some people think it ’ s going to make a huge difference. Some people think it doesn ’ t go far enough and some people are angry about it, frankly. And you have really publicly said that you think that the new rules are a good start and you ’ re optimistic. I ’ m curious, though, if you think they ’ re going to make a real tangible difference in the kinds of movies that are getting produced. But again, because of the way in which the sort of thresholds are structured, if you just hire one like a woman of color in a senior role at your distribution company and like have an internship program with two interns, you ’ re fine. And so the way I read the academy ’ s sort of announcement is a public statement that in order to be a responsible corporate citizen of the **film** industry, you have to be trying to expand the pipeline ever so slightly. And if you ’ re not doing that, then we ’ re not going to give you the chance of winning an Oscar. But they did not prevent anyone who has made a movie from getting, you know, the sort of laurels that their artistic accomplishment may have earned them. And that ’ s the thing like, look, for me personally, I don ’ t need for any individual movie to include black people. Right. Or any other group. If you want to make a movie with all like made by and about all straight white men over the age of 50 who grew up upper middle class, like more power to you. I just want to make sure that if somebody wants to make a movie about trans women who are black and poor, that they have just as much likelihood of getting that movie made as the white dudes did. And then, you know, best movie wins. The problem is not that we need all of these movies to be super diverse and for all of these groups to be diverse when they make them, though, that would be nice. The problem is, is that for the entire history of Hollywood, we ’ ve had massive amounts of affirmative action for one group, white, upper middle class, straight says men and everybody else has to not only make something good, but also do it and overcome all of these obstacles to just getting their movie made or even being in a position where they can make a movie. So I would like to focus on the the access to resources and the access to distribution problem far more than I would. Hey, who ’ s eligible for an Oscar? But I do think that because the Academy Awards are, you know, the time every year when most people are thinking about the the ecosystem of the **film** industry, it ’ s critical that we have that conversation about the Oscars as part of a broader conversation that should be tackling year round. I also have to say, shout out to Epuron, who came up with the hashtag Oscars so white, there ’ s very little chance that we ’ d be having this conversation right now if it wasn ’ t for her. And I think it ’ s really important that we remember that Oscars so white is not just about black actors, it is about all non-white men and making sure that everyone is represented in the culture because we have a better culture when that ’ s true and we all make more money when that ’ s true. And I think that, you know, I ’ m really just in awe of what she built with that with something very, very simple that had the power to change the world. Yeah. And the fact that she did make such a huge impact with that. And she ’ s not at the very top of the power structure and the money. She ’ s not the person. Greenlining. The **films**, I think, does speak to the fact that. Anyone can actually have a real impact on the **films** that are getting made in the culture that is being spread around the world. That is the power that all of us have in a world where social media exists. Again, that is a sword that cuts both ways as well. But it is something that that power exists for all of us if we want to become advocates on behalf of any ideas, you know, diversifying Hollywood or diversifying Congress or making sure that people have enough food to eat and a **roof** over their heads. We ’ ll be right back with more from Franklin Leonard after this break. Here we are, we ’ re back. How do you think people who maybe don ’ t see themselves as having that kind of power, how can they think about the the creative force that they can they can create change? And I think it ’ s really about just modeling your values in your day to day actions. You don ’ t have to be an advocate to to change the way a person sees the world or somebody else. But I think that if you are in a position where you see somebody mistreating somebody else or you see somebody being disrespectful to somebody else or you you hear somebody say something that ’ s maybe not even disrespectful to anybody who ’ s in the room, but maybe tell them, hey. Not cool. Have you considered this? Do you realize that when you say this, you also mean this? That ’ s one way, but also than just modeling kindness? Like, again, it ’ s super simple. It ’ s a super it ’ s a very cliched idea, but on a fundamental basis, you don ’ t know the effect that your actions will have on someone else who may be watching you and you never know who may be watching you. We all fail to live up to our highest **ideals**. We all do. I know I do. But aspiring towards them has effects that we can never anticipate. And so. You may never even know what the consequences, but you can ’ t really go wrong by trying. Hmm. That ’ s literally saccharin, but true, you know, it ’ s weird. So what can audiences both in the U. S. and abroad, what can audiences do to kind of help support systemic change or broader representation? Ironically, because I think a lot of people in the **film** and television industry are very uncomfortable with these sort of review aggregators. But Rotten Tomatoes and Metacritic are a great place to start. You know, look, we are all in a time of sort of super abundance of content, right? There ’ s more TV shows to watch than any human being could ever watch. There ’ s more movies to watch than any human being could ever watch. And we all want to watch the good stuff. Right. And by good, I want to be clear. I don ’ t mean pretentious. I don ’ t mean Oscar winning. I just mean best in class. Right. Like, if you want to watch a weird comedy, you want to watch the best week comedy. You want to watch the bad one. Right. **Film** critics, television critics. There are deep problems with those communities. They tend to be, you know, overrepresented by it, by white older men. But seek out critics who who consistently have opinions that mirror your own right. If you love a movie, go find a critic who felt similarly to you that wrote about the movie in a way that you found compelling and go see what else they liked. Right. Because odds are you will find other movies that you will be intrigued by. And then you can be the critic that shares information about those movies with other people in your community. And I know that sounds like a very elaborate thing to do in order to find a good movie or television show. But I promise you two things. One, you will enjoy the process of looking because you will learn about things that you would not otherwise learn about. And if people are reviewing things in a way that is compelling, that process alone will be entertaining. And too, you will find better things to watch. You will have fewer nights where you made the decision to watch something for two hours and at the end of the two hours you ' re like, that ' s two hours of my life. I ' m never getting back. So there ' s there ' s obviously a huge portion of the movie going audience that mainly watches things like superhero movies or big franchise **films**. Do you not believe that that ' s a problem? I think people should watch what they like. And if that ' s superhero movies, it ' s all good. Right? There are a lot of really good superhero movies out there. Black Panther, excellent **film**. Thor Ragnarok, excellent **film**. Right. Thor Ragnarok is a meditation on refugees and the displacement of peoples Black Panther. There ' s a reason why Immigrant Song is the song they play over the climactic battle scene. Black Panther is about many things, but it is fundamentally about this tension between, you know, the black community wanting to sort of shutter itself off and sort of integrate into the world despite the tortures that the rest of the world has put us through. Right. As Martin versus Malcolm and literally the climactic fight scene happens on a literal underground **railroad**. There ' s a tendency for a lot of people to sort of tut tut about, you know, these big studio action movies and act like they ' re somehow like a diminution of the art form. And I just have never believe that that ' s true. Now, some of them are not good, but there are many indie pretentious movies that are not good either. So what I would say is, is look for things that you love. And if you loved that thing right, if you love Black Panther, maybe check out Creed by the same director, Ryan Coogler. And if you love Creed, maybe check out Fruitvale Station also by that director. You know, if you loved Thor Ragnarok, there ' s a reason Tycho Waititi, right. An indigenous New Zealander, got the job for Thor. Why don ' t you go watch the stuff that he made that got him that job? There ' s a good chance you ' re going to like that, too. And the thing about it is, is you ' re the only person losing by not checking those things out. Right. Like they got your money for Thor, they got your money for Black Panther. The industry is going to be fine. You have an opportunity and the world is going to open up to you and you ' re going to have these moments of joy in these moments of sadness and these moments of exhilaration that you haven ' t gotten to have yet. And that is fundamentally, for me at least, the beauty of **film** when the beauty of art and the beauty of a cultural world in which we live. You know, we ' ve been talking about movies and cinema, but obviously the experience of watching a **film** has changed dramatically with theaters being closed. I guess even if they ' re open, people being scared to go. I even think about that a little bit personally, because there ' s a movie theater right down the block from where I live here in Los Angeles. And on their big marquee rather than new movie title, it says to be continued. But it ' s said that for months now and their doors still haven ' t reopened. So what at first was kind of just like charming and even funny sign is now a real open question, right? Like, will that theater ever actually reopen? And I hope they do. I hope they do, because I think that there ’ s something really powerful about seeing movies in person. That classic experience, which you describe so beautifully in your talk from a few years ago. Here ’ s a clip of that this weekend. Tens of millions of people in the United States and tens of millions of. All around the world, in Columbus, Georgia, in Cardiff, Wales, in Chongqing, China, in Chennai, India, will leave their homes, they ’ ll get in their cars or they ’ ll take public transportation, or they will carry themselves by **foot** and they ’ ll step into a room and sit down next to someone they don ’ t know or maybe someone they do. And the lights will go down and they ’ ll watch a movie. They watch movies about aliens or robots or robot aliens or regular people, but they will all be movies about what it means to be human. Millions will feel all or fear, millions will laugh and millions will cry, and then the lights will come back on and they ’ ll reemerge into the world they knew several hours prior. And millions of people will look at the world a little bit differently than they did when they went in by going to temple or a mosque or a church or any other religious institution. Movie going is in many ways a sacred ritual, repeated week after week after week. I ’ ll be there this weekend, just like I was on most weekends between the years of 1996 and 1990 at the multiplex near the shopping mall, about five miles from my childhood home in Columbus, Georgia. The funny thing is that somewhere between then and now, I accidentally changed part of the conversation about which of those movies get made. You obviously gave that talk well before the pandemic or any of the current concerns about movie theaters and public health existed. But I imagine you must be thinking about that a lot during this time right now. So do you have any new perspective on why movies matter and why this experience matters? Well, you know, I think the absence of these communal environments wherein we learn about what it means to be human and right. And that was sort of a link that I was making between religion and movies, is that, you know, um, but I think what ’ s interesting to me about movies and I would include television and really any storytelling in this regard or art more generally, the movies as a popular medium is that, you know, fortunately we have these virtual spaces where we can sort of commune around them and it ’ s not quite the same, but it still ends up being a common language and a common touch point for humankind. Right. You know, I think Netflix just put out that they had seventy eight million people watched Gina Prince Bythewood movie The Old Guard. And when I meet somebody and they ’ ve watched it also, we will have a really positive conversation about Gina Prince bywords, brilliant work, and we will feel closer as a consequence. And that has nothing to do with us being both black or both men or whatever it is. It ’ s just that like we saw this thing about these people and we bonded over it. I don ’ t know. I ’ m really appreciative that that exists. Now, that ’ s the positive side. There is also a negative side, which is and I think that the sort of moment of racial reckoning that we ’ re seeing around the globe is in large part connected to the movie industry, because when we go into a room and we sit with a lot of people we don ’ t know and we learn about the world and what we learn about the world is a lie in terms of race, in terms of gender, in terms of sexuality, in terms of religion. Those lies being projected 40 **feet** high in front of tens of millions, if not hundreds of millions of people have real human substantive consequences, particularly for black lives. You know, I ’ ve increasingly, over the last few months been struck by the notion that the first ever Hollywood blockbuster was birth of a nation. And, you know, we ’ re seeing the consequences of it now. So I think it cuts both ways. I ’ m and part of the reason why I ’ m so attracted to **film** as an art form is because it does cut both ways incredibly sharply and with an incredibly large sword. Hmm. What is one movie or book or cultural artifact or idea that ’ s made you a better human? I mean. Look, I ’ m very lucky in that I have two parents who. Very clearly communicated to me and my two younger siblings that we could do anything and as black kids in the Deep South in the 80s, that probably wasn ’ t true. But they convinced us of that anyway, and I think between that and their very clear expectation that the obligation that we had was not just to do whatever we wanted to do and aspire to whatever we wanted to aspire towards, it was to make sure that we made it more likely that anybody had more of a chance of doing it. Somehow they managed to convince us that, like we could do anything and also explain to us that the world was organized so that not everybody could and that we it was our responsibility to make sure that everybody could. And that ’ s not a cultural artifact, but it ’ s the thing that for me, I ’ m most thankful for and it ’ s the thing that I hope I ’ m able to incorporate from a values perspective and all of my work and the arts that I contribute to. I don ’ t know if that answers your question, but it ’ s something that I been greatly on my mind of late. And a related question right now, in this point in your life, what is something that you ’ re trying to be a better human at? I ’ m trying to have more patience with people. I ’ m trying to be better at recognizing that the world is on fire, figuratively and literally, and that everybody is going through a lot. And that moment when I feel the need to judge or they feel the need to cast disapproval on, I need to take a moment and realize that there may be other explanations than that, which I would assume. Well, Franklin, Leonard, thank you so much for talking with us. It ’ s been an absolute honor and a pleasure being a pleasure. Thank you for having me. Thanks so much for listening to this episode of How to be a Better Human. That ’ s our show for today. Thank you to our **guest**, Franklin Leonard. You can find the black list at B. L. Seek Elstein Dotcom. I am your host, Chris Duffie. This show is produced by Abby MONITUS, Danielle Arezzo, Frederica Elizabeth Yosfiah and Karen Newman at Ted and Jocelyn Gonzalez, Pedro Rafael Rosado and Sandra Lopez among from Peru Productions. For more on how to be a better human visit, ideas dot. com. We ’ ll see you next week.

Text Sample 739: POS Dim 5 – 2021 – Score 7.00 – 2021/t003892.txt

So the climate crisis, in my way of thinking about it, is the most serious manifestation of an underlying collision between human civilization as we ’ ve presently organized it and the Earth ’ s ecological systems. And the system most in jeopardy is the very thin shell of atmosphere surrounding our planet, because we ’ re spewing 162 million tons of human-caused global warming pollution into it every single day, as if this is an open sewer. It ’ s not an open sewer. It ’ s so thin that if you could drive an automobile at autobahn speeds to the top of that blue shell, you ’ d reach it in about five minutes. And that ’ s where all the greenhouse **gases** are. The accumulated amount, coming from the burning of fossil fuels primarily, CO2 – fastest-growing source of methane is from fossil fuels as well, also, agriculture as you have heard – the accumulated amount traps as much heat now as would be released by 600, 000 Hiroshima-class atomic bombs exploding every day. So the temperatures are going up at almost record levels every year. Last year was the hottest year in recorded history, according to NASA, and the scientists say it ’ s absolutely unequivocal that we are the cause of that. And we ’ re hearing Mother Nature and seeing the extreme events. The most anomalous extreme event since records began 200 years ago was in the Pacific Northwest of North America. Forty nine and a half degrees, 121 degrees Fahrenheit in British Columbia. In the tropics and subtropics, the combination of temperature and humidity is now making larger areas literally uninhabitable, the area so described is relatively small now, but if we continue over the next few decades, these areas are predicted to expand, and billions of people will be in areas where it is not safe to stay outside for more than a couple of hours. Already, the climate refugees and migrants are four times more from the climate crisis than from all the wars and conflicts going on right now. And the respected”Lancet”commission has predicted as many as a billion climate refugees in this century. That ’ s one of the reasons why we are seeing this wave of populist authoritarianism. Sea level rise is also contributing, and of course, 93 percent of the extra heat is absorbed in the oceans, and the ocean temperatures are reaching record levels as well. And that means more water vapor comes off the oceans, and the warmer ocean temperature makes the cyclonic storms, like hurricanes and typhoons much stronger. Hurricane Ida struck the Gulf Coast as a category four, and as is so often the case, communities of color and poor people were disproportionately victimized. This storm continued on north and northeast across North America to New York, New Jersey and Pennsylvania, killed a lot of people and dropped rain bombs. And in New York City some basement apartments were flooded. And I appreciate this family giving me the right to show this video. He ’ s safe, the guy is screaming for his mother. He and his mother were both rescued by his brother, who punched a hole through the **roof** from the floor above. These rain bombs are becoming much more frequent and much more extreme. And actually the water coming off the oceans is held in much greater volumes by the warmer air. Atmospheric rivers are becoming larger. Here ’ s one, from Hawaii in the lower left to Silicon Valley in the upper right, 2, 300 kilometers. What was happening in Silicon Valley when this satellite **picture** was made? Well, that ’ s what happens when these rain bombs drop, and the average atmospheric river now contains as much moisture as 25 Mississippi Rivers. They ’ re creating what you could call”atmospheric tsunamis”in some areas. The downpours get much bigger and much more frequent, four times more frequent now than in 1980. One of them dropped on Germany and neighboring countries in July, killed more than 200 people. Look at the before and after. This is an example of what we ’ re doing to our planet. Ten days ago, in part of Italy, there were 74 centimeters that fell in 12 hours, 29 inches of rain in 12 hours. One year ago, October 3rd, as much rain fell here in the UK as there is water in Loch Ness. And as a result, the insurance industry is now seeing record recoveries, and those recoveries I showed you from last year may get a tiny bit larger, depending on the outcome of this lawsuit. The owners and operators of this giant replica of Noah ’ s Ark have sued their insurance company for a million dollars in flood damages. Hard to make some of this stuff up. The same extra heat is pulling the moisture out of the first meter of the soil, creating the worst droughts in memory. 93 percent of the American West is in drought now, 100 percent of California, half of California is in the most extreme form of drought, and the same heat is also draining the reservoirs, evaporating the reservoirs. Lake Mead is down to levels not seen since they started filling it in the 1930s. In Brazil, the same thing is happening. In Eastern Europe, the Czech Republic has been going through the worst drought in at least 500 years. And in the southern cone of Africa, 100 million people are experiencing food insecurity primarily because of the extended droughts. And when the temperatures go up, the fires get a lot worse and the worst fires in California and western US history have been in the last two years. Also in Siberia, in Australia, in southern Europe. It doesn ’ t have to ruin your golf game. And this is a serious point, because we can ’ t let these conditions become the new normal. It ’ s not fine. And this is an example of why it ’ s not fine. A lightning strike hitting a natural **gas** leak in the middle of the Gulf of Mexico. Lightning gets more common with the climate crisis. We ’ re relying on dead plants and animals, leaving their residue in the atmosphere to threaten the species that are still alive, and 50 percent of them are in danger of extinction in this century. And as we push into previously wild areas of the world, we encounter millions of new viruses that we have not dealt with in the past. Five new infectious diseases every year, emerging, three quarters of them from animals, like the COVID-19 pandemic. Which raises some of the same questions that are raised by the climate crisis. When the world ’ s leading scientists are setting their hair on fire to get our attention, should we listen to them? Check. Can our interconnected global civilization suddenly be turned upside down? Check. Are the poor and marginalized populations of the world the most affected? Check. Can science and technology give us nearly miraculous solutions in record time? Check. Will we deploy those solutions in time? That is the question. We have inequitable vaccine distribution in the world, and it threatens everyone in the world. We also have solutions to the climate crisis, but they ’ re not equitably distributed. Worldwide, 90 percent of all of the new electricity generation installed last year was renewables. Almost all of it from solar and wind. Just one year before the Paris Agreement, solar and wind electricity was cheaper than fossil electricity in only one percent of the world. Five years later, two thirds of the world. Three years from now, it will be the cheapest source in 100 percent of the world. Coal is not getting cheaper. **Gas** is not getting cheaper. Nuclear has been getting more expensive. Wind is cheaper than all three, and solar is continuing to plummet in cost and is the cheapest of all now because the cost of making the solar **panels** and the windmills continues to come down. By the way, the famous coal **museum** in Kentucky just installed solar **panels** on its **roof** in order to save in its operating budget. Now we ’ re getting battery storage. I ’ ll rescale this graph to show you the predicted emergence of a new one-trillion-dollar industry in the next few decades and green hydrogen on top of that. The car batteries are getting cheaper as demand continues to increase. And within less than two years in some model categories, the EVs will be cheaper than their internal combustion engine counterparts and within four years in all model categories. So, the oil and **gas** industry has been the worst investment in global markets for more than a decade, while the **clean** energy companies are really becoming more profitable. Now the oil and **gas** companies say that they ’ re going to invest a lot more in renewables and CCS. Yes, it ’ s the fastest-growing – they ’ ve tripled their investments all the way up to four percent. Ninety-six percent of the money they ’ re spending is still going into oil and **gas** and coal. The impression they ’ ve given us is not an honest impression, not for the first time. And they ’ re telling a different story to Wall Street. They still have planes, trains, a few automobiles and ships, but they ’ re telling Wall Street and financial markets they ’ re going to make it up in plastics, which is 75 percent of their third-largest market, petrochemicals. How ’ s that working out for us? Not so well. Banning single-use plastics is one of the many things that we have to do. We have to shift to sustainability. And here ’ s the good news, the sustainability revolution is the single biggest business opportunity in the history of the world. It has the scale of the industrial revolution coupled with the speed of the digital revolution. And what we ’ re seeing is that we have to seize this opportunity, but we need reforms in the current version of capitalism. Capitalism does a lot of things great. It balances supply and demand and allocates resources efficiently and often unlocks a higher fraction of the human potential. And by the way, the alternatives on the left and right explored in the 20th century didn ’ t work out very well. But in order to see how we need to change capitalism, we have to pull out our focus. And let me present an analogy. The electromagnetic spectrum from the long radio waves to the short gamma rays and all the things in between, the portion of visible light that we can see with our eyes makes up only 0. 1 percent of the total. For the eight years I worked in the White House, I got a daily report from the intelligence community that collected from all parts of the spectrum, and it was a much more accurate **picture**. Here ' s the analogy. The value spectrum is something we too frequently look at through the very narrow aperture of short-term profits for one stakeholder, the shareholders. But this leaves out negative externalities, as the economists call them, like the pollution. That ' s why we need a price on carbon and a price on plastic pollution. It also leaves out positive externalities. So we ' re chronically underinvesting in education and health care and environmental protection, pandemic preparedness. We ' re ignoring the depletion of resources like topsoil and underground water aquifers. And we ' re ignoring the distribution of incomes and net worths to the point where one percent of the people have almost half of the world ' s wealth. That ' s one of the other factors that ' s driving populist authoritarianism. We have to take account of the environmental effects and the effects on people and their families and the communities where they live and the communities in their supply chain and the ethics in the C-suites. And we have to realize that hyper inequality is a threat to both capitalism and to democracy. There is an emergent form called multistakeholder capitalism, and it is driving a lot of new decisions. For example, in asset management, almost half of all the assets in the world under management are now in portfolios committed to net-zero. One reason is that the Paris Agreement set the direction of travel, where every country in the world committed to net-zero. So just last May, the G7 nations banned financing of coal plants overseas. And just three weeks ago, China did, which is good, because they were financing most of them. I hope that they will cut down on the coal chain in China domestically as well. And now more than half of all the greenhouse **gas** emissions and two thirds of global GDP is coming from countries that have set net-zero targets. So here ' s the hope. Once we reach net-zero, then with a lag time of as little as three to five years, the temperatures in the world will stop going up. And once we reach net-zero within as little as 25 to 30 years, half of the human-caused CO2 will fall out of the atmosphere. It is as if we have a switch that we can flip in order to stop the climate crisis. Regrettably, some damage has been done, but we can stop the temperatures from going up and start the healing process. But we all have to flip this switch known as reaching net-zero. The young people are telling us that we have to, and they ' re marching in every country in the world. And what ' s the response? As recently as this morning we heard,"Well, it may be impossible."Well, it ' s not impossible. Nelson Mandela said,"It always seems impossible until it ' s done."That ' s what they told the abolitionists."It ' s impossible to eliminate slavery."That ' s what they told the women ' s suffragettes."It ' s impossible to have equal rights for women."In the civil rights movement in my country and the anti-apartheid movement in South Africa and more recently, the lesbian and gay liberation and equal rights movement. We can do this. This is the biggest emergent social movement in all of history. We can do this. And if anybody thinks that we don ' t have the political will, remember, political will is itself a renewable resource. Thank you very much. Thank you.

Text Sample 740: POS Dim 5 – 2019 – Score 8.00 – 2019/t001498.txt

My mom has always reminded me that I have the same proportions as a LEGO man. And she does actually have a point. LEGO is a company that has succeeded in making everybody believe that LEGO is from their home country. But it ’ s not, it ’ s from my home country. So you can imagine my excitement when the LEGO family called me and asked us to work with them to design the Home of the Brick. This is the architectural model — we built it out of LEGO, obviously. This is the final result. And what we tried to do was to design a building that would be as interactive and as engaging and as playful as LEGO is itself, with these kind of interconnected playgrounds on the roofscape. You can enter a square on the ground where the citizens of Billund can roam around freely without a ticket. And it ’ s probably one of the only **museums** in the world where you ’ re allowed to touch all the artifacts. But the Danish word for design is”formgivning,”which literally means to give form to that which has not yet been given form. In other words, to give form to the future. And what I love about LEGO is that LEGO is not a toy. It ’ s a tool that empowers the child to build his or her own world, and then to inhabit that world through play and to invite her friends to join her in cohabiting and cocreating that world. And that is exactly what formgivning is. As human beings, we have the power to give form to our future. Inspired by LEGO, we ’ ve built a social housing project in Copenhagen, where we stacked blocks of wood next to each other. Between them, they leave spaces with extra ceiling heights and balconies. And by gently wiggling the blocks, we can actually create **curves** or any organic form, adapting to any urban context. Because adaptability is probably one of the strongest drivers of architecture. Another example is here in Vancouver. We were asked to look at the site where Granville bridge triforks as it touches downtown. And we started, like, mapping the different constraints. There ’ s like a 100-foot setback from the bridge because the city want to make sure that no one looks into the traffic on the bridge. There ’ s a **park** where we can ’ t cast any shadows. So finally, we ’ re left with a tiny triangular footprint, almost too small to build. But then we thought, like, what if the 100-foot minimum distance is really about minimum distance — once we get 100 **feet** up in the air, we can grow the building back out. And so we did. When you drive over the bridge, it ’ s as if someone is pulling a curtain aback, welcoming you to Vancouver. Or a like a weed growing through the cracks in the pavement and blossoming as it gets light and air. Underneath the bridge, we ’ ve worked with Rodney Graham and a handful of Vancouver artists, to create what we called the Sistine Chapel of street art, an art gallery turned upside down, that tries to turn the negative impact of the bridge into a positive. So even if it looks like this kind of surreal architecture, it ’ s highly adapted to its surroundings. So if a bridge can become a **museum**, a **museum** can also serve as a bridge. In Norway, we are building a **museum** that spans across a river and allows people to sort of journey through the exhibitions as they cross from one side of a sculpture **park** to the other. An architecture sort of adapted to its landscape. In China, we built a headquarters for an energy company and we designed the facade like an Issey Miyake fabric. It ’ s rippled, so that facing the predominant direction of the sun, it ’ s all opaque ; facing away from the sun, it ’ s all glass. On average, it sort of transitions from solid to clear. And this very simple idea without any moving parts or any sort of technology, purely because of the geometry of the facade, reduces the energy consumption on cooling by 30 percent. So you can say what makes the building look elegant is also what makes it perform elegantly. It ’ s an architecture that is adapted to its climate. You can also adapt one culture to another, like in Manhattan, we took the Copenhagen courtyard building with a social space where people can hang out in this kind of oasis in the middle of a city, and we combined it with the density and the verticality of an American skyscraper, creating what we ’ ve called a”courtscraper.”From New York to Copenhagen. On the waterfront of Copenhagen, we are right now finishing this waste-to-energy power plant. It ’ s going to be the **cleanest** waste-to-energy power plant in the world, there are no toxins coming out of the chimney. An amazing marvel of engineering that is completely invisible. So we thought, how can we express this? And in Copenhagen we have snow, as you can see, but we have absolutely no mountains. We have to go six hours by bus to get to Sweden, to get alpine skiing. So we thought, let ’ s put an alpine ski slope on the **roof** of the power plant. So this is the first test run we did a few months ago. And what I like about this is that it also show you the sort of world-changing power of formgivning. I have a five-month-old son, and he ’ s going to grow up in a world not knowing that there was ever a time when you couldn ’ t ski on the **roof** of the power plant. So imagine for him and his generation, that ’ s their baseline. Imagine how far they can leap, what kind of wild ideas they can put forward for their future. So right in front of it, we ’ re building our smallest project. It ’ s basically nine containers that we have stacked in a shipyard in Poland, then we ’ ve schlepped it across the Baltic sea and docked it in the port of Copenhagen, where it is now the home of 12 students. Each student has a view to the water, they can jump out the window into the **clean** port of Copenhagen, and they can get back in. All of the heat comes from the thermal mass of the sea, all the power comes from the sun. This is the first 12 units in Copenhagen, another 60 on their way, another 200 are going to Gothenburg, and we ’ re speaking with the Paris Olympics to put a small floating village on the Seine. So very much this kind of, almost like nomadic, impermanent architecture. And the waterfronts of our cities are experiencing a lot of change. Economic change, industrial change and climate change. This is Manhattan before Hurricane Sandy, and this is Manhattan after Sandy. We got invited by the city of New York to look if we could make the necessary flood protection for Manhattan without building a seawall that would segregate the life of the city from the water around it. And we got inspired by the High Line. You probably know the High Line — it ’ s this amazing new **park** in New York. It ’ s basically decommissioned train tracks that now have become one of the most popular promenades in the city. So we thought, could we design the necessary flood protection for Manhattan so we don ’ t have to wait until we shut it down before it gets nice? So we sat down with the citizens living along the waterfront of New York, and we worked with them to try to design the necessary flood protection in such a way that it only makes their waterfront more accessible and more enjoyable. Underneath the FDR, we are putting, like, pavilions with pocket walls that can slide out and protect from the water. We are creating little stepped terraces that are going to make the underside more enjoyable, but also protect from flooding. Further north in the East River Park, we are creating rolling hills that protect the **park** from the noise of the highway, but in turn also become the necessary flood protection that can stop the waves during an incoming storm surge. So in a way, this project that we have called the Dryline, it ’ s essentially the High Line — The High Line that ’ s going to keep Manhattan dry. It ’ s scheduled to break ground on the first East River portion at the end of this year. But it has essentially been codesigned with the citizens of Lower Manhattan to take all of the necessary infrastructure for **resilience** and give it positive social and environmental side effects. So, New York is not alone in facing this situation. In fact, by 2050, 90 percent of the major cities in the world are going to be dealing with rising seas. In Hamburg, they ’ ve created a whole neighborhood where the **bottom** floors are designed to withstand the inevitable flood. In Sweden, they ’ ve designed a city where all of the **parks** are wet gardens, designed to deal with storm water and waste water. So we thought, could we perhaps — Actually, today, three million people are already permanently living on the sea. So we thought, could we actually imagine a floating city designed to incorporate all of the Sustainable Development Goals of the United Nations into a whole new human-made ecosystem. And of course, we have to design it so it can produce its own power, harvesting the thermal mass of the oceans, the force of the tides, of the currents, of the waves, the power of the wind, the heat and the energy of the sun. Also, we are going to collect all of the rain water that drops on this man-made archipelago and deal with it organically and mechanically and store it and **clean** it. We have to grow all of our food locally, it has to be fish- and plant-based, because you won ’ t have the space or the resources for a dairy diet. And finally, we are going to deal with all the waste locally, with compost, recycling, and turning the waste into energy. So imagine where a traditional urban master plan, you typically draw the street grid where the cars can drive and the building plots where you can put some buildings. This master plan, we sat down with a handful of scientists and basically started with all of the renewable, available natural resources, and then we started channeling the flow of resources through this kind of human- made ecosystem or this kind of urban metabolism. So it ’ s going to be modular, it ’ s going to be buoyant, it ’ s going to be designed to resist a tropical storm. You can prefabricate it at scale, and tow it to dock with others, to form a small community. We ’ re designing these kind of coastal additions, so that even if it ’ s modular and rational, each island can be unique with its own coastal landscape. The architecture has to remain relatively low to keep the center of gravity buoyant. We ’ re going to take all of the agriculture and use it to also create social space so you can actually enjoy the permaculture gardens. We ’ re designing it for the tropics, so all of the **roofs** are maximized to harvest solar power and to shade from the sun. All the materials are going to be light and renewable, like bamboo and wood, which is also going to create this charming, warm environment. And any architecture is supposed to be able to fit on this platform. Underneath we have all the storage inside the pontoon, almost like a mega version of the student housings that we ’ ve already worked with. We have all the storage for the energy that ’ s produced, all of the water storage and remediation. We are sort of dealing with all of the waste and the composting. And we also have some backup farming with aeroponics and hydroponics. So imagine almost like a vertical section through this landscape that goes from the air above, where we have vertical farms ; below, we have the aeroponics and the aquaponics. Even further below, we have the ocean farms and where we tie the island to the ground, we ’ re using biorock to create new reefs to regenerate habitat. So think of this small island for 300 people. It can then group together to form a cluster or a neighborhood that then can sort of group together to form an entire city for 10, 000 people. And you can imagine if this floating city flourishes, it can sort of grow like a culture in a petri dish. So one of the first places we are looking at placing this, or anchoring this floating city, is in the Pearl River delta. So imagine this kind of canopy of photovoltaics on this archipelago floating in the sea. As you sail towards the island, you will see the maritime residents moving around on alternative forms of aquatic transportation. You come into this kind of community port. You can roam around in the permaculture gardens that are productive landscapes, but also social landscapes. The greenhouses also become orangeries for the cultural life of the city, and below, under the sea, it ’ s teeming with life of farming and science and social spaces. So in a way, you can imagine this community port is where people gather, both by day and by night. And even if the first one is designed for the tropics, we also imagine that the architecture can adapt to any culture, so imagine, like, a Middle Eastern floating city or Southeast Asian floating city or maybe a Scandinavian floating city one day. So maybe just to conclude. The human body is 70 percent water. And the surface of our planet is 70 percent water. And it ’ s rising. And even if the whole world woke up tomorrow and became carbon-neutral over night, there are still island nations that are destined to sink in the seas, unless we also develop alternate forms of floating human habitats. And the only constant in the universe is change. Our world is always changing, and right now, our climate is changing. No matter how critical the crisis is, and it is, this is also our collective human superpower. That we have the power to adapt to change and we have the power to give form to our future.

My day starts just like yours. When I wake up in the morning, I check my phone, and then I have a cup of coffee. But then my day truly starts. It may not be like yours, because I live my life as an artwork. **Picture** yourself in a giant jewelry box with all the beautiful things that you have ever seen in your life. Then imagine that your body is a canvas. And on that canvas, you have a mission to create a masterpiece using the contents of your giant jewelry box. Once you ’ ve created your masterpiece, you might think,”Wow, I created that. This is who I am today.”Then you would pick up your house keys, walk out the door into the real world, maybe take public transport to the center of the town... Possibly walk along the streets or even go shopping. That ’ s my life, every day. When I walk out the door, these artworks are me. I am art. I have lived as art my entire adult life. Living as art is how I became myself. I was brought up in a small village called Fillongley, in England, and it was last mentioned in the”Domesday Book,”so that ’ s the mentality. I was raised by my grandparents, and they were antiques dealers, so I grew up surrounded by history and beautiful things. I had the most amazing dress-up box. So as you can imagine, it started then. I moved to London when I was 17 to become a model. And then I went to study photography. I wasn ’ t really happy with myself at the time, so I was always looking for escapism. I studied the works of David LaChapelle and Steven Arnold, photographers who both curated and created worlds that were mind-blowing to me. So I decided one day to cross over from the superficial fashion world to the superficial art world. I decided to live my life as a work of art. I spend hours, sometimes months, making things. My go-to tool is a safety pin, like this — They ’ re never big enough. And I use my fabrics time and time again, so I recycle everything that I use. When I get dressed I ’ m guided by color, texture and shape. I rarely have a theme. I find beautiful objects from all over the world, and I curate them into 3-D tapestries over a base layer that covers my whole body shape... because I ’ m not very happy with my body. I ask myself,”Should I take something off or should I put something on? 100 pieces, maybe?”And sometimes, I do that. I promise you it ’ s not too uncomfortable — well, just a little — I might have a safety pin poking at me sometimes when I ’ m having a conversation with you, so I ’ ll kind of go off — It usually takes me about 20 minutes to get ready, which nobody ever believes. It ’ s true — sometimes. So, it ’ s my version of a t-shirt and jeans. When I get dressed, I build like an **architect**. I carefully place things till I feel they belong. Then, I get a lot of my ideas from lucid dreaming. I actually go to sleep to come up with my ideas, and I ’ ve taught myself to wake up to write them down. I wear things till they fall apart, and then, I give them a new life. The gold outfit, for example — it was the outfit that I wore to the Houses of Parliament in London. It ’ s made of armor, sequins and broken jewelry, and I was the first person to wear armor to Parliament since Oliver Cromwell banned it in the 17th century. Things don ’ t need to be expensive to be beautiful. Try making outfits out of bin liners or trash you found out on the streets. You never know, they might end up on the pages of”Vogue.”There ’ s over 6, 000 pieces in my collection, ranging from 2, 000-year-old Roman rings to ancient Buddhist artifacts. I believe in sharing what I do and what I have with others, so I decided to create an art exhibition, which is currently traveling to **museums** around the world. It contains an army of me — life-size sculptures as you can see behind me, they ’ re here — they are my life, really. They ’ re kind of like 3-D tapestries of my existence as living as art. They contain plastic crystals mixed with diamonds, beer cans and royal silks all in one look. I like the fact that the viewer can never make the assumption about what ’ s real and what ’ s fake. I find it important to explore and share cultures through my works. I use clothing as a means to investigate and appreciate people from all over the world. Sometimes, people think I ’ m a performer or a drag queen. I ’ m not. Although my life appears to be a performance, it ’ s not. It ’ s very real. People respond to me as they would any other type of artwork. Many people are **fascinated** and engaged. Some people walk around me, staring, shy at first. Then they come up to me and they say they love or absolutely hate what I do. I sometimes respond, and other times I let the art talk for itself. The most annoying thing in the world is when people want to touch the artwork. But I understand. But like a lot of contemporary art, many people are dismissive. Some people are critical, others are abusive. I think it comes from the fear of the different — the unknown. There are so many reactions to what I do, and I ’ ve just learned not to take them personally. I ’ ve never lived as Daniel Lismore, the person. I ’ ve lived as Daniel Lismore, the artwork. And I ’ ve faced every obstacle as an artwork. It can be hard... especially if your wardrobe takes up a 40-foot container, three storage units and 30 boxes from IKEA — and sometimes, it can be very difficult, getting into cars, and sometimes — well, this morning I didn ’ t fit through my bathroom door, so that was a problem. What does it mean to be yourself? People say it all the time, but what does it truly mean, and why does it matter? How does life change when you choose to be unapologetically yourself? I ’ ve had to face struggles and triumphs whilst living my life as art. I ’ ve been put on private jets and flown around the world. My work ’ s been displayed in prestigious **museums**, and I ’ ve had the opportunity — that is my grandparents, by the way, they ’ re the people that raised me, and there I am — So I ’ ve been put on private jets, flown around the world, and yet, it ’ s not been that easy because at times, I ’ ve been homeless, I ’ ve been spat at, I ’ ve been abused, sometimes daily, bullied my entire life, rejected by countless individuals, and I ’ ve been stabbed. But what hurt the most was being put on the”Worst Dressed”list. It can be hard, being yourself, but I ’ ve found it ’ s the best way. There ’ s the”Worst Dressed.”As the quote goes,”Everyone else is already taken.”I ’ ve come to realize that confidence is a concept you can choose. I ’ ve come to realize that authenticity is necessary, and it ’ s powerful. I ’ ve tried to spend time being like other people. It didn ’ t work. It ’ s a lot of hard work, not being yourself. I have a few questions for you all. Who are you? How many versions of you are there? And I have one final question : Are you using them all to your advantage? In reality, everyone is capable of creating their own masterpiece. You should try it sometime. It ’ s quite **fun**. Thank you.

Hi. I ’ m Maisie Williams. And I ’ m kind of just waiting for someone to come on stage and tell me that there ’ s been some sort of miscommunication, and that I should probably leave. No? Damn it. So, some of you may know me as an actress. Some of you may know me for my really average tweets. Oh, yeah. And some of you may be finding out who I am for the first time right now. Hello. Whether you knew me before or not, you ’ re probably wondering what I ’ m going to talk to you about today. And I would be lying if I said it didn ’ t take me one or two sleepless nights, trying to figure that out, too. At last, here I am. Upon finding out the news that I would be giving a TEDx Talk, I did what I think most people do and watched about 50 TED talks back-to-back, and read”Talk like TED”by Carmine Gallo for some inspiration. Was I inspired? Yes and no. Did it make me want to go out and change the world? **Hell** yeah. Did it make me feel like a totally inadequate public speaker with absolutely no point to make, who was definitely in need of a big thesaurus if she wants to keep up? Indeed. What could I possibly say that would have any impact? What point am I trying to make? And who the **hell** thought it was a good idea to give me a TEDx talk? So here ’ s the part where I tell you what I know : I ’ m the youngest of four siblings. My parents divorced when I was four months old. I really was the icing on the cake of a terrible marriage. I have two step siblings who are younger than me and a half brother who ’ s older than all of us. I grew up in a three-bedroom council house with four of my six siblings just outside of Bristol. I went to a very ordinary school. I got very ordinary grades. I wasn ’ t quite good enough to get a gold star, and I also wasn ’ t quite bad enough to be kept after school. I walked that nice center line where if I kept my mouth shut in class, then I could probably get away with not being spoken to you by teachers for weeks on end. Everything about me was pretty damn ordinary, except for how I felt on the inside. I had big dreams. Shock. From as young as I can remember, I have dreamed of becoming a professional dancer. There are certain memories from my childhood that I would really rather forget. But during those times of immense pain, I found myself instinctively walking over to my mother ’ s CD player, cranking up the volume to drown out the noise and letting my body move to the beat. It ’ s hard to describe how it felt. I was harnessing emotions that I didn ’ t even really know the names of yet. I was summoning all of this energy and feeling it flow through my body and out of my fingertips. I was alone in my own head, and I felt the most alive. I didn ’ t really know much about the big wide world then, but I knew that this feeling was addictive ; and I was going to stop at nothing until I made it my profession. At eight years old, I was enrolled in dance class. And by ten, I informed my mother that I didn ’ t want to go to school anymore. I wanted to be like Billy Elliot and go to stage school. This was the first opportunity or challenge I was presented with. Even as young as ten, I was willing to give up all of my friends and go away to board at a private school, away from my siblings, away from my mom. She would repeatedly ask me,”Are you sure this is what you want?”And to me, it was a no-brainer. I didn ’ t just want this ; I needed it. My grubby knees and crooked teeth were not on the list of requirements for becoming a professional dancer. And when I look back now, both myself and my mother looked severely out of place. But at the time, I was just too young and naive to feel inadequate. I didn ’ t care. If Billy Elliot could do it, so could I. Once my audition was done, I returned home for two weeks of staring out the window, waiting for the postman, waiting for my ticket out of my sleepy village and into a world of jazz hands and dorm rooms. It was good news followed by bad news : I had got in, but the fees to attend a school like this were not cheap, and despite my best efforts, I had not received any government funding. I auditioned again the following year. And this time, I received 40 % funding, but this was still just money that we didn ’ t have, and it broke my heart. I was good enough. I made the cut. But I wasn ’ t going anywhere. It was a blessing in disguise, although if anyone had said that to me back then, I probably would ' ve given them the finger and told them to jog on. I wasn ' t willing to give up that easily. So at age 11, I was bursting with excitement when my dance teacher informed me of a talent show which boasted opportunities of making you a star. This was the second opportunity I was faced with. I entered into singing, acting, dancing and modeling. The talent show consisted of workshops and seminars with specialists who would help train you up for your performance at the end of the week. After meeting a woman called Louise Johnston in an improvisation acting workshop, she gave me the words"bowling ball,"and asked me to create a short scene inspired by these words. After making her laugh with a fictional story, of how I threw a bowling ball at my brother and it bounced, she asked me to join her acting agency. I didn ' t really know what this meant. I knew that I would do auditions for **films** and maybe become an actor, but I still had big dreams of becoming a professional dancer, so this woman was going to have to work a lot harder than that if she was going to convince eleven-year-old me that I was going to become an actress. Was this going to take time away from the 30 hours of dancing I was doing a week? And what if I didn ' t get the part? Was this going to be too upsetting? And do actresses have teeth like mine? Because if they do, I ' m yet to watch any of their movies. After meeting Louise in the February of 2009 and trying but failing to land the part in the hit sequel"Nanny McPhee"to"The Big Bang,"my second audition was for a show called"Game of Thrones."This was the third opportunity or challenge I was presented with. I climbed the steps to the Methodist Church with my mother ' s hand in mine. I perched my tiny **bottom** in one of the seats outside the audition room and listened to an annoying girl with her even more annoying mother tell me all about the number of auditions she had done prior to this one. And also about her pet fish. My name was called, then I stepped inside. I had a hard Bristolian accent and dark rings around my eyes that were so big they took up half my face and a hole in the knee of my trousers which I tried to cover with my left hand as I was talking to the kind lady who **taped** my audition. But as soon as she pressed record, it all drifted away. Much like when I was dancing in my mother ' s living room, I harnessed all of my insecurities and self-doubt and let it flow through the words that came out of my mouth. I was cheeky. I was loud. I was angry. And for this, I was perfect. After getting the part and shooting the pilot episode, the show slowly grew to become one of the biggest shows in television history. To this day, we ' ve smashed previous HBO viewing records. We ' ve been nominated for over 130 Emmys, making us the most Emmy-nominated show to ever exist. We ' ve recently finished shooting our eighth and final season, which is predicted to smash records that we ' ve already broken. And nearly a decade to the day since my first audition, I ' m still wondering, when am I going to get to be Billy Elliot? I joke, but in all seriousness, I have absolutely no plans of slowing down. Throughout my time in this industry, it has been a minefield. I have grown from a child into an adult, and from four **feet** tall into a whopping five **feet** tall. I have constantly been trying to say the right thing, accidentally saying the wrong thing, trying not to swear too much and trying to stop saying"like, like"all of the time. In February of 2017, a friend of mine, Dom, and I were swigging beers in my kitchen, and he confessed to me that there is a huge problem with the creative industries. I agreed. The series of events that had got me to that point were based mainly on luck and timing and were unable to be recreated. He suggested to me that we create a social media, but just for artists to be able to collaborate with one another and create a career. This was the fourth opportunity or challenge I was presented with."Great,"I thought."How the **hell** do we do that?"And daisie was born. Of course, everyone who I spoke to about my latest endeavor thought that

I was mad ; however, I know that this is something that I can help change. This last year in the industry, we ’ ve seen a huge shift with the Me Too movement. The industry is built with gatekeepers holding all of the power and selecting who they deem talented enough to advance to the next level. More often than not, it ’ s easier to catch the attention of those people if you have graduated from an expensive school. But even then, I have so many friends who are fresh out of art school, having trained for years and are still no closer to creating a career. Now, I ’ m not claiming that with daisie I can make everybody a star, but I do believe that the key to success within creative industries is collaborating. Actors are only as good as their writers. Musicians are only as strong as their producers. And designers need their teams. To start the company, we self-funded. I had a pot of cash from”Game of Thrones”that I was free to invest wherever I liked. Dom had a series of businesses from the age of 16, which meant he was also left with a pot of cash. We threw our money together 50-50, and we built a team. Now, Lady Gaga has repeatedly said that there could be a room of 100 people, and 99 don ’ t believe in you, but it just takes that one person to believe in you, and they can change your life. Well, now we have a team of six. Over the next 16 months, we built our MVP. Now, if you ’ re wondering what an MVP is, I only found out what it is about six months ago. And from what I can gather, it ’ s a product which proves as a problem worth solving with the minimum team effort. So basically from my point of view, you ’ re marketing something which you know is going to be good one day, but is a little bit bad right now. And for us, that was an iOS app. The six of us made an office in Dom ’ s garden, and on August 1, 2018, we released our version one. We had over 30, 000 downloads in the first 24 hours and over 30, 000 comments asking when the Android version was going to be coming. Despite our app being imperfect, buggy and literally built by one man alone, this was exactly what we needed for people to invest. We learned a lot from our angry users and our scary investors. And over the last six months, we have grown our team to 16 people. From then till now, we ’ ve been building version two, which we will be launching in April. Within the industry, there is a common phrase which I think we ’ re all pretty familiar with. And that is,”It ’ s not what you know, it ’ s who you know.”And with daisie, I hope to give that power back to the creator. I want to encourage people to create a list of contacts that they will work with and support as they take their first steps into the fickle and often challenging creative world. I am of the generation who grew up with the Internet. I ’ ve never known anything else. We are connected, we are aware, and we are the future. I hope daisie can breathe new life into the slightly dystopian, ad-riddled hellscapes that social media platforms have become. I hope to create a space where people can boast their art and creativity rather than what car they are driving and whether or not they bought it in cash or on finance. In a world where literally anyone can be famous, I hope to inspire people to be talented instead. Talent will carry you so much further than your 15 minutes of fame. So why am I telling you all this? The very fact that I ’ m here giving a TEDx talk right now is so far from anything I thought that I was capable of. Even writing the bio for my speech made me realize that in a decade, everything in my life has changed. I am an Emmy-nominated actress, an entrepreneur and an activist ; yet I have no formal qualifications to my name. When I left school about seven years ago, I made it my mission to continue learning even though I never wanted to set **foot** in a classroom again. Who knows what ’ s going to happen to my life in the next 10 years? I surely have no idea. I ’ ve never had an end goal. It ’ s working out okay so far. So trust that you ’ re good enough. If there ’ s one thing that I ’ ve learned is that there truly is a place for everyone. Ask questions, and laugh in the face of people who say that they ’ re stupid questions. Be open to learning and admitting when you don ’ t know what the **hell** is going on. Refuse to hold yourself back, and dare to dream big. Thank you for listening.

A Love Letter to my Garden by Debbie Millman In the beginning of time, there was no time. The universe began with every bit of energy contained in a very tiny, incredibly dense point. It was even smaller than this point. The point exploded with an unimaginable force and created everything we know and are made of. Seeds are a bit like that too. They ’ re tiny and densely packed with their entire existence. Time feels different now, while we shelter at home. Time is scary and uncertain. So we decided to plant some mint. We actually started a little garden a while ago, but now we have more time. We thought that these flowers had died, but they miraculously came back to life. A hopeful sign about the future, perhaps? We planted foxglove and it thrived. And then we went a little crazy. We planted tomatoes, carrots, beans, corn, lettuce and cucumbers, strawberries, blueberries and limes. It ’ s such a strange time in the world. There is so much beauty amidst so much fear. It ’ s so hard to know what to do. In the meantime, we watch and wait and remain grateful we ’ re able to make things with our hands. A love letter to New York City by Debbie Millman I ’ m a native New Yorker. I ’ ve lived here my entire life, yet the city never ceases to surprise me. Everywhere you look, there ’ s something to see. There is Tom Otterness underground and Lawrence Weiner underfoot. There are so many of us. Everyone wants to be someone. Everyone seeks to be heard. Everyone has an opinion, A point of view. And seemingly something to sell. But life is different now as we shelter at home. Under the same sky, at the same moment, at the same time. I ’ m thinking about how tough New York can be, how rough and unrelenting. But maybe that intensity is what fuels our tenacity. As we navigate through this crisis, I am hopeful we will find some solace together. A Love Letter to Travel by Debbie Millman My work has taken me all over the world. There have been many early departures, and many evenings in the air. In all my travels, I ’ ve been struck by so many things. I ’ ve observed how people lived in some of the most ancient places on the planet. This is Machu Picchu. This is Easter Island. This is Samoa. This is Angkor Wat. This is Petra in Jordan. The ancient city contained a church, a theater and tombs for the dead. Families lived in two and three-bedroom apartments. We ’ ve come a long way. Some of the structures that remain are rather mysterious, some are otherworldly, some are glorious odes to love, some house the souls of the dead. Some have forced us to choose sides. Some have succumbed to the power of nature. And some have not. The view from the sky is so abstract. It reveals our connections, our continuity and our scale. Nevertheless, it ’ s hard to see the big **picture** right now. It ’ s such a difficult time in the world as we pause and dismantle and rebuild our culture. I think back to my travels. I ’ ve seen how different we are, how diverse and distinct. But I ’ ve also seen our commonalities. How much worship means in Tibet, in Pakistan, in Italy, in China, in Cambodia and in Peru. How much peace means to our future. How much we regret the mistakes of our past. And now, insisting on what matters no matter what. There is still so much beauty in the world. So much love. I ’ m hopeful for the next generation. For every creature, large and small. And for the planet we call home. A Love Letter to Storytelling by Debbie Millman”A need to tell and hear stories is essential to the species Homo Sapiens. The sound of story is the dominant sound of our lives.”- Joseph Campbell I ’ ve loved telling stories all of my life. I ’ ve loved writing them and drawing them, and I love teaching my students how to make them. Now I conduct visual storytelling workshops all over the world. Over the years, the students have invented many new ways of expressing their stories. They tell their truths. They reveal secrets. They bare their souls. They share stories of pain, of feeling seen, of not being smart enough. Stories of being scared, feeling pretty or not. No matter where I teach, I ’ ve come to realize how many of their stories are universal. They convey so many shared experiences : rejection, judgment, insecurity, prejudice, forgetting and remembering. But there are also stories of hope, strength, awareness, courage and realizations. Their stories reflect who they really are, how deeply they want to feel connected. And now, as they share their visions for a more optimistic future, their stories are becoming the stories of our times.

Can you paint with all the colors of the wind? I love this song from the first time I heard it. I was 14, growing up in public housing in western Sydney. So maybe a little too old for this Disney classic from”Pocahontas.”But it spoke to me. I saw something of myself in it. At this stage, I think I knew I was queer. I mean, come on, I was rocking out to Disney. And look at those glasses. Seriously, what a queer kid. But I was also from a Pacific Indigenous heritage with conservative views and values. I didn ’ t feel like I could fit into any of the boxes that were being presented to me. Straight, gay, Fijian, Australian. I couldn ’ t pick just one color to paint with. Prior to colonization, sexuality amongst many of our Pacific islands across the region was fluid. Men would have sex with men without the stigma or shame afforded it today. Sexual intimacy was a way of being able to connect socially and relationally. Sex wasn ’ t just for procreation. Or in marriage. It wasn ’ t exclusively monogamous. Just because you had sex with a man didn ’ t define your sexuality. It didn ’ t make you an outcast. But as Europeans started to colonize the Pacific region, they brought Christian missionaries with them. They told us to cover up our beautiful bodies. We were taught shame. We were told to stop practicing Pacifica cultures and values that were seen as provocative. To a Western and white perspective, our non-binary sexuality was judged as tribal, outdated, sinful and impossible to practice alongside a Christian faith. Still today, those who are Indigenous to the Pacific are negatively impacted by whiteness. That”white is right, West is best.”I was brought up to espouse strong Christian beliefs, views and values which would shape my burgeoning identity as an adult. From these staunch conservative views, I was taught to fear the queer. Those people that were seen as unusual and fruity. And in essence, I grew to despise a part of myself. I sought to separate my queerness from my identity. I could never see myself as part of that world. Growing up, biracial and bisexual constantly challenged the way I saw the world around me. I was unsure about my thinking, feelings and behaviors around liking males and females. I was unsure about my thinking, feelings and behaviors when it came to whether I needed to be a white Australian or a Fijian person. And whether this needed to be framed within a binary to choose one over the other. In this way, I don ’ t think that my story is unique. There ’ s plenty of people in the queer world that have escaped conservative upbringings, religions and cultures. But this is only part of my story. Another common story in the queer community is the coming-out story. When did you tell your parents? How did they react? How it liberated you or ultimately separated you from your family. But this didn ’ t feel like an option for me either. I believe that embedded in these particular stories, these tropes, is a part of dominant queer culture that made it very hard for me to access the queer world. For example, when I started to go to gay clubs, I would be lining up at the front of the club and often I would get door staff come up to me and go,"Sorry, you do know this is a gay club, right?"From these lived experiences, I feel that there is a whiteness that pervades queer culture. And I didn ' t want to give up my identity and my appearance as a Pacific indigenous person to be queer. Pacifica cultures really, really value and esteem the collective above the individual. For Pacifica people, our families are inextricably connected to our own sense of self-agency, self-determination, self-esteem, self-love and self-worth. Our own individual identities are meshed and intertwined with our family ' s reputation and standing in the community. Our mind, body and souls are inextricably connected to the broader community, to our families, to ourselves and to others. I didn ' t want to come out to potentially ostracize myself, to make a point to separate myself from my Pacific and faith communities. I couldn ' t then see my authentic self in any of these spaces. And a quick shout out to my son on the **left-hand** side. Round of applause for my son. He said to me this morning,"Daddy, make sure you mention me."So I was like,"OK, son. Alright."So there you go for the recording, son. And the rest are my other family, that ' s up there as well. Across queer cultures and the broader community, we have learned to embrace our gender and sexual differences. We encourage individuals to be allies for each other and to support safe spaces for those that are seen to not fit in. We empower and really encourage individuals to really develop and express their self-agency, their self-determination, their self love, their self-worth. We boldly go into spaces striving to bring others with us to ensure that we can create inclusive societies for everyone. However, the dominant Western view in queer cultures is still based on the individual. Me, myself and I. And my individual pursuits towards happiness. As a queer Indigenous Pacific person, I feel that there are parts of queer culture that is white, feels very white. We may fail to see the importance of bringing our families and our cultural communities along our journey as queer people. It ' s either the queer way or the highway. It ' s one or the other. Young or old. Rich or poor. Smart or stupid. Masculine or feminine. Fit or fat. These binaries create a sense of us and them, those people. A binary approach and position that we generally in Western white societies use to determine the norm. We create, conflate, perpetuate binaries that create divisions in our society. Saints or sinner, straight or gay. I see it like this. Binaries are a very white and Western way of thinking, feeling and behaving. As individuals today, we live within these binaries and create identities that then create these labels. We use these labels to then define and confine people and places. We are one or the other. But what we fail to see is that our identities are more than a set of binaries. Our own identities are comprised of intersecting identifiers that contributes to who you are, including our age, class, color, education, gender, size, spirituality, sexuality, and so, so much more. We need to decolonize queerness, to live beyond"white is right, West is best."Because if we don ' t, we ' re going to continue to create silos and divisions in our societies that don ' t create inclusive and safe spaces for everyone. For Indigenous queer people, they shape our connection to community and culture, our families. If we don ' t include that within our understanding of who we are, even as queer people, then we ' re not able to be, again, our true and authentic selves. We ' re not able to then be our fabulous selves as part of the queer community. And it ' s really, really interesting because I believe that we can learn so much from pre-colonial cultures like those that were practiced in the Pacific, that provide a different way of looking at a society. A queer way that pre-dates all the privileges that go into binary ways of thinking, feeling and behaving. Across many of our Pacifica languages we have a lot of key concepts that help solidify and support a shared understanding of the collective. For example, in Fijian,”solesolevaki”is all about reciprocal living, where my wellbeing is your wellbeing. I will actively seek to ensure that your well-being and every part of your life is catered for, knowing that you will do the same for me. We strive to enact”veiqaravi,”as tatted here on my hand, to serve others. We strive to also embed and embold and empower people to practice”veirokovi,”respect for self and others where we are relationally driven, where that is so important to our spaces and places. My sense of ability to actually put this into practice, my ability to actually understand these Indigenous perspectives has greatly helped shape and reconcile my queer identity today. But what ’ s really interesting is that it ’ s not just queer communities that need to decolonize itself. It ’ s all of us as a broader society that needs to be part of a shared conversation to decolonize, deconstruct and disrupt binary ways of thinking, feeling and behaving. So how can we practically do that? Practice cultural humility, where you are constantly learning and embracing differences, where you get over yourselves and strive to learn about other people ’ s differences and how that can be meaningfully included in the way in which you create safe spaces for everyone. I also believe it ’ s possible to bring Indigenous perspectives into Western and white workplaces. For example, I ’ ve introduced the concept of”talanoa”in all of my work meetings. Talanoa is all about being able to create a safe space where everyone is able to contribute to a collective, collegial and collaborative conversation. Where people are able to bring their authentic selves into these spaces. Literally, I will chair meetings where I have no firm set agenda items and I literally would just hold space for participants just to bring themselves. So you can tell I ’ m a social worker, right? Safe space, safe space, safe space. It ’ s OK, it ’ s OK. But it ’ s through these safe spaces that people can bring their multiple, intersecting identifiers, including their age, their class, color, education, gender, size, spirituality, sexuality and so, so much more. I invite queer communities to come talanoa with Pacific Indigenous Communities to create robust and resilient queer cultures. I have been able to greatly reconcile my queer and Pacifica identities, which has now really been embraced to help shape how I see the world around me today. And it ’ s through these shared perspectives and approaches that we can truly embrace cultural diversity and its differences. And to know that people can live beyond those binaries and those labels we continue to perpetuate and perpetrate against others. It is a commitment from queer communities to decolonize queerness. It ’ s a commitment from me, from you and all of us to decolonize Western and white societies and to live beyond the binary way of thinking, feeling and behaving. I genuinely believe that it ’ s through this common goal that we can truly learn how to paint with all the colors of the wind.”Vinaka vakalevu”and thank you.

HW : Hi everyone, I am Helen Walters. I am head of Media and Curation here at TED. Welcome to another episode of TED Explains the World with the one and only, Ian Bremmer. It is Monday, February 24, a little more than a month since President Trump was inaugurated once more, and safe to say, a lot has been going on. So we figured we ’ d check in with Ian to determine what we should really be paying attention to amid the extreme noise. Ian, hi. Ian Bremmer : Helen, great to be back with you. HW : So we asked the TED community to share their questions for you, and we wanted them to share what they ’ re most curious to know. And we really got some amazing questions that I plan to pepper this conversation with. So let ’ s start with one right now. Two months into 2025, where does the US stand? IB : Very powerfully, in the sense that the US economy, of course, is performing considerably better than any of the other G7 economies coming still out of the pandemic. Technologically, only close competitor is China, ahead of the US in some areas, behind the US and other critical areas. But compared to every other country in the world, the US is head and shoulders and neck or waist above them. Militarily, of course, the US is the only country with global ability to project power. No one else is close. And the US dollar is still the global reserve currency, no one is approximate challenger. I say all of those things because those are the things that haven ' t really changed over the course of the last few months, but I suspect that isn ' t what the questioner was asking. What they were really asking is what ' s happening politically. And politically, the United States is unwinding its own global order. It is no longer particularly interested in promoting collective security or NATO. It ' s no longer really interested in promoting involvement and leadership of multilateral institutions, of consistent rule of law and free trade that ' s well regulated, certainly not very interested in promoting democracy around the world. I mean, this is an environment where other countries around the world have to figure out how to adapt to the United States, and that the US has become the principal driver of geopolitical risk and uncertainty in the world today, unlike any other time in my lifetime and yours, that ' s perhaps the biggest change. HW : That is quite a statement. Alright, you are a geopolitical expert. Let ' s talk about Europe. So Defense Secretary Pete Hegseth stated that America ' s foreign policy focus no longer lies in Europe. Vice President JD Vance caused some raised eyebrows, dropped jaws and, I suspect, some choice expletives after his recent speech at the Munich Security Conference, in which he accused European leaders of suppressing free speech and warned of the threat from within. So you were in Munich. Was it as dramatic as the stories we read had it? And what happens next? IB : It was. I was in the room. I was maybe 30 **feet** away from him when he gave that speech. Standing right in the front, right next to me was the president of Czechia, the president of Finland, the prime minister of Sweden, watching all of them and their reactions. What he said, let ' s keep in mind, this is the Munich Security Conference. It ' s been going on now for something like 61 years. And he was the head of the US delegation. And every year the head of the US delegation gives a big speech on the state of the transatlantic alliance and on global security. And he didn ' t do that. I mean, the people in the audience were expecting a challenging speech. They were expecting that the Americans would be less committed to the alignment with the Europeans on Ukraine. The US had just had that direct Trump phone call with Vladimir Putin, 90 minutes long. Hadn ' t coordinated that with the Europeans, never mind the Ukrainians, in advance. So, I mean, they were definitely prepared for a very challenging plenary. But Vance did none of that. Vance said,"I ' m not going to talk about Ukraine or Russia or China, because the biggest problem is actually what ' s happening inside Europe. The biggest problem, essentially, are you guys sitting in front of me, that I ' m speaking to, because you ' re suppressing free speech. You ' re suppressing the far right. You ' ve been infected by the woke mind virus, and you aren ' t real democracies as a consequence."And specifically he said, and this is something that I think is underappreciated in the United States, he attacked the German firewall. And said that – And let me explain what the German firewall is. That is a principle by the leaders of all of the mainstream German parties and their supporters that they will not, under any circumstances, work with, enter into coalition with the Alternative for Deutschland party, the AfD. Because the AfD, under surveillance from German intelligence agencies, is considered to be a neo-Nazi party. And the United States, of course, after World War II, led de-nazification of Germany.

The day before, Vance had actually gone to Dachau and visited a concentration camp, and then came to speak in Germany about the firewall needing to be ended. And at that point someone yelled out from the crowd,"This is unacceptable!"And it was right in the front. And people in the room, about 1, 500 people in the room, standing room only, couldn ' t see who it was. They ' d just see the back of his head. I saw who it was. It was the German Defense Minister, Pistorius. And in 15 years of me going to the Munich Security Conference, I have never seen anything remotely like that. And the reason I mention all of this, and of course, on the back of that, let me be clear, Vance refused to meet with the German chancellor because he ' s basically, well, he ' s not relevant. He ' s only going to be there for a couple more months until a new government, so why should I bother? But does meet with the leader of this AfD, goes and meets with her directly, does a bilateral that evening. So that is a very important backdrop for this last weekend ' s German elections, where the victor, Friedrich Mertz, who is going to be the next chancellor, actually referred specifically to America ' s intervention in German democracy and support of the AfD being every bit as bad as what the Kremlin is doing inside Germany, and also said that the Europeans need to develop a defense policy which is independent of the United States, in other words, essentially saying that it will be the end of NATO. Again, staggering comments, unheard of, impossible to imagine even two weeks ago. And that ' s why it ' s very critical that you have the context of what happened between Vance, Elon Musk over the past couple of months, Trump, with the Germans, with the Europeans. So you can understand why the incoming German chancellor would make a statement like that. HW : What should we make of all of the conversation about the rise of Nazism, the return of Nazism? Obviously, the AfD just won 20 percent in the German election. We ' ve also seen people allegedly giving Nazi salutes at various US conventions and speeches. Do you think this is overblown? Is this a fear that people have rationally? And what should we make of that? IB : In Germany, the Alternative for Deutschland, are winning all of former East Germany. This is a group that increasingly understands that they ' re never going to really catch up to the rest of Germany. Remember, Germany hasn ' t really grown in five years now. They ' ve been in recession for the last two. And the average citizen, the average voter, living in former East Germany no longer are just angry about not catching up. They ' re basically saying,"I ' m done with this system."So that ' s why you ' re getting this very strident, revanchist nationalism that is, you know, it ' s not just taking a hard line on illegal immigrants. The AfD even supports removing citizens of Germany that they claim have not adequately integrated into German culture and nationality. And so, I mean, this is some very, very strong stuff, stuff that really does feel like what they were doing back in Nazi Germany. But in former East Germany, they win. They get the largest number of votes, where, in much of the wealthier part of West Germany, including, you know, where I was, in Munich, the AfD can ' t break out of single digits. So it ' s a very, very divided country. And also the AfD is doing very, very well among young men. There ' s a clear gender divide here as well, just as there is in the United States. In the US, I mean, I, of course, saw Elon Musk and that, you know, sort of grabbing his heart, saying,"My heart goes out to you"and then doing what appeared to be mimicking a Nazi salute. And then Steve Bannon doing the same without the initial heartfelt comment. It clearly was trolling. Clearly was trying to get a reaction from folks. It ' s very performative. And it ' s meant to also, you know, attack and attach, make the left lose their minds on something that isn ' t very critical to what the Trump administration is trying to do compared to the revolutionary changes inside the US government that they are very much prioritizing right now. So I ' m very concerned about the rise of neo-Nazism in Germany. I am very much not concerned about that in the US. I ’ m concerned about other things I ’ m thinking is being used as gaslighting for those that can use distractions or can be distracted by them. And I would also say that this election in Germany wasn ’ t surprising. It was exactly as the polls have expected for several months now. But the key elections in Germany and the key elections in Europe are the next cycle. I ’ ve spoken with a lot of people around the Trump administration that believe that the Europeans are one electoral cycle behind the United States. So in other words, Trumpism is coming, just not quite yet. And so in the UK, you ’ ve got Labour for a full term. But the Reform Party is increasingly the most popular. And just with a little nudge, maybe a little external money, and Elon said he ’ s already thinking about giving them 100 million dollars, which is a massive amount in UK politics, not so much in the US, that the Conservatives would fragment, a rump group would join with Reform, and they could win the next elections. In France, you ’ ve had all of these governments continue to collapse. Macron, very unpopular. Marine Le Pen and the National Rally party could easily win upcoming elections in 2027. In 2029, in Germany, if the Germans are incapable of turning their economy around, incapable of unwinding their debt break and spending some of the capital that ’ s just sitting there and as their debt to GDP goes down, but their economy contracts at the same time, then AfD could easily win in 2029, and then the firewall is no more. And then, of course, in the European Union elections overall, in five years ’ time, now four and a half, you could easily see the Patriots front, which is the equivalent to the far right grouping that these parties are a part of, they could all come together and be the dominant party. And then the EU as we know it is really a thing of the past. So these are existential changes that are happening not just for NATO right now, but also for the EU and quite plausibly, for the future of democracy as we know it. HW : Alright, let ’ s turn to Ukraine. So President Trump accused President Zelenskyy of starting the war with Russia and called him”a dictator without elections.”Last week, senior American and Russian officials met in Riyadh to discuss a potential cease-fire with no Ukrainians present. Now Zelenskyy has offered to step down in return for Ukrainian admission to NATO, although apparently he doesn ’ t really mean this. So what happens to Ukraine now? What should we be paying attention to? IB : Well, I mean, I think he would mean it if NATO membership happened. I ’ d love to see Trump call his bluff on that. But of course it ’ s not going to. And he wasn ’ t saying that six months or a year ago. He ’ s saying it now that NATO is truly being pulled off the table. I think it ’ s the right thing for him to do. It is, again, performative and helps to remind those around the world that Ukraine is fighting for self-determination. They ’ re fighting for the ability to join their own alliance, as any country in the world should be able to do. But that is not Trump ’ s belief. Trump believes that what you get to do is determined by how powerful you are, not by the fact that you happen to run a country. And indeed, the territorial integrity is something that is afforded to powerful countries, but not so much for weak countries. And that ’ s the way he feels about Panama, and that ’ s the way he feels about Denmark and Greenland. And that ’ s certainly the way he feels about Ukraine. So right now, as you and I are speaking, the United States is putting forward a new UN resolution at the General Assembly that says that the war has to end as fast as possible but does not recognize Ukraine ’ s territorial integrity, which has been a core precept of the international order that the United States has supported since creating the United Nations and since the end of World War II in 1945. The Americans are now throwing that out. And the Russians, of course, are fully supportive of that. America ’ s allies in Europe are not. But the US has gotten the Saudis to agree, and they ’ re getting a unified Arab block. The Americans have privately worked with a lot of poorer countries in Africa, in the Asia Pacific and others, smaller countries, and saying,"You ' re not going to get any aid from the US unless you vote in favor of this new resolution."I fully expect the resolution is going to pass. But of course, what that means is that the Americans are preparing to cut a deal on Ukraine over the heads of the Ukrainians. In other words, the US and Russia together will figure out what a ceasefire should and should not entail as part of a broader US-Russia rapprochement. This is obviously a disaster for the Ukrainians and the Ukrainians who initially refuse to accept this so-called deal, on Ukrainian natural resources that would grant the Americans $500 billion in access to such resources in return for"paying off"aid that the Americans had granted to the Ukrainians without conditions or strings, but apparently no longer. And so, you know, what does this all mean? Well it means it ' s yet another case of why people shouldn ' t trust the United States from one administration to the next, because foreign policy will change completely. And what you thought was an American commitment won ' t stand. It shows that there is a fundamental rift between the Americans and the Europeans and indeed, Emmanuel Macron in the United States right now, as you and I speak, hoping that he can do something that will keep Trump from, as Macron believes, essentially surrendering to, conceding to, the Russian position and maintaining some level of coordination with the Europeans. But he doesn ' t have a lot to offer. And the Ukrainians, you know, now in a position of desperation where maybe they will end up signing over a lot of their natural resources to the Americans. But what, if anything, will they get in return for that? And how empowered will the Russians be in any deal that is cut? And will an independent Ukraine even be able to survive, and what will the terms that will be required of them? Of course, Putin is saying things like, no European troops of any sort, whether in a NATO formulation or not, would be allowed as peacekeepers in Ukraine. Well, then, how would you guarantee, what kind of security commitments would you give to the Ukrainians? These are all open questions, but apparently questions that President Trump is prepared to largely resolve on Russia ' s terms. And again, this is such a dramatic change from where the United States and where the Western order was just a month or two ago. HW : So let ' s take some quick-fire questions from our community related to this topic. And I think the first one is particularly pertinent to what you just said, so it ' s simple. What does Putin have over Trump? IB : I don ' t think that Putin"has"anything over Trump. If he did, then why wouldn ' t Trump have granted Russia more in his first term? In his first term he gave the Ukrainians those javelin anti-tank missiles that Obama refused to give. And, you know, he thought they were too risky. He increased sanctions against Russia. Now that was his administration with a lot of hawkish in orientation advisors around him that he doesn ' t have this time around. They ' re all directly loyal to him. But, I mean, if it was a priority for him, he could have stopped it. And if the Russians had something over him, then why wouldn ' t they have used it in that case? It feels like a conspiracy theory. I don ' t buy it. I think very differently. We can explain what ' s happening because number one, Trump wants to end wars. It ' s very popular with his base. He ' s said this on Gaza. He ' s said this on Iran, where Israel wants him to support attacks on Iran ' s nuclear capabilities, and Trump has said no. And he ' s showing this on Ukraine. He doesn ' t want to spend money on the Ukrainians going forward after spending over 100 billion dollars under the last three years from the Biden administration. He doesn ' t want to spend that money going forward. And he also doesn ' t value a strong Europe. He actually thinks that a weak Europe is in America ' s interests, where you have more Brexits. He used to always talk to the French about that during his first term,"Why won ' t you do Brexit?"He wants all of these

MAGA-type populist parties, including the AfD, to win in Europe because that legitimizes his own popularity. Just like he loves Milei in Argentina or Bukele in El Salvador. And so I think if you put those things together, you actually get to why Trump is doing what he ' s doing with the Russians without needing to create a story about Trump somehow being threatened by some secret, shadowy information that the Russians have on Trump that they ' ve let him know about but nobody else knows. I just don ' t buy that. HW : Great. OK, another community question. If the US hands Ukraine to Russia, will Russia keep going? Will they attempt to take over Europe? IB : It ' s interesting that Trump just met with the Polish president, President Duda. It was supposed to be an hour meeting, it was only 10 minutes. So he kind of embarrassed him at home in Poland. But he did say that the US is still committed to maintaining a troop presence on the ground in Poland. And so it ' s very hard to imagine the Russians rolling through Ukraine and then into Poland, even though there ' s been lots of asymmetric warfare, for example, and even there have been, you know, Russian missiles launched into Lviv, Ukrainian air defense, missile defense, and with Polish villagers getting killed because of the fighting. So, I mean, there ' s been spillover. But America is still going to be in Poland. Why is that? They get along pretty well, and the Poles are heading towards five percent of GDP defense spend this year, which has been the high water mark of American demands of defense spend. So he ' s, you know, been consistent on that over the past months. Baltic states. I mean, they ' re all spending a lot more money on their defense. And so, I mean, in principle, you could imagine the United States maintaining these rotational deployments in the Baltics, which would prevent the Russians from invading. But might Trump say, as part of a deal,"Why do we have all those troops there?"You mentioned Pete Hegseth saying the Americans need to get troops out of Europe and get them to Asia, which is where their principal competitive, you know, sort of, strategy is going to be oriented. And the US hasn ' t been pressing the Japanese or the Indians, the principal partners, allies in Asia vis-à-vis China, the way they ' ve been pressing the French, the Brits, the Germans in Europe. So I think it is certainly plausible that the Russians will do more, especially with those countries that refuse to align with a Trump rapprochement towards Russia. The countries I would be most worried about are Moldova, are Georgia. I ' d be most worried about the countries that are in the so-called"near abroad"that aren ' t a part of NATO, and aren ' t going to become a part of NATO, and therefore are much more vulnerable. But certainly in terms of Russia ' s willingness to engage in espionage, to fund actors on the ground for arson attacks, assassinations, critical infrastructure attacks on fiber networks, on pipelines, I think all of those things are likely to increase against European states across the board, on the back of this US-Russia rapprochement. HW : OK, final community question for this segment. What happens if the US no longer supports NATO? IB : It ' s possible that the United States is moving towards a similar posture in Europe that they presently have in Asia, which is strong individual bilateral deals with a number of countries : South Korea, Japan, Australia, but not a collective security agreement, where those countries together have more of a call on the United States and there ' s a lot more free riding. So I could imagine that NATO falls apart and becomes that. The danger is that even though the Europeans now understand the nature of the threat, that it is very plausible and maybe even baseline, that the Americans are going to leave Europe collectively on its own. That that seriousness does not equate to the ability to increase spending adequately in the near term. The Germans did manage to pull together an electoral outcome that will allow for a so-called grand coalition, just barely. So you ' ll have a two-party government in all likelihood instead of a three. But you also have a blocking capacity on the part of the far right and the far left that will prevent the Germans from really blowing out their spending, including their defense spending, unless they can pull something off before that new government is formed. Which is possible, but it ' s unlikely to be very big. The Brits are now talking about maybe moving the 2. 5 percent of GDP defense spend over years with a very challenging fiscal environment. The Spaniards, not even close, the Italians, not even close. So what does a European military capability really look like? And without the Americans, the answer is it ' s not there. It ' s not there. So I think that if NATO falls apart, the reality is that most of Europe will be incredibly vulnerable to external attack, especially Russian attack, And there won ' t be a way for them to defend themselves, and some of them will break and therefore want to work more directly and individually with the United States. And that could be the end, not only of NATO, but it could be the end of the European Union. I think this is, the stakes are incredibly high, this is an existential challenge for European governments that needed to take this seriously 30 years ago, 20 years ago, certainly in 2014, when the Russians invaded Ukraine, certainly, certainly in 2016 when Trump was elected, and certainly, certainly, certainly in 2022 when the Russians then invaded all of Ukraine. And at every point the Europeans were basically saying,"We ' re still fine with the Americans basically doing this."And now they are in very serious trouble. HW : No time like the present, I suppose. Alright, let ' s move on. So I mentioned the discussions in Saudi and obviously also on the agenda there with the discussions about Gaza and Trump ' s proposal to build a Gaza Riviera. What should we make of that? Or as one of our community members asked, what is the actual solution for Gaza? And surely it isn ' t what the US is proposing. IB : Well, look, here ' s what ' s interesting. You know, Trump says a lot of things, and when they don ' t work [out], he backs out fairly quickly. And you know, I thought – just stick with Ukraine for one second on this. It was interesting to me that Trump has said that he doesn ' t want to talk to Zelenskyy because he has no cards, he has no leverage. And so why should he let him at the table? And so Trump ' s going to cut the deal. Very interesting that if that is true, then why is it that the Secretary of Treasury brings this deal and says,"You ' ve got to sign this right now, Zelenskyy"And Zelenskyy refuses. And then a few days later, the Americans come back with a new deal with altered terms that are not quite as predatory vis-à-vis Ukraine. Why would the Americans change their tune for someone that has no leverage? Because, I don ' t think it ' s because Trump is a nice guy. He ' s not going soft at 78. I think it ' s because he overstated how little leverage Ukraine has. Ukraine is very popular among the GOP in the House and Senate, far more than Putin. Zelenskyy is far more popular in the United States among the voting population than Putin. And of course, he ' s also much more popular among the Europeans and even globally than Putin. And so it turns out that maybe there is a little bit of leverage that Zelenskyy has, and maybe Trump does have to give a little bit more. So this is relevant in the context of Gaza, because Trump was very annoyed that, you know, despite his ability to get a cease fire between Hamas and Israel over the goal line, that his friends in the Middle East were not coming up with a plan for Gaza. Where they were supposed to provide security and provide investment and lead reconstruction and deal with the Palestinian populations in the interim. And that wasn ' t happening. And so Trump then meeting with Prime Minister Netanyahu from Israel in Washington, then after that, summoning the Jordanian king, who was the ally that is most reliant on the United States and so, therefore, most needing to say yes to whatever Trump orders of him. Basically says, as you mentioned, Helen, that Gaza is going to be a Riviera, that the US is going to turn this into an incredible place. They ' re going to build wonderful homes for the Palestinians someplace else. And the Palestinians will all volunteer to leave Gaza and go to those homes, and Gaza will be depopulated and new people will come in and live there. That was the plan. And when he was asked, standing there with King Abdullah from Jordan, under whose authority? Trump ' s response was :"Under my authority."And that went over like a lead balloon among America ' s allies in the Middle East. They all said,"We ' re not up for this. We ' re not resettling Palestinian populations. They won ' t actually leave voluntarily. This will would actually be a huge problem for Israel ' s own national security long-term. And we ' re going to come up with another plan. And our plan will keep the Palestinians on the ground in Gaza."At which point Trump pivots to work with the new plan. And his advisers say that Trump was only trying to start the conversation. And what he said was his plan is not actually what he ' s going to do. So, what ' s sustainable? What would be sustainable would be a lot of Gulf money going in and maybe some European money too, though they ' re going to be really pressed, given everything you and I just talked about, to try to reconstruct a completely devastated Gaza that eventually some two million-plus Palestinians will be able to live normal lives in, and the governance will be provided by some technocratic group of a Palestinian Authority that will be working with, selected by, those that are involved in the reconstruction and the security. Namely the Egyptians, the Jordanians, the Saudis and the Emiratis. That is the best possible deal that they ' re going to get. But that ' s happening as Israel has just evacuated forcibly another 40, 000 Palestinians from refugee camps in the West Bank, sending tanks in for the first time in decades and probably precipitating more Israeli settlers taking more land on the ground in the West Bank. And so, as we are possibly taking a small step towards a sustainable solution in Gaza, we are taking a slightly larger step away from a sustainable solution for the Palestinians in the West Bank, twas ever thus over the past decades in this incredibly horrible problem and conflict. HW : And why is Israel doing that? I mean, are they feeling emboldened by the US, or why the incursions in the West Bank now? IB : Well, I think they ' re feeling emboldened by their own successes. They have shown that they are the dominant military power in the Middle East, and they have the ability to determine the level of escalation unilaterally, and their adversaries and enemies can ' t really do any damage to them. They proved that after October 7, in their response to Hamas. They proved that in decapitating and taking out the military capabilities of Hezbollah. And they ' ve proved that also with overturning – they didn ' t do it, but the fact that the Assad regime in Syria is gone, which means that the Iranians no longer have a land bridge to get additional weapons to what had been the strongest adversary of Israel militarily, Hezbollah. So all of that has shown that Israel can decide outcomes. They ' re the ones that have all the power here. And also that depopulation of Gaza is very popular among Israelis. There was a poll recently in the Jerusalem Post, which is pretty mainstream in Israel. 80 percent of Israeli respondents said that they wanted to depopulate Gaza of all Palestinians. Taking more land is very popular, especially in the West Bank, especially among Netanyahu ' s present right-wing coalition, that he would like to keep together, to continue to govern. And this is a sop to them as he is looking to potentially extend the ceasefire in Gaza and move from phase one to phase two, which is facing some delays and open questions right now. So, yes, certainly, the United States has been underpinning that military capability of Israel. And I think it is instructive to remember that not only does the US provide more military aid in peacetime to any country in the world, to Israel, but that unlike in Ukraine, where the Trump administration is saying,"No, I ' m not happy with the grants, you ' ve got to pay that back,"The billions and billions that the United States sends to

Israel, nobody is suggesting that that should be alone or that the Americans should get technology rights or mineral rights or anything else from Israel, despite the fact that Trump ' s policy is America First. Israel is a very clear exception to America First in Trump ' s visioning of it. HW : Alright, so we talked about the fact that the foreign policy focus of America is shifting to Asia. So what are you hearing about how China is feeling in all of this? And what should we be paying attention to on that front? IB : China has had a couple of good weeks economically and specifically on the back of that huge announcement of DeepSeek, which has, you know, far less money behind it than the comparable American chatbots but is performing at an extremely high level. And, you know, given the fact that there are all of these export controls on semiconductors and other parts of advanced technology, that this is giving people more of a belief that the Chinese really are capable of driving innovation even in that space. And they ' re, of course, dominating the post-carbon energy space. We see that with electric vehicles and batteries. But we ' re also seeing that with massive investment now in green hydrogen, for example, we ' re seeing it in advanced nuclear capabilities, all of these things. And so there is more investment in that space that the Chinese are not only driving as a state, but that they ' re also increasingly able to raise and move in their own private sector. So the story that you and I have been discussing for the last couple of years is the Chinese economy is radically underperforming. That is still true, but there is an emerging counter-narrative here that I would be remiss not to mention. Now more broadly, what the Chinese here are seeing is that Trump ' s direct policies are going to hurt them economically. His tariffs that he ' s already announced on China, the 10 percent, on a whole bunch of Chinese goods for export, the reciprocal tariffs that are global, that will clearly hurt China and that they ' ll have a hard time negotiating out of, and also the willingness of the United States to expand their export controls, their sanctions on China, especially in areas that are considered relevant, even loosely relevant to American national security. All of that is going to constrain Chinese growth. All of that is going to negatively impact the Chinese economy. That ' s the downside. And the Americans are doing that not only in bilateral relations with China but also pressuring other countries to get Chinese tech out of their supply chain. And you see that with Americans pushing other countries that produce semiconductors to take the Chinese out. They ' re pushing American allies and trade partners to get China out of the export chain. So Mexico being pushed very hard by Trump to stop allowing China to pass goods through Mexico into the United States. India, same conversation. Vietnam, same conversation. A lot of that going on. So baseline, the US-China relationship is getting worse. But the Chinese see huge advantages in America ' s reversion to unilateralism that we haven ' t really seen since the original America First movement in the run up to World War II. Charles Lindbergh saying,"Don ' t get into the war, don ' t fight the Nazis. The US is far away. This isn ' t our our problem."And now you have the Americans not only doing that with Russia and Ukraine with the new America First, but you also see that happening with the Americans pulling out of the Paris Climate Accord, again, pulling out of the World Health Organization. You see it with the Americans shutting down USAID. And America has historically been responsible for about 40 percent of global humanitarian support and aid. And absolutely, some of that is corrupt. Absolutely, some of that is on woke programs that the vast majority of American taxpayers would never support. But the majority of that money is actually spent on programs that are really important in advancing American soft power and influence over countries in the Global South, all over the world. The Chinese know that. That ' s why they ' ve started humanitarian programs. It ' s not out of some great love for, you know, providing foreign aid for these countries. It ’ s more because they see it creates influence. Now the Americans are leaving a vacuum that the Chinese can absolutely take advantage of. And we ’ ll see this across, you know, sort of, microstates in the Pacific. We ’ ll see this across sub-Saharan Africa. We ’ ll see this across South America. The Chinese see huge opportunities from the United States creating a leadership vacuum. And the place they ’ re most capable of doing that is if the US stops paying dues in the United Nations, where China is number two, and they ’ ll suddenly have the most influence over all the key positions, which will give them a role in global governance that they ’ ve really been constrained from having over the past decades. HW : What do you think are the chances that the US stops paying its dues to the UN? IB : You know, if it were up to Congress and only Congress and Trump doesn ’ t lean on them, I ’ d say fairly low. I ’ d say that they ’ d probably, you know, cut back on some programs. But in terms of baseline dues, they ’ d keep paying it. But Trump personally, I think increasingly sees the UN as hostile to the United States. That ’ s particularly true in terms of Israel policy, which Trump is leaning in on. And, you know – let me put it this way. Tulsi Gabbard did not have the votes to get confirmed. There were Republican senators that were going to vote against her. And Elon called those individual senators and threatened them. And this was, you know, fully aligned with what Trump wanted Elon to do. And those votes went away. And the only person that ended up voting against Tulsi was McConnell. And as a consequence, it went through. So look, I think that we should not underestimate the level of power and control that Trump and Elon have over the Republican Party this time around, compared to 2017, where it was really the Republican Party that was much stronger than Trump, both in his administration creating a lot of guardrails, but also in Congress. This time around, Trump has all the chips and he ’ s using them. So if he decides he wants to stop paying dues, I think that ’ s what ’ s going to happen. This is a much more revolutionary presidency, domestically, where last time around it was much more transactional. HW : Alright. Let ’ s talk a little bit more about what ’ s actually happening inside the US. You bring up Elon, who obviously with DOGE has been sending out emails and asking for information from people and kind of trying to do a lot very quickly. Some of these high-profile moves are – I think what ’ s interesting is that no one would really argue that there isn ’ t inefficiency in government, that that ’ s an understood reality. But the way that some of these moves are being made are maybe going to cause irreparable damage. And that ’ s to people from red states, that ’ s to scientists, that ’ s to veterans, that ’ s to people who voted for Trump and that ’ s to people around the world. You talk about soft power and the United States, but what about actually what ’ s happening inside the United States? And why do you think that the administration is willing to go so quickly, to go so fast and to cause such damage? IB : Well, and you saw Trump this weekend saying that he wants Elon to move faster, to be more aggressive. And I don ’ t think that was just a troll. I think that ’ s true. Trump is 78 years old, and with his friends he talks about the fact that he doesn ’ t have much time. That in two years ’ time, the Democrats could take the House in four years ’ time, you know, that ’ s it. He ’ s not talking privately of”I ’ m going to be president for life.”He also knows he was almost killed. He was shot in the head. And do I think that changes somebody? Absolutely. I think that he believes that he was saved by God, and that his level of confidence that what he is doing is fundamentally right and necessary now is so much higher than the insecurity that I frequently saw in him in his first presidency. So I think his willingness to push, push, push, and his view that Elon is a great activator and executor on that intention, and someone that he had nowhere close to someone with that kind of capability and energy and execution ability in his first term. And now he does. So first of all, I think that relationship between Trump and Elon isn ' t going anywhere. I think it ' s actually very stable. People that say it is are people that want it to go away. But hope is not a strategy. And I also think that the intention of revolutionary politics domestically is to shoot first and ask questions later. It ' s to break things. It ' s a view that the bureaucracy has been weaponized against Trump first and foremost, and also against the will of the American people. And therefore it must be broken. And you ' re going to break eggs when you want to make that omelet. Now your point is that there are a lot of Republicans that work in government. There are a lot of Republicans and Trump voters that are losing their jobs and that are not being treated with a level of care and compassion as a result of what Trump and Elon are doing. And I think there will be a backlash. But I ' m not so sure that a one-term, 78-year-old-Trump presidency cares all that much about that. And, you know, if that means that his popularity slips to like, the high 30s, frankly, you know, in a very, very polarized country, high 30s isn ' t that bad. It still means 80, 90 percent of the people that voted for him still support him, and I think he ' s probably more comfortable with that this time around. So I think a lot more has to happen before we can start talking about whether there ' s really going to be significant pushback against what Trump is trying to accomplish at home. HW : Do you expect to see any of Congress standing up to Trump? We saw the governor of Maine recently kind of take him on. Do you expect to see more of that, or do you feel like for the next two years at least, people will just go where Trump takes them? IB : Well, sure, but, you know, in the case of Maine, that ' s a Democrat. So I don ' t know how much that means. I don ' t expect to see a lot of Republicans standing up against him. And of course, since the Republicans control the House and the Senate, that ' s the only thing that really matters. I mean, you know, you saw Kash Patel got through, Pete Hegseth got through. Now look, I actually think that a lot of the members of cabinet are very capable. I mean, they ' ve been picked for their loyalty and they will be loyal to Trump, but they ' re very capable. I think JD Vance is very capable. Mike Waltz, I know quite well. Marco Rubio, over the years. These are people that are very well respected, have been by their colleagues and could have served under any Republican administration. But there are some people that are completely incapable for the roles that they have been selected, completely incapable. They would not be selected in a role in any cabinet, in any democracy. And yet here they are, serving in critical roles in the most powerful country in the world. And yes, I ' m talking about the Secretary of Defense. I ' m talking about the Secretary of Health and Human Services. I ' m talking about the Director of National Intelligence. I ' m talking about the Director of FBI. These are important roles. And they were all confirmed. And if you ' re a Republican senator – and senator – I ' m not talking about the House here where, you know, it ' s a lot more diffuse and there are a lot more wackos and it ' s easier to get in. But Senate has always been like, responsible and more oriented towards bipartisanship and the rest, and they are utterly petrified of what it means if they publicly get crosswise with President Trump and number two, Elon. And they ' re not willing to do it. So I think that there ' s very little belief that you are going to see Congress step up. I think that you will see justices step up because those justices are independent. The problem is that many of those justices are progressive and have a known progressive lean. And so when cases come up and justices that have that political lean oppose something Trump wants, his willingness, his administration ' s willingness to attack them and refuse to execute on that judicial decision, unconstitutionally, is real. Now the case will of course go then up to the Supreme Court eventually. And I don ' t feel the same way about Trump refusing to listen to adhere to the rulings of the Supreme Court. But if there ’ s 100 rulings like that and you overwhelm the judicial process, you quickly see how you might erode a core check on executive power in the United States. And Trump and Elon clearly intend to every day test those checks and balances and break them if they can. I mean, that is the intent, that is the intent. HW : So you mentioned democracy. When we last spoke, you said very clearly that the US is not Hungary, meaning that democracy is not threatened and that the US is not in danger of turning into an autocracy. Do you stand by that? IB : Yes, I do. I mean, in the sense that I think in two years we ’ re going to have midterm elections, and they will be largely free and fair. And in four years we ’ ll have presidential elections. And US elections are held at the federal level, right? They ’ re held state by state. They make the rules. It ’ s very easy to make people believe that the election has been stolen. It ’ s extremely hard to actually rig an American election. And I don ’ t believe that that is very likely at all. It ’ s very unlikely. The American military, despite the firings that we ’ ve seen just last Friday, is still an independent and professional military that I believe will carry out its orders and its duties professionally. I see the judiciary in the United States as independent and a clear check on the executive power in the United States. Where I see a problem, is that the US is becoming more kleptocratic every day. And the US was already much more of a kleptocracy over the past 10 years under Democrats and Republicans than any other advanced industrial democracy in the world. Clearly, money buys power in America in a way that it doesn ’ t in any other major democracy, wealthy democracy. That is getting dramatically worse. I saw specifically that Elon Musk, who is a walking conflict of interest at the highest level, met with Narendra Modi, the Prime Minister of India, in Blair House, so part of the official White House complex, right after Trump met with him. And Trump was asked later in the day, was Modi meeting with Elon in Elon ’ s private-sector capacity to advance his business interests or his official capacity to advance the policies of the United States? And Trump answered honestly. He said,”I don ’ t know.”And how could he know, right? Because, I mean, those two things are completely intertwined. But that is not remotely acceptable for rule of law in a functional democracy, and yet nothing is being done about it. In fact, it ’ s getting more and more entrenched every day. So the single place where the United States was least functional as an advanced democracy is now getting far, far worse. And I don ’ t see any checks and balances on that. I think that ’ s a very, very serious problem. HW : Alright, Ian, thank you, as always for all of your insights. Let ’ s close out with a couple more questions from our community. And this one indeed relates to the kleptocratic conversation that you were just raising. So why are the billionaires enabling fascism? What do they get out of it? IB : Fascism is a very politically loaded argument. That ’ s a political system where the cruelty against a subgroup or a perceived subgroup in the society is the intention, the expressed intention of the policy. And I certainly wouldn ’ t define the United States as a fascist system today. But I do believe that billionaires in the United States, at least a significant subset of them, are really under-interested in the well-being of their fellow countrymen and women. And this is a country that really makes heroic the individual. And it undermines the community. We ’ ve seen a significant erosion of civic engagement in the United States and civic associations. The church is not what it was in the US. Fewer people go, fewer people trust the church. Public education is not what it was. And wealthy people increasingly opt out. The family is not what it was. It ’ s increasingly atomized and people spend much more, much more of their time being, you know, isolated and atomized and intermediated by algorithms. And you and I have spoken about that problem in the past. We are increasingly a society of individuals as opposed to a nation together. I will tell you that that is a real problem when you have large numbers of billionaires that believe that they built it themselves, that they ’ re not responsible to a collective whole for any of their success and therefore they ’ re not accountable for their fellow citizens. And that ’ s what I think we have. I think we have a lot of winners in the United States and not a lot of leaders. And when you have winners, you have losers. When you have winners, you don ’ t have a collectivity. I will say that in this anti-DEI thing, I have a lot of sympathy for the people that don ’ t like DEI. I thought it was rammed down the throats of a lot of people And I ’ ve said this before, it was well beyond what the average American was willing to tolerate, and also it came with a level of high-handedness that that basically said, if you ’ re not with us in supporting these programs, you ’ re evil, you ’ re stupid, you ’ re uneducated. That ’ s unacceptable, too. It was a completely, you know, sort of oppositional way to try to have what ’ s a very challenging conversation. But I ’ ve never been a champion of diversity for diversity ’ s sake. What ’ s amazing about the history of the United States is despite all of our diversity, we find commonalities with each other. We find connectedness. That ’ s what ’ s amazing, is the connectedness, is that, you know, on this world, we ’ ve got eight billion people. And despite how different we all are, we all actually connect as human beings. That is what we need to focus on, not the diversity, the connectedness. And I think that ’ s what the billionaires today in the United States are losing. They ’ re doing incredibly well themselves. They ’ ve got theirs, they ’ ve got access to power, they ’ re paying good money for it, they ’ re going to get even more. But they ’ re forgetting that for us to succeed as a society and as a planet, we have to be connected to each other. You can ’ t throw out diversity and forget connectedness, and that ’ s what we ’ re forgetting right now. That ’ s why the country feels so much trauma and pain right now. And I think why the United States has given up on a lot of its really aspirational values that made such a difference to the world, that almost lost World War II for many generations. And now we ’ re giving it all away. HW : I mean, I think that ’ s why you find that diversity and inclusion go hand in hand, that that ’ s actually speaking to that. But in some of the moves that are being made to kind of throw out any type of diversity, to **scan** documents, to find words in order to highlight programs that are wasteful, that we ’ re actually going to lose what many, many studies actually highlight as being the benefits of diversity and the fact that you need diversity in order to be actually successful. IB : Shooting first and asking questions later, you know, moving fast and breaking things, those things make sense in a turbocharged venture capital technology environment. They do not work in government. They don ’ t work in government at all. In government, we have something called checks and balances, and we need them. And moving fast and breaking things undermines those checks and balances. So we ’ re going to do a lot of damage unintentionally. A lot of people are going to get hurt. A lot of folks don ’ t care about that in power right now, but they should because it would be much, much better. I know people want to move fast, but actually to think a little bit, do a little bit of your own research before you decide to kill that program, before you decide to fire that person. We ’ d be in a lot better shape as a government right now. HW : OK, the final question that I have for you actually comes from my 10-year-old son, and it ’ s a bit of a miserable question. We have a very lovely house, I promise. But his question nonetheless is are we heading into World War III? So, Ian, what should I tell him? IB : No, no, I don ’ t think we ’ re heading into World War III but we are absolutely heading into a world of much greater conflict. I think it ’ s much more likely, for example, in the next five, 10 years, that we ’ ll have a nuclear weapon go off. And I thought that was pretty unlikely since the Cuban Missile

Crisis. In other words, over the course of my life. I think we ’ re going to see a lot more terrorism at scale, because a lot more people are going to feel angry and disaffected, I think. You know, you saw that assassination of the CEO of UnitedHealthcare just a few dozen blocks from my house. I think you ’ re going to see more things like that. And so, no, not World War III because the fact is that outside of the US and China, all the other countries know that they need to work with everybody. And there are even forces inside US-China that are trying to make sure that you don ’ t throw the baby out with the bathwater. But underneath that World War III risk, there ’ s an awful lot of damage that ’ s going to get done, an awful lot of crisis that I think we ’ re going to have to live through before we start to see what we create on the other side. A lot of defense as well, that we ’ re going to be playing in this environment. HW : Well, Ian, it is always a pleasure to talk to you, and we ’ re so glad that you are **scanning** the world to understand what is happening and then you come here and explain it to us all. Couldn ’ t be more grateful and thank you for everything. IB : Thank you.

10 NEG Dim 5

Text Sample 746: NEG Dim 5 – 2025 – Score 1.00 – 2025/t003002.txt
HW : Hi everyone, I am Helen Walters. I am head of Media and Curation here at TED. Welcome to another episode of TED Explains the World with the one and only, Ian Bremmer. It is Monday, February 24, a little more than a month since President Trump was inaugurated once more, and safe to say, a lot has been going on. So we figured we ’ d check in with Ian to determine what we should really be paying attention to amid the extreme noise. Ian, hi. Ian Bremmer : Helen, great to be back with you. HW : So we asked the TED community to share their questions for you, and we wanted them to share what they ’ re most curious to know. And we really got some amazing questions that I plan to pepper this conversation with. So let ’ s start with one right now. Two months into 2025, where does the US stand? IB : Very powerfully, in the sense that the US economy, of course, is performing considerably better than any of the other G7 economies coming still out of the pandemic. Technologically, only close competitor is China, ahead of the US in some areas, behind the US and other critical areas. But compared to every other country in the world, the US is head and shoulders and neck or waist above them. Militarily, of course, the US is the only country with global ability to project power. No one else is close. And the US dollar is still the global reserve currency, no one is approximate challenger. I say all of those things because those are the things that haven ’ t really changed over the course of the last few months, but I suspect that isn ’ t what the questioner was asking. What they were really asking is what ’ s happening politically. And politically, the United States is unwinding its own global order. It is no longer particularly interested in promoting collective security or NATO. It ’ s no longer really interested in promoting involvement and leadership of multilateral institutions, of consistent rule of law and free trade that ’ s well regulated, certainly not very interested in promoting democracy around the world. I mean, this is an environment where other countries around the world have to figure out how to adapt to the United States, and that the US has become the principal driver of geopolitical risk and uncertainty in the world today, unlike any other time in my lifetime and yours, that ’ s perhaps the biggest

change. HW : That is quite a statement. Alright, you are a geopolitical expert. Let ’ s talk about Europe. So Defense Secretary Pete Hegseth stated that America ’ s foreign policy focus no longer lies in Europe. Vice President JD Vance caused some raised eyebrows, dropped jaws and, I suspect, some choice expletives after his recent speech at the Munich Security Conference, in which he accused European leaders of suppressing free speech and warned of the threat from within. So you were in Munich. Was it as dramatic as the stories we read had it? And what happens next? IB : It was. I was in the room. I was maybe 30 feet away from him when he gave that speech. Standing right in the front, right next to me was the president of Czechia, the president of Finland, the prime minister of Sweden, watching all of them and their reactions. What he said, let ’ s keep in mind, this is the Munich Security Conference. It ’ s been going on now for something like 61 years. And he was the head of the US delegation. And every year the head of the US delegation gives a big speech on the state of the transatlantic alliance and on global security. And he didn ’ t do that. I mean, the people in the audience were expecting a challenging speech. They were expecting that the Americans would be less committed to the alignment with the Europeans on Ukraine. The US had just had that direct Trump phone call with Vladimir Putin, 90 minutes long. Hadn ’ t coordinated that with the Europeans, never mind the Ukrainians, in advance. So, I mean, they were definitely prepared for a very challenging plenary. But Vance did none of that. Vance said,”I ’ m not going to talk about Ukraine or Russia or China, because the biggest problem is actually what ’ s happening inside Europe. The biggest problem, essentially, are you guys sitting in front of me, that I ’ m speaking to, because you ’ re suppressing free speech. You ’ re suppressing the far right. You ’ ve been infected by the woke mind virus, and you aren ’ t real democracies as a consequence.”And specifically he said, and this is something that I think is underappreciated in the United States, he attacked the German firewall. And said that – And let me explain what the German firewall is. That is a principle by the leaders of all of the mainstream German parties and their supporters that they will not, under any circumstances, work with, enter into coalition with the Alternative for Deutschland party, the AfD. Because the AfD, under surveillance from German intelligence agencies, is considered to be a neo-Nazi party. And the United States, of course, after World War II, led de-nazification of Germany. The day before, Vance had actually gone to Dachau and visited a concentration camp, and then came to speak in Germany about the firewall needing to be ended. And at that point someone yelled out from the crowd,”This is unacceptable!”And it was right in the front. And people in the room, about 1, 500 people in the room, standing room only, couldn ’ t see who it was. They ’ d just see the back of his head. I saw who it was. It was the German Defense Minister, Pistorius. And in 15 years of me going to the Munich Security Conference, I have never seen anything remotely like that. And the reason I mention all of this, and of course, on the back of that, let me be clear, Vance refused to meet with the German chancellor because he ’ s basically, well, he ’ s not relevant. He ’ s only going to be there for a couple more months until a new government, so why should I bother? But does meet with the leader of this AfD, goes and meets with her directly, does a bilateral that evening. So that is a very important backdrop for this last weekend ’ s German elections, where the victor, Friedrich Mertz, who is going to be the next chancellor, actually referred specifically to America ’ s intervention in German democracy and support of the AfD being every bit as bad as what the Kremlin is doing inside Germany, and also said that the Europeans need to develop a defense policy which is independent of the United States, in other words, essentially saying that it will be the end of NATO. Again, staggering comments, unheard of, impossible to imagine even two weeks ago. And that ’ s why it ’ s very critical that you have the context of what happened between Vance, Elon Musk over the past couple of months, Trump, with the Germans, with the Europeans. So you can understand why the incoming German chancellor would make a statement like that. HW : What should we make of all of the conversation about the rise of Nazism, the return of Nazism? Obviously, the AfD just won 20 percent in the German election. We ’ ve also seen people allegedly giving Nazi salutes at various US conventions and speeches. Do you think this is overblown? Is this a fear that people have rationally? And what should we make of that? IB : In Germany, the Alternative for Deutschland, are winning all of former East Germany. This is a group that increasingly understands that they ’ re never going to really catch up to the rest of Germany. Remember, Germany hasn ’ t really grown in five years now. They ’ ve been in recession for the last two. And the average citizen, the average voter, living in former East Germany no longer are just angry about not catching up. They ’ re basically saying,”I ’ m done with this system.”So that ’ s why you ’ re getting this very strident, revanchist nationalism that is, you know, it ’ s not just taking a hard line on illegal immigrants. The AfD even supports removing citizens of Germany that they claim have not adequately integrated into German culture and nationality. And so, I mean, this is some very, very strong stuff, stuff that really does feel like what they were doing back in Nazi Germany. But in former East Germany, they win. They get the largest number of votes, where, in much of the wealthier part of West Germany, including, you know, where I was, in Munich, the AfD can ’ t break out of single digits. So it ’ s a very, very divided country. And also the AfD is doing very, very well among young men. There ’ s a clear gender divide here as well, just as there is in the United States. In the US, I mean, I, of course, saw Elon Musk and that, you know, sort of grabbing his heart, saying,”My heart goes out to you”and then doing what appeared to be mimicking a Nazi salute. And then Steve Bannon doing the same without the initial heartfelt comment. It clearly was trolling. Clearly was trying to get a reaction from folks. It ’ s very performative. And it ’ s meant to also, you know, attack and attach, make the left lose their minds on something that isn ’ t very critical to what the Trump administration is trying to do compared to the revolutionary changes inside the US government that they are very much prioritizing right now. So I ’ m very concerned about the rise of neo-Nazism in Germany. I am very much not concerned about that in the US. I ’ m concerned about other things I ’ m thinking is being used as gaslighting for those that can use distractions or can be distracted by them. And I would also say that this election in Germany wasn ’ t surprising. It was exactly as the polls have expected for several months now. But the key elections in Germany and the key elections in Europe are the next cycle. I ’ ve spoken with a lot of people around the Trump administration that believe that the Europeans are one electoral cycle behind the United States. So in other words, Trumpism is coming, just not quite yet. And so in the UK, you ’ ve got Labour for a full term. But the Reform Party is increasingly the most popular. And just with a little nudge, maybe a little external money, and Elon said he ’ s already thinking about giving them 100 million dollars, which is a massive amount in UK politics, not so much in the US, that the Conservatives would fragment, a rump group would join with Reform, and they could win the next elections. In France, you ’ ve had all of these governments continue to collapse. Macron, very unpopular. Marine Le Pen and the National Rally party could easily win upcoming elections in 2027. In 2029, in Germany, if the Germans are incapable of turning their economy around, incapable of unwinding their debt break and spending some of the capital that ’ s just sitting there and as their debt to GDP goes down, but their economy contracts at the same time, then AfD could easily win in 2029, and then the firewall is no more. And then, of course, in the European Union elections overall, in five years ’ time, now four and a half, you could easily see the Patriots front, which is the equivalent to the far right grouping that these parties are a part of, they could all come together and be the dominant party. And then the EU as we know it is really a thing of the past. So these are existential changes that are happening not just for NATO right now, but also for the EU and quite plausibly, for the future of democracy as we know it. HW : Alright, let ’ s turn to Ukraine. So President Trump accused President Zelenskyy of starting the war with Russia and called him”a dictator without elections.”Last week, senior American and Russian officials met in Riyadh to discuss a potential cease-fire with no Ukrainians present. Now Zelenskyy has offered to step down in return for Ukrainian admission to NATO, although apparently he doesn ’ t really mean this. So what happens to Ukraine now? What should we be paying attention to? IB : Well, I mean, I think he would mean it if NATO membership happened. I ’ d love to see Trump call his bluff on that. But of course it ’ s not going to. And he wasn ’ t saying that six months or a year ago. He ’ s saying it now that NATO is truly being pulled off the table. I think it ’ s the right thing for him to do. It is, again, performative and helps to remind those around the world that Ukraine is fighting for self-determination. They ’ re fighting for the ability to join their own alliance, as any country in the world should be able to do. But that is not Trump ’ s belief. Trump believes that what you get to do is determined by how powerful you are, not by the fact that you happen to run a country. And indeed, the territorial integrity is something that is afforded to powerful countries, but not so much for weak countries. And that ’ s the way he feels about Panama, and that ’ s the way he feels about Denmark and Greenland. And that ’ s certainly the way he feels about Ukraine. So right now, as you and I are speaking, the United States is putting forward a new UN resolution at the General Assembly that says that the war has to end as fast as possible but does not recognize Ukraine ’ s territorial integrity, which has been a core precept of the international order that the United States has supported since creating the United Nations and since the end of World War II in 1945. The Americans are now throwing that out. And the Russians, of course, are fully supportive of that. America ’ s allies in Europe are not. But the US has gotten the Saudis to agree, and they ’ re getting a unified Arab block. The Americans have privately worked with a lot of poorer countries in Africa, in the Asia Pacific and others, smaller countries, and saying,”You ’ re not going to get any aid from the US unless you vote in favor of this new resolution.”I fully expect the resolution is going to pass. But of course, what that means is that the Americans are preparing to cut a deal on Ukraine over the heads of the Ukrainians. In other words, the US and Russia together will figure out what a ceasefire should and should not entail as part of a broader US-Russia rapprochement. This is obviously a disaster for the Ukrainians and the Ukrainians who initially refuse to accept this so-called deal, on Ukrainian natural resources that would grant the Americans $500 billion in access to such resources in return for”paying off”aid that the Americans had granted to the Ukrainians without conditions or strings, but apparently no longer. And so, you know, what does this all mean? Well it means it ’ s yet another case of why people shouldn ’ t trust the United States from one administration to the next, because foreign policy will change completely. And what you thought was an American commitment won ’ t stand. It shows that there is a fundamental rift between the Americans and the Europeans and indeed, Emmanuel Macron in the United States right now, as you and I speak, hoping that he can do something that will keep Trump from, as Macron believes, essentially surrendering to, conceding to, the Russian position and maintaining some level of coordination with the Europeans. But he doesn ’ t have a lot to offer. And the Ukrainians, you know, now in a position of desperation where maybe they will end up signing over a lot of their natural resources to the Americans. But what, if anything, will they get in return for that? And how empowered will the Russians be in any deal that is cut? And will an independent Ukraine even be able to survive, and what will the terms that will be required of them? Of course, Putin is saying things like, no European troops of any sort, whether in a NATO formulation or not, would be allowed as peacekeepers in Ukraine. Well, then, how would you guarantee, what kind of security commitments would you give to the Ukrainians? These are all open questions, but apparently questions that President Trump is prepared to largely resolve on Russia ’ s terms. And again, this is such a dramatic change from where the United States and where the Western order was just a month or two ago. HW : So let ’ s take some quick-fire questions from our community related to this topic. And I think the first one is particularly pertinent to what you just said, so it ’ s simple. What does Putin have over Trump? IB : I don ’ t think that Putin”has”anything over Trump. If he did, then why wouldn ’ t Trump have granted Russia more in his first term? In his first term he gave the Ukrainians those javelin anti-tank missiles that Obama refused to give. And, you know, he thought they were too risky. He increased sanctions against Russia. Now that was his administration with a lot of hawkish in orientation advisors around him that he doesn ’ t have this time around. They ’ re all directly loyal to him. But, I mean, if it was a priority for him, he could have stopped it. And if the Russians had something over him, then why wouldn ’ t they have used it in that case? It feels like a conspiracy theory. I don ’ t buy it. I think very differently. We can explain what ’ s happening because number one, Trump wants to end wars. It ’ s very popular with his base. He ’ s said this on Gaza. He ’ s said this on Iran, where Israel wants him to support attacks on Iran ’ s nuclear capabilities, and Trump has said no. And he ’ s showing this on Ukraine. He doesn ’ t want to spend money on the Ukrainians going forward after spending over 100 billion dollars under the last three years from the Biden administration. He doesn ’ t want to spend that money going forward. And he also doesn ’ t value a strong Europe. He actually thinks that a weak Europe is in America ’ s interests, where you have more Brexits. He used to always talk to the French about that during his first term,”Why won ’ t you do Brexit?”He wants all of these MAGA-type populist parties, including the AfD, to win in Europe because that legitimizes his own popularity. Just like he loves Milei in Argentina or Bukele in El Salvador. And so I think if you put those things together, you actually get to why Trump is doing what he ’ s doing with the Russians without needing to create a story about Trump somehow being threatened by some secret, shadowy information that the Russians have on Trump that they ’ ve let him know about but nobody else knows. I just don ’ t buy that. HW : Great. OK, another community question. If the US hands Ukraine to Russia, will Russia keep going? Will they attempt to take over Europe? IB : It ’ s interesting that Trump just met with the Polish president, President Duda. It was supposed to be an hour meeting, it was only 10 minutes. So he kind of embarrassed him at home in Poland. But he did say that the US is still committed to maintaining a troop presence on the ground in Poland. And so it ’ s very hard to imagine the Russians rolling through Ukraine and then into Poland, even though there ’ s been lots of asymmetric warfare, for example, and even there have been, you know, Russian missiles launched into Lviv, Ukrainian air defense, missile defense, and with Polish villagers getting killed because of the fighting. So, I mean, there ’ s been spillover. But America is still going to be in Poland. Why is that? They get along pretty well, and the Poles are heading towards five percent of GDP defense spend this year, which has been the high water mark of American demands of defense spend. So he ’ s, you know, been consistent on that over the past months. Baltic states. I mean, they ’ re all spending a lot more money on their defense. And so, I mean, in principle, you could imagine the United States maintaining these rotational deployments in the Baltics, which would prevent the Russians from invading. But might Trump say, as part of a deal,”Why do we have all those troops there?”You mentioned Pete Hegseth saying the Americans need to get troops out of Europe and get them to Asia, which is where their principal competitive, you know, sort of, strategy is going to be oriented. And the US hasn ’ t been pressing the Japanese or the Indians, the principal partners, allies in Asia vis-à-vis China, the way they ’ ve been pressing the French, the Brits, the Germans in Europe. So I think it is certainly plausible that the Russians will do more, especially with those countries that refuse to align with a Trump rapprochement towards Russia. The countries I would be most worried about are Moldova, are Georgia. I ’ d be most worried about the countries that are in the so-called”near abroad”that aren ’ t a part of NATO, and aren ’ t going to become a part of NATO, and therefore are much more vulnerable. But certainly in terms of Russia ’ s willingness to engage in espionage, to fund actors on the ground for arson attacks, assassinations, critical infrastructure attacks on fiber networks, on pipelines, I think all of those things are likely to increase against European states across the board, on the back of this US-Russia rapprochement. HW : OK, final community question for this segment. What happens if the US no longer supports NATO? IB : It ’ s possible that the United States is moving towards a similar posture in Europe that they presently have in Asia, which is strong individual bilateral deals with a number of countries : South Korea, Japan, Australia, but not a collective security agreement, where those countries together have more of a call on the United States and there ’ s a lot more free riding. So I could imagine that NATO falls apart and becomes that. The danger is that even though the Europeans now understand the nature of the threat, that it is very plausible and maybe even baseline, that the Americans are going to leave Europe collectively on its own. That that seriousness does not equate to the ability to increase spending adequately in the near term. The Germans did manage to pull together an electoral outcome that will allow for a so-called grand coalition, just barely. So you ’ ll have a two-party government in all likelihood instead of a three. But you also have a blocking capacity on the part of the far right and the far left that will prevent the Germans from really **blowing** out their spending, including their defense spending, unless they can pull something off before that new government is formed. Which is possible, but it ’ s unlikely to be very big. The Brits are now talking about maybe moving the 2. 5 percent of GDP defense spend over years with a very challenging fiscal environment. The Spaniards, not even close, the Italians, not even close. So what does a European military capability really look like? And without the Americans, the answer is it ’ s not there. It ’ s not there. So I think that if NATO falls apart, the reality is that most of Europe will be incredibly vulnerable to external attack, especially Russian attack, And there won ’ t be a way for them to defend themselves, and some of them will break and therefore want to work more directly and individually with the United States. And that could be the end, not only of NATO, but it could be the end of the European Union. I think this is, the stakes are incredibly high, this is an existential challenge for European governments that needed to take this seriously 30 years ago, 20 years ago, certainly in 2014, when the Russians invaded Ukraine, certainly, certainly in 2016 when Trump was elected, and certainly, certainly, certainly in 2022 when the Russians then invaded all of Ukraine. And at every point the Europeans were basically saying,”We ’ re still fine with the Americans basically doing this.”And now they are in very serious trouble. HW : No time like the present, I suppose. Alright, let ’ s move on. So I mentioned the discussions in Saudi and obviously also on the agenda there with the discussions about Gaza and Trump ’ s proposal to build a Gaza Riviera. What should we make of that? Or as one of our community members asked, what is the actual solution for Gaza? And surely it isn ’ t what the US is proposing. IB : Well, look, here ’ s what ’ s interesting. You know, Trump says a lot of things, and when they don ’ t work [out], he backs out fairly quickly. And you know, I thought – just stick with Ukraine for one second on this. It was interesting to me that Trump has said that he doesn ’ t want to talk to Zelenskyy because he has no cards, he has no leverage. And so why should he let him at the table? And so Trump ’ s going to cut the deal. Very interesting that if that is true, then why is it that the Secretary of Treasury brings this deal and says,”You ’ ve got to sign this right now, Zelenskyy”And Zelenskyy refuses. And then a few days later, the Americans come back with a new deal with altered terms that are not quite as predatory vis-à-vis Ukraine. Why would the Americans change their tune for someone that has no leverage? Because, I don ’ t think it ’ s because Trump is a nice guy. He ’ s not going soft at 78. I think it ’ s because he overstated how little leverage Ukraine has. Ukraine is very popular among the GOP in the House and Senate, far more than Putin. Zelenskyy is far more popular in the United States among the voting population than Putin. And of course, he ’ s also much more popular among the Europeans and even globally than Putin. And so it turns out that maybe there is a little bit of leverage that Zelenskyy has, and maybe Trump does have to give a little bit more. So this is relevant in the context of Gaza, because Trump was very annoyed that, you know, despite his ability to get a cease fire between Hamas and Israel over the goal line, that his friends in the Middle East were not coming up with a plan for Gaza. Where they were supposed to provide security and provide investment and lead reconstruction and deal with the Palestinian populations in the interim. And that wasn ’ t happening. And so Trump then meeting with Prime Minister Netanyahu from Israel in Washington, then after that, summoning the Jordanian king, who was the ally that is most reliant on the United States and so, therefore, most needing to say yes to whatever Trump orders of him. Basically says, as you mentioned, Helen, that Gaza is going to be a Riviera, that the US is going to turn this into an incredible place. They ’ re going to build wonderful homes for the Palestinians someplace else. And the Palestinians will all volunteer to leave Gaza and go to those homes, and Gaza will be depopulated and new people will come in and live there. That was the plan. And when he was asked, standing there with King Abdullah from Jordan, under whose authority? Trump ’ s response was :”Under my authority.”And that went over like a lead balloon among America ’ s allies in the Middle East. They all said,”We ’ re not up for this. We ’ re not resettling Palestinian populations. They won ’ t actually leave voluntarily. This will would actually be a huge problem for Israel ’ s own national security long-term. And we ’ re going to come up with another plan. And our plan will keep the Palestinians on the ground in Gaza.”At which point Trump pivots to work with the new plan. And his advisers say that Trump was only trying to start the conversation. And what he said was his plan is not actually what he ’ s going to do. So, what ’ s sustainable? What would be sustainable would be a lot of Gulf money going in and maybe some European money too, though they ’ re going to be really pressed, given everything you and I just talked about, to try to reconstruct a completely devastated Gaza that eventually some two million-plus Palestinians will be able to live normal lives in, and the governance will be provided by some technocratic group of a Palestinian Authority that will be working with, selected by, those that are involved in the reconstruction and the security. Namely the Egyptians, the Jordanians, the Saudis and the Emiratis. That is the best possible deal that they ’ re going to get. But that ’ s happening as Israel has just evacuated forcibly another 40, 000 Palestinians from refugee camps in the West Bank, sending tanks in for the first time in decades and probably precipitating more Israeli settlers taking more land on the ground in the West Bank. And so, as we are possibly taking a small step towards a sustainable solution in Gaza, we are taking a slightly larger step away from a sustainable solution for the Palestinians in the West Bank, twas ever thus over the past decades in this incredibly horrible problem and conflict. HW : And why is Israel doing that? I mean, are they feeling emboldened by the US, or why the incursions in the West Bank now? IB : Well, I think they ’ re feeling emboldened by their own successes. They have shown that they are the dominant military power in the Middle East, and they have the ability to determine the level of escalation unilaterally, and their adversaries and enemies can ’ t really do any damage to them. They proved that after October 7, in their response to Hamas. They proved that in decapitating and taking out the military capabilities of Hezbollah. And they ’ ve proved that also with overturning – they didn ’ t do it, but the fact that the Assad regime in Syria is gone, which means that the Iranians no longer have a land bridge to get additional weapons to what had been the strongest adversary of Israel militarily, Hezbollah. So all of that has shown that Israel can decide outcomes. They ’ re the ones that have all the power here. And also that depopulation of Gaza is very popular among Israelis. There was a poll recently in the Jerusalem Post, which is pretty mainstream in Israel. 80 percent of Israeli respondents said that they wanted to depopulate Gaza of all Palestinians. Taking more land is very popular, especially in the West Bank, especially among Netanyahu ’ s present right-wing coalition, that he would like to keep together, to continue to govern. And this is a sop to them as he is looking to potentially extend the ceasefire in Gaza and move from phase one to phase two, which is facing some delays and open questions right now. So, yes, certainly, the United States has been underpinning that military capability of Israel. And I think it is instructive to remember that not only does the US provide more military aid in peacetime to any country in the world, to Israel, but that unlike in Ukraine, where the Trump administration is saying,”No, I ’ m not happy with the grants, you ’ ve got to pay that back,”The billions and billions that the United States sends to Israel, nobody is suggesting that that should be alone or that the Americans should get technology rights or mineral rights or anything else from Israel, despite the fact that Trump ’ s policy is America First. Israel is a very clear exception to America First in Trump ’ s visioning of it. HW : Alright, so we talked about the fact that the foreign policy focus of America is shifting to Asia. So what are you hearing about how China is feeling in all of this? And what should we be paying attention to on that front? IB : China has had a couple of good weeks economically and specifically on the back of that huge announcement of DeepSeek, which has, you know, far less money behind it than the comparable American chatbots but is performing at an extremely high level. And, you know, given the fact that there are all of these export controls on semiconductors and other parts of advanced technology, that this is giving people more of a belief that the Chinese really are capable of driving innovation even in that space. And they ’ re, of course, dominating the post-carbon energy space. We see that with electric vehicles and batteries. But we ’ re also seeing that with massive investment now in green hydrogen, for example, we ’ re seeing it in advanced nuclear capabilities, all of these things. And so there is more investment in that space that the Chinese are not only driving as a state, but that they ’ re also increasingly able to raise and move in their own private sector. So the story that you and I have been discussing for the last couple of years is the Chinese economy is radically underperforming. That is still true, but there is an emerging counter-narrative here that I would be remiss not to mention. Now more broadly, what the Chinese here are seeing is that Trump ' s direct policies are going to hurt them economically. His tariffs that he ' s already announced on China, the 10 percent, on a whole bunch of Chinese goods for export, the reciprocal tariffs that are global, that will clearly hurt China and that they ' ll have a hard time negotiating out of, and also the willingness of the United States to expand their export controls, their sanctions on China, especially in areas that are considered relevant, even loosely relevant to American national security. All of that is going to constrain Chinese growth. All of that is going to negatively impact the Chinese economy. That ' s the downside. And the Americans are doing that not only in bilateral relations with China but also pressuring other countries to get Chinese tech out of their supply chain. And you see that with Americans pushing other countries that produce semiconductors to take the Chinese out. They ' re pushing American allies and trade partners to get China out of the export chain. So Mexico being pushed very hard by Trump to stop allowing China to pass goods through Mexico into the United States. India, same conversation. Vietnam, same conversation. A lot of that going on. So baseline, the US-China relationship is getting worse. But the Chinese see huge advantages in America ' s reversion to unilateralism that we haven ' t really seen since the original America First movement in the run up to World War II. Charles Lindbergh saying,"Don ' t get into the war, don ' t fight the Nazis. The US is far away. This isn ' t our our problem."And now you have the Americans not only doing that with Russia and Ukraine with the new America First, but you also see that happening with the Americans pulling out of the Paris Climate Accord, again, pulling out of the World Health Organization. You see it with the Americans shutting down USAID. And America has historically been responsible for about 40 percent of global humanitarian support and aid. And absolutely, some of that is corrupt. Absolutely, some of that is on woke programs that the vast majority of American taxpayers would never support. But the majority of that money is actually spent on programs that are really important in advancing American soft power and influence over countries in the Global South, all over the world. The Chinese know that. That ' s why they ' ve started humanitarian programs. It ' s not out of some great love for, you know, providing foreign aid for these countries. It ' s more because they see it creates influence. Now the Americans are leaving a vacuum that the Chinese can absolutely take advantage of. And we ' ll see this across, you know, sort of, microstates in the Pacific. We ' ll see this across sub-Saharan Africa. We ' ll see this across South America. The Chinese see huge opportunities from the United States creating a leadership vacuum. And the place they ' re most capable of doing that is if the US stops paying dues in the United Nations, where China is number two, and they ' ll suddenly have the most influence over all the key positions, which will give them a role in global governance that they ' ve really been constrained from having over the past decades. HW : What do you think are the chances that the US stops paying its dues to the UN? IB : You know, if it were up to Congress and only Congress and Trump doesn ' t lean on them, I ' d say fairly low. I ' d say that they ' d probably, you know, cut back on some programs. But in terms of baseline dues, they ' d keep paying it. But Trump personally, I think increasingly sees the UN as hostile to the United States. That ' s particularly true in terms of Israel policy, which Trump is leaning in on. And, you know – let me put it this way. Tulsi Gabbard did not have the votes to get confirmed. There were Republican senators that were going to vote against her. And Elon called those individual senators and threatened them. And this was, you know, fully aligned with what Trump wanted Elon to do. And those votes went away. And the only person that ended up voting against Tulsi was McConnell. And as a consequence, it went through. So look, I think that we should not underestimate the level of power and control that Trump and Elon have over the Republican Party this time around, compared to 2017, where it was really the Republican Party that was much stronger than Trump, both in his administration creating a lot of guardrails, but also in Congress. This time around, Trump has all the chips and he ’ s using them. So if he decides he wants to stop paying dues, I think that ’ s what ’ s going to happen. This is a much more revolutionary presidency, domestically, where last time around it was much more transactional. HW : Alright. Let ’ s talk a little bit more about what ’ s actually happening inside the US. You bring up Elon, who obviously with DOGE has been sending out emails and asking for information from people and kind of trying to do a lot very quickly. Some of these high-profile moves are – I think what ’ s interesting is that no one would really argue that there isn ’ t inefficiency in government, that that ’ s an understood reality. But the way that some of these moves are being made are maybe going to cause irreparable damage. And that ’ s to people from red states, that ’ s to scientists, that ’ s to veterans, that ’ s to people who voted for Trump and that ’ s to people around the world. You talk about soft power and the United States, but what about actually what ’ s happening inside the United States? And why do you think that the administration is willing to go so quickly, to go so fast and to cause such damage? IB : Well, and you saw Trump this weekend saying that he wants Elon to move faster, to be more aggressive. And I don ’ t think that was just a troll. I think that ’ s true. Trump is 78 years old, and with his friends he talks about the fact that he doesn ’ t have much time. That in two years ’ time, the Democrats could take the House in four years ’ time, you know, that ’ s it. He ’ s not talking privately of”I ’ m going to be president for life.”He also knows he was almost killed. He was shot in the head. And do I think that changes somebody? Absolutely. I think that he believes that he was saved by God, and that his level of confidence that what he is doing is fundamentally right and necessary now is so much higher than the insecurity that I frequently saw in him in his first presidency. So I think his willingness to push, push, push, and his view that Elon is a great activator and executor on that intention, and someone that he had nowhere close to someone with that kind of capability and energy and execution ability in his first term. And now he does. So first of all, I think that relationship between Trump and Elon isn ’ t going anywhere. I think it ’ s actually very stable. People that say it is are people that want it to go away. But hope is not a strategy. And I also think that the intention of revolutionary politics domestically is to shoot first and ask questions later. It ’ s to break things. It ’ s a view that the bureaucracy has been weaponized against Trump first and foremost, and also against the will of the American people. And therefore it must be broken. And you ’ re going to break eggs when you want to make that omelet. Now your point is that there are a lot of Republicans that work in government. There are a lot of Republicans and Trump voters that are losing their jobs and that are not being treated with a level of care and compassion as a result of what Trump and Elon are doing. And I think there will be a backlash. But I ’ m not so sure that a one-term, 78-year-old-Trump presidency cares all that much about that. And, you know, if that means that his popularity slips to like, the high 30s, frankly, you know, in a very, very polarized country, high 30s isn ’ t that bad. It still means 80, 90 percent of the people that voted for him still support him, and I think he ’ s probably more comfortable with that this time around. So I think a lot more has to happen before we can start talking about whether there ’ s really going to be significant pushback against what Trump is trying to accomplish at home. HW : Do you expect to see any of Congress standing up to Trump? We saw the governor of Maine recently kind of take him on. Do you expect to see more of that, or do you feel like for the next two years at least, people will just go where Trump takes them? IB : Well, sure, but, you know, in the case of Maine, that ’ s a Democrat. So I don ’ t know how much that means. I don ’ t expect to see a lot of Republicans standing up against him. And of course, since the Republicans control the House and the Senate, that ’ s the only thing that really matters. I mean, you know, you saw Kash Patel got through, Pete Hegseth got through. Now look, I actually think that a lot of the members of cabinet are very capable. I mean, they ’ ve been picked for their loyalty and they will be loyal to Trump, but they ’ re very capable. I think JD Vance is very capable. Mike Waltz, I know quite well. Marco Rubio, over the years. These are people that are very well respected, have been by their colleagues and could have served under any Republican administration. But there are some people that are completely incapable for the roles that they have been selected, completely incapable. They would not be selected in a role in any cabinet, in any democracy. And yet here they are, serving in critical roles in the most powerful country in the world. And yes, I ’ m talking about the Secretary of Defense. I ’ m talking about the Secretary of Health and Human Services. I ’ m talking about the Director of National Intelligence. I ’ m talking about the Director of FBI. These are important roles. And they were all confirmed. And if you ’ re a Republican senator – and senator – I ’ m not talking about the House here where, you know, it ’ s a lot more diffuse and there are a lot more wackos and it ’ s easier to get in. But Senate has always been like, responsible and more oriented towards bipartisanship and the rest, and they are utterly petrified of what it means if they publicly get crosswise with President Trump and number two, Elon. And they ’ re not willing to do it. So I think that there ’ s very little belief that you are going to see Congress step up. I think that you will see justices step up because those justices are independent. The problem is that many of those justices are progressive and have a known progressive lean. And so when cases come up and justices that have that political lean oppose something Trump wants, his willingness, his administration ’ s willingness to attack them and refuse to execute on that judicial decision, unconstitutionally, is real. Now the case will of course go then up to the Supreme Court eventually. And I don ’ t feel the same way about Trump refusing to listen to adhere to the rulings of the Supreme Court. But if there ’ s 100 rulings like that and you overwhelm the judicial process, you quickly see how you might erode a core check on executive power in the United States. And Trump and Elon clearly intend to every day test those checks and balances and break them if they can. I mean, that is the intent, that is the intent. HW : So you mentioned democracy. When we last spoke, you said very clearly that the US is not Hungary, meaning that democracy is not threatened and that the US is not in danger of turning into an autocracy. Do you stand by that? IB : Yes, I do. I mean, in the sense that I think in two years we ’ re going to have midterm elections, and they will be largely free and fair. And in four years we ’ ll have presidential elections. And US elections are held at the federal level, right? They ’ re held state by state. They make the rules. It ’ s very easy to make people believe that the election has been stolen. It ’ s extremely hard to actually rig an American election. And I don ’ t believe that that is very likely at all. It ’ s very unlikely. The American military, despite the firings that we ’ ve seen just last Friday, is still an independent and professional military that I believe will carry out its orders and its duties professionally. I see the judiciary in the United States as independent and a clear check on the executive power in the United States. Where I see a problem, is that the US is becoming more kleptocratic every day. And the US was already much more of a kleptocracy over the past 10 years under

Democrats and Republicans than any other advanced industrial democracy in the world. Clearly, money buys power in America in a way that it doesn ' t in any other major democracy, wealthy democracy. That is getting dramatically worse. I saw specifically that Elon Musk, who is a walking conflict of interest at the highest level, met with Narendra Modi, the Prime Minister of India, in Blair House, so part of the official White House complex, right after Trump met with him. And Trump was asked later in the day, was Modi meeting with Elon in Elon ' s private-sector capacity to advance his business interests or his official capacity to advance the policies of the United States? And Trump answered honestly. He said,"I don ' t know."And how could he know, right? Because, I mean, those two things are completely intertwined. But that is not remotely acceptable for rule of law in a functional democracy, and yet nothing is being done about it. In fact, it ' s getting more and more entrenched every day. So the single place where the United States was least functional as an advanced democracy is now getting far, far worse. And I don ' t see any checks and balances on that. I think that ' s a very, very serious problem. HW : Alright, Ian, thank you, as always for all of your insights. Let ' s close out with a couple more questions from our community. And this one indeed relates to the kleptocratic conversation that you were just raising. So why are the billionaires enabling fascism? What do they get out of it? IB : Fascism is a very politically loaded argument. That ' s a political system where the cruelty against a subgroup or a perceived subgroup in the society is the intention, the expressed intention of the policy. And I certainly wouldn ' t define the United States as a fascist system today. But I do believe that billionaires in the United States, at least a significant subset of them, are really under-interested in the well-being of their fellow countrymen and women. And this is a country that really makes heroic the individual. And it undermines the community. We ' ve seen a significant erosion of civic engagement in the United States and civic associations. The church is not what it was in the US. Fewer people go, fewer people trust the church. Public education is not what it was. And wealthy people increasingly opt out. The family is not what it was. It ' s increasingly atomized and people spend much more, much more of their time being, you know, isolated and atomized and intermediated by algorithms. And you and I have spoken about that problem in the past. We are increasingly a society of individuals as opposed to a nation together. I will tell you that that is a real problem when you have large numbers of billionaires that believe that they built it themselves, that they ' re not responsible to a collective whole for any of their success and therefore they ' re not accountable for their fellow citizens. And that ' s what I think we have. I think we have a lot of winners in the United States and not a lot of leaders. And when you have winners, you have losers. When you have winners, you don ' t have a collectivity. I will say that in this anti-DEI thing, I have a lot of sympathy for the people that don ' t like DEI. I thought it was rammed down the throats of a lot of people And I ' ve said this before, it was well beyond what the average American was willing to tolerate, and also it came with a level of high-handedness that that basically said, if you ' re not with us in supporting these programs, you ' re evil, you ' re stupid, you ' re uneducated. That ' s unacceptable, too. It was a completely, you know, sort of oppositional way to try to have what ' s a very challenging conversation. But I ' ve never been a champion of diversity for diversity ' s sake. What ' s amazing about the history of the United States is despite all of our diversity, we find commonalities with each other. We find connectedness. That ' s what ' s amazing, is the connectedness, is that, you know, on this world, we ' ve got eight billion people. And despite how different we all are, we all actually connect as human beings. That is what we need to focus on, not the diversity, the connectedness. And I think that ’ s what the billionaires today in the United States are losing. They ’ re doing incredibly well themselves. They ’ ve got theirs, they ’ ve got access to power, they ’ re paying good money for it, they ’ re going to get even more. But they ’ re forgetting that for us to succeed as a society and as a planet, we have to be connected to each other. You can ’ t throw out diversity and forget connectedness, and that ’ s what we ’ re forgetting right now. That ’ s why the country feels so much trauma and pain right now. And I think why the United States has given up on a lot of its really aspirational values that made such a difference to the world, that almost lost World War II for many generations. And now we ’ re giving it all away. HW : I mean, I think that ’ s why you find that diversity and inclusion go hand in hand, that that ’ s actually speaking to that. But in some of the moves that are being made to kind of throw out any type of diversity, to scan documents, to find words in order to highlight programs that are wasteful, that we ’ re actually going to lose what many, many studies actually highlight as being the benefits of diversity and the fact that you need diversity in order to be actually successful. IB : Shooting first and asking questions later, you know, moving fast and breaking things, those things make sense in a turbocharged venture capital technology environment. They do not work in government. They don ’ t work in government at all. In government, we have something called checks and balances, and we need them. And moving fast and breaking things undermines those checks and balances. So we ’ re going to do a lot of damage unintentionally. A lot of people are going to get hurt. A lot of folks don ’ t care about that in power right now, but they should because it would be much, much better. I know people want to move fast, but actually to think a little bit, do a little bit of your own research before you decide to kill that program, before you decide to fire that person. We ’ d be in a lot better shape as a government right now. HW : OK, the final question that I have for you actually comes from my 10-year-old son, and it ’ s a bit of a miserable question. We have a very lovely house, I promise. But his question nonetheless is are we heading into World War III? So, Ian, what should I tell him? IB : No, no, I don ’ t think we ’ re heading into World War III but we are absolutely heading into a world of much greater conflict. I think it ’ s much more likely, for example, in the next five, 10 years, that we ’ ll have a nuclear weapon go off. And I thought that was pretty unlikely since the Cuban Missile Crisis. In other words, over the course of my life. I think we ’ re going to see a lot more terrorism at scale, because a lot more people are going to feel angry and disaffected, I think. You know, you saw that assassination of the CEO of UnitedHealthcare just a few dozen blocks from my house. I think you ’ re going to see more things like that. And so, no, not World War III because the fact is that outside of the US and China, all the other countries know that they need to work with everybody. And there are even forces inside US-China that are trying to make sure that you don ’ t throw the baby out with the bathwater. But underneath that World War III risk, there ’ s an awful lot of damage that ’ s going to get done, an awful lot of crisis that I think we ’ re going to have to live through before we start to see what we create on the other side. A lot of defense as well, that we ’ re going to be playing in this environment. HW : Well, Ian, it is always a pleasure to talk to you, and we ’ re so glad that you are scanning the world to understand what is happening and then you come here and explain it to us all. Couldn ’ t be more grateful and thank you for everything. IB : Thank you.

Can you paint with all the colors of the wind? I love this song from the first time I heard it. I was 14, growing up in public housing in western Sydney. So maybe a little too old for this Disney classic from"Pocahontas."But it spoke to me. I saw something of myself in it. At this stage, I think I knew I was queer. I mean, come on, I was rocking out to Disney. And look at those glasses. Seriously, what a queer kid. But I was also from a Pacific Indigenous heritage with conservative views and values. I didn ' t feel like I could fit into any of the boxes that were being presented to me. Straight, gay, Fijian, Australian. I couldn ' t pick just one color to paint with. Prior to colonization, sexuality amongst many of our Pacific islands across the region was fluid. Men would have sex with men without the stigma or shame afforded it today. Sexual intimacy was a way of being able to connect socially and relationally. Sex wasn ' t just for procreation. Or in marriage. It wasn ' t exclusively monogamous. Just because you had sex with a man didn ' t define your sexuality. It didn ' t make you an outcast. But as Europeans started to colonize the Pacific region, they brought Christian missionaries with them. They told us to cover up our beautiful bodies. We were taught shame. We were told to stop practicing Pacifica cultures and values that were seen as provocative. To a Western and white perspective, our non-binary sexuality was judged as tribal, outdated, sinful and impossible to practice alongside a Christian faith. Still today, those who are Indigenous to the Pacific are negatively impacted by whiteness. That"white is right, West is best."I was brought up to espouse strong Christian beliefs, views and values which would shape my burgeoning identity as an adult. From these staunch conservative views, I was taught to fear the queer. Those people that were seen as unusual and fruity. And in essence, I grew to despise a part of myself. I sought to separate my queerness from my identity. I could never see myself as part of that world. Growing up, biracial and bisexual constantly challenged the way I saw the world around me. I was unsure about my thinking, feelings and behaviors around liking males and females. I was unsure about my thinking, feelings and behaviors when it came to whether I needed to be a white Australian or a Fijian person. And whether this needed to be framed within a binary to choose one over the other. In this way, I don ' t think that my story is unique. There ' s plenty of people in the queer world that have escaped conservative upbringings, religions and cultures. But this is only part of my story. Another common story in the queer community is the coming-out story. When did you tell your parents? How did they react? How it liberated you or ultimately separated you from your family. But this didn ' t feel like an option for me either. I believe that embedded in these particular stories, these tropes, is a part of dominant queer culture that made it very hard for me to access the queer world. For example, when I started to go to gay clubs, I would be lining up at the front of the club and often I would get door staff come up to me and go,"Sorry, you do know this is a gay club, right?"From these lived experiences, I feel that there is a whiteness that pervades queer culture. And I didn ' t want to give up my identity and my appearance as a Pacific indigenous person to be queer. Pacifica cultures really, really value and esteem the collective above the individual. For Pacifica people, our families are inextricably connected to our own sense of self-agency, self-determination, self-esteem, self-love and self-worth. Our own individual identities are meshed and intertwined with our family ' s reputation and standing in the community. Our mind, body and souls are inextricably connected to the broader community, to our families, to ourselves and to others. I didn ' t want to come out to potentially ostracize myself, to make a point to separate myself from my Pacific and faith communities. I couldn ' t then see my authentic self in any of these spaces. And a quick shout out to my son on the left-hand side. Round of applause for my son. He said to me this morning,”Daddy, make sure you mention me.”So I was like,”OK, son. Alright.”So there you go for the recording, son. And the rest are my other family, that ’ s up there as well. Across queer cultures and the broader community, we have learned to embrace our gender and sexual differences. We encourage individuals to be allies for each other and to support safe spaces for those that are seen to not fit in. We empower and really encourage individuals to really develop and express their self-agency, their self-determination, their self love, their self-worth. We boldly go into spaces striving to bring others with us to ensure that we can create inclusive societies for everyone. However, the dominant Western view in queer cultures is still based on the individual. Me, myself and I. And my individual pursuits towards happiness. As a queer Indigenous Pacific person, I feel that there are parts of queer culture that is white, feels very white. We may fail to see the importance of bringing our families and our cultural communities along our journey as queer people. It ’ s either the queer way or the highway. It ’ s one or the other. Young or old. Rich or poor. Smart or stupid. Masculine or feminine. Fit or fat. These binaries create a sense of us and them, those people. A binary approach and position that we generally in Western white societies use to determine the norm. We create, conflate, perpetuate binaries that create divisions in our society. Saints or sinner, straight or gay. I see it like this. Binaries are a very white and Western way of thinking, feeling and behaving. As individuals today, we live within these binaries and create identities that then create these labels. We use these labels to then define and confine people and places. We are one or the other. But what we fail to see is that our identities are more than a set of binaries. Our own identities are comprised of intersecting identifiers that contributes to who you are, including our age, class, color, education, gender, size, spirituality, sexuality, and so, so much more. We need to decolonize queerness, to live beyond”white is right, West is best.”Because if we don ’ t, we ’ re going to continue to create silos and divisions in our societies that don ’ t create inclusive and safe spaces for everyone. For Indigenous queer people, they shape our connection to community and culture, our families. If we don ’ t include that within our understanding of who we are, even as queer people, then we ’ re not able to be, again, our true and authentic selves. We ’ re not able to then be our fabulous selves as part of the queer community. And it ’ s really, really interesting because I believe that we can learn so much from pre-colonial cultures like those that were practiced in the Pacific, that provide a different way of looking at a society. A queer way that pre-dates all the privileges that go into binary ways of thinking, feeling and behaving. Across many of our Pacifica languages we have a lot of key concepts that help solidify and support a shared understanding of the collective. For example, in Fijian,”solesolevaki”is all about reciprocal living, where my wellbeing is your wellbeing. I will actively seek to ensure that your well-being and every part of your life is catered for, knowing that you will do the same for me. We strive to enact”veiqaravi,”as tatted here on my hand, to serve others. We strive to also embed and embold and empower people to practice”veirokovi,”respect for self and others where we are relationally driven, where that is so important to our spaces and places. My sense of ability to actually put this into practice, my ability to actually understand these Indigenous perspectives has greatly helped shape and reconcile my queer identity today. But what ’ s really interesting is that it ’ s not just queer communities that need to decolonize itself. It ’ s all of us as a broader society that needs to be part of a shared conversation to decolonize, deconstruct and disrupt binary ways of thinking, feeling and behaving. So how can we practically do that? Practice cultural humility, where you are constantly learning and embracing differences, where you get over yourselves and strive to learn about other people ’ s differences and how that can be meaningfully included in the way in which you create safe spaces for everyone. I also believe it ’ s possible to bring Indigenous perspectives into Western and white workplaces. For example, I ’ ve introduced the concept of”talanoa”in all of my work meetings. Talanoa is all about being able to create a safe space where everyone is able to contribute to a collective, collegial and collaborative conversation. Where people are able to bring their authentic selves into these spaces. Literally, I will chair meetings where I have no firm set agenda items and I literally would just hold space for participants just to bring themselves. So you can tell I ’ m a social worker, right? Safe space, safe space, safe space. It ’ s OK, it ’ s OK. But it ’ s through these safe spaces that people can bring their multiple, intersecting identifiers, including their age, their class, color, education, gender, size, spirituality, sexuality and so, so much more. I invite queer communities to come talanoa with Pacific Indigenous Communities to create robust and resilient queer cultures. I have been able to greatly reconcile my queer and Pacifica identities, which has now really been embraced to help shape how I see the world around me today. And it ’ s through these shared perspectives and approaches that we can truly embrace cultural diversity and its differences. And to know that people can live beyond those binaries and those labels we continue to perpetuate and perpetrate against others. It is a commitment from queer communities to decolonize queerness. It ’ s a commitment from me, from you and all of us to decolonize Western and white societies and to live beyond the binary way of thinking, feeling and behaving. I genuinely believe that it ’ s through this common goal that we can truly learn how to paint with all the colors of the wind.”Vinaka vakalevu”and thank you.

A Love Letter to my Garden by Debbie Millman In the beginning of time, there was no time. The universe began with every bit of energy contained in a very tiny, incredibly dense point. It was even smaller than this point. The point exploded with an unimaginable force and created everything we know and are made of. Seeds are a bit like that too. They ’ re tiny and densely packed with their entire existence. Time feels different now, while we shelter at home. Time is scary and uncertain. So we decided to plant some mint. We actually started a little garden a while ago, but now we have more time. We thought that these flowers had died, but they miraculously came back to life. A hopeful sign about the future, perhaps? We planted foxglove and it thrived. And then we went a little crazy. We planted tomatoes, carrots, beans, corn, lettuce and cucumbers, strawberries, blueberries and limes. It ’ s such a strange time in the world. There is so much beauty amidst so much fear. It ’ s so hard to know what to do. In the meantime, we watch and wait and remain grateful we ’ re able to make things with our hands. A love letter to New York City by Debbie Millman I ’ m a native New Yorker. I ’ ve lived here my entire life, yet the city never ceases to surprise me. Everywhere you look, there ’ s something to see. There is Tom Otterness underground and Lawrence Weiner underfoot. There are so many of us. Everyone wants to be someone. Everyone seeks to be heard. Everyone has an opinion, A point of view. And seemingly something to sell. But life is different now as we shelter at home. Under the same sky, at the same moment, at the same time. I ’ m thinking about how tough New York can be, how rough and unrelenting. But maybe that intensity is what fuels our tenacity. As we navigate through this crisis, I am hopeful we will find some solace together. A Love Letter to Travel by Debbie Millman My work has taken me all over the world. There have been many early departures, and many evenings in the air.

In all my travels, I ’ ve been struck by so many things. I ’ ve observed how people lived in some of the most ancient places on the planet. This is Machu Picchu. This is Easter Island. This is Samoa. This is Angkor Wat. This is Petra in Jordan. The ancient city contained a church, a theater and tombs for the dead. Families lived in two and three-bedroom apartments. We ’ ve come a long way. Some of the structures that remain are rather mysterious, some are otherworldly, some are glorious odes to love, some house the souls of the dead. Some have forced us to choose sides. Some have succumbed to the power of nature. And some have not. The view from the sky is so abstract. It reveals our connections, our continuity and our scale. Nevertheless, it ’ s hard to see the big picture right now. It ’ s such a difficult time in the world as we pause and dismantle and rebuild our culture. I think back to my travels. I ’ ve seen how different we are, how diverse and distinct. But I ’ ve also seen our commonalities. How much worship means in Tibet, in Pakistan, in Italy, in China, in Cambodia and in Peru. How much peace means to our future. How much we regret the mistakes of our past. And now, insisting on what matters no matter what. There is still so much beauty in the world. So much love. I ’ m hopeful for the next generation. For every creature, large and small. And for the planet we call home. A Love Letter to Storytelling by Debbie Millman”A need to tell and hear stories is essential to the species Homo Sapiens. The sound of story is the dominant sound of our lives.”- Joseph Campbell I ’ ve loved telling stories all of my life. I ’ ve loved writing them and drawing them, and I love teaching my students how to make them. Now I conduct visual storytelling workshops all over the world. Over the years, the students have invented many new ways of expressing their stories. They tell their truths. They reveal secrets. They bare their souls. They share stories of pain, of feeling seen, of not being smart enough. Stories of being scared, feeling pretty or not. No matter where I teach, I ’ ve come to realize how many of their stories are universal. They convey so many shared experiences : rejection, judgment, insecurity, prejudice, forgetting and remembering. But there are also stories of hope, strength, awareness, courage and realizations. Their stories reflect who they really are, how deeply they want to feel connected. And now, as they share their visions for a more optimistic future, their stories are becoming the stories of our times.

My parents gave me an extraordinary name : Baratunde Rafiq Thurston. Now, Baratunde is based on a Yoruba name from Nigeria, but we ’ re not Nigerian. That ’ s just how black my mama was.”Get this boy the blackest name possible. What does the book say?”Rafiq is an Arabic name, but we are not Arabs. My mom just wanted me to have difficulty boarding planes in the 21st century. She foresaw America ’ s turn toward nativism. She was a black futurist. Thurston is a British name, but we are not British. Shoutout to the multigenerational, dehumanizing economic institution of American chattel slavery, though. Also, Thurston makes for a great Starbucks name. Really expedites the process. My mother was a renaissance woman. Arnita Lorraine Thurston was a computer programmer, former domestic worker, survivor of sexual assault, an artist and an activist. She prepared me for this world with lessons in black history, in martial arts, in urban farming, and then she sent me in the seventh grade to the private Sidwell Friends School, where US presidents send their daughters, and where she sent me looking like this. I had two key tasks going to that school : don ’ t lose your blackness and don ’ t lose your glasses. This accomplished both. Sidwell was a great place to learn the arts and the sciences, but also the art of living amongst whiteness. That would prepare me for life later at Harvard, or doing corporate consulting, or for my jobs at"The Daily Show"and"The Onion."I would write down many of these lessons in my memoir,"How to Be Black,"which if you haven ' t read yet, makes you a racist, because — you ' ve had plenty of time to read the book. But America insists on reminding me and teaching me what it means to be black in America. It ' s December 2018, I ' m with my fianc in the suburbs of Wisconsin. We are visiting her parents, both of whom are white, which makes her white. That ' s how it works. I don ' t make the rules. She ' s had some drinks, so I drive us in her parents ' car, and we get pulled over by the police. I ' m scared. I turn on the flashing lights to indicate compliance. I pull over slowly under the brightest streetlight I can find in case I need witnesses or dashcam footage. We get out my identification, the car registration, lay it out in the open, roll down the windows, my hands are placed on the steering wheel, all before the officer exits the vehicle. This is how to stay alive. As we wait, I think about these headlines —"Police shoot another unarmed black person"— and I don ' t want to join them. The good news is, our officer was friendly. She told us our tags were expired. So to all the white parents out there, if your child is involved with a person whose skin tone is rated Dwayne"The Rock"Johnson or darker — you need to get that car inspected, update the paperwork every time we visit. That ' s just common courtesy. I got lucky. I got a law enforcement professional. I survived something that should not require survival. And I think about this series of stories —"Police shoot another unarmed black person"— and that season when those stories popped up everywhere. I would scroll through my feed and I would see a baby announcement photo. I ' d see an ad for a product I had just whispered to a friend about yesterday. I would see a video of a police officer gunning down someone who looked just like me. And I ' d see a think piece about how millennials have replaced sex with avocado toast. It was a confusing time. Those stories kept popping up, but in 2018, those stories got changed out for a different type of story, stories like,"White Woman Calls Cops On Black Woman Waiting For An Uber."That was Brooklyn Becky. Then there was,"White Woman Calls Police On Eight-Year-Old Black Girl Selling Water."That was Permit Patty. Then there was,"Woman Calls Police On Black Family BBQing At Lake In Oakland."That was now infamous BBQ Becky. And I contend that these stories of living while black are actually progress. We used to find out after the extrajudicial police killings. Now, we ' re getting video of people calling 911. We ' re moving upstream, closer to the problem and closer to the solution. So I started a collection of as many of these stories as I could find. I built an evolving, still-growing database at baratunde. com / livingwhileblack. Seeking understanding, I realized the process was really diagramming sentences to understand these headlines. And I want to thank my Sidwell English teacher Erica Berry and all English teachers. You have given us tools to fight for our own freedom. What I found was a process to break down the headline and understand the consistent layers in each one : a **subject** takes an action against a target engaged in some activity, so that"White Woman Calls Police On Eight-Year-Old Black Girl"is the same as"White Man Calls Police On Black Woman Using Neighborhood Pool"is the same as"Woman Calls Cops On Black Oregon Lawmaker Campaigning In Her District."They ' re the same. Diagramming the sentences allowed me to diagram the white supremacy which allowed such sentences to be true, and I will pause to define my terms. When I say"white supremacy,"I ' m not just talking about Nazis or white power activists, and I ' m definitely not saying that all white people are racist. What I ' m referring to is a system of structural advantage that favors white people over others in social, economic and political arenas. It ' s what Bryan Stevenson at the Equal Justice

Initiative calls the narrative of racial difference, the story we told ourselves to justify slavery and Jim Crow and mass incarceration and beyond. So when I saw this pattern repeating, I got angry, but I also got inspired to create a game, a game of words that would allow me to transform this traumatic exposure into more of a healing experience. I ’ m going to talk you through the game. The first level is a training level, and I need your participation. Our objective : to determine if this is real or fake. Did this happen or not? Here is the example :”Catholic University Law Librarian Calls Police On Student For ’ Being Argumentative. ’”Clap your hands if you think this is real. Clap your hands if you think this is fake. The reals have it, unfortunately, and a point of information, being argumentative in a law library is the exact right place to do that. This student should be promoted to professor. Training level complete, so we move on to the real levels. Level one, our objective is simple : reverse the roles. That means”Woman Calls Cops On Black Oregon Lawmaker”becomes”Black Oregon Lawmaker Calls Cops On Woman.”That means”White Man Calls Police On Black Woman Using Neighborhood Pool”becomes”Black Woman Calls Police On White Man Using Neighborhood Pool.”How do you like them reverse racist apples? That ’ s it, level one complete, and so we level up to level two, where our objective is to increase the believability of the reversal. Let ’ s face it, a black woman calling police on a white man using a pool isn ’ t absurd enough, but what if that white man was trying to touch her hair without asking, or maybe he was making oat milk while riding a unicycle, or maybe he ’ s just talking over everyone in a meeting. We ’ ve all been there, right? Seriously, we ’ ve all been there. So that ’ s it, level two complete. But it comes with a warning : simply reversing the flow of injustice is not justice. That is vengeance, that is not our mission, that ’ s a different game so we level up to level three, where the objective is to change the action, also known as”calling the police is not your only option OMG, what is wrong with you people!”And I need to pause the game to remind us of the structure. A **subject** takes an action against a target engaged in some activity.”White Woman Calls Police On Black Real Estate Investor Inspecting His Own Property.””California Safeway Calls Cops On Black Woman Donating Food To The Homeless.””Gold Club Twice Calls Cops On Black Women For Playing Too Slow.”In all these cases, the **subject** is usually white, the target is usually black, and the activities are anything, from sitting in a Starbucks to using the wrong type of barbecue to napping to walking”agitated”on the way to work, which I just call”walking to work.”And, my personal favorite, not stopping his dog from humping her dog, which is clearly a case for dog police, not people police. All of these activities add up to living. Our existence is being interpreted as crime. Now, this is the obligatory moment in the presentation where I have to say, not everything is about race. Crime is a thing, should be reported, but ask yourself, do we need armed men to show up and resolve this situation, because when they show up for me, it ’ s different. We know that police officers use force more with black people than with white people, and we are learning the role of 911 calls in this. Thanks to preliminary research from the Center for Policing Equity, we ’ re learning that in some cities, most of the interactions between cops and citizens is due to 911 calls, not officer-initiated stops, and most of the violence, the use of force by police on citizens, is in response to those calls. Further, when those officers responding to calls use force, that increases in areas where the percentage of the white population has also increased, aka gentrification, aka unicycles and oat milk, aka when BBQ Becky feels threatened, she becomes a threat to me in my own neighborhood, which forces me and people like me to police ourselves. We quiet ourselves, we walk on eggshells, we maybe pull over to the side of the road under the brightest light we can find so that our murder might be caught cleanly on camera, and we do this because we live in a system in which white people can too easily call on deadly force to ensure their comfort. The California Safeway didn ’ t just call cops on black woman donating food to homeless. They ordered armed, unaccountable men upon her. They essentially called in a drone strike. This is weaponized discomfort, and it is not new. From 1877 to 1950, there were at least 4, 400 documented racial terror lynchings of black people in the United States. They had headlines as well.”Rev. T. A. Allen was lynched in Hernando, Mississippi for organizing local sharecroppers.””Oliver Moore was lynched in Edgecomb County, North Carolina, for frightening a white girl.””Nathan Bird was lynched near Luling, Texas, for refusing to turn his son over to a mob.”We need to change the action, whether that action is”lynches”or”calls police.”And now that I have shortened the distance between those two, let ’ s get back to our game, to our mission. Our objective in level three is to change the action. So what if, instead of”Calls Cops On Black Woman Donating Food To Homeless,”that California Safeway simply thanks her. Thanking is far cheaper than bringing law enforcement to the scene. Or, instead, they could give the food they would have wasted to her, upped their civic cred. Or, the white woman who called the police on the eight-year- old black girl, she could have bought all the inventory from that little black girl, support a small business. And the white woman who called the police on the black real estate investor, we would all be better off, the cops agree, if she had simply ignored him and minded her own damn business. Minding one ’ s own damn business is an excellent choice, excellent choice. Choose it more often. Level three is complete, but there is a final bonus level, where the objective is inclusion. We have also seen headlines like this :”Powerful Man Masturbates In Front Of Young Women Visiting His Office.”What an odd choice for powerful man to make. So many other actions available to him. Like, such as,”listens to,””mentors,””inspired by, starts joint venture, everybody rich now.”I want to live in that world of everybody rich now, but because of his poor choice, we are all in a poorer world. Doesn ’ t have to be this way. This word game reminded me that there is a structure to white supremacy, as there is to misogyny, as there is to all systemic abuses of power. Structure is what makes them systemic. I ’ m asking people here to see the structure, where the power is in it, and even more importantly to see the humanity of those of us made targets by this structure. I am here because I was loved and invested in and protected and lucky, because I went to the right schools, I ’ m semifamous, mostly happy, meditate twice a day, and yet, I walk around in fear, because I know that someone seeing me as a threat can become a threat to my life, and I am tired. I am tired of carrying this invisible burden of other people ’ s fears, and many of us are, and we shouldn ’ t have to, because we can change this, because we can change the action, which changes the story, which changes the system that allows those stories to happen. Systems are just collective stories we all buy into. When we change them, we write a better reality for us all to be a part of. I am asking us to use our power to choose. I am asking us to level up. Thank you. I am Baratunde Rafiq Thurston.

When I look in the mirror today, I see a justice and education scholar at Columbia University, a youth mentor, an activist and a future New York state senator. I see all of that and a man who spent a quarter of his life in state prison â six years, to be exact, starting as a teenager on Rikers Island for an act that nearly cost a man his life. But what got me from there to here wasn ’ t the punishment I faced as a teenager in adult prison or the harshness of our legal system. Instead, it was a learning environment of a classroom that introduced me to something I didn ’ t think was possible for me or our justice system as a whole. A few weeks before my release on parole, a counselor encouraged me to enroll in a new college course being offered in the prison. It was called Inside Criminal Justice. That seems pretty straightforward, though, right? Well, it turns out, the class would be made up of eight incarcerated men and eight assistant district attorneys. Columbia University psychology professor Geraldine Downey and Manhattan Assistant DA Lucy Lang co-taught the course, and it was the first of its kind. I can honestly say this wasn ’ t how I imagined starting college. My mind was **blown** from day one. I assumed all the prosecutors in the room would be white. But I remember walking into the room on the first day of class and seeing three black prosecutors and thinking to myself,”Wow, being a black prosecutor â that ’ s a thing!”By the end of the first session, I was all in. In fact, a few weeks after my release, I found myself doing something I prayed I wouldn ’ t. I walked right back into prison. But thankfully, this time it was just as a student, to join my fellow classmates. And this time, I got to go home when class was over. In the next session, we talked about what had brought each of us to this point of our lives and into the classroom together. I eventually got comfortable enough to reveal my truth to everyone in the room about where I came from. I talked about how my sisters and I watched our mother suffer years of abuse at the hands of our stepfather, escaping, only to find ourselves living in a shelter. I talked about how I swore an oath to my family to keep them safe. I even explained how I didn ’ t feel like a teenager at 13, but more like a soldier on a mission. And like any soldier, this meant carrying an emotional burden on my shoulders, and I hate to say it, but a gun on my waist. And just a few days after my 17th birthday, that mission completely failed. As my sister and I were walking to the laundromat, a crowd stopped in front of us. Two girls out of nowhere attacked my sister. Still confused about what was happening, I tried to pull one girl away, and just as I did, I felt something brush across my face. With my adrenaline rushing, I didn ’ t realize a man had leaped out of the crowd and cut me. As I felt warm blood ooze down my face, and watching him raise his knife toward me again, I turned to defend myself and pulled that gun from my waistband and squeezed the trigger. Thankfully, he didn ’ t lose his life that day. My hands shaking and heart racing, I was paralyzed in fear. From that moment, I felt regret that would never leave me. I learned later on they attacked my sister in a case of mistaken identity, thinking she was someone else. It was terrifying, but clear that I wasn ’ t trained, nor was I qualified, to be the soldier that I thought I needed to be. But in my neighborhood, I only felt safe carrying a weapon. Now, back in the classroom, after hearing my story, the prosecutors could tell I never wanted to hurt anyone. I just wanted us to make it home. I could literally see the gradual change in each of their faces as they heard story after story from the other incarcerated men in the room. Stories that have trapped many of us within the vicious cycle of incarceration, that most haven ’ t been able to break free of. And sure â there are people who commit terrible crimes. But the stories of these individuals ’ lives before they commit those acts were the kinds of stories these prosecutors had never heard. And when it was their turn to speak â the prosecutors â I was surprised, too. They weren ’ t emotionless drones or robocops, preprogrammed to send people to prison. They were sons and daughters, brothers and sisters. But most of all, they were good students. They were ambitious and motivated. And they believed that they could use the power of law to protect people. They were on a mission that I could definitely understand. Midway through the course, Nick, a fellow incarcerated student, poured out his concern that the prosecutors were tiptoeing around the racial bias and discrimination within our criminal justice system. Now, if you ’ ve ever been to prison, you would know it ’ s impossible to talk about justice reform without talking about race. So we silently cheered for Nick and were eager to hear the prosecutors ’ response. And no, I don ’ t remember who spoke first, but when Chauncey Parker, a senior prosecutor, agreed with Nick and said he was committed to ending the mass incarceration of people of color, I believed him. And I knew we were headed in the right direction. We now started to move as a team. We started exploring new possibilities and uncovering truths about our justice system and how real change happens for us. For me, it wasn ’ t the mandatory programs inside of the prison. Instead, it was listening to the advice of elders â men who have been sentenced to spend the rest of their lives in prison. These men helped me reframe my mindset around manhood. And they instilled in me all of their aspirations and goals, in the hopes that I would never return to prison, and that I would serve as their ambassador to the free world. As I talked, I could see the lights turning on for one prosecutor, who said something I thought was obvious : that I had transformed despite my incarceration and not because of it. It was clear these prosecutors hadn ’ t thought much about what happens to us after they win a conviction. But through the simple process of sitting in a classroom, these lawyers started to see that keeping us locked up didn ’ t benefit our community or us. Toward the end of the course, the prosecutors were excited, as we talked about our plans for life after being released. But they hadn ’ t realized how rough it was actually going to be. I can literally still see the shock on one of the junior ADA ’ s face when it hit her : the temporary ID given to us with our freedom displayed that we were just released from prison. She hadn ’ t imagined how many barriers this would create for us as we reenter society. But I could also see her genuine empathy for the choice we had to make between coming home to a bed in a shelter or a couch in a relative ’ s overcrowded apartment. What we learned in the class worked its way into concrete policy recommendations. We presented our proposals to the state Department of Corrections commissioner and to the Manhattan DA, at our graduation in a packed Columbia auditorium. As a team, I couldn ’ t have imagined a more memorable way to conclude our eight weeks together. And just 10 months after coming home from prison, I again found myself in a strange room, invited by the commissioner of NYPD to share my perspective at a policing summit. And while speaking, I recognized a familiar face in the audience. It was the attorney who prosecuted my case. Seeing him, I thought about our days in the courtroom seven years earlier, as I listened to him recommend a long prison sentence, as if my young life was meaningless and had no potential. But this time, the circumstances were different. I shook off my thoughts and walked over to shake his hand. He looked happy to see me. Surprised, but happy. He acknowledged how proud he was about being in that room with me, and we began a conversation about working together to improve the conditions of our community. And so today, I carry all of these experiences with me, as I develop the Justice Ambassadors Youth Council at Columbia University, bringing young New Yorkers â some who have already spent time locked up and others who are still enrolled in high school â together with city officials. And in this classroom, everyone will brainstorm ideas about improving the lives of our city ’ s most vulnerable youth before they get tried within the criminal justice system. This is possible if we do the work. Our society and justice system has convinced us that we can lock up our problems and punish our way out of social challenges. But that ’ s not real. Imagine with me for a second a future where no one can become a prosecutor, a judge, a cop or even a parole officer without first sitting in a classroom to learn from and connect with the very people whose lives will be in their hands. I ’ m doing my part to promote the power of conversations and the need for collaborations. It is through education that we will arrive at a truth that is inclusive and unites us all in the pursuit of justice. For me, it was a brand- new conversation and a new kind of classroom that showed me how both my mindset and our criminal justice system could be transformed. They say the truth shall set you free. But I believe it ’ s education and communication. Thank you.

Preparing for this talk has been scarier for me than preparing for LSD therapy.”Psychedelics are to the study of the mind what the microscope is to biology and the telescope is to astronomy.”Dr. Stanislav Grof spoke those words. He ’ s one of the leading psychedelic researchers in the world, and he ’ s also been my mentor. Today, I ’ d like to share with you how psychedelics, when used wisely, have the potential to help heal us, help inspire us, and perhaps even to help save us. In the 1950s and 60s, psychedelic research flourished all over the world and showed great promise for the fields of psychiatry, psychology and psychotherapy, neuroscience and the study of mystical experiences. But psychedelics leaked out of the research settings and began to be used by the counterculture, and by the anti-Vietnam War movement. And there was unwise use. And so there was a backlash. And in 1970, the US government criminalized all uses of psychedelics, and they began shutting down all psychedelic research. And this ban spread all over the world and lasted for decades. and it was tragic, since psychedelics are really just tools, and whether their outcomes are beneficial or harmful depends on how they ’ re used. Psychedelic means”mind-manifesting,”and it relates to drugs like LSD, psilocybin, mescaline, iboga and other drugs. When I was 18 years old, I was a college freshman, I was experimenting with LSD and mescaline, and these experiences brought me in touch with my emotions. And they helped me have a spiritual connection that unfortunately, my bar mitzvah did not produce. When I wanted to tease my parents, I would tell them that they drove me to psychedelics because my bar mitzvah had failed to turn me into a man. But most importantly, psychedelics gave me this feeling of our shared humanity, of our unity with all life. And other people reported that same thing as well. And I felt that these experiences had the potential to help be an antidote to tribalism, to fundamentalism, to genocide and environmental destruction. And so I decided to focus my life on changing the laws and becoming a legal psychedelic psychotherapist. Now, half a century after the ban, we ’ re in the midst of a global renaissance of psychedelic research. Psychedelic psychotherapy is showing great promise for the treatment of post-traumatic stress disorder, or PTSD, depression, social anxiety, substance abuse and alcoholism and suicide. Psychedelic psychotherapy is an attempt to go after the root causes of the problems, with just relatively few administrations, as contrasted to most of the psychiatric drugs used today that are mostly just reducing symptoms and are meant to be taken on a daily basis. Psychedelics are now also being used as tools for neuroscience to study brain function and to study the enduring mystery of human consciousness. And psychedelics and the mystical experiences they produce are being explored for their connections between meditation and mindfulness, including a paper just recently published about lifelong zen meditators taking psilocybin in the midst of a meditation retreat and showing long-term benefits and brain changes. Now, how do these drugs work? Modern neuroscience research has demonstrated that psychedelics reduce activity in what ’ s known as the brain ’ s default mode network. This is where we create our sense of self. It ’ s our equivalent to the ego, and it filters all incoming information according to our personal needs and priorities. When activity is reduced in the default mode network, our ego shifts from the foreground to the background, and we see that it ' s just part of a larger field of awareness. It ' s similar to the shift that Copernicus and Galileo were able to produce in humanity using the telescope to show that the earth was no longer the center of the universe, but was actually something that revolved around the sun, something bigger than itself. For some people, this shift in awareness is the most important and among the most important experiences of their lives. They feel more connected to the world bigger than themselves. They feel more altruistic, and they lose some of their fear of death. Not all drugs work this way. MDMA, also known as Ecstasy, or Molly, works fundamentally different. And I ' ll be able to share with you the story of Marcela, who suffered from post-traumatic stress disorder from a violent sexual assault. Marcela and I were introduced in 1984, when MDMA was still legal, but it was beginning also to leak out of therapeutic circles. Marcela had tried MDMA in a recreational setting, and during that, her past trauma flooded her awareness and it intensified her suicidal feelings. During our first conversation, I shared that when MDMA is taken therapeutically, it can reduce the fear of difficult emotions, and she could help move forward past her trauma. I asked her to promise not to commit suicide if we were to work together. She agreed and made that promise. During her therapeutic sessions, Marcela was able to process her trauma more fluidly, more easily. And yet, she was able to tell that the rapist had told her that if she ever shared her story, he would kill her. And she realized that that was keeping her a prisoner in her own mind. So being able to share the story and experience the feelings and the thoughts in her mind freed her, and she was able to decide that she wanted to move forward with her life. And in that moment, I realized that MDMA could be very effective for treating PTSD. Now, 35 years later, after Marcela ' s treatment, she ' s actually a therapist, training other therapists to help people overcome PTSD with MDMA. Now, how does MDMA work? How did MDMA help Marcela? People who have PTSD have brains that are different from those of us who don ' t have PTSD. They have a hyperactive amygdala, where we process fear. They have reduced activity in the prefrontal cortex, where we think logically. And they have reduced activity in the hippocampus, where we store memories into long-term storage. MDMA changes the brain in the opposite way. MDMA reduces activity in the amygdala, increases activity in the prefrontal cortex and increases connectivity between the amygdala and the hippocampus to remit traumatic memories to move into long-term storage. Recently, researchers at Johns Hopkins published a paper in"Nature,"in which they demonstrated that MDMA releases oxytocin, the hormone of love and nurturing. The same researchers also did studies in octopuses, who are normally asocial, unless it ' s mating season. But lo and behold, you give them MDMA, and they become prosocial. Several months after Marcela and I worked together, the Drug Enforcement Administration moved to criminalize Ecstasy, having no knowledge of its therapeutic use. So I went to Washington, and I went into the headquarters of the Drug Enforcement Administration, and I filed a lawsuit demanding a hearing, at which psychiatrists and psychotherapists would be able to present information about therapeutic use of MDMA to try to keep it legal. And in the middle of the hearing, the DEA freaked out, declared an emergency and criminalized all uses of MDMA. And so the only way that I could see to bring it back was through science, through medicine and through the FDA drug development process. So in 1986, I started MAPS as a nonprofit psychedelic pharmaceutical company. It took us 30 years, till 2016, to develop the data that we needed to present to FDA to request permission to move into the large-scale Phase 3 studies that are required to prove safety and efficacy before you get approval for prescription use. Tony was a veteran in one of our pilot studies. According to the Veterans Administration, there ’ s over a million veterans now disabled with PTSD. And at least 20 veterans a day are committing suicide, many of them from PTSD. The treatment that Tony was to receive was three and a half months long. But during that period of time, he would only get MDMA on three occasions, separated by 12, 90-minute non-drug psychotherapy sessions, three before the first MDMA session for preparation and three after each MDMA session for integration. We call our treatment approach”inner-directed therapy,”in that we support the patient to experience whatever ’ s emerging within their minds or their bodies. Even with MDMA, this is hard work. And a lot of our **subjects** have said,”I don ’ t know why they call this Ecstasy.”During Tony ’ s first MDMA session, he lay on the couch, he had eyeshades on, he listened to music, and he would speak to the therapists, who were a male-female co-therapy team, whenever he felt that he needed to. After several hours, in a moment of calmness and clarity, Tony shared that he had realized his PTSD was a way of connecting him to his friends. It was a way of honoring the memory of his friends who had died. But he was able to shift and see himself through the eyes of his dead friends. And he realized that they would not want him to suffer, to squander his life. They would want him to live more fully, which they were unable to do. And so he realized that there was a new way to honor their memory, which was to live as fully as possible. He also realized that he was telling himself a story that he was taking opiates for pain. But actually, he realized, he was taking them for escape. So he decided he didn ’ t need the opiates anymore, he didn ’ t need the MDMA anymore, and he was dropping out of the study. That was seven years ago. Tony is still free of PTSD, has never returned to opiates and is helping others less fortunate than himself in Cambodia. The data that we presented to FDA from 107 people in our pilot studies, including Tony, showed that 23 percent of the people that received therapy without active MDMA no longer had PTSD at the end of treatment. This is really pretty good for this patient population. However, when you add MDMA, the results more than double, to 56 percent no longer having PTSD. But most importantly, once people learn that if they don ’ t need to suppress their trauma, but they can process it, they keep getting better on their own. So at the 12-month follow-up one year after the last treatment session, two- thirds no longer have PTSD. And of the one-third that do, many have clinically significant reductions in symptoms. On the basis of this data, the FDA has declared MDMA-assisted psychotherapy for PTSD a breakthrough therapy. FDA has also declared psilocybin a breakthrough therapy for treatment-resistant depression and just recently approved esketamine for depression. I ’ m proud to say that we have now initiated our Phase 3 studies. And if the results are as we hope, and if they ’ re similar to the Phase 2 studies, by the end of 2021, FDA will approve MDMA-assisted psychotherapy for PTSD. If approved, the only therapists who will be able to directly administer it to patients are going to be therapists that have been through our training program, and they will only be able to administer MDMA under direct supervision in clinic settings. We anticipate that over the next several decades, there will be thousands of psychedelic clinics established, at which, therapists will be able to administer MDMA, psilocybin, ketamine and other psychedelics to potentially millions of patients. These clinics can also evolve into centers where people can come for psychedelic psychotherapy for personal growth, for couples therapy or for spiritual, mystical experiences. Humanity now is in a race between catastrophe and consciousness. The psychedelic renaissance is here to help consciousness triumph. And now, if you all just look under your seats... Just joking! Thank you. Thank you. Corey Hajim : You ’ ve got to stay up here for a minute. Thank you so much, Rick. I guess it ' s a supportive audience. Rick Doblin : Yes, very. Many of them have also been to Burning Man. CH : There ' s some synergy. RD : CH : So, in your talk, you talked about using these drugs to address some pretty serious traumas. So what about some more common mental illnesses like anxiety and depression, and is that where microdosing comes in? RD : Well, microdosing can be helpful for depression, I do know someone that has been using it. But in general, for therapeutic purposes, we prefer macro-dosing rather than microdosing, in order to really help people deal with the root causes. Microdosing is more for creativity, for artistic inspiration, for focus... And it also does have a mood-elevation lift. But I think for serious illnesses, we ' d rather not get people thinking that they need a daily drug, but do more deeper, intense work. CH : And what about outside the United States and North America, is this research being done there? RD : Oh yeah, we ' re globalizing. Our Phase 3 studies are actually being done in Israel, Canada and the United States. So once we get approval in FDA, it will also become approved in Israel and in Canada. We ' re just starting research in Europe. And we ' re actually going to be training some therapists from China. CH : That ' s great. We were going to do an audience vote to see if people felt like this was a good idea to move forward with this research or not, but I have a feeling I know the answer to that, so... Thank you so much, Rick. RD : Thank you. Thank you all.

I love bugs. I think of them as nature ' s tiny engineers because they come up with the most extraordinary and incredible solutions to life ' s problems. And I just love observing them because they ' re so full of surprises and curiosities. During my career, I studied spiders that use their webs as a slingshot to capture prey deep in the Amazon rainforest, worms that tangle up with each other and form knots to form these shape-shifting blobs to survive in harsh environments such as sewers and caves, and tiny aquatic beetles that bring their own scuba gear when they dive, on their butts. But today, I ' m going to tell you a story about one of nature ' s most extraordinary engineers that pushes the limits of fluid mechanics and bioengineering and, arguably, solves their number one problem – how insects pee. A few years ago, my student, Elio Challita, and I observed this tiny insect having a private moment in our own backyards in Atlanta, and we couldn ' t believe our eyes. This insect was peeing for hours, and it was so quick we could barely see it. And we were **blown** away – we had never seen anything like this. We had never seen an insect pee. So today, I ' m going to tell you how insects pee, why they pee so much and in this way, and finally, why you should care about insect pee. So sit back and relax – you ' re in for a treat. So one of the first things we had to discuss is"Wait a second – insects pee?"And it turns out that almost all insects pee, in one form or another. It ' s a closed system – what goes in must come out. But the protagonist of today ' s story, Homalodisca vitripennis, or a glassy-winged sharpshooter – isn ' t it gorgeous? You can see where it gets its name from, it ' s got these transparent wings. This insect specializes in feeding on xylem fluid from plants. It ' s a sapsucker. But I think of it as a plant ' s mosquito. And just after a mosquito sucks your blood, it leaves behind a parting gift – so do these sharpshooters that spread bacteria into these plants, and it causes devastating and deadly diseases in plants, killing them. This is a huge problem in agriculture, including here in California, where it caused millions of dollars in damage to vineyards. And you can appreciate what they lack in size, they make up in numbers. This is what millions of insects feeding and peeing looks like. If only this woman knew where that water was coming from. Now, don ’ t worry, this insect ’ s pee is just water. And so for the first time, I ’ m going to show you this behavior, slowed down with our high-speed cameras, and this is what we discovered. We realized that this insect forms a droplet of pee, and then it flings them at extreme accelerations, of 40 g-forces. That ’ s 40 times faster than the sprint of a cheetah. These insects are really packing a punch from their butts. And we wanted to under – We wanted to take a closer look at this flicker, so we put this insect and took a look under a microscope at its business end, and this beautiful structure has a scientific name : it ’ s called a butt flicker. And this is what we discovered. We realized that this insect had evolved springs and latches, just like a catapult, so that it could efficiently hurl its droplets of pee, repeatedly, at these high accelerations. Now, we wanted to measure the speed at which this flicker was moving, and the droplets, so we measured the speed of both the droplets and the flicker. And this is where we made a puzzling observation. The speed of the droplets in the air was faster than the flicker. So if you take a ratio of that, we were expecting it to be 100 percent, but turns out that the speed of the droplets are about 150 to 200 [percent] faster than the flicker itself. This is why this is counterintuitive : imagine a Yankees baseball player throwing a ball at 100 miles an hour. At some point during that throw, their hands and fingers are moving at 100 miles an hour. Say an amateur ballplayer throws a ball at 50 miles an hour, and if you measure the speed of the ball and it ’ s 100 miles an hour in midair, we ’ d be surprised – where would that extra speed come from, right? This is exactly what these insects are doing. So to solve this puzzle, we went back and looked at our videos. And we ’ ll play this a couple of times – see if you can figure this out. Did you catch it? Let me grab a frame. We realized that unlike a baseball that ’ s rigid... due to surface tension, these tiny droplets are squishy, and we had an”aha”moment. We were wondering if this insect is storing energy due to the surface tension just before launch. And to test this, we did, naturally, what any of us would do – we converted our kitchen tables into a lab to test this. So now, we ’ re going to place droplets on a speaker, to squish them at high speeds, and this is what we discovered. We realized that water that flows in our faucets like a liquid, at these tiny scales, due to surface tension, with the right timing, can get a kick, store energy, and if you time it just right, you can launch these off at extremely high speeds, just like a child on a trampoline. And to test this idea of timing, we even built a catapult. Our should I say a”cata-pee”? And it reinforced this idea : too slow, the droplets don ’ t go off, and then if you move at the right speed, you ’ ve flung this. So I ’ ve told you today how these insects use this catapulting structure to store energy and surface tension and throw these droplets at record-breaking speeds to be, really, number one... at number one. But why have these insects evolved this remarkable ability? And there are two reasons for this. Number one is they are on a zero-calorie diet. These tiny bugs are feeding from the xylem fluid that comes up through the roots, through the soil, and goes to the rest of the plant. It ’ s very, very poor in nutrients – it ’ s just water and some minerals. This is unlike the phloem fluid, which is rich in sugar, coming through photosynthesis at the leaves and going through the rest of the plant. This is akin to a human purely sustaining themselves on a diet of diet lemonade. Very low energy source – you ’ d have to constantly drink, but you ’ d have to constantly pee as well. This still doesn ’ t explain why these insects pee in droplets, and not in jets, like you and I would, if you were to take a bio break. Let ’ s take a look at cicadas. These are the cousins of these sharpshooters. They ’ re also xylem fluid feeders... and they pee in jets. I love this video. This shows cicadas doing two of their favorite things when they come out of hibernation – singing at the top of their lungs and peeing in the wind. And the second reason why these insects pee in droplets is size – these things are tiny, they ’ re smaller than my pinky. In fact, the surface tension that enables them to store energy in these droplets to launch is actually an impediment, because gravity doesn ’ t matter, and surface tension sticks these droplets to their bodies. So they actually have to flick these droplets away – it ’ s actually very difficult for these tiny bugs to pee. And that ’ s why I just love studying bugs. This tiny engineer has figured out how to survive on barely just water through the xylem fluid. And it ’ s figured out to do so, it has to drink a lot, and pee a lot. In that sense, it ’ s not so different from other engineers I know on a Friday night at a bar. But to do so, it ’ s figured out it had to evolve this catapulting structure and fling these droplets at high speeds. And that ’ s why I always tell my students when we explore new bugs,”It ’ s not a bug, it ’ s a feature.”OK, so why should you care about insect pee, and what ’ s the practical application of this work? Maybe, maybe one day, these ideas, these principles could help us design more efficient water-ejector systems for our smartphones, our watches and hearing aids. But I have to be honest, that ’ s not really why I ’ ve obsessed over insect pee for the last four years. I do this because when I share my work with kids, it ignites their curiosity. When I talk about insect pee, it makes their eyes light up. They laugh, they run around in their backyards, looking at bugs and asking questions. It reminds them and us that we can discover marvelous in the mundane, even in our own backyards. We just have to look closely. Thank you so much. I ’ ve got to go pee.

So when I was born on September 26, 1988, my grandparents and great grandparents back in India didn ’ t find out for two weeks, which is a shame because I mean, look how perfect I was. And it ’ s not because the phone lines were down or because they weren ’ t available. It ’ s because there was a complication with my birth. And that complication was being assigned female at birth. You see, because my mom had been told that if she gave birth to a daughter, it wasn ’ t worth phoning home about. After all, she ’ d already given birth to my older sister, and this time everyone had high hopes that she would do right and have a son. But she didn ’ t. She had me. And so there were no congratulations or Indian sweets sent our way. Just the reality that from the moment I came into this world, I was already a disappointment to so many people. It ’ s as if they had a time machine and already knew the trajectory of my entire career and life and decided that I had less to offer. And it sucked. So why am I telling you this heavy story? I ’ m supposed to be a funny person. I have the nerve to come out here and hit you right in the feels. How dare I? I ’ m telling you this because although this is my lived experience, it ’ s also the reality that millions of girls face every day across every culture and in every country. And I ’ m telling you this because being born into this reality set me on a lifetime mission of trying to prove myself and just feel like I was enough. What did I want to be when I grow up? I wanted to be treated equally. And I ’ m not alone in this mission. In fact, us girls, what we desperately want is a seat at the table. It ’ s what every motivational poster, Tumblr post, Instagram account you follow, business card tells us : Success is a seat at the table. And if they want to be extra spicy, they say,”If there is no seat, drag your own seat.”I ’ m sure you ’ ve heard this, right? And so my marching orders were clear. Get a seat at this coveted table by any means necessary. And that ’ s been the driving force behind my entire career. Now, in 2010, I noticed that no one on YouTube looked like me. There was no South Asian woman who ' s very loud and uses her hands a lot, giving her take on the world. There was no me in front of a camera. I saw a seat up for grabs. So I got to work, and I started a channel under the name"Superwoman."Yeah, because although I ' m smart enough to do a TED Talk, I ' m not smart enough to understand copyright. I taught myself how to write, shoot and edit my own content. And I worked really hard. When I finally got the hang of it, I committed to posting two comedy videos a week. And I found success. With a backwards snapback on my head, I gave my take on relationships, pop culture, taboo **subjects** and, most popularly, dressed up like my parents. I can ' t tell you how many times I forgot to wipe that chest hair off. A lot of times. Now fast forward to 2015, and I ' m on stage in India announcing my first world tour. As fate would have it, the day after this monumental milestone, I was set to fly to Punjab, India to visit my grandfather for the first time in my adult life. And whoo, nothing could have prepared me for what was about to happen. I vividly remember it. I was in the car driving to his house. He was standing outside. I nervously got out of the car, walked up to him. He walked up to me, looked me right in the eyes, and he raised his hand and decorated me with a flower garland : a gesture fit for people of importance. He then proceeded to welcome me into his home, my mom by my side, and proceed to show me all the newspaper clippings he had saved with my name and face on them. He said the words he was wrong. Words I had never heard a man say before to me. He said that I had done what no one else could have done, and I had made the family name proud. Me, Lilly, the baby born a girl. That ' s right. Now in that moment I truly felt like Superwoman. I did. You know, through my YouTube videos, I ' ve amassed almost 15 million subscribers and three billion views. But more important than all of that, I managed to change one view. I challenged my grandfather ' s entrenched gender beliefs. And for the first time in my life, I remember thinking in that moment,"Oh, I finally got a seat at the table..."Hello, props."... alongside the men in the industry."I felt like that. And encouraged by my grandfather ' s approval, I became more confident in my influence. I remember thinking,"Oh, I ' m going to talk at this table, I ' m going to join the dinner conversation."You know, a lot of my male mentors make comments and posts about box office numbers and salaries and titles and those dollar dollar bills. So I thought, I ' m going to chime in here. I learned very quickly that whenever I spoke of money, people got a little uncomfortable. Like the time I pointed out the gender gap in the Forbes list for online creators, a list I ' d previously been on. I remember wanting to start a critical conversation because I saw this article and I was heartbroken. You know, the digital space had always been a place that I thought was without gatekeepers. And here it was looking just like old Hollywood. Well, let me tell you, the internet was not interested. I don ' t know how it ' s possible, but it literally felt as if Twitter leaped through my screen and body slammed me onto my desk. The message was clear : you can be on this list, but don ' t try to start any conversations about the inequality on this list. I have thousands and thousands of videos. One of my most disliked videos is why I ' m not in a relationship. Yeah. A lot of the men at the table did not like me telling them why I didn ' t need a boyfriend. I quickly learned that there ' s an invisible gatekeeper called culture, and the table is smack dab in the middle of it. Now, in 2019, I made history with my late-night show,"A Little Late with Lilly Singh."Thank you, thank you. There I was, Lilly, the baby born a brown girl, rubbing elbows, or at least time slots, with comedy royalty. And I got to give a huge shout out to NBC for boldly trying to break late-night tradition. I remember when the show came out, I remember all the articles because they looked practically identical."Bisexual Woman of Color Gets Late-Night Show."I almost legally changed my name to"bisexual woman of color”because that ’ s what people called me so often. And you know, as strange as that sentiment was, I thought, OK, the silver lining is that we ’ ll finally get a different perspective in late-night. A little bit of melanin, a dash of queer, a different take on things. Let ’ s do this! And I remember thinking,”Now, oh, now I ’ ve been invited to the big table. And now things will be different.”So I took my seat. Now, unfortunately, the budget wasn ’ t based on the importance or significance or historic nature of the show. It was based on the 1:30am time-slot that we had. So to say the budget was small, the writing staff even smaller, and to do the first season, I had to shoot 96 episodes of late-night television in three months. Audience : Whoo. LS : Whoo is right. To put that into perspective, that is shooting two to three episodes a day versus the network standard of one a day, maybe two on Thursday. We did it all with a writing staff of about half a dozen writers versus the network standard that ’ s about double that. Words cannot explain to you how exhausting, emotionally and spiritually challenging that was. And I started to feel like,”Hm, I think this chair ’ s a little wobbly.”Now, I think we can all agree that the beauty and magic of late-night is its timeliness. You know that no matter what ’ s happening in the world, you can turn on late-night television and hear all about it. But when you shoot 96 episodes in three months, you kind of lose that magic. I was the only show talking about hooking up, partying, cuddling, traveling, in front of a live audience during a literal global pandemic. Now, still, I thought, if the budget doesn ’ t celebrate the historicness of the show, then the creative can. I can bring some much needed spice to late-night. And sometimes I was successful. But other times, I would receive notes like,”Don ’ t be so loud.””Don ’ t be so big.””Don ’ t be so angry, smile more.”And my all time favorite,”Don ’ t overindex on the South Asian stuff.”After all, everyone else at the table who ’ s been sitting there for years, people are used to them. I might be a little jarring to audiences. Now, during season two of my show, I remember I went into overdrive. I found all the loopholes, I did all the necessary jobs to try to make the show more timely. And I was excited to. And I felt compelled to because for the first time in history, we had a woman, not to mention half South Asian woman, become vice president of the United States. Now we witnessed one of the greatest protests in human history with the farmer protests in India. And I was excited to finally give my take on these things. But my take was almost never included in topical media news coverage round-ups. You know, we still got the same voices, the same perspectives, even though someone and something different was literally in the next time slot. I kept trying to pull up my seat. I kept trying to join the dinner conversation. I kept trying to ask for a more supportive seat. But every time I would be told that I should be grateful to have a seat in the first place. After all, everyone else that looks like me is still waiting outside the restaurant in the cold. You know, the strange thing about having a wobbly seat is that you spend so much time trying to keep it upright that you can never bring your full self to the table. So now, why am I telling you all this? Well, because my therapist costs 200 dollars an hour and this is way cheaper. But also because I just experienced one of the most notorious boys ’ clubs ever in late-night television. And I ’ m here to offer solutions. I don ’ t always follow up a venting session with solutions, but when I do, it ’ s a TED Talk. That ’ s right. You see, my goal was always a seat at the table. It ’ s what women are conditioned to believe success is. And when the chair doesn ’ t fit, when it doesn ’ t reach the table, when it ’ s wobbly, when it ’ s full of splinters, we don ’ t have the luxury of fixing it or finding another one. But we try anyways. We take on that responsibility, and we shoulder that burden. Now, I ’ ve been fortunate enough to sit at a few seats, at a few different tables. And what I ’ ve learned is, when you get the seat, trying to fix the seat won ’ t fix the problem. Why? Because the table was never built for us in the first place. The solution? Build better tables. So, allow me to be your very own IKEA manual. I would like to present to you a set of guidelines I very eloquently call :"How to Build a Table that Doesn ' t Suck". I ' ve been told I ' m very literal. Now, right off the bat, let me tell you, this assembly is going to take more than one person or group of people. It ' s going to take everyone. Are you ready? Should we dive in? Let ' s do it. Up first, don ' t weaponize gratitude. Now, don ' t get me wrong, gratitude is a great word. It ' s nice, it ' s fluffy, a solid 11 points in Scrabble. However, let ' s be clear. Although gratitude feels warm and fuzzy, it ' s not a form of currency. Women are assigned 10 percent more work and spend more time on unrewarded, unrecognized and non-promotable tasks. Basically, what this means is all the things men don ' t want to do are being handed to women, and a lot of those things largely include things that advance inclusivity, equity and diversity in the workplace. So hear me when I say, a woman shouldn ' t be grateful to sit at a table. She should be paid to sit at a table. Especially ones she largely helped build. And a woman ' s seat shouldn ' t be threatened if she doesn ' t seem"grateful"enough. In other words, corporations, this step involves a woman doing a job and being paid in money, opportunity and promotion, not just gratitude. And women – yeah, go ahead, live it up, live your life. And women, a moment of real talk, trust me, I ' ve been there and I know it ' s so tough, but we have to understand and remember that being grateful and being treated fairly are not mutually exclusive. I can be grateful but still know exactly what I deserve. And that ' s the way to do it. Up next, invest in potential. When investing in women, don ' t invest in the 1:30am time slot. Invest in empowering something different. Invest in a new voice. Give them the support they actually need. Cultural change takes time and money. Heck, it took my grandfather 25 years to see that I was worthy of more. So a true investment is one that values potential over proof. Because so often that proof doesn ' t exist for women. Not because we aren ' t qualified, but because we haven ' t been given the opportunity. In other words, if you ' re trying to be inclusive, don ' t give someone new a seat made of straw until they prove they deserve a better one. Don ' t hold something called a"prove it again"bias, which requires less privileged people to constantly keep proving themselves, even though white men tend to get by on just their potential. Give them a seat that they can thrive in, that they can do the job you hired them to do in. Allow them to contribute to the table, and they will make it better. Up next, this is my favorite one. My favorite one, it ' s quite common sense, actually. Make space for us. You know, for every three men at a table, there ' s only one place setting for a woman. People are so used to more men showing up that they plan for it. There ' s an extra seat in the corner, there ' s a steak under the heat lamp. When more men show up, the table gets longer. But when that extra RSVP is a woman, more often than not she ' s encouraged to compete against the only other woman that was invited to the table. Instead, we need to build multiple seats for multiple women, not just one or two, so that women are not sitting on top of each other ' s laps, fighting for one meal. We already know that more diverse teams perform better. A recent study shows that corporations that have more gender diversity on their executive teams, were 25 percent more likely to experience above average profitability. And more racially diverse companies had 36 percent more profit. So really, no matter how you look at it, it ' s time to build longer tables and more seats. And I want to say something, and I want to admit something, I want to be vulnerable for a second. Because I ' ve fallen victim to this so many times, and women, let me know if you ' ve experienced this. We have to get rid of the scarcity mindset and champion each other, you know, because I ' ve learned what ' s the better win? Me sitting at a table or us sitting at a table?

Don ’ t be convinced to fight for one spot. Instead fight for multiple spots. And let me lead by example right now and say, I know there ’ s many other women that are going to come on this stage, and I hope they all nail it, and I will be cheering you all on because we can all win. And I ’ m going to be your biggest cheerleader when you ’ re up here. Last, it ’ s time to upgrade the table talk. Now, I believe stories make the world go around. You thought it had something to do the solar system? Joke ’ s on you, it ’ s stories. Stories are how we understand ourselves, how we understand others and how we understand the world. And arguably the most important stories are those we see in the media. Because we ’ ve seen time and time that they control the narrative and impact culture. Now, when it comes to genre, you can argue that certain genres have certain target demographics. When it comes to the world news, the target demographic is the world, and we know half of the world is female. Yet women and girls make up only a quarter of the people interviewed or that the news is even about in the first place. Instead, when it comes to issues that impact women, we not only need to be included in the coverage, we need to be driving those stories and dimensionalizing our own experience. Inviting everyone in on the table talk isn ’ t just a nice gesture. It makes for better, more productive, smarter conversation with more than one point of view. And that ’ s how you get better. So this all sounds like a lot of work. And it is. But I ’ m going to tell you why it ’ s necessary and worth it. To be honest, this is about so much more than just women in the workplace. In fact, I could probably come up with many more guidelines across many other industries. This is about creating a world where half of the population can thrive. You see, because the work we do today can create a world where future generations of girls can have equitable access and opportunity. And here ’ s the best part. Are you ready for it? Everyone listening today, all the men, the women, everyone in between, the big companies, the small ones, the media outlets, the people that snuck into the back, all of you, you can help create this future. A future where we have longer tables and more seats that actually work instead of fighting for a seat at the old ones that don ’ t. A future where everyone is seated at the table equally. And a future where being assigned female at birth is not a disappointment or a disadvantage, because girls are encouraged, empowered and expected to do great things. And I can ’ t wait to make that a reality. Thank you so much.

My name, Ndidi, means patience in Igbo. But I ’ m probably one of the most impatient people you ’ ve ever met. I was in such a rush to enter the world that I was born in the parking lot of the University of Nigeria Teaching Hospital. True story. Agriculture was my favorite **subject** in school. My mom remembers me squealing for joy when I ran home from school and saw green beans ready for harvesting. Or when I sold a bag of avocados in our local market. I considered studying agriculture in school, but instead opted to study business and started in corporate America. But many twists and turns led me back to my first love : consulting, working with entrepreneurs and then starting businesses. A defining moment for me was in 2007, during the first world food crisis in my adult life. I recognized how connected we were. Oil price shocks led to cereal price hikes, which affected bread prices all over the world. And the most vulnerable were hurt. Fourteen years later, my impatience has grown. We ’ re even more connected, and our food ecosystem is even more broken. Thankfully, the Rockefeller Foundation has some pioneering research on the true cost of food in the United States, which indicates that even though we spend 1. 1 trillion on our annual food expenditure, we actually spend 2. 1 trillion on costs linked to health and climate, all because of our broken food ecosystem. These same statistics have been replicated all over the world. In fact, according to the UN Food Systems Scientific Group, our food system is value-destroying. There ’ s a need for urgent action. From at least three lenses. A health lens, an equity lens and a climate lens. Starting with the climate lens, we must modify how we grow food and reduce food waste. Our food ecosystem is one of the largest contributors to climate change. We keep cutting down trees to grow more food, and we keep wasting food which ends up in landfills and rots, generates methane. The good news is that we have the technology and the science today to grow enough food to feed the world and to address our food waste problems. We have the knowledge, but we ’ re not using it. There are exciting examples from my ecosystem where we ’ re seeing dramatic impact. The Songhai Center in Benin Republic educates young Africans on regenerative agriculture and zero-waste total production. And one of these young people is doing just that. Through his company, Bioloop, he ’ s feeding waste, cassava peels, yam peels, to black soldier fly larva. They ’ re growing really quickly and becoming wonderful fish feed. The byproducts and the residue from this process is wonderful soil supplements. And the entire production process is run on renewable energy. Through my work with Sahel Consulting, we ’ re demonstrating that farmers can double and triple yields without hurting the environment. We ’ re using technology and science from our local research institutions, and we ’ re proving that in Africa, there are great examples for the rest of the world to emulate. Now we need to scale these interventions. And we need to ensure that our governments, our private sector, our farmers, are incentivized to change behavior and to improve lives. If you ’ re as impatient as I am, you also have a role to play, by reducing the food waste in your home. Every single person here can take up a policy to ensure that their schools, their companies, their civil society groups have a sustainability policy and a food waste policy. And please don ’ t tell your children to finish their dinner because there are hungry children anywhere. Tell them to finish their dinner because it ’ s good for the environment, and healthy food is good for them. Second, we must ensure that healthy food is affordable and accessible for the most vulnerable. This is a huge challenge. Unhealthy food kills. And we know this. One out of every five deaths is linked to unhealthy food. And yet, one third of our world ’ s population cannot afford a healthy diet. This is a big challenge. Now food is medicine. Healthy food gives us long and productive lives. And during COVID, we ’ ve seen the impact of closures, shipping challenges that have affected food prices, and the most vulnerable have had to shift from healthy diets to unhealthy diets because they are cheaper. This has caused more damage to lives all over the world. We must take a stand on this, and we can learn a lot from Africa. There Hadzabe people in Tanzania live in harmony with the land, and through their lives, we ’ ve seen the ability to have a healthy diet. They eat ten times more fiber than the average American. Oftentimes we don ’ t realize that even in our own traditional communities, we have so much to learn. In urban communities, we also have exciting social enterprises like mDoc that ’ s using digital technology, cell phones and training to get urban populations that are struggling with diabetes, high blood pressure and so many other health challenges linked to eating ultra-processed food to shift to more traditional diets, and they ’ re seeing measurable outcomes. We must scale these type of interventions, but we must also hold our private sector companies responsible for the amount of sugar and salt contained in food. We must set standards for what healthy food is and define healthy food according to plant-based diet, low salt, low sugar, and keep all of us accountable. We must also encourage our governments and ensure that at the local, state and federal level, our school feeding programs prioritize healthy food, our public procurement programs prioritize healthy food, and collectively, we ensure that we keep the standards high for everybody, every child. If you are as impatient as me, you must also set standards and hold those in your spheres of influence accountable for delivering unhealthy food for the most vulnerable. Third, we must support small- and medium-sized enterprises. In the food ecosystem, small- and medium-sized enterprises are the bedrock of our economy. They create jobs, they are innovative, and they can pivot very quickly. But during the pandemic, we ' ve seen something. They are most affected by shocks. The mortality rates of small- and medium-sized enterprises in the food ecosystem has been quite high. Now through my work, I ' ve seen the value and the power of small- and medium-sized enterprises. I ' m the co-founder of a food company called AACE Foods. Over 50 percent of our staff are women. Fifty percent of our board are women. And we produce healthy food, sourced from over 10, 000 farmers. Through this company, we ' re demonstrating that when you empower women, you empower communities. One product that we sell has a ripple effect through the entire ecosystem. Another company that ' s worthy of emulation is Twiga, using mobile money and cell phones to connect farmers to urban retailers. Now their efficiency and removing the middlemen, creating shorter value chains, ensures that not only the farmer benefits, the retailer benefits, but the consumer has access to healthier food. And finally, I ' m most inspired by these dynamic women entrepreneurs. Through Nourishing Africa, I work with enterprises in 37 African countries who are scaling sustainable businesses, building healthy food companies and demonstrating that strong, small- and medium-sized enterprises, committed to sustainable agriculture and healthy food, can become change agents. We need to support our small- and medium-sized enterprises, creating an enabling environment for them, providing catalytic financing, enabling them to scale, and supporting women-owned businesses, especially businesses run by young women. In the food ecosystem, we ' re often told to be patient when we plant the seed to let it grow. We ' re often told to let the vegetables simmer so that the juices will flow. We ' re told that”ndidiamaka,”patience is a virtue. But a wise woman once said,”For the dreamer, impatience is a virtue.”I am impatient about the current pace of change in the food ecosystem. And I think we all must be courageous and bold to transform this landscape. The next time you eat a meal, ask yourself a few questions. Who grew this food? Where was it grown? When was it grown? How many steps and stops did it make before it got to your table? How much food waste was generated because of this meal? Let your answers influence your next meal. The fact that you have a choice gives you privilege and also gives you a voice to demand that the solutions to the food ecosystem align with what works for people and planet. We must collectively create a food ecosystem that works not just for us but for future generations. Our children and grandchildren will hold us accountable for what we chose to do today to transform the food ecosystem. Thank you so much.

Whenever I tell people I work at a middle school, they often lean back and suck their teeth. It ' s like they ' re having a visceral reaction to the mere mention of those years, and it makes sense. Middle school is a time like no other. It ' s when significant biological, neurological and emotional changes are happening all at the same time. So how do middle schoolers respond to these changes? Well, some might ignore deodorant but overuse Axe body spray. You can find

them holding up the walls during the school dance. And there ’ s usually a desire to be treated like an adult, but they can ’ t quite let go of their action figures. You might imagine that it looks a little like this. This was me in sixth grade, and like many middle school students, I was earnest, I was goofy, and I was just discovering who I wanted to be. Now I had no idea that I ’ d go on to teach middle school. They say the grade levels you teach are most reflective of your personality. So I ’ m not quite sure what it says about me that I later went on to found a middle school for boys. But in all seriousness, it didn ’ t take long as a teacher to realize that my male students were acting kind of strange. I remember there was this one year, we were doing a get-to-know-you activity where students would use old magazines to create collages representing who they were. And many of the collages had all of the things that typical middle schoolers like : the outdoors, sports, the latest fashion, the hottest shoes, you know, all the important stuff. However, there were some that were not exactly what I had in mind. A group of middle school boys created these collages that were comical, if not concerning. It was almost as if they had made templates of who they thought that they should be. Girls in bikinis, fast cars, professional wrestlers, first-person shooter video games. You get the idea. One collage actually had to have had at least 25 different images of Kim Kardashian. And this wasn ’ t an isolated incident. Whether it was going down a somewhat sketchy YouTube rabbit hole or mindlessly indulging in meme culture, which we know can get really hairy really fast, I was noticing a pattern with my boys. Instead of chalking it up as mindless activities or typical middle school behavior, I decided to investigate. I became a mentor for an afterschool program called My Brother ’ s Keeper. And in this space, we could have more in-depth conversations. Inspired by the 2016 presidential debates, I asked this group of boys an age-old question :”Does absolute power corrupt absolutely?”Students began to discuss amongst themselves. And then I asked,”Now what would you do if you had this kind of power? And what if it was unchecked?”Students continued talking and then they shared out. Many of them said that they would use their power for good or even share it. And as I listened, I felt hopeful. Realizing that young men could take a different path. And then I brought the group together and I just said,”Does it have to be this way?”Their collective light bulbs lit up, realizing that they could reject this version of masculinity. And at the same time, I too had an”aha!”moment. It became clear to me that middle school boys are so impressionable and so full of potential. But what if I told you those same middle school boys could lead us to a more just and equitable society by redefining masculinity? Now in the days and weeks that followed, I continued to reflect on this idea. What actually is masculinity? If we reject the gender binary and affirm people of all genders, how does masculinity fit into that? What are the expectations of masculinity when it comes to race, class and other social factors? I knew that middle school is fertile ground for this work. And my reflection led me to identify three critical skills that middle schoolers can practice to redefine masculinity. I call them the three C ’ s. The first one is confidence, the second is communication, and the third is community. Now these three C ’ s stand as the pillars of my school to show people that middle schoolers can redefine masculinity. Now number one, confidence is essential to teach in middle school. Students are exploring their identities, and they ’ re more open to abstract thinking. I believe that having a healthy and balanced confidence allows boys to feel good about who they are rather than feeling uncomfortable for trying to be someone they ’ re not. It ’ s different than simply being praised or rewarded for achievements but rather rooted in a deep sense of self. And so what my school does is move away from either-or thinking. Instead of boys believing that they have to choose between being smart or athletic, poetic or pragmatic, we guide our boys to a more holistic version of masculinity that includes both-and. And as bell hooks and Olga Silverstein said, we need men who are empathetic and strong ; autonomous and connected ; responsible to self, friends, family, to community ; and capable of understanding how those responsibilities are ultimately inseparable. And from a purely academic standpoint, we provide opportunities to teach confidence through cross-curricular work and projects that include math, science, the humanities, art, home ec, sports to show them that deep learning and critical thinking often require an integration of all of these **subjects**. Teaching confidence allows boys to understand that there ' s an entire spectrum of how they can express themselves, and they can feel good and value the complexity of their identity and stand firm in it with confidence. The second C represents communication. Now communication is key. To counter the messages that society tells boys to constrict their emotions, my school practices a variety of communication methods, both intrapersonally and interpersonally. Now intrapersonally is how you communicate with yourself, and interpersonally is how you communicate with others. One example of our intrapersonal communication methods is we ' ll have students arrive at their desks at the beginning of the day. They ' ll close their eyes, breathe evenly for about a minute so they can just check in with themselves, see how they ' re doing, what they ' re thinking, how they ' re feeling. It allows them to put a frame around their thoughts and emotions so they can focus on it a little more deeply throughout the day. Students also keep gratitude journals. Research shows that when students express gratitude on a regular basis, it increases positive emotions toward themselves and toward others. An interpersonal practice that we like to do is at the end of the day, we ' ll have students gather in a circle to offer an appreciation for someone or something. Open it up to an apology or talk about a social issue that might be on their hearts. And we normalize these forms of communication to show boys that it is perfectly human to open your minds and your hearts to your community. Now the third C represents community, to counter this false sense of individualism and having to pull yourself up by your bootstraps. While we also know that there is great value in teaching our boys the importance of independence, it can be stymied when taken to an extreme. And so what we do is we engage in an inquiry process where we observe what ' s going on in our communities, either locally, nationally or globally, and then pose an essential question. One year we posed an essential question to our students that asked,"How can we create a community where everyone feels a sense of belonging?"Students took this question. They generated initial thoughts. They sought multiple perspectives from their peers, their teachers, community leaders. And then they came back to us and said,"We ' d like to address homelessness in Seattle."We loved this idea. And so we partnered with a local construction company to design, build and donate a tiny house. Now what we realized is through this community learning process, students felt a greater sense of satisfaction with studying, taking academic risks and just valuing the overall learning process. In addition, students felt more comfortable taking on leadership roles inside and outside of the classroom. One thing to note that in each of these three C ' s the adults involved modeled this new version of masculinity to prove to students that they don ' t have to fit into a stereotype. And while I ' m often impressed by the vulnerability and kindness of each of my students, it ' s still a middle school. It ' s this liminal space between childhood and adulthood. And amongst our sophisticated conversations, there ' s a lot of nonsensical humor. And very few of them have taken up regular usage of deodorant. And I know that this is lifelong work and there ' s no quick fix, but they show me that a better future is possible. What if masculinity meant having a healthy and balanced confidence, communicating clearly, being connected to your community? Just imagine how different our world would be. My students don ’ t even show me that this future is possible, but this future is here, with middle school boys leading the way. Thank you.

Text Sample 756: NEG Dim 5 – 2023 – Score -1.00 – 2023/t003545.txt
My name is Sharif El-Mekki. I ’ ve been an educator for almost 30 years. 10 as a classroom teacher, 16 as a principal. In the last few years, I ’ ve been a proud CEO for the Center for Black Educator Development. Between my time as a student and my career as an educator, I noticed a deep disconnect between the education of Black students — or what we should continue to call their miseducation — and their daily lived experiences. I grew up in the great city of Philadelphia. But I was fortunate because I did not experience the traditional American schooling system. My earliest memories of school was in a pre-K my mother started or helped to start, in Masjid Mujahideen. She insisted that faith-based institutions should not just be for the nourishment of adults, but they should also support the intellectual development of children. From this pre-K, I transitioned to Nidhamu Sasa, an African free school in the historic Germantown section of Philadelphia. From there we transitioned to Qom, Iran, where I attended Tabatabai Middle School, before returning for high school at Overbrook, an iconic and legendary school in West Philadelphia. The partnership between my home and my elementary school, Nidhamu Sasa, was grounded in the histories that stretched from the freedom schools of the north to the deep south, to enslavement, to reconstruction, to Jim Crow and redlining, to the Civil Rights, Black Power, and independent Black school movements. But it went deeper than that. My educational experience was rooted in how people on the continent of Africa viewed their relationship between teaching and learning, scholars and scholarship, and self-discipline, self-determination, and education. After Nidhamu Sasa, we went to Iran. Qom, Iran. And from there I gained an international perspective of how people viewed education and their children. From there, we returned to the States. And I enrolled at Overbrook High School. I loved my high school. And it was the first time I experienced low expectations as a student. It started with my placement test. Based on my score, my mother was encouraged to allow me to skip two grades. She declined — but she did let me skip one. I remember my sophomore year and cutting English class for almost a month. And sometimes I would run into my teacher in the hallway. And I was so nervous. We would lock eyes and she would look away and go about her way. But I also had Mr. Charles Mosley. One of the few Black teachers that I had in high school. He would connect history to his literature class. He had the audacity to believe that an English class should include the works of Black authors. One of the few times in high school that I experienced seeing myself in the curriculum. It was my high school experience that convinced me that there was something deeply troubling with the American education system and how I and other Black students were being educated. But it also helped propel me into a career and mission. My teaching career was grounded in the intellectual genealogy of Black educators who were immersed in Black history and Black culture, and Black social and political perspectives. I knew from intimate experiences the connection between activism and teaching Black students superbly ; the inextricable linkages between education and racial justice. You see today, in schools and classrooms around the country, educators use the foundations that were provided to them by educator prep programs. But most of these educator prep programs derive their understanding of the art and science of teaching and learning from white,

educational and behavioral theorists — Horace Mann, John Dewey, B. F. Skinner, Piaget, and Freud. Theorists who couldn ’ t even fathom that the majority of public school students today would be made up of students of color. So it goes without saying that they did not create these practices and educational frameworks with Black students ’ well-being and learning needs in mind. Today, almost 80 % of public school teachers are white. And often they enter America ’ s schools trained and armed with theories and practices that do not address Black students ’ needs or their lived experiences. But I believe there ’ s a better way. And it resembles how I was taught : with methods and mindsets that stretch from pre-colonial Africa to today. Dr. Greg Carr has taught about this extensively, and my friend Dr. Akosua Lesesne wrote her dissertation on it. She coined it the”Black Teaching Tradition.”The Black Teaching Tradition is a lineage of practices, values, and belief systems that stretch across time and centers how Black people have always taught and learned, regardless of the time and space. The Black Teaching Tradition is grounded in the humanity of students and is meant to support them specifically, but not exclusively. Because these practices and mindsets can be applied to the humanity of all students. In our work at the Center for Black Educator Development, we have 20 competencies that we believe fuel the healthy mindsets that educators must have in order to be effective educators of children and be able to serve and partner with communities. Behind these competencies are three core tenets : communities centered on care, content that is rich, rigorous, and accurate, and the courage to implement both, in often hostile environments. So, let ’ s start with community. This educator is not well known. But she should be considered one of the matriarchs of Black education and Black school founders. Her intellectual genealogy can be traced through the work of Black Educator Hall of Famers, who she mentored and inspired. Educators like Nannie Helen Burroughs, Charlotte Hawkins, and Mary McLeod Bethune. Lucy Craft Laney would convene with other educators to evolve and advance the education of Black children in America. And during that time, this was no easy feat. They weren ’ t hopping in Zoom rooms and DM-ing each other on social media, or hopping on jets. This was a slow and deliberate process. Lucy and her colleagues would come together to plot and plan for their people. For the education of the children and their students ’ grandchildren. Lucy and other educators were relying on word of mouth and handwritten letters to come together to do this very important work. And it ’ s because of her understanding of and proximity to the Black community, that Lucy and her colleagues understood the racial stress that Black children were often **subjected** to in school. And from this understanding they tailor their teaching, and design schools to accelerate student achievement. From Lucy Craft Laney and her protégés, hundreds of schools for Black children were opened and thousands of Black students were taught. From Lucy Craft Laney we can learn the importance and impact of communities centered on care, but also the ripple effect that it can have on generations to come. This next educator may be a little bit more well-known. His dedication to Black history led to Black History Month, formally known as Negro History Week. But what many people don ’ t realize is that this educator was fired from Howard University, an HBCU. At that time, talking about Black history and centering it in education was looked at as too radical. He should be considered as the father of Black history : none other than Dr. Carter G. Woodson. Dr. Carter G. Woodson believed that in order to be an effective educator of Black youth, you had to have both content mastery and understand the sociopolitical conditions that undermine their education. He believed that the content mastery and understanding of the historical importance of their contributions is what will allow Black students to thrive. The first part, content mastery, is pretty straightforward. Because how can you teach effectively if you ’ ve not mastered the content that you ’ re trying to teach students? But the second part, understanding the sociopolitical conditions and accurate Black history, is equally as important. Because how can you teach with an affirming lens if your understanding of their historical identity and contributions is minimized to enslavement? And how can you teach them and lead them effectively if you ’ re ignorant of the barriers that fence in their success? Dr. Carter G. Woodson teaches us that you can only be an effective educator if you have **subject** mastery and deep understanding of the context in which students are situated. Last, but definitely not least, Septima Clark was born to a laundry woman and a formerly enslaved father. Her parents were not educated, but they insisted on education, and Septima eventually became a well-respected teacher-activist in South Carolina. Her activism included work with the NAACP. And she participated in a class-action lawsuit against disparate pay between Black and white teachers. This eventually raised the ire of her employers, and they passed a policy where teachers could not belong to a civil rights organization. Septima and many Black educators had to decide between their activism and their employment. Septima chose courage. And she was eventually fired. But that did not stop her teaching. She continued teaching at the Highlander School in Tennessee. Rosa Parks participated in Septima ’ s workshops mere months before heading back to Montgomery to help lead the Montgomery Bus Boycott. In 1976, 20 years after being unjustly fired, Septima ’ s pension was reinstated by the governor of South Carolina. Septima teaches us today that courage may be educating despite anti-CRT legislation. And it may be at the risk of losing our teacher certification or our livelihood. And it may come at a great cost. But we also cannot continue to abide by the ramifications of staying silent. I invite everyone to join us in the Black Teaching Tradition. We know that teaching and centering communities of care, mastering content in the sociopolitical context that our students grow up in, can lead to better educational outcomes. And not just for Black students, but for all. Thank you.

Text Sample 757: NEG Dim 5 – 2023 – Score -1.00 – 2023/t003523.txt

Many years ago, I was finishing college and I was in that,”so what ’ s next?”phase of life, and I decided I wanted to see the world. And that was all well and good, but to do that I needed money and a job. So I headed off to my college ’ s advising center, thumbed through a Transitions Abroad magazine, and there it was. It was this ad that said something like,”Do you want to teach English abroad?”And I thought,”well, if that ’ ll get me abroad, then yeah, I guess perhaps I do.”So fast forward to several months later, I had a fellowship and I was off to Finland for a year to teach English to elementary school students. Now, before I got to Finland, I already knew that it was a really cool place, but what I didn ’ t realize was how linguistically diverse a place it was. Because I was on my way to teach elementary school students English, but those same students, unbeknownst to me, were already studying Finnish and Swedish and sometimes other languages in school. At the time I thought Finland must be some sort of multilingual anomaly. It couldn ’ t be the norm for elementary school students to be learning multiple languages, could it? Well, it turns out, globally, it often is. America really is more of a global standout, and not for good reason in this case. The US stands out due to its monolingualism in schools, which is in sharp contrast to the fact that this country is an incredibly linguistically diverse place. So, how do I know? Well, I ’ ve been working with and studying multilingual learners for over 20 years. I ’ ve been a language learner, I ’ ve taught English as a second language and English as a foreign language. And I ’ ve carried out language policy research in several different countries. And this is what I ’ ve realized : here in the US, we ’ re doing it wrong. America is not tapping into what I see as our greatest asset, which is our linguistic diversity. So you might be thinking, okay, but does this even matter? And if it matters, what do we do about it? So, spoiler alert : it matters. And I ’ m going to talk about what we can do about it. But first, I ’ d like you to come with me on a journey to an American public elementary school. Feel free to imagine your own from growing up, or maybe one near where you currently live, or maybe even one from TV. Now, let ’ s go inside. Once we step in, it ’ s immediately evident that this is a multilingual place. So, how do you know? Maybe there ’ s posters and decor in multiple languages. Maybe you hear conversations happening with adults and students in different languages, and maybe there ’ s even signs that explicitly say that multiple languages are welcomed and can be supported. Now let ’ s walk down the hall into a classroom. Inside, students are doing a math lesson in English. They ’ re working in small groups on word problems as the teacher walks around the class supporting the learning. And then, in Spanish, the teacher says it ’ s time to transition to a science lesson. She talks about the science content, hands out some papers for the day ’ s assignment. The students attentively listen, and then they begin to interact with each other and the new science content — all in Spanish. So one **subject** in English and the next **subject** in Spanish. Whoa. How does this feel? Full disclosure, to me, this is like a school-based multilingual dream come true. But I bet that this also might feel kind of unnerving or surprising or a little bit chaotic to some. And I think that those feelings may stem from the fact that this true embracing of multilingualism is very, very unusual in the US and it ’ s very uncommon to see in American schools. But here ’ s the thing, here in the US, we have tons of raw potential when it comes to language diversity. In fact, in 2022, Ethnologue ranked the US 5th of all countries in the world in terms of language diversity with 337 spoken languages. Similarly, nearly one quarter of students in American schools speak a home language other than English. This means that millions of students possess rich language skills, but we ’ re not encouraging the development of those skills alongside the development of English. And therefore we are not tapping into the linguistic diversity that exists among us and is already present. When students enter schools, their language use and English proficiency is screened, and if they ’ re in need of support, they ’ re provided it. But their home and heritage languages are often set aside due to long standing policies and practices that focus heavily on English. Now, don ’ t get me wrong — I am not here to tell you that students educated in America shouldn ’ t learn English. Well, there ’ s no official language in this country. That ’ s right. There is no official language in the US. English absolutely is a lingua franca and it ’ s an important sociocultural and economic tool for communicating in various settings. However, students ’ home and heritage languages are incredibly valuable too. And that is what we ’ re missing. Students are entering schools with rich language backgrounds and cultural experience and knowledge. And schools are often ill-equipped to support that, which means that these languages often go uncelebrated, or even worse, over time, they ’ re lost and forgotten. So it ’ s time that we stop leveraging dated policies and operating schools in a monolingual way. But there ’ s good news here. Because research shows that there ’ s a language development program model called dual language that is highly effective for all students. And by all, I mean all. There are different kinds of dual language programs, but the general gist is that participating students receive instruction in two languages, meaning that over time they become bilingual. Historically in the US, language policies and programs have often been subtractive, but dual language programs are additive, which means that they ’ re focused on developing, cultivating, and sustaining two languages. And research shows that these programs are really good for all kids. Not only are they the most effective type of instruction for students who speak a language other than English, but they also benefit native English speakers, and students from diverse racial and ethnic backgrounds, and students with special education needs and exceptionalities. Students enter these programs speaking one language and they come out of these programs speaking, listening, reading, and writing in two languages proficiently. Dual language programs work and we could implement them around the country. Because the fact of the matter is that being multilingual matters, both for the individual and for our society. Speaking multiple languages expands our worldview. It connects us to our own identity and links us to our communities, our cultures, and our families. And research shows that there ’ s these incredible cognitive benefits too. Brains function better and can do more when they ’ re multilingual. For instance, research indicates that bilingual brains are better than their monolingual counterparts at conflict management, and at executive functioning activities, like multitasking. I mean, the effects of this are incredibly far-reaching and impactful. It really is amazing, isn ’ t it? And it doesn ’ t end there, because there ’ s these economic and geopolitical benefits too. More and more jobs seek bilingual candidates, and being multilingual often leads to more lucrative job opportunities with global potential. Around the world, schools are producing bi- and trilingual individuals. But that ’ s notably uncommon here, which means that students educated in America are at a disadvantage globally in this way. As technology shrinks our world and leads to faster communication, and commerce, and political action, being multilingual can lead to increased opportunities for travel, study, work, and personal growth. So let ’ s go back to that journey we took. Because the fact of the matter is that doesn ’ t have to be a figment of our imagination. That journey took us to a dual language program, and what we need to do is build and grow these programs in order to build and grow multilingualism. Through dual language, we have the opportunity to cultivate languages, honor cultural and linguistic capital, and foster connections within schools and communities. So instead of thinking of it as a journey, let ’ s think of it as a foundation upon which to build better school programs that honor the language diversity that exists among us. It ’ s the first step towards celebrating and elevating multilingualism. Together, we can help students develop skills in more than one language. Students who will then go on to be multilingual adults, workers, travelers, community members, and global citizens. Thank you.

Chris Anderson : Cai is incredible, Cai ’ s language is Mandarin. Many of us do not speak Mandarin. But Cai agreed to do a wild experiment. For this talk, we collaborated with another TED speaker, Tom Graham, and his team at Metaphysic, who built an AI model to make Cai ’ s translator ’ s voice sound just like Cai speaking – just like he is speaking in English. So Sang is in a sound booth now. Sang, Hello. Sang : Hi, everyone. CA : OK, so it ’ s great to see you. Now let ’ s hear you sounding as if you were Cai. Sang : My name is Cai Guo-Qiang. CA : OK, nothing ’ s going to go wrong here. Nothing ’ s going to go wrong. The stage is yours. Cai Guo-Qiang : Thank you. More than 1, 000 years ago, when Chinese alchemists were developing elixir of immortality, one recipe caused an explosion. Boom. Boom. They named their discovery”fire medicine,”the Chinese word for gunpowder. From the very beginning, gunpowder has been about accidents, loss of control and destruction. But it ’ s also been about the healing power and unseen energies. I dreamed of becoming an artist when I was little, but like my father, who was an avid painter himself, I was cautious and timid. Caution is a fine quality in life, but not so in art. And Chinese society was also very controlling when I was young, so I longed for an artistic medium that could help me free myself and lose control. I came from an ancient city in southeast China called Quanzhou. The city had many firecracker factories when I was young, so it was easy to get gunpowder. When I first began using gunpowder to create art, I would lay out a canvas in the living room and set up small explosions on it. Seeing the canvas on fire one day, my grandmother threw a linen rag over the flame and put it out with a small puff. It was my grandma who taught me that while it ’ s important to light fires, it ’ s more important to know how to put them out. Over the decades, I ’ ve grown closer to gunpowder and mastered more techniques. My creations forever oscillate between destruction and construction, control and freedom, dictatorship and democracy. For example, here I first painted my imagination of Paradise, a mirage of temptations. I exploded colored gunpowder to create a sensual and dazzling garden, so beautiful that I didn ’ t want to lay a finger on it. However, I picked up my courage and scattered black powder all over this beauty. Covered it with a blank canvas and ignited again. Bang! When I removed the canvas on top, the once enchanting garden was now forever sealed beneath the black. However, what shocked me the most was the canvas on top, which now looked like an apparition of that heavenly garden. At the end of 1986, I moved to Japan. My cosmology, which till then was a simple one, developed by stargazing and studying feng shui in Quanzhou, suddenly expanded to include the latest developments in modern astrophysics. As a young artist from China, my grueling experiences with getting visas around the world inspired me to explode a chain of big footprints that traversed the Earth. The footprints would evoke extraterrestrials racing across several kilometers, bam bam bam, in only a few strides, ignoring artificial borders and disappearing into the distance. After decades of attempts around the world, this concept was finally realized as 29 footprint fireworks at the opening ceremony of the 2008 Beijing Olympics. The big footprints walked across the 15-kilometer central axis of Beijing, like an invisible giant in the sky. Witnessed by 1. 5... Witnessed by 1. 5 billion people in person and through live broadcasts, this work symbolized the era ’ s idealistic delusion of globalization. In the early ’ 90s, I conceived a work titled Sky ladder, a ladder made of fireworks that would connect heaven and Earth. I made many failed attempts to realize the idea over 21 years. The difficulty of the project lay in its technical requirements. We needed a helium balloon of over 6, 000 cubic meters in order to raise a ladder as high as the World Trade Center. Once up, the balloon could easily be **blown** away. And because it would carry lots of dangerous materials, we had to acquire numerous permits for land, sea and air. In my hometown, it ’ s said that 500 meters is the height of the clouds, so the ladder symbolized a useful dream of reaching for the stars and touching the clouds. I ’ ve created so much art around the world, but my grandma has never seen any of them in person, so I was determined to do something awesome for her to see. One! Fire! Cai Guo-Qiang : One morning in 2015, at the crack of dawn, a golden ladder rose into the sky. It was a birthday present for my grandmother, who turned 100 that year. She passed away one month later. In 1995, I moved from Japan to New York with my wife and daughter. After I came to New York, my work became more site-specific, addressing more socio-political themes and reflecting the changes I ’ ve developed from living in the West. This transition also allowed me to better thrive in different cultures around the world. Some have asked why I never deal with the **subject** of sex. I would often say,"Isn ' t explosion sexy in itself?"Ten years ago, I was invited to create an artwork in Paris. I decided to invite 50 couples from around the world to a sightseeing boat on the Seine, where they would first enjoy a 12-minute firework display that simulates the process of lovemaking. Why 12 minutes? Because that seems to be the average duration of French lovemaking. According to the internet. Excited by the passionate climax of the fireworks, the couples then entered individual tents to do whatever they wanted. When satisfied, they could press a button and trigger fireworks from a small boat nearby. I had prepared 300 shots of fireworks. However, the couples didn ' t use them all. In the end, the fireworks spelled out the words :"Sorry, gotta go."Nighttime fireworks are visible because of light and are more focused on the explosions themselves. Daytime fireworks rely on smoke. They are like a painter ' s brush moving across the sunlit sky in real time. In Shanghai, I realized the daytime fireworks"Elegy,"lamenting the severe environmental problems China faces. On the day, clouds loomed low over the Huangpu River, and the firework smoke lingered in the air long afterwards, like an ink painting with its gentle sorrow. For my solo exhibition at Uffizi Galleries, I created fireworks in the shapes of flowers and plants from Renaissance paintings. People from across the city could see the fireworks as they launched from the Michelangelo Square, reigniting the spirit of the Renaissance. Last year I realized the project"When the Sky Blooms with Sakura"in Fukushima, which suffered the earthquake and tsunami 12 years ago. On the June day, we had a rare collaboration of the wind and the waves to realize these daytime fireworks like a symphony of reverence for nature. I ' ve realized over 600 solo exhibitions and projects worldwide, often facing numerous challenges such as weather conditions, legal regulations and social-political hurdles. But such is the nature of my art. Behind the momentary magic lies countless unknown factors. Gunpowder and I have been travel companions on a 40-year-long, fantastical journey. Yet, I have never grown tired of it, thanks to its uncertainty and uncontrollability. And it ' s the same fascination with the unforeseeable that led to my research in artificial intelligence that began in 2017. This led to the launch of my AI Cai, my custom AI model. AI Cai deep learns from my artworks, archives and areas of interest. It also mimics contemporary and historical figures I admire developing distinct personas that can debate with each other, forming an independent and free community. AI Cai is my artwork, but it ' s also a partner for dialogue and collaboration. In the future, it may even create art by itself. Recently, we also enabled AI Cai to sprinkle and ignite gunpowder on canvases. Nowadays, if I burn through a canvas, it ' s usually an intentional loss of control for effect. But when AI Cai burns something, it ' s a genuine accident. Perhaps AI Cai is that rash, clumsy boy Cai. People often assume that I like fireworks, but what I really like are explosions. I like their energy and magic. Over the years, the goal of my gunpowder creations has never been political, but their results do carry political significance. At a recent Nobel Prize event, I said,"Using explosions to create beauty rather than warfare and violence provides a sliver of hope for our shared human future."Gunpowder helped me set my timid personality and liberate myself in a repressive society. Its uncertainty makes me both uneasy and exhilarated. That ' s similar to my interactions with AI. The unknown and uncontrollable aspects of AI are indeed unsettling. But today, as contemporary art seems weak and conservative, I hope that AI can help me unleash creativity, transcending the current dimensions of human cognition. Can AI reveal heavenly secrets and open a door to interspecies civilizations for us? If the disruptive nature of gunpowder can bring hope to people through the beauty of explosions, then can the unsettling power of AI do the same, bringing hope to mankind ' s future by expanding the unknown world? I ’ m always at the beginning of the next great journey. Thank you everyone, and thank you AI.

I love being a cartoonist because I can travel anywhere. I can visit historical artifacts and make improvements. I can voyage to mythical lands and solve problems. I can bring objects to life, and I can make those objects think and talk. And I can send those objects wherever I want them to go. I became a cartoonist to travel through space and time, and I became a graphic memoirist because the place I wanted to go was the past. I come from a legacy of dramatic stories and lost characters. My grandmother, Lily, on my mother ’ s side, was born in Warsaw, Poland, the oldest of four sisters. She was 13 in 1939, when Nazi bombs razed her home and her family was sealed to starve inside the Warsaw Ghetto. Eventually, her father encouraged her to slip through a hole in the wall, and she survived the Holocaust on her own, hiding her Jewish identity. This is the **subject** of my first book. I wondered : What did my grandmother ’ s lost home and lost family look like? Her parents, her grandmother and her sisters, they are all gone without a trace. My father ’ s parents were luckier. They were also Jewish, and they both fled Austria at the start of the war. My father ’ s father, Fred, was a pianist and conductor. In 1937, the year before the Nazis marched into Austria, he was 26, and he conducted a magnificent choral concert at a music hall in Vienna. A wealthy American woman in the audience was so impressed with his performance that she later agreed to sponsor his visa to the US. So music saved his life. But three decades later, Fred died of heart disease. I never met him. While alive, Fred meticulously preserved the documents of his life, a response to the threat of erasure he fled in Europe. And for decades after his father ’ s death, my father continued this preservation project. This is the **subject** of my second book. You might know my father, Ray Kurzweil, as an inventor and futurist. You should also know that he ’ s a person with an extraordinary sense of humor. [”Can I call you an Uber?””Sure.”] [”You ’ re an Uber.”] Good one dad. And although he ’ s dedicated his mind to the future, his life is full of the past. My father has worked for decades on natural language processing. And several years ago, he realized that if we married AI with my grandfather ’ s writing, we could build a chatbot that writes in my grandfather ’ s voice. Back in 2018, this seemed very sci-fi. But rather than ushering in our demise, this project helped me realize that AI could actually help us ward off annihilation by animating the legacies of our families and our cultures. I wanted to talk to my grandfather because he, like me, was an artist. I wondered : Could I get to know him? Could I even come to love him, even though our lifespans didn ’ t overlap? So I got involved. This chatbot needed language from my grandfather, as much as could be found. So I, with some assistance, set about finding his words and transcribing them. This was a selective chatbot, meaning it responded to questions with answers from the pool of sentences that Fred actually wrote at some point in his life. The more examples of Fred ’ s writing we could find, the more dynamic the experience of chatting with the bot would feel. Sometimes this transcription task proved challenging. But the more time I spent with the symbols of my grandfather ’ s life, the more easily I could decode them. Finally, after much anticipation, I sat down to chat with this new intelligence : an algorithm commanding over 600 typed pages of letters, lectures, notes, essays and other written documents from the grandfather I never met. When I asked about Fred ’ s dreams, he told me about the challenge of keeping his new orchestra afloat. When I asked about Fred ’ s anxieties, I learned about the stress of being a new father while working so hard. When I asked about the meaning of life, Fred wrote about the joy of working with other musicians in pursuit of beauty, and he wrote about the highest aims of art. I asked again about the meaning of life because isn ’ t that really the best question for a robot? And Fred ’ s second answer was much simpler, but even better. [”Love.”] Some of these answers felt familiar to me. I remembered seeing them in the archive, but the words gained impact through surprise and the role-play of conversation. I could identify patterns in my grandfather ’ s life and patterns across generations, because I was also an artist trying to make it in New York City. And I also believe the meaning of life is art and connection and love. I had wondered if this project would feel like a resurrection. But rather than bringing my grandfather from the past into the present, it felt like I was the one time traveling, visiting him for a moment at different points in his life. And this kind of time travel didn ’ t feel like sci-fi. It felt like the kind of imaginative travel I do when I ’ m cartooning. When I ’ m cartooning, I ’ m always thinking about how I could possibly represent a person fully. And the answer is : I can ’ t. Similarly, I know how many aspects of my grandfather can ’ t be captured by digital text alone. There ’ s all those quivers in his handwriting and what they denote about the sensations in his body. There ’ s his body, how it moved and how it felt. There ’ s his music and all the ineffable aspects of his performance. And of course, there ’ s everything he thought but didn ’ t write down. What would we have to do to be able to capture all of this? I may fail as an artist to fully represent a person ’ s constantly evolving complexity, but I can ask what features of a person are essential to who they are across a lifetime. The puzzle of personal identity is one of our oldest philosophical questions, so I ’ m not here to solve that one for you, I ’ m just a cartoonist after all. [Robot cat passes Turing test] I do believe that we, maybe not cats, but we are more than our bodies. That the projects and impressions we leave behind are a part of our essential selves. And I think AI has a special role to play in the mission of memory. I did not come to see the chatbot of my grandfather as replacing my grandfather. I came to see it as one way to interact with his legacy. As somebody who has spent their whole life trying to document people, I can assure you that people are much bigger and weirder than any one depiction or any one moment in time can possibly evoke. And I can also assure you that people don ’ t just disappear when they die. AI swirls our conception of time and space. It can remix and extend our identities. Our own digital archives are growing beyond belief, and we need a framework for understanding technologies of representation. So I offer you mine. Just like the comics I ’ ve drawn, about the characters in my life, these technologies are animated portraits. They are one part of our true immortal selves. Seen this way, AI, like cartooning and all good artistic endeavors, could help us appreciate the vastness of humanity – if we let it. Thank you.

I ’ m a couples therapist and an absolute romance fiend. I ’ m talking about everything from”The Notebook”to”Twilight”to a show some of you may remember called”The Flavor of Love.”It ’ s a reality competition show where the prize was the love of Flavor Flav. I think about relationships a lot, and something that comes up a lot in my work is this belief that relationships are hard. And we believe that due to one primary reason : our metric of success is based on what we ’ ve seen everyone else do. Imagine how you would honestly feel if you heard the following about another couple. OK, I said honestly. OK?”I heard they don ’ t even sleep in the same bed anymore.””They claim they never want to get married.””I don ’ t think they ever plan to live together.”Would you think to yourself”it sounds like they have some serious issues?”If we ’ re honest, a lot of us would. And it ’ s not because we ’ re not open-minded, but we ’ ve been taught that these are warning signs for a relationship in trouble. And while they can be for a lot of people, that is not always the case. Relationship experts have found that one of the primary obstacles that couples face are their own expectations. When we compare ourselves to societal norms, we can develop a sense of resentment toward our partner, as well as a sense of shame for how we ourselves are coming up short. Now, before we really get into this, I have to say that some of us have to reckon with the fact that we may be with the wrong person. And that will be clear if your deepest desire is that your partner change fundamental aspects of who they are. You really want them to be a different person. But if you ’ re confident that you ’ re with the right person and you just still feel frustrated and dissatisfied, we may find that rejecting everything we ’ ve known about good relationships is the key to actually having one. I work with couples every day, and I help them through relational crises. I remember I was working with an engaged couple for about a year, and when they first came to me, they said,”We ’ re 95 percent good. We just want to address the five percent.”And I hear something to this effect often when I first meet a couple. It turns out that five percent was more like 75 percent and increasing. They were struggling to make a blended family work. One partner had kids, the other one had never lived with kids before, and they moved in together after only knowing each other for three months. One time I went on vacation, and by the time I got back, they ’ d called off their wedding. But why? Their love was, honestly, it was evident, and they were not cruel to each other. Their issue was figuring out how to continue building their romantic relationship while also figuring out how to raise teenagers, who, to be honest, already had two very involved parents, they weren ’ t really in need of a third. After a particularly big **blow** up over chores and responsibilities, I finally asked a dangerous question. I said,”Do you think that living together has hurt or helped your relationship more?”We took a few weeks to explore that question, and they decided to test it out. They got a short-term lease on an apartment nearby for the partner who didn ’ t have kids. And we were really strategic. We made a contract. Let ’ s talk about dates. Let ’ s talk about expectations while you guys are living separately. And by the time they came back to me, I ’ d never seen them communicate so well. They said that they were looking forward to every weekend that they got to spend together. It felt like a vacation because they would spend the entire week planning their time together and savoring every moment they had together. They also found that their individual relationships with the kids drastically improved, without the pressure of trying to transition them into an entirely new household dynamic, especially when they only had a couple years left in the house. So at this point, some of you may be asking yourselves,”What kind of couples therapist recommends that couples live apart?”That ’ s a fair question. And to be honest, for a majority of my clients, this solution would not work. And that is the point. When we ’ re thinking about our relationships, we have to avoid focusing on what is normal. There ’ s no such thing as normal when we ’ re talking about two unique individuals with their own backgrounds and their own values. For this particular couple, they had to figure out a way to separate their romantic relationship from what really boiled down to roommate issues. And they had a circumstance that supported the option to live apart. One conflict that comes up a lot in my work is the difference in values between arriving on time and arriving looking and feeling your best. Neither one is wrong. But I had a great model for this with my parents. When I was growing up, we drove absolutely everywhere separately. Everywhere. You know, if you ’ re going to be a little bit late, you would ride with my mom and if you ’ re arriving on time, you ’ d go with my dad. They had two minivans for only two kids. OK. We didn ’ t go anywhere together. And one time when I was about 12 years old, one of my closest friends finally worked up the courage to ask me about it. And I could tell she was so nervous. Like I was about to reveal to her that my parents were secretly separated, and she just figured it out. You know, now that I think about it, I bet her mom put her up to this. What ’ s interesting is that her parents did go on to get divorced, and my parents stayed together for 23 years before my mom passed away. Now do I think that ’ s due to them commuting separately? Of course not. But I think it shows us two things. First, it shows us that any deviation from the norm can be met with curiosity and even judgment. It also shows us that sometimes, when we decide to do things a little differently, we can avoid the difference between having a really challenging day as a couple or a smooth day, by simply accepting our differences not as a couple, but as individuals. Instead of trying to change our partners, what if we instead embraced their differences, our difference in values, and release the pressure of doing what everyone else is doing? It ’ s OK to be a stay-at-home dad. It ’ s OK if you prefer to travel without each other. It ’ s OK if you need to have your own bedrooms so you can maintain personal space and be sane for each other. It ’ s OK if you want to break tradition and create a new last name. It ’ s OK if you want to share your love on social media, but it ’ s also OK if you want to protect it from public opinion. It ’ s OK if you ’ re in a season of life where you both just cannot prioritize sex. It ’ s OK if people are confused about your relationship. It was never theirs to understand in the first place. If we continue to accept the narrative that relationships are hard, then we ’ ll continue to do nothing about it. If our relationships feel hard, I encourage us to reflect on what is hard about it. Is it really the relationship or is it external factors like our own personal trauma histories or work stress? If it really is your relationship, let ’ s really think about what you and your partner are willing to do differently to enjoy it again. I want us to reject everything we ’ ve ever known about relationships, and challenge ourselves to create a relationship that not only defies expectations but honors the peculiarities that make us, us. Thank you.

I have a tendency to assume the worst, and once in a while, this habit plays tricks on me. For example, if I feel unexpected pain in my body that I have not experienced before and that I cannot attribute, then all of a sudden, my mind might turn a tense back into heart disease or calf muscle pain into deep vein thrombosis. But so far, I haven ’ t been diagnosed with any deadly or incurable disease. Sometimes things just hurt for no clear reason. But not everyone is as lucky as me. Every year, more than 50 million people die worldwide. Especially in high-income economies like ours, a large fraction of deaths is caused by slowly progressing diseases : heart disease, chronic lung disease, cancer, Alzheimer ’ s, diabetes, just to name a few. Now, humanity has made tremendous progress in diagnosing and treating many of these. But we are at a stage where further advancement in health cannot be achieved only by developing new treatments. And this becomes evident when we look at one aspect that many of these diseases have in common : the probability for successful treatment strongly depends on when treatment is started. But a disease is typically only detected once symptoms occur. The problem here is that, in fact, many diseases can remain asymptomatic, hence undetected, for a long period of time. Because of this, there is a persisting need for new ways of detecting disease at early stage, way before any symptoms occur. In health care, this is called screening. And as defined by the World Health Organization, screening is"the presumptive identification of unrecognized disease in an apparently healthy person, by means of tests... that can be applied rapidly and easily..."That ' s a long definition, so let me repeat it : identification of unrecognized disease in an apparently healthy person by means of tests that can be applied both rapidly and easily. And I want to put special emphasis on the words"rapidly"and"easily"because many of the existing screening methods are exactly the opposite. And those of you who have undergone colonoscopy as part of a screening program for colorectal cancer will know what I mean. Obviously, there ' s a variety of medical tools available to perform screening tests. This ranges from imaging techniques such as radiography or magnetic resonance imaging to the analysis of blood or tissue. We have all had such tests. But there ' s one medium that for long has been overlooked : a medium that is easily accessible, basically nondepletable, and it holds tremendous promise for medical analysis. And that is our breath. Human breath is essentially composed of five components : nitrogen, oxygen, carbon dioxide, water and argon. But besides these five, there are hundreds of other components that are present in very low quantity. These are called volatile organic compounds, and we release hundreds, even thousands of them every time we exhale. The analysis of these volatile organic compounds in our breath is called breath analysis. In fact, I believe that many of you have already experienced breath analysis. Imagine : you ' re driving home late at night, when suddenly, there ' s a friendly police officer who asks you kindly but firmly to pull over and **blow** into a device like this one. This is an alcohol breath tester that is used to measure the ethanol concentration in your breath and determine whether driving in your condition is a clever idea. Now, I ' d say my driving was pretty good, but let me check. 0. 0, so nothing to worry about, all fine. Now imagine a device like this one, that does not only measure alcohol levels in your breath, but that detects diseases like the ones I ' ve shown you and potentially many more. The concept of correlating the smell of a person ' s breath with certain medical conditions, in fact, dates back to Ancient Greece. But only recently, research efforts on breath analysis have skyrocketed, and what once was a dream is now becoming reality. And let me pull up this list again that I showed you earlier. For the majority of diseases listed here, there ' s substantial scientific evidence suggesting that the disease could be detected by breath analysis. But how does it work, exactly? The essential part is a sensor device that detects the volatile organic compounds in our breath. Simply put : when exposed to a breath sample, the sensor outputs a complex signature that results from the mixture of volatile organic compounds that we exhale. Now, this signature represents a fingerprint of your metabolism, your microbiome and the biochemical processes that occur in your body. If you have a disease, your organism will change, and so will the composition of your exhaled breath. And then the only thing that is left to do is to correlate a certain signature with the presence or absence of certain medical conditions. The technology promises several undeniable benefits. Firstly, the sensor can be miniaturized and integrated into small, handheld devices like this alcohol breath tester. This would allow the test to be used in many different settings and even at home, so that a visit at the doctor ' s office is not needed each time a test shall be performed. Secondly, breath analysis is noninvasive and can be as simple as **blowing** into an alcohol breath tester. Such simplicity and ease of use would reduce patient burden and provide an incentive for broad adoption of the technology. And thirdly, the technology is so flexible that the same device could be used to detect a broad range of medical conditions. Breath analysis could be used to screen for multiple diseases at the same time. Nowadays, each disease typically requires a different medical tool to perform a screening test. But this means you can only find what you ' re looking for. With all of these features, breath analysis is predestined to deliver what many traditional screening tests are lacking. And most importantly, all of these features should eventually provide us with a platform for medical analysis that can operate at attractively low cost per test. On the contrary, existing medical tools often lead to rather high cost per test. Then, in order to keep costs down, the number of tests needs to be restricted, and this means that the tests can only be performed on a narrow part of the population, for example, the high-risk population ; and that the number of tests per person needs to be kept at a minimum. But wouldn ' t it actually be beneficial if the test was performed on a larger group of people, and more often and over a longer period of time for each individual? Especially the latter would give access to something very valuable that is called longitudinal data. Longitudinal data is a data set that tracks the same patient over the course of many months or years. Nowadays, medical decisions are often based on a limited data set, where only a glimpse of a patient ' s medical history is available for decision-making. In such a case, abnormalities are typically detected by comparing a patient ' s health profile to the average health profile of a reference population. Longitudinal data would open up a new dimension and allow abnormalities to be detected based on a patient ' s own medical history. This will pave the way for personalized treatment. Sounds pretty great, right? Now you will certainly have a question that is something like,"If the technology is as great as he says, then why aren ' t we using it today?"And the only answer I can give you is : not everything is as easy as it sounds. There are technical challenges, for example. There ' s the need for extremely reliable sensors that can detect mixtures of volatile organic compounds with sufficient reproducibility. And another technical challenge is this : How do you sample a person ' s breath in a very defined manner so that the sampling process itself does not alter the result of the analysis? And there ' s the need for data. Breath analysis needs to be validated in clinical trials, and enough data needs to be collected so that individual conditions can be measured against baselines. Breath analysis can only succeed if a large enough data set can be generated and made available for broad use. If breath analysis holds up to its promises, this is a technology that could truly aid us to transform our health care system — transform it from a reactive system where treatment is triggered by symptoms of disease to a proactive system, where disease detection, diagnosis and treatment can happen at early stage, way before any symptoms occur. Now this brings me to my last point, and it ' s a fundamental one. What exactly is a disease? Imagine that breath analysis can be commercialized as I describe it, and early detection becomes routine. A problem that remains is, in fact, a problem that any screening activity has to face because, for many diseases, it is often impossible to predict with sufficient certainty whether the disease would ever cause any symptoms or put a person ' s life at risk. This is called overdiagnosis, and it leads to a dilemma. If a disease is identified, you could decide not to treat it because there ' s a certain probability that you would never suffer from it. But how much would you suffer just from knowing that you have a potentially deadly disease? And wouldn ' t you actually regret that the disease was detected in the first place? Your second option is to undergo early treatment with the hope for curing it. But often, this would not come without side effects. To be precise : the bigger problem is not overdiagnosis, it ' s overtreatment, because not every disease has to be treated immediately just because a treatment is available. The increasing adoption of routine screening will raise the question

: What do we call a disease that can rationalize treatment, and what is just an abnormality that should not be a source of concern? My hopes are that routine screening using breath analysis can provide enough data and insight so that at some point, we ’ ll be able to break this dilemma and predict with sufficient certainty whether and when to treat at early stage. Our breath and the mixture of volatile organic compounds that we exhale hold tremendous amounts of information on our physiological condition. With what we know today, we have only scratched the surface. As we collect more and more data and breath profiles across the population, including all varieties of gender, age, origin and lifestyle, the power of breath analysis should increase. And eventually, breath analysis should provide us with a powerful tool not only to proactively detect specific diseases but to predict and ultimately prevent them. And this should be enough motivation to embrace the opportunities and challenges that breath analysis can provide, even for people that are not part-time hypochondriacs like me. Thank you.

Do you hear that? Do you know what that is? Silence. The sound of silence. Simon and Garfunkel wrote a song about it. But silence is a pretty rare commodity these days, and we ’ re all paying a price for it in terms of our health â a surprisingly big price, as it turns out. Luckily, there are things we can do right now, both individually and as a society, to better protect our health and give us more of the benefits of the sounds of silence. I assume that most of you know that too much noise is bad for your hearing. Whenever you leave a concert or a bar and you have that ringing in your ears, you can be certain that you have done some damage to your hearing, likely permanent. And that ’ s very important. However, noise affects our health in many different ways beyond hearing. They ’ re less well-known, but they ’ re just as dangerous as the auditory effects. So what do we mean when we talk about noise? Well, noise is defined as unwanted sound, and as such, both has a physical component, the sound, and a psychological component, the circumstances that make the sound unwanted. A very good example is a rock concert. A person attending the rock concert, being exposed to 100 decibels, does not think of the music as noise. This person likes the band, and even paid a hundred dollars for the ticket, so no matter how loud the music, this person doesn ’ t think of it as noise. In contrast, think of a person living three blocks away from the concert hall. That person is trying to read a book, but cannot concentrate because of the music. And although the sound pressure levels are much lower in this situation, this person still thinks of the music as noise, and it may trigger reactions that can, in the long run, have health consequences. So why are quiet spaces so important? Because noise affects our health in so many ways beyond hearing. However, it ’ s becoming increasingly difficult to find quiet spaces in times of constantly increasing traffic, growing urbanization, construction sites, air-conditioning units, leaf blowers, lawnmowers, outdoor concerts and bars, personal music players, and your neighbors partying until 3am. Whew! In 2011, the World Health Organization estimated that 1. 6 million healthy life years are lost every year due to exposure to environmental noise in the Western European member states alone. One important effect of noise is that it disturbs communication. You may have to raise your voice to be understood. In extreme cases, you may even have to pause the conversation. It ’ s also more likely to be misunderstood in a noisy environment. These are all likely reasons why studies have found that children who attend schools in noisy areas are more likely to lag behind their peers in academic performance. Another very important health effect of noise is the increased risk for cardiovascular disease in those who are exposed to relevant noise levels for prolonged periods of time. Noise is stress, especially if we have little or no control over it. Our body excretes stress hormones like adrenaline and cortisol that lead to changes in the composition of our blood and in the structure of our blood vessels, which have been shown to be stiffer after a single night of noise exposure. Epidemiological studies show associations between the noise exposure and an increased risk for high blood pressure, heart attacks and stroke, and although the overall risk increases are relatively small, this still constitutes a major public health problem because noise is so ubiquitous, and so many people are exposed to relevant noise levels. A recent study found that US society could save 3. 9 billion dollars each year by lowering environmental noise exposure by five decibels, just by saving costs for treating cardiovascular disease. There are other diseases like cancer, diabetes and obesity that have been linked to noise exposure, but we do not have enough evidence yet to, in fact, conclude that these diseases are caused by the noise. Yet another important effect of noise is sleep disturbance. Sleep is a very active mechanism that recuperates us and prepares us for the next wake period. A quiet bedroom is a cornerstone of what sleep researchers call"a good sleep hygiene."And our auditory system has a watchman function. It ' s constantly monitoring our environment for threats, even while we ' re sleeping. So noise in the bedroom can cause a delay in the time it takes us to fall asleep, it can wake us up during the night, and it can prevent our blood pressure from going down during the night. We have the hypothesis that if these noise-induced sleep disturbances continue for months and years, then an increased risk for cardiovascular disease is likely the consequence. However, we are often not aware of these noise-induced sleep disturbances, because we are unconscious while we ' re sleeping. In the past, we ' ve done studies on the effects of traffic noise on sleep, and research **subjects** would often wake up in the morning and say,"Ah, I had a wonderful night, I fell asleep right away, never really woke up."When we would go back to the physiological signals we had recorded during the night, we would often see numerous awakenings and a severely fragmented sleep structure. These awakenings were too brief for the **subjects** to regain consciousness and to remember them during the next morning, but they may nevertheless have a profound impact on how restful our sleep is. So when is loud too loud? A good sign of too loud is once you start changing your behavior. You may have to raise your voice to be understood, or you increase the volume of your TV. You ' re avoiding outside areas, or you ' re closing your window. You ' re moving your bedroom to the basement of the house, or you even have sound insulation installed. Many people will move away to less noisy areas, but obviously not everybody can afford that. So what can we do right now to improve our sound environment and to better protect our health? Well, first of all, if something ' s too loud, speak up. For example, many owners of movie theaters seem to think that only people hard of hearing are still going to the movies. If you complain about the noise and nothing happens, demand a refund and leave. That ' s the language that managers typically do understand. Also, talk to your children about the health effects of noise and that listening to loud music today will have consequences when they ' re older. You can also move your bedroom to the quiet side of the house, where your own building shields you from road traffic noise. If you ' re looking to rent or buy a new place, make low noise a priority. Visit the property during different times of the day and talk to the neighbors about noise. You can wear noise-canceling headphones when you ' re traveling or if your office has high background noise levels. In general, seek out quiet spaces, especially on the weekend or when you ’ re on vacation. Allow your system to wind down. I, very appropriately for this talk, attended a noise conference in Japan four years ago. When I returned to the United States and entered the airport, a wall of sound hit me. This tells you that we don ’ t realize anymore the constant degree of noise pollution we ’ re exposed to and how much we could profit from more quiet spaces. What else can we do about noise? Well, very much like a carbon footprint, we all have a noise footprint, and there are things we can do to make that noise footprint smaller. For example, don ’ t start mowing your lawn at 7am on a Saturday morning. Your neighbors will thank you. Or use a rake instead of a leaf blower. In general, noise reduction at the source makes the most sense, so whenever you ’ re looking to buy a new car, air-conditioning unit, blender, you name it, make low noise a priority. Many manufacturers will list the noise levels their devices generate, and some even advertise with them. Use that information. Many people think that stronger noise regulation and enforcement are good ideas, even obvious solutions, perhaps, but it ’ s not as easy as you may think, because many of the activities that generate noise also generate revenue. Think about an airport and all the business that is associated with it. Our research tells politicians at what noise level they can expect a certain health effect, and that helps inform better noise policy. Robert Koch supposedly once said,”One day, mankind will fight noise as relentlessly as cholera and the pest.”I think we ’ re there, and I hope that we will win this fight, and when we do, we can all have a nice, quiet celebration. Thank you.

Text Sample 763: NEG Dim 5 – 2018 – Score -1.00 – 2018/t000041.txt

I want to share with you a moment in my life when the hurt and wounds of racism were both deadly and paralyzing for me. And I think what I ’ ve learned can be a source of healing for all of us. When I was 17 years old, I was a college student at Tuskegee University, and I was a worker in the Southern freedom movement, which we call the Civil Rights Movement. During this time, I met another young 26-year-old, white seminary and college student named Jonathan Daniels, from Cambridge, Massachusetts. He and I were both part of a generation of idealistic young people, whose life has been ignited by the freedom fire that ordinary black people were spreading around the nation and throughout the South. We had come to Lowndes County to work in the movement. And it was a nonviolent movement to redeem the souls of America. We believe that everyone, both black and white, people in the South, could find a redemptive pathway out of the stranglehold of racism that had gripped them for more than 400 years. And on a hot, summer day in August, Jonathan and I joined a demonstration of local young black people, who were protesting the exploitation [of] black sharecroppers by rich land holders who cheated them out of their money. We decided to demonstrate alongside them. And on the morning that we showed up for the demonstration, we were met with a mob of howling white men with baseball bats, shotguns and any weapon that you could imagine. And they were threatening to kill us. And the sheriff, seeing the danger that we faced, arrested us and put us on a garbage truck and took us to the local jail, where we were put in cells with the most inhumane conditions you can imagine. And we were threatened by the jailers with drinking water that came from toilets. We were finally released on the sixth day, without any knowledge, without any forewarning. Just out of the clear blue sky, we were made to leave. And we knew that this was a dangerous sign, because Goodman, Schwerner and Chaney had also been forced to leave jail and were murdered because no one knew what had happened to them. And so, despite our fervent resistance, the sheriff made us leave the jail, and of course, nobody was waiting for us. It was hot, one of those Southern days where you could literally feel the pavement — the vapor seeping out of the pavement. And the group of about 14 of us selected Jonathan Daniels, Father Morrisroe, who had recently come to the county, Joyce Bailey, a local 17-year-old girl and I to go and get the drinks. When we got to the door, a white man was standing in the doorway with a shotgun, and he said,"Bitch, I ' ll **blow** your brains out!"And before I could even react, before I could even process what was going on, Jonathan intentionally pulled my blouse, and I fell back, thinking that I was dead. And in that instant, when I looked up, Jonathan Daniels was standing in the line of fire, and he took the blast, and he saved my life. I was so traumatized and paralyzed by that event, where Tom Coleman deliberately, with malicious intent, killed my beloved friend and colleague, Jonathan Myrick Daniels. On that day, which was one of the most important days in my life, I saw both love and hate coming from two very different white men that represented the best and the worst of white America. So deep was my hurt at seeing Tom Coleman murder Jonathan before my eyes, that I became a silent person, and I did not speak for six months. I finally learned to touch that hurt in me as I became older and began to talk about the Southern freedom movement, and began to connect my stories with the stories of my other colleagues and freedom fighters, who, like me, had faced deadly trauma of racism, and who had lost friends along the way, and who themselves have been beaten and thrown in jail. It is 50 years later. Many people were beaten and thrown in jail. Others were murdered like Jonathan Daniels. And yet, we are still, as a nation, mired down in the quicksand of racism. And everywhere I go around the nation, I see and hear the hurt. And I ask people everywhere,"Tell me, where does it hurt?"Do you see and feel the hurt that I see and feel? I feel and see the hurt in black and brown people who every day feel the vicious volley of racism and every day have their civil and human rights stripped away. And the people who do this use stereotypes and myths to justify doing it. Everywhere I go, I see and hear women who speak out against — who speak out against men who invade our bodies. These same men who then turn around — the same men who promote racism and then turn around and steal our labor and pay us unequal wages. I hear and feel the hurt of white men at the betrayal by the same powerful white men who tell them that their skin color is their ticket to a good life and power, only to discover, as the circle of whiteness narrows, that their tickets have expired and no longer carry first- class status. Now that we ' ve touched the hurt, we must ask ourselves,"Where does it hurt and what is the source of the hurt?"I propose that we must look deeply into the culture of whiteness. That is a river that drowns out all of our identities and drowns us in false uniformity to protect the status quo. Notice, everybody, I said culture of whiteness, and not white people. Because in my estimation, the problem is not white people. Instead, it is the culture of whiteness. And by culture of whiteness, I mean a systemic and organized set of beliefs, values, canonized knowledge and even religion, to maintain a hierarchical, over-and-against power structure based on skin color, against people of color. It is a culture where white people are seen as necessary and friendly insiders, while people of color, especially black people, are seen as dangerous and threatening outsiders, who pose a clear and present danger to the safety and the efficacy of the culture of whiteness. Listen to me and see if you can imagine the culture of whiteness as a dehumanizing process that melts away all of our multiple and interlocking identities, such as race, class, gender and sexualities, so that... so that unity is maintained for power. I believe, because I know and believe that the culture of whiteness is a social construct. Each of us, from birth to death, are socialized in this culture. And it marks people of color also. And it makes people of color, like white people, vote against our interests. Some of you might ask — and my students always tell me I give hard assignments — some of you might ask, and rightfully so,"How do we fix this? It seems so all-powerful and overwhelming."I believe that we must fix it, because we cannot humanize our future if we continue to be complicit with the culture of whiteness. Each of us must connect with our authentic selves, with our authentic ethnic selves. And we must connect with the other aspects of our identities. And we must move out of the constructs of whiteness, brownness and blackness to become who we are at our fullest. How do we do this? I believe that we do this through our collective narratives. And our collective narratives must contain our individual stories, the arts, spiritual reflections, literature, and yes, even drumming. It must be a collective telling, because individual stories just create a paradigm where we are pitting one story against another story. These different models that I have talked about tonight I think are essential to providing us a pathway out of the quagmire of racism. And I want to talk about another very important model. And that is redemption. I believe that movements for racial justice must be redemptive rather than punitive. And yes, I believe that we must provide the possibility of redemption for everyone. And we must be willing, despite some of the vitriolic language that might come from those very people who oppress us, I think that we must listen to them and try to figure out where do they hurt. We must do this, I believe, because our redemption is tied into their redemption, And we will not be free until we ’ ve all been redeemed from unredemptive anger. The challenge is not easy. And in a technological society, it grows even more complicated, because often we use technologies to perpetuate the very values of racism that we indulge in every day. We use technology to bully, to perpetuate hate speech and to degrade each other ’ s humanities. And so I believe that if we ’ re going to humanize the future, we must design ways to use technology not to degrade us, but to elevate us so that we can live into the fullest of our capacities. And I believe that technology must provide us larger vistas so that we might engage with each other and move beyond the segregated spaces that we live in, every day of our lives. I believe that we can achieve this if we set our minds and hopes on the prize. The question before us tonight is very serious. It is :"Do you want to be healed? Do you want to be healed?"Do you want to become whole and live into all of your identities? Or do you want to continue to cannibalize your multiple identities and privilege one identity over the other? Do you want to join a long line of generations of people who believed in the promise of America and had the faith to upbuild democracy? Do you want to live into the fullest of your potential? I certainly do. And I believe you do, too. Let me just say, quite seriously, I believe in you. And despite everything, I still believe in America. I hope that this offering that I ’ ve given to you tonight, that I ’ ve shared with you tonight, will provide redemptive pathways so that you might claim the fullest of your identity and become a major participant in humanizing not only the future for yourselves, but also for our democracy. Thank you.

María Teresa Kumar : Much has been made of the 2020 US election. Right now, just over a week later, pollsters are issuing mea culpas, Democrats are tentatively celebrating, Republicans are **blowing** their collective tops, lawyers are busier than ever, ballot-counters are still hard at it, and demographers are desperately trying to understand who voted, for whom, where and why. Much has been said of the Latino vote in this election, which is something I know a little bit about, having been working obsessively over it for the last 16 years. Latinos are the fastest-growing demographic, with the largest voter registration cap in America. A Latino youth turns 18 every 30 seconds. While the mode for whites in America is 58, the mode for Latinx is 11 years old. You heard that right. And it ’ s these new voters and the youth who are translating America for their immigrant families who are leading the charge for audacious change. An estimated 73 percent of Latinx youth voted for Biden. As members of the largest generation globally, these Latino youth mirror their peers, seeking intervention for climate equity, racial justice and gender parity. What we ’ re hearing right now in America and around the globe is a demand for a massive reset on how we will govern in the 21st century for a world that is livable, equitable and just. Too many young people are drowning in student debt here in America, their families have been ravaged by the pandemic, who have lost jobs, lives and housing, and still, in 2020, they showed up for an America to believe in. Many say that 1914, the eve of World War I, defined the 20th century in America. That meant FDR ’ s New Deal that doubled down on its citizens by nation-building, offering pathways to the middle class through public works, education and sponsoring artists and musicians, building roads to provide jobs and sponsoring science-driven blueprints that allowed a man almost 40 years later to look up at the Moon and say that he wanted to go there. And we did that with less technology than the smartphone feeding this talk. So my hope is that the 21st century will be remembered as starting February 2020, not because that was when COVID ravaged us and in doing so, exposed the real, deep socioeconomic and racial disparities that ail us, but because that was when Americans cast a ballot for the future that believes in addressing the climate crisis, that health care is a right, that racial inequities hinder us all. We have a window to meet the precedent set by the Greatest Generation and define our century as one that is equitable and sustained. I, for one, am excited to get to work. I hope you ’ ll join me to usher in this audacious change together. Bianca DeJesus : María Teresa, thank you so much for that. MTK : Thank you, Bianca. Thank you for this conversation. BD : It is an honor. So, some commentators seem to be confounded that in certain places, Republicans received meaningful numbers of Latinx votes. Of course, it ’ s kind of silly to imagine that any demographic is a monolith, and within our community, there are so many differences. So what is the most productive way to think about heterogeneity within the Latinx, and really, within any community? MTK : If we don ’ t have public elected officials talking to our community, especially a new community, that is coming of age, that is relatively new to the democratic process, someone else will fill that vacuum. But I can share with you one of the things that we knew at Voto Latino was that young Latinos are navigating America for their families. Those youth turned up to protect their families, and it was not just in Arizona, but we also saw it Nevada, we also saw it in Pennsylvania, we saw it in Georgia and in North Carolina. And if you want to have an inclusive America, you have to fight for the vote, and that is basically what we need to see right now. But when we talk to young people, they voted disproportionately because they wanted climate change, they wanted access to health care, and they wanted to talk about the real racial inequities. When George Floyd sadly was murdered tragically, Latinos were side by side with the African American community because we recognize that that is something that truly plagues our American existence and that we have to address it if we want to move forward. BD : Absolutely. So do you see evidence that patterns change regarding first- and second- generation Latinx voters, and how does assimilation play out in terms of long-term voting trends? MTK : That ’ s interesting. So at Voto Latino, we don ’ t believe that there ’ s an assimilation. Right? What we want is an enhancement of American culture. Just like we celebrate St. Patrick ’ s Day, we want to be able to celebrate our roots and recognize the importance of that richness. We are in a very unique moment in America, where we have the most diverse population in the world, and one can argue that that is why some people don ’ t want us to succeed, because it ’ s our human capital, our vision, our ability to move forward and our diversity that prepares us for this century. And so when we talk about the differences in the Latino community, it ’ s also the differences in America that makes us so much richer with our imagination, with our ability to have entrepreneurship, and we have to use that and harness it for good. Some people will say race is what is our Achilles ’ heel. I actually believe that it ’ s the diversity of our races and our cultures that actually prepares us to battle the 21st century that it ’ s already interglobal. And the more that we harness that beauty of that diversity, that is what prepares us to compete and define the 21st century. BD : Wow. Yeah. I think that ’ s beautiful and totally agree. So how can we make first-time voters repeat voters who are engaged in future elections and not just for presidential elections but for local government as well? MTK : One of the things that we are seeing is that we ’ re seeing more young people run for office, and the more people start running for office, they realize that local government is what makes the most impact, at least here in America. So if you want, for example, some racial reform in your judicial system, vote for your district attorney, vote for your city councilman. If you think that there ’ s disparities in our education system, run for your school board. So that ’ s one. But the other thing to send very clearly to politicians is that when young – Americans voted their heart out. Young Latinos, youth in general, outvoted the people before them, but they ’ re voting on making a bet that their life will change, because the last four years could not have been rockier. And if the folks that are elected don ’ t meet the challenges of addressing climate change, addressing racial equity and gender parity and health care for all, they run the risk of not having those people vote again in 2024, and we need everybody on deck. And so our job as citizens is to ensure that we give the people that we just voted into office the courage to do the right thing, and that means to continue the rallies, continue calling our members of Congress, writing those letters and running for office ourselves. BD : So one question that speaks to the theme of this year ’ s TED Women,”Fearless,”I think it ’ s accurate to say that there ’ s been a lot of fear within the Latinx community over the last few years. How does that begin to change now? MTK : I will share with you, the day after Donald Trump was elected, all of our worst nightmares came to fruition. We saw family separation, one of the cruelest forms of our nation ’ s history came back to haunt us, because we ’ ve done it before, and everyone lived in fear. And the day after Joe Biden ’ s declaration on Saturday, I can tell that there was a collective – we ’ ve been holding our breath for so long, there was a collective release of not only that are we going to be OK but that fellow Americans stood up as allies and said,”Not one more.”And so that is what gives me hope, is that this was a collective America who outvoted their hearts out, because we see that in our celebration of our country ’ s future is believing in democracy, believing in a transition of power, believing that the most votes won and the electoral college was on our side, and more importantly, that these issues that Trump tried to ascend his presidency for the second time that were based on racism, that were based on the callousness of treating people and women differently, that they were not going to withstand. And so we do have to rebuild, but we have to rebuild not because of the four years of Donald Trump. If anything, I think he just exposed a lot of our fractures. We have to rebuild based on the last, I would say, 20 years. But the great thing is that the voters are here for it, and young people are here for it. I don ’ t have to change a young person ’ s mind that we are in a climate crisis. They get it. Cultural change is the hardest to do, but we have generations there with us, because they ’ re there and they get it. BD : That ’ s a relief. So, you yourself have been fearlessly outspoken. What drives you forward personally? MTK : I deeply – I don ’ t know if I ’ ve been fearless – I deeply believe in our country, and I deeply believe in us, and I deeply believe that when we are present, there ’ s nothing we can ’ t do. And when I say that, we... As a generation, we will not have an opportunity to reimagine what our country looks like, our systems of governments look like, and there will be people – you know, my children are six and eight, who will ask me 15 years from now,”What did you do?”And I want to say that I was alongside allies and the American people to rebuild better and to reimagine better. And we have always been a country of entrepreneurship, design and imagination, and what a perfect place to start when the majority of Americans are with us. BD : Absolutely. Well, thank you so, so much, María Teresa. MTK : Thank you.

Right now, there ’ s a lot happening with the Moon. China has announced plans for an inhabited South Pole station by the 2030s, and the United States has an official road map seeking an increasing number of people living and working in space. This will start with NASA ’ s Artemis program, an international program to send the first woman and the next man to the Moon this decade. Billionaires and the private sector are getting involved in unprecedented ways. There are over a hundred launch companies around the world and roughly a dozen private lunar transportation companies readying robotic missions to the lunar surface. We have reusable rockets for the first time in human history. This will enable the development of infrastructure and utilization of resources. While estimates vary, scientists think there could be up to a billion metric tons of water ice on the Moon. That ’ s greater than the size of Lake Erie, and enough water to support perhaps hundreds of thousands of people living and working on the Moon. So although official plans are always evolving, there ’ s real reason to think that we could see people starting to live and work on the Moon in the next decade. However, the Moon is roughly the size of the continent of Africa, and we ’ re starting to see that the key resources may be concentrated in small areas near the poles. This raises important questions about coordinating access to scarce resources. And there are also legitimate questions about going to the Moon : colonialism, cultural heritage and reproducing the systemic inequalities of today ’ s capitalism. And more to the point : Don ’ t we have enough big challenges here on Earth? Internet governance, pandemics, terrorism and, perhaps most importantly, climate crisis and biodiversity loss. In some senses, the idea of the Moon as just a destination embodies these problematic qualities. It conjures a frontier attitude of conquest, big rockets and expensive projects, competition and winning. But what ’ s most interesting about the Moon isn ’ t the billionaires with their rockets or the same old power struggle between states. In fact, it ’ s not the hardware at all. It ’ s the software. It ’ s the norms, customs and laws. It ’ s our social technologies. And it ’ s the opportunity to update our democratic institutions and the rule of law to respond to a new era of planetary-scale challenges. I ’ m going to tell you about how the Moon can be a canvas for solving some of our biggest challenges here on Earth. I ’ ve been kind of obsessed with this topic since I was a teenager. I ’ ve spent the last two decades working on international space policy, but also on small community projects with bottom-up governance design. When I was 17, I went to a UN conference on the peaceful uses of outer space in Vienna. Over two weeks, 160 young people from over 60 countries were crammed into a big hotel next to the UN building. We were invited to make recommendations to Member States about the role of space in humanity ' s future. After the conference, some of us were so inspired that we actually decided to keep living together. Now, living with 20 people might sound kind of crazy, but over the years, it enabled us to create a high-trust group that allowed us to experiment with these social technologies. We designed governance systems ranging from assigning a CEO to using a jury process. And as we grew into our careers, and we moved from DC think tanks to working for NASA to starting our own companies, these experiments enabled us to see how even small groups could be a petri dish for important societal questions such as representation, sustainability or opportunity. People often talk about the Moon as a petri dish or even a blank slate. But because of the legal agreements that govern the Moon, it actually has something very important in common with our global challenges here on Earth. They both involve issues that require us to think beyond territory and borders, meaning the Moon is actually more of a template than a blank slate. Signed in 1967, the Outer Space Treaty is the defining treaty governing activities in outer space, including the Moon. And it has two key ingredients that radically alter the basis on which laws can be constructed. The first is a requirement for free access to all areas of a celestial body. And the second is that the Moon and other celestial bodies are not **subject** to national appropriation. Now, this is crazy, because the entire earthly international system – the United Nations, the system of treaties and international agreements – is built on the idea of state sovereignty, on the appropriation of land and resources within borders and the autonomy to control free access within those borders. By doing away with both of these, we create the conditions for what are called the"commons."Based on the work of Nobel Prize-winning economist Elinor Ostrom, global commons are those resources that we all share that require us to work together to manage and protect important aspects of our survival and well-being, like climate or the oceans. Commons-based approaches offer a greenfield for institution design that ' s only beginning to be explored at the global and interplanetary level. What do property rights look like? And how do we manage resources when the traditional tools of external authority and private property don ' t apply? Though we don ' t have all the answers, climate, internet governance, authoritarianism – these are all deeply existential threats that we have failed to address with our current ways of thinking. Successful paths forward will require us to develop new tools. So how do we incorporate commons-based logic into our global and space institutions? Well, here ' s one attempt that came from an unlikely source. As a young activist in World War II, Arvid Pardo was arrested for anti-fascist organizing and held under death sentence by the Gestapo. After the war, he worked his way into the diplomatic corps, eventually becoming the first permanent representative of Malta to the United Nations. Pardo saw that international law did not have the tools to address management of shared global resources, such as the high seas. He also saw an opportunity to advocate for equitable sharing between nations. In 1967, Pardo gave a famous speech to the United Nations, introducing the idea that the oceans and their resources were the"common heritage of mankind."The phrase was eventually adopted as part of the Law of the Sea Treaty, probably the most sophisticated commons-management regime on the planet today. It was seen as a watershed moment, a constitution for the seas. But the language proved so controversial that it took over 12 years to gain enough signatures for the treaty to enter into force, and some states still refuse to sign it. The objection was not so much about sharing per se, but the obligation to share. States felt that the principle of equality undermined their autonomy and state sovereignty, the same autonomy and state sovereignty that underpins international law. So in many ways, the story of the common heritage principle is a tragedy. But it ’ s powerful because it makes plain the ways in which the current world order will put up antibodies and defenses and resist attempts at structural reform. But here ’ s the thing : the Outer Space Treaty has already made these structural reforms. At the height of the Cold War, terrified that each would get to the Moon first, the United States and the USSR made the Westphalian equivalent of a deal with the devil. By requiring free access and preventing territorial appropriation, we are required to redesign our most basic institutions, and perhaps in doing so, learn something new we can apply here on Earth. So although the Moon might seem a little far away sometimes, how we answer basic questions now will set precedent for who has a seat at the table and what consent looks like. And these are questions of social technology, not rockets and hardware. In fact, these conversations are starting to happen right now. The space community is discussing basic shared agreements, such as how do we designate lunar areas as heritage sites, and how do we get permission for where to land when traditional external authority doesn ’ t apply? How do we enforce requirements for coordination when it ’ s against the rules to tell people where to go? And how do we manage access to scarce resources such as water, minerals or even the peaks of eternal light – craters that sit at just the right latitude to receive near-constant exposure to sunlight – and therefore, power? Now, some people think that the lack of rules on the Moon is terrifying. And there are legitimately some terrifying elements of it. If there are no rules on the Moon, then won ’ t we end up in a first-come, first-served situation? And we might, if we dismiss this moment. But not if we ’ re willing to be bold and to engage the challenge. As we learned in our communities of self-governance, it ’ s easier to create something new than trying to dismantle the old. And where else but the Moon can we prototype new institutions at global scale in a self-contained environment with the exact design constraints needed for our biggest challenges here on Earth? Back in 1999, the United Nations taught a group of young space geeks that we could think bigger, that we could impact nations if we chose to. Today, the stage is set for the next step : to envision what comes after territory and borders. Thank you.

Text Sample 766: NEG Dim 5 – 2020 – Score 1.00 – 2020/t003961.txt

When I ’ m out at the grocery store or maybe a restaurant or the park with my son – he ’ s six and a half – people will stop us and mention that they think that he ’ s handsome. I agree. They ’ ll use that opportunity to chop it up with him, and often when they ’ re done talking with him, they ’ ll mention that they think he ’ s a smart and engaging little guy. When those people walk away, the thought that comes to my mind is that I hope they remember meeting him as a child when they see him again as a grown man. This thought comes to my mind because I ’ ve written two books about race and racism in the United States, and this kind of work can produce feelings of pessimism. One of the things that I ’ ve learned is that Americans have an orientation toward progress. In this context, what that means is that we often celebrate the distance between where we were and where we are now. But that same orientation can blind us from the gap between where we are and where we could or should be. The other thing I ’ ve learned about Americans is that we have a very, very narrow understanding of racism, mostly in the minds and hearts of people, usually old people – old people from the South. And this really narrow definition can constrain our opportunities to produce a more racially egalitarian society. We like to hunt for races and distance ourselves from people who say mean things about whole groups of people or who idealize the 1950s. But the fact of the matter is that we might just need to look in the mirror. Now, I ’ m not saying that everyone here is a racist, but what I am saying is that everyone here has the capacity and perhaps even the propensity to live their life in a way, to make decisions, to rely on biases that reproduce racial inequality. Some people say,”Well, you do all this work about racism. What ’ s the answer?”And I say that the first thing we might need to do is to come to a shared understanding about what racism is in the first place. History shows that racists have had the upper hand in deciding who the racists are and what racism is, and it ’ s never them or the things that they do. But maybe if we come together and come to a shared and perhaps a precise definition of what racism is, we can work toward creating a society where mothers like me aren ’ t in constant fear of their children ’ s lives. I ’ d like to dispel three myths about racism on our trek toward mutual understanding. First : it ’ s true that the South has done its work to earn its reputation as the most racist region. But there are other states and regions that are competing for the title. For example, if we look at the most segregated states in terms of where Black kids go to school, we ’ ll see, sure, some are in the South. There are some out west, in the Midwest and in the Northeast. They ’ re where we live. Or if we look at states with the biggest racial disparities in terms of prison populations, we see that none of them are in the South. They ’ re where we live. My colleague Rebecca Kreitzer and I looked at a standard battery of racial attitudes of prejudice, and we found that in the 1990s, states in the South dominated the most racially negative attitudes. But this geography has evolved, and things have changed. By 2016, we found that the Dakotas, Nebraska, states in the Midwest, in the Northeast, were competing for the”most prejudiced population”titles. Now, I ’ m not saying that one state is more racist than another, but what I am saying is that every state might have its own special brand of racism. And it doesn ’ t have to be like this. Most of the inequalities that we see in our day-to-day lives happen at the state and local level. What that means is that we don ’ t have to go all the way to Congress to make change in our communities. We can simply hold our city, our county, our state legislators to task to produce more equitable outcomes. Myth two : we ’ re not that good at hunting for racists. Remember that time when the governor of Virginia did blackface, and people were like,”Oh, that ’ s bad. I need to get that racist out of here”? I was giving y ’ all the side-eye, and here ’ s why. While people were going back to yearbooks to look for things that were obviously racist, fewer people were looking into the current-day policy stances of legislators who probably did blackface but didn ’ t get caught. So, how many of us might have supported a candidate who is willing to let neighborhoods secede from their district so that kids could go to all-white schools – in the 21st century? Or how many of us might have supported a ballot measure that systematically reduced some groups ’ chances of voting? Or how many of us might have focused on the behavior of Black mothers rather than doctors or health care systems and policies when we learn about the huge racial disparities in maternal and infant mortality? It doesn ’ t have to be like this. We could do something different. We could scrutinize the behaviors of the rule makers. We could orient ourselves toward a more just society, and on our way there, we can ’ t mystify practical policy solutions. Myth three : If you believe that when all the grandmas in Mississippi die that racism is going to go with them, you are in for a big disappointment. We like to think that young people are going to do the hard work of eradicating racism, but there are some things that we should note. We know that young folks, young white folks especially, like diversity, they appreciate it, they ’ re looking for it. But we also know that they don ’ t live diverse lives. Research shows that the average white American literally has one black friend. And what that means is that most don ’ t have any at all. Sociologists like Sarah Mayorga show that even when well-meaning white folks move to diverse neighborhoods, they don ’ t necessarily have positive interactions, no less any with their neighbors who aren ’ t white. My research with Professor Christopher DeSante shows that when we ask white millennials their racial attitudes and policy preferences, that they ’ re sometimes, just as in other times, even more racially conservative than boomers. When we ask them about the things that are important to them, they don ’ t have any particular sense of urgency around questions of racial inequality. How did we get like this? Well, one of the things we might think about is how we raise our kids and equip them to solve the problems that we want them to solve. Research shows that white parents in particular will either choose to not talk about issues of racism to their kids in order to protect them from a harsh racial reality or they instill colorblind lessons, and that can actually reinforce negative racial attitudes. So it ’ s kind of like how some of your parents might have given you books about puberty so they didn ’ t have to talk about the birds and the bees, and then you tried to connect all the dots and then you did it all wrong. It ’ s like that. It doesn ’ t have to be like this. We can do better. We can have hard conversations with our kids so that they don ’ t grow up like many of us did, thinking that talking about racism makes you a racist – it doesn ’ t – and so that we can prevent them from making the same mistakes that we ’ ve seen in the past. Remember a long, long time ago in 2008, when we were all pining to live in a post-racial world? Well, I say that it ’ s time for us to think bigger and dream bigger and think about what it would be like to live in a post-racist world. But in order to do that, we ’ d have to come together to have a shared definition of racism – not just in the matter of hearts and minds, but in systems, policies, rules, decisions made over and over again to marginalize some people – and agree to become anti-racists – people who learn more and do better. So we could ask harder questions of candidates about their stances on racial inequality before we throw our full weight behind them. We could buycott or boycott businesses whose practices don ’ t align with our values. We could talk to our kids about racism. We could figure out our state ’ s special brand of racism and work to eradicate it. People made racial disparities, and people can unmake them. And sure, it ’ ll be hard, but the fact of the matter is, someone is depending on us to do nothing at all. Thank you.

You ’ ve all been in a bar, right? But have you ever gone to a bar and come out with a $200 million business? That ’ s what happened to us about 10 years ago. We ’ d had a terrible day. We had this huge client that was killing us. We ’ re a software consulting firm, and we couldn ’ t find a very specific programming skill to help this client deploy a cutting-edge cloud system. We have a bunch of engineers, but none of them could please this client. And we were about to be fired. So we go out to the bar, and we ’ re hanging out with our bartender friend Jeff, and he ’ s doing what all good bartenders do : he ’ s commiserating with us, making us feel better, relating to our pain, saying,”Hey, these guys are overblowing it. Don ’ t worry about it.”And finally, he deadpans us and says,”Why don ’ t you send me in there? I can figure it out.”So the next morning, we ’ re hanging out in our team meeting, and we ’ re all a little hazy... and I half-jokingly throw it out there. I say,”Hey, I mean, we ’ re about to be fired.”So I say,”Why don ’ t we send in Jeff, the bartender?”And there ’ s some silence, some quizzical looks. Finally, my chief of staff says,”That is a great idea.””Jeff is wicked smart. He ’ s brilliant. He ’ ll figure it out. Let ’ s send him in there.”Now, Jeff was not a programmer. In fact, he had dropped out of Penn as a philosophy major. But he was brilliant, and he could go deep on topics, and we were about to be fired. So we sent him in. After a couple days of suspense, Jeff was still there. They hadn ’ t sent him home. I couldn ’ t believe it. What was he doing? Here ’ s what I learned. He had completely disarmed their fixation on the programming skill. And he had changed the conversation, even changing what we were building. The conversation was now about what we were going to build and why. And yes, Jeff figured out how to program the solution, and the client became one of our best references. Back then, we were 200 people, and half of our company was made up of computer science majors or engineers, but our experience with Jeff left us wondering : Could we repeat this through our business? So we changed the way we recruited and trained. And while we still sought after computer engineers and computer science majors, we sprinkled in artists, musicians, writers... and Jeff ’ s story started to multiply itself throughout our company. Our chief technology officer is an English major, and he was a bike messenger in Manhattan. And today, we ’ re a thousand people, yet still less than a hundred have degrees in computer science or engineering. And yes, we ’ re still a computer consulting firm. We ’ re the number one player in our market. We work with the fastest- growing software package to ever reach 10 billion dollars in annual sales. So it ’ s working. Meanwhile, the push for STEM-based education in this country — science, technology, engineering, mathematics — is fierce. It ’ s in all of our faces. And this is a colossal mistake. Since 2009, STEM majors in the United States have increased by 43 percent, while the humanities have stayed flat. Our past president dedicated over a billion dollars towards STEM education at the expense of other **subjects**, and our current president recently redirected 200 million dollars of Department of Education funding into computer science. And CEOs are continually complaining about an engineering-starved workforce. These campaigns, coupled with the undeniable success of the tech economy — I mean, let ’ s face it, seven out of the 10 most valuable companies in the world by market cap are technology firms — these things create an assumption that the path of our future workforce will be dominated by STEM. I get it. On paper, it makes sense. It ’ s tempting. But it ’ s totally overblown. It ’ s like, the entire soccer team chases the ball into the corner, because that ’ s where the ball is. We shouldn ’ t overvalue STEM. We shouldn ’ t value the sciences any more than we value the humanities. And there are a couple of reasons. Number one, today ’ s technologies are incredibly intuitive. The reason we ’ ve been able to recruit from all disciplines and swivel into specialized skills is because modern systems can be manipulated without writing code. They ’ re like LEGO : easy to put together, easy to learn, even easy to program, given the vast amounts of information that are available for learning. Yes, our workforce needs specialized skill, but that skill requires a far less rigorous and formalized education than it did in the past. Number two, the skills that are imperative and differentiated in a world with intuitive technology are the skills that help us to work together as humans, where the hard work is envisioning the end product and its usefulness, which requires real-world experience and judgment and historical context. What Jeff ’ s story taught us is that the customer was focused on the wrong thing. It ’ s the classic case : the technologist struggling to communicate with the business and the end user, and the business failing to articulate their needs. I see it every day. We are scratching the surface in our ability as humans to communicate and invent together, and while the sciences teach us how to build things, it ’ s the humanities that teach us what to build and why to build them. And they ’ re equally as important, and they ’ re just as hard. It irks me... when I hear people treat the humanities as a lesser path, as the easier path. Come on! The humanities give us the context of our world. They teach us how to think critically. They are purposely unstructured, while the sciences are purposely structured. They teach us to persuade, they give us our language, which we use to convert our emotions to thought and action. And they need to be on equal footing with the sciences. And yes, you can hire a bunch of artists and build a tech company and have an incredible outcome. Now, I ’ m not here today to tell you that STEM ’ s bad. I ’ m not here today to tell you that girls shouldn ’ t code. Please. And that next bridge I drive over or that next elevator we all jump into — let ’ s make sure there ’ s an engineer behind it. But to fall into this paranoia that our future jobs will be dominated by STEM, that ’ s just folly. If you have friends or kids or relatives or grandchildren or nieces or nephews... encourage them to be whatever they want to be. The jobs will be there. Those tech CEOs that are clamoring for STEM grads, you know what they ’ re hiring for? Google, Apple, Facebook. Sixty-five percent of their open job opportunities are non-technical : marketers, designers, project managers, program managers, product managers, lawyers, HR specialists, trainers, coaches, sellers, buyers, on and on. These are the jobs they ’ re hiring for. And if there ’ s one thing that our future workforce needs — and I think we can all agree on this — it ’ s diversity. But that diversity shouldn ’ t end with gender or race. We need a diversity of backgrounds and skills, with introverts and extroverts and leaders and followers. That is our future workforce. And the fact that the technology is getting easier and more accessible frees that workforce up to study whatever they damn well please. Thank you.

Words matter. They can heal and they can kill... yet, they have a limit. When I was in eighth grade, my teacher gave me a vocabulary sheet with the word”genocide.”I hated it. The word genocide is clinical... overgeneral... bloodless... dehumanizing. No word can describe what this does to a nation. You need to know, in this kind of war, husbands kills wives, wives kill husbands, neighbors and friends kill each other. Someone in power says,”Those over there... they don ’ t belong. They ’ re not human.”And people believe it. I don ’ t want words to describe this kind of behavior. I want words to stop it. But where are the words to stop this? And how do we find the words? But I believe, truly, we have to keep trying. I was born in Kigali, Rwanda. I felt loved by my entire family and my neighbors. I was constantly being teased by everybody, especially my two older siblings. When I lost my front tooth, my brother looked at me and said,”Oh, it has happened to you, too? It will never grow back.”I enjoyed playing everywhere, especially my mother ’ s garden and my neighbor ’ s. I loved my kindergarten. We sang songs, we played everywhere and ate lunch. I had a childhood that I would wish for anyone. But when I was six, the adults in my family began to speak in whispers and shushed me any time that I asked a question. One night, my mom and dad came. They had this strange look when they woke us. They sent my older sister Claire and I to our grandparent ’ s, hoping whatever was happening would **blow** away. Soon we had to escape from there, too. We hid, we crawled, we sometimes ran. Sometimes I heard laughter and then screaming and crying and then noise that I had never heard. You see, I did not know what those noises were. They were neither human — and also at the same time, they were human. I saw people who were not breathing. I

thought they were asleep. I still didn ’ t understand what death was, or killing in itself. When we would stop to rest for a little bit or search for food, I would close my eyes, hoping when I opened them, I would be awake. I had no idea which direction was home. Days were for hiding and night for walking. You go from a person who ’ s away from home to a person with no home. The place that is supposed to want you has pushed you out, and no one takes you in. You are unwanted by anyone. You are a refugee. From age six to 12, I lived in seven different countries, moving from one refugee camp to another, hoping we would be wanted. My older sister Claire, she became a young mother... and a master at getting things done. When I was 12, I came to America with Claire and her family on refugee status. And that ’ s only the beginning, because even though I was 12 years old, sometimes I felt like three years old and sometimes 50 years old. My past receded, grew jumbled, distorted. Everything was too much and nothing. Time seemed like pages torn out of a book and scattered everywhere. This still happens to me standing right here. After I got to America, Claire and I did not talk about our past. In 2006, after 12 years being separated away from my family, and then seven years knowing that they were dead and them thinking that we were dead, we reunited... in the most dramatic, American way possible. Live, on television — on”The Oprah Show.”I told you, I told you. But after the show, as I spent time with my mom and dad and my little sister and my two new siblings that I never met, I felt anger. I felt every deep pain in me. And I know that there is absolutely nothing, nothing, that could restore the time we lost with each other and the relationship we could ’ ve had. Soon, my parents moved to the United States, but like Claire, they don ’ t talk about our past. They live in never-ending present. Not asking too many questions, not allowing themselves to feel — moving in small steps. None of us, of course, can make sense of what happened to us. Though my family is alive — yes, we were broken, and yes, we are numb and we were silenced by our own experience. It ’ s not just my family. Rwanda is not the only country where people have turned on each other and murdered each other. The entire human race, in many ways, is like my family. Not dead ; yes, broken, numb and silenced by the violence of the world that has taken over. You see, the chaos of the violence continues inside in the words we use and the stories we create every single day. But also on the labels that we impose on ourselves and each other. Once we call someone”other,””less than,””one of them”or”better than,”believe me... under the right condition, it ’ s a short path to more destruction. More chaos and more noise that we will not understand. Words will never be enough to quantify and qualify the many magnitudes of human-caused destruction. In order for us to stop the violence that goes on in the world, I hope — at least I beg you — to pause. Let ’ s ask ourselves : Who are we without words? Who are we without labels? Who are we in our breath? Who are we in our heartbeat?

Nina DÃ¸lvik Brochmann : We grew up believing that the hymen is a proof of virginity. But it turns out, we were wrong. What we discovered is that the popular story we ’ re told about female virginity is based on two anatomical myths. The truth has been known in medical communities for over 100 years, yet somehow these two myths continue to make life difficult for women around the world. Ellen StÃ¸kken Dahl : The first myth is about blood. It tells us that the hymen breaks and bleeds the first time a woman has vaginal sex. In other words, if there is no blood on the sheets afterwards, then the woman was simply not a virgin. The second myth is a logical consequence of the first. Since the hymen is thought to break and bleed, people also believe that it actually disappears or is in some way radically altered during a woman ' s first intercourse. If that were true, one would easily be able to determine if a woman is a virgin or not by examining her genitals, by doing a virginity check. NDB : So that ' s our two myths : virgins bleed, and hymens are lost forever. Now, this may sound like a minor issue to you. Why should you care about an obscure little skin fold on the female body? But the truth is, this is about so much more than an anatomical misunderstanding. The myths about the hymen have lived on for centuries because they have cultural significance. They have been used as a powerful tool in the effort to control women ' s sexuality in about every culture, religion and historical decade. Women are still mistrusted, shamed, harmed and, in the worst cases, **subjected** to honor killings if they don ' t bleed on their wedding night. Other women are forced through degrading virginity checks, simply to obtain a job, to save their reputation or to get married. ESD : Like in Indonesia, where women are systematically examined to enter military service. After the Egyptian uprisings in 2011, a group of female protesters were forced to undergo virginity checks by their military. In Oslo, doctors are examining the hymens of young girls to reassure parents that their children are not ruined. And sadly, the list goes on. Women are so afraid not to live up to the myths about the hymen that they choose to use different virginity quick fixes to assure a bleeding. That could be plastic surgery, known as"revirgination,"it could be vials of blood poured on the sheets after sex or fake hymens bought online, complete with theater blood and a promise to"kiss your deep, dark secret goodbye."NDB : By telling girls that no deed can be kept secret, that their bodies will reveal them no matter what, we have endowed them with fear. Girls are afraid of ruining themselves, either through sport, play, tampon use or a sexual activity. We have curtailed their opportunities and their freedoms. It ' s time we put an end to the virginity fraud. It ' s time we break the myths about the hymen once and for all. ESD : We are medical students, sexual health workers and the authors of"The Wonder Down Under."That ' s a popular science book about the female genitals. And in our experience, people seem to believe that the hymen is some kind of a seal covering the vaginal opening. In Norwegian, it is even called"the virgin membrane."And with this, we picture something fragile, something easily destructible, something you can rip through, perhaps like a sheet of plastic wrapping. You may have wondered why we brought a hula hoop onstage today. We ' ll show you. Now, it is very hard to hide that something has happened to this hoop, right? It is different before and after I punched it. The seal is broken, and unless we change the plastic, it won ' t get back to its intact state. So if we wanted to do a virginity check on this hoop right here, right now, that would be very easy. It ' s easy to say that this hoop is not a virgin anymore. NDB : But the hymen is nothing like a piece of plastic you can wrap around your food, or a seal. In fact... it ' s more like this â a scrunchie or a rubber band. The hymen is a rim of tissue at the outer opening of the vagina. And usually, it has a doughnut or a half-moon shape with a large, central hole. But this varies a lot, and sometimes hymens can have fringes, it can have several holes, or it can consist of lobes. In other words, hymens naturally vary a lot in looks, and that is what makes it so hard to do a virginity check. ESD : Now that we know a bit more about the hymen ' s anatomy, it ' s time to get back to our two myths : virgins bleed, hymens are lost forever. But the hymen doesn ' t have to break at all. The hymen is like a scrunchie in function as well as in looks. And you can stretch a scrunchie, right? You can stretch a hymen, too. In fact, it ' s very elastic. And for a lot of women, the hymen will be elastic enough to handle a vaginal intercourse without sustaining any damage. For other women, the hymen may tear a bit to make room for the penis, but that won ’ t make it disappear. But it may look a bit different from before. It naturally follows that you can ’ t examine the hymen to check for virginity status. This was noted over 100 years ago in 1906 by the Norwegian doctor Marie Jeancet. She examined a middle-aged sex worker and concluded that her genitalia were reminiscent of a teenage virgin. But that makes sense, right? Because if her hymen was never damaged during sex, then what were we expecting to see? ESD : Since hymens come in every shape and form, it is difficult to know if a dent or a fold in it is there because of previous damage or if it ’ s just a normal anatomical variant. The absurdity of virgin testing is illustrated in a study done on 36 pregnant teenagers. When doctors examined their hymens, they could only find clear signs of penetration in two out of the 36 girls. So unless you believe in 34 cases of virgin births â we must all agree that also our second myth has taken a vital **blow**. You simply cannot look a woman between her legs and read her sexual story. NDB : Like most myths, the myths about the hymen are untrue. There is no virgin seal that magically disappears after sex, and half of virgins can easily have sex without bleeding. We wish we could say that by removing these myths, everything would be OK, that shame, harm and honor killings would all just disappear. But of course, it ’ s not that simple. Sexual oppression of women comes from something much deeper than a simple anatomical misunderstanding about the properties of the hymen. It ’ s a question of cultural and religious control of women ’ s sexuality. And that is much harder to change. But we must try. ESD : As medical professionals, this is our contribution. We want every girl, parent and [future] husband to know what the hymen is and how it works. We want them to know that the hymen can ’ t be used as a proof of virginity. And that way, we can remove one of the most powerful tools used to control young women today. After telling you this, you may wonder what the alternative is, for if we cannot use the hymen as a proof of virginity for women, then what should we use? We opt for using nothing. If you â If you really want to know if a woman is a virgin or not, ask her. But how she answers that question is her choice. Thank you.

Text Sample 770: NEG Dim 5 – 2016 – Score -1.00 – 2016/t000952.txt

A few years ago, about seven years ago, I found myself hiding in a festival toilet, a music festival toilet, and if anyone ’ s been to a music festival, yeah, you ’ ll know that by the third day, it ’ s pretty nasty. I was standing in the toilet because I couldn ’ t even sit down, because the toilet roll had run out, there was mud everywhere, and it smelled pretty bad. And I stood there thinking,”What am I doing? I don ’ t even need the toilet.”But the reason I went was because I was volunteering for a large charity on climate justice, and it was seven years ago, when lots of people didn ’ t believe in climate change, people were very cynical about activism, and my role, with all of my teammates, was to get people to sign petitions on climate justice and educate them a bit more about the issue. And I cared deeply about climate change and lots of inequality, so I ’ d go and I ’ d talk to lots of people, which made me nervous and drained me of energy, but I did it because I cared, but I would hide in the toilets, because I ’ d be exhausted, and I didn ’ t want my teammates doubting my commitment to the cause, thinking that I was slacking. And we ’ d go and meet at the end of our shift, and we ’ d count how many petitions had been signed, and often I ’ d win the amount of petitions signed even though I had my little breaks in the toilet. But I was always very jealous of the other activists, because either they had the same amount of energy as they had when they began the shift of getting people to sign petitions, or often they had more energy, and they ’ d be really excited about going to watch the bands in the evening and having a dance. And even if I loved the bands, all I wanted to do was to go back to my tent and have a sleep, because I ' d just feel completely wiped out, and I was really jealous of people that had the energy to go and party hard at the festivals. But it also made me really angry, as well, inside. I thought,"This isn ' t fair, I ' m an introvert, and all of the offline campaigning seems to be favoring extroverts."I would go on marches which drained me. That was the other option. Or I ' d go and join campaigns outside embassies or shops. The only thing that was on offer was around lots of people, it was very loud activism, it always involved lots of people, it was performing. None of it was for introverts, and I not only thought that that wasn ' t fair, because a third to a half of the world ' s population are introverts, which isn ' t fair on them, because we burn out, or we ' d be put off by activism and not do it, and everyone needs to be an activist in this world. And also, I didn ' t think it was particularly clever, but I could see that a lot of the activism that worked wasn ' t only extrovert activism. It wasn ' t only the loud stuff. It wasn ' t about people performing all the time. A lot of the work that was needed was in the background, was hidden, wasn ' t seen. And when I ended up just being a campaigner, because it ' s the only job I can do, really — I was campaigning at university, and for the last 10 years, I ' ve been a professional campaigner for large charities, and now I ' m a creative campaigner consultant for different charities as well as other work I do — but I knew that there were other forms of activism that were needed. I started tinkering about seven years ago to see what quieter forms of activism I could engage with so I didn ' t burn out as an activist, but also to look at some of the issues I was concerned about in campaigning. I was very lucky that, when I worked for Oxfam and other big charities, I could read lots of big reports on what influenced politicians and businesses and the general public, what campaigns worked really well, which ones didn ' t. And I ' m a bit of a geek, so I look at all of that stuff, and I wanted to tinker around to see how I could engage people in social change in a different way, because I think if we want the world to be more beautiful, kind and just, then our activism should be beautiful, kind and just, and often it ' s not. And today, I just want to talk about three ways that I think activism needs introverts. I think there ' s lot of other ways, but I ' m just going to talk about three. And the first one is : activism is often very quick, and it ' s about doing, so extroverts, often their immediate response to injustice is, we ' ve got to do stuff now, we ' ve got to react really quickly — and yes, we do need to react, but we need to be strategic in our campaigning, and if we just act on anger, often we do the wrong things. I use craft, like needlework — like this guy behind me is doing — as a way to not only slow down those extrovert doers, but also to bring in nervous, quiet introverts into activism. By doing repetitive actions, like handicraft, you can ' t do it fast, you have to do it slowly. And those repetitive stitches help you meditate on the big, complex, messy social change issues and figure out what we can do as a citizen, as a consumer, as a constituent, and all of those different things. It helps you think critically while you ' re stitching away, and it helps you be more mindful of what are your motives. Are you that Barbie aid worker that was mentioned before? Are you about joining people in solidarity, or do you want to be the savior, which often isn ' t very ethical? But doing needle work together, as well, extroverts and introverts and ambivert — everyone ' s on the scale in different places — because it ' s a quiet, slow form of activism, it really helps introverts be heard in other areas, where they are often not heard. It sounds odd, but while you ' re stitching, you don ' t need eye contact with people. So, for nervous introverts, it means that you can stitch away next to someone or a group of people and ask questions that you ' re thinking that often you don ' t get time to ask people, or you ' re too nervous to ask if you give them eye contact. So you can get introverts, who are those big, deep thinkers, saying,"That ' s really interesting that you want to do that extrovert form of activism that ' s about shaming people or quickly going out somewhere, but who are you trying to target and how, and is that the best way to do it?"So it means you could have these discussions in a very slow way, which is great for the extrovert to slow down and think deeply, but it ' s really good for the introvert as well, to be heard and to feel part of that movement for change, in a good way. Some ways we do it is stitch cards about what values we thread through our activism, and making sure that we don ' t just react in unethical ways. One, sometimes we work with art institutions where we will get over 150 people at the V&A who can come for hours, sit and stitch together on a particular issue, and then tweet what they ' re thinking or how it went, like this one. Also, I always think that activism needs introverts because we ' re really good at intimate activism. So we ' re good at slow activism, and we ' re really good at intimate activism, and if this year has told us anything, it ' s told us that we need to, when we ' re engaging power holders, we need to engage them by listening to people we disagree with, by building bridges not walls — walls or wars — and by being critical friends, not aggressive enemies. And one example that I do a lot with introverts, but with lots of people, is make gifts for people in power, so not be outside screaming at them, but to give them something like a bespoke handkerchief saying,"Don ' t **blow** it. Use your power for good. We know you ' ve got a difficult job in your position of power. How can we help you?"And what ' s great is, for the introverts, we can write letters while we ' re making these gifts, so for us, Marks and Spencer, we tried to campaign to get them to implement the living wage. So we made all the 14 board members bespoke handkerchiefs. We wrote them letters, we boxed them up, and we went to the AGM to hand-deliver our gifts and to have that form of intimate activism where we had discussions with them. And what was brilliant was that the chair of the board told us how amazing our campaign was, how heartfelt it was. The board members, like Martha Lane Fox, who has hundreds of thousands of followers on Twitter, and highly influential in business, tweeted how impressed she was, and within 10 months, we ' d had meetings with Marks and Spencer to say,"We know this is difficult to be a living wage employer, but if you can be one, the rest of the sector will look at it, and it ' s not right that some of your amazing workers are working full time and still can ' t pay their bills. And we love Marks and Spencer. How can you be the role model that we want you to be?"So that was that intimate form of activism. We had lots of meetings with them. We then gave them Christmas cards and Valentine ' s cards to say,"We really want to encourage you to implement the living wage, and within 10 months, they ' d announced to the media that they were going to pay the independent living wage, and now — Thank you. And now we ' re trying to work with them to be accredited, which is really important, and we went back to the last AGM this June and we had these amazing one-to-one discussions with the board members, who told us how much they loved their hankies and how it really moved them, what we were doing, and they all told us that if we were standing outside screaming at them and not being gentle in our protest, they wouldn ' t have even listened to us, never mind had those discussions with us. And I think introverts are really good at intimate activism because we like to listen, we like one-to-ones, we don ' t like small talks, we like those big, juicy issues to discuss with people, we don ' t like conflict, so we avoid it at all costs, which is really important when we ' re trying to engage power holders, not to be conflicting with them all the time. The third way I think activists are really missing out if they don ' t engage introverts is that introverts, like I said, can be half of the world ' s population, and most of us won ' t say that we ' re introvert, or we get embarrassed by saying what overwhelms us. So for me, a few years ago, my mom used to send me texts in capital letters — and she can now do emojis and everything, she ’ s fine — but as soon as I ’ d see this text, I ’ d wince and think,”Ooh, it ’ s capital letters, it ’ s too much.”And I ’ d have to ignore it to read the lovely text she sent me. And that ’ s a bit embarrassing, to tell people that capital letters overwhelm you, but we really need introverts to help us do intriguing activism that attracts them rather than puts them off. We ’ re put off by big and brash giant posters and capital letters and explanation marks telling us what to do and vying for our attention. So some of the things I do with people around the world who take part is make small bits of provocative street art which are hung off eye level, very small, and they ’ re provocative messages. They ’ re not preaching at people or telling them what to do. They ’ re just getting people to engage in different ways, and think for themselves, because we don ’ t like to be told what to do. It might be wearing a green heart on your sleeve saying what you love and how climate change will affect it, and we ’ ll wear it, and if people say,”Why are you wearing a green heart with the word ’ chocolate ’ on?”and we can have those one-to-one intimate conversations and say,”I love chocolate. Climate change is going to affect it, and I think there ’ s lot of other things that climate change will affect, and I really want to make sure I ’ m part of the solution, not the problem.”And then we deflect, because we don ’ t like to be the center of attention, and say,”What do you love and how will climate change affect it?”Or it might be shop-dropping instead of shop-lifting, where we ’ ll make little mini-scrolls with lovely stories on about what ’ s the story behind your clothes. Is it a joyful story of how it ’ s made, or is it a torturous one? And we ’ ll just drop them in little pockets in shops, all lowercase, all handwritten, with kisses and smiley faces in ribbon, and then people are excited that they found it. And we often drop them in unethical shops or in front pockets, and it ’ s a way that we can do offline campaigning that engages us and doesn ’ t burn us out, but also engages other people in an intriguing way online and offline. So I ’ ve got two calls to action, for the introverts and for the extroverts. For the ambivert, you ’ re involved in all of it. For the extroverts, I want to say that when you ’ re planning a campaign, think about introverts. Think about how valuable our skills are, just as much as extroverts ’. We ’ re good at slowing down and thinking deeply, and the detail of issues, we ’ re really good at bringing them out. We ’ re good at intimate activism, so use us in that way. And we ’ re good at intriguing people by doing strange little things that help create conversations and thought. Introverts, my call to action for you is, I know you like being on your own, I know you like being in your head, but activism needs you, so sometimes you ’ ve got to get out there. It doesn ’ t mean that you ’ ve got to turn into an extrovert and burn out, because that ’ s no use for anyone, but what it does mean is that you should value the skills and the traits that you have that activism needs. So for everyone in this room, whether you ’ re an extrovert or an introvert or an ambivert, the world needs you now more than ever, and you ’ ve got no excuse not to get involved. Thanks.

Text Sample 771: NEG Dim 5 – 2016 – Score -1.00 – 2016/t000580.txt

I love football. I started playing when I was 12 years old. It has been a dominant presence in my life ever since. From youth football, to high-school, and college, and now as a coach. Football has played a huge role in shaping me as a person. Recently, I achieved my dream job of becoming varsity line coach at my high-school alma mater. Last March I was at a coaching clinic. It was late in the afternoon and I was tired. These coaching clinics can tend to be a bit of a drag at times. Hours and hours, and days and days of the presentations on the x ’ s and o ’ s of football. There was one presentation, though, that looked interesting. It was titled”Disneyland.”This presentation changed my life. This talk was not about the x ’ s and o ’ s of football. But rather about the emotional truth of why we coaches coach. We are coaches so that we can have a meaningful impact on young people ’ s lives, and help them become better people. As coaches, we want to have the kind of impact that assure that one day our players can hold hands with their children and walk into Disneyland. The moral of this incredible message was this : as coaches, we can preach to our players that it is more important for them be better people than it is great football players. But if we are not honest with them and do not practice what we preach, it will never work. In other words, teenagers are adept at sensing bullshit. As coaches, we must be willing to share our truth. And sharing our truth is the only way we can have the kind of impact we truly want to have. The coach who gave this presentation, his truth was that his son became a drug addict due to the bullying and pressure he was **subjected** to from his dad being the head football coach at his school in Eagle, Idaho, a program that at the time was not very succesful. I went from a presentation on how to run the power against a 3-4 defense to the most honest, emotional and inspirational talks on coaching philosophy I ’ d ever heard. So it got me thinking. What ’ s my bullshit? What is unique about me that I bring to the table that will have a meaningful impact? What is my truth? My truth is this. I ’ m a former college football player. I ’ m a current high-school football coach. And I am gay. I battled with this truth for a long time. Personally, professionally and certainly in my coaching and athletic career. It was an identity crisis that had a tremendous impact on my life. Long before I heard this presentation on Disneyland I thought about coming out in football. In the beginning, I told myself”You ’ re gay and you will take it to the grave.”Now, I ’ ve come a long way since that day. Thank you. Thank you. I ’ ve come a long way since that day, but the process almost cost me my life. I chose to come out to family and friends starting in August of 2014. I told my immediate family first, and then I carefully picked my way through family and friends, trying to choose the right time and place. Only being part way out of the closet meant that I had to be two different people and always be very aware of where I was and whom I was with. It caused a constant state of panic and anxiety. So the question became,”Is it important for me to come out publicly?”Yes it is, and here is why. My time in-and-out of the closet helped my realize that there are other people in my situation. And it is not a pretty one. It also helped me realize that coming out is not about sharing my bedroom habits, but about giving myself permission to live my life in its entirety. Let me explain. After talking to one of my fellow coaches, he told me :”I don ’ t talk about my sex life with players, why would you?”And it ’ s a legitimate question, but a common misconception about coming out. Again, I ’ m not talking about my sex life. I ’ m talking about my life. It ’ s often said that your private life is your private life. But imagine you are put in a situation where going virtually anywhere and doing very normal, healthy, human activities with your significant other could have substantial consequences on your life, reputation and career. You gain a very new perspective on what your private life actually is. That ’ s how being in the closet affected my life. It was quite literally a closet. No space, no freedom and no comfort. It ’ s a suffocating lifestyle with measurable effects. It wore me down until eventually I was abusing alcohol and prescription medications to keep my anxiety in check. It was a horrible time in my life. When you are put in a situation of having to live a double life, it strips you off dignity and normal coping mechanisms. At that time the only place I felt somewhat safe was at home. I was living with my parents, who had been nothing but supportive, but I did not feel comfortable bringing guys around them yet. So there I was. No safe place, no place to be myself, facing a new lifestyle I did not know how to navigate, the anxiety and depression were inescapable. And I responded the only way I felt I could at the time. Drugs and alcohol. Football teaches so many great life lessons to those who play or coach. Perseverance, toughness, respect, self-esteem. But the one negative thing that it does teach is that being gay is not OK. To be frank, the word"faggot"is used almost as much as the word"football."There is a misconception about the prominence of gay men in football, and it has serious consequences. I ' m the perfect example of this issue. An all-state player in high-school. A two-year varsity captain among a select few in school history to go play for a top tier division 1 football program. The youngest line coach in the history of the school. And I was ready to kill myself. Because I thought that even though this program was like a second family to me, I feared they would shun me. It was a crushing weight that I was carrying with me all the time. Months and months of sleep deprivation, severe anxiety and depression. And honestly, a lack of the will to live began to catch up with me. It was too much. I was desperate for a way out. Any way out. One night I reached for a bottle of vodka and a couple of pills. I didn ' t see a way out. I just wanted it to be over. If I couldn ' t be me and still live my life, what was the point? I passed out on the bathroom floor, and my mom found me. I was fortunate to wake up the next day. I escaped an overdose. It was the scariest moment of my life. When I woke up the next day, I knew I really wasn ' t ready to give up. And when I heard that talk on Disneyland, I knew how, when and why it was important for me to share my story. I worried for so long about how the football community would react. And while at this point only time will tell, my experience has given me a theory. It ' s simple. One day, being gay in football will be normal. But in order for that to happen, those of us who are gay need to stand up and own it. The coaches I know are perfect examples of this. I have been met with nothing but love and support from my fellow coaching friends. But now the challenge is to change this. And not just on the private level. The odds of a gay teen or young adult abusing drugs, alcohol, or experiencing anxiety, depression, or even attempting suicide are drastically high. When it comes to football, the social norm that we ' ve created leaves many without hope. We ' ve made incredible progress in the equal rights movement under the law. But now we must tackle a different problem. Social equality and the message we send to young people who play football. Continue to use sports to inspire, connect and to share a positive message. A healthy person cannot live life in the dark. And if you are out there, stand up and own it. Thank you.

For the past few years, I ' ve been spending my summers in the marine biological laboratory in Woods Hole, Massachusetts. And there, what I ' ve been doing is essentially renting a boat. What I would like to do is ask you to come on a boat ride with me tonight. So, we ride off from Eel Pond into Vineyard Sound, right off the coast of Martha ' s Vineyard, equipped with a drone to identify potential spots from which to peer into the Atlantic. Earlier, I was going to say into the depths of the Atlantic, but we don ' t have to go too deep to reach the unknown. Here, barely two miles away from what is arguably the greatest marine biology lab in the world, we lower a simple plankton net into the water and bring up to the surface things that humanity rarely pays any attention to, and oftentimes has never seen before. Here ' s one of the organisms that we caught in our net. This is a jellyfish. But look closely, and living inside of this animal is another organism that is very likely entirely new to science. A complete new species. Or how about this other transparent beauty with a beating heart, asexually growing on top of its head, progeny that will move on to reproduce sexually. Let me say that again : this animal is growing asexually on top of its head, progeny that is going to reproduce sexually in the next generation. A weird jellyfish? Not quite. This is an ascidian. This is a group of animals that now we know we share extensive genomic ancestry with, and it is perhaps the closest invertebrate species to our own. Meet your cousin, Thalia democratica. I ' m pretty sure you didn ' t save a spot at your last family reunion for Thalia, but let me tell you, these animals are profoundly related to us in ways that we ' re just beginning to understand. So, next time you hear anybody derisively telling you that this type of research is a simple fishing expedition, I hope that you ' ll remember the trip that we just took. Today, many of the biological sciences only see value in studying deeper what we already know — in mapping already-discovered continents. But some of us are much more interested in the unknown. We want to discover completely new continents, and gaze at magnificent vistas of ignorance. We crave the experience of being completely baffled by something we ' ve never seen before. And yes, I agree there ' s a lot of little ego satisfaction in being able to say,"Hey, I was the first one to discover that."But this is not a self- aggrandizing enterprise, because in this type of discovery research, if you don ' t feel like a complete idiot most of the time, you ' re just not sciencing hard enough. So every summer I bring onto the deck of this little boat of ours more and more things that we know very little about. I would like tonight to tell you a story about life that rarely gets told in an environment like this. From the vantage point of our 21st-century biological laboratories, we have begun to illuminate many mysteries of life with knowledge. We sense that after centuries of scientific research, we ' re beginning to make significant inroads into understanding some of the most fundamental principles of life. Our collective optimism is reflected by the growth of biotechnology across the globe, striving to utilize scientific knowledge to cure human diseases. Things like cancer, aging, degenerative diseases ; these are but some of the undesirables we wish to tame. I often wonder : Why is it that we are having so much trouble trying to solve the problem of cancer? Is it that we ' re trying to solve the problem of cancer, and not trying to understand life? Life on this planet shares a common origin, and I can summarize 3. 5 billion years of the history of life on this planet in a single slide. What you see here are representatives of all known species in our planet. In this immensity of life and biodiversity, we occupy a rather unremarkable position. Homo sapiens. The last of our kind. And though I don ' t really want to disparage at all the accomplishments of our species, as much as we wish it to be so and often pretend that it is, we are not the measure of all things. We are, however, the measurers of many things. We relentlessly quantify, analyze and compare, and some of this is absolutely invaluable and indeed necessary. But this emphasis today on forcing biological research to specialize and to produce practical outcomes is actually restricting our ability to interrogate life to unacceptably narrow confines and unsatisfying depths. We are measuring an astonishingly narrow sliver of life, and hoping that those numbers will save all of our lives. How narrow do you ask? Well, let me give you a number. The National Oceanic and Atmospheric Administration recently estimated that about 95 percent of our oceans remain unexplored. Now let that sink in for a second. 95 percent of our oceans remain unexplored. I think it ' s very safe to say that we don ' t even know how much about life we do not know. So, it ' s not surprising that every week in my field we begin to see the addition of more and more new species to this amazing tree of life. This one for example

— discovered earlier this summer, new to science, and now occupying its lonely branch in our family tree. What is even more tragic is that we know about a bunch of other species of animals out there, but their biology remains sorely under-studied. I ’ m sure some of you have heard about the fact that a starfish can actually regenerate its arm after it ’ s lost. But some of you might not know that the arm itself can actually regenerate a complete starfish. And there are animals out there that do truly astounding things. I ’ m almost willing to bet that many of you have never heard of the flatworm, Schmidtea mediterranea. This little guy right here does things that essentially just **blow** my mind. You can grab one of these animals and cut it into 18 different fragments, and each and every one of those fragments will go on to regenerate a complete animal in under two weeks. 18 heads, 18 bodies, 18 mysteries. For the past decade and a half or so, I ’ ve been trying to figure out how these little dudes do what they do, and how they pull this magic trick off. But like all good magicians, they ’ re not really releasing their secrets readily to me. So here we are, after 20 years of essentially studying these animals, genome mapping, chin scratching, and thousands of amputations and thousands of regenerations, we still don ’ t fully understand how these animals do what they do. Each planarian an ocean unto itself, full of unknowns. One of the common characteristics of all of these animals I ’ ve been talking to you about is that they did not appear to have received the memo that they need to behave according to the rules that we have derived from a handful of randomly selected animals that currently populate the vast majority of biomedical laboratories across the world. Meet our Nobel Prize winners. Seven species, essentially, that have produced for us the brunt of our understanding of biological behavior today. This little guy right here — three Nobel Prizes in 12 years. And yet, after all the attention they have garnered, and all the knowledge they have generated, as well as the lion ’ s share of the funding, here we are standing [before] the same litany of intractable problems and many new challenges. And that ’ s because, unfortunately, these seven animals essentially correspond to 0. 0009 percent of all of the species that inhabit the planet. So I ’ m beginning to suspect that our specialization is beginning to impede our progress at best, and at worst, is leading us astray. That ’ s because life on this planet and its history is the history of rule breakers. Life started on the face of this planet as single-cell organisms, swimming for millions of years in the ocean, until one of those creatures decided,”I ’ m going to do things differently today ; today I would like to invent something called multicellularity, and I ’ m going to do this.”And I ’ m sure it wasn ’ t a popular decision at the time — but somehow, it managed to do it. And then, multicellular organisms began to populate all these ancestral oceans, and they thrived. And we have them here today. Land masses began to emerge from the surface of the oceans, and another creature thought,”Hey, that looks like a really nice piece of real estate. I ’ d like to move there.””Are you crazy? You ’ re going to desiccate out there. Nothing can live out of water.”But life found a way, and there are organisms now that live on land. Once on land, they may have looked up into the sky and said,”It would be nice to go to the clouds, I ’ m going to fly.””You can ’ t break the law of gravity, there ’ s no way you can fly.”And yet, nature has invented — multiple and independent times — ways to fly. I love to study these animals that break the rules, because every time they break a rule, they invent something new that made it possible for us to be able to be here today. These animals did not get the memo. They break the rules. So if we ’ re going to study animals that break the rules, shouldn ’ t how we study them also break the rules? I think we need to renew our spirit of exploration. Rather than bring nature into our laboratories and interrogate it there, we need to bring our science into the majestic laboratory that is nature, and there, with our modern technological armamentarium, interrogate every new form of life we find, and any new biological attribute that we may find. We actually need to bring all of our intelligence to becoming stupid again — clueless [before] the immensity of the unknown. Because after all, science is not really about knowledge. Science is about ignorance. That ’ s what we do. Once, Antoine de Saint-Exupry wrote,”If you want to build a ship, don ’ t drum up people to collect wood and don ’ t assign them tasks and work, but rather teach them to long for the endless immensity of the sea...”As a scientist and a teacher, I like to paraphrase this to read that we scientists need to teach our students to long for the endless immensity of the sea that is our ignorance. We Homo sapiens are the only species we know of that is driven to scientific inquiry. We, like all other species on this planet, are inextricably woven into the history of life on this planet. And I think I ’ m a little wrong when I say that life is a mystery, because I think that life is actually an open secret that has been beckoning our species for millennia to understand it. So I ask you : Aren ’ t we the best chance that life has to know itself? And if so, what the heck are we waiting for? Thank you.

I ’ m turning 44 next month, and I have the sense that 44 is going to be a very good year, a year of fulfillment, realization. I have that sense, not because of anything particular in store for me, but because I read it would be a good year in a 1968 book by Norman Mailer.”He felt his own age, forty-four...”wrote Mailer in”The Armies of the Night,””... felt as if he were a solid embodiment of bone, muscle, heart, mind, and sentiment to be a man, as if he had arrived.”Yes, I know Mailer wasn ’ t writing about me. But I also know that he was ; for all of us — you, me, the **subject** of his book, age more or less in step, proceed from birth along the same great sequence : through the wonders and confinements of childhood ; the emancipations and frustrations of adolescence ; the empowerments and millstones of adulthood ; the recognitions and resignations of old age. There are patterns to life, and they are shared. As Thomas Mann wrote :”It will happen to me as to them.”We don ’ t simply live these patterns. We record them, too. We write them down in books, where they become narratives that we can then read and recognize. Books tell us who we ’ ve been, who we are, who we will be, too. So they have for millennia. As James Salter wrote,”Life passes into pages if it passes into anything.”And so six years ago, a thought leapt to mind : if life passed into pages, there were, somewhere, passages written about every age. If I could find them, I could assemble them into a narrative. I could assemble them into a life, a long life, a hundred-year life, the entirety of that same great sequence through which the luckiest among us pass. I was then 37 years old,”an age of discretion,”wrote William Trevor. I was prone to meditating on time and age. An illness in the family and later an injury to me had long made clear that growing old could not be assumed. And besides, growing old only postponed the inevitable, time seeing through what circumstance did not. It was all a bit disheartening. A list, though, would last. To chronicle a life year by vulnerable year would be to clasp and to ground what was fleeting, would be to provide myself and others a glimpse into the future, whether we made it there or not. And when I then began to compile my list, I was quickly obsessed, searching pages and pages for ages and ages. Here we were at every annual step through our first hundred years.”Twenty-seven... a time of sudden revelations,””sixty-two,... of subtle diminishments.”I was mindful, of course, that such insights were relative. For starters, we now live longer, and so age more slowly. Christopher Isherwood used the phrase"the yellow leaf"to describe a man at 53, only one century after Lord Byron used it to describe himself at 36. I was mindful, too, that life can swing wildly and unpredictably from one year to the next, and that people may experience the same age differently. But even so, as the list coalesced, so, too, on the page, clear as the reflection in the mirror, did the life that I had been living : finding at 20 that"... one is less and less sure of who one is ;"emerging at 30 from the"... wasteland of preparation into active life ;"learning at 40"... to close softly the doors to rooms [I would] not be coming back to."There I was. Of course, there we all are. Milton Glaser, the great graphic designer whose beautiful visualizations you see here, and who today is 85 — all those years"... a ripening and an apotheosis,"wrote Nabokov — noted to me that, like art and like color, literature helps us to remember what we ' ve experienced. And indeed, when I shared the list with my grandfather, he nodded in recognition. He was then 95 and soon to die, which, wrote Roberto Bolao,"... is the same as never dying."And looking back, he said to me that, yes, Proust was right that at 22, we are sure we will not die, just as a thanatologist named Edwin Shneidman was right that at 90, we are sure we will. It had happened to him, as to them. Now the list is done : a hundred years. And looking back over it, I know that I am not done. I still have my life to live, still have many more pages to pass into. And mindful of Mailer, I await 44. Thank you.

People returning to work after a career break : I call them relaunchers. These are people who have taken career breaks for elder care, for childcare reasons, pursuing a personal interest or a personal health issue. Closely related are career transitioners of all kinds : veterans, military spouses, retirees coming out of retirement or repatriating expats. Returning to work after a career break is hard because of a disconnect between the employers and the relaunchers. Employers can view hiring people with a gap on their resume as a high-risk proposition, and individuals on career break can have doubts about their abilities to relaunch their careers, especially if they ' ve been out for a long time. This disconnect is a problem that I ' m trying to help solve. Now, successful relaunchers are everywhere and in every field. This is Sami Kafala. He ' s a nuclear physicist in the UK who took a five-year career break to be home with his five children. The Singapore press recently wrote about nurses returning to work after long career breaks. And speaking of long career breaks, this is Mimi Kahn. She ' s a social worker in Orange County, California, who returned to work in a social services organization after a 25-year career break. That ' s the longest career break that I ' m aware of. Supreme Court Justice Sandra Day O ' Connor took a five-year career break early in her career. And this is Tracy Shapiro, who took a 13-year career break. Tracy answered a call for essays by the Today Show from people who were trying to return to work but having a difficult time of it. Tracy wrote in that she was a mom of five who loved her time at home, but she had gone through a divorce and needed to return to work, plus she really wanted to bring work back into her life because she loved working. Tracy was doing what so many of us do when we feel like we ' ve put in a good day in the job search. She was looking for a finance or accounting role, and she had just spent the last nine months very diligently researching companies online and applying for jobs with no results. I met Tracy in June of 2011, when the Today Show asked me if I could work with her to see if I could help her turn things around. The first thing I told Tracy was she had to get out of the house. I told her she had to go public with her job search and tell everyone she knew about her interest in returning to work. I also told her,"You are going to have a lot of conversations that don ' t go anywhere. Expect that, and don ' t be discouraged by it. There will be a handful that ultimately lead to a job opportunity."I ' ll tell you what happened with Tracy in a little bit, but I want to share with you a discovery that I made when I was returning to work after my own career break of 11 years out of the full-time workforce. And that is, that people ' s view of you is frozen in time. What I mean by this is, when you start to get in touch with people and you get back in touch with those people from the past, the people with whom you worked or went to school, they are going to remember you as you were before your career break. And that ' s even if your sense of self has diminished over time, as happens with so many of us the farther removed we are from our professional identities. So for example, you might think of yourself as someone who looks like this. This is me, crazy after a day of driving around in my minivan. Or here I am in the kitchen. But those people from the past, they don ' t know about any of this. They only remember you as you were, and it ' s a great confidence boost to be back in touch with these people and hear their enthusiasm about your interest in returning to work. There ' s one more thing I remember vividly from my own career break. And that was that I hardly kept up with the business news. My background is in finance, and I hardly kept up with any news when I was home caring for my four young children. So I was afraid I ' d go into an interview and start talking about a company that didn ' t exist anymore. So I had to resubscribe to the Wall Street Journal and read it for a good six months cover to cover before I felt like I had a handle on what was going on in the business world again. I believe relaunchers are a gem of the workforce, and here ' s why. Think about our life stage : for those of us who took career breaks for childcare reasons, we have fewer or no maternity leaves. We did that already. We have fewer spousal or partner job relocations. We ' re in a more settled time of life. We have great work experience. We have a more mature perspective. We ' re not trying to find ourselves at an employer ' s expense. Plus we have an energy, an enthusiasm about returning to work precisely because we ' ve been away from it for a while. On the flip side, I speak with employers, and here are two concerns that employers have about hiring relaunchers. The first one is, employers are worried that relaunchers are technologically obsolete. Now, I can tell you, having been technologically obsolete myself at one point, that it ' s a temporary condition. I had done my financial analysis so long ago that I used Lotus 1-2-3. I don ' t know if anyone can even remember back that far, but I had to relearn it on Excel. It actually wasn ' t that hard. A lot of the commands are the same. I found PowerPoint much more challenging, but now I use PowerPoint all the time. I tell relaunchers that employers expect them to come to the table with a working knowledge of basic office management software. And if they ' re not up to speed, then it ' s their responsibility to get there. And they do. The second area of concern that employers have about relaunchers is they ' re worried that relaunchers don ' t know what they want to do. I tell relaunchers that they need to do the hard work to figure out whether their interests and skills have changed or have not changed while they have been on career break. That ' s not the employer ' s job. It ' s the relauncher ' s responsibility to demonstrate to the employer where they can add the most value. Back in 2010 I started noticing something. I had been tracking return to work programs since 2008, and in 2010, I started noticing the use of a short-term paid work opportunity, whether it was called an internship or not, but an internship-like experience, as a way for professionals to return to work. I saw Goldman Sachs and Sara Lee start corporate reentry internship programs. I saw a returning engineer, a nontraditional reentry candidate, apply for an entry- level internship program in the military, and then get a permanent job afterward. I saw two universities integrate internships into mid-career executive education programs. So I wrote a report about what I was seeing, and it became this article for Harvard Business Review called"The 40-Year-Old Intern."I have to thank the editors there for that title, and also for this artwork where you can see the 40-year-old intern in the midst of all the college interns. And then, courtesy of Fox Business News, they called the concept"The 50-Year-Old Intern."So five of the biggest financial services companies have reentry internship programs for returning finance professionals. And at this point, hundreds of people have participated. These internships are paid, and the people who move on to permanent roles are commanding competitive salaries. And now, seven of the biggest engineering companies are piloting reentry internship programs for returning engineers as part of an initiative with the Society of Women Engineers. Now, why are companies embracing the reentry internship? Because the internship allows the employer to base their hiring decision on an actual work sample instead of a series of interviews, and the employer does not have to make that permanent hiring decision until the internship period is over. This testing out period removes the perceived risk that some managers attach to hiring relaunchers, and they are attracting excellent candidates who are turning into great hires. Think about how far we have come. Before this, most employers were not interested in engaging with relaunchers at all. But now, not only are programs being developed specifically with relaunchers in mind, but you can ' t even apply for these programs unless you have a gap on your rsum. This is the mark of real change, of true institutional shift, because if we can solve this problem for relaunchers, we can solve it for other career transitioners too. In fact, an employer just told me that their veterans return to work program is based on their reentry internship program. And there ' s no reason why there can ' t be a retiree internship program. Different pool, same concept. So let me tell you what happened with Tracy Shapiro. Remember that she had to tell everyone she knew about her interest in returning to work. Well, one critical conversation with another parent in her community led to a job offer for Tracy, and it was an accounting job in a finance department. But it was a temp job. The company told her there was a possibility it could turn into something more, but no guarantees. This was in the fall of 2011. Tracy loved this company, and she loved the people and the office was less than 10 minutes from her house. So even though she had a second job offer at another company for a permanent full-time role, she decided to take her chances with this internship and hope for the best. Well, she ended up **blowing** away all of their expectations, and the company not only made her a permanent offer at the beginning of 2012, but they made it even more interesting and challenging, because they knew what Tracy could handle. Fast forward to 2015, Tracy ' s been promoted. They ' ve paid for her to get her MBA at night. She ' s even hired another relauncher to work for her. Tracy ' s temp job was a tryout, just like an internship, and it ended up being a win for both Tracy and her employer. Now, my goal is to bring the reentry internship concept to more and more employers. But in the meantime, if you are returning to work after a career break, don ' t hesitate to suggest an internship or an internship-like arrangement to an employer that does not have a formal reentry internship program. Be their first success story, and you can be the example for more relaunchers to come. Thank you.

So you go to the doctor and get some tests. The doctor determines that you have high cholesterol and you would benefit from medication to treat it. So you get a pillbox. You have some confidence, your physician has some confidence that this is going to work. The company that invented it did a lot of studies, submitted it to the FDA. They studied it very carefully, skeptically, they approved it. They have a rough idea of how it works, they have a rough idea of what the side effects are. It should be OK. You have a little more of a conversation with your physician and the physician is a little worried because you ’ ve been blue, haven ’ t felt like yourself, you haven ’ t been able to enjoy things in life quite as much as you usually do. Your physician says,”You know, I think you have some depression. I ’ m going to have to give you another pill.”So now we ’ re talking about two medications. This pill also — millions of people have taken it, the company did studies, the FDA looked at it — all good. Think things should go OK. Think things should go OK. Well, wait a minute. How much have we studied these two together? Well, it ’ s very hard to do that. In fact, it ’ s not traditionally done. We totally depend on what we call”post-marketing surveillance,”after the drugs hit the market. How can we figure out if bad things are happening between two medications? Three? Five? Seven? Ask your favorite person who has several diagnoses how many medications they ’ re on. Why do I care about this problem? I care about it deeply. I ’ m an informatics and data science guy and really, in my opinion, the only hope — only hope — to understand these interactions is to leverage lots of different sources of data in order to figure out when drugs can be used together safely and when it ’ s not so safe. So let me tell you a data science story. And it begins with my student Nick. Let ’ s call him”Nick,”because that ’ s his name. Nick was a young student. I said,”You know, Nick, we have to understand how drugs work and how they work together and how they work separately, and we don ’ t have a great understanding. But the FDA has made available an amazing database. It ’ s a database of adverse events. They literally put on the web — publicly available, you could all download it right now — hundreds of thousands of adverse event reports from patients, doctors, companies, pharmacists. And these reports are pretty simple : it has all the diseases that the patient has, all the drugs that they ’ re on, and all the adverse events, or side effects, that they experience. It is not all of the adverse events that are occurring in America today, but it ’ s hundreds and hundreds of thousands of drugs. So I said to Nick,”Let ’ s think about glucose. Glucose is very important, and we know it ’ s involved with diabetes. Let ’ s see if we can understand glucose response. I sent Nick off. Nick came back.”Russ,”he said,”I ’ ve created a classifier that can look at the side effects of a drug based on looking at this database, and can tell you whether that drug is likely to change glucose or not.”He did it. It was very simple, in a way. He took all the drugs that were known to change glucose and a bunch of drugs that don ’ t change glucose, and said,”What ’ s the difference in their side effects? Differences in fatigue? In appetite? In urination habits?”All those things conspired to give him a really good predictor. He said,”Russ, I can predict with 93 percent accuracy when a drug will change glucose.”I said,”Nick, that ’ s great.”He ’ s a young student, you have to build his confidence.”But Nick, there ’ s a problem. It ’ s that every physician in the world knows all the drugs that change glucose, because it ’ s core to our practice. So it ’ s great, good job, but not really that interesting, definitely not publishable.”He said,”I know, Russ. I thought you might say that.”Nick is smart.”I thought you might say that, so I did one other experiment. I looked at people in this database who were on two drugs, and I looked for signals similar, glucose-changing signals, for people taking two drugs, where each drug alone did not change glucose, but together I saw a strong signal.”And I said,”Oh! You ’ re clever. Good idea.

Show me the list."And there ' s a bunch of drugs, not very exciting. But what caught my eye was, on the list there were two drugs : paroxetine, or Paxil, an antidepressant ; and pravastatin, or Pravachol, a cholesterol medication. And I said,"Huh. There are millions of Americans on those two drugs."In fact, we learned later, 15 million Americans on paroxetine at the time, 15 million on pravastatin, and a million, we estimated, on both. So that ' s a million people who might be having some problems with their glucose if this machine-learning mumbo jumbo that he did in the FDA database actually holds up. But I said,"It ' s still not publishable, because I love what you did with the mumbo jumbo, with the machine learning, but it ' s not really standard-of-proof evidence that we have."So we have to do something else. Let ' s go into the Stanford electronic medical record. We have a copy of it that ' s OK for research, we removed identifying information. And I said,"Let ' s see if people on these two drugs have problems with their glucose."Now there are thousands and thousands of people in the Stanford medical records that take paroxetine and pravastatin. But we needed special patients. We needed patients who were on one of them and had a glucose measurement, then got the second one and had another glucose measurement, all within a reasonable period of time — something like two months. And when we did that, we found 10 patients. However, eight out of the 10 had a bump in their glucose when they got the second P — we call this P and P — when they got the second P. Either one could be first, the second one comes up, glucose went up 20 milligrams per deciliter. Just as a reminder, you walk around normally, if you ' re not diabetic, with a glucose of around 90. And if it gets up to 120, 125, your doctor begins to think about a potential diagnosis of diabetes. So a 20 bump — pretty significant. I said,"Nick, this is very cool. But, I ' m sorry, we still don ' t have a paper, because this is 10 patients and — give me a break — it ' s not enough patients."So we said, what can we do? And we said, let ' s call our friends at Harvard and Vanderbilt, who also — Harvard in Boston, Vanderbilt in Nashville, who also have electronic medical records similar to ours. Let ' s see if they can find similar patients with the one P, the other P, the glucose measurements in that range that we need. God bless them, Vanderbilt in one week found 40 such patients, same trend. Harvard found 100 patients, same trend. So at the end, we had 150 patients from three diverse medical centers that were telling us that patients getting these two drugs were having their glucose bump somewhat significantly. More interestingly, we had left out diabetics, because diabetics already have messed up glucose. When we looked at the glucose of diabetics, it was going up 60 milligrams per deciliter, not just 20. This was a big deal, and we said,"We ' ve got to publish this."We submitted the paper. It was all data evidence, data from the FDA, data from Stanford, data from Vanderbilt, data from Harvard. We had not done a single real experiment. But we were nervous. So Nick, while the paper was in review, went to the lab. We found somebody who knew about lab stuff. I don ' t do that. I take care of patients, but I don ' t do pipettes. They taught us how to feed mice drugs. We took mice and we gave them one P, paroxetine. We gave some other mice pravastatin. And we gave a third group of mice both of them. And lo and behold, glucose went up 20 to 60 milligrams per deciliter in the mice. So the paper was accepted based on the informatics evidence alone, but we added a little note at the end, saying, oh by the way, if you give these to mice, it goes up. That was great, and the story could have ended there. But I still have six and a half minutes. So we were sitting around thinking about all of this, and I don ' t remember who thought of it, but somebody said,"I wonder if patients who are taking these two drugs are noticing side effects of hyperglycemia. They could and they should. How would we ever determine that?"We said, well, what do you do? You ' re taking a medication, one new medication or two, and you get a funny feeling. What do you do? You go to Google and type in the two drugs you ' re taking or the one drug you ' re taking, and you type in"side effects."What are you experiencing? So we said OK, let ' s ask Google if they will share their search logs with us, so that we can look at the search logs and see if patients are doing these kinds of searches. Google, I am sorry to say, denied our request. So I was bummed. I was at a dinner with a colleague who works at Microsoft Research and I said,"We wanted to do this study, Google said no, it ' s kind of a bummer."He said,"Well, we have the Bing searches."Yeah. That ' s great. Now I felt like I was — I felt like I was talking to Nick again. He works for one of the largest companies in the world, and I ' m already trying to make him feel better. But he said,"No, Russ — you might not understand. We not only have Bing searches, but if you use Internet Explorer to do searches at Google, Yahoo, Bing, any... Then, for 18 months, we keep that data for research purposes only."I said,"Now you ' re talking!"This was Eric Horvitz, my friend at Microsoft. So we did a study where we defined 50 words that a regular person might type in if they ' re having hyperglycemia, like"fatigue,""loss of appetite,""urinating a lot,""peeing a lot"— forgive me, but that ' s one of the things you might type in. So we had 50 phrases that we called the"diabetes words."And we did first a baseline. And it turns out that about. 5 to one percent of all searches on the Internet involve one of those words. So that ' s our baseline rate. If people type in"paroxetine"or"Paxil"— those are synonyms — and one of those words, the rate goes up to about two percent of diabetes-type words, if you already know that there ' s that"paroxetine"word. If it ' s"pravastatin,"the rate goes up to about three percent from the baseline. If both"paroxetine"and"pravastatin"are present in the query, it goes up to 10 percent, a huge three- to four-fold increase in those searches with the two drugs that we were interested in, and diabetes-type words or hyperglycemia-type words. We published this, and it got some attention. The reason it deserves attention is that patients are telling us their side effects indirectly through their searches. We brought this to the attention of the FDA. They were interested. They have set up social media surveillance programs to collaborate with Microsoft, which had a nice infrastructure for doing this, and others, to look at Twitter feeds, to look at Facebook feeds, to look at search logs, to try to see early signs that drugs, either individually or together, are causing problems. What do I take from this? Why tell this story? Well, first of all, we have now the promise of big data and medium-sized data to help us understand drug interactions and really, fundamentally, drug actions. How do drugs work? This will create and has created a new ecosystem for understanding how drugs work and to optimize their use. Nick went on ; he ' s a professor at Columbia now. He did this in his PhD for hundreds of pairs of drugs. He found several very important interactions, and so we replicated this and we showed that this is a way that really works for finding drug-drug interactions. However, there ' s a couple of things. We don ' t just use pairs of drugs at a time. As I said before, there are patients on three, five, seven, nine drugs. Have they been studied with respect to their nine-way interaction? Yes, we can do pair-wise, A and B, A and C, A and D, but what about A, B, C, D, E, F, G all together, being taken by the same patient, perhaps interacting with each other in ways that either makes them more effective or less effective or causes side effects that are unexpected? We really have no idea. It ' s a blue sky, open field for us to use data to try to understand the interaction of drugs. Two more lessons : I want you to think about the power that we were able to generate with the data from people who had volunteered their adverse reactions through their pharmacists, through themselves, through their doctors, the people who allowed the databases at Stanford, Harvard, Vanderbilt, to be used for research. People are worried about data. They ' re worried about their privacy and security — they should be. We need secure systems. But we can ’ t have a system that closes that data off, because it is too rich of a source of inspiration, innovation and discovery for new things in medicine. And the final thing I want to say is, in this case we found two drugs and it was a little bit of a sad story. The two drugs actually caused problems. They increased glucose. They could throw somebody into diabetes who would otherwise not be in diabetes, and so you would want to use the two drugs very carefully together, perhaps not together, make different choices when you ’ re prescribing. But there was another possibility. We could have found two drugs or three drugs that were interacting in a beneficial way. We could have found new effects of drugs that neither of them has alone, but together, instead of causing a side effect, they could be a new and novel treatment for diseases that don ’ t have treatments or where the treatments are not effective. If we think about drug treatment today, all the major breakthroughs — for HIV, for tuberculosis, for depression, for diabetes — it ’ s always a cocktail of drugs. And so the upside here, and the **subject** for a different TED Talk on a different day, is how can we use the same data sources to find good effects of drugs in combination that will provide us new treatments, new insights into how drugs work and enable us to take care of our patients even better? Thank you very much.

I thought I would read poems I have that relate to the **subject** of youth and age. I was sort of astonished to find out how many I have actually. The first one is dedicated to Spencer, and his grandmother, who was shocked by his work. My poem is called”Dirt.”My grandmother is washing my mouth out with soap ; half a long century gone and still she comes at me with that thick cruel yellow bar. All because of a word I said, not even said really, only repeated. But”Open,”she says,”open up!”her hand clawing at my head. I know now her life was hard ; she lost three children as babies, then her husband died too, leaving young sons, and no money. She ’ d stand me in the sink to pee because there was never room in the toilet. But oh, her soap! Might its bitter burning have been what made me a poet? The street she lived on was unpaved, her flat, two cramped rooms and a fetid kitchen where she stalked and caught me. Dare I admit that after she did it I never really loved her again? She lived to a hundred, even then. All along it was the sadness, the squalor, but I never, until now loved her again. When that was published in a magazine I got an irate letter from my uncle.”You have maligned a great woman.”It took some diplomacy. This is called”The Dress.”It ’ s a longer poem. In those days, those days which exist for me only as the most elusive memory now, when often the first sound you ’ d hear in the morning would be a storm of birdsong, then the soft clop of the hooves of the horse hauling a milk wagon down your block, and the last sound at night as likely as not would be your father pulling up in his car, having worked late again, always late, and going heavily down to the cellar, to the furnace, to shake out the ashes and damp the draft before he came upstairs to fall into bed — in those long-ago days, women, my mother, my friends ’ mothers, our neighbors, all the women I knew — wore, often much of the day, what were called housedresses, cheap, printed, pulpy, seemingly purposefully shapeless light cotton shifts that you wore over your nightgown and, when you had to go look for a child, hang wash on the line, or run down to the grocery store on the corner, under a coat, the twisted hem of the nightgown always lank and yellowed, dangling beneath. More than the curlers some of the women seemed constantly to have in their hair in preparation for some great event — a ball, one would think — that never came to pass ; more than the way most women ’ s faces not only were never made up during the day, but seemed scraped, bleached, and, with their plucked eyebrows, scarily masklike ; more than all that it was those dresses that made women so unknowable and forbidding, adepts of enigmas to which men could have no access, and boys no conception. Only later would I see the dresses also as a proclamation : that in your dim kitchen, your laundry, your bleak concrete yard, what you revealed of yourself was a fabulation ; your real sensual nature, veiled in those sexless vestments, was utterly your dominion. In those days, one hid much else as well : grown men didn ’ t embrace one another, unless someone had died, and not always then ; you shook hands or, at a ball game, thumped your friend ’ s back and exchanged **blows** meant to be codes for affection ; once out of childhood you ’ d never again know the shock of your father ’ s whiskers on your cheek, not until mores at last had evolved, and you could hug another man, then hold on for a moment, then even kiss. What release finally, the embrace : though we were wary — it seemed so audacious — how much unspoken joy there was in that affirmation of equality and communion, no matter how much misunderstanding and pain had passed between you by then. We knew so little in those days, as little as now, I suppose about healing those hurts : even the women, in their best dresses, with beads and sequins sewn on the bodices, even in lipstick and mascara, their hair aflow, could only stand wringing their hands, begging for peace, while father and son, like thugs, like thieves, like Romans, simmered and hissed and hated, inflicting sorrows that endured, the worst anyway, through the kiss and embrace, bleeding from brother to brother, into the generations. In those days there was still countryside close to the city, farms, cornfields, cows ; even not far from our building with its blurred brick and long shadowy hallway you could find tracts with hills and trees you could pretend were mountains and forests. Or you could go out by yourself even to a half-block-long empty lot, into the bushes : like a creature of leaves you ’ d lurk, crouched, crawling, simplified, savage, alone ; already there was wanting to be simpler, wanting, when they called you, never to go back. This is another longish one, about the old and the young. It actually happened right at the time we met. Part of the poem takes place in space we shared and time we shared. It ’ s called”The Neighbor.”Her five horrid, deformed little dogs who incessantly yap on the roof under my window. Her cats, God knows how many, who must piss on her rugs — her landing ’ s a sickening reek. Her shadow once, fumbling the chain on her door, then the door slamming fearfully shut, only the barking and the music — jazz — filtering as it does, day and night into the hall. The time it was Chris Connor singing”Lush Life”— how it brought back my college sweetheart, my first real love, who — till I left her — played the same record. And head on my shoulder, hand on my thigh, sang sweetly along, of regrets and depletions she was too young for, as I was too young, later, to believe in her pain. It startled, then bored, then repelled me. My starting to fancy she ’ d ended up in this fire-trap in the Village, that my neighbor was her. My thinking we ’ d meet, recognize one another, become friends, that I ’ d accomplish a penance. My seeing her, it wasn ’ t her, at the mailbox. Gray-yellow hair, army pants under a nightgown, her turning away, hiding her ravaged face in her hands, muttering an inappropriate”Hi.”Sometimes there are frightening goings-on in the stairwell. A man shouting,”Shut up!”The dogs frantically snarling, claws scrabbling, then her — her voice hoarse, harsh, hollow, almost only a tone, incoherent, a note, a squawk, bone on metal, metal gone molten, calling them back,”Come back darlings, come back dear ones. My sweet angels, come back.”Medea she was, next time I saw her. Sorceress, tranced, ecstatic, stock-still on the sidewalk ragged coat hanging agape, passersby flowing around her, her mouth torn suddenly open as though in a scream, silently though, as though only in her brain or breast had it erupted. A cry so pure, practiced, detached, it had no need of a voice, or could no longer bear one. These invisible links that allure, these transfigurations, even of anguish, that hold us. The girl, my old love, the last lost time I saw her when she came to find me at a party, her drunkenly stumbling, falling, sprawling, skirt hiked, eyes veined red, swollen with tears, her shame, her dishonor. My ignorant, arrogant coarseness, my secret pride, my turning away. Still life on a rooftop, dead trees in barrels, a bench broken, dogs, excrement, sky. What pathways through pain, what junctures of vulnerability, what crossings and counterings? Too many lives in our lives already, too many chances for sorrow, too many unaccounted-for pasts.”Behold me,”the god of frenzied, inexhaustible love says, rising in bloody splendor,”Behold me.”Her making her way down the littered vestibule stairs, one agonized step at a time. My holding the door. Her crossing the fragmented tiles, faltering at the step to the street, droning, not looking at me,”Can you help me?”Taking my arm, leaning lightly against me. Her wavering step into the world. Her whispering,”Thanks love.”Lightly, lightly against me. I think I ’ ll lighten up a little. Another, different kind of poem of youth and age. It ’ s called”Gas.”Wouldn ’ t it be nice, I think, when the blue-haired lady in the doctor ’ s waiting room bends over the magazine table and farts, just a little, and violently blushes. Wouldn ’ t it be nice if intestinal gas came embodied in visible clouds, so she could see that her really quite inoffensive pop had only barely grazed my face before it drifted away. Besides, for this to have happened now is a nice coincidence. Because not an hour ago, while we were on our walk, my dog was startled by a backfire and jumped straight up like a horse bucking. And that brought back to me the stable I worked on weekends when I was 12, and a splendid piebald stallion, who whenever he was mounted would buck just like that, though more hugely of course, enormous, gleaming, resplendent. And the woman, her face abashedly buried in her”Elle”now, reminded me — I ’ d forgotten that not the least part of my awe consisted of the fact that with every jump he took the horse would powerfully fart. Phwap! Phwap! Phwap! Something never mentioned in the dozens of books about horses and their riders I devoured in those days. All that savage grandeur, the steely glinting hooves, the eruptions driven from the creature ’ s mighty innards, breath stopped, heart stopped, nostrils madly flared, I didn ’ t know if I wanted to break him, or be him. This is called”Thirst.”Many — most of my poems actually are urban poems. I happen to be reading a bunch that aren ’ t.”Thirst.”Here was my relation with the woman who lived all last autumn and winter, day and night, on a bench in the 103rd Street subway station, until finally one day she vanished. We regarded each other, scrutinized one another. Me shyly, obliquely, trying not to be furtive. She boldly, unblinkingly, even pugnaciously, wrathfully even, when her bottle was empty. I was frightened of her. I felt like a child. I was afraid some repressed part of myself would go out of control, and I ’ d be forever entrapped in the shocking seethe of her stench. Not excrement merely, not merely surface and orifice going unwashed, rediffusion of rum, there was will in it, and intention, power and purpose — a social, ethical rage and rebellion — despair too, though, grief, loss. Sometimes I ’ d think I should take her home with me, bathe her, comfort her, dress her. She wouldn ’ t have wanted me to, I would think. Instead, I ’ d step into my train. How rich I would think, is the lexicon of our self-absolving. How enduring, our bland fatal assurance that reflection is righteousness being accomplished. The dance of our glances, the clash, pulling each other through our perceptual punctures, then holocaust, holocaust, host on host of ill, injured presences, squandered, consumed. Her vigil somewhere I know continues. Her occupancy, her absolute, faithful attendance. The dance of our glances, challenge, abdication, effacement, the perfume of our consternation. This is a newer poem, a brand new poem. The title is”This Happened.”A student, a young woman in a fourth-floor hallway of her lycee, perched on the ledge of an open window chatting with friends between classes ; a teacher passes and chides her,”Be careful, you might fall,”almost banteringly chides her,”You might fall,”and the young woman, 18, a girl really, though she wouldn ’ t think that, as brilliant as she is, first in her class, and”Beautiful, too,”she ’ s often told, smiles back, and leans into the open window, which wouldn ’ t even be open if it were winter — if it were winter someone would have closed it — leans into the window, farther, still smiling, farther and farther, though it takes less time than this, really an instant, and lets herself fall. Herself fall. A casual impulse, a fancy, never thought of until now, hardly thought of even now... No, more than impulse or fancy, the girl knows what she ’ s doing, the girl means something, the girl means to mean, because it occurs to her in that instant, that beautiful or not, bright yes or no, she ’ s not who she is, she ’ s not the person she is, and the reason, she suddenly knows, is that there ’ s been so much premeditation where she is, so much plotting and planning, there ’ s hardly a person where she is, or if there is, it ’ s not her, or not wholly her, it ’ s a self inhabited, lived in by her, and seemingly even as she thinks it she knows what ’ s been missing : grace, not premeditation but grace, a kind of being in the world spontaneously, with grace. Weightfully upon me was the world. Weightfully this self which graced the world yet never wholly itself. Weightfully this self which weighed upon me, the release from which is what I desire and what I achieve. And the girl remembers, in this infinite instant already now so many times divided, the sadness she felt once, hardly knowing she felt it, to merely inhabit herself. Yes, the girl falls, absurd to fall, even the earth with its compulsion to take unto itself all that falls must know that falling is absurd, yet the girl falling isn ’ t myself, or she is myself, but a self I took of my own volition unto myself. Forever. With grace. This happened. I ’ ll read just one more. I don ’ t usually say that. I like to just end. But I ’ m afraid that Ricky will come out here and shake his fist at me. This is called”Old Man,”appropriately enough.”Special : big tits,”Says the advertisement for a soft-core magazine on our neighborhood newsstand. But forget her breasts. A lush, fresh-lipped blond, skin glowing gold, sprawls there, resplendent. 60 nearly, yet these hardly tangible, hardly better than harlots, can still stir me. Maybe a coming of age in the American sensual darkness, never seeing an unsmudged nipple, an uncensored vagina, has left me forever infected with an unquenchable lust of the eye. Always that erotic murmur, I ’ m hardly myself if I ’ m not in a state of incipient desire. God knows though, there are worse twists your obsessions can take. Last year in Israel, a young ultra-orthodox Rabbi guiding some teenage girls through the Shrine of the Shoah forbade them to look in one room. Because there were images in it he said were licentious. The display was a photo. Men and women stripped naked, some trying to cover their genitals, others too frightened to bother, lined up in snow waiting to be shot and thrown into a ditch. The girls, to my horror, averted their gaze. What carnal mistrust had their teacher taught them. Even that though. Another confession : Once in a book on pre-war Poland, a studio portrait, an absolute angel, an absolute angel with tormented, tormenting eyes. I kept finding myself at her page. That she died in the camps made her — I didn ’ t dare wonder why — more present, more precious. Died in the camps, that too people — or Jews anyway — kept from their children back then. But it was like sex, you didn ’ t have to be told. Sex and death, how close they can seem. So constantly conscious now of death moving towards me, sometimes I think I confound them. My wife ’ s loveliness almost consumes me. My passion for her goes beyond reasonable bounds. When we make love, her holding me everywhere all around me, I ’ m there and not there. My mind teems, jumbles of faces, voices, impressions, I live my life over, as though I were drowning. Then I am drowning, in despair at having to leave her, this, everything, all, unbearable, awful. Still, to be able to die with no special contrition, not having been slaughtered, or enslaved. And not having to know history ’ s next mad rage or regression, it might be a relief. No. Again, no. I don ’ t mean that for a moment. What I mean is the world holds me so tightly — the good and the bad — my own follies and weakness that even this counterfeit Venus with her sham heat, and her bosom probably plumped with gel, so moves me my breath catches. Vamp. Siren. Seductress. How much more she reveals in her glare of ink than she knows. How she incarnates our desperate human need for regard, our passion to live in beauty, to be beauty, to be cherished by glances, if by no more, of something like love, or love. Thank you.

I ’ d like to do pretty much what I did the first time, which is to choose a lighthearted theme. Last time, I talked about death and dying. This time, I ’ m going to talk about mental illness. But it has to be technological, so I ’ ll talk about electroshock therapy. You know, ever since man had any notion that some of his other people, his colleagues, could be different, could be strange, could be severely depressed or what we now recognize as schizophrenia, he was certain that this kind of illness had to come from evil spirits getting into the body. So, the way of treating these diseases in early times was to, in some way or other, exorcise those evil spirits, and this is still going on, as you know. But it wasn ’ t enough to use the priests. When medicine became somewhat scientific, in about 450 BC, with Hippocrates and those boys, they tried to look for herbs, plants that would literally shake the bad spirits out. So, they found certain plants that could cause convulsions. And the herbals, the botanical books of up to the late Middle Ages, the Renaissance are filled with prescriptions for causing convulsions to shake the evil spirits out. Finally, in about the sixteenth century, a physician whose name was Theophrastus Bombastus Aureolus von Hohenheim, called Paracelsus, a name probably familiar to some people here — — good, old Paracelsus found that he could predict the degree of convulsion by using a measured amount of camphor to produce the convulsion. Can you imagine going to your closet, pulling out a mothball, and chewing on it if you ’ re feeling depressed? It ’ s better than Prozac, but I wouldn ’ t recommend it. So what we see in the seventeenth, eighteenth century is the continued search for medications other than camphor that ’ ll do the trick. Well, along comes Benjamin Franklin, and he comes close to convulsing himself with a bolt of electricity off the end of his kite. And so people begin thinking in terms of electricity to produce convulsions. And then, we fast-forward to about 1932, when three Italian psychiatrists, who were largely treating depression, began to notice among their patients, who were also epileptics, that if they had an epileptic — a series of epileptic fits, a lot of them in a row — the depression would very frequently lift. Not only would it lift, but it might never return. So they got very interested in producing convulsions, measured types of convulsions. And they thought,”Well, we ’ ve got electricity, we ’ ll plug somebody into the wall. That always makes hair stand up and people shake a lot.”So, they tried it on a few pigs, and none of the pigs were killed. So, they went to the police and they said,”We know that at the Rome railroad station, there are all these lost souls wandering around, muttering gibberish. Can you bring one of them to us?”Someone who is, as the Italians say,”cagoots.”So they found this”cagoots”guy, a 39-year-old man who was really hopelessly schizophrenic, who was known, had been known for months, to be literally defecating on himself, talking nothing that made any sense, and they brought him into the hospital. So these three psychiatrists, after about two or three weeks of observation, laid him down on a table, connected his temples to a very small source of current. They thought,”Well, we ’ ll try 55 volts, two-tenths of a second. That ’ s not going to do anything terrible to him.”So they did that. Well, I have the following from a firsthand observer, who told me this about 35 years ago, when I was thinking about these things for some research project of mine. He said,”This fellow”— remember, he wasn ’ t even put to sleep —”after this major grand mal convulsion, sat right up, looked at these three fellas and said, ’ What the fuck are you assholes trying to do? ’”If I could only say that in Italian. Well, they were happy as could be, because he hadn ’ t said a rational word in the weeks of observation. So they plugged him in again, and this time they used 110 volts for half a second. And to their amazement, after it was over, he began speaking like he was perfectly well. He relapsed a little bit, they gave him a series of treatments, and he was essentially cured. But of course, having schizophrenia, within a few months, it returned. But they wrote a paper about this, and everybody in the Western world began using electricity to convulse people who were either schizophrenic or severely depressed. It didn ’ t work very well on the schizophrenics, but it was pretty clear in the ’ 30s and by the middle of the ’ 40s that electroconvulsive therapy was very, very effective in the treatment of depression. And of course, in those days, there were no antidepressant drugs, and it became very, very popular. They would anesthetize people, convulse them, but the real difficulty was that there was no way to paralyze muscles. So people would have a real grand mal seizure. Bones were broken. Especially in old, fragile people, you couldn ’ t use it. And then in the 1950s, late 1950s, the so-called muscle relaxants were developed by pharmacologists, and it got so that you could induce a complete convulsion, an electroencephalographic convulsion — you could see it on the brain waves — without causing any convulsion in the body except a little bit of twitching of the toes. So again, it was very, very popular and very, very useful. Well, you know, in the middle ’ 60s, the first antidepressants came out. Tofranil was the first. In the late ’ 70s, early ’ 80s, there were others, and they were very effective. And patients ’ rights groups seemed to get very upset about the kinds of things that they would witness. And so the whole idea of electroconvulsive, electroshock therapy disappeared, but has had a renaissance in the last 10 years. And the reason that it has had a renaissance is that probably about 10 percent of the people, severe depressives, do not respond, regardless of what is done for them. Now, why am I telling you this story at this meeting? I ’ m telling you this story, because actually ever since Richard called me and asked me to talk about — as he asked all of his speakers — to talk about something that would be new to this audience, that we had never talked about, never written about, I ’ ve been planning this moment. This reason really is that I am a man who, almost 30 years ago, had his life saved by two long courses of electroshock therapy. And let me tell you this story. I was, in the 1960s, in a marriage. To use the word bad would be perhaps the understatement of the year. It was dreadful. There are, I ’ m sure, enough divorced people in this room to know about the hostility, the anger, who knows what. Being someone who had had a very difficult childhood, a very difficult adolescence — it had to do with not quite poverty but close. It had to do with being brought up in a family where no one spoke English, no one could read or write English. It had to do with death and disease and lots of other things. I was a little prone to depression. So, as things got worse, as we really began to hate each other, I became progressively depressed over a period of a couple of years, trying to save this marriage, which was inevitably not to be saved. Finally, I would schedule — all my major surgical cases, I was scheduling them for 12, one o ’ clock in the afternoon, because I couldn ’ t get out of bed before about 11 o ’ clock. And anybody who ’ s been depressed here knows what that ’ s like. I couldn ’ t even pull the covers off myself. Well, you ’ re in a university medical center, where everybody knows everybody, and it ’ s perfectly clear to my colleagues, so my referrals began to decrease. As my referrals began to decrease, I clearly became increasingly depressed until I thought, my God, I can ’ t work anymore. And, in fact, it didn ’ t make any difference because I didn ’ t have any patients anymore. So, with the advice of my physician, I had myself admitted to the acute care psychiatric unit of our university hospital. And my colleagues, who had known me since medical school in that place, said,”Don ’ t worry, chap. Six weeks, you ’ re back in the operating room. Everything ’ s going to be great.”Well, you know what bovine stercus is? That proved to be a lot of bovine stercus. I know some people who got tenure in that place with lies like that. So I was one of their failures. But it wasn ’ t that simple. Because by the time I got out of that unit, I was not functional at all. I could hardly see five feet in front of myself. I shuffled when I walked. I was bowed over. I rarely bathed. I sometimes didn ’ t shave. It was dreadful. And it was clear — not to me, because nothing was clear to me at that time anymore — that I would need long-term hospitalization in that awful place called a mental hospital. So I was admitted, in 1973, in the spring of 1973, to the Institute of Living, which used to be called the Hartford Retreat. It was founded in the eighteenth century, the largest psychiatric hospital in the state of Connecticut, other than the huge public hospitals that existed at that time. And they tried everything they had. They tried the usual psychotherapy. They tried every medication available in those days. And they did have Tofranil and other things — Mellaril, who knows what. Nothing happened except that I got jaundiced from one of these things. And finally, because I was well known in Connecticut, they decided they better have a meeting of the senior staff. All the senior staff got together, and I later found out what happened. They put all their heads together and they decided that there was nothing that could be done for this surgeon who had essentially separated himself from the world, who by that time had become so overwhelmed, not just with depression and feelings of worthlessness and inadequacy, but with obsessional thinking, obsessional thinking about coincidences. And there were particular numbers that every time I saw them, just got me dreadfully upset — all kinds of ritualistic observances, just awful, awful stuff. Remember when you were a kid, and you had to step on every line? Well, I was a grown man who had all of these rituals, and it got so there was a throbbing, there was a ferocious fear in my head. You ’ ve seen this painting by Edvard Munch, The Scream. Every moment was a scream. It was impossible. So they decided there was no therapy, there was no treatment. But there was one treatment, which actually had been pioneered at the Hartford hospital in the early 1940s, and you can imagine what it was. It was pre-frontal lobotomy. So they decided — I didn ’ t know this, again, I found this out later — that the only thing that could be done was for this 43-year-old man to have a pre-frontal lobotomy. Well, as in all hospitals, there was a resident assigned to my case. He was 27 years old, and he would meet with me two or three times a week. And of course, I had been there, what, three or four months at the time. And he asked to meet with the senior staff, and they agreed to meet with him because he was very well thought of in that place. They thought he had a really extraordinary future. And he dug in his heels and said,”No. I know this man better than any of you. I have met with him over and over again. You ’ ve just seen him from time to time. You ’ ve read reports and so forth. I really honestly believe that the basic problem here is pure depression, and all of the obsessional thinking comes out of it. And you know, of course, what ’ ll happen if you do a pre- frontal lobotomy. Any of the results along the spectrum, from pretty bad to terrible, terrible, terrible is going to happen. If he does the best he can, he will have no further obsessions, probably no depression, but his affect will be dulled, he will never go back to surgery, he will never be the loving father that he was to his two children, his life will be changed. If he has the usual result, he will end up like ’ One Flew Over the Cuckoo ’ s Nest. ’ And you know about that, just essentially in a stupor the rest of his life.”Well, he said,”Can ’ t we try a course of electroshock therapy?”And you know why they agreed? They agreed to humor him. They just thought,”Well, we ’ ll give a course of 10. And so we ’ ll lose a little time. Big deal. It doesn ’ t make any difference.”So they gave the course of 10, and the first — the usual course, incidentally, was six to eight and still is six to eight. Plugged me into the wires, put me to sleep, gave me the muscle relaxant. Six didn ’ t work. Seven didn ’ t work. Eight didn ’ t work. At nine, I noticed — and it ’ s wonderful that I could notice anything — I noticed a change. And at 10, I noticed a real change. And he went back to them, and they agreed to do another 10. Again, not a single one of them — I think there are about seven or eight of them — thought this would do any good. They thought this was a temporary change. But, lo and behold, by 16, by 17, there were demonstrable differences in the way I felt. By 18 and 19, I was sleeping through the night. And by 20, I had the sense, I really had the sense that I could overcome this, that I was now strong enough that by an act of will, I could **blow** the obsessional thinking away. I could **blow** the depression away. And I ’ ve never forgotten — I never will forget — standing in the kitchen of the unit, it was a Sunday morning in January of 1974, standing in the kitchen by myself and thinking,”I ’ ve got the strength now to do this.”It was as though those tightly coiled wires in my head had been disconnected and I could think clearly. But I need a formula. I need some thing to say to myself when I begin thinking obsessionally, obsessively. Well, the Gilbert and Sullivan fans in this room will remember”Ruddigore,”and they will remember Mad Margaret, and they will remember that she was married to a fellow named Sir Despard Murgatroyd. And she used to go nuts, every five minutes or so in the play, and he said to her,”We must have a word to bring you back to reality, and the word, my dear, will be ’ Basingstoke. ’”So every time she got a little nuts, he would say,”Basingstoke!”And she would say,”Basingstoke, it is.”And she would be fine for a little while. Well, you know, I ’ m from the Bronx. I can ’ t say”Basingstoke.”But I had something better. And it was very simple. It was,”Ah, fuck it!”Much better than”Basingstoke,”at least for me. And it worked — my God, it worked. Every time I would begin thinking obsessionally — again, once more, after 20 shock treatments — I would say,”Ah, fuck it.”And things got better and better, and within three or four months, I was discharged from that hospital, and I joined a group of surgeons where I could work with other people in the community, not in New Haven, but fairly close by. I stayed there for three years. At the end of three years, I went back to New Haven, had remarried by that time. I brought my wife with me, actually, to make sure I could get through this. My children came back to live with us. We had two more children after that. Resuscitated the career, even better than it had been before. Went right back into the university and began to write books. Well, you know, it ’ s been a wonderful life. It ’ s been, as I said, close to 30 years. I stopped doing surgery about six years ago and became a full-time writer, as many people know. But it ’ s been very exciting. It ’ s been very happy. Every once in a while, I have to say,”Ah, fuck it.”Every once in a while, I get somewhat depressed and a little obsessional. So, I ’ m not free of all of this. But it ’ s worked. It ’ s always worked. Why have I chosen, after never, ever talking about this, to talk about it now? Well, those of you who know some of these books know that one is about death and dying, one is about the human body and the human spirit, one is about the way mystical thoughts are constantly in our minds, and they have always to do with my own personal experiences. One might think reading these books — and I ’ ve gotten thousands of letters about them by people who do think this — that based on my life ’ s history as I ’ ve portrayed in the books, my early life ’ s history, I am someone who has overcome adversity. That I am someone who has drunk, drank, drunk of the bitter dregs of near-disaster in childhood and emerged not just unscathed but strengthened. I really have it figured out, so that I can advise people about death and dying, so that I can talk about mysticism and the human spirit. And I ’ ve always felt guilty about that. I ’ ve always felt that somehow I was an impostor because my readers don ’ t know what I have just told you. It ’ s known by some people in New Haven, obviously, but it is not generally known. So one of the reasons that I have come here to talk about this today is to — frankly, selfishly — unburden myself and let it be known that this is not an untroubled mind that has written all of these books. But more importantly, I think, is the fact that a very significant proportion of people in this audience are under 30, and there are many, of course, who are well over 30. For people under 30, and it looks to me like almost all of you — I would say all of you — are either on the cusp of a magnificent and exciting career or right into a magnificent and exciting career : anything can happen to you. Things change. Accidents happen. Something from childhood comes back to haunt you. You can be thrown off the track. I hope it happens to none of you, but it will probably happen to a small percentage of you. To those to whom it doesn ’ t happen, there will be adversities. If I, with the bleakness of spirit, with no spirit, that I had in the 1970s and no possibility of recovery, as far as that group of very experienced psychiatrists thought, if I can find my way back from this, believe me, anybody can find their way back from any adversity that exists in their lives. And for those who are older, who have lived through perhaps not something as bad as this, but who have lived through difficult times, perhaps where they lost everything, as I did, and started out all over again, some of these things will seem very familiar. There is recovery. There is redemption. And there is resurrection. There are resurrection themes in every society that has ever been studied, and it is because not just only do we fantasize about the possibility of resurrection and recovery, but it actually happens. And it happens a lot. Perhaps the most popular resurrection theme, outside of specifically religious ones, is the one about the phoenix, the ancient story of the phoenix, who, every 500 years, resurrects itself from its own ashes to go on to live a life that is even more beautiful than it was before. Richard, thanks very much.

I coined my own definition of success in 1934, when I was teaching at a high school in South Bend, Indiana, being a little bit disappointed, and [disillusioned] perhaps, by the way parents of the youngsters in my English classes expected their youngsters to get an A or a B. They thought a C was all right for the neighbors ’ children, because they were all average. But they weren ’ t satisfied when their own — it would make the teacher feel that they had failed, or the youngster had failed. And that ’ s not right. The good Lord in his infinite wisdom didn ’ t create us all equal as far as intelligence is concerned, any more than we

’ re equal for size, appearance. Not everybody could earn an A or a B, and I didn ’ t like that way of judging, and I did know how the alumni of various schools back in the ’ 30s judged coaches and athletic teams. If you won them all, you were considered to be reasonably successful — not completely. Because I found out — we had a number of years at UCLA where we didn ’ t lose a game. But it seemed that we didn ’ t win each individual game by the margin that some of our alumni had predicted — And quite frequently I really felt that they had backed up their predictions in a more materialistic manner. But that was true back in the 30s, so I understood that. But I didn ’ t like it, I didn ’ t agree with it. I wanted to come up with something I hoped could make me a better teacher, and give the youngsters under my supervision, be it in athletics or the English classroom, something to which to aspire, other than just a higher mark in the classroom, or more points in some athletic contest. I thought about that for quite a spell, and I wanted to come up with my own definition. I thought that might help. And I knew how Mr. Webster defined it, as the accumulation of material possessions or the attainment of a position of power or prestige, or something of that sort, worthy accomplishments perhaps, but in my opinion, not necessarily indicative of success. So I wanted to come up with something of my own. And I recalled — I was raised on a small farm in Southern Indiana, and Dad tried to teach me and my brothers that you should never try to be better than someone else. I ’ m sure at the time he did that, I didn ’ t — it didn ’ t — well, somewhere, I guess in the hidden recesses of the mind, it popped out years later. Never try to be better than someone else, always learn from others. Never cease trying to be the best you can be — that ’ s under your control. If you get too engrossed and involved and concerned in regard to the things over which you have no control, it will adversely affect the things over which you have control. Then I ran across this simple verse that said,”At God ’ s footstool to confess, a poor soul knelt, and bowed his head. ’ I failed! ’ he cried. The Master said, ’ Thou didst thy best, that is success. ’”From those things, and one other perhaps, I coined my own definition of success, which is : Peace of mind attained only through self-satisfaction in knowing you made the effort to do the best of which you ’ re capable. I believe that ’ s true. If you make the effort to do the best of which you ’ re capable, trying to improve the situation that exists for you, I think that ’ s success, and I don ’ t think others can judge that ; it ’ s like character and reputation — your reputation is what you ’ re perceived to be ; your character is what you really are. And I think that character is much more important than what you are perceived to be. You ’ d hope they ’ d both be good, but they won ’ t necessarily be the same. Well, that was my idea that I was going to try to get across to the youngsters. I ran across other things. I love to teach, and it was mentioned by the previous speaker that I enjoy poetry, and I dabble in it a bit, and love it. There are some things that helped me, I think, be better than I would have been. I know I ’ m not what I ought to be, what I should be, but I think I ’ m better than I would have been if I hadn ’ t run across certain things. One was just a little verse that said,”No written word, no spoken plea can teach our youth what they should be ; nor all the books on all the shelves — it ’ s what the teachers are themselves.”That made an impression on me in the 1930s. And I tried to use that more or less in my teaching, whether it be in sports, or whether it be in the English classroom. I love poetry and always had an interest in that somehow. Maybe it ’ s because Dad used to read to us at night, by coal oil lamp — we didn ’ t have electricity in our farm home. And Dad would read poetry to us. So I always liked it. And about the same time I ran across this one verse, I ran across another one. Someone asked a lady teacher why she taught, and after some time, she said she wanted to think about that. Then she came up and said,”They ask me why I teach, and I reply,

’ Where could I find such splendid company? ’ There sits a statesman, strong, unbiased, wise ; another Daniel Webster, silver-tongued. A doctor sits beside him, whose quick, steady hand may mend a bone, or stem the life-blood ’ s flow. And there a builder ; upward rise the arch of a church he builds, wherein that minister may speak the word of God, and lead a stumbling soul to touch the Christ. And all about, a gathering of teachers, farmers, merchants, laborers — those who work and vote and build and plan and pray into a great tomorrow. And I may say, I may not see the church, or hear the word, or eat the food their hands may grow, but yet again I may ; And later I may say, I knew him once, and he was weak, or strong, or bold or proud or gay. I knew him once, but then he was a boy. They ask me why I teach and I reply, ’ Where could I find such splendid company? ’”And I believe the teaching profession — it ’ s true, you have so many youngsters, and I ’ ve got to think of my youngsters at UCLA — 30-some attorneys, 11 dentists and doctors, many, many teachers and other professions. And that gives you a great deal of pleasure, to see them go on. I always tried to make the youngsters feel that they ’ re there to get an education, number one ; basketball was second, because it was paying their way, and they do need a little time for social activities, but you let social activities take a little precedence over the other two, and you ’ re not going to have any very long. So that was the idea that I tried to get across to the youngsters under my supervision. I had three rules, pretty much, that I stuck with practically all the time. I ’ d learned these prior to coming to UCLA, and I decided they were very important. One was”Never be late.”Later on I said certain things — the players, if we were leaving for somewhere, had to be neat and clean. There was a time when I made them wear jackets and shirts and ties. Then I saw our chancellor coming to school in denims and turtlenecks, and thought, it ’ s not right for me to keep this other [rule] so I let them just — they had to be neat and clean. I had one of my greatest players that you probably heard of, Bill Walton. He came to catch the bus ; we were leaving for somewhere to play. And he wasn ’ t clean and neat, so I wouldn ’ t let him go. He couldn ’ t get on the bus, he had to go home and get cleaned up to get to the airport. So I was a stickler for that. I believed in that. I believe in time ; very important. I believe you should be on time, but I felt at practice, for example — we start on time, we close on time. The youngsters didn ’ t have to feel that we were going to keep them over. When I speak at coaching clinics, I often tell young coaches — and at coaching clinics, more or less, they ’ ll be the younger coaches getting in the profession. Most of them are young, you know, and probably newly-married. And I tell them,”Don ’ t run practices late, because you ’ ll go home in a bad mood, and that ’ s not good, for a young married man to go home in a bad mood. When you get older, it doesn ’ t make any difference, but —”So I did believe : on time. I believe starting on time, and I believe closing on time. And another one I had was, not one word of profanity. One word of profanity, and you are out of here for the day. If I see it in a game, you ’ re going to come out and sit on the bench. And the third one was, never criticize a teammate. I didn ’ t want that. I used to tell them I was paid to do that. That ’ s my job. I ’ m paid to do it. Pitifully poor, but I am paid to do it. Not like the coaches today, for gracious sakes, no. It ’ s a little different than it was in my day. Those were three things that I stuck with pretty closely all the time. And those actually came from my dad. That ’ s what he tried to teach me and my brothers at one time. I came up with a pyramid eventually, that I don ’ t have the time to go on that. But that helped me, I think, become a better teacher. It ’ s something like this : And I had blocks in the pyramid, and the cornerstones being industriousness and enthusiasm, working hard and enjoying what you ’ re doing, coming up to the apex, according to my definition of success. And right at the top, faith and patience. And I say to you, in whatever you ' re doing, you must be patient. You have to have patience to — we want things to happen. We talk about our youth being impatient a lot, and they are. They want to change everything. They think all change is progress. And we get a little older — we sort of let things go. And we forget there is no progress without change. So you must have patience, and I believe that we must have faith. I believe that we must believe, truly believe. Not just give it word service, believe that things will work out as they should, providing we do what we should. I think our tendency is to hope things will turn out the way we want them to much of the time, but we don ' t do the things that are necessary to make those things become reality. I worked on this for some 14 years, and I think it helped me become a better teacher. But it all revolved around that original definition of success. You know, a number of years ago, there was a Major League Baseball umpire by the name of George Moriarty. He spelled Moriarty with only one ' i '. I ' d never seen that before, but he did. Big league baseball players — they ' re very perceptive about those things, and they noticed he had only one ' i ' in his name. You ' d be surprised how many also told him that that was one more than he had in his head at various times. But he wrote something where I think he did what I tried to do in this pyramid. He called it"The Road Ahead, or the Road Behind."He said,"Sometimes I think the Fates must grin as we denounce them and insist the only reason we can ' t win, is the Fates themselves have missed. Yet there lives on the ancient claim : we win or lose within ourselves. The shining trophies on our shelves can never win tomorrow ' s game. You and I know deeper down, there ' s always a chance to win the crown. But when we fail to give our best, we simply haven ' t met the test, of giving all and saving none until the game is really won ; of showing what is meant by grit ; of playing through when others quit ; of playing through, not letting up. It ' s bearing down that wins the cup. Of dreaming there ' s a goal ahead ; of hoping when our dreams are dead ; of praying when our hopes have fled ; yet losing, not afraid to fall, if, bravely, we have given all. For who can ask more of a man than giving all within his span. Giving all, it seems to me, is not so far from victory. And so the Fates are seldom wrong, no matter how they twist and wind. It ' s you and I who make our fates — we open up or close the gates on the road ahead or the road behind."Reminds me of another set of threes that my dad tried to get across to us : Don ' t whine. Don ' t complain. Don ' t make excuses. Just get out there, and whatever you ' re doing, do it to the best of your ability. And no one can do more than that. I tried to get across, too, that — my opponents will tell you — you never heard me mention winning. Never mention winning. My idea is that you can lose when you outscore somebody in a game, and you can win when you ' re outscored. I ' ve felt that way on certain occasions, at various times. And I just wanted them to be able to hold their head up after a game. I used to say that when a game is over, and you see somebody that didn ' t know the outcome, I hope they couldn ' t tell by your actions whether you outscored an opponent or the opponent outscored you. That ' s what really matters : if you make an effort to do the best you can regularly, the results will be about what they should be. Not necessarily what you ' d want them to be but they ' ll be about what they should ; only you will know whether you can do that. And that ' s what I wanted from them more than anything else. And as time went by, and I learned more about other things, I think it worked a little better, as far as the results. But I wanted the score of a game to be the byproduct of these other things, and not the end itself. I believe it was one great philosopher who said — no, no — Cervantes. Cervantes said,"The journey is better than the end."And I like that. I think that it is — it ' s getting there. Sometimes when you get there, there ' s almost a let down. But it ' s the getting there that ' s the fun. As a basketball coach at UCLA, I liked our practices to be the journey, and the game would be the end, the end result. I liked to go up and sit in the stands and watch the players play, and see whether I ’ d done a decent job during the week. There again, it ’ s getting the players to get that self-satisfaction, in knowing that they ’ d made the effort to do the best of which they are capable. Sometimes I ’ m asked who was the best player I had, or the best teams. I can never answer that. As far as the individuals are concerned — I was asked one time about that, and they said,”Suppose that you, in some way, could make the perfect player. What would you want?”And I said,”Well, I ’ d want one that knew why he was at UCLA : to get an education, he was a good student, really knew why he was there in the first place. But I ’ d want one that could play, too. I ’ d want one to realize that defense usually wins championships, and who would work hard on defense. But I ’ d want one who would play offense, too. I ’ d want him to be unselfish, and look for the pass first and not shoot all the time. And I ’ d want one that could pass and would pass. I ’ ve had some that could and wouldn ’ t, and I ’ ve had some that would and could. So, yeah, I ’ d want that. And I wanted them to be able to shoot from the outside. I wanted them to be good inside too. I ’ d want them to be able to rebound well at both ends, too. Why not just take someone like Keith Wilkes and let it go at that. He had the qualifications. Not the only one, but he was one that I used in that particular category, because I think he made the effort to become the best. There was a couple. I mention in my book,”They Call Me Coach,”two players that gave me great satisfaction, that came as close as I think anyone I ever had to reach their full potential : one was Conrad Burke, and one was Doug McIntosh. When I saw them as freshmen, on our freshmen team — freshmen couldn ’ t play varsity when I taught. I thought,”Oh gracious, if these two players, either one of them”— they were different years, but I thought about each one at the time he was there —”Oh, if he ever makes the varsity, our varsity must be pretty miserable, if he ’ s good enough to make it.”And you know, one of them was a starting player for a season and a half. The other one, his next year, played 32 minutes in a national championship game, Did a tremendous job for us. The next year, he was a starting player on the national championship team, and here I thought he ’ d never play a minute, when he was — so those are the things that give you great joy, and great satisfaction to see. Neither one of those youngsters could shoot very well. But they had outstanding shooting percentages, because they didn ’ t force it. And neither one could jump very well, but they kept good position, and so they did well rebounding. They remembered that every shot that ’ s taken, they assumed would be missed. I ’ ve had too many stand around and wait to see if it ’ s missed, then they go and it ’ s too late, somebody else is in there ahead of them. They weren ’ t very quick, but they played good position, kept in good balance. And so they played pretty good defense for us. So they had qualities that — they came close to — as close to reaching possibly their full potential as any players I ever had. So I consider them to be as successful as Lewis Alcindor or Bill Walton, or many of the others that we had ; there were some outstanding players. Have I rambled enough? I was told that when he makes his appearance, I was supposed to shut up.

Text Sample 779: NEG Dim 5 – 2022 – Score -1.00 – 2022/t003570.txt

About a decade ago, I met someone who had experienced a few episodes of schizophrenia. They had felt that their sense of self, of what it feels like to be them, changing somewhat. The boundaries of their body began to feel a bit nebulous. Even their psychological self felt a bit porous at times. They were experiencing what could be called an altered sense of self. Over the years, I met many such brave and insightful people who shared what it ’ s like to live with their altered selves. And by”altered,”I mean”different,”not”deficient,”while acknowledging that coping with altered selves can be a struggle at times. So speaking with them, and with theologians, philosophers, neuroscientists, I came to understand that this self that each one of us takes oneself to be is not as real as it seems. The self is a slippery **subject**. We all intuitively know what it means. It ’ s there when we wake up. It disappears when we fall asleep. It reappears in our dreams. It ’ s what makes us who we are. It seems solid, unchanging, permanent. And yet, we can examine aspects of the self that seem real to us, and ask,”Just how real are they?”Take, for instance, the question”Who am I?”The most likely answer you will get or give to such a question will be in the form of a story. We tell others – and indeed, ourselves – stories about who we are. We take our stories to be sacrosanct. We are our stories. But a condition that most of us, sadly, will be familiar with – Alzheimer ’ s disease – tells us something quite different. Alzheimer ’ s begins by affecting short-term memory. Think about what that does to someone ’ s story. In order for our stories to form, to grow, something that just happens to us has to first enter short-term memory, and then, get incorporated into what ’ s called long-term episodic memory. It has to become an episode in our narrative. But what if the experience doesn ’ t even enter short-term memory? That ’ s exactly what Alzheimer ’ s does. In the beginning, Alzheimer ’ s impairs the formation of short-term memory. It impairs the growth of the narrative. It ’ s as if our stories begin stalling upon the onset of the disease. Eventually, Alzheimer ’ s eats away at all the long-term memories. So if you were to meet someone with mid-stage Alzheimer ’ s, they will likely be able to tell you stories about who they are. But if you know their real stories, you ’ ll be able to tell that they sometimes scramble up their narrative, that they sometimes mix up the sequence of episodes from their lives. It ’ s as if they are recalling their own stories in ways that are not quite accurate. It ’ s important, at this stage, to realize that there is still a person experiencing that scrambled narrative. Sadly, Alzheimer ’ s goes on to destroy one ’ s narrative, and so much more. And towards the end, it ’ s unclear whether there is still someone experiencing something, because the person cannot communicate verbally anymore. And yet, Alzheimer ’ s tells us that these stories that we take ourselves to be, what philosophers call the”narrative self,”these are spun by the brain and body. They are constructions. Sometimes, the constructions are disrupted, even destroyed. And while that is horrific for the person experiencing it, and for their caregivers, it is nonetheless a window onto the constructed nature of our narrative self. And when the construction goes wrong, we perceive our own stories in ways that are not quite real. From the narrative self, let ’ s talk about our body. Let ’ s take a very basic aspect of our bodily self. This feeling we all have, that we are owners of our body and body parts, that our bodies and body parts belong to us. It seems such a strange thing to think that it could even be otherwise. If I were to ask you,”Does your hand belong to you?”you ’ re going to say,”Of course it does. What a foolish question.”But not everyone would agree. Early on in my research, a neuropsychologist alerted me to a condition called xenomelia, or foreign limb syndrome. You may have heard of something called phantom limb syndrome, in which people who have had an amputation feel the presence of that limb, sometimes. Xenomelia is somewhat of an opposite condition, where people feel like some part of their body – usually the extremities, their hands or legs – don ’ t belong to them. So this neuropsychologist talked of phantom limb syndrome as animation without incarnation. So the limb is gone, it ’ s not incarnate anymore, but it ’ s animated in your mind. And he talked of xenomelia as incarnation without animation. So the limb is present, healthy even, incarnate, and yet, in your own mind, it feels like it doesn ’ t belong to you. So in xenomelia, the brain and bodily processes that give rise to our sense of ownership of our body parts, they ’ re misfiring, so to speak, and the consequences can be serious. People with xenomelia will sometimes take extreme measures to get rid of, to amputate their foreign-seeming body parts. From the perspective of the self, though, xenomelia is telling us something very profound. It ’ s telling us that something as basic as the sense of ownership of our own body parts is a construction. And sometimes, the construction goes wrong, and we perceive our own bodies in ways that are not quite real. Let ’ s take another aspect of our bodily self. It ’ s called the sense of agency. So when I do something like pick up a cup, I have this implicit feeling that I am the agent of that action, that I have willed that action into existence. That feeling is the sense of agency. But someone with schizophrenia may not have that feeling, always. Someone with schizophrenia might do something and not feel like they are the agent of that action. So schizophrenia tells us that it is possible to be someone who does something but doesn ’ t have an accompanying sense of agency. So just like the narrative self and the sense of ownership of body parts, the sense of agency is also a construction, and it, too, can fail. So you can see where this is going. Let me take one more example to drive home this point. Let ’ s talk of what it feels to be a body here and now. Not the feeling of being a story, but the feeling of being a body in the present moment. Psychologists estimate that about five percent of the general population will, at some point in their lives, have an out-of-body experience. Let ’ s assume that all of us right now are having an in-body experience. But what that means is having this feeling of being in a body, being anchored to a body, occupying a certain volume of space and looking at the world from behind our eyes. But if you are having an out-of-body experience, you could possibly be feeling that you ’ re up near the ceiling, looking down at your own body sitting in the chair below. People do report such experiences, and mild versions of this have been replicated in labs. But if you think, like I do, that out-of-body experiences are the outcome of brain processes that are misfiring, then it stands to reason that the experience of being in-body, of being embodied, is itself a construction, and that, too, can come apart. So what are these experiences of altered selves telling us? They ’ re telling us that just about everything we take to be real about ourselves –”real”in the sense that we think we are always experiencing undeniable truths about our bodies, our stories – well, that ’ s just not the case. So when theologians and philosophers tell us that the self is an illusion, this is partly what they mean. You may have realized by now that there still remains the question of who or what is doing the experiencing, even in the case of altered selves. This experiencing”I”in the question”Who am I?”is at the heart of the debate about the self. This experiencing”I”doesn ’ t go away if one or a few aspects of the self are disrupted. But what if all of the aspects of the self that comprise us were to be disrupted? Would the experiencing”I”disappear? We don ’ t have a satisfactory answer to that question, yet. It ’ s possible that the experiencing”I”is also an illusion, in the sense of being a construction, a construction without a constructor. That debate, however, is somewhat unresolved. Despite such doubts, I, personally – whatever I am – think that the self has no reality outside of the brain and body. I think that the experiencing”I”will not persist after the body is gone. So what does one make of such knowledge? Well, firstly, these ideas will feel liberating to some and might sit heavily upon others. Regardless, I think we can all attend to the stories that we think we are. Our feelings and emotions are modulated by our stories, and in turn, our feelings and emotions become part of our stories. And our stories, our narratives, are not just cognitive – they live in our bodies, and our bodies structure and shape our stories. So knowing all this, recognizing the constructive nature of it all, maybe we can hold on less tightly to our stories. Maybe we can learn to let go. But that ’ s easier said than done, because the thing that is doing the letting go is also the thing that has to be let go of. Maybe we can just marvel at the efforts of people over millennia, from the Buddha sitting under the Bodhi tree to the modern philosopher and neuroscientist who has asked themselves the question”Who am I?”But most of all, I think we owe a debt to those amongst us who bravely bear witness to our altered selves – whether we do so voluntarily, like monks and nuns do when they meditate, or whether it ’ s brought upon us by biology and circumstance. There is something remarkably robust about the processes that give rise to the totality of our sense of self. But there ’ s something frighteningly fragile about them too. They can crack. And any one of us, at any time in our lives, may have to confront such cracks. And that knowledge, I believe, should make us empathetic towards those of us dealing with altered selves. But I also believe that altered selves should not be seen as the outcome of deficits, or as the outcome of a lack of attributes considered normal. They are different ways of being, and it ’ s the willingness of some of us to confront the self ’ s constructed nature that is helping make sense of the self for all of us. Thank you. Thank you.

So I would like to discuss about meditation. But first of all, I ’ d like to ask you a very simple question. Can you see my hand? Yes, raise your hand. Audience : Yes. Yongey Mingyur Rinpoche : OK, can you hear me? Audience : Yes. YMR : Yes? Great. That is the meditation. So, finished. My TED Talk is finished. Of course, I ’ m just kidding. But in a way that is true. Why? What we call the essence of meditation is awareness. And what is awareness? Knows what you are thinking, feeling, doing, seeing, hearing. That ’ s all. So actually meditation is very easy, but many people find it difficult. Why? There are two misunderstandings about meditation. So the first is many people think meditation means, think of nothing, stop thinking, concentration. Ah. Shh! I ’ m meditating, keep quiet. So the more, when you try to stop thinking what happens, you will think more. So we will do a small experiment, OK? Now, please don ’ t think about pizza. No pizza. No pizza. What happened? Did you think about pizza or not? Yes, raise your hand. I know. Actually, we don ’ t need to stop thinking. We just need to connect with awareness. And another misunderstanding about meditation is what we call”blissing out.”Looking for peace, calm, joy, relax. The more you look for relax, then peace, calm, joy, relax run away. So... Let me share [with] you my own experience. When I was young, I had panic attacks. Although I was born right in the middle of the Himalayan mountains, the area, the village, wonderful, but panic followed me like a shadow. And I have so much fear [of] strangers, I cannot go out and meet people. And lot of storms in the Himalayan mountains, thunderstorm, snowstorm. These storms drive me crazy. And when I was nine years old, I asked my father to teach me meditation. Luckily, he was a great meditation teacher. And the first thing what he said is,”Don ’ t try to fight with the panic. Don ’ t try to get rid of panic.””And actually,”he said,”you don ’ t have to.”Why? Awareness is like sky in the mountain, and the panic is like storm in the mountain, like cloud. And no matter how strong a storm is, it doesn ’ t change the nature of sky. So sky is always present, pure, calm. Similarly, our fundamental quality of mind, awareness is always present, pure, calm. But the problem is we don ’ t know how to connect with awareness, what we see, only a thought, emotion, that ’ s all. So he said, there are three steps of practice to connect with awareness. The first one, we have to use an object. Support, to connect with awareness. So this is one of my first meditation techniques that I learned from my father. So you can join and you can relax your muscles in your body. If you cannot relax, also OK, allowed. And close your eyes, and please listen to sound. And when you hear the sound, through ear and mind together... That is the meditation. And let panic come and go. Let pizza come and go. And maybe two pizzas, three pizzas, ten pizzas. As long as you remember the sound, you can have pizza. OK, how was it? Did you hear the sound? Yes, raise your hand. Great. That is the meditation. Very easy. Just hear, that ’ s all. You don ’ t have to do anything. So if panic comes, let panic come and go, don ’ t care. Just listen to sound. Monkey mind comes blah, blah, blah. Let it come and go, just listen to sound. So I did that. But I had a big problem. The problem is lazy. I ’ m lazy boy, I love the idea of meditation, but I don ’ t like the practice of meditation. So on and off like that for five years. When I was 13 years old in India, there ’ s traditional three-year retreat going to start. I thought I should join this because it ’ s good for my laziness. And I join. The first month, wonderful, no lazy. Second month, lazy come back. Now what happened? My lazy and my panic, they two become good friends. The life in the retreat becomes disaster. And I thought I should leave. But I feel embarrassed to leave because I told all my childhood friends that I can do the retreat, you know. I don ’ t want to lose my face. But if I stay, almost three years to go. Then I thought, what should I do? In the end, I decided to learn how to live with the panic. So now we have the second step what we call, actually, we can meditate everywhere, anytime with anything. So you can meditate with panic. How do you do that? Just like listen to sound, when you listen to sound, sound becomes support for your meditation. Now you ’ re going to watch panic. If you see the panic, great. What we call, when you see the river, you ’ re out of the river. When you see the mountain, you ’ re out of the montain. So now awareness becomes more than panic. More than depression, stress. Monkey mind, whatever. Let them come, let them go. So that is the first benefit and second benefit of what we call, there ’ s a wisdom comes. So when you look at the panic, panic is not solid stone anymore. Panic becomes pieces. Sensation here, frightening image, voice, background belief. And if you take one of these away, you cannot find panic. So what I call panic becomes like shaving foam, looks like a piece of rock but inside full of bubbles. Then three, what I call this is acceptance, like self-kind, self-love, self-compassion. You let panic come and go, that ’ s the real acceptance, isn ’ t it? So three in one : awareness, love and compassion, wisdom. Sometimes what I call buy one, get two free. Big deal, right? And all this because of panic. So now panic becomes your teacher, your best friend. So I did this practice and in the end, me and my panic become very good friends. And few weeks later, panic is gone. I miss my friend. And I finished my retreat, my retreat went very well. And after that I have been eager to share this wonderful technique with the world. So I taught meditation many places, wrote three books, become bestseller, and then students and become abbot of a few monasteries. And what happened? Kind of new ego emerged within me. I thought, oh, I have to watch out, this so. Then I decided to do something very special, what we call wandering retreat. Meaning you leave everything behind, go on the street with nothing. So I decided to do that. In 2011, I left my monastery, my students, my wonderful cozy bed. Everything, and got on street with only a few thousand Indian rupees, and that finished within a few weeks. Now I have to beg for food. And I got food poisoning. Vomiting, diarrhea. I ’ m alone on the street, now I ’ m going to die. Then I thought, what should I do? So now we have the third step, what we call open awareness meditation. Awareness, be with itself. Sky, be with itself. Now, no need to have support. Just be awareness itself. I did that practice. Then what happened? My body become decayed, I cannot see, I cannot hear. But my mind becomes so present, beyond free. And I was in that state for a few hours. Luckily, I didn ’ t die, I come back. So when I come back, the street becomes like my home. When I look at a tree, tree becomes like tree of love. And the wind **blows** to my face become a joyful experience. And the rest of my retreat went very well. I learned a lot from my retreat. So I like to share this open awareness meditation, but it is very difficult to explain. But I want to do something drama. And this is what I learned from my father. So what we call, this mala is the crazy monkey mind, blah, blah, blah, yada yada. And the open awareness meditation means you don ’ t have to do anything. Just be. That ’ s all, and you don ’ t need to meditate. The sense of presence, being, but not loss. Be free. Be present. Thank you very much.

Text Sample 781: NEG Dim 5 – 2022 – Score 1.00 – 2022/t003808.txt

Let ’ s talk about regret. It is, to my mind, our most misunderstood emotion, and so I decided to spend a couple of years studying it. And one of the things that I did is I went back and I looked at about 50 years of social science on regret. And here ’ s what it tells you. I ’ ll save you the trouble of reading a half century of social science. The research tells us that everybody has regrets, regrets make us human. Truly, the only people without regrets are five-year-olds, people with brain damage and sociopaths. The rest of us, we have regrets, and if we treat our regrets right, and that ’ s a big if, but there are ways to do it, regrets can actually make us better. They can improve our decision-making skills, improve our negotiation skills, make us better strategists, make us better problem solvers, enhance our sense of meaning if we treat them right. And the good news is that there ’ s a systematic way to do that. But I want to take just a few minutes to tell you about another aspect of regret that I think is really, really just super interesting. As part of the research here, I decided to ask people for their regrets, and to my surprise, I ended up collecting about 16, 000 regrets from people in 105 countries. It ’ s an extraordinary trove. And what I realized when I went through this incredible database of human longing and aspiration is that around the world, and there ’ s very little national difference here, people kept expressing the same four regrets. Around the world, there are the same four regrets that keep coming up over and over and over again. So what I want to do is just quickly tell you about these four core regrets, because I think they reveal something incredibly important and interesting. So the four core regrets that I ’ m going to cover. Number one, what I call foundation regrets. Foundation regrets. These are people who regret things like this : not saving enough money, which would be like, you know, financial regret, not taking care of their health and not eating right, health regret. But they ’ re the same. Those kinds of regrets are about making choices that didn ’ t allow you to have some stability, a stable platform for their life. I have a lot of people who regret not working hard enough in school. A lot of people who regret – I got a lot of regrets about not saving money. And it reminds me a little bit of Aesop ’ s fable of the ant and the grasshopper, where earlier in their life they acted like a grasshopper instead of the ant, and now it ’ s catching up with them. So foundation regrets sound like this :”If only”– And that ’ s the catch phrase of regret,”if only”–”If only I ’ d done the work.”Second category. I love this category, it ’ s fascinating. Boldness regrets. I have hundreds of regrets around the world that go like this :”X years ago, there was a man / woman whom I really liked. I wanted to ask him / her out on a date, but I was too scared to do it and I ’ ve regretted it ever since.”I also have hundreds of regrets by people who said :”Oh, I always wanted to start a business, but I never had the guts to do that.”People who said :”Oh, I wish I ’ d spoken up more. I wish I ’ d said something and asserted myself.”These are, as I said before, what I call boldness regrets. And we get to a juncture in our life and we have a choice. We can play it safe or we can take the chance. And what I found is overwhelmingly people regret not taking the chance. Even people who took the chance and it didn ’ t work out don ’ t really have many regrets about that. It ’ s the people who didn ’ t take the chance. So this is boldness regrets. Boldness regrets sound like this :”If only I ’ d taken the chance.”Third category. Moral regrets. Very interesting, very interesting category. These are people who, again, a lot of these regrets begin at a juncture. You ’ re at a juncture, you can do the right thing or you can do the wrong thing. People do the wrong thing, and they regret it. I mean, one of the ones that really stuck with me, I ’ m going to try to pull it up here, is this one here, this woman. She ’ s a 71-year-old woman in New Jersey.”When I was a kid, my mother would send me to a small local store for a few items. I frequently would steal a candy bar when the grocer wasn ’ t looking. That ’ s bothered me for about 60 years.”So 71-year-old woman in New Jersey, for 60 years, she ’ s been bugged by this moral breach. So moral regrets. We have people regretting bullying, we have people regretting marital infidelity. All kinds of things. Moral regrets sound like this,”If only I ’ d done the right thing.”And finally, our fourth category, or what I call connection regrets. Connection regrets are like this : You have a relationship or ought to have a relationship. And it doesn ’ t matter what the relationship is. Kids, parents, siblings, cousins, friends, colleagues, but you have a relationship or ought to have had a relationship, and the relationship comes apart. And what ’ s interesting is that what these 16, 000 people were telling me is that the way these relationships come apart is often not very dramatic, not very dramatic at all. They often come apart by drifting apart rather than through some kind of explosive rift. And what happens is that people don ’ t want to reach out because they say it ’ s going to be awkward to reach out, and the other side is not going to care. One of the lessons that I learned from this book for myself is always reach out. So that ’ s what connection regrets are.”If only I ’ d reached out.”And so over and over and over again, we see these same regrets : Foundation regrets :”If only I ’ d done the work.”Boldness regrets :”If only I ’ d taken the chance.”Moral regrets :”If only I ’ d done the right thing.”And connection regrets :”If only I ’ d reached out.”And when we look at these regrets, so that ’ s interesting in itself, but what I realized is that these four core regrets operate as a kind of photographic negative of the good life. Because if we understand what people regret the most, we actually can understand what they value the most. And each of these regrets, to my mind, reveals something fundamental about humanity and about what we need. We need stability. Nobody wants to have an unstable life. We want a chance to learn and grow and do something. We recognize that we are not here forever, and we want to do something and try something. And at least feel the exhilaration of being bold. Moral regrets, I think most of us, almost all of us want to do the right thing. At some level, these moral regrets are very heartening. The idea that people are bugged for years, decades, by these moral breaches earlier in their life. I think most of us want to do the right thing. And then connection regrets. We want love, not love only in the romantic sense, but love in the broader sense of connection and relationship and affinity with other people. And so in a weird way, this negative emotion of regret points the way to a good life. By studying regret, we know what constitutes a good life, a life of stability, a life where you have a chance to take a few risks, a life where you ’ re doing the right thing and a life where you have people who love you and whom you love. And so to me, I started out saying,”Oh, boy, is this book going to be a downer, studying regret?”And it ended up being very uplifting. And so, those are the four core regrets. Regret points us to the good life. And so I hope that you ’ ll begin to reckon with your own regrets because I think they ’ re going to give you direction to a life well lived. Whitney Pennigton Rogers : Well, thank you for that, Dan I was clapping behind the scenes when you couldn ’ t actually see me, for everyone who I know also really appreciated what you shared there. First, Dan, you mentioned, you know, this big takeaway about how thinking about regret can help us figure out what is the recipe for the good life. I guess what has been your biggest takeaway from doing this work beyond that? DHP : I found it really interesting how much people want to talk about this, and that ’ s what got me on it in the first place. That is, I had an experience in my life where one of my kids graduated from college, and that sort of marker in my life made me start thinking about what regrets that I had. And I just mentioned it to a few people, and I found them, like, leaning in to the conversation. So I was amazed at how much people want to talk about this and how much this taboo of like,”Oh, I don ’ t have any regrets,”is so ridiculous. I mean, it ’ s absurd. And that if we actually start talking about it, we ’ re going to be better off. For me personally, I think that the biggest takeaway was the... Was the connection regrets. Because I had so many people who had the same story where they had a friendship, some kind of relationship, and it comes apart, and they want to reach out and they say,”Oh no, it ’ s going to be really awkward. And the other side ’ s not going to care.”And we ’ re so wrong about that. It ’ s not awkward, and the other side almost always appreciates it. And so for me, I guess the takeaway is if I ’ m at a juncture in my life where I ’ m thinking,”Should I reach out or should I not reach out?”I ’ ve answered the question. That the answer to that question at that juncture, if you reach that juncture, the answer is, always reach out. You know, especially coming out a time like this, Whitney, we need that sense of of connection. And so the ethic of always reaching out, to me, is one of the best life lessons that I ’ ve learned. WPR : Well, we ’ re going to do something a little interesting next, Dan, which is have some Members share their own regrets. And so I want to, I guess, hand things over to you right now so that you can bring in our first Member and we can explore more what this process of thinking about making our regrets help us live the good life actually looks like. DHP : Sure, sure. And so let ’ s bring on Lily. I don ’ t want it to sound like a magic act, but Lily and I don ’ t know each other. We haven ’ t gone through this before, but what I want to try to do is actually, the hearing of the stories of people ’ s regrets I think is super interesting and revealing. We ’ re going to hear Lily ’ s regret, and we ’ re going to talk through what science says might be some appropriate responses to that. So, Lily, welcome. Lily : Thank you, hi everyone. DHP : And tell us where you are. L : I ’ m currently in Brooklyn, New York. DHP : Brooklyn is in the house here at TED Membership. So Lily, tell us you regret. L : Yeah. So my regret that I want to share is that for most of my young adult life from kindergarten, really, straight through high school is that I was painfully, painfully shy with really low self-confidence. As I was thinking about this, I was remembering, and there were times where I just wanted to close my eyes and be invisible. And I think that, you know, my... Like, I didn ’ t really come into my own until I got to college, where I found a really great group of friends, really, like, I was confident in expressing myself and, you know, just being myself. And I think that, you know, my regret is that I just really wish I had taken a little bit more effort to build my confidence to fight this a little bit more, because I worry about what opportunities I might have missed. So ever since then, I feel like I try to counteract it now. And if ever I meet someone who might be going through, especially if they ’ re younger, like going through the same thing I did, I try to make them feel seen and try to empathize with how they ’ re feeling. So that ’ s kind of a takeaway, I guess, from that regret. DHP : But I mean, it sounds like... So is this a regret that ’ s still with you? L : I think... DHP : It sounds to me like you might have sort of begun the process of resolving it a little bit. L : Absolutely. But I think that, you know, even just, you know, prepping for this, I start to think about like, you know, there could have been more things that I could have done if I had just put myself a little bit out there, if I didn ’ t, just try to hide so much. DHP : OK, alright. This is fascinating, Lily, and I have to say, I have this database of regrets. And you can search the database. And if I were to search the database for the phrase”speak up,””spoke up,””spoken up,”I would get huge, huge numbers of of people. It is one of the most common regrets, is that people regret not speaking up. The important thing about our regrets that comes from the science is this : it ’ s how we deal with them. So we can take that regret and say,”You know what? It doesn ’ t matter that I feel terrible and I have this regret, because I ’ m just going to ignore it,”right? That ’ s like the blithe”no regrets”philosophy. That ’ s a bad idea, alright? The other way at it is to say,”Oh my God, I have all these regrets, it ’ s so terrible, I ’ m going to wallow in them.”That ’ s a bad idea too. What we want to do, and I think that you ’ ve already done a really brilliant job of it is use these regrets as signals. Signals for our thinking ; what is it teaching me? And so there are a few things in the research that give us some clues about what to do. So one of them is this. So we start with sort of, reframing the regret and how we think about it in ourselves. So do you think that you are the only person with this kind of regret? L : I don ’ t know. DHP : Not at all. I ’ m watching the chat, man. Somebody said,”Lily, you ’ re telling my story.”So one of the things that we can do with our regret is treat ourselves with self-compassion, alright? Not boost our self-esteem, that ’ s sometimes dangerous. Not rip ourselves down with self-criticism, but actually say, treat ourselves with kindness rather than contempt and recognize that what we ’ re going through is part of the shared human experience. That ’ s one thing. The second thing that we can do is we can disclose our regret. And there are few things that are interesting about disclosure. There ’ s something amazing why 16, 000 people were willing to share their regrets with me. I mean, like, what ’ s going on there, right? And the reason is that when we disclose our regrets, we relieve some of the burden. That ’ s one thing. The second thing that we do is that when we actually talk about our regrets, converting these kind of blobby mental abstractions into concrete words, whether it ’ s spoken or writing, defangs them. It begins the sense-making process. And the other thing about disclosure, which is a dirty little secret that I ’ ll reveal to all of you that comes out in the research very clearly, is that when we disclose our vulnerabilities and our weaknesses, people don ’ t like us less, they actually like us more. Because they empathize with us. They respect our courage. And the final thing is to actually try to extract a lesson from it, to use this regret. So what would you say, Lily, is the lesson that you ’ ve learned from this regret? L : I think that... What would have gone wrong if I... DHP : That ’ s interesting. L : If I were more open about expressing myself, like, people might discover I ’ m a little weird, or they might think that maybe I ’ m nice and hopefully maybe a little funny. So I think, like, maybe that ’ s one thing that jumps to mind. Like, what could have gone wrong? You know. DHP : So what ’ s the lesson that you have applied going forward? Taking this regret, OK, so you ’ ve sort of treated yourself with kindness rather than contempt. You ’ ve disclosed it to all these people here. You ’ ve begun the sense-making process by talking about it and writing about it. What ’ s a lesson that you can extract from this?

L : I think that... I ’ m not sure. DHP : Well, then let me tell you. I think that the lesson is to... Next time, speak up. Next time, speak up. Next time when you are at a juncture,”Should I speak up or not,”think about this. Think about this and speak up. Do you have any kind of work meetings or anything coming on where you ’ re going to be confronted with this? L : Yeah, and I think that happens all the time. Like, you know, I have an idea. Oh, but someone starts talking, and then like, you just sort of fade back into the background, and that ’ s something I want to counteract more often. Because, more often than not, you know that idea is a contribution, and why am I hesitating so much? DHP : Yeah. So you have a lesson. The lesson is, speak up. So why don ’ t you – So how about the next meeting you ’ re in, when you have something to say, don ’ t hesitate and speak up. L : Done, I ’ ll do it. DHP : OK, but here ’ s the thing, what I like about this is you ’ ve just made a promise to 300 people. So you ’ re on the hook. L : I ’ m on the hook. DHP : So this is it. So, Lily has this regret. She ’ s looking backwards, saying,”Oh, if only I ’ d spoken up,”and instead of beating herself up, she is divulging it, she ’ s extracting a lesson from it, and she ’ s taking that and applying it to some next interaction. So this is what we do. This is how, again, looking backward can move you forward. Lily, that ’ s such a fantastic – People in the chat are saying,”We will hold Lily accountable,”which I love. So Lily, thanks for that. We ’ re going to bring – I really, really appreciate your sharing that with us, and I want you to report back that you did speak up. L : I will, thank you. DHP : Thanks, Lily. WPR : Well, we have a question here from Claudia, who asks,”Can you speak to the issue of painful life regrets? Major opportunities lost? Do you have some advice on how to avoid being paralyzed by fear or further regret?”DHP : Yeah. It ’ s interesting that Claudia said”opportunities lost,”and let me pick up on that phrase right here. Because one of the things I saw in my own research, because I also did a huge survey of the American population where we surveyed a representative sample of 4, 489 Americans about regret and how it worked. But one of the things you see widespread is that there are, in the architecture of regret, there are often two kinds of regrets. One are regrets of action and one are regrets of inaction. Regrets about what we did. Regrets about what we didn ’ t do. And overwhelmingly, inaction regrets predominate. And that ’ s what an opportunity lost is. With action regrets, we can try to undo them. We can make amends. We can look for the silver lining, and we can reduce the sting. For inaction regrets, it is harder. And so the key here on the opportunities lost is to think about, you know, really like, what are you going to do? You sort of reduce the level of abstraction and say,”What are you going to do next time?”Not an abstraction of like,”Oh, I ’ m going to be more bold.”It ’ s like, what are you going to do next time? This is what we were talking about with Lily. What are you going to do next time? All regrets begin at the juncture. You can go this way or you can go that way. And so for Claudia, I would say, the next time you ’ re at this juncture, take the opportunity, play it safe. Stop, think about your regret, and make the decision there. Or another thing that you could do. I ’ ll give you another, sort of, decision-making heuristic. Two of them, in fact. When you ’ re at that juncture, Claudia, next time, go forward five years. This is called self-distancing. Be Claudia five years from now, look back on Claudia today. What decision do you want? What decision does Claudia of 2027 want Claudia of 2022 to make? It ’ s very clear. Or the best decision-making heuristic there is : You ’ re at a juncture, what would you tell your best friend to do? When you ask people that when they ’ re trying to make a decision, say,”What would you tell your best friend to do?”Everybody always knows. So, I think that ’ s it. Remember, the main thing, though, is don ’ t let it bog you down. Use it as a tool for thinking – not as a tool for wallowing, not as a tool for ignoring

– but as a tool for thinking. WPR : A question from Kim, she ’ s asking – She says you ’ re talking as if any bad decision or mistake is also a regret, and I ’ m not sure that that ’ s always the case. Can you share your definition of regret? Especially after doing this project. What is your definition? DHP : There ’ s a difference between a regret and a mistake, alright? So you can make a mistake and not regret it because you say, you immediately learn something from it or it was a worthy mistake. A regret is something where you look backward at something that where you had control, where you had some agency... Where you had some agency, you did something that, well, you did something wrong, and it sticks with you. It doesn ’ t go away. And it sticks with you for a very long time. So there ’ s a big difference, for instance, between... I can make a mistake and actually not regret it because it ’ s not significant enough to me to linger, right? So that ’ s the difference between a regret and a mistake. It ’ s basically the duration, essentially, the half-life of the negative emotion. There ’ s a huge difference between regret and disappointment. Huge difference between regret and disappointment. Because with disappointment, you don ’ t have any kind of control. The great example of that is from Janet Landman, a former professor at the University of Michigan who, to me, is like, she tells the story of like, OK, so a kid loses her third tooth. A seven-year-old loses her third tooth. She loses her tooth, she goes to sleep, before she goes to sleep, she puts the tooth under the pillow. When she wakes up, the tooth is still there. The kid is disappointed, but the parents regret not leaving that – So you have to have some agency and it has to have a... It has to have enough significance that it stays with you. And once again, going back to these four core regrets, it ends up being the same kinds of... it ends up being the same kinds of things. If you said,”Oh, I shouldn ’ t have bought that kind of car,”it might sting for a little bit, but the half-life is very, very short. But other kinds of things stick with us and stick with us, and those are the things often of significance. WPR : Thank you so much, Dan, for chatting with us, and I love ending there,”If not now when?”And we ’ ll see you soon. Thank you, Dan. DHP : Thanks a lot, what a pleasure. I just met you on a bus, and we would really like to get to know each other, but I ’ ve got to get off at the next stop, so you ’ re going to tell me three things about yourself that just define you as a person, three things about yourself that will help me understand who you are, three things that just get to your very essence. And what I ’ m wondering is, of those three things, is any one of them surviving some kind of trauma? Cancer survivor, rape survivor, Holocaust survivor, incest survivor. Ever notice how we tend to identify ourselves by our wounds? And where I have seen this survivor identity have the most consequences is in the cancer community. And I ’ ve been around this community for a long time, because I ’ ve been a hospice and a hospital chaplain for almost 30 years. And in 2005, I was working at a big cancer center when I received the news that my mother had breast cancer. And then five days later, I received the news that I had breast cancer. My mother and I can be competitive — — but I was really not trying to compete with her on this one. And in fact, I thought, well, if you have to have cancer, it ’ s pretty convenient to be working at a place that treats it. But this is what I heard from a lot of outraged people. What? You ’ re the chaplain. You should be immune. Like, maybe I should have just gotten off with a warning instead of an actual ticket, because I ’ m on the force. So I did get my treatment at the cancer center where I worked, which was amazingly convenient, and I had chemotherapy and a mastectomy, and a saline implant put in, and so before I say another word, let me just say right now, this is the fake one. I have found that I need to get that out of the way, because I ’ ll see somebody go”Oh, I know it ’ s this one.”And then I ’ ll move or I ’ ll gesture and they ’ ll go,”No, it ’ s that one.”So now you know. I learned a lot being a patient, and one of the surprising things was that only a small part of the cancer experience is about medicine. Most of it is about feelings and faith and losing and finding your identity and discovering strength and flexibility you never even knew you had. It ’ s about realizing that the most important things in life are not things at all, but relationships, and it ’ s about laughing in the face of uncertainty and learning that the way to get out of almost anything is to say,”I have cancer.”So the other thing I learned was that I don ’ t have to take on”cancer survivor”as my identity, but, boy, are there powerful forces pushing me to do just that. Now, don ’ t, please, misunderstand me. Cancer organizations and the drive for early screening and cancer awareness and cancer research have normalized cancer, and this is a wonderful thing. We can now talk about cancer without whispering. We can talk about cancer and we can support one another. But sometimes, it feels like people go a little overboard and they start telling us how we ’ re going to feel. So about a week after my surgery, we had a houseguest. That was probably our first mistake. And keep in mind that at this point in my life I had been a chaplain for over 20 years, and issues like dying and death and the meaning of life, these are all things I ’ d been yakking about forever. So at dinner that night, our houseguest proceeds to stretch his arms up over his head, and say,”You know, Deb, now you ’ re really going to learn what ’ s important. Yes, you are going to make some big changes in your life, and now you ’ re going to start thinking about your death. Yep, this cancer is your wakeup call.”Now, these are golden words coming from someone who is speaking about their own experience, but when someone is telling you how you are going to feel, it ’ s instant crap. The only reason I did not kill him with my bare hands was because I could not lift my right arm. But I did say a really bad word to him, followed by a regular word, that — — made my husband say,”She ’ s on narcotics.”And then after my treatment, it just felt like everyone was telling me what my experience was going to mean.”Oh, this means you ’ re going to be doing the walk.””Oh, this means you ’ re coming to the luncheon.””This means you ’ re going to be wearing the pink ribbon and the pink t-shirt and the headband and the earrings and the bracelet and the panties.”Panties. No, seriously, google it. How is that raising awareness? Only my husband should be seeing my panties. He ’ s pretty aware of cancer already. It was at that point where I felt like, oh my God, this is just taking over my life. And that ’ s when I told myself, claim your experience. Don ’ t let it claim you. We all know that the way to cope with trauma, with loss, with any life- changing experience, is to find meaning. But here ’ s the thing : No one can tell us what our experience means. We have to decide what it means. And it doesn ’ t have to be some gigantic, extroverted meaning. We don ’ t all have to start a foundation or an organization or write a book or make a documentary. Meaning can be quiet and introverted. Maybe we make one small decision about our lives that can bring about big change. Many years ago, I had a patient, just a wonderful young man who was loved by the staff, and so it was something of a shock to us to realize that he had no friends. He lived by himself, he would come in for chemotherapy by himself, he would receive his treatment, and then he ’ d walk home alone. And I even asked him. I said,”Hey, how come you never bring a friend with you?”And he said,”I don ’ t really have any friends.”But he had tons of friends on the infusion floor. We all loved him, and people were going in and out of his room all the time. So at his last chemo, we sang him the song and we put the crown on his head and we **blew** the bubbles, and then I asked him, I said,”So what are you going to do now?”And he answered,”Make friends.”And he did. He started volunteering and he made friends there, and he began going to a church and he made friends there, and at Christmas he invited my husband and me to a party in his apartment, and the place was filled with his friends. Claim your experience. Don ’ t let it claim you. He decided that the meaning of his experience was to know the joy of friendship, and then learn to make friends. So what about you? How are you going to find meaning in your crappy experience? It could be a recent one, or it could be one that you ’ ve been carrying around for a really long time. It ’ s never too late to change what it means, because meaning is dynamic. What it means today may not be what it means a year from now, or 10 years from now. It ’ s never too late to become someone other than simply a survivor. Hear how static that word sounds? Survivor. No movement, no growth. Claim your experience. Don ’ t let it claim you, because if you do, I believe you will become trapped, you will not grow, you will not evolve. But of course, sometimes it ’ s not outside pressures that cause us to take on that identity of survivor. Sometimes we just like the perks. Sometimes there ’ s a payoff. But then we get stuck. Now, one of the first things I learned as a chaplain intern was the three C ’ s of the chaplain ’ s job : Comfort, clarify and, when necessary, confront or challenge. Now, we all pretty much love the comforting and the clarifying. The confronting, not so much. One of the other things that I loved about being a chaplain was seeing patients a year, or even several years after their treatment, because it was just really cool to see how they had changed and how their lives had evolved and what had happened to them. So I was thrilled one day to get a page down into the lobby of the clinic from a patient who I had seen the year before, and she was there with her two adult daughters, who I also knew, for her one year follow-up exam. So I got down to the lobby, and they were ecstatic because she had just gotten all of her test results back and she was NED : No Evidence of Disease. Which I used to think meant Not Entirely Dead. So they were ecstatic, we sat down to visit, and it was so weird, because within two minutes, she started retelling me the story of her diagnosis and her surgery and her chemo, even though, as her chaplain, I saw her every week, and so I knew this story. And she was using words like suffering, agony, struggle. And she ended her story with,”I felt crucified.”And at that point, her two daughters got up and said,”We ’ re going to go get coffee.”And they left. Tell me three things about yourself before the next stop. People were leaving the bus before she even got to number two or number three. So I handed her a tissue, and I gave her a hug, and then, because I really cared for this woman, I said,”Get down off your cross.”And she said,”What?”And I repeated,”Get down off your cross.”And to her credit, she could talk about her reasons for embracing and then clinging to this identity. It got her a lot of attention. People were taking care of her for a change. But now, it was having the opposite effect. It was pushing people away. People kept leaving to get coffee. She felt crucified by her experience, but she didn ’ t want to let that crucified self die. Now, perhaps you are thinking I was a little harsh with her, so I must tell you that I was speaking out of my own experience. Many, many years before, I had been fired from a job that I loved, and I would not stop talking about my innocence and the injustice and the betrayal and the deceipt, until finally, just like this woman, people were walking away from me, until I finally realized I wasn ’ t just processing my feelings, I was feeding them. I didn ’ t want to let that crucified self die. But we all know that with any resurrection story, you have to die first. The Christian story, Jesus was dead a whole day in the tomb before he was resurrected. And I believe that for us, being in the tomb means doing our own deep inner work around our wounds and allowing ourselves to be healed. We have to let that crucified self die so that a new self, a truer self, is born. We have to let that old story go so that a new story, a truer story, can be told. Claim your experience. Don ' t let it claim you. What if there were no survivors, meaning, what if people decided to just claim their trauma as an experience instead of taking it on as an identity? Maybe it would be the end of being trapped in our wounds and the beginning of amazing self-exploration and discovery and growth. Maybe it would be the start of defining ourselves by who we have become and who we are becoming. So perhaps survivor was not one of the three things that you would tell me. No matter. I just want you all to know that I am really glad that we are on this bus together, and this is my stop.

As an Arab female photographer, I have always found ample inspiration for my projects in personal experiences. The passion I developed for knowledge, which allowed me to break barriers towards a better life was the motivation for my project I Read I Write. Pushed by my own experience, as I was not allowed initially to pursue my higher education, I decided to explore and document stories of other women who changed their lives through education, while exposing and questioning the barriers they face. I covered a range of topics that concern women ' s education, keeping in mind the differences among Arab countries due to economic and social factors. These issues include female illiteracy, which is quite high in the region ; educational reforms ; programs for dropout students ; and political activism among university students. As I started this work, it was not always easy to convince the women to participate. Only after explaining to them how their stories might influence other women ' s lives, how they would become role models for their own community, did some agree. Seeking a collaborative and reflexive approach, I asked them to write their own words and ideas on prints of their own images. Those images were then shared in some of the classrooms, and worked to inspire and motivate other women going through similar educations and situations. Aisha, a teacher from Yemen, wrote,"I sought education in order to be independent and to not count on men with everything."One of my first **subjects** was Umm El-Saad from Egypt. When we first met, she was barely able to write her name. She was attending a nine-month literacy program run by a local NGO in the Cairo suburbs. Months later, she was joking that her husband had threatened to pull her out of the classes, as he found out that his now literate wife was going through his phone text messages. Naughty Umm El-Saad. Of course, that ' s not why Umm El-Saad joined the program. I saw how she was longing to gain control over her simple daily routines, small details that we take for granted, from counting money at the market to helping her kids in homework. Despite her poverty and her community ' s mindset, which belittles women ' s education, Umm El-Saad, along with her Egyptian classmates, was eager to learn how to read and write. In Tunisia, I met Asma, one of the four activist women I interviewed. The secular bioengineering student is quite active on social media. Regarding her country, which treasured what has been called the Arab Spring, she said,"I ' ve always dreamt of discovering a new bacteria. Now, after the revolution, we have a new one every single day."Asma was referring to the rise of religious fundamentalism in the region, which is another obstacle to women in particular. Out of all the women I met, Fayza from Yemen affected me the most. Fayza was forced to drop out of school at the age of eight when she was married. That marriage lasted for a year. At 14, she became the third wife of a 60-year-old man, and by

the time she was 18, she was a divorced mother of three. Despite her poverty, despite her social status as a divorce in an ultra-conservative society, and despite the opposition of her parents to her going back to school, Fayza knew that her only way to control her life was through education. She is now 26. She received a grant from a local NGO to fund her business studies at the university. Her goal is to find a job, rent a place to live in, and bring her kids back with her. The Arab states are going through tremendous change, and the struggles women face are overwhelming. Just like the women I photographed, I had to overcome many barriers to becoming the photographer I am today, many people along the way telling me what I can and cannot do. Umm El-Saad, Asma and Fayza, and many women across the Arab world, show that it is possible to overcome barriers to education, which they know is the best means to a better future. And here I would like to end with a quote by Yasmine, one of the four activist women I interviewed in Tunisia. Yasmine wrote,"Question your convictions. Be who you to want to be, not who they want you to be. Don ' t accept their enslavement, for your mother birthed you free."Thank you.

When my first children ' s book was published in 2001, I returned to my old elementary school to talk to the students about being an author and an illustrator, and when I was setting up my slide projector in the cafetorium, I looked across the room, and there she was : my old lunch lady. She was still there at the school and she was busily preparing lunches for the day. So I approached her to say hello, and I said,"Hi, Jeannie! How are you?"And she looked at me, and I could tell that she recognized me, but she couldn ' t quite place me, and she looked at me and she said,"Stephen Krosoczka?"And I was amazed that she knew I was a Krosoczka, but Stephen is my uncle who is 20 years older than I am, and she had been his lunch lady when he was a kid. And she started telling me about her grandkids, and that **blew** my mind. My lunch lady had grandkids, and therefore kids, and therefore left school at the end of the day? I thought she lived in the cafeteria with the serving spoons. I had never thought about any of that before. Well, that chance encounter inspired my imagination, and I created the Lunch Lady graphic novel series, a series of comics about a lunch lady who uses her fish stick nunchucks to fight off evil cyborg substitutes, a school bus monster, and mutant mathletes, and the end of every book, they get the bad guy with their hairnet, and they proclaim,"Justice is served!"And it ' s been amazing, because the series was so welcomed into the reading lives of children, and they sent me the most amazing letters and cards and artwork. And I would notice as I would visit schools, the lunch staff would be involved in the programming in a very meaningful way. And coast to coast, all of the lunch ladies told me the same thing :"Thank you for making a superhero in our likeness."Because the lunch lady has not been treated very kindly in popular culture over time. But it meant the most to Jeannie. When the books were first published, I invited her to the book launch party, and in front of everyone there, everyone she had fed over the years, I gave her a piece of artwork and some books. And two years after this photo was taken, she passed away, and I attended her wake, and nothing could have prepared me for what I saw there, because next to her casket was this painting, and her husband told me it meant so much to her that I had acknowledged her hard work, I had validated what she did. And that inspired me to create a day where we could recreate that feeling in cafeterias across the country : School Lunch Hero Day, a day where kids can make creative projects for their lunch staff. And I partnered with the

School Nutrition Association, and did you know that a little over 30 million kids participate in school lunch programs every day. That equals up to a little over five billion lunches made every school year. And the stories of heroism go well beyond just a kid getting a few extra chicken nuggets on their lunch tray. There is Ms. Brenda in California, who keeps a close eye on every student that comes through her line and then reports back to the guidance counselor if anything is amiss. There are the lunch ladies in Kentucky who realized that 67 percent of their students relied on those meals every day, and they were going without food over the summer, so they retrofitted a school bus to create a mobile feeding unit, and they traveled around the neighborhoods feedings 500 kids a day during the summer. And kids made the most amazing projects. I knew they would. Kids made hamburger cards that were made out of construction paper. They took photos of their lunch lady ' s head and plastered it onto my cartoon lunch lady and fixed that to a milk carton and presented them with flowers. And they made their own comics, starring the cartoon lunch lady alongside their actual lunch ladies. And they made thank you pizzas, where every kid signed a different topping of a construction paper pizza. For me, I was so moved by the response that came from the lunch ladies, because one woman said to me, she said,"Before this day, I felt like I was at the end of the planet at this school. I didn ' t think that anyone noticed us down here."Another woman said to me,"You know, what I got out of this is that what I do is important."And of course what she does is important. What they all do is important. They ' re feeding our children every single day, and before a child can learn, their belly needs to be full, and these women and men are working on the front lines to create an educated society. So I hope that you don ' t wait for School Lunch Hero Day to say thank you to your lunch staff, and I hope that you remember how powerful a thank you can be. A thank you can change a life. It changes the life of the person who receives it, and it changes the life of the person who expresses it. Thank you.

I would like to tell you a story connecting the notorious privacy incident involving Adam and Eve, and the remarkable shift in the boundaries between public and private which has occurred in the past 10 years. You know the incident. Adam and Eve one day in the Garden of Eden realize they are naked. They freak out. And the rest is history. Nowadays, Adam and Eve would probably act differently. [@Adam Last nite was a blast! loved dat apple LOL] [@Eve yep.. babe, know what happened to my pants tho?] We do reveal so much more information about ourselves online than ever before, and so much information about us is being collected by organizations. Now there is much to gain and benefit from this massive analysis of personal information, or big data, but there are also complex tradeoffs that come from giving away our privacy. And my story is about these tradeoffs. We start with an observation which, in my mind, has become clearer and clearer in the past few years, that any personal information can become sensitive information. Back in the year 2000, about 100 billion photos were shot worldwide, but only a minuscule proportion of them were actually uploaded online. In 2010, only on Facebook, in a single month, 2. 5 billion photos were uploaded, most of them identified. In the same span of time, computers ' ability to recognize people in photos improved by three orders of magnitude. What happens when you combine these technologies together : increasing availability of facial data ; improving facial recognizing ability by computers ; but also cloud computing, which gives anyone in this theater the kind of computational power which a few years ago was only the domain of three-letter agencies ; and ubiquitous computing, which allows my phone, which is not a supercomputer, to connect to the Internet and do there hundreds of thousands of face metrics in a few seconds? Well, we conjecture that the result of this combination of technologies will be a radical change in our very notions of privacy and anonymity. To test that, we did an experiment on Carnegie Mellon University campus. We asked students who were walking by to participate in a study, and we took a shot with a webcam, and we asked them to fill out a survey on a laptop. While they were filling out the survey, we uploaded their shot to a cloud-computing cluster, and we started using a facial recognizer to match that shot to a database of some hundreds of thousands of images which we had downloaded from Facebook profiles. By the time the **subject** reached the last page on the survey, the page had been dynamically updated with the 10 best matching photos which the recognizer had found, and we asked the **subjects** to indicate whether he or she found themselves in the photo. Do you see the **subject**? Well, the computer did, and in fact did so for one out of three **subjects**. So essentially, we can start from an anonymous face, offline or online, and we can use facial recognition to give a name to that anonymous face thanks to social media data. But a few years back, we did something else. We started from social media data, we combined it statistically with data from U. S. government social security, and we ended up predicting social security numbers, which in the United States are extremely sensitive information. Do you see where I ' m going with this? So if you combine the two studies together, then the question becomes, can you start from a face and, using facial recognition, find a name and publicly available information about that name and that person, and from that publicly available information infer non- publicly available information, much more sensitive ones which you link back to the face? And the answer is, yes, we can, and we did. Of course, the accuracy keeps getting worse. [27 % of **subjects** ' first 5 SSN digits identified] But in fact, we even decided to develop an iPhone app which uses the phone ' s internal camera to take a shot of a **subject** and then upload it to a cloud and then do what I just described to you in real time : looking for a match, finding public information, trying to infer sensitive information, and then sending back to the phone so that it is overlaid on the face of the **subject**, an example of augmented reality, probably a creepy example of augmented reality. In fact, we didn ' t develop the app to make it available, just as a proof of concept. In fact, take these technologies and push them to their logical extreme. Imagine a future in which strangers around you will look at you through their Google Glasses or, one day, their contact lenses, and use seven or eight data points about you to infer anything else which may be known about you. What will this future without secrets look like? And should we care? We may like to believe that the future with so much wealth of data would be a future with no more biases, but in fact, having so much information doesn ' t mean that we will make decisions which are more objective. In another experiment, we presented to our **subjects** information about a potential job candidate. We included in this information some references to some funny, absolutely legal, but perhaps slightly embarrassing information that the **subject** had posted online. Now interestingly, among our **subjects**, some had posted comparable information, and some had not. Which group do you think was more likely to judge harshly our **subject**? Paradoxically, it was the group who had posted similar information, an example of moral dissonance. Now you may be thinking, this does not apply to me, because I have nothing to hide. But in fact, privacy is not about having something negative to hide. Imagine that you are the H. R. director of a certain organization, and you receive rsums, and you decide to find more information about the candidates. Therefore, you Google their names and in a certain universe, you find this information. Or in a parallel universe, you find this information. Do you think that you would be equally likely to call either candidate for an interview? If you think so, then you are not like the U. S. employers who are, in fact, part of our experiment, meaning we did exactly that. We created Facebook profiles, manipulating traits, then we started sending out rsums to companies in the U. S., and we detected, we monitored, whether they were searching for our candidates, and whether they were acting on the information they found on social media. And they were. Discrimination was happening through social media for equally skilled candidates. Now marketers like us to believe that all information about us will always be used in a manner which is in our favor. But think again. Why should that be always the case? In a movie which came out a few years ago,"Minority Report,"a famous scene had Tom Cruise walk in a mall and holographic personalized advertising would appear around him. Now, that movie is set in 2054, about 40 years from now, and as exciting as that technology looks, it already vastly underestimates the amount of information that organizations can gather about you, and how they can use it to influence you in a way that you will not even detect. So as an example, this is another experiment actually we are running, not yet completed. Imagine that an organization has access to your list of Facebook friends, and through some kind of algorithm they can detect the two friends that you like the most. And then they create, in real time, a facial composite of these two friends. Now studies prior to ours have shown that people don ' t recognize any longer even themselves in facial composites, but they react to those composites in a positive manner. So next time you are looking for a certain product, and there is an ad suggesting you to buy it, it will not be just a standard spokesperson. It will be one of your friends, and you will not even know that this is happening. Now the problem is that the current policy mechanisms we have to protect ourselves from the abuses of personal information are like bringing a knife to a gunfight. One of these mechanisms is transparency, telling people what you are going to do with their data. And in principle, that ' s a very good thing. It ' s necessary, but it is not sufficient. Transparency can be misdirected. You can tell people what you are going to do, and then you still nudge them to disclose arbitrary amounts of personal information. So in yet another experiment, this one with students, we asked them to provide information about their campus behavior, including pretty sensitive questions, such as this one. [Have you ever cheated in an exam?] Now to one group of **subjects**, we told them,"Only other students will see your answers."To another group of **subjects**, we told them,"Students and faculty will see your answers."Transparency. Notification. And sure enough, this worked, in the sense that the first group of **subjects** were much more likely to disclose than the second. It makes sense, right? But then we added the misdirection. We repeated the experiment with the same two groups, this time adding a delay between the time we told **subjects** how we would use their data and the time we actually started answering the questions. How long a delay do you think we had to add in order to nullify the inhibitory effect of knowing that faculty would see your answers? Ten minutes? Five minutes? One minute? How about 15 seconds? Fifteen seconds were sufficient to have the two groups disclose the same amount of information, as if the second group now no longer cares for faculty reading their answers. Now I have to admit that this talk so far may sound exceedingly gloomy, but that is not my point. In fact, I want to share with you the fact that there are alternatives. The way we are doing things now is not the only way they can done, and certainly not the best way they can be done. When someone tells you,"People don ' t care about privacy,"consider whether the game has been designed and rigged so that they cannot care about privacy, and coming to the realization that these manipulations occur is already halfway through the process of being able to protect yourself. When someone tells you that privacy is incompatible with the benefits of big data, consider that in the last 20 years, researchers have created technologies to allow virtually any electronic transactions to take place in a more privacy-preserving manner. We can browse the Internet anonymously. We can send emails that can only be read by the intended recipient, not even the NSA. We can have even privacy-preserving data mining. In other words, we can have the benefits of big data while protecting privacy. Of course, these technologies imply a shifting of cost and revenues between data holders and data **subjects**, which is why, perhaps, you don ’ t hear more about them. Which brings me back to the Garden of Eden. There is a second privacy interpretation of the story of the Garden of Eden which doesn ’ t have to do with the issue of Adam and Eve feeling naked and feeling ashamed. You can find echoes of this interpretation in John Milton ’ s”Paradise Lost.”In the garden, Adam and Eve are materially content. They ’ re happy. They are satisfied. However, they also lack knowledge and self-awareness. The moment they eat the aptly named fruit of knowledge, that ’ s when they discover themselves. They become aware. They achieve autonomy. The price to pay, however, is leaving the garden. So privacy, in a way, is both the means and the price to pay for freedom. Again, marketers tell us that big data and social media are not just a paradise of profit for them, but a Garden of Eden for the rest of us. We get free content. We get to play Angry Birds. We get targeted apps. But in fact, in a few years, organizations will know so much about us, they will be able to infer our desires before we even form them, and perhaps buy products on our behalf before we even know we need them. Now there was one English author who anticipated this kind of future where we would trade away our autonomy and freedom for comfort. Even more so than George Orwell, the author is, of course, Aldous Huxley. In”Brave New World,”he imagines a society where technologies that we created originally for freedom end up coercing us. However, in the book, he also offers us a way out of that society, similar to the path that Adam and Eve had to follow to leave the garden. In the words of the Savage, regaining autonomy and freedom is possible, although the price to pay is steep. So I do believe that one of the defining fights of our times will be the fight for the control over personal information, the fight over whether big data will become a force for freedom, rather than a force which will hiddenly manipulate us. Right now, many of us do not even know that the fight is going on, but it is, whether you like it or not. And at the risk of playing the serpent, I will tell you that the tools for the fight are here, the awareness of what is going on, and in your hands, just a few clicks away. Thank you.

Text Sample 786: NEG Dim 5 – 2013 – Score -1.00 – 2013/t001914.txt

So when I was in Morocco, in Casablanca, not so long ago, I met a young unmarried mother called Faiza. Faiza showed me photos of her infant son and she told me the story of his conception, pregnancy, and delivery. It was a remarkable tale, but Faiza saved the best for last.”You know, I am a virgin,”she told me.”I have two medical certificates to prove it.”This is the modern Middle East, where two millennia after the coming of Christ, virgin births are still a fact of life. Faiza ’ s story is just one of hundreds I ’ ve heard over the years, traveling across the Arab region talking to people about sex. Now, I know this might sound like a dream job, or possibly a highly dubious occupation, but for me, it ’ s something else altogether. I ’ m half Egyptian, and I ’ m Muslim. But I grew up in Canada, far from my Arab roots. Like so many who straddle East and West, I ’ ve been drawn, over the years, to try to better understand my origins. That I chose to look at sex comes from my background in HIV / AIDS, as a writer and a researcher and an activist. Sex lies at the heart of an emerging epidemic in the Middle East and North Africa, which is one of only two regions in the world where HIV / AIDS is still on the rise. Now sexuality is an incredibly powerful lens with which to study any society, because what happens in our intimate lives is reflected by forces on a bigger stage : in politics and economics, in religion and tradition, in gender and generations. As I found, if you really want to know a people, you start by looking inside their bedrooms. Now to be sure, the Arab world is vast and varied. But running across it are three red lines — these are topics you are not supposed to challenge in word or deed. The first of these is politics. But the Arab Spring has changed all that, in uprisings which have blossomed across the region since 2011. Now while those in power, old and new, continue to cling to business as usual, millions are still pushing back, and pushing forward to what they hope will be a better life. That second red line is religion. But now religion and politics are connected, with the rise of such groups as the Muslim Brotherhood. And some people, at least, are starting to ask questions about the role of Islam in public and private life. You know, as for that third red line, that off-limits **subject**, what do you think it might be? Audience : Sex. Shereen El Feki : Louder, I can ’ t hear you. Audience : Sex. SEF : Again, please don ’ t be shy. Audience : Sex. SEF : Absolutely, that ’ s right, it ’ s sex. Across the Arab region, the only accepted context for sex is marriage — approved by your parents, sanctioned by religion and registered by the state. Marriage is your ticket to adulthood. If you don ’ t tie the knot, you can ’ t move out of your parents ’ place, and you ’ re not supposed to be having sex, and you ’ re definitely not supposed to be having children. It ’ s a social citadel ; it ’ s an impregnable fortress which resists any assault, any alternative. And around the fortress is this vast field of taboo against premarital sex, against condoms, against abortion, against homosexuality, you name it. Faiza was living proof of this. Her virginity statement was not a piece of wishful thinking. Although the major religions of the region extoll premarital chastity, in a patriarchy, boys will be boys. Men have sex before marriage, and people more or less turn a blind eye. Not so for women, who are expected to be virgins on their wedding night — that is, to turn up with your hymen intact. This is not a question of individual concern, this is a matter of family honor, and in particular, men ’ s honor. And so women and their relatives will go to great lengths to preserve this tiny piece of anatomy — from female genital mutilation, to virginity testing, to hymen repair surgery. Faiza chose a different route : non-vaginal sex. Only she became pregnant all the same. But Faiza didn ’ t actually realize this, because there ’ s so little sexuality education in schools, and so little communication in the family. When her condition became hard to hide, Faiza ’ s mother helped her flee her father and brothers. This is because honor killings are a real threat for untold numbers of women in the Arab region. And so when Faiza eventually fetched up at a hospital in Casablanca, the man who offered to help her, instead tried to rape her. Sadly, Faiza is not alone. In Egypt, where my research is focused, I have seen plenty of trouble in and out of the citadel. There are legions of young men who can ’ t afford to get married, because marriage has become a very expensive proposition. They are expected to bear the burden of costs in married life, but they can ’ t find jobs. This is one of the major drivers of the recent uprisings, and it is one of the reasons for the rising age of marriage in much of the Arab region. There are career women who want to get married, but can ’ t find a husband, because they defy gender expectations, or as one young female doctor in Tunisia put it to me,”The women, they are becoming more and more open. But the man, he is still at the prehistoric stage.”And then there are men and women who cross the heterosexual line, who have sex with their own sex, or who have a different gender identity. They are on the receiving end of laws which punish their activities, even their appearance. And they face a daily struggle with social stigma, with family despair, and with religious fire and brimstone. Now, it ’ s not as if it ’ s all rosy in the marital bed either. Couples who are looking for greater happiness, greater sexual happiness in their married lives, but are at a loss of how to achieve it, especially wives, who are afraid of being seen as bad women if they show some spark in the bedroom. And then there are those whose marriages are actually a veil for prostitution. They have been sold by their families, often to wealthy Arab tourists. This is just one face of a booming sex trade across the Arab region. Now raise your hand if any of this is sounding familiar to you, from your part of the world. Yeah. It ’ s not as if the Arab world has a monopoly on sexual hangups. And although we don ’ t yet have an Arab Kinsey Report to tell us exactly what ’ s happening inside bedrooms across the Arab region, It ’ s pretty clear that something is not right. Double standards for men and women, sex as a source of shame, family control limiting individual choices, and a vast gulf between appearance and reality : what people are doing and what they ’ re willing to admit to, and a general reluctance to move beyond private whispers to a serious and sustained public discussion. As one doctor in Cairo summed it up for me,”Here, sex is the opposite of sport. Football, everybody talks about it, but hardly anyone plays. But sex, everybody is doing it, but nobody wants to talk about it.”SEF : I want to give you a piece of advice, which if you follow it, will make you happy in life. When your husband reaches out to you, when he seizes a part of your body, sigh deeply and look at him lustily. When he penetrates you with his penis, try to talk flirtatiously and move yourself in harmony with him. Hot stuff! And it might sound that these handy hints come from”The Joy of Sex”or YouPorn. But in fact, they come from a 10th-century Arabic book called”The Encyclopedia of Pleasure,”which covers sex from aphrodisiacs to zoophilia, and everything in between. The Encyclopedia is just one in a long line of Arabic erotica, much of it written by religious scholars. Going right back to the Prophet Muhammad, there is a rich tradition in Islam of talking frankly about sex : not just its problems, but also its pleasures, and not just for men, but also for women. A thousand years ago, we used to have whole dictionaries of sex in Arabic. Words to cover every conceivable sexual feature, position and preference, a body of language that was rich enough to make up the body of the woman you see on this page. Today, this history is largely unknown in the Arab region. Even by educated people, who often feel more comfortable talking about sex in a foreign language than they do in their own tongue. Today ’ s sexual landscape looks a lot like Europe and America on the brink of the sexual revolution. But while the West has opened on sex, what we found is that Arab societies appear to have been moving in the opposite direction. In Egypt and many of its neighbors, this closing down is part of a wider closing in political, social and cultural thought. And it is the product of a complex historical process, one which has gained ground with the rise of Islamic conservatism since the late 1970s.”Just say no”is what conservatives around the world say to any challenge to the sexual status quo. In the Arab region, they brand these attempts as a Western conspiracy to undermine traditional Arab and Islamic values. But what ’ s really at stake here is one of their most powerful tools of control : sex wrapped up in religion. But history shows us that even as recently as our fathers ’ and grandfathers ’ day, there have been times of greater pragmatism, and tolerance, and a willingness to consider other interpretations : be it abortion, or masturbation, or even the incendiary topic of homosexuality. It is not black and white, as conservatives would have us believe. In these, as in so many other matters, Islam offers us at least 50 shades of gray. Over my travels, I ’ ve met men and women across the Arab region who ’ ve been exploring that spectrum — sexologists who are trying to help couples find greater happiness in their marriages, innovators who are managing to get sexuality education into schools, small groups of men and women, lesbian, gay, transgendered, transsexual, who are reaching out to their peers with online initiatives and real-world support. Women, and increasingly men, who are starting to speak out and push back against sexual violence on the streets and in the home. Groups that are trying to help sex workers protect themselves against HIV and other occupational hazards, and NGOs that are helping unwed mothers like Faiza find a place in society, and critically, stay with their kids. Now these efforts are small, they ’ re often underfunded, and they face formidable opposition. But I am optimistic that, in the long run, times are changing, and they and their ideas will gain ground. Social change doesn ’ t happen in the Arab region through dramatic confrontation, beating or indeed baring of breasts, but rather through negotiation. What we ’ re talking here is not about a sexual revolution, but a sexual evolution, learning from other parts of the world, adapting to local conditions, forging our own path, not following one blazed by another. That path, I hope, will one day lead us to the right to control our own bodies, and to access the information and services we need to lead satisfying and safe sexual lives. The right to express our ideas freely, to marry whom we choose, to choose our own partners, to be sexually active or not, to decide whether to have children and when, all this without violence or force or discrimination. Now we are very far from this across the Arab region, and so much needs to change : law, education, media, the economy, the list goes on and on, and it is the work of a generation, at least. But it begins with a journey that I myself have made, asking hard questions of received wisdoms in sexual life. And it is a journey which has only served to strengthen my faith, and my appreciation of local histories and cultures by showing me possibilities where I once only saw absolutes. Now given the turmoil in many countries in the Arab region, talking about sex, challenging the taboos, seeking alternatives might sound like something of a luxury. But at this critical moment in history, if we do not anchor freedom and justice, dignity and equality, privacy and autonomy in our personal lives, in our sexual lives, we will find it very hard to achieve in public life. The political and the sexual are intimate bedfellows, and that is true for us all. no matter where we live and love. Thank you.

Pat Mitchell : Your first time back on the TEDWomen stage. Sheryl Sandberg : First time back. Nice to see everyone. It ’ s always so nice to look out and see so many women. It ’ s so not my regular experience, as I know anyone else ’ s. PM : So when we first started talking about, maybe the **subject** wouldn ’ t be social media, which we assumed it would be, but that you had very much on your mind the missing leadership positions, particularly in the sector of technology and social media. But how did that evolve for you as a thought, and end up being the TED Talk that you gave? SS : So I was really scared to get on this stage and talk about women, because I grew up in the business world, as I think so many of us did. You never talk about being a woman, because someone might notice that you ’ re a woman, right? They might notice. Or worse, if you say”woman,”people on the other end of the table think you ’ re asking for special treatment, or complaining. Or worse, about to sue them.

And so I went through — Right? I went through my entire business career, and never spoke about being a woman, never spoke about it publicly. But I also had noticed that it wasn ’ t working. I came out of college over 20 years ago, and I thought that all of my peers were men and women, all the people above me were all men, but that would change, because your generation had done such an amazing job fighting for equality, equality was now ours for the taking. And it wasn ’ t. Because year after year, I was one of fewer and fewer, and now, often the only woman in a room. And I talked to a bunch of people about, should I give a speech at TEDWomen about women, and they said, oh no, no. It will end your business career. You cannot be a serious business executive and speak about being a woman. You ’ ll never be taken seriously again. But fortunately, there were the few, the proud — like you — who told me I should give the speech, and I asked myself the question Mark Zuckerberg might — the founder of Facebook and my boss — asks all of us, which is, what would I do if I wasn ’ t afraid? And the answer to what would I do if I wasn ’ t afraid is I would get on the TED stage, and talk about women, and leadership. And I did, and survived. PM : I would say, not only survived. I ’ m thinking of that moment, Sheryl, when you and I were standing backstage together, and you turned to me, and you told me a story. And I said — very last minute — you know, you really should share that story. SS : Oh, yeah. PM : What was that story? SS : Well, it ’ s an important part of the journey. So I had — TEDWomen — the original one was in D. C. — so I live here, so I had gotten on a plane the day before, and my daughter was three, she was clinging to my leg :”Mommy, don ’ t go.”And Pat ’ s a friend, and so, not related to the speech I was planning on giving, which was chock full of facts and figures, and nothing personal, I told Pat the story. I said, well, I ’ m having a hard day. Yesterday my daughter was clinging to my leg, and”Don ’ t go.”And you looked at me and said, you have to tell that story. I said, on the TED stage? Are you kidding? I ’ m going to get on a stage and admit my daughter was clinging to my leg? And you said yes, because if you want to talk about getting more women into leadership roles, you have to be honest about how hard it is. And I did. And I think that ’ s a really important part of the journey. The same thing happened when I wrote my book. I started writing the book. I wrote a first chapter, I thought it was fabulous. It was chock-full of data and figures, I had three pages on matrilineal Maasai tribes, and their sociological patterns. My husband read it and he was like, this is like eating your Wheaties. No one — and I apologize to Wheaties if there ’ s someone — no one, no one will read this book. And I realized through the process that I had to be more honest and more open, and I had to tell my stories. My stories of still not feeling as self-confident as I should, in many situations. My first and failed marriage. Crying at work. Felling like I didn ’ t belong there, feeling guilty to this day. And part of my journey, starting on this stage, going to”Lean In,”going to the foundation, is all about being more open and honest about those challenges, so that other women can be more open and honest, and all of us can work together towards real equality. PM : I think that one of the most striking parts about the book, and in my opinion, one of the reasons it ’ s hit such a nerve and is resonating around the world, is that you are personal in the book, and that you do make it clear that, while you ’ ve observed some things that are very important for other women to know, that you ’ ve had the same challenges that many others of us have, as you faced the hurdles and the barriers and possibly the people who don ’ t believe the same. So talk about that process : deciding you ’ d go public with the private part, and then you would also put yourself in the position of something of an expert on how to resolve those challenges. SS : After I did the TED Talk, what happened was — you know, I never really expected to write a book, I ’ m not an author, I

’ m not a writer, and it was viewed a lot, and it really started impacting people ’ s lives. I got this great — - one of the first letters I got was from a woman who said that she was offered a really big promotion at work, and she turned it down, and she told her best friend she turned it down, and her best friend said, you really need to watch this TED Talk. And so she watched this TED Talk, and she went back the next day, she took the job, she went home, and she handed her husband the grocery list. And she said, I can do this. And what really mattered to me — it wasn ’ t only women in the corporate world, even though I did hear from a lot of them, and it did impact a lot of them, it was also people of all different circumstances. There was a doctor I met who was an attending physician at Johns Hopkins, and he said that until he saw my TED Talk, it never really occurred to him that even though half the students in his med school classes were women, they weren ’ t speaking as much as the men as he did his rounds. So he started paying attention, and as he waited for raised hands, he realized the men ’ s hands were up. So he started encouraging the women to raise their hands more, and it still didn ’ t work. So he told everyone, no more hand raising, I ’ m cold-calling. So he could call evenly on men and women. And what he proved to himself was that the women knew the answers just as well or better, and he was able to go back to them and tell them that. And then there was the woman, stay-at-home mom, lives in a really difficult neighborhood, with not a great school, she said that TED Talk — she ’ s never had a corporate job, but that TED Talk inspired her to go to her school and fight for a better teacher for her child. And I guess it was part of was finding my own voice. And I realized that other women and men could find their voice through it, which is why I went from the talk to the book. PM : And in the book, you not only found your voice, which is clear and strong in the book, but you also share what you ’ ve learned — the experiences of other people in the lessons. And that ’ s what I ’ m thinking about in terms of putting yourself in a — you became a sort of expert in how you lean in. So what did that feel like, and become like in your life? To launch not just a book, not just a best-selling, best-viewed talk, but a movement, where people began to literally describe their actions at work as, I ’ m leaning in. SS : I mean, I ’ m grateful, I ’ m honored, I ’ m happy, and it ’ s the very beginning. So I don ’ t know if I ’ m an expert, or if anyone is an expert. I certainly have done a lot of research. I have read every study, I have pored over the materials, and the lessons are very clear. Because here ’ s what we know : What we know is that stereotypes are holding women back from leadership roles all over the world. It ’ s so striking.”Lean In”is very global, I ’ ve been all over the world, talking about it, and — cultures are so different. Even within our own country, to Japan, to Korea, to China, to Asia, Europe, they ’ re so different. Except for one thing : gender. All over the world, no matter what our cultures are, we think men should be strong, assertive, aggressive, have voice ; we think women should speak when spoken to, help others. Now we have, all over the world, women are called”bossy.”There is a word for”bossy,”for little girls, in every language there ’ s one. It ’ s a word that ’ s pretty much not used for little boys, because if a little boy leads, there ’ s no negative word for it, it ’ s expected. But if a little girl leads, she ’ s bossy. Now I know there aren ’ t a lot of men here, but bear with me. If you ’ re a man, you ’ ll have to represent your gender. Please raise your hand if you ’ ve been told you ’ re too aggressive at work. There ’ s always a few, it runs about five percent. Okay, get ready, gentlemen. If you ’ re a woman, please raise your hand if you ’ ve ever been told you ’ re too aggressive at work. That is what audiences have said in every country in the world, and it ’ s deeply supported by the data. Now, do we think women are more aggressive than men? Of course not. It ’ s just that we judge them through a different lens, and a lot of the character traits that you must exhibit to perform at work, to get results, to lead, are ones that we think, in a man, he ’ s a boss, and in a woman, she ’ s bossy. And the good news about this is that we can change this by acknowledging it. One of the happiest moments I had in this whole journey is, after the book came out, I stood on a stage with John Chambers, the CEO of Cisco. He read the book. He stood on a stage with me, he invited me in front of his whole management team, men and women, and he said, I thought we were good at this. I thought I was good at this. And then I read this book, and I realized that we — my company — we have called all of our senior women too aggressive, and I ’ m standing on this stage, and I ’ m sorry. And I want you to know we ’ re never going to do it again. PM : Can we send that to a lot of other people that we know? SS : And so John is doing that because he believes it ’ s good for his company, and so this kind of acknowledgement of these biases can change it. And so next time you all see someone call a little girl”bossy,”you walk right up to that person, big smile, and you say,”That little girl ’ s not bossy. That little girl has executive leadership skills.”PM : I know that ’ s what you ’ re telling your daughter. SS : Absolutely. PM : And you did focus in the book — and the reason, as you said, in writing it, was to create a dialogue about this. I mean, let ’ s just put it out there, face the fact that women are — in a time when we have more open doors, and more opportunities — are still not getting to the leadership positions. So in the months that have come since the book, in which”Lean In”focused on that and said, here are some of the challenges that remain, and many of them we have to own within ourselves and look at ourselves. What has changed? Have you seen changes? SS : Well, there ’ s certainly more dialogue, which is great. But what really matters to me, and I think all of us, is action. So everywhere I go, CEOs, they ’ re mostly men, say to me, you ’ re costing me so much money because all the women want to be paid as much as the men. And to them I say, I ’ m not sorry at all. At all. I mean, the women should be paid as much as the men. Everywhere I go, women tell me they ask for raises. Everywhere I go, women say they ’ re getting better relationships with their spouses, asking for more help at home, asking for the promotions they should be getting at work, and importantly, believing it themselves. Even little things. One of the governors of one of the states told me that he didn ’ t realize that more women were, in fact, literally sitting on the side of the room, which they are, and now he made a rule that all the women on his staff need to sit at the table. The foundation I started along with the book”Lean In”helps women, or men, start circles — small groups, it can be 10, it can be however many you want, which meet once a month. I would have hoped that by now, we ’ d have about 500 circles. That would ’ ve been great. You know, 500 times roughly 10. There are over 12, 000 circles in 50 countries in the world. PM : Wow, that ’ s amazing. SS : And these are people who are meeting every single month. I met one of them, I was in Beijing. A group of women, they ’ re all about 29 or 30, they started the first Lean In circle in Beijing, several of them grew up in very poor, rural China. These women are 29, they are told by their society that they are”left over,”because they are not yet married, and the process of coming together once a month at a meeting is helping them define who they are for themselves. What they want in their careers. The kind of partners they want, if at all. I looked at them, we went around and introduced ourselves, and they all said their names and where they ’ re from, and I said, I ’ m Sheryl Sandberg, and this was my dream. And I kind of just started crying. Right, which, I admit, I do. Right? I ’ ve talked about it before. But the fact that a woman so far away out in the world, who grew up in a rural village, who ’ s being told to marry someone she doesn ’ t want to marry, can now go meet once a month with a group of people and refuse that, and find life on her own terms. That

’ s the kind of change we have to hope for. PM : Have you been surprised by the global nature of the message? Because I think when the book first came out, many people thought, well, this is a really important handbook for young women on their way up. They need to look at this, anticipate the barriers, and recognize them, put them out in the open, have the dialogue about it, but that it ’ s really for women who are that. Doing that. Pursuing the corporate world. And yet the book is being read, as you say, in rural and developing countries. What part of that has surprised you, and perhaps led to a new perspective on your part? SS : The book is about self-confidence, and about equality. And it turns out, everywhere in the world, women need more self-confidence, because the world tells us we ’ re not equal to men. Everywhere in the world, we live in a world where the men get”and,”and women get”or.”I ’ ve never met a man who ’ s been asked how he does it all. Again, I ’ m going to turn to the men in the audience : Please raise your hand if you ’ ve been asked, how do you do it all? Men only. Women, women. Please raise your hand if you ’ ve been asked how you do it all? We assume men can do it all, slash — have jobs and children. We assume women can ’ t, and that ’ s ridiculous, because the great majority of women everywhere in the world, including the United States, work full time and have children. And I think people don ’ t fully understand how broad the message is. There is a circle that ’ s been started for rescued sex workers in Miami. They ’ re using”Lean In”to help people make the transition back to what would be a fair life, really rescuing them from their pimps, and using it. There are dress-for- success groups in Texas which are using the book, for women who have never been to college. And we know there are groups all the way to Ethiopia. And so these messages of equality — of how women are told they can ’ t have what men can have — how we assume that leadership is for men, how we assume that voice is for men, these affect all of us, and I think they are very universal. And it ’ s part of what TEDWomen does. It unites all of us in a cause we have to believe in, which is more women, more voice, more equality. PM : If you were invited now to make another TEDWomen talk, what would you say that is a result of this experience, for you personally, and what you ’ ve learned about women, and men, as you ’ ve made this journey? SS : I think I would say — I tried to say this strongly, but I think I can say it more strongly — I want to say that the status quo is not enough. That it ’ s not good enough, that it ’ s not changing quickly enough. Since I gave my TED Talk and published my book, another year of data came out from the U. S. Census. And you know what we found? No movement in the wage gap for women in the United States. Seventy-seven cents to the dollar. If you are a black woman, 64 cents. If you are a Latina, we ’ re at 54 cents. Do you know when the last time those numbers went up? 2002. We are stagnating, we are stagnating in so many ways. And I think we are not really being honest about that, for so many reasons. It ’ s so hard to talk about gender. We shy away from the word”feminist,”a word I really think we need to embrace. We have to get rid of the word bossy and bring back — I think I would say in a louder voice, we need to get rid of the word”bossy”and bring back the word”feminist,”because we need it. PM : And we all need to do a lot more leaning in. SS : A lot more leaning in. PM : Thank you, Sheryl. Thanks for leaning in and saying yes. SS : Thank you.

Text Sample 788: NEG Dim 5 – 2012 – Score -1.00 – 2012/t002169.txt

So I want to talk to you about two things tonight. Number one : Teaching surgery and doing surgery is really hard. And second, that language is one of the most profound things that separate us all over the world. And in my little corner of the world, these two things are actually related, and I want to tell you how tonight. Now, nobody wants an operation. Who here has had surgery? Did you want it? Keep your hands up if you wanted an operation. Nobody wants an operation. In particular, nobody wants an operation with tools like these through large incisions that cause a lot of pain, that cause a lot of time out of work or out of school, that leave a big scar. But if you have to have an operation, what you really want is a minimally invasive operation. That ' s what I want to talk to you about tonight — how doing and teaching this type of surgery led us on a search for a better universal translator. Now, this type of surgery is hard, and it starts by putting people to sleep, putting carbon dioxide in their abdomen, **blowing** them up like a balloon, sticking one of these sharp pointy things into their abdomen — it ' s dangerous stuff — and taking instruments and watching it on a TV screen. So let ' s see what it looks like. So this is gallbladder surgery. We perform a million of these a year in the United States alone. This is the real thing. There ' s no blood. And you can see how focused the surgeons are, how much concentration it takes. You can see it in their faces. It ' s hard to teach, and it ' s not all that easy to learn. We do about five million of these in the United States and maybe 20 million of these worldwide. All right, you ' ve all heard the term :”He ' s a born surgeon.”Let me tell you, surgeons are not born. Surgeons are not made either. There are no little tanks where we ' re making surgeons. Surgeons are trained one step at a time. It starts with a foundation, basic skills. We build on that and we take people, hopefully, to the operating room where they learn to be an assistant. Then we teach them to be a surgeon in training. And when they do all of that for about five years, they get the coveted board certification. If you need surgery, you want to be operated on by a board-certified surgeon. You get your board certificate, and you can go out into practice. And eventually, if you ' re lucky, you achieve mastery. Now that foundation is so important that a number of us from the largest general surgery society in the United States, SAGES, started in the late 1990s a training program that would assure that every surgeon who practices minimally invasive surgery would have a strong foundation of knowledge and skills necessary to go on and do procedures. Now the science behind this is so potent that it became required by the American Board of Surgery in order for a young surgeon to become board certified. It ' s not a lecture, it ' s not a course, it ' s all of that plus a high-stakes assessment. It ' s hard. Now just this past year, one of our partners, the American College of Surgeons, teamed up with us to make an announcement that all surgeons should be FLS -certified before they do minimally invasive surgery. And are we talking about just people here in the U. S. and Canada? No, we just said all surgeons. So to lift this education and training worldwide is a very large task, something I ' m very personally excited about as we travel around the world. SAGES does surgery all over the world, teaching and educating surgeons. So we have a problem, and one of the problems is distance. We can ' t travel everywhere. We need to make the world a smaller place. And I think that we can develop some tools to do so. And one of the tools I like personally is using video. So I was inspired by a friend. This is Allan Okrainec from Toronto. And he proved that you could actually teach people to do surgery using video conferencing. So here ' s Allan teaching an English-speaking surgeon in Africa these basic fundamental skills necessary to do minimally invasive surgery. Very inspiring. But for this examination, which is really hard, we have a problem. Even people who say they speak English, only 14 percent pass. Because for them it ' s not a surgery test, it ' s an English test. Let me bring it to you locally. I work at the Cambridge Hospital. It ' s the primary Harvard Medical School teaching facility. We have more than 100 translators covering 63 languages, and we spend millions of dollars just in our little hospital. It ’ s a big labor-intensive effort. If you think about the worldwide burden of trying to talk to your patients — not just teaching surgeons, just trying to talk to your patients — there aren ’ t enough translators in the world. We need to employ technology to assist us in this quest. At our hospital we see everybody from Harvard professors to people who just got here last week. And you have no idea how hard it is to talk to somebody or take care of somebody you can ’ t talk to. And there isn ’ t always a translator available. So we need tools. We need a universal translator. One of the things that I want to leave you with as you think about this talk is that this talk is not just about us preaching to the world. It ’ s really about setting up a dialogue. We have a lot to learn. Here in the United States we spend more money per person for outcomes that are not better than many countries in the world. Maybe we have something to learn as well. So I ’ m passionate about teaching these FLS skills all over the world. This past year I ’ ve been in Latin America, I ’ ve been in China, talking about the fundamentals of laparoscopic surgery. And everywhere I go the barrier is :”We want this, but we need it in our language.”So here ’ s what we think we want to do : Imagine giving a lecture and being able to talk to people in their own native language simultaneously. I want to talk to the people in Asia, Latin America, Africa, Europe seamlessly, accurately and in a cost-effective fashion using technology. And it has to be bi-directional. They have to be able to teach us something as well. It ’ s a big task. So we looked for a universal translator ; I thought there would be one out there. Your webpage has translation, your cellphone has translation, but nothing that ’ s good enough to teach surgery. Because we need a lexicon. What is a lexicon? A lexicon is a body of words that describes a domain. I need to have a health care lexicon. And in that I need a surgery lexicon. That ’ s a tall order. We have to work at it. So let me show you what we ’ re doing. This is research — can ’ t buy it. We ’ re working with the folks at IBM Research from the Accessibility Center to string together technologies to work towards the universal translator. It starts with a framework system where when the surgeon delivers the lecture using a framework of captioning technology, we then add another technology to do video conferencing. But we don ’ t have the words yet, so we add a third technology. And now we ’ ve got the words, and we can apply the special sauce : the translation. We get the words up in a window and then apply the magic. We work with a fourth technology. And we currently have access to eleven language pairs. More to come as we think about trying to make the world a smaller place. And I ’ d like to show you our prototype of stringing all of these technologies that don ’ t necessarily always talk to each other to become something useful. Narrator : Fundamentals of Laparoscopic Surgery. Module five : manual skills practice. Students may display captions in their native language. Steven Schwaitzberg : If you ’ re in Latin America, you click the”I want it in Spanish”button and out it comes in real time in Spanish. But if you happen to be sitting in Beijing at the same time, by using technology in a constructive fashion, you could get it in Mandarin or you could get it in Russian — on and on and on, simultaneously without the use of human translators. But that ’ s the lectures. If you remember what I told you about FLS at the beginning, it ’ s knowledge and skills. The difference in an operation between doing something successfully and not may be moving your hand this much. So we ’ re going to take it one step further ; we ’ ve brought my friend Allan back. Allan Okrainec : Today we ’ re going to practice suturing. This is how you hold the needle. Grab the needle at the tip. It ’ s important to be accurate. Aim for the black dots. Orient your loop this way. Now go ahead and cut. Very good Oscar. I ’ ll see you next week. SS : So that ’ s what we ’ re working on in our quest for the universal translator. We want it to be bi-directional. We have a need to learn as well as to teach. I can think of a million uses for a tool like this. As we think about intersecting technologies — everybody has a cell phone with a camera — we could use this everywhere, whether it be health care, patient care, engineering, law, conferencing, translating videos. This is a ubiquitous tool. In order to break down our barriers, we have to learn to talk to people, to demand that people work on translation. We need it for our everyday life, in order to make the world a smaller place. Thank you very much.

I ’ d like to share with you the story of one of my patients called Celine. Celine is a housewife and lives in a rural district of Cameroon in west Central Africa. Six years ago, at the time of her HIV diagnosis, she was recruited to participate in the clinical trial which was running in her health district at the time. When I first met Celine, a little over a year ago, she had gone for 18 months without any antiretroviral therapy, and she was very ill. She told me that she stopped coming to the clinic when the trial ended because she had no money for the bus fare and was too ill to walk the 35-kilometer distance. Now during the clinical trial, she ’ d been given all her antiretroviral drugs free of charge, and her transportation costs had been covered by the research funds. All of these ended once the trial was completed, leaving Celine with no alternatives. She was unable to tell me the names of the drugs she ’ d received during the trial, or even what the trial had been about. I didn ’ t bother to ask her what the results of the trial were because it seemed obvious to me that she would have no clue. Yet what puzzled me most was Celine had given her informed consent to be a part of this trial, yet she clearly did not understand the implications of being a participant or what would happen to her once the trial had been completed. Now, I have shared this story with you as an example of what can happen to participants in the clinical trial when it is poorly conducted. Maybe this particular trial yielded exciting results. Maybe it even got published in a high-profile scientific journal. Maybe it would inform clinicians around the world on how to improve on the clinical management of HIV patients. But it would have done so at a price to hundreds of patients who, like Celine, were left to their own devices once the research had been completed. I do not stand here today to suggest in any way that conducting HIV clinical trials in developing countries is bad. On the contrary, clinical trials are extremely useful tools, and are much needed to address the burden of disease in developing countries. However, the inequalities that exist between richer countries and developing countries in terms of funding pose a real risk for exploitation, especially in the context of externally-funded research. Sadly enough, the fact remains that a lot of the studies that are conducted in developing countries could never be authorized in the richer countries which fund the research. I ’ m sure you must be asking yourselves what makes developing countries, especially those in sub-Saharan Africa, so attractive for these HIV clinical trials? Well, in order for a clinical trial to generate valid and widely applicable results, they need to be conducted with large numbers of study participants and preferably on a population with a high incidence of new HIV infections. Sub-Saharan Africa largely fits this description, with 22 million people living with HIV, an estimated 70 percent of the 30 million people who are infected worldwide. Also, research within the continent is a lot easier to conduct due to widespread poverty, endemic diseases and inadequate health care systems. A clinical trial that is considered to be potentially beneficial to the population is more likely to be authorized, and in the

absence of good health care systems, almost any offer of medical assistance is accepted as better than nothing. Even more problematic reasons include lower risk of litigation, less rigorous ethical reviews, and populations that are willing to participate in almost any study that hints at a cure. As funding for HIV research increases in developing countries and ethical review in richer countries become more strict, you can see why this context becomes very, very attractive. The high prevalence of HIV drives researchers to conduct research that is sometimes scientifically acceptable but on many levels ethically questionable. How then can we ensure that, in our search for the cure, we do not take an unfair advantage of those who are already most affected by the pandemic? I invite you to consider four areas I think we can focus on in order to improve the way in which things are done. The first of these is informed consent. Now, in order for a clinical trial to be considered ethically acceptable, participants must be given the relevant information in a way in which they can understand, and must freely consent to participate in the trial. This is especially important in developing countries, where a lot of participants consent to research because they believe it is the only way in which they can receive medical care or other benefits. Consent procedures that are used in richer countries are often inappropriate or ineffective in a lot of developing countries. For example, it is counterintuitive to have an illiterate study participant, like Celine, sign a lengthy consent form that they are unable to read, let alone understand. Local communities need to be more involved in establishing the criteria for recruiting participants in clinical trials, as well as the incentives for participation. The information in these trials needs to be given to the potential participants in linguistically and culturally acceptable formats. The second point I would like for you to consider is the standard of care that is provided to participants within any clinical trial. Now, this is **subject** to a lot of debate and controversy. Should the control group in the clinical trial be given the best current treatment which is available anywhere in the world? Or should they be given an alternative standard of care, such as the best current treatment available in the country in which the research is being conducted? Is it fair to evaluate a treatment regimen which may not be affordable or accessible to the study participants once the research has been completed? Now, in a situation where the best current treatment is inexpensive and simple to deliver, the answer is straightforward. However, the best current treatment available anywhere in the world is often very difficult to provide in developing countries. It is important to assess the potential risks and benefits of the standard of care which is to be provided to participants in any clinical trial, and establish one which is relevant for the context of the study and most beneficial for the participants within the study. That brings us to the third point I want you think about : the ethical review of research. An effective system for reviewing the ethical suitability of clinical trials is primordial to safeguard participants within any clinical trial. Unfortunately, this is often lacking or inefficient in a lot of developing countries. Local governments need to set up effective systems for reviewing the ethical issues around the clinical trials which are authorized in different developing countries, and they need to do this by setting up ethical review committees that are independent of the government and research sponsors. Public accountability needs to be promoted through transparency and independent review by non-governmental and international organizations as appropriate. The final point I would like for you to consider tonight is what happens to participants in the clinical trial once the research has been completed. I think it is absolutely wrong for research to begin in the first place without a clear plan for what would happen to the participants once the trial has ended. Now, researchers need to make every effort to ensure that an intervention that has been shown to be beneficial during a clinical trial is accessible to the participants of the trial once the trial has been completed. In addition, they should be able to consider the possibility of introducing and maintaining effective treatments in the wider community once the trial ends. If, for any reason, they feel that this might not be possible, then I think they should have to ethically justify why the clinical trial should be conducted in the first place. Now, fortunately for Celine, our meeting did not end in my office. I was able to get her enrolled into a free HIV treatment program closer to her home, and with a support group to help her cope. Her story has a positive ending, but there are thousands of others in similar situations who are much less fortunate. Although she may not know this, my encounter with Celine has completely changed the way in which I view HIV clinical trials in developing countries, and made me even more determined to be part of the movement to change the way in which things are done. I believe that every single person listening to me tonight can be part of that change. If you are a researcher, I hold you to a higher standard of moral conscience, to remain ethical in your research, and not compromise human welfare in your search for answers. If you work for a funding agency or pharmaceutical company, I challenge you to hold your employers to fund research that is ethically sound. If you come from a developing country like myself, I urge you to hold your government to a more thorough review of the clinical trials which are authorized in your country. Yes, there is a need for us to find a cure for HIV, to find an effective vaccine for malaria, to find a diagnostic tool that works for T. B., but I believe that we owe it to those who willingly and selflessly consent to participate in these clinical trials to do this in a humane way. Thank you.

["Rebecca Newberger Goldstein"] ["Steven Pinker"] ["The Long Reach of Reason"] Cabbie : Twenty-two dollars. Steven Pinker : Okay. Rebecca Newberger Goldstein : Reason appears to have fallen on hard times : Popular culture plumbs new depths of dumbth and political discourse has become a race to the bottom. We ' re living in an era of scientific creationism, 9 / 11 conspiracy theories, psychic hotlines, and a resurgence of religious fundamentalism. People who think too well are often accused of elitism, and even in the academy, there are attacks on logocentrism, the crime of letting logic dominate our thinking. SP : But is this necessarily a bad thing? Perhaps reason is overrated. Many pundits have argued that a good heart and steadfast moral clarity are superior to triangulations of overeducated policy wonks, like the best and brightest and that dragged us into the quagmire of Vietnam. And wasn ' t it reason that gave us the means to despoil the planet and threaten our species with weapons of mass destruction? In this way of thinking, it ' s character and conscience, not cold- hearted calculation, that will save us. Besides, a human being is not a brain on a stick. My fellow psychologists have shown that we ' re led by our bodies and our emotions and use our puny powers of reason merely to rationalize our gut feelings after the fact. RNG : How could a reasoned argument logically entail the ineffectiveness of reasoned arguments? Look, you ' re trying to persuade us of reason ' s impotence. You ' re not threatening us or bribing us, suggesting that we resolve the issue with a show of hands or a beauty contest. By the very act of trying to reason us into your position, you ' re conceding reason ' s potency. Reason isn ' t up for grabs here. It can ' t be. You show up for that debate and you ' ve already lost it. SP : But can reason lead us in directions that are good or decent or moral? After all, you pointed out that reason is just a means to an end, and the end depends on the reasoner ' s passions. Reason can lay out a road map to peace and harmony if the reasoner wants peace and harmony, but it can also lay out a road map to conflict and strife if the reasoner delights in conflict and strife. Can reason force the reasoner to want less cruelty and waste? RNG : All on its own, the answer is no, but it doesn ’ t take much to switch it to yes. You need two conditions : The first is that reasoners all care about their own well-being. That ’ s one of the passions that has to be present in order for reason to go to work, and it ’ s obviously present in all of us. We all care passionately about our own well-being. The second condition is that reasoners are members of a community of reasoners who can affect one another ’ s well- being, can exchange messages, and comprehend each other ’ s reasoning. And that ’ s certainly true of our gregarious and loquatious species, well endowed with the instinct for language. SP : Well, that sounds good in theory, but has it worked that way in practice? In particular, can it explain a momentous historical development that I spoke about five years ago here at TED? Namely, we seem to be getting more humane. Centuries ago, our ancestors would burn cats alive as a form of popular entertainment. Knights waged constant war on each other by trying to kill as many of each other ’ s peasants as possible. Governments executed people for frivolous reasons, like stealing a cabbage or criticizing the royal garden. The executions were designed to be as prolonged and as painful as possible, like crucifixion, disembowelment, breaking on the wheel. Respectable people kept slaves. For all our flaws, we have abandoned these barbaric practices. RNG : So, do you think it ’ s human nature that ’ s changed? SP : Not exactly. I think we still harbor instincts that can erupt in violence, like greed, tribalism, revenge, dominance, sadism. But we also have instincts that can steer us away, like self-control, empathy, a sense of fairness, what Abraham Lincoln called the better angels of our nature. RNG : So if human nature didn ’ t change, what invigorated those better angels? SP : Well, among other things, our circle of empathy expanded. Years ago, our ancestors would feel the pain only of their family and people in their village. But with the expansion of literacy and travel, people started to sympathize with wider and wider circles, the clan, the tribe, the nation, the race, and perhaps eventually, all of humanity. RNG : Can hard-headed scientists really give so much credit to soft-hearted empathy? SP : They can and do. Neurophysiologists have found neurons in the brain that respond to other people ’ s actions the same way they respond to our own. Empathy emerges early in life, perhaps before the age of one. Books on empathy have become bestsellers, like”The Empathic Civilization”and”The Age of Empathy.”RNG : I ’ m all for empathy. I mean, who isn ’ t? But all on its own, it ’ s a feeble instrument for making moral progress. For one thing, it ’ s innately biased toward blood relations, babies and warm, fuzzy animals. As far as empathy is concerned, ugly outsiders can go to hell. And even our best attempts to work up sympathy for those who are unconnected with us fall miserably short, a sad truth about human nature that was pointed out by Adam Smith. Adam Smith : Let us suppose that the great empire of China was suddenly swallowed up by an earthquake, and let us consider how a man of humanity in Europe would react on receiving intelligence of this dreadful calamity. He would, I imagine, first of all express very strongly his sorrow for the misfortune of that unhappy people. He would make many melancholy reflections upon the precariousness of human life, and when all these humane sentiments had been once fairly expressed, he would pursue his business or his pleasure with the same ease and tranquility as if no such accident had happened. If he was to lose his little finger tomorrow, he would not sleep tonight, but provided he never saw them, he would snore with the most profound security over the ruin of a hundred million of his brethren. SP : But if empathy wasn ’ t enough to make us more humane, what else was there? RNG

: Well, you didn ' t mention what might be one of our most effective better angels : reason. Reason has muscle. It ' s reason that provides the push to widen that circle of empathy. Every one of the humanitarian developments that you mentioned originated with thinkers who gave reasons for why some practice was indefensible. They demonstrated that the way people treated some particular group of others was logically inconsistent with the way they insisted on being treated themselves. SP : Are you saying that reason can actually change people ' s minds? Don ' t people just stick with whatever conviction serves their interests or conforms to the culture that they grew up in? RNG : Here ' s a fascinating fact about us : Contradictions bother us, at least when we ' re forced to confront them, which is just another way of saying that we are susceptible to reason. And if you look at the history of moral progress, you can trace a direct pathway from reasoned arguments to changes in the way that we actually feel. Time and again, a thinker would lay out an argument as to why some practice was indefensible, irrational, inconsistent with values already held. Their essay would go viral, get translated into many languages, get debated at pubs and coffee houses and salons, and at dinner parties, and influence leaders, legislators, popular opinion. Eventually their conclusions get absorbed into the common sense of decency, erasing the tracks of the original argument that had gotten us there. Few of us today feel any need to put forth a rigorous philosophical argument as to why slavery is wrong or public hangings or beating children. By now, these things just feel wrong. But just those arguments had to be made, and they were, in centuries past. SP : Are you saying that people needed a step-by-step argument to grasp why something might be a wee bit wrong with burning heretics at the stake? RNG : Oh, they did. Here ' s the French theologian Sebastian Castellio making the case. Sebastian Castellio : Calvin says that he ' s certain, and other sects say that they are. Who shall be judge? If the matter is certain, to whom is it so? To Calvin? But then, why does he write so many books about manifest truth? In view of the uncertainty, we must define heretics simply as one with whom we disagree. And if then we are going to kill heretics, the logical outcome will be a war of extermination, since each is sure of himself. SP : Or with hideous punishments like breaking on the wheel? RNG : The prohibition in our constitution of cruel and unusual punishments was a response to a pamphlet circulated in 1764 by the Italian jurist Cesare Beccaria. Cesare Beccaria : As punishments become more cruel, the minds of men, which like fluids always adjust to the level of the objects that surround them, become hardened, and after a hundred years of cruel punishments, breaking on the wheel causes no more fear than imprisonment previously did. For a punishment to achieve its objective, it is only necessary that the harm that it inflicts outweighs the benefit that derives from the crime, and into this calculation ought to be factored the certainty of punishment and the loss of the good that the commission of the crime will produce. Everything beyond this is superfluous, and therefore tyrannical. SP : But surely antiwar movements depended on mass demonstrations and catchy tunes by folk singers and wrenching photographs of the human costs of war. RNG : No doubt, but modern anti-war movements reach back to a long chain of thinkers who had argued as to why we ought to mobilize our emotions against war, such as the father of modernity, Erasmus. Erasmus : The advantages derived from peace diffuse themselves far and wide, and reach great numbers, while in war, if anything turns out happily, the advantage redounds only to a few, and those unworthy of reaping it. One man ' s safety is owing to the destruction of another. One man ' s prize is derived from the plunder of another. The cause of rejoicings made by one side is to the other a cause of mourning. Whatever is unfortunate in war, is severely so indeed, and whatever, on the contrary, is called good fortune, is a savage and a cruel good fortune, an ungenerous happiness deriving its existence from another ' s woe. SP : But everyone knows that the movement to abolish slavery depended on faith and emotion. It was a movement spearheaded by the Quakers, and it only became popular when Harriet Beecher Stowe ' s novel"Uncle Tom ' s Cabin"became a bestseller. RNG : But the ball got rolling a century before. John Locke bucked the tide of millennia that had regarded the practice as perfectly natural. He argued that it was inconsistent with the principles of rational government. John Locke : Freedom of men under government is to have a standing rule to live by common to everyone of that society and made by the legislative power erected in it, a liberty to follow my own will in all things where that rule prescribes not, not to be **subject** to the inconstant, uncertain, unknown, arbitrary will of another man, as freedom of nature is to be under no other restraint but the law of nature. SP : Those words sound familiar. Where have I read them before? Ah, yes. Mary Astell : If absolute sovereignty be not necessary in a state, how comes it to be so in a family? Or if in a family, why not in a state? Since no reason can be alleged for the one that will not hold more strongly for the other, if all men are born free, how is it that all women are born slaves, as they must be if being **subjected** to the inconstant, uncertain, unknown, arbitrary will of men be the perfect condition of slavery? RNG : That sort of co-option is all in the job description of reason. One movement for the expansion of rights inspires another because the logic is the same, and once that ' s hammered home, it becomes increasingly uncomfortable to ignore the inconsistency. In the 1960s, the Civil Rights Movement inspired the movements for women ' s rights, children ' s rights, gay rights and even animal rights. But fully two centuries before, the Enlightenment thinker Jeremy Bentham had exposed the indefensibility of customary practices such as the cruelty to animals. Jeremy Bentham : The question is not, can they reason, nor can they talk, but can they suffer? RNG : And the persecution of homosexuals. JB : As to any primary mischief, it ' s evident that it produces no pain in anyone. On the contrary, it produces pleasure. The partners are both willing. If either of them be unwilling, the act is an offense, totally different in its nature of effects. It ' s a personal injury. It ' s a kind of rape. As to the any danger exclusive of pain, the danger, if any, much consist in the tendency of the example. But what is the tendency of this example? To dispose others to engage in the same practices. But this practice produces not pain of any kind to anyone. SP : Still, in every case, it took at least a century for the arguments of these great thinkers to trickle down and infiltrate the population as a whole. It kind of makes you wonder about our own time. Are there practices that we engage in where the arguments against them are there for all to see but nonetheless we persist in them? RNG : When our great grandchildren look back at us, will they be as appalled by some of our practices as we are by our slave-owning, heretic-burning, wife- beating, gay-bashing ancestors? SP : I ' m sure everyone here could think of an example. RNG : I opt for the mistreatment of animals in factory farms. SP : The imprisonment of nonviolent drug offenders and the toleration of rape in our nation ' s prisons. RNG : Scrimping on donations to life-saving charities in the developing world. SP : The possession of nuclear weapons. RNG : The appeal to religion to justify the otherwise unjustifiable, such as the ban on contraception. SP : What about religious faith in general? RNG : Eh, I ' m not holding my breath. SP : Still, I have become convinced that reason is a better angel that deserves the greatest credit for the moral progress our species has enjoyed and that holds out the greatest hope for continuing moral progress in the future. RNG : And if, our friends, you detect a flaw in this argument, just remember you ' ll be depending on reason to point it out. Thank you. SP : Thank you.

Text Sample 791: NEG Dim 5 – 2009 – Score -1.00 – 2009/t000207.txt

A human child is born, and for quite a long time is a consumer. It cannot be consciously a contributor. It is helpless. It doesn ’ t know how to survive, even though it is endowed with an instinct to survive. It needs the help of mother, or a foster mother, to survive. It can ’ t afford to doubt the person who tends the child. It has to totally surrender, as one surrenders to an anesthesiologist. It has to totally surrender. That implies a lot of trust. That implies the trusted person won ’ t violate the trust. As the child grows, it begins to discover that the person trusted is violating the trust. It doesn ’ t know even the word”violation.”Therefore, it has to blame itself, a wordless blame, which is more difficult to really resolve — the wordless self-blame. As the child grows to become an adult : so far, it has been a consumer, but the growth of a human being lies in his or her capacity to contribute, to be a contributor. One cannot contribute unless one feels secure, one feels big, one feels : I have enough. To be compassionate is not a joke. It ’ s not that simple. One has to discover a certain bigness in oneself. That bigness should be centered on oneself, not in terms of money, not in terms of power you wield, not in terms of any status that you can command in the society, but it should be centered on oneself. The self : you are self-aware. On that self, it should be centered — a bigness, a wholeness. Otherwise, compassion is just a word and a dream. You can be compassionate occasionally, more moved by empathy than by compassion. Thank God we are empathetic. When somebody ’ s in pain, we pick up the pain. In a Wimbledon final match, these two guys fight it out. Each one has got two games. It can be anybody ’ s game. What they have sweated so far has no meaning. One person wins. The tennis etiquette is, both the players have to come to the net and shake hands. The winner boxes the air and kisses the ground, throws his shirt as though somebody is waiting for it. And this guy has to come to the net. When he comes to the net, you see, his whole face changes. It looks as though he ’ s wishing that he didn ’ t win. Why? Empathy. That ’ s human heart. No human heart is denied of that empathy. No religion can demolish that by indoctrination. No culture, no nation and nationalism — nothing can touch it because it is empathy. And that capacity to empathize is the window through which you reach out to people, you do something that makes a difference in somebody ’ s life — even words, even time. Compassion is not defined in one form. There ’ s no Indian compassion. There ’ s no American compassion. It transcends nation, the gender, the age. Why? Because it is there in everybody. It ’ s experienced by people occasionally. Then this occasional compassion, we are not talking about — it will never remain occasional. By mandate, you cannot make a person compassionate. You can ’ t say,”Please love me.”Love is something you discover. It ’ s not an action, but in the English language, it is also an action. I will come to it later. So one has got to discover a certain wholeness. I am going to cite the possibility of being whole, which is within our experience, everybody ’ s experience. In spite of a very tragic life, one is happy in moments which are very few and far between. And the one who is happy, even for a slapstick joke, accepts himself and also the scheme of things in which one finds oneself. That means the whole universe, known things and unknown things. All of them are totally accepted because you discover your wholeness in yourself. The **subject** —”me”— and the object — the scheme of things — fuse into oneness, an experience nobody can say,”I am denied of,”an experience common to all and sundry. That experience confirms that, in spite of all your limitations — all your wants, desires, unfulfilled, and the credit cards and layoffs and, finally, baldness — you can be happy. But the extension of the logic is that you don ’ t need to fulfill your desire to be happy. You are the very happiness, the wholeness that you want to be. There ’ s no choice in this : that only confirms the reality that the wholeness cannot be different from you, cannot be minus you. It has got to be you. You cannot be a part of wholeness and still be whole. Your moment of happiness reveals that reality, that realization, that recognition :”Maybe I am the whole. Maybe the swami is right. Maybe the swami is right.”You start your new life. Then everything becomes meaningful. I have no more reason to blame myself. If one has to blame oneself, one has a million reasons plus many. But if I say, in spite of my body being limited — if it is black it is not white, if it is white it is not black : body is limited any which way you look at it. Limited. Your knowledge is limited, health is limited, and power is therefore limited, and the cheerfulness is going to be limited. Compassion is going to be limited. Everything is going to be limitless. You cannot command compassion unless you become limitless, and nobody can become limitless, either you are or you are not. Period. And there is no way of your being not limitless too. Your own experience reveals, in spite of all limitations, you are the whole. And the wholeness is the reality of you when you relate to the world. It is love first. When you relate to the world, the dynamic manifestation of the wholeness is, what we say, love. And itself becomes compassion if the object that you relate to evokes that emotion. Then that again transforms into giving, into sharing. You express yourself because you have compassion. To discover compassion, you need to be compassionate. To discover the capacity to give and share, you need to be giving and sharing. There is no shortcut : it is like swimming by swimming. You learn swimming by swimming. You cannot learn swimming on a foam mattress and enter into water. You learn swimming by swimming. You learn cycling by cycling. You learn cooking by cooking, having some sympathetic people around you to eat what you cook. And, therefore, what I say, you have to fake it and make it. You need to. My predecessor meant that. You have to act it out. You have to act compassionately. There is no verb for compassion, but you have an adverb for compassion. That ’ s interesting to me. You act compassionately. But then, how to act compassionately if you don ’ t have compassion? That is where you fake. You fake it and make it. This is the mantra of the United States of America. You fake it and make it. You act compassionately as though you have compassion : grind your teeth, take all the support system. If you know how to pray, pray. Ask for compassion. Let me act compassionately. Do it. You ’ ll discover compassion and also slowly a relative compassion, and slowly, perhaps if you get the right teaching, you ’ ll discover compassion is a dynamic manifestation of the reality of yourself, which is oneness, wholeness, and that ’ s what you are. With these words, thank you very much.

Text Sample 792: NEG Dim 5 – 2009 – Score -1.00 – 2009/t000106.txt

We look around the media, as we see on the news from Iraq, Afghanistan, Sierra Leone, and the conflict seems incomprehensible to us. And that ’ s certainly how it seemed to me when I started this project. But as a physicist, I thought, well if you give me some data, I could maybe understand this. You know, give us a go. So as a naive New Zealander I thought, well I ’ ll go to the Pentagon. Can you get me some information? No. So I had to think a little harder. And I was watching the news one night in Oxford. And I looked down at the chattering heads on my channel of choice. And I saw that there was information there. There was data within the streams of news that we consume. All this noise around us actually has information. So what I started thinking was, perhaps there is something like open source intelligence here. If we can get enough of these streams of information together, we can perhaps start to understand the war. So this is exactly what I did. We started bringing a team together, an interdisciplinary team of scientists, of economists, mathematicians. We brought these guys together and we started to try and solve this. We did it in three steps. The first step we did was to collect. We did 130 different sources of information — from NGO reports to newspapers and cable news. We brought this raw data in and we filtered it. We extracted the key bits on information to build the database. That database contained the timing of attacks, the location, the size and the weapons used. It ' s all in the streams of information we consume daily, we just have to know how to pull it out. And once we had this we could start doing some cool stuff. What if we were to look at the distribution of the sizes of attacks? What would that tell us? So we started doing this. And you can see here on the horizontal axis you ' ve got the number of people killed in an attack or the size of the attack. And on the vertical axis you ' ve got the number of attacks. So we plot data for sample on this. You see some sort of random distribution — perhaps 67 attacks, one person was killed, or 47 attacks where seven people were killed. We did this exact same thing for Iraq. And we didn ' t know, for Iraq what we were going to find. It turns out what we found was pretty surprising. You take all of the conflict, all of the chaos, all of the noise, and out of that comes this precise mathematical distribution of the way attacks are ordered in this conflict. This **blew** our mind. Why should a conflict like Iraq have this as its fundamental signature? Why should there be order in war? We didn ' t really understand that. We thought maybe there is something special about Iraq. So we looked at a few more conflicts. We looked at Colombia, we looked at Afghanistan, and we looked at Senegal. And the same pattern emerged in each conflict. This wasn ' t supposed to happen. These are different wars, with different religious factions, different political factions, and different socioeconomic problems. And yet the fundamental patterns underlying them are the same. So we went a little wider. We looked around the world at all the data we could get our hands on. From Peru to Indonesia, we studied this same pattern again. And we found that not only were the distributions these straight lines, but the slope of these lines, they clustered around this value of alpha equals 2. 5. And we could generate an equation that could predict the likelihood of an attack. What we ' re saying here is the probability of an attack killing X number of people in a country like Iraq is equal to a constant, times the size of that attack, raised to the power of negative alpha. And negative alpha is the slope of that line I showed you before. So what? This is data, statistics. What does it tell us about these conflicts? That was a challenge we had to face as physicists. How do we explain this? And what we really found was that alpha, if we think about it, is the organizational structure of the insurgency. Alpha is the distribution of the sizes of attacks, which is really the distribution of the group strength carrying out the attacks. So we look at a process of group dynamics : coalescence and fragmentation, groups coming together, groups breaking apart. And we start running the numbers on this. Can we simulate it? Can we create the kind of patterns that we ' re seeing in places like Iraq? Turns out we kind of do a reasonable job. We can run these simulations. We can recreate this using a process of group dynamics to explain the patterns that we see all around the conflicts around the world. So what ' s going on? Why should these different — seemingly different conflicts have the same patterns? Now what I believe is going on is that the insurgent forces, they evolve over time. They adapt. And it turns out there is only one solution to fight a much stronger enemy. And if you don ' t find that solution as an insurgent force, you don ' t exist. So every insurgent force that is ongoing, every conflict that is ongoing, it ' s going to look something like this. And that is what we think is happening. Taking it forward, how do we change it? How do we end a war like Iraq? What does it look like? Alpha is the structure. It ’ s got a stable state at 2. 5. This is what wars look like when they continue. We ’ ve got to change that. We can push it up : the forces become more fragmented ; there is more of them, but they are weaker. Or we push it down : they ’ re more robust ; there is less groups ; but perhaps you can sit and talk to them. So this graph here, I ’ m going to show you now. No one has seen this before. This is literally stuff that we ’ ve come through last week. And we see the evolution of Alpha through time. We see it start. And we see it grow up to the stable state the wars around the world look like. And it stays there through the invasion of Fallujah until the Samarra bombings in the Iraqi elections of ’ 06. And the system gets perturbed. It moves upwards to a fragmented state. This is when the surge happens. And depending on who you ask, the surge was supposed to push it up even further. The opposite happened. The groups became stronger. They became more robust. And so I ’ m thinking, right, great, it ’ s going to keep going down. We can talk to them. We can get a solution. The opposite happened. It ’ s moved up again. The groups are more fragmented. And this tells me one of two things. Either we ’ re back where we started and the surge has had no effect ; or finally the groups have been fragmented to the extent that we can start to think about maybe moving out. I don ’ t know what the answer is to that. But I know that we should be looking at the structure of the insurgency to answer that question. Thank you.

So sometimes I get invited to give weird talks. I got invited to speak to the people who dress up in big stuffed animal costumes to perform at sporting events. Unfortunately I couldn ’ t go. But it got me thinking about the fact that these guys, at least most of them, know what it is that they do for a living. What they do is they dress up as stuffed animals and entertain people at sporting events. Shortly after that I got invited to speak at the convention of the people who make balloon animals. And again, I couldn ’ t go. But it ’ s a fascinating group. They make balloon animals. There is a big schism between the ones who make gospel animals and porn animals, but — they do a lot of really cool stuff with balloons. Sometimes they get in trouble, but not often. And the other thing about these guys is, they also know what they do for a living. They make balloon animals. But what do we do for a living? What exactly to the people watching this do every day? And I want to argue that what we do is we try to change everything. That we try to find a piece of the status quo — something that bothers us, something that needs to be improved, something that is itching to be changed — and we change it. We try to make big, permanent, important change. But we don ’ t think about it that way. And we haven ’ t spent a lot of time talking about what that process is like. And I ’ ve been studying it for a couple years. And I want to share a couple stories with you today. First, about a guy named Nathan Winograd. Nathan was the number two person at the San Francisco SPCA. And what you may not know about the history of the SPCA is, it was founded to kill dogs and cats. Cities gave them a charter to get rid of the stray animals on the street and destroy them. In a typical year four million dogs and cats were killed, most of them within 24 hours of being scooped off of the street. Nathan and his boss saw this, and they could not tolerate it. So they set out to make San Francisco a no-kill city : create an entire city where every dog and cat, unless it was ill or dangerous, would be adopted, not killed. And everyone said it was impossible. Nathan and his boss went to the city council to get a change in the ordinance. And people from SPCAs and humane shelters around the country flew to San Francisco to testify against them — to say it would hurt the movement and it was inhumane. They persisted. And Nathan went directly to the community. He connected with people who cared about this : nonprofessionals, people with passion. And within just a couple years, San Francisco became the first no-kill city, running no deficit, completely supported by the community. Nathan left and went to Tompkins County, New York — a place as different from San Francisco as you can be and still be in the United States. And he did it again. He went from being a glorified dogcatcher to completely transforming the community. And then he went to North Carolina and did it again. And he went to Reno and he did it again. And when I think about what Nathan did, and when I think about what people here do, I think about ideas. And I think about the idea that creating an idea, spreading an idea has a lot behind it. I don ' t know if you ' ve ever been to a Jewish wedding, but what they do is, they take a light bulb and they smash it. Now there is a bunch of reasons for that, and stories about it. But one reason is because it indicates a change, from before to after. It is a moment in time. And I want to argue that we are living through and are right at the key moment of a change in the way ideas are created and spread and implemented. We started with the factory idea : that you could change the whole world if you had an efficient factory that could churn out change. We then went to the TV idea, that said if you had a big enough mouthpiece, if you could get on TV enough times, if you could buy enough ads, you could win. And now we ' re in this new model of leadership, where the way we make change is not by using money or power to lever a system, but by leading. So let me tell you about the three cycles. The first one is the factory cycle. Henry Ford comes up with a really cool idea. It enables him to hire men who used to get paid 50 cents a day and pay them five dollars a day. Because he ' s got an efficient enough factory. Well with that sort of advantage you can churn out a lot of cars. You can make a lot of change. You can get roads built. You can change the fabric of an entire country. That the essence of what you ' re doing is you need ever-cheaper labor, and ever-faster machines. And the problem we ' ve run into is, we ' re running out of both. Ever-cheaper labor and ever- faster machines. So we shift gears for a minute, and say,"I know : television ; advertising. Push push. Take a good idea and push it on the world. I have a better mousetrap. And if I can just get enough money to tell enough people, I ' ll sell enough."And you can build an entire industry on that. If necessary you can put babies in your ads. If necessary you can use babies to sell other stuff. And if babies don ' t work, you can use doctors. But be careful. Because you don ' t want to get an unfortunate juxtaposition, where you ' re talking about one thing instead of the other. This model requires you to act like the king, like the person in the front of the room throwing things to the peons in the back. That you are in charge, and you ' re going to tell people what to do next. The quick little diagram of it is, you ' re up here, and you are pushing it out to the world. This method — mass marketing — requires average ideas, because you ' re going to the masses, and plenty of ads. What we ' ve done as spammers is tried to hypnotize everyone into buying our idea, hypnotize everyone into donating to our cause, hypnotize everyone into voting for our candidate. And, unfortunately, it doesn ' t work so well anymore either. But there is good news around the corner — really good news. I call it the idea of tribes. What tribes are, is a very simple concept that goes back 50, 000 years. It ' s about leading and connecting people and ideas. And it ' s something that people have wanted forever. Lots of people are used to having a spiritual tribe, or a church tribe, having a work tribe, having a community tribe. But now, thanks to the internet, thanks to the explosion of mass media, thanks to a lot of other things that are bubbling through our society around the world, tribes are everywhere. The Internet was supposed to homogenize everyone by connecting us all. Instead what it ' s allowed is silos of interest. So you ' ve got the red-hat ladies over here. You ' ve got the red-hat triathletes over there. You ' ve got the organized armies over here. You ' ve got the disorganized rebels over here. You ' ve got people in white hats making food. And people in white hats sailing boats. The point is that you can find Ukrainian folk dancers and connect with them, because you want to be connected. That people on the fringes can find each other, connect and go somewhere. Every town that has a volunteer fire department understands this way of thinking. Now it turns out this is a legitimate non-photoshopped photo. People I know who are firemen told me that this is not uncommon. And that what firemen do to train sometimes is they take a house that is going to be torn down, and they burn it down instead, and practice putting it out. But they always stop and take a picture. You know the pirate tribe is a fascinating one. They ' ve got their own flag. They ' ve got the eye patches. You can tell when you ' re running into someone in a tribe. And it turns out that it ' s tribes — not money, not factories — that can change our world, that can change politics, that can align large numbers of people. Not because you force them to do something against their will, but because they wanted to connect. That what we do for a living now, all of us, I think, is find something worth changing, and then assemble tribes that assemble tribes that spread the idea and spread the idea. And it becomes something far bigger than ourselves, it becomes a movement. So when Al Gore set out to change the world again, he didn ' t do it by himself. And he didn ' t do it by buying a lot of ads. He did it by creating a movement. Thousands of people around the country who could give his presentation for him, because he can ' t be in 100 or 200 or 500 cities in each night. You don ' t need everyone. What Kevin Kelley has taught us is you just need, I don ' t know, a thousand true fans — a thousand people who care enough that they will get you the next round and the next round and the next round. And that means that the idea you create, the product you create, the movement you create isn ' t for everyone, it ' s not a mass thing. That ' s not what this is about. What it ' s about instead is finding the true believers. It ' s easy to look at what I ' ve said so far, and say,"Wait a minute, I don ' t have what it takes to be that kind of leader."So here are two leaders. They don ' t have a lot in common. They ' re about the same age. But that ' s about it. What they did, though, is each in their own way, created a different way of navigating your way through technology. So some people will go out and get people to be on one team. And some people will get people to be on the other team. It also informs the decisions you make when you make products or services. You know, this is one of my favorite devices. But what a shame that it ' s not organized to help authors create movements. What would happen if, when you ' re using your Kindle, you could see the comments and quotes and notes from all the other people reading the same book as you in that moment. Or from your book group. Or from your friends, or from the circle you want. What would happen if authors, or people with ideas could use version two, which comes out on Monday, and use it to organize people who want to talk about something. Now there is a million things I could share with you about the mechanics here. But let me just try a couple. The Beatles did not invent teenagers. They merely decided to lead them. That most movements, most leadership that we ' re doing is about finding a group that ' s disconnected but already has a yearning — not persuading people to want something they don ' t have yet. When Diane Hatz worked on"The Meatrix,"her video that spread all across the internet about the way farm animals are treated, she didn ' t invent the idea of being a vegan. She didn

’ t invent the idea of caring about this issue. But she helped organize people, and helped turn it into a movement. Hugo Chavez did not invent the disaffected middle and lower class of Venezuela. He merely led them. Bob Marley did not invent Rastafarians. He just stepped up and said,”Follow me.”Derek Sivers invented CD Baby, which allowed independent musicians to have a place to sell their music without selling out to the man — to have place to take the mission they already wanted to go to, and connect with each other. What all these people have in common is that they are heretics. That heretics look at the status quo and say,”This will not stand. I can ’ t abide this status quo. I am willing to stand up and be counted and move things forward. I see what the status quo is ; I don ’ t like it.”That instead of looking at all the little rules and following each one of them, that instead of being what I call a sheepwalker — somebody who ’ s half asleep, following instructions, keeping their head down, fitting in — every once in a while someone stands up and says,”Not me.”Someone stands up and says,”This one is important. We need to organize around it.”And not everyone will. But you don ’ t need everyone. You just need a few people — — who will look at the rules, realize they make no sense, and realize how much they want to be connected. So Tony Hsieh does not run a shoe store. Zappos isn ’ t a shoe store. Zappos is the one, the only, the best-there-ever-was place for people who are into shoes to find each other, to talk about their passion, to connect with people who care more about customer service than making a nickel tomorrow. It can be something as prosaic as shoes, and something as complicated as overthrowing a government. It ’ s exactly the same behavior though. What it requires, as Geraldine Carter has discovered, is to be able to say,”I can ’ t do this by myself. But if I can get other people to join my Climb and Ride, then together we can get something that we all want. We ’ re just waiting for someone to lead us.”Michelle Kaufman has pioneered new ways of thinking about environmental architecture. She doesn ’ t do it by quietly building one house at a time. She does it by telling a story to people who want to hear it. By connecting a tribe of people who are desperate to be connected to each other. By leading a movement and making change. And around and around and around it goes. So three questions I ’ d offer you. The first one is, who exactly are you upsetting? Because if you ’ re not upsetting anyone, you ’ re not changing the status quo. The second question is, who are you connecting? Because for a lot of people, that ’ s what they ’ re in it for : the connections that are being made, one to the other. And the third one is, who are you leading? Because focusing on that part of it — not the mechanics of what you ’ re building, but the who, and the leading part — is where change comes. So Blake, at Tom ’ s Shoes, had a very simple idea.”What would happen if every time someone bought a pair of these shoes I gave exactly the same pair to someone who doesn ’ t even own a pair of shoes?”This is not the story of how you get shelf space at Neiman Marcus. It ’ s a story of a product that tells a story. And as you walk around with this remarkable pair of shoes and someone says,”What are those?”You get to tell the story on Blake ’ s behalf, on behalf of the people who got the shoes. And suddenly it ’ s not one pair of shoes or 100 pairs of shoes. It ’ s tens of thousands of pairs of shoes. My friend Red Maxwell has spent the last 10 years fighting against juvenile diabetes. Not fighting the organization that ’ s fighting it — fighting with them, leading them, connecting them, challenging the status quo because it ’ s important to him. And the people he surrounds himself with need the connection. They need the leadership. It makes a difference. You don ’ t need permission from people to lead them. But in case you do, here it is : they ’ re waiting, we ’ re waiting for you to show us where to go next. So here is what leaders have in common. The first thing is, they challenge the status quo. They challenge what ’ s currently there. The second thing is, they build a culture. A secret language, a seven-second handshake, a way of knowing that you ’ re in or out. They have curiosity. Curiosity about people in the tribe, curiosity about outsiders. They ’ re asking questions. They connect people to one another. Do you know what people want more than anything? They want to be missed. They want to be missed the day they don ’ t show up. They want to be missed when they ’ re gone. And tribe leaders can do that. It ’ s fascinating, because all tribe leaders have charisma, but you don ’ t need charisma to become a leader. Being a leader gives you charisma. If you look and study the leaders who have succeeded, that ’ s where charisma comes from — from the leading. Finally, they commit. They commit to the cause. They commit to the tribe. They commit to the people who are there. So I ’ d like you to do something for me. And I hope you ’ ll think about it before you reject it out-of-hand. What I want you to do, it only takes 24 hours, is : create a movement. Something that matters. Start. Do it. We need it. Thank you very much. I appreciate it.

The story I want to tell you about, started to me, in 1996 when I was studying in England. One day, I was glancing through my bank statement and I ’ ve noticed that in the upper corner there was a symbol, that I ’ m going to show you, saying that document had been made in plain language, for me to understand it. The idea interested me ; I tried to find out what that was and I found out that there was a campaign for the simplification of language, which was the”Plain English Campaign”. I thought it was a fabulous idea, for about one day or two, and I ’ ve never thought about it since. When I came back to Portugal, for good, I came across with several documents - for example, my work contract, the papers I had to sign to buy a house, the electricity bill — a series of documents that reminded me of that bank statement. Not because they were equally clear and simple, but because they were the exact opposite. Because I had to read everything twice or thrice, to begin to understand what was written there. And then, that little seed that had been sown in 1996, started germinating. And one day, I found myself entering through my boss ’ office and quitting my job to dedicate myself to this. And so, what did I find out, right off the start? I found out that it was a much more severe problem than I thought. It wasn ’ t only about these documents being complex and annoying, it was the fact that Portuguese people ’ s literacy — literacy is the hability to understand written documents — is extremely low. I ’ m going to show you a chart about Portuguese people ’ s literacy [rate]. You know that about 10, 11 % of people, in Portugal, don ’ t know how to read nor write at all, yet. Over there are those who know, or say they know, how to read and write. So, what do we have? We have that group of red people in level 1, which is the lowest in literacy [rate]. They are persons who are able to join letters, but they can ’ t, actually, understand. For example, if a person, from that red group, has to pick up the package leaflet of a medicinal product, to give a dose of medicine to his / her child, he / she can ’ t, can ’ t understand the information. 50 % of the Portuguese. Then we have 30 % more, those yellow ones, over there, people who get by on the daily basis. That is, if they don ’ t have to read anything too new or too different, they will manage. But, for example, if they work in a factory and a new machine arrives and they have to read the machine ’ s manual to be able to work with it, they can ’ t do it anymore. And there they go, 80 % of the Portuguese people. Then we have a few more that can handle documents, as long as they are not too complex, and we have 5 % of the population that can handle really complex documents.

Now, just so you don ’ t think this is normal, that over there is Sweden. While we have 20 % of people with the literacy considered essential for a daily basis, Sweden has 75 %. And looking at that, what did I realize? I realized we live in an apartheid of information. I realized that there ’ s a small minority of people who has indeed access to information and can use it to their advantage and a huge majority that can ’ t. And because they can ’ t, they are excluded and they are impaired. Let me give you an example. That one is Mr. Domingos, my building ’ s doorkeeper. Mr. Domingos started to read at the age of 27, so, he falls in that yellow group that we have seen a little while ago. From time to time, I ’ m arriving home and he says :”Miss Sandra!”;”Yes, Mr. Domingos.””Here is a little letter.”So, the deal is : when Mr. Domingos or someone in the family or in the neighbourhood receives something that they don ’ t understand, they come to me and I help them to translate it. And so, that time he said to me like this :”Oh, Miss Sandra, I ’ m about to throw this away, but check it if this is important.”It was very important. He had been waiting, for quite a while, to have a knee surgery and that was the letter of the famous surgery-bank checks. When a person is waiting for a long time, they get a bank check and with that bank check they can have that surgery in the private sector. It was almost thrown away into the garbage, Mr. Domingos ’ letter. In that same year, I ’ ve found out, only 20 % of people had used these surgery-bank checks. The other 80 %, I don ’ t believe they had been cured while they were waiting. They most likely did the same as Mr. Domingos :”Ah! What ’ s this? I ’ m not understanding, it ’ s going to the garbage”. They lost the opportunity to have the surgery they needed. What happens here? When people don ’ t understand this has severe consequences — to the individual, but also for the country. When I don ’ t understand which are my rights, the benefits I can have access to, I can ’ t understand my duties and I ’ m not an active and participative citizen either. Now, maybe, you are sitting there and thinking :”Yeah, poor Mr. Domingos... Bad luck, isn ’ t it? Me?! I ’ m in the green ones.””I ’ m absolutely sure that I ’ m one of the green ones. I was selected to come to TED! Hum?”So the deal is : I have here some texts to read to you and I ’ m going to see what color are you when I finish reading. So, come on, this is an automobile insurance contract. It says this :”Unless contrary stipulation, the decease of the ensured person, the ensured capital is provided, in case of predeceasing of the beneficiary relatively to the ensured person, to the heirs of the last, in case of the simultaneous decease of the ensured person and of the beneficiary, to the heirs of the last”. Hum? Next, there ’ s another one, from the medicines ’ package leaflet, that says the following :”Warning! It may also occur erythema, edema, vesiculation, keratolysis and urticaria.”Hum? Are you clear? And this one is really good. This one, I signed a renting contract to the new office on Friday and I laughed my head off. So, it said :”I, as a cosigner, assume the opportune payment of the rents, waiving the benefits of the division and prior foreclosure.”When I heard”opportune payment”[”storm payment”in Portuguese], I imagined myself bursting in there, slamming the door and saying :”Here ’ s the money!!!”But it ’ s not! But it ’ s not! So, it ’ s this : when we leave our area of expertise — and it only takes a little ; there is no need to go to the string theory or something like that, it only takes a little... What happens? We get as lost as Mr. Domingos. And these documents are not written by experts to experts, as the ones from the string theory. No! These are documents written for me, these are the public documents, the public documents I need to understand in my daily life, to govern myself, to live my life. These are the renting contracts, the package leaflet of the medicines. It ’ s all this. The electricity bills. This has to be clear, so that I can understand. Because, if I can ’ t understand, what happens? I make mistakes, I get wrong. I ’ m going to give you an example of mistakes that were committed, bad decisions made for not being able to understand documents. Do you remember the subprime crisis that took place in the United States? What happened? People signed those loans to buy houses, without truly understanding what they were signing. Because if they knew what they were signing, they ’ d know that as soon as the interest rate started to rise, the monthly payment would also increase, they wouldn ’ t be able to pay anymore and they would end up without a house. So, the rest, after that, next, everything crumbled down and we know the rest. Do you think that if there was a culture of clarity in the financial sector things would have got up to where they ’ ve got? I don ’ t think so. So, how do you solve this problem, this such big difference between the literacy [rate] of the Portuguese, that is down here, and the complexity of the public documents, those ones we need to understand in our daily lives, sorry, that are up here? So, the first think that comes to mind is,”If literacy is down here, let ’ s make it rise”— isn ’ t it? Let ’ s educate people. Let ’ s, let ’ s... of course we will, of course we will educate people. The thing is, it ’ s hard and it ’ s slow. And I don ’ t even want to imagine how many generations it will take until we are at Sweden ’ s level. But, besides that, it ’ s not only because it is slow. There is another problem. If the language of the documents isn ’ t simpler, we ’ ve already seen that people, even with a high literacy level, like you, if the language is hard, they don ’ t get cleared, they continue to be unable to understand these documents. So, besides increasing literacy [rate], and for now, it ’ s much more important to reduce the complexity of documents and simplify the language. I ’ m going to show you an example. When I talk about simplifying the language. Notice! On the left side of a contract :”It is agreed that the insurance company, bla bla bla, bla bla bla, bla bla...”This is a before and after example. What do we mean with simplifying language? It ’ s communicating in a simple and clear way, enabling our reader to understand it at first glance. What do you prefer? Before or after? There isn ’ t much doubt, is there? So, how is this achieved? How can you make the State and companies communicate with citizens in a language they can understand at first glance? There are several ways. There are countries that are going by the path of legislation. For example, Sweden and the United States introduced, last year, a legislation that forces the State to communicate with people in a language they can understand. And you think,”Well, that ’ s normal. They are countries that are a bit ahead.”Sweden, maybe, much more than the United States.”But they are countries that are a bit ahead.”It would be nice if in our country there was also legislation towards that, wouldn ’ t it be?”So it would. And there is! Since 1999. The Law of the Administrative Modernization says that the communication between the State and the people should be simple, clear, concise, meaningful, without acronyms, bla bla bla... But the thing is : it is not applied. So, the question, the path of going through legislation, enforcing through legislation, works in those countries where laws are made to be applied. Now, there is another way, the way of marketing. How does that work? It ’ s like this : private companies change their language ; communicate in a clearer and simpler way, they make a big fuss about it, consumers love it, the sales rise, it works beautifully. But it works for the private sector. Now, what is the third path, and to me, the most important one? It ’ s the path of civil movements, that are based in a mentality shift. In countries where this really went forward — do you remember the English label, of the”Plain English Campaign”? — this is all based on a consumers ’ movement. So, what does it take for that civic movement to happen? We need to understand two very important things : First, wanting to understand these public documents is not a whim, is not an intellectual curiosity. It is a necessity that I have in my daily life. And above all, it is a right, it is everyone ’ s right. On this side we have : understanding is a right. And we have to understand another thing too, which is : he who writes, has to write in order to be understood. How do we get there? First of all : we have to become demanding consumers and citizens. Think it this way : next time someone gives you a document that you just simply don ’ t understand, don ’ t be shy, don ’ t keep quiet, pretending that you are understanding everything. No! Demand to understand. Ask. I know that this is not easy. Turn to the gentleman in the little suite and say :”Look here, this contract, this part, what does this mean?”It ’ s not easy, and perhaps it ’ s even a bit embarrassing, isn ’ t it? But it is not. It ’ s a sign of intelligence. What do you teach your children when they have doubts in school?”Don ’ t say nothing to anyone, shut up really good and act smart.”No, you don ’ t, right? You say :”Look, when you don ’ t understand, you put your hand up in the air and ask the teacher until you are cleared.”And that is exactly what we have to do, as consumers and citizens. So, next time you come across with a document you don ’ t understand, demand to understand, put aside your pride and ask until you get completely cleared. Then, there ’ s the other side, which is :”Okay, these awful documents”which are in circulation, they don ’ t grow on trees.”Someone wrote them.”Hum? Maybe, among this big group, some persons... I don ’ t know, some lawyers, some public employees — I ’ m not asking you to identify yourselves, but I ask you to search your own conscience. How many times do you write documents for the general public, for people that don ’ t share your language, and you write them in a language that only you will understand? And you ’ ll say :”Ah, that ’ s because there is a reason, here!”Dear friends, I already heard all the reasons. There are thousands of reasons. They go like these :”Ah, it ’ s the house ’ s culture”;”Oh, my boss!””Oh, the judge! And what if this goes to court?””What you want is to destroy language. We have to educate people.””We can ’ t lower the level”; bla, bla, bla... I ’ ve seen all of this. These are excuses. A while ago, they told us about Einstein. Einstein said this :”If you can ’ t write about a **subject**, in a simple way, it ’ s because, in fact, you don ’ t understand it.”So, if you... To Einstein... To Einstein... So — ah, ah, I don ’ t have time! — so, if you do know what you want to say — don ’ t you? — you are aware of what you want to say, you just have to do one thing : believe that it is possible to write in a simple way. And how do you do that? It ’ s very easy. You write to your grandmother. Hum? You write to your grandmother. I ’ m going to show grandma to you. You write with respect and without paternalism. And you use three techniques that I ’ m going to teach you. First of all : Start by the most important. Grandma has a lot to do. She is not going to read three pages to get to the main idea. Start by the most important. Next, use short sentences, because grandma, like anyone of us, if you make very long sentences, she gets to the end and she can ’ t remember what you said in the beginning, anymore. And lastly, the third, use plain words, those ones that grandma knows. Alright? It ’ s easy! Before I leave, I would like to talk to you about”Clara”.”Clara”is a project of social responsibility. It has this mission : to change the way how public communication is made. What do we do? We are going to launch this year a collection of”Claro”guides, that is, we are going to pick very, very, very complex **subjects** and put them simple. We are going to start with the”Claro”Guide of Justice. I think it is an area... that comes in handy. And now I ’ m going to follow Manuel [Forjaz] ’ s advise. If it ’ s time to ask, whoever wants to sponsor the”Claro”Guide of Justice — I don ’ t know... for example, the EDP Foundation, or... ha? — come talk to me later. Another thing we will do is to grant prizes to the worse and best documents, because, indeed, there are people who are working to communicate in a clearer way, and that have to be rewarded, and there are lazy people that do nothing about it and need to be humiliated. So, we ’ ll give prizes to the worst and to the best. I ’ m counting on your help. We are going to launch... we are going to launch the campaign via Clara ’ s Facebook, so, send your friendship request and you ’ ll be up to date. But, lastly, above all, what does”Clara”want? It wants to put two little things in your heads. The first one : demand to understand. Don ’ t be shy. And write in order to be understood. Write to your grandma. And if you don ’ t have a grandmother, write to Mr. Domingos, he will like it. Thank you.

Text Sample 795: NEG Dim 5 – 2011 – Score -1.00 – 2011/t002473.txt
There ’ s a poem written by a very famous English poet at the end of the 19th century. It was said to echo in Churchill ’ s brain in the 1930s. And the poem goes :”On the idle hill of summer, lazy with the flow of streams, hark I hear a distant drummer, drumming like a sound in dreams, far and near and low and louder on the roads of earth go by, dear to friend and food to powder, soldiers marching, soon to die.”Those who are interested in poetry, the poem is”A Shropshire Lad”written by A. E. Housman. But what Housman understood, and you hear it in the symphonies of Nielsen too, was that the long, hot, silvan summers of stability of the 19th century were coming to a close, and that we were about to move into one of those terrifying periods of history when power changes. And these are always periods, ladies and gentlemen, accompanied by turbulence, and all too often by blood. And my message for you is that I believe we are condemned, if you like, to live at just one of those moments in history when the gimbals upon which the established order of power is beginning to change and the new look of the world, the new powers that exist in the world, are beginning to take form. And these are — and we see it very clearly today — nearly always highly turbulent times, highly difficult times, and all too often very bloody times. By the way, it happens about once every century. You might argue that the last time it happened — and that ’ s what Housman felt coming and what Churchill felt too — was that when power passed from the old nations, the old powers of Europe, across the Atlantic to the new emerging power of the United States of America — the beginning of the American century. And of course, into the vacuum where the too-old European powers used to be were played the two bloody catastrophes of the last century — the one in the first part and the one in the second part : the two great World Wars. Mao Zedong used to refer to them as the European civil wars, and it ’ s probably a more accurate way of describing them. Well, ladies and gentlemen, we live at one of those times. But for us, I want to talk about three factors today. And the first of these, the first two of these, is about a shift in power. And the second is about some new dimension which I want to refer to, which has never quite happened in the way it ’ s happening now. But let ’ s talk about the shifts of power that are occurring to the world. And what is happening today is, in one sense, frightening because it ’ s never happened before. We have seen lateral shifts of power — the power of Greece passed to Rome and the power shifts that occurred during the European civilizations — but we are seeing something slightly different. For power is not just moving laterally from nation to nation. It ’ s also moving vertically. What ’ s happening today is that the power that was encased, held to accountability, held to the rule of law, within the institution of the nation state has now migrated in very large measure onto the global stage. The globalization of power — we talk about the globalization of markets, but actually it ’ s the globalization of real power. And where, at the nation state level that power is held to accountability **subject** to the rule of law, on the international stage it is not. The international stage and the global stage where power now resides :

the power of the Internet, the power of the satellite broadcasters, the power of the money changers — this vast money-go-round that circulates now 32 times the amount of money necessary for the trade it ' s supposed to be there to finance — the money changers, if you like, the financial speculators that have brought us all to our knees quite recently, the power of the multinational corporations now developing budgets often bigger than medium-sized countries. These live in a global space which is largely unregulated, not **subject** to the rule of law, and in which people may act free of constraint. Now that suits the powerful up to a moment. It ' s always suitable for those who have the most power to operate in spaces without constraint, but the lesson of history is that, sooner or later, unregulated space — space not **subject** to the rule of law — becomes populated, not just by the things you wanted — international trade, the Internet, etc. — but also by the things you don ' t want — international criminality, international terrorism. The revelation of 9 / 11 is that even if you are the most powerful nation on earth, nevertheless, those who inhabit that space can attack you even in your most iconic of cities one bright September morning. It ' s said that something like 60 percent of the four million dollars that was taken to fund 9 / 11 actually passed through the institutions of the Twin Towers which 9 / 11 destroyed. You see, our enemies also use this space — the space of mass travel, the Internet, satellite broadcasters — to be able to get around their poison, which is about destroying our systems and our ways. Sooner or later, sooner or later, the rule of history is that where power goes governance must follow. And if it is therefore the case, as I believe it is, that one of the phenomenon of our time is the globalization of power, then it follows that one of the challenges of our time is to bring governance to the global space. And I believe that the decades ahead of us now will be to a greater or lesser extent turbulent the more or less we are able to achieve that aim : to bring governance to the global space. Now notice, I ' m not talking about government. I ' m not talking about setting up some global democratic institution. My own view, by the way, ladies and gentlemen, is that this is unlikely to be done by spawning more U. N. institutions. If we didn ' t have the U. N., we ' d have to invent it. The world needs an international forum. It needs a means by which you can legitimize international action. But when it comes to governance of the global space, my guess is this won ' t happen through the creation of more U. N. institutions. It will actually happen by the powerful coming together and making treaty-based systems, treaty-based agreements, to govern that global space. And if you look, you can see them happening, already beginning to emerge. The World Trade Organization : treaty-based organization, entirely treaty-based, and yet, powerful enough to hold even the most powerful, the United States, to account if necessary. Kyoto : the beginnings of struggling to create a treaty- based organization. The G20 : we know now that we have to put together an institution which is capable of bringing governance to that financial space for financial speculation. And that ' s what the G20 is, a treaty-based institution. Now there ' s a problem there, and we ' ll come back to it in a minute, which is that if you bring the most powerful together to make the rules in treaty-based institutions, to fill that governance space, then what happens to the weak who are left out? And that ' s a big problem, and we ' ll return to it in just a second. So there ' s my first message, that if you are to pass through these turbulent times more or less turbulently, then our success in doing that will in large measure depend on our capacity to bring sensible governance to the global space. And watch that beginning to happen. My second point is, and I know I don ' t have to talk to an audience like this about such a thing, but power is not just shifting vertically, it ' s also shifting horizontally. You might argue that the story, the history of civilizations, has been civilizations gathered around seas — with the first ones around the Mediterranean, the more recent ones in the ascendents of Western power around the Atlantic. Well it seems to me that we ’ re now seeing a fundamental shift of power, broadly speaking, away from nations gathered around the Atlantic [seaboard] to the nations gathered around the Pacific rim. Now that begins with economic power, but that ’ s the way it always begins. You already begin to see the development of foreign policies, the augmentation of military budgets occurring in the other growing powers in the world. I think actually this is not so much a shift from the West to the East ; something different is happening. My guess is, for what it ’ s worth, is that the United States will remain the most powerful nation on earth for the next 10 years, 15, but the context in which she holds her power has now radically altered ; it has radically changed. We are coming out of 50 years, most unusual years, of history in which we have had a totally mono-polar world, in which every compass needle for or against has to be referenced by its position to Washington — a world bestrode by a single colossus. But that ’ s not a usual case in history. In fact, what ’ s now emerging is the much more normal case of history. You ’ re beginning to see the emergence of a multi-polar world. Up until now, the United States has been the dominant feature of our world. They will remain the most powerful nation, but they will be the most powerful nation in an increasingly multi-polar world. And you begin to see the alternative centers of power building up — in China, of course, though my own guess is that China ’ s ascent to greatness is not smooth. It ’ s going to be quite grumpy as China begins to democratize her society after liberalizing her economy. But that ’ s a **subject** of a different discussion. You see India, you see Brazil. You see increasingly that the world now looks actually, for us Europeans, much more like Europe in the 19th century. Europe in the 19th century : a great British foreign secretary, Lord Canning, used to describe it as the”European concert of powers.”There was a balance, a five-sided balance. Britain always played to the balance. If Paris got together with Berlin, Britain got together with Vienna and Rome to provide a counterbalance. Now notice, in a period which is dominated by a mono-polar world, you have fixed alliances — NATO, the Warsaw Pact. A fixed polarity of power means fixed alliances. But a multiple polarity of power means shifting and changing alliances. And that ’ s the world we ’ re coming into, in which we will increasingly see that our alliances are not fixed. Canning, the great British foreign secretary once said,”Britain has a common interest, but no common allies.”And we will see increasingly that even we in the West will reach out, have to reach out, beyond the cozy circle of the Atlantic powers to make alliances with others if we want to get things done in the world. Note, that when we went into Libya, it was not good enough for the West to do it alone ; we had to bring others in. We had to bring, in this case, the Arab League in. My guess is Iraq and Afghanistan are the last times when the West has tried to do it themselves, and we haven ’ t succeeded. My guess is that we ’ re reaching the beginning of the end of 400 years — I say 400 years because it ’ s the end of the Ottoman Empire — of the hegemony of Western power, Western institutions and Western values. You know, up until now, if the West got its act together, it could propose and dispose in every corner of the world. But that ’ s no longer true. Take the last financial crisis after the Second World War. The West got together — the Bretton Woods Institution, World Bank, International Monetary Fund — the problem solved. Now we have to call in others. Now we have to create the G20. Now we have to reach beyond the cozy circle of our Western friends. Let me make a prediction for you, which is probably even more startling. I suspect we are now reaching the end of 400 years when Western power was enough. People say to me,”The Chinese, of course, they ’ ll never get themselves involved in peace-making, multilateral peace-making around the world.”Oh yes? Why not? How many Chinese troops are serving under the blue beret, serving under the blue flag, serving under the U. N. command in the world today? 3, 700. How many Americans? 11. What is the largest naval contingent tackling the issue of Somali pirates? The Chinese naval contingent. Of course they are, they are a mercantilist nation. They want to keep the sea lanes open. Increasingly, we are going to have to do business with people with whom we do not share values, but with whom, for the moment, we share common interests. It ’ s a whole new different way of looking at the world that is now emerging. And here ’ s the third factor, which is totally different. Today in our modern world, because of the Internet, because of the kinds of things people have been talking about here, everything is connected to everything. We are now interdependent. We are now interlocked, as nations, as individuals, in a way which has never been the case before, never been the case before. The interrelationship of nations, well it ’ s always existed. Diplomacy is about managing the interrelationship of nations. But now we are intimately locked together. You get swine flu in Mexico, it ’ s a problem for Charles de Gaulle Airport 24 hours later. Lehman Brothers goes down, the whole lot collapses. There are fires in the steppes of Russia, food riots in Africa. We are all now deeply, deeply, deeply interconnected. And what that means is the idea of a nation state acting alone, not connected with others, not working with others, is no longer a viable proposition. Because the actions of a nation state are neither confined to itself, nor is it sufficient for the nation state itself to control its own territory, because the effects outside the nation state are now beginning to affect what happens inside them. I was a young soldier in the last of the small empire wars of Britain. At that time, the defense of my country was about one thing and one thing only : how strong was our army, how strong was our air force, how strong was our navy and how strong were our allies. That was when the enemy was outside the walls. Now the enemy is inside the walls. Now if I want to talk about the defense of my country, I have to speak to the Minister of Health because pandemic disease is a threat to my security, I have to speak to the Minister of Agriculture because food security is a threat to my security, I have to speak to the Minister of Industry because the fragility of our hi-tech infrastructure is now a point of attack for our enemies — as we see from cyber warfare — I have to speak to the Minister of Home Affairs because who has entered my country, who lives in that terraced house in that inner city has a direct effect on what happens in my country — as we in London saw in the 7 / 7 bombings. It ’ s no longer the case that the security of a country is simply a matter for its soldiers and its ministry of defense. It ’ s its capacity to lock together its institutions. And this tells you something very important. It tells you that, in fact, our governments, vertically constructed, constructed on the economic model of the Industrial Revolution — vertical hierarchy, specialization of tasks, command structures — have got the wrong structures completely. You in business know that the paradigm structure of our time, ladies and gentlemen, is the network. It ’ s your capacity to network that matters, both within your governments and externally. So here is Ashdown ’ s third law. By the way, don ’ t ask me about Ashdown ’ s first law and second law because I haven ’ t invented those yet ; it always sounds better if there ’ s a third law, doesn ’ t it? Ashdown ’ s third law is that in the modern age, where everything is connected to everything, the most important thing about what you can do is what you can do with others. The most important bit about your structure — whether you ’ re a government, whether you ’ re an army regiment, whether you ’ re a business — is your docking points, your interconnectors, your capacity to network with others. You understand that in industry ; governments don ’ t. But now one final thing. If it is the case, ladies and gentlemen — and it is — that we are now locked together in a way that has never been quite the same before, then it ’ s also the case that we share a destiny with each other. Suddenly and for the very first time, collective defense, the thing that has dominated us as the concept of securing our nations, is no longer enough. It used to be the case that if my tribe was more powerful than their tribe, I was safe ; if my country was more powerful than their country, I was safe ; my alliance, like NATO, was more powerful than their alliance, I was safe. It is no longer the case. The advent of the interconnectedness and of the weapons of mass destruction means that, increasingly, I share a destiny with my enemy. When I was a diplomat negotiating the disarmament treaties with the Soviet Union in Geneva in the 1970s, we succeeded because we understood we shared a destiny with them. Collective security is not enough. Peace has come to Northern Ireland because both sides realized that the zero-sum game couldn ’ t work. They shared a destiny with their enemies. One of the great barriers to peace in the Middle East is that both sides, both Israel and, I think, the Palestinians, do not understand that they share a collective destiny. And so suddenly, ladies and gentlemen, what has been the proposition of visionaries and poets down the ages becomes something we have to take seriously as a matter of public policy. I started with a poem, I ’ ll end with one. The great poem of John Donne ’ s.”Send not for whom the bell tolls.”The poem is called”No Man is an Island.”And it goes :”Every man ’ s death affected me, for I am involved in mankind, send not to ask for whom the bell tolls, it tolls for thee.”For John Donne, a recommendation of morality. For us, I think, part of the equation for our survival. Thank you very much.

Text Sample 796: NEG Dim 5 – 2011 – Score -1.00 – 2011/t002558.txt

So the type of magic I like, and I ’ m a magician, is magic that uses technology to create illusions. So I would like to show you something I ’ ve been working on. It ’ s an application that I think will be useful for artists â multimedia artists in particular. It synchronizes videos across multiple screens of mobile devices. I borrowed these three iPods from people here in the audience to show you what I mean. And I ’ m going to use them to tell you a little bit about my favorite **subject** : deception. One of my favorite magicians is Karl Germain. He had this wonderful trick where a rosebush would bloom right in front of your eyes. But it was his production of a butterfly that was the most beautiful. Announcer : Ladies and gentlemen, the creation of life. Marco Tempest : When asked about deception, he said this : Announcer : Magic is the only honest profession. A magician promises to deceive you â and he does. MT : I like to think of myself as an honest magician. I use a lot of tricks, which means that sometimes I have to lie to you. Now I feel bad about that. But people lie every day. Hold on. Phone : Hey, where are you? MT : Stuck in traffic. I ’ ll be there soon. You ’ ve all done it. Right : I ’ ll be ready in just a minute, darling. Center : It ’ s just what I ’ ve always wanted. Left : You were great. MT : Deception, it ’ s a fundamental part of life. Now polls show that men tell twice as many lies as women â assuming the women they asked told the truth. We deceive to gain advantage and to hide our weaknesses. The Chinese general Sun Tzu said that all war was based on deception. Oscar Wilde said the same thing of romance. Some people deceive for money. Let ’ s play a game. Three cards, three chances. Announcer : One five will get you 10, 10 will get you 20. Now, where ’ s the lady? Where is the queen? MT : This one? Sorry. You lose. Well, I didn ’ t deceive you. You deceived yourself. Self-deception. That ’ s when we convince ourselves that a lie is the truth. Sometimes it ’ s hard to tell the two apart. Compulsive gamblers are experts at self-deception. They believe they can win. They forget the times they lose. The brain is very good at forgetting. Bad experiences are quickly forgotten. Bad experiences quickly disappear. Which is why in this vast and lonely cosmos, we are so wonderfully optimistic. Our self-deception becomes a positive illusion â why movies are able to take us onto extraordinary adventures ; why we believe Romeo when he says he loves Juliet ; and why single notes of music, when played together, become a sonata and conjure up meaning. That ’ s”Clair De lune.”Its composer, called Debussy, said that art was the greatest deception of all. Art is a deception that creates real emotions â a lie that creates a truth. And when you give yourself over to that deception, it becomes magic. [MAGIC] Thank you. Thank you very much.

Text Sample 797: NEG Dim 5 – 2010 – Score -1.00 – 2010/t002838.txt

The greatest irony in global health is that the poorest countries carry the largest disease burden. If we resize the countries of the globe in proportion to the **subject** of interest, we see that Sub-Saharan Africa is the worst hit region by HIV / AIDS. This is the most devastating epidemic of our time. We also see that this region has the least capability in terms of dealing with the disease. There are very few doctors and, quite frankly, these countries do not have the resources that are needed to cope with such epidemics. So what the Western countries, developed countries, have generously done is they have proposed to provide free drugs to all people in Third World countries who actually can ’ t afford these medications. And this has already saved millions of lives, and it has prevented entire economies from capsizing in Sub- Saharan Africa. But there is a fundamental problem that is killing the efforts in fighting this disease, because if you keep throwing drugs out at people who don ’ t have diagnostic services, you end up creating a problem of drug resistance. This is already beginning to happen in Sub-Saharan Africa. The problem is that, what begins as a tragedy in the Third World could easily become a global problem. And the last thing we want to see is drug-resistant strains of HIV popping up all over the world, because it will make treatment more expensive and it could also restore the pre-ARV carnage of HIV / AIDS. I experienced this firsthand as a high school student in Uganda. This was in the 90s during the peak of the HIV epidemic, before there were any ARVs in Sub- Saharan Africa. And during that time, I actually lost more relatives, as well as the teachers who taught me, to HIV / AIDS. So this became one of the driving passions of my life, to help find real solutions that could address these kinds of problems. We all know about the miracle of miniaturization. Back in the day, computers used to fill this entire room, and people actually used to work inside the computers. But what electronic miniaturization has done is that it has allowed people to shrink technology into a cell phone. And I ’ m sure everyone here enjoys cell phones that can actually be used in the remote areas of the world, in the Third World countries. The good news is that the same technology that allowed miniaturization of electronics is now allowing us to miniaturize biological laboratories. So, right now, we can actually miniaturize biological and chemistry laboratories onto microfluidic chips. I was very lucky to come to the US right after high school, and was able to work on this technology and develop some devices. This is a microfluidic chip that I developed. A close look at how the technology works : These are channels that are about the size of a human hair — so you have integrated valves, pumps, mixers and injectors — so you can fit entire diagnostic experiments onto a microfluidic system. So what I plan to do with this technology is to actually take the current state of the technology and build an HIV kit in a microfluidic system. So, with one microfluidic chip, which is the size of an iPhone, you can actually diagnose 100 patients at the same time. For each patient, we will be able to do up to 100 different viral loads per patient. And this is only done in four hours, 50 times faster than the current state of the art, at a cost that will be five to 500 times cheaper than the current options. So this will allow us to create personalized medicines in the Third World at a cost that is actually achievable and make the world a safer place. I invite your interest as well as your involvement in driving this vision to a point of practical reality. Thank you very much.

Text Sample 798: NEG Dim 5 – 2010 – Score -1.00 – 2010/t002772.txt
So I work in marketing, which I love, but my first passion was physics, a passion brought to me by a wonderful school teacher, when I had a little less gray hair. So he taught me that physics is cool because it teaches us so much about the world around us. And I ’ m going to spend the next few minutes trying to convince you that physics can teach us something about marketing. So quick show of hands — who studied some marketing in university? Who studied some physics in university? Pretty good. And at school? Okay, lots of you. So, hopefully this will bring back some happy, or possibly some slightly disturbing memories. So, physics and marketing. We ’ ll start with something very simple — Newton ’ s Law :”The force equals mass times acceleration.”This is something that perhaps Turkish Airlines should have studied a bit more carefully before they ran this campaign. But if we rearrange this formula quickly, we can get to acceleration equals force over mass, which means that for a larger particle — a larger mass — it requires more force to change its direction. It ’ s the same with brands : the more massive a brand, the more baggage it has, the more force is needed to change its positioning. And that ’ s one of the reasons why Arthur Andersen chose to launch Accenture rather than try to persuade the world that Andersen ’ s could stand for something other than accountancy. It explains why Hoover found it very difficult to persuade the world that it was more than vacuum cleaners, and why companies like Unilever and P&G keep brands separate, like Ariel and Pringles and Dove rather than having one giant parent brand. So the physics is that the bigger the mass of an object the more force is needed to change its direction. The marketing is, the bigger a brand, the more difficult it is to reposition it. So think about a portfolio of brands or maybe new brands for new ventures. Now, who remembers Heisenberg ’ s uncertainty principle? Getting a little more technical now. So this says that it ’ s impossible, by definition, to measure exactly the state — i. e., the position — and the momentum of a particle, because the act of measuring it, by definition, changes it. So to explain that — if you ’ ve got an elementary particle and you shine a light on it, then the photon of light has momentum, which knocks the particle, so you don ’ t know where it was before you looked at it. By measuring it, the act of measurement changes it. The act of observation changes it. It ’ s the same in marketing. So with the act of observing consumers, changes their behavior. Think about the group of moms who are talking about their wonderful children in a focus group, and almost none of them buy lots of junk food. And yet, McDonald ’ s sells hundreds of millions of burgers every year. Think about the people who are on accompanied shops in supermarkets, who stuff their trolleys full of fresh green vegetables and fruit, but don ’ t shop like that any other day. And if you think about the number of people who claim in surveys to regularly look for porn on the Web, it ’ s very few. Yet, at Google, we know

it ’ s the number-one searched for category. So luckily, the science — no, sorry — the marketing is getting easier. Luckily, with now better point-of-sale tracking, more digital media consumption, you can measure more what consumers actually do, rather than what they say they do. So the physics is you can never accurately and exactly measure a particle, because the observation changes it. The marketing is — the message for marketing is — that try to measure what consumers actually do, rather than what they say they ’ ll do or anticipate they ’ ll do. So next, the scientific method — an axiom of physics, of all science — says you cannot prove a hypothesis through observation, you can only disprove it. What this means is you can gather more and more data around a hypothesis or a positioning, and it will strengthen it, but it will not conclusively prove it. And only one contrary data point can **blow** your theory out of the water. So if we take an example — Ptolemy had dozens of data points to support his theory that the planets would rotate around the Earth. It only took one robust observation from Copernicus to **blow** that idea out of the water. And there are parallels for marketing — you can invest for a long time in a brand, but a single contrary observation of that positioning will destroy consumers ’ belief. Take BP — they spent millions of pounds over many years building up its credentials as an environmentally friendly brand, but then one little accident. Think about Toyota. It was, for a long time, revered as the most reliable of cars, and then they had the big recall incident. And Tiger Woods, for a long time, the perfect brand ambassador. Well, you know the story. So the physics is that you cannot prove a hypothesis, but it ’ s easy to disprove it — any hypothesis is shaky. And the marketing is that not matter how much you ’ ve invested in your brand, one bad week can undermine decades of good work. So be really careful to try and avoid the screw-ups that can undermine your brand. And lastly, to the slightly obscure world of entropy — the second law of thermodynamics. This says that entropy, which is a measure of the disorder of a system, will always increase. The same is true of marketing. If we go back 20 years, the one message pretty much controlled by one marketing manager could pretty much define a brand. But where we are today, things have changed. You can get a strong brand image or a message and put it out there like the Conservative Party did earlier this year with their election poster. But then you lose control of it. With the kind of digital comment creation and distribution tools that are available now to every consumer, it ’ s impossible to control where it goes. Your brand starts being dispersed, it gets more chaotic. It ’ s out of your control. I actually saw him speak — he did a good job. But while this may be unsettling for marketers, it ’ s actually a good thing. This distribution of brand energy gets your brand closer to the people, more in with the people. It makes this distribution of energy a democratizing force, which is ultimately good for your brand. So, the lesson from physics is that entropy will always increase ; it ’ s a fundamental law. The message for marketing is that your brand is more dispersed. You can ’ t fight it, so embrace it and find a way to work with it. So to close, my teacher, Mr. Vutter, told me that physics is cool, and hopefully, I ’ ve convinced you that physics can teach all of us, even in the world of marketing, something special. Thank you.

Some of the greatest innovations and developments in the world often happen at the intersection of two fields. So tonight I ’ d like to tell you about the intersection that I ’ m most excited about at this very moment, which is entertainment and robotics. So if we ’ re trying to make robots that can be more expressive and that can connect better with us in society, maybe we should look to some of the human professionals of artificial emotion and personality that occur in the dramatic arts. I ’ m also interested in creating new technologies for the arts and to attract people to science and technology. Some people in the last decade or two have started creating artwork with technology. With my new venture, Marilyn Monrobot, I would like to use art to create tech. So we ’ re based in New York City. And if you ’ re a performer that wants to collaborate with an adorable robot, or if you have a robot that needs entertainment representation, please contact me, the Bot-Agent. The bot, our rising celebrity, also has his own Twitter account : @robotinthewild. I ’ d like to introduce you to one of our first robots, Data. He ’ s named after the Star Trek character. I think he ’ s going to be super popular. We ’ ve got the robot — in his head is a database of a lot of jokes. Now each of these jokes is labeled with certain attributes. So it knows something about the **subject** ; it knows about the length. It knows how much it ’ s moving. And so it ’ s going to try to watch your response. I actually have no idea what my robot is going to do today. It can also learn from you about the quality of its jokes and cater things, sort of like Netflix-style, over longer-term to different communities or audiences, children versus adults, different cultures. You can learn something from the robot about the community that you ’ re in. And also I can use each one of you as the acting coach to our future robot companions. Some of you in this middle section — you have red / green paddles. If you like what ’ s going on, show the green. If you don ’ t like the **subject** or the performance, you can hold the red. Now don ’ t be shy. It ’ s just a robot. It doesn ’ t have feelings... yet. And the rest of you, you still count, you still matter. There ’ s also a microphone that ’ s listening to the aggregate laughter and applause and booing — I hope not — to help make some of its next decisions. Right, so, let the robot stand-up comedy begin. Data : Hello TEDWomen. It ’ s an honor to be here. You guys are looking good out there. Ready for some jokes? Audience : Yeah. Data : Here ’ s the first one. Right, so, a doctor says to his patient,”I have bad news and worse news. The bad news is that you only have 24 hours to live.””That ’ s terrible,”said the patient.”How can the news possibly be worse?””I ’ ve been trying to contact you since yesterday.”The Swiss have an interesting army. Five hundred years without a war. Heather Knight : He ’ s talking about the Swiss. Data : Pretty lucky for them. Ever see that little Swiss Army knife they have to fight with?”Come on buddy, I have the toe clippers right here. You get past me, the guy behind me has a spoon.”HK : He ’ s a French robot. Data : A couple of New Jersey hunters are out in the woods. One of them falls to the ground. He does not seem to be breathing. The other guy whips out his cell phone and calls 911. He gasps to the operator,”My friend is dead. What can I do?”The operator says,”Just take it easy. I can help. First, let ’ s make sure he ’ s dead.”There is a silence, and the operator hears a shot. The guy ’ s voice comes back on the line,”Okay, now what?”Question : Why is television called a medium? Anyone? Because it ’ s neither rare nor well done. But to be completely honest with you, I kind of love television. Any of you like television? Audience : Yes. Data : I find it incredibly educational. Actually, as soon as someone turns it on, I go into the other room and read. That ’ s all for now. Was that okay for my first time? You ’ ve been a great audience. Thank you. HK : Yay. So this is actually the first time we ’ ve ever done live audience feedback to a performance. So thank you all for being a part of it. There ’ s a lot more to come. And we hope to learn a lot about robot expression. Thank you very much.

I am very, very happy to be amidst some of the most â the lights are really disturbing my eyes and they ’ re reflecting on my glasses. I am very happy and honored to be amidst very, very innovative and intelligent people. I have listened to the three previous speakers, and guess what happened? Every single thing I planned to say, they have said it here, and it looks and sounds like I have nothing else to say. But there is a saying in my culture that if a bud leaves a tree without saying something, that bud is a young one. So, I will â since I am not young and am very old, I still will say something. We are hosting this conference at a very opportune moment, because another conference is taking place in Berlin. It is the G8 Summit. The G8 Summit proposes that the solution to Africa ’ s problems should be a massive increase in aid, something akin to the Marshall Plan. Unfortunately, I personally do not believe in the Marshall Plan. One, because the benefits of the Marshall Plan have been overstated. Its largest recipients were Germany and France, and it was only 2. 5 percent of their GDP. An average African country receives foreign aid to the tune of 13, 15 percent of its GDP, and that is an unprecedented transfer of financial resources from rich countries to poor countries. But I want to say that there are two things we need to connect. How the media covers Africa in the West, and the consequences of that. By displaying despair, helplessness and hopelessness, the media is telling the truth about Africa, and nothing but the truth. However, the media is not telling us the whole truth. Because despair, civil war, hunger and famine, although they ’ re part and parcel of our African reality, they are not the only reality. And secondly, they are the smallest reality. Africa has 53 nations. We have civil wars only in six countries, which means that the media are covering only six countries. Africa has immense opportunities that never navigate through the web of despair and helplessness that the Western media largely presents to its audience. But the effect of that presentation is, it appeals to sympathy. It appeals to pity. It appeals to something called charity. And, as a consequence, the Western view of Africa ’ s economic dilemma is framed wrongly. The wrong framing is a product of thinking that Africa is a place of despair. What should we do with it? We should give food to the hungry. We should deliver medicines to those who are ill. We should send peacekeeping troops to serve those who are facing a civil war. And in the process, Africa has been stripped of self-initiative. I want to say that it is important to recognize that Africa has fundamental weaknesses. But equally, it has opportunities and a lot of potential. We need to reframe the challenge that is facing Africa, from a challenge of despair, which is called poverty reduction, to a challenge of hope. We frame it as a challenge of hope, and that is worth creation. The challenge facing all those who are interested in Africa is not the challenge of reducing poverty. It should be a challenge of creating wealth. Once we change those two things â if you say the Africans are poor and they need poverty reduction, you have the international cartel of good intentions moving onto the continent, with what? Medicines for the poor, food relief for those who are hungry, and peacekeepers for those who are facing civil war. And in the process, none of these things really are productive because you are treating the symptoms, not the causes of Africa ’ s fundamental problems. Sending somebody to school and giving them medicines, ladies and gentlemen, does not create wealth for them. Wealth is a function of income, and income comes from you finding a profitable trading opportunity or a well-paying job. Now, once we begin to talk about wealth creation in Africa, our second challenge will be, who are the wealth-creating agents in any society? They are entrepreneurs. [Unclear] told us they are always about four percent of the population, but 16 percent are imitators. But they also succeed at the job of entrepreneurship. So, where should we be putting the money? We need to put money where it can productively grow. Support private investment in Africa, both domestic and foreign. Support research institutions, because knowledge is an important part of wealth creation. But what is the international aid community doing with Africa today? They are throwing large sums of money for primary health, for primary education, for food relief. The entire continent has been turned into a place of despair, in need of charity. Ladies and gentlemen, can any one of you tell me a neighbor, a friend, a relative that you know, who became rich by receiving charity? By holding the begging bowl and receiving alms? Does any one of you in the audience have that person? Does any one of you know a country that developed because of the generosity and kindness of another? Well, since I ’ m not seeing the hand, it appears that what I ’ m stating is true. Andrew Mwenda : I can see Bono says he knows the country. Which country is that? AM : Thank you very much. But let me tell you this. External actors can only present to you an opportunity. The ability to utilize that opportunity and turn it into an advantage depends on your internal capacity. Africa has received many opportunities. Many of them we haven ’ t benefited much. Why? Because we lack the internal, institutional framework and policy framework that can make it possible for us to benefit from our external relations. I ’ ll give you an example. Under the Cotonou Agreement, formerly known as the Lome Convention, African countries have been given an opportunity by Europe to export goods, duty-free, to the European Union market. My own country, Uganda, has a quota to export 50, 000 metric tons of sugar to the European Union market. We haven ’ t exported one kilogram yet. We import 50, 000 metric tons of sugar from Brazil and Cuba. Secondly, under the beef protocol of that agreement, African countries that produce beef have quotas to export beef duty-free to the European Union market. None of those countries, including Africa ’ s most successful nation, Botswana, has ever met its quota. So, I want to argue today that the fundamental source of Africa ’ s inability to engage the rest of the world in a more productive relationship is because it has a poor institutional and policy framework. And all forms of intervention need support, the evolution of the kinds of institutions that create wealth, the kinds of institutions that increase productivity. How do we begin to do that, and why is aid the bad instrument? Aid is the bad instrument, and do you know why? Because all governments across the world need money to survive. Money is needed for a simple thing like keeping law and order. You have to pay the army and the police to show law and order. And because many of our governments are quite dictatorial, they need really to have the army clobber the opposition. The second thing you need to do is pay your political hangers-on. Why should people support their government? Well, because it gives them good, paying jobs, or, in many African countries, unofficial opportunities to profit from corruption. The fact is no government in the world, with the exception of a few, like that of Idi Amin, can seek to depend entirely on force as an instrument of rule. Many countries in the [unclear], they need legitimacy. To get legitimacy, governments often need to deliver things like primary education, primary health, roads, build hospitals and clinics. If the government ’ s fiscal survival depends on it having to raise money from its own people, such a government is driven by self-interest to govern in a more enlightened fashion. It will sit with those who create wealth. Talk to them about the kind of policies and institutions that are necessary for them to expand a scale and scope of business so that it can collect more tax revenues from them. The problem with the African continent and the problem with the aid industry is that it has distorted the structure of incentives facing the governments in Africa. The productive margin in our governments ’ search for revenue does not lie in the domestic economy, it lies with international donors. Rather than sit with Ugandan â â rather than sit with Ugandan entrepreneurs, Ghanaian businessmen, South African enterprising leaders, our governments find it more productive to talk to the IMF and the World Bank. I can tell you, even if you have ten Ph. Ds., you can never beat Bill Gates in understanding the computer industry. Why? Because the knowledge that is required for you to understand the incentives necessary to expand a business â it requires that you listen to the people, the private sector actors in that industry. Governments in Africa have therefore been given an opportunity, by the international community, to avoid building productive arrangements with your own citizens, and therefore allowed to begin endless negotiations with the IMF and the World Bank, and then it is the IMF and the World Bank that tell them what its citizens need. In the process, we, the African people, have been sidelined from the policy-making, policy-orientation, and policy- implementation process in our countries. We have limited input, because he who pays the piper calls the tune. The IMF, the World Bank, and the cartel of good intentions in the world has taken over our rights as citizens, and therefore what our governments are doing, because they depend on aid, is to listen to international creditors rather than their own citizens. But I want to put a caveat on my argument, and that caveat is that it is not true that aid is always destructive. Some aid may have built a hospital, fed a hungry village. It may have built a road, and that road may have served a very good role. The mistake of the international aid industry is to pick these isolated incidents of success, generalize them, pour billions and trillions of dollars into them, and then spread them across the whole world, ignoring the specific and unique circumstances in a given village, the skills, the practices, the norms and habits that allowed that small aid project to succeed â like in Sauri village, in Kenya, where Jeffrey Sachs is working â and therefore generalize this experience as the experience of everybody. Aid increases the resources available to governments, and that makes working in a government the most profitable thing you can have, as a person in Africa seeking a career. By increasing the political attractiveness of the state, especially in our ethnically fragmented societies in Africa, aid tends to accentuate ethnic tensions as every single ethnic group now begins struggling to enter the state in order to get access to the foreign aid pie. Ladies and gentlemen, the most enterprising people in Africa cannot find opportunities to trade and to work in the private sector because the institutional and policy environment is hostile to business. Governments are not changing it. Why? Because they don ’ t need to talk to their own citizens. They talk to international donors. So, the most enterprising Africans end up going to work for government, and that has increased the political tensions in our countries precisely because we depend on aid. I also want to say that it is important for us to note that, over the last 50 years, Africa has been receiving increasing aid from the international community, in the form of technical assistance, and financial aid, and all other forms of aid. Between 1960 and 2003, our continent received 600 billion dollars of aid, and we are still told that there is a lot of poverty in Africa. Where has all the aid gone? I want to use the example of my own country, called Uganda, and the kind of structure of incentives that aid has brought there. In the 2006-2007 budget, expected revenue : 2. 5 trillion shillings. The expected foreign aid : 1. 9 trillion. Uganda ’ s recurrent expenditure â by recurrent what do I mean? Hand- to-mouth is 2. 6 trillion. Why does the government of Uganda budget spend 110 percent of its own revenue? It ’ s because there ’ s somebody there called foreign aid, who contributes for it. But this shows you that the government of Uganda is not committed to spending its own revenue to invest in productive investments, but rather it devotes this revenue to paying structure of public expenditure. Public administration, which is largely patronage, takes 690 billion. The military, 380 billion. Agriculture, which employs 18 percent of our poverty-stricken citizens, takes only 18 billion. Trade and industry takes 43 billion. And let me show you, what does public expenditure â rather, public administration expenditure â in Uganda constitute? There you go. 70 cabinet ministers, 114 presidential advisers, by the way, who never see the president, except on television. And when they see him physically, it is at public functions like this, and even there, it is him who advises them. We have 81 units of local government. Each local government is organized like the central government â a bureaucracy, a cabinet, a parliament, and so many jobs for the political hangers-on. There were 56, and when our president wanted to amend the constitution and remove term limits, he had to create 25 new districts, and now there are 81. Three hundred thirty-three members of parliament. You need Wembley Stadium to host our parliament. One hundred thirty-four commissions and semi-autonomous government bodies, all of which have directors and the cars. And the final thing, this is addressed to Mr. Bono. In his work, he may help us on this. A recent government of Uganda study found that there are 3, 000 four-wheel drive motor vehicles at the Minister of Health headquarters. Uganda has 961 sub- counties, each of them with a dispensary, none of which has an ambulance. So, the four-wheel drive vehicles at the headquarters drive the ministers, the permanent secretaries, the bureaucrats and the international aid bureaucrats who work in aid projects, while the poor die without ambulances and medicine. Finally, I want to say that before I came to speak here, I was told that the principle of TEDGlobal is that the good speech should be like a miniskirt. It should be short enough to arouse interest, but long enough to cover the **subject**. I hope I have achieved that. Thank you very much.

You know, what I do is write for children, and I ’ m probably America ’ s most widely read children ’ s author, in fact. And I always tell people that I don ’ t want to show up looking like a scientist. You can have me as a farmer, or in leathers, and no one has ever chose farmer. I ’ m here today to talk to you about circles and epiphanies. And you know, an epiphany is usually something you find that you dropped someplace. You ’ ve just got to go around the block to see it as an epiphany. That ’ s a painting of a circle. A friend of mine did that — Richard Bollingbroke. It ’ s the kind of complicated circle that I ’ m going to tell you about. My circle began back in the ’ 60s in high school in Stow, Ohio where I was the class queer. I was the guy beaten up bloody every week in the boys ’ room, until one teacher saved my life. She saved my life by letting me go to the bathroom in the teachers ’ lounge. She did it in secret. She did it for three years. And I had to get out of town. I had a thumb, I had 85 dollars, and I ended up in San Francisco, California — met a lover — and back in the ’ 80s, found it necessary to begin work on AIDS organizations. About three or four years ago, I got a phone call in the middle of the night from that teacher, Mrs. Posten, who said,”I need to see you. I ’ m disappointed that we never got to know each other as adults. Could you please come to Ohio, and please bring that man that I know you have found by now. And I should mention that I have pancreatic cancer, and I ’ d like you to please be quick about this.”Well, the next day we were in Cleveland. We took a look at her, we laughed, we cried, and we knew that she needed to be in a hospice. We found her one, we got her there, and we took care of her and watched over her family, because it was necessary. It

’ s something we knew how to do. And just as the woman who wanted to know me as an adult got to know me, she turned into a box of ashes and was placed in my hands. And what had happened was the circle had closed, it had become a circle — and that epiphany I talked about presented itself. The epiphany is that death is a part of life. She saved my life ; I and my partner saved hers. And you know, that part of life needs everything that the rest of life does. It needs truth and beauty, and I ’ m so happy it ’ s been mentioned so much here today. It also needs — it needs dignity, love and pleasure, and it ’ s our job to hand those things out. Thank you.

So, I kind of believe that we ’ re in like the”cave-painting”era of computer interfaces. Like, they ’ re very kind of â they don ’ t go as deep or as emotionally engaging as they possibly could be and I ’ d like to change all that. Hit me. OK. So I mean, this is the kind of status quo interface, right? It ’ s very flat, kind of rigid. And OK, so you could sex it up and like go to a much more lickable Mac, you know, but really it ’ s the kind of same old crap we ’ ve had for the last, you know, 30 years. Like I think we really put up with a lot of crap with our computers. I mean it ’ s point and click, it ’ s like the menus, icons, it ’ s all the kind of same thing. And so one kind of information space that I take inspiration from is my real desk. It ’ s so much more subtle, so much more visceral â you know, what ’ s visible, what ’ s not. And I ’ d like to bring that experience to the desktop. So I kind of have a â this is BumpTop. It ’ s kind of like a new approach to desktop computing. So you can bump things â they ’ re all physically, you know, manipulable and stuff. And instead of that point and click, it ’ s like a push and pull, things collide as you ’ d expect them. Just like on my real desk, I can â let me just grab these guys â I can turn things into piles instead of just the folders that we have. And once things are in a pile I can browse them by throwing them into a grid, or you know, flip through them like a book or I can lay them out like a deck of cards. When they ’ re laid out, I can pull things to new locations or delete things or just quickly sort a whole pile, you know, just immediately, right? And then, it ’ s all smoothly animated, instead of these jarring changes you see in today ’ s interfaces. Also, if I want to add something to a pile, well, how do I do that? I just toss it to the pile, and it ’ s added right to the top. It ’ s a kind of nice way. Also some of the stuff we can do is, for these individual icons we thought â I mean, how can we play with the idea of an icon, and push that further? And one of the things I can do is make it bigger if I want to emphasize it and make it more important. But what ’ s really cool is that since there ’ s a physics simulation running under this, it ’ s actually heavier. So the lighter stuff doesn ’ t really move but if I throw it at the lighter guys, right? So it ’ s cute, but it ’ s also like a subtle channel of conveying information, right? This is heavy so it feels more important. So it ’ s kind of cool. Despite computers everywhere paper really hasn ’ t disappeared, because it has a lot of, I think, valuable properties. And some of those we wanted to transfer to the icons in our system. So one of the things you can do to our icons, just like paper, is crease them and fold them, just like paper. Remember, you know, something for later. Or if you want to be destructive, you can just crumple it up and, you know, toss it to the corner. Also just like paper, around our workspace we ’ ll pin things up to the wall to remember them later, and I can do the same thing here, and you know, you ’ ll see post-it notes and things like that around people ’ s offices. And I can pull them off when I want to work with them. So, one of the criticisms of this kind of approach to organization is that, you know,”Okay, well my real desk is really messy. I don ’ t want that mess on my computer.”So one thing we have for that is like a grid align, kind of â so you get that more traditional desktop. Things are kind of grid aligned. More boring, but you still have that kind of colliding and bumping. And you can still do fun things like make shelves on your desktop. Let ’ s just break this shelf. Okay, that shelf broke. I think beyond the icons, I think another really cool domain for this software â I think it applies to more than just icons and your desktop â but browsing photographs. I think you can really enrich the way we browse our photographs and bring it to that kind of shoebox of, you know, photos with your family on the kitchen table kind of thing. I can toss these things around. They ’ re so much more tangible and touchable â and you know I can double-click on something to take a look at it. And I can do all that kind of same stuff I showed you before. So I can pile things up, I can flip through it, I can, you know â okay, let ’ s move this photo to the back, let ’ s delete this guy here, and I think it ’ s just a much more rich kind of way of interacting with your information. And that ’ s BumpTop. Thanks!

You know, I am so bad at tech that my daughter â who is now 41 â when she was five, was overheard by me to say to a friend of hers, If it doesn ’ t bleed when you cut it, my daddy doesn ’ t understand it. So, the assignment I ’ ve been given may be an insuperable obstacle for me, but I ’ m certainly going to try. What have I heard during these last four days? This is my third visit to TED. One was to TEDMED, and one, as you ’ ve heard, was a regular TED two years ago. I ’ ve heard what I consider an extraordinary thing that I ’ ve only heard a little bit in the two previous TEDs, and what that is is an interweaving and an interlarding, an intermixing, of a sense of social responsibility in so many of the talks â global responsibility, in fact, appealing to enlightened self- interest, but it goes far beyond enlightened self-interest. One of the most impressive things about what some, perhaps 10, of the speakers have been talking about is the realization, as you listen to them carefully, that they ’ re not saying : Well, this is what we should do ; this is what I would like you to do. It ’ s : This is what I have done because I ’ m excited by it, because it ’ s a wonderful thing, and it ’ s done something for me and, of course, it ’ s accomplished a great deal. It ’ s the old concept, the real Greek concept, of philanthropy in its original sense : philanthropy, the love of humankind. And the only explanation I can have for some of what you ’ ve been hearing in the last four days is that it arises, in fact, out of a form of love. And this gives me enormous hope. And hope, of course, is the topic that I ’ m supposed to be speaking about, which I ’ d completely forgotten about until I arrived. And when I did, I thought, well, I ’ d better look this word up in the dictionary. So, Sarah and I â my wife â walked over to the public library, which is four blocks away, on Pacific Street, and we got the OED, and we looked in there, and there are 14 definitions of hope, none of which really hits you between the eyes as being the appropriate one. And, of course, that makes sense, because hope is an abstract phenomenon ; it ’ s an abstract idea, it ’ s not a concrete word. Well, it reminds me a little bit of surgery. If there ’ s one operation for a disease, you know it works. If there are 15 operations, you know that none of them work. And that ’ s the way it is with definitions of words. If you have appendicitis, they take your appendix out, and you ’ re cured. If you ’ ve got reflux oesophagitis, there are 15 procedures, and Joe Schmo does it one way and Will Blow does it another way, and none of them work, and that ’ s the way it is with this word, hope. They all come down to the idea of an expectation of something good that is due to happen. And you know what I found out? The Indo- European root of the word hope is a stem, K-E-U â we would spell it K-E-U ; it ’ s pronounced koy â and it is the same root from which the word curve comes from. But what it means in the original Indo-European is a change in direction, going in a different way. And I find that very interesting and very provocative, because what you ’ ve been hearing in the last couple of days is the sense of going in different directions : directions that are specific and unique to problems. There are different paradigms. You ’ ve heard that word several times in the last four days, and everyone ’ s familiar with Kuhnian paradigms. So, when we think of hope now, we have to think of looking in other directions than we have been looking. There ’ s another â not definition, but description, of hope that has always appealed to me, and it was one by VĂĄclav Havel in his perfectly spectacular book”Breaking the Peace,”in which he says that hope does not consist of the expectation that things will come out exactly right, but the expectation that they will make sense regardless of how they come out. I can ’ t tell you how reassured I was by the very last sentence in that glorious presentation by Dean Kamen a few days ago. I wasn ’ t sure I heard it right, so I found him in one of the inter-sessions. He was talking to a very large man, but I didn ’ t care. I interrupted, and I said,”Did you say this?”He said,”I think so.”So, here ’ s what it is : I ’ ll repeat it.”The world will not be saved by the Internet.”It ’ s wonderful. Do you know what the world will be saved by? I ’ ll tell you. It ’ ll be saved by the human spirit. And by the human spirit, I don ’ t mean anything divine, I don ’ t mean anything supernatural â certainly not coming from this skeptic. What I mean is this ability that each of us has to be something greater than herself or himself ; to arise out of our ordinary selves and achieve something that at the beginning we thought perhaps we were not capable of. On an elemental level, we have all felt that spirituality at the time of childbirth. Some of you have felt it in laboratories ; some of you have felt it at the workbench. We feel it at concerts. I ’ ve felt it in the operating room, at the bedside. It is an elevation of us beyond ourselves. And I think that it ’ s going to be, in time, the elements of the human spirit that we ’ ve been hearing about bit by bit by bit from so many of the speakers in the last few days. And if there ’ s anything that has permeated this room, it is precisely that. I ’ m intrigued by a concept that was brought to life in the early part of the 19th century â actually, in the second decade of the 19th century â by a 27-year-old poet whose name was Percy Shelley. Now, we all think that Shelley obviously is the great romantic poet that he was ; many of us tend to forget that he wrote some perfectly wonderful essays, too, and the most well- remembered essay is one called”A Defence of Poetry.”Now, it ’ s about five, six, seven, eight pages long, and it gets kind of deep and difficult after about the third page, but somewhere on the second page he begins talking about the notion that he calls”moral imagination.”And here ’ s what he says, roughly translated : A man â generic man â a man, to be greatly good, must imagine clearly. He must see himself and the world through the eyes of another, and of many others. See himself and the world â not just the world, but see himself. What is it that is expected of us by the billions of people who live in what Laurie Garrett the other day so appropriately called despair and disparity? What is it that they have every right to ask of us? What is it that we have every right to ask of ourselves, out of our shared humanity and out of the human spirit? Well, you know precisely what it is. There ’ s a great deal of argument about whether we, as the great nation that we are, should be the policeman of the world, the world ’ s constabulary, but there should be virtually no argument about whether we should be the world ’ s healer. There has certainly been no argument about that in this room in the past four days. So, if we are to be the world ’ s healer, every disadvantaged person in this world â including in the United States â becomes our patient. Every disadvantaged nation, and perhaps our own nation, becomes our patient. So, it ’ s fun to think about the etymology of the word”patient.”It comes initially from the Latin patior, to endure, or to suffer. So, you go back to the old Indo- European root again, and what do you find? The Indo-European stem is pronounced payen â we would spell it P-A-E-N â and, lo and behold, mirabile dictu, it is the same root as the word compassion comes from, P-A-E-N. So, the lesson is very clear. The lesson is that our patient â the world, and the disadvantaged of the world â that patient deserves our compassion. But beyond our compassion, and far greater than compassion, is our moral imagination and our identification with each individual who lives in that world, not to think of them as a huge forest, but as individual trees. Of course, in this day and age, the trick is not to let each tree be obscured by that Bush in Washington that can get â can get in the way. So, here we are. We are, should be, morally committed to being the healer of the world. And we have had examples over and over and over again â you ’ ve just heard one in the last 15 minutes â of people who have not only had that commitment, but had the charisma, the brilliance â and I think in this room it ’ s easy to use the word brilliant, my God â the brilliance to succeed at least at the beginning of their quest, and who no doubt will continue to succeed, as long as more and more of us enlist ourselves in their cause. Now, if we ’ re talking about medicine, and we ’ re talking about healing, I ’ d like to quote someone who hasn ’ t been quoted. It seems to me everybody in the world ’ s been quoted here : Pogo ’ s been quoted ; Shakespeare ’ s been quoted backwards, forwards, inside out. I would like to quote one of my own household gods. I suspect he never really said this, because we don ’ t know what Hippocrates really said, but we do know for sure that one of the great Greek physicians said the following, and it has been recorded in one of the books attributed to Hippocrates, and the book is called”Precepts.”And I ’ ll read you what it is. Remember, I have been talking about, essentially philanthropy : the love of humankind, the individual humankind and the individual humankind that can bring that kind of love translated into action, translated, in some cases, into enlightened self-interest. And here he is, 2, 400 years ago :”Where there is love of humankind, there is love of healing.”We have seen that here today with the sense, with the sensitivity â and in the last three days, and with the power of the indomitable human spirit. Thank you very much.

When I first arrived in beautiful Zimbabwe, it was difficult to understand that 35 percent of the population is HIV positive. It really wasn ’ t until I was invited to the homes of people that I started to understand the human toll of the epidemic. For instance, this is Herbert with his grandmother. When I first met him, he was sitting on his grandmother ’ s lap. He has been orphaned, as both of his parents died of AIDS, and his grandmother took care of him until he too died of AIDS. He liked to sit on her lap because he said that it was painful for him to lie in his own bed. When she got up to make tea, she placed him in my own lap and I had never felt a child that was that emaciated. Before I left, I actually asked him if I could get him something. I thought he would ask for a toy, or candy, and he asked me for slippers, because he said that his feet were cold. This is Joyce who ’ s — in this picture — 21. Single mother, HIV positive. I photographed her before and after the birth of her beautiful baby girl, Issa. And I was last week walking on Lafayette Street in Manhattan and got a call from a woman who I didn ’ t know, but she called to tell me that Joyce had passed away at the age of 23. Joyce ’ s mother is now taking care of her daughter, like so many other Zimbabwean children who ’ ve been orphaned by the epidemic. So a few of the stories. With every picture, there are individuals who have full lives and stories that deserve to be told. All these pictures are from Zimbabwe. Chris Anderson : Kirsten, will you just take one minute, just to tell your own story of how you got to Africa? Kirsten Ashburn : Mmm, gosh. CA : Just — KA : Actually, I was working at the time, doing production for a fashion photographer. And I was constantly reading the New York Times, and stunned by the statistics, the numbers. It was just frightening. So I quit my job and decided that that ’ s the **subject** that I wanted to tackle. And I first actually went to Botswana, where I spent a month — this is in December 2000 — then went to Zimbabwe for a month and a half, and then went back again this March 2002 for another month and a half in Zimbabwe. CA : That ’ s an amazing story, thank you. KB : Thanks for letting me show these.

So, about three years ago I was in London, and somebody called Howard Burton came to me and said, I represent a group of people, and we want to start an institute in theoretical physics. We have about 120 million dollars, and we want to do it well. We want to be in the forefront fields, and we want to do it differently. We want to get out of this thing where the young people have all the ideas, and the old people have all the power and decide what science gets done. It took me about 25 seconds to decide that that was a good idea. Three years later, we have the Perimeter Institute for Theoretical Physics in Waterloo, Ontario. It—s the most exciting job I—ve ever had. And it—s the first time I—ve had a job where I—m afraid to go away because of everything that—s going to happen in this week when I—m here. But in any case, what I—m going to do in my little bit of time is take you on a quick tour of some of the things that we talk about and we think about. So, we think a lot about what really makes science work? The first thing that anybody who knows science, and has been around science, is that the stuff you learn in school as a scientific method is wrong. There is no method. On the other hand, somehow we manage to reason together as a community, from incomplete evidence to conclusions that we all agree about. And this is, by the way, something that a democratic society also has to do. So how does it work? Well, my belief is that it works because scientists are a community bound together by an ethics. And here are some of the ethical principles. I—m not going to read them all to you because I—m not in teacher mode. I—m in entertain, amaze mode. But one of the principles is that everybody who is part of the community gets to fight and argue as hard as they can for what they believe. But we—re all disciplined by the understanding that the only people who are going to decide, you know, whether I—m right or somebody else is right, are the people in our community in the next generation, in 30 and 50 years. So it—s this combination of respect for the tradition and community we—re in, and rebellion that the community requires to get anywhere, that makes science work. And being in this process of being in a community that reasons from shared evidence to conclusions, I believe, teaches us about democracy. Not only is there a relationship between the ethics of science and the ethics of being a citizen in democracy, but there has been, historically, a relationship between how people think about space and time, and what the cosmos is, and how people think about the society that they live in. And I want to talk about three stages in that evolution. The first science of cosmology that was anything like science was Aristotelian science, and that was hierarchical. The earth is in the center, then there are these crystal spheres, the sun, the moon, the planets and finally the celestial sphere, where the stars are. And everything in this universe has a place. And Aristotle—s law of motion was that everything goes to its natural place, which was of course, the rule of the society that Aristotle lived in, and more importantly, the medieval society that, through Christianity, embraced Aristotle and blessed it. And the idea is that everything is defined. Where something is, is defined with respect to this last sphere, the celestial sphere, outside of which is this eternal, perfect realm, where lives God, who is the ultimate judge of everything. So that is both Aristotelian cosmology, and in a certain sense, medieval society. Now, in the 17th century there was a revolution in thinking about space and time and motion and so forth of Newton. And at the same time there was a revolution in social thought of John Locke and his collaborators. And they were very closely associated. In fact, Newton and Locke were friends. Their way of thinking about space and time and motion on the one hand, and a society on the other hand, were closely related. And let me show you. In a Newtonian universe, there—s no center — thank you. There are particles and they move around with respect to a fixed, absolute framework of space and time. It—s meaningful to say absolutely where something is in space, because that—s defined, not with respect to say, where other things are, but with respect to this absolute notion of space, which for Newton was God. Now, similarly, in Locke—s society there are individuals who have certain rights, properties in a formal sense, and those are defined with respect to some absolute, abstract notions of rights and justice, and so forth, which are independent of what else has happened in the society. Of who else there is, of the history and so forth. There is also an omniscient observer who knows everything, who is God, who is in a certain sense outside the universe, because he has no role in anything that happens, but is in a certain sense everywhere, because space is just the way that God knows where everything is, according to Newton, OK? So this is the foundations of what—s called, traditionally, liberal political theory and Newtonian physics. Now, in the 20th century we had a revolution that was initiated at the beginning of the 20th century, and which is still going on. It was begun with the invention of relativity theory and quantum theory. And merging them together to make the final quantum theory of space and time and gravity, is the culmination of that, something that—s going on right now. And in this universe there—s nothing fixed and absolute. Zilch, OK. This universe is described by being a network of relationships. Space is just one aspect, so there—s no meaning to say absolutely where something is. There—s only where it is relative to everything else that is. And this network of relations is ever-evolving. So we call it a relational universe. All properties of things are about these kinds of relationships. And also, if you—re embedded in such a network of relationships, your view of the world has to do with what information comes to you through the network of relations. And there—s no place for an omniscient observer or an outside intelligence knowing everything and making everything. So this is general relativity, this is quantum theory. This is also, if you talk to legal scholars, the foundations of new ideas in legal thought. They—re thinking about the same things. And not only that, they make the analogy to relativity theory and cosmology often. So there—s an interesting discussion going on there. This last view of cosmology is called the relational view. So the main slogan here is that there—s nothing outside the universe, which means that there—s no place to put an explanation for something outside. So in such a relational universe, if you come upon something that—s ordered and structured, like this device here, or that device there, or something beautiful, like all the living things, all of you guys in the room —”guys”in physics, by the way, is a generic term : men and women. Then you want to know, you—re a person, you want to know how is it made. And in a relational universe the only possible explanation was, somehow it made itself. There must be mechanisms of self-organization inside the universe that make things. Because there—s no place to put a maker outside, as there was in the Aristotelian and the Newtonian universe. So in a relational universe we must have processes of self-organization. Now, Darwin taught us that there are processes of self-organization that suffice to explain all of us and everything we see. So it works. But not only that, if you think about how natural selection works, then it turns out that natural selection would only make sense in such a relational universe. That is, natural selection works on properties, like fitness, which are about relationships of some species to some other species. Darwin wouldn—t make sense in an Aristotelian universe, and wouldn—t really make sense in a Newtonian universe. So a theory of biology based on natural selection requires a relational notion of what are the properties of biological systems. And if you push that all the way down, really, it makes the best sense in a relational universe where all properties are relational. Now, not only that, but Einstein taught us that gravity is the result of the world being relational. If it wasn—t for gravity, there wouldn—t be life, because gravity causes stars to form and live for a very long time, keeping pieces of the world, like the surface of the Earth, out of thermal equilibrium for billions of years so life can evolve. In the 20th century, we saw the independent development of two big themes in science. In the biological sciences, they explored the implications of the notion that order and complexity and structure arise in a self-organized way. That was the triumph of Neo-Darwinism and so forth. And slowly, that idea is leaking out to the cognitive sciences, the human sciences, economics, et cetera. At the same time, we physicists have been busy trying to make sense of and build on and integrate the discoveries of quantum theory and relativity. And what we—ve been working out is the implications, really, of the idea that the universe is made up of relations. 21st-century science is going to be driven by the integration of these two ideas : the triumph of relational ways of thinking about the world, on the one hand, and self-organization or Darwinian ways of thinking about the world, on the other hand. And also, is that in the 21st century our thinking about space and time and cosmology, and our thinking about society are both going to continue to evolve. And what they—re evolving towards is the union of these two big ideas, Darwinism and relationalism. Now, if you think about democracy from this perspective, a new pluralistic notion of democracy would be one that recognizes that there are many different interests, many different agendas, many different individuals, many different points of view. Each one is incomplete, because you—re embedded in a network of relationships. Any actor in a democracy is embedded in a network of relationships. And you understand some things better than other things, and because of that there—s a continual jostling and give and take, which is politics. And politics is, in the ideal sense, the way in which we continually address our network of relations in order to achieve a better life and a better society. And I also think that science will never go away and — I—m finishing on this line. In fact, I—m finished. Science will never go away.

Thank you so much, Chris. And it ’ s truly a great honor to have the opportunity to come to this stage twice ; I ’ m extremely grateful. I have been **blown** away by this conference, and I want to thank all of you for the many nice comments about what I had to say the other night. And I say that sincerely, partly because I need that. Put yourselves in my position. I flew on Air Force Two for eight years. Now I have to take off my shoes or boots to get on an airplane! I ' ll tell you one quick story to illustrate what that ' s been like for me. It ' s a true story — every bit of this is true. Soon after Tipper and I left the — White House — we were driving from our home in Nashville to a little farm we have 50 miles east of Nashville. Driving ourselves. I know it sounds like a little thing to you, but — I looked in the rear-view mirror and all of a sudden it just hit me. There was no motorcade back there. You ' ve heard of phantom limb pain? This was a rented Ford Taurus. It was dinnertime, and we started looking for a place to eat. We were on I-40. We got to Exit 238, Lebanon, Tennessee. We got off the exit, we found a Shoney ' s restaurant. Low-cost family restaurant chain, for those of you who don ' t know it. We went in and sat down at the booth, and the waitress came over, made a big commotion over Tipper. She took our order, and then went to the couple in the booth next to us, and she lowered her voice so much, I had to really strain to hear what she was saying. And she said"Yes, that ' s former Vice President Al Gore and his wife, Tipper."And the man said,"He ' s come down a long way, hasn ' t he?"There ' s been kind of a series of epiphanies. The very next day, continuing the totally true story, I got on a G-V to fly to Africa to make a speech in Nigeria, in the city of Lagos, on the topic of energy. And I began the speech by telling them the story of what had just happened the day before in Nashville. And I told it pretty much the same way I ' ve just shared it with you : Tipper and I were driving ourselves, Shoney ' s, low-cost family restaurant chain, what the man said — they laughed. I gave my speech, then went back out to the airport to fly back home. I fell asleep on the plane until, during the middle of the night, we landed on the Azores Islands for refueling. I woke up, they opened the door, I went out to get some fresh air, and I looked, and there was a man running across the runway. And he was waving a piece of paper, and he was yelling,"Call Washington! Call Washington!"And I thought to myself, in the middle of the night, in the middle of the Atlantic, what in the world could be wrong in Washington? Then I remembered it could be a bunch of things. But what it turned out to be, was that my staff was extremely upset because one of the wire services in Nigeria had already written a story about my speech, and it had already been printed in cities all across the United States of America. It was printed in Monterey, I checked. And the story began,"Former Vice President Al Gore announced in Nigeria yesterday,"quote : ' My wife Tipper and I have opened a low-cost family restaurant '"—"' named Shoney ' s, and we are running it ourselves. '"Before I could get back to U. S. soil, David Letterman and Jay Leno had already started in on — one of them had me in a big white chef ' s hat, Tipper was saying,"One more burger with fries!"Three days later, I got a nice, long, handwritten letter from my friend and partner and colleague Bill Clinton, saying,"Congratulations on the new restaurant, Al!"We like to celebrate each other ' s successes in life. I was going to talk about information ecology. But I was thinking that, since I plan to make a lifelong habit of coming back to TED, that maybe I could talk about that another time. Chris Anderson : It ' s a deal! Al Gore : I want to focus on what many of you have said you would like me to elaborate on : What can you do about the climate crisis? I want to start with a couple of — I ' m going to show some new images, and I ' m going to recapitulate just four or five. Now, the slide show. I update the slide show every time I give it. I add new images, because I learn more about it every time I give it. It ' s like beach-combing, you know? Every time the tide comes in and out, you find some more shells. Just in the last two days, we got the new temperature records in January. This is just for the United States of America. Historical average for

Januarys is 31 degrees ; last month was 39. 5 degrees. Now, I know that you wanted some more bad news about the environment — I ’ m kidding. But these are the recapitulation slides, and then I ’ m going to go into new material about what you can do. But I wanted to elaborate on a couple of these. First of all, this is where we ’ re projected to go with the U. S. contribution to global warming, under business as usual. Efficiency in end-use electricity and end-use of all energy is the low-hanging fruit. Efficiency and conservation — it ’ s not a cost ; it ’ s a profit. The sign is wrong. It ’ s not negative ; it ’ s positive. These are investments that pay for themselves. But they are also very effective in deflecting our path. Cars and trucks — I talked about that in the slideshow, but I want you to put it in perspective. It ’ s an easy, visible target of concern — and it should be — but there is more global warming pollution that comes from buildings than from cars and trucks. Cars and trucks are very significant, and we have the lowest standards in the world. And so we should address that. But it ’ s part of the puzzle. Other transportation efficiency is as important as cars and trucks. Renewables at the current levels of technological efficiency can make this much difference. And with what Vinod, and John Doerr and others, many of you here — there are a lot of people directly involved in this — this wedge is going to grow much more rapidly than the current projection shows it. Carbon Capture and Sequestration — that ’ s what CCS stands for — is likely to become the killer app that will enable us to continue to use fossil fuels in a way that is safe. Not quite there yet. OK. Now, what can you do? Reduce emissions in your home. Most of these expenditures are also profitable. Insulation, better design. Buy green electricity where you can. I mentioned automobiles — buy a hybrid. Use light rail. Figure out some of the other options that are much better. It ’ s important. Be a green consumer. You have choices with everything you buy, between things that have a harsh effect, or a much less harsh effect on the global climate crisis. Consider this : Make a decision to live a carbon-neutral life. Those of you who are good at branding, I ’ d love to get your advice and help on how to say this in a way that connects with the most people. It is easier than you think. It really is. A lot of us in here have made that decision, and it is really pretty easy. It means reduce your carbon dioxide emissions with the full range of choices that you make, and then purchase or acquire offsets for the remainder that you have not completely reduced. And what it means is elaborated at climatecrisis. net. There is a carbon calculator. Participant Productions convened — with my active involvement — the leading software writers in the world, on this arcane science of carbon calculation, to construct a consumer-friendly carbon calculator. You can very precisely calculate what your CO2 emissions are, and then you will be given options to reduce. And by the time the movie comes out in May, this will be updated to 2. 0, and we will have click-through purchases of offsets. Next, consider making your business carbon-neutral. Again, some of us have done that, and it ’ s not as hard as you think. Integrate climate solutions into all of your innovations, whether you are from the technology, or entertainment, or design and architecture community. Invest sustainably. Majora mentioned this. Listen, if you have invested money with managers who you compensate on the basis of their annual performance, don ’ t ever again complain about quarterly report CEO management. Over time, people do what you pay them to do. And if they judge how much they ’ re going to get paid on your capital that they ’ ve invested, based on the short-term returns, you ’ re going to get short-term decisions. A lot more to be said about that. Become a catalyst of change. Teach others, learn about it, talk about it. The movie is a movie version of the slideshow I gave two nights ago, except it ’ s a lot more entertaining. And it comes out in May. Many of you here have the opportunity to ensure that a lot of people see it. Consider sending somebody to Nashville. Pick well. And I am personally going to train people to give this slideshow — re-purposed, with some of the personal stories obviously replaced with a generic approach, and it ’ s not just the slides, it ’ s what they mean. And it ’ s how they link together. And so I ’ m going to be conducting a course this summer for a group of people that are nominated by different folks to come and then give it en masse, in communities all across the country, and we ’ re going to update the slideshow for all of them every single week, to keep it right on the cutting edge. Working with Larry Lessig, it will be, somewhere in that process, posted with tools and limited-use copyrights, so that young people can remix it and do it in their own way. Where did anybody get the idea that you ought to stay arm ’ s length from politics? It doesn ’ t mean that if you ’ re a Republican, that I ’ m trying to convince you to be a Democrat. We need Republicans as well. This used to be a bipartisan issue, and I know that in this group it really is. Become politically active. Make our democracy work the way it ’ s supposed to work. Support the idea of capping carbon dioxide emissions — global warming pollution — and trading it. Here ’ s why : as long as the United States is out of the world system, it ’ s not a closed system. Once it becomes a closed system, with U. S. participation, then everybody who ’ s on a board of directors — how many people here serve on the board of directors of a corporation? Once it ’ s a closed system, you will have legal liability if you do not urge your CEO to get the maximum income from reducing and trading the carbon emissions that can be avoided. The market will work to solve this problem — if we can accomplish this. Help with the mass persuasion campaign that will start this spring. We have to change the minds of the American people. Because presently, the politicians do not have permission to do what needs to be done. And in our modern country, the role of logic and reason no longer includes mediating between wealth and power the way it once did. It ’ s now repetition of short, hot-button, 30-second, 28-second television ads. We have to buy a lot of those ads. Let ’ s re-brand global warming, as many of you have suggested. I like”climate crisis”instead of”climate collapse,”but again, those of you who are good at branding, I need your help on this. Somebody said the test we ’ re facing now, a scientist told me, is whether the combination of an opposable thumb and a neocortex is a viable combination. That ’ s really true. I said the other night, and I ’ ll repeat now : this is not a political issue. Again, the Republicans here — this shouldn ’ t be partisan. You have more influence than some of us who are Democrats do. This is an opportunity. Not just this, but connected to the ideas that are here, to bring more coherence to them. We are one. Thank you very much, I appreciate it.

I ’ ve got apparently 18 minutes to convince you that history has a direction, an arrow ; that in some fundamental sense, it ’ s good ; that the arrow points to something positive. Now, when the TED people first approached me about giving this upbeat talk â□□ â□□ that was before the cartoon of Muhammad had triggered global rioting. It was before the avian flu had reached Europe. It was before Hamas had won the Palestinian election, eliciting various counter- measures by Israel. And to be honest, if I had known when I was asked to give this upbeat talk that even as I was giving the upbeat talk, the apocalypse would be unfolding â□□ â□□ I might have said,”Is it okay if I talk about something else?”But I didn ’ t, OK. So we ’ re here. I ’ ll do what I can. I ’ ll do what I can. I ’ ve got to warn you : the sense in which my worldview is upbeat has always been kind of subtle, sometimes even elusive. The sense in which I can be uplifting and inspiring â I mean, there ' s always been a kind of a certain grim dimension to the way I try to uplift, so if grim inspiration â â if grim inspiration is not a contradiction in terms, that is, I ' m afraid, the most you can hope for. OK, today â that ' s if I succeed. I ' ll see what I can do. OK? Now, in one sense, the claim that history has a direction is not that controversial. If you ' re just talking about social structure, OK, clearly that ' s gotten more complex a little over the last 10, 000 years â has reached higher and higher levels. And in fact, that ' s actually sustaining a long- standing trend that predates human beings, OK, that biological evolution was doing for us. Because what happened in the beginning, this stuff encases itself in a cell, then cells start hanging out together in societies. Eventually they get so close, they form multicellular organisms, then you get complex multicellular organisms ; they form societies. But then at some point, one of these multicellular organisms does something completely amazing with this stuff, which is it launches a whole second kind of evolution : cultural evolution. And amazingly, that evolution sustains the trajectory that biological evolution had established toward greater complexity. By cultural evolution we mean the evolution of ideas. A lot of you have heard the term"memes."The evolution of technology, I pay a lot of attention to, so, you know, one of the first things you got was a little hand axe. Generations go by, somebody says, hey, why don ' t we put it on a stick? Just absolutely delights the little ones. Next best thing to a video game. This may not seem to impress, but technological evolution is progressive, so another 10, 20, 000 years, and armaments technology takes you here. Impressive. And the rate of technological evolution speeds up, so a mere quarter of a century after this, you get this, OK. And this. I ' m sorry â it was a cheap laugh, but I wanted to find a way to transition back to this idea of the unfolding apocalypse, and I thought that might do it. So, what threatens to happen with this unfolding apocalypse is the collapse of global social organization. Now, first let me remind you how much work it took to get us where we are, to be on the brink of true global social organization. Originally, you had the most complex societies, the hunter-gatherer village. Stonehenge is the remnant of a chiefdom, which is what you get with the invention of agriculture : multi-village polity with centralized rule. With the invention of writing, you start getting cities. This is blurry. I kind of like that because it makes it look like a one-celled organism and reminds you how many levels organic organization has already moved through to get to this point. And then you get to, you know, you get empires. I want to stress, you know, social organization can transcend political bounds. This is the Silk Road connecting the Chinese Empire and the Roman Empire. So you had social complexity spanning the whole continent, even if no polity did similarly. Today, you ' ve got nation states. Point is : there ' s obviously collaboration and organization going on beyond national bounds. This is actually just a picture of the earth at night, and I ' m just putting it up because I think it ' s pretty. Does kind of convey the sense that this is an integrated system. Now, I explained this growth of complexity by reference to something called"non-zero sumness."Assuming that a few of you did not do the assigned reading, very quickly, the key idea is the distinction between zero-sum games, in which correlations are inverse : always a winner and a loser. Non-zero-sum games in which correlations can be positive, OK. So like in tennis, usually it ' s win- lose ; it always adds up to zero-zero-sum. But if you ' re playing doubles, the person on your side of the net, they ' re in the same boat as you, so you ' re playing a non-zero-sum game with them. It ' s either for the better or for the worse, OK. A lot of forms of non-zero-sum behavior in the realm of economics and so on in everyday life often leads to cooperation. The argument I make is basically that, well, non-zero-sum games have always been part of life. You have them in hunter-gatherer societies, but then through technological evolution, new forms of technology arise that facilitate or encourage the playing of non-zero-sum games, involving more people over larger territory. Social structure adapts to accommodate this possibility and to harness this productive potential, so you get cities, you know, and you get all the non-zero-sum games you don ' t think about that are being played across the world. Like, have you ever thought when you buy a car, how many people on how many different continents contributed to the manufacture of that car? Those are people in effect you ' re playing a non-zero-sum game with. I mean, there are certainly plenty of them around. Now, this sounds like an intrinsically upbeat worldview in a way, because when you think of non-zero, you think win-win, you know, that ' s good. Well, there are a few reasons that actually it ' s not intrinsically upbeat. First of all, it can accommodate ; it doesn ' t deny the existence of inequality exploitation war. But there ' s a more fundamental reason that it ' s not intrinsically upbeat, because a non-zero-sum game, all it tells you for sure is that the fortunes will be correlated for better or worse. It doesn ' t necessarily predict a win- win outcome. So, in a way, the question is : on what grounds am I upbeat at all about history? And the answer is, first of all, on balance I would say people have played their games to more win-win outcomes than lose-lose outcomes. On balance, I think history is a net positive in the non-zero-sum game department. And a testament to this is the thing that most amazes me, most impresses me, and most uplifts me, which is that there is a moral dimension to history ; there is a moral arrow. We have seen moral progress over time. 2, 500 years ago, members of one Greek city-state considered members of another Greek city-state subhuman and treated them that way. And then this moral revolution arrived, and they decided that actually, no, Greeks are human beings. It ' s just the Persians who aren ' t fully human and don ' t deserve to be treated very nicely. But this was progress â you know, give them credit. And now today, we ' ve seen more progress. I think â I hope â most people here would say that all people everywhere are human beings, deserve to be treated decently, unless they do something horrendous, regardless of race or religion. And you have to read your ancient history to realize what a revolution that has been, OK. This was not a prevalent view, few thousand years ago, and I attribute it to this non- zero-sum dynamic. I think that ' s the reason there is as much tolerance toward nationalities, ethnicities, religions as there is today. If you asked me, you know, why am I not in favor of bombing Japan, well, I ' m only half-joking when I say they built my car. We have this non-zero-sum relationship, and I think that does lead to a kind of a tolerance to the extent that you realize that someone else ' s welfare is positively correlated with yours â you ' re more likely to cut them a break. I kind of think this is a kind of a business-class morality. Unfortunately, I don ' t fly trans-Atlantic business class often enough to know, or any other kind of business class really, but I assume that in business class, you don ' t hear many expressions of, you know, bigotry about racial groups or ethnic groups, because the people who are flying trans-Atlantic business class are doing business with all these people ; they ' re making money off all these people. And I really do think that, in that sense at least, capitalism has been a constructive force, and more fundamentally, it ' s a non-zero-sumness that has been a constructive force in expanding people ' s realm of moral awareness. I think the non-zero-sum dynamic, which is not only economic by any means â it ' s not always commerce â but it has driven us to the verge of a moral truth, which is the fundamental equality of everyone. It has done that. As it has moved global, moved us toward a global level of social organization, it has driven us toward moral truth. I think that ' s wonderful. Now, back to the unfolding apocalypse. And you may wonder, OK, that ' s all fine, sounds great â moral direction in history â but what about this so-called clash of civilizations? Well, first of all, I would emphasize that it fits into the non-zero-sum framework, OK. If you look at the relationship between the so- called Muslim world and Western world â two terms I don ' t like, but can ' t really avoid ; in such a short span of time, they ' re efficient if nothing else â it is non-zero-sum. And by that I mean, if people in the Muslim world get more hateful, more resentful, less happy with their place in the world, it ' ll be bad for the West. If they get more happy, it ' ll be good for the West. So that is a non-zero-sum dynamic. And I would say the non-zero-sum dynamic is only going to grow more intense over time because of technological trends, but more intense in a kind of negative way. It ' s the downside correlation of their fortunes that will become more and more possible. And one reason is because of something I call the"growing lethality of hatred."More and more, it ' s possible for grassroots hatred abroad to manifest itself in the form of organized violence on American soil. And that ' s pretty new, and I think it ' s probably going to get a lot worse â this capacity â because of trends in information technology, in technologies that can be used for purposes of munitions like biotechnology and nanotechnology. We may be hearing more about that today. And there ' s something I worry about especially, which is that this dynamic will lead to a kind of a feedback cycle that puts us on a slippery slope. What I have in mind is : terrorism happens here ; we overreact to it. That, you know, we ' re not sufficiently surgical in our retaliation leads to more hatred abroad, more terrorism. We overreact because being human, we feel like retaliating, and it gets worse and worse and worse. You could call this the positive feedback of negative vibes, but I think in something so spooky, we really shouldn ' t have the word positive there at all, even in a technical sense. So let ' s call it the death spiral of negativity. I assure you if it happens, at the end, both the West and the Muslim world will have suffered. So, what do we do? Well, first of all, we can do a lot more with arms control, the international regulation of dangerous technologies. I have a whole global governance sermon that I will spare you right now, because I don ' t think that ' s going to be enough anyway, although it ' s essential. I think we ' re going to have to have a major round of moral progress in the world. I think you ' re just going to have to see less hatred among groups, less bigotry, and, you know, racial groups, religious groups, whatever. I ' ve got to admit I feel silly saying that. It sounds so kind of Pollyannaish. I feel like Rodney King, you know, saying, why can ' t we all just get along? But hey, I don ' t really see any alternative, given the way I read the situation. There ' s going to have to be moral progress. There ' s going to have to be a lessening of the amount of hatred in the world, given how dangerous it ' s becoming. In my defense, I ' d say, as naive as this may sound, it ' s ultimately grounded in cynicism. That is to say â â thank you, thank you. That is to say, remember : my whole view of morality is that it boils down to self-interest. It ' s when people ' s fortunes are correlated. It ' s when your welfare conduces to mine, that I decide, oh yeah, I ' m all in favor of your welfare. That ' s what ' s responsible for this growth of this moral progress so far, and I ' m saying we once again have a correlation of fortunes, and if people respond to it intelligently, we will see the development of tolerance and so on â the norms that we need, you know. We will see the further evolution of this kind of business-class morality. So, these two things, you know, if they get people ' s attention and drive home the positive correlation and people do what ' s in their self-interests, which is further the moral evolution, then they could actually have a constructive effect. And that ' s why I lump growing lethality of hatred and death spiral of negativity under the general rubric, reasons to be cheerful. Doing the best I can, OK. I never called myself Mr. Uplift. I ' m just doing what I can here. Now, launching a moral revolution has got to be hard, right? I mean, what do you do? And I think the answer is a lot of different people are going to have to do a lot of different things. We all start where we are. Speaking as an American who has children whose security 10, 20, 30 years down the road I worry about â what I personally want to start out doing is figuring out why so many people around the world hate us, OK. I think that ’ s a worthy research project myself. I also like it because it ’ s an intrinsically kind of morally redeeming exercise. Because to understand why somebody in a very different culture does something â somebody you ’ re kind of viewing as alien, who ’ s doing things you consider strange in a culture you consider strange â to really understand why they do the things they do is a morally redeeming accomplishment, because you ’ ve got to relate their experience to yours. To really understand it, you ’ ve got to say,”Oh, I get it. So when they feel resentful, it ’ s kind of like the way I feel resentful when this happens, and for somewhat the same reasons.”That ’ s true understanding. And I think that is an expansion of your moral compass when you manage to do that. It ’ s especially hard to do when people hate you, OK, because you don ’ t really, in a sense, want to completely understand why people hate you. I mean, you want to hear the reason, but you don ’ t want to be able to relate to it. You don ’ t want it to make sense, right? You don ’ t want to say,”Well, yeah, I can kind of understand how a human being in those circumstances would hate the country I live in.”That ’ s not a pleasant thing, but I think it ’ s something that we ’ re going to have to get used to and work on. Now, I want to stress that to understand, you know â there are people who don ’ t like this whole business of understanding the grassroots, the root causes of things ; they don ’ t want to know why people hate us. I want to understand it. The reason you ’ re trying to understand why they hate us, is to get them to quit hating us. The idea when you go through this moral exercise of really coming to appreciate their humanity and better understand them, is part of an effort to get them to appreciate your humanity in the long run. I think it ’ s the first step toward that. That ’ s the long-term goal. There are people who worry about this, and in fact, I, myself, apparently, was denounced on national TV a couple of nights ago because of an op-ed I ’ d written. It was kind of along these lines, and the allegation was that I have, quote,”affection for terrorists.”Now, the good news is that the person who said it was Ann Coulter. I mean, if you ’ ve got to have an enemy, do make it Ann Coulter. But it ’ s not a crazy concern, OK, because understanding behavior can lead to a kind of empathy, and it can make it a little harder to deliver tough love, and so on. But I think we ’ re a lot closer to erring on the side of not comprehending the situation clearly enough, than in comprehending it so clearly that we just can ’ t, you know, get the army out to kill terrorists. So I ’ m not really worried about it. So â â I mean, we ’ re going to have to work on a lot of fronts, but if we succeed â if we succeed â then once again, non-zero-sumness and the recognition of non-zero-sum dynamics will have forced us to a higher moral level. And a kind of saving higher moral level, something that kind of literally saves the world. If you look at the word”salvation”in the Bible â the Christian usage that we ’ re familiar with â saving souls, that people go to heaven â that ’ s actually a latecomer. The original meaning of the word”salvation”in the Bible is about saving the social system.”Yahweh is our Savior”means”He has saved the nation of Israel,”which at the time, was a pretty high-level social organization. Now, social organization has reached the global level, and I guess, if there ’ s good news I can say I ’ m bringing you, it ’ s just that all the salvation of the world requires is the intelligent pursuit of self-interests in a disciplined and careful way. It ’ s going to be hard. I say we give it a shot anyway because we ’ ve just come too far to screw it up now. Thanks.

If you haven ’ t ordered yet, I generally find the rigatoni with the spicy tomato sauce goes best with diseases of the small intestine. So, sorry â it just feels like I should be doing stand-up up here because of the setting. No, what I want to do is take you back to 1854 in London for the next few minutes, and tell the story â in brief â of this outbreak, which in many ways, I think, helped create the world that we live in today, and particularly the kind of city that we live in today. This period in 1854, in the middle part of the 19th century, in London ’ s history, is incredibly interesting for a number of reasons. But I think the most important one is that London was this city of 2. 5 million people, and it was the largest city on the face of the planet at that point. But it was also the largest city that had ever been built. And so the Victorians were trying to live through and simultaneously invent a whole new scale of living : this scale of living that we, you know, now call”metropolitan living.”And it was in many ways, at this point in the mid-1850s, a complete disaster. They were basically a city living with a modern kind of industrial metropolis with an Elizabethan public infrastructure. So people, for instance, just to gross you out for a second, had cesspools of human waste in their basement. Like, a foot to two feet deep. And they would just kind of throw the buckets down there and hope that it would somehow go away, and of course it never really would go away. And all of this stuff, basically, had accumulated to the point where the city was incredibly offensive to just walk around in. It was an amazingly smelly city. Not just because of the cesspools, but also the sheer number of livestock in the city would shock people. Not just the horses, but people had cows in their attics that they would use for milk, that they would hoist up there and keep them in the attic until literally their milk ran out and they died, and then they would drag them off to the bone boilers down the street. So, you would just walk around London at this point and just be overwhelmed with this stench. And what ended up happening is that an entire emerging public health system became convinced that it was the smell that was killing everybody, that was creating these diseases that would wipe through the city every three or four years. And cholera was really the great killer of this period. It arrived in London in 1832, and every four or five years another epidemic would take 10, 000, 20, 000 people in London and throughout the U. K. And so the authorities became convinced that this smell was this problem. We had to get rid of the smell. And so, in fact, they concocted a couple of early, you know, founding public-health interventions in the system of the city, one of which was called the”Nuisances Act,”which they got everybody as far as they could to empty out their cesspools and just pour all that waste into the river. Because if we get it out of the streets, it ’ ll smell much better, and â oh right, we drink from the river. So what ended up happening, actually, is they ended up increasing the outbreaks of cholera because, as we now know, cholera is actually in the water. It ’ s a waterborne disease, not something that ’ s in the air. It ’ s not something you smell or inhale ; it ’ s something you ingest. And so one of the founding moments of public health in the 19th century effectively poisoned the water supply of London much more effectively than any modern day bioterrorist could have ever dreamed of doing. So this was the state of London in 1854, and in the middle of all this carnage and offensive conditions, and in the midst of all this scientific confusion about what was actually killing people, it was a very talented classic 19th century multi- disciplinarian named John Snow, who was a local doctor in Soho in London, who had been arguing for about four or five years that cholera was, in fact, a waterborne disease, and had basically convinced nobody of this. The public health authorities had largely ignored what he had to say. And he ' d made the case in a number of papers and done a number of studies, but nothing had really stuck. And part of â what ' s so interesting about this story to me is that in some ways, it ' s a great case study in how cultural change happens, how a good idea eventually comes to win out over much worse ideas. And Snow labored for a long time with this great insight that everybody ignored. And then on one day, August 28th of 1854, a young child, a five-month-old girl whose first name we don ' t know, we know her only as Baby Lewis, somehow contracted cholera, came down with cholera at 40 Broad Street. You can ' t really see it in this map, but this is the map that becomes the central focus in the second half of my book. It ' s in the middle of Soho, in this working class neighborhood, this little girl becomes sick and it turns out that the cesspool, that they still continue to have, despite the Nuisances Act, bordered on an extremely popular water pump, local watering hole that was well known for the best water in all of Soho, that all the residents from Soho and the surrounding neighborhoods would go to. And so this little girl inadvertently ended up contaminating the water in this popular pump, and one of the most terrifying outbreaks in the history of England erupted about two or three days later. Literally, 10 percent of the neighborhood died in seven days, and much more would have died if people hadn ' t fled after the initial outbreak kicked in. So it was this incredibly terrifying event. You had these scenes of entire families dying over the course of 48 hours of cholera, alone in their one-room apartments, in their little flats. Just an extraordinary, terrifying scene. Snow lived near there, heard about the outbreak, and in this amazing act of courage went directly into the belly of the beast because he thought an outbreak that concentrated could actually potentially end up convincing people that, in fact, the real menace of cholera was in the water supply and not in the air. He suspected an outbreak that concentrated would probably involve a single point source. One single thing that everybody was going to because it didn ' t have the traditional slower path of infections that you might expect. And so he went right in there and started interviewing people. He eventually enlisted the help of this amazing other figure, who ' s kind of the other protagonist of the book â this guy, Henry Whitehead, who was a local minister, who was not at all a man of science, but was incredibly socially connected ; he knew everybody in the neighborhood. And he managed to track down, Whitehead did, many of the cases of people who had drunk water from the pump, or who hadn ' t drunk water from the pump. And eventually Snow made a map of the outbreak. He found increasingly that people who drank from the pump were getting sick. People who hadn ' t drunk from the pump were not getting sick. And he thought about representing that as a kind of a table of statistics of people living in different neighborhoods, people who hadn ' t, you know, percentages of people who hadn ' t, but eventually he hit upon the idea that what he needed was something that you could see. Something that would take in a sense a higher-level view of all this activity that had been happening in the neighborhood. And so he created this map, which basically ended up representing all the deaths in the neighborhoods as black bars at each address. And you can see in this map, the pump right at the center of it and you can see that one of the residences down the way had about 15 people dead. And the map is actually a little bit bigger. As you get further and further away from the pump, the deaths begin to grow less and less frequent. And so you can see this something poisonous emanating out of this pump that you could see in a glance. And so, with the help of this map, and with the help of more evangelizing that he did over the next few years and that Whitehead did, eventually, actually, the authorities slowly started to come around. It took much longer than sometimes we like to think in this story, but by 1866, when the next big cholera outbreak came to London, the authorities had been convinced â in part because of this story, in part because of this map â that in fact the water was the problem. And they had already started building the sewers in London, and they immediately went to this outbreak and they told everybody to start boiling their water. And that was the last time that London has seen a cholera outbreak since. So, part of this story, I think â well, it ' s a terrifying story, it ' s a very dark story and it ' s a story that continues on in many of the developing cities of the world. It ' s also a story really that is fundamentally optimistic, which is to say that it ' s possible to solve these problems if we listen to reason, if we listen to the kind of wisdom of these kinds of maps, if we listen to people like Snow and Whitehead, if we listen to the locals who understand what ' s going on in these kinds of situations. And what it ended up doing is making the idea of large-scale metropolitan living a sustainable one. When people were looking at 10 percent of their neighborhoods dying in the space of seven days, there was a widespread consensus that this couldn ' t go on, that people weren ' t meant to live in cities of 2. 5 million people. But because of what Snow did, because of this map, because of the whole series of reforms that happened in the wake of this map, we now take for granted that cities have 10 million people, cities like this one are in fact sustainable things. We don ' t worry that New York City is going to collapse in on itself quite the way that, you know, Rome did, and be 10 percent of its size in 100 years or 200 years. And so that in a way is the ultimate legacy of this map. It ' s a map of deaths that ended up creating a whole new way of life, the life that we ' re enjoying here today. Thank you very much.

When you have 21 minutes to speak, two million years seems like a really long time. But evolutionarily, two million years is nothing. And yet, in two million years, the human brain has nearly tripled in mass, going from the one-and-a-quarter-pound brain of our ancestor here, Habilis, to the almost three-pound meatloaf everybody here has between their ears. What is it about a big brain that nature was so eager for every one of us to have one? Well, it turns out when brains triple in size, they don ' t just get three times bigger ; they gain new structures. And one of the main reasons our brain got so big is because it got a new part, called the"frontal lobe,"particularly, a part called the"pre-frontal cortex."What does a prefrontal cortex do for you that should justify the entire architectural overhaul of the human skull in the blink of evolutionary time? Well, it turns out the prefrontal cortex does lots of things, but one of the most important things it does is it ' s an experience simulator. Pilots practice in flight simulators so that they don ' t make real mistakes in planes. Human beings have this marvelous adaptation that they can actually have experiences in their heads before they try them out in real life. This is a trick that none of our ancestors could do, and that no other animal can do quite like we can. It ' s a marvelous adaptation. It ' s up there with opposable thumbs and standing upright and language as one of the things that got our species out of the trees and into the shopping mall. All of you have done this. Ben and Jerry ' s doesn ' t have"liver and onion"ice cream, and it ' s not because they whipped some up, tried it and went,"Yuck!"It ' s because, without leaving your armchair, you can simulate that flavor and say"yuck"before you make it. Let ' s see how your experience simulators are working. Let ' s just run a quick diagnostic before I proceed with the rest of the talk. Here ' s two different futures that I invite you to contemplate. You can try to simulate them and tell me which one you think you might prefer. One of them is winning the lottery. This is about 314 million dollars. And the other is becoming paraplegic. Just give it a moment of thought. You probably don ’ t feel like you need a moment of thought. Interestingly, there are data on these two groups of people, data on how happy they are. And this is exactly what you expected, isn ’ t it? But these aren ’ t the data. I made these up! These are the data. You failed the pop quiz, and you ’ re hardly five minutes into the lecture. Because the fact is that a year after losing the use of their legs and a year after winning the lotto, lottery winners and paraplegics are equally happy with their lives. Don ’ t feel too bad about failing the first pop quiz, because everybody fails all of the pop quizzes all of the time. The research that my laboratory has been doing, that economists and psychologists around the country have been doing, has revealed something really quite startling to us, something we call the”impact bias,”which is the tendency for the simulator to work badly, for the simulator to make you believe that different outcomes are more different than, in fact, they really are. From field studies to laboratory studies, we see that winning or losing an election, gaining or losing a romantic partner, getting or not getting a promotion, passing or not passing a college test, on and on, have far less impact, less intensity and much less duration than people expect them to have. A recent study — this almost floors me — a recent study showing how major life traumas affect people suggests that if it happened over three months ago, with only a few exceptions, it has no impact whatsoever on your happiness. Why? Because happiness can be synthesized. Sir Thomas Brown wrote in 1642,”I am the happiest man alive. I have that in me that can convert poverty to riches, adversity to prosperity. I am more invulnerable than Achilles ; fortune hath not one place to hit me.”What kind of remarkable machinery does this guy have in his head? Well, it turns out it ’ s precisely the same remarkable machinery that all of us have. Human beings have something that we might think of as a”psychological immune system,”a system of cognitive processes, largely nonconscious cognitive processes, that help them change their views of the world, so that they can feel better about the worlds in which they find themselves. Like Sir Thomas, you have this machine. Unlike Sir Thomas, you seem not to know it. We synthesize happiness, but we think happiness is a thing to be found. Now, you don ’ t need me to give you too many examples of people synthesizing happiness, I suspect, though I ’ m going to show you some experimental evidence. You don ’ t have to look very far for evidence. I took a copy of the”New York Times”and tried to find some instances of people synthesizing happiness. Here are three guys synthesizing happiness.”I ’ m better off physically, financially, mentally...””I don ’ t have one minute ’ s regret. It was a glorious experience.””I believe it turned out for the best.”Who are these characters who are so damn happy? The first one is Jim Wright. Some of you are old enough to remember : he was the chairman of the House of Representatives, and he resigned in disgrace when this young Republican named Newt Gingrich found out about a shady book deal that he had done. He lost everything. The most powerful Democrat in the country lost everything : he lost his money, he lost his power. What does he have to say all these years later about it?”I am so much better off physically, financially, mentally and in almost every other way.”What other way would there be to be better off? Vegetably? Minerally? Animally? He ’ s pretty much covered them there. Moreese Bickham is somebody you ’ ve never heard of. Moreese Bickham uttered these words upon being released. He was 78 years old. He ’ d spent 37 years in Louisiana State Penitentiary for a crime he didn ’ t commit. He was ultimately [released for good behavior halfway through his sentence.] What did he have to say about his experience?”I don ’ t have one minute ’ s regret. It was a glorious experience.”Glorious! This guy ’ s not saying,”There were some nice guys. They had a gym.””Glorious”— a word we usually reserve for something like a religious experience. Harry S. Langerman uttered these words. He ’ s somebody you might have known but didn ’ t, because in 1949, he read a little article in the paper about a hamburger stand owned by these two brothers named McDonald. And he thought,”That ’ s a really neat idea!”So he went to find them. They said,”We can give you a franchise on this for 3, 000 bucks.”Harry went back to New York, asked his brother, an investment banker, to loan him 3, 000 dollars, and his brother ’ s immortal words were,”You idiot, nobody eats hamburgers.”He wouldn ’ t lend him the money. Of course, six months later, Ray Kroc had exactly the same idea. It turns out, people do eat hamburgers, and Ray Kroc, for a while, became the richest man in America. And then, finally, some of you recognize this young photo of Pete Best, who was the original drummer for the Beatles, until they, you know, sent him out on an errand and snuck away and picked up Ringo on a tour. Well, in 1994, when Pete Best was interviewed — yes, he ’ s still a drummer ; yes, he ’ s a studio musician — he had this to say :”I ’ m happier than I would have been with the Beatles.”OK, there ’ s something important to be learned from these people, and it is the secret of happiness. Here it is, finally to be revealed. First : accrue wealth, power and prestige, then lose it. Second : spend as much of your life in prison as you possibly can. Third : make somebody else really, really rich. And finally : never, ever join the Beatles. Yeah, right. Because when people synthesize happiness, as these gentlemen seem to have done, we all smile at them, but we kind of roll our eyes and say,”Yeah, right, you never really wanted the job.””Oh yeah, right — you really didn ’ t have that much in common with her, and you figured that out just about the time she threw the engagement ring in your face.”We smirk, because we believe that synthetic happiness is not of the same quality as what we might call”natural happiness.”What are these terms? Natural happiness is what we get when we get what we wanted, and synthetic happiness is what we make when we don ’ t get what we wanted. And in our society, we have a strong belief that synthetic happiness is of an inferior kind. Why do we have that belief? Well, it ’ s very simple. What kind of economic engine would keep churning if we believed that not getting what we want could make us just as happy as getting it? With all apologies to my friend Matthieu Ricard, a shopping mall full of Zen monks is not going to be particularly profitable, because they don ’ t want stuff enough. I want to suggest to you that synthetic happiness is every bit as real and enduring as the kind of happiness you stumble upon when you get exactly what you were aiming for. Now, I ’ m a scientist, so I ’ m going to do this not with rhetoric, but by marinating you in a little bit of data. Let me first show you an experimental paradigm that ’ s used to demonstrate the synthesis of happiness among regular old folks. This isn ’ t mine, it ’ s a 50- year-old paradigm called the”free choice paradigm.”It ’ s very simple. You bring in, say, six objects, and you ask a **subject** to rank them from the most to the least liked. In this case, because this experiment uses them, these are Monet prints. Everybody ranks these Monet prints from the one they like the most to the one they like the least. Now we give you a choice :”We happen to have some extra prints in the closet. We ’ re going to give you one as your prize to take home. We happen to have number three and number four,”we tell the **subject**. This is a bit of a difficult choice, because neither one is preferred strongly to the other, but naturally, people tend to pick number three, because they liked it a little better than number four. Sometime later — it could be 15 minutes, it could be 15 days — the same stimuli are put before the **subject**, and the **subject** is asked to re-rank the stimuli.”Tell us how much you like them now.”What happens? Watch as happiness is synthesized.

This is the result that ' s been replicated over and over again. You ' re watching happiness be synthesized. Would you like to see it again? Happiness!"The one I got is really better than I thought! That other one I didn ' t get sucks!"That ' s the synthesis of happiness. Now, what ' s the right response to that?"Yeah, right!"Now, here ' s the experiment we did, and I hope this is going to convince you that"Yeah, right!"was not the right response. We did this experiment with a group of patients who had anterograde amnesia. These are hospitalized patients. Most of them have Korsakoff syndrome, a polyneuritic psychosis. They drank way too much, and they can ' t make new memories. They remember their childhood, but if you walk in and introduce yourself and then leave the room, when you come back, they don ' t know who you are. We took our Monet prints to the hospital. And we asked these patients to rank them from the one they liked the most to the one they liked the least. We then gave them the choice between number three and number four. Like everybody else, they said,"Gee, thanks Doc! That ' s great! I could use a new print. I ' ll take number three."We explained we would have number three mailed to them. We gathered up our materials, and we went out of the room and counted to a half hour. Back into the room, we say,"Hi, we ' re back."The patients, bless them, say,"Ah, Doc, I ' m sorry, I ' ve got a memory problem ; that ' s why I ' m here. If I ' ve met you before, I don ' t remember.""Really, Jim, you don ' t remember? I was just here with the Monet prints?""Sorry, Doc, I just don ' t have a clue.""No problem, Jim. All I want you to do is rank these for me, from the one you like the most to the one you like the least."What do they do? Well, let ' s first check and make sure they ' re really amnesiac. We ask these amnesiac patients to tell us which one they own, which one they chose last time, which one is theirs. And what we find is, amnesiac patients just guess. These are normal controls, where if I did this with you, all of you would know which print you chose. But if I do this with amnesiac patients, they don ' t have a clue. They can ' t pick their print out of a lineup. Here ' s what normal controls do : they synthesize happiness. Right? This is the change in liking score, the change from the first time they ranked to the second time they ranked. Normal controls show — that was the magic I showed you ; now I ' m showing it to you in graphical form —"The one I own is better than I thought. The one I didn ' t own, the one I left behind, is not as good as I thought."Amnesiacs do exactly the same thing. Think about this result. These people like better the one they own, but they don ' t know they own it."Yeah, right"is not the right response! What these people did when they synthesized happiness is they really, truly changed their affective, hedonic, aesthetic reactions to that poster. They ' re not just saying it because they own it, because they don ' t know they own it. When psychologists show you bars, you know that they are showing you averages of lots of people. And yet, all of us have this psychological immune system, this capacity to synthesize happiness, but some of us do this trick better than others. And some situations allow anybody to do it more effectively than other situations do. It turns out that freedom, the ability to make up your mind and change your mind, is the friend of natural happiness, because it allows you to choose among all those delicious futures and find the one that you would most enjoy. But freedom to choose, to change and make up your mind, is the enemy of synthetic happiness, and I ' m going to show you why. Dilbert already knows, of course."Dogbert ' s tech support. How may I abuse you?""My printer prints a blank page after every document.""Why complain about getting free paper?""Free? Aren ' t you just giving me my own paper?""Look at the quality of the free paper compared to your lousy regular paper! Only a fool or a liar would say that they look the same!""Now that you mention it, it does seem a little silkier!""What are you doing?""I ' m helping people accept the things they cannot change."Indeed. The psychological immune system works best when we are totally stuck, when we are trapped. This is the difference between dating and marriage. You go out on a date with a guy, and he picks his nose ; you don ’ t go out on another date. You ’ re married to a guy and he picks his nose? He has a heart of gold. Don ’ t touch the fruitcake! You find a way to be happy with what ’ s happened. Now, what I want to show you is that people don ’ t know this about themselves, and not knowing this can work to our supreme disadvantage. Here ’ s an experiment we did at Harvard. We created a black-and-white photography course, and we allowed students to come in and learn how to use a darkroom. So we gave them cameras, they went around campus, they took 12 pictures of their favorite professors and their dorm room and their dog, and all the other things they wanted to have Harvard memories of. They bring us the camera, we make up a contact sheet, they figure out which are the two best pictures. We now spend six hours teaching them about darkrooms, and they **blow** two of them up. They have two gorgeous 8 x 10 glossies of meaningful things to them, and we say,”Which one would you like to give up?””I have to give one up?””Yes, we need one as evidence of the class project. So you have to give me one. You have to make a choice. You get to keep one, and I get to keep one.”Now, there are two conditions in this experiment. In one case, the students are told,”But you know, if you want to change your mind, I ’ ll always have the other one here, and in the next four days, before I actually mail it to headquarters”— yeah,”headquarters”—”I ’ ll be glad to swap it out with you. In fact, I ’ ll come to your dorm room, just give me an email. Better yet, I ’ ll check with you. You ever want to change your mind, it ’ s totally returnable.”The other half of the students are told exactly the opposite :”Make your choice, and by the way, the mail is going out, gosh, in two minutes, to England. Your picture will be winging its way over the Atlantic. You will never see it again.”Half of the students in each of these conditions are asked to make predictions about how much they ’ re going to come to like the picture that they keep and the picture they leave behind. Other students are just sent back to their little dorm rooms and they are measured over the next three to six days on their satisfaction with the pictures. Look at what we find. First of all, here ’ s what students think is going to happen. They think they ’ re going to maybe come to like the picture they chose a little more than the one they left behind. But these are not statistically significant differences. It ’ s a very small increase, and it doesn ’ t much matter whether they were in the reversible or irreversible condition. Wrong-o. Bad simulators. Because here ’ s what ’ s really happening. Both right before the swap and five days later, people who are stuck with that picture, who have no choice, who can never change their mind, like it a lot. And people who are deliberating —”Should I return it? Have I gotten the right one? Maybe this isn ’ t the good one. Maybe I left the good one?”— have killed themselves. They don ’ t like their picture. In fact, even after the opportunity to swap has expired, they still don ’ t like their picture. Why? Because the [reversible] condition is not conducive to the synthesis of happiness. So here ’ s the final piece of this experiment. We bring in a whole new group of naive Harvard students and we say,”You know, we ’ re doing a photography course, and we can do it one of two ways. We could do it so that when you take the two pictures, you ’ d have four days to change your mind, or we ’ re doing another course where you take the two pictures and you make up your mind right away and you can never change it. Which course would you like to be in?”Duh! Sixty-six percent of the students, two-thirds, prefer to be in the course where they have the opportunity to change their mind. Hello? Sixty-six percent of the students choose to be in the course in which they will ultimately be deeply dissatisfied with the picture — because they do not know the conditions under which synthetic happiness grows. The Bard said everything best, of course, and he ’ s making my point here but he ’ s making it hyperbolically :”’ Tis nothing good or bad But thinking makes it so.”It ’ s nice poetry, but that can ’ t exactly be right. Is there really nothing good or bad? Is it really the case that gall bladder surgery and a trip to Paris are just the same thing? That seems like a one-question IQ test. They can ’ t be exactly the same. In more turgid prose, but closer to the truth, was the father of modern capitalism, Adam Smith, and he said this. This is worth contemplating :”The great source of both the misery and disorders of human life seems to arise from overrating the difference between one permanent situation and another. Some of these situations may, no doubt, deserve to be preferred to others, but none of them can deserve to be pursued with that passionate ardor which drives us to violate the rules either of prudence or of justice, or to corrupt the future tranquility of our minds, either by shame from the remembrance of our own folly, or by remorse for the horror of our own injustice.”In other words : yes, some things are better than others. We should have preferences that lead us into one future over another. But when those preferences drive us too hard and too fast because we have overrated the difference between these futures, we are at risk. When our ambition is bounded, it leads us to work joyfully. When our ambition is unbounded, it leads us to lie, to cheat, to steal, to hurt others, to sacrifice things of real value. When our fears are bounded, we ’ re prudent, we ’ re cautious, we ’ re thoughtful. When our fears are unbounded and overblown, we ’ re reckless, and we ’ re cowardly. The lesson I want to leave you with, from these data, is that our longings and our worries are both to some degree overblown, because we have within us the capacity to manufacture the very commodity we are constantly chasing when we choose experience. Thank you.

This machine, which we all have residing in our skulls, reminds me of an aphorism, of a comment of Woody Allen to ask about what is the very best thing to have within your skull. And it ’ s this machine. And it ’ s constructed for change. It ’ s all about change. It confers on us the ability to do things tomorrow that we can ’ t do today, things today that we couldn ’ t do yesterday. And of course it ’ s born stupid. The last time you were in the presence of a baby — this happens to be my granddaughter, Mitra. Isn ’ t she fabulous? But nonetheless when she popped out despite the fact that her brain had actually been progressing in its development for several months before on the basis of her experiences in the womb — nonetheless she had very limited abilities, as does every infant at the time of normal, natural full-term birth. If we were to assay her perceptual abilities, they would be crude. There is no real indication that there is any real thinking going on. In fact there is little evidence that there is any cognitive ability in a very young infant. Infants don ’ t respond to much. There is not really much of an indication in fact that there is a person on board. And they can only in a very primitive way, and in a very limited way control their movements. It would be several months before this infant could do something as simple as reach out and grasp under voluntary control an object and retrieve it, usually to the mouth. And it will be some months beforeward, and we see a long steady progression of the evolution from the first wiggles, to rolling over, and sitting up, and crawling, standing, walking, before we get to that magical point in which we can motate in the world. And yet, when we look forward in the brain we see really remarkable advance. By this age the brain can actually store. It has stored, recorded, can fastly retrieve the meanings of thousands, tens of thousands of objects, actions, and their relationships in the world. And those relationships can in fact be constructed in hundreds of thousands, potentially millions of ways. By this age the brain controls very refined perceptual abilities. And it actually has a growing repertoire of cognitive skills. This brain is very much a thinking machine. And by this age there is absolutely no question that this brain, it has a person on board. And in fact at this age it is substantially controlling its own self-development. And by this age we see a remarkable evolution in its capacity to control movement. Now movement has advanced to the point where it can actually control movement simultaneously, in a complex sequence, in complex ways as would be required for example for playing a complicated game, like soccer. Now this boy can bounce a soccer ball on his head. And where this boy comes from, Sao Paulo, Brazil, about 40 percent of boys of his age have this ability. You could go out into the community in Monterey, and you ' d have difficulty finding a boy that has this ability. And if you did he ' d probably be from Sao Paulo. That ' s all another way of saying that our individual skills and abilities are very much shaped by our environments. That environment extends into our contemporary culture, the thing our brain is challenged with. Because what we ' ve done in our personal evolutions is build up a large repertoire of specific skills and abilities that are specific to our own individual histories. And in fact they result in a wonderful differentiation in humankind, in the way that, in fact, no two of us are quite alike. Every one of us has a different set of acquired skills and abilities that all derive out of the plasticity, the adaptability of this really remarkable adaptive machine. In an adult brain of course we ' ve built up a large repertoire of mastered skills and abilities that we can perform more or less automatically from memory, and that define us as acting, moving, thinking creatures. Now we study this, as the nerdy, laboratory, university-based scientists that we are, by engaging the brains of animals like rats, or monkeys, or of this particularly curious creature — one of the more bizarre forms of life on earth — to engage them in learning new skills and abilities. And we try to track the changes that occur as the new skill or ability is acquired. In fact we do this in individuals of any age, in these different species — that is to say from infancies, infancy up to adulthood and old age. So we might engage a rat, for example, to acquire a new skill or ability that might involve the rat using its paw to master particular manual grasp behaviors just like we might examine a child and their ability to acquire the sub-skills, or the general overall skill of accomplishing something like mastering the ability to read. Or you might look in an older individual who has mastered a complex set of abilities that might relate to reading musical notation or performing the mechanical acts of performance that apply to musical performance. From these studies we defined two great epochs of the plastic history of the brain. The first great epoch is commonly called the"Critical Period."And that is the period in which the brain is setting up in its initial form its basic processing machinery. This is actually a period of dramatic change in which it doesn ' t take learning, per se, to drive the initial differentiation of the machinery of the brain. All it takes for example in the sound domain, is exposure to sound. And the brain actually is at the mercy of the sound environment in which it is reared. So for example I can rear an animal in an environment in which there is meaningless dumb sound, a repertoire of sound that I make up, that I make, just by exposure, artificially important to the animal and its young brain. And what I see is that the animal ' s brain sets up its initial processing of that sound in a form that ' s idealized, within the limits of its processing achievements to represent it in an organized and orderly way. The sound doesn ' t have to be valuable to the animal : I could raise the animal in something that could be hypothetically valuable, like the sounds that simulate the sounds of a native language of a child. And I see the brain actually develop a processor that is specialized — specialized for that complex array, a repertoire of sounds. It actually exaggerates their separateness of representation, in multi-dimensional neuronal representational terms. Or I can expose the animal to a completely meaningless and destructive sound. I can raise an animal under conditions that would be equivalent to raising a baby under a moderately loud ceiling fan, in the presence of continuous noise. And when I do that I actually specialize the brain to be a master processor for that meaningless sound. And I frustrate its ability to represent any meaningful sound as a consequence. Such things in the early history of babies occur in real babies. And they account for, for example the beautiful evolution of a language-specific processor in every normally developing baby. And so they also account for development of defective processing in a substantial population of children who are more limited, as a consequence, in their language abilities at an older age. Now in this early period of plasticity the brain actually changes outside of a learning context. I don ’ t have to be paying attention to what I hear. The input doesn ’ t really have to be meaningful. I don ’ t have to be in a behavioral context. This is required so the brain sets up it ’ s processing so that it can act differentially, so that it can act selectively, so that the creature that wears it, that carries it, can begin to operate on it in a selective way. In the next great epoch of life, which applies for most of life, the brain is actually refining its machinery as it masters a wide repertoire of skills and abilities. And in this epoch, which extends from late in the first year of life to death ; it ’ s actually doing this under behavioral control. And that ’ s another way of saying the brain has strategies that define the significance of the input to the brain. And it ’ s focusing on skill after skill, or ability after ability, under specific attentional control. It ’ s a function of whether a goal in a behavior is achieved or whether the individual is rewarded in the behavior. This is actually very powerful. This lifelong capacity for plasticity, for brain change, is powerfully expressed. It is the basis of our real differentiation, one individual from another. You can look down in the brain of an animal that ’ s engaged in a specific skill, and you can witness or document this change on a variety of levels. So here is a very simple experiment. It was actually conducted about five years ago in collaboration with scientists from the University of Provence in Marseilles. It ’ s a very simple experiment where a monkey has been trained in a task that involves it manipulating a tool that ’ s equivalent in its difficulty to a child learning to manipulate or handle a spoon. The monkey actually mastered the task in about 700 practice tries. So in the beginning the monkey could not perform this task at all. It had a success rate of about one in eight tries. Those tries were elaborate. Each attempt was substantially different from the other. But the monkey gradually developed a strategy. And 700 or so tries later the monkey is performing it flawlessly — never fails. He ’ s successful in his retrieval of food with this tool every time. At this point the task is being performed in a beautifully stereotyped way : very beautifully regulated and highly repeated, trial to trial. We can look down in the brain of the monkey. And we see that it ’ s distorted. We can track these changes, and have tracked these changes in many such behaviors across time. And here we see the distortion reflected in the map of the skin surfaces of the hand of the monkey. Now this is a map, down in the surface of the brain, in which, in a very elaborate experiment we ’ ve reconstructed the responses, location by location, in a highly detailed response mapping of the responses of its neurons. We see here a reconstruction of how the hand is represented in the brain. We ’ ve actually distorted the map by the exercise. And that is indicated in the pink. We have a couple fingertip surfaces that are larger. These are the surfaces the monkey is using to manipulate the tool. If we look at the selectivity of responses in the cortex of the monkey, we see that the monkey has actually changed the filter characteristics which represents input from the skin of the fingertips that are engaged. In other words there is still a single, simple representation of the fingertips in this most organized of cortical areas of the surface of the skin of the body. Monkey has like you have. And yet now it ' s represented in substantially finer grain. The monkey is getting more detailed information from these surfaces. And that is an unknown — unsuspected, maybe, by you — part of acquiring the skill or ability. Now actually we ' ve looked in several different cortical areas in the monkey learning this task. And each one of them changes in ways that are specific to the skill or ability. So for example we can look to the cortical area that represents input that ' s controlling the posture of the monkey. We look in cortical areas that control specific movements, and the sequences of movements that are required in the behavior, and so forth. They are all remodeled. They all become specialized for the task at hand. There are 15 or 20 cortical areas that are changed specifically when you learn a simple skill like this. And that represents in your brain, really massive change. It represents the change in a reliable way of the responses of tens of millions, possibly hundreds of millions of neurons in your brain. It represents changes of hundreds of millions, possibly billions of synaptic connections in your brain. This is constructed by physical change. And the level of construction that occurs is massive. Think about the changes that occur in the brain of a child through the course of acquiring their movement behavior abilities in general. Or acquiring their native language abilities. The changes are massive. What it ' s all about is the selective representations of things that are important to the brain. Because in most of the life of the brain this is under control of behavioral context. It ' s what you pay attention to. It ' s what ' s rewarding to you. It ' s what the brain regards, itself, as positive and important to you. It ' s all about cortical processing and forebrain specialization. And that underlies your specialization. That is why you, in your many skills and abilities, are a unique specialist : a specialist that ' s vastly different in your physical brain in detail than the brain of an individual 100 years ago ; enormously different in the details from the brain of the average individual 1, 000 years ago. Now, one of the characteristics of this change process is that information is always related to other inputs or information that is occurring in immediate time, in context. And that ' s because the brain is constructing representations of things that are correlated in little moments of time and that relate to one another in little moments of successive time. The brain is recording all information and driving all change in temporal context. Now overwhelmingly the most powerful context that ' s occurred in your brain is you. Billions of events have occurred in your history that are related in time to yourself as the receiver, or yourself as the actor, yourself as the thinker, yourself as the mover. Billions of times little pieces of sensation have come in from the surface of your body that are always associated with you as the receiver, and that result in the embodiment of you. You are constructed, your self is constructed from these billions of events. It ' s constructed. It ' s created in your brain. And it ' s created in the brain via physical change. This is a marvelously constructed thing that results in individual form because each one of us has vastly different histories, and vastly different experiences, that drive in to us this marvelous differentiation of self, of personhood. Now we ' ve used this research to try to understand not just how a normal person develops, and elaborates their skills and abilities, but also try to understand the origins of impairment, and the origins of differences or variations that might limit the capacities of a child, or an adult. I ' m going to talk about using these strategies to actually design brain plasticity-based approach to drive corrections in the machinery of a child that increases the competence of the child as a language receiver and user and, thereafter, as a reader. And I ’ m going to talk about experiments that involve actually using this brain science, first of all to understand how it contributes to the loss of function as we age. And then, by using it in a targeted approach we ’ re going to try to differentiate the machinery to recover function in old age. So the first example I ’ m going to talk about relates to children with learning impairments. We now have a large body of literature that demonstrates that the fundamental problem that occurs in the majority of children that have early language impairments, and that are going to struggle to learn to read, is that their language processor is created in a defective form. And the reason that it rises in a defective form is because early in the baby ’ s brain ’ s life the machine process is noisy. It ’ s that simple. It ’ s a signal-to-noise problem. Okay? And there are a lot of things that contribute to that. There are numerous inherited faults that could make the machine process noisier. Now I might say the noise problem could also occur on the basis of information provided in the world from the ears. If any — those of you who are older in the audience know that when I was a child we understood that a child born with a cleft palate was born with what we called mental retardation. We knew that they were going to be slow cognitively ; we knew they were going to struggle to learn to develop normal language abilities ; and we knew that they were going to struggle to learn to read. Most of them would be intellectual and academic failures. That ’ s disappeared. That no longer applies. That inherited weakness, that inherited condition has evaporated. We don ’ t hear about that anymore. Where did it go? Well, it was understood by a Dutch surgeon, about 35 years ago, that if you simply fix the problem early enough, when the brain is still in this initial plastic period so it can set up this machinery adequately, in this initial set up time in the critical period, none of that happens. What are you doing by operating on the cleft palate to correct it? You ’ re basically opening up the tubes that drain fluid from the middle ears, which have had them reliably full. Every sound the child hears uncorrected is muffled. It ’ s degraded. The child ’ s native language is such a case is not English. It ’ s not Japanese. It ’ s muffled English. It ’ s degraded Japanese. It ’ s crap. And the brain specializes for it. It creates a representation of language crap. And then the child is stuck with it. Now the crap doesn ’ t just happen in the ear. It can also happen in the brain. The brain itself can be noisy. It ’ s commonly noisy. There are many inherited faults that can make it noisier. And the native language for a child with such a brain is degraded. It ’ s not English. It ’ s noisy English. And that results in defective representations of sounds of words — not normal — a different strategy, by a machine that has different time constants and different space constants. And you can look in the brain of such a child and record those time constants. They are about an order of magnitude longer, about 11 times longer in duration on average, than in a normal child. Space constants are about three times greater. Such a child will have memory and cognitive deficits in this domain. Of course they will. Because as a receiver of language, they are receiving it and representing it, and in information it ’ s representing crap. And they are going to have poor reading skills. Because reading is dependent upon the translation of word sounds into this orthographic or visual representational form. If you don ’ t have a brain representation of word sounds that translation makes no sense. And you are going to have corresponding abnormal neurology. Then these children increasingly in evaluation after evaluation, in their operations in language, and their operations in reading — we document that abnormal neurology. The point is is that you can train the brain out of this. A way to think about this is you can actually re-refine the processing capacity of the machinery by changing it. Changing it in detail. It takes about 30 hours on the average. And we ’ ve accomplished that in about 430, 000 kids today. Actually, probably about 15, 000 children are being trained as we speak. And actually when you look at the impacts, the impacts are substantial. So here we ’ re looking at the normal distribution. What we ’ re most interested in is these kids on the left side of the distribution. This is from about 3, 000 children. You can see that most of the children on the left side of the distribution are moving into the middle or the right. This is in a broad assessment of their language abilities. This is like an IQ test for language. The impact in the distribution, if you trained every child in the United States, would be to shift the whole distribution to the right and narrow the distribution. This is a substantially large impact. Think of a classroom of children in the language arts. Think of the children on the slow side of the class. We have the potential to move most of those children to the middle or to the right side. In addition to accurate language training it also fixes memory and cognition speech fluency and speech production. And an important language dependent skill is enabled by this training — that is to say reading. And to a large extent it fixes the brain. You can look down in the brain of a child in a variety of tasks that scientists have at Stanford, and MIT, and UCSF, and UCLA, and a number of other institutions. And children operating in various language behaviors, or in various reading behaviors, you see for the most extent, for most children, their neuronal responses, complexly abnormal before you start, are normalized by the training. Now you can also take the same approach to address problems in aging. Where again the machinery is deteriorating now from competent machinery, it ’ s going south. Noise is increasing in the brain. And learning modulation and control is deteriorating. And you can actually look down on the brain of such an individual and witness a change in the time constants and space constants with which, for example, the brain is representing language again. Just as the brain came out of chaos at the beginning, it ’ s going back into chaos in the end. This results in declines in memory in cognition, and in postural ability and agility. It turns out you can train the brain of such an individual — this is a small population of such individuals — train equally intensively for about 30 hours. These are 80- to 90-year-olds. And what you see are substantial improvements of their immediate memory, of their ability to remember things after a delay, of their ability to control their attention, their language abilities and visual-spatial abilities. The overall neuropsychological index of these trained individuals in this population is about two standard deviations. That means that if you sit at the left side of the distribution, and I ’ m looking at your neuropyschological abilities, the average person has moved to the middle or the right side of the distribution. It means that most people who are at risk for senility, more or less immediately, are now in a protected position. My issues are to try to get to rescuing older citizens more completely and in larger numbers, because I think this can be done in this arena on a vast scale — and the same for kids. My main interest is how to elaborate this science to address other maladies. I ’ m specifically interested in things like autism, and cerebral palsy, these great childhood catastrophes. And in older age conditions like Parkinsonism, and in other acquired impairments like schizophrenia. Your issues as it relates to this science, is how to maintain your own high- functioning learning machine. And of course, a well-ordered life in which learning is a continuous part of it, is key. But also in your future is brain aerobics. Get ready for it. It ’ s going to be a part of every life not too far in the future, just like physical exercise is a part of every well organized life in the contemporary period. The other way that we will ultimately come to consider this literature and the science that is important to you is in a consideration of how to nurture yourself. Now that you know, now that science is telling us that you are in charge, that it ’ s under your control, that your happiness, your well-being, your abilities, your capacities, are capable of continuous modification, continuous improvement, and you ’ re the responsible agent and party. Of course a lot of people will ignore this advice. It will be a long time before they really understand it. Now that ’ s another issue and not my fault. Okay. Thank you.

Text Sample 811: NEG Dim 5 – 2004 – Score 1.00 – 2004/t000196.txt

I grew up in Europe, and World War II caught me when I was between seven and 10 years old. And I realized how few of the grown-ups that I knew were able to withstand the tragedies that the war visited on them â how few of them could even resemble a normal, contented, satisfied, happy life once their job, their home, their security was destroyed by the war. So I became interested in understanding what contributed to a life that was worth living. And I tried, as a child, as a teenager, to read philosophy and to get involved in art and religion and many other ways that I could see as a possible answer to that question. And finally I ended up encountering psychology by chance. I was at a ski resort in Switzerland without any money to actually enjoy myself, because the snow had melted and I didn ’ t have money to go to a movie. But I found that on the â I read in the newspapers that there was to be a presentation by someone in a place that I ’ d seen in the center of Zurich, and it was about flying saucers [that] he was going to talk. And I thought, well, since I can ’ t go to the movies, at least I will go for free to listen to flying saucers. And the man who talked at that evening lecture was very interesting. Instead of talking about little green men, he talked about how the psyche of the Europeans had been traumatized by the war, and now they ’ re projecting flying saucers into the sky. He talked about how the mandalas of ancient Hindu religion were kind of projected into the sky as an attempt to regain some sense of order after the chaos of war. And this seemed very interesting to me. And I started reading his books after that lecture. And that was Carl Jung, whose name or work I had no idea about. Then I came to this country to study psychology and I started trying to understand the roots of happiness. This is a typical result that many people have presented, and there are many variations on it. But this, for instance, shows that about 30 percent of the people surveyed in the United States since 1956 say that their life is very happy. And that hasn ’ t changed at all. Whereas the personal income, on a scale that has been held constant to accommodate for inflation, has more than doubled, almost tripled, in that period. But you find essentially the same results, namely, that after a certain basic point â which corresponds more or less to just a few 1, 000 dollars above the minimum poverty level â increases in material well-being don ’ t seem to affect how happy people are. In fact, you can find that the lack of basic resources, material resources, contributes to unhappiness, but the increase in material resources does not increase happiness. So my research has been focused more on â after finding out these things that actually corresponded to my own experience, I tried to understand : where â in everyday life, in our normal experience â do we feel really happy? And to start those studies about 40 years ago, I began to look at creative people â first artists and scientists, and so forth â trying to understand what made them feel that it was worth essentially spending their life doing things for which many of them didn ’ t expect either fame or fortune, but which made their life meaningful and worth doing. This was one of the leading composers of American music back in the ’ 70s. And the interview was 40 pages long. But this little excerpt is a very good summary of what he was saying during the interview. And it describes how he feels when composing is going well. And he says by describing it as an ecstatic state. Now,"ecstasy"in Greek meant simply to stand to the side of something. And then it became essentially an analogy for a mental state where you feel that you are not doing your ordinary everyday routines. So ecstasy is essentially a stepping into an alternative reality. And it ' s interesting, if you think about it, how, when we think about the civilizations that we look up to as having been pinnacles of human achievement â whether it ' s China, Greece, the Hindu civilization, or the Mayas, or Egyptians â what we know about them is really about their ecstasies, not about their everyday life. We know the temples they built, where people could come to experience a different reality. We know about the circuses, the arenas, the theaters. These are the remains of civilizations and they are the places that people went to experience life in a more concentrated, more ordered form. Now, this man doesn ' t need to go to a place like this, which is also â this place, this arena, which is built like a Greek amphitheatre, is a place for ecstasy also. We are participating in a reality that is different from that of the everyday life that we ' re used to. But this man doesn ' t need to go there. He needs just a piece of paper where he can put down little marks, and as he does that, he can imagine sounds that had not existed before in that particular combination. So once he gets to that point of beginning to create, like Jennifer did in her improvisation, a new reality â that is, a moment of ecstasy â he enters that different reality. Now he says also that this is so intense an experience that it feels almost as if he didn ' t exist. And that sounds like a kind of a romantic exaggeration. But actually, our nervous system is incapable of processing more than about 110 bits of information per second. And in order to hear me and understand what I ' m saying, you need to process about 60 bits per second. That ' s why you can ' t hear more than two people. You can ' t understand more than two people talking to you. Well, when you are really involved in this completely engaging process of creating something new, as this man is, he doesn ' t have enough attention left over to monitor how his body feels, or his problems at home. He can ' t feel even that he ' s hungry or tired. His body disappears, his identity disappears from his consciousness, because he doesn ' t have enough attention, like none of us do, to really do well something that requires a lot of concentration, and at the same time to feel that he exists. So existence is temporarily suspended. And he says that his hand seems to be moving by itself. Now, I could look at my hand for two weeks, and I wouldn ' t feel any awe or wonder, because I can ' t compose. So what it ' s telling you here is that obviously this automatic, spontaneous process that he ' s describing can only happen to someone who is very well trained and who has developed technique. And it has become a kind of a truism in the study of creativity that you can ' t be creating anything with less than 10 years of technical-knowledge immersion in a particular field. Whether it ' s mathematics or music, it takes that long to be able to begin to change something in a way that it ' s better than what was there before. Now, when that happens, he says the music just flows out. And because all of these people I started interviewing â this was an interview which is over 30 years old â so many of the people described this as a spontaneous flow that I called this type of experience the"flow experience."And it happens in different realms. For instance, a poet describes it in this form. This is by a student of mine who interviewed some of the leading writers and poets in the United States. And it describes the same effortless, spontaneous feeling that you get when you enter into this ecstatic state. This poet describes it as opening a door that floats in the sky â a very similar description to what Albert Einstein gave as to how he imagined the forces of relativity, when he was struggling with trying to understand how it worked. But it happens in other activities. For instance, this is another student of mine, Susan Jackson from Australia, who did work with some of the leading athletes in the world. And you see here in this description of an Olympic skater, the same essential description of the phenomenology of the inner state of the person. You don ’ t think ; it goes automatically, if you merge yourself with the music, and so forth. It happens also, actually, in the most recent book I wrote, called”Good Business,”where I interviewed some of the CEOs who had been nominated by their peers as being both very successful and very ethical, very socially responsible. You see that these people define success as something that helps others and at the same time makes you feel happy as you are working at it. And like all of these successful and responsible CEOs say, you can ’ t have just one of these things be successful if you want a meaningful and successful job. Anita Roddick is another one of these CEOs we interviewed. She is the founder of Body Shop, the natural cosmetics king. It ’ s kind of a passion that comes from doing the best and having flow while you ’ re working. This is an interesting little quote from Masaru Ibuka, who was at that time starting out Sony without any money, without a product â they didn ’ t have a product, they didn ’ t have anything, but they had an idea. And the idea he had was to establish a place of work where engineers can feel the joy of technological innovation, be aware of their mission to society and work to their heart ’ s content. I couldn ’ t improve on this as a good example of how flow enters the workplace. Now, when we do studies â we have, with other colleagues around the world, done over 8, 000 interviews of people â from Dominican monks, to blind nuns, to Himalayan climbers, to Navajo shepherds â who enjoy their work. And regardless of the culture, regardless of education or whatever, there are these seven conditions that seem to be there when a person is in flow. There ’ s this focus that, once it becomes intense, leads to a sense of ecstasy, a sense of clarity : you know exactly what you want to do from one moment to the other ; you get immediate feedback. You know that what you need to do is possible to do, even though difficult, and sense of time disappears, you forget yourself, you feel part of something larger. And once the conditions are present, what you are doing becomes worth doing for its own sake. In our studies, we represent the everyday life of people in this simple scheme. And we can measure this very precisely, actually, because we give people electronic pagers that go off 10 times a day, and whenever they go off you say what you ’ re doing, how you feel, where you are, what you ’ re thinking about. And two things that we measure is the amount of challenge people experience at that moment and the amount of skill that they feel they have at that moment. So for each person we can establish an average, which is the center of the diagram. That would be your mean level of challenge and skill, which will be different from that of anybody else. But you have a kind of a set point there, which would be in the middle. If we know what that set point is, we can predict fairly accurately when you will be in flow, and it will be when your challenges are higher than average and skills are higher than average. And you may be doing things very differently from other people, but for everyone that flow channel, that area there, will be when you are doing what you really like to do â play the piano, be with your best friend, perhaps work, if work is what provides flow for you. And then the other areas become less and less positive. Arousal is still good because you are over-challenged there. Your skills are not quite as high as they should be, but you can move into flow fairly easily by just developing a little more skill. So, arousal is the area where most people learn from, because that ’ s where they ’ re pushed beyond their comfort zone and to enter that â going back to flow â then they develop higher skills. Control is also a good place to be, because there you feel comfortable, but not very excited. It ’ s not very challenging any more. And if you want to enter flow from control, you have to increase the challenges. So those two are ideal and complementary areas from which flow is easy to go into. The other combinations of challenge and skill become progressively less optimal. Relaxation is fine â you still feel OK. Boredom begins to be very aversive and apathy becomes very negative : you don ’ t feel that you ’ re doing anything, you don ’ t use your skills, there ’ s no challenge. Unfortunately, a lot of people ’ s experience is in apathy. The largest single contributor to that experience is watching television ; the next one is being in the bathroom, sitting. Even though sometimes watching television about seven to eight percent of the time is in flow, but that ’ s when you choose a program you really want to watch and you get feedback from it. So the question we are trying to address â and I ’ m way over time â is how to put more and more of everyday life in that flow channel. And that is the kind of challenge that we ’ re trying to understand. And some of you obviously know how to do that spontaneously without any advice, but unfortunately a lot of people don ’ t. And that ’ s what our mandate is, in a way, to do. Thank you.

Text Sample 812: NEG Dim 5 – 2008 – Score -1.00 – 2008/t000203.txt

I spent the better part of a decade looking at American responses to mass atrocity and genocide. And I ’ d like to start by sharing with you one moment that to me sums up what there is to know about American and democratic responses to mass atrocity. And that moment came on April 21, 1994. So 14 years ago, almost, in the middle of the Rwandan genocide, in which 800, 000 people would be systematically exterminated by the Rwandan government and some extremist militia. On April 21, in the New York Times, the paper reported that somewhere between 200, 000 and 300, 000 people had already been killed in the genocide. It was in the paper — not on the front page. It was a lot like the Holocaust coverage, it was buried in the paper. Rwanda itself was not seen as newsworthy, and amazingly, genocide itself was not seen as newsworthy. But on April 21, a wonderfully honest moment occurred. And that was that an American congresswoman named Patricia Schroeder from Colorado met with a group of journalists. And one of the journalists said to her, what ’ s up? What ’ s going on in the U. S. government? Two to 300, 000 people have just been exterminated in the last couple of weeks in Rwanda. It ’ s two weeks into the genocide at that time, but of course, at that time you don ’ t know how long it ’ s going to last. And the journalist said, why is there so little response out of Washington? Why no hearings, no denunciations, no people getting arrested in front of the Rwandan embassy or in front of the White House? What ’ s the deal? And she said — she was so honest — she said,”It ’ s a great question. All I can tell you is that in my congressional office in Colorado and my office in Washington, we ’ re getting hundreds and hundreds of calls about the endangered ape and gorilla population in Rwanda, but nobody is calling about the people. The phones just aren ’ t ringing about the people.”And the reason I give you this moment is there ’ s a deep truth in it. And that truth is, or was, in the 20th century, that while we were beginning to develop endangered species movements, we didn ’ t have an endangered people ’ s movement. We had Holocaust education in the schools. Most of us were groomed not only on images of nuclear catastrophe, but also on images and knowledge of the Holocaust. There ’ s a museum, of course, on the Mall in Washington, right next to Lincoln and Jefferson. I mean, we have owned Never Again culturally, appropriately, interestingly. And yet the politicization of Never Again, the operationalization of Never Again, had never occurred in the 20th century. And that ’ s what that moment with Patricia Schroeder I think shows : that if we are to bring about an end to the world ’ s worst atrocities, we have to make it such. There has to be a role — there has to be the creation of political noise and political costs in response to massive crimes against humanity, and so forth. So that was the 20th century. Now here — and this will be a relief to you at this point in the afternoon — there is good news, amazing news, in the 21st century, and that is that, almost out of nowhere, there has come into being an anti-genocide movement, an anti-genocide constituency, and one that looks destined, in fact, to be permanent. It grew up in response to the atrocities in Darfur. It is comprised of students. There are something like 300 anti-genocide chapters on college campuses around the country. It ’ s bigger than the anti-apartheid movement. There are something like 500 high school chapters devoted to stopping the genocide in Darfur. Evangelicals have joined it. Jewish groups have joined it.”Hotel Rwanda”watchers have joined it. It is a cacophonous movement. To call it a movement, as with all movements, perhaps, is a little misleading. It ’ s diverse. It ’ s got a lot of different approaches. It ’ s got all the ups and the downs of movements. But it has been amazingly successful in one regard, in that it has become, it has congealed into this endangered people ’ s movement that was missing in the 20th century. It sees itself, such as it is, the it, as something that will create the impression that there will be political cost, there will be a political price to be paid, for allowing genocide, for not having an heroic imagination, for not being an upstander but for being, in fact, a bystander. Now because it ’ s student-driven, there ’ s some amazing things that the movement has done. They have launched a divestment campaign that has now convinced, I think, 55 universities in 22 states to divest their holdings of stocks with regard to companies doing business in Sudan. They have a 1-800-GENOCIDE number — this is going to sound very kitsch, but for those of you who may not be, I mean, may be apolitical, but interested in doing something about genocide, you dial 1-800-GENOCIDE and you type in your zip code, and you don ’ t even have to know who your congressperson is. It will refer you directly to your congressperson, to your U. S. senator, to your governor where divestment legislation is pending. They ’ ve lowered the transaction costs of stopping genocide. I think the most innovative thing they ’ ve introduced recently are genocide grades. And it takes students to introduce genocide grades. So what you now have when a Congress is in session is members of Congress calling up these 19-year-olds or 24-year-olds and saying, I ’ m just told I have a D minus on genocide ; what do I do to get a C? I just want to get a C. Help me. And the students and the others who are part of this incredibly energized base are there to answer that, and there ’ s always something to do. Now, what this movement has done is it has extracted from the Bush administration from the United States, at a time of massive over-stretch — military, financial, diplomatic — a whole series of commitments to Darfur that no other country in the world is making. For instance, the referral of the crimes in Darfur to the International Criminal Court, which the Bush administration doesn ’ t like. The expenditure of 3 billion dollars in refugee camps to try to keep, basically, the people who ’ ve been displaced from their homes by the Sudanese government, by the so-called Janjaweed, the militia, to keep those people alive until something more durable can be achieved. And recently, or now not that recently, about six months ago, the authorization of a peacekeeping force of 26, 000 that will go. And that ’ s all the Bush administration ’ s leadership, and it ’ s all because of this bottom-up pressure and the fact that the phones haven ’ t stopped ringing from the beginning of this crisis. The bad news, however, to this question of will evil prevail, is that evil lives on. The people in those camps are surrounded on all sides by so-called Janjaweed, these men on horseback with spears and

Kalashnikovs. Women who go to get firewood in order to heat the humanitarian aid in order to feed their families — humanitarian aid, the dirty secret of it is it has to be heated, really, to be edible — are themselves **subjected** to rape, which is a tool of the genocide that is being used. And the peacekeepers I ’ ve mentioned, the force has been authorized, but almost no country on Earth has stepped forward since the authorization to actually put its troops or its police in harm ’ s way. So we have achieved an awful lot relative to the 20th century, and yet far too little relative to the gravity of the crime that is unfolding as we sit here, as we speak. Why the limits to the movement? Why is what has been achieved, or what the movement has done, been necessary but not sufficient to the crime? I think there are a couple — there are many reasons — but a couple just to focus on briefly. The first is that the movement, such as it is, stops at America ’ s borders. It is not a global movement. It does not have too many compatriots abroad who themselves are asking their governments to do more to stop genocide. And the Holocaust culture that we have in this country makes Americans, sort of, more prone to, I think, want to bring Never Again to life. The guilt that the Clinton administration expressed, that Bill Clinton expressed over Rwanda, created a space in our society for a consensus that Rwanda was bad and wrong and we wish we had done more, and that is something that the movement has taken advantage of. European governments, for the most part, haven ’ t acknowledged responsibility, and there ’ s nothing to kind of to push back and up against. So this movement, if it ’ s to be durable and global, will have to cross borders, and you will have to see other citizens in democracies, not simply resting on the assumption that their government would do something in the face of genocide, but actually making it such. Governments will never gravitate towards crimes of this magnitude naturally or eagerly. As we saw, they haven ’ t even gravitated towards protecting our ports or reigning in loose nukes. Why would we expect in a bureaucracy that it would orient itself towards distant suffering? So one reason is it hasn ’ t gone global. The second is, of course, that at this time in particular in America ’ s history, we have a credibility problem, a legitimacy problem in international institutions. It is structurally really, really hard to do, as the Bush administration rightly does, which is to denounce genocide on a Monday and then describe water boarding on a Tuesday as a no-brainer and then turn up on Wednesday and look for troop commitments. Now, other countries have their own reasons for not wanting to get involved. Let me be clear. They ’ re in some ways using the Bush administration as an alibi. But it is essential for us to be a leader in this sphere, of course to restore our standing and our leadership in the world. The recovery ’ s going to take some time. We have to ask ourselves, what now? What do we do going forward as a country and as citizens in relationship to the world ’ s worst places, the world ’ s worst suffering, killers, and the kinds of killers that could come home to roost sometime in the future? The place that I turned to answer that question was to a man that many of you may not have ever heard of, and that is a Brazilian named Sergio Vieira de Mello who, as Chris said, was **blown** up in Iraq in 2003. He was the victim of the first-ever suicide bomb in Iraq. It ’ s hard to remember, but there was actually a time in the summer of 2003, even after the U. S. invasion, where, apart from looting, civilians were relatively safe in Iraq. Now, who was Sergio? Sergio Vieira de Mello was his name. In addition to being Brazilian, he was described to me before I met him in 1994 as someone who was a cross between James Bond on the one hand and Bobby Kennedy on the other. And in the U. N., you don ’ t get that many people who actually manage to merge those qualities. He was James Bond-like in that he was ingenious. He was drawn to the flames, he chased the flames, he was like a moth to the flames. Something of an adrenalin junkie. He was successful with women. He was Bobby Kennedy-like because in some ways one could never tell if he was a realist masquerading as an idealist or an idealist masquerading as a realist, as people always wondered about Bobby Kennedy and John Kennedy in that way. What he was was a decathlete of nation-building, of problem-solving, of troubleshooting in the world ’ s worst places and in the world ’ s most broken places. In failing states, genocidal states, under-governed states, precisely the kinds of places that threats to this country exist on the horizon, and precisely the kinds of places where most of the world ’ s suffering tends to get concentrated. These are the places he was drawn to. He moved with the headlines. He was in the U. N. for 34 years. He joined at the age of 21. Started off when the causes in the wars du jour in the ’ 70s were wars of independence and decolonization. He was there in Bangladesh dealing with the outflow of millions of refugees — the largest refugee flow in history up to that point. He was in Sudan when the civil war broke out there. He was in Cyprus right after the Turkish invasion. He was in Mozambique for the War of Independence. He was in Lebanon. Amazingly, he was in Lebanon — the U. N. base was used — Palestinians staged attacks out from behind the U. N. base. Israel then invaded and overran the U. N. base. Sergio was in Beirut when the U. S. Embassy was hit by the first-ever suicide attack against the United States. People date the beginning of this new era to 9 / 11, but surely 1983, with the attack on the US Embassy and the Marine barracks — which Sergio witnessed — those are, in fact, in some ways, the dawning of the era that we find ourselves in today. From Lebanon he went to Bosnia in the ’ 90s. The issues were, of course, ethnic sectarian violence. He was the first person to negotiate with the Khmer Rouge. Talk about evil prevailing. I mean, here he was in the room with the embodiment of evil in Cambodia. He negotiates with the Serbs. He actually crosses so far into this realm of talking to evil and trying to convince evil that it doesn ’ t need to prevail that he earns the nickname — not Sergio but Serbio while he ’ s living in the Balkans and conducting these kinds of negotiations. He then goes to Rwanda and to Congo in the aftermath of the genocide, and he ’ s the guy who has to decide — huh, OK, the genocide is over ; 800, 000 people have been killed ; the people responsible are fleeing into neighboring countries — into Congo, into Tanzania. I ’ m Sergio, I ’ m a humanitarian, and I want to feed those — well, I don ’ t want to feed the killers but I want to feed the two million people who are with them, so we ’ re going to go, we ’ re going to set up camps, and we ’ re going to supply humanitarian aid. But, uh-oh, the killers are within the camps. Well, I ’ d like to separate the sheep from the wolves. Let me go door-to-door to the international community and see if anybody will give me police or troops to do the separation. And their response, of course, was no more than we wanted to stop the genocide and put our troops in harm ’ s way to do that, nor do we now want to get in the way and pluck genocidaires from camps. So then you have to make the decision. Do you turn off the international spigot of life support and risk two million civilian lives? Or do you continue feeding the civilians, knowing that the genocidaires are in the camps, literally sharpening their knives for future battle? What do you do? It ’ s all lesser-evil terrain in these broken places. Late ’ 90s : nation-building is the cause du jour. He ’ s the guy put in charge. He ’ s the Paul Bremer or the Jerry Bremer of first Kosovo and then East Timor. He governs the places. He ’ s the viceroy. He has to decide on tax policy, on currency, on border patrol, on policing. He has to make all these judgments. He ’ s a Brazilian in these places. He speaks seven languages. He ’ s been up to that point in 14 war zones so he ’ s positioned to make better judgments, perhaps, than people who have never done that kind of work. But nonetheless, he is the cutting edge of our experimentation with doing good with very few resources being brought to bear in, again, the world ’ s worst places. And then after Timor, 9 / 11 has happened, he ’ s named U. N. Human Rights Commissioner, and he has to balance liberty and security and figure out, what do you do when the most powerful country in the United Nations is bowing out of the Geneva Conventions, bowing out of international law? Do you denounce? Well, if you denounce, you ’ re probably never going to get back in the room. Maybe you stay reticent. Maybe you try to charm President Bush — and that ’ s what he did. And in so doing he earned himself, unfortunately, his final and tragic appointment to Iraq — the one that resulted in his death. One note on his death, which is so devastating, is that despite predicating the war on Iraq on a link between Saddam Hussein and terrorism in 9 / 11, believe it or not, the Bush administration or the invaders did no planning, no pre-war planning, to respond to terrorism. So Sergio — this receptacle of all of this learning on how to deal with evil and how to deal with brokenness, lay under the rubble for three and a half hours without rescue. Stateless. The guy who tried to help the stateless people his whole career. Like a refugee. Because he represents the U. N. If you represent everyone, in some ways you represent no one. You ’ re un-owned. And what the American — the most powerful military in the history of mankind was able to muster for his rescue, believe it or not, was literally these heroic two American soldiers went into the shaft. Building was shaking. One of them had been at 9 / 11 and lost his buddies on September 11th, and yet went in and risked his life in order to save Sergio. But all they had was a woman ’ s handbag — literally one of those basket handbags — and they tied it to a curtain rope from one of the offices at U. N. headquarters, and created a pulley system into this shaft in this quivering building in the interests of rescuing this person, the person we most need to turn to now, this shepherd, at a time when so many of us feel like we ’ re lacking guidance. And this was the pulley system. This was what we were able to muster for Sergio. The good news, for what it ’ s worth, is after Sergio and 21 others were killed that day in the attack on the U. N., the military created a search and rescue unit that had the cutting equipment, the shoring wood, the cranes, the things that you would have needed to do the rescue. But it was too late for Sergio. I want to wrap up, but I want to close with what I take to be the four lessons from Sergio ’ s life on this question of how do we prevent evil from prevailing, which is how I would have framed the question. Here ’ s this guy who got a 34- year head start thinking about the kinds of questions we as a country are grappling with, we as citizens are grappling with now. What do we take away? First, I think, is his relationship to, in fact, evil is something to learn from. He, over the course of his career, changed a great deal. He had a lot of flaws, but he was very adaptive. I think that was his greatest quality. He started as somebody who would denounce harmdoers, he would charge up to people who were violating international law, and he would say, you ’ re violating, this is the U. N. Charter. Don ’ t you see it ’ s unacceptable what you ’ re doing? And they would laugh at him because he didn ’ t have the power of states, the power of any military or police. He just had the rules, he had the norms, and he tried to use them. And in Lebanon, Southern Lebanon in ’ 82, he said to himself and to everybody else, I will never use the word”unacceptable”again. I will never use it. I will try to make it such, but I will never use that word again. But he lunged in the opposite direction. He started, as I mentioned, to get in the room with evil, to not denounce, and became almost obsequious when he won the nickname Serbio, for instance, and even when he negotiated with the Khmer Rouge would black-box what had occurred prior to entering the room. But by the end of his life, I think he had struck a balance that we as a country can learn from. Be in the room, don ’ t be afraid of talking to your adversaries, but don ’ t bracket what happened before you entered the room.

Don ’ t black-box history. Don ’ t check your principles at the door. And I think that ’ s something that we have to be in the room, whether it ’ s Nixon going to China or Khrushchev and Kennedy or Reagan and Gorbachev. All the great progress in this country with relation to our adversaries has come by going into the room. And it doesn ’ t have to be an act of weakness. You can actually do far more to build an international coalition against a harmdoer or a wrongdoer by being in the room and showing to the rest of the world that that person, that regime, is the problem and that you, the United States, are not the problem. Second take-away from Sergio ’ s life, briefly. What I take away, and this in some ways is the most important, he espoused and exhibited a reverence for dignity that was really, really unusual. At a micro level, the individuals around him were visible. He saw them. At a macro level, he thought, you know, we talk about democracy promotion, but we do it in a way sometimes that ’ s an affront to people ’ s dignity. We put people on humanitarian aid and we boast about it because we ’ ve spent three billion. It ’ s incredibly important, those people would no longer be alive if the United States, for instance, hadn ’ t spent that money in Darfur, but it ’ s not a way to live. If we think about dignity in our conduct as citizens and as individuals with relation to the people around us, and as a country, if we could inject a regard for dignity into our dealings with other countries, it would be something of a revolution. Third point, very briefly. He talked a lot about freedom from fear. And I recognize there is so much to be afraid of. There are so many genuine threats in the world. But what Sergio was talking about is, let ’ s calibrate our relationship to the threat. Let ’ s not hype the threat ; let ’ s actually see it clearly. We have reason to be afraid of melting ice caps. We have reason to be afraid that we haven ’ t secured loose nuclear material in the former Soviet Union. Let ’ s focus on what are the legitimate challenges and threats, but not lunge into bad decisions because of a panic, of a fear. In times of fear, for instance, one of the things Sergio used to say is, fear is a bad advisor. We lunge towards the extremes when we aren ’ t operating and trying to, again, calibrate our relationship to the world around us. Fourth and final point : he somehow, because he was working in all the world ’ s worst places and all lesser evils, had a humility, of course, and an awareness of the complexity of the world around him. I mean, such an acute awareness of how hard it was. How Sisyphean this task was of mending, and yet aware of that complexity, humbled by it, he wasn ’ t paralyzed by it. And we as citizens, as we go through this experience of the kind of, the crisis of confidence, crisis of competence, crisis of legitimacy, I think there ’ s a temptation to pull back from the world and say, ah, Katrina, Iraq — we don ’ t know what we ’ re doing. We can ’ t afford to pull back from the world. It ’ s a question of how to be in the world. And the lesson, I think, of the anti-genocide movement that I mentioned, that is a partial success but by no means has it achieved what it has set out to do — it ’ ll be many decades, probably, before that happens — but is that if we want to see change, we have to become the change. We can ’ t rely upon our institutions to do the work of necessarily talking to adversaries on their own without us creating a space for that to happen, for having respect for dignity, and for bringing that combination of humility and a sort of emboldened sense of responsibility to our dealings with the rest of the world. So will evil prevail? Is that the question? I think the short answer is : no, not unless we let it. Thank you.

Text Sample 813: NEG Dim 5 – 2008 – Score 1.00 – 2008/t000289.txt
I grew up to study the brain because I have a brother who has been diagnosed

with a brain disorder, schizophrenia. And as a sister and later, as a scientist, I wanted to understand, why is it that I can take my dreams, I can connect them to my reality, and I can make my dreams come true? What is it about my brother ' s brain and his schizophrenia that he cannot connect his dreams to a common and shared reality, so they instead become delusion? So I dedicated my career to research into the severe mental illnesses. And I moved from my home state of Indiana to Boston, where I was working in the lab of Dr. Francine Benes, in the Harvard Department of Psychiatry. And in the lab, we were asking the question,"What are the biological differences between the brains of individuals who would be diagnosed as normal control, as compared with the brains of individuals diagnosed with schizophrenia, schizoaffective or bipolar disorder?"So we were essentially mapping the microcircuitry of the brain : which cells are communicating with which cells, with which chemicals, and then in what quantities of those chemicals? So there was a lot of meaning in my life because I was performing this type of research during the day, but then in the evenings and on the weekends, I traveled as an advocate for NAMI, the National Alliance on Mental Illness. But on the morning of December 10, 1996, I woke up to discover that I had a brain disorder of my own. A blood vessel exploded in the left half of my brain. And in the course of four hours, I watched my brain completely deteriorate in its ability to process all information. On the morning of the hemorrhage, I could not walk, talk, read, write or recall any of my life. I essentially became an infant in a woman ' s body. If you ' ve ever seen a human brain, it ' s obvious that the two hemispheres are completely separate from one another. And I have brought for you a real human brain. So this is a real human brain. This is the front of the brain, the back of brain with the spinal cord hanging down, and this is how it would be positioned inside of my head. And when you look at the brain, it ' s obvious that the two cerebral cortices are completely separate from one another. For those of you who understand computers, our right hemisphere functions like a parallel processor, while our left hemisphere functions like a serial processor. The two hemispheres do communicate with one another through the corpus callosum, which is made up of some 300 million axonal fibers. But other than that, the two hemispheres are completely separate. Because they process information differently, each of our hemispheres think about different things, they care about different things, and, dare I say, they have very different personalities. Excuse me. Thank you. It ' s been a joy. Assistant : It has been. Our right human hemisphere is all about this present moment. It ' s all about"right here, right now."Our right hemisphere, it thinks in pictures and it learns kinesthetically through the movement of our bodies. Information, in the form of energy, streams in simultaneously through all of our sensory systems and then it explodes into this enormous collage of what this present moment looks like, what this present moment smells like and tastes like, what it feels like and what it sounds like. I am an energy-being connected to the energy all around me through the consciousness of my right hemisphere. We are energy- beings connected to one another through the consciousness of our right hemispheres as one human family. And right here, right now, we are brothers and sisters on this planet, here to make the world a better place. And in this moment we are perfect, we are whole and we are beautiful. My left hemisphere, our left hemisphere, is a very different place. Our left hemisphere thinks linearly and methodically. Our left hemisphere is all about the past and it ' s all about the future. Our left hemisphere is designed to take that enormous collage of the present moment and start picking out details, and more details about those details. It then categorizes and organizes all that information, associates it with everything in the past we ' ve ever learned, and projects into the future all of our possibilities. And our left hemisphere thinks in language. It ' s that ongoing brain chatter that connects me and my internal world to my external world. It ’ s that little voice that says to me,”Hey, you ’ ve got to remember to pick up bananas on your way home. I need them in the morning.”It ’ s that calculating intelligence that reminds me when I have to do my laundry. But perhaps most important, it ’ s that little voice that says to me,”I am. I am.”And as soon as my left hemisphere says to me”I am,”I become separate. I become a single solid individual, separate from the energy flow around me and separate from you. And this was the portion of my brain that I lost on the morning of my stroke. On the morning of the stroke, I woke up to a pounding pain behind my left eye. And it was the kind of caustic pain that you get when you bite into ice cream. And it just gripped me — and then it released me. And then it just gripped me — and then it released me. And it was very unusual for me to ever experience any kind of pain, so I thought,”OK, I ’ ll just start my normal routine.”So I got up and I jumped onto my cardio glider, which is a full-body, full-exercise machine. And I ’ m jamming away on this thing, and I ’ m realizing that my hands look like primitive claws grasping onto the bar. And I thought,”That ’ s very peculiar.”And I looked down at my body and I thought,”Whoa, I ’ m a weird- looking thing.”And it was as though my consciousness had shifted away from my normal perception of reality, where I ’ m the person on the machine having the experience, to some esoteric space where I ’ m witnessing myself having this experience. And it was all very peculiar, and my headache was just getting worse. So I get off the machine, and I ’ m walking across my living room floor, and I realize that everything inside of my body has slowed way down. And every step is very rigid and very deliberate. There ’ s no fluidity to my pace, and there ’ s this constriction in my area of perception, so I ’ m just focused on internal systems. And I ’ m standing in my bathroom getting ready to step into the shower, and I could actually hear the dialogue inside of my body. I heard a little voice saying,”OK. You muscles, you ’ ve got to contract. You muscles, you relax.”And then I lost my balance, and I ’ m propped up against the wall. And I look down at my arm and I realize that I can no longer define the boundaries of my body. I can ’ t define where I begin and where I end, because the atoms and the molecules of my arm blended with the atoms and molecules of the wall. And all I could detect was this energy — energy. And I ’ m asking myself,”What is wrong with me? What is going on?”And in that moment, my left hemisphere brain chatter went totally silent. Just like someone took a remote control and pushed the mute button. Total silence. And at first I was shocked to find myself inside of a silent mind. But then I was immediately captivated by the magnificence of the energy around me. And because I could no longer identify the boundaries of my body, I felt enormous and expansive. I felt at one with all the energy that was, and it was beautiful there. Then all of a sudden my left hemisphere comes back online and it says to me,”Hey! We ’ ve got a problem! We ’ ve got to get some help.”And I ’ m going,”Ahh! I ’ ve got a problem!”So it ’ s like,”OK, I ’ ve got a problem.”But then I immediately drifted right back out into the consciousness — and I affectionately refer to this space as La La Land. But it was beautiful there. Imagine what it would be like to be totally disconnected from your brain chatter that connects you to the external world. So here I am in this space, and my job, and any stress related to my job — it was gone. And I felt lighter in my body. And imagine all of the relationships in the external world and any stressors related to any of those — they were gone. And I felt this sense of peacefulness. And imagine what it would feel like to lose 37 years of emotional baggage! Oh! I felt euphoria — euphoria. It was beautiful. And again, my left hemisphere comes online and it says,”Hey! You ’ ve got to pay attention. We ’ ve got to get help.”And I ’ m thinking,”I ’ ve got to get help. I ’ ve got to focus.”So I get out of the shower and I mechanically dress and I ’ m walking around my apartment, and I ’ m thinking,”I ’ ve got to get to work. Can I drive?”And in that moment, my right arm went totally paralyzed by my side. Then I realized,”Oh my gosh! I ’ m having a stroke!”And the next thing my brain says to me is, Wow! This is so cool! This is so cool! How many brain scientists have the opportunity to study their own brain from the inside out?”And then it crosses my mind,”But I ’ m a very busy woman!””I don ’ t have time for a stroke!”So I ’ m like,”OK, I can ’ t stop the stroke from happening, so I ’ ll do this for a week or two, and then I ’ ll get back to my routine. OK. So I ’ ve got to call help. I ’ ve got to call work.”I couldn ’ t remember the number at work, so I remembered, in my office I had a business card with my number. So I go into my business room, I pull out a three-inch stack of business cards. And I ’ m looking at the card on top and even though I could see clearly in my mind ’ s eye what my business card looked like, I couldn ’ t tell if this was my card or not, because all I could see were pixels. And the pixels of the words blended with the pixels of the background and the pixels of the symbols, and I just couldn ’ t tell. And then I would wait for what I call a wave of clarity. And in that moment, I would be able to reattach to normal reality and I could tell that ’ s not the card... that ’ s not the card. It took me 45 minutes to get one inch down inside of that stack of cards. In the meantime, for 45 minutes, the hemorrhage is getting bigger in my left hemisphere. I do not understand numbers, I do not understand the telephone, but it ’ s the only plan I have. So I take the phone pad and I put it right here. I take the business card, I put it right here, and I ’ m matching the shape of the squiggles on the card to the shape of the squiggles on the phone pad. But then I would drift back out into La La Land, and not remember when I came back if I ’ d already dialed those numbers. So I had to wield my paralyzed arm like a stump and cover the numbers as I went along and pushed them, so that as I would come back to normal reality, I ’ d be able to tell,”Yes, I ’ ve already dialed that number.”Eventually, the whole number gets dialed and I ’ m listening to the phone, and my colleague picks up the phone and he says to me,”Woo woo woo woo.”And I think to myself,”Oh my gosh, he sounds like a Golden Retriever!”And so I say to him — clear in my mind, I say to him :”This is Jill! I need help!”And what comes out of my voice is,”Woo woo woo woo woo.”I ’ m thinking,”Oh my gosh, I sound like a Golden Retriever.”So I couldn ’ t know — I didn ’ t know that I couldn ’ t speak or understand language until I tried. So he recognizes that I need help and he gets me help. And a little while later, I am riding in an ambulance from one hospital across Boston to [Massachusetts] General Hospital. And I curl up into a little fetal ball. And just like a balloon with the last bit of air, just right out of the balloon, I just felt my energy lift and just I felt my spirit surrender. And in that moment, I knew that I was no longer the choreographer of my life. And either the doctors rescue my body and give me a second chance at life, or this was perhaps my moment of transition. When I woke later that afternoon, I was shocked to discover that I was still alive. When I felt my spirit surrender, I said goodbye to my life. And my mind was now suspended between two very opposite planes of reality. Stimulation coming in through my sensory systems felt like pure pain. Light burned my brain like wildfire, and sounds were so loud and chaotic that I could not pick a voice out from the background noise, and I just wanted to escape. Because I could not identify the position of my body in space, I felt enormous and expansive, like a genie just liberated from her bottle. And my spirit soared free, like a great whale gliding through the sea of silent euphoria. Nirvana. I found Nirvana. And I remember thinking, there ’ s no way I would ever be able to squeeze the enormousness of myself back inside this tiny little body. But then I realized,”But I ’ m still alive! I ’ m still alive, and I have found Nirvana. And if I have found Nirvana and I ’ m still alive, then everyone who is alive can find Nirvana."And I pictured a world filled with beautiful, peaceful, compassionate, loving people who knew that they could come to this space at any time. And that they could purposely choose to step to the right of their left hemispheres — and find this peace. And then I realized what a tremendous gift this experience could be, what a stroke of insight this could be to how we live our lives. And it motivated me to recover. Two and a half weeks after the hemorrhage, the surgeons went in, and they removed a blood clot the size of a golf ball that was pushing on my language centers. Here I am with my mama, who is a true angel in my life. It took me eight years to completely recover. So who are we? We are the life-force power of the universe, with manual dexterity and two cognitive minds. And we have the power to choose, moment by moment, who and how we want to be in the world. Right here, right now, I can step into the consciousness of my right hemisphere, where we are. I am the life-force power of the universe. I am the life-force power of the 50 trillion beautiful molecular geniuses that make up my form, at one with all that is. Or, I can choose to step into the consciousness of my left hemisphere, where I become a single individual, a solid. Separate from the flow, separate from you. I am Dr. Jill Bolte Taylor : intellectual, neuroanatomist. These are the"we"inside of me. Which would you choose? Which do you choose? And when? I believe that the more time we spend choosing to run the deep inner-peace circuitry of our right hemispheres, the more peace we will project into the world, and the more peaceful our planet will be. And I thought that was an idea worth spreading. Thank you.

How many of you have seen the Alfred Hitchcock film"The Birds"? Any of you get really freaked out by that? You might want to leave now. So this is a vending machine for crows. Over the past few days, many of you have been asking,"How did you come to this? How did you get started doing this?"It started, as with many great ideas, or many ideas you can ’ t get rid of, anyway, at a cocktail party. About 10 years ago, I was at a cocktail party with a friend of mine. We were sitting there, and he was complaining about the crows that were all over his yard and making a big mess. And he was telling me we ought to eradicate these things, kill them, because they ’ re making a mess. I said that was stupid, maybe we should just train them to do something useful. And he said that was impossible. And I ’ m sure I ’ m in good company in finding that tremendously annoying, when someone tells you it ’ s impossible. So I spent the next 10 years reading about crows in my spare time. And after 10 years of this, my wife said,"You ’ ve got to do this thing you ’ ve been talking about, and build the vending machine."So I did. But part of the reason I found this interesting is, I started noticing that we ’ re very aware of all the species that are going extinct on the planet as a result of human habitation expansion, and no one seems to be paying attention to all the species that are actually living ; they ’ re surviving. And I ’ m talking specifically about synanthropic species, which have adapted specifically for human ecologies, species like rats and cockroaches and crows. And as I started looking at them, I was finding that they had hyper-adapted. They ’ d become extremely adept at living with us. And in return, we just tried to kill them all the time. And in doing so, we were breeding them for parasitism. We were giving them all sorts of reasons to adapt new ways. So, for example, rats are incredibly responsive breeders. And cockroaches, as anyone who ’ s tried to get rid of them knows, have become really immune to the poisons that we ’ re using. So I thought, let ’ s build something that

’ s mutually beneficial ; something that we can both benefit from, and find some way to make a new relationship with these species. So I built the vending machine. But the story of the vending machine is a little more interesting if you know more about crows. It turns out, crows aren ’ t just surviving with human beings ; they ’ re actually thriving. They ’ re found everywhere on the planet except for the Arctic and the southern tip of South America. And in all that area, they ’ re only rarely found breeding more than five kilometers away from human beings. So we may not think about them, but they ’ re always around. And not surprisingly, given the human population growth, more than half of the human population is living in cities now. And out of those, nine-tenths of the human growth population is occurring in cities. We ’ re seeing a population boom with crows. So bird counts are indicating that we might be seeing up to exponential growth in their numbers. So that ’ s no great surprise. But what was really interesting to me was to find out that the birds were adapting in a pretty unusual way. And I ’ ll give you an example of that. This is Betty. She ’ s a New Caledonian crow. And these crows use sticks in the wild to get insects and whatnot out of pieces of wood. Here, she ’ s trying to get a piece of meat out of a tube. But the researchers had a problem. They messed up and left just a stick of wire in there. And she hadn ’ t had the opportunity to do this before. You see, it wasn ’ t working very well. So she adapted. Now, this is completely unprompted ; she had never seen this done before. No one taught her to bend this into a hook or had shown her how it could happen. But she did it all on her own. So keep in mind — she ’ s never seen this done. Right. Yeah. All right. So that ’ s the part where the researchers freak out. It turns out, we ’ ve been finding more and more that crows are really intelligent. Their brains are in the same proportion as chimpanzee brains are. There ’ s all kinds of anecdotes for the different kinds of intelligence they have. For example, in Sweden, crows will wait for fishermen to drop lines through holes in the ice. And when the fishermen move off, the crows fly down, reel up the lines, and eat the fish or the bait. It ’ s pretty annoying for the fishermen. On an entirely different tack, at University of Washington a few years ago, they were doing an experiment where they captured some crows on campus. Some students went out, netted some crows, brought them in, weighed and measured them, and let them back out again. And they were entertained to discover that for the rest of the week, whenever these particular students walked around campus, these crows would caw at them and run around, and make their life kind of miserable. They were significantly less entertained when this went on for the next week. And the next month. And after summer break. Until they finally graduated and left campus, and — glad to get away, I ’ m sure — came back sometime later, and found the crows still remembered them. So, the moral being : don ’ t piss off crows. So now, students at the University of Washington that are studying these crows, do so with a giant wig and a big mask. It ’ s fairly interesting. So we know these crows are really smart, but the more I dug into this, the more I found that they actually have an even more significant adaptation. Video : Crows have become highly skilled at making a living in these new urban environments. In this Japanese city, they have devised a way of eating a food that normally they can ’ t manage : drop it among the traffic. The problem now is collecting the bits, without getting run over. Wait for the light to stop the traffic. Then, collect your cracked nut in safety. Joshua Klein : Yeah, pretty interesting. What ’ s significant about this isn ’ t that crows are using cars to crack nuts. In fact, that ’ s old hat for crows. This happened about 10 years ago in a place called Sendai City, at a driving school in the suburbs of Tokyo. And since that time, all the crows in the neighborhood are picking up this behavior. Now every crow within five kilometers is standing by a sidewalk, waiting to collect its lunch. So they ’ re learning from each other. And research bears this out. Parents seem to be teaching their young. They learn from their peers, they learn from their enemies. If I have a little extra time, I ’ ll tell you about a case of crow infidelity that illustrates that nicely. The point being, they ’ ve developed cultural adaptation. And as we heard yesterday, that ’ s the Pandora ’ s box that ’ s getting human beings in trouble, and we ’ re starting to see it with them. They ’ re able to very quickly and very flexibly adapt to new challenges and new resources in their environment, which is really useful if you live in a city. So we know that there ’ s lots of crows. We found out they ’ re really smart and they can teach each other. When all this became clear, I realized the only obvious thing to do is build a vending machine. So that ’ s what we did. This is a vending machine for crows. And it uses Skinnerian training to shape their behavior over four stages. It ’ s pretty simple. Basically, what happens is that we put this out in a field or someplace where there ’ s lots of crows. We put coins and peanuts all around the base of the machine. Crows eventually come by, eat the peanuts, and get used to the machine being there. Eventually, they eat all the peanuts. Then they see peanuts here on the feeder tray, and hop up and help themselves. Then they leave, the machine spits up more coins and peanuts, and life is dandy if you ’ re a crow — you can come back anytime and get yourself a peanut. So when they get really used to that, we move on to the crows coming back. Now they ’ re used to the sound of the machine ; they keep coming back and digging out peanuts from the pile of coins that ’ s there. When they get really happy about this, we stymie them. We move to the third stage, where we only give them a coin. Now, like most of us who have gotten used to a good thing, this really pisses them off. So they do what they do in nature when they ’ re looking for something : sweep things out of the way with their beak. They do that here, and that knocks the coins down the slot. When that happens, they get a peanut. This goes on for some time. The crows learn that all they have to do is show up, wait for the coin to come out, put it in the slot, then get their peanut. When they ’ re good and comfortable with that, we move to the final stage, where they show up and nothing happens. This is where we see the difference between crows and other animals. Squirrels, for example, would show up, look for the peanut, go away. Come back, look for the peanut, go away. They do this maybe half a dozen times before they get bored, and then they go off and play in traffic. Crows, on the other hand, show up and they try and figure it out. They know this machine has been messing with them through three different stages of behavior. They figure there must be more to it. So they poke at it and peck at it. And eventually some crow gets a bright idea :”Hey, there ’ s lots of coins lying around from the first stage, hops down, picks it up, drops it in the slot, and we ’ re off to the races. That crow enjoys a temporary monopoly on peanuts, until his friends figure out how to do it, and then there we go. So, what ’ s significant about this to me isn ’ t that we can train crows to pick up peanuts. Mind you, there ’ s 216 million dollars ’ worth of change lost every year, but I ’ m not sure I can depend on that ROI from crows. Instead, I think we should look a little bit larger. I think crows can be trained to do other things. For example, why not train them to pick up garbage after stadium events? Or find expensive components from discarded electronics? Or maybe do search and rescue? The main point of all this for me is, we can find mutually beneficial systems for these species. We can find ways to interact with these other species that doesn ’ t involve exterminating them, but involves finding an equilibrium with them that ’ s a useful balance. Thanks very much.

Back in 1992, I started working for a company called Interval Research, which was just then being founded by David Lidell and Paul Allen as a for-profit research enterprise in Silicon Valley. I met with David to talk about what I might do in his company. I was just coming out of a failed virtual reality business and supporting myself by being on the speaking circuit and writing books — after twenty years or so in the computer game industry having ideas that people didn ' t think they could sell. And David and I discovered that we had a question in common, that we really wanted the answer to, and that was,"Why hasn ' t anybody built any computer games for little girls?"Why is that? It can ' t just be a giant sexist conspiracy. These people aren ' t that smart. There ' s six billion dollars on the table. They would go for it if they could figure out how. So, what is the deal here? And as we thought about our goals — I should say that Interval is really a humanistic institution, in the classical sense that humanism, at its best, finds a way to combine clear-eyed empirical research with a set of core values that fundamentally love and respect people. The basic idea of humanism is the improvable quality of life ; that we can do good things, that there are things worth doing because they ' re good things to do, and that clear-eyed empiricism can help us figure out how to do them. So, contrary to popular belief, there is not a conflict of interest between empiricism and values. And Interval Research is kind of the living example of how that can be true. So David and I decided to go find out, through the best research we could muster, what it would take to get a little girl to put her hands on a computer, to achieve the level of comfort and ease with the technology that little boys have because they play video games. We spent two and a half years conducting research ; we spent another year and a half in advance development. Then we formed a spin-off company. In the research phase of the project at Interval, we partnered with a company called Cheskin Research, and these people — Davis Masten and Christopher Ireland — changed my mind entirely about what market research was and what it could be. They taught me how to look and see, and they did not do the incredibly stupid thing of saying to a child,"Of all these things we already make you, which do you like best?"— which gives you zero answers that are usable. So, what we did for the first two and a half years was four things : We did an extensive review of the literature in related fields, like cognitive psychology, spatial cognition, gender studies, play theory, sociology, primatology. Thank you Frans de Waal, wherever you are, I love you and I ' d give anything to meet you. After we had done that with a pretty large team of people and discovered what we thought the salient issues were with girls and boys and playing — because, after all, that ' s really what this is about — we moved to the second phase of our work, where we interviewed adult experts in academia, some of the people who ' d produced the literature that we found relevant. Also, we did focus groups with people who were on the ground with kids every day, like playground supervisors. We talked to them, confirmed some hypotheses and identified some serious questions about gender difference and play. Then we did what I consider to be the heart of the work : interviewed 1, 100 children, boys and girls, ages seven to 12, all over the United States — except for Silicon Valley, Boston and Austin because we knew that their little families would have millions of computers in them and they wouldn ' t be a representative sample. And at the end of those remarkable conversations with kids and their best friends across the United States, after two years, we pulled together some survey data from another 10, 000 children, drew up a set up of what we thought were the key findings of our research, and spent another year transforming them into design heuristics, for designing computer-based products — and, in fact, any kind of products — for little girls, ages eight to 12. And we spent that time designing interactive prototypes for computer software and testing them with little girls. In 1996, in November, we formed the company Purple Moon which was a spinoff of Interval Research, and our chief investors were Interval Research, Vulcan Northwest, Institutional Venture Partners and Allen and Company. We launched a website on September 2nd that has now served 25 million pages, and has 42, 000 registered young girl users. They visit an average of one and a half times a day, spend an average of 35 minutes a visit, and look at 50 pages a visit. So we feel that we ’ ve formed a successful online community with girls. We launched two titles in October —”Rockett ’ s New School”— the first of a series of products — is about a character called Rockett beginning her first day of school in eighth grade at a brand new place, with a blank slate, which allows girls to play with the question of,”What will I be like when I ’ m older?””What ’ s it going to be like to be in high school or junior high school? Who are my friends?”; to exercise the love of social complexity and the narrative intelligence that drives most of their play behavior ; and which embeds in it values about noticing that we have lots of choices in our lives and the ways that we conduct ourselves. The other title that we launched is called”Secret Paths in the Forest,”which addresses the more fantasy-oriented, inner lives of girls. These two titles both showed up in the top 50 entertainment titles in PC Data — entertainment titles in PC Data in December, right up there with”John Madden Football,”which thrills me to death. So, we ’ re real, and we ’ ve touched several hundreds of thousands of little girls. We ’ ve made half-a-billion impressions with marketing and PR for this brand, Purple Moon. Ninety-six percent of them, roughly, have been positive ; four percent of them have been”other.”I want to talk about the other, because the politics of this enterprise, in a way, have been the most fascinating part of it, for me. There are really two kinds of negative reviews that we ’ ve received. One kind of reviewer is a male gamer who thinks he knows what games ought to be, and won ’ t show the product to little girls. The other kind of reviewer is a certain flavor of feminist who thinks they know what little girls ought to be. And so it ’ s funny to me that these interesting, odd bedfellows have one thing in common : they don ’ t listen to little girls. They haven ’ t looked at children and they ’ re certainly not demonstrating any love for them. I ’ d like to play you some voices of little girls from the two-and-a-half years of research that we did — actually, some of the voices are more recent. And these voices will be accompanied by photographs that they took for us of their lives, of the things that they value and care about. These are pictures the girls themselves never saw, but they gave to us This is the stuff those reviewers don ’ t know about and aren ’ t listening to and this is the kind of research I recommend to those who want to do humanistic work. Girl 1 : Yeah, my character is usually a tomboy. Hers is more into boys. Girl 2 : Uh, yeah. Girl 1 : We have — in the very beginning of the whole game, always we do this : we each have a piece of paper ; we write down our name, our age — are we rich, very rich, not rich, poor, medium, wealthy, boyfriends, dogs, pets — what else — sisters, brothers, and all those. Girl 2 : Divorced — parents divorced, maybe. Girl 3 : This is my pretend [unclear] one. Girl 4 : We make a school newspaper on the computer. Girl 5 : For a girl ’ s game also usually they ’ ll have really pretty scenery with clouds and flowers. Girl 6 : Like, if you were a girl and you were really adventurous and a real big tomboy, you would think that girls ’ games were kinda sissy. Girl 7 : I run track, I played soccer, I play basketball, and I love a lot of things to do. And sometimes I feel like I can ’ t really enjoy myself unless it ’ s like a vacation, like when I get Mondays and all those days off. Girl 8 : Well, sometimes there is a lot of stuff going on because I have music lessons and I ’ m on swim team — all this different stuff that I have to do, and sometimes it gets overwhelming. Girl 9 :

My friend Justine kinda took my friend Kelly, and now they ’ re being mean to me. Girl 10 : Well, sometimes it gets annoying when your brothers and sisters, or brother or sister, when they copy you and you get your idea first and they take your idea and they do it themselves. Girl 11 : Because my older sister, she gets everything and, like, when I ask my mom for something, she ’ ll say,”No”—all the time. But she gives my sister everything. Brenda Laurel : I want to show you, real quickly, just a minute of”Rockett ’ s Tricky Decision,”which went gold two days ago. Let ’ s hope it ’ s really stable. This is the second day in Rockett ’ s life. The reason I ’ m showing you this is I ’ m hoping that the scene that I ’ m going to show you will look familiar and sound familiar, now that you ’ ve listened to some girls ’ voices. And you can see how we ’ ve tried to incorporate the issues that matter to them in the game that we ’ ve created. Miko : Hey Rockett! C ’ mere! Rockett : Hi Miko! What ’ s going on? Miko : Did you hear about Nakilia ’ s big Halloween party this weekend? She asked me to make sure you knew about it. Nakilia invited Reuben too, but — Rockett : But what? Isn ’ t he coming? Miko : I don ’ t think so. I mean, I heard his band is playing at another party the same night. Rockett : Really? What other party? Girl : Max ’ s party is going to be so cool, Whitney. He ’ s invited all the best people. BL : I ’ m going to fast-forward to the decision point because I know I don ’ t have a lot of time. After this awful event occurs, Rocket gets to decide how she feels about it. Rockett : Who ’ d want to show up at that party anyway? I could get invited to that party any day if I wanted to. Gee, I doubt I ’ ll make Max ’ s best people list. BL : OK, so we ’ re going to emotionally navigate. If we were playing the game, that ’ s what we ’ d do. If at any time during the game we want to learn more about the characters, we can go into this hidden hallway, and I ’ ll quickly just show you the interface. We can, for example, go find Miko ’ s locker and get some more information about her. Oops, I turned the wrong way. But you get the general idea of the product. I wanted to show you the ways, innocuous as they seem, in which we ’ re incorporating what we ’ ve learned about girls — their desires to experience greater emotional flexibility, and to play around with the social complexity of their lives. I want to make the point that what we ’ re giving girls, I think, through this effort, is a kind of validation, a sense of being seen. And a sense of the choices that are available in their lives. We love them. We see them. We ’ re not trying to tell them who they ought to be. But we ’ re really, really happy about who they are. It turns out they ’ re really great. I want to close by showing you a videotape that ’ s a version of a future game in the Rockett series that our graphic artists and design people put together, that we feel would please that four percent of reviewers.”Rockett 28!”Rockett : It ’ s like I ’ m just waking up, you know? BL : Thanks.

As a clergyman, you can imagine how out of place I feel. I feel like a fish out of water, or maybe an owl out of the air. I was preaching in San Jose some time ago, and my friend Mark Kvamme, who helped introduce me to this conference, brought several CEOs and leaders of some of the companies here in the Silicon Valley to have breakfast with me, or I with them. And I was so stimulated. And had such — it was an eye-opening experience to hear them talk about the world that is yet to come through technology and science. I know that we ’ re near the end of this conference, and some of you may be wondering why they have a speaker from the field of religion. Richard can answer that, because he made that decision. But some years ago I was on an elevator in Philadelphia, coming down. I was to address a conference at a hotel. And on that elevator a man said,"I hear Billy Graham is staying in this hotel."And another man looked in my direction and said,"Yes, there he is. He ' s on this elevator with us."And this man looked me up and down for about 10 seconds, and he said,"My, what an anticlimax!"I hope that you won ' t feel that these few moments with me is not a — is an anticlimax, after all these tremendous talks that you ' ve heard, and addresses, which I intend to listen to every one of them. But I was on an airplane in the east some years ago, and the man sitting across the aisle from me was the mayor of Charlotte, North Carolina. His name was John Belk. Some of you will probably know him. And there was a drunk man on there, and he got up out of his seat two or three times, and he was making everybody upset by what he was trying to do. And he was slapping the stewardess and pinching her as she went by, and everybody was upset with him. And finally, John Belk said,"Do you know who ' s sitting here?"And the man said,"No, who?"He said,"It ' s Billy Graham, the preacher."He said,"You don ' t say!"And he turned to me, and he said,"Put her there!"He said,"Your sermons have certainly helped me."And I suppose that that ' s true with thousands of people. I know that as you have been peering into the future, and as we ' ve heard some of it here tonight, I would like to live in that age and see what is going to be. But I won ' t, because I ' m 80 years old. This is my eightieth year, and I know that my time is brief. I have phlebitis at the moment, in both legs, and that ' s the reason that I had to have a little help in getting up here, because I have Parkinson ' s disease in addition to that, and some other problems that I won ' t talk about. But this is not the first time that we ' ve had a technological revolution. We ' ve had others. And there ' s one that I want to talk about. In one generation, the nation of the people of Israel had a tremendous and dramatic change that made them a great power in the Near East. A man by the name of David came to the throne, and King David became one of the great leaders of his generation. He was a man of tremendous leadership. He had the favor of God with him. He was a brilliant poet, philosopher, writer, soldier — with strategies in battle and conflict that people study even today. But about two centuries before David, the Hittites had discovered the secret of smelting and processing of iron, and, slowly, that skill spread. But they wouldn ' t allow the Israelis to look into it, or to have any. But David changed all of that, and he introduced the Iron Age to Israel. And the Bible says that David laid up great stores of iron, and which archaeologists have found, that in present-day Palestine, there are evidences of that generation. Now, instead of crude tools made of sticks and stones, Israel now had iron plows, and sickles, and hoes and military weapons. And in the course of one generation, Israel was completely changed. The introduction of iron, in some ways, had an impact a little bit like the microchip has had on our generation. And David found that there were many problems that technology could not solve. There were many problems still left. And they ' re still with us, and you haven ' t solved them, and I haven ' t heard anybody here speak to that. How do we solve these three problems that I ' d like to mention? The first one that David saw was human evil. Where does it come from? How do we solve it? Over again and again in the Psalms, which Gladstone said was the greatest book in the world, David describes the evils of the human race. And yet he says,"He restores my soul."Have you ever thought about what a contradiction we are? On one hand, we can probe the deepest secrets of the universe and dramatically push back the frontiers of technology, as this conference vividly demonstrates. We ' ve seen under the sea, three miles down, or galaxies hundreds of billions of years out in the future. But on the other hand, something is wrong. Our battleships, our soldiers, are on a frontier now, almost ready to go to war with Iraq. Now, what causes this? Why do we have these wars in every generation, and in every part of the world? And revolutions? We can ’ t get along with other people, even in our own families. We find ourselves in the paralyzing grip of self-destructive habits we can ’ t break. Racism and injustice and violence sweep our world, bringing a tragic harvest of heartache and death. Even the most sophisticated among us seem powerless to break this cycle. I would like to see Oracle take up that, or some other technological geniuses work on this. How do we change man, so that he doesn ’ t lie and cheat, and our newspapers are not filled with stories of fraud in business or labor or athletics or wherever? The Bible says the problem is within us, within our hearts and our souls. Our problem is that we are separated from our Creator, which we call God, and we need to have our souls restored, something only God can do. Jesus said,”For out of the heart come evil thoughts : murders, sexual immorality, theft, false testimonies, slander.”The British philosopher Bertrand Russell was not a religious man, but he said,”It ’ s in our hearts that the evil lies, and it ’ s from our hearts that it must be plucked out.”Albert Einstein — I was just talking to someone, when I was speaking at Princeton, and I met Mr. Einstein. He didn ’ t have a doctor ’ s degree, because he said nobody was qualified to give him one. But he made this statement. He said,”It ’ s easier to denature plutonium than to denature the evil spirit of man.”And many of you, I ’ m sure, have thought about that and puzzled over it. You ’ ve seen people take beneficial technological advances, such as the Internet we ’ ve heard about tonight, and twist them into something corrupting. You ’ ve seen brilliant people devise computer viruses that bring down whole systems. The Oklahoma City bombing was simple technology, horribly used. The problem is not technology. The problem is the person or persons using it. King David said that he knew the depths of his own soul. He couldn ’ t free himself from personal problems and personal evils that included murder and adultery. Yet King David sought God ’ s forgiveness, and said,”You can restore my soul.”You see, the Bible teaches that we ’ re more than a body and a mind. We are a soul. And there ’ s something inside of us that is beyond our understanding. That ’ s the part of us that yearns for God, or something more than we find in technology. Your soul is that part of you that yearns for meaning in life, and which seeks for something beyond this life. It ’ s the part of you that yearns, really, for God. I find [that] young people all over the world are searching for something. They don ’ t know what it is. I speak at many universities, and I have many questions and answer periods, and whether it ’ s Cambridge, or Harvard, or Oxford — I ’ ve spoken at all of those universities. I ’ m going to Harvard in about three or four — no, it ’ s about two months from now — to give a lecture. And I ’ ll be asked the same questions that I was asked the last few times I ’ ve been there. And it ’ ll be on these questions : where did I come from? Why am I here? Where am I going? What ’ s life all about? Why am I here? Even if you have no religious belief, there are times when you wonder that there ’ s something else. Thomas Edison also said,”When you see everything that happens in the world of science, and in the working of the universe, you cannot deny that there ’ s a captain on the bridge.”I remember once, I sat beside Mrs. Gorbachev at a White House dinner. I went to Ambassador Dobrynin, whom I knew very well. And I ’ d been to Russia several times under the Communists, and they ’ d given me marvelous freedom that I didn ’ t expect. And I knew Mr. Dobrynin very well, and I said,”I ’ m going to sit beside Mrs. Gorbachev tonight. What shall I talk to her about?”And he surprised me with the answer. He said,”Talk to her about religion and philosophy. That ’ s what she ’ s really interested in.”I was a little bit surprised, but that evening that ’ s what we talked about, and it was a stimulating conversation. And afterward, she said,”You know, I ’ m an atheist, but I know that there ’ s something up there higher than we are.”The second problem that King David realized he could not solve was the problem of human suffering. Writing the oldest book in the world was Job, and he said,"Man is born unto trouble as the sparks fly upward."Yes, to be sure, science has done much to push back certain types of human suffering. But I ' m — in a few months, I ' ll be 80 years of age. I admit that I ' m very grateful for all the medical advances that have kept me in relatively good health all these years. My doctors at the Mayo Clinic urged me not to take this trip out here to this — to be here. I haven ' t given a talk in nearly four months. And when you speak as much as I do, three or four times a day, you get rusty. That ' s the reason I ' m using this podium and using these notes. Every time you ever hear me on the television or somewhere, I ' m ad-libbing. I ' m not reading. I never read an address. I never read a speech or a talk or a lecture. I talk ad lib. But tonight, I ' ve got some notes here so that if I begin to forget, which I do sometimes, I ' ve got something I can turn to. But even here among us, most — in the most advanced society in the world, we have poverty. We have families that self-destruct, friends that betray us. Unbearable psychological pressures bear down on us. I ' ve never met a person in the world that didn ' t have a problem or a worry. Why do we suffer? It ' s an age- old question that we haven ' t answered. Yet David again and again said that he would turn to God. He said,"The Lord is my shepherd."The final problem that David knew he could not solve was death. Many commentators have said that death is the forbidden **subject** of our generation. Most people live as if they ' re never going to die. Technology projects the myth of control over our mortality. We see people on our screens. Marilyn Monroe is just as beautiful on the screen as she was in person, and our — many young people think she ' s still alive. They don ' t know that she ' s dead. Or Clark Gable, or whoever it is. The old stars, they come to life. And they ' re — they ' re just as great on that screen as they were in person. But death is inevitable. I spoke some time ago to a joint session of Congress, last year. And we were meeting in that room, the statue room. About 300 of them were there. And I said,"There ' s one thing that we have in common in this room, all of us together, whether Republican or Democrat, or whoever."I said,"We ' re all going to die. And we have that in common with all these great men of the past that are staring down at us."And it ' s often difficult for young people to understand that. It ' s difficult for them to understand that they ' re going to die. As the ancient writer of Ecclesiastes wrote, he said, there ' s every activity under heaven. There ' s a time to be born, and there ' s a time to die. I ' ve stood at the deathbed of several famous people, whom you would know. I ' ve talked to them. I ' ve seen them in those agonizing moments when they were scared to death. And yet, a few years earlier, death never crossed their mind. I talked to a woman this past week whose father was a famous doctor. She said he never thought of God, never talked about God, didn ' t believe in God. He was an atheist. But she said, as he came to die, he sat up on the side of the bed one day, and he asked the nurse if he could see the chaplain. And he said, for the first time in his life he ' d thought about the inevitable, and about God. Was there a God? A few years ago, a university student asked me,"What is the greatest surprise in your life?"And I said,"The greatest surprise in my life is the brevity of life. It passes so fast."But it does not need to have to be that way. Wernher von Braun, in the aftermath of World War II concluded, quote :"science and religion are not antagonists. On the contrary, they ' re sisters."He put it on a personal basis. I knew Dr. von Braun very well. And he said,"Speaking for myself, I can only say that the grandeur of the cosmos serves only to confirm a belief in the certainty of a creator."He also said,"In our search to know God, I ' ve come to believe that the life of Jesus Christ should be the focus of our efforts and inspiration. The reality of this life and His resurrection is the hope of mankind."I ' ve done a lot of speaking in Germany and in France, and in different parts of the world — 105 countries it ' s been my privilege to speak in. And I was invited one day to visit Chancellor Adenauer, who was looked upon as sort of the founder of modern Germany, since the war. And he once — and he said to me, he said,"Young man."He said,"Do you believe in the resurrection of Jesus Christ?"And I said,"Sir, I do."He said,"So do I."He said,"When I leave office, I ' m going to spend my time writing a book on why Jesus Christ rose again, and why it ' s so important to believe that."In one of his plays, Alexander Solzhenitsyn depicts a man dying, who says to those gathered around his bed,"The moment when it ' s terrible to feel regret is when one is dying."How should one live in order not to feel regret when one is dying? Blaise Pascal asked exactly that question in seventeenth-century France. Pascal has been called the architect of modern civilization. He was a brilliant scientist at the frontiers of mathematics, even as a teenager. He is viewed by many as the founder of the probability theory, and a creator of the first model of a computer. And of course, you are all familiar with the computer language named for him. Pascal explored in depth our human dilemmas of evil, suffering and death. He was astounded at the phenomenon we ' ve been considering : that people can achieve extraordinary heights in science, the arts and human enterprise, yet they also are full of anger, hypocrisy and have — and self- hatreds. Pascal saw us as a remarkable mixture of genius and self-delusion. On November 23, 1654, Pascal had a profound religious experience. He wrote in his journal these words :"I submit myself, absolutely, to Jesus Christ, my redeemer."A French historian said, two centuries later,"Seldom has so mighty an intellect submitted with such humility to the authority of Jesus Christ."Pascal came to believe not only the love and the grace of God could bring us back into harmony, but he believed that his own sins and failures could be forgiven, and that when he died he would go to a place called heaven. He experienced it in a way that went beyond scientific observation and reason. It was he who penned the well-known words,"The heart has its reasons, which reason knows not of."Equally well known is Pascal ' s Wager. Essentially, he said this :"if you bet on God, and open yourself to his love, you lose nothing, even if you ' re wrong. But if instead you bet that there is no God, then you can lose it all, in this life and the life to come."For Pascal, scientific knowledge paled beside the knowledge of God. The knowledge of God was far beyond anything that ever crossed his mind. He was ready to face him when he died at the age of 39. King David lived to be 70, a long time in his era. Yet he too had to face death, and he wrote these words :"even though I walk through the valley of the shadow of death, I will fear no evil, for you are with me."This was David ' s answer to three dilemmas of evil, suffering and death. It can be yours, as well, as you seek the living God and allow him to fill your life and give you hope for the future. When I was 17 years of age, I was born and reared on a farm in North Carolina. I milked cows every morning, and I had to milk the same cows every evening when I came home from school. And there were 20 of them that I had — that I was responsible for, and I worked on the farm and tried to keep up with my studies. I didn ' t make good grades in high school. I didn ' t make them in college, until something happened in my heart. One day, I was faced face-to-face with Christ. He said,"I am the way, the truth and the life."Can you imagine that?"I am the truth. I ' m the embodiment of all truth."He was a liar. Or he was insane. Or he was what he claimed to be. Which was he? I had to make that decision. I couldn ' t prove it. I couldn ' t take it to a laboratory and experiment with it. But by faith I said, I believe him, and he came into my heart and changed my life. And now I ' m ready, when I hear that call, to go into the presence of God. Thank you, and God bless all of you. Thank you for the privilege. It was great. Richard Wurman : You did it. Thanks.

Text Sample 817: NEG Dim 5 – 1998 – Score 4.00 – 1998/t000113.txt

Sheryl Shade : Hi, Aimee. Aimee Mullins : Hi. SS : Aimee and I thought we ’ d just talk a little bit, and I wanted her to tell all of you what makes her a distinctive athlete. AM : Well, for those of you who have seen the picture in the little bio â it might have given it away â I ’ m a double amputee, and I was born without fibulas in both legs. I was amputated at age one, and I ’ ve been running like hell ever since, all over the place. SS : Well, why don ’ t you tell them how you got to Georgetown â why don ’ t we start there? Why don ’ t we start there? AM : I ’ m a senior in Georgetown in the Foreign Service program. I won a full academic scholarship out of high school. They pick three students out of the nation every year to get involved in international affairs, and so I won a full ride to Georgetown and I ’ ve been there for four years. Love it. SS : When Aimee got there, she decided that she ’ s, kind of, curious about track and field, so she decided to call someone and start asking about it. So, why don ’ t you tell that story? AM : Yeah. Well, I guess I ’ ve always been involved in sports. I played softball for five years growing up. I skied competitively throughout high school, and I got a little restless in college because I wasn ’ t doing anything for about a year or two sports-wise. And I ’ d never competed on a disabled level, you know â I ’ d always competed against other able-bodied athletes. That ’ s all I ’ d ever known. In fact, I ’ d never even met another amputee until I was 17. And I heard that they do these track meets with all disabled runners, and I figured,”Oh, I don ’ t know about this, but before I judge it, let me go see what it ’ s all about.”So, I booked myself a flight to Boston in ’ 95, 19 years old and definitely the dark horse candidate at this race. I ’ d never done it before. I went out on a gravel track a couple of weeks before this meet to see how far I could run, and about 50 meters was enough for me, panting and heaving. And I had these legs that were made of a wood and plastic compound, attached with Velcro straps â big, thick, five-ply wool socks on â you know, not the most comfortable things, but all I ’ d ever known. And I ’ m up there in Boston against people wearing legs made of all things â carbon graphite and, you know, shock absorbers in them and all sorts of things â and they ’ re all looking at me like, OK, we know who ’ s not going to win this race. And, I mean, I went up there expecting â I don ’ t know what I was expecting â but, you know, when I saw a man who was missing an entire leg go up to the high jump, hop on one leg to the high jump and clear it at six feet, two inches... Dan O ’ Brien jumped 5 ’ 11”in ’ 96 in Atlanta, I mean, if it just gives you a comparison of â these are truly accomplished athletes, without qualifying that word”athlete.”And so I decided to give this a shot : heart pounding, I ran my first race and I beat the national record-holder by three hundredths of a second, and became the new national record-holder on my first try out. And, you know, people said,”Aimee, you know, you ’ ve got speed â you ’ ve got natural speed â but you don ’ t have any skill or finesse going down that track. You were all over the place. We all saw how hard you were working.”And so I decided to call the track coach at Georgetown. And I thank god I didn ’ t know just how huge this man is in the track and field world. He ’ s coached five Olympians, and the man ’ s office is lined from floor to ceiling with All America certificates of all these athletes he ’ s coached. He ’ s just a rather intimidating figure. And I called him up and said,”Listen, I ran one race and I won...””I want to see if I can, you know â I need to just see if I can sit in on some of your practices, see what drills you do and whatever.”That ’ s all I wanted â just two practices.”Can I just sit in and see what you do?”And he said,”Well, we should meet first, before we decide anything.”You know, he ’ s thinking,”What am I getting myself into?”So, I met the man, walked in his office, and saw these posters and magazine covers of people he has coached. And we got to talking, and it turned out to be a great partnership because he ’ d never coached a disabled athlete, so therefore he had no preconceived notions of what I was or wasn ’ t capable of, and I ’ d never been coached before. So this was like,”Here we go â let ’ s start on this trip.”So he started giving me four days a week of his lunch break, his free time, and I would come up to the track and train with him. So that ’ s how I met Frank. That was fall of ’ 95. But then, by the time that winter was rolling around, he said,”You know, you ’ re good enough. You can run on our women ’ s track team here.”And I said,”No, come on.”And he said,”No, no, really. You can. You can run with our women ’ s track team.”In the spring of 1996, with my goal of making the U. S. Paralympic team that May coming up full speed, I joined the women ’ s track team. And no disabled person had ever done that â run at a collegiate level. So I don ’ t know, it started to become an interesting mix. SS : Well, on your way to the Olympics, a couple of memorable events happened at Georgetown. Why don ’ t you just tell them? AM : Yes, well, you know, I ’ d won everything as far as the disabled meets â everything I competed in â and, you know, training in Georgetown and knowing that I was going to have to get used to seeing the backs of all these women ’ s shirts â you know, I ’ m running against the next Flo-Jo â and they ’ re all looking at me like,”Hmm, what ’ s, you know, what ’ s going on here?”And putting on my Georgetown uniform and going out there and knowing that, you know, in order to become better â and I ’ m already the best in the country â you know, you have to train with people who are inherently better than you. And I went out there and made it to the Big East, which was sort of the championship race at the end of the season. It was really, really hot. And it ’ s the first â I had just gotten these new sprinting legs that you see in that bio, and I didn ’ t realize at that time that the amount of sweating I would be doing in the sock â it actually acted like a lubricant and I ’ d be, kind of, pistoning in the socket. And at about 85 meters of my 100 meters sprint, in all my glory, I came out of my leg. Like, I almost came out of it, in front of, like, 5, 000 people. And I, I mean, was just mortified â because I was signed up for the 200, you know, which went off in a half hour. I went to my coach :”Please, don ’ t make me do this.”I can ’ t do this in front of all those people. My legs will come off. And if it came off at 85 there ’ s no way I ’ m going 200 meters. And he just sat there like this. My pleas fell on deaf ears, thank god. Because you know, the man is from Brooklyn ; he ’ s a big man. He says,”Aimee, so what if your leg falls off? You pick it up, you put the damn thing back on, and finish the goddamn race!”And I did. So, he kept me in line. He kept me on the right track. SS : So, then Aimee makes it to the 1996 Paralympics, and she ’ s all excited. Her family ’ s coming down â it ’ s a big deal. It ’ s now two years that you ’ ve been running? AM : No, a year. SS : A year. And why don ’ t you tell them what happened right before you go run your race? AM : Okay, well, Atlanta. The Paralympics, just for a little bit of clarification, are the Olympics for people with physical disabilities â amputees, persons with cerebral palsy, and wheelchair athletes â as opposed to the Special Olympics, which deals with people with mental disabilities. So, here we are, a week after the Olympics and down at Atlanta, and I ’ m just **blown** away by the fact that just a year ago, I got out on a gravel track and couldn ’ t run 50 meters. And so, here I am â never lost. I set new records at the U. S. Nationals â the Olympic trials â that May, and was sure that I was coming home with the gold. I was also the only, what they call”bilateral BK”â below the knee. I was the only woman who would be doing the long jump. I had just done the long jump, and a guy who was missing two legs came up to me and says,"How do you do that? You know, we ' re supposed to have a planar foot, so we can ' t get off on the springboard."I said,"Well, I just did it. No one told me that."So, it ' s funny â I ' m three inches within the world record â and kept on from that point, you know, so I ' m signed up in the long jump â signed up? No, I made it for the long jump and the 100-meter. And I ' m sure of it, you know? I made the front page of my hometown paper that I delivered for six years, you know? It was, like, this is my time for shine. And we ' re at the trainee warm-up track, which is a few blocks away from the Olympic stadium. These legs that I was on, which I ' ll take out right now â I was the first person in the world on these legs. I was the guinea pig., I ' m telling you, this was, like â talk about a tourist attraction. Everyone was taking pictures â"What is this girl running on?"And I ' m always looking around, like, where is my competition? It ' s my first international meet. I tried to get it out of anybody I could, you know,"Who am I running against here?""Oh, Aimee, we ' ll have to get back to you on that one."I wanted to find out times."Don ' t worry, you ' re doing great."This is 20 minutes before my race in the Olympic stadium, and they post the heat sheets. And I go over and look. And my fastest time, which was the world record, was 15. 77. Then I ' m looking : the next lane, lane two, is 12. 8. Lane three is 12. 5. Lane four is 12. 2. I said,"What ' s going on?"And they shove us all into the shuttle bus, and all the women there are missing a hand. So, I ' m just, like â they ' re all looking at me like ' which one of these is not like the other, ' you know? I ' m sitting there, like,"Oh, my god. Oh, my god."You know, I ' d never lost anything, like, whether it would be the scholarship or, you know, I ' d won five golds when I skied. In everything, I came in first. And Georgetown â that was great. I was losing, but it was the best training because this was Atlanta. Here we are, like, crĂ¨me de la crĂ¨me, and there is no doubt about it, that I ' m going to lose big. And, you know, I ' m just thinking,"Oh, my god, my whole family got in a van and drove down here from Pennsylvania."And, you know, I was the only female U. S. sprinter. So they call us out and, you know â"Ladies, you have one minute."And I remember putting my blocks in and just feeling horrified because there was just this murmur coming over the crowd, like, the ones who are close enough to the starting line to see. And I ' m like,"I know! Look! This isn ' t right."And I ' m thinking that ' s my last card to play here ; if I ' m not going to beat these girls, I ' m going to mess their heads a little, you know? I mean, it was definitely the"Rocky IV"sensation of me versus Germany, and everyone else â Estonia and Poland â was in this heat. And the gun went off, and all I remember was finishing last and fighting back tears of frustration and incredible â incredible â this feeling of just being overwhelmed. And I had to think,"Why did I do this?"If I had won everything â but it was like, what was the point? All this training â I had transformed my life. I became a collegiate athlete, you know. I became an Olympic athlete. And it made me really think about how the achievement was getting there. I mean, the fact that I set my sights, just a year and three months before, on becoming an Olympic athlete and saying,"Here ' s my life going in this direction â and I want to take it here for a while, and just seeing how far I could push it."And the fact that I asked for help â how many people jumped on board? How many people gave of their time and their expertise, and their patience, to deal with me? And that was this collective glory â that there was, you know, 50 people behind me that had joined in this incredible experience of going to Atlanta. So, I apply this sort of philosophy now to everything I do : sitting back and realizing the progression, how far you ' ve come at this day to this goal, you know. It ' s important to focus on a goal, I think, but also recognize the progression on the way there and how you ’ ve grown as a person. That ’ s the achievement, I think. That ’ s the real achievement. SS : Why don ’ t you show them your legs? AM : Oh, sure. SS : You know, show us more than one set of legs. AM : Well, these are my pretty legs. No, these are my cosmetic legs, actually, and they ’ re absolutely beautiful. You ’ ve got to come up and see them. There are hair follicles on them, and I can paint my toenails. And, seriously, like, I can wear heels. Like, you guys don ’ t understand what that ’ s like to be able to just go into a shoe store and buy whatever you want. SS : You got to pick your height? AM : I got to pick my height, exactly. Patrick Ewing, who played for Georgetown in the ’ 80s, comes back every summer. And I had incessant fun making fun of him in the training room because he ’ d come in with foot injuries. I ’ m like,”Get it off! Don ’ t worry about it, you know. You can be eight feet tall. Just take them off.”He didn ’ t find it as humorous as I did, anyway. OK, now, these are my sprinting legs, made of carbon graphite, like I said, and I ’ ve got to make sure I ’ ve got the right socket. No, I ’ ve got so many legs in here. These are â do you want to hold that actually? That ’ s another leg I have for, like, tennis and softball. It has a shock absorber in it so it, like,”Shhhh,”makes this neat sound when you jump around on it. All right. And then this is the silicon sheath I roll over, to keep it on. Which, when I sweat, you know, I ’ m pistoning out of it. SS : Are you a different height? AM : In these? SS : In these. AM : I don ’ t know. I don ’ t think so. I may be a little taller. I actually can put both of them on. SS : She can ’ t really stand on these legs. She has to be moving, so... AM : Yeah, I definitely have to be moving, and balance is a little bit of an art in them. But without having the silicon sock, I ’ m just going to try slip in it. And so, I run on these, and have shocked half the world on these. These are supposed to simulate the actual form of a sprinter when they run. If you ever watch a sprinter, the ball of their foot is the only thing that ever hits the track. So when I stand in these legs, my hamstring and my glutes are contracted, as they would be had I had feet and were standing on the ball of my feet. AM : It ’ s a company in San Diego called Flex-Foot. And I was a guinea pig, as I hope to continue to be in every new form of prosthetic limbs that come out. But actually these, like I said, are still the actual prototype. I need to get some new ones because the last meet I was at, they were everywhere. You know, it ’ s like a big â it ’ s come full circle. Moderator : Aimee and the designer of them will be at TEDMED 2, and we ’ ll talk about the design of them. AM : Yes, we ’ ll do that. SS : Yes, there you go. AM : So, these are the sprint legs, and I can put my other... SS : Can you tell about who designed your other legs? AM : Yes. These I got in a place called Bournemouth, England, about two hours south of London, and I ’ m the only person in the United States with these, which is a crime because they are so beautiful. And I don ’ t even mean, like, because of the toes and everything. For me, while I ’ m such a serious athlete on the track, I want to be feminine off the track, and I think it ’ s so important not to be limited in any capacity, whether it ’ s, you know, your mobility or even fashion. I mean, I love the fact that I can go in anywhere and pick out what I want â the shoes I want, the skirts I want â and I ’ m hoping to try to bring these over here and make them accessible to a lot of people. They ’ re also silicon. This is a really basic, basic prosthetic limb under here. It ’ s like a Barbie foot under this. It is. It ’ s just stuck in this position, so I have to wear a two-inch heel. And, I mean, it ’ s really â let me take this off so you can see it. I don ’ t know how good you can see it, but, like, it really is. There ’ re veins on the feet, and then my heel is pink, and my Achilles ’ tendon â that moves a little bit. And it ’ s really an amazing store. I got them a year and two weeks ago. And this is just a silicon piece of skin. I mean, what happened was, two years ago this man in Belgium was saying,”God, if I can go to Madame Tussauds ’ wax museum and see Jerry Hall replicated down to the color of her eyes, looking so real as if she breathed, why can ’ t they build a limb for someone that looks like a leg, or an arm, or a hand?”I mean, they make ears for burn victims. They do amazing stuff with silicon. SS : Two weeks ago, Aimee was up for the Arthur Ashe award at the ESPYs. And she came into town and she rushed around and she said,”I have to buy some new shoes!”We ’ re an hour before the ESPYs, and she thought she ’ d gotten a two-inch heel but she ’ d actually bought a three-inch heel. AM : And this poses a problem for me, because it means I ’ m walking like that all night long. SS : For 45 minutes. Luckily, the hotel was terrific. They got someone to come in and saw off the shoes. AM : I said to the receptionist â I mean, I am just harried, and Sheryl ’ s at my side â I said,”Look, do you have anybody here who could help me? Because I have this problem...”You know, at first they were just going to write me off, like,”If you don ’ t like your shoes, sorry. It ’ s too late.””No, no, no, no. I ’ ve got these special feet that need a two-inch heel. I have a three-inch heel. I need a little bit off.”They didn ’ t even want to go there. They didn ’ t even want to touch that one. They just did it. No, these legs are great. I ’ m actually going back in a couple of weeks to get some improvements. I want to get legs like these made for flat feet so I can wear sneakers, because I can ’ t with these ones. So... Moderator : That ’ s it. SS : That ’ s Aimee Mullins.

I think it ’ ll be a relief to some people and a disappointment to others that I ’ m not going to talk about vaginas today. I began”The Vagina Monologues”because I was worried about vaginas. I ’ m very worried today about this notion, this world, this prevailing kind of force of security. I see this word, hear this word, feel this word everywhere. Real security, security checks, security watch, security clearance. Why has all this focus on security made me feel so much more insecure? What does anyone mean when they talk about real security? And why have we, as Americans particularly, become a nation that strives for security above all else? In fact, I think that security is elusive. It ’ s impossible. We all die. We all get old. We all get sick. People leave us. People change us. Nothing is secure. And that ’ s actually the good news. This is, of course, unless your whole life is about being secure. I think that when that is the focus of your life, these are the things that happen. You can ’ t travel very far or venture too far outside a certain circle. You can ’ t allow too many conflicting ideas into your mind at one time, as they might confuse you or challenge you. You can ’ t open yourself to new experiences, new people, new ways of doing things — they might take you off course. You can ’ t not know who you are, so you cling to hard-matter identity. You become a Christian, Muslim, Jew. You ’ re an Indian, Egyptian, Italian, American. You ’ re a heterosexual or a homosexual, or you never have sex. Or at least, that ’ s what you say when you identify yourself. You become part of an”us.”In order to be secure, you defend against”them.”You cling to your land because it is your secure place. You must fight anyone who encroaches upon it. You become your nation. You become your religion. You become whatever it is that will freeze you, numb you and protect you from doubt or change. But all this does, actually, is shut down your mind. In reality, it does not really make you safer. I was in Sri Lanka, for example, three days after the tsunami, and I was standing on the beaches and it was absolutely clear that, in a matter of five minutes, a 30-foot wave could rise up and desecrate a people, a population and lives. All this striving for security, in fact, has made you much more insecure because now you have to watch out all the time. There are people not like you — people who you now call enemies. You have places you cannot go, thoughts you cannot think, worlds that you can no longer inhabit. And so you spend your days fighting things off, defending your territory and becoming more entrenched in your fundamental thinking. Your days become devoted to protecting yourself. This becomes your mission. That is all you do. Ideas get shorter. They become sound bytes. There are evildoers and saints, criminals and victims. There are those who, if they ' re not with us, are against us. It gets easier to hurt people because you do not feel what ' s inside them. It gets easier to lock them up, force them to be naked, humiliate them, occupy them, invade them and kill them, because they are only obstacles now to your security. In six years, I ' ve had the extraordinary privilege through V-Day, a global movement against [violence against] women, to travel probably to 60 countries, and spend a great deal of time in different portions. I ' ve met women and men all over this planet, who through various circumstances — war, poverty, racism, multiple forms of violence — have never known security, or have had their illusion of security forever devastated. I ' ve spent time with women in Afghanistan under the Taliban, who were essentially brutalized and censored. I ' ve been in Bosnian refugee camps. I was with women in Pakistan who have had their faces melted off with acid. I ' ve been with girls all across America who were date-raped, or raped by their best friends when they were drugged one night. One of the amazing things that I ' ve discovered in my travels is that there is this emerging species. I loved when he was talking about this other world that ' s right next to this world. I ' ve discovered these people, who, in V-Day world, we call Vagina Warriors. These particular people, rather than getting AK-47s, or weapons of mass destruction, or machetes, in the spirit of the warrior, have gone into the center, the heart of pain, of loss. They have grieved it, they have died into it, and allowed and encouraged poison to turn into medicine. They have used the fuel of their pain to begin to redirect that energy towards another mission and another trajectory. These warriors now devote themselves and their lives to making sure what happened to them doesn ' t happen to anyone else. There are thousands if not millions of them on the planet. I venture there are many in this room. They have a fierceness and a freedom that I believe is the bedrock of a new paradigm. They have broken out of the existing frame of victim and perpetrator. Their own personal security is not their end goal, and because of that, because, rather than worrying about security, because the transformation of suffering is their end goal, I actually believe they are creating real safety and a whole new idea of security. I want to talk about a few of these people that I ' ve met. Tomorrow, I am going to Cairo, and I ' m so moved that I will be with women in Cairo who are V-Day women, who are opening the first safe house for battered women in the Middle East. That will happen because women in Cairo made a decision to stand up and put themselves on the line, and talk about the degree of violence that is happening in Egypt, and were willing to be attacked and criticized. And through their work over the last years, this is not only happening that this house is opening, but it ' s being supported by many factions of the society who never would have supported it. Women in Uganda this year, who put on"The Vagina Monologues"during V-Day, actually evoked the wrath of the government. And, I love this story so much. There was a cabinet meeting and a meeting of the presidents to talk about whether"Vaginas"could come to Uganda. And in this meeting — it went on for weeks in the press, two weeks where there was huge discussion. The government finally made a decision that"The Vagina Monologues"could not be performed in Uganda. But the amazing news was that because they had stood up, these women, and because they had been willing to risk their security, it began a discussion that not only happened in Uganda, but all of Africa. As a result, this production, which had already sold out, every single person in that 800-seat audience, except for 10 people, made a decision to keep the money. They raised 10, 000 dollars on a production that never occurred. There ’ s a young woman named Carrie Rethlefsen in Minnesota. She ’ s a high school student. She had seen”The Vagina Monologues”and she was really moved. And as a result, she wore an”I heart my vagina”button to her high school in Minnesota. She was basically threatened to be expelled from school. They told her she couldn ’ t love her vagina in high school, that it was not a legal thing, that it was not a moral thing, that it was not a good thing. So she really struggled with this, what to do, because she was a senior and she was doing well in her school and she was threatened expulsion. So what she did is she got all her friends together — I believe it was 100, 150 students all wore”I love my vagina”T-shirts, and the boys wore”I love her vagina”T-shirts to school. Now this seems like a fairly, you know, frivolous, but what happened as a result of that, is that that school now is forming a sex education class. It ’ s beginning to talk about sex, it ’ s beginning to look at why it would be wrong for a young high school girl to talk about her vagina publicly or to say that she loved her vagina publicly. I know I ’ ve talked about Agnes here before, but I want to give you an update on Agnes. I met Agnes three years ago in the Rift Valley. When she was a young girl, she had been mutilated against her will. That mutilation of her clitoris had actually obviously impacted her life and changed it in a way that was devastating. She made a decision not to go and get a razor or a glass shard, but to devote her life to stopping that happening to other girls. For eight years, she walked through the Rift Valley. She had this amazing box that she carried and it had a torso of a woman ’ s body in it, a half a torso, and she would teach people, everywhere she went, what a healthy vagina looked like and what a mutilated vagina looked like. In the years that she walked, she educated parents, mothers, fathers. She saved 1, 500 girls from being cut. When V-Day met her, we asked her how we could support her and she said,”Well, if you got me a Jeep, I could get around a lot faster.”So, we bought her a Jeep. In the year she had the Jeep, she saved 4, 500 girls from being cut. So, we said, what else could we do? She said,”If you help me get money, I could open a house.”Three years ago, Agnes opened a safe house in Africa to stop mutilation. When she began her mission eight years ago, she was reviled, she was detested, she was completely slandered in her community. I am proud to tell you that six months ago, she was elected the deputy mayor of Narok. I think what I ’ m trying to say here is that if your end goal is security, and if that ’ s all you ’ re focusing on, what ends up happening is that you create not only more insecurity in other people, but you make yourself far more insecure. Real security is contemplating death, not pretending it doesn ’ t exist. Not running from loss, but entering grief, surrendering to sorrow. Real security is not knowing something, when you don ’ t know it. Real security is hungering for connection rather than power. It cannot be bought or arranged or made with bombs. It is deeper, it is a process, it is acute awareness that we are all utterly inter-bended, and one action by one being in one tiny town has consequences everywhere. Real security is not only being able to tolerate mystery, complexity, ambiguity, but hungering for them and only trusting a situation when they are present. Something happened when I began traveling in V-Day, eight years ago. I got lost. I remember being on a plane going from Kenya to South Africa, and I had no idea where I was. I didn ’ t know where I was going, where I ’ d come from, and I panicked. I had a total anxiety attack. And then I suddenly realized that it absolutely didn ’ t matter where I was going, or where I had come from because we are all essentially permanently displaced people. All of us are refugees. We come from somewhere and we are hopefully traveling all the time, moving towards a new place. Freedom means I may not be identified as any one group, but that I can visit and find myself in every group. It does not mean that I don ’ t have values or beliefs, but it does mean I am not hardened around them. I do not use them as weapons. In the shared future, it will be just that, shared. The end goal will [be] becoming vulnerable, realizing the place of our connection to one another, rather than becoming secure, in control and alone. Thank you very much. Chris Anderson : And how are you doing? Are you exhausted? On a typical day, do you wake up with hope or gloom? Eve Ensler : You know, I think Carl Jung once said that in order to survive the twentieth century, we have to live with two existing thoughts, opposite thoughts, at the same time. And I think part of what I ’ m learning in this process is that one must allow oneself to feel grief. And I think as long as I keep grieving, and weeping, and then moving on, I ’ m fine. When I start to pretend that what I ’ m seeing isn ’ t impacting me, and isn ’ t changing my heart, then I get in trouble. Because when you spend a lot of time going from place to place, country to country, and city to city, the degree to which women, for example, are violated, and the epidemic of it, and the kind of ordinariness of it, is so devastating to one ’ s soul that you have to take the time, or I have to take the time now, to process that. CA : There are a lot of causes out there in the world that have been talked about, you know, poverty, sickness and so on. You spent eight years on this one. Why this one? EE : I think that if you think about women, women are the primary resource of the planet. They give birth, we come from them, they are mothers, they are visionaries, they are the future. If you think that the U. N. now says that one out of three women on the planet will be raped or beaten in their lifetime, we ’ re talking about the desecration of the primary resource of the planet, we ’ re talking about the place where we come from, we ’ re talking about parenting. Imagine that you ’ ve been raped and you ’ re bringing up a boy child. How does it impact your ability to work, or envision a future, or thrive, as opposed to just survive? What I believe is if we could figure out how to make women safe and honor women, it would be parallel or equal to honoring life itself.

Good morning, ladies and gentlemen. My name is Art Benjamin, and I am a”mathemagician.”What that means is, I combine my loves of math and magic to do something I call”mathemagics.”But before I get started, I have a quick question for the audience. By any chance, did anyone happen to bring with them this morning a calculator? Seriously, if you have a calculator with you, raise your hand. Raise your hand. Did your hand go up? Now bring it out, bring it out. Anybody else? I see, I see one way in the back. You sir, that ’ s three. And anybody on this side here? OK, over there on the aisle. Would the four of you please bring out your calculators, then join me up on stage. Let ’ s give them a nice round of applause. That ’ s right. Now, since I haven ’ t had the chance to work with these calculators, I need to make sure that they are all working properly. Would somebody get us started by giving us a two-digit number, please? How about a two-digit number? Audience : 22. AB : 22. And another two-digit number, sir? Audience : 47. AB : Multiply 22 times 47, make sure you get 1, 034, or the calculators are not working. Do all of you get 1, 034? 1, 034? Volunteer : No. AB : 594. Let ’ s give three of them a nice round of applause there. Would you like to try a more standard calculator, just in case? OK, great. What I ’ m going to try and do then — I notice it took some of you a little bit of time to get your answer. That ’ s OK. I ’ ll give you a shortcut for multiplying even faster on the calculator. There is something called the square of a number, which most of you know is taking a number and multiplying it by itself. For instance, five squared would be? Audience : 25. AB : 25. The way we can square on most calculators — let me demonstrate with this one — is by taking the number, such as five, hitting”times”and then”equals,”and on most calculators that will give you the square. On some of these ancient RPN calculators, you ’ ve got an”x squared”button on it, will allow you to do the calculation even faster. What I ’ m going to try and do now is to square, in my head, four two-digit numbers faster than they can do on their calculators, even using the shortcut method. What I ’ ll use is the second row this time, and I ’ ll get four of you to each yell out a two-digit number, and if you would square the first number, and if you would square the second, the third and the fourth, I will try and race you to the answer. OK? So quickly, a two-digit number please. Audience : 37. Arthur Benjamin : 37 squared, OK. Audience : 23. AB : 23 squared, OK. Audience : 59. AB : 59 squared, OK, and finally? Audience : 93. AB : 93 squared. Would you call out your answers, please? Volunteer : 1369. AB : 1369. Volunteer : 529. AB : 529. Volunteer : 3481. AB : 3481. Volunteer : 8649. AB : Thank you very much. Let me try to take this one step further. I ’ m going to try to square some three-digit numbers this time. I won ’ t even write these down — I ’ ll just call them out as they ’ re called out to me. Anyone I point to, call out a three-digit number. Anyone on our panel, verify the answer. Just give some indication if it ’ s right. A three-digit number, sir, yes? Audience : 987. AB : 987 squared is 974, 169. AB : Yes? Good. Another three-digit — — another three-digit number, sir? Audience : 457. AB : 457 squared is 205, 849. 205, 849? AB : Yes? OK, another, another three-digit number, sir? Audience : 321. AB : 321 is 103, 041. 103, 041. Yes? One more three-digit number please. Audience : Oh, 722. AB : 722 is 500, that ’ s a harder one. Is that 513, 284? Volunteer : Yes. AB : Yes? Oh, one more, one more three-digit number please. Audience : 162. 162 squared is 26, 244. Volunteer : Yes. Thank you very much. Let me try to take this one step further. I ’ m going to try to square a four-digit number this time. You can all take your time on this ; I will not beat you to the answer on this one, but I will try to get the answer right. To make this a little bit more random, let ’ s take the fourth row this time, let ’ s say, one, two, three, four. If each of you would call out a single digit between zero and nine, that will be the four-digit number that I ’ ll square. Nine. Seven. Five. Eight. 9, 758, this will take me a little bit of time, so bear with me. 95 million — 218, 564? Volunteer : Yes! AB : Thank you very much. Now, I would attempt to square a five-digit number — and I can — but unfortunately, most calculators cannot. Eight-digit capacity — don ’ t you hate that? So, since we ’ ve reached the limits of our calculators — what ’ s that? Does yours go higher? Volunteer : I don ’ t know. AB : Oh, yours does? Volunteer : I can probably do it. AB : I ’ ll talk to you later. In the meanwhile, let me conclude the first part of my show by doing something a little trickier. Let ’ s take the largest number on the board here, 8649. Would you each enter that on your calculator? And instead of squaring it this time, I want you to take that number and multiply it by any three-digit number that you want, but don ’ t tell me what you ’ re multiplying by — just multiply it by any random three-digit number. So you should have as an answer either a six-digit or probably a seven-digit number. How many digits do you have, six or seven? Seven, and yours? Seven? Seven? And, uncertain. Seven. Is there any possible way that I could know what seven-digit numbers you have? Say”No.”Good, then I shall attempt the impossible — or at least the improbable. What I ’ d like each of you to do is to call out for me any six of your seven digits, any six of them, in any order you ’ d like. One digit at a time, I shall try and determine the digit you ' ve left out. Starting with your seven-digit number, call out any six of them please. Volunteer : 1, 9, 7, 0, 4, 2. AB : Did you leave out the number 6? Good, OK, that ' s one. You have a seven-digit number, call out any six of them please. Volunteer : 4, 4, 8, 7, 5. I think I only heard five numbers. I — wait — 44875 — did you leave out the number 6? Same as she did, OK. You ' ve got a seven-digit number — call out any six of them loud and clear. Volunteer : 0, 7, 9, 0, 4, 4. I think you left out the number 3? AB : That ' s three. The odds of me getting all four of these right by random guessing would be one in 10, 000 : 10 to the fourth power. OK, any six of them. Really scramble them up this time, please. Volunteer : 2, 6, 3, 9, 7, 2. Did you leave out the number 7? And let ' s give all four of these people a nice round of applause. Thank you very much. For my next number — while I mentally recharge my batteries, I have one more question for the audience. By any chance, does anybody here happen to know the day of the week that they were born on? If you think you know your birth day, raise your hand. Let ' s see, starting with — let ' s start with a gentleman first. What year was it, first of all? That ' s why I pick a gentleman first. Audience : 1953. 1953, and the month? November what? 23rd — was that a Monday? Audience : Yes. Good. Somebody else? I haven ' t seen any women ' s hands up. OK, how about you, what year? 1949, and the month? October what? Fifth — was that a Wednesday? Yes! I ' ll go way to the back right now, how about you? Yell it out, what year? Audience : 1959. 1959, OK — and the month? Audience : February. February what? Sixth — was that a Friday? Audience : Yes. Good, how about the person behind her? Call out, what year was it? Audience : 1947. AB : 1947, and the month? Audience : May. AB : May what? Seventh — would that be a Wednesday? Audience : Yes. AB : Thank you very much. Anybody here who ' d like to know the day of the week they were born? We can do it that way. Of course, I could just make up an answer and you wouldn ' t know, so I come prepared for that. I brought with me a book of calendars. It goes as far back into the past as 1800, because you never know. I didn ' t mean to look at you, sir — you were just sitting there. Anyway, Chris, you can help me out here, if you wouldn ' t mind. This is a book of calendars. Who wanted to know their birth day? What year was it, first of all? Audience : 1966. 66 — turn to the calendar with 1966. And what month? Audience : April. AB : April what? Audience : 17th. I believe that was a Sunday. Can you confirm, Chris? Chris Anderson : Yes. AB : I ' ll tell you what, Chris : as long as you have that book in front of you, do me a favor, turn to a year outside of the 1900s, either into the 1800s or way into the 2000s — that ' ll be a much greater challenge for me. AB : What year would you like? CA : 1824. AB : 1824, OK. AB : And what month? CA : June. AB : June what? CA : Sixth. AB : Was that a Sunday? CA : It was. AB : And it was cloudy. Good, thank you very much. But I ' d like to wrap things up now by alluding to something from earlier in the presentation. There was a gentleman up here who had a 10-digit calculator. Where is he, would you stand up, 10-digit guy? OK, stand up for me just for a second, so I can see where you are. You have a 10-digit calculator, sir, as well? OK, what I ' m going to try and do, is to square in my head a five-digit number requiring a 10-digit calculator. But to make my job more interesting for you, as well as for me, I ' m going to do this problem thinking out loud. So you can actually, honestly hear what ' s going on in my mind while I do a calculation of this size. Now, I have to apologize to our magician friend Lennart Green. I know as a magician we ' re not supposed to reveal our secrets, but I ' m not too afraid that people are going to start doing my show next week, so — I think we ' re OK. So, let ' s see, let ' s take a different row of people, starting with you. I ' ll get five digits : one, two, three, four. Oh, I did this row already. Let ' s do the row before you, starting with you : one, two, three, four, five. Call out a single digit — that will be the five-digit number that I will try to square, go ahead. Five. Seven. Six. Eight. Three. 57, 683 — squared. Yuck. Let me explain to you how I ’ m going to attempt this problem. I ’ m going to break the problem down into three parts. I ’ ll do 57, 000 squared, plus 683 squared, plus 57, 000 times 683 times two. Add all those numbers together, and with any luck, arrive at the answer. Now, let me recap. Thank you. While I explain something else — — I know, that you can use, right? While I do these calculations, you might hear certain words, as opposed to numbers, creep into the calculation. Let me explain what that is. This is a phonetic code, a mnemonic device that I use, that allows me to convert numbers into words. I store them as words, and later on retrieve them as numbers. I know it sounds complicated ; it ’ s not. I don ’ t want you to think you ’ re seeing something out of”Rain Man.”There ’ s definitely a method to my madness — definitely, definitely. Sorry. If you want to talk to me about ADHD afterwards, you can talk to me then. By the way, one last instruction, for my judges with the calculators — you know who you are — there is at least a 50 percent chance that I will make a mistake here. If I do, don ’ t tell me what the mistake is ; just say,”you ’ re close,”or something like that, and I ’ ll try and figure out the answer — which could be pretty entertaining in itself. If, however, I am right, whatever you do, don ’ t keep it to yourself, OK? Make sure everybody knows that I got the answer right, because this is my big finish, OK. So, without any more stalling, here we go. I ’ ll start the problem in the middle, with 57 times 683. 57 times 68 is 3, 400, plus 476 is 3876, that ’ s 38, 760 plus 171, 38, 760 plus 171 is 38, 931. 38, 931 ; double that to get 77, 862. 77, 862 becomes cookie fission, cookie fission is 77, 822. That seems right, I ’ ll go on. Cookie fission, OK. Next, I do 57 squared, which is 3, 249, so I can say, three billion. Take the 249, add that to cookie, 249, oops, but I see a carry coming — 249 — add that to cookie, 250 plus 77, is 327 million — fission, fission, OK, finally, we do 683 squared, that ’ s 700 times 666, plus 17 squared is 466, 489, rev up if I need it, rev up, take the 466, add that to fission, to get, oh gee — 328, 489. Audience : Yeah! AB : Good. Thank you very much. I hope you enjoyed mathemagics. Thank you.

18 minutes is an absolutely brutal time limit, so I ’ m going to dive straight in, right at the point where I get this thing to work. Here we go. I ’ m going to talk about five different things. I ’ m going to talk about why defeating aging is desirable. I ’ m going to talk about why we have to get our shit together, and actually talk about this a bit more than we do. I ’ m going to talk about feasibility as well, of course. I ’ m going to talk about why we are so fatalistic about doing anything about aging. And then I ’ m going spend perhaps the second half of the talk talking about, you know, how we might actually be able to prove that fatalism is wrong, namely, by actually doing something about it. I ’ m going to do that in two steps. The first one I ’ m going to talk about is how to get from a relatively modest amount of life extension — which I ’ m going to define as 30 years, applied to people who are already in middle-age when you start — to a point which can genuinely be called defeating aging. Namely, essentially an elimination of the relationship between how old you are and how likely you are to die in the next year — or indeed, to get sick in the first place. And of course, the last thing I ’ m going to talk about is how to reach that intermediate step, that point of maybe 30 years life extension. So I ’ m going to start with why we should. Now, I want to ask a question. Hands

up : anyone in the audience who is in favor of malaria? That was easy. OK. OK. Hands up : anyone in the audience who ' s not sure whether malaria is a good thing or a bad thing? OK. So we all think malaria is a bad thing. That ' s very good news, because I thought that was what the answer would be. Now the thing is, I would like to put it to you that the main reason why we think that malaria is a bad thing is because of a characteristic of malaria that it shares with aging. And here is that characteristic. The only real difference is that aging kills considerably more people than malaria does. Now, I like in an audience, in Britain especially, to talk about the comparison with foxhunting, which is something that was banned after a long struggle, by the government not very many months ago. I mean, I know I ' m with a sympathetic audience here, but, as we know, a lot of people are not entirely persuaded by this logic. And this is actually a rather good comparison, it seems to me. You know, a lot of people said,"Well, you know, city boys have no business telling us rural types what to do with our time. It ' s a traditional part of the way of life, and we should be allowed to carry on doing it. It ' s ecologically sound ; it stops the population explosion of foxes."But ultimately, the government prevailed in the end, because the majority of the British public, and certainly the majority of members of Parliament, came to the conclusion that it was really something that should not be tolerated in a civilized society. And I think that human aging shares all of these characteristics in spades. What part of this do people not understand? It ' s not just about life, of course — — it ' s about healthy life, you know — getting frail and miserable and dependent is no fun, whether or not dying may be fun. So really, this is how I would like to describe it. It ' s a global trance. These are the sorts of unbelievable excuses that people give for aging. And, I mean, OK, I ' m not actually saying that these excuses are completely valueless. There are some good points to be made here, things that we ought to be thinking about, forward planning so that nothing goes too — well, so that we minimize the turbulence when we actually figure out how to fix aging. But these are completely crazy, when you actually remember your sense of proportion. You know, these are arguments ; these are things that would be legitimate to be concerned about. But the question is, are they so dangerous — these risks of doing something about aging — that they outweigh the downside of doing the opposite, namely, leaving aging as it is? Are these so bad that they outweigh condemning 100, 000 people a day to an unnecessarily early death? You know, if you haven ' t got an argument that ' s that strong, then just don ' t waste my time, is what I say. Now, there is one argument that some people do think really is that strong, and here it is. People worry about overpopulation ; they say,"Well, if we fix aging, no one ' s going to die to speak of, or at least the death toll is going to be much lower, only from crossing St. Giles carelessly. And therefore, we ' re not going to be able to have many kids, and kids are really important to most people."And that ' s true. And you know, a lot of people try to fudge this question, and give answers like this. I don ' t agree with those answers. I think they basically don ' t work. I think it ' s true, that we will face a dilemma in this respect. We will have to decide whether to have a low birth rate, or a high death rate. A high death rate will, of course, arise from simply rejecting these therapies, in favor of carrying on having a lot of kids. And, I say that that ' s fine — the future of humanity is entitled to make that choice. What ' s not fine is for us to make that choice on behalf of the future. If we vacillate, hesitate, and do not actually develop these therapies, then we are condemning a whole cohort of people — who would have been young enough and healthy enough to benefit from those therapies, but will not be, because we haven ' t developed them as quickly as we could — we ' ll be denying those people an indefinite life span, and I consider that that is immoral. That ' s my answer to the overpopulation question. Right. So the next thing is, now why should we get a little bit more active on this? And the fundamental answer is that the pro-aging trance is not as dumb as it looks. It ' s actually a sensible way of coping with the inevitability of aging. Aging is ghastly, but it ' s inevitable, so, you know, we ' ve got to find some way to put it out of our minds, and it ' s rational to do anything that we might want to do, to do that. Like, for example, making up these ridiculous reasons why aging is actually a good thing after all. But of course, that only works when we have both of these components. And as soon as the inevitability bit becomes a little bit unclear — and we might be in range of doing something about aging — this becomes part of the problem. This pro-aging trance is what stops us from agitating about these things. And that ' s why we have to really talk about this a lot — evangelize, I will go so far as to say, quite a lot — in order to get people ' s attention, and make people realize that they are in a trance in this regard. So that ' s all I ' m going to say about that. I ' m now going to talk about feasibility. And the fundamental reason, I think, why we feel that aging is inevitable is summed up in a definition of aging that I ' m giving here. A very simple definition. Aging is a side effect of being alive in the first place, which is to say, metabolism. This is not a completely tautological statement ; it ' s a reasonable statement. Aging is basically a process that happens to inanimate objects like cars, and it also happens to us, despite the fact that we have a lot of clever self-repair mechanisms, because those self-repair mechanisms are not perfect. So basically, metabolism, which is defined as basically everything that keeps us alive from one day to the next, has side effects. Those side effects accumulate and eventually cause pathology. That ' s a fine definition. So we can put it this way : we can say that, you know, we have this chain of events. And there are really two games in town, according to most people, with regard to postponing aging. They ' re what I ' m calling here the"gerontology approach"and the"geriatrics approach."The geriatrician will intervene late in the day, when pathology is becoming evident, and the geriatrician will try and hold back the sands of time, and stop the accumulation of side effects from causing the pathology quite so soon. Of course, it ' s a very short-term-ist strategy ; it ' s a losing battle, because the things that are causing the pathology are becoming more abundant as time goes on. The gerontology approach looks much more promising on the surface, because, you know, prevention is better than cure. But unfortunately the thing is that we don ' t understand metabolism very well. In fact, we have a pitifully poor understanding of how organisms work — even cells we ' re not really too good on yet. We ' ve discovered things like, for example, RNA interference only a few years ago, and this is a really fundamental component of how cells work. Basically, gerontology is a fine approach in the end, but it is not an approach whose time has come when we ' re talking about intervention. So then, what do we do about that? I mean, that ' s a fine logic, that sounds pretty convincing, pretty ironclad, doesn ' t it? But it isn ' t. Before I tell you why it isn ' t, I ' m going to go a little bit into what I ' m calling step two. Just suppose, as I said, that we do acquire — let ' s say we do it today for the sake of argument — the ability to confer 30 extra years of healthy life on people who are already in middle age, let ' s say 55. I ' m going to call that"robust human rejuvenation."OK. What would that actually mean for how long people of various ages today — or equivalently, of various ages at the time that these therapies arrive — would actually live? In order to answer that question — you might think it ' s simple, but it ' s not simple. We can ' t just say,"Well, if they ' re young enough to benefit from these therapies, then they ' ll live 30 years longer."That ' s the wrong answer. And the reason it ' s the wrong answer is because of progress. There are two sorts of technological progress really, for this purpose. There are fundamental, major breakthroughs, and there are incremental refinements of those breakthroughs. Now, they differ a great deal in terms of the predictability of time frames. Fundamental breakthroughs : very hard to predict how long it ’ s going to take to make a fundamental breakthrough. It was a very long time ago that we decided that flying would be fun, and it took us until 1903 to actually work out how to do it. But after that, things were pretty steady and pretty uniform. I think this is a reasonable sequence of events that happened in the progression of the technology of powered flight. We can think, really, that each one is sort of beyond the imagination of the inventor of the previous one, if you like. The incremental advances have added up to something which is not incremental anymore. This is the sort of thing you see after a fundamental breakthrough. And you see it in all sorts of technologies. Computers : you can look at a more or less parallel time line, happening of course a bit later. You can look at medical care. I mean, hygiene, vaccines, antibiotics — you know, the same sort of time frame. So I think that actually step two, that I called a step a moment ago, isn ’ t a step at all. That in fact, the people who are young enough to benefit from these first therapies that give this moderate amount of life extension, even though those people are already middle-aged when the therapies arrive, will be at some sort of cusp. They will mostly survive long enough to receive improved treatments that will give them a further 30 or maybe 50 years. In other words, they will be staying ahead of the game. The therapies will be improving faster than the remaining imperfections in the therapies are catching up with us. This is a very important point for me to get across. Because, you know, most people, when they hear that I predict that a lot of people alive today are going to live to 1, 000 or more, they think that I ’ m saying that we ’ re going to invent therapies in the next few decades that are so thoroughly eliminating aging that those therapies will let us live to 1, 000 or more. I ’ m not saying that at all. I ’ m saying that the rate of improvement of those therapies will be enough. They ’ ll never be perfect, but we ’ ll be able to fix the things that 200- year-olds die of, before we have any 200-year-olds. And the same for 300 and 400 and so on. I decided to give this a little name, which is”longevity escape velocity.”Well, it seems to get the point across. So, these trajectories here are basically how we would expect people to live, in terms of remaining life expectancy, as measured by their health, for given ages that they were at the time that these therapies arrive. If you ’ re already 100, or even if you ’ re 80 — and an average 80-year-old, we probably can ’ t do a lot for you with these therapies, because you ’ re too close to death ’ s door for the really initial, experimental therapies to be good enough for you. You won ’ t be able to withstand them. But if you ’ re only 50, then there ’ s a chance that you might be able to pull out of the dive and, you know — — eventually get through this and start becoming biologically younger in a meaningful sense, in terms of your youthfulness, both physical and mental, and in terms of your risk of death from age-related causes. And of course, if you ’ re a bit younger than that, then you ’ re never really even going to get near to being fragile enough to die of age-related causes. So this is a genuine conclusion that I come to, that the first 150-year-old — we don ’ t know how old that person is today, because we don ’ t know how long it ’ s going to take to get these first-generation therapies. But irrespective of that age, I ’ m claiming that the first person to live to 1, 000 — **subject** of course, to, you know, global catastrophes — is actually, probably, only about 10 years younger than the first 150-year-old. And that ’ s quite a thought. Alright, so finally I ’ m going to spend the rest of the talk, my last seven-and- a-half minutes, on step one ; namely, how do we actually get to this moderate amount of life extension that will allow us to get to escape velocity? And in order to do that, I need to talk about mice a little bit. I have a corresponding milestone to robust human rejuvenation. I ' m calling it"robust mouse rejuvenation,"not very imaginatively. And this is what it is. I say we ' re going to take a long-lived strain of mouse, which basically means mice that live about three years on average. We do exactly nothing to them until they ' re already two years old. And then we do a whole bunch of stuff to them, and with those therapies, we get them to live, on average, to their fifth birthday. So, in other words, we add two years — we treble their remaining lifespan, starting from the point that we started the therapies. The question then is, what would that actually mean for the time frame until we get to the milestone I talked about earlier for humans? Which we can now, as I ' ve explained, equivalently call either robust human rejuvenation or longevity escape velocity. Secondly, what does it mean for the public ' s perception of how long it ' s going to take for us to get to those things, starting from the time we get the mice? And thirdly, the question is, what will it do to actually how much people want it? And it seems to me that the first question is entirely a biology question, and it ' s extremely hard to answer. One has to be very speculative, and many of my colleagues would say that we should not do this speculation, that we should simply keep our counsel until we know more. I say that ' s nonsense. I say we absolutely are irresponsible if we stay silent on this. We need to give our best guess as to the time frame, in order to give people a sense of proportion so that they can assess their priorities. So, I say that we have a 50 / 50 chance of reaching this RHR milestone, robust human rejuvenation, within 15 years from the point that we get to robust mouse rejuvenation. 15 years from the robust mouse. The public ' s perception will probably be somewhat better than that. The public tends to underestimate how difficult scientific things are. So they ' ll probably think it ' s five years away. They ' ll be wrong, but that actually won ' t matter too much. And finally, of course, I think it ' s fair to say that a large part of the reason why the public is so ambivalent about aging now is the global trance I spoke about earlier, the coping strategy. That will be history at this point, because it will no longer be possible to believe that aging is inevitable in humans, since it ' s been postponed so very effectively in mice. So we ' re likely to end up with a very strong change in people ' s attitudes, and of course that has enormous implications. So in order to tell you now how we ' re going to get these mice, I ' m going to add a little bit to my description of aging. I ' m going to use this word"damage"to denote these intermediate things that are caused by metabolism and that eventually cause pathology. Because the critical thing about this is that even though the damage only eventually causes pathology, the damage itself is caused ongoing-ly throughout life, starting before we ' re born. But it is not part of metabolism itself. And this turns out to be useful. Because we can re-draw our original diagram this way. We can say that, fundamentally, the difference between gerontology and geriatrics is that gerontology tries to inhibit the rate at which metabolism lays down this damage. And I ' m going to explain exactly what damage is in concrete biological terms in a moment. And geriatricians try to hold back the sands of time by stopping the damage converting into pathology. And the reason it ' s a losing battle is because the damage is continuing to accumulate. So there ' s a third approach, if we look at it this way. We can call it the"engineering approach,"and I claim that the engineering approach is within range. The engineering approach does not intervene in any processes. It does not intervene in this process or this one. And that ' s good because it means that it ' s not a losing battle, and it ' s something that we are within range of being able to do, because it doesn ' t involve improving on evolution. The engineering approach simply says,"Let ' s go and periodically repair all of these various types of damage — not necessarily repair them completely, but repair them quite a lot, so that we keep the level of damage down below the threshold that must exist, that causes it to be pathogenic."We know that this threshold exists, because we don ' t get age-related diseases until we ' re in middle age, even though the damage has been accumulating since before we were born. Why do I say that we ' re in range? Well, this is basically it. The point about this slide is actually the bottom. If we try to say which bits of metabolism are important for aging, we will be here all night, because basically all of metabolism is important for aging in one way or another. This list is just for illustration ; it is incomplete. The list on the right is also incomplete. It ' s a list of types of pathology that are age-related, and it ' s just an incomplete list. But I would like to claim to you that this list in the middle is actually complete — this is the list of types of thing that qualify as damage, side effects of metabolism that cause pathology in the end, or that might cause pathology. And there are only seven of them. They ' re categories of things, of course, but there ' s only seven of them. Cell loss, mutations in chromosomes, mutations in the mitochondria and so on. First of all, I ' d like to give you an argument for why that list is complete. Of course one can make a biological argument. One can say,"OK, what are we made of?"We ' re made of cells and stuff between cells. What can damage accumulate in? The answer is : long-lived molecules, because if a short-lived molecule undergoes damage, but then the molecule is destroyed — like by a protein being destroyed by proteolysis — then the damage is gone, too. It ' s got to be long-lived molecules. So, these seven things were all under discussion in gerontology a long time ago and that is pretty good news, because it means that, you know, we ' ve come a long way in biology in these 20 years, so the fact that we haven ' t extended this list is a pretty good indication that there ' s no extension to be done. However, it ' s better than that ; we actually know how to fix them all, in mice, in principle — and what I mean by in principle is, we probably can actually implement these fixes within a decade. Some of them are partially implemented already, the ones at the top. I haven ' t got time to go through them at all, but my conclusion is that, if we can actually get suitable funding for this, then we can probably develop robust mouse rejuvenation in only 10 years, but we do need to get serious about it. We do need to really start trying. So of course, there are some biologists in the audience, and I want to give some answers to some of the questions that you may have. You may have been dissatisfied with this talk, but fundamentally you have to go and read this stuff. I ' ve published a great deal on this ; I cite the experimental work on which my optimism is based, and there ' s quite a lot of detail there. The detail is what makes me confident of my rather aggressive time frames that I ' m predicting here. So if you think that I ' m wrong, you ' d better damn well go and find out why you think I ' m wrong. And of course the main thing is that you shouldn ' t trust people who call themselves gerontologists because, as with any radical departure from previous thinking within a particular field, you know, you expect people in the mainstream to be a bit resistant and not really to take it seriously. So, you know, you ' ve got to actually do your homework, in order to understand whether this is true. And we ' ll just end with a few things. One thing is, you know, you ' ll be hearing from a guy in the next session who said some time ago that he could sequence the human genome in half no time, and everyone said,"Well, it ' s obviously impossible."And you know what happened. So, you know, this does happen. We have various strategies — there ' s the Methuselah Mouse Prize, which is basically an incentive to innovate, and to do what you think is going to work, and you get money for it if you win. There ' s a proposal to actually put together an institute. This is what ' s going to take a bit of money. But, I mean, look — how long does it take to spend that on the war in Iraq? Not very long. OK. It ' s got to be philanthropic, because profits distract biotech, but it ' s basically got a 90 percent chance, I think, of succeeding in this. And I think we know how to do it. And I ’ ll stop there. Thank you. Chris Anderson : OK. I don ’ t know if there ’ s going to be any questions but I thought I would give people the chance. Audience : Since you ’ ve been talking about aging and trying to defeat it, why is it that you make yourself appear like an old man? AG : Because I am an old man. I am actually 158. Audience : Species on this planet have evolved with immune systems to fight off all the diseases so that individuals live long enough to procreate. However, as far as I know, all the species have evolved to actually die, so when cells divide, the telomerase get shorter, and eventually species die. So, why does — evolution has — seems to have selected against immortality, when it is so advantageous, or is evolution just incomplete? AG : Brilliant. Thank you for asking a question that I can answer with an uncontroversial answer. I ’ m going to tell you the genuine mainstream answer to your question, which I happen to agree with, which is that, no, aging is not a product of selection, evolution ; [aging] is simply a product of evolutionary neglect. In other words, we have aging because it ’ s hard work not to have aging ; you need more genetic pathways, more sophistication in your genes in order to age more slowly, and that carries on being true the longer you push it out. So, to the extent that evolution doesn ’ t matter, doesn ’ t care whether genes are passed on by individuals, living a long time or by procreation, there ’ s a certain amount of modulation of that, which is why different species have different lifespans, but that ’ s why there are no immortal species. CA : The genes don ’ t care but we do? AG : That ’ s right. Audience : Hello. I read somewhere that in the last 20 years, the average lifespan of basically anyone on the planet has grown by 10 years. If I project that, that would make me think that I would live until 120 if I don ’ t crash on my motorbike. That means that I ’ m one of your **subjects** to become a 1, 000-year- old? AG : If you lose a bit of weight. Your numbers are a bit out. The standard numbers are that lifespans have been growing at between one and two years per decade. So, it ’ s not quite as good as you might think, you might hope. But I intend to move it up to one year per year as soon as possible. Audience : I was told that many of the brain cells we have as adults are actually in the human embryo, and that the brain cells last 80 years or so. If that is indeed true, biologically are there implications in the world of rejuvenation? If there are cells in my body that live all 80 years, as opposed to a typical, you know, couple of months? AG : There are technical implications certainly. Basically what we need to do is replace cells in those few areas of the brain that lose cells at a respectable rate, especially neurons, but we don ’ t want to replace them any faster than that — or not much faster anyway, because replacing them too fast would degrade cognitive function. What I said about there being no non-aging species earlier on was a little bit of an oversimplification. There are species that have no aging — Hydra for example — but they do it by not having a nervous system — and not having any tissues in fact that rely for their function on very long-lived cells.

Because I usually take the role of trying to explain to people how wonderful the new technologies that are coming along are going to be, and I thought that, since I was among friends here, I would tell you what I really think and try to look back and try to understand what is really going on here with these amazing jumps in technology that seem so fast that we can barely keep on top of it. So I ’ m going to start out by showing just one very boring technology slide. And then, so if you can just turn on the slide that ’ s on. This is just a random slide that I picked out of my file. What I want to show you is not so much the details of the slide, but the general form of it. This happens to be a slide of some analysis that we were doing about the power of RISC microprocessors versus the power of local area networks. And the interesting thing about it is that this slide, like so many technology slides that we ’ re used to, is a sort of a straight line on a semi-log curve. In other words, every step here represents an order of magnitude in performance scale. And this is a new thing that we talk about technology on semi-log curves. Something really weird is going on here. And that ’ s basically what I ’ m going to be talking about. So, if you could bring up the lights. If you could bring up the lights higher, because I ’ m just going to use a piece of paper here. Now why do we draw technology curves in semi-log curves? Well the answer is, if I drew it on a normal curve where, let ’ s say, this is years, this is time of some sort, and this is whatever measure of the technology that I ’ m trying to graph, the graphs look sort of silly. They sort of go like this. And they don ’ t tell us much. Now if I graph, for instance, some other technology, say transportation technology, on a semi-log curve, it would look very stupid, it would look like a flat line. But when something like this happens, things are qualitatively changing. So if transportation technology was moving along as fast as microprocessor technology, then the day after tomorrow, I would be able to get in a taxi cab and be in Tokyo in 30 seconds. It ’ s not moving like that. And there ’ s nothing precedented in the history of technology development of this kind of self- feeding growth where you go by orders of magnitude every few years. Now the question that I ’ d like to ask is, if you look at these exponential curves, they don ’ t go on forever. Things just can ’ t possibly keep changing as fast as they are. One of two things is going to happen. Either it ’ s going to turn into a sort of classical S-curve like this, until something totally different comes along, or maybe it ’ s going to do this. That ’ s about all it can do. Now I ’ m an optimist, so I sort of think it ’ s probably going to do something like that. If so, that means that what we ’ re in the middle of right now is a transition. We ’ re sort of on this line in a transition from the way the world used to be to some new way that the world is. And so what I ’ m trying to ask, what I ’ ve been asking myself, is what ’ s this new way that the world is? What ’ s that new state that the world is heading toward? Because the transition seems very, very confusing when we ’ re right in the middle of it. Now when I was a kid growing up, the future was kind of the year 2000, and people used to talk about what would happen in the year 2000. Now here ’ s a conference in which people talk about the future, and you notice that the future is still at about the year 2000. It ’ s about as far as we go out. So in other words, the future has kind of been shrinking one year per year for my whole lifetime. Now I think that the reason is because we all feel that something ’ s happening there. That transition is happening. We can all sense it. And we know that it just doesn ’ t make too much sense to think out 30, 50 years because everything ’ s going to be so different that a simple extrapolation of what we ’ re doing just doesn ’ t make any sense at all. So what I would like to talk about is what that could be, what that transition could be that we ’ re going through. Now in order to do that I ’ m going to have to talk about a bunch of stuff that really has nothing to do with technology and computers. Because I think the only way to understand this is to really step back and take a long time scale look at things. So the time scale that I would like to look at this on is the time scale of life on Earth. So I think this picture makes sense if you look at it a few billion years at a time. So if you go back about two and a half billion years, the Earth was this big, sterile hunk of rock with a lot of chemicals floating around on it. And if you look at the way that the chemicals got organized, we begin to get a pretty good idea of how they do it. And I think that there ’ s theories that are beginning to understand about how it started with RNA, but I ’ m going to tell a sort of simple story of it, which is that, at that time, there were little drops of oil floating around with all kinds of different recipes of chemicals in them. And some of those drops of oil had a particular combination of chemicals in them which caused them to incorporate chemicals from the outside and grow the drops of oil. And those that were like that started to split and divide. And those were the most primitive forms of cells in a sense, those little drops of oil. But now those drops of oil weren ’ t really alive, as we say it now, because every one of them was a little random recipe of chemicals. And every time it divided, they got sort of unequal division of the chemicals within them. And so every drop was a little bit different. In fact, the drops that were different in a way that caused them to be better at incorporating chemicals around them, grew more and incorporated more chemicals and divided more. So those tended to live longer, get expressed more. Now that ’ s sort of just a very simple chemical form of life, but when things got interesting was when these drops learned a trick about abstraction. Somehow by ways that we don ’ t quite understand, these little drops learned to write down information. They learned to record the information that was the recipe of the cell onto a particular kind of chemical called DNA. So in other words, they worked out, in this mindless sort of evolutionary way, a form of writing that let them write down what they were, so that that way of writing it down could get copied. The amazing thing is that that way of writing seems to have stayed steady since it evolved two and a half billion years ago. In fact the recipe for us, our genes, is exactly that same code and that same way of writing. In fact, every living creature is written in exactly the same set of letters and the same code. In fact, one of the things that I did just for amusement purposes is we can now write things in this code. And I ’ ve got here a little 100 micrograms of white powder, which I try not to let the security people see at airports. But this has in it — what I did is I took this code — the code has standard letters that we use for symbolizing it — and I wrote my business card onto a piece of DNA and amplified it 10 to the 22 times. So if anyone would like a hundred million copies of my business card, I have plenty for everyone in the room, and, in fact, everyone in the world, and it ’ s right here. If I had really been a egotist, I would have put it into a virus and released it in the room. So what was the next step? Writing down the DNA was an interesting step. And that caused these cells — that kept them happy for another billion years. But then there was another really interesting step where things became completely different, which is these cells started exchanging and communicating information, so that they began to get communities of cells. I don ’ t know if you know this, but bacteria can actually exchange DNA. Now that ’ s why, for instance, antibiotic resistance has evolved. Some bacteria figured out how to stay away from penicillin, and it went around sort of creating its little DNA information with other bacteria, and now we have a lot of bacteria that are resistant to penicillin, because bacteria communicate. Now what this communication allowed was communities to form that, in some sense, were in the same boat together ; they were synergistic. So they survived or they failed together, which means that if a community was very successful, all the individuals in that community were repeated more and they were favored by evolution. Now the transition point happened when these communities got so close that, in fact, they got together and decided to write down the whole recipe for the community together on one string of DNA. And so the next stage that ’ s interesting in life took about another billion years. And at that stage, we have multi-cellular communities, communities of lots of different types of cells, working together as a single organism. And in fact, we ’ re such a multi- cellular community. We have lots of cells that are not out for themselves anymore. Your skin cell is really useless without a heart cell, muscle cell, a brain cell and so on. So these communities began to evolve so that the interesting level on which evolution was taking place was no longer a cell, but a community which we call an organism. Now the next step that happened is within these communities. These communities of cells, again, began to abstract information. And they began building very special structures that did nothing but process information within the community. And those are the neural structures. So neurons are the information processing apparatus that those communities of cells built up. And in fact, they began to get specialists in the community and special structures that were responsible for recording, understanding, learning information. And that was the brains and the nervous system of those communities. And that gave them an evolutionary advantage. Because at that point, an individual — learning could happen within the time span of a single organism, instead of over this evolutionary time span. So an organism could, for instance, learn not to eat a certain kind of fruit because it tasted bad and it got sick last time it ate it. That could happen within the lifetime of a single organism, whereas before they ' d built these special information processing structures, that would have had to be learned evolutionarily over hundreds of thousands of years by the individuals dying off that ate that kind of fruit. So that nervous system, the fact that they built these special information structures, tremendously sped up the whole process of evolution. Because evolution could now happen within an individual. It could happen in learning time scales. But then what happened was the individuals worked out, of course, tricks of communicating. And for example, the most sophisticated version that we ' re aware of is human language. It ' s really a pretty amazing invention if you think about it. Here I have a very complicated, messy, confused idea in my head. I ' m sitting here making grunting sounds basically, and hopefully constructing a similar messy, confused idea in your head that bears some analogy to it. But we ' re taking something very complicated, turning it into sound, sequences of sounds, and producing something very complicated in your brain. So this allows us now to begin to start functioning as a single organism. And so, in fact, what we ' ve done is we, humanity, have started abstracting out. We ' re going through the same levels that multi-cellular organisms have gone through — abstracting out our methods of recording, presenting, processing information. So for example, the invention of language was a tiny step in that direction. Telephony, computers, videotapes, CD-ROMs and so on are all our specialized mechanisms that we ' ve now built within our society for handling that information. And it all connects us together into something that is much bigger and much faster and able to evolve than what we were before. So now, evolution can take place on a scale of microseconds. And you saw Ty ' s little evolutionary example where he sort of did a little bit of evolution on the Convolution program right before your eyes. So now we ' ve speeded up the time scales once again. So the first steps of the story that I told you about took a billion years a piece. And the next steps, like nervous systems and brains, took a few hundred million years. Then the next steps, like language and so on, took less than a million years. And these next steps, like electronics, seem to be taking only a few decades. The process is feeding on itself and becoming, I guess, autocatalytic is the word for it — when something reinforces its rate of change. The more it changes, the faster it changes. And I think that that ' s what we ' re seeing here in this explosion of curve. We ' re seeing this process feeding back on itself. Now I design computers for a living, and I know that the mechanisms that I use to design computers would be impossible without recent advances in computers. So right now, what I do is I design objects at such complexity that it ' s really impossible for me to design them in the traditional sense. I don ' t know what every transistor in the connection machine does. There are billions of them. Instead, what I do and what the designers at Thinking Machines do is we think at some level of abstraction and then we hand it to the machine and the machine takes it beyond what we could ever do, much farther and faster than we could ever do. And in fact, sometimes it takes it by methods that we don ’ t quite even understand. One method that ’ s particularly interesting that I ’ ve been using a lot lately is evolution itself. So what we do is we put inside the machine a process of evolution that takes place on the microsecond time scale. So for example, in the most extreme cases, we can actually evolve a program by starting out with random sequences of instructions. Say,”Computer, would you please make a hundred million random sequences of instructions. Now would you please run all of those random sequences of instructions, run all of those programs, and pick out the ones that came closest to doing what I wanted.”So in other words, I define what I wanted. Let ’ s say I want to sort numbers, as a simple example I ’ ve done it with. So find the programs that come closest to sorting numbers. So of course, random sequences of instructions are very unlikely to sort numbers, so none of them will really do it. But one of them, by luck, may put two numbers in the right order. And I say,”Computer, would you please now take the 10 percent of those random sequences that did the best job. Save those. Kill off the rest. And now let ’ s reproduce the ones that sorted numbers the best. And let ’ s reproduce them by a process of recombination analogous to sex.”Take two programs and they produce children by exchanging their subroutines, and the children inherit the traits of the subroutines of the two programs. So I ’ ve got now a new generation of programs that are produced by combinations of the programs that did a little bit better job. Say,”Please repeat that process.”Score them again. Introduce some mutations perhaps. And try that again and do that for another generation. Well every one of those generations just takes a few milliseconds. So I can do the equivalent of millions of years of evolution on that within the computer in a few minutes, or in the complicated cases, in a few hours. At the end of that, I end up with programs that are absolutely perfect at sorting numbers. In fact, they are programs that are much more efficient than programs I could have ever written by hand. Now if I look at those programs, I can ’ t tell you how they work. I ’ ve tried looking at them and telling you how they work. They ’ re obscure, weird programs. But they do the job. And in fact, I know, I ’ m very confident that they do the job because they come from a line of hundreds of thousands of programs that did the job. In fact, their life depended on doing the job. I was riding in a 747 with Marvin Minsky once, and he pulls out this card and says,”Oh look. Look at this. It says, ’ This plane has hundreds of thousands of tiny parts working together to make you a safe flight. ’ Doesn ’ t that make you feel confident?”In fact, we know that the engineering process doesn ’ t work very well when it gets complicated. So we ’ re beginning to depend on computers to do a process that ’ s very different than engineering. And it lets us produce things of much more complexity than normal engineering lets us produce. And yet, we don ’ t quite understand the options of it. So in a sense, it ’ s getting ahead of us. We ’ re now using those programs to make much faster computers so that we ’ ll be able to run this process much faster. So it ’ s feeding back on itself. The thing is becoming faster and that ’ s why I think it seems so confusing. Because all of these technologies are feeding back on themselves. We ’ re taking off. And what we are is we ’ re at a point in time which is analogous to when single- celled organisms were turning into multi-celled organisms. So we ’ re the amoebas and we can ’ t quite figure out what the hell this thing is we ’ re creating. We ’ re right at that point of transition. But I think that there really is something coming along after us. I think it ’ s very haughty of us to think that we ’ re the end product of evolution. And

I think all of us here are a part of producing whatever that next thing is. So lunch is coming along, and I think I will stop at that point, before I get selected out.

Text Sample 822: NEG Dim 5 – 1984 – Score 5.00 – 1984/t000297.txt

In this rather long sort of marathon presentation, I ’ ve tried to break it up into three parts : the first being a whole lot of examples on how it can be a little bit more pleasurable to deal with a computer and really address the qualities of the human interface. And these will be some simple design qualities and they will also be some qualities of, if you will, the intelligence of interaction. Then the second part will really just be examples of new technologies — new media falling very much into that mold. Again, I will go through them as fast as possible. And then the last one will be some examples I ’ ve been able to collect, which I think illustrate this at least as best I can, in the world of entertainment. People have this belief — and I share most of it — that we will be using the TV screens or their equivalents for electronic books of the future. But then you think,”My God! What a terrible image you get when you look at still pictures on TV.”Well, it doesn ’ t have to be terrible. And that is a slide taken from a TV set and it was pre- processed to be very sympathetic to the TV medium, and it absolutely looks beautiful. Well, what ’ s happened? How did people get into this mess? Where you are now, all of a sudden, sitting in front of personal computers and video text — teletext systems, and somewhat horrified by what you see on the screen? Well, you have to remember that TV was designed to be looked at eight times the distance of the diagonal. So you get a 13-inch, 19-inch, whatever, TV, and then you should multiply that by eight and that ’ s the distance you should sit away from the TV set. Now we ’ ve put people 18 inches in front of a TV, and all the artifacts that none of the original designers expected to be seen, all of a sudden, are staring you in the face : the shadow mask, the scan lines, all of that. And they can be treated very easily ; there are actually ways of getting rid of them, there are actually ways of just making absolutely beautiful pictures. I ’ m talking here a little bit about display technologies. Let me talk about how you might input information. And my favorite example is always fingers. I ’ m very interested in touch-sensitive displays. High-tech, high-touch. Isn ’ t that what some of you said? It ’ s certainly a very important medium for input, and a lot of people think that fingers are a very low- resolution sort of stylus for inputting to a display. In fact, they ’ re not : it ’ s really a very, very high-resolution input medium — you have to just do it twice, you have to touch the screen and then rotate your finger slightly — and you can move a cursor with great accuracy. And so when you see on the market these systems that have just a few light emitting diodes on the side and are very low resolution, it ’ s nice that they exist because it still is better than nothing. But it, in some sense, misses the point : namely, that fingers are a very, very high-resolution input medium. Now, what are some of the other advantages? Well, the one advantage is that you don ’ t have to pick them up, and people don ’ t realize how important that is — not having to pick up your fingers to use them. When you think for a second of the mouse on Macintosh — and I will not criticize the mouse too much — when you ’ re typing — what you have — you want to now put something — first of all, you ’ ve got to find the mouse. You have to probably stop. Maybe not come to a grinding halt, but you ’ ve got to sort of find that mouse. Then you find the mouse, and you ’ re going to have to wiggle it a little bit to see where the cursor is on the screen. And then when you finally see where it is, then you ’ ve got to move it to get the cursor over there, and then —"Bang"— you ' ve got to hit a button or do whatever. That ' s four separate steps versus typing and then touching and typing and just doing it all in one motion — or one-and-a-half, depending on how you want to count. Again, what I ' m trying to do is just illustrate the kinds of problems that I think face the designers of new computer systems and entertainment systems and educational systems from the perspective of the quality of that interface. And another advantage, of course, of using fingers is you have 10 of them. And we have never known how to do this technically, so this slide is a fake slide. We never succeeded in using ten fingers, but there are certain things you can do, obviously, with more than one-finger input, which is rather fascinating. What we did stumble across was something... Again, which is typical of the computer field, is when you have a bug that you can ' t get rid of you turn it into a feature. And maybe... maybe a mouse is a new kind of bug. But the bug in our case was in touch-sensitive displays : we wanted to be able to draw — you know, rub your finger across the screen to input continuous points — and there was just too much friction created between your finger and the glass — if glass was the substrate, which it usually is. So we found that that actually was a feature in the sense you could build a pressure-sensitive display. And when you touch it with your finger, you can actually, then, introduce all the forces on the face of that screen, and that actually has a certain amount of value. Let me see if I can load another disc and show you, quickly, an example. Now, imagine a screen, which is not only touch-sensitive now, it ' s pressure-sensitive. And it ' s pressure-sensitive to the forces both in the plane of the screen — X, Y, and Z at least in one direction ; we couldn ' t figure out how to come in the other direction. But let me get rid of the slide, and let ' s see if this comes on. OK. So there is the pressure-sensitive display in operation. The person ' s just, if you will, pushing on the screen to make a curve. But this is the interesting part. I want to stop it for a second because the movie is very badly made. And the particular display was built about six years ago, and when we moved from one room to another room, a rather large person sat on it and it got destroyed. So all we have is this record. But imagine that screen having lots of objects on it and the person has touched an object — one of N — like he did there, and then pushed on it. Now, imagine a program where some of those objects are physically heavy and some are light : one is an anvil on a fuzzy rug and the other one is a ping-pong ball on a sheet of glass. And when you touch it, you have to really push very hard to move that anvil across the screen, and yet you touch the ping-pong ball very lightly and it just scoots across the screen. And what you can do — oops, I didn ' t mean to do that — what you can do is actually feed back to the user the feeling of the physical properties. So again, they don ' t have to be weight ; they could be a general trying to move troops, and he ' s got to move an aircraft carrier versus a little boat. In fact, they funded it for that very reason. The whole notion, then, is one that at the interface there are physical properties in that transducer — in this case it ' s pressure and touches — that allow you to present things to the user that you could never present before. So it ' s not simply looking at the quality or, if you will, the luxury of that interface, but it ' s actually looking at the idea of presenting things that previously couldn ' t be presented before. I want to move on to another example, which is one of a different sort, where we ' re trying to use computer and video disc technology now to come up with a new kind of book. Here, the idea is that you ' re going to take this book, if you will, and it ' s going to come alive. You ' re going to sort of breathe life into it. We are so used to doing monologues. Filmmakers, for example, are the experts in monologue making : you make a film and it has a well-formed beginning, middle and end, and in some sense the art of it is that. And you then say,"There ' s an opportunity for making conversational movies.”Well, what does that mean? And it sort of nibbles at the core of the whole profession and all the assumptions of that medium. So, book writing is the same thing. What I ’ ll show you very quickly is a new kind of book where it is mixed now with... all sorts of things live in there, but you have to keep a few things in mind. One is that this book knows about itself. Each frame of the movie has information about itself. So it knows, or at least there is computer-readable information in the medium itself. It ’ s just not a static movie frame. That ’ s one thing. The other is that you have to realize that it is a random access medium, and you can, in fact, branch and expand and elaborate and shrink. And here — again, my favorite example — is the cookbook, the”Larousse Gastronomique.”And I think I use the example all too often, but it ’ s a great one because there is a classic ending in that little encyclopedia-style cookbook that tells you how to do something like penguin, and you get to the end of the recipe and it says,”Cook until done.”Now, that would be, if you will, the top green track, which doesn ’ t mean too much. But you might have to elaborate for me or for somebody who isn ’ t an expert, and say,”Cook at 380 degrees for 45 minutes.”And then for a real beginner, you would go down even further and elaborate more — say,”Open the oven, preheat, wait for the light to go out, open the door, don ’ t leave it open too long, put the penguin in and shut the door...”whatever. And that ’ s a much more elaborate one than you dribble back. That ’ s one kind of use of random access. And the other is where you want to explain the same thing in different ways. If you ’ re in a classroom situation and somebody asks a question, the last thing you do is repeat what you just said. You try and think of a different way of saying the same thing, or if you know the particular student and that student ’ s cognitive style, then you might say it in a way that you think would have a good impedance match with that student. There are all sorts of techniques you will use — and again, this is a different kind of branching. So, what I will show you is... it ’ s a rather boring book, but I ’ m afraid sometimes you have to do boring books because your sponsors aren ’ t necessarily interested in fiction and entertainment. And this is a book on how to repair a transmission. Now, I don ’ t even know what vintage the transmission is, but let me just show you very quickly some of it, and we ’ ll move on. Narrator : And continue to get descriptions for each of these chapters. Nicholas Negroponte : Now, this is his table of contents. Just a picture of the transmission, and as you rub your finger across the transmission it highlights the various parts. Narrator : When I find a chapter that I want to see, I just touch the text and the system will format pages for me to read. The words or phrases that are lit up in red are glossary words, so I can get a different definition by just touching the word, and the definition appears, superimposed over the illustration. NN : This is about the oil pan, or the oil filter and all that. This is relatively important because it sets the page... Narrator : This is another example of a page with glossary words highlighted in red. I can get a definition of these words just by touching them, and the definition will appear in the illustration corner. I can get back to the illustration, but in this case it ’ s not a single frame, but it ’ s actually a movie of someone coming into the frame and doing the repair that ’ s described in the text. The two-headed slider is a speed control that allows me to watch the movie at various speeds, in forward or reverse. And the movie is displayed as a full frame movie. I can go back to the beginning... and play the movie at full speed. Here ’ s another step-by-step procedure, only in this case — NN : Okay, this movie is... Everybody ’ s heard of sound-sync movies — this is text-sync movies, so as the movie plays, the text gets highlighted. We highlight the text as we go through the movie. Repairman :... Not too far out. Front poles, preferably. Don ’ t loosen them too far. If you loosen them too far, you ’ ll have a big mess. NN : I suspect that some of you might not even understand that language. OK. I ’ m at the third and last part of this, which I said I would make an attempt to at least give you some examples that may be more directly related to the world of entertainment. And of course, good education has got to be good entertainment, so my first example will be drawn from a very recent experiment that we ’ ve been doing — in this case, in Senegal — where we have tried to use personal computers as a pedagogical medium. But not as teaching machines at all ; the whole notion is to use this as an instrument where there is a complete reversal of roles — the child is, if you will, the teacher and the machine is the student — and the art of computer programming is a vehicle that sort of approximates thinking about thinking. But teaching kids programming per se is utterly irrelevant. And there are just a few slides I want to go through, but there ’ s a story I ’ d like to tell. And that was when, before we did this in any developing countries — we ’ re doing it, in fact, in three developing countries right now : Pakistan, Colombia and Senegal — we did it in some pretty rough areas of New York City. And one child, whose name I ’ ve forgotten, was about seven or eight years old, absolutely considered mentally handicapped — couldn ’ t read, didn ’ t even make it in the lowest section of the school ’ s classes — and was pretty much not in school, though physically there. But did hang around the, quote,”computer room,”where there were quite a few computers, and learned this particular language called Logo — and learned it with great ease and found it a lot of fun, it was very interesting. And one day, by chance, some visitors from the NIE came by in their double-breasted suits looking at this setup, and none of the children who were normally there, except for this one child, were there. He was, and he said,”Let me show you how this works,”and they got an absolutely ingenuous, wonderful description of Logo. And the child was just zipping right through it, showing them all sorts of things until they asked him how to do something which he couldn ’ t explain and so he flipped through the manual, found the explanation and typed the command and got it to do what they asked. They were delighted, and by the time it was time to go see the principal, whom they ’ d actually come to see — not the computer room — they went upstairs and they said,”This is absolutely remarkable! That child was very articulate and showed us and even dealt with the things he couldn ’ t do automatically with that manual. It was just absolutely fantastic.”The principal said,”There ’ s a dreadful mistake, because that child can ’ t read. And you obviously have been hoodwinked or you ’ ve talked about somebody else.”And they all got up and they all went downstairs and the child was still there. And they did something very intelligent : they asked the child,”Can you read?”And the child said,”No, I can ’ t.”And then they said,”But wait a minute. You just looked through that manual and you found...”and he said,”Oh, but that ’ s not reading.”And so they said,”Well, what ’ s reading then?”He says,”Well, reading is this junk they give me in little books to read. It ’ s absolutely irrelevant, and I get nothing for it. But here, with a little bit of effort I get a lot of return.”And it really meant something to the child. The child read beautifully, it turned out, and was really very competent. So it actually meant something. And that story has many other anecdotes that are similar, but wow. The key to the future of computers in education is right there, and it is : when does it mean something to a child? There is a myth, and it truly is a myth : we believe — and I ’ m sure a lot of you believe in this room — that it is harder to read and write than it is to learn how to speak. And it ’ s not, but we think speech —”My God, little children pick it up somehow, and by the age of two they ’ re doing a mediocre job, and by three and four they ’ re speaking reasonably well. And yet you ’ ve got to go to school to learn how to read, and you have to sit in a classroom and somebody has to teach you. Hence, it must be harder.”Well, it ’ s not harder.

What the truth is is that speaking has great value to a child ; the child can get a great deal by talking to you. Reading and writing is utterly useless. There is no reason for a child to read and write except blind faith, and that it ’ s going to help you. So what happens is you go to school and people say,”Just believe me, you ’ re going to like it. You ’ re going to like reading,”and just read and read. On the other hand, you give a kid — a three-year-old kid — a computer and they type a little command and — Poof! — something happens. And all of a sudden... You may not call that reading and writing, but a certain bit of typing and reading stuff on the screen has a huge payoff, and it ’ s a lot of fun. And in fact, it ’ s a powerful educational instrument. Well, in Senegal we found that this was the traditional classroom : 120 kids — three per desk — one teacher, a little bit of chalk. This student was one of our first students, and it ’ s the girl on the left leaning with her chalkboard, and she came... within two days — I want to show you the program she wrote, and remember her hairstyle. And that is the program she made. That ’ s what meant something to her, is doing the hair pattern, and actually did it within two days — an hour each day — and found it was, to her, absolutely the most meaningful piece... But rooted in that, little did she know how much knowledge she was acquiring about geometry and just math and logic and all the rest. And again, I could talk for three hours about this **subject**. I will come to my last example and then quit. And my last example — as some of my former colleagues, whom I see in the room, can imagine what it will be. Yes, it is. It ’ s our work — that was a while ago, and it still is my favorite project — of teleconferencing. And the reason it remains a favorite project is that we were asked to do a teleconferencing system where you had the following situation : you had five people at five different sites — they were known people — and you had to have these people in teleconference, such that each one was utterly convinced that the other four were physically present. Now, that is sufficiently zany that we would, obviously, jump to the bait, and we did. And the fact that we knew the people — we had to take a page out of the history of Walt Disney — we actually went so far as to build CRTs in the shapes of the people ’ s faces. So if I wanted to call my friend Peter Sprague on the phone, my secretary would get his head out and bring it and set it on the desk, and that would be the TV used for the occasion. And it ’ s uncanny : there ’ s no way I can explain to you the amount of eye contact you get with that physical face projected on a 3D CRT of that sort. The next thing that we had to do is to persuade them that there needed to be spatial correspondence, which is straightforward, but again, it ’ s something that didn ’ t fall naturally out of a telecommunications or computing style of thinking ; it was a very, if you will, architectural or spatial concept. And that was to recognize that when you sit around the table, the actual location of the people becomes rather important. And when somebody gets up, in fact, to go answer a phone or use a bathroom or something, the empty seat becomes, if you will, that person. And you point frequently to the empty seat and you say,”He or she wouldn ’ t agree,”and the empty chair is that person and the spatiality is crucial. So we said,”Well, these will be on round tables and the order around the table had to be the same, so that at my site, I would be, if you will, real and then at each other ’ s site you ’ d have these plastic heads. And the plastic heads, sometimes you want to project them. And there are a number of schemes, which I don ’ t want to dwell on, but this is the one that we finally used where we projected onto rear screen material that was molded in the face — literally in the face of the person. And I ’ ll show you one more slide, where this is actually made from something called a solid photograph and is the screen. Now, we track, on the person ’ s head, the head motions — so we transmit with a video the head positions — and so this head moves in about two axes. So if I, all of a sudden, turn to the person to my left and start talking to that person, then at the person to my right ' s site, he ' ll see these two plastic heads talking to each other. And then if that person interrupts, then those two heads may turn. And it really is reconstructing, quite accurately, teleconferencing.

Thank you. Ooh, I ' m like,"Phew, phew, calm down. Get back into my body now."Usually when I play out, the first thing that happens is people scream out,"What ' s she doing?!"I ' ll play at these rock shows, be on stage standing completely still, and they ' re like,"What ' s she doing?! What ' s she doing?!"And then I ' ll kind of be like — — and then they ' re like,"Whoa!"I ' m sure you ' re trying to figure out,"Well, how does this thing work?"Well, what I ' m doing is controlling the pitch with my left hand. See, the closer I get to this antenna, the higher the note gets — — and you can get it really low. And with this hand I ' m controlling the volume, so the further away my right hand gets, the louder it gets. So basically, with both of your hands you ' re controlling pitch and volume and kind of trying to create the illusion that you ' re doing separate notes, when really it ' s continuously going... Sometimes I startle myself : I ' ll forget that I have it on, and I ' ll lean over to pick up something, and then it goes like — —"Oh!"And it ' s like a funny sound effect that follows you around if you don ' t turn the thing off. Maybe we ' ll go into the next tune, because I totally lost where this is going. We ' re going to do a song by David Mash called"Listen : the Words Are Gone,"and maybe I ' ll have words come back into me afterwards if I can relax. So, I ' m trying to think of some of the questions that are commonly asked ; there are so many. And... Well, I guess I could tell you a little of the history of the theremin. It was invented around the 1920s, and the inventor, Lon Theremin — he also was a musician besides an inventor — he came up with the idea for making the theremin, I think, when he was working on some shortwave radios. And there ' d be that sound in the signal — it ' s like — and he thought,"Oh, what if I could control that sound and turn it into an instrument, because there are pitches in it."And so somehow through developing that, he eventually came to make the theremin the way it is now. And a lot of times, even kids nowadays, they ' ll make reference to a theremin by going,"Whoo-hoo-hoo-hoo,"because in the ' 50s it was used in the sci-fi horror movies, that sound that ' s like... It ' s kind of a funny, goofy sound to do. And sometimes if I have too much coffee, then my vibrato gets out of hand. You ' re really sensitive to your body and its functions when you ' re behind this thing. You have to stay so still if you want to have the most control. It reminds me of the balancing act earlier on — what Michael was doing — because you ' re fighting so hard to keep the balance with what you ' re playing with and stay in tune, and at the same time you don ' t want to focus so much on being in tune all the time ; you want to be feeling the music. And then also, you ' re trying to stay very, very, very still because little movements with other parts of your body will affect the pitch, or sometimes if you ' re holding a low note — — and breathing will make it... If I pass out on the next song... I think of it almost like like a yoga instrument because it makes you so aware of every little crazy thing your body is doing, or just aware of what you don ' t want it to be doing while you ' re playing ; you don ' t want to have any sudden movements. And if I go to a club and play a gig, people are like,"Here, have some drinks on us!"And it ' s like,"Well, I ' m about to go on soon ; I don ' t want to be like — — you know?"It really does reflect the mood that you ' re in also, if you ' re... it ' s similar to being a vocalist, except instead of it coming out of your throat, you

’ re controlling it just in the air and you don ’ t really have a point of reference ; you ’ re always relying on your ears and adjusting constantly. You just have to always adjust to what ’ s happening and realize you ’ ll have bummer notes come here and there and listen to it, adjust it, and just move on, or else you ’ ll get too tied up and go crazy. Like me. I think we will play another tune now. I ’ m going to do”Lush Life.”It ’ s one of my favorite tunes to play.

How many Creationists do we have in the room? Probably none. I think we ’ re all Darwinians. And yet many Darwinians are anxious, a little uneasy â would like to see some limits on just how far the Darwinism goes. It ’ s all right. You know spiderwebs? Sure, they are products of evolution. The World Wide Web? Not so sure. Beaver dams, yes. Hoover Dam, no. What do they think it is that prevents the products of human ingenuity from being themselves, fruits of the tree of life, and hence, in some sense, obeying evolutionary rules? And yet people are interestingly resistant to the idea of applying evolutionary thinking to thinking â to our thinking. And so I ’ m going to talk a little bit about that, keeping in mind that we have a lot on the program here. So you ’ re out in the woods, or you ’ re out in the pasture, and you see this ant crawling up this blade of grass. It climbs up to the top, and it falls, and it climbs, and it falls, and it climbs â trying to stay at the very top of the blade of grass. What is this ant doing? What is this in aid of? What goals is this ant trying to achieve by climbing this blade of grass? What ’ s in it for the ant? And the answer is : nothing. There ’ s nothing in it for the ant. Well then, why is it doing this? Is it just a fluke? Yeah, it ’ s just a fluke. It ’ s a lancet fluke. It ’ s a little brain worm. It ’ s a parasitic brain worm that has to get into the stomach of a sheep or a cow in order to continue its life cycle. Salmon swim upstream to get to their spawning grounds, and lancet flukes commandeer a passing ant, crawl into its brain, and drive it up a blade of grass like an all-terrain vehicle. So there ’ s nothing in it for the ant. The ant ’ s brain has been hijacked by a parasite that infects the brain, inducing suicidal behavior. Pretty scary. Well, does anything like that happen with human beings? This is all on behalf of a cause other than one ’ s own genetic fitness, of course. Well, it may already have occurred to you that Islam means”surrender,”or”submission of self-interest to the will of Allah.”Well, it ’ s ideas â not worms â that hijack our brains. Now, am I saying that a sizable minority of the world ’ s population has had their brain hijacked by parasitic ideas? No, it ’ s worse than that. Most people have. There are a lot of ideas to die for. Freedom, if you ’ re from New Hampshire. Justice. Truth. Communism. Many people have laid down their lives for communism, and many have laid down their lives for capitalism. And many for Catholicism. And many for Islam. These are just a few of the ideas that are to die for. They ’ re infectious. Yesterday, Amory Lovins spoke about”infectious repititis.”It was a term of abuse, in effect. This is unthinking engineering. Well, most of the cultural spread that goes on is not brilliant, new, out-of-the-box thinking. It ’ s”infectious repetitis,”and we might as well try to have a theory of what ’ s going on when that happens so that we can understand the conditions of infection. Hosts work hard to spread these ideas to others. I myself am a philosopher, and one of our occupational hazards is that people ask us what the meaning of life is. And you have to have a bumper sticker, you know. You have to have a statement. So, this is mine. The secret of happiness is : Find something more important than you are and dedicate your life to it. Most of us â now that the”Me Decade”is well

in the past â now we actually do this. One set of ideas or another have simply replaced our biological imperatives in our own lives. This is what our summum bonum is. It ’ s not maximizing the number of grandchildren we have. Now, this is a profound biological effect. It ’ s the subordination of genetic interest to other interests. And no other species does anything at all like it. Well, how are we going to think about this? It is, on the one hand, a biological effect, and a very large one. Unmistakable. Now, what theories do we want to use to look at this? Well, many theories. But how could something tie them together? The idea of replicating ideas ; ideas that replicate by passing from brain to brain. Richard Dawkins, whom you ’ ll be hearing later in the day, invented the term”memes,”and put forward the first really clear and vivid version of this idea in his book”The Selfish Gene.”Now here am I talking about his idea. Well, you see, it ’ s not his. Yes â he started it. But it ’ s everybody ’ s idea now. And he ’ s not responsible for what I say about memes. I ’ m responsible for what I say about memes. Actually, I think we ’ re all responsible for not just the intended effects of our ideas, but for their likely misuses. So it is important, I think, to Richard, and to me, that these ideas not be abused and misused. They ’ re very easy to misuse. That ’ s why they ’ re dangerous. And it ’ s just about a full-time job trying to prevent people who are scared of these ideas from caricaturing them and then running off to one dire purpose or another. So we have to keep plugging away, trying to correct the misapprehensions so that only the benign and useful variants of our ideas continue to spread. But it is a problem. We don ’ t have much time, and I ’ m going to go over just a little bit of this and cut out, because there ’ s a lot of other things that are going to be said. So let me just point out : memes are like viruses. That ’ s what Richard said, back in ’ 93. And you might think,”Well, how can that be? I mean, a virus is â you know, it ’ s stuff! What ’ s a meme made of?”Yesterday, Negroponte was talking about viral telecommunications but â what ’ s a virus? A virus is a string of nucleic acid with attitude. That is, there is something about it that tends to make it replicate better than the competition does. And that ’ s what a meme is. It ’ s an information packet with attitude. What ’ s a meme made of? What are bits made of, Mom? Not silicon. They ’ re made of information, and can be carried in any physical medium. What ’ s a word made of? Sometimes when people say,”Do memes exist?”I say,”Well, do words exist? Are they in your ontology?”If they are, words are memes that can be pronounced. Then there ’ s all the other memes that can ’ t be pronounced. There are different species of memes. Remember the Shakers? Gift to be simple? Simple, beautiful furniture? And, of course, they ’ re basically extinct now. And one of the reasons is that among the creed of Shaker-dom is that one should be celibate. Not just the priests. Everybody. Well, it ’ s not so surprising that they ’ ve gone extinct. But in fact that ’ s not why they went extinct. They survived as long as they did at a time when the social safety nets weren ’ t there. And there were lots of widows and orphans, people like that, who needed a foster home. And so they had a ready supply of converts. And they could keep it going. And, in principle, it could ’ ve gone on forever, with perfect celibacy on the part of the hosts. The idea being passed on through proselytizing, instead of through the gene line. So the ideas can live on in spite of the fact that they ’ re not being passed on genetically. A meme can flourish in spite of having a negative impact on genetic fitness. After all, the meme for Shaker-dom was essentially a sterilizing parasite. There are other parasites that do this â which render the host sterile. It ’ s part of their plan. They don ’ t have to have minds to have a plan. I ’ m just going to draw your attention to just one of the many implications of the memetic perspective, which I recommend. I ’ ve not time to go into more of it. In Jared Diamond ’ s wonderful book,”Guns, Germs and Steel,”he talks about how it was germs, more than guns and steel, that conquered the new hemisphere â the Western hemisphere â that conquered the rest of the world. When European explorers and travelers spread out, they brought with them the germs that they had become essentially immune to, that they had learned how to tolerate over hundreds and hundreds of years, thousands of years, of living with domesticated animals who were the sources of those pathogens. And they just wiped out â these pathogens just wiped out the native people, who had no immunity to them at all. And we ’ re doing it again. We ’ re doing it this time with toxic ideas. Yesterday, a number of people â Nicholas Negroponte and others â spoke about all the wonderful things that are happening when our ideas get spread out, thanks to all the new technology all over the world. And I agree. It is largely wonderful. Largely wonderful. But among all those ideas that inevitably flow out into the whole world thanks to our technology, are a lot of toxic ideas. Now, this has been realized for some time. Sayyid Qutb is one of the founding fathers of fanatical Islam, one of the ideologues that inspired Osama bin Laden.”One has only to glance at its press films, fashion shows, beauty contests, ballrooms, wine bars and broadcasting stations.”Memes. These memes are spreading around the world and they are wiping out whole cultures. They are wiping out languages. They are wiping out traditions and practices. And it ’ s not our fault, anymore than it ’ s our fault when our germs lay waste to people that haven ’ t developed the immunity. We have an immunity to all of the junk that lies around the edges of our culture. We ’ re a free society, so we let pornography and all these things â we shrug them off. They ’ re like a mild cold. They ’ re not a big deal for us. But we should recognize that for many people in the world, they are a big deal. And we should be very alert to this. As we spread our education and our technology, one of the things that we are doing is we ’ re the vectors of memes that are correctly viewed by the hosts of many other memes as a dire threat to their favorite memes â the memes that they are prepared to die for. Well now, how are we going to tell the good memes from the bad memes? That is not the job of the science of memetics. Memetics is morally neutral. And so it should be. This is not the place for hate and anger. If you ’ ve had a friend who ’ s died of AIDS, then you hate HIV. But the way to deal with that is to do science, and understand how it spreads and why in a morally neutral perspective. Get the facts. Work out the implications. There ’ s plenty of room for moral passion once we ’ ve got the facts and can figure out the best thing to do. And, as with germs, the trick is not to try to annihilate them. You will never annihilate the germs. What you can do, however, is foster public health measures and the like that will encourage the evolution of avirulence. That will encourage the spread of relatively benign mutations of the most toxic varieties. That ’ s all the time I have, so thank you very much for your attention.

This is your conference, and I think you have a right to know a little bit right now, in this transition period, about this guy who ’ s going to be looking after it for you for a bit. So, I ’ m just going to grab a chair here. Two years ago at TED, I think â I ’ ve come to this conclusion â I think I may have been suffering from a strange delusion. I think that I may have believed unconsciously, then, that I was kind of a business hero. I had this company that I ’ d spent 15 years building. It ’ s called Future ; it was a magazine publishing company. It had recently gone public and the market said that it was apparently worth two billion dollars, a number I didn ’ t really understand. A magazine I ’ d recently launched called Business 2. 0 was fatter than a telephone directory, busy pumping hot air into the bubble. And I was the 40 percent owner of a dotcom that was about to go public and no doubt be worth billions more. And all this had come from nothing. Fifteen years earlier, I was a science journalist who people just laughed at when I said,"I really would like to start my own computer magazine."And 15 years later, there are 100 of them and 2, 000 people on staff and it was just such heady times. The date was February 2000. I thought the little graph of my business life that kind of looked a bit like Moore ' s Law â ever upward and to the right â it was going to go on forever. I mean, it had to. Right? I was in for quite a surprise. The dotcom, ironically called Snowball, was the very last consumer web company to go public the next month before NASDAQ exploded, and I entered 18 months of business hell. I watched everything that I ' d built crumbling, and it looked like all this stuff was going to die and 15 years work would have come for nothing. And it was gut wrenching. It took eight years of blood, sweat and tears to reach 350 employees, something which I was very proud of in the business. February 2001 â in one day we laid off 350 people, and before the bloodshed was finished, 1, 000 people had lost their jobs from my companies. I felt sick. I watched my own net worth falling by about a million dollars a day, every day, for 18 months. And worse than that, far worse than that, my sense of self-worth was kind of evaporating. I was going around with this big sign on my forehead :"LOSER."And I think what disgusts me more than anything, looking back, is how the hell did I let my personal happiness get so tied up with this business thing? Well, in the end, we were able to save Future and Snowball, but I was, at that point, ready to move on. And to cut a long story short, here ' s where I came to. And the reason I ' m telling this story is that I believe, from many conversations, that a lot of people in this room have been through a similar kind of rollercoaster â emotional rollercoaster â in the last couple years. This has been a big, big transition time, and I believe that this conference can play a big part for all of us in taking us forward to the next stage to whatever ' s next. The theme next year is re-birth. It was at the same TED two years ago when Richard and I reached an agreement on the future of TED. And at about the same time, and I think partly because of that, I started doing something that I ' d forgotten about in my business focus : I started to read again. And I discovered that while I ' d been busy playing business games, there ' d been this incredible revolution in so many areas of interest : cosmology to psychology to evolutionary psychology to anthropology to... all this stuff had changed. And the way in which you could think about us as a species and us as a planet had just changed so much, and it was incredibly exciting. And what was really most exciting â and I think Richard Wurman discovered this at least 20 years before I did â was that all this stuff is connected. It ' s connected ; it all hooks into each other. We talk about this a lot, and I thought about trying to give an example of this. So, just one example : Madame de Gaulle, the wife of the French president, was famously asked once,"What do you most desire?"And she answered,"A penis."And when you think about it, it ' s very true : what we all most desire is a penis â or"happiness"as we say in English. And something... good luck with that one in the Japanese translation room. But something as basic as happiness, which 20 years ago would have been just something for discussion in the church or mosque or synagogue, today it turns out that there ' s dozens of TED-like questions that you can ask about it, which are really interesting. You can ask about what causes it biochemically : neuroscience, serotonin, all that stuff. You can ask what are the psychological causes of it : nature? Nurture? Current circumstance? Turns out that the research done on that is absolutely mind-blowing. You can view it as a computing problem, an artificial intelligence problem : do you need to incorporate some sort of analog of happiness into a computer brain to make it work properly? You can view it in sort of geopolitical terms and say, why is it that a billion people on this planet are so desperately needy that they have no possibility of happiness, and whereas almost all the rest of them, regardless of how much money they have â whether it ’ s two dollars a day or whatever â are almost equally happy on average? Or you can view it as an evolutionary psychology kind of thing : did our genes invent this as a kind of trick to get us to behave in certain ways? The ant ’ s brain, parasitized, to make us behave in certain ways so that our genes would propagate? Are we the victims of a mass delusion? And so on, and so on. To understand even something as important to us as happiness, you kind of have to branch off in all these different directions, and there ’ s nowhere that I ’ ve discovered â other than TED â where you can ask that many questions in that many different directions. And so, it ’ s the profound thing that Richard talks about : to understand anything, you just need to understand the little bits ; a little bit about everything that surrounds it. And so, gradually over these three days, you start off kind of trying to figure out,”Why am I listening to all this irrelevant stuff?”And at the end of the four days, your brain is humming and you feel energized, alive and excited, and it ’ s because all these different bits have been put together. It ’ s the total brain experience, we ’ re going to... it ’ s the mental equivalent of the full body massage. Every mental organ addressed. It really is. Enough of the theory, Chris. Tell us what you ’ re actually going to do, all right? So, I will. Here ’ s the vision for TED. Number one : do nothing. This thing ain ’ t broke, so I ain ’ t gonna fix it. Jeff Bezos kindly remarked to me,”Chris, TED is a really great conference. You ’ re going to have to fuck up really badly to make it bad.”So, I gave myself the job title of TED Custodian for a reason, and I will promise you right here and now that the core values that make TED special are not going to be interfered with. Truth, curiosity, diversity, no selling, no corporate bullshit, no bandwagoning, no platforms. Just the pursuit of interest, wherever it lies, across all the disciplines that are represented here. That ’ s not going to be changed at all. Number two : I am going to put together an incredible line up of speakers for next year. The time scale on which TED operates is just fantastic after coming out of a magazine business with monthly deadlines. There ’ s a year to do this, and already â I hope to show you a bit later â there ’ s 25 or so terrific speakers signed up for next year. And I ’ m getting fantastic help from the community ; this is just such a great community. And combined, our contacts reach pretty much everyone who ’ s interesting in the country, if not the planet. It ’ s true. Number three : I do want to, if I can, find a way of extending the TED experience throughout the year a little bit. And one key way that we ’ re going to do this is to introduce this book club. Books kind of saved me in the last couple years, and that ’ s a gift that I would like to pass on. So, when you sign up for TED2003, every six weeks you ’ ll get a care package with a book or two and a reason why they ’ re linked to TED. They may well be by a TED speaker, and so we can get the conversation going during the year and come back next year having had the same intellectual, emotional journey. I think it will be great. And then, fourthly : I want to mention the Sapling Foundation, which is the new owner of TED. What Sapling ’ s ownership means is that all of the proceeds of TED will go towards the causes that Sapling stands for. And more important, I think, the ideas that are exhibited and realized here are ideas that the foundation can use, because there ’ s fantastic synergy. Already, just in the last few days, we ’ ve had so many people talking about stuff that they care about, that they ’ re passionate about, that can make a difference in the world, and the idea of getting this group of people together â some of the causes that we believe in, the money that this conference can raise and the ideas â I really believe that that combination will, over time, make a difference. I ’ m incredibly excited about that. In fact, I don ’ t think, overall, that I ’ ve been as excited by anything ever in my life. I ’ m in this for the long run, and I would be greatly honored and excited if you ’ ll come on this journey with me.

I ’ m going to go right into the slides. And all I ’ m going to try and prove to you with these slides is that I do just very straight stuff. And my ideas are â in my head, anyway â they ’ re very logical and relate to what ’ s going on and problem solving for clients. I either convince clients at the end that I solve their problems, or I really do solve their problems, because usually they seem to like it. Let me go right into the slides. Can you turn off the light? Down. I like to be in the dark. I don ’ t want you to see what I ’ m doing up here. Anyway, I did this house in Santa Monica, and it got a lot of notoriety. In fact, it appeared in a porno comic book, which is the slide on the right. This is in Venice. I just show it because I want you to know I ’ m concerned about context. On the left-hand side, I had the context of those little houses, and I tried to build a building that fit into that context. When people take pictures of these buildings out of that context they look really weird, and my premise is that they make a lot more sense when they ’ re photographed or seen in that space. And then, once I deal with the context, I then try to make a place that ’ s comfortable and private and fairly serene, as I hope you ’ ll find that slide on the right. And then I did a law school for Loyola in downtown L. A. I was concerned about making a place for the study of law. And we continue to work with this client. The building on the right at the top is now under construction. The garage on the right â the gray structure â will be torn down, finally, and several small classrooms will be placed along this avenue that we ’ ve created, this campus. And it all related to the clients and the students from the very first meeting saying they felt denied a place. They wanted a sense of place. And so the whole idea here was to create that kind of space in downtown, in a neighborhood that was difficult to fit into. And it was my theory, or my point of view, that one didn ’ t upstage the neighborhood â one made accommodations. I tried to be inclusive, to include the buildings in the neighborhood, whether they were buildings I liked or not. In the ’ 60s I started working with paper furniture and made a bunch of stuff that was very successful in Bloomingdale ’ s. We even made flooring, walls and everything, out of cardboard. And the success of it threw me for a loop. I couldn ’ t deal with the success of furniture â I wasn ’ t secure enough as an architect â and so I closed it all up and made furniture that nobody would like. So, nobody would like this. And it was in this, preliminary to these pieces of furniture, that Ricky and I worked on furniture by the slice. And after we failed, I just kept failing. The piece on the left â and that ultimately led to the piece on the right â happened when the kid that was working on this took one of those long strings of stuff and folded it up to put it in the wastebasket. And I put a piece of tape around it, as you see there, and realized you could sit on it, and it had a lot of resilience and strength and so on. So, it was an accidental discovery. I got into fish. I mean, the story I tell is that I got mad at postmodernism â at po-mo â and said that fish were 500 million years earlier than man, and if you ’ re going to go back, we might as well go back to the beginning. And so I started making these funny things. And they started to have a life of their own and got bigger â as the one glass at the Walker. And then, I sliced off the head and the tail and everything and tried to translate what I was learning about the form of the fish and the movement. And a lot of my architectural ideas that came from it â accidental, again â it was an intuitive kind of thing, and I just kept going with it, and made this proposal for a building, which was only a proposal. I did this building in Japan. I was taken out to dinner after the contract for this little restaurant was signed. And I love sake and Kobe and all that stuff. And after I got â I was really drunk â I was asked to do some sketches on napkins. And I made some sketches on napkins â little boxes and Morandi-like things that I used to do. And the client said,"Why no fish?"And so I made a drawing with a fish, and I left Japan. Three weeks later, I received a complete set of drawings saying we ' d won the competition. Now, it ' s hard to do. It ' s hard to translate a fish form, because they ' re so beautiful â perfect â into a building or object like this. And Oldenburg, who I work with a little once in a while, told me I couldn ' t do it, and so that made it even more exciting. But he was right â I couldn ' t do the tail. I started to get the head OK, but the tail I couldn ' t do. It was pretty hard. The thing on the right is a snake form, a ziggurat. And I put them together, and you walk between them. It was a dialog with the context again. Now, if you saw a picture of this as it was published in Architectural Record â they didn ' t show the context, so you would think,"God, what a pushy guy this is."But a friend of mine spent four hours wandering around here looking for this restaurant. Couldn ' t find it. So... As for craft and technology and all those things that you ' ve all been talking about, I was thrown for a complete loop. This was built in six months. The way we sent drawings to Japan : we used the magic computer in Michigan that does carved models, and we used to make foam models, which that thing scanned. We made the drawings of the fish and the scales. And when I got there, everything was perfect â except the tail. So, I decided to cut off the head and the tail. And I made the object on the left for my show at the Walker. And it ' s one of the nicest pieces I ' ve ever made, I think. And then Jay Chiat, a friend and client, asked me to do his headquarters building in L. A. For reasons we don ' t want to talk about, it got delayed. Toxic waste, I guess, is the key clue to that one. And so we built a temporary building â I ' m getting good at temporary â and we put a conference room in that ' s a fish. And, finally, Jay dragged me to my hometown, Toronto, Canada. And there is a story â it ' s a real story â about my grandmother buying a carp on Thursday, bringing it home, putting it in the bathtub when I was a kid. I played with it in the evening. When I went to sleep, the next day it wasn ' t there. And the next night, we had gefilte fish. And so I set up this interior for Jay ' s offices and I made a pedestal for a sculpture. And he didn ' t buy a sculpture, so I made one. I went around Toronto and found a bathtub like my grandmother ' s, and I put the fish in. It was a joke. I play with funny people like [Claes] Oldenburg. We ' ve been friends for a long time. And we ' ve started to work on things. A few years ago, we did a performance piece in Venice, Italy, called"Il Corso del Coltello"â the Swiss Army knife. And most of the imagery is â Claes ', but those two little boys are my sons, and they were Claes ' assistants in the play. He was the Swiss Army knife. He was a souvenir salesman who always wanted to be a painter, and I was Frankie P. Toronto. P for Palladio. Dressed up like the AT&T building by Claes â with a fish hat. The highlight of the performance was at the end. This beautiful object, the Swiss Army knife, which I get credit for participating in. And I can tell you â it ' s totally an Oldenburg. I had nothing to do with it. The only thing I did was, I made it possible for them to turn those blades so you could sail this thing in the canal, because I love sailing. We made it into a sailing craft. I ' ve been known to mess with things like chain link fencing. I do it because it ' s a curious thing in the culture, when things are made in such great quantities, absorbed in such great quantities, and there ’ s so much denial about them. People hate it. And I ’ m fascinated with that, which, like the paper furniture â it ’ s one of those materials. And I ’ m always drawn to that. And so I did a lot of dirty things with chain link, which nobody will forgive me for. But Claes made homage to it in the Loyola Law School. And that chain link is really expensive. It ’ s in perspective and everything. And then we did a camp together for children with cancer. And you can see, we started making a building together. Of course, the milk can is his. But we were trying to collide our ideas, to put objects next to each other. Like a Morandi â like the little bottles â composing them like a still life. And it seemed to work as a way to put he and I together. Then Jay Chiat asked me to do this building on this funny lot in Venice, and I started with this three-piece thing, and you entered in the middle. And Jay asked me what I was going to do with the piece in the middle. And he pushed that. And one day I had a â oh, well, the other way. I had the binoculars from Claes, and I put them there, and I could never get rid of them after that. Oldenburg made the binoculars incredible when he sent me the first model of the real proposal. It made my building look sick. And it was this interaction between that kind of, up-the-ante stuff that became pretty interesting. It led to the building on the left. And I still think the Time magazine picture will be of the binoculars, you know, leaving out the â what the hell. I use a lot of metal in my work, and I have a hard time connecting with the craft. The whole thing about my house, the whole use of rough carpentry and everything, was the frustration with the crafts available. I said,”If I can ’ t get the craft that I want, I ’ ll use the craft I can get.”There were plenty of models for that, in Rauschenberg and Jasper Johns, and many artists who were making beautiful art and sculpture with junk materials. I went into the metal because it was a way of building a building that was a sculpture. And it was all of one material, and the metal could go on the roof as well as the walls. The metalworkers, for the most part, do ducts behind the ceilings and stuff. I was given an opportunity to design an exhibit for the metalworkers ’ unions of America and Canada in Washington, and I did it on the condition that they become my partners in the future and help me with all future metal buildings, etc. etc. And it ’ s working very well to have these people, these craftsmen, interested in it. I just tell the stories. It ’ s a way of connecting, at least, with some of those people that are so important to the realization of architecture. The metal continued into a building â Herman Miller, in Sacramento. And it ’ s just a complex of factory buildings. And Herman Miller has this philosophy of having a place â a people place. I mean, it ’ s kind of a trite thing to say, but it is real that they wanted to have a central place where the cafeteria would be, where the people would come and where the people working would interact. So it ’ s out in the middle of nowhere, and you approach it. It ’ s copper and galvanize. I used the galvanize and copper in a very light gauge, so it would buckle. I spent a lot of time undoing Richard Meier ’ s aesthetic. Everybody ’ s trying to get the panels perfect, and I always try to get them sloppy and fuzzy. And they end up looking like stone. This is the central area. There ’ s a ramp. And that little dome in there is a building by Stanley Tigerman. Stanley was instrumental in my getting this job. And when I was awarded the contract I, at the very beginning, asked the client if they would let Stanley do a cameo piece with me. Because these were ideas that we were talking about, building things next to each other, making â it ’ s all about [a] metaphor for a city, maybe. And so Stanley did the little dome thing. And we did it over the phone and by fax. He would send me a fax and show me something. He ’ d made a building with a dome and he had a little tower. I told him,”No, no, that ’ s too ongepotchket. I don ’ t want the tower.”So he came back with a simpler building, but he put some funny details on it, and he moved it closer to my building. And so I decided to put him in a depression. I put him in a hole and made a kind of a hole that he sits in. And so then he put two bridges â this all happened on the fax, going back and forth over a couple of weeks ’ period. And he put these two bridges with pink guardrails on it. And so then I put this big billboard behind it. And I call it,”David and Goliath.”And that ’ s my cafeteria. In Boston, we had that old building on the left. It was a very prominent building off the freeway, and we added a floor and cleaned it up and fixed it up and used the kind of â I thought â the language of the neighborhood, which had these cornices, projecting cornices. Mine got a little exuberant, but I used lead copper, which is a beautiful material, and it turns green in 100 years. Instead of, like, copper in 10 or 15. We redid the side of the building and re-proportioned the windows so it sort of fit into the space. And it surprised both Boston and myself that we got it approved, because they have very strict kind of design guideline, and they wouldn ’ t normally think I would fit them. The detailing was very careful with the lead copper and making panels and fitting it tightly into the fabric of the existing building. In Barcelona, on Las Ramblas for some film festival, I did the Hollywood sign going and coming, made a building out of it, and they built it. I flew in one night and took this picture. But they made it a third smaller than my model without telling me. And then more metal and some chain link in Santa Monica â a little shopping center. And this is a laser laboratory at the University of Iowa, in which the fish comes back as an abstraction in the back. It ’ s the support labs, which, by some coincidence, required no windows. And the shape fit perfectly. I just joined the points. In the curved part there ’ s all the mechanical equipment. That solid wall behind it is a pipe chase â a pipe canyon â and so it was an opportunity that I seized, because I didn ’ t have to have any protruding ducts or vents or things in this form. It gave me an opportunity to make a sculpture out of it. This is a small house somewhere. They ’ ve been building it so long I don ’ t remember where it is. It ’ s in the West Valley. And we started with the stream and built the house along the stream â dammed it up to make a lake. These are the models. The reality, with the lake â the workmanship is pretty bad. And it reminded me why I play defensively in things like my house. When you have to do something really cheaply, it ’ s hard to get perfect corners and stuff. That big metal thing is a passage, and in it is â you go downstairs into the living room and then down into the bedroom, which is on the right. It ’ s kind of like a whole built town. I was asked to do a hospital for schizophrenic adolescents at Yale. I thought it was fitting for me to be doing that. This is a house next to a Philip Johnson house in Minnesota. The owners had a dilemma â they asked Philip to do it. He was too busy. He didn ’ t recommend me, by the way. We ended up having to make it a sculpture, because the dilemma was, how do you build a building that doesn ’ t look like the language? Is it going to look like this beautiful estate is sub-divided? Etc. etc. You ’ ve got the idea. And so we finally ended up making it. These people are art collectors. And we finally made it so it appears very sculptural from the main house and all the windows are on the other side. And the building is very sculptural as you walk around it. It ’ s made of metal and the brown stuff is Fin-Ply â it ’ s that formed lumber from Finland. We used it at Loyola on the chapel, and it didn ’ t work. I keep trying to make it work. In this case we learned how to detail it. In Cleveland, there ’ s Burnham Mall, on the left. It ’ s never been finished. Going out to the lake, you can see all those new buildings we built. And we had the opportunity to build a building on this site. There ’ s a railroad track. This is the city hall over here somewhere, and the courthouse. And the centerline of the mall goes out. Burnham had designed a railroad station that was never built, and so we followed. Sohio is on the axis here, and we followed the axis, and they ’ re two kind of goalposts. And this is our building, which is a corporate headquarters for an insurance company. We collaborated with Oldenburg and put the newspaper on top, folded. The health club is fastened to the garage with a C-clamp, for Cleveland. You drive down. So it ’ s about a 10-story C-clamp. And all this stuff at the bottom is a museum, and an idea for a very fancy automobile entry. This owner has a pet peeve about bad automobile entries. And this would be a hotel. So, the centerline of this thing â we ’ d preserve it, and it would start to work with the scale of the new buildings by Pelli and Kohn Pederson Fox, etc., that are underway. It ’ s hard to do high-rise. I feel much more comfortable down here. This is a piece of property in Brentwood. And a long time ago, about ’ 82 or something, after my house â I designed a house for myself that would be a village of several pavilions around a courtyard â and the owner of this lot worked for me and built that actual model on the left. And she came back, I guess wealthier or something â something happened â and asked me to design a house for her on this site. And following that basic idea of the village, we changed it as we got into it. I locked the house into the site by cutting the back end â here you see on the photographs of the site â slicing into it and putting all the bathrooms and dressing rooms like a retaining wall, creating a lower level zone for the master bedroom, which I designed like a kind of a barge, looking like a boat. And that ’ s it, built. The dome was a request from the client. She wanted a dome somewhere in the house. She didn ’ t care where. When you sleep in this bedroom, I hope â I mean, I haven ’ t slept in it yet. I ’ ve offered to marry her so I could sleep there, but she said I didn ’ t have to do that. But when you ’ re in that room, you feel like you ’ re on a kind of barge on some kind of lake. And it ’ s very private. The landscape is being built around to create a private garden. And then up above there ’ s a garden on this side of the living room, and one on the other side. These aren ’ t focused very well. I don ’ t know how to do it from here. Focus the one on the right. It ’ s up there. Left â it ’ s my right. Anyway, you enter into a garden with a beautiful grove of trees. That ’ s the living room. Servants ’ quarters. A guest bedroom, which has this dome with marble on it. And then you enter into the living room and then so on. This is the bedroom. You come down from this level along the stairway, and you enter the bedroom here, going into the lake. And the bed is back in this space, with windows looking out onto the lake. These Stonehenge things were designed to give foreground and to create a greater depth in this shallow lot. The material is lead copper, like in the building in Boston. And so it was an intent to make this small piece of land â it ’ s 100 by 250 â into a kind of an estate by separating these areas and making the living room and dining room into this pavilion with a high space in it. And this happened by accident that I got this right on axis with the dining room table. It looks like I got a Baldessari painting for free. But the idea is, the windows are all placed so you see pieces of the house outside. Eventually this will be screened â these trees will come up â and it will be very private. And you feel like you ’ re in your own kind of village. This is for Michael Eisner â Disney. We ’ re doing some work for him. And this is in Anaheim, California, and it ’ s a freeway building. You go under this bridge at about 65 miles an hour, and there ’ s another bridge here. And you ’ re through this room in a split second, and the building will sort of reflect that. On the backside, it ’ s much more humane â entrance, dining hall, etc. And then this thing here â I ’ m hoping as you drive by you ’ ll hear the picket fence effect of the sound hitting it. Kind of a fun thing to do. I ’ m doing a building in Switzerland, Basel, which is an office building for a furniture company. And we struggled with the image. These are the early studies, but they have to sell furniture to normal people, so if I did the building and it was too fancy, then people might say,”Well, the furniture looks OK in his thing, but no, it ain ’ t going to look good in my normal building.”So we ’ ve made a kind of pragmatic slab in the second phase here, and we ’ ve taken the conference facilities and made a villa out of them so that the communal space is very sculptural and separate. And you ’ re looking at it from the offices and you create a kind of interaction between these pieces. This is in Paris, along the Seine. Palais des Sports, the Gare de Lyon over here. The Minister of Finance â the guy that moved from the Louvre â goes in here. There ’ s a new library across the river. And back in here, in this already treed park, we ’ re doing a very dense building called the American Center, which has a theater, apartments, dance school, an art museum, restaurants and all kinds of â it ’ s a very dense program â bookstores, etc. In a very tight, small â this is the ground level. And the French have this extraordinary way of screwing things up by taking a beautiful site and cutting the corner off. They call it the plan coupe. And I struggled with that thing â how to get around the corner. These are the models for it. I showed you the other model, the one â this is the way I organized myself so I could make the drawing â so I understood the problem. I was trying to get around this plan coupe â how do you do it? Apartments, etc. And these are the kind of study models we did. And the one on the left is pretty awful. You can see why I was ready to commit suicide when this one was built. But out of it came finally this resolution, where the elevator piece worked frontally to this, parallel to this street, and also parallel to here. And then this kind of twist, with this balcony and the skirt, kind of like a ballerina lifting her skirt to let you into the foyer. The restaurants here â the apartments and the theater, etc. So it would all be built in stone, in French limestone, except for this metal piece. And it faces into a park. And the idea was to make this express the energy of this. On the side facing the street it ’ s much more normal, except I slipped a few mansards down, so that coming on the point, these housing units made a gesture to the corner. And this will be some kind of high-tech billboard. If any of you guys have any ideas for it, please contact me. I don ’ t know what to do. Jay Chiat is a glutton for punishment, and he hired me to do a house for him in the Hamptons. And it ’ s got a fish. And I keep thinking,”This is going to be the last fish.”It ’ s like a drug addict. I say,”I ’ m not going to do it anymore â I don ’ t want to do it anymore â I ’ m not going to do it.”And then I do it. There it is. But it ’ s the living room. And this piece here is â I don ’ t know what it is. I just added it so that we ’ d have enough money in the budget so we could take something out. This is Euro Disney, and I ’ ve worked with all of the guys that presented to you earlier. We ’ ve had a lot of fun working together. I think I ’ m from Mars for them, and they are for me, but somehow we all manage to work together, and I think, productively. So far. This is a shopping thing. You come into the Magic Kingdom and the hotel that Tony Baxter ’ s group is doing out here. And then this is a kind of a shopping mall, with a rodeo and restaurants. And another restaurant. What I did â because of the Paris skies being quite dull, I made a light grid that ’ s perpendicular to the train station, to the route of the train. It looks like it ’ s kind of been there, and then crashed all these simpler forms into it. The light grid will have a light, be lit up at night and give a kind of light ceiling. In Switzerland â Germany, actually â on the Rhine across from Basel, we did a furniture factory and a furniture museum. And I tried to â there ’ s a Nick Grimshaw building over here, there ’ s an Oldenburg sculpture over here â I tried to make a relationship urbanistically. And I don ’ t gave good slides to show â it ’ s just been completed â but this piece here is this building, and these pieces here and here. And as you pass by it ’ s always part â you see it as all of these pieces accrue and become part of an overall neighborhood. It ’ s plaster and just zinc. And you wonder, if this is a museum, what it ’ s going to be like inside? If it ’ s going to be so busy and crazy that you wouldn ’ t show anything, and just wait. I ’ m so cunning and clever â I made it quiet and wonderful. But on the outside it does scream out at you a bit. It ’ s actually basically three square rooms with a couple of skylights and stuff. And from the building in the back, you see it as an iceberg floating by in the hills. I know I ’ m over time. See, that skylight goes down and becomes that one. So it ’ s pretty quiet inside. This is the Disney Hall â the concert hall. It ’ s a complicated project. It has a chamber hall. It ’ s related to an existing Chandler Pavilion that was built with a lot of love and tears and caring. And it ’ s not a great building, but I approached it optimistically, that we would make a compositional relationship between us that would strengthen both of us. And the plan of this â it ’ s a concert hall. This is the foyer, which is kind of a garden structure. There ’ s commercial at the ground floor. These are offices, which, really, in the competition, we didn ’ t have to design. But finally, there ’ s a hotel there. These were the kind of relationships made to the Chandler, composing these elevations together and relating them to the buildings that existed â to MOCA, etc. The acoustician in the competition gave us criteria, which led to this compartmentalized scheme, which we found out after the competition would not work at all. But everybody liked these forms and liked the space, and so that ’ s one of the problems of a competition. You have to then try and get that back in some way. And we studied many models. This was our original model. These were the three buildings that were the ideal â the Concertgebouw, Boston and Berlin. Everybody liked the surround. Actually, this is the smallest hall in size, and it has more seats than any of these because it has double balconies. Our client doesn ’ t want balconies, so â and when we met our new acoustician, he told us this was the right shape or this was the right shape. And we tried many shapes, trying to get the energy of the original design within an acoustical, acceptable format. We finally settled on a shape that was the proportion of the Concertgebouw with the sloping outside walls, which the acoustician said were crucial to this and later decided they weren ’ t, but now we have them. And our idea is to make the seating carriage very sculptural and out of wood and like a big boat sitting in this plaster room. That ’ s the idea. And the corners would have skylights and these columns would be structural. And the nice thing about introducing columns is they give you a kind of sense of proscenium from wherever you sit, and create intimacy. Now, this is not a final design â these are just on the way to being â and so I wouldn ’ t take it literally, except the feeling of the space. We studied the acoustics with laser stuff, and they bounce them off this and see where it all works. But you get the sense of the hall in section. Most halls come straight down into a proscenium. In this case we ’ re opening it back up and getting skylights in the four corners. And so it will be quite a different shape. The original building, because it was frog-like, fit nicely on the site and cranked itself well. When you get into a box, it ’ s harder to do it â and here we are, struggling with how to put the hotel in. And this is a teapot I designed for Alessi. I just stuck it on there. But this is how I do work. I do take pieces and bits and look at it and struggle with it and cut it away. And of course it ’ s not going to look like that, but it is the crazy way I tend to work. And then finally, in L. A. I was asked to do a sculpture at the foot of Interstate Bank Tower, the highest building in L. A. Larry Halprin is doing the stairs. And I was asked to do a fish, and so I did a snake. It ’ s a public space, and I made it kind of a garden structure, and you can go in it. It ’ s a kiva, and Larry ’ s putting some water in there, and it works much better than a fish. In Barcelona I was asked to do a fish, and we ’ re working on that, at the foot of a Ritz-Carlton Tower being done by

Skidmore, Owings and Merrill. And the Ritz-Carlton Tower is being designed with exposed steel, non-fire proof, much like those old gas tanks. And so we took the language of this exposed steel and used it, perverted it, into the form of the fish, and created a kind of a 19th- century contraption that looks like, that will sit â this is the beach and the harbor out in front, and this is really a shopping center with department stores. And we split these bridges. Originally, this was all solid with a hole in it. We cut them loose and made several bridges and created a kind of a foreground for this hotel. We showed this to the hotel people the other day, and they were terrified and said that nobody would come to the Ritz-Carlton anymore, because of this fish. And finally, I just threw these in â Lou Danziger. I didn ’ t expect Lou Danziger to be here, but this is a building I did for him in 1964, I think. A little studio â and it ’ s sadly for sale. Time goes on. And this is my son working with me on a small fast-food thing. He designed the robot as the cashier, and the head moves, and I did the rest of it. And the food wasn ’ t as good as the stuff, and so it failed. It should have been the other way around â the food should have been good first. It didn ’ t work. Thank you very much.

11 POS Dim 6

Text Sample 827: POS Dim 6 – 1984 – Score 58.00 – 1984/t000297.txt

In this rather long sort of **marathon presentation**, I ’ ve tried to break it up into three parts : the first being a whole lot of examples on how it can be a little bit more **pleasurable** to deal with a computer and really address the qualities of the human **interface**. And these will be some simple design qualities and they will also be some qualities of, if you will, the intelligence of interaction. Then the second part will really just be examples of new technologies — new media falling very much into that mold. Again, I will go through them as fast as possible. And then the last one will be some examples I ’ ve been able to collect, which I think **illustrate** this at least as best I can, in the world of entertainment. People have this belief — and I share most of it — that we will be using the TV screens or their equivalents for electronic books of the future. But then you think,”My God! What a terrible image you get when you look at still pictures on TV.”Well, it doesn ’ t have to be terrible. And that is a slide taken from a TV set and it was pre- processed to be very sympathetic to the TV medium, and it absolutely looks beautiful. Well, what ’ s happened? How did people get into this mess? Where you are now, all of a sudden, sitting in front of personal computers and video text — teletext systems, and somewhat horrified by what you see on the screen? Well, you have to remember that TV was designed to be looked at eight times the distance of the **diagonal**. So you get a 13-inch, 19-inch, whatever, TV, and then you should multiply that by eight and that ’ s the distance you should sit away from the TV set. Now we ’ ve put people 18 inches in front of a TV, and all the **artifacts** that none of the original designers expected to be seen, all of a sudden, are staring you in the face : the shadow **mask**, the scan lines, all of that. And they can be treated very easily ; there are actually ways of getting rid of them, there are actually ways of just making absolutely beautiful pictures. I ’ m talking here a little bit about **display** technologies. Let me talk about how you might input information. And my favorite example is always fingers. I ’ m very interested in **touch-sensitive displays**. High-tech, **high-touch**. Isn ’ t that what some of you said? It ’ s certainly a very important medium for input, and a lot of people think that fingers are a very low- resolution sort of **stylus** for inputting to a **display**. In fact, they ' re not : it ' s really a very, very high-resolution input medium — you have to just do it twice, you have to touch the screen and then rotate your finger slightly — and you can move a **cursor** with great accuracy. And so when you see on the market these systems that have just a few light emitting **diodes** on the side and are very low resolution, it ' s nice that they exist because it still is better than nothing. But it, in some sense, misses the point : namely, that fingers are a very, very high-resolution input medium. Now, what are some of the other advantages? Well, the one advantage is that you don ' t have to pick them up, and people don ' t realize how important that is — not having to pick up your fingers to use them. When you think for a second of the mouse on Macintosh — and I will not criticize the mouse too much — when you ' re typing — what you have — you want to now put something — first of all, you ' ve got to find the mouse. You have to probably stop. Maybe not come to a grinding halt, but you ' ve got to sort of find that mouse. Then you find the mouse, and you ' re going to have to wiggle it a little bit to see where the **cursor** is on the screen. And then when you finally see where it is, then you ' ve got to move it to get the **cursor** over there, and then —"Bang"— you ' ve got to hit a button or do whatever. That ' s four separate steps versus typing and then touching and typing and just doing it all in one motion — or **one-and-a-half**, depending on how you want to count. Again, what I ' m trying to do is just **illustrate** the kinds of problems that I think face the designers of new computer systems and entertainment systems and educational systems from the perspective of the quality of that **interface**. And another advantage, of course, of using fingers is you have 10 of them. And we have never known how to do this technically, so this slide is a fake slide. We never succeeded in using ten fingers, but there are certain things you can do, obviously, with more than one-finger input, which is rather fascinating. What we did stumble across was something... Again, which is **typical** of the computer field, is when you have a bug that you can ' t get rid of you turn it into a feature. And maybe... maybe a mouse is a new kind of bug. But the bug in our case was in **touch-sensitive displays** : we wanted to be able to draw — you know, rub your finger across the screen to input continuous points — and there was just too much friction created between your finger and the glass — if glass was the **substrate**, which it usually is. So we found that that actually was a feature in the sense you could build a **pressure-sensitive display**. And when you touch it with your finger, you can actually, then, introduce all the forces on the face of that screen, and that actually has a certain amount of value. Let me see if I can load another disc and show you, quickly, an example. Now, imagine a screen, which is not only **touch-sensitive** now, it ' s **pressure-sensitive**. And it ' s **pressure-sensitive** to the forces both in the plane of the screen — X, Y, and Z at least in one direction ; we couldn ' t figure out how to come in the other direction. But let me get rid of the slide, and let ' s see if this comes on. OK. So there is the **pressure-sensitive display** in operation. The person ' s just, if you will, pushing on the screen to make a curve. But this is the interesting part. I want to stop it for a second because the **movie** is very badly made. And the particular **display** was built about six years ago, and when we moved from one room to another room, a rather large person sat on it and it got destroyed. So all we have is this record. But imagine that screen having lots of objects on it and the person has touched an object — one of N — like he did there, and then pushed on it. Now, imagine a program where some of those objects are physically heavy and some are light : one is an **anvil** on a fuzzy rug and the other one is a **ping-pong ball** on a sheet of glass. And when you touch it, you have to really push very hard to move that **anvil** across the screen, and yet you touch the **ping-pong ball** very lightly and it just **scoots** across the screen. And what you can do — oops, I didn ’ t mean to do that — what you can do is actually feed back to the user the feeling of the physical properties. So again, they don ’ t have to be weight ; they could be a general trying to move **troops**, and he ’ s got to move an aircraft carrier versus a little boat. In fact, they funded it for that very reason. The whole notion, then, is one that at the **interface** there are physical properties in that **transducer** — in this case it ’ s pressure and touches — that allow you to present things to the user that you could never present before. So it ’ s not simply looking at the quality or, if you will, the luxury of that **interface**, but it ’ s actually looking at the idea of presenting things that previously couldn ’ t be presented before. I want to move on to another example, which is one of a different sort, where we ’ re trying to use computer and video disc technology now to come up with a new kind of book. Here, the idea is that you ’ re going to take this book, if you will, and it ’ s going to come alive. You ’ re going to sort of breathe life into it. We are so used to doing monologues. **Filmmakers**, for example, are the experts in monologue making : you make a film and it has a **well-formed** beginning, middle and end, and in some sense the art of it is that. And you then say,”There ’ s an opportunity for making conversational **movies**.”Well, what does that mean? And it sort of **nibbles** at the core of the whole profession and all the assumptions of that medium. So, book writing is the same thing. What I ’ ll show you very quickly is a new kind of book where it is mixed now with... all sorts of things live in there, but you have to keep a few things in mind. One is that this book knows about itself. Each frame of the **movie** has information about itself. So it knows, or at least there is computer-readable information in the medium itself. It ’ s just not a static **movie** frame. That ’ s one thing. The other is that you have to realize that it is a random access medium, and you can, in fact, branch and expand and elaborate and shrink. And here — again, my favorite example — is the **cookbook**, the”Larousse Gastronomique.”And I think I use the example all too often, but it ’ s a great one because there is a classic ending in that little encyclopedia-style **cookbook** that tells you how to do something like penguin, and you get to the end of the recipe and it says,”Cook until done.”Now, that would be, if you will, the top green track, which doesn ’ t mean too much. But you might have to elaborate for me or for somebody who isn ’ t an expert, and say,”Cook at 380 degrees for 45 minutes.”And then for a real **beginner**, you would go down even further and elaborate more — say,”Open the oven, preheat, wait for the light to go out, open the door, don ’ t leave it open too long, put the penguin in and shut the door...”whatever. And that ’ s a much more elaborate one than you **dribble** back. That ’ s one kind of use of random access. And the other is where you want to explain the same thing in different ways. If you ’ re in a classroom situation and somebody asks a question, the last thing you do is repeat what you just said. You try and think of a different way of saying the same thing, or if you know the particular student and that student ’ s cognitive style, then you might say it in a way that you think would have a good **impedance** match with that student. There are all sorts of techniques you will use — and again, this is a different kind of branching. So, what I will show you is... it ’ s a rather boring book, but I ’ m afraid sometimes you have to do boring books because your sponsors aren ’ t necessarily interested in fiction and entertainment. And this is a book on how to repair a transmission. Now, I don ’ t even know what **vintage** the transmission is, but let me just show you very quickly some of it, and we ’ ll move on. Narrator : And continue to get descriptions for each of these chapters. Nicholas Negroponte : Now, this is his table of contents. Just a picture of the transmission, and as you rub your finger across the transmission it highlights the **various** parts. Narrator :

When I find a chapter that I want to see, I just touch the text and the system will format pages for me to read. The words or phrases that are lit up in red are glossary words, so I can get a different definition by just touching the word, and the definition appears, **superimposed** over the illustration. NN : This is about the oil pan, or the oil **filter** and all that. This is relatively important because it sets the page... Narrator : This is another example of a page with glossary words highlighted in red. I can get a definition of these words just by touching them, and the definition will appear in the illustration corner. I can get back to the illustration, but in this case it ' s not a single frame, but it ' s actually a **movie** of someone coming into the frame and doing the repair that ' s described in the text. The **two-headed** slider is a speed control that allows me to watch the **movie** at **various** speeds, in forward or reverse. And the **movie** is **displayed** as a full frame **movie**. I can go back to the beginning... and play the **movie** at full speed. Here ' s another step-by-step procedure, only in this case — NN : Okay, this **movie** is... Everybody ' s heard of sound-sync **movies** — this is text-sync **movies**, so as the **movie** plays, the text gets highlighted. We highlight the text as we go through the **movie**. Repairman :... Not too far out. Front **poles**, preferably. Don ' t **loosen** them too far. If you **loosen** them too far, you ' ll have a big mess. NN : I suspect that some of you might not even understand that language. OK. I ' m at the third and last part of this, which I said I would make an attempt to at least give you some examples that may be more directly related to the world of entertainment. And of course, good education has got to be good entertainment, so my first example will be drawn from a very recent experiment that we ' ve been doing — in this case, in Senegal — where we have tried to use personal computers as a **pedagogical** medium. But not as teaching machines at all ; the whole notion is to use this as an instrument where there is a complete reversal of roles — the child is, if you will, the teacher and the machine is the student — and the art of computer programming is a vehicle that sort of approximates thinking about thinking. But teaching kids programming per se is utterly irrelevant. And there are just a few slides I want to go through, but there ' s a story I ' d like to tell. And that was when, before we did this in any developing countries — we ' re doing it, in fact, in three developing countries right now : Pakistan, Colombia and Senegal — we did it in some pretty rough areas of New York City. And one child, whose name I ' ve forgotten, was about seven or eight years old, absolutely considered mentally **handicapped** — couldn ' t read, didn ' t even make it in the lowest section of the school ' s classes — and was pretty much not in school, though physically there. But did hang around the, quote,"computer room,"where there were quite a few computers, and learned this particular language called Logo — and learned it with great ease and found it a lot of fun, it was very interesting. And one day, by chance, some visitors from the NIE came by in their double-breasted suits looking at this setup, and none of the children who were normally there, except for this one child, were there. He was, and he said,"Let me show you how this works,"and they got an absolutely ingenuous, wonderful description of Logo. And the child was just zipping right through it, showing them all sorts of things until they asked him how to do something which he couldn ' t explain and so he flipped through the manual, found the explanation and typed the command and got it to do what they asked. They were delighted, and by the time it was time to go see the principal, whom they ' d actually come to see — not the computer room — they went upstairs and they said,"This is absolutely **remarkable**! That child was very **articulate** and showed us and even dealt with the things he couldn ' t do automatically with that manual. It was just absolutely fantastic."The principal said,"There ' s a dreadful mistake, because that child can ' t read. And you obviously have been

hoodwinked or you ’ ve talked about somebody else.”And they all got up and they all went downstairs and the child was still there. And they did something very intelligent : they asked the child,”Can you read?”And the child said,”No, I can ’ t.”And then they said,”But wait a minute. You just looked through that manual and you found...”and he said,”Oh, but that ’ s not reading.”And so they said,”Well, what ’ s reading then?”He says,”Well, reading is this junk they give me in little books to read. It ’ s absolutely irrelevant, and I get nothing for it. But here, with a little bit of effort I get a lot of return.”And it really meant something to the child. The child read beautifully, it turned out, and was really very competent. So it actually meant something. And that story has many other anecdotes that are similar, but wow. The key to the future of computers in education is right there, and it is : when does it mean something to a child? There is a myth, and it truly is a myth : we believe — and I ’ m sure a lot of you believe in this room — that it is harder to read and write than it is to learn how to speak. And it ’ s not, but we think speech —”My God, little children pick it up somehow, and by the age of two they ’ re doing a mediocre job, and by three and four they ’ re speaking reasonably well. And yet you ’ ve got to go to school to learn how to read, and you have to sit in a classroom and somebody has to teach you. Hence, it must be harder.”Well, it ’ s not harder. What the truth is is that speaking has great value to a child ; the child can get a great deal by talking to you. Reading and writing is utterly useless. There is no reason for a child to read and write except blind faith, and that it ’ s going to help you. So what happens is you go to school and people say,”Just believe me, you ’ re going to like it. You ’ re going to like reading,”and just read and read. On the other hand, you give a kid — a three-year-old kid — a computer and they type a little command and — **Poof**! — something happens. And all of a sudden... You may not call that reading and writing, but a certain bit of typing and reading stuff on the screen has a huge payoff, and it ’ s a lot of fun. And in fact, it ’ s a powerful educational instrument. Well, in Senegal we found that this was the traditional classroom : 120 kids — three per desk — one teacher, a little bit of chalk. This student was one of our first students, and it ’ s the girl on the left **leaning** with her **chalkboard**, and she came... within two days — I want to show you the program she wrote, and remember her hairstyle. And that is the program she made. That ’ s what meant something to her, is doing the hair pattern, and actually did it within two days — an hour each day — and found it was, to her, absolutely the most meaningful piece... But rooted in that, little did she know how much knowledge she was acquiring about geometry and just math and logic and all the rest. And again, I could talk for three hours about this subject. I will come to my last example and then quit. And my last example — as some of my former colleagues, whom I see in the room, can imagine what it will be. Yes, it is. It ’ s our work — that was a while ago, and it still is my favorite project — of **teleconferencing**. And the reason it remains a favorite project is that we were asked to do a **teleconferencing** system where you had the following situation : you had five people at five different sites — they were known people — and you had to have these people in **teleconference**, such that each one was utterly convinced that the other four were physically present. Now, that is sufficiently **zany** that we would, obviously, jump to the bait, and we did. And the fact that we knew the people — we had to take a page out of the history of Walt Disney — we actually went so far as to build CRTs in the shapes of the people ’ s faces. So if I wanted to call my friend Peter Sprague on the phone, my secretary would get his head out and bring it and set it on the desk, and that would be the TV used for the occasion. And it ’ s uncanny : there ’ s no way I can explain to you the amount of eye contact you get with that physical face projected on a 3D CRT of that sort. The next thing that we had to do is to persuade them that there needed to be **spatial** correspondence, which is straightforward, but again, it ’ s something that didn ’ t fall naturally out of a telecommunications or computing style of thinking ; it was a very, if you will, architectural or **spatial** concept. And that was to recognize that when you sit around the table, the actual location of the people becomes rather important. And when somebody gets up, in fact, to go answer a phone or use a bathroom or something, the empty seat becomes, if you will, that person. And you point frequently to the empty seat and you say,”He or she wouldn ’ t agree,”and the empty chair is that person and the spatiality is crucial. So we said,”Well, these will be on round tables and the order around the table had to be the same, so that at my site, I would be, if you will, real and then at each other ’ s site you ’ d have these plastic heads. And the plastic heads, sometimes you want to project them. And there are a number of schemes, which I don ’ t want to dwell on, but this is the one that we finally used where we projected onto rear screen material that was molded in the face — literally in the face of the person. And I ’ ll show you one more slide, where this is actually made from something called a solid photograph and is the screen. Now, we track, on the person ’ s head, the head motions — so we transmit with a video the head positions — and so this head moves in about two axes. So if I, all of a sudden, turn to the person to my left and start talking to that person, then at the person to my right ’ s site, he ’ ll see these two plastic heads talking to each other. And then if that person interrupts, then those two heads may turn. And it really is reconstructing, quite accurately, **teleconferencing**.

Of the five senses, vision is the one that I appreciate the most, and it ’ s the one that I can least take for granted. I think this is partially due to my father, who was blind. It was a fact that he didn ’ t make much of a fuss about, usually. One time in Nova Scotia, when we went to see a total eclipse of the sun — Yeah, same one as in the Carly Simon song, which may or may not refer to James Taylor, Warren Beatty or Mick Jagger ; we ’ re not really sure. They handed out these dark plastic viewers that allowed us to look directly at the sun without damaging our eyes. But Dad got really scared ; he didn ’ t want us doing that. He wanted us instead to use these cheap cardboard viewers, so that there was no chance at all that our eyes would be damaged. I thought this was a little strange at the time. What I didn ’ t know at the time was that my father had actually been born with perfect eyesight. When he and his sister Martha were just very little, their mom took them out to see a total eclipse — or actually, a solar eclipse — and not long after that, both of them started losing their eyesight. Decades later, it turned out that the source of their blindness was most likely some sort of bacterial infection. As near as we can tell, it had nothing whatsoever to do with that solar eclipse, but by then my grandmother had already gone to her grave thinking it was her fault. So, Dad graduated Harvard in 1946, married my mom, and bought a house in Lexington, Massachusetts, where the first shots were fired against the British in 1775, although we didn ’ t actually hit any of them until Concord. He got a job working for Raytheon designing guidance systems, which was part of the Route 128 high-tech axis in those days — so, the equivalent of Silicon Valley in the ’ 70s. Dad wasn ’ t a real militaristic kind of guy ; he just felt bad that he wasn ’ t able to fight in World War II on account of his handicap, although they did let him get through the several-hour-long army physical exam before they got to the very last test, which was for vision. So Dad started racking up all of these patents and gaining a reputation as a blind genius, rocket scientist, inventor. But to us he was just Dad, and our home life was pretty normal. As a kid, I watched a lot of television and had lots of nerdy hobbies like mineralogy and microbiology and the space program and a little bit of politics. I played a lot of chess. But at the age of 14, a friend got me interested in comic books, and I decided that was what I wanted to do for a living. So, here ' s my dad : he ' s a scientist, he ' s an engineer and he ' s a military contractor. So, he has four kids, right? One grows up to become a computer scientist, one grows up to join the Navy, one grows up to become an engineer... And then there ' s me : the comic book artist. Which, incidentally, makes me the opposite of Dean Kamen, because I ' m a comic book artist, son of an inventor, and he ' s an inventor, son of a comic book artist. Right? It ' s true. The funny thing is, Dad had a lot of faith in me. He had faith in my abilities as a cartoonist, even though he had no direct evidence that I was any good whatsoever ; everything he saw was just a blur. Now, this gives a real meaning to the term"blind faith,"which doesn ' t have the same negative connotation for me that it does for other people. Now, faith in things which cannot be seen, which cannot be proved, is not the sort of faith that I ' ve ever really related to all that much. I tend to like science, where what we see and can ascertain are the foundation of what we know. But there ' s a middle ground, too — a middle ground tread by people like poor old Charles Babbage and his steam-driven computers that were never built. Nobody really understood what it was that he had in mind except for Ada Lovelace, and he went to his grave trying to pursue that dream. Vannevar Bush with his memex — this idea of all of human knowledge at your fingertips — he had this vision. And I think a lot of people in his day probably thought he was a bit of a kook. And, yeah, we can look back in retrospect and say,"Yeah, ha-ha, it ' s all microfilm — But that ' s not the point ; he understood the shape of the future. So did J. C. R. Licklider and his notions for computer-human interaction. Same thing : he understood the shape of the future, even though it was something that would only be implemented by people much later. Or Paul Baran, and his vision for packet switching. Hardly anybody listened to him in his day. Or even the people who actually pulled it off, the people at Bolt, Beranek and Newman in Boston, who just would sketch out these structures of what would eventually become a worldwide network, and sketching things on the back of napkins and on note papers and arguing over dinner at Howard Johnson ' s — on Route 128 in Lexington, Massachusetts, just two miles from where I was studying the Queen ' s Gambit Deferred and listening to Gladys Knight & The Pips singing"Midnight Train to Georgia"— in my dad ' s big easy chair, you know? So, three types of vision, right? Vision based on what one cannot see, the vision of that unseen and unknowable. The vision of that which has already been proven or can be ascertained. And this third kind, a vision of something which can be, which may be, based on knowledge but is, as yet, unproven. Now, we ' ve seen a lot of examples of people who are pursuing that sort of vision in science, but I think it ' s also true in the arts, it ' s true in politics, it ' s even true in personal endeavors. What it comes down to, really, is four basic principles : learn from everyone ; follow no one ; watch for patterns ; and work like hell. I think these are the four principles that go into this. And it ' s that third one, especially, where visions of the future begin to manifest themselves. What ' s interesting is that this particular way of looking at the world, is, I think, only one of four different ways that manifest themselves in different fields of endeavor. In comics, I know that it results in sort of a formalist attitude towards trying to understand how it works. Then there ' s another, more classical attitude which embraces beauty and craft ; another one which believes in the pure transparency of content ; and then another, which emphasizes the authenticity of human experience and honesty and rawness. These are four very different ways of looking at the world. I even gave them names : the classicist, the animist, the formalist and iconoclast. Interestingly, they seem to correspond more or less to Jung ' s four subdivisions of human thought. And they reflect a dichotomy of art and delight on left and the right ; tradition and revolution on the top and the bottom. And if you go on the **diagonal**, you get content and form, and then beauty and truth. And it probably applies just as much to music and **movies** and fine art, which has nothing whatsoever to do with vision at all, or, for that matter, nothing to do with our conference theme of"Inspired by Nature,"except to the extent of the fable of the frog who gives a ride to the scorpion on his back to get across the river because the scorpion promises not to sting him, but the scorpion stings him anyway and they both die, but not before the frog asks him why, and the scorpion says,"Because it ' s my nature."In that sense, yes. So this was my nature. The thing was, I saw that the route I took to discovering this focus in my work and who I was — I saw it as just this road to discovery. Actually, it was just me embracing my nature, which means that I didn ' t actually fall that far from the tree, after all. So what does a"scientific mind"do in the arts? I started making comics, but I also started trying to understand them, almost immediately. One of the most important things about comics that I discovered was that comics are a visual medium, but they try to embrace all of the senses within it. So, the different elements of comics, like pictures and words, and the different symbols and everything in between that comics presents, are all funneled through the single conduit, a vision. So we have things like resemblance, where something which resembles the physical world can be abstracted in a couple of different directions : abstracted from resemblance, but still retaining the complete meaning, or abstracted away from both resemblance and meaning towards the picture plane. Put all these three together, and you have a nice little map of the entire boundary of visual iconography, which comics can embrace. And if you move to the right you also get language, because that ' s abstracting even further from resemblance, but still maintaining meaning. Vision is called upon to represent sound and to understand the common properties of those two and their common heritage as well ; also, to try to represent the texture of sound to capture its essential character through visuals. There ' s also a balance between the visible and the invisible in comics. Comics is a kind of call and response, in which the artist gives you something to see within the panels, and then gives you something to imagine between the panels. Also, another sense which comics ' vision represents, and that ' s time. Sequence is a very important aspect of comics. Comics presents a kind of temporal map. And this temporal map was something that energizes modern comics, but I was wondering if perhaps it also energizes other sorts of forms, and I found some in history. You can see this same principle operating in these ancient versions of the same idea. What ' s happening is, an art form is colliding with a given technology, whether it ' s paint on stone, like the Tomb of Menna the Scribe in ancient Egypt, or a bas-relief sculpture rising up a stone column, or a 200- foot-long embroidery, or painted deerskin and tree bark running across 88 accordion-folded pages. What ' s interesting is, once you hit"print"— and this is from 1450, by the way — all of the **artifacts** of modern comics start to present themselves : rectilinear panel arrangements, simple line drawings without tone, and a left- to-right reading sequence. And within 100 years, you already start to see word balloons and captions, and it ' s really just a hop, skip and a jump from here to here. So I wrote a book about this in ' 93, but as I was finishing the book, I had to do a little bit of typesetting, and I was tired of going to my local copy shop to do it, so I bought a computer. And it was just a little thing — it wasn ' t good for much except text entry — but my father had told me about Moore ' s law back in the ’ 70s, and I knew what was coming. And so, I kept my eyes peeled to see if the sort of changes that happened when we went from pre-print comics to print comics would happen when we went beyond, to post-print comics. So, one of the first things proposed was that we could mix the visuals of comics with the sound, motion and interactivity of the CD-ROMs being made in those days. This was even before the Web. And one of the first things they did was, they tried to take the comics page as is and transplant it to monitors, which was a classic McLuhanesque mistake of appropriating the shape of the previous technology as the content of the new technology. And so, what they would do is have these comic pages that resemble print comics pages, and they would introduce all this sound and motion. The problem was that if you go with this basic idea that space equals time in comics, what happens is that when you introduce sound and motion, which are temporal phenomena that can only be represented through time, they break with that continuity of **presentation**. Interactivity was another thing. There were hypertext comics, but the thing about hypertext is that everything in hypertext is either here, not here, or connected to here ; it ’ s profoundly nonspatial. The distance from Abraham Lincoln to a Lincoln penny to Penny Marshall to the Marshall Plan to”Plan 9”to nine lives : it ’ s all the same. But in comics, every aspect of the work, every element of the work, has a **spatial** relationship to every other element at all times. So the question was : Was there any way to preserve that **spatial** relationship while still taking advantage of all of the things that digital had to offer us? And I found my personal answer for this in those ancient comics that I was showing you. Each of them has a single unbroken reading line, whether it ’ s going zigzag across the walls or spiraling up a column or just straight left to right, or even going in a backwards zigzag across those 88 accordion-folded pages, the same thing is happening ; that is, that the basic idea that as you move through space you move through time, is being carried out without any compromise, but there were compromises when print hit. Adjacent spaces were no longer adjacent moments, so the basic idea of comics was being broken again and again and again and again. And I thought, OK, well, if that ’ s true, is there any way, when we go beyond today ’ s print, to somehow bring that back? Now, the monitor is just as limited as the page, technically, right? It ’ s a different shape, but other than that, it ’ s the same basic limitation. But that ’ s only if you look at the monitor as a page, but not if you look at the monitor as a window. And that ’ s what I propose, that perhaps we could create these comics on an infinite canvas, along the X axis and the Y axis and staircases. We could do circular narratives that were literally circular. We could do a turn in a story that was literally a turn. Parallel narratives could be literally parallel. X, Y and also Z. So I had all these notions. This was back in the late ’ 90s, and other people in my business thought I was pretty crazy, but a lot of people then went on and actually did it. I ’ m going to show you a couple now. This was an early collage comic by a fellow named Jasen Lex. And notice what ’ s going on here. What I ’ m searching for is a durable mutation — that ’ s what all of us are searching for. As media head into this new era, we are looking for mutations that are durable, that have some sort of staying power. Now, we ’ re taking this basic idea of presenting comics in a visual medium, and we ’ re carrying it through all the way from beginning to end. That ’ s that entire comic you just saw, up on the screen right now. But even though we ’ re only experiencing it one piece at a time, that ’ s just where the technology is right now. As the technology evolves, as you get full immersive **displays** and whatnot, this sort of thing will only grow ; it will adapt. It will adapt to its environment ; it ’ s a durable mutation. Here ’ s another one. This is by Drew Weing ; this is called”’ Pup ’ Ponders the Heat Death of the Universe.”See what ’ s going on here as we draw these stories on an infinite canvas is you ' re creating a more pure expression of what this medium is all about. We ' ll go by this a little quickly. You get the idea. I just want to get to the last panel. [Cat 1 : Pup! Earth to Pup! Cat 2 : Come play baseball with us!] [Pup : Did either of you realize that eventually the universe will be nothing but a thin, cold gas spread across infinite, lonely space?] [Cat 1 : Oh... Cat 2 : We ' d better hurry, then!] Just one more. Talk about your infinite canvas. It ' s by a guy named Daniel Merlin Goodbrey, in Britain. Why is this important? I think this is important because media — all media — provide us a window back into our world. Now, it could be that motion pictures and eventually, virtual reality, or something equivalent to it, some sort of immersive **display**, is going to provide us with our most efficient escape from the world that we ' re in. That ' s why most people turn to storytelling, to escape. But media provides us with a window back into the world we live in. And when media evolve so that the identity of the media becomes increasingly unique — because what you ' re looking at is comics cubed, you ' re looking at comics that are more comics-like than they ' ve ever been before — when that happens, you provide people with multiple ways of reentering the world through different windows. And when you do that, it allows them to triangulate the world they live in and see its shape. That ' s why I think this is important. One of many reasons, but I ' ve got to go now. Thank you for having me.

This is a picture of Maurice Druon, the Honorary Perpetual Secretary of L ' Academie francaise, the French Academy. He is splendidly attired in his 68, 000-dollar uniform, befitting the role of the French Academy as legislating the correct usage in French and perpetuating the language. The French Academy has two main tasks : it compiles a dictionary of official French. They ' re now working on their ninth edition, which they began in 1930, and they ' ve reached the letter P. They also legislate on correct usage, such as the proper term for what the French call"email,"which ought to be"courriel."The World Wide Web, the French are told, ought to be referred to as"la toile d ' araignee mondiale"— the Global Spider Web — recommendations that the French gaily ignore. Now, this is one model of how language comes to be : namely, it ' s legislated by an academy. But anyone who looks at language realizes that this is a rather silly conceit, that language, rather, emerges from human minds interacting from one another. And this is visible in the unstoppable change in language — the fact that by the time the Academy finishes their dictionary, it will already be well out of date. We see it in the constant appearance of slang and jargon, of the historical change in languages, in divergence of dialects and the formation of new languages. So language is not so much a creator or shaper of human nature, so much as a window onto human nature. In a book that I ' m currently working on, I hope to use language to shed light on a number of aspects of human nature, including the cognitive machinery with which humans conceptualize the world and the relationship types that govern human interaction. And I ' m going to say a few words about each one this morning. Let me start off with a technical problem in language that I ' ve worried about for quite some time — and indulge me in my passion for verbs and how they ' re used. The problem is, which verbs go in which constructions? The verb is the chassis of the sentence. It ' s the framework onto which the other parts are bolted. Let me give you a quick reminder of something that you ' ve long forgotten. An intransitive verb, such as"dine,"for example, can ' t take a direct object. You have to say,"Sam dined,"not,"Sam dined the pizza."A transitive verb mandates that there has to be an object there :”Sam devoured the pizza.”You can ’ t just say,”Sam devoured.”There are dozens or scores of verbs of this type, each of which shapes its sentence. So, a problem in explaining how children learn language, a problem in teaching language to adults so that they don ’ t make grammatical errors, and a problem in programming computers to use language is which verbs go in which constructions. For example, the dative construction in English. You can say,”Give a muffin to a mouse,”the prepositional dative. Or,”Give a mouse a muffin,”the double- object dative.”Promise anything to her,””Promise her anything,”and so on. Hundreds of verbs can go both ways. So a tempting generalization for a child, for an adult, for a computer is that any verb that can appear in the construction,”subject-verb-thing-to-a-recipient”can also be expressed as”subject-verb-recipient-thing.”A handy thing to have, because language is infinite, and you can ’ t just parrot back the sentences that you ’ ve heard. You ’ ve got to extract generalizations so you can produce and understand new sentences. This would be an example of how to do that. Unfortunately, there appear to be idiosyncratic exceptions. You can say,”Biff drove the car to Chicago,”but not,”Biff drove Chicago the car.”You can say,”Sal gave Jason a headache,”but it ’ s a bit odd to say,”Sal gave a headache to Jason.”The solution is that these constructions, despite initial appearance, are not synonymous, that when you crank up the microscope on human cognition, you see that there ’ s a subtle difference in meaning between them. So,”give the X to the Y,”that construction corresponds to the thought”cause X to go to Y.”Whereas”give the Y the X”corresponds to the thought”cause Y to have X.”Now, many events can be subject to either construal, kind of like the classic figure-ground reversal illusions, in which you can either pay attention to the particular object, in which case the space around it recedes from attention, or you can see the faces in the empty space, in which case the object recedes out of consciousness. How are these construals reflected in language? Well, in both cases, the thing that is construed as being affected is expressed as the direct object, the noun after the verb. So, when you think of the event as causing the muffin to go somewhere — where you ’ re doing something to the muffin — you say,”Give the muffin to the mouse.”When you construe it as”cause the mouse to have something,”you ’ re doing something to the mouse, and therefore you express it as,”Give the mouse the muffin.”So which verbs go in which construction — the problem with which I began — depends on whether the verb specifies a kind of motion or a kind of possession change. To give something involves both causing something to go and causing someone to have. To drive the car only causes something to go, because Chicago ’ s not the kind of thing that can possess something. Only humans can possess things. And to give someone a headache causes them to have the headache, but it ’ s not as if you ’ re taking the headache out of your head and causing it to go to the other person, and implanting it in them. You may just be loud or obnoxious, or some other way causing them to have the headache. So, that ’ s an example of the kind of thing that I do in my day job. So why should anyone care? Well, there are a number of interesting conclusions, I think, from this and many similar kinds of analyses of hundreds of English verbs. First, there ’ s a level of fine-grained conceptual structure, which we automatically and unconsciously compute every time we produce or utter a sentence, that governs our use of language. You can think of this as the language of thought, or”mentalese.”It seems to be based on a fixed set of concepts, which govern dozens of constructions and thousands of verbs — not only in English, but in all other languages — fundamental concepts such as space, time, causation and human intention, such as, what is the means and what is the ends? These are reminiscent of the kinds of categories that Immanuel Kant argued are the basic framework for human thought, and it ' s interesting that our unconscious use of language seems to reflect these Kantian categories. Doesn ' t care about perceptual qualities, such as color, texture, weight and speed, which virtually never differentiate the use of verbs in different constructions. An additional twist is that all of the constructions in English are used not only literally, but in a quasi-metaphorical way. For example, this construction, the dative, is used not only to transfer things, but also for the metaphorical transfer of ideas, as when we say,"She told a story to me"or"told me a story,""Max taught Spanish to the students"or"taught the students Spanish."It ' s exactly the same construction, but no muffins, no mice, nothing moving at all. It evokes the container metaphor of communication, in which we conceive of ideas as objects, sentences as containers, and communication as a kind of sending. As when we say we"gather"our ideas, to"put"them"into"words, and if our words aren ' t"empty"or"hollow,"we might get these ideas"across"to a listener, who can"unpack"our words to"extract"their"content."And indeed, this kind of verbiage is not the exception, but the rule. It ' s very hard to find any example of abstract language that is not based on some concrete metaphor. For example, you can use the verb"go"and the prepositions"to"and"from"in a literal, **spatial** sense."The messenger went from Paris to Istanbul."You can also say,"Biff went from sick to well."He needn ' t go anywhere. He could have been in bed the whole time, but it ' s as if his health is a point in state space that you conceptualize as moving. Or,"The meeting went from three to four,"in which we conceive of time as stretched along a line. Likewise, we use"force"to indicate not only physical force, as in,"Rose forced the door to open,"but also interpersonal force, as in,"Rose forced Sadie to go,"not necessarily by manhandling her, but by issuing a threat. Or,"Rose forced herself to go,"as if there were two entities inside Rose ' s head, engaged in a tug of a war. Second conclusion is that the ability to conceive of a given event in two different ways, such as"cause something to go to someone"and"causing someone to have something,"I think is a fundamental feature of human thought, and it ' s the basis for much human argumentation, in which people don ' t differ so much on the facts as on how they ought to be construed. Just to give you a few examples :"ending a pregnancy"versus"killing a fetus ;""a **ball** of cells"versus"an unborn child ;""invading Iraq"versus"liberating Iraq ;""redistributing wealth"versus"confiscating earnings."And I think the biggest picture of all would take seriously the fact that so much of our verbiage about abstract events is based on a concrete metaphor and see human intelligence itself as consisting of a repertoire of concepts — such as objects, space, time, causation and intention — which are useful in a social, knowledge- intensive species, whose evolution you can well imagine, and a process of metaphorical abstraction that allows us to bleach these concepts of their original conceptual content — space, time and force — and apply them to new abstract domains, therefore allowing a species that evolved to deal with rocks and tools and animals, to conceptualize mathematics, physics, law and other abstract domains. Well, I said I ' d talk about two windows on human nature — the cognitive machinery with which we conceptualize the world, and now I ' m going to say a few words about the relationship types that govern human social interaction, again, as reflected in language. And I ' ll start out with a puzzle, the puzzle of indirect speech acts. Now, I ' m sure most of you have seen the **movie**"Fargo."And you might remember the scene in which the kidnapper is pulled over by a police officer, is asked to show his driver ' s license and holds his wallet out with a 50-dollar bill extending at a slight angle out of the wallet. And he says,"I was just thinking that maybe we could take care of it here in Fargo,"which everyone, including the audience, interprets as a veiled bribe. This kind of indirect speech is rampant in language. For example, in polite requests, if someone says,”If you could pass the guacamole, that would be awesome,”we know exactly what he means, even though that ’ s a rather bizarre concept being expressed.”Would you like to come up and see my etchings?”I think most people understand the intent behind that. And likewise, if someone says,”Nice store you ’ ve got there. It would be a real shame if something happened to it”— — we understand that as a veiled threat, rather than a musing of hypothetical possibilities. So the puzzle is, why are bribes, polite requests, solicitations and threats so often veiled? No one ’ s fooled. Both parties know exactly what the speaker means, and the speaker knows the listener knows that the speaker knows that the listener knows, etc., etc. So what ’ s going on? I think the key idea is that language is a way of negotiating relationships, and human relationships fall into a number of types. There ’ s an influential taxonomy by the anthropologist Alan Fiske, in which relationships can be categorized, more or less, into communality, which works on the principle”what ’ s mine is thine, what ’ s thine is mine,”the kind of mindset that operates within a family, for example ; dominance, whose principle is”don ’ t mess with me ;”reciprocity,”you scratch my back, I ’ ll scratch yours ;”and sexuality, in the immortal words of Cole Porter,”Let ’ s do it.”Now, relationship types can be negotiated. Even though there are default situations in which one of these mindsets can be applied, they can be stretched and extended. For example, communality applies most naturally within family or friends, but it can be used to try to transfer the mentality of sharing to groups that ordinarily would not be disposed to exercise it. For example, in brotherhoods, fraternal organizations, sororities, locutions like”the family of man,”you try to get people who are not related to use the relationship type that would ordinarily be appropriate to close kin. Now, mismatches — when one person assumes one relationship type, and another assumes a different one — can be awkward. If you went over and you helped yourself to a shrimp off your boss ’ plate, for example, that would be an awkward situation. Or if a dinner guest after the meal pulled out his wallet and offered to pay you for the meal, that would be rather awkward as well. In less blatant cases, there ’ s still a kind of negotiation that often goes on. In the workplace, for example, there ’ s often a tension over whether an employee can socialize with the boss, or refer to him or her on a first-name basis. If two friends have a reciprocal transaction, like selling a car, it ’ s well known that this can be a source of tension or awkwardness. In dating, the transition from friendship to sex can lead to, notoriously, **various** forms of awkwardness, and as can sex in the workplace, in which we call the conflict between a dominant and a sexual relationship”sexual harassment.”Well, what does this have to do with language? Well, language, as a social interaction, has to satisfy two conditions. You have to convey the actual content — here we get back to the container metaphor. You want to express the bribe, the command, the promise, the solicitation and so on, but you also have to negotiate and maintain the kind of relationship you have with the other person. The solution, I think, is that we use language at two levels : the literal form signals the safest relationship with the listener, whereas the implicated content — the reading between the lines that we count on the listener to perform — allows the listener to derive the interpretation which is most relevant in context, which possibly initiates a changed relationship. The simplest example of this is in the polite request. If you express your request as a conditional —”if you could open the window, that would be great”— even though the content is an imperative, the fact that you ’ re not using the imperative voice means that you ’ re not acting as if you ’ re in a relationship of dominance, where you could presuppose the compliance of the other person. On the other hand, you want the damn guacamole. By expressing it as an if-then statement, you can get the message across without appearing to boss another person around. And in a more subtle way, I think, this works for all of the veiled speech acts involving plausible deniability : the bribes, threats, propositions, solicitations and so on. One way of thinking about it is to imagine what it would be like if language — where it could only be used literally. And you can think of it in terms of a game-theoretic payoff matrix. Put yourself in the position of the kidnapper wanting to bribe the officer. There ' s a high stakes in the two possibilities of having a dishonest officer or an honest officer. If you don ' t bribe the officer, then you will get a traffic ticket — or, as is the case of"Fargo,"worse — whether the honest officer is honest or dishonest. Nothing ventured, nothing gained. In that case, the consequences are rather severe. On the other hand, if you extend the bribe, if the officer is dishonest, you get a huge payoff of going free. If the officer is honest, you get a huge penalty of being arrested for bribery. So this is a rather fraught situation. On the other hand, with indirect language, if you issue a veiled bribe, then the dishonest officer could interpret it as a bribe, in which case you get the payoff of going free. The honest officer can ' t hold you to it as being a bribe, and therefore, you get the nuisance of the traffic ticket. So you get the best of both worlds. And a similar analysis, I think, can apply to the potential awkwardness of a sexual solicitation, and other cases where plausible deniability is an asset. I think this affirms something that ' s long been known by diplomats — namely, that the vagueness of language, far from being a bug or an imperfection, actually might be a feature of language, one that we use to our advantage in social interactions. So to sum up : language is a collective human creation, reflecting human nature, how we conceptualize reality, how we relate to one another. And then by analyzing the **various** quirks and complexities of language, I think we can get a window onto what makes us tick. Thank you very much.

If you take 10, 000 people at random, 9, 999 have something in common : their interests in business lie on or near the Earth ' s surface. The odd one out is an astronomer, and I am one of that strange breed. My talk will be in two parts. I ' ll talk first as an astronomer, and then as a worried member of the human race. But let ' s start off by remembering that Darwin showed how we ' re the outcome of four billion years of evolution. And what we try to do in astronomy and cosmology is to go back before Darwin ' s simple beginning, to set our Earth in a cosmic context. And let me just run through a few slides. This was the impact that happened last week on a comet. If they ' d sent a nuke, it would have been rather more spectacular than what actually happened last Monday. So that ' s another project for NASA. That ' s Mars from the European Mars Express, and at New Year. This artist ' s impression turned into reality when a parachute landed on Titan, Saturn ' s giant moon. It landed on the surface. This is pictures taken on the way down. That looks like a coastline. It is indeed, but the ocean is liquid methane — the temperature minus 170 degrees centigrade. If we go beyond our solar system, we ' ve learned that the stars aren ' t twinkly points of light. Each one is like a sun with a retinue of planets orbiting around it. And we can see places where stars are forming, like the Eagle Nebula. We see stars dying. In six billion years, the sun will look like that. And some stars die spectacularly in a supernova explosion, leaving remnants like that. On a still bigger scale, we see entire galaxies of stars. We see entire ecosystems where gas is being recycled. And to the cosmologist, these galaxies are just the atoms, as it were, of the large-scale universe. This picture shows a patch of sky so small that it would take about 100 patches like it to cover the full moon in the sky. Through a small telescope, this would look quite blank, but you see here hundreds of little, faint smudges. Each is a galaxy, fully like ours or Andromeda, which looks so small and faint because its light has taken 10 billion light-years to get to us. The stars in those galaxies probably don ’ t have planets around them. There ’ s scant chance of life there — that ’ s because there ’ s been no time for the nuclear fusion in stars to make silicon and carbon and iron, the building blocks of planets and of life. We believe that all of this emerged from a Big Bang — a hot, dense state. So how did that amorphous Big Bang turn into our complex cosmos? I ’ m going to show you a **movie** simulation 16 powers of 10 faster than real time, which shows a patch of the universe where the expansions have subtracted out. But you see, as time goes on in gigayears at the bottom, you will see structures evolve as gravity feeds on small, dense irregularities, and structures develop. And we ’ ll end up after 13 billion years with something looking rather like our own universe. And we compare simulated universes like that — I ’ ll show you a better simulation at the end of my talk — with what we actually see in the sky. Well, we can trace things back to the earlier stages of the Big Bang, but we still don ’ t know what **banged** and why it **banged**. That ’ s a challenge for 21st-century science. If my research group had a logo, it would be this picture here : an ouroboros, where you see the micro-world on the left — the world of the quantum — and on the right the large-scale universe of planets, stars and galaxies. We know our universes are united though — links between left and right. The everyday world is determined by atoms, how they stick together to make molecules. Stars are fueled by how the nuclei in those atoms react together. And, as we ’ ve learned in the last few years, galaxies are held together by the gravitational pull of so-called dark matter : particles in huge swarms, far smaller even than atomic nuclei. But we ’ d like to know the synthesis symbolized at the very top. The micro-world of the quantum is understood. On the right hand side, gravity holds sway. Einstein explained that. But the unfinished business for 21st-century science is to link together cosmos and micro-world with a unified theory — symbolized, as it were, gastronomically at the top of that picture. And until we have that synthesis, we won ’ t be able to understand the very beginning of our universe because when our universe was itself the size of an atom, quantum effects could shake everything. And so we need a theory that unifies the very large and the very small, which we don ’ t yet have. One idea, incidentally — and I had this hazard sign to say I ’ m going to speculate from now on — is that our Big Bang was not the only one. One idea is that our three-dimensional universe may be embedded in a high- dimensional space, just as you can imagine on these sheets of paper. You can imagine ants on one of them thinking it ’ s a two-dimensional universe, not being aware of another population of ants on the other. So there could be another universe just a millimeter away from ours, but we ’ re not aware of it because that millimeter is measured in some fourth **spatial** dimension, and we ’ re imprisoned in our three. And so we believe that there may be a lot more to physical reality than what we ’ ve normally called our universe — the aftermath of our Big Bang. And here ’ s another picture. Bottom right depicts our universe, which on the horizon is not beyond that, but even that is just one bubble, as it were, in some vaster reality. Many people suspect that just as we ’ ve gone from believing in one solar system to zillions of solar systems, one galaxy to many galaxies, we have to go to many Big Bangs from one Big Bang, perhaps these many Big Bangs **displaying** an immense variety of properties. Well, let ’ s go back to this picture. There ’ s one challenge symbolized at the top, but there ’ s another challenge to science symbolized at the bottom. You want to not only synthesize the very large and the very small, but we want to understand the very complex. And the most complex things are ourselves, midway between atoms and stars. We depend on stars to make the atoms we ’ re made of. We depend on chemistry to determine our complex structure. We clearly have to be large, compared to atoms, to have layer upon layer of complex structure. We clearly have to be small, compared to stars and planets — otherwise we ’ d be crushed by gravity. And in fact, we are midway. It would take as many human bodies to make up the sun as there are atoms in each of us. The geometric mean of the mass of a proton and the mass of the sun is 50 kilograms, within a factor of two of the mass of each person here. Well, most of you anyway. The science of complexity is probably the greatest challenge of all, greater than that of the very small on the left and the very large on the right. And it ’ s this science, which is not only enlightening our understanding of the biological world, but also transforming our world faster than ever. And more than that, it ’ s engendering new kinds of change. And I now move on to the second part of my talk, and the book”Our Final Century”was mentioned. If I was not a self-effacing Brit, I would mention the book myself, and I would add that it ’ s available in paperback. And in America it was called”Our Final Hour”because Americans like instant gratification. But my theme is that in this century, not only has science changed the world faster than ever, but in new and different ways. Targeted drugs, genetic modification, artificial intelligence, perhaps even implants into our brains, may change human beings themselves. And human beings, their physique and character, has not changed for thousands of years. It may change this century. It ’ s new in our history. And the human impact on the global environment — greenhouse warming, mass extinctions and so forth — is unprecedented, too. And so, this makes this coming century a challenge. Bio- and cybertechnologies are environmentally benign in that they offer marvelous prospects, while, nonetheless, reducing pressure on energy and resources. But they will have a dark side. In our interconnected world, novel technology could empower just one fanatic, or some weirdo with a mindset of those who now design computer viruses, to trigger some kind on disaster. Indeed, catastrophe could arise simply from technical misadventure — error rather than terror. And even a tiny probability of catastrophe is unacceptable when the downside could be of global consequence. In fact, some years ago, Bill Joy wrote an article expressing tremendous concern about robots taking us over, etc. I don ’ t go along with all that, but it ’ s interesting that he had a simple solution. It was what he called”fine-grained relinquishment.”He wanted to give up the dangerous kind of science and keep the good bits. Now, that ’ s absurdly naive for two reasons. First, any scientific discovery has benign consequences as well as dangerous ones. And also, when a scientist makes a discovery, he or she normally has no clue what the applications are going to be. And so what this means is that we have to accept the risks if we are going to enjoy the benefits of science. We have to accept that there will be hazards. And I think we have to go back to what happened in the post-War era, post-World War II, when the nuclear scientists who ’ d been involved in making the atomic bomb, in many cases were concerned that they should do all they could to alert the world to the dangers. And they were inspired not by the young Einstein, who did the great work in relativity, but by the old Einstein, the icon of poster and t-shirt, who failed in his scientific efforts to unify the physical laws. He was premature. But he was a moral compass — an inspiration to scientists who were concerned with arms control. And perhaps the greatest living person is someone I ’ m privileged to know, Joe Rothblatt. Equally untidy office there, as you can see. He ’ s 96 years old, and he founded the Pugwash movement. He persuaded Einstein, as his last act, to sign the famous memorandum of Bertrand Russell. And he sets an example of the concerned scientist. And I think to harness science optimally, to choose which doors to open and which to leave closed, we need latter-day counterparts of people like Joseph Rothblatt. We need not just campaigning physicists, but we need biologists, computer experts and environmentalists as well. And I think academics and independent entrepreneurs have a special obligation because they have more freedom than those in government service, or company employees subject to commercial pressure. I wrote my book,"Our Final Century,"as a scientist, just a general scientist. But there ' s one respect, I think, in which being a cosmologist offered a special perspective, and that ' s that it offers an awareness of the immense future. The stupendous time spans of the evolutionary past are now part of common culture — outside the American Bible Belt, anyway — but most people, even those who are familiar with evolution, aren ' t mindful that even more time lies ahead. The sun has been shining for four and a half billion years, but it ' ll be another six billion years before its fuel runs out. On that schematic picture, a sort of time-lapse picture, we ' re halfway. And it ' ll be another six billion before that happens, and any remaining life on Earth is vaporized. There ' s an unthinking tendency to imagine that humans will be there, experiencing the sun ' s demise, but any life and intelligence that exists then will be as different from us as we are from bacteria. The unfolding of intelligence and complexity still has immensely far to go, here on Earth and probably far beyond. So we are still at the beginning of the emergence of complexity in our Earth and beyond. If you represent the Earth ' s lifetime by a single year, say from January when it was made to December, the 21st-century would be a quarter of a second in June — a tiny fraction of the year. But even in this concertinaed cosmic perspective, our century is very, very special, the first when humans can change themselves and their home planet. As I should have shown this earlier, it will not be humans who witness the end point of the sun ; it will be creatures as different from us as we are from bacteria. When Einstein died in 1955, one striking tribute to his global status was this cartoon by Herblock in the Washington Post. The plaque reads,"Albert Einstein lived here."And I ' d like to end with a vignette, as it were, inspired by this image. We ' ve been familiar for 40 years with this image : the fragile beauty of land, ocean and clouds, contrasted with the sterile moonscape on which the astronauts left their footprints. But let ' s suppose some aliens had been watching our pale blue dot in the cosmos from afar, not just for 40 years, but for the entire 4. 5 billion-year history of our Earth. What would they have seen? Over nearly all that immense time, Earth ' s appearance would have changed very gradually. The only abrupt worldwide change would have been major asteroid impacts or volcanic super-eruptions. Apart from those brief traumas, nothing happens suddenly. The continental landmasses drifted around. Ice cover waxed and waned. Successions of new species emerged, evolved and became extinct. But in just a tiny sliver of the Earth ' s history, the last one-millionth part, a few thousand years, the patterns of vegetation altered much faster than before. This signaled the start of agriculture. Change has accelerated as human populations rose. Then other things happened even more abruptly. Within just 50 years — that ' s one hundredth of one millionth of the Earth ' s age — the amount of carbon dioxide in the atmosphere started to rise, and ominously fast. The planet became an intense emitter of radio waves — the total output from all TV and cell phones and radar transmissions. And something else happened. Metallic objects — albeit very small ones, a few tons at most — escaped into orbit around the Earth. Some journeyed to the moons and planets. A race of advanced extraterrestrials watching our solar system from afar could confidently predict Earth ' s final doom in another six billion years. But could they have predicted this unprecedented spike less than halfway through the Earth ' s life? These human-induced alterations occupying overall less than a millionth of the elapsed lifetime and seemingly occurring with runaway speed? If they continued their vigil, what might these hypothetical aliens witness in the next hundred years? Will some spasm foreclose Earth ' s future? Or will the biosphere stabilize? Or will some of the metallic objects launched from the Earth spawn new oases, a post-human life elsewhere? The science done by the young Einstein will continue as long as our civilization, but for civilization to survive, we ' ll need the wisdom of the old Einstein — humane, global and farseeing. And whatever happens in this uniquely crucial century will resonate into the remote future and perhaps far beyond the Earth, far beyond the Earth as depicted here. Thank you very much.

What I want to do today is spend some time talking about some stuff that ' s giving me a little bit of existential angst, for lack of a better word, over the past couple of years. And basically, these three quotes tell what ' s going on."When God made the color purple, God was just showing off,"Alice Walker wrote in"The Color Purple."And Zora Neale Hurston wrote in"Dust Tracks On A Road,""Research is a formalized curiosity. It ' s poking and prying with a purpose."And then finally, when I think about the near future, we have this attitude,"Well, whatever happens, happens."Right? So that goes along with the Cheshire Cat saying,"If you don ' t care much where you want to get to, it doesn ' t much matter which way you go."But I think it does matter which way we go and what road we take, because when I think about design in the near future, what I think are the most important issues, what ' s really crucial and vital, is that we need to revitalize the arts and sciences right now, in 2002. If we describe the near future as 10, 20, 15 years from now, that means that what we do today is going to be critically important, because in the year 2015, in the year 2020, 2025, the world our society is going to be building on, the basic knowledge and abstract ideas, the discoveries that we came up with today, just as all these wonderful things we ' re hearing about here at the TED conference that we take for granted in the world right now, were really knowledge and ideas that came up in the 50s, the 60s and the 70s. That ' s the **substrate** that we ' re exploiting today. Whether it ' s the internet, genetic engineering, laser scanners, guided missiles, fiber optics, high-definition television, remote sensing from space and the wonderful remote-sensing photos that we see in 3D weaving, TV programs like Tracker and Enterprise, CD-rewrite drives, flat-screen, Alvin Ailey ' s"Suite Otis,"or Sarah Jones ' s"Your Revolution Will Not [Happen] Between These Thighs,"which, by the way, was banned by the FCC, or ska — all of these things, without question, almost without exception, are really based on ideas and abstract and creativity from years before. So we have to ask ourselves : What are we contributing to that legacy right now? And when I think about it, I ' m really worried. To be quite frank, I ' m concerned. I ' m skeptical that we ' re doing very much of anything. We ' re, in a sense, failing to act in the future. We ' re purposefully, consciously being laggards. We ' re lagging behind. Frantz Fanon, who was a psychiatrist from Martinique, said,"Each generation must, out of relative obscurity, discover its mission and fulfill or betray it."What is our mission? What do we have to do? I think our mission is to reconcile, to reintegrate science and the arts, because right now, there ' s a schism that exists in popular culture. People have this idea that science and the arts are really separate ; we think of them as separate and different things. And this idea was probably introduced centuries ago, but it ' s really becoming critical now, because we ' re making decisions about our society every day that, if we keep thinking that the arts are separate from the sciences, and we keep thinking it ’ s cute to say,”I don ’ t understand anything about this one, I don ’ t understand anything about the other one,”then we ’ re going to have problems. Now, I know no one here at TED thinks this. All of us, we already know that they ’ re very connected. But I ’ m going to let you know that some folks in the outside world, believe it or not, think it ’ s neat when they say,”Scientists and science is not creative. Maybe scientists are ingenious, but they ’ re not creative.”And then we have this tendency, the career counselors and **various** people say things like,”Artists are not analytical. They ’ re ingenious, perhaps, but not analytical.”And when these concepts underlie our teaching and what we think about the world, then we have a problem, because we stymie support for everything. By accepting this dichotomy, whether it ’ s tongue-in- cheek, when we attempt to accommodate it in our world, and we try to build our foundation for the world, we ’ re messing up the future, because : Who wants to be uncreative? Who wants to be illogical? Talent would run from either of these fields if you said you had to choose either. Then they ’ ll go to something where they think,”Well, I can be creative and logical at the same time.”Now, I grew up in the ’ 60s and I ’ ll admit it — actually, my childhood spanned the ’ 60s, and I was a wannabe hippie, and I always resented the fact that I wasn ’ t old enough to be a hippie. And I know there are people here, the younger generation, who want to be hippies. People talk about the ’ 60s all the time. And they talk about the anarchy that was there. But when I think about the ’ 60s, what I took away from it was that there was hope for the future. We thought everyone could participate. There were wonderful, incredible ideas that were always percolating, and so much of what ’ s cool or hot today is really based on some of those concepts, whether it ’ s people trying to use the Prime Directive from Star Trek, being involved in things, or, again, that three- dimensional weaving and fax machines that I read about in my weekly readers that the technology and engineering was just getting started. But the ’ 60s left me with a problem. You see, I always assumed I would go into space, because I followed all of this. But I also loved the arts and sciences. You see, when I was growing up as a little girl and as a teenager, I loved designing and making doll clothes and wanting to be a fashion designer. I took art and ceramics. I loved dance : Lola Falana, Alvin Ailey, Jerome Robbins. And I also avidly followed the Gemini and the Apollo programs. I had science projects and tons of astronomy books. I took calculus and philosophy. I wondered about infinity and the Big Bang theory. And when I was at Stanford, I found myself, my senior year, chemical engineering major, half the folks thought I was a political science and performing arts major, which was sort of true, because I was Black Student Union President, and I did major in some other things. And I found myself the last quarter juggling chemical engineering separation processes, logic classes, nuclear magnetic resonance spectroscopy, and also producing and choreographing a dance production. And I had to do the lighting and the design work, and I was trying to figure out : Do I go to New York City to try to become a professional dancer, or to go to medical school? Now, my mother helped me figure that one out. But when I went into space, I carried a number of things up with me. I carried a poster by Alvin Ailey — you can figure out now, I love the dance company — an Alvin Ailey poster of Judith Jamison performing the dance”Cry,”dedicated to all black women everywhere ; a Bundu statue, which was from the women ’ s society in Sierra Leone ; and a certificate for the Chicago Public School students to work to improve their science and math. And folks asked me,”Why did you take up what you took up?”And I had to say,”Because it represents human creativity ; the creativity that allowed us, that we were required to have to conceive and build and launch the space shuttle, which springs from the same source as the imagination and analysis that it took to carve a Bundu statue, or the ingenuity it took to design, choreograph and stage"Cry."Each one of them are different manifestations, incarnations, of creativity — avatars of human creativity. And that ' s what we have to reconcile in our minds, how these things fit together. The difference between arts and sciences is not analytical versus intuitive. Right? E = mc2 required an intuitive leap, and then you had to do the analysis afterwards. Einstein said, in fact,"The most beautiful thing we can experience is the mysterious. It is the source of all true art and science."Dance requires us to express and want to express the jubilation in life, but then you have to figure out : Exactly what movement do I do to make sure it comes across correctly? The difference between arts and sciences is also not constructive versus deconstructive. A lot of people think of the sciences as deconstructive, you have to pull things apart. And yeah, subatomic physics is deconstructive — you literally try to tear atoms apart to understand what ' s inside of them. But sculpture, from what I understand from great sculptors, is deconstructive, because you see a piece and you remove what doesn ' t need to be there. Biotechnology is constructive. Orchestral arranging is constructive. So, in fact, we use constructive and deconstructive techniques in everything. The difference between science and the arts is not that they are different sides of the same coin, even, or even different parts of the same continuum, but rather, they ' re manifestations of the same thing. Different quantum states of an atom? Or maybe if I want to be more 21st century, I could say that they ' re different harmonic resonances of a superstring. But we ' ll leave that alone. They spring from the same source. The arts and sciences are avatars of human creativity. It ' s our attempt as humans to build an understanding of the universe, the world around us. It ' s our attempt to influence things, the universe internal to ourselves and external to us. The sciences, to me, are manifestations of our attempt to express or share our understanding, our experience, to influence the universe external to ourselves. It doesn ' t rely on us as individuals. It ' s the universe, as experienced by everyone. The arts manifest our desire, our attempt to share or influence others through experiences that are peculiar to us as individuals. Let me say it again another way : science provides an understanding of a universal experience, and arts provide a universal understanding of a personal experience. That ' s what we have to think about, that they ' re all part of us, they ' re all part of a continuum. It ' s not just the tools, it ' s not just the sciences, the mathematics and the numerical stuff and the statistics, because we heard, very much on this stage, people talked about music being mathematical. Arts don ' t just use clay, aren ' t the only ones that use clay, light and sound and movement. They use analysis as well. So people might say,"Well, I still like that intuitive versus analytical thing,"because everybody wants to do the right brain, left brain thing. We ' ve all been accused of being right-brained or left-brained at some point in time, depending on who we disagreed with. You know, people say"intuitive"— that ' s like you ' re in touch with nature, in touch with yourself and relationships ; analytical, you put your mind to work. I ' m going to tell you a little secret. You all know this, though. But sometimes people use this analysis idea, that things are outside of ourselves, to say, this is what we ' re going to elevate as the true, most important sciences, right? Then you have artists — and you all know this is true as well — artists will say things about scientists because they say they ' re too concrete, they ' re disconnected from the world. But, we ' ve even had that here on stage, so don ' t act like you don ' t know what I ' m talking about. We had folks talking about the Flat Earth Society and flower arrangers, so there ' s this whole dichotomy that we continue to carry along, even when we know better. And folks say we need to choose either-or.

But it would really be foolish to choose either one, intuitive versus analytical. That ’ s a foolish choice. It ’ s foolish just like trying to choose between being realistic or idealistic. You need both in life. Why do people do this? I ’ m going to quote a molecular biologist, Sydney Brenner, who ’ s 70 years old, so he can say this. He said,”It ’ s always important to distinguish between chastity and impotence.”Now — I want to share with you a little equation, OK? How does understanding science and the arts fit into our lives and what ’ s going on and the things we ’ re talking about here at the design conference? And this is a little thing I came up with : understanding and our resources and our will cause us to have outcomes. Our understanding is our science, our arts, our religion ; how we see the universe around us ; our resources, our money, our labor, our minerals — those things that are out there in the world we have to work with. But more importantly, there ’ s our will. This is our vision, our aspirations of the future, our hopes, our dreams, our struggles and our fears. Our successes and our failures influence what we do with all of those. And to me, design and engineering, craftsmanship and skilled labor, are all the things that work on this to have our outcome, which is our human quality of life. Where do we want the world to be? And guess what? Regardless of how we look at this, whether we look at arts and sciences as separate or different, they ’ re both being influenced now and they ’ re both having problems. I did a project called S. E. E. ing the Future : Science, Engineering and Education. It was looking at how to shed light on the most effective use of government funding. We got a bunch of scientists in all stages of their careers. They came to Dartmouth College, where I was teaching. And they talked about, with theologians and financiers : What are some of the issues of public funding for science and engineering research? What ’ s most important about it? There are some ideas that emerged that I think have really powerful parallels to the arts. The first thing they said was that the circumstances that we find ourselves in today in the sciences and engineering that made us world leaders are very different than the ’ 40s, the ’ 50s, and the ’ 60s and the ’ 70s, when we emerged as world leaders, because we ’ re no longer in competition with fascism, with Soviet-style communism. And by the way, that competition wasn ’ t just military ; it included social competition and political competition as well, that allowed us to look at space as one of those platforms to prove that our social system was better. Another thing they talked about was that the infrastructure that supports the sciences is becoming obsolete. We look at universities and colleges — small, mid-sized community colleges across the country — their laboratories are becoming obsolete. And this is where we train most of our science workers and our researchers — and our teachers, by the way. And there ’ s a media that doesn ’ t support the dissemination of any more than the most mundane and inane of information. There ’ s pseudoscience, crop circles, alien autopsy, haunted houses, or disasters. And that ’ s what we see. This isn ’ t really the information you need to operate in everyday life and figure out how to participate in this democracy and determine what ’ s going on. They also said there ’ s a change in the corporate mentality. Whereas government money had always been there for basic science and engineering research, we also counted on some companies to do some basic research. But what ’ s happened now is companies put more energy into short-term product development than they do in basic engineering and science research. And education is not keeping up. In K through 12, people are taking out wet labs. They think if we put a computer in the room, it ’ s going to take the place of actually mixing the acids or growing the potatoes. And government funding is decreasing in spending, and then they ’ re saying, let ’ s have corporations take over, and that ’ s not true. Government funding should at least do things like recognize cost benefits of basic science and engineering research. We have to know that we have a responsibility as global citizens in this world. We have to look at the education of humans. We need to build our resources today to make sure that they ’ re trained so they understand the importance of these things. And we have to support the vitality of science. That doesn ’ t mean that everything has to have one thing that ’ s going to go on, or that we know exactly what ’ s going to be the outcome of it, but that we support the vitality and the intellectual curiosity that goes along [with it]. And if you think about those parallels to the arts — the competition with the Bolshoi Ballet spurred the Joffrey and the New York City Ballet to become better. Infrastructure, museums, theaters, **movie** houses across the country are disappearing. We have more television stations with less to watch, we have more money spent on rewrites to get old television programs in the **movies**. We have corporate funding now that, when it goes to support the arts, it almost requires that the product be part of the picture that the artist draws. We have stadiums that are named over and over again by corporations. In Houston, we ’ re trying to figure out what to do with that Enron Stadium thing. Fine arts and education in the schools is disappearing, And we have a government that seems like it ’ s gutting the NEA and other programs. So we have to really stop and think : What are we trying to do with the sciences and the arts? There ’ s a need to revitalize them. We have to pay attention to it. I just want to tell you quickly what I ’ m doing — I want to tell you what I ’ ve been doing a little bit since... I feel this need to sort of integrate some of the ideas that I ’ ve had and run across over time. One of the things that I found out is that there ’ s a need to repair the dichotomy between the mind and body as well. My mother always told me, you have to be observant, know what ’ s going on in your mind and your body. And as a dancer, I had this tremendous faith in my ability to know my body, just as I knew how to sense colors. Then I went to medical school, and I was supposed to just go on what the machine said about bodies. You know, you would ask patients questions and some people would tell you,”Don ’ t listen to what the patient said.”We know that patients know and understand their bodies better, but these days we ’ re trying to divorce them from that idea. We have to reconcile the patient ’ s knowledge of their body with physicians ’ measurements. We had someone talk about measuring emotions and getting machines to figure out what to keep us from acting crazy. No, we shouldn ’ t measure. We shouldn ’ t use machines to measure road rage and then do something to keep us from engaging in it. Maybe we can have machines help us to recognize that we have road rage, and then we need to know how to control that without the machines. We even need to be able to recognize that without the machines. What I ’ m very concerned about is : How do we bolster our self-awareness as humans, as biological organisms? Michael Moschen spoke of having to teach and learn how to feel with my eyes, to see with my hands. We have all kinds of possibilities to use our senses by, and that ’ s what we have to do. That ’ s what I want to do — to try to use bioinstrumentation, those kind of things, to help our senses in what we do. That ’ s the work I ’ ve been doing now, as a company called BioSentient Corporation. I figured I ’ d have to do that ad, because I ’ m an entrepreneur, and”entrepreneur”says”somebody who does what they want to do, because they ’ re not broke enough that they have to get a real job.”But that ’ s the work I ’ m doing, BioSentient Corporation, trying to figure out : How do we integrate these things? Let me finish by saying that my personal design issue for the future is really about integrating ; to think about that intuitive and that analytical. The arts and sciences are not separate. High school physics lesson before you leave : high school physics teacher used to hold up a **ball**. She would say,”This **ball** has potential energy. But nothing will happen to it, it can ’ t do any work, until I drop it and it changes states.”I like to think of ideas as potential energy. They ’ re really wonderful, but nothing will happen until we risk putting them into action. This conference is filled with wonderful ideas. We ’ re going to share lots of things with people. But nothing ’ s going to happen until we risk putting those ideas into action. We need to revitalize the arts and sciences today. We need to take responsibility for the future. We can ’ t hide behind saying it ’ s just for company profits, or it ’ s just a business, or I ’ m an artist or an academician. Here ’ s how you judge what you ’ re doing : I talked about that balance between intuitive, analytical. Fran Lebowitz, my favorite cynic, said,”The three questions of greatest concern...”— now I ’ m going to add on to design —”... are : Is it attractive?”That ’ s the intuitive.”Is it amusing?”— the analytical, and,”Does it know its place?”— the balance. Thank you very much.

Text Sample 832: POS Dim 6 – 2002 – Score 4.00 – 2002/t000269.txt

Welcome. If I could have the first slide, please? Contrary to calculations made by some engineers, bees can fly, dolphins can swim, and geckos can even climb up the smoothest surfaces. Now, what I want to do, in the short time I have, is to try to allow each of you to experience the thrill of revealing nature ’ s design. I get to do this all the time, and it ’ s just incredible. I want to try to share just a little bit of that with you in this **presentation**. The challenge of looking at nature ’ s designs — and I ’ ll tell you the way that we perceive it, and the way we ’ ve used it. The challenge, of course, is to answer this question : what permits this extraordinary performance of animals that allows them basically to go anywhere? And if we could figure that out, how can we implement those designs? Well, many biologists will tell engineers, and others, organisms have millions of years to get it right ; they ’ re spectacular ; they can do everything wonderfully well. So, the answer is bio-mimicry : just copy nature directly. We know from working on animals that the truth is that ’ s exactly what you don ’ t want to do — because evolution works on the just-good-enough principle, not on a perfecting principle. And the constraints in building any organism, when you look at it, are really severe. Natural technologies have incredible constraints. Think about it. If you were an engineer and I told you that you had to build an automobile, but it had to start off to be this big, then it had to grow to be full size and had to work every step along the way. Or think about the fact that if you build an automobile, I ’ ll tell you that you also — inside it — have to put a factory that allows you to make another automobile. And you can absolutely never, absolutely never, because of history and the inherited plan, start with a clean slate. So, organisms have this important history. Really evolution works more like a tinkerer than an engineer. And this is really important when you begin to look at animals. Instead, we believe you need to be inspired by biology. You need to discover the general principles of nature, and then use these analogies when they ’ re advantageous. This is a real challenge to do this, because animals, when you start to really look inside them — how they work — appear hopelessly complex. There ’ s no detailed history of the design plans, you can ’ t go look it up anywhere. They have way too many motions for their joints, too many muscles. Even the simplest animal we think of, something like an insect, and they have more neurons and connections than you can imagine. How can you make sense of this? Well, we believed — and we hypothesized — that one way animals could work simply, is if the control of their movements tended to be built into their bodies themselves. What we discovered was that two-, four-, six- and eight-legged animals all produce the same forces on the ground when they move. They all work like this kangaroo, they bounce. And they can be modeled by a spring-mass system that we call the spring mass system because we ’ re biomechanists. It ’ s actually a pogo stick. They all produce the pattern of a pogo stick. How is that true? Well, a human, one of your legs works like two legs of a trotting dog, or works like three legs, together as one, of a trotting insect, or four legs as one of a trotting crab. And then they alternate in their propulsion, but the patterns are all the same. Almost every organism we ’ ve looked at this way — you ’ ll see next week, I ’ ll give you a hint, there ’ ll be an article coming out that says that really big things like T. rex probably couldn ’ t do this, but you ’ ll see that next week. Now, what ’ s interesting is the animals, then — we said — bounce along the vertical plane this way, and in our collaborations with Pixar, in”A Bug ’ s Life,”we discussed the bipedal nature of the characters of the ants. And we told them, of course, they move in another plane as well. And they asked us this question. They say,”Why model just in the sagittal plane or the vertical plane, when you ’ re telling us these animals are moving in the horizontal plane?”This is a good question. Nobody in biology ever modeled it this way. We took their advice and we modeled the animals moving in the horizontal plane as well. We took their three legs, we collapsed them down as one. We got some of the best mathematicians in the world from Princeton to work on this problem. And we were able to create a model where animals are not only bouncing up and down, but they ’ re also bouncing side to side at the same time. And many organisms fit this kind of pattern. Now, why is this important to have this model? Because it ’ s very interesting. When you take this model and you perturb it, you give it a push, as it bumps into something, it self-stabilizes, with no brain or no reflexes, just by the structure alone. It ’ s a beautiful model. Let ’ s look at the mathematics. That ’ s enough! The animals, when you look at them running, appear to be self-stabilizing like this, using basically springy legs. That is, the legs can do computations on their own ; the control algorithms, in a sense, are embedded in the form of the animal itself. Why haven ’ t we been more inspired by nature and these kinds of discoveries? Well, I would argue that human technologies are really different from natural technologies, at least they have been so far. Think about the **typical** kind of robot that you see. Human technologies have tended to be large, flat, with right angles, stiff, made of metal. They have rolling devices and axles. There are very few motors, very few sensors. Whereas nature tends to be small, and curved, and it bends and twists, and has legs instead, and appendages, and has many muscles and many, many sensors. So it ’ s a very different design. However, what ’ s changing, what ’ s really exciting — and I ’ ll show you some of that next — is that as human technology takes on more of the characteristics of nature, then nature really can become a much more useful teacher. And here ’ s one example that ’ s really exciting. This is a collaboration we have with Stanford. And they developed this new technique, called Shape Deposition Manufacturing. It ’ s a technique where they can mix materials together and mold any shape that they like, and put in the material properties. They can embed sensors and actuators right in the form itself. For example, here ’ s a leg : the clear part is stiff, the white part is compliant, and you don ’ t need any axles there or anything. It just bends by itself beautifully. So, you can put those properties in. It inspired them to show off this design by producing a little robot they named Sprawl. Our work has also inspired another robot, a biologically inspired bouncing robot, from the University of Michigan and McGill named RHex, for robot hexapod, and this one ’ s autonomous. Let ’ s go to the video, and let me show you some of these animals moving and then some of the simple robots that have been inspired by our discoveries. Here ’ s what some of you did this morning, although you did it outside, not on a treadmill. Here ’ s what we do. This is a death ’ s head cockroach. This is an American cockroach you think you don ’ t have in your kitchen. This is an eight-legged scorpion, six-legged ant, forty-four-legged centipede. Now, I said all these animals are sort of working like pogo sticks — they ’ re bouncing along as they move. And you can see that in this ghost crab, from the beaches of Panama and North Carolina. It goes up to four meters per second when it runs. It actually leaps into the air, and has aerial phases when it does it, like a horse, and you ’ ll see it ’ s bouncing here. What we discovered is whether you look at the leg of a human like Richard, or a cockroach, or a crab, or a kangaroo, the relative leg stiffness of that spring is the same for everything we ’ ve seen so far. Now, what good are springy legs then? What can they do? Well, we wanted to see if they allowed the animals to have greater stability and maneuverability. So, we built a terrain that had obstacles three times the hip height of the animals that we ’ re looking at. And we were certain they couldn ’ t do this. And here ’ s what they did. The animal ran over it and it didn ’ t even slow down! It didn ’ t decrease its preferred speed at all. We couldn ’ t believe that it could do this. It said to us that if you could build a robot with very simple, springy legs, you could make it as maneuverable as any that ’ s ever been built. Here ’ s the first example of that. This is the Stanford Shape Deposition Manufactured robot, named Sprawl. It has six legs — there are the tuned, springy legs. It moves in a gait that an insect uses, and here it is going on the treadmill. Now, what ’ s important about this robot, compared to other robots, is that it can ’ t see anything, it can ’ t feel anything, it doesn ’ t have a brain, yet it can maneuver over these obstacles without any difficulty whatsoever. It ’ s this technique of building the properties into the form. This is a graduate student. This is what he ’ s doing to his thesis project — very robust, if a graduate student does that to his thesis project. This is from McGill and University of Michigan. This is the RHex, making its first outing in a demo. Same principle : it only has six moving parts, six motors, but it has springy, tuned legs. It moves in the gait of the insect. It has the middle leg moving in synchrony with the front, and the hind leg on the other side. Sort of an alternating tripod, and they can negotiate obstacles just like the animal. Robert Full : It ’ ll go on different surfaces — here ’ s sand — although we haven ’ t perfected the feet yet, but I ’ ll talk about that later. Here ’ s RHex entering the woods. Again, this robot can ’ t see anything, it can ’ t feel anything, it has no brain. It ’ s just working with a tuned mechanical system, with very simple parts, but inspired from the fundamental dynamics of the animal. RF : Here ’ s it going down a pathway. I presented this to the jet propulsion lab at NASA, and they said that they had no ability to go down craters to look for ice, and life, ultimately, on Mars. And he said — especially with legged-robots, because they ’ re way too complicated. Nothing can do that. And I talk next. I showed them this video with the simple design of RHex here. And just to convince them we should go to Mars in 2011, I tinted the video orange just to give them the sense of being on Mars. Another reason why animals have extraordinary performance, and can go anywhere, is because they have an effective interaction with the environment. The animal I ’ m going to show you, that we studied to look at this, is the gecko. We have one here and notice its position. It ’ s holding on. Now I ’ m going to challenge you. I ’ m going show you a video. One of the animals is going to be running on the level, and the other one ’ s going to be running up a wall. Which one ’ s which? They ’ re going at a meter a second. How many think the one on the left is running up the wall? Okay. The point is it ’ s really hard to tell, isn ’ t it? It ’ s incredible, we looked at students do this and they couldn ’ t tell. They can run up a wall at a meter a second, 15 steps per second, and they look like they ’ re running on the level. How do they do this? It ’ s just phenomenal. The one on the right was going up the hill. How do they do this? They have bizarre toes. They have toes that uncurl like party favors when you blow them out, and then peel off the surface, like tape. Like if we had a piece of tape now, we ’ d peel it this way. They do this with their toes. It ’ s bizarre! This peeling inspired iRobot — that we work with — to build Mecho-Geckos. Here ’ s a legged version and a tractor version, or a bulldozer version. Let ’ s see some of the geckos move with some video, and then I ’ ll show you a little bit of a clip of the robots. Here ’ s the gecko running up a vertical surface. There it goes, in real time. There it goes again. Obviously, we have to slow this down a little bit. You can ’ t use regular cameras. You have to take 1, 000 pictures per second to see this. And here ’ s some video at 1, 000 frames per second. Now, I want you to look at the animal ’ s back. Do you see how much it ’ s bending like that? We can ’ t figure that out — that ’ s an unsolved mystery. We don ’ t know how it works. If you have a son or a daughter that wants to come to Berkeley, come to my lab and we ’ ll figure this out. Okay, send them to Berkeley because that ’ s the next thing I want to do. Here ’ s the gecko mill. It ’ s a see-through treadmill with a see-through treadmill belt, so we can watch the animal ’ s feet, and videotape them through the treadmill belt, to see how they move. Here ’ s the animal that we have here, running on a vertical surface. Pick a foot and try to watch a toe, and see if you can see what the animal ’ s doing. See it uncurl and then peel these toes. It can do this in 14 milliseconds. It ’ s unbelievable. Here are the robots that they inspire, the Mecho-Geckos from iRobot. First we ’ ll see the animals toes peeling — look at that. And here ’ s the peeling action of the Mecho-Gecko. It uses a pressure- sensitive adhesive to do it. Peeling in the animal. Peeling in the Mecho-Gecko — that allows them climb autonomously. Can go on the flat surface, transition to a wall, and then go onto a ceiling. There ’ s the bulldozer version. Now, it doesn ’ t use **pressure-sensitive** glue. The animal does not use that. But that ’ s what we ’ re limited to, at the moment. What does the animal do? The animal has weird toes. And if you look at the toes, they have these little leaves there, and if you blow them up and zoom in, you ’ ll see that ’ s there ’ s little striations in these leaves. And if you zoom in 270 times, you ’ ll see it looks like a rug. And if you blow that up, and zoom in 900 times, you see there are hairs there, tiny hairs. And if you look carefully, those tiny hairs have striations. And if you zoom in on those 30, 000 times, you ’ ll see each hair has split ends. And if you blow those up, they have these little structures on the end. The smallest branch of the hairs looks like spatulae, and an animal like that has one billion of these nano-size split ends, to get very close to the surface. In fact, there ’ s the diameter of your hair — a gecko has two million of these, and each hair has 100 to 1, 000 split ends. Think of the contact of that that ’ s possible. We were fortunate to work with another group at Stanford that built us a special manned sensor, that we were able to measure the force of an individual hair. Here ’ s an individual hair with a little split end there. When we measured the forces, they were enormous. They were so large that a patch of hairs about this size — the gecko ’ s foot could support the weight of a small child, about 40 pounds, easily. Now, how do they do it? We ’ ve recently discovered this. Do they do it by friction? No, force is too low. Do they do it by electrostatics? No, you can change the charge — they still hold on. Do they do it by interlocking? That ’ s kind of a like a Velcro-like thing. No, you can put them on molecular smooth surfaces — they don ’ t do it. How about suction? They stick on in a vacuum. How about wet adhesion? Or capillary adhesion? They don ’ t have any glue, and they even stick under water just fine. If you put their foot under water, they grab on. How do they do it then? Believe it or not, they grab on by intermolecular forces, by Van der Waals forces. You know, you probably had this a long time ago in chemistry, where you had these two atoms, they ’ re close together, and the electrons are moving around. That tiny force is sufficient to allow them to do that because it ' s added up so many times with these small structures. What we ' re doing is, we ' re taking that inspiration of the hairs, and with another colleague at Berkeley, we ' re manufacturing them. And just recently we ' ve made a breakthrough, where we now believe we ' re going to be able to create the first synthetic, self-cleaning, dry adhesive. Many companies are interested in this. We also presented to Nike even. We ' ll see where this goes. We were so excited about this that we realized that that small-size scale — and where everything gets sticky, and gravity doesn ' t matter anymore — we needed to look at ants and their feet, because one of my other colleagues at Berkeley has built a six-millimeter silicone robot with legs. But it gets stuck. It doesn ' t move very well. But the ants do, and we ' ll figure out why, so that ultimately we ' ll make this move. And imagine : you ' re going to be able to have swarms of these six-millimeter robots available to run around. Where ' s this going? I think you can see it already. Clearly, the Internet is already having eyes and ears, you have web cams and so forth. But it ' s going to also have legs and hands. You ' re going to be able to do programmable work through these kinds of robots, so that you can run, fly and swim anywhere. We saw David Kelly is at the beginning of that with his fish. So, in conclusion, I think the message is clear. If you need a message, if nature ' s not enough, if you care about search and rescue, or mine clearance, or medicine, or the **various** things we ' re working on, we must preserve nature ' s designs, otherwise these secrets will be lost forever. Thank you.

Text Sample 833: POS Dim 6 – 2002 – Score 3.00 – 2002/t000410.txt

That splendid music, the coming-in music,"The Elephant March"from"Aida,"is the music I ' ve chosen for my funeral. And you can see why. It ' s triumphal. I won ' t feel anything, but if I could, I would feel triumphal at having lived at all, and at having lived on this splendid planet, and having been given the opportunity to understand something about why I was here in the first place, before not being here. Can you understand my quaint English accent? Like everybody else, I was entranced yesterday by the animal session. Robert Full and Frans Lanting and others ; the beauty of the things that they showed. The only slight jarring note was when Jeffrey Katzenberg said of the mustang,"the most splendid creatures that God put on this earth."Now of course, we know that he didn ' t really mean that, but in this country at the moment, you can ' t be too careful. I ' m a biologist, and the central theorem of our subject : the theory of design, Darwin ' s theory of evolution by natural selection. In professional circles everywhere, it ' s of course universally accepted. In non-professional circles outside America, it ' s largely ignored. But in non-professional circles within America, it arouses so much hostility — it ' s fair to say that American biologists are in a state of war. The war is so worrying at present, with court cases coming up in one state after another, that I felt I had to say something about it. If you want to know what I have to say about Darwinism itself, I ' m afraid you ' re going to have to look at my books, which you won ' t find in the bookstore outside. Contemporary court cases often concern an allegedly new version of creationism, called"Intelligent Design,"or ID. Don ' t be fooled. There ' s nothing new about ID. It ' s just creationism under another name, rechristened — I choose the word advisedly — for tactical, political reasons. The arguments of so-called ID theorists are the same old arguments that had been refuted again and again, since Darwin down to the present day. There is an effective evolution lobby coordinating the fight on behalf of science, and I try to do all I can to help them, but they get quite upset when people like me dare to mention that we happen to be atheists as well as evolutionists. They see us as rocking the boat, and you can understand why. Creationists, lacking any coherent scientific argument for their case, fall back on the popular phobia against atheism : Teach your children evolution in biology class, and they ' ll soon move on to drugs, grand larceny and sexual"pre-version."In fact, of course, educated theologians from the Pope down are firm in their support of evolution. This book,"Finding Darwin ' s God,"by Kenneth Miller, is one of the most effective attacks on Intelligent Design that I know and it ' s all the more effective because it ' s written by a devout Christian. People like Kenneth Miller could be called a"godsend"to the evolution lobby, because they expose the lie that evolutionism is, as a matter of fact, tantamount to atheism. People like me, on the other hand, rock the boat. But here, I want to say something nice about creationists. It ' s not a thing I often do, so listen carefully. I think they ' re right about one thing. I think they ' re right that evolution is fundamentally hostile to religion. I ' ve already said that many individual evolutionists, like the Pope, are also religious, but I think they ' re deluding themselves. I believe a true understanding of Darwinism is deeply corrosive to religious faith. Now, it may sound as though I ' m about to preach atheism, and I want to reassure you that that ' s not what I ' m going to do. In an audience as sophisticated as this one, that would be preaching to the choir. No, what I want to urge upon you — Instead, what I want to urge upon you is militant atheism. But that ' s putting it too negatively. If I was a person who were interested in preserving religious faith, I would be very afraid of the positive power of evolutionary science, and indeed science generally, but evolution in particular, to inspire and enthrall, precisely because it is atheistic. Now, the difficult problem for any theory of biological design is to explain the massive statistical improbability of living things. Statistical improbability in the direction of good design —"complexity"is another word for this. The standard creationist argument — there is only one ; they ' re all reduced to this one — takes off from a statistical improbability. Living creatures are too complex to have come about by chance ; therefore, they must have had a designer. This argument of course, shoots itself in the foot. Any designer capable of designing something really complex has to be even more complex himself, and that ' s before we even start on the other things he ' s expected to do, like forgive sins, bless marriages, listen to prayers — favor our side in a war — disapprove of our sex lives, and so on. Complexity is the problem that any theory of biology has to solve, and you can ' t solve it by postulating an agent that is even more complex, thereby simply compounding the problem. Darwinian natural selection is so stunningly elegant because it solves the problem of explaining complexity in terms of nothing but simplicity. Essentially, it does it by providing a smooth ramp of gradual, step-by-step increment. But here, I only want to make the point that the elegance of Darwinism is corrosive to religion, precisely because it is so elegant, so parsimonious, so powerful, so economically powerful. It has the sinewy economy of a beautiful suspension bridge. The God theory is not just a bad theory. It turns out to be — in principle — incapable of doing the job required of it. So, returning to tactics and the evolution lobby, I want to argue that rocking the boat may be just the right thing to do. My approach to attacking creationism is — unlike the evolution lobby — my approach to attacking creationism is to attack religion as a whole. And at this point I need to acknowledge the **remarkable** taboo against speaking ill of religion, and I ' m going to do so in the words of the late Douglas Adams, a dear friend who, if he never came to TED, certainly should have been invited. Richard Dawkins : He was. Good. I thought he must have been. He begins this speech, which was tape recorded in Cambridge shortly before he died — he begins by explaining how science works through the testing of hypotheses that are framed to be vulnerable to disproof, and then he goes on. I quote,"Religion doesn ' t seem to work like that. It has certain ideas at the heart of it, which we call ' sacred ' or ' holy. ' What it means is : here is an idea or a notion that you ' re not allowed to say anything bad about. You ' re just not. Why not? Because you ' re not.""Why should it be that it ' s perfectly legitimate to support the Republicans or Democrats, this model of economics versus that, Macintosh instead of Windows, but to have an opinion about how the universe began, about who created the universe — no, that ' s holy. So, we ' re used to not challenging religious ideas, and it ' s very interesting how much of a furor Richard creates when he does it."— He meant me, not that one."Everybody gets absolutely frantic about it, because you ' re not allowed to say these things. Yet when you look at it rationally, there ' s no reason why those ideas shouldn ' t be as open to debate as any other, except that we ' ve agreed somehow between us that they shouldn ' t be."And that ' s the end of the quote from Douglas. In my view, not only is science corrosive to religion ; religion is corrosive to science. It teaches people to be satisfied with trivial, supernatural non- explanations, and blinds them to the wonderful, real explanations that we have within our grasp. It teaches them to accept authority, revelation and faith, instead of always insisting on evidence. There ' s Douglas Adams, magnificent picture from his book,"Last Chance to See."Now, there ' s a **typical** scientific journal, The Quarterly Review of Biology. And I ' m going to put together, as guest editor, a special issue on the question,"Did an asteroid kill the dinosaurs?"And the first paper is a standard scientific paper, presenting evidence,"Iridium layer at the K-T boundary, and potassium argon dated crater in Yucatan, indicate that an asteroid killed the dinosaurs."Perfectly ordinary scientific paper. Now, the next one."The President of the Royal Society has been vouchsafed a strong inner conviction that an asteroid killed the dinosaurs.""It has been privately revealed to Professor Huxtane that an asteroid killed the dinosaurs.""Professor Hordley was brought up to have total and unquestioning faith"— —"that an asteroid killed the dinosaurs.""Professor Hawkins has promulgated an official dogma binding on all loyal Hawkinsians that an asteroid killed the dinosaurs."That ' s inconceivable, of course. But suppose — [Supporters of the Asteroid Theory cannot be patriotic citizens] In 1987, a reporter asked George Bush, Sr. whether he recognized the equal citizenship and patriotism of Americans who are atheists. Mr. Bush ' s reply has become infamous."No, I don ' t know that atheists should be considered citizens, nor should they be considered patriots. This is one nation under God."Bush ' s bigotry was not an isolated mistake, blurted out in the heat of the moment and later retracted. He stood by it in the face of repeated calls for clarification or withdrawal. He really meant it. More to the point, he knew it posed no threat to his election — quite the contrary. Democrats as well as Republicans parade their religiousness if they want to get elected. Both parties invoke"one nation under God."What would Thomas Jefferson have said? [In every country and in every age, the priest has been hostile to liberty] Incidentally, I ' m not usually very proud of being British, but you can ' t help making the comparison. In practice, what is an atheist? An atheist is just somebody who feels about Yahweh the way any decent Christian feels about Thor or Baal or the golden calf. As has been said before, we are all atheists about most of the gods that humanity has ever believed in. Some of us just go one god further. And however we define atheism, it ' s surely the kind of academic belief that a person is entitled to hold without being vilified as an unpatriotic, unelectable non-citizen. Nevertheless, it ' s an undeniable fact that to own up to being an atheist is tantamount to introducing yourself as Mr. Hitler or Miss Beelzebub. And that all stems from the perception of atheists as some kind of weird, way-out minority. Natalie Angier wrote a rather sad piece in the New Yorker, saying how lonely she felt as an atheist. She clearly feels in a beleaguered minority. But actually, how do American atheists stack up numerically? The latest survey makes surprisingly encouraging reading. Christianity, of course, takes a massive lion ’ s share of the population, with nearly 160 million. But what would you think was the second largest group, convincingly outnumbering Jews with 2. 8 million, Muslims at 1. 1 million, Hindus, Buddhists and all other religions put together? The second largest group, with nearly 30 million, is the one described as non-religious or secular. You can ’ t help wondering why vote-seeking politicians are so proverbially overawed by the power of, for example, the Jewish lobby — the state of Israel seems to owe its very existence to the American Jewish vote — while at the same time, consigning the non-religious to political oblivion. This secular non-religious vote, if properly mobilized, is nine times as numerous as the Jewish vote. Why does this far more substantial minority not make a move to exercise its political muscle? Well, so much for quantity. How about quality? Is there any correlation, positive or negative, between intelligence and tendency to be religious? [Them folks misunderestimated me] The survey that I quoted, which is the ARIS survey, didn ’ t break down its data by socio-economic class or education, IQ or anything else. But a recent article by Paul G. Bell in the Mensa magazine provides some straws in the wind. Mensa, as you know, is an international organization for people with very high IQ. And from a meta-analysis of the literature, Bell concludes that, I quote —”Of 43 studies carried out since 1927 on the relationship between religious belief, and one ’ s intelligence or educational level, all but four found an inverse connection. That is, the higher one ’ s intelligence or educational level, the less one is likely to be religious.”Well, I haven ’ t seen the original 42 studies, and I can ’ t comment on that meta-analysis, but I would like to see more studies done along those lines. And I know that there are — if I could put a little plug here — there are people in this audience easily capable of financing a massive research survey to settle the question, and I put the suggestion up, for what it ’ s worth. But let me know show you some data that have been properly published and analyzed, on one special group — namely, top scientists. In 1998, Larson and Witham polled the cream of American scientists, those who ’ d been honored by election to the National Academy of Sciences, and among this select group, belief in a personal God dropped to a shattering seven percent. About 20 percent are agnostic ; the rest could fairly be called atheists. Similar figures obtained for belief in personal immortality. Among biological scientists, the figure is even lower : 5. 5 percent, only, believe in God. Physical scientists, it ’ s 7. 5 percent. I ’ ve not seen corresponding figures for elite scholars in other fields, such as history or philosophy, but I ’ d be surprised if they were different. So, we ’ ve reached a truly **remarkable** situation, a grotesque mismatch between the American intelligentsia and the American electorate. A philosophical opinion about the nature of the universe, which is held by the vast majority of top American scientists and probably the majority of the intelligentsia generally, is so abhorrent to the American electorate that no candidate for popular election dare affirm it in public. If I ’ m right, this means that high office in the greatest country in the world is barred to the very people best qualified to hold it — the intelligentsia — unless they are prepared to lie about their beliefs. To put it bluntly : American political opportunities are heavily loaded against those who are simultaneously intelligent and honest. I ’ m not a citizen of this country, so I hope it won ’ t be thought unbecoming if I suggest that something needs to be done. And I ’ ve already hinted what that something is. From what I ’ ve seen of TED, I think this may be the ideal place to launch it. Again, I fear it will cost money. We need a consciousness-raising, coming-out campaign for American atheists. This could be similar to the campaign organized by homosexuals a few years ago, although heaven forbid that we should stoop to public outing of people against their will. In most cases, people who out themselves will help to destroy the myth that there is something wrong with atheists. On the contrary, they ' ll demonstrate that atheists are often the kinds of people who could serve as decent role models for your children, the kinds of people an advertising agent could use to recommend a product, the kinds of people who are sitting in this room. There should be a snowball effect, a positive feedback, such that the more names we have, the more we get. There could be non-linearities, threshold effects. When a critical mass has been obtained, there ' s an abrupt acceleration in recruitment. And again, it will need money. I suspect that the word"atheist"itself contains or remains a stumbling block far out of proportion to what it actually means, and a stumbling block to people who otherwise might be happy to out themselves. So, what other words might be used to smooth the path, oil the wheels, sugar the pill? Darwin himself preferred"agnostic"— and not only out of loyalty to his friend Huxley, who coined the term. Darwin said,"I have never been an atheist in the same sense of denying the existence of a God. I think that generally an ' agnostic ' would be the most correct description of my state of mind."He even became uncharacteristically tetchy with Edward Aveling. Aveling was a militant atheist who failed to persuade Darwin to accept the dedication of his book on atheism — incidentally, giving rise to a fascinating myth that Karl Marx tried to dedicate"Das Kapital"to Darwin, which he didn ' t, it was actually Edward Aveling. What happened was that Aveling ' s mistress was Marx ' s daughter, and when both Darwin and Marx were dead, Marx ' s papers became muddled up with Aveling ' s papers, and a letter from Darwin saying,"My dear sir, thank you very much but I don ' t want you to dedicate your book to me,"was mistakenly supposed to be addressed to Marx, and that gave rise to this whole myth, which you ' ve probably heard. It ' s a sort of urban myth, that Marx tried to dedicate"Kapital"to Darwin. Anyway, it was Aveling, and when they met, Darwin challenged Aveling."Why do you call yourselves atheists?""' Agnostic, '"retorted Aveling,"was simply ' atheist ' writ respectable, and ' atheist ' was simply ' agnostic ' writ aggressive."Darwin complained,"But why should you be so aggressive?"Darwin thought that atheism might be well and good for the intelligentsia, but that ordinary people were not, quote,"ripe for it."Which is, of course, our old friend, the"don ' t rock the boat"argument. It ' s not recorded whether Aveling told Darwin to come down off his high horse. But in any case, that was more than 100 years ago. You ' d think we might have grown up since then. Now, a friend, an intelligent lapsed Jew, who, incidentally, observes the Sabbath for reasons of cultural solidarity, describes himself as a"tooth-fairy agnostic."He won ' t call himself an atheist because it ' s, in principle, impossible to prove a negative, but"agnostic"on its own might suggest that God ' s existence was therefore on equal terms of likelihood as his non-existence. So, my friend is strictly agnostic about the tooth fairy, but it isn ' t very likely, is it? Like God. Hence the phrase,"tooth-fairy agnostic."Bertrand Russell made the same point using a hypothetical teapot in orbit about Mars. You would strictly have to be agnostic about whether there is a teapot in orbit about Mars, but that doesn ' t mean you treat the likelihood of its existence as on all fours with its non-existence. The list of things which we strictly have to be agnostic about doesn ' t stop at tooth fairies and teapots ; it ' s infinite. If you want to believe one particular one of them — unicorns or tooth fairies or teapots or Yahweh — the onus is on you to say why. The onus is not on the rest of us to say why not. We, who are atheists, are also a-fairyists and a-teapotists. But we don ' t bother to say so. And this is why my friend uses"tooth-fairy agnostic”as a label for what most people would call atheist. Nonetheless, if we want to attract deep-down atheists to come out publicly, we ’ re going to have find something better to stick on our banner than”tooth-fairy”or”teapot agnostic.”So, how about”humanist”? This has the advantage of a worldwide network of well-organized associations and journals and things already in place. My problem with it is only its apparent anthropocentrism. One of the things we ’ ve learned from Darwin is that the human species is only one among millions of cousins, some close, some distant. And there are other possibilities, like”naturalist,”but that also has problems of confusion, because Darwin would have thought naturalist —”Naturalist”means, of course, as opposed to”supernaturalist”— and it is used sometimes — Darwin would have been confused by the other sense of”naturalist,”which he was, of course, and I suppose there might be others who would confuse it with”nudism”. Such people might be those belonging to the British lynch mob, which last year attacked a pediatrician in mistake for a pedophile. I think the best of the available alternatives for”atheist”is simply”non- theist.”It lacks the strong connotation that there ’ s definitely no God, and it could therefore easily be embraced by teapot or tooth-fairy agnostics. It ’ s completely compatible with the God of the physicists. When atheists like Stephen Hawking and Albert Einstein use the word”God,”they use it of course as a metaphorical shorthand for that deep, mysterious part of physics which we don ’ t yet understand.”Non-theist”will do for all that, yet unlike”atheist,”it doesn ’ t have the same phobic, hysterical responses. But I think, actually, the alternative is to grasp the nettle of the word”atheism”itself, precisely because it is a taboo word, carrying frissons of hysterical phobia. Critical mass may be harder to achieve with the word”atheist”than with the word”non- theist,”or some other non-confrontational word. But if we did achieve it with that dread word”atheist”itself, the political impact would be even greater. Now, I said that if I were religious, I ’ d be very afraid of evolution — I ’ d go further : I would fear science in general, if properly understood. And this is because the scientific worldview is so much more exciting, more poetic, more filled with sheer wonder than anything in the poverty-stricken arsenals of the religious imagination. As Carl Sagan, another recently dead hero, put it,”How is it that hardly any major religion has looked at science and concluded, ’ This is better than we thought! The universe is much bigger than our prophet said, grander, more subtle, more elegant ’? Instead they say, ’ No, no, no! My god is a little god, and I want him to stay that way. ’ A religion, old or new, that stressed the magnificence of the universe as revealed by modern science, might be able to draw forth reserves of reverence and awe hardly tapped by the conventional faiths.”Now, this is an elite audience, and I would therefore expect about 10 percent of you to be religious. Many of you probably subscribe to our polite cultural belief that we should respect religion. But I also suspect that a fair number of those secretly despise religion as much as I do. If you ’ re one of them, and of course many of you may not be, but if you are one of them, I ’ m asking you to stop being polite, come out, and say so. And if you happen to be rich, give some thought to ways in which you might make a difference. The religious lobby in this country is massively financed by foundations — to say nothing of all the tax benefits — by foundations, such as the Templeton Foundation and the Discovery Institute. We need an anti- Templeton to step forward. If my books sold as well as Stephen Hawking ’ s books, instead of only as well as Richard Dawkins ’ books, I ’ d do it myself. People are always going on about,”How did September the 11th change you?”Well, here ’ s how it changed me. Let ’ s all stop being so damned respectful. Thank you very much.

I ’ ve been at MIT for 44 years. I went to TED I. There ’ s only one other person here, I think, who did that. All the other TEDs â and I went to them all, under Ricky ’ s regime â I talked about what the Media Lab was doing, which today has almost 500 people in it. And if you read the press, last week it actually said I quit the Media Lab. I didn ’ t quit the Media Lab, I stepped down as chairman â which was a kind of ridiculous title, but someone else has taken it on â and one of the things you can do as a professor is you stay on as a professor. And I will now do for the rest of my life the One Laptop Per Child, which I ’ ve sort of been doing for a year and a half, anyway. So I ’ m going to tell you about this, use my 18 minutes to tell you why we ’ re doing it, how we ’ re doing it and then what we ’ re doing. And at some point I ’ ll even pass around what the $100 laptop might be like. I was asked by Chris to talk about some of the big issues, and so I figured I ’ d start with the three that at least drove me to do this. And the first is pretty obvious. It ’ s amazing when you meet a head of state, and you say,”What is your most precious natural resource?”They will not say”children”at first, and then when you say,”children,”they will pretty quickly agree with you. And so that isn ’ t very hard. Everybody agrees that whatever the solutions are to the big problems, they include education, sometimes can be just education and can never be without some element of education. So that ’ s certainly part of it. And the third is a little bit less obvious. And that is that we all in this room learned how to walk, how to talk, not by being taught how to talk, or taught how to walk, but by interacting with the world, by having certain results as a consequence of being able to ask for something, or being able to stand up and reach it. Whereas at about the age six, we were told to stop learning that way, and that all learning from then on would happen through teaching, whether it ’ s people standing up, like I ’ m doing now, or a book, or something. But it was really through teaching. And one of the things in general that computers have provided to learning is that it now includes a kind of learning which is a little bit more like walking and talking, in the sense that a lot of it is driven by the learner himself or herself. So with those as the principles â some of you may know Seymour Papert. This is back in 1982, when we were working in Senegal. Because some people think that the $100 laptop just happened a year ago, or two years ago, or we were struck by lightning â this actually has gone back a long time, and in fact, back to the ’ 60s. Here we ’ re in the ’ 80s. Steve Jobs had given us some laptops. We were in Senegal. It didn ’ t scale but it at least was bringing computers to developing countries and learning pretty quickly that these kids, even though English wasn ’ t their language, the Latin alphabet barely was their language, but they could just swim like fish. They could play these like pianos. A little bit more recently, I got involved personally. And these are two anecdotes â one was in Cambodia, in a village that has no electricity, no water, no television, no telephone, but has broadband Internet now. And these kids, their first English word is”Google”and they only know Skype. They ’ ve never heard of telephony. They just use Skype. And they go home at night â they ’ ve got a broadband connection in a hut that doesn ’ t have electricity. The parents love it, because when they open up the laptops, it ’ s the brightest light source in the house. And talk about where metaphors and reality mix â this is the actual school. In parallel with this, Seymour Papert got the governor of Maine to legislate one laptop per child in the year 2002. Now at the time, I think it ’ s fair to say that 80 percent of the teachers were â let me say, apprehensive. Really, they were actually against it. And they really preferred that the money would be used for higher salaries, more schools, whatever. And now, three and a half years later, guess what? They ’ re reporting five things : drop of truancy to almost zero, attending parent-teacher meetings â which nobody did and now almost everybody does â drop in discipline problems, increase in student participation. Teachers are now saying it ' s kind of fun to teach. Kids are engaged â they have laptops! â and then the fifth, which interests me the most, is that the servers have to be turned off at certain times at night because the teachers are getting too much email from the kids asking them for help. So when you see that kind of thing â this is not something that you have to test. The days of pilot projects are over, when people say,"We ' d like to do three or four thousand in our country to see how it works."Screw you. Go to the back of the line and someone else will do it, and then when you figure out that this works, you can join as well. And this is what we ' re doing. So, One Laptop Per Child was formed about a year and a half ago. It ' s a nonprofit association. It raised about 20 million dollars to do the engineering to just get this built, and then have it produced afterwards. Scale is truly important. And it ' s not important because you can buy components at a lower price, OK? It ' s because you can go to a manufacturer â and I will leave the name out â but we wanted a small **display**, doesn ' t have to have perfect color uniformity. It can even have a pixel or two missing. It doesn ' t have to be that bright. And this particular manufacturer said,"We ' re not interested in that. We ' re interested in the living room. We ' re interested in perfect color uniformity. We ' re interested in big **displays**, bright **displays**. You ' re not part of our strategic plan."And I said,"That ' s kind of too bad, because we need 100 million units a year."And they said,"Oh, well, maybe we could become part of your strategic plan."And that ' s why scale counts. And that ' s why we will not launch this without five to 10 million units in the first run. And the idea is to launch with enough scale that the scale itself helps bring the price down, and that ' s why I said seven to 10 million there. And we ' re doing it without a sales-and- marketing team. I mean, you ' re looking at the sales-and-marketing team. We will do it by going to seven large countries and getting them to agree and launch it, and then the others can follow. We have partners. It ' s not hard to guess Google would be one. The others are all playing to pending. And this has been in the press a great deal. It ' s the so-called Green Machine that we introduced with Kofi Annan in November at the World Summit that was held in Tunisia. Now once people start looking at this, they say,"Ah, this is a laptop project."Well, no, it ' s not a laptop project. It ' s an education project. And the fun part â and I ' m quite focused on it â I tell people I used to be a light bulb, but now I ' m a laser â I ' m just going to get that thing built, and it turns out it ' s not so hard. Because laptop economics are the following : I say 50 percent here â it ' s more like 60, 60 percent of the cost of your laptop is sales, marketing, distribution and profit. Now we have none of those, OK? None of those figure into our cost, because first of all, we sell it at cost, and the governments distribute it. It gets distributed to the school system like a textbook. So that piece disappears. Then you have **display** and everything else. Now the **display** on your laptop costs, in rough numbers, 10 dollars a **diagonal** inch. That can drop to eight ; it can drop to seven but it ' s not going to drop to two, or to one and a half, unless we do some pretty clever things. It ' s the rest â that little brown box â that is pretty fascinating, because the rest of your laptop is devoted to itself. It ' s a little bit like an obese person having to use most of their energy to move their obesity. And we have a situation today which is incredible. I ' ve been using laptops since their inception. And my laptop runs slower, less reliably and less pleasantly than it ever has before. And this year is worse. People clap, sometimes you even get standing ovations, and I say,"What the hell ' s wrong with you? Why are we all sitting there?"And somebody â to remain nameless â called our laptop a"gadget"recently. And I said,"God, our laptop ' s going to go like a bat out of hell. When you open it up, it ’ s going to go ’ bing. ’”It ’ ll be on. It ’ ll be just like it was in 1985, when you bought an Apple Macintosh 512. It worked really well. And we ’ ve been going steadily downhill. Now, people ask all the time what it is. That ’ s what it is. The two pieces that are probably notable : it ’ ll be a mesh network, so when the kids open up their laptops, they all become a network, and then just need one or two points of backhaul. You can serve a couple of thousand kids with two megabits. So you really can bring into a village, and then the villages can connect themselves, and you really can do it quite well. The dual mode **display** â the idea is to have a **display** that both works outdoors â isn ’ t it fun using your cell phone outdoors in the sunlight? Well, you can ’ t see it. And one of the reasons you can ’ t see it is because it ’ s backlighting most of the time, most cell phones. Now, what we ’ re doing is, we ’ re doing one that will be both frontlit and backlit. And whether you manually switch it or you do it in the software is to be seen. But when it ’ s backlit, it ’ s color. And when it ’ s frontlit, it ’ s black and white at three times the resolution. Is it all worked out? No. That ’ s why a lot of our people are more or less living in Taiwan right now. And in about 30 days, we ’ ll know for sure whether this works. Probably the most important piece there is that the kids really can do the maintenance. And this is again something that people don ’ t believe, but I really think it ’ s quite true. That ’ s the machine we showed in Tunis. This is more the direction that we ’ re going to go. And it ’ s something that we didn ’ t think was possible. Now, I ’ m going to pass this around. This isn ’ t a design, OK? So this is just a mechanical engineering sort of embodiment of it for you to play with. And it ’ s clearly just a model. The working one is at MIT. I ’ m going to pass it to this handsome gentleman. At least you can decide whether it goes left or â Chris Anderson : Before you do it, for the people down in simulcast â Nicholas Negroponte : Sorry! I forgot. CA : Just show it off a bit. So wherever the camera is â OK, good point. Thank you, Chris. The idea was that it would be not only a laptop, but that it could transform into an electronic book. So it ’ s sort of an electronic book. This is where when you go outside, it ’ s in black and white. The games buttons are missing, but it ’ ll also be a games machine, book machine. Set it up this way, and it ’ s a television set. Etc., etc. â is that enough for simulcast? OK, sorry. I ’ ll let Jim decide which way to send it afterwards. OK. Seven countries. I say”maybe”for Massachusetts, because they actually have to do a bid. By law you ’ ve got to bid, and so on and so forth. So I can ’ t quite name them. In the other cases, they don ’ t have to do bids. They can decide â it ’ s the federal government in each case. It ’ s kind of agonizing, because a lot of people say,”Let ’ s do it at the state level,”because states are more nimble than the feds, just because of size. And yet we count. We ’ re really dealing with the federal government. We ’ re really dealing with ministries of education. And if you look at governments around the world, ministries of education tend to be the most conservative, and also the ones that have huge payrolls. Everybody thinks they know about education, a lot of culture is built into it as well. It ’ s really hard. And so it ’ s certainly the hard road. If you look at the countries, they ’ re pretty geoculturally distributed. Have they all agreed? No, not completely. Probably Thailand, Brazil and Nigeria are the three that are the most active and most agreed. We ’ re purposely not signing anything with anybody until we actually have the working ones. And since I visit each one of those countries within at least every three months, I ’ m just going around the world every three weeks. Here ’ s sort of the schedule and I put at the bottom we might give some away free in two years at this meeting. Everybody says it ’ s a $100 laptop â you can ’ t do it. Well, guess what, we ’ re not. We ’ re coming in probably at 135, to start, then drift down. And that ’ s very important, because so many things hit the market at a price and then drift up. It ’ s kind of the loss leader, and then as soon as it looks interesting, it can ’ t be afforded, or it can ’ t be scaled out. So we ’ re targeting 50 dollars in 2010. The gray market ’ s a big issue. And one of the ways â just one â but one of the ways to help in the case of the gray market is to make something that is so utterly unique â It ’ s a little bit like the fact that automobiles â thousands of automobiles are stolen every day in the United States. Not one single post-office truck is stolen. And why? Because there ’ s no market for post-office trucks. It looks like a post-office truck. You can spray paint it. You can do anything you want. I just learned recently : in South Africa, no white Volvos are stolen. Period. None. Zero. So we want to make it very much like a white Volvo. Each government has a task force. This perhaps is less interesting, but we ’ re trying to get the governments to all work together and it ’ s not easy. The economics of this is to start with the federal governments and then later, to subsequently go to other â whether it ’ s child-to-child funding, so a child in this country buys one for a child in the developing world, maybe of the same gender, maybe of the same age. An uncle gives a niece or a nephew that as a birthday present. I mean, there are all sorts of things that will happen, and they ’ ll be very, very exciting. And everybody says â I say â it ’ s an education project. Are we providing the software? The answer is : The system certainly has software, but no, we ’ re not providing the education content. That is really done in the countries. But we are certainly constructionists. And we certainly believe in learning by doing and everything from Logo, which was started in 1968, to more modern things, like Scratch, if you ’ ve ever even heard of it, are very, very much part of it. And that ’ s the rollout. Are we dreaming? Is this real? It actually is real. The only criticism, and people really don ’ t want to criticize this, because it is a humanitarian effort, a nonprofit effort and to criticize it is a little bit stupid, actually. But the one thing that people could criticize was,”Great idea, but these guys can ’ t do it.”And that could either mean these guys, professors and so on couldn ’ t do it, or that it ’ s not possible. Well, on December 12, a company called Quanta agreed to build it, and since they make about one-third of all the laptops on the planet today, that question disappeared. So it ’ s not a matter of whether it ’ s going to happen. It is going to happen. And if it comes out at 138 dollars, so what? If it comes out six months late, so what? That ’ s a pretty soft landing. Thank you.

I ’ m the luckiest guy in the world. I got to see the last case of killer smallpox in the world. I was in India this past year, and I may have seen the last cases of polio in the world. There ’ s nothing that makes you feel more â the blessing and the honor of working in a program like that â than to know that something that horrible no longer exists. So I ’ m going to tell you â so I ’ m going to show you some dirty pictures. They are difficult to watch, but you should look at them with optimism, because the horror of these pictures will be matched by the uplifting quality of knowing that they no longer exist. But first, I ’ m going to tell you a little bit about my own journey. My background is not exactly the conventional medical education that you might expect. When I was an intern in San Francisco, I heard about a group of Native Americans who had taken over Alcatraz Island, and a Native American who wanted to give birth on that island, and no other doctor wanted to go and help her give birth. I went out to Alcatraz, and I lived on the island for several weeks. She gave birth ; I caught the baby ; I got off the island ; I landed in San Francisco ; and all the press wanted to talk to me, because my three weeks on the island made me an expert in Indian affairs. I wound up on every television show. Someone saw me on television ; they called me up ; and they asked me if I ’ d like to be in a **movie** and to play a young doctor for a bunch of rock and roll stars who were traveling in a bus ride from San Francisco to England. And I said, yes, I would do that, so I became the doctor in an absolutely awful **movie** called”Medicine Ball Caravan.”Now, you know from the ’ 60s, you ’ re either on the bus or you ’ re off the bus ; I was on the bus. My wife of 37 years and I joined the bus. Our bus ride took us from San Francisco to London, then we switched buses at the big pond. We then got on two more buses and we drove through Turkey and Iran, Afghanistan, over the Khyber Pass into Pakistan, like every other young doctor. This is us at the Khyber Pass, and that ’ s our bus. We had some difficulty getting over the Khyber Pass. But we wound up in India. And then, like everyone else in our generation, we went to live in a Himalayan monastery. This is just like a residency program, for those of you that are in medical school. And we studied with a wise man, a guru named Karoli Baba, who then told me to get rid of the dress, put on a three-piece suit, go join the United Nations as a diplomat and work for the World Health Organization. And he made an outrageous prediction that smallpox would be eradicated, and that this was God ’ s gift to humanity, because of the hard work of dedicated scientists. And that prediction came true. This little girl is Rahima Banu, and she was the last case of killer smallpox in the world. And this document is the certificate that the global commission signed, certifying the world to have eradicated the first disease in history. The key to eradicating smallpox was early detection, early response. I ’ m going to ask you to repeat that : early detection, early response. Can you say that? Audience : Early detection, early response. Larry Brilliant : Smallpox was the worst disease in history. It killed more people than all the wars in history. In the last century, it killed 500 million people. You ’ re reading about Larry Page already. Somebody reads very fast. In the year that Larry Page and Sergey Brin â with whom I have a certain affection and a new affiliation â in the year in which they were born, two million people died of smallpox. We declared smallpox eradicated in 1980. This is the most important slide that I ’ ve ever seen in public health, [Sovereigns killed by smallpox] because it shows you to be the richest and the strongest, and to be kings and queens of the world, did not protect you from dying of smallpox. Never can you doubt that we are all in this together. But to see smallpox from the perspective of a sovereign is the wrong perspective. You should see it from the perspective of a mother, watching her child develop this disease and standing by helplessly. Day one, day two, day three, day four, day five, day six. You ’ re a mother and you ’ re watching your child, and on day six, you see pustules that become hard. Day seven, they show the classic scars of smallpox umbilication. Day eight. And Al Gore said earlier that the most photographed image in the world, the most printed image in the world, was that of the Earth. But this was in 1974, and as of that moment, this photograph was the photograph that was the most widely printed, because we printed two billion copies of this photograph, and we took them hand to hand, door to door, to show people and ask them if there was smallpox in their house, because that was our surveillance system. We didn ’ t have Google, we didn ’ t have web crawlers, we didn ’ t have computers. By day nine â you look at this picture and you ’ re horrified ; I look at this picture and I say,”Thank God,”because it ’ s clear that this is only an ordinary case of smallpox, and I know this child will live. And by day 13, the lesions are scabbing, his eyelids are swollen, but you know this child has no other secondary infection. And by day 20, while he will be scarred for life, he will live. There are other kinds of smallpox that are not like that. This is confluent smallpox, in which there isn ’ t a single place on the body where you could put a finger and not be covered by lesions. Flat smallpox, which killed 100 percent of people who got it. And hemorrhagic smallpox, the most cruel of all, which had a predilection for pregnant women. I ’ ve probably had 50 women die. They all had hemorrhagic smallpox. I ’ ve never seen anybody die from it who wasn ’ t a pregnant woman. In 1967, the WHO embarked on what was an outrageous program to eradicate a disease. In that year, there were 34 countries affected with smallpox. By 1970, we were down to 18 countries. 1974, we were down to five countries. But in that year, smallpox exploded throughout India. And India was the place where smallpox made its last stand. In 1974, India had a population of 600 million. There are 21 linguistic states in India, which is like saying 21 different countries. There are 20 million people on the road at any time, in buses and trains, walking ; 500, 000 villages, 120 million households, and none of them wanted to report if they had a case of smallpox in their house, because they thought that smallpox was the visitation of a deity, Shitala Mata, the cooling mother, and it was wrong to bring strangers into your house when the deity was in the house. No incentive to report smallpox. It wasn ’ t just India that had smallpox deities ; smallpox deities were prevalent all over the world. So, how we eradicated smallpox was â mass vaccination wouldn ’ t work. You could vaccinate everybody in India, but one year later there ’ d be 21 million new babies, which was then the population of Canada. It wouldn ’ t do just to vaccinate everyone. You had to find every single case of smallpox in the world at the same time, and draw a circle of immunity around it. And that ’ s what we did. In India alone, my 150, 000 best friends and I went door to door, with that same picture, to every single house in India. We made over one billion house calls. And in the process, I learned something very important. Every time we did a house-to-house search, we had a spike in the number of reports of smallpox. When we didn ’ t search, we had the illusion that there was no disease. When we did search, we had the illusion that there was more disease. A surveillance system was necessary, because what we needed was early detection, early response. So we searched and we searched, and we found every case of smallpox in India. We had a reward. We raised the reward. We continued to increase the reward. We had a scorecard that we wrote on every house. And as we did that, the number of reported cases in the world dropped to zero. And in 1980, we declared the globe free of smallpox. It was the largest campaign in United Nations history, until the Iraq war. 150, 000 people from all over the world â doctors of every race, religion, culture and nation, who fought side by side, brothers and sisters, with each other, not against each other, in a common cause to make the world better. But smallpox was the fourth disease that was intended for eradication. We failed three other times. We failed against malaria, yellow fever and yaws. But soon we may see polio eradicated. But the key to eradicating polio is early detection, early response. This may be the year we eradicate polio. That will make it the second disease in history. And David Heymann, who ’ s watching this on the webcast â David, keep on going. We ’ re close! We ’ re down to four countries. I feel like Hank Aaron. Barry Bonds can replace me any time. Let ’ s get another disease off the list of terrible things to worry about. I was just in India working on the polio program. The polio surveillance program is four million people going door to door. That is the surveillance system. But we need to have early detection, early response. Blindness, the same thing. The key to discovering blindness is doing epidemiological surveys and finding out the causes of blindness, so you can mount the correct response. The Seva Foundation was started by a group of alumni of the Smallpox Eradication Programme, who, having climbed the highest mountain, tasted the elixir of the success of eradicating a disease, wanted to do it again. And over the last 27 years, Seva ’ s programs in 15 countries have given back sight to more than two million blind people. Seva got started because we wanted to apply these lessons of surveillance and epidemiology to something which nobody else was looking at as a public health issue : blindness, which heretofore had been thought of only as a clinical disease. In 1980, Steve Jobs gave me that computer, which is Apple number 12, and it ’ s still in Kathmandu, and it ’ s still working, and we ought to go get it and auction it off and make more money for Seva. And we conducted the first Nepal survey ever done for health, and the first nationwide blindness survey ever done, and we had astonishing results. Instead of finding out what we thought was the case â that blindness was caused mostly by glaucoma and trachoma â we were astounded to find out that blindness was caused instead by cataract. You can ’ t cure or prevent what you don ’ t know is there. In your TED packages there ’ s a DVD,”Infinite Vision,”about Dr. V and the Aravind Eye Hospital. I hope that you will take a look at it. Aravind, which started as a Seva project, is now the world ’ s largest and best eye hospital. This year, that one hospital will give back sight to more than 300, 000 people in Tamil Nadu, India. Bird flu. I stand here as a representative of all terrible things â this might be the worst. The key to preventing or mitigating pandemic bird flu is early detection and rapid response. We will not have a vaccine or adequate supplies of an antiviral to combat bird flu if it occurs in the next three years. WHO stages the progress of a pandemic. We are now at stage three on the pandemic alert stage, with just a little bit of human-to-human transmission, but no human-to-human-to-human sustained transmission. The moment WHO says we ’ ve moved to category four â this will not be like Katrina. The world as we know it will stop. There ’ ll be no airplanes flying. Would you get in an airplane with 250 people you didn ’ t know, coughing and sneezing, when you knew that some of them might carry a disease that could kill you, for which you had no antivirals or vaccine? I did a study of the top epidemiologists in the world in October. I asked them â these are all fluologists and specialists in influenza â and I asked them the questions you ’ d like to ask them : What do you think the likelihood is that there ’ ll be a pandemic? If it happens, how bad do you think it will be? Fifteen percent said they thought there ’ d be a pandemic within three years. But much worse than that, 90 percent said they thought there ’ d be a pandemic within your children or your grandchildren ’ s lifetime. And they thought that if there was a pandemic, a billion people would get sick. As many as 165 million people would die. There would be a global recession and depression as our just-in-time inventory system and the tight rubber band of globalization broke, and the cost to our economy of one to three trillion dollars would be far worse for everyone than merely 100 million people dying, because so many more people would lose their job and their healthcare benefits, that the consequences are almost unthinkable. And it ’ s getting worse, because travel is getting so much better. Let me show you a simulation of what a pandemic looks like. So we know what we ’ re talking about. Let ’ s assume, for example, that the first case occurs in South Asia. It initially goes quite slowly. You get two or three discrete locations. Then there ’ ll be secondary outbreaks, and the disease will spread from country to country so fast that you won ’ t know what hit you. Within three weeks it will be everywhere in the world. Now, if we had an”undo”button, and we could go back and isolate it and grab it when it first started â if we could find it early, and we had early detection and early response, and we could put each one of those viruses in jail â that ’ s the only way to deal with something like a pandemic. And let me show you why that is. We have a joke. This is an epidemic curve, and everyone in medicine, I think, ultimately gets to know what it is. But the joke is, an epidemiologist likes to arrive at an epidemic right here and ride to glory on the downhill curve. But you don ’ t get to do that usually. You usually arrive right about here. What we really want is to arrive right here, so we can stop the epidemic. But you can ’ t always do that. But there ’ s an organization that has been able to find a way to learn when the first cases occur, and that is called GPHIN ; it ’ s the Global Public Health Information Network. And that simulation that I showed you that you thought was bird flu â that was SARS. And SARS is the pandemic that did not occur. And it didn ’ t occur because GPHIN found the pandemic-to-be of SARS three months before WHO actually announced it, and because of that, we were able to stop the SARS pandemic. And I think we owe a great debt of gratitude to GPHIN and to Ron St. John, who I hope is in the audience some place â over there â who ’ s the founder of GPHIN. Hello, Ron! And TED has flown Ron here from Ottawa, where GPHIN is located, because not only did GPHIN find SARS early, but you may have seen last week that Iran announced that they had bird flu in Iran, but GPHIN found the bird flu in Iran not February 14 â but last September. We need an early-warning system to protect us against the things that are humanity ’ s worst nightmare. And so my TED wish is based on the common denominator of these experiences. Smallpox â early detection, early response. Blindness, polio â early detection, early response. Pandemic bird flu â early detection, early response. It is a litany. It is so obvious that our only way of dealing with these new diseases is to find them early and to kill them before they spread. So, my TED wish is for you to help build a global system â an early-warning system â to protect us against humanity ’ s worst nightmares. And what I thought I would call it is”Early Detection,”But it should really be called...”Total Early Detection.”[TED] What? What? But in all seriousness, because this idea is birthed in TED, I would like it to be a legacy of TED, and I ’ d like to call it the”International System for Total Early Disease Detection.”[INSTEDD] And INSTEDD then becomes our mantra. So instead of a hidden pandemic of bird flu, we find it and immediately contain it. Instead of a novel virus caused by bio-terror or bio-error, or shift or drift, we find it and we contain it. Instead of industrial accidents like oil spills or the catastrophe in Bhopal, we find them, and we respond to them. Instead of famine, hidden until it is too late, we detect it, and we respond. And instead of a system which is owned by a government, and hidden in the bowels of government, let ’ s build an early detection system that ’ s freely available to anyone in the world in their own language. Let ’ s make it transparent, non-governmental, not owned by any single country or company, housed in a neutral country, with redundant backup in a different time zone and a different continent. And let ’ s build it on GPHIN. Let ’ s start with GPHIN. Let ’ s increase the websites that they crawl from 20, 000 to 20 million. Let ’ s increase the languages they crawl from seven to 70, or more. Let ’ s build in outbound confirmation messages, using text messages or SMS or instant messaging to find out from people who are within 100 meters of the rumor that you hear, if it is, in fact, valid. And let ’ s add satellite confirmation. And we ’ ll add Gapminder ’ s amazing graphics to the front end. And we ’ ll grow it as a moral force in the world, finding out those terrible things before anybody else knows about them, and sending our response to them, so that next year, instead of us meeting here, lamenting how many terrible things there are in the world, we will have pulled together, used the unique skills and the magic of this community, and be proud that we have done everything we can to stop pandemics, other catastrophes, and change the world, beginning right now. Chris Anderson : An amazing **presentation**. First of all, just so everyone understands : you ’ re saying that by creating web crawlers, looking on the Internet for patterns, they can detect something suspicious before WHO, before anyone else can see it? Give an example of how that could possibly be true. Larry Brilliant : You ’ re not mad about the copyright violation? CA : No. I love it. LB : Well, as Ron St. John â I hope you ’ ll go and meet him in the dinner afterwards and talk to him. When he started GPHIN â In 1997, there was an outbreak of bird flu â H5N1. It was in Hong Kong. And a **remarkable** doctor in Hong Kong responded immediately, by slaughtering 1. 5 million chickens and birds, and they stopped that outbreak in its tracks. Immediate detection, immediate response. Then a number of years went by, and there were a lot of rumors about bird flu. Ron and his team in Ottawa began to crawl the web â only crawling 20, 000 different websites, mostly periodicals â and they read about and heard about a concern, of a lot of children who had high fever and symptoms of bird flu. They reported this to WHO. WHO took a little while taking action, because WHO will only receive a report from a government, because it ’ s the United Nations. But they were able to point to WHO and let them know that there was this surprising and unexplained cluster of illnesses that looked like bird flu. That turned out to be SARS. That ’ s how the world found out about SARS. And because of that, we were able to stop SARS. Now, what ’ s really important is that, before there was GPHIN, 100 percent of all the world ’ s reports of bad things â whether you ’ re talking about famine or you ’ re talking about bird flu or you ’ re talking about Ebola â 100 percent of all those reports came from nations. The moment these guys in Ottawa â on a budget of 800, 000 dollars a year â got cracking, 75 percent of all the reports in the world came from GPHIN, 25 percent of all the reports in the world came from all the other 180 nations. Now, here ’ s what ’ s really interesting : after they ’ d been working for a couple years, what do you think happened to those nations? They felt pretty stupid. So they started sending in their reports early. And now, their reporting percentage is down to 50 percent, because other nations have started to report. So, can you find diseases early by crawling the web? Of course you can. Can you find it even earlier than GPHIN does now? Of course you can. You saw that they found SARS using their Chinese web crawler a full six weeks before they found it using their English web crawler. Well, they ’ re only crawling in seven languages. These bad viruses really don ’ t have any intention of showing up first in English or Spanish or French. So yes, I want to take GPHIN, I want to build on it. I want to add all the languages of the world that we possibly can. I want to make this open to everybody, so that the health officer in Nairobi or in Patna, Bihar will have as much access to it as the folks in Ottawa or in CDC. And I want to make it part of our culture that there is a community of people who are watching out for the worst nightmares of humanity, and that it ’ s accessible to everyone.

The future that we will create can be a future that we ’ ll be proud of. I think about this every day ; it ’ s quite literally my job. I ’ m co-founder and senior columnist at Worldchanging. com. Alex Steffen and I founded Worldchanging in late 2003, and since then we and our growing global team of contributors have documented the ever-expanding variety of solutions that are out there, right now and on the near horizon. In a little over two years, we ’ ve written up about 4, 000 items — replicable models, technological tools, emerging ideas — all providing a path to a future that ’ s more sustainable, more equitable and more desirable. Our emphasis on solutions is quite intentional. There are tons of places to go, online and off, if what you want to find is the latest bit of news about just how quickly our hell-bound handbasket is moving. We want to offer people an idea of what they can do about it. We focus primarily on the planet ’ s environment, but we also address issues of global development, international conflict, responsible use of emerging technologies, even the rise of the so-called Second Superpower and much, much more. The scope of solutions that we discuss is actually pretty broad, but that reflects both the range of challenges that need to be met and the kinds of innovations that will allow us to do so. A quick sampling really can barely scratch the surface, but to give you a sense of what we cover : tools for rapid disaster relief, such as this inflatable concrete shelter ; innovative uses of bioscience, such as a flower that changes color in the presence of landmines ; ultra high-efficiency designs for homes and offices ; distributed power generation using solar power, wind power, ocean power, other clean energy sources ; ultra, ultra high-efficiency vehicles of the future ; ultra high- efficiency vehicles you can get right now ; and better urban design, so you don ' t need to drive as much in the first place ; bio-mimetic approaches to design that take advantage of the efficiencies of natural models in both vehicles and buildings ; distributed computing projects that will help us model the future of the climate. Also, a number of the topics that we ' ve been talking about this week at TED are things that we ' ve addressed in the past on Worldchanging : cradle-to-cradle design, MIT ' s Fab Labs, the consequences of extreme longevity, the One Laptop per Child project, even Gapminder. As a born-in-the-mid-1960s Gen X-er, hurtling all too quickly to my fortieth birthday, I ' m naturally inclined to pessimism. But working at Worldchanging has convinced me, much to my own surprise, that successful responses to the world ' s problems are nonetheless possible. Moreover, I ' ve come to realize that focusing only on negative outcomes can really blind you to the very possibility of success. As Norwegian social scientist Evelin Lindner has observed,"Pessimism is a luxury of good times... In difficult times, pessimism is a self- fulfilling, self-inflicted death sentence."The truth is, we can build a better world, and we can do so right now. We have the tools : we saw a hint of that a moment ago, and we ' re coming up with new ones all the time. We have the knowledge, and our understanding of the planet improves every day. Most importantly, we have the motive : we have a world that needs fixing, and nobody ' s going to do it for us. Many of the solutions that I and my colleagues seek out and write up every day have some important aspects in common : transparency, collaboration, a willingness to experiment, and an appreciation of science — or, more appropriately, science! The majority of models, tools and ideas on Worldchanging encompass combinations of these characteristics, so I want to give you a few concrete examples of how these principles combine in world- changing ways. We can see world-changing values in the emergence of tools to make the invisible visible — that is, to make apparent the conditions of the world around us that would otherwise be largely imperceptible. We know that people often change their behavior when they can see and understand the impact of their actions. As a small example, many of us have experienced the change in driving behavior that comes from having a real time **display** of mileage showing precisely how one ' s driving habits affect the vehicle ' s efficiency. The last few years have all seen the rise of innovations in how we measure and **display** aspects of the world that can be too big, or too intangible, or too slippery to grasp easily. Simple technologies, like wall-mounted devices that **display** how much power your household is using, and what kind of results you ' ll get if you turn off a few lights — these can actually have a direct positive impact on your energy footprint. Community tools, like text messaging, that can tell you when pollen counts are up or smog levels are rising or a natural disaster is unfolding, can give you the information you need to act in a timely fashion. Data-rich **displays** like maps of campaign contributions, or maps of the disappearing polar ice caps, allow us to better understand the context and the flow of processes that affect us all.

We can see world-changing values in research projects that seek to meet the world ’ s medical needs through open access to data and collaborative action. Now, some people emphasize the risks of knowledge-enabled dangers, but I ’ m convinced that the benefits of knowledge-enabled solutions are far more important. For example, open-access journals, like the Public Library of Science, make cutting-edge scientific research free to all — everyone in the world. And actually, a growing number of science publishers are adopting this model. Last year, hundreds of volunteer biology and chemistry researchers around the world worked together to sequence the genome of the parasite responsible for some of the developing world ’ s worst diseases : African sleeping sickness, leishmaniasis and Chagas disease. That genome data can now be found on open-access genetic data banks around the world, and it ’ s an enormous boon to researchers trying to come up with treatments. But my favorite example has to be the global response to the SARS epidemic in 2003, 2004, which relied on worldwide access to the full gene sequence of the SARS virus. The U. S. National Research Council in its follow-up report on the outbreak specifically cited this open availability of the sequence as a key reason why the treatment for SARS could be developed so quickly. And we can see world-changing values in something as humble as a cell phone. I can probably count on my fingers the number of people in this room who do not use a mobile phone — and where is Aubrey, because I know he doesn ’ t? For many of us, cell phones have really become almost an extension of ourselves, and we ’ re really now beginning to see the social changes that mobile phones can bring about. You may already know some of the big-picture aspects : globally, more camera phones were sold last year than any other kind of camera, and a growing number of people live lives mediated through the lens, and over the network — and sometimes enter history books. In the developing world, mobile phones have become economic drivers. A study last year showed a direct correlation between the growth of mobile phone use and subsequent GDP increases across Africa. In Kenya, mobile phone minutes have actually become an alternative currency. The political aspects of mobile phones can ’ t be ignored either, from text message swarms in Korea helping to bring down a government, to the Blairwatch Project in the UK, keeping tabs on politicians who try to avoid the press. And it ’ s just going to get more wild. Pervasive, always-on networks, high quality sound and video, even devices made to be worn instead of carried in the pocket, will transform how we live on a scale that few really appreciate. It ’ s no exaggeration to say that the mobile phone may be among the world ’ s most important technologies. And in this rapidly evolving context, it ’ s possible to imagine a world in which the mobile phone becomes something far more than a medium for social interaction. I ’ ve long admired the Witness project, and Peter Gabriel told us more details about it on Wednesday, in his profoundly moving **presentation**. And I ’ m just incredibly happy to see the news that Witness is going to be opening up a Web portal to enable users of digital cameras and camera phones to send in their recordings over the Internet, rather than just hand-carrying the videotape. Not only does this add a new and potentially safer avenue for documenting abuses, it opens up the program to the growing global digital generation. Now, imagine a similar model for networking environmentalists. Imagine a Web portal collecting recordings and evidence of what ’ s happening to the planet : putting news and data at the fingertips of people of all kinds, from activists and researchers to businesspeople and political figures. It would highlight the changes that are underway, but would more importantly give voice to the people who are willing to work to see a new world, a better world, come about. It would give everyday citizens a chance to play a role in the protection of the planet. It would be, in essence, an”Earth Witness”project. Now, just to be clear, in this talk I ’ m using the name”Earth Witness”as part of the scenario, simply as a shorthand, for what this imaginary project could aspire to, not to piggyback on the wonderful work of the Witness organization. It could just as easily be called,”Environmental Transparency Project,””Smart Mobs for Natural Security”— but Earth Witness is a lot easier to say. Now, many of the people who participate in Earth Witness would focus on ecological problems, human-caused or otherwise, especially environmental crimes and significant sources of greenhouse gases and emissions. That ’ s understandable and important. We need better documentation of what ’ s happening to the planet if we ’ re ever going to have a chance of repairing the damage. But the Earth Witness project wouldn ’ t need to be limited to problems. In the best Worldchanging tradition, it might also serve as a showcase for good ideas, successful projects and efforts to make a difference that deserve much more visibility. Earth Witness would show us two worlds : the world we ’ re leaving behind, and the world we ’ re building for generations to come. And what makes this scenario particularly appealing to me is we could do it today. The key components are already widely available. Camera phones, of course, would be fundamental to the project. And for a lot of us, they ’ re as close as we have yet to always-on, widely available information tools. We may not remember to bring our digital cameras with us wherever we go, but very few of us forget our phones. You could even imagine a version of this scenario in which people actually build their own phones. Over the course of last year, open-source hardware hackers have come up with multiple models for usable, Linux-based mobile phones, and the Earth Phone could spin off from this kind of project. At the other end of the network, there ’ d be a server for people to send photos and messages to, accessible over the Web, combining a photo-sharing service, social networking platforms and a collaborative **filtering** system. Now, you Web 2. 0 folks in the audience know what I ’ m talking about, but for those of you for whom that last sentence was in a crazy moon language, I mean simply this : the online part of the Earth Witness project would be created by the users, working together and working openly. That ’ s enough right there to start to build a compelling chronicle of what ’ s now happening to our planet, but we could do more. An Earth Witness site could also serve as a collection spot for all sorts of data about conditions around the planet picked up by environmental sensors that attach to your cell phone. Now, you don ’ t see these devices as add-ons for phones yet, but students and engineers around the world have attached atmospheric sensors to bicycles and handheld computers and cheap robots and the backs of pigeons — that being a project that ’ s actually underway right now at U. C. Irvine, using bird-mounted sensors as a way of measuring smog-forming pollution. It ’ s hardly a stretch to imagine putting the same thing on a phone carried by a person. Now, the idea of connecting a sensor to your phone is not new : phone-makers around the world offer phones that sniff for bad breath, or tell you to worry about too much sun exposure. Swedish firm Uppsala Biomedical, more seriously, makes a mobile phone add-on that can process blood tests in the field, uploading the data, **displaying** the results. Even the Lawrence Livermore National Labs have gotten into the act, designing a prototype phone that has radiation sensors to find dirty bombs. Now, there ’ s an enormous variety of tiny, inexpensive sensors on the market, and you can easily imagine someone putting together a phone that could measure temperature, CO2 or methane levels, the presence of some biotoxins — potentially, in a few years, maybe even H5N1 avian flu virus. You could see that some kind of system like this would actually be a really good fit with Larry Brilliant ’ s InSTEDD project. Now, all of this data could be tagged with geographic information and mashed up with online maps for easy viewing and analysis. And that ’ s worth noting in particular. The impact of open-access online maps over the last year or two has been simply phenomenal. Developers around the world have come up with an amazing variety of ways to layer useful data on top of the maps, from bus routes and crime statistics to the global progress of avian flu. Earth Witness would take this further, linking what you see with what thousands or millions of other people see around the world. It ’ s kind of exciting to think about what might be accomplished if something like this ever existed. We ’ d have a far better — far better knowledge of what ’ s happening on our planet environmentally than could be gathered with satellites and a handful of government sensor nets alone. It would be a collaborative, bottom-up approach to environmental awareness and protection, able to respond to emerging concerns in a smart mobs kind of way — and if you need greater sensor density, just have more people show up. And most important, you can ’ t ignore how important mobile phones are to global youth. This is a system that could put the next generation at the front lines of gathering environmental data. And as we work to figure out ways to mitigate the worst effects of climate disruption, every little bit of information matters. A system like Earth Witness would be a tool for all of us to participate in the improvement of our knowledge and, ultimately, the improvement of the planet itself. Now, as I suggested at the outset, there are thousands upon thousands of good ideas out there, so why have I spent the bulk of my time telling you about something that doesn ’ t exist? Because this is what tomorrow could look like : bottom-up, technology-enabled global collaboration to handle the biggest crisis our civilization has ever faced. We can save the planet, but we can ’ t do it alone — we need each other. Nobody ’ s going to fix the world for us, but working together, making use of technological innovations and human communities alike, we might just be able to fix it ourselves. We have at our fingertips a cornucopia of compelling models, powerful tools, and innovative ideas that can make a meaningful difference in our planet ’ s future. We don ’ t need to wait for a magic bullet to save us all ; we already have an arsenal of solutions just waiting to be used. There ’ s a staggering array of wonders out there, across diverse disciplines, all telling us the same thing : success can be ours if we ’ re willing to try. And as we say at Worldchanging, another world isn ’ t just possible ; another world is here. We just need to open our eyes. Thank you very much.

Text Sample 837: POS Dim 6 – 2008 – Score 4.00 – 2008/t000156.txt

I thought I would think about changing your perspective on the world a bit, and showing you some of the designs that we have in nature. And so, I have my first slide to talk about the dawning of the universe and what I call the cosmic scene investigation, that is, looking at the relics of creation and inferring what happened at the beginning, and then following it up and trying to understand it. And so one of the questions that I asked you is, when you look around, what do you see? Well, you see this space that ’ s created by designers and by the work of people, but what you actually see is a lot of material that was already here, being reshaped in a certain form. And so the question is : how did that material get here? How did it get into the form that it had before it got reshaped, and so forth? It ’ s a question of what ’ s the continuity? So one of the things I look at is, how did the universe begin and shape? What was the whole process in the creation and the evolution of the universe to getting to the point that we have these kinds of materials? So that ’ s sort of the part, and let me move on then and show you the Hubble Ultra Deep Field. If you look at this picture, what you will see is a lot of dark with some light objects in it. And everything but — four of these light objects are stars, and you can see them there — little pluses. This is a star, this is a star, everything else is a galaxy, OK? So there ' s a couple of thousand galaxies you can see easily with your eye in here. And when I look out at particularly this galaxy, which looks a lot like ours, I wonder if there ' s an art design college conference going on, and intelligent beings there are thinking about, you know, what designs they might do, and there might be a few cosmologists trying to understand where the universe itself came from, and there might even be some in that galaxy looking at ours trying to figure out what ' s going on over here. But there ' s a lot of other galaxies, and some are nearby, and they ' re kind of the color of the Sun, and some are further away and they ' re a little bluer, and so forth. But one of the questions is — this should be, to you — how come there are so many galaxies? Because this represents a very clean fraction of the sky. This is only 1, 000 galaxies. We think there ' s on the order — visible to the Hubble Space Telescope, if you had the time to scan it around — about 100 billion galaxies. Right? It ' s a very large number of galaxies. And that ' s roughly how many stars there are in our own galaxy. But when you look at some of these regions like this, you ' ll see more galaxies than stars, which is kind of a conundrum. So the question should come to your mind is, what kind of design, you know, what kind of creative process and what kind of design produced the world like that? And then I ' m going to show you it ' s actually a lot more complicated. We ' re going to try and follow it up. We have a tool that actually helps us out in this study, and that ' s the fact that the universe is so incredibly big that it ' s a time machine, in a certain sense. We draw this set of nested spheres cut away so you see it. Put the Earth at the center of the nested spheres, just because that ' s where we ' re making observations. And the moon is only two seconds away, so if you take a picture of the moon using ordinary light, it ' s the moon two seconds ago, and who cares. Two seconds is like the present. The Sun is eight minutes ago. That ' s not such a big deal, right, unless there ' s solar flares coming then you want to get out the way. You ' d like to have a little advance warning. But you get out to Jupiter and it ' s 40 minutes away. It ' s a problem. You hear about Mars, it ' s a problem communicating to Mars because it takes light long enough to go there. But if you look out to the nearest set of stars, to the nearest 40 or 50 stars, it ' s about 10 years. So if you take a picture of what ' s going on, it ' s 10 years ago. But you go and look to the center of the galaxy, it ' s thousands of years ago. If you look at Andromeda, which is the nearest big galaxy, and it ' s two million years ago. If you took a picture of the Earth two million years ago, there ' d be no evidence of humans at all, because we don ' t think there were humans yet. I mean, it just gives you the scale. With the Hubble Space Telescope, we ' re looking at hundreds of millions of years to a billion years. But if we were capable to come up with an idea of how to look even further — there ' s some things even further, and that was what I did in a lot of my work, was to develop the techniques — we could look out back to even earlier epochs before there were stars and before there were galaxies, back to when the universe was hot and dense and very different. And so that ' s the sort of sequence, and so I have a more artistic impression of this. There ' s the galaxy in the middle, which is the Milky Way, and around that are the Hubble — you know, nearby kind of galaxies, and there ' s a sphere that marks the different times. And behind that are some more modern galaxies. You see the whole big picture? The beginning of time is funny — it ' s on the outside, right? And then there ' s a part of the universe we can ' t see because it ' s so dense and so hot, light can ' t escape. It ' s like you can ' t see to the center of the Sun ; you have to use other techniques to know what ' s going on inside the Sun. But you can see the edge of the Sun, and the universe gets that way, and you can see that. And then you see this sort of model area around the outside, and that is the radiation coming from the Big Bang, which is actually incredibly uniform. The universe is almost a perfect sphere, but there are these very tiny variations which we show here in great exaggeration. And from them in the time sequence we ’ re going to have to go from these tiny variations to these irregular galaxies and first stars to these more advanced galaxies, and eventually the solar system, and so forth. So it ’ s a big design job, but we ’ ll see about how things are going on. So the way these measurements were done, there ’ s been a set of satellites, and this is where you get to see. So there was the COBE satellite, which was launched in 1989, and we discovered these variations. And then in 2000, the MAP satellite was launched — the WMAP — and it made somewhat better pictures. And later this year — this is the cool stealth version, the one that actually has some beautiful design features to it, and you should look — the Planck satellite will be launched, and it will make very high-resolution maps. And that will be the sequence of understanding the very beginning of the universe. And what we saw was, we saw these variations, and then they told us the secrets, both about the structure of space-time, and about the contents of the universe, and about how the universe started in its original motions. So we have this picture, which is quite a spectacular picture, and I ’ ll come back to the beginning, where we ’ re going to have some mysterious process that kicks the universe off at the beginning. And we go through a period of accelerating expansion, and the universe expands and cools until it gets to the point where it becomes transparent, then to the Dark Ages, and then the first stars turn on, and they evolve into galaxies, and then later they get to the more expansive galaxies. And somewhere around this period is when our solar system started forming. And it ’ s maturing up to the present time. And there ’ s some spectacular things. And this wastebasket part, that ’ s to represent what the structure of space-time itself is doing during this period. And so this is a pretty weird model, right? What kind of evidence do we have for that? So let me show you some of nature ’ s patterns that are the result of this. I always think of space-time as being the real substance of space, and the galaxies and the stars just like the foam on the ocean. It ’ s a marker of where the interesting waves are and whatever went on. So here is the Sloan Digital Sky Survey showing the location of a million galaxies. So there ’ s a dot on here for every galaxy. They go out and point a telescope at the sky, take a picture, identify what are stars and throw them away, look at the galaxies, estimate how far away they are, and plot them up. And just put radially they ’ re going out that way. And you see these structures, this thing we call the Great Wall, but there are voids and those kinds of stuff, and they kind of fade out because the telescope isn ’ t sensitive enough to do it. Now I ’ m going to show you this in 3D. What happens is, you take pictures as the Earth rotates, you get a fan across the sky. There are some places you can ’ t look because of our own galaxy, or because there are no telescopes available to do it. So the next picture shows you the three-dimensional version of this rotating around. Do you see the fan-like scans made across the sky? Remember, every spot on here is a galaxy, and you see the galaxies, you know, sort of in our neighborhood, and you sort of see the structure. And you see this thing we call the Great Wall, and you see the complicated structure, and you see these voids. There are places where there are no galaxies and there are places where there are thousands of galaxies clumped together, right. So there ’ s an interesting pattern, but we don ’ t have enough data here to actually see the pattern. We only have a million galaxies, right? So we ’ re keeping, like, a million **balls** in the air but, what ’ s going on? There ’ s another survey which is very similar to this, called the Two-degree Field of View Galaxy Redshift Survey. Now we ’ re going to fly through it at warp a million. And every time there ’ s a galaxy — at its location there ’ s a galaxy — and if we know anything about the galaxy, which we do, because there ’ s a redshift measurement and everything, you put in the type of galaxy and the color, so this is the real representation. And when you ’ re in the middle of the galaxies it ’ s hard to see the pattern ; it ’ s like being in the middle of life. It ’ s hard to see the pattern in the middle of the audience, it ’ s hard to see the pattern of this. So we ’ re going to go out and swing around and look back at this. And you ’ ll see, first, the structure of the survey, and then you ’ ll start seeing the structure of the galaxies that we see out there. So again, you can see the extension of this Great Wall of galaxies showing up here. But you can see the voids, you can see the complicated structure, and you say, well, how did this happen? Suppose you ’ re the cosmic designer. How are you going to put galaxies out there in a pattern like that? It ’ s not just throwing them out at random. There ’ s a more complicated process going on here. How are you going to end up doing that? And so now we ’ re in for some serious play. That is, we have to seriously play God, not just change people ’ s lives, but make the universe, right. So if that ’ s your responsibility, how are you going to do that? What ’ s the kind of technique? What ’ s the kind of thing you ’ re going to do? So I ’ m going to show you the results of a very large-scale simulation of what we think the universe might be like, using, essentially, some of the play principles and some of the design principles that, you know, humans have labored so hard to pick up, but apparently nature knew how to do at the beginning. And that is, you start out with very simple ingredients and some simple rules, but you have to have enough ingredients to make it complicated. And then you put in some randomness, some fluctuations and some randomness, and realize a whole bunch of different representations. So what I ’ m going to do is show you the distribution of matter as a function of scales. We ’ re going to zoom in, but this is a plot of what it is. And we had to add one more thing to make the universe come out right. It ’ s called dark matter. That is matter that doesn ’ t interact with light the **typical** way that ordinary matter does, the way the light ’ s shining on me or on the stage. It ’ s transparent to light, but in order for you to see it, we ’ re going to make it white. OK? So the stuff that ’ s in this picture that ’ s white, that is the dark matter. It should be called invisible matter, but the dark matter we ’ ve made visible. And the stuff that is in the yellow color, that is the ordinary kind of matter that ’ s turned into stars and galaxies. So I ’ ll show you the next **movie**. So this — we ’ re going to zoom in. Notice this pattern and pay attention to this pattern. We ’ re going to zoom in and zoom in. And you ’ ll see there are all these filaments and structures and voids. And when a number of filaments come together in a knot, that makes a supercluster of galaxies. This one we ’ re zooming in on is somewhere between 100, 000 and a million galaxies in that small region. So we live in the boonies. We don ’ t live in the center of the solar system, we don ’ t live in the center of the galaxy and our galaxy ’ s not in the center of the cluster. So we ’ re zooming in. This is a region which probably has more than 100, 000, on the order of a million galaxies in that region. We ’ re going to keep zooming in. OK. And so I forgot to tell you the scale. A parsec is 3. 26 light years. So a gigaparsec is three billion light years — that ’ s the scale. So it takes light three billion years to travel over that distance. Now we ’ re into a distance sort of between here and here. That ’ s the distance between us and Andromeda, right? These little specks that you ’ re seeing in here, they ’ re galaxies. Now we ’ re going to zoom back out, and you can see this structure that, when we get very far out, looks very regular, but it ’ s made up of a lot of irregular variations. So they ’ re simple building blocks. There ’ s a very simple fluid to begin with. It ’ s got dark matter, it ’ s got ordinary matter, it ’ s got photons and it ’ s got neutrinos, which don ’ t play much role in the later part of the universe. And it ’ s just a simple fluid and it, over time, develops into this complicated structure. And so you know when you first saw this picture, it didn ’ t mean quite so much to you. Here you ’ re looking across one percent of the volume of the visible universe and you ’ re seeing billions of galaxies, right, and nodes, but you realize they ’ re not even the main structure. There ’ s a framework, which is the dark matter, the invisible matter, that ’ s out there that ’ s actually holding it all together. So let ’ s fly through it, and you can see how much harder it is when you ’ re in the middle of something to figure this out. So here ’ s that same end result. You see a filament, you see the light is the invisible matter, and the yellow is the stars or the galaxies showing up. And we ’ re going to fly around, and we ’ ll fly around, and you ’ ll see occasionally a couple of filaments intersect, and you get a large cluster of galaxies. And then we ’ ll fly in to where the very large cluster is, and you can see what it looks like. And so from inside, it doesn ’ t look very complicated, right? It ’ s only when you look at it at a very large scale, and explore it and so forth, you realize it ’ s a very intricate, complicated kind of a design, right? And it ’ s grown up in some kind of way. So the question is, how hard would it be to assemble this, right? How big a contractor team would you need to put this universe together, right? That ’ s the issue, right? And so here we are. You see how the filament — you see how several filaments are coming together, therefore making this supercluster of galaxies. And you have to understand, this is not how it would actually look if you — first, you can ’ t travel this fast, everything would be distorted, but this is using simple rendering and graphic arts kind of stuff. This is how, if you took billions of years to go around, it might look to you, right? And if you could see invisible matter, too. And so the idea is, you know, how would you put together the universe in a very simple way? We ’ re going to start and realize that the entire visible universe, everything we can see in every direction with the Hubble Space Telescope plus our other instruments, was once in a region that was smaller than an atom. It started with tiny quantum mechanical fluctuations, but expanding at a tremendous rate. And those fluctuations were stretched to astronomical sizes, and those fluctuations eventually are the things we see in the cosmic microwave background. And then we needed some way to turn those fluctuations into galaxies and clusters of galaxies and make these kinds of structures go on. So I ’ m going to show you a smaller simulation. This simulation was run on 1, 000 processors for a month in order to make just this simple visible one. So I ’ m going to show you one that can be run on a desktop in two days in the next picture. So you start out with teeny fluctuations when the universe was at this point, now four times smaller, and so forth. And you start seeing these networks, this cosmic web of structure forming. And this is a simple one, because it doesn ’ t have the ordinary matter and it just has the dark matter in it. And you see how the dark matter lumps up, and the ordinary matter just trails along behind. So there it is. At the beginning it ’ s very uniform. The fluctuations are a part in 100, 000. There are a few peaks that are a part in 10, 000, and then over billions of years, gravity just pulls in. This is light over density, pulls the material around in. That pulls in more material and pulls in more material. But the distances on the universe are so large and the time scales are so large that it takes a long time for this to form. And it keeps forming until the universe is roughly about half the size it is now, in terms of its expansion. And at that point, the universe mysteriously starts accelerating its expansion and cuts off the formation of larger-scale structure. So we ’ re just seeing as large a scale structure as we can see, and then only things that have started forming already are going to form, and then from then on it ’ s going to go on. So we ’ re able to do the simulation, but this is two days on a desktop. We need, you know, 30 days on 1, 000 processors to do the kind of simulation that I showed you before. So we have an idea of how to play seriously, creating the universe by starting with essentially less than an eyedrop full of material, and we create everything we can see in any direction, right, from almost nothing — that is, something extremely tiny, extremely small — and it is almost perfect, except it has these tiny fluctuations at a part in 100, 000 level, which turn out to produce the interesting patterns and designs we see, that is, galaxies and stars and so forth. So we have a model, and we can calculate it, and we can use it to make designs of what we think the universe really looks like. And that design is sort of way beyond what our original imagination ever was. So this is what we started with 15 years ago, with the Cosmic Background Explorer — made the map on the upper right, which basically showed us that there were large-scale fluctuations, and actually fluctuations on several scales. You can kind of see that. Since then we ’ ve had WMAP, which just gives us higher angular resolution. We see the same large-scale structure, but we see additional small-scale structure. And on the bottom right is if the satellite had flipped upside down and mapped the Earth, what kind of a map we would have got of the Earth. You can see, well, you can, kind of pick out all the major continents, but that ’ s about it. But what we ’ re hoping when we get to Planck, we ’ ll have resolution about equivalent to the resolution you see of the Earth there, where you can really see the complicated pattern that exists on the Earth. And you can also tell, because of the sharp edges and the way things fit together, there are some non- linear processes. Geology has these effects, which is moving the plates around and so forth. You can see that just from the map alone. We want to get to the point in our maps of the early universe we can see whether there are any non- linear effects that are starting to move, to modify, and are giving us a hint about how space-time itself was actually created at the beginning moments. So that ’ s where we are today, and that ’ s what I wanted to give you a flavor of. Give you a different view about what the design and what everything else looks like. Thank you.

You know, we ’ re going to do things a little differently. I ’ m not going to show you a **presentation**. I ’ m going to talk to you. And at the same time, we ’ re going to look at just images from a photo stream that is pretty close to live of things that â snapshots from Second Life. So hopefully this will be fascinating. You can â I can compete for your attention with the strange pictures that you see on screen that come from there. I thought I ’ d talk a little bit about some just big ideas about this, and then get John back out here so we can talk interactively a little bit more and think and ask questions. You know, I guess the first question is, why build a virtual world at all? And I think the answer to that is always going to be at least driven to a certain extent by the people initially crazy enough to start the project, you know. So I can give you a little bit of first background just on me and what moved me as a â really going back as far as a teenager and then an adult, to actually try and build this kind of thing. I was a very creative kid who read a lot, and got into electronics first, and then later, programming computers, when I was really young. I was just always trying to make things. I was just obsessed with taking things apart and building things, and just anything I could do with my hands or with wood or electronics or metal or anything else. And so, for example â and it ’ s a great Second Life thing â I had a bedroom. And every kid, you know, as a teenager, has got his bedroom he retreats to â but I wanted my door, I thought it would be cool if my door went up rather than opened, like on Star Trek. I thought it would be neat to do that. And so I got up in the ceiling and I cut through the ceiling joists, much to my parents ’ delight, and put the door, you know, being pulled up through the ceiling. I built â I put a garage-door opener up in the attic that would pull this door up. You can imagine the amount of time that it took me to do this to the house and the displeasure of my parents. The thing that was always striking to me was that we as people could have so many really amazing ideas about things we ’ d like to do, but are so often unable, in the real world, to actually do those things â to actually cobble together the materials and go through the actual execution phase of building something that you imagine from a design perspective. And so for me, I know that when the Internet came around and I was doing computer programming and just, you know, just generally trying to run my own little company and figure out what to do with the Internet and with computers, I was just immediately struck by how the ultimate thing that you would really want to do with the Internet and with computers would be to use the Internet and connected computers to simulate a world to sort of recreate the laws of physics and the rules of how things went together â the sort of â the idea of atoms and how to make things, and do that inside a computer so that we could all get in there and make stuff. And so for me that was the thing that was so enticing. I just wanted this place where you could build things. And so I think you see that in the genesis of what has happened with Second Life, and I think it ’ s important. I also think that more generally, the use of the Internet and technology as a kind of a space between us for creativity and design is a general trend. It is a â sort of a great human progress. Technology is just generally being used to allow us to create in as shared and social a way as possible. And I think that Second Life and virtual worlds more generally represent the best we can do to achieve that right now. You know, another way to look at that, and related to the content and, you know, thinking about space, is to connect sort of virtual worlds to space. I thought that might be a fun thing to talk about for a second. If you think about going into space, it ’ s a fascinating thing. So many **movies**, so many kids, we all sort of dream about exploring space. Now, why is that? Stop for a moment and ask, why that conceit? Why do we as people want to do that? I think there ’ s a couple of things. It ’ s what we see in the **movies** â you know, it ’ s this dream that we all share. One is that if you went into space you ’ d be able to begin again. In some sense, you would become someone else in that journey, because there wouldn ’ t be â you ’ d leave society and life as you know it, behind. And so inevitably, you would transform yourself â irreversibly, in all likelihood â as you began this exploration. And then the second thing is that there ’ s this tangible sense that if you travel far enough, you can find out there â oh, yeah â you have no idea what you ’ re going to find once you get there, into space. It ’ s going to be different than here. And in fact, it ’ s going to be so different than what we see here on earth that anything is going to be possible. So that ’ s kind of the idea â we as humans crave the idea of creating a new identity and going into a place where anything is possible. And I think that if you really sit and think about it, virtual worlds, and where we ’ re going with more and more computing technology, represent essentially the likely, really tactically possible version of space exploration. We are moved by the idea of virtual worlds because, like space, they allow us to reinvent ourselves and they contain anything and everything, and probably anything could happen there. You know, to give you a size idea about scale, you know, comparing space to Second Life, most people don ’ t realize, kind of â and then this is just like the Internet in the early ’ 90s. In fact, Second Life virtual worlds are a lot like the Internet in the early ’ 90s today : everybody ’ s very excited, there ’ s a lot of hype and excitement about one idea or the next from moment to moment, and then there ’ s despair and everybody thinks the whole thing ’ s not going to work. Everything that ’ s happening with Second Life and more broadly with virtual worlds, all happened in the early ’ 90s. We always play a game at the office where you can take any article and find the same article where you just replace the words”Second Life”with”Web,”and”virtual reality”with”Internet.”You can find exactly the same articles written about everything that people are observing. To give you an idea of scale, Second Life is about 20, 000 CPUs at this point. It ’ s about 20, 000 computers connected together in three facilities in the United States right now, that are simulating this virtual space. And the virtual space itself â there ’ s about 250, 000 people a day that are wandering around in there, so the kind of, active population is something like a smallish city. The space itself is about 10 times the size of San Francisco, and it ’ s about as densely built out. So it gives you an idea of scale. Now, it ’ s expanding very rapidly â about five percent a month or so right now, in terms of new servers being added. And so of course, radically unlike the real world, and like the Internet, the whole thing is expanding very, very quickly, and historically exponentially. So that sort of space exploration thing is matched up here by the amount of content that ’ s in there, and I think that amount is critical. It was critical with the virtual world that it be this space of truly infinite possibility. We ’ re very sensitive to that as humans. You know, you know when you see it. You know when you can do anything in a space and you know when you can ’ t. Second Life today is this 20, 000 machines, and it ’ s about 100 million or so user-created objects where, you know, an object would be something like this, possibly interactive. Tens of millions of them are thinking all the time ; they have code attached to them. So it ’ s a really large world already, in terms of the amount of stuff that ’ s there and that ’ s very important. If anybody plays, like, World of Warcraft, World of Warcraft comes on, like, four DVDs. Second Life, by comparison, has about 100 terabytes of user-created data, making it about 25, 000 times larger. So again, like the Internet compared to AOL, and the sort of chat rooms and content on AOL at the time, what ’ s happening here is something very different, because the sheer scale of what people can do when they ’ re enabled to do anything they want is pretty amazing. The last big thought is that it is almost certainly true that whatever this is going to evolve into is going to be bigger in total usage than the Web itself. And let me justify that with two statements. Generically, what we use the Web for is to organize, exchange, create and consume information. It ’ s kind of like Irene talking about Google being data-driven. I ’ d say I kind of think about the world as being information. Everything that we interact with, all the experiences that we have, is kind of us flowing through a sea of information and interacting with it in different ways. The Web puts information in the form of text and images. The topology, the geography of the Web is text-to-text links for the most part. That ’ s one way of organizing information, but there are two things about the way you access information in a virtual world that I think are the important ways that they ’ re very different and much better than what we ’ ve been able to do to date with the Web. The first is that, as I said, the â well, the first difference for virtual worlds is that information is presented to you in the virtual world using the most powerful iconic symbols that you can possibly use with human beings. So for example, C-H-A-I-R is the English word for that, but a picture of this is a universal symbol. Everybody knows what it means. There ’ s no need to translate it. It ’ s also more memorable if I show you that picture, and I show you C-H-A- I-R on a piece of paper. You can do tests that show that you ’ ll remember that I was talking about a chair a couple of days later a lot better. So when you organize information using the symbols of our memory, using the most common symbols that we ’ ve been immersed in all our lives, you maximally both excite, stimulate, are able to remember, transfer and manipulate data. And so virtual worlds are the best way for us to essentially organize and experience information. And I think that ’ s something that people have talked about for 20 years â you know, that 3D, that lifelike environments are really important in some magical way to us. But the second thing â and I think this one is less obvious â is that the experience of creating, consuming, exploring that information is in the virtual world implicitly and inherently social. You are always there with other people. And we as humans are social creatures and must, or are aided by, or enjoy more, the consumption of information in the presence of others. It ’ s essential to us. You can ’ t escape it. When you ’ re on Amazon. com and you ’ re looking for digital cameras or whatever, you ’ re on there right now, when you ’ re on the site, with like 5, 000 other people, but you can ’ t talk to them. You can ’ t just turn to the people that are browsing digital cameras on the same page as you, and ask them,”Hey, have you seen one of these before? Because I ’ m thinking about buying it.”That experience of like, shopping together, just as a simple example, is an example of how as social creatures we want to experience information in that way. So that second point, that we inherently experience information together or want to experience it together, is critical to essentially, kind of, this trend of where we ’ re going to use technology to connect us. And so I think, again, that it ’ s likely that in the next decade or so these virtual worlds are going to be the most common way as human beings that we kind of use the electronics of the Internet, if you will, to be together, to consume information. You know, mapping in India â that ’ s such a great example. Maybe the solution there involves talking to other people in real time. Asking for advice, rather than any possible way that you could just statically organize a map. So I think that ’ s another big point. I think that wherever this is all going, whether it ’ s Second Life or its descendants, or something broader that happens all around the world at a lot of different points â this is what we ’ re going to see the Internet used for, and total traffic and total unique users is going to invert, so that the Web and its bibliographic set of text and graphical information is going to become a tool or a part of that consumption pattern, but the pattern itself is going to happen mostly in this type of an environment. Big idea, but I think highly defensible. So let me stop there and bring John back, and maybe we can just have a longer conversation. Thank you. John. That ’ s great. John Hockenberry : Why is the creation, the impulse to create Second Life, not a utopian impulse? Like for example, in the 19th century, any number of works of literature that imagined alternative worlds were explicitly utopian. Philip Rosedale : I think that ’ s great. That ’ s such a deep question. Yeah. Is a virtual world likely to be a utopia, would be one way I ’ d say it. The answer is no, and I think the reason why is because the Web itself as a good example is profoundly bottoms-up. That idea of infinite possibility, that magic of anything can happen, only happens in an environment where you really know that there ’ s a fundamental freedom at the level of the individual actor, at the level of the Lego blocks, if you will, that make up the virtual world. You have to have that level of freedom, and so I ’ m often asked that, you know, is there a, kind of, utopian or, is there a utopian tendency to Second Life and things like it, that you would create a world that has a grand scheme to it? Those top-down schemes are alienating to just about everybody, even if you mean well when you build them. And what ’ s more, human society, when it ’ s controlled, when you set out a grand scheme of rules, a new way of people interacting, or a new way of laying out a city, or whatever, that stuff historically has never scaled much beyond, you know â I always laughingly say â the Mall of America, you know, which is like, the largest piece of centrally designed architecture that, you know, has been built.

JH : The Kremlin was pretty big. PR : The Kremlin, yeah. That ’ s true. The whole complex. JH : Give me a story of a tool you created at the beginning in Second Life that you were pretty sure people would want to use in the creation of their avatars or in communicating that people actually in practice said, no, I ’ m not interested in that at all, and name something that you didn ’ t come up with that almost immediately people began to demand. PR : I ’ m sure I can think of multiple examples of both of those. One of my favorites. I had this feature that I built into Second Life â I was really passionate about it. It was an ability to kind of walk up close to somebody and have a more private conversation, but it wasn ’ t instant messaging because you had to sort of befriend somebody. It was just this idea that you could kind of have a private chat. I just remember it was one of those examples of data- driven design. I thought it was such a good idea from my perspective, and it was just absolutely never used, and we ultimately â I think we ’ ve now turned it off, if I remember. We finally gave up, took it out of the code. But more generally, you know, one other example I think about this, which is great relative to the utopian idea. Second Life originally had 16 simulators. It now has 20, 000. So when it only had 16, it was only about as big as this college campus. And we had â we zoned it, you know : we put a nightclub, we put a disco where you could dance, and then we had a place where you could fight with guns if you wanted to, and we had another place that was like a boardwalk, kind of a Coney Island. And we laid out the zoning, but of course, people could build all around it however they wanted to. And what was so amazing right from the start was that the idea that we had put out in the zoning concept, basically, was instantly and thoroughly ignored, and like, two months into the whole thing, â which is really a small amount of time, even in Second Life time â I remember the users, the people who were then using Second Life, the residents came to me and said, we want to buy the disco â because I had built it â we want to buy that land and raze it and put houses on it. And I sold it to them â I mean, we transferred ownership and they had a big party and blew up the entire building. And I remember that that was just so telling, you know, that you didn ’ t know exactly what was going to happen. When you think about stuff that people have built that ’ s popular â JH : CBGB ’ s has to close eventually, you know. That ’ s the rule. PR : Exactly. And it â but it closed on day one, basically, in Internet time. You know, an example of something â pregnancy. You can have a baby in Second Life. This is done entirely using, kind of, the tools that are built into Second Life, so the innate concept of becoming pregnant and having a baby, of course â Second Life is, at the platform level, at the level of the company â at Linden Lab â Second Life has no game properties to it whatsoever. There is no attempt to structure the experience, to make it utopian in that sense that we put into it. So of course, we never would have put a mechanism for having babies or, you know, taking two avatars and merging them, or something. But people built the ability to have babies and care for babies as a purchasable experience that you can have in Second Life and so â I mean, that ’ s a pretty fascinating example of, you know, what goes on in the overall economy. And of course, the existence of an economy is another idea. I didn ’ t talk about it, but it ’ s a critical feature. When people are given the opportunity to create in the world, there ’ s really two things they want. One is fair ownership of the things they create. And then the second one is â if they feel like it, and they ’ re not going to do it in every case, but in many they are â they want to actually be able to sell that creation as a way of providing for their own livelihood. True on the Web â also true in Second Life. And so the existence of an economy is critical. JH : Questions for Philip Rosedale? Right here. JH : The observation is, Philip has been accused of looking like a character, an avatar, in

Second Life. Respond, and then we ’ ll get the rest of your question. PR : But I don ’ t look like my avatar. How many people here know what my avatar looks like? That ’ s probably not very many. JH : Are you ripping off somebody else ’ s avatar with that, sort of â PR : No, no. I didn ’ t. One of the other guys at work had a fantastic avatar â a female avatar â that I used to be once in a while. But my avatar is a guy wearing chaps. Spiky hair â spikier than this. Kind of orange hair. Handlebar mustache. Kind of a Village People sort of a character. So, very cool. JH : And your question? JH : The question is, there appears to be a lack of cultural fine-tuning in Second Life. It doesn ’ t seem to have its own culture, and the sort of differences that exist in the real world aren ’ t translated into the Second Life map. PR : Well, first of all, we ’ re very early, so this has only been going on for a few years. And so part of what we see is the same evolution of human behavior that you see in emerging societies. So a fair criticism â is what it is â of Second Life today is that it ’ s more like the Wild West than it is like Rome, from a cultural standpoint. That said, the evolution of, and the nuanced interaction that creates culture, is happening at 10 times the speed of the real world, and in an environment where, if you walk into a bar in Second Life, 65 percent of the people there are not in the United States, and in fact are speaking their, you know, **various** and different languages. In fact, one of the ways to make money in Second Life is to make really cool translators that you drag onto your body and they basically, kind of, pop up on your screen and allow you to use Google or Babel Fish or one of the other online text translators to on-the-fly translate spoken â I ’ m sorry â typed text between individuals. And so, the multicultural nature and the sort of cultural melting pot that ’ s happening inside Second Life is quite â I think, quite **remarkable** relative to what in real human terms in the real world we ’ ve ever been able to achieve. So, I think that culture will fine-tune, it will emerge, but we still have some years to wait while that happens, as you would naturally expect. JH : Other questions? Right here. JH : What ’ s your demographic? PR : So, the question is, what ’ s the demographic. So, the average age of a person in Second Life is 32, however, the use of Second Life increases dramatically as your physical age increases. So as you go from age 30 to age 60 â and there are many people in their sixties using Second Life â this is also not a sharp curve â it ’ s very, very distributed â usage goes up in terms of, like, hours per week by 40 percent as you go from age 30 to age 60 in real life, so there ’ s not â many people make the mistake of believing that Second Life is some kind of an online game. Actually it ’ s generally unappealing â I ’ m just speaking broadly and critically â it ’ s not very appealing to people that play online video games, because the graphics are not yet equivalent to â I mean, these are very nice pictures, but in general the graphics are not quite equivalent to the fine-tuned graphics that you see in a Grand Theft Auto 4. So average age : 32. I mentioned 65 percent of the users are not in the United States. The distribution amongst countries is extremely broad. There ’ s users from, you know, virtually every country in the world now in Second Life. The dominant ones are â if you take the UK and Europe, together they make up about 55 percent of the usage base in Second Life. In terms of psychographic â oh, men and women : men and women are almost equally matched in Second Life, so about 45 percent of the people online right now on Second Life are women. Women use Second Life, though, about 30 to 40 percent more, on an hours basis, than men do, meaning that more men sign up than women, and more women stay and use it than men. So that ’ s another demographic fact. In terms of psychographic, you know, the people in Second Life are remarkably dissimilar relative to what you might think, when you go in and talk to them and meet them, and I would, you know, challenge you to just do this and find out. But it ’ s not a bunch of programmers. It ’ s not easy to describe as a demographic. If I had to just sort of paint a broad picture, I ’ d say, remember the people who were really getting into eBay in the first few years of eBay? Maybe a little bit like that : in other words, people who are early adopters. They tend to be creative. They tend to be entrepreneurial. A lot of them â about 55, 000 people so far â are cash-flow positive : they ’ re making money from what â I mean, real-world money â from what they ’ re doing in Second Life, so it ’ s a very build â still a creative, building things, build-your-own-business type of an orientation. So, that ’ s it. JH : You describe yourself, Philip, as someone who was really creative when you were young and, you know, liked to make things. I mean, it ’ s not often that you hear somebody describe themselves as really creative. I suspect that ’ s possibly a euphemism for C student who spent a lot of time in his room? Is it possible? PR : I was a â there were times I was a C student. You know, it ’ s funny. When I got to college â I studied physics in college â and I got really â it was funny, because I was definitely a more antisocial kid. I read all the time. I was shy. I don ’ t seem like it now, but I was very shy. Moved around a bunch â had that experience too. So I did, kind of, I think, live in my own world, and obviously that helps, you know, engage your real interest in something. JH : So you ’ re on your fifth life at this point? PR : If you count, yeah, cities. So â but I did â and I didn ’ t do â I think I didn ’ t do as well in school as I could have. I think you ’ re right. I wasn ’ t, like, an obsessed â you know, get A ’ s kind of guy. I was going to say, I had a great social experience when I went to college that I hadn ’ t had before, a more fraternal experience, where I met six or seven other guys who I studied physics with, and I was very competitive with them, so then I started to get A ’ s. But you ’ re right : I wasn ’ t an A student. JH : Last question. Right here. JH : You want to paraphrase that? PR : Yeah, so let me restate that. So, you ’ re saying that in the pamphlet there ’ s a statement that we may come to prefer our digital selves to our real ones â our more malleable or manageable digital identities to our real identities â and that in fact, much of human life and human experience may move into the digital realm. And then that ’ s kind of a horrifying thought, of course. That ’ s a frightening change, frightening disruption. I guess, and you ’ re asking, what do I think about that? How do I â JH : What ’ s your response to the people who would say, that ’ s horrifying? PR : Well, I ’ d say a couple of things. One is, it ’ s disturbing like the Internet or electricity was. That is to say, it ’ s a big change, but it isn ’ t avoidable. So, no amount of backpedaling or intentional behavior or political behavior is going to keep these technology changes from connecting us together, because the basic motive that people have â to be creative and entrepreneurial â is going to drive energy into these virtual worlds in the same way that it has with the Web. So this change, I believe, is a huge disruptive change. Obviously, I ’ m the optimist and a big believer in what ’ s going on here, but I think that as â even a sober, you know, the most sober, disconnected thinker about this, looking at it from the side, has to conclude, based on the data, that with those kinds of economic forces at play, there is definitely going to be a sea change, and that change is going to be intensely disruptive relative to our concept of our very lives and being, and our identities, as well. I don ’ t think we can get away from those changes. I think generally, we were talking about this â I think that generally being present in a virtual world and being challenged by it, being â surviving there, having a good life there, so to speak, is a challenge because of the multiculturality of it, because of the languages, because of the entrepreneurial richness of it, the sort of flea market nature, if you will, of the virtual world today. It puts challenges on us to rise to. We must be better than ourselves, in many ways. We must learn things and, you know, be more tolerant, and be smarter and learn faster and be more creative, perhaps, than we are typically in our real lives. And I think that if that is true of virtual worlds, then these changes, though scary â and, I say, inevitable â are ultimately for the better, and therefore something that we should ride out. But I would say that â and many other authors and speakers about this, other than me, have said, you know, fasten your seat belts because the change is coming. There are going to be big changes. JH : Philip Rosedale, thank you very much.

Text Sample 839: POS Dim 6 – 2008 – Score 4.00 – 2008/t000133.txt

The"Dirty Jobs"crew and I were called to a little town in Colorado, called Craig. It ' s only a couple dozen square miles. It ' s in the Rockies. And the job in question was sheep rancher. My role on the show, for those of you who haven ' t seen it â it ' s pretty simple. I ' m an apprentice, and I work with the people who do the jobs in question. And my responsibilities are to simply try and keep up, and give an honest account of what it ' s like to be these people for one day in their life. The job in question : herding sheep. Great. We go to Craig and we check into a hotel, and I realize the next day that castration is going to be an absolute part of this work. Normally, I never do any research at all. But this is a touchy subject, and I work for the Discovery Channel, and we want to portray accurately whatever it is we do. And we certainly want to do it with a lot of respect for the animals. So I call the Humane Society and I say,"Look, I ' m going to be castrating some lambs. Can you tell me the deal?"And they ' re like,"Yeah, it ' s pretty straightforward."They use a band, basically, a rubber band, like this, only a little smaller. This one was actually around the playing cards I got yesterday â But it had a certain familiarity to it. And I said,"Well, what exactly is the process?"And they said,"The band is applied to the tail, tightly. And then another band is applied to the scrotum, tightly. Blood flow is slowly retarded ; a week later the parts in question fall off."Great â got it."OK, I call the SPCA to confirm this. They confirm it. I also call PETA just for fun, and they don ' t like it, but they confirm it. OK, that ' s basically how you do it. So the next day I go out. And I ' m given a horse and we go get the lambs and we take them to a pen that we built, and we go about the business of animal husbandry. Melanie is the wife of Albert. Albert is the shepherd in question. Melanie picks up the lamb, one hand on both legs on the right, likewise on the left. Lamb goes on the post, she opens it up. Alright. Great. Albert goes in, I follow Albert, the crew is around. I always watch the process done the first time before I try it. Being an apprentice, you know, you do that. Albert reaches in his pocket to pull out, you know, this black rubber band, but what comes out instead is a knife. And I ' m like,"Hmm, that ' s not rubber at all,"you know? And he kind of flicked it open in a way that caught the sun that was just coming over the Rockies, it was very â It was... it was impressive. In the space of about two seconds, Albert had the knife between the cartilage of the tail, right next to the butt of the lamb, and very quickly, the tail was gone and in the bucket that I was holding. A second later, with a big thumb and a well-calloused forefinger, he had the scrotum firmly in his grasp. And he pulled it toward him, like so, and he took the knife and he put it on the tip."Now, you think you know what ' s coming, Michael, You don ' t, OK?"He snips it, throws the tip over his shoulder, and then grabs the scrotum and pushes it upward, and then his head dips down, obscuring my view. But what I hear is a slurping sound, and a noise that sounds like Velcro being yanked off a sticky wall, and I am not even kidding. Can we roll the video? No, I ' m kidding, we don ' t â I thought it best to talk in pictures. I do something now I ' ve never, ever done on a”Dirty Jobs”shoot, ever. I say,”Time out. Stop.”You guys know the show, we use take one ; we don ’ t do take two. There ’ s no writing, there ’ s no scripting, there ’ s no nonsense. We don ’ t fool around, we don ’ t rehearse â we shoot what we get! I said,”Stop. This is nuts.”I mean â”This is crazy. We can ’ t do this.”And Albert ’ s like,”What?”And I ’ m like,”I don ’ t know what just happened, but there are testicles in this bucket, and that ’ s not how we do it.”He said”Well, that ’ s how we do it.”I said,”Why would you do it this way?”And before I even let him explain, I said,”I want to do it the right way, with the rubber bands.”And he says,”Like the Humane Society?”I said,”Yes, like the Humane Society. Let ’ s do something that doesn ’ t make the lamb squeal and bleed. We ’ re on in five continents, dude! We ’ re on twice a day on the Discovery â we can ’ t do this.”He says,”OK.”He goes to his box and pulls out a bag of these little rubber bands. Melanie picks up another lamb, puts it on the post, band goes on the tail, band goes on the scrotum. Lamb goes on the ground, lamb takes two steps, falls down, gets up, shakes a little, takes another couple steps, falls down. I ’ m like, this is not a good sign for this lamb, at all. Gets up, walks to the corner. It ’ s quivering, and it lies down and it ’ s in obvious distress. And I ’ m looking at the lamb and I say,”Albert, how long? When does he get up?”He ’ s like,”A day?”I said,”A day! How long does it take them to fall off?””A week.”Meanwhile, the lamb that he had just done his little procedure on is, you know, he ’ s just prancing around, bleeding stopped. He ’ s, you know, **nibbling** on some grass, frolicking. And I was just so blown away at how completely wrong I was, in that second. And I was reminded how utterly wrong I am, so much of the time. And I was especially reminded of what a ridiculously short straw I had that day, because now I had to do what Albert had just done, and there are like 100 of these lambs in the pen. And suddenly, this whole thing ’ s starting to feel like a German porno, and I ’ m like â Melanie picks up the lamb, puts it on the post, opens it up. Albert hands me the knife. I go in, tail comes off. I go in, I grab the scrotum, tip comes off. Albert instructs,”Push it way up there.”I do.”Push it further.”I do. The testicles emerge. They look like thumbs, coming right at you. And he says,”Bite ’ em. Just bite ’ em off.”And I heard him, I heard all the words â Like, how did I get here? How did â I mean â how did I get here? It ’ s just â it ’ s one of those moments where the brain goes off on its own, and suddenly, I ’ m standing there in the Rockies, and all I can think of is the Aristotelian definition of a tragedy. You know, Aristotle says a tragedy is that moment when the hero comes face to face with his true identity. And I ’ m like,”What is this jacked-up metaphor? I don ’ t like what I ’ m thinking right now.”And I can ’ t get this thought out of my head, and I can ’ t get that vision out of my sight, so I did what I had to do. I went in and I took them. I took them like this, and I yanked my head back. And I ’ m standing there with two testicles on my chin. And now I can ’ t get â I can ’ t shake the metaphor. I ’ m still in”Poetics,”in Aristotle, and I ’ m thinking â out of nowhere, two terms come crashing into my head, that I hadn ’ t heard since my classics professor in college drilled them there. And they are”anagnorisis”and”peripeteia.”Anagnorisis and peripeteia. Anagnorisis is the Greek word for discovery. Literally, the transition from ignorance to knowledge is anagnorisis. It ’ s what our network does ; it ’ s what”Dirty Jobs”is. And I ’ m up to my neck in anagnorises every single day. Great. The other word, peripeteia, that ’ s the moment in the great tragedies â Euripides and Sophocles. That ’ s the moment where Oedipus has his moment, where he suddenly realizes that hot chick he ’ s been sleeping with and having babies with is his mother. That ’ s peripety, or peripeteia. And this metaphor in my head â I ’ ve got anagnorisis and peripeteia on my chin â I ’ ve got to tell you, it ’ s such a great device, though. When you start to look for peripeteia, you find it everywhere. I mean, Bruce Willis in"The Sixth Sense,"right? Spends the whole **movie** trying to help the little kid who sees dead people, and then â boom! â"Oh, I ' m dead."Peripeteia. You know? It ' s crushing when the audience sees it the right way. Neo in"The Matrix,"you know?"Oh, I ' m living in a computer program. That ' s weird."These discoveries that lead to sudden realizations. And I ' ve been having them, over 200 dirty jobs, I have them all the time, but that one â that one drilled something home in a way that I just wasn ' t prepared for. And, as I stood there, looking at the happy lamb that I had just defiled â but it looked OK ; looking at that poor other little thing that I ' d done it the right way on, and I just was struck by â if I ' m wrong about that, and if I ' m wrong so often, in a literal way, what other peripatetic misconceptions might I be able to comment upon? Because, look â I ' m not a social anthropologist, but I have a friend who is. And I talk to him. And he says,"Hey Mike, look. I don ' t know if your brain is interested in this sort of thing or not, but do you realize you ' ve shot in every state? You ' ve worked in mining, you ' ve worked in fishing, you ' ve worked in steel, you ' ve worked in every major industry. You ' ve had your back shoulder to shoulder with these guys that our politicians are desperate to relate to every four years, right?"I can still see Hillary doing the shots of rye, **dribbling** down her chin, with the steel workers. I mean, these are the people that I work with every single day."And if you have something to say about their thoughts, collectively, it might be time to think about it. Because, dude, you know, four years."So, that ' s in my head, testicles are on my chin, thoughts are bouncing around. And, after that shoot,"Dirty Jobs"really didn ' t change, in terms of what the show is, but it changed for me, personally. And now, when I talk about the show, I no longer just tell the story you heard and 190 like it. I do, but I also start to talk about some of the other things I got wrong ; some of the other notions of work that I ' ve just been assuming are sacrosanct, and they ' re not. People with dirty jobs are happier than you think. As a group, they ' re the happiest people I know. And I don ' t want to start whistling"Look for the Union Label,"and all that happy-worker crap. I ' m just telling you that these are balanced people who do unthinkable work. Roadkill picker-uppers whistle while they work, I swear to God â I did it with them. They ' ve got this amazing sort of symmetry to their life. And I see it over and over and over again. So I started to wonder what would happen if we challenged some of these sacred cows? Follow your passion â we ' ve been talking about it here for the last 36 hours. Follow your passion â what could possibly be wrong with that? It ' s probably the worst advice I ever got. Follow your dreams and go broke, right? I mean, that ' s all I heard growing up. I didn ' t know what to do with my life, but I was told if you follow your passion, it ' s going to work out. I can give you 30 examples right now. Bob Combs, the pig farmer in Las Vegas who collects the uneaten scraps of food from the casinos and feeds them to his swine. Why? Because there ' s so much protein in the stuff we don ' t eat, his pigs grow at twice the normal speed, and he ' s one rich pig farmer. He ' s good for the environment, he spends his days doing this incredible service, and he smells like hell, but God bless him. He ' s making a great living. You ask him,"Did you follow your passion here?"and he ' d laugh at you. The guy ' s worth â he just got offered like 60 million dollars for his farm and turned it down, outside of Vegas. He didn ' t follow his passion. He stepped back and he watched where everybody was going, and he went the other way. And I hear that story over and over. Matt Freund, a dairy farmer in New Canaan, Connecticut, who woke up one day and realized the crap from his cows was worth more than their milk, if he could use it to make these biodegradable flowerpots. Now he ' s selling them to Walmart, right? Follow his passion? The guy ' s â come on. So I started to look at passion, I started to look at efficiency vs. effectiveness. As Tim talked about earlier, that ' s a huge distinction. I started to look at teamwork and determination. And basically, all those platitudes they call"successories"that hang with that schmaltzy art in boardrooms around the world right now, that stuff â it ' s suddenly all been turned on its head. Safety. Safety first is... Going back to OSHA and PETA and the Humane Society : What if OSHA got it wrong? I mean â this is heresy, what I ' m about to say â but what if it ' s really safety third? Right? No, I mean, really. What I mean to say is : I value my safety on these crazy jobs as much as the people that I ' m working with, but the ones who really get it done â they ' re not out there talking about safety first. They know that other things come first â the business of doing the work comes first, the business of getting it done. And I ' ll never forget, up in the Bering Sea, I was on a crab boat with the"Deadliest Catch"guys â which I also work on in the first season. We were about 100 miles off the coast of Russia : 50-foot seas, big waves, green water coming over the wheelhouse, right? Most hazardous environment I ' d ever seen, and I was back with a guy, lashing the pots down. So I ' m 40 feet off the deck, which is like looking down at the top of your shoe, you know, and it ' s doing this in the ocean. Unspeakably dangerous. I scamper down, I go into the wheelhouse and I say, with some level of incredulity,"Captain â OSHA?"And he says,"OSHA? Ocean."And he points out there. But in that moment, what he said next can ' t be repeated in the Lower 48. It can ' t be repeated on any factory floor or any construction site. But he looked at me and said,"Son,"â he ' s my age, by the way, he calls me"son,"I love that â he says,"Son, I ' m the captain of a crab boat. My responsibility is not to get you home alive. My responsibility is to get you home rich."You want to get home alive, that ' s on you."And for the rest of that day â safety first. I mean, I was like â So, the idea that we create this sense of complacency when all we do is talk about somebody else ' s responsibility as though it ' s our own, and vice versa. Anyhow, a whole lot of things. I could talk at length about the many little distinctions we made and the endless list of ways that I got it wrong. But what it all comes down to is this : I ' ve formed a theory, and I ' m going to share it now in my remaining 2 minutes and 30 seconds. It goes like this : we ' ve declared war on work, as a society â all of us. It ' s a civil war. It ' s a cold war, really. We didn ' t set out to do it and we didn ' t twist our mustache in some Machiavellian way, but we ' ve done it. And we ' ve waged this war on at least four fronts, certainly in Hollywood. The way we portray working people on TV â it ' s laughable. If there ' s a plumber, he ' s 300 pounds and he ' s got a giant butt crack, admit it. You see him all the time. That ' s what plumbers look like, right? We turn them into heroes, or we turn them into punch lines. That ' s what TV does. We try hard on"Dirty Jobs"not to do that, which is why I do the work and I don ' t cheat. But, we ' ve waged this war on Madison Avenue. So many of the commercials that come out there in the way of a message â what ' s really being said?"Your life would be better if you could work a little less, didn ' t have to work so hard, got home a little earlier, could retire a little faster, punch out a little sooner."It ' s all in there, over and over, again and again. Washington? I can ' t even begin to talk about the deals and policies in place that affect the bottom-line reality of the available jobs, because I don ' t really know ; I just know that that ' s a front in this war. And right here, guys â Silicon Valley. I mean â how many people have an iPhone on them right now? How many people have their BlackBerry? We ' re plugged in ; we ' re connected. I would never suggest for a second that something bad has come out of the tech revolution. Good grief, not to this crowd. But I would suggest that innovation without imitation is a complete waste of time. And nobody celebrates imitation the way"Dirty

Jobs”guys know it has to be done. Your iPhone without those people making the same **interface**, the same circuitry, the same board, over and over â all of that â that ’ s what makes it equally as possible as the genius that goes inside of it. So, we ’ ve got this new toolbox. You know? Our tools today don ’ t look like shovels and picks. They look like the stuff we walk around with. And so the collective effect of all of that has been this marginalization of lots and lots of jobs. And I realized, probably too late in this game â I hope not, because I don ’ t know if I can do 200 more of these things â but we ’ re going to do as many as we can. And to me, the most important thing to know and to really come face to face with, is that fact that I got it wrong about a lot of things, not just the testicles on my chin. I got a lot wrong. So, we ’ re thinking â by”we,”I mean me â that the thing to do is to talk about a PR campaign for work â manual labor, skilled labor. Somebody needs to be out there, talking about the forgotten benefits. I ’ m talking about grandfather stuff, the stuff a lot us probably grew up with but we ’ ve kind of â you know, kind of lost a little. Barack wants to create two and a half million jobs. The infrastructure is a huge deal. This war on work that I suppose exists, has casualties like any other war. The infrastructure is the first one, declining trade school enrollments are the second one. Every single year, fewer electricians, fewer carpenters, fewer plumbers, fewer welders, fewer pipe fitters, fewer steam fitters. The infrastructure jobs that everybody is talking about creating are those guys â the ones that have been in decline, over and over. Meanwhile, we ’ ve got two trillion dollars, at a minimum, according to the American Society of Civil Engineers, that we need to expend to even make a dent in the infrastructure, which is currently rated at a D minus. So, if I were running for anything â and I ’ m not â I would simply say that the jobs we hope to make and the jobs we hope to create aren ’ t going to stick unless they ’ re jobs that people want. And I know the point of this conference is to celebrate things that are near and dear to us, but I also know that clean and dirty aren ’ t opposites. They ’ re two sides of the same coin, just like innovation and imitation, like risk and responsibility, like peripeteia and anagnorisis, like that poor little lamb, who I hope isn ’ t quivering anymore, and like my time that ’ s gone. It ’ s been great talking to you. And get back to work, will you?

Text Sample 840: POS Dim 6 – 1998 – Score 3.00 – 1998/t000118.txt

Back in 1992, I started working for a company called Interval Research, which was just then being founded by David Lidell and Paul Allen as a for-profit research enterprise in Silicon Valley. I met with David to talk about what I might do in his company. I was just coming out of a failed virtual reality business and supporting myself by being on the speaking circuit and writing books — after twenty years or so in the computer game industry having ideas that people didn ’ t think they could sell. And David and I discovered that we had a question in common, that we really wanted the answer to, and that was,”Why hasn ’ t anybody built any computer games for little girls?”Why is that? It can ’ t just be a giant sexist conspiracy. These people aren ’ t that smart. There ’ s six billion dollars on the table. They would go for it if they could figure out how. So, what is the deal here? And as we thought about our goals — I should say that Interval is really a humanistic institution, in the classical sense that humanism, at its best, finds a way to combine clear-eyed empirical research with a set of core values that fundamentally love and respect people. The basic idea of humanism is the improvable quality of life ; that we can do good things, that there are things worth doing because they ’ re good things to do, and that clear-eyed empiricism can help us figure out how to do them. So, contrary to popular belief, there is not a conflict of interest between empiricism and values. And Interval Research is kind of the living example of how that can be true. So David and I decided to go find out, through the best research we could muster, what it would take to get a little girl to put her hands on a computer, to achieve the level of comfort and ease with the technology that little boys have because they play video games. We spent two and a half years conducting research ; we spent another year and a half in advance development. Then we formed a spin-off company. In the research phase of the project at Interval, we partnered with a company called Cheskin Research, and these people — Davis Masten and Christopher Ireland — changed my mind entirely about what market research was and what it could be. They taught me how to look and see, and they did not do the incredibly stupid thing of saying to a child,"Of all these things we already make you, which do you like best?"— which gives you zero answers that are usable. So, what we did for the first two and a half years was four things : We did an extensive review of the literature in related fields, like cognitive psychology, **spatial** cognition, gender studies, play theory, sociology, primatology. Thank you Frans de Waal, wherever you are, I love you and I ' d give anything to meet you. After we had done that with a pretty large team of people and discovered what we thought the salient issues were with girls and boys and playing — because, after all, that ' s really what this is about — we moved to the second phase of our work, where we interviewed adult experts in academia, some of the people who ' d produced the literature that we found relevant. Also, we did focus groups with people who were on the ground with kids every day, like playground supervisors. We talked to them, confirmed some hypotheses and identified some serious questions about gender difference and play. Then we did what I consider to be the heart of the work : interviewed 1, 100 children, boys and girls, ages seven to 12, all over the United States — except for Silicon Valley, Boston and Austin because we knew that their little families would have millions of computers in them and they wouldn ' t be a representative sample. And at the end of those **remarkable** conversations with kids and their best friends across the United States, after two years, we pulled together some survey data from another 10, 000 children, drew up a set up of what we thought were the key findings of our research, and spent another year transforming them into design heuristics, for designing computer-based products — and, in fact, any kind of products — for little girls, ages eight to 12. And we spent that time designing interactive prototypes for computer software and testing them with little girls. In 1996, in November, we formed the company Purple Moon which was a spinoff of Interval Research, and our chief investors were Interval Research, Vulcan Northwest, Institutional Venture Partners and Allen and Company. We launched a website on September 2nd that has now served 25 million pages, and has 42, 000 registered young girl users. They visit an average of one and a half times a day, spend an average of 35 minutes a visit, and look at 50 pages a visit. So we feel that we ' ve formed a successful online community with girls. We launched two titles in October —"Rockett ' s New School"— the first of a series of products — is about a character called Rockett beginning her first day of school in eighth grade at a brand new place, with a blank slate, which allows girls to play with the question of,"What will I be like when I ' m older?""What ' s it going to be like to be in high school or junior high school? Who are my friends?"; to exercise the love of social complexity and the narrative intelligence that drives most of their play behavior ; and which embeds in it values about noticing that we have lots of choices in our lives and the ways that we conduct ourselves. The other title that we launched is called"Secret Paths in the Forest,"which addresses the more fantasy-oriented, inner lives of girls. These two titles both showed up in the top 50 entertainment titles in PC Data — entertainment titles in PC Data in December, right up there with"John Madden Football,"which thrills me to death. So, we ' re real, and we ' ve touched several hundreds of thousands of little girls. We ' ve made half-a-billion impressions with marketing and PR for this brand, Purple Moon. Ninety-six percent of them, roughly, have been positive ; four percent of them have been"other."I want to talk about the other, because the politics of this enterprise, in a way, have been the most fascinating part of it, for me. There are really two kinds of negative reviews that we ' ve received. One kind of reviewer is a male gamer who thinks he knows what games ought to be, and won ' t show the product to little girls. The other kind of reviewer is a certain flavor of feminist who thinks they know what little girls ought to be. And so it ' s funny to me that these interesting, odd bedfellows have one thing in common : they don ' t listen to little girls. They haven ' t looked at children and they ' re certainly not demonstrating any love for them. I ' d like to play you some voices of little girls from the two-and-a-half years of research that we did — actually, some of the voices are more recent. And these voices will be accompanied by photographs that they took for us of their lives, of the things that they value and care about. These are pictures the girls themselves never saw, but they gave to us This is the stuff those reviewers don ' t know about and aren ' t listening to and this is the kind of research I recommend to those who want to do humanistic work. Girl 1 : Yeah, my character is usually a tomboy. Hers is more into boys. Girl 2 : Uh, yeah. Girl 1 : We have — in the very beginning of the whole game, always we do this : we each have a piece of paper ; we write down our name, our age — are we rich, very rich, not rich, poor, medium, wealthy, boyfriends, dogs, pets — what else — sisters, brothers, and all those. Girl 2 : Divorced — parents divorced, maybe. Girl 3 : This is my pretend [unclear] one. Girl 4 : We make a school newspaper on the computer. Girl 5 : For a girl ' s game also usually they ' ll have really pretty scenery with clouds and flowers. Girl 6 : Like, if you were a girl and you were really adventurous and a real big tomboy, you would think that girls ' games were kinda sissy. Girl 7 : I run track, I played soccer, I play basketball, and I love a lot of things to do. And sometimes I feel like I can ' t really enjoy myself unless it ' s like a vacation, like when I get Mondays and all those days off. Girl 8 : Well, sometimes there is a lot of stuff going on because I have music lessons and I ' m on swim team — all this different stuff that I have to do, and sometimes it gets overwhelming. Girl 9 : My friend Justine kinda took my friend Kelly, and now they ' re being mean to me. Girl 10 : Well, sometimes it gets annoying when your brothers and sisters, or brother or sister, when they copy you and you get your idea first and they take your idea and they do it themselves. Girl 11 : Because my older sister, she gets everything and, like, when I ask my mom for something, she ' ll say,"No"— all the time. But she gives my sister everything. Brenda Laurel : I want to show you, real quickly, just a minute of"Rockett ' s Tricky Decision,"which went gold two days ago. Let ' s hope it ' s really stable. This is the second day in Rockett ' s life. The reason I ' m showing you this is I ' m hoping that the scene that I ' m going to show you will look familiar and sound familiar, now that you ' ve listened to some girls ' voices. And you can see how we ' ve tried to incorporate the issues that matter to them in the game that we ' ve created. Miko : Hey Rockett! C ' mere! Rockett : Hi Miko! What ' s going on? Miko : Did you hear about Nakilia ' s big Halloween party this weekend? She asked me to make sure you knew about it. Nakilia invited Reuben too, but — Rockett : But what? Isn ' t he coming? Miko : I don ' t think so. I mean, I heard his band is playing at another party the same night. Rockett : Really? What other party? Girl : Max ' s party is going to be so cool, Whitney. He ' s invited all the best people.

BL : I ’ m going to fast-forward to the decision point because I know I don ’ t have a lot of time. After this awful event occurs, Rocket gets to decide how she feels about it. Rockett : Who ’ d want to show up at that party anyway? I could get invited to that party any day if I wanted to. Gee, I doubt I ’ ll make Max ’ s best people list. BL : OK, so we ’ re going to emotionally navigate. If we were playing the game, that ’ s what we ’ d do. If at any time during the game we want to learn more about the characters, we can go into this hidden hallway, and I ’ ll quickly just show you the **interface**. We can, for example, go find Miko ’ s locker and get some more information about her. Oops, I turned the wrong way. But you get the general idea of the product. I wanted to show you the ways, innocuous as they seem, in which we ’ re incorporating what we ’ ve learned about girls — their desires to experience greater emotional flexibility, and to play around with the social complexity of their lives. I want to make the point that what we ’ re giving girls, I think, through this effort, is a kind of validation, a sense of being seen. And a sense of the choices that are available in their lives. We love them. We see them. We ’ re not trying to tell them who they ought to be. But we ’ re really, really happy about who they are. It turns out they ’ re really great. I want to close by showing you a videotape that ’ s a version of a future game in the Rockett series that our graphic artists and design people put together, that we feel would please that four percent of reviewers.”Rockett 28!”Rockett : It ’ s like I ’ m just waking up, you know? BL : Thanks.

’ Theme and variations ’ is one of those forms that require a certain kind of intellectual activity, because you are always comparing the variation with the theme that you hold in your mind. You might say that the theme is nature and everything that follows is a variation on the subject. I was asked, I guess about six years ago, to do a series of paintings that in some way would celebrate the birth of Piero della Francesca. And it was very difficult for me to imagine how to paint pictures that were based on Piero until I realized that I could look at Piero as nature — that I would have the same attitude towards looking at Piero della Francesca as I would if I were looking out a window at a tree. And that was enormously liberating to me. Perhaps it ’ s not a very insightful observation, but that really started me on a path to be able to do a kind of theme and variations based on a work by Piero, in this case that **remarkable** painting that ’ s in the Uffizi,”The Duke of Montefeltro,”who faces his consort, Battista. Once I realized that I could take some liberties with the subject, I did the following series of drawings. That ’ s the real Piero della Francesca — one of the greatest portraits in human history. And these, I ’ ll just show these without comment. It ’ s just a series of variations on the head of the Duke of Montefeltro, who ’ s a great, great figure in the Renaissance, and probably the basis for Machiavelli ’ s”The Prince.”He apparently lost an eye in battle, which is why he is always shown in profile. And this is Battista. And then I decided I could move them around a little bit — so that for the first time in history, they ’ re facing the same direction. Whoops! Passed each other. And then a visitor from another painting by Piero, this is from”The Resurrection of Christ”— as though the cast had just gotten of the set to have a chat. And now, four large panels : this is upper left ; upper right ; lower left ; lower right. Incidentally, I ’ ve never understood the conflict between abstraction and naturalism. Since all paintings are inherently abstract to begin with there doesn ’ t seem to be an argument there. On another subject — — I was driving in the country one day with my wife, and I saw this sign, and I said,”That is a fabulous piece of design.”And she said,”What are you talking about?”I said,”Well, it ’ s so persuasive, because the purpose of that sign is to get you into the garage, and since most people are so suspicious of garages, and know that they ’ re going to be ripped off, they use the word ’ reliable. ’ But everybody says they ’ re reliable. But, reliable Dutchman”— —”Fantastic!”Because as soon as you hear the word Dutchman — which is an archaic word, nobody calls Dutch people”Dutchmen”anymore — but as soon as you hear Dutchman, you get this picture of the kid with his finger in the dike, preventing the thing from falling and flooding Holland, and so on. And so the entire issue is detoxified by the use of”Dutchman.”Now, if you think I ’ m exaggerating at all in this, all you have to do is substitute something else, like”Indonesian.”Or even”French.”Now,”Swiss”works, but you know it ’ s going to cost a lot of money. I ’ m going to take you quickly through the actual process of doing a poster. I do a lot of work for the School of Visual Arts, where I teach, and the director of this school — a **remarkable** man named Silas Rhodes — often gives you a piece of text and he says,”Do something with this.”And so he did. And this was the text —”In words as fashion the same rule will hold / Alike fantastic if too new or old / Be not the first by whom the new are tried / Nor yet the last to lay the old aside.”I could make nothing of that. And I really struggled with this one. And the first thing I did, which was sort of in the absence of another idea, was say I ’ ll sort of write it out and make some words big, and I ’ ll have some kind of design on the back somehow, and I was hoping — as one often does — to stumble into something. So I took another crack at it — you ’ ve got to keep it moving — and I Xeroxed some words on pieces of colored paper and I pasted them down on an ugly board. I thought that something would come out of it, like”Words rule fantastic new old first last Pope”because it ’ s by Alexander Pope, but I sort of made a mess out of it, and then I thought I ’ d repeat it in some way so it was legible. So, it was going nowhere. Sometimes, in the middle of a resistant problem, I write down things that I know about it. But you can see the beginning of an idea there, because you can see the word”new”emerging from the”old.”That ’ s what happens. There ’ s a relationship between the old and the new ; the new emerges from the context of the old. And then I did some variations of it, but it still wasn ’ t coalescing graphically at all. I had this other version which had something interesting about it in terms of being able to put it together in your mind from clues. The W was clearly a W, the N was clearly an N, even though they were very fragmentary and there wasn ’ t a lot of information in it. Then I got the words”new”and”old”and now I had regressed back to a point where there seemed to be no return. I was really desperate at this point. And so, I do something I ’ m truthfully ashamed of, which is that I took two drawings I had made for another purpose and I put them together. It says”dreams”at the top. And I was going to do a thing, I say,”Well, change the copy. Let it say something about dreams, and come to SVA and you ’ ll sort of fulfill your dreams.”But, to my credit, I was so embarrassed about doing that that I never submitted this sketch. And, finally, I arrived at the following solution. Now, it doesn ’ t look terribly interesting, but it does have something that distinguishes it from a lot of other posters. For one thing, it transgresses the idea of what a poster ’ s supposed to be, which is to be understood and seen immediately, and not explained. I remember hearing all of you in the graphic arts —”If you have to explain it, it ain ’ t working.”And one day I woke up and I said,”Well, suppose that ’ s not true?”So here ’ s what it says in my explanation at the bottom left. It says,”Thoughts : This poem is impossible. Silas usually has a better touch with his choice of quotations. This one generates no imagery at all.”I am now exposing myself to my audience, right? Which is something you never want to do professionally.”Maybe the words can make the image without anything else happening. What ’ s the heart of this poem? Don ’ t be trendy if you want to be serious. Is doing the poster this way trendy in itself? I guess one could reduce the idea further by suggesting that the new emerges behind and through the old, like this.”And then I show you a little drawing — you see, you remember that old thing I discarded? Well, I found a way to use it. So, there ’ s that little alternative over there, and I say,”Not bad,”— criticizing myself —”but more didactic than visual. Maybe what wants to be said is that old and the new are locked in a dialectical embrace, a kind of dance where each defines the other.”And then more self-questioning —”Am I being simple-minded? Is this the kind of simple that looks obvious, or the kind that looks profound? There ’ s a significant difference. This could be embarrassing. Actually, I realize fear of embarrassment drives me as much as any ambition. Do you think this sort of thing could really attract a student to the school?”Well, I think there are two fresh things here — two fresh things. One is the sort of willingness to expose myself to a critical audience, and not to suggest that I am confident about what I ’ m doing. And as you know, you have to have a front. I mean — you ’ ve got to be confident ; if you don ’ t believe in your work, who else is going to believe in it? So that ’ s one thing, to introduce the idea of doubt into graphics. That can be a big contribution. The other thing is to actually give you two solutions for the price of one ; you get the big one and if you don ’ t like that, how about the little one? And that too is a relatively new idea. And here ’ s just a series of experiments where I ask the question of — does a poster have to be square? Now, this is a little illusion. That poster is not folded. It ’ s not folded, that ’ s a photograph and it ’ s cut on the **diagonal**. Same cheap trick in the upper left- hand corner. And here, a very peculiar poster because, simply because of using the isometric perspective in the computer, it won ’ t sit still in the space. At times, it seems to be wider at the back than the front, and then it shifts. And if you sit here long enough, it ’ ll float off the page into the audience. But, we don ’ t have time. And then an experiment — a little bit about the nature of perspective, where the outside shape is determined by the peculiarity of perspective, but the shape of the bottle — which is identical to the outside shape — is seen frontally. And another piece for the art directors ’ club is”Anna Rees”casting long shadows. This is another poster from the School of Visual Arts. There were 10 artists invited to participate in it, and it was one of those things where it was extremely competitive and I didn ’ t want to be embarrassed, so I worked very hard on this. The idea was — and it was a brilliant idea — was to have 10 posters distributed throughout the city ’ s subway system so every time you got on the subway you ’ d be passing a different poster, all of which had a different idea of what art is. But I was absolutely stuck on the idea of”art is”and trying to determine what art was. But then I gave up and I said,”Well, art is whatever.”And as soon as I said that, I discovered that the word”hat”was hidden in the word”whatever,”and that led me to the inevitable conclusion. But then again, it ’ s on my list of didactic posters. My intent is to have a literary accompaniment that explains the poster, in case you don ’ t get it. Now this says,”Note to the viewer : I thought I might use a visual cliche of our time — Magritte ’ s everyman — to express the idea that art is mystery, continuity and history. I ’ m also convinced that, in an age of computer manipulation, surrealism has become banal, a shadow of its former self. The phrase ’ Art is whatever ’ expresses the current inclusiveness that surrounds art-making — a sort of ’ it ain ’ t what you do, it ’ s the way that you do it ’ notion. The shadow of Magritte falls across the central part of the poster a poetic event that occurs as the shadow man isolates the word ’ hat, ’ hidden in the word ’ whatever. ’ The four hats shown in the poster suggests how art might be defined : as a thing itself, the worth of the thing, the shadow of the thing, and the shape of the thing. Whatever.”OK. And the one that I did not submit, which I still like, I wanted to use the same phrase. There were wonderful experiments by Bruno Munari on letterforms some years ago — sort of, see how far you could go and still be able to read them. And that idea stuck in my head. But then I took the pieces that I had taken off and put them at the bottom. And, of course those are the remains, and they ’ re so labeled. But what really happens is that you read it as :”Art is whatever remains.”Thank you.

You hear that this is the era of environment â or biology, or information technology... Well, it ’ s the era of a lot of different things that we ’ re in right now. But one thing for sure : it ’ s the era of change. There ’ s more change going on than ever has occurred in the history of human life on earth. And you all sort of know it, but it ’ s hard to get it so that you really understand it. And I ’ ve tried to put together something that ’ s a good start for this. I ’ ve tried to show in this â though the color doesn ’ t come out â that what I ’ m concerned with is the little 50-year time bubble that you are in. You tend to be interested in a generation past, a generation future â your parents, your kids, things you can change over the next few decades â and this 50-year time bubble you kind of move along in. And in that 50 years, if you look at the population curve, you find the population of humans on the earth more than doubles and we ’ re up three-and-a-half times since I was born. When you have a new baby, by the time that kid gets out of high school more people will be added than existed on earth when I was born. This is unprecedented, and it ’ s big. Where it goes in the future is questioned. So that ’ s the human part. Now, the human part related to animals : look at the left side of that. What I call the human portion â humans and their livestock and pets â versus the natural portion â all the other wild animals and just â these are vertebrates and all the birds, etc., in the land and air, not in the water. How does it balance? Certainly, 10, 000 years ago, the civilization ’ s beginning, the human portion was less than one tenth of one percent. Let ’ s look at it now. You follow this curve and you see the whiter spot in the middle â that ’ s your 50- year time bubble. Humans, livestock and pets are now 97 percent of that integrated total mass on earth and all wild nature is three percent. We have won. The next generation doesn ’ t even have to worry about this game â it is over. And the biggest problem came in the last 25 years : it went from 25 percent up to that 97 percent. And this really is a sobering picture upon realizing that we, humans, are in charge of life on earth ; we ’ re like the capricious Gods of old Greek myths, kind of playing with life â and not a great deal of wisdom injected into it. Now, the third curve is information technology. This is Moore ’ s Law plotted here, which relates to density of information, but it has been pretty good for showing a lot of other things about information technology â computers, their use, Internet, etc. And what ’ s important is it just goes straight up through the top of the curve, and has no real limits to it. Now try and contrast these. This is the size of the earth going through that same â â frame. And to make it really clear, I ’ ve put all four on one graph. There ’ s no need to see the little detailed words on it. That first one is humans-versus-nature ; we ’ ve won, there ’ s no more gain. Human population. And so if you ’ re looking for growth industries to get into, that ’ s not a good one â protecting natural creatures. Human population is going up ; it ’ s going to continue for quite a while. Good business in obstetricians, morticians, and farming, housing, etc. â they all deal with human bodies, which require being fed, transported, housed and so on. And the information technology, which connects to our brains, has no limit â now, that is a wonderful field to be in. You ’ re looking for growth opportunity? It ’ s just going up through the roof. And then, the size of the Earth. Somehow making these all compatible with the Earth looks like a pretty bad industry to be involved with. So, that ’ s the stage out of all this. I find, for reasons I don ’ t understand, I really do have a goal. And the goal is that the world be desirable and sustainable when my kids reach my age â and I think that ’ s â in other words, the next generation. I think that ’ s a goal that we probably all share. I think it ’ s a hopeless goal. Technologically, it ’ s achievable ; economically, it ’ s achievable ; politically, it means sort of the habits, institutions of people â it ’ s impossible. The institutions of the past with all their inertia are just irrelevant for the future, except they ’ re there and we have to deal with them. I spend about 15 percent of my time trying to save the world, the other 85 percent, the usual â and whatever else we devote ourselves to. And in that 15 percent, the main focus is on human mind, thinking skills, somehow trying to unleash kids from the straightjacket of school, which is putting information and dogma into them, get them so they really think, ask tough questions, argue about serious subjects, don ’ t believe everything that ’ s in the book, think broadly or creative. They can be. Our school systems are very flawed and do not reward you for the things that are important in life or for the survival of civilization ; they reward you for a lot of learning and sopping up stuff. We can ’ t go into that today because there isn ’ t time â it ’ s a broad subject. One thing for sure, in the future there is an essential feature â necessary, but not sufficient â which is doing more with less. We ’ ve got to be doing things with more efficiency using less energy, less material. Your great-great grandparents got by on muscle power, and yet we all think there ’ s this huge power that ’ s essential for our lifestyle. And with all the wonderful technology we have we can do things that are much more efficient : conserve, recycle, etc. Let me just rush very quickly through things that we ’ ve done. Human-powered airplane â Gossamer Condor sort of started me in this direction in 1976 and 77, winning the Kremer prize in aviation history, followed by the Albatross. And we began making **various** odd planes and creatures. Here ’ s a giant flying replica of a pterosaur that has no tail. Trying to have it fly straight is like trying to shoot an arrow with the feathered end forward. It was a tough job, and boy it made me have a lot of respect for nature. This was the full size of the original creature. We did things on land, in the air, on water â vehicles of all different kinds, usually with some electronics or electric power systems in them. I find they ’ re all the same, whether its land, air or water. I ’ ll be focusing on the air here. This is a solar-powered airplane â 165 miles carrying a person from France to England as a symbol that solar power is going to be an important part of our future. Then we did the solar car for General Motors â the Sunracer â that won the race in Australia. We got a lot of people thinking about electric cars, what you could do with them. A few years later, when we suggested to GM that now is the time and we could do a thing called the Impact, they sponsored it, and here ’ s the Impact that we developed with them on their programs. This is the demonstrator. And they put huge effort into turning it into a commercial product. With that preamble, let ’ s show the first two-minute videotape, which shows a little airplane for surveillance and moving to a giant airplane. Narrator : A tiny airplane, the AV Pointer serves for surveillance â in effect, a pair of roving eyeglasses. A cutting-edge example of where miniaturization can lead if the operator is remote from the vehicle. It is convenient to carry, assemble and launch by hand. Battery-powered, it is silent and rarely noticed. It sends high-resolution video pictures back to the operator. With onboard GPS, it can navigate autonomously, and it is rugged enough to self-land without damage. The modern sailplane is superbly efficient. Some can glide as flat as 60 feet forward for every foot of descent. They are powered only by the energy they can extract from the atmosphere â an atmosphere nature stirs up by solar energy. Humans and soaring birds have found nature to be generous in providing replenishable energy. Sailplanes have flown over 1, 000 miles, and the altitude record is over 50, 000 feet. The Solar Challenger was made to serve as a symbol that photovoltaic cells can produce real power and will be part of the world ’ s energy future. In 1981, it flew 163 miles from Paris to England, solely on the power of sunbeams, and established a basis for the Pathfinder. The message from all these vehicles is that ideas and technology can be harnessed to produce **remarkable** gains in doing more with less â gains that can help us attain a desirable balance between technology and nature. The stakes are high as we speed toward a challenging future. Buckminster Fuller said it clearly :”there are no passengers on spaceship Earth, only crew. We, the crew, can and must do more with less â much less.”Paul MacCready : If we could have the second video, the one-minute, put in as quickly as you can, which â this will show the Pathfinder airplane in some flights this past year in Hawaii, and will show a sequence of some of the beauty behind it after it had just flown to 71, 530 feet â higher than any propeller airplane has ever flown. It ’ s amazing : just on the puny power of the sun â by having a super lightweight plane, you ’ re able to get it up there. It ’ s part of a long-term program NASA sponsored. And we worked very closely with the whole thing being a team effort, and with wonderful results like that flight. And we ’ re working on a bigger plane â 220-foot span â and an intermediate-size, one with a regenerative fuel cell that can store excess energy during the day, feed it back at night, and stay up 65, 000 feet for months at a time. Ray Morgan ’ s voice will come in here. There he ’ s the project manager. Anything they do is certainly a team effort. He ran this program. Here ’ s... some things he showed as a celebration at the very end. Ray Morgan : We ’ d just ended a seven-month deployment of Hawaii. For those who live on the mainland, it was tough being away from home. The friendly support, the quiet confidence, congenial hospitality shown by our Hawaiian and military hosts â this is starting â made the experience enjoyable and unforgettable. PM : We have real-time IR scans going out through the Internet while the plane is flying. And it ’ s exploring without polluting the stratosphere. That ’ s its goal : the stratosphere, the blanket that really controls the radiation of the earth and permits life on earth to be the success that it is â probing that is very important. And also we consider it as a sort of poor man ’ s stationary satellite, because it can stay right overhead for months at a time, 2, 000 times closer than the real GFC synchronous satellite. We couldn ’ t bring one here to fly it and show you. But now let ’ s look at the other end. In the video you saw that nine-pound or eight-pound Pointer airplane surveillance drone that Keenan has developed and just done a **remarkable** job. Where some have servos that have gotten down to, oh, 18 or 25 grams, his weigh one-third of a gram. And what he ’ s going to bring out here is a surveillance drone that weighs about 2 ounces â that includes the video camera, the batteries that run it, the telemetry, the receiver and so on. And we ’ ll fly it, we hope, with the same success that we had last night when we did the practice. So Matt Keenan, just any time you ’ re â all right â ready to let her go. But first, we ’ re going to make sure that it ’ s appearing on the screen, so you see what it sees. You can imagine yourself being a mouse or fly inside of it, looking out of its camera. Matt Keenan : It ’ s switched on. PM : But now we ’ re trying to get the video. There we go.

MK : Can you bring up the house lights? PM : Yeah, the house lights and we ’ ll see you all better and be able to fly the plane better. MK : All right, we ’ ll try to do a few laps around and bring it back in. Here we go. PM : The video worked right for the first few and I don ’ t know why it â there it goes. Oh, that was only a minute, but I think you ’ d be safe to have that near the end of the flight, perhaps. We get to do the classic. All right. If this hits you, it will not hurt you. OK. Thank you very much. Thank you. But now, as they say in infomercials, we have something much better for you, which we ’ re working on : planes that are only six inches â 15 centimeters â in size. And Matt ’ s plane was on the cover of Popular Science last month, showing what this can lead to. And in a while, something this size will have GPS and a video camera in it. We ’ ve had one of these fly nine miles through the air at 35 miles an hour with just a little battery in it. But there ’ s a lot of technology going. There are just milestones along the way of some **remarkable** things. This one doesn ’ t have the video in it, but you get a little feel from what it can do. OK, here we go. MK : Sorry. OK. PM : If you can pass it down when you ’ re done. Yeah, I think â I lost a little orientation ; I looked up into this light. It hit the building. And the building was poorly placed, actually. But you ’ re beginning to see what can be done. We ’ re working on projects now â even wing-flapping things the size of hawk moths â DARPA contracts, working with Caltech, UCLA. Where all this leads, I don ’ t know. Is it practical? I don ’ t know. But like any basic research, when you ’ re really forced to do things that are way beyond existing technology, you can get there with micro-technology, nanotechnology. You can do amazing things when you realize what nature has been doing all along. As you get to these small scales, you realize we have a lot to learn from nature â not with 747s â but when you get down to the nature ’ s realm, nature has 200 million years of experience. It never makes a mistake. Because if you make a mistake, you don ’ t leave any progeny. We should have nothing but success stories from nature, for you or for birds, and we ’ re learning a lot from its fascinating subjects. In concluding, I want to get back to the big picture and I have just two final slides to try and put it in perspective. The first I ’ ll just read. At last, I put in three sentences and had it say what I wanted. Over billions of years on a unique sphere, chance has painted a thin covering of life â complex, improbable, wonderful and fragile. Suddenly, we humans â a recently arrived species, no longer subject to the checks and balances inherent in nature â have grown in population, technology and intelligence to a position of terrible power. We now wield the paintbrush. And that ’ s serious : we ’ re not very bright. We ’ re short on wisdom ; we ’ re high on technology. Where ’ s it going to lead? Well, inspired by the sentences, I decided to wield the paintbrush. Every 25 years I do a picture. Here ’ s the one â tries to show that the world isn ’ t getting any bigger. Sort of a timeline, very non-linear scale, nature rates and trilobites and dinosaurs, and eventually we saw some humans with caves... Birds were flying overhead, after pterosaurs. And then we get to the civilization above the little TV set with a gun on it. Then traffic jams, and power systems, and some dots for digital. Where it ’ s going to lead â I have no idea. And so I just put robotic and natural cockroaches out there, but you can fill in whatever you want. This is not a forecast. This is a warning, and we have to think seriously about it. And that time when this is happening is not 100 years or 500 years. Things are going on this decade, next decade ; it ’ s a very short time that we have to decide what we are going to do. And if we can get some agreement on where we want the world to be â desirable, sustainable when your kids reach your age â I think we actually can reach it. Now, I said this was a warning, not a forecast. That was before â I painted this before we started in on making robotic versions of hawk moths and cockroaches, and now I ’ m beginning to wonder seriously â was this more of a forecast than I wanted? I personally think the surviving intelligent life form on earth is not going to be carbon-based ; it ’ s going to be silicon-based. And so where it all goes, I don ’ t know. The one final bit of sparkle we ’ ll put in at the very end here is an utterly impractical flight vehicle, which is a little ornithopter wing-flapping device that â rubber-band powered â that we ’ ll show you. MK : 32 gram. Sorry, one gram. PM : Last night we gave it a few too many turns and it tried to bash the roof out also. It ’ s about a gram. The tube there ’ s hollow, about paper-thin. And if this lands on you, I assure you it will not hurt you. But if you reach out to grab it or hold it, you will destroy it. So, be gentle, just act like a wooden Indian or something. And when it comes down â and we ’ ll see how it goes. We consider this to be sort of the spirit of TED. And you wonder, is it practical? And it turns out if I had not been â Unfortunately, we have some light bulb changes. We can probably get it down, but it ’ s possible it ’ s gone up to a greater destiny up there â â than it ever had. And I wanted to make â just â But I want to make just two points. One is, you think it ’ s frivolous ; there ’ s nothing to it. And yet if I had not been making ornithopters like that, a little bit cruder, in 1939 â a long, long time ago â there wouldn ’ t have been a Gossamer Condor, there wouldn ’ t have been an Albatross, a Solar Challenger, there wouldn ’ t be an Impact car, there wouldn ’ t be a mandate on zero-emission vehicles in California. A lot of these things â or similar â would have happened some time, probably a decade later. I didn ’ t realize at the time I was doing inquiry-based, hands-on things with teams, like they ’ re trying to get in education systems. So I think that, as a symbol, it ’ s important. And I believe that also is important. You can think of it as a sort of a symbol for learning and TED that somehow gets you thinking of technology and nature, and puts it all together in things that are â that make this conference, I think, more important than any that ’ s taken place in this country in this decade. Thank you.

I dabble in design. I ’ m a curator of architecture and design ; I happen to be at the Museum of Modern Art. But what we ’ re going to talk about today is really design. Really good designers are like sponges : they really are curious and absorb every kind of information that comes their way, and transform it so that it can be used by people like us. And so that gives me an opportunity, because every design show that I curate kind of looks at a different world. And it ’ s great, because it seems like every time I change jobs. And what I ’ m going to do today is I ’ m going to give you a preview of the next exhibition that I ’ m working on, which is called”Design and the Elastic Mind.”The world that I decided to focus on this particular time is the world of science and the world of technology. Technology always comes into play when design is involved, but science does a little less. But designers are great at taking big revolutions that happen and transforming them so that we can use them. And this is what this exhibition looks at. If you think about your life today, you go every day through many different scales, many different changes of rhythm and pace. You work over different time zones, you talk to very different people, you multitask. We all know it, and we do it kind of automatically. Some of the minds in this audience are super elastic, others are a little slower, others have a few stretch marks, but nonetheless this is a quite exceptional audience from that viewpoint. Other people are not as elastic. I can ’ t get my father in Italy to work on the Internet. He doesn ’ t want to put high-speed Internet at home. And that ’ s because there ’ s some little bit of fear, little bit of resistance or just clogged mechanisms. So designers work on this particular malaise that we have, these kinds of discomforts that we have, and try to make life easier for us. Elasticity of mind is something that we really need, you know, we really need, we really cherish and we really work on. And this exhibition is about the work of designers that help us be more elastic, and also of designers that really work on this elasticity as an opportunity. And one last thing is that it ’ s not only designers, but it ’ s also scientists. And before I launch into the **display** of some of the slides and into the preview, I would like to point out this beautiful detail about scientists and design. You can say that the relationship between science and design goes back centuries. You can of course talk about Leonardo da Vinci and many other Renaissance men and women — and there ’ s a gigantic history behind it. But according to a really great science historian you might know, Peter Galison — he teaches at Harvard — what nanotechnology in particular and quantum physics have brought to designers is this renewed interest, this real passion for design. So basically, the idea of being able to build things bottom up, atom by atom, has made them all into tinkerers. And all of a sudden scientists are seeking designers, just like designers are seeking scientists. It ’ s a brand-new love affair that we ’ re trying to cultivate at MOMA. Together with Adam Bly, who is the founder of Seed magazine — that ’ s now a multimedia company, you might know it — we founded about a year ago a monthly salon for designers and scientists, and it ’ s quite beautiful. And Keith has come, and also Jonathan has come and many others. And it was great, because at the beginning was this apology fest — you know, scientists would tell designers, you know, I don ’ t know what style is, I ’ m not really elegant. And designers would like, oh, I don ’ t know how to do an equation, I don ’ t understand what you ’ re saying. And then all of a sudden they really started talking each others ’ language, and now we ’ re already at the point that they collaborate. Paul Steinhardt, a physicist from New York, and Aranda / Lasch, architects, collaborated in an installation in London at the Serpentine. And it ’ s really interesting to see how this happens. The exhibition will talk about the work of both designers and scientists, and show how they ’ re presenting the possibilities of the future to us. I ’ m showing to you different sections of the show right now, just to give you a taste of it. Nanophysics and nanotechnology, for instance, have really opened the designer ’ s mind. In this case I ’ m showing more the designers ’ work, because they ’ re the ones that have really been stimulated. A lot of the objects in the show are concepts, not objects that exist already. But what you ’ re looking at here is the work of some scientists from UCLA. This kind of alphabet soup is a new way to mark proteins — not only by color but literally by alphabet letters. So they construct it, and they can construct all kinds of forms at the nanoscale. This is the work of design students from the Royal College of Arts in London that have been working together with their tutor, Tony Dunne, and with a bunch of scientists around Great Britain on the possibilities of nanotechnology for design in the future. New sensing elements on the body — you can grow hairs on your nails, and therefore grab some of the particles from another person. They seem very, very obsessed with finding out more about the ideal mate. So they ’ re working on enhancing everything : touch, smell — everything they can, in order to find the perfect mate. Very interesting. This is a typeface designer from Israel who has designed — he calls them”typosperma.”He ’ s thinking — of course it ’ s all a concept — of injecting typefaces into spermatozoa, I don ’ t know how to say it in English — spermatazoi — in order to make them become — to almost have a song or a whole poem written with every ejaculation. I tell you, designers are quite fantastic, you know. So, tissue design. In this case too, you have a mixture of scientists and designers. This here is part of the same lab at the Royal College of Arts. The RCA is really quite an amazing school from that viewpoint. One of the assignments for a year was to work with in-vitro meat. You know that already you can grow meat in vitro. In Australia they did it — this research company, called SymbioticA. But the problem is that it ' s a really ugly patty. And so, the assignment to the students was, how should the steak of tomorrow be? When you don ' t have to kill cows and it can have any shape, what should it be like? So this particular student, James King, went around the beautiful English countryside, picked the best, best cow that he could see, and then put her in the MRI machine. Then, he took the scans of the best organs and made the meat — of course, this is done with a Japanese resins food maker, but you know, in the future it could be made better — which reproduces the best MRI scan of the best cow he could find. Instead, this element here is much more banal. Something that you know can be done already is to grow bone tissue, so that you can make a wedding ring out of the bone tissue of your loved one — literally. So, this is indeed made of human bone tissue. This is SymbioticA, and they ' ve been working — they were the first ones to do this in-vitro meat — and now they ' ve also done an in-vitro coat, a leather coat. It ' s miniscule, but it ' s a real coat. It ' s shaped like one. So, we ' ll be able to really not have any excuse to be wearing everything leather in the future. One of the most important topics of the show — you know, as anything in our life today, we can look at it from many, many different viewpoints, and at different levels. One of the most interesting and most important concepts is the idea of scale. We change scale very often : we change resolution of screens, and we ' re not really fazed by it, we do it very comfortably. So you go, even in the exhibition, from the idea of nanotechnology and the nanoscale to the manipulation of really great amounts of data — the mapping and tagging of the universe and of the world. In this particular case a section will be devoted to information design. You see here the work of Ben Fry. This is"Human vs. Chimps"— the few chromosomes that distinguish us from chimps. It was a beautiful visualization that he did for Seed magazine. And here ' s the whole code of Pac-Man, visualized with all the go-to, go-back-to, also made into a beautiful choreography. And then also graphs by scientists, this beautiful diagraph of protein homology. Scientists are starting to also consider aesthetics. We were discussing with Keith Shrubb* this morning the fact that many scientists tend not to use anything beautiful in their **presentations**, otherwise they ' re afraid of being considered dumb blondes. So they pick the worst background from any kind of PowerPoint **presentation**, the worst typeface. It ' s only recently that this kind of marriage between design and science is producing some of the first"pretty"— if we can say so — scientific **presentations**. Another aspect of contemporary design that I think is mind-opening, promising and will really be the future of design, is the idea of collective design. You know, the whole XO laptop, from One Laptop per Child, is based on the idea of collaboration and mash and networking. So, the more the merrier. The more computers, the stronger the signal, and children work on the **interface** so that it ' s all based on doing things together, tasks together. So the idea of collective design is something that will become even bigger in the future, and this is chosen as an example. Related to the idea of collective design and to the new balance between the individual and the collectiveness, collectivity is the idea of existence maximum. That ' s a term that I coined a few years ago while I was thinking of how pressed we are together, and at the same time how these small objects, like the Walkman first and then the iPod, create bubbles of space around us that enable us to have a metaphysical space that is much bigger than our physical space. You can be in the subway and you can be completely isolated and have your own room in your iPod. And this is the work of several designers that really enhance the idea of solitude and expansion by means of **various** techniques. This is a spa telephone. The idea is that it ’ s become so difficult to have a private conversation anywhere that you go to the spa, you have a massage, you have a facial, maybe a rub, and then you have this beautiful pool with this perfect temperature, and you can have this isolation tank phone conversation with whomever you ’ ve been wanting to talk with for a long time. And same thing here, Social Tele- presence. It ’ s actually already used by the military a little bit, but it ’ s the idea of being able to be somewhere else with your senses while you ’ re removed from it physically. And this is called Blind Date. It ’ s a [unclear], so if you ’ re too shy to be really at the date, you can stay at a distance with your flowers and somebody else reenacts the date for you. Rapid manufacturing is another big area in which technology and design are, I think, bound to change the world. You ’ ve heard about it before many times. Rapid manufacturing is a computer file sent directly from the computer to the manufacturing machine. It used to be called rapid prototyping, rapid modeling. It started out in the ’ 80s, but at the beginning it was machines carving out of a foam block a model that was very, very fragile, and could not have any real use. Slowly but surely, the materials became better — better resins. Techniques became better — not only carving but also stereolithography and laser — solidifying all kinds of resins, whether in powder or in liquid form. And the vats became bigger, to the point that now we can have actual chairs made by rapid manufacturing. It takes seven days today to manufacture a chair, but you know what? One day it will take seven hours. And then the dream is that you ’ ll be able to, from home, customize your chair. You know, companies and designers will be designing the matrix or the margins that respect both solidity and brand, and design identity. And then you can send it to the Kinko ’ s store at the corner and go get your chair. Now, the implications of this are enormous, not only regarding the participation of the final buyer in the design process, but also no tracking, no warehousing, no wasted materials. Also, I can imagine many design manufacturers will have to retool their own business plans and maybe invest in this Kinko ’ s store. But it really is a big change. And here I ’ m showing a picture that was in Wired Magazine — you know, the **Artifacts** of the Future section that I love so much — that shows you can have your desktop 3D printer and print your own basketball. But here instead are examples, you can already 3D-print textiles, which is very interesting. This is just a really nice touch — it ’ s called slow prototyping. It ’ s a designer that put 10, 000 bees at work and they built this vase. They had a particular shape that they had to stay in. Mapping and tagging. As the capacity of computers becomes really, really big, and the capacity of our mind not that much bigger, we find that we need to tag as much as we can what we do in order to then retrace our path. Also, we do it in order to share with other people. Again, this communal sense of experience that seems to be so important today. So, **various** ways to map and tag are also the work of many designers nowadays. Also, the senses — designers and scientists all work on trying to expand our senses capabilities so that we can achieve more. And also animal senses in a way. This particular object that many people love so much is actually based on kind of a scientific experiment — the fact that bees have a very strong olfactory sense, and so — much like dogs that can smell certain kinds of skin cancer — bees can be trained by Pavlovian reflex to detect one type of cancer, and also pregnancy. And so this student at the RCA designed this beautiful blown- glass object where the bees move from one chamber to the other if they detect that particular smell that signifies, in this case, pregnancy. Another shape is made for cancer. Design for Debate is a very interesting new endeavor that designers have really shaped for themselves. Some designers don ’ t design objects, products, things that we ’ re going to actually use, but rather, they design scenarios that are object-based. They ’ re still very useful. They help companies and other designers think better about the future. And usually they are accompanied by videos. This is quite beautiful. It ’ s Dunne and Raby,”All the Robots.”Those are a series of robots that are meant to be taken care of. We always think that robots will take care of us, and instead they designed these robots that are very, very needy. You need to take one in your arms and look at it in the eyes for about five minutes before it does something. Another one gets really, really nervous if you get in to the room, and starts shaking, so you have to calm it down. So it ’ s really a way to make us think more about what robots mean to us. Noam Toran and”Accessories for Lonely Men”: the idea is that when you lose your loved one or you go through a bad breakup, what you miss the most are those annoying things that you used to hate when you were with the other person. So he designed all these series of accessories. This one is something that takes away the sheets from you at night. Then there ’ s another one that breathes on your neck. There ’ s another one that throws plates and breaks them. So it ’ s just this idea of what we really miss in life. Elio Caccavale : he took the idea of those dolls that explain leukemia. He ’ s working on dolls that explain xenotransplantation, and also the spider gene into the goat, from a few years ago. He ’ s working for the exhibition on a whole series of dolls that explain to children where babies come from today. Because it ’ s not anymore Mom, Dad, the flowers and the bees, and then there ’ s the baby. No, it can be two moms, three dads, in-vitro — there ’ s the whole idea of how babies can be made today that has changed. So it ’ s a series of dolls that he ’ s working on right now. One of the most beautiful things is that designers really work on life, even though they take technology into account. And many designers have been working recently on the idea of death and mourning, and what we can do about it today with new technologies. Or how we should behave about it with new technologies. These three objects over there are hard drives with a Bluetooth connection. But they ’ re in reality very, very beautiful sculpted **artifacts** that contain the whole desktop and computer memory of somebody who passed away. So instead of having only the pictures, you will be able to put this object next to the computer and all of a sudden have, you know, Gertrude ’ s whole life and all of her files and her address book come alive. And this is even better. This is Auger-Loizeau,”AfterLife.”It ’ s the idea that some people don ’ t believe in an afterlife. So to give them something tangible that shows that there is something after death, they take the gastric juices of people who passed away and concentrate them, and put them into a battery that can actually be used to power flashlights. They also go — you know, sex toys, whatever. It ’ s quite amazing how these things can make you smile, can make you laugh, can make you cry sometimes. But I ’ m hoping that this particular exhibition will be able to trace a new portrait of where design is going — which is always, hopefully, a portrait a few years in advance of where the world is going. Thank you very much.

Text Sample 844: POS Dim 6 – 2007 – Score 5.00 – 2007/t000238.txt

Well, good morning. You know, the computer and television both recently turned 60, and today I ’ d like to talk about their relationship. Despite their middle age, if you ’ ve been following the themes of this conference or the entertainment industry, it ’ s pretty clear that one has been picking on the other. So it ’ s about time that we talked about how the computer ambushed television, or why the invention of the atomic bomb unleashed forces that lead to the writers ’ strike. And it ’ s not just what these are doing to each other, but it ’ s what the audience thinks that really frames this matter. To get a sense of this, and it ’ s been a theme we ’ ve talked about all week, I recently talked to a bunch of tweeners. I wrote on cards :”television,””radio,””MySpace,””Internet,””PC.”And I said, just arrange these, from what ’ s important to you and what ’ s not, and then tell me why. Let ’ s listen to what happens when they get to the portion of the discussion on television. Girl 1 : Well, I think it ’ s important but, like, not necessary because you can do a lot of other stuff with your free time than watch programs. Peter Hirshberg : Which is more fun, Internet or TV? Girls : Internet. Girl 2 : I think we — the reasons, one of the reasons we put computer before TV is because nowadays, like, we have TV shows on the computer. Girl 2 : And then you can download onto your iPod. PH : Would you like to be the president of a TV network? Girl 4 : I wouldn ’ t like it. Girl 2 : That would be so stressful. Girl 5 : No. PH : How come? Girl 5 : Because they ’ re going to lose all their money eventually. Girl 3 : Like the stock market, it goes up and down and stuff. I think right now the computers will be at the top and everything will be kind of going down and stuff. PH : There ’ s been an uneasy relationship between the TV business and the tech business, really ever since they both turned about 30. We go through periods of enthrallment, followed by reactions in boardrooms, in the finance community best characterized as, what ’ s the finance term? Ick pooey. Let me give you an example of this. The year is 1976, and Warner buys Atari because video games are on the rise. The next year they march forward and they introduce Qube, the first interactive cable TV system, and the New York Times heralds this as telecommunications moving to the home, convergence, great things are happening. Everybody in the East Coast gets in the pictures — Citicorp, Penney, RCA — all getting into this big vision. By the way, this is about when I enter the picture. I ’ m going to do a summer internship at Time Warner. That summer I ’ m all — I ’ m at Warner that summer — I ’ m all excited to work on convergence, and then the bottom falls out. Doesn ’ t work out too well for them, they lose money. And I had a happy brush with convergence until, kind of, Warner basically has to liquidate the whole thing. That ’ s when I leave graduate school, and I can ’ t work in New York on kind of entertainment and technology because I have to be exiled to California, where the remaining jobs are, almost to the sea, to go to work for Apple Computer. Warner, of course, writes off more than 400 million dollars. Four hundred million dollars, which was real money back in the ’ 70s. But they were onto something and they got better at it. By the year 2000, the process was perfected. They merged with AOL, and in just four years, managed to shed about 200 billion dollars of market capitalization, showing that they ’ d actually mastered the art of applying Moore ’ s law of successive miniaturization to their balance sheet. Now, I think that one reason that the media and the entertainment communities, or the media community, is driven so crazy by the tech community is that tech folks talk differently. You know, for 50 years, we ’ ve talked about changing the world, about total transformation. For 50 years, it ’ s been about hopes and fears and promises of a better world. And I got to thinking, you know, who else talks that way? And the answer is pretty clearly — it ’ s people in religion and in politics. And so I realized that actually the tech world is best understood, not as a business cycle, but as a messianic movement. We promise something great, we evangelize it, we ’ re going to change the world. It doesn ’ t work out too well, and so we actually go back to the well and start all over again, as the people in New York and L. A. look on in absolute, morbid astonishment. But it ’ s this irrational view of things that drives us on to the next thing. So, what I ’ d like to ask is, if the computer is becoming a principal tool of media and entertainment, how did we get here? I mean, how did a machine that was built for accounting and artillery morph into media? Of course, the first computer was built just after World War II to solve military problems, but things got really interesting just a couple of years later — 1949 with Whirlwind, built at MIT ’ s Lincoln Lab. Jay Forrester was building this for the Navy, but you can ’ t help but see that the creator of this machine had in mind a machine that might actually be a potential media star. So take a look at what happens when the foremost journalist of early television meets one of the foremost computer pioneers, and the computer begins to express itself. Journalist : It ’ s a Whirlwind electronic computer. With considerable trepidation, we undertake to interview this new machine. Jay Forrester : Hello New York, this is Cambridge. And this is the oscilloscope of the Whirlwind electronic computer. Would you like if I used the machine? Journalist : Yes, of course. But I have an idea, Mr. Forrester. Since this computer was made in conjunction with the Office of Naval Research, why don ’ t we switch down to the Pentagon in Washington and let the Navy ’ s research chief, Admiral Bolster, give Whirlwind the workout? Calvin Bolster : Well, Ed, this problem concerns the Navy ’ s Viking rocket. This rocket goes up 135 miles into the sky. Now, at the standard rate of fuel consumption, I would like to see the computer trace the flight path of this rocket and see how it can determine, at any instant, say at the end of 40 seconds, the amount of fuel remaining, and the velocity at that set instant. JF : Over on the left-hand side, you will notice fuel consumption decreasing as the rocket takes off. And on the right-hand side, there ’ s a scale that shows the rocket ’ s velocity. The rocket ’ s position is shown by the trajectory that we ’ re now looking at. And as it reaches the peak of its trajectory, the velocity, you will notice, has dropped off to a minimum. Then, as the rocket dives down, velocity picks up again toward a maximum velocity and the rocket hits the ground. How ’ s that? Journalist : What about that, Admiral? CB : Looks very good to me. JF : And before leaving, we would like to show you another kind of mathematical problem that some of the boys have worked out in their spare time, in a less serious vein, for a Sunday afternoon. Journalist : Thank you very much indeed, Mr. Forrester and the MIT lab. PH : You know, so much was worked out : the first real-time interaction, the video **display**, pointing a gun. It lead to the microcomputer, but unfortunately, it was too pricey for the Navy, and all of this would have been lost if it weren ’ t for a happy coincidence. Enter the atomic bomb. We ’ re threatened by the greatest weapon ever, and knowing a good thing when it sees it, the Air Force decides it needs the biggest computer ever to protect us. They adapt Whirlwind to a massive air defense system, deploy it all across the frozen north, and spend nearly three times as much on this computer as was spent on the Manhattan Project building the A-Bomb in the first place. Talk about a shot in the arm for the computer industry. And you can imagine that the Air Force became a pretty good salesman. Here ’ s their marketing video. Narrator : In a mass raid, high-speed bombers could be in on us before we could determine their tracks. And then it would be too late to act. We cannot afford to take that chance. It is to meet this threat that the Air Force has been developing SAGE, the Semi-Automatic Ground Environment system, to strengthen our air defenses. This new computer, built to become the nerve center of a defense network, is able to perform all the complex mathematical problems involved in countering a mass enemy raid. It is provided with its own powerhouse containing large diesel-driven generators, air-conditioning equipment, and cooling towers required to cool the thousands of vacuum tubes in the computer. PH : You know, that one computer was huge. There ’ s an interesting marketing lesson from it, which is basically, when you market a product, you can either say, this is going to be wonderful, it will make you feel better and enliven you. Or there ’ s one other marketing proposition

: if you don ’ t use our product, you ’ ll die. This is a really good example of that. This had the first pointing device. It was distributed, so it worked out — distributed computing and modems — so all these things could talk to each other. About 20 percent of all the nation ’ s programmers were wrapped up in this thing, and it led to an awful lot of what we have today. It also used vacuum tubes. You saw how huge it was, and to give you a sense for this — because we ’ ve talked a lot about Moore ’ s law and making things small at this conference, so let ’ s talk about making things large. If we took Whirlwind and put it in a place that you all know, say, Century City, it would fit beautifully. You ’ d kind of have to take Century City out, but it could fit in there. But like, let ’ s imagine we took the latest Pentium processor, the latest Core 2 Extreme, which is a four-core processor that Intel ’ s working on, it will be our laptop tomorrow. To build that, what we ’ d do with Whirlwind technology is we ’ d have to take up roughly from the 10 to Mulholland, and from the 405 to La Cienega just with those Whirlwinds. And then, the 92 nuclear power plants that it would take to provide the power would fill up the rest of Los Angeles. That ’ s roughly a third more nuclear power than all of France creates. So, the next time they tell you they ’ re on to something, clearly they ’ re not. So — and we haven ’ t even worked out the cooling needs. But it gives you the kind of power that people have, that the audience has, and the reasons these transformations are happening. All of this stuff starts moving into industry. DEC kind of reduces all this and makes the first mini-computer. It shows up at places like MIT, and then a mutation happens. Spacewar! is built, the first computer game, and all of a sudden, interactivity and involvement and passion is worked out. Actually, many MIT students stayed up all night long working on this thing, and many of the principles of gaming today were worked out. DEC knew a good thing about wasting time. It shipped every one of its computers with that game. Meanwhile, as all of this is happening, by the mid- ’ 50s, the business model of traditional broadcasting and cinema has been busted completely. A new technology has confounded radio men and **movie** moguls and they ’ re quite certain that television is about to do them in. In fact, despair is in the air. And a quote that sounds largely reminiscent from everything I ’ ve been reading all week. RCA had David Sarnoff, who basically commercialized radio, said this,”I don ’ t say that radio networks must die. Every effort has been made and will continue to be made to find a new pattern, new selling arrangements and new types of programs that may arrest the declining revenues. It may yet be possible to eke out a poor existence for radio, but I don ’ t know how.”And of course, as the computer industry develops interactively, producers in the emerging TV business actually hit on the same idea. And they fake it. Jack Berry : Boys and girls, I think you all know how to get your magic windows up on the set, you just get them out. First of all, get your Winky Dink kits out. Put out your Magic Window and your erasing glove, and rub it like this. That ’ s the way we get some of the magic into it, boys and girls. Then take it and put it right up against the screen of your own television set, and rub it out from the center to the corners, like this. Make sure you keep your magic crayons handy, your Winky Dink crayons and your erasing glove, because you ’ ll be using them during the show to draw like that. You all set? OK, let ’ s get right to the first story about Dusty Man. Come on into the secret lab. PH : It was the dawn of interactive TV, and you may have noticed they wanted to sell you the Winky Dink kits. Those are the Winky Dink crayons. I know what you ’ re saying.”Pete, I could use any ordinary open-source crayon, why do I have to buy theirs?”I assure you, that ’ s not the case. Turns out they told us directly that these are the only crayons you should ever use with your Winky Dink Magic Window, other crayons may discolor or hurt the window. This proprietary principle of vendor lock-in would go on to be perfected with great success as one of the enduring principles of windowing systems everywhere. It led to lawsuits — — federal investigations, and lots of repercussions, and that ’ s a scandal we won ’ t discuss today. But we will discuss this scandal, because this man, Jack Berry, the host of”Winky Dink,”went on to become the host of”Twenty One,”one of the most important quiz shows ever. And it was rigged, and it became unraveled when this man, Charles van Doren, was outed after an unnatural winning streak, ending Berry ’ s career. And actually, ending the career of a lot of people at CBS. It turns out there was a lot to learn about how this new medium worked. And 50 years ago, if you ’ d been at a meeting like this and were trying to understand the media, there was one prophet and only but one you wanted to hear from, Professor Marshall McLuhan. He actually understood something about a theme that we ’ ve been discussing all week. It ’ s the role of the audience in an era of pervasive electronic communications. Here he is talking from the 1960s. Marshall McLuhan : If the audience can become involved in the actual process of making the ad, then it ’ s happy. It ’ s like the old quiz shows. They were great TV because it gave the audience a role, something to do. They were horrified when they discovered they ’ d really been left out all the time because the shows were rigged. Now, then, this was a horrible misunderstanding of TV on the part of the programmers. PH : You know, McLuhan talked about the global village. If you substitute the word blogosphere, of the Internet today, it is very true that his understanding is probably very enlightening now. Let ’ s listen in to him. MM : The global village is a world in which you don ’ t necessarily have harmony. You have extreme concern with everybody else ’ s business and much involvement in everybody else ’ s life. It ’ s a sort of Ann Landers ’ column writ large. And it doesn ’ t necessarily mean harmony and peace and quiet, but it does mean huge involvement in everybody else ’ s affairs. And so the global village is as big as a planet, and as small as a village post office. PH : We ’ ll talk a little bit more about him later. We ’ re now right into the 1960s. It ’ s the era of big business and data centers for computing. But all that was about to change. You know, the expression of technology reflects the people and the time of the culture it was built in. And when I say that code expresses our hopes and aspirations, it ’ s not just a joke about messianism, it ’ s actually what we do. But for this part of the story, I ’ d actually like to throw it to America ’ s leading technology correspondent, John Markoff. John Markoff : Do you want to know what the counterculture in drugs, sex, rock ’ n ’ roll and the anti-war movement had to do with computing? Everything. It all happened within five miles of where I ’ m standing, at Stanford University, between 1960 and 1975. In the midst of revolution in the streets and rock and roll concerts in the parks, a group of researchers led by people like John McCarthy, a computer scientist at the Stanford Artificial Intelligence Lab, and Doug Engelbart, a computer scientist at SRI, changed the world. Engelbart came out of a pretty dry engineering culture, but while he was beginning to do his work, all of this stuff was bubbling on the mid-peninsula. There was LSD leaking out of Kesey ’ s Veterans ’ Hospital experiments and other areas around the campus, and there was music literally in the streets. The Grateful Dead was playing in the pizza parlors. People were leaving to go back to the land. There was the Vietnam War. There was black liberation. There was women ’ s liberation. This was a **remarkable** place, at a **remarkable** time. And into that ferment came the microprocessor. I think it was that interaction that led to personal computing. They saw these tools that were controlled by the establishment as ones that could actually be liberated and put to use by these communities that they were trying to build. And most importantly, they had this ethos of sharing information. I think these ideas are difficult to understand, because when you

’ re trapped in one paradigm, the next paradigm is always like a science fiction universe — it makes no sense. The stories were so compelling that I decided to write a book about them. The title of the book is,”What the Dormouse Said : How the ’ 60s Counterculture Shaped the Personal Computer Industry.”The title was taken from the lyrics to a Jefferson Airplane song. The lyrics go,”Remember what the dormouse said. Feed your head, feed your head, feed your head.”PH : By this time, computing had kind of leapt into media territory, and in short order much of what we ’ re doing today was imagined in Cambridge and Silicon Valley. Here ’ s the Architecture Machine Group, the predecessor of the Media Lab, in 1981. Meanwhile, in California, we were trying to commercialize a lot of this stuff. HyperCard was the first program to introduce the public to hyperlinks, where you could randomly hook to any kind of picture, or piece of text, or data across a file system, and we had no way of explaining it. There was no metaphor. Was it a database? A prototyping tool? A scripted language? Heck, it was everything. So we ended up writing a marketing brochure. We asked a question about how the mind works, and we let our customers play the role of so many blind men filling out the elephant. A few years later, we then hit on the idea of explaining to people the secret of, how do you get the content you want, the way you want it and the easy way? Here ’ s the Apple marketing video. James Burke : You ’ ll be pleased to know, I ’ m sure, that there are several ways to create a HyperCard interactive video. The most involved method is to go ahead and produce your own videodisc as well as build your own HyperCard stacks. By far the simplest method is to buy a pre-made videodisc and HyperCard stacks from a commercial supplier. The method we **illustrate** in this video uses a pre-made videodisc but creates custom HyperCard stacks. This method allows you to use existing videodisc materials in ways which suit your specific needs and interests. PH : I hope you realize how subversive that is. That ’ s like a Dick Cheney speech. You think he ’ s a nice balding guy, but he ’ s just declared war on the content business. Find the commercial stuff, mash it up, tell the story your way. Now, as long as we confine this to the education market, and a personal matter between the computer and the file system, that ’ s fine, but as you can see, it was about to leap out and upset Jack Valenti and a lot of other people. By the way, speaking of the filing system, it never occurred to us that these hyperlinks could go beyond the local area network. A few years later, Tim Berners-Lee worked that out. It became a killer app of links, and today, of course, we call that the World Wide Web. Now, not only was I instrumental in helping Apple miss the Internet, but a couple of years later, I helped Bill Gates do the same thing. The year is 1993 and he was working on a book and I was working on a video to help him kind of explain where we were all heading and how to popularize all this. We were plenty aware that we were messing with media, and on the surface, it looks like we predicted a lot of the right things, but we also missed an awful lot. Let ’ s take a look. Narrator : The pyramids, the Colosseum, the New York subway system and TV dinners, ancient and modern wonders of the man-made world all. Yet each pales to insignificance with the completion of that magnificent accomplishment of twenty-first-century technology, the Digital Superhighway. Once it was only a dream of technoids and a few long-forgotten politicians. The Digital Highway arrived in America ’ s living rooms late in the twentieth century. Let us recall the pioneers who made this technical marvel possible. The Digital Highway would follow the rutted trail first blazed by Alexander Graham Bell. Though some were incredulous... Man 1 : The phone company! Narrator : Stirred by the prospects of mass communication and making big bucks on advertising, David Sarnoff commercializes radio. Man 2 : Never had scientists been put under such pressure and demand. Narrator : The medium introduced America to new products. Voice 1 : Say, mom, Windows for Radio means more enjoyment and greater ease of use for the whole family. Be sure to enjoy Windows for Radio at home and at work. Narrator : In 1939, the Radio Corporation of America introduced television. Man 2 : Never had scientists been put under such pressure and demand. Narrator : Eventually, the race to the future took on added momentum with the breakup of the telephone company. And further stimulus came with the deregulation of the cable television industry, and the re-regulation of the cable television industry. Ted Turner : We did the work to build this, this cable industry, now the broadcasters want some of our money. I mean, it ' s ridiculous. Narrator : Computers, once the unwieldy tools of accountants and other geeks, escaped the backrooms to enter the media fracas. The world and all its culture reduced to bits, the lingua franca of all media. And the forces of convergence exploded. Finally, four great industrial sectors combined. Telecommunications, entertainment, computing and everything else. Man 3 : We ' ll see channels for the gourmet and we ' ll see channels for the pet lover. Voice 2 : Next on the gourmet pet channel, decorating birthday cakes for your schnauzer. Narrator : All of industry was in play, as investors flocked to place their bets. At stake : the battle for you, the consumer, and the right to spend billions to send a lot of information into the parlors of America. PH : We missed a lot. You know, you missed, we missed the Internet, the long tail, the role of the audience, open systems, social networks. It just goes to show how tough it is to come up with the right uses of media. Thomas Edison had the same problem. He wrote a list of what the phonograph might be good for when he invented it, and kind of only one of his ideas turned out to have been the right early idea. Well, you know where we ' re going on from here. We come into the era of the dotcom, the World Wide Web, and I don ' t need to tell you about that because we all went through that bubble together. But when we emerge from this and what we call Web 2. 0, things actually are quite different. And I think it ' s the reason that TV ' s so challenged. If Internet one was about pages, now it ' s about people. It ' s a customer, it ' s an audience, it ' s a person who ' s participating. It ' s the formidable thing that is changing entertainment now. MM : Because it gave the audience a role, something to do. PH : In my own company, Technorati, we see something like 67, 000 blog posts an hour come in. That ' s about 2, 700 fresh, connective links across about 112 million blogs that are out there. And it ' s no wonder that as we head into the writers ' strike, odd things happen. You know, it reminds me of that old saw in Hollywood, that a producer is anyone who knows a writer. I now think a network boss is anyone who has a cable modem. But it ' s not a joke. This is a real headline."Websites attract striking writers : operators of sites like MyDamnChannel. com could benefit from labor disputes."Meanwhile, you have the TV bloggers going out on strike, in sympathy with the television writers. And then you have TV Guide, a Fox property, which is about to sponsor the online video awards — but cancels it out of sympathy with traditional television, not appearing to gloat. To show you how schizophrenic this all is, here ' s the head of MySpace, or Fox Interactive, a News Corp company, being asked, well, with the writers ' strike, isn ' t this going to hurt News Corp and help you online? Man : But I, yeah, I think there ' s an opportunity. As the strike continues, there ' s an opportunity for more people to experience video on places like MySpace TV. PH : Oh, but then he remembers he works for Rupert Murdoch. Man : Yes, well, first, you know, I ' m part of News Corporation as part of Fox Entertainment Group. Obviously, we hope that the strike is — that the issues are resolved as quickly as possible. PH : One of the great things that ' s going on here is the globalization of content really is happening. Here is a clip from a video, from a piece of animation that was written by a writer in Hollywood, animation worked out in

Israel, farmed out to Croatia and India, and it ’ s now an international series. Narrator : The following takes place between the minutes of 2:15 p. m. and 2:18 p. m., in the months preceding the presidential primaries. Voice 1 : You ’ ll have to stay here in the safe house until we get word the terrorist threat is over. Voice 2 : You mean we ’ ll have to live here, together? Voices 2, 3 and 4 : With her? Voice 2 : Well, there goes the neighborhood. PH : The company that created this, Aniboom, is an interesting example of where this is headed. Traditional TV animation costs, say, between 80, 000 and 10, 000 dollars a minute. They ’ re producing things for between 1, 500 and 800 dollars a minute. And they ’ re offering their creators 30 percent of the back end, in a much more entrepreneurial manner. So, it ’ s a different model. What the entertainment business is struggling with, the world of brands is figuring out. For example, Nike now understands that Nike Plus is not just a device in its shoe, it ’ s a network to hook its customers together. And the head of marketing at Nike says,”People are coming to our site an average of three times a week. We don ’ t have to go to them.”Which means television advertising is down 57 percent for Nike. Or, as Nike ’ s head of marketing says,”We ’ re not in the business of keeping media companies alive. We ’ re in the business of connecting with consumers.”And media companies realize the audience is important also. Here ’ s a man announcing the new Market Watch from Dow Jones, powered 100 percent by the user experience on the home page — user-generated content married up with traditional content. It turns out you have a bigger audience and more interest if you hook up with them. Or, as Geoffrey Moore once told me, it ’ s intellectual curiosity that ’ s the trade that brands need in the age of the blogosphere. And I think this is beginning to happen in the entertainment business. One of my heroes is songwriter, Ally Willis, who just wrote”The Color Purple”and has been an R and — rhythm and blues writer, and this is what she said about where songwriting ’ s going. Ally Willis : Where millions of collaborators wanted the song, because to look at them strictly as spam is missing what this medium is about. PH : So, to wrap up, I ’ d love to throw it back to Marshall McLuhan, who, 40 years ago, was dealing with audiences that were going through just as much change, and I think that, today, traditional Hollywood and the writers are framing this perhaps in the way that it was being framed before. But I don ’ t need to tell you this, let ’ s throw it back to him. Narrator : We are in the middle of a tremendous clash between the old and the new. MM : The medium does things to people and they are always completely unaware of this. They don ’ t really notice the new medium that is wrapping them up. They think of the old medium, because the old medium is always the content of the new medium, as **movies** tend to be the content of TV, and as books used to be the content, novels used to be the content of **movies**. And so every time a new medium arrives, the old medium is the content, and it is highly observable, highly noticeable, but the real, real roughing up and massaging is done by the new medium, and it is ignored. PH : I think it ’ s a great time of enthrallment. There ’ s been more raw DNA of communications and media thrown out there. Content is moving from shows to particles that are batted back and forth, and part of social communications, and I think this is going to be a time of great renaissance and opportunity. And whereas television may have gotten beat up, what ’ s getting built is a really exciting new form of communication, and we kind of have the merger of the two industries and a new way of thinking to look at it. Thanks very much.

Text Sample 845: POS Dim 6 – 2007 – Score 5.00 – 2007/t000276.txt

A great way to start, I think, with my view of simplicity is to take a look at TED. Here you are, understanding why we ’ re here, what ’ s going on with no difficulty at all. The best A. I. in the planet would find it complex and confusing, and my little dog Watson would find it simple and understandable but would miss the point. He would have a great time. And of course, if you ’ re a speaker here, like Hans Rosling, a speaker finds this complex, tricky. But in Hans Rosling ’ s case, he had a secret weapon yesterday, literally, in his sword swallowing act. And I must say, I thought of quite a few objects that I might try to swallow today and finally gave up on, but he just did it and that was a wonderful thing. So Puck meant not only are we fools in the pejorative sense, but that we ’ re easily fooled. In fact, what Shakespeare was pointing out is we go to the theater in order to be fooled, so we ’ re actually looking forward to it. We go to magic shows in order to be fooled. And this makes many things fun, but it makes it difficult to actually get any kind of picture on the world we live in or on ourselves. And our friend, Betty Edwards, the”Drawing on the Right Side of the Brain”lady, shows these two tables to her drawing class and says,”The problem you have with learning to draw is not that you can ’ t move your hand, but that the way your brain perceives images is faulty. It ’ s trying to perceive images into objects rather than seeing what ’ s there.”And to prove it, she says,”The exact size and shape of these tabletops is the same, and I ’ m going to prove it to you.”She does this with cardboard, but since I have an expensive computer here I ’ ll just rotate this little guy around and... Now having seen that — and I ’ ve seen it hundreds of times, because I use this in every talk I give — I still can ’ t see that they ’ re the same size and shape, and I doubt that you can either. So what do artists do? Well, what artists do is to measure. They measure very, very carefully. And if you measure very, very carefully with a stiff arm and a straight edge, you ’ ll see that those two shapes are exactly the same size. And the Talmud saw this a long time ago, saying,”We see things not as they are, but as we are.”I certainly would like to know what happened to the person who had that insight back then, if they actually followed it to its ultimate conclusion. So if the world is not as it seems and we see things as we are, then what we call reality is a kind of hallucination happening inside here. It ’ s a waking dream, and understanding that that is what we actually exist in is one of the biggest epistemological barriers in human history. And what that means :”simple and understandable”might not be actually simple or understandable, and things we think are”complex”might be made simple and understandable. Somehow we have to understand ourselves to get around our flaws. We can think of ourselves as kind of a noisy channel. The way I think of it is, we can ’ t learn to see until we admit we ’ re blind. Once you start down at this very humble level, then you can start finding ways to see things. And what ’ s happened, over the last 400 years in particular, is that human beings have invented”brainlets”— little additional parts for our brain — made out of powerful ideas that help us see the world in different ways. And these are in the form of sensory apparatus — telescopes, microscopes — reasoning apparatus — **various** ways of thinking — and, most importantly, in the ability to change perspective on things. I ’ ll talk about that a little bit. It ’ s this change in perspective on what it is we think we ’ re perceiving that has helped us make more progress in the last 400 years than we have in the rest of human history. And yet, it is not taught in any K through 12 curriculum in America that I ’ m aware of. So one of the things that goes from simple to complex is when we do more. We like more. If we do more in a kind of a stupid way, the simplicity gets complex and, in fact, we can keep on doing it for a very long time. But Murray Gell- Mann yesterday talked about emergent properties ; another name for them could be”architecture”as a metaphor for taking the same old material and thinking about non-obvious, non-simple ways of combining it. And in fact, what Murray was talking about yesterday in the fractal beauty of nature — of having the descriptions at **various** levels be rather similar — all goes down to the idea that the elementary particles are both sticky and standoffish, and they ’ re in violent motion. Those three things give rise to all the different levels of what seem to be complexity in our world. But how simple? So, when I saw Roslings ’ Gapminder stuff a few years ago, I just thought it was the greatest thing I ’ d seen in conveying complex ideas simply. But then I had a thought of,”Boy, maybe it ’ s too simple.”And I put some effort in to try and check to see how well these simple portrayals of trends over time actually matched up with some ideas and investigations from the side, and I found that they matched up very well. So the Roslings have been able to do simplicity without removing what ’ s important about the data. Whereas the film yesterday that we saw of the simulation of the inside of a cell, as a former molecular biologist, I didn ’ t like that at all. Not because it wasn ’ t beautiful or anything, but because it misses the thing that most students fail to understand about molecular biology, and that is : why is there any probability at all of two complex shapes finding each other just the right way so they combine together and be catalyzed? And what we saw yesterday was every reaction was fortuitous ; they just swooped in the air and bound, and something happened. But in fact, those molecules are spinning at the rate of about a million revolutions per second ; they ’ re agitating back and forth their size every two nanoseconds ; they ’ re completely crowded together, they ’ re jammed, they ’ re bashing up against each other. And if you don ’ t understand that in your mental model of this stuff, what happens inside of a cell seems completely mysterious and fortuitous, and I think that ’ s exactly the wrong image for when you ’ re trying to teach science. So, another thing that we do is to confuse adult sophistication with the actual understanding of some principle. So a kid who ’ s 14 in high school gets this version of the Pythagorean theorem, which is a truly subtle and interesting proof, but in fact it ’ s not a good way to start learning about mathematics. So a more direct one, one that gives you more of the feeling of math, is something closer to Pythagoras ’ own proof, which goes like this : so here we have this triangle, and if we surround that C square with three more triangles and we copy that, notice that we can move those triangles down like this. And that leaves two open areas that are kind of suspicious... and bingo. That is all you have to do. And this kind of proof is the kind of proof that you need to learn when you ’ re learning mathematics in order to get an idea of what it means before you look into the, literally, 1, 200 or 1, 500 proofs of Pythagoras ’ theorem that have been discovered. Now let ’ s go to young children. This is a very unusual teacher who was a kindergarten and first-grade teacher, but was a natural mathematician. So she was like that jazz musician friend you have who never studied music but is a terrific musician ; she just had a feeling for math. And here are her six-year- olds, and she ’ s got them making shapes out of a shape. So they pick a shape they like — like a diamond, or a square, or a triangle, or a trapezoid — and then they try and make the next larger shape of that same shape, and the next larger shape. You can see the trapezoids are a little challenging there. And what this teacher did on every project was to have the children act like first it was a creative arts project, and then something like science. So they had created these **artifacts**. Now she had them look at them and do this... laborious, which I thought for a long time, until she explained to me was to slow them down so they ’ ll think. So they ’ re cutting out the little pieces of cardboard here and pasting them up. But the whole point of this thing is for them to look at this chart and fill it out.”What have you noticed about what you did?”And so six-year-old Lauren there noticed that the first one took one, and the second one took three more and the total was four on that one, the third one took five more and the total was nine on that one, and then the next one. She saw right away that the additional tiles that you had to add around the edges was always going to grow by two, so she was very confident about how she made those numbers there. And she could see that these were the square numbers up until about six, where she wasn ’ t sure what six times six was and what seven times seven was, but then she was confident again. So that ’ s what Lauren did. And then the teacher, Gillian Ishijima, had the kids bring all of their projects up to the front of the room and put them on the floor, and everybody went batshit :”Holy shit! They ’ re the same!”No matter what the shapes were, the growth law is the same. And the mathematicians and scientists in the crowd will recognize these two progressions as a first-order discrete differential equation and a second-order discrete differential equation, derived by six- year-olds. Well, that ’ s pretty amazing. That isn ’ t what we usually try to teach six-year-olds. So, let ’ s take a look now at how we might use the computer for some of this. And so the first idea here is just to show you the kind of things that children do. I ’ m using the software that we ’ re putting on the $100 laptop. So I ’ d like to draw a little car here — I ’ ll just do this very quickly — and put a big tire on him. And I get a little object here and I can look inside this object, I ’ ll call it a car. And here ’ s a little behavior : car forward. Each time I click it, car turn. If I want to make a little script to do this over and over again, I just drag these guys out and set them going. And I can try steering the car here by... See the car turn by five here? So what if I click this down to zero? It goes straight. That ’ s a big revelation for nine-year-olds. Make it go in the other direction. But of course, that ’ s a little bit like kissing your sister as far as driving a car, so the kids want to do a steering wheel ; so they draw a steering wheel. And we ’ ll call this a wheel. See this wheel ’ s heading here? If I turn this wheel, you can see that number over there going minus and positive. That ’ s kind of an invitation to pick up this name of those numbers coming out there and to just drop it into the script here, and now I can steer the car with the steering wheel. And it ’ s interesting. You know how much trouble the children have with variables, but by learning it this way, in a situated fashion, they never forget from this single trial what a variable is and how to use it. And we can reflect here the way Gillian Ishijima did. So if you look at the little script here, the speed is always going to be 30. We ’ re going to move the car according to that over and over again. And I ’ m dropping a little dot for each one of these things ; they ’ re evenly spaced because they ’ re 30 apart. And what if I do this progression that the six-year-olds did of saying,”OK, I ’ m going to increase the speed by two each time, and then I ’ m going to increase the distance by the speed each time? What do I get there?”We get a visual pattern of what these nine-year-olds called acceleration. So how do the children do science? Teacher : [Choose] objects that you think will fall to the Earth at the same time. Student 1 : Ooh, this is nice. Teacher : Do not pay any attention to what anybody else is doing. Who ’ s got the apple? Alan Kay : They ’ ve got little stopwatches. Student 2 : What did you get? What did you get? AK : Stopwatches aren ’ t accurate enough. Student 3 : 0. 99 seconds. Teacher : So put”sponge **ball**”... Student 4l : [I decided to] do the shot put and the sponge **ball** because they ’ re two totally different weights, and if you drop them at the same time, maybe they ’ ll drop at the same speed. Teacher : Drop. Class : Whoa! AK : So obviously, Aristotle never asked a child about this particular point because, of course, he didn ’ t bother doing the experiment, and neither did St. Thomas Aquinas. And it was not until Galileo actually did it that an adult thought like a child, only 400 years ago. We get one child like that about every classroom of 30 kids who will actually cut straight to the chase. Now, what if we want to look at this more closely? We can take a **movie** of what ’ s going on, but even if we single stepped this **movie**, it ’ s tricky to see what ’ s going on. And so what we can do is we can lay out the frames side by side or stack them up. So when the children see this, they say,”Ah! Acceleration,”remembering back four months when they did their cars sideways, and they start measuring to find out what kind of acceleration it is. So what I ’ m doing is measuring from the bottom of one image to the bottom of the next image, about a fifth of a second later, like that. And they ’ re getting faster and faster each time, and if I stack these guys up, then we see the differences ; the increase in the speed is constant. And they say,”Oh, yeah. Constant acceleration. We ’ ve done that already.”And how shall we look and verify that we actually have it? So you can ’ t tell much from just making the **ball** drop there, but if we drop the **ball** and run the **movie** at the same time, we can see that we have come up with an accurate physical model. Galileo, by the way, did this very cleverly by running a **ball** backwards down the strings of his lute. I pulled out those apples to remind myself to tell you that this is actually probably a Newton and the apple type story, but it ’ s a great story. And I thought I would do just one thing on the $100 laptop here just to prove that this stuff works here. So once you have gravity, here ’ s this — increase the speed by something, increase the ship ’ s speed. If I start the little game here that the kids have done, it ’ ll crash the space ship. But if I oppose gravity, here we go... Oops! One more. Yeah, there we go. Yeah, OK? I guess the best way to end this is with two quotes : Marshall McLuhan said,”Children are the messages that we send to the future,”but in fact, if you think of it, children are the future we send to the future. Forget about messages ; children are the future, and children in the first and second world and, most especially, in the third world need mentors. And this summer, we ’ re going to build five million of these $100 laptops, and maybe 50 million next year. But we couldn ’ t create 1, 000 new teachers this summer to save our life. That means that we, once again, have a thing where we can put technology out, but the mentoring that is required to go from a simple new iChat instant messaging system to something with depth is missing. I believe this has to be done with a new kind of user **interface**, and this new kind of user **interface** could be done with an expenditure of about 100 million dollars. It sounds like a lot, but it is literally 18 minutes of what we ’ re spending in Iraq — we ’ re spending 8 billion dollars a month ; 18 minutes is 100 million dollars — so this is actually cheap. And Einstein said,”Things should be as simple as possible, but not simpler.”Thank you.

I want to take you back basically to my hometown, and to a picture of my hometown of the week that”Emergence”came out. And it ’ s a picture we ’ ve seen several times. Basically,”Emergence”was published on 9 / 11. I live right there in the West Village, so the plume was luckily blowing west, away from us. We had a two-and-a-half-day-old baby in the house that was ours — we hadn ’ t taken it from somebody else. And one of the thoughts that I had dealing with these two separate emergences of a book and a baby, and having this event happen so close — that my first thought, when I was still kind of in the apartment looking out at it all or walking out on the street and looking out on it just in front of our building, was that I ’ d made a terrible miscalculation in the book that I ’ d just written. Because so much of that book was a celebration of the power and creative potential of density, of largely urban density, of connecting people and putting them together in one place, and putting them on sidewalks together and having them share ideas and share physical space together. And it seemed to me looking at that — that tower burning and then falling, those towers burning and falling — that in fact, one of the lessons here was that density kills. And that of all the technologies that were exploited to make that carnage come into being, probably the single group of technologies that cost the most lives were those that enable 50, 000 people to live in two buildings 110 stories above the ground. If they hadn ’ t been crowded — you compare the loss of life at the Pentagon to the Twin Towers, and you can see that very powerfully. And so I started to think, well, you know, density, density — I ’ m not sure if, you know, this was the right call. And I kind of ruminated on that for a couple of days. And then about two days later, the wind started to change a little bit, and you could sense that the air was not healthy. And so even though there were no cars still in the West Village where we lived, my wife sent me out to buy a, you know, a large air **filter** at the Bed Bath and Beyond, which was located about 20 blocks away, north. And so I went out. And obviously I ’ m physically a very strong person, as you can tell — — so I wasn ’ t worried about carrying this thing 20 blocks. And I walked out, and this really miraculous thing happened to me as I was walking north to buy this air **filter**, which was that the streets were completely alive with people. There was an incredible — it was, you know, a beautiful day, as it was for about a week after, and the West Village had never seemed more lively. I walked up along Hudson Street — where Jane Jacobs had lived and written her great book that so influenced what I was writing in"Emergence"— past the White Horse Tavern, that great old bar where Dylan Thomas drank himself to death, and the Bleecker Street playground was filled with kids. And all the people who lived in the neighborhood, who owned restaurants and bars in the neighborhood, were all out there — had them all open. People were out. There were no cars, so it seemed even better, in some ways. And it was a beautiful urban day, and the incredible thing about it was that the city was working. The city was there. All the things that make a great city successful and all the things that make a great city stimulating — they were all on **display** there on those streets. And I thought, well, this is the power of a city. I mean, the power of the city — we talked about cities as being centralized in space, but what makes them so strong most of the time is they ’ re decentralized in function. They don ’ t have a center executive branch that you can take out and cause the whole thing to fail. If they did, it probably was right there at Ground Zero. I mean, you know, the emergency bunker was right there, was destroyed by the attacks, and obviously the damage done to the building and the lives. But nonetheless, just 20 blocks north, two days later, the city had never looked more alive. If you ’ d gone into the minds of the people, well, you would have seen a lot of trauma, and you would have seen a lot of heartache, and you would have seen a lot of things that would take a long time to recover. But the system itself of this city was thriving. So I took heart in seeing that. So I wanted to talk a little bit about the reasons why that works so well, and how some of those reasons kind of map on to where the Web is going right now. The question that I found myself asking to people when I was talking about the book afterwards is — when you ’ ve talked about emergent behavior, when you ’ ve talked about collective intelligence, the best way to get people to kind of wrap their heads around that is to ask, who builds a neighborhood? Who decides that Soho should have this personality and that the Latin Quarter should have this personality? Well, there are some kind of executive decisions, but mostly the answer is — everybody and nobody. Everybody contributes a little bit. No single person is really the ultimate actor behind the personality of a neighborhood. Same thing to the question of, who was keeping the streets alive post-9 / 11 in my neighborhood? Well, it was the whole city. The whole system kind of working on it, and everybody contributing a small little part. And this is increasingly what we ' re starting to see on the Web in a bunch of interesting ways — most of which weren ' t around, actually, except in very experimental things, when I was writing"Emergence"and when the book came out. So it ' s been a very optimistic time, I think, and I want to just talk about a few of those things. I think that there is effectively a new kind of model of interactivity that ' s starting to emerge online right now. And the old one looked like this. This is not the future King of England, although it looks like it. It ' s some guy, it ' s a GeoCities homepage of some guy that I found online who ' s interested, if you look at the bottom, in soccer and Jesus and Garth Brooks and Clint Beckham and"my hometown"— those are his links. But nothing really says this model of interactivity — which was so exciting and captures the real, the Web Zeitgeist of 1995 — than"Click here for a picture of my dog."That is — you know, there ' s no sentence that kind of conjures up that period better than that, I think, which is that you suddenly have the power to put up a picture of your dog and link to it, and somebody reading the page has the power to click on that link or not click on that link. And, you know, I don ' t want to belittle that. That, in a sense — to reference what Jeff was talking about yesterday — that was, in a sense, the kind of **interface** electricity that powered a lot of the explosion of interest in the Web : that you could put up a link, and somebody could click on it, and it could take you anywhere you wanted to go. But it ' s still a very one-to-one kind of relationship. There ' s one person putting up the link, and there ' s another person on the other end trying to decide whether to click on it or not. The new model is much more like this, and we ' ve already seen a couple of references to this. This is what happens when you search"Steven Johnson"on Google. About two months ago, I had the great breakthrough — one of my great, kind of shining achievements — which is that my website finally became a top result for"Steven Johnson."There ' s some theoretical physicist at MIT named Steven Johnson who has dropped two spots, I ' m happy to say. And, you know, I mean, I ' ll look at a couple of things like this, but Google is obviously the greatest technology ever invented for navel gazing. It ' s just that there are so many other people in your navel when you gaze. Because effectively, what ' s happening here, what ' s creating this page, obviously — and we all know this, but it ' s worth just thinking about it — is not some person deciding that I am the number one answer for Steven Johnson, but rather somehow the entire web of people putting up pages and deciding to link to my page or not link to it, and Google just sitting there and running the numbers. So there ' s this collective decision-making that ' s going on. This page is effectively, collectively authored by the Web, and Google is just helping us kind of to put the authorship in one kind of coherent place. Now, they ' re more innovative — well, Google ' s pretty innovative — but there are some new twists on this. There ' s this incredibly interesting new site — Technorati — that ' s filled with lots of little widgets that are expanding on these. And these are looking in the blog world and the world of weblogs. He ' s analyzed basically all the weblogs out there that he ' s tracking. And he ' s tracking how many other weblogs linked to those weblogs, and so you have kind of an authority — a weblog that has a lot of links to it is more authoritative than a weblog that has few links to it. And so at any given time, on any given page on the Web, actually, you can say, what does the weblog community think about this page? And you can get a list. This is what they think about my site ; it ' s ranked by blog authority. You can also rank it by the latest posts. So when I was talking in"Emergence,"I talked about the limitations of the one-way linking architecture that, basically, you could link to somebody else but they wouldn ' t necessarily know that you were pointing to them. And that was one of the reasons why the web wasn ' t quite as emergent as it could be because you needed two-way linking, you needed that kind of feedback mechanism to be able to really do interesting things. Well, something like Technorati is supplying that. Now what ' s interesting here is that this is a quote from Dave Weinberger, where he talks about everything being purposive in the Web — there ' s nothing artificial. He has this line where he says, you know, you ' re going to put up a link there, if you see a link, somebody decided to put it there. And he says, the link to one site didn ' t just grow on the other page"like a tree fungus."And in fact, I think that ' s not entirely true anymore. I could put up a feed of all those links generated by Technorati on the right-hand side of my page, and they would change as the overall ecology of the Web changes. That little list there would change. I wouldn ' t really be directly in control of it. So it ' s much closer, in a way, to a data fungus, in a sense, wrapped around that page, than it is to a deliberate link that I ' ve placed there. Now, what you ' re having here is basically a global brain that you ' re able to do lots of kind of experiments on to see what it ' s thinking. And there are all these interesting tools. Google does the Google Zeitgeist, which looks at search requests to test what ' s going on, what people are interested in, and they publish it with lots of fun graphs. And I ' m saying a lot of nice things about Google, so I ' ll be I ' ll be saying one little critical thing. There ' s a problem with the Google Zeitgeist, which is it often comes back with news that a lot of people are searching for Britney Spears pictures, which is not necessarily news. The Columbia blows up, suddenly there are a lot of searches on Columbia. Well, you know, we should expect to see that. That ' s not necessarily something we didn ' t know already. So the key thing in terms of these new tools that are kind of plumbing the depths of the global brain, that are sending kind of trace dyes through that whole bloodstream — the question is, are you finding out something new? And one of the things that I experimented with is this thing called Google Share which is basically, you take an abstract term, and you search Google for that term, and then you search the results that you get back for somebody ' s name. So basically, the number of pages that mention this term, that also mention this page, the percentage of those pages is that person ' s Google Share of that term. So you can do kind of interesting contests. Like for instance, this is a Google Share of the TED Conference. So Richard Saul Wurman has about a 15 percent Google Share of the TED conference. Our good friend Chris has about a six percent — but with a bullet, I might add. But the interesting thing is, you can broaden the search a little bit. And it turns out, actually, that 42 percent is the Mola mola fish. I had no idea. No, that ' s not true. I made that up because I just wanted to put up a slide of the Mola mola fish. I also did — and I don ' t want to start a little fight in the next panel — but I did a Google Share analysis of evolution and natural selection. So right here — now this is a big category, you have smaller percentages, so this is 0. 7 percent — Dan Dennett, who ' ll be speaking shortly. Right below him, 0. 5 percent, Steven Pinker. So Dennett ' s in the lead a little bit there. But what ' s interesting is you can then broaden the search and actually see interesting things and get a sense of what else is out there. So Gary Bauer is not too far behind — has slightly different theories about evolution and natural selection. And right behind him is L. Ron Hubbard. So — you can see we ' re in the ascot, which is always good. And by the way, Chris, that would ' ve been a really good panel, I think, right there. Hubbard apparently started to reach, but besides that, I think it would be good next year. Another quick thing — this is a slightly different thing, but this analysis some of you may have seen. It just came out. This is bursty words, looking at the historical record of State of the Union Addresses. So these are words that suddenly start to appear out of nowhere, so they ' re kind of, you know, memes that start taking off, that didn ’ t have a lot of historical precedent before. So the first one is — these are the bursty words around 1860s — slaves, emancipation, slavery, rebellion, Kansas. That ’ s Britney Spears. I mean, you know, OK, interesting. They ’ re talking about slavery in 1860. 1935 — relief, depression, recovery banks. And OK, I didn ’ t learn anything new there as well — that ’ s pretty obvious. 1985, right at the center of the Reagan years — that ’ s, we ’ re, there ’ s, we ’ ve, it ’ s. Now, there ’ s one way to interpret this, which is to say that”emancipation”and”depression”and”recovery”all have a lot of syllables. So you know, you can actually download — it ’ s hard to remember those. But seriously, actually, what you can see there, in a way that would be very hard to detect otherwise, is Reagan reinventing the political language of the country and shifting to a much more intimate, much more folksy, much more telegenic — contracting all those verbs. You know, 20 years before it was still,”Ask not what you can do,”but with Reagan, it ’ s,”that ’ s where, there ’ s Nancy and I,”that kind of language. And so something we kind of knew, but you didn ’ t actually notice syntactically what he was doing. I ’ ll go very quickly. The question now — and this is the really interesting question — is, what kind of higher-level shape is emerging right now in the overall Web ecosystem — and particularly in the ecosystem of the blogs because they are really kind of at the cutting edge. And I think what happens there will also happen in the wider system. Now there was a very interesting article by Clay Shirky that got a lot of attention about a month ago, and this is basically the distribution of links on the web to all these **various** different blogs. It follows a power law, so that there are a few extremely well-linked to, popular blogs, and a long tail of blogs with very few links. So 20 percent of the blogs get 80 percent of the links. Now this is a very interesting thing. It ’ s caused a lot of controversy because people thought that this was the ultimate kind of one man, one modem democracy, where anybody can get out there and get their voice heard. And so the question is,”Why is this happening?”It ’ s not being imposed by fiat from above. It ’ s an emergent property of the blogosphere right now. Now, what ’ s great about it is that people are working on — within seconds of Clay publishing this piece, people started working on changing the underlying rules of the system so that a different shape would start appearing. And basically, the shape appears largely because of a kind of a first-mover advantage. if you ’ re the first site there, everybody links to you. If you ’ re the second site there, most people link to you. And so very quickly you can accumulate a bunch of links, and it makes it more likely for newcomers to link to you in the future, and then you get this kind of shape. And so what Dave Sifry at Technorati started working on, literally as Shirky started — after he published his piece — was something that basically just gave a new kind of priority to newcomers. And he started looking at interesting newcomers that don ’ t have a lot of links, that suddenly get a bunch of links in the last 24 hours. So in a sense, bursty weblogs coming from new voices. So he ’ s working on a tool right there that can actually change the overall system. And it creates a kind of planned emergence. You ’ re not totally in control, but you ’ re changing the underlying rules in interesting ways because you have an end result which is maybe a more democratic spread of voices. So the most amazing thing about this — and I ’ ll end on this note — is, most emergent systems, most self- organizing systems are not made up of component parts that are capable of looking at the overall pattern and changing their behavior based on whether they like the pattern or not. So the most wonderful thing, I think, about this whole debate about power laws and software that could change it is the fact that we ’ re having the conversation. I hope it continues here. Thanks a lot.

A year ago, I spoke to you about a book that I was just in the process of completing, that has come out in the interim, and I would like to talk to you today about some of the controversies that that book inspired. The book is called”The Blank Slate,”based on the popular idea that the human mind is a blank slate, and that all of its structure comes from socialization, culture, parenting, experience. The”blank slate”was an influential idea in the 20th century. Here are a few quotes indicating that :”Man has no nature,”from the historian Jose Ortega y Gasset ;”Man has no instincts,”from the anthropologist Ashley Montagu ;”The human brain is capable of a full range of behaviors and predisposed to none,”from the late scientist Stephen Jay Gould. There are a number of reasons to doubt that the human mind is a blank slate, and some of them just come from common sense. As many people have told me over the years, anyone who ’ s had more than one child knows that kids come into the world with certain temperaments and talents ; it doesn ’ t all come from the outside. Oh, and anyone who has both a child and a house pet has surely noticed that the child, exposed to speech, will acquire a human language, whereas the house pet won ’ t, presumably because of some innate different between them. And anyone who ’ s ever been in a heterosexual relationship knows that the minds of men and the minds of women are not indistinguishable. There are also, I think, increasing results from the scientific study of humans that, indeed, we ’ re not born blank slates. One of them, from anthropology, is the study of human universals. If you ’ ve ever taken anthropology, you know that it ’ s a — kind of an occupational pleasure of anthropologists to show how exotic other cultures can be, and that there are places out there where, supposedly, everything is the opposite to the way it is here. But if you instead look at what is common to the world ’ s cultures, you find that there is an enormously rich set of behaviors and emotions and ways of construing the world that can be found in all of the world ’ s 6, 000-odd cultures. The anthropologist Donald Brown has tried to list them all, and they range from aesthetics, affection and age statuses all the way down to weaning, weapons, weather, attempts to control, the color white and a worldview. Also, genetics and neuroscience are increasingly showing that the brain is intricately structured. This is a recent study by the neurobiologist Paul Thompson and his colleagues in which they — using MRI — measured the distribution of gray matter — that is, the outer layer of the cortex — in a large sample of pairs of people. They coded correlations in the thickness of gray matter in different parts of the brain using a false color scheme, in which no difference is coded as purple, and any color other than purple indicates a statistically significant correlation. Well, this is what happens when you pair people up at random. By definition, two people picked at random can ’ t have correlations in the distribution of gray matter in the cortex. This is what happens in people who share half of their DNA — fraternal twins. And as you can see, large amounts of the brain are not purple, showing that if one person has a thicker bit of cortex in that region, so does his fraternal twin. And here ’ s what happens if you get a pair of people who share all their DNA — namely, clones or identical twins. And you can see huge areas of cortex where there are massive correlations in the distribution of gray matter. Now, these aren ’ t just differences in anatomy, like the shape of your ear lobes, but they have consequences in thought and behavior that are well **illustrated** in this famous cartoon by Charles Addams :”Separated at birth, the Mallifert twins meet accidentally.”As you can see, there are two inventors with identical contraptions in their lap, meeting in the waiting room of a patent attorney. Now, the cartoon is not such an exaggeration, because studies of identical twins who were separated at birth and then tested in adulthood show that they have astonishing similarities. And this happens in every pair of identical twins separated at birth ever studied — but much less so with fraternal twins separated at birth. My favorite example is a pair of twins, one of whom was brought up as a Catholic in a Nazi family in Germany, the other brought up in a Jewish family in Trinidad. When they walked into the lab in Minnesota, they were wearing identical navy blue shirts with epaulettes ; both of them liked to dip buttered toast in coffee, both of them kept rubber bands around their wrists, both of them flushed the toilet before using it as well as after, and both of them liked to surprise people by sneezing in crowded elevators to watch them jump. Now — the story might seem to good to be true, but when you administer batteries of psychological tests, you get the same results — namely, identical twins separated at birth show quite astonishing similarities. Now, given both the common sense and scientific data calling the doctrine of the blank slate into question, why should it have been such an appealing notion? Well, there are a number of political reasons why people have found it congenial. The foremost is that if we ’ re blank slates, then, by definition, we are equal, because zero equals zero equals zero. But if something is written on the slate, then some people could have more of it than others, and according to this line of thinking, that would justify discrimination and inequality. Another political fear of human nature is that if we are blank slates, we can perfect mankind — the age-old dream of the perfectibility of our species through social engineering. Whereas, if we ’ re born with certain instincts, then perhaps some of them might condemn us to selfishness, prejudice and violence. Well, in the book, I argue that these are, in fact, non sequiturs. And just to make a long story short : first of all, the concept of fairness is not the same as the concept of sameness. And so when Thomas Jefferson wrote in the Declaration of Independence,”We hold these truths to be self-evident, that all men are created equal,”he did not mean”We hold these truths to be self- evident, that all men are clones.”Rather, that all men are equal in terms of their rights, and that every person ought to be treated as an individual, and not prejudged by the statistics of particular groups that they may belong to. Also, even if we were born with certain ignoble motives, they don ’ t automatically lead to ignoble behavior. That is because the human mind is a complex system with many parts, and some of them can inhibit others. For example, there ’ s excellent reason to believe that virtually all humans are born with a moral sense, and that we have cognitive abilities that allow us to profit from the lessons of history. So even if people did have impulses towards selfishness or greed, that ’ s not the only thing in the skull, and there are other parts of the mind that can counteract them. In the book, I go over controversies such as this one, and a number of other hot buttons, hot zones, Chernobyls, third rails, and so on — including the arts, cloning, crime, free will, education, evolution, gender differences, God, homosexuality, infanticide, inequality, Marxism, morality, Nazism, parenting, politics, race, rape, religion, resource depletion, social engineering, technological risk and war. And needless to say, there were certain risks in taking on these subjects. When I wrote a first draft of the book, I circulated it to a number of colleagues for comments, and here are some of the reactions that I got :”Better get a security camera for your house.””Don ’ t expect to get any more awards, job offers or positions in scholarly societies.””Tell your publisher not to list your hometown in your author bio.””Do you have tenure?”Well, the book came out in October, and nothing terrible has happened. I — I like — There was indeed reason to be nervous, and there were moments in which I did feel nervous, knowing the history of what has happened to people who ’ ve taken controversial stands or discovered disquieting findings in the behavioral sciences. There are many cases, some of which I talk about in the book, of people who have been slandered, called Nazis, physically assaulted, threatened with criminal prosecution for stumbling across or arguing about controversial findings. And you never know when you ' re going to come across one of these booby traps. My favorite example is a pair of psychologists who did research on left-handers, and published some data showing that left-handers are, on average, more susceptible to disease, more prone to accidents and have a shorter lifespan. It ' s not clear, by the way, since then, whether that is an accurate generalization, but the data at the time seemed to support that. Well, pretty soon they were barraged with enraged letters, death threats, ban on the topic in a number of scientific journals, coming from irate left-handers and their advocates, and they were literally afraid to open their mail because of the venom and vituperation that they had inadvertently inspired. Well, the night is young, but the book has been out for half a year, and nothing terrible has happened. None of the dire professional consequences has taken place — I haven ' t been exiled from the city of Cambridge. But what I wanted to talk about are two of these hot buttons that have aroused the strongest response in the 80-odd reviews that The Blank Slate has received. I ' ll just put that list up for a few seconds, and see if you can guess which two — I would estimate that probably two of these topics inspired probably 90 percent of the reaction in the **various** reviews and radio interviews. It ' s not violence and war, it ' s not race, it ' s not gender, it ' s not Marxism, it ' s not Nazism. They are : the arts and parenting. So let me tell you what aroused such irate responses, and I ' ll let you decide if whether they — the claims are really that outrageous. Let me start with the arts. I note that among the long list of human universals that I presented a few slides ago are art. There is no society ever discovered in the remotest corner of the world that has not had something that we would consider the arts. Visual arts — decoration of surfaces and bodies — appears to be a human universal. The telling of stories, music, dance, poetry — found in all cultures, and many of the motifs and themes that give us pleasure in the arts can be found in all human societies : a preference for symmetrical forms, the use of repetition and variation, even things as specific as the fact that in poetry all over the world, you have lines that are very close to three seconds long, separated by pauses. Now, on the other hand, in the second half of the 20th century, the arts are frequently said to be in decline. And I have a collection, probably 10 or 15 headlines, from highbrow magazines deploring the fact that the arts are in decline in our time. I ' ll give you a couple of representative quotes :"We can assert with some confidence that our own period is one of decline, that the standards of culture are lower than they were 50 years ago, and that the evidences of this decline are visible in every department of human activity."That ' s a quote from T. S. Eliot, a little more than 50 years ago. And a more recent one :"The possibility of sustaining high culture in our time is becoming increasing problematical. Serious book stores are losing their franchise, nonprofit theaters are surviving primarily by commercializing their repertory, symphony orchestras are diluting their programs, public television is increasing its dependence on reruns of British sitcoms, classical radio stations are dwindling, museums are resorting to blockbuster shows, dance is dying."That ' s from Robert Brustein, the famous drama critic and director, in The New Republic about five years ago. Well, in fact, the arts are not in decline. I don ' t think this will as a surprise to anyone in this room, but by any standard they have never been flourishing to a greater extent. There are, of course, entirely new art forms and new media, many of which you ' ve heard over these few days. By any economic standard, the demand for art of all forms is skyrocketing, as you can tell from the price of opera tickets, by the number of books sold, by the number of books published, the number of musical titles released, the number of new albums and so on. The only grain of truth to this complaint that the arts are in decline come from three spheres. One of them is in elite art since the 1930s — say, the kinds of works performed by major symphony orchestras, where most of the repertory is before 1930, or the works shown in major galleries and prestigious museums. In literary criticism and analysis, probably 40 or 50 years ago, literary critics were a kind of cultural hero ; now they ' re kind of a national joke. And the humanities and arts programs in the universities, which by many measures, indeed are in decline. Students are staying away in droves, universities are disinvesting in the arts and humanities. Well, here ' s a diagnosis. They didn ' t ask me, but by their own admission, they need all the help that they can get. And I would like to suggest that it ' s not a coincidence that this supposed decline in the elite arts and criticism occurred in the same point in history in which there was a widespread denial of human nature. A famous quotation can be found — if you look on the web, you can find it in literally scores of English core syllabuses —"In or about December 1910, human nature changed."A paraphrase of a quote by Virginia Woolf, and there ' s some debate as to what she actually meant by that. But it ' s very clear, looking at these syllabuses, that — it ' s used now as a way of saying that all forms of appreciation of art that were in place for centuries, or millennia, in the 20th century were discarded. The beauty and pleasure in art — probably a human universal — were — began to be considered saccharine, or kitsch, or commercial. Barnett Newman had a famous quote that"the impulse of modern art is the desire to destroy beauty"— which was considered bourgeois or tacky. And here ' s just one example. I mean, this is perhaps a representative example of the visual depiction of the female form in the 15th century ; here is a representative example of the depiction of the female form in the 20th century. And, as you can see, there — something has changed in the way the elite arts appeal to the senses. Indeed, in movements of modernism and post-modernism, there was visual art without beauty, literature without narrative and plot, poetry without meter and rhyme, architecture and planning without ornament, human scale, green space and natural light, music without melody and rhythm, and criticism without clarity, attention to aesthetics and insight into the human condition. Let me give just you an example to back up that last statement. But here, there — one of the most famous literary English scholars of our time is the Berkeley professor, Judith Butler. And here is an example of one of her analyses :"The move from a structuralist account in which capital is understood to structure social relations in relatively homologous ways to a view of hegemony in which power relations are subject to repetition, convergence and rearticulation brought the question of temporality into the thinking of structure, and marked a shift from the form of Althusserian theory that takes structural totalities as theoretical objects..."Well, you get the idea. By the way, this is one sentence — you can actually parse it. Well, the argument in"The Blank Slate"was that elite art and criticism in the 20th century, although not the arts in general, have disdained beauty, pleasure, clarity, insight and style. People are staying away from elite art and criticism. What a puzzle — I wonder why. Well, this turned out to be probably the most controversial claim in the book. Someone asked me whether I stuck it in in order to deflect ire from discussions of gender and Nazism and race and so on. I won ' t comment on that. But it certainly inspired an energetic reaction from many university professors. Well, the other hot button is parenting. And the starting point is the — for that discussion was the fact that we have all been subject to the advice of the parenting industrial complex. Now, here is — here is a representative quote from a besieged mother :"I ' m overwhelmed with parenting advice. I ' m supposed to do lots of physical activity with my kids so I can instill in them a physical fitness habit so they ' ll grow up to be healthy adults. And I ' m supposed to do all kinds of intellectual play so they

’ ll grow up smart. And there are all kinds of play — clay for finger dexterity, word games for reading success, large motor play, small motor play. I feel like I could devote my life to figuring out what to play with my kids.”I think anyone who ’ s recently been a parent can sympathize with this mother. Well, here ’ s some sobering facts about parenting. Most studies of parenting on which this advice is based are useless. They ’ re useless because they don ’ t control for heritability. They measure some correlation between what the parents do, how the children turn out and assume a causal relation : that the parenting shaped the child. Parents who talk a lot to their kids have kids who grow up to be **articulate**, parents who spank their kids have kids who grow up to be violent and so on. And very few of them control for the possibility that parents pass on genes for — that increase the chances a child will be **articulate** or violent and so on. Until the studies are redone with adoptive children, who provide an environment but not genes to their kids, we have no way of knowing whether these conclusions are valid. The genetically controlled studies have some sobering results. Remember the Mallifert twins : separated at birth, then they meet in the patent office — remarkably similar. Well, what would have happened if the Mallifert twins had grown up together? You might think, well, then they ’ d be even more similar, because not only would they share their genes, but they would also share their environment. That would make them super-similar, right? Wrong. Identical twins, or any siblings, who are separated at birth are no less similar than if they had grown up together. Everything that happens to you in a given home over all of those years appears to leave no permanent stamp on your personality or intellect. A complementary finding, from a completely different methodology, is that adopted siblings reared together — the mirror image of identical twins reared apart, they share their parents, their home, their neighborhood, don ’ t share their genes — end up not similar at all. OK — two different bodies of research with a similar finding. What it suggests is that children are shaped not by their parents over the long run, but in part — only in part — by their genes, in part by their culture — the culture of the country at large and the children ’ s own culture, namely their peer group — as we heard from Jill Sobule earlier today, that ’ s what kids care about — and, to a very large extent, larger than most people are prepared to acknowledge, by chance : chance events in the wiring of the brain in utero ; chance events as you live your life. So let me conclude with just a remark to bring it back to the theme of choices. I think that the sciences of human nature — behavioral genetics, evolutionary psychology, neuroscience, cognitive science — are going to, increasingly in the years to come, upset **various** dogmas, careers and deeply-held political belief systems. And that presents us with a choice. The choice is whether certain facts about humans, or topics, are to be considered taboos, forbidden knowledge, where we shouldn ’ t go there because no good can come from it, or whether we should explore them honestly. I have my own answer to that question, which comes from a great artist of the 19th century, Anton Chekhov, who said,”Man will become better when you show him what he is like.”And I think that the argument can ’ t be put any more eloquently than that. Thank you very much.

Text Sample 848: POS Dim 6 – 2003 – Score 3.00 – 2003/t000242.txt

What I want to tell you about today is how I see robots invading our lives at multiple levels, over multiple timescales. And when I look out in the future, I can ’ t imagine a world, 500 years from now, where we don ’ t have robots everywhere. Assuming â despite all the dire predictions from many people about our future â assuming we ’ re still around, I can ’ t imagine the world not being populated with robots. And then the question is, well, if they ’ re going to be here in 500 years, are they going to be everywhere sooner than that? Are they going to be around in 50 years? Yeah, I think that ’ s pretty likely â there ’ s going to be lots of robots everywhere. And in fact I think that ’ s going to be a lot sooner than that. I think we ’ re sort of on the cusp of robots becoming common, and I think we ’ re sort of around 1978 or 1980 in personal computer years, where the first few robots are starting to appear. Computers sort of came around through games and toys. And you know, the first computer most people had in the house may have been a computer to play Pong, a little microprocessor embedded, and then other games that came after that. And we ’ re starting to see that same sort of thing with robots : LEGO Mindstorms, Furbies â who here â did anyone here have a Furby? Yeah, there ’ s 38 million of them sold worldwide. They are pretty common. And they ’ re a little tiny robot, a simple robot with some sensors, a little bit of processing actuation. On the right there is another robot doll, who you could get a couple of years ago. And just as in the early days, when there was a lot of sort of amateur interaction over computers, you can now get **various** hacking kits, how-to-hack books. And on the left there is a platform from Evolution Robotics, where you put a PC on, and you program this thing with a GUI to wander around your house and do **various** stuff. And then there ’ s a higher price point sort of robot toys â the Sony Aibo. And on the right there, is one that the NEC developed, the PaPeRo, which I don ’ t think they ’ re going to release. But nevertheless, those sorts of things are out there. And we ’ ve seen, over the last two or three years, lawn-mowing robots, Husqvarna on the bottom, Friendly Robotics on top there, an Israeli company. And then in the last 12 months or so we ’ ve started to see a bunch of home-cleaning robots appear. The top left one is a very nice home-cleaning robot from a company called Dyson, in the U. K. Except it was so expensive â 3, 500 dollars â they didn ’ t release it. But at the bottom left, you see Electrolux, which is on sale. Another one from Karcher. At the bottom right is one that I built in my lab about 10 years ago, and we finally turned that into a product. And let me just show you that. We ’ re going to give this away I think, Chris said, after the talk. This is a robot that you can go out and buy, and that will clean up your floor. And it starts off sort of just going around in ever-increasing circles. If it hits something â you people see that? Now it ’ s doing wall-following, it ’ s following around my feet to clean up around me. Let ’ s see, let ’ s â oh, who stole my Rice Krispies? They stole my Rice Krispies! Don ’ t worry, relax, no, relax, it ’ s a robot, it ’ s smart! See, the three-year-old kids, they don ’ t worry about it. It ’ s grown-ups that get really upset. We ’ ll just put some crap here. Okay. I don ’ t know if you see â so, I put a bunch of Rice Krispies there, I put some pennies, let ’ s just shoot it at that, see if it cleans up. Yeah, OK. So â we ’ ll leave that for later. Part of the trick was building a better cleaning mechanism, actually ; the intelligence on board was fairly simple. And that ’ s true with a lot of robots. We ’ ve all, I think, become, sort of computational chauvinists, and think that computation is everything, but the mechanics still matter. Here ’ s another robot, the PackBot, that we ’ ve been building for a bunch of years. It ’ s a military surveillance robot, to go in ahead of **troops** â looking at caves, for instance. But we had to make it fairly robust, much more robust than the robots we build in our labs. On board that robot is a PC running Linux. It can withstand a 400G shock. The robot has local intelligence : it can flip itself over, can get itself into communication range, can go upstairs by itself, et cetera. Okay, so it ’ s doing local navigation there. A soldier gives it a command to go upstairs, and it does. That was not a controlled descent. Now it ’ s going to head off. And the big breakthrough for these robots, really, was September 11th. We had the robots down at the World Trade Center late that evening. Couldn ’ t do a lot in the main rubble pile, things were just too â there was nothing left to do. But we did go into all the surrounding buildings that had been evacuated, and searched for possible survivors in the buildings that were too dangerous to go into. Let ’ s run this video. Reporter :... battlefield companions are helping to reduce the combat risks. Nick Robertson has that story. Rodney Brooks : Can we have another one of these? Okay, good. So, this is a corporal who had seen a robot two weeks previously. He ’ s sending robots into caves, looking at what ’ s going on. The robot ’ s being totally autonomous. The worst thing that ’ s happened in the cave so far was one of the robots fell down ten meters. So one year ago, the US military didn ’ t have these robots. Now they ’ re on active duty in Afghanistan every day. And that ’ s one of the reasons they say a robot invasion is happening. There ’ s a sea change happening in how â where technology ’ s going. Thanks. And over the next couple of months, we ’ re going to be sending robots in production down producing oil wells to get that last few years of oil out of the ground. Very hostile environments, 150Ë C, 10, 000 PSI. Autonomous robots going down, doing this sort of work. But robots like this, they ’ re a little hard to program. How, in the future, are we going to program our robots and make them easier to use? And I want to actually use a robot here â a robot named Chris â stand up. Yeah. Okay. Come over here. Now notice, he thinks robots have to be a bit stiff. He sort of does that. But I ’ m going to â Chris Anderson : I ’ m just British. RB : Oh. I ’ m going to show this robot a task. It ’ s a very complex task. Now notice, he nodded there, he was giving me some indication he was understanding the flow of communication. And if I ’ d said something completely bizarre he would have looked askance at me, and regulated the conversation. So now I brought this up in front of him. I ’ d looked at his eyes, and I saw his eyes looked at this bottle top. And I ’ m doing this task here, and he ’ s checking up. His eyes are going back and forth up to me, to see what I ’ m looking at â so we ’ ve got shared attention. And so I do this task, and he looks, and he looks to me to see what ’ s happening next. And now I ’ ll give him the bottle, and we ’ ll see if he can do the task. Can you do that? Okay. He ’ s pretty good. Yeah. Good, good, good. I didn ’ t show you how to do that. Now see if you can put it back together. And he thinks a robot has to be really slow. Good robot, that ’ s good. So we saw a bunch of things there. We saw when we ’ re interacting, we ’ re trying to show someone how to do something, we direct their visual attention. The other thing communicates their internal state to us, whether he ’ s understanding or not, regulates a social interaction. There was shared attention looking at the same sort of thing, and recognizing socially communicated reinforcement at the end. And we ’ ve been trying to put that into our lab robots because we think this is how you ’ re going to want to interact with robots in the future. I just want to show you one technical diagram here. The most important thing for building a robot that you can interact with socially is its visual attention system. Because what it pays attention to is what it ’ s seeing and interacting with, and what you ’ re understanding what it ’ s doing. So in the videos I ’ m about to show you, you ’ re going to see a visual attention system on a robot which has â it looks for skin tone in HSV space, so it works across all human colorings. It looks for highly saturated colors, from toys. And it looks for things that move around. And it weights those together into an attention window, and it looks for the highest-scoring place â the stuff where the most interesting stuff is happening â and that is what its eyes then segue to. And it looks right at that. At the same time, some top-down sort of stuff : might decide that it ’ s lonely and look for skin tone, or might decide that it ’ s bored and look for a toy to play with. And so these weights change. And over here on the right, this is what we call the Steven Spielberg memorial module. Did people see the **movie**”AI”? RB : Yeah, it was really bad, but â remember, especially when Haley Joel Osment, the little robot, looked at the blue fairy for 2, 000 years without taking his eyes off it? Well, this gets rid of that, because this is a habituation Gaussian that gets negative, and more and more intense as it looks at one thing. And it gets bored, so it will then look away at something else. So, once you ’ ve got that â and here ’ s a robot, here ’ s Kismet, looking around for a toy. You can tell what it ’ s looking at. You can estimate its gaze direction from those eyeballs covering its camera, and you can tell when it ’ s actually seeing the toy. And it ’ s got a little bit of an emotional response here. But it ’ s still going to pay attention if something more significant comes into its field of view â such as Cynthia Breazeal, the builder of this robot, from the right. It sees her, pays attention to her. Kismet has an underlying, three-dimensional emotional space, a vector space, of where it is emotionally. And at different places in that space, it expresses â can we have the volume on here? Can you hear that now, out there? Kismet : Do you really think so? Do you really think so? Do you really think so? RB : So it ’ s expressing its emotion through its face and the prosody in its voice. And when I was dealing with my robot over here, Chris, the robot, was measuring the prosody in my voice, and so we have the robot measure prosody for four basic messages that mothers give their children pre-linguistically. Here we ’ ve got naive subjects praising the robot : Voice : Nice robot. You ’ re such a cute little robot. RB : And the robot ’ s reacting appropriately. Voice :... very good, Kismet. Voice : Look at my smile. RB : It smiles. She imitates the smile. This happens a lot. These are naive subjects. Here we asked them to get the robot ’ s attention and indicate when they have the robot ’ s attention. Voice : Hey, Kismet, ah, there it is. RB : So she realizes she has the robot ’ s attention. Voice : Kismet, do you like the toy? Oh. RB : Now, here they ’ re asked to prohibit the robot, and this first woman really pushes the robot into an emotional corner. Voice : No. No. You ’ re not to do that. No. Not appropriate. No. No. RB : I ’ m going to leave it at that. We put that together. Then we put in turn taking. When we talk to someone, we talk. Then we sort of raise our eyebrows, move our eyes, give the other person the idea it ’ s their turn to talk. And then they talk, and then we pass the baton back and forth between each other. So we put this in the robot. We got a bunch of naive subjects in, we didn ’ t tell them anything about the robot, sat them down in front of the robot and said, talk to the robot. Now what they didn ’ t know was, the robot wasn ’ t understanding a word they said, and that the robot wasn ’ t speaking English. It was just saying random English phonemes. And I want you to watch carefully, at the beginning of this, where this person, Ritchie, who happened to talk to the robot for 25 minutes â â says,”I want to show you something. I want to show you my watch.”And he brings the watch center, into the robot ’ s field of vision, points to it, gives it a motion cue, and the robot looks at the watch quite successfully. We don ’ t know whether he understood or not that the robot â Notice the turn-taking. Ritchie : OK, I want to show you something. OK, this is a watch that my girlfriend gave me. Robot : Oh, cool. Ritchie : Yeah, look, it ’ s got a little blue light in it too. I almost lost it this week. RB : So it ’ s making eye contact with him, following his eyes. Ritchie : Can you do the same thing? Robot : Yeah, sure. RB : And they successfully have that sort of communication. And here ’ s another aspect of the sorts of things that Chris and I were doing. This is another robot, Cog. They first make eye contact, and then, when Christie looks over at this toy, the robot estimates her gaze direction and looks at the same thing that she ’ s looking at. So we ’ re going to see more and more of this sort of robot over the next few years in labs. But then the big questions, two big questions that people ask me are : if we make these robots more and more human-like, will we accept them, will we â will they need rights eventually? And the other question people ask me is, will they want to take over? And on the first â you know, this has been a very Hollywood theme with lots of **movies**. You probably recognize these characters here â where in each of these cases, the robots want more respect. Well, do you ever need to give robots respect? They ’ re just machines, after all. But I think, you know, we have to accept that we are just machines. After all, that ’ s certainly what modern molecular biology says about us. You don ’ t see a description of how, you know, Molecule A, you know, comes up and docks with this other molecule. And it ’ s moving forward, you know, propelled by **various** charges, and then the soul steps in and tweaks those molecules so that they connect. It ’ s all mechanistic. We are mechanism. If we are machines, then in principle at least, we should be able to build machines out of other stuff, which are just as alive as we are. But I think for us to admit that, we have to give up on our special-ness, in a certain way. And we ’ ve had the retreat from special-ness under the barrage of science and technology many times over the last few hundred years, at least. 500 years ago we had to give up the idea that we are the center of the universe when the earth started to go around the sun ; 150 years ago, with Darwin, we had to give up the idea we were different from animals. And to imagine â you know, it ’ s always hard for us. Recently we ’ ve been battered with the idea that maybe we didn ’ t even have our own creation event, here on earth, which people didn ’ t like much. And then the human genome said, maybe we only have 35, 000 genes. And that was really â people didn ’ t like that, we ’ ve got more genes than that. We don ’ t like to give up our special-ness, so, you know, having the idea that robots could really have emotions, or that robots could be living creatures â I think is going to be hard for us to accept. But we ’ re going to come to accept it over the next 50 years or so. And the second question is, will the machines want to take over? And here the standard scenario is that we create these things, they grow, we nurture them, they learn a lot from us, and then they start to decide that we ’ re pretty boring, slow. They want to take over from us. And for those of you that have teenagers, you know what that ’ s like. But Hollywood extends it to the robots. And the question is, you know, will someone accidentally build a robot that takes over from us? And that ’ s sort of like this lone guy in the backyard, you know â”I accidentally built a 747.”I don ’ t think that ’ s going to happen. And I don ’ t think â â I don ’ t think we ’ re going to deliberately build robots that we ’ re uncomfortable with. We ’ ll â you know, they ’ re not going to have a super bad robot. Before that has to come to be a mildly bad robot, and before that a not so bad robot. And we ’ re just not going to let it go that way. So, I think I ’ m going to leave it at that : the robots are coming, we don ’ t have too much to worry about, it ’ s going to be a lot of fun, and I hope you all enjoy the journey over the next 50 years.

Text Sample 849: POS Dim 6 – 2001 – Score 3.00 – 2001/t000083.txt

I thought I would read poems I have that relate to the subject of youth and age. I was sort of astonished to find out how many I have actually. The first one is dedicated to Spencer, and his grandmother, who was shocked by his work. My poem is called”Dirt.”My grandmother is washing my mouth out with soap ; half a long century gone and still she comes at me with that thick cruel yellow bar. All because of a word I said, not even said really, only repeated. But”Open,”she says,”open up!”her hand clawing at my head. I know now her life was hard ; she lost three children as babies, then her husband died too, leaving young sons, and no money. She ' d stand me in the sink to pee because there was never room in the toilet. But oh, her soap! Might its bitter burning have been what made me a poet? The street she lived on was unpaved, her flat, two cramped rooms and a fetid kitchen where she stalked and caught me. Dare I admit that after she did it I never really loved her again? She lived to a hundred, even then. All along it was the sadness, the squalor, but I never, until now loved her again. When that was published in a magazine I got an irate letter from my uncle."You have maligned a great woman."It took some diplomacy. This is called"The Dress."It ' s a longer poem. In those days, those days which exist for me only as the most elusive memory now, when often the first sound you ' d hear in the morning would be a storm of birdsong, then the soft clop of the hooves of the horse hauling a milk wagon down your block, and the last sound at night as likely as not would be your father pulling up in his car, having worked late again, always late, and going heavily down to the cellar, to the furnace, to shake out the ashes and damp the draft before he came upstairs to fall into bed — in those long-ago days, women, my mother, my friends ' mothers, our neighbors, all the women I knew — wore, often much of the day, what were called house-dresses, cheap, printed, pulpy, seemingly purposefully shapeless light cotton shifts that you wore over your nightgown and, when you had to go look for a child, hang wash on the line, or run down to the grocery store on the corner, under a coat, the twisted hem of the nightgown always lank and yellowed, dangling beneath. More than the curlers some of the women seemed constantly to have in their hair in preparation for some great event — a **ball**, one would think — that never came to pass ; more than the way most women ' s faces not only were never made up during the day, but seemed scraped, bleached, and, with their plucked eyebrows, scarily masklike ; more than all that it was those dresses that made women so unknowable and forbidding, adepts of enigmas to which men could have no access, and boys no conception. Only later would I see the dresses also as a proclamation : that in your dim kitchen, your laundry, your bleak concrete yard, what you revealed of yourself was a fabulation ; your real sensual nature, veiled in those sexless vestments, was utterly your dominion. In those days, one hid much else as well : grown men didn ' t embrace one another, unless someone had died, and not always then ; you shook hands or, at a **ball** game, thumped your friend ' s back and exchanged blows meant to be codes for affection ; once out of childhood you ' d never again know the shock of your father ' s whiskers on your cheek, not until mores at last had evolved, and you could hug another man, then hold on for a moment, then even kiss. What release finally, the embrace : though we were wary — it seemed so audacious — how much unspoken joy there was in that affirmation of equality and communion, no matter how much misunderstanding and pain had passed between you by then. We knew so little in those days, as little as now, I suppose about healing those hurts : even the women, in their best dresses, with beads and sequins sewn on the bodices, even in lipstick and mascara, their hair aflow, could only stand wringing their hands, begging for peace, while father and son, like thugs, like thieves, like Romans, simmered and hissed and hated, inflicting sorrows that endured, the worst anyway, through the kiss and embrace, bleeding from brother to brother, into the generations. In those days there was still countryside close to the city, farms, cornfields, cows ; even not far from our building with its blurred brick and long shadowy hallway you could find tracts with hills and trees you could pretend were mountains and forests. Or you could go out by yourself even to a half-block-long empty lot, into the bushes : like a creature of leaves you ' d lurk, crouched, crawling, simplified, savage, alone ; already there was wanting to be simpler, wanting, when they called you, never to go back. This is another longish one, about the old and the young. It actually happened right at the time we met. Part of the poem takes place in space we shared and time we shared. It ’ s called”The Neighbor.”Her five horrid, deformed little dogs who incessantly yap on the roof under my window. Her cats, God knows how many, who must piss on her rugs — her landing ’ s a sickening reek. Her shadow once, fumbling the chain on her door, then the door slamming fearfully shut, only the barking and the music — jazz — **filtering** as it does, day and night into the hall. The time it was Chris Connor singing”Lush Life”— how it brought back my college sweetheart, my first real love, who — till I left her — played the same record. And head on my shoulder, hand on my thigh, sang sweetly along, of regrets and depletions she was too young for, as I was too young, later, to believe in her pain. It startled, then bored, then repelled me. My starting to fancy she ’ d ended up in this fire-trap in the Village, that my neighbor was her. My thinking we ’ d meet, recognize one another, become friends, that I ’ d accomplish a penance. My seeing her, it wasn ’ t her, at the mailbox. Gray-yellow hair, army pants under a nightgown, her turning away, hiding her ravaged face in her hands, muttering an inappropriate”Hi.”Sometimes there are frightening goings-on in the stairwell. A man shouting,”Shut up!”The dogs frantically snarling, claws scrabbling, then her — her voice hoarse, harsh, hollow, almost only a tone, incoherent, a note, a squawk, bone on metal, metal gone molten, calling them back,”Come back darlings, come back dear ones. My sweet angels, come back.”Medea she was, next time I saw her. Sorceress, tranced, ecstatic, stock-still on the sidewalk ragged coat hanging agape, passersby flowing around her, her mouth torn suddenly open as though in a scream, silently though, as though only in her brain or breast had it erupted. A cry so pure, practiced, detached, it had no need of a voice, or could no longer bear one. These invisible links that allure, these transfigurations, even of anguish, that hold us. The girl, my old love, the last lost time I saw her when she came to find me at a party, her drunkenly stumbling, falling, sprawling, skirt hiked, eyes veined red, swollen with tears, her shame, her dishonor. My ignorant, arrogant coarseness, my secret pride, my turning away. Still life on a rooftop, dead trees in barrels, a bench broken, dogs, excrement, sky. What pathways through pain, what junctures of vulnerability, what crossings and counterings? Too many lives in our lives already, too many chances for sorrow, too many unaccounted-for pasts.”Behold me,”the god of frenzied, inexhaustible love says, rising in bloody splendor,”Behold me.”Her making her way down the littered vestibule stairs, one agonized step at a time. My holding the door. Her crossing the fragmented tiles, faltering at the step to the street, droning, not looking at me,”Can you help me?”Taking my arm, leaning lightly against me. Her wavering step into the world. Her whispering,”Thanks love.”Lightly, lightly against me. I think I ’ ll lighten up a little. Another, different kind of poem of youth and age. It ’ s called”Gas.”Wouldn ’ t it be nice, I think, when the blue-haired lady in the doctor ’ s waiting room bends over the magazine table and farts, just a little, and violently blushes. Wouldn ’ t it be nice if intestinal gas came embodied in visible clouds, so she could see that her really quite inoffensive pop had only barely grazed my face before it drifted away. Besides, for this to have happened now is a nice coincidence. Because not an hour ago, while we were on our walk, my dog was startled by a backfire and jumped straight up like a horse bucking. And that brought back to me the stable I worked on weekends when I was 12, and a splendid piebald stallion, who whenever he was mounted would buck just like that, though more hugely of course, enormous, gleaming, resplendent. And the woman, her face abashedly buried in her”Elle”now, reminded me — I ’ d forgotten that not the least part of my awe consisted of the fact that with every jump he took the horse would powerfully fart. Phwap! Phwap! Phwap! Something never mentioned in the dozens of books about horses and their riders I devoured in those days. All that savage grandeur, the steely glinting hooves, the eruptions driven from the creature ’ s mighty innards, breath stopped, heart stopped, nostrils madly flared, I didn ’ t know if I wanted to break him, or be him. This is called”Thirst.”Many — most of my poems actually are urban poems. I happen to be reading a bunch that aren ’ t.”Thirst.”Here was my relation with the woman who lived all last autumn and winter, day and night, on a bench in the 103rd Street subway station, until finally one day she vanished. We regarded each other, scrutinized one another. Me shyly, obliquely, trying not to be furtive. She boldly, unblinkingly, even pugnaciously, wrathfully even, when her bottle was empty. I was frightened of her. I felt like a child. I was afraid some repressed part of myself would go out of control, and I ’ d be forever entrapped in the shocking seethe of her stench. Not excrement merely, not merely surface and orifice going unwashed, rediffusion of rum, there was will in it, and intention, power and purpose — a social, ethical rage and rebellion — despair too, though, grief, loss. Sometimes I ’ d think I should take her home with me, bathe her, comfort her, dress her. She wouldn ’ t have wanted me to, I would think. Instead, I ’ d step into my train. How rich I would think, is the lexicon of our self-absolving. How enduring, our bland fatal assurance that reflection is righteousness being accomplished. The dance of our glances, the clash, pulling each other through our perceptual punctures, then holocaust, holocaust, host on host of ill, injured presences, squandered, consumed. Her vigil somewhere I know continues. Her occupancy, her absolute, faithful attendance. The dance of our glances, challenge, abdication, effacement, the perfume of our consternation. This is a newer poem, a brand new poem. The title is”This Happened.”A student, a young woman in a fourth-floor hallway of her lycee, perched on the ledge of an open window chatting with friends between classes ; a teacher passes and chides her,”Be careful, you might fall,”almost banteringly chides her,”You might fall,”and the young woman, 18, a girl really, though she wouldn ’ t think that, as brilliant as she is, first in her class, and”Beautiful, too,”she ’ s often told, smiles back, and leans into the open window, which wouldn ’ t even be open if it were winter — if it were winter someone would have closed it — leans into the window, farther, still smiling, farther and farther, though it takes less time than this, really an instant, and lets herself fall. Herself fall. A casual impulse, a fancy, never thought of until now, hardly thought of even now... No, more than impulse or fancy, the girl knows what she ’ s doing, the girl means something, the girl means to mean, because it occurs to her in that instant, that beautiful or not, bright yes or no, she ’ s not who she is, she ’ s not the person she is, and the reason, she suddenly knows, is that there ’ s been so much premeditation where she is, so much plotting and planning, there ’ s hardly a person where she is, or if there is, it ’ s not her, or not wholly her, it ’ s a self inhabited, lived in by her, and seemingly even as she thinks it she knows what ’ s been missing : grace, not premeditation but grace, a kind of being in the world spontaneously, with grace. Weightfully upon me was the world. Weightfully this self which graced the world yet never wholly itself. Weightfully this self which weighed upon me, the release from which is what I desire and what I achieve. And the girl remembers, in this infinite instant already now so many times divided, the sadness she felt once, hardly knowing she felt it, to merely inhabit herself. Yes, the girl falls, absurd to fall, even the earth with its compulsion to take unto itself all that falls must know that falling is absurd, yet the girl falling isn ’ t myself, or she is myself, but a self I took of my own volition unto myself. Forever. With grace. This happened. I ’ ll read just one more. I don ’ t usually say that. I like to just end. But I ’ m afraid that

Ricky will come out here and shake his fist at me. This is called”Old Man,”appropriately enough.”Special : big tits,”Says the advertisement for a soft-core magazine on our neighborhood newsstand. But forget her breasts. A lush, fresh-lipped blond, skin glowing gold, sprawls there, resplendent. 60 nearly, yet these hardly tangible, hardly better than harlots, can still stir me. Maybe a coming of age in the American sensual darkness, never seeing an unsmudged nipple, an uncensored vagina, has left me forever infected with an unquenchable lust of the eye. Always that erotic murmur, I ’ m hardly myself if I ’ m not in a state of incipient desire. God knows though, there are worse twists your obsessions can take. Last year in Israel, a young ultra-orthodox Rabbi guiding some teenage girls through the Shrine of the Shoah forbade them to look in one room. Because there were images in it he said were licentious. The **display** was a photo. Men and women stripped naked, some trying to cover their genitals, others too frightened to bother, lined up in snow waiting to be shot and thrown into a ditch. The girls, to my horror, averted their gaze. What carnal mistrust had their teacher taught them. Even that though. Another confession : Once in a book on pre-war Poland, a studio portrait, an absolute angel, an absolute angel with tormented, tormenting eyes. I kept finding myself at her page. That she died in the camps made her — I didn ’ t dare wonder why — more present, more precious. Died in the camps, that too people — or Jews anyway — kept from their children back then. But it was like sex, you didn ’ t have to be told. Sex and death, how close they can seem. So constantly conscious now of death moving towards me, sometimes I think I confound them. My wife ’ s loveliness almost consumes me. My passion for her goes beyond reasonable bounds. When we make love, her holding me everywhere all around me, I ’ m there and not there. My mind teems, jumbles of faces, voices, impressions, I live my life over, as though I were drowning. Then I am drowning, in despair at having to leave her, this, everything, all, unbearable, awful. Still, to be able to die with no special contrition, not having been slaughtered, or enslaved. And not having to know history ’ s next mad rage or regression, it might be a relief. No. Again, no. I don ’ t mean that for a moment. What I mean is the world holds me so tightly — the good and the bad — my own follies and weakness that even this counterfeit Venus with her sham heat, and her bosom probably plumped with gel, so moves me my breath catches. Vamp. Siren. Seductress. How much more she reveals in her glare of ink than she knows. How she incarnates our desperate human need for regard, our passion to live in beauty, to be beauty, to be cherished by glances, if by no more, of something like love, or love. Thank you.

I coined my own definition of success in 1934, when I was teaching at a high school in South Bend, Indiana, being a little bit disappointed, and [disillusioned] perhaps, by the way parents of the youngsters in my English classes expected their youngsters to get an A or a B. They thought a C was all right for the neighbors ’ children, because they were all average. But they weren ’ t satisfied when their own — it would make the teacher feel that they had failed, or the youngster had failed. And that ’ s not right. The good Lord in his infinite wisdom didn ’ t create us all equal as far as intelligence is concerned, any more than we ’ re equal for size, appearance. Not everybody could earn an A or a B, and I didn ’ t like that way of judging, and I did know how the alumni of **various** schools back in the ’ 30s judged coaches and athletic teams. If you won them all, you were considered to be reasonably successful — not completely. Because I found out — we had a number of years at UCLA where we didn ’ t lose a game. But it seemed that we didn ’ t win each individual game by the margin that some of our alumni had predicted — And quite frequently I really felt that they had backed up their predictions in a more materialistic manner. But that was true back in the 30s, so I understood that. But I didn ’ t like it, I didn ’ t agree with it. I wanted to come up with something I hoped could make me a better teacher, and give the youngsters under my supervision, be it in athletics or the English classroom, something to which to aspire, other than just a higher mark in the classroom, or more points in some athletic contest. I thought about that for quite a spell, and I wanted to come up with my own definition. I thought that might help. And I knew how Mr. Webster defined it, as the accumulation of material possessions or the attainment of a position of power or prestige, or something of that sort, worthy accomplishments perhaps, but in my opinion, not necessarily indicative of success. So I wanted to come up with something of my own. And I recalled — I was raised on a small farm in Southern Indiana, and Dad tried to teach me and my brothers that you should never try to be better than someone else. I ’ m sure at the time he did that, I didn ’ t — it didn ’ t — well, somewhere, I guess in the hidden recesses of the mind, it popped out years later. Never try to be better than someone else, always learn from others. Never cease trying to be the best you can be — that ’ s under your control. If you get too engrossed and involved and concerned in regard to the things over which you have no control, it will adversely affect the things over which you have control. Then I ran across this simple verse that said,”At God ’ s footstool to confess, a poor soul knelt, and bowed his head. ’ I failed! ’ he cried. The Master said, ’ Thou didst thy best, that is success. ’”From those things, and one other perhaps, I coined my own definition of success, which is : Peace of mind attained only through self-satisfaction in knowing you made the effort to do the best of which you ’ re capable. I believe that ’ s true. If you make the effort to do the best of which you ’ re capable, trying to improve the situation that exists for you, I think that ’ s success, and I don ’ t think others can judge that ; it ’ s like character and reputation — your reputation is what you ’ re perceived to be ; your character is what you really are. And I think that character is much more important than what you are perceived to be. You ’ d hope they ’ d both be good, but they won ’ t necessarily be the same. Well, that was my idea that I was going to try to get across to the youngsters. I ran across other things. I love to teach, and it was mentioned by the previous speaker that I enjoy poetry, and I dabble in it a bit, and love it. There are some things that helped me, I think, be better than I would have been. I know I ’ m not what I ought to be, what I should be, but I think I ’ m better than I would have been if I hadn ’ t run across certain things. One was just a little verse that said,”No written word, no spoken plea can teach our youth what they should be ; nor all the books on all the shelves — it ’ s what the teachers are themselves.”That made an impression on me in the 1930s. And I tried to use that more or less in my teaching, whether it be in sports, or whether it be in the English classroom. I love poetry and always had an interest in that somehow. Maybe it ’ s because Dad used to read to us at night, by coal oil lamp — we didn ’ t have electricity in our farm home. And Dad would read poetry to us. So I always liked it. And about the same time I ran across this one verse, I ran across another one. Someone asked a lady teacher why she taught, and after some time, she said she wanted to think about that. Then she came up and said,”They ask me why I teach, and I reply, ’ Where could I find such splendid company? ’ There sits a statesman, strong, unbiased, wise ; another Daniel Webster, silver-tongued. A doctor sits beside him, whose quick, steady hand may mend a bone, or stem the life-blood ’ s flow. And there a builder ; upward rise the arch of a church he builds, wherein that minister may speak the word of God, and lead a stumbling soul to touch the Christ. And all about, a gathering of teachers, farmers, merchants, laborers — those who work and vote and build and plan and pray into a great tomorrow. And I may say, I may not see the church, or hear the word, or eat the food their hands may grow, but yet again I may ; And later I may say, I knew him once, and he was weak, or strong, or bold or proud or gay. I knew him once, but then he was a boy. They ask me why I teach and I reply, ' Where could I find such splendid company? '"And I believe the teaching profession — it ' s true, you have so many youngsters, and I ' ve got to think of my youngsters at UCLA — 30-some attorneys, 11 dentists and doctors, many, many teachers and other professions. And that gives you a great deal of pleasure, to see them go on. I always tried to make the youngsters feel that they ' re there to get an education, number one ; basketball was second, because it was paying their way, and they do need a little time for social activities, but you let social activities take a little precedence over the other two, and you ' re not going to have any very long. So that was the idea that I tried to get across to the youngsters under my supervision. I had three rules, pretty much, that I stuck with practically all the time. I ' d learned these prior to coming to UCLA, and I decided they were very important. One was"Never be late."Later on I said certain things — the players, if we were leaving for somewhere, had to be neat and clean. There was a time when I made them wear jackets and shirts and ties. Then I saw our chancellor coming to school in denims and turtlenecks, and thought, it ' s not right for me to keep this other [rule] so I let them just — they had to be neat and clean. I had one of my greatest players that you probably heard of, Bill Walton. He came to catch the bus ; we were leaving for somewhere to play. And he wasn ' t clean and neat, so I wouldn ' t let him go. He couldn ' t get on the bus, he had to go home and get cleaned up to get to the airport. So I was a stickler for that. I believed in that. I believe in time ; very important. I believe you should be on time, but I felt at practice, for example — we start on time, we close on time. The youngsters didn ' t have to feel that we were going to keep them over. When I speak at coaching clinics, I often tell young coaches — and at coaching clinics, more or less, they ' ll be the younger coaches getting in the profession. Most of them are young, you know, and probably newly-married. And I tell them,"Don ' t run practices late, because you ' ll go home in a bad mood, and that ' s not good, for a young married man to go home in a bad mood. When you get older, it doesn ' t make any difference, but —"So I did believe : on time. I believe starting on time, and I believe closing on time. And another one I had was, not one word of profanity. One word of profanity, and you are out of here for the day. If I see it in a game, you ' re going to come out and sit on the bench. And the third one was, never criticize a teammate. I didn ' t want that. I used to tell them I was paid to do that. That ' s my job. I ' m paid to do it. Pitifully poor, but I am paid to do it. Not like the coaches today, for gracious sakes, no. It ' s a little different than it was in my day. Those were three things that I stuck with pretty closely all the time. And those actually came from my dad. That ' s what he tried to teach me and my brothers at one time. I came up with a pyramid eventually, that I don ' t have the time to go on that. But that helped me, I think, become a better teacher. It ' s something like this : And I had blocks in the pyramid, and the cornerstones being industriousness and enthusiasm, working hard and enjoying what you ' re doing, coming up to the apex, according to my definition of success. And right at the top, faith and patience. And I say to you, in whatever you ' re doing, you must be patient. You have to have patience to — we want things to happen. We talk about our youth being impatient a lot, and they are. They want to change everything. They think all change is progress. And we get a little older — we sort of let things go. And we forget there is no progress without change. So you must have patience, and I believe that we must have faith. I believe that we must believe, truly believe. Not just give it word service, believe that things will work out as they should, providing we do what we should. I think our tendency is to hope things will turn out the way we want them to much of the time, but we don ’ t do the things that are necessary to make those things become reality. I worked on this for some 14 years, and I think it helped me become a better teacher. But it all revolved around that original definition of success. You know, a number of years ago, there was a Major League Baseball umpire by the name of George Moriarty. He spelled Moriarty with only one ’ i ’. I ’ d never seen that before, but he did. Big league baseball players — they ’ re very perceptive about those things, and they noticed he had only one ’ i ’ in his name. You ’ d be surprised how many also told him that that was one more than he had in his head at **various** times. But he wrote something where I think he did what I tried to do in this pyramid. He called it”The Road Ahead, or the Road Behind.”He said,”Sometimes I think the Fates must grin as we denounce them and insist the only reason we can ’ t win, is the Fates themselves have missed. Yet there lives on the ancient claim : we win or lose within ourselves. The shining trophies on our shelves can never win tomorrow ’ s game. You and I know deeper down, there ’ s always a chance to win the crown. But when we fail to give our best, we simply haven ’ t met the test, of giving all and saving none until the game is really won ; of showing what is meant by grit ; of playing through when others quit ; of playing through, not letting up. It ’ s bearing down that wins the cup. Of dreaming there ’ s a goal ahead ; of hoping when our dreams are dead ; of praying when our hopes have fled ; yet losing, not afraid to fall, if, bravely, we have given all. For who can ask more of a man than giving all within his span. Giving all, it seems to me, is not so far from victory. And so the Fates are seldom wrong, no matter how they twist and wind. It ’ s you and I who make our fates — we open up or close the gates on the road ahead or the road behind.”Reminds me of another set of threes that my dad tried to get across to us : Don ’ t whine. Don ’ t complain. Don ’ t make excuses. Just get out there, and whatever you ’ re doing, do it to the best of your ability. And no one can do more than that. I tried to get across, too, that — my opponents will tell you — you never heard me mention winning. Never mention winning. My idea is that you can lose when you outscore somebody in a game, and you can win when you ’ re outscored. I ’ ve felt that way on certain occasions, at **various** times. And I just wanted them to be able to hold their head up after a game. I used to say that when a game is over, and you see somebody that didn ’ t know the outcome, I hope they couldn ’ t tell by your actions whether you outscored an opponent or the opponent outscored you. That ’ s what really matters : if you make an effort to do the best you can regularly, the results will be about what they should be. Not necessarily what you ’ d want them to be but they ’ ll be about what they should ; only you will know whether you can do that. And that ’ s what I wanted from them more than anything else. And as time went by, and I learned more about other things, I think it worked a little better, as far as the results. But I wanted the score of a game to be the byproduct of these other things, and not the end itself. I believe it was one great philosopher who said — no, no — Cervantes. Cervantes said,”The journey is better than the end.”And I like that. I think that it is — it ’ s getting there. Sometimes when you get there, there ’ s almost a let down. But it ’ s the getting there that ’ s the fun. As a basketball coach at UCLA, I liked our practices to be the journey, and the game would be the end, the end result. I liked to go up and sit in the stands and watch the players play, and see whether I ’ d done a decent job during the week. There again, it ’ s getting the players to get that self-satisfaction, in knowing that they

’ d made the effort to do the best of which they are capable. Sometimes I ’ m asked who was the best player I had, or the best teams. I can never answer that. As far as the individuals are concerned — I was asked one time about that, and they said,”Suppose that you, in some way, could make the perfect player. What would you want?”And I said,”Well, I ’ d want one that knew why he was at UCLA : to get an education, he was a good student, really knew why he was there in the first place. But I ’ d want one that could play, too. I ’ d want one to realize that defense usually wins championships, and who would work hard on defense. But I ’ d want one who would play offense, too. I ’ d want him to be unselfish, and look for the pass first and not shoot all the time. And I ’ d want one that could pass and would pass. I ’ ve had some that could and wouldn ’ t, and I ’ ve had some that would and could. So, yeah, I ’ d want that. And I wanted them to be able to shoot from the outside. I wanted them to be good inside too. I ’ d want them to be able to rebound well at both ends, too. Why not just take someone like Keith Wilkes and let it go at that. He had the qualifications. Not the only one, but he was one that I used in that particular category, because I think he made the effort to become the best. There was a couple. I mention in my book,”They Call Me Coach,”two players that gave me great satisfaction, that came as close as I think anyone I ever had to reach their full potential : one was Conrad Burke, and one was Doug McIntosh. When I saw them as freshmen, on our freshmen team — freshmen couldn ’ t play varsity when I taught. I thought,”Oh gracious, if these two players, either one of them”— they were different years, but I thought about each one at the time he was there —”Oh, if he ever makes the varsity, our varsity must be pretty miserable, if he ’ s good enough to make it.”And you know, one of them was a starting player for a season and a half. The other one, his next year, played 32 minutes in a national championship game, Did a tremendous job for us. The next year, he was a starting player on the national championship team, and here I thought he ’ d never play a minute, when he was — so those are the things that give you great joy, and great satisfaction to see. Neither one of those youngsters could shoot very well. But they had outstanding shooting percentages, because they didn ’ t force it. And neither one could jump very well, but they kept good position, and so they did well rebounding. They remembered that every shot that ’ s taken, they assumed would be missed. I ’ ve had too many stand around and wait to see if it ’ s missed, then they go and it ’ s too late, somebody else is in there ahead of them. They weren ’ t very quick, but they played good position, kept in good balance. And so they played pretty good defense for us. So they had qualities that — they came close to — as close to reaching possibly their full potential as any players I ever had. So I consider them to be as successful as Lewis Alcindor or Bill Walton, or many of the others that we had ; there were some outstanding players. Have I rambled enough? I was told that when he makes his appearance, I was supposed to shut up.

So I understand that this meeting was planned, and the slogan was From Was to Still. And I am **illustrating** Still. Which, of course, I am not agreeing with because, although I am 94, I am not still working. And anybody who asks me,”Are you still doing this or that?”I don ’ t answer because I ’ m not doing things still, I ’ m doing it like I always did. I still have — or did I use the word still? I didn ’ t mean that. I have my file which is called To Do. I have my plans. I have my clients. I am doing my work like I always did. So this takes care of my age. I want to show you my work so you know what I am doing and why I am here.

This was about 1925. All of these things were made during the last 75 years. But, of course, I ’ m working since 25, doing more or less what you see here. This is Castleton China. This was an exhibition at the Museum of Modern Art. This is now for sale at the Metropolitan Museum. This is still at the Metropolitan Museum now for sale. This is a portrait of my daughter and myself. These were just some of the things I ’ ve made. I made hundreds of them for the last 75 years. I call myself a maker of things. I don ’ t call myself an industrial designer because I ’ m other things. Industrial designers want to make novel things. Novelty is a concept of commerce, not an aesthetic concept. The industrial design magazine, I believe, is called”Innovation.”Innovation is not part of the aim of my work. Well, makers of things : they make things more beautiful, more elegant, more comfortable than just the craftsmen do. I have so much to say. I have to think what I am going to say. Well, to describe our profession otherwise, we are actually concerned with the playful search for beauty. That means the playful search for beauty was called the first activity of Man. Sarah Smith, who was a mathematics professor at MIT, wrote,”The playful search for beauty was Man ’ s first activity — that all useful qualities and all material qualities were developed from the playful search for beauty.”These are tiles. The word,”playful”is a necessary aspect of our work because, actually, one of our problems is that we have to make, produce, lovely things throughout all of life, and this for me is now 75 years. So how can you, without drying up, make things with the same pleasure, as a gift to others, for so long? The playful is therefore an important part of our quality as designer. Let me tell you some about my life. As I said, I started to do these things 75 years ago. My first exhibition in the United States was at the Sesquicentennial exhibition in 1926 — that the Hungarian government sent one of my hand-drawn pieces as part of the exhibit. My work actually took me through many countries, and showed me a great part of the world. This is not that they took me — the work didn ’ t take me — I made the things particularly because I wanted to use them to see the world. I was incredibly curious to see the world, and I made all these things, which then finally did take me to see many countries and many cultures. I started as an apprentice to a Hungarian craftsman, and this taught me what the guild system was in Middle Ages. The guild system : that means when I was an apprentice, I had to apprentice myself in order to become a pottery master. In my shop where I studied, or learned, there was a traditional hierarchy of master, journeyman and learned worker, and apprentice, and I worked as the apprentice. The work as an apprentice was very primitive. That means I had to actually learn every aspect of making pottery by hand. We mashed the clay with our feet when it came from the hillside. After that, it had to be kneaded. It had to then go in, kind of, a mangle. And then finally it was prepared for the throwing. And there I really worked as an apprentice. My master took me to set ovens because this was part of oven-making, oven-setting, in the time. And finally, I had received a document that I had accomplished my apprenticeship successfully, that I had behaved morally, and this document was given to me by the Guild of Roof- Coverers, Rail-Diggers, Oven-Setters, Chimney Sweeps and Potters. I also got at the time a workbook which explained my rights and my working conditions, and I still have that workbook. First I set up a shop in my own garden, and made pottery which I sold on the marketplace in Budapest. And there I was sitting, and my then-boyfriend — I didn ’ t mean it was a boyfriend like it is meant today — but my boyfriend and I sat at the market and sold the pots. My mother thought that this was not very proper, so she sat with us to add propriety to this activity. However, after a while there was a new factory being built in Budapest, a pottery factory, a large one. And I visited it with several ladies, and asked all sorts of questions of the director. Then the director asked me, why do you ask all these questions? I said, I also have a pottery. So he asked me, could he please visit me, and then finally he did, and explained to me that what I did now in my shop was an anachronism, that the industrial revolution had broken out, and that I rather should join the factory. There he made an art department for me where I worked for several months. However, everybody in the factory spent his time at the art department. The director there said there were several women casting and producing my designs now in molds, and this was sold also to America. I remember that it was quite successful. However, the director, the chemist, model maker — everybody — concerned himself much more with the art department — that means, with my work — than making toilets, so finally they got a letter from the center, from the bank who owned the factory, saying, make toilet-setting behind the art department, and that was my end. So this gave me the possibility because now I was a journeyman, and journeymen also take their satchel and go to see the world. So as a journeyman, I put an ad into the paper that I had studied, that I was a down-to-earth potter ’ s journeyman and I was looking for a job as a journeyman. And I got several answers, and I accepted the one which was farthest from home and practically, I thought, halfway to America. And that was in Hamburg. Then I first took this job in Hamburg, at an art pottery where everything was done on the wheel, and so I worked in a shop where there were several potters. And the first day, I was coming to take my place at the turntable — there were three or four turntables — and one of them, behind where I was sitting, was a hunchback, a deaf-mute hunchback, who smelled very bad. So I doused him in cologne every day, which he thought was very nice, and therefore he brought bread and butter every day, which I had to eat out of courtesy. The first day I came to work in this shop there was on my wheel a surprise for me. My colleagues had thoughtfully put on the wheel where I was supposed to work a very nicely modeled natural man ’ s organs. After I brushed them off with a hand motion, they were very — I finally was now accepted, and worked there for some six months. This was my first job. If I go on like this, you will be here till midnight. So I will try speed it up a little Moderator : Eva, we have about five minutes. Eva Zeisel : Are you sure? Moderator : Yes, I am sure. EZ : Well, if you are sure, I have to tell you that within five minutes I will talk very fast. And actually, my work took me to many countries because I used my work to fill my curiosity. And among other things, other countries I worked, was in the Soviet Union, where I worked from ’ 32 to ’ 37 — actually, to ’ 36. I was finally there, although I had nothing to do — I was a foreign expert. I became art director of the china and glass industry, and eventually under Stalin ’ s purges — at the beginning of Stalin ’ s purges, I didn ’ t know that hundreds of thousands of innocent people were arrested. So I was arrested quite early in Stalin ’ s purges, and spent 16 months in a Russian prison. The accusation was that I had successfully prepared an Attentat on Stalin ’ s life. This was a very dangerous accusation. And if this is the end of my five minutes, I want to tell you that I actually did survive, which was a surprise. But since I survived and I ’ m here, and since this is the end of the five minutes, I will — Moderator : Tell me when your last trip to Russia was. Weren ’ t you there recently? EZ : Oh, this summer, in fact, the Lomonosov factory was bought by an American company, invited me. They found out that I had worked in ’ 33 at this factory, and they came to my studio in Rockland County, and brought the 15 of their artists to visit me here. And they invited myself to come to the Russian factory last summer, in July, to make some dishes, design some dishes. And since I don ’ t like to travel alone, they also invited my daughter, son-in-law and granddaughter, so we had a lovely trip to see Russia today, which is not a very pleasant and happy view. Here I am now, if this is the end? Thank you.

This machine, which we all have residing in our skulls, reminds me of an aphorism, of a comment of Woody Allen to ask about what is the very best thing to have within your skull. And it ’ s this machine. And it ’ s constructed for change. It ’ s all about change. It confers on us the ability to do things tomorrow that we can ’ t do today, things today that we couldn ’ t do yesterday. And of course it ’ s born stupid. The last time you were in the presence of a baby — this happens to be my granddaughter, Mitra. Isn ’ t she fabulous? But nonetheless when she popped out despite the fact that her brain had actually been progressing in its development for several months before on the basis of her experiences in the womb — nonetheless she had very limited abilities, as does every infant at the time of normal, natural full-term birth. If we were to assay her perceptual abilities, they would be crude. There is no real indication that there is any real thinking going on. In fact there is little evidence that there is any cognitive ability in a very young infant. Infants don ’ t respond to much. There is not really much of an indication in fact that there is a person on board. And they can only in a very primitive way, and in a very limited way control their movements. It would be several months before this infant could do something as simple as reach out and grasp under voluntary control an object and retrieve it, usually to the mouth. And it will be some months beforeward, and we see a long steady progression of the evolution from the first wiggles, to rolling over, and sitting up, and crawling, standing, walking, before we get to that magical point in which we can motate in the world. And yet, when we look forward in the brain we see really **remarkable** advance. By this age the brain can actually store. It has stored, recorded, can fastly retrieve the meanings of thousands, tens of thousands of objects, actions, and their relationships in the world. And those relationships can in fact be constructed in hundreds of thousands, potentially millions of ways. By this age the brain controls very refined perceptual abilities. And it actually has a growing repertoire of cognitive skills. This brain is very much a thinking machine. And by this age there is absolutely no question that this brain, it has a person on board. And in fact at this age it is substantially controlling its own self-development. And by this age we see a **remarkable** evolution in its capacity to control movement. Now movement has advanced to the point where it can actually control movement simultaneously, in a complex sequence, in complex ways as would be required for example for playing a complicated game, like soccer. Now this boy can bounce a soccer **ball** on his head. And where this boy comes from, Sao Paulo, Brazil, about 40 percent of boys of his age have this ability. You could go out into the community in Monterey, and you ’ d have difficulty finding a boy that has this ability. And if you did he ’ d probably be from Sao Paulo. That ’ s all another way of saying that our individual skills and abilities are very much shaped by our environments. That environment extends into our contemporary culture, the thing our brain is challenged with. Because what we ’ ve done in our personal evolutions is build up a large repertoire of specific skills and abilities that are specific to our own individual histories. And in fact they result in a wonderful differentiation in humankind, in the way that, in fact, no two of us are quite alike. Every one of us has a different set of acquired skills and abilities that all derive out of the plasticity, the adaptability of this really **remarkable** adaptive machine. In an adult brain of course we ’ ve built up a large repertoire of mastered skills and abilities that we can perform more or less automatically from memory, and that define us as acting, moving, thinking creatures. Now we study this, as the nerdy, laboratory, university-based scientists that we are, by engaging the brains of animals like rats, or monkeys, or of this particularly curious creature — one of the more bizarre forms of life on earth — to engage them in learning new skills and abilities. And we try to track the changes that occur as the new skill or ability is acquired. In fact we do this in individuals of any age, in these different species — that is to say from infancies, infancy up to adulthood and old age. So we might engage a rat, for example, to acquire a new skill or ability that might involve the rat using its paw to master particular manual grasp behaviors just like we might examine a child and their ability to acquire the sub-skills, or the general overall skill of accomplishing something like mastering the ability to read. Or you might look in an older individual who has mastered a complex set of abilities that might relate to reading musical notation or performing the mechanical acts of performance that apply to musical performance. From these studies we defined two great epochs of the plastic history of the brain. The first great epoch is commonly called the"Critical Period."And that is the period in which the brain is setting up in its initial form its basic processing machinery. This is actually a period of dramatic change in which it doesn ' t take learning, per se, to drive the initial differentiation of the machinery of the brain. All it takes for example in the sound domain, is exposure to sound. And the brain actually is at the mercy of the sound environment in which it is reared. So for example I can rear an animal in an environment in which there is meaningless dumb sound, a repertoire of sound that I make up, that I make, just by exposure, artificially important to the animal and its young brain. And what I see is that the animal ' s brain sets up its initial processing of that sound in a form that ' s idealized, within the limits of its processing achievements to represent it in an organized and orderly way. The sound doesn ' t have to be valuable to the animal : I could raise the animal in something that could be hypothetically valuable, like the sounds that simulate the sounds of a native language of a child. And I see the brain actually develop a processor that is specialized — specialized for that complex array, a repertoire of sounds. It actually exaggerates their separateness of representation, in multi-dimensional neuronal representational terms. Or I can expose the animal to a completely meaningless and destructive sound. I can raise an animal under conditions that would be equivalent to raising a baby under a moderately loud ceiling fan, in the presence of continuous noise. And when I do that I actually specialize the brain to be a master processor for that meaningless sound. And I frustrate its ability to represent any meaningful sound as a consequence. Such things in the early history of babies occur in real babies. And they account for, for example the beautiful evolution of a language-specific processor in every normally developing baby. And so they also account for development of defective processing in a substantial population of children who are more limited, as a consequence, in their language abilities at an older age. Now in this early period of plasticity the brain actually changes outside of a learning context. I don ' t have to be paying attention to what I hear. The input doesn ' t really have to be meaningful. I don ' t have to be in a behavioral context. This is required so the brain sets up it ' s processing so that it can act differentially, so that it can act selectively, so that the creature that wears it, that carries it, can begin to operate on it in a selective way. In the next great epoch of life, which applies for most of life, the brain is actually refining its machinery as it masters a wide repertoire of skills and abilities. And in this epoch, which extends from late in the first year of life to death ; it ' s actually doing this under behavioral control. And that ' s another way of saying the brain has strategies that define the significance of the input to the brain. And it ' s focusing on skill after skill, or ability after ability, under specific attentional control. It ' s a function of whether a goal in a behavior is achieved or whether the individual is rewarded in the behavior. This is actually very powerful. This lifelong capacity for plasticity, for brain change, is powerfully expressed. It is the basis of our real differentiation, one individual from another. You can look down in the brain of an animal that ’ s engaged in a specific skill, and you can witness or document this change on a variety of levels. So here is a very simple experiment. It was actually conducted about five years ago in collaboration with scientists from the University of Provence in Marseilles. It ’ s a very simple experiment where a monkey has been trained in a task that involves it manipulating a tool that ’ s equivalent in its difficulty to a child learning to manipulate or handle a spoon. The monkey actually mastered the task in about 700 practice tries. So in the beginning the monkey could not perform this task at all. It had a success rate of about one in eight tries. Those tries were elaborate. Each attempt was substantially different from the other. But the monkey gradually developed a strategy. And 700 or so tries later the monkey is performing it flawlessly — never fails. He ’ s successful in his retrieval of food with this tool every time. At this point the task is being performed in a beautifully stereotyped way : very beautifully regulated and highly repeated, trial to trial. We can look down in the brain of the monkey. And we see that it ’ s distorted. We can track these changes, and have tracked these changes in many such behaviors across time. And here we see the distortion reflected in the map of the skin surfaces of the hand of the monkey. Now this is a map, down in the surface of the brain, in which, in a very elaborate experiment we ’ ve reconstructed the responses, location by location, in a highly detailed response mapping of the responses of its neurons. We see here a reconstruction of how the hand is represented in the brain. We ’ ve actually distorted the map by the exercise. And that is indicated in the pink. We have a couple fingertip surfaces that are larger. These are the surfaces the monkey is using to manipulate the tool. If we look at the selectivity of responses in the cortex of the monkey, we see that the monkey has actually changed the **filter** characteristics which represents input from the skin of the fingertips that are engaged. In other words there is still a single, simple representation of the fingertips in this most organized of cortical areas of the surface of the skin of the body. Monkey has like you have. And yet now it ’ s represented in substantially finer grain. The monkey is getting more detailed information from these surfaces. And that is an unknown — unsuspected, maybe, by you — part of acquiring the skill or ability. Now actually we ’ ve looked in several different cortical areas in the monkey learning this task. And each one of them changes in ways that are specific to the skill or ability. So for example we can look to the cortical area that represents input that ’ s controlling the posture of the monkey. We look in cortical areas that control specific movements, and the sequences of movements that are required in the behavior, and so forth. They are all remodeled. They all become specialized for the task at hand. There are 15 or 20 cortical areas that are changed specifically when you learn a simple skill like this. And that represents in your brain, really massive change. It represents the change in a reliable way of the responses of tens of millions, possibly hundreds of millions of neurons in your brain. It represents changes of hundreds of millions, possibly billions of synaptic connections in your brain. This is constructed by physical change. And the level of construction that occurs is massive. Think about the changes that occur in the brain of a child through the course of acquiring their movement behavior abilities in general. Or acquiring their native language abilities. The changes are massive. What it ’ s all about is the selective representations of things that are important to the brain. Because in most of the life of the brain this is under control of behavioral context. It ’ s what you pay attention to. It ’ s what ’ s rewarding to you. It ’ s what the brain regards, itself, as positive and important to you. It ’ s all about cortical processing and forebrain specialization. And that underlies your specialization. That is why you, in your many skills and abilities, are a unique specialist : a specialist that ' s vastly different in your physical brain in detail than the brain of an individual 100 years ago ; enormously different in the details from the brain of the average individual 1, 000 years ago. Now, one of the characteristics of this change process is that information is always related to other inputs or information that is occurring in immediate time, in context. And that ' s because the brain is constructing representations of things that are correlated in little moments of time and that relate to one another in little moments of successive time. The brain is recording all information and driving all change in temporal context. Now overwhelmingly the most powerful context that ' s occurred in your brain is you. Billions of events have occurred in your history that are related in time to yourself as the receiver, or yourself as the actor, yourself as the thinker, yourself as the mover. Billions of times little pieces of sensation have come in from the surface of your body that are always associated with you as the receiver, and that result in the embodiment of you. You are constructed, your self is constructed from these billions of events. It ' s constructed. It ' s created in your brain. And it ' s created in the brain via physical change. This is a marvelously constructed thing that results in individual form because each one of us has vastly different histories, and vastly different experiences, that drive in to us this marvelous differentiation of self, of personhood. Now we ' ve used this research to try to understand not just how a normal person develops, and elaborates their skills and abilities, but also try to understand the origins of impairment, and the origins of differences or variations that might limit the capacities of a child, or an adult. I ' m going to talk about using these strategies to actually design brain plasticity-based approach to drive corrections in the machinery of a child that increases the competence of the child as a language receiver and user and, thereafter, as a reader. And I ' m going to talk about experiments that involve actually using this brain science, first of all to understand how it contributes to the loss of function as we age. And then, by using it in a targeted approach we ' re going to try to differentiate the machinery to recover function in old age. So the first example I ' m going to talk about relates to children with learning impairments. We now have a large body of literature that demonstrates that the fundamental problem that occurs in the majority of children that have early language impairments, and that are going to struggle to learn to read, is that their language processor is created in a defective form. And the reason that it rises in a defective form is because early in the baby ' s brain ' s life the machine process is noisy. It ' s that simple. It ' s a signal-to-noise problem. Okay? And there are a lot of things that contribute to that. There are numerous inherited faults that could make the machine process noisier. Now I might say the noise problem could also occur on the basis of information provided in the world from the ears. If any — those of you who are older in the audience know that when I was a child we understood that a child born with a cleft palate was born with what we called mental retardation. We knew that they were going to be slow cognitively ; we knew they were going to struggle to learn to develop normal language abilities ; and we knew that they were going to struggle to learn to read. Most of them would be intellectual and academic failures. That ' s disappeared. That no longer applies. That inherited weakness, that inherited condition has evaporated. We don ' t hear about that anymore. Where did it go? Well, it was understood by a Dutch surgeon, about 35 years ago, that if you simply fix the problem early enough, when the brain is still in this initial plastic period so it can set up this machinery adequately, in this initial set up time in the critical period, none of that happens. What are you doing by operating on the cleft palate to correct it? You ' re basically opening up the tubes that drain fluid from the middle ears, which have had them reliably full. Every sound the child hears uncorrected is muffled. It ' s degraded. The child ' s native language is such a case is not English. It ' s not Japanese. It ' s muffled English. It ' s degraded Japanese. It ' s crap. And the brain specializes for it. It creates a representation of language crap. And then the child is stuck with it. Now the crap doesn ' t just happen in the ear. It can also happen in the brain. The brain itself can be noisy. It ' s commonly noisy. There are many inherited faults that can make it noisier. And the native language for a child with such a brain is degraded. It ' s not English. It ' s noisy English. And that results in defective representations of sounds of words — not normal — a different strategy, by a machine that has different time constants and different space constants. And you can look in the brain of such a child and record those time constants. They are about an order of magnitude longer, about 11 times longer in duration on average, than in a normal child. Space constants are about three times greater. Such a child will have memory and cognitive deficits in this domain. Of course they will. Because as a receiver of language, they are receiving it and representing it, and in information it ' s representing crap. And they are going to have poor reading skills. Because reading is dependent upon the translation of word sounds into this orthographic or visual representational form. If you don ' t have a brain representation of word sounds that translation makes no sense. And you are going to have corresponding abnormal neurology. Then these children increasingly in evaluation after evaluation, in their operations in language, and their operations in reading — we document that abnormal neurology. The point is is that you can train the brain out of this. A way to think about this is you can actually re-refine the processing capacity of the machinery by changing it. Changing it in detail. It takes about 30 hours on the average. And we ' ve accomplished that in about 430, 000 kids today. Actually, probably about 15, 000 children are being trained as we speak. And actually when you look at the impacts, the impacts are substantial. So here we ' re looking at the normal distribution. What we ' re most interested in is these kids on the left side of the distribution. This is from about 3, 000 children. You can see that most of the children on the left side of the distribution are moving into the middle or the right. This is in a broad assessment of their language abilities. This is like an IQ test for language. The impact in the distribution, if you trained every child in the United States, would be to shift the whole distribution to the right and narrow the distribution. This is a substantially large impact. Think of a classroom of children in the language arts. Think of the children on the slow side of the class. We have the potential to move most of those children to the middle or to the right side. In addition to accurate language training it also fixes memory and cognition speech fluency and speech production. And an important language dependent skill is enabled by this training — that is to say reading. And to a large extent it fixes the brain. You can look down in the brain of a child in a variety of tasks that scientists have at Stanford, and MIT, and UCSF, and UCLA, and a number of other institutions. And children operating in **various** language behaviors, or in **various** reading behaviors, you see for the most extent, for most children, their neuronal responses, complexly abnormal before you start, are normalized by the training. Now you can also take the same approach to address problems in aging. Where again the machinery is deteriorating now from competent machinery, it ' s going south. Noise is increasing in the brain. And learning modulation and control is deteriorating. And you can actually look down on the brain of such an individual and witness a change in the time constants and space constants with which, for example, the brain is representing language again. Just as the brain came out of chaos at the beginning, it ' s going back into chaos in the end. This results in declines in memory in cognition, and in postural ability and agility. It turns out you can train the brain of such an individual — this is a small population of such individuals — train equally intensively for about 30 hours. These are 80- to 90-year-olds. And what you see are substantial improvements of their immediate memory, of their ability to remember things after a delay, of their ability to control their attention, their language abilities and visual-spatial abilities. The overall neuropsychological index of these trained individuals in this population is about two standard deviations. That means that if you sit at the left side of the distribution, and I ' m looking at your neuropyschological abilities, the average person has moved to the middle or the right side of the distribution. It means that most people who are at risk for senility, more or less immediately, are now in a protected position. My issues are to try to get to rescuing older citizens more completely and in larger numbers, because I think this can be done in this arena on a vast scale — and the same for kids. My main interest is how to elaborate this science to address other maladies. I ' m specifically interested in things like autism, and cerebral palsy, these great childhood catastrophes. And in older age conditions like Parkinsonism, and in other acquired impairments like schizophrenia. Your issues as it relates to this science, is how to maintain your own high- functioning learning machine. And of course, a well-ordered life in which learning is a continuous part of it, is key. But also in your future is brain aerobics. Get ready for it. It ' s going to be a part of every life not too far in the future, just like physical exercise is a part of every well organized life in the contemporary period. The other way that we will ultimately come to consider this literature and the science that is important to you is in a consideration of how to nurture yourself. Now that you know, now that science is telling us that you are in charge, that it ' s under your control, that your happiness, your well-being, your abilities, your capacities, are capable of continuous modification, continuous improvement, and you ' re the responsible agent and party. Of course a lot of people will ignore this advice. It will be a long time before they really understand it. Now that ' s another issue and not my fault. Okay. Thank you.

Text Sample 853: POS Dim 6 – 2004 – Score 4.00 – 2004/t000361.txt

So, I guess it is a result of globalization that you can find Coca-Cola tins on top of Everest and a Buddhist monk in Monterey. And so I just came, two days ago, from the Himalayas to your kind invitation. So I would like to invite you, also, for a while, to the Himalayas themselves. And to show the place where meditators, like me, who began with being a molecular biologist in Pasteur Institute, and found their way to the mountains. So these are a few images I was lucky to take and be there. There ' s Mount Kailash in Eastern Tibet — wonderful setting. This is from Marlboro country. This is a turquoise lake. A meditator. This is the hottest day of the year somewhere in Eastern Tibet, on August 1. And the night before, we camped, and my Tibetan friends said,"We are going to sleep outside."And I said,"Why? We have enough space in the tent."They said,"Yes, but it ' s summertime."So now, we are going to speak of happiness. As a Frenchman, I must say that there are a lot of French intellectuals that think happiness is not at all interesting. I just wrote an essay on happiness, and there was a controversy. And someone wrote an article saying,"Don ' t impose on us the dirty work of happiness.""We don ' t care about being happy. We need to live with passion. We like the ups and downs of life. We like our suffering because it ' s so good when it ceases for a while."This is what I see from the balcony of my hermitage in the Himalayas. It ’ s about two meters by three, and you are all welcome any time. Now, let ’ s come to happiness or well-being. And first of all, you know, despite what the French intellectuals say, it seems that no one wakes up in the morning thinking,”May I suffer the whole day?”Which means that somehow, consciously or not, directly or indirectly, in the short or the long term, whatever we do, whatever we hope, whatever we dream — somehow, is related to a deep, profound desire for well-being or happiness. As Pascal said, even the one who hangs himself, somehow, is looking for cessation of suffering. He finds no other way. But then, if you look in the literature, East and West, you can find incredible diversity of definition of happiness. Some people say, I only believed in remembering the past, imagining the future, never the present. Some people say happiness is right now ; it ’ s the quality of the freshness of the present moment. And that led Henri Bergson, the French philosopher, to say,”All the great thinkers of humanity have left happiness in the vague so that each of them could define their own terms.”Well, that would be fine if it was just a secondary preoccupation in life. But now, if it is something that is going to determine the quality of every instant of our life, then we better know what it is, have some clearer idea. And probably, the fact that we don ’ t know that is why, so often, although we seek happiness, it seems we turn our back to it. Although we want to avoid suffering, it seems we are running somewhat towards it. And that can also come from some kind of confusions. One of the most common ones is happiness and pleasure. But if you look at the characteristics of those two, pleasure is contingent upon time, upon its object, upon the place. It is something that — changes of nature. Beautiful chocolate cake : first serving is delicious, second one not so much, then we feel disgust. That ’ s the nature of things. We get tired. I used to be a fan of Bach. I used to play it on the guitar, you know. I can hear it two, three, five times. If I had to hear it 24 hours, non-stop, it might be very tiring. If you are feeling very cold, you come near a fire, it ’ s so wonderful. After some moments, you just go a little back, and then it starts burning. It sort of uses itself as you experience it. And also, again, it can — also, it ’ s something that you — it is not something that is radiating outside. Like, you can feel intense pleasure and some others around you can be suffering a lot. Now, what, then, will be happiness? And happiness, of course, is such a vague word, so let ’ s say well-being. And so, I think the best definition, according to the Buddhist view, is that well-being is not just a mere **pleasurable** sensation. It is a deep sense of serenity and fulfillment. A state that actually pervades and underlies all emotional states, and all the joys and sorrows that can come one ’ s way. For you, that might be surprising. Can we have this kind of well-being while being sad? In a way, why not? Because we are speaking of a different level. Look at the waves coming near the shore. When you are at the bottom of the wave, you hit the bottom. You hit the solid rock. When you are surfing on the top, you are all elated. So you go from elation to depression — there ’ s no depth. Now, if you look at the high sea, there might be beautiful, calm ocean, like a mirror. There might be storms, but the depth of the ocean is still there, unchanged. So now, how is that? It can only be a state of being, not just a fleeting emotion, sensation. Even joy — that can be the spring of happiness. But there ’ s also wicked joy, you can rejoice in someone ’ s suffering. So how do we proceed in our quest for happiness? Very often, we look outside. We think that if we could gather this and that, all the conditions, something that we say,”Everything to be happy — to have everything to be happy.”That very sentence already reveals the doom, destruction of happiness. To have everything. If we miss something, it collapses. And also, when things go wrong, we try to fix the outside so much, but our control of the outer world is limited, temporary, and often, illusory. So now, look at inner conditions. Aren ’ t they stronger? Isn ’ t it the mind that translates the outer condition into happiness and suffering? And isn ’ t that stronger? We know, by experience, that we can be what we call”a little paradise,”and yet, be completely unhappy within. The Dalai Lama was once in Portugal, and there was a lot of construction going on everywhere. So one evening, he said,”Look, you are doing all these things, but isn ’ t it nice, also, to build something within?”And he said,”[Without] that — even if you get a high-tech flat on the 100th floor of a super-modern and comfortable building, if you are deeply unhappy within, all you are going to look for is a window from which to jump.”So now, at the opposite, we know a lot of people who, in very difficult circumstances, manage to keep serenity, inner strength, inner freedom, confidence. So now, if the inner conditions are stronger — of course, the outer conditions do influence, and it ’ s wonderful to live longer, healthier, to have access to information, education, to be able to travel, to have freedom. It ’ s highly desirable. However, this is not enough. Those are just auxiliary, help conditions. The experience that translates everything is within the mind. So then, when we ask oneself how to nurture the condition for happiness, the inner conditions, and which are those which will undermine happiness. So then, this just needs to have some experience. We have to know from ourselves, there are certain states of mind that are conducive to this flourishing, to this well-being, what the Greeks called eudaimonia, flourishing. There are some which are adverse to this well-being. And so, if we look from our own experience, anger, hatred, jealousy, arrogance, obsessive desire, strong grasping, they don ’ t leave us in such a good state after we have experienced it. And also, they are detrimental to others ’ happiness. So we may consider that the more those are invading our mind, and, like a chain reaction, the more we feel miserable, we feel tormented. At the opposite, everyone knows deep within that an act of selfless generosity, if from the distance, without anyone knowing anything about it, we could save a child ’ s life, make someone happy. We don ’ t need the recognition. We don ’ t need any gratitude. Just the mere fact of doing that fills such a sense of adequation with our deep nature. And we would like to be like that all the time. So is that possible, to change our way of being, to transform one ’ s mind? Aren ’ t those negative emotions, or destructive emotions, inherent to the nature of mind? Is change possible in our emotions, in our traits, in our moods? For that we have to ask, what is the nature of mind? And if we look from the experiential point of view, there is a primary quality of consciousness that ’ s just the mere fact to be cognitive, to be aware. Consciousness is like a mirror that allows all images to rise on it. You can have ugly faces, beautiful faces in the mirror. The mirror allows that, but the mirror is not tainted, is not modified, is not altered by those images. Likewise, behind every single thought there is the bare consciousness, pure awareness. This is the nature. It cannot be tainted intrinsically with hatred or jealousy because then, if it was always there — like a dye that would permeate the whole cloth — then it would be found all the time, somewhere. We know we ’ re not always angry, always jealous, always generous. So, because the basic fabric of consciousness is this pure cognitive quality that differentiates it from a stone, there is a possibility for change because all emotions are fleeting. That is the ground for mind training. Mind training is based on the idea that two opposite mental factors cannot happen at the same time. You could go from love to hate. But you cannot, at the same time, toward the same object, the same person, want to harm and want to do good. You cannot, in the same gesture, shake hand and give a blow. So, there are natural antidotes to emotions that are destructive to our inner well-being. So that ’ s the way to proceed. Rejoicing compared to jealousy. A kind of sense of inner freedom as opposite to intense grasping and obsession. Benevolence, loving kindness against hatred. But, of course, each emotion then would need a particular antidote. Another way is to try to find a general antidote to all emotions, and that ' s by looking at the very nature. Usually, when we feel annoyed, hatred or upset with someone, or obsessed with something, the mind goes again and again to that object. Each time it goes to the object, it reinforces that obsession or that annoyance. So then, it ' s a self-perpetuating process. So what we need to look for now is, instead of looking outward, we look inward. Look at anger itself. It looks very menacing, like a billowing monsoon cloud or thunderstorm. We think we could sit on the cloud, but if you go there, it ' s just mist. Likewise, if you look at the thought of anger, it will vanish like frost under the morning sun. If you do this again and again, the propensity, the tendencies for anger to arise again will be less and less each time you dissolve it. And, at the end, although it may rise, it will just cross the mind, like a bird crossing the sky without leaving any track. So this is the principal of mind training. Now, it takes time, because it took time for all those faults in our mind, the tendencies, to build up, so it will take time to unfold them as well. But that ' s the only way to go. Mind transformation — that is the very meaning of meditation. It means familiarization with a new way of being, new way of perceiving things, which is more in adequation with reality, with interdependence, with the stream and continuous transformation, which our being and our consciousness is. So, the **interface** with cognitive science, since we need to come to that, it was, I suppose, the subject of — we have to deal in such a short time — with brain plasticity. The brain was thought to be more or less fixed. All the nominal connections, in numbers and quantities, were thought, until the last 20 years, to be more or less fixed when we reached adult age. Now, recently, it has been found that it can change a lot. A violinist, as we heard, who has done 10, 000 hours of violin practice, some area that controls the movements of fingers in the brain changes a lot, increasing reinforcement of the synaptic connections. So can we do that with human qualities? With loving kindness, with patience, with openness? So that ' s what those great meditators have been doing. Some of them who came to the labs, like in Madison, Wisconsin, or in Berkeley, did 20 to 40, 000 hours of meditation. They do, like, three years ' retreat, where they do meditate 12 hours a day. And then, the rest of their life, they will do three or four hours a day. They are real Olympic champions of mind training. This is the place where the meditators — you can see it ' s kind of inspiring. Now, here with 256 electrodes. So what did they find? Of course, same thing. The scientific embargo — a paper has been submitted to"Nature,"hopefully, it will be accepted. It deals with the state of compassion, unconditional compassion. We asked meditators, who have been doing that for years and years, to put their mind in a state where there ' s nothing but loving kindness, total availability to sentient being. Of course, during the training, we do that with objects. We think of people suffering, of people we love, but at some point, it can be a state which is all pervading. Here is the preliminary result, which I can show because it ' s already been shown. The bell curve shows 150 controls, and what is being looked at is the difference between the right and the left frontal lobe. In very short, people who have more activity in the right side of the prefrontal cortex are more depressed, withdrawn. They don ' t describe a lot of positive affect. It ' s the opposite on the left side : more tendency to altruism, to happiness, to express, and curiosity and so forth. So there ' s a basic line for people. And also, it can be changed. If you see a comic **movie**, you go off to the left side. If you are happy about something, you ' ll go more to the left side. If you have a bout of depression, you ' ll go to the right side. Here, the -0. 5 is the full standard deviation of a meditator who meditated on compassion. It ' s something that is totally out of the bell curve. So, I ' ve no time to go into all the different scientific results. Hopefully, they will come. But they found that — this is after three and a half hours in an fMRI, it ' s like coming out of a space ship. Also, it has been shown in other labs — for instance, Paul Ekman ' s labs in Berkeley — that some meditators are able, also, to control their emotional response more than it could be thought. Like the startle experiments, for example. If you sit a guy on a chair with all this apparatus measuring your physiology, and there ' s kind of a bomb that goes off, it ' s such an instinctive response that, in 20 years, they never saw anyone who would not jump. Some meditators, without trying to stop it, but simply by being completely open, thinking that that **bang** is just going to be a small event like a shooting star, they are able not to move at all. So the whole point of that is not, sort of, to make, like, a circus thing of showing exceptional beings who can jump, or whatever. It ' s more to say that mind training matters. That this is not just a luxury. This is not a supplementary vitamin for the soul. This is something that ' s going to determine the quality of every instant of our lives. We are ready to spend 15 years achieving education. We love to do jogging, fitness. We do all kinds of things to remain beautiful. Yet, we spend surprisingly little time taking care of what matters most — the way our mind functions — which, again, is the ultimate thing that determines the quality of our experience. Now, compassion is supposed to be put in action. That ' s what we try to do in different places. Just this one example is worth a lot of work. This lady with bone TB, left alone in a tent, was going to die with her only daughter. One year later, how she is. Different schools and clinics we ' ve been doing in Tibet. And just, I leave you with the beauty of those looks that tells more about happiness than I could ever say. And jumping monks of Tibet. Flying monks. Thank you very much.

I grew up in Europe, and World War II caught me when I was between seven and 10 years old. And I realized how few of the grown-ups that I knew were able to withstand the tragedies that the war visited on them â how few of them could even resemble a normal, contented, satisfied, happy life once their job, their home, their security was destroyed by the war. So I became interested in understanding what contributed to a life that was worth living. And I tried, as a child, as a teenager, to read philosophy and to get involved in art and religion and many other ways that I could see as a possible answer to that question. And finally I ended up encountering psychology by chance. I was at a ski resort in Switzerland without any money to actually enjoy myself, because the snow had melted and I didn ' t have money to go to a **movie**. But I found that on the â I read in the newspapers that there was to be a **presentation** by someone in a place that I ' d seen in the center of Zurich, and it was about flying saucers [that] he was going to talk. And I thought, well, since I can ' t go to the **movies**, at least I will go for free to listen to flying saucers. And the man who talked at that evening lecture was very interesting. Instead of talking about little green men, he talked about how the psyche of the Europeans had been traumatized by the war, and now they ' re projecting flying saucers into the sky. He talked about how the mandalas of ancient Hindu religion were kind of projected into the sky as an attempt to regain some sense of order after the chaos of war. And this seemed very interesting to me. And I started reading his books after that lecture. And that was Carl Jung, whose name or work I had no idea about. Then I came to this country to study psychology and I started trying to understand the roots of happiness. This is a **typical** result that many people have presented, and there are many variations on it. But this, for instance, shows that about 30 percent of the people surveyed in the United States since 1956 say that their life is very happy. And that hasn ’ t changed at all. Whereas the personal income, on a scale that has been held constant to accommodate for inflation, has more than doubled, almost tripled, in that period. But you find essentially the same results, namely, that after a certain basic point â which corresponds more or less to just a few 1, 000 dollars above the minimum poverty level â increases in material well-being don ’ t seem to affect how happy people are. In fact, you can find that the lack of basic resources, material resources, contributes to unhappiness, but the increase in material resources does not increase happiness. So my research has been focused more on â after finding out these things that actually corresponded to my own experience, I tried to understand : where â in everyday life, in our normal experience â do we feel really happy? And to start those studies about 40 years ago, I began to look at creative people â first artists and scientists, and so forth â trying to understand what made them feel that it was worth essentially spending their life doing things for which many of them didn ’ t expect either fame or fortune, but which made their life meaningful and worth doing. This was one of the leading composers of American music back in the ’ 70s. And the interview was 40 pages long. But this little excerpt is a very good summary of what he was saying during the interview. And it describes how he feels when composing is going well. And he says by describing it as an ecstatic state. Now,”ecstasy”in Greek meant simply to stand to the side of something. And then it became essentially an analogy for a mental state where you feel that you are not doing your ordinary everyday routines. So ecstasy is essentially a stepping into an alternative reality. And it ’ s interesting, if you think about it, how, when we think about the civilizations that we look up to as having been pinnacles of human achievement â whether it ’ s China, Greece, the Hindu civilization, or the Mayas, or Egyptians â what we know about them is really about their ecstasies, not about their everyday life. We know the temples they built, where people could come to experience a different reality. We know about the circuses, the arenas, the theaters. These are the remains of civilizations and they are the places that people went to experience life in a more concentrated, more ordered form. Now, this man doesn ’ t need to go to a place like this, which is also â this place, this arena, which is built like a Greek amphitheatre, is a place for ecstasy also. We are participating in a reality that is different from that of the everyday life that we ’ re used to. But this man doesn ’ t need to go there. He needs just a piece of paper where he can put down little marks, and as he does that, he can imagine sounds that had not existed before in that particular combination. So once he gets to that point of beginning to create, like Jennifer did in her improvisation, a new reality â that is, a moment of ecstasy â he enters that different reality. Now he says also that this is so intense an experience that it feels almost as if he didn ’ t exist. And that sounds like a kind of a romantic exaggeration. But actually, our nervous system is incapable of processing more than about 110 bits of information per second. And in order to hear me and understand what I ’ m saying, you need to process about 60 bits per second. That ’ s why you can ’ t hear more than two people. You can ’ t understand more than two people talking to you. Well, when you are really involved in this completely engaging process of creating something new, as this man is, he doesn ’ t have enough attention left over to monitor how his body feels, or his problems at home. He can ’ t feel even that he ’ s hungry or tired. His body disappears, his identity disappears from his consciousness, because he doesn ’ t have enough attention, like none of us do, to really do well something that requires a lot of concentration, and at the same time to feel that he exists. So existence is temporarily suspended. And he says that his hand seems to be moving by itself. Now, I could look at my hand for two weeks, and I wouldn ’ t feel any awe or wonder, because I can ’ t compose. So what it ’ s telling you here is that obviously this automatic, spontaneous process that he ’ s describing can only happen to someone who is very well trained and who has developed technique. And it has become a kind of a truism in the study of creativity that you can ’ t be creating anything with less than 10 years of technical-knowledge immersion in a particular field. Whether it ’ s mathematics or music, it takes that long to be able to begin to change something in a way that it ’ s better than what was there before. Now, when that happens, he says the music just flows out. And because all of these people I started interviewing â this was an interview which is over 30 years old â so many of the people described this as a spontaneous flow that I called this type of experience the”flow experience.”And it happens in different realms. For instance, a poet describes it in this form. This is by a student of mine who interviewed some of the leading writers and poets in the United States. And it describes the same effortless, spontaneous feeling that you get when you enter into this ecstatic state. This poet describes it as opening a door that floats in the sky â a very similar description to what Albert Einstein gave as to how he imagined the forces of relativity, when he was struggling with trying to understand how it worked. But it happens in other activities. For instance, this is another student of mine, Susan Jackson from Australia, who did work with some of the leading athletes in the world. And you see here in this description of an Olympic skater, the same essential description of the phenomenology of the inner state of the person. You don ’ t think ; it goes automatically, if you merge yourself with the music, and so forth. It happens also, actually, in the most recent book I wrote, called”Good Business,”where I interviewed some of the CEOs who had been nominated by their peers as being both very successful and very ethical, very socially responsible. You see that these people define success as something that helps others and at the same time makes you feel happy as you are working at it. And like all of these successful and responsible CEOs say, you can ’ t have just one of these things be successful if you want a meaningful and successful job. Anita Roddick is another one of these CEOs we interviewed. She is the founder of Body Shop, the natural cosmetics king. It ’ s kind of a passion that comes from doing the best and having flow while you ’ re working. This is an interesting little quote from Masaru Ibuka, who was at that time starting out Sony without any money, without a product â they didn ’ t have a product, they didn ’ t have anything, but they had an idea. And the idea he had was to establish a place of work where engineers can feel the joy of technological innovation, be aware of their mission to society and work to their heart ’ s content. I couldn ’ t improve on this as a good example of how flow enters the workplace. Now, when we do studies â we have, with other colleagues around the world, done over 8, 000 interviews of people â from Dominican monks, to blind nuns, to Himalayan climbers, to Navajo shepherds â who enjoy their work. And regardless of the culture, regardless of education or whatever, there are these seven conditions that seem to be there when a person is in flow. There ’ s this focus that, once it becomes intense, leads to a sense of ecstasy, a sense of clarity : you know exactly what you want to do from one moment to the other ; you get immediate feedback. You know that what you need to do is possible to do, even though difficult, and sense of time disappears, you forget yourself, you feel part of something larger. And once the conditions are present, what you are doing becomes worth doing for its own sake. In our studies, we represent the everyday life of people in this simple scheme. And we can measure this very precisely, actually, because we give people electronic pagers that go off 10 times a day, and whenever they go off you say what you ’ re doing, how you feel, where you are, what you ’ re thinking about. And two things that we measure is the amount of challenge people experience at that moment and the amount of skill that they feel they have at that moment. So for each person we can establish an average, which is the center of the diagram. That would be your mean level of challenge and skill, which will be different from that of anybody else. But you have a kind of a set point there, which would be in the middle. If we know what that set point is, we can predict fairly accurately when you will be in flow, and it will be when your challenges are higher than average and skills are higher than average. And you may be doing things very differently from other people, but for everyone that flow channel, that area there, will be when you are doing what you really like to do â play the piano, be with your best friend, perhaps work, if work is what provides flow for you. And then the other areas become less and less positive. Arousal is still good because you are over-challenged there. Your skills are not quite as high as they should be, but you can move into flow fairly easily by just developing a little more skill. So, arousal is the area where most people learn from, because that ’ s where they ’ re pushed beyond their comfort zone and to enter that â going back to flow â then they develop higher skills. Control is also a good place to be, because there you feel comfortable, but not very excited. It ’ s not very challenging any more. And if you want to enter flow from control, you have to increase the challenges. So those two are ideal and complementary areas from which flow is easy to go into. The other combinations of challenge and skill become progressively less optimal. Relaxation is fine â you still feel OK. Boredom begins to be very aversive and apathy becomes very negative : you don ’ t feel that you ’ re doing anything, you don ’ t use your skills, there ’ s no challenge. Unfortunately, a lot of people ’ s experience is in apathy. The largest single contributor to that experience is watching television ; the next one is being in the bathroom, sitting. Even though sometimes watching television about seven to eight percent of the time is in flow, but that ’ s when you choose a program you really want to watch and you get feedback from it. So the question we are trying to address â and I ’ m way over time â is how to put more and more of everyday life in that flow channel. And that is the kind of challenge that we ’ re trying to understand. And some of you obviously know how to do that spontaneously without any advice, but unfortunately a lot of people don ’ t. And that ’ s what our mandate is, in a way, to do. Thank you.

I want you to put off your preconceptions, your preconceived fears and thoughts about reptiles. Because that is the only way I ’ m going to get my story across to you. And by the way, if I come across as a sort of rabid, hippie conservationist, it ’ s purely a figment of your imagination. Okay. We are actually the first species on Earth to be so prolific to actually threaten our own survival. And I know we ’ ve all seen images enough to make us numb, of the tragedies that we ’ re perpetrating on the planet. We ’ re kind of like greedy kids, using it all up, aren ’ t we? And today is a time for me to talk to you about water. It ’ s not only because we like to drink lots of it, and its marvelous derivatives, beer, wine, etc. And, of course, watch it fall from the sky and flow in our wonderful rivers, but for several other reasons as well. When I was a kid, growing up in New York, I was smitten by snakes, the same way most kids are smitten by tops, marbles, cars, trains, cricket **balls**. And my mother, brave lady, was partly to blame, taking me to the New York Natural History Museum, buying me books on snakes, and then starting this infamous career of mine, which has culminated in of course, arriving in India 60 years ago, brought by my mother, Doris Norden, and my stepfather, Rama Chattopadhyaya. It ' s been a roller coaster ride. Two animals, two iconic reptiles really captivated me very early on. One of them was the **remarkable** gharial. This crocodile, which grows to almost 20 feet long in the northern rivers, and this charismatic snake, the king cobra. What my purpose of the talk today really is, is to sort of indelibly scar your minds with these charismatic and majestic creatures. Because this is what you will take away from here, a reconnection with nature, I hope. The king cobra is quite **remarkable** for several reasons. What you ' re seeing here is very recently shot images in a forest nearby here, of a female king cobra making her nest. Here is a limbless animal, capable of gathering a huge mound of leaves, and then laying her eggs inside, to withstand 5 to 10 [meters of rainfall], in order that the eggs can incubate over the next 90 days, and hatch into little baby king cobras. So, she protects her eggs, and after three months, the babies finally do hatch out. A majority of them will die, of course. There is very high mortality in little baby reptiles who are just 10 to 12 inches long. My first experience with king cobras was in ' 72 at a magical place called Agumbe, in Karnataka, this state. And it is a marvelous rain forest. This first encounter was kind of like the Maasai boy who kills the lion to become a warrior. It really changed my life totally. And it brought me straight into the conservation fray. I ended up starting this research and education station in Agumbe, which you are all of course invited to visit. This is basically a base wherein we are trying to gather and learn virtually everything about the biodiversity of this incredibly complex forest system, and try to hang on to what ' s there, make sure the water sources are protected and kept clean, and of course, having a good time too. You can almost hear the drums throbbing back in that little cottage where we stay when we ' re there. It was very important for us to get through to the people. And through the children is usually the way to go. They are fascinated with snakes. They haven ' t got that steely thing that you end up either fearing or hating or despising or loathing them in some way. They are interested. And it really works to start with them. This gives you an idea of the size of some of these snakes. This is an average size king cobra, about 12 feet long. And it actually crawled into somebody ' s bathroom, and was hanging around there for two or three days. The people of this part of India worship the king cobra. And they didn ' t kill it. They called us to catch it. Now we ' ve caught more than 100 king cobras over the last three years, and relocated them in nearby forests. But in order to find out the real secrets of these creatures [it was necessary] for us to actually insert a small radio transmitter inside [each] snake. Now we are able to follow them and find out their secrets, where the babies go after they hatch, and **remarkable** things like this you ' re about to see. This was just a few days ago in Agumbe. I had the pleasure of being close to this large king cobra who had caught a venomous pit viper. And it does it in such a way that it doesn ' t get bitten itself. And king cobras feed only on snakes. This [little snake] was kind of a tid-bit for it, what we ' d call a"vadai"or a donut or something like that. Usually they eat something a bit larger. In this case a rather strange and inexplicable activity happened over the last breeding season, wherein a large male king cobra actually grabbed a female king cobra, didn ' t mate with it, actually killed it and swallowed it. We ' re still trying to explain and come to terms with what is the evolutionary advantage of this. But they do also a lot of other **remarkable** things. This is again, something [we were able to see] by virtue of the fact that we had a radio transmitter in one of the snakes. This male snake, 12 feet long, met another male king cobra. And they did this incredible ritual combat dance. It ' s very much like the rutting of mammals, including humans, you know, sorting out our differences, but gentler, no biting allowed. It ' s just a wresting match, but a **remarkable** activity. Now, what are we doing with all this information? What ' s the point of all this? Well, the king cobra is literally a keystone species in these rainforests. And our job is to convince the authorities that these forests have to be protected. And this is one of the ways we do it, by learning as much as we can about something so **remarkable** and so iconic in the rainforests there, in order to help protect trees, animals and of course the water sources. You ' ve all heard, perhaps, of Project Tiger which started back in the early ' 70s, which was, in fact, a very dynamic time for conservation. We were piloted, I could say, by a highly autocratic stateswoman, but who also had an incredible passion for environment. And this is the time when Project Tiger emerged. And, just like Project Tiger, our activities with the king cobra is to look at a species of animal so that we protect its habitat and everything within it. So, the tiger is the icon. And now the king cobra is a new one. All the major rivers in south India are sourced in the Western Ghats, the chain of hills running along the west coast of India. It pours out millions of gallons every hour, and supplies drinking water to at least 300 million people, and washes many, many babies, and of course feeds many, many animals, both domestic and wild, produces thousands of tons of rice. And what do we do? How do we respond to this? Well, basically, we dam it, we pollute it, we pour in pesticides, weedicides, fungicides. You drink it in peril of your life. And the thing is, it ' s not just big industry. It ' s not misguided river engineers who are doing all this ; it ' s us. It seems that our citizens find the best way to dispose of garbage are in water sources. Okay. Now we ' re going north, very far north. North central India, the Chambal River is where we have our base. This is the home of the gharial, this incredible crocodile. It is an animal which has been on the Earth for just about 100 million years. It survived even during the time that the dinosaurs died off. It has **remarkable** features. Even though it grows to 20 feet long, since it eats only fish it ' s not dangerous to human beings. It does have big teeth, however, and it ' s kind of hard to convince people if an animal has big teeth, that it ' s a harmless creature. But we, actually, back in the early ' 70s, did surveys, and found that gharial were extremely rare. In fact, if you see the map, the range of their original habitat was all the way from the Indus in Pakistan to the Irrawaddy in Burma. And now it ' s just limited to a couple of spots in Nepal and India. So, in fact at this point there are only 200 breeding gharial left in the wild. So, starting in the mid- ' 70s when conservation was at the fore, we were actually able to start projects which were basically government supported to collect eggs from the wild from the few remaining nests and release 5, 000 baby gharial back to the wild. And pretty soon we were seeing sights like this. I mean, just incredible to see bunches of gharial basking on the river again. But complacency does have a tendency to breed contempt. And, sure enough, with all the other pressures on the river, like sand mining, for example, very, very heavy cultivation all the way down to the river ' s edge, not allowing the animals to breed anymore, we ' re looking at even more problems building up for the gharial, despite the early good intentions. Their nests hatching along the riverside producing hundreds of hatchlings. It ' s just an amazing sight. This was actually just taken last year. But then the monsoon arrives, and unfortunately downriver there is always a dam or there is always a barrage, and, shoop, they get washed down to their doom. Luckily there is still a lot of interest. My pals in the Crocodile Specialist Group of the IUCN, the [Madras Crocodile Bank], an NGO, the World Wildlife Fund, the Wildlife Institute of India, State Forest Departments, and the Ministry of Environment, we all work together on stuff. But it ' s possibly, and definitely not enough. For example, in the winter of 2007 and 2008, there was this incredible die-off of gharial, in the Chambal River. Suddenly dozens of gharial appearing on the river, dead. Why? How could it happen? This is a relatively clean river. The Chambal, if you look at it, has clear water. People scoop water out of the Chambal and drink it, something you wouldn ’ t do in most north Indian rivers. So, in order to try to find out the answer to this, we got veterinarians from all over the world working with Indian vets to try to figure out what was happening. I was there for a lot of the necropsies on the riverside. And we actually looked through all their organs and tried to figure out what was going on. And it came down to something called gout, which, as a result of kidney breakdown is actually uric acid crystals throughout the body, and worse in the joints, which made the gharial unable to swim. And it ’ s a horribly painful death. Just downriver from the Chambal is the filthy Yamuna river, the sacred Yamuna river. And I hate to be so ironic and sarcastic about it but it ’ s the truth. It ’ s just one of the filthiest cesspools you can imagine. It flows down through Delhi, Mathura, Agra, and gets just about every bit of effluent you can imagine. So, it seemed that the toxin that was killing the gharial was something in the food chain, something in the fish they were eating. And, you know, once a toxin is in the food chain everything is affected, including us. Because these rivers are the lifeblood of people all along their course. In order to try to answer some of these questions, we again turn to technology, to biological technology, in this case, again, telemetry, putting radios on 10 gharial, and actually following their movements. They ’ re being watched everyday as we speak, to try to find out what this mysterious toxin is. The Chambal river is an absolutely incredible place. It ’ s a place that ’ s famous to a lot of you who know about the bandits, the dacoits who used to work up there. And there still are quite a few around. But Poolan Devi was one [of them]. Which actually Shekhar Kapur made an incredible **movie**,”The Bandit Queen,”which I urge you to see. You ’ ll get to see the incredible [Chambal] landscape as well. But, again, heavy fishing pressures. This is one of the last repositories of the Ganges river dolphin, **various** species of turtles, thousands of migratory birds, and fishing is causing problems like this. And now [these] new elements of human intolerance for river creatures like the gharial means that if they don ’ t drown in the net, then they simply cut their beaks off. Animals like the Ganges river dolphin which is just down to a few left, and it is also critically endangered. So, who is next? Us? Because we are all dependent on these water sources. So, we all know about the Narmada river, the tragedies of dams, the tragedies of huge projects which displace people and wreck river systems without providing livelihoods. And development just basically going berserk, for a double figure growth index, basically. So, we ’ re not sure where this story is going to end, whether it ’ s got a happy or sad ending. And climate change is certainly going to turn all of our theories and predictions on their heads. We ’ re still working hard at it. We ’ ve got a lot of a good team of people working up there. And the thing is, you know, the decision makers, the folks in power, they ’ re up in their bungalows and so on in Delhi, in the city capitals. They are all supplied with plenty of water. It ’ s cool. But out on the rivers there are still millions of people who are in really bad shape. And it ’ s a bleak future for them. So, we have our Ganges and Yamuna cleanup project. We ’ ve spent hundreds of millions of dollars on it, and nothing to show for it. Incredible. So, people talk about political will. During the die-off of the gharial we did galvanize a lot of action. Government cut through all the red tape, we got foreign vets on it. It was great. So, we can do it. But if you stroll down to the Yamuna or to the Gomati in Lucknow, or to the Adyar river in Chennai, or the Mula-Mutha river in Pune, just see what we ’ re capable of doing to a river. It ’ s sad. But I think the final note really is that we can do it. The corporates, the artists, the wildlife nuts, the good old everyday folks can actually bring these rivers back. And the final word is that there is a king cobra looking over our shoulders. And there is a gharial looking at us from the river. And these are powerful water totems. And they are going to disturb our dreams until we do the right thing. Namaste. Chris Anderson : Thanks, Rom. Thanks a lot. You know, most people are terrified of snakes. And there might be quite a few people here who would be very glad to see the last king cobra bite the dust. Do you have those conversations with people? How do you really get them to care? Romulus Whitaker : I take the sort of humble approach, I guess you could say. I don ’ t say that snakes are huggable exactly. It ’ s not like the teddy bear. But I sort of — there is an innocence in these animals. And when the average person looks at a cobra going”Ssssss!”like that, they say,”My god, look at that angry, dangerous creature.”I look at it as a creature who is totally frightened of something so dangerous as a human being. And that is the truth. And that ’ s what I try to get out. CA : Now, incredible footage you showed of the viper being killed. You were saying that that hasn ’ t been filmed before. RW : Yes, this is actually the first time anyone of us knew about it, for one thing. As I said, it ’ s just like a little snack for him, you know? Usually they eat larger snakes like rat snakes, or even cobras. But this guy who we ’ re following right now is in the deep jungle. Whereas other king cobras very often come into the human **interface**, you know, the plantations, to find big rat snakes and stuff. This guy specializes in pit vipers. And the guy who is working there with them, he ’ s from Maharashtra, he said,”I think he ’ s after the nusha.”Now, the nusha means the high. Whenever he eats the pit viper he gets this little venom rush. CA : Thanks Rom. Thank you.

As technology progresses, and as it advances, many of us assume that these advances make us more intelligent, make us smarter and more connected to the world. And what I ’ d like to argue is that that ’ s not necessarily the case, as progress is simply a word for change, and with change you gain something, but you also lose something. And to really **illustrate** this point, what I ’ d like to do is to show you how technology has dealt with a very simple, a very common, an everyday question. And that question is this. What time is it? What time is it? If you glance at your iPhone, it ’ s so simple to tell the time. But, I ’ d like to ask you, how would you tell the time if you didn ’ t have an iPhone? How would you tell the time, say, 600 years ago? How would you do it? Well, the way you would do it is by using a device that ’ s called an astrolabe. So, an astrolabe is relatively unknown in today ’ s world. But, at the time, in the 13th century, it was the gadget of the day. It was the world ’ s first popular computer. And it was a device that, in fact, is a model of the sky. So, the different parts of the astrolabe, in this particular type, the rete corresponds to the positions of the stars. The plate corresponds to a coordinate system. And the mater has some scales and puts it all together. If you were an educated child, you would know how to not only use the astrolabe, you would also know how to make an astrolabe. And we know this because the first treatise on the astrolabe, the first technical manual in the English language, was written by Geoffrey Chaucer. Yes, that Geoffrey Chaucer, in 1391, to his little Lewis, his 11-year-old son. And in this book, little Lewis would know the big idea. And the central idea that makes this computer work is this thing called stereographic projection. And basically, the concept is, how do you represent the three-dimensional image of the night sky that surrounds us onto a flat, portable, two-dimensional surface. The idea is actually relatively simple. Imagine that that Earth is at the center of the universe, and surrounding it is the sky projected onto a sphere. Each point on the surface of the sphere is mapped through the bottom **pole**, onto a flat surface, where it is then recorded. So the North Star corresponds to the center of the device. The ecliptic, which is the path of the sun, moon, and planets correspond to an offset circle. The bright stars correspond to little daggers on the rete. And the altitude corresponds to the plate system. Now, the real genius of the astrolabe is not just the projection. The real genius is that it brings together two coordinate systems so they fit perfectly. There is the position of the sun, moon and planets on the movable rete. And then there is their location on the sky as seen from a certain latitude on the back plate. Okay? So how would you use this device? Well, let me first back up for a moment. This is an astrolabe. Pretty impressive, isn ' t it? And so, this astrolabe is on loan from us from the Oxford School of — Museum of History. And you can see the different components. This is the mater, the scales on the back. This is the rete. Okay. Do you see that? That ' s the movable part of the sky. And in the back you can see a spider web pattern. And that spider web pattern corresponds to the local coordinates in the sky. This is a rule device. And on the back are some other devices, measuring tools and scales, to be able to make some calculations. Okay? You know, I ' ve always wanted one of these. For my thesis I actually built one of these out of paper. And this one, this is a replica from a 15th-century device. And it ' s worth probably about three MacBook Pros. But a real one would cost about as much as my house, and the house next to it, and actually every house on the block, on both sides of the street, maybe a school thrown in, and some — you know, a church. They are just incredibly expensive. But let me show you how to work this device. So let ' s go to step one. First thing that you do is you select a star in the night sky, if you ' re telling time at night. So, tonight, if it ' s clear you ' ll be able to see the summer triangle. And there is a bright star called Deneb. So let ' s select Deneb. Second, is you measure the altitude of Deneb. So, step two, I hold the device up, and then I sight its altitude there so I can see it clearly now. And then I measure its altitude. So, it ' s about 26 degrees. You can ' t see it from over there. Step three is identify the star on the front of the device. Deneb is there. I can tell. Step four is I then move the rete, move the sky, so the altitude of the star corresponds to the scale on the back. Okay, so when that happens everything lines up. I have here a model of the sky that corresponds to the real sky. Okay? So, it is, in a sense, holding a model of the universe in my hands. And then finally, I take a rule, and move the rule to a date line which then tells me the time here. Right. So, that ' s how the device is used. So, I know what you ' re thinking :"That ' s a lot of work, isn ' t it? Isn ' t it a ton of work to be able to tell the time?"as you glance at your iPod to just check out the time. But there is a difference between the two, because with your iPod you can tell — or your iPhone, you can tell exactly what the time is, with precision. The way little Lewis would tell the time is by a picture of the sky. He would know where things would fit in the sky. He would not only know what time it was, he would also know where the sun would rise, and how it would move across the sky. He would know what time the sun would rise, and what time it would set. And he would know that for essentially every celestial object in the heavens. So, in computer graphics and computer user **interface** design, there is a term called affordances. So, affordances are the qualities of an object that allow us to perform an action with it. And what the astrolabe does is it allows us, it affords us, to connect to the night sky, to look up into the night sky and be much more — to see the visible and the invisible together. So, that ' s just one use. Incredible, there is probably 350, 400 uses. In fact, there is a text, and that has over a thousand uses of this first computer. On the back there is scales and measurements for terrestrial navigation. You can survey with it. The city of Baghdad was surveyed with it. It can be used for calculating mathematical equations of all different types. And it would take a full university course to **illustrate** it. Astrolabes have an incredible history. They are over 2, 000 years old. The concept of stereographic projection originated in 330 B. C. And the astrolabes come in many different sizes and shapes and forms. There is portable ones. There is large **display** ones. And I think what is common to all astrolabes is that they are beautiful works of art. There is a quality of craftsmanship and precision that is just astonishing and **remarkable**. Astrolabes, like every technology, do evolve over time. So, the earliest retes, for example, were very simple and primitive. And advancing retes became cultural emblems. This is one from Oxford. And I find this one really extraordinary because the rete pattern is completely symmetrical, and it accurately maps a completely asymmetrical, or random sky. How cool is that? This is just amazing. So, would little Lewis have an astrolabe? Probably not one made of brass. He would have one made out of wood, or paper. And the vast majority of this first computer was a portable device that you could keep in the back of your pocket. So, what does the astrolabe inspire? Well, I think the first thing is that it reminds us just how resourceful people were, our forebears were, years and years ago. It ’ s just an incredible device. Every technology advances. Every technology is transformed and moved by others. And what we gain with a new technology, of course, is precision and accuracy. But what we lose, I think, is an accurate — a felt sense of the sky, a sense of context. Knowing the sky, knowing your relationship with the sky, is the center of the real answer to knowing what time it is. So, it ’ s — I think astrolabes are just **remarkable** devices. And so, what can you learn from these devices? Well, primarily that there is a subtle knowledge that we can connect with the world. And astrolabes return us to this subtle sense of how things all fit together, and also how we connect to the world. Thanks very much.

I want to start out by asking you to think back to when you were a kid, playing with blocks. As you figured out how to reach out and grasp, pick them up and move them around, you were actually learning how to think and solve problems by understanding and manipulating **spatial** relationships. **Spatial** reasoning is deeply connected to how we understand a lot of the world around us. So, as a computer scientist inspired by this utility of our interactions with physical objects — along with my adviser Pattie, and my collaborator Jeevan Kalanithi — I started to wonder — what if when we used a computer, instead of having this one mouse **cursor** that was a like a digital fingertip moving around a flat desktop, what if we could reach in with both hands and grasp information physically, arranging it the way we wanted? This question was so compelling that we decided to explore the answer, by building Siftables. In a nutshell, a Siftable is an interactive computer the size of a cookie. They ’ re able to be moved around by hand, they can sense each other, they can sense their motion, and they have a screen and a wireless radio. Most importantly, they ’ re physical, so like the blocks, you can move them just by reaching out and grasping. And Siftables are an example of a new ecosystem of tools for manipulating digital information. And as these tools become more physical, more aware of their motion, aware of each other, and aware of the nuance of how we move them, we can start to explore some new and fun interaction styles. So, I ’ m going to start with some simple examples. This Siftable is configured to show video, and if I tilt it in one direction, it ’ ll roll the video this way ; if I tilt it the other way it

rolls it backwards. And these interactive portraits are aware of each other. So if I put them next to each other, they get interested. If they get surrounded, they notice that too, they might get a little flustered. And they can also sense their motion and tilt. One of the interesting implications on interaction, we started to realize, was that we could use everyday gestures on data, like pouring a color the way we might pour a liquid. So in this case, we ’ ve got three Siftables configured to be paint buckets and I can use them to pour color into that central one, where they get mixed. If we overshoot, we can pour a little bit back. There are also some neat possibilities for education, like language, math and logic games where we want to give people the ability to try things quickly, and view the results immediately. So here I ’ m — This is a Fibonacci sequence that I ’ m making with a simple equation program. Here we have a word game that ’ s kind of like a mash-up between Scrabble and Boggle. Basically, in every round you get a randomly assigned letter on each Siftable, and as you try to make words it checks against a dictionary. Then, after about 30 seconds, it reshuffles, and you have a new set of letters and new possibilities to try. Thank you. So these are some kids that came on a field trip to the Media Lab, and I managed to get them to try it out, and shoot a video. They really loved it. And, one of the interesting things about this kind of application is that you don ’ t have to give people many instructions. All you have to say is,”Make words,”and they know exactly what to do. So here ’ s another few people trying it out. That ’ s our youngest beta tester, down there on the right. Turns out, all he wanted to do was to stack the Siftables up. So to him, they were just blocks. Now, this is an interactive cartoon application. And we wanted to build a learning tool for language learners. And this is Felix, actually. And he can bring new characters into the scene, just by lifting the Siftables off the table that have that character shown on them. Here, he ’ s bringing the sun out. Video : The sun is rising. David Merrill : Now he ’ s brought a tractor into the scene. Video : The orange tractor. Good job! Yeah! DM : So by shaking the Siftables and putting them next to each other he can make the characters interact — Video : Woof! DM : inventing his own narrative. Video : Hello! DM : It ’ s an open-ended story, and he gets to decide how it unfolds. Video : Fly away, cat. DM : So, the last example I have time to show you today is a music sequencing and live performance tool that we ’ ve built recently, in which Siftables act as sounds like lead, bass and drums. Each of these has four different variations, you get to choose which one you want to use. And you can inject these sounds into a sequence that you can assemble into the pattern that you want. And you inject it by just bumping up the sound Siftable against a sequence Siftable. There are effects that you can control live, like reverb and **filter**. You attach it to a particular sound and then tilt to adjust it. And then, overall effects like tempo and volume that apply to the entire sequence. So let ’ s have a look. Video : DM : We ’ ll start by putting a lead into two sequence Siftables, arrange them into a series, extend it, add a little more lead. Now I put a bass line in. Video : DM : Now I ’ ll put some percussion in. Video : DM : And now I ’ ll attach the **filter** to the drums, so I can control the effect live. Video : DM : I can speed up the whole sequence by tilting the tempo one way or the other. Video : DM : And now I ’ ll attach the **filter** to the bass for some more expression. Video : DM : I can rearrange the sequence while it plays. So I don ’ t have to plan it out in advance, but I can improvise, making it longer or shorter as I go. And now, finally, I can fade the whole sequence out using the volume Siftable, tilted to the left. Thank you. So, as you can see, my passion is for making new human-computer **interfaces** that are a better match to the ways our brains and bodies work. And today, I had time to show you one point in this new design space, and a few of the possibilities that we ’ re working to bring out of the laboratory. So the thought

I want to leave you with is that we ’ re on the cusp of this new generation of tools for interacting with digital media that are going to bring information into our world on our terms. Thank you very much. I look forward to talking with all of you.

Thank you. I ’ m thrilled to be here. I ’ m going to talk about a new, old material that still continues to amaze us, and that might impact the way we think about material science, high technology â and maybe, along the way, also do some stuff for medicine and for global health and help reforestation. So that ’ s kind of a bold statement. I ’ ll tell you a little bit more. This material actually has some traits that make it seem almost too good to be true. It ’ s sustainable ; it ’ s a sustainable material that is processed all in water and at room temperature â and is biodegradable with a clock, so you can watch it dissolve instantaneously in a glass of water or have it stable for years. It ’ s edible ; it ’ s implantable in the human body without causing any immune response. It actually gets reintegrated in the body. And it ’ s technological, so it can do things like microelectronics, and maybe photonics do. And the material looks something like this. In fact, this material you see is clear and transparent. The components of this material are just water and protein. So this material is silk. So it ’ s kind of different from what we ’ re used to thinking about silk. So the question is, how do you reinvent something that has been around for five millennia? The process of discovery, generally, is inspired by nature. And so we marvel at silk worms â the silk worm you see here spinning its fiber. The silk worm does a **remarkable** thing : it uses these two ingredients, protein and water, that are in its gland, to make a material that is exceptionally tough for protection â so comparable to technical fibers like Kevlar. And so in the reverse engineering process that we know about, and that we ’ re familiar with, for the textile industry, the textile industry goes and unwinds the cocoon and then weaves glamorous things. We want to know how you go from water and protein to this liquid Kevlar, to this natural Kevlar. So the insight is how do you actually reverse engineer this and go from cocoon to gland and get water and protein that is your starting material. And this is an insight that came, about two decades ago, from a person that I ’ m very fortunate to work with, David Kaplan. And so we get this starting material. And so this starting material is back to the basic building block. And then we use this to do a variety of things â like, for example, this film. And we take advantage of something that is very simple. The recipe to make those films is to take advantage of the fact that proteins are extremely smart at what they do. They find their way to self-assemble. So the recipe is simple : you take the silk solution, you pour it, and you wait for the protein to self-assemble. And then you detach the protein and you get this film, as the proteins find each other as the water evaporates. But I mentioned that the film is also technological. And so what does that mean? It means that you can **interface** it with some of the things that are **typical** of technology, like microelectronics and nanoscale technology. And the image of the DVD here is just to **illustrate** a point that silk follows very subtle topographies of the surface, which means that it can replicate features on the nanoscale. So it would be able to replicate the information that is on the DVD. And we can store information that ’ s film with water and protein. So we tried something out, and we wrote a message in a piece of silk, which is right here, and the message is over there. And much like in the DVD, you can read it out optically. And this requires a stable hand, so this is why I decided to do it onstage in front of a thousand people. So let me see. So as you see the film go in transparently through there, and then... And the most **remarkable** feat is that my hand actually stayed still long enough to do that. So once you have these attributes of this material, then you can do a lot of things. It ’ s actually not limited to films. And so the material can assume a lot of formats. And then you go a little crazy, and so you do **various** optical components or you do microprism arrays, like the reflective tape that you have on your running shoes. Or you can do beautiful things that, if the camera can capture, you can make. You can add a third dimensionality to the film. And if the angle is right, you can actually see a hologram appear in this film of silk. But you can do other things. You can imagine that then maybe you can use a pure protein to guide light, and so we ’ ve made optical fibers. But silk is versatile and it goes beyond optics. And you can think of different formats. So for instance, if you ’ re afraid of going to the doctor and getting stuck with a needle, we do microneedle arrays. What you see there on the screen is a human hair **superimposed** on the needle that ’ s made of silk â just to give you a sense of size. You can do bigger things. You can do gears and nuts and bolts â that you can buy at Whole Foods. And the gears work in water as well. So you think of alternative mechanical parts. And maybe you can use that liquid Kevlar if you need something strong to replace peripheral veins, for example, or maybe an entire bone. And so you have here a little example of a small skull â what we call mini Yorick. But you can do things like cups, for example, and so, if you add a little bit of gold, if you add a little bit of semiconductors you could do sensors that stick on the surfaces of foods. You can do electronic pieces that fold and wrap. Or if you ’ re fashion forward, some silk LED tattoos. So there ’ s versatility, as you see, in the material formats, that you can do with silk. But there are still some unique traits. I mean, why would you want to do all these things for real? I mentioned it briefly at the beginning ; the protein is biodegradable and biocompatible. And you see here a picture of a tissue section. And so what does that mean, that it ’ s biodegradable and biocompatible? You can implant it in the body without needing to retrieve what is implanted. Which means that all the devices that you ’ ve seen before and all the formats, in principle, can be implanted and disappear. And what you see there in that tissue section, in fact, is you see that reflector tape. So, much like you ’ re seen at night by a car, then the idea is that you can see, if you illuminate tissue, you can see deeper parts of tissue because there is that reflective tape there that is made out of silk. And you see there, it gets reintegrated in tissue. And reintegration in the human body is not the only thing, but reintegration in the environment is important. So you have a clock, you have protein, and now a silk cup like this can be thrown away without guilt â unlike the polystyrene cups that unfortunately fill our landfills everyday. It ’ s edible, so you can do smart packaging around food that you can cook with the food. It doesn ’ t taste good, so I ’ m going to need some help with that. But probably the most **remarkable** thing is that it comes full circle. Silk, during its self-assembly process, acts like a cocoon for biological matter. And so if you change the recipe, and you add things when you pour â so you add things to your liquid silk solution â where these things are enzymes or antibodies or vaccines, the self-assembly process preserves the biological function of these dopants. So it makes the materials environmentally active and interactive. So that screw that you thought about beforehand can actually be used to screw a bone together â a fractured bone together â and deliver drugs at the same, while your bone is healing, for example. Or you could put drugs in your wallet and not in your fridge. So we ’ ve made a silk card with penicillin in it. And we stored penicillin at 60 degrees C, so 140 degrees Fahrenheit, for two months without loss of efficacy of the penicillin. And so that could be â- that could be potentially a good alternative to solar powered refrigerated camels. And of course, there ’ s no use in storage if you can ’ t use [it]. And so there is this other unique material trait that these materials have, that they ’ re programmably degradable. And so what you see there is the difference. In the top, you have a film that has been programmed not to degrade, and in the bottom, a film that has been programmed to degrade in water. And what you see is that the film on the bottom releases what is inside it. So it allows for the recovery of what we ’ ve stored before. And so this allows for a controlled delivery of drugs and for reintegration in the environment in all of these formats that you ’ ve seen. So the thread of discovery that we have really is a thread. We ’ re impassioned with this idea that whatever you want to do, whether you want to replace a vein or a bone, or maybe be more sustainable in microelectronics, perhaps drink a coffee in a cup and throw it away without guilt, maybe carry your drugs in your pocket, deliver them inside your body or deliver them across the desert, the answer may be in a thread of silk. Thank you.

Hello, everyone. My name is Keith Nolan. Iâm a cadet private. My talk today is on the topic of the military. How many of you out there thought youâd ever like to join the military? I see a number of you nodding. And I thought the same thing ever since I was young. Growing up, Iâd always wanted to join the military. I loved military history and Iâve read a great deal on the subject. Also, I have **various** family members, such as my grandfather and great uncle, who fought in World War II. And like them, I wanted the same thing : to serve my country. So the question is : Can I? No, I canât. Why? Simply because Iâm deaf. Regardless of that fact, I still had that longing to join the military. For example, after I graduated from high school, three months before 9 / 11 occurred, I went to a naval recruiting center with high hopes of joining the navy. I went in and a strapping naval man stood up and addressed me. As he was speaking to me, it was impossible for me to read his lips, so I said, âI ’ m sorry, Iâm deaf. â He tore off a little piece of paper and wrote down three words : âBad ear. Disqual. â He didn ’ t even fully spell out”Disqualified,”just : âBad ear. Disqual. â So I went on my way. I tried **various** locations a number of different times, trying to join, but over and over again, I got the same response : âSorry, youâre deaf. We canât accept you. â So I shifted gears and decided to become a teacher. I completed a master ’ s in deaf education and taught for almost two years, until this past spring, when three things occurred that changed that course, the first of which, while I was teaching a high school history class. Iâd lectured on the Mexican-American War. The bell had rung, and I was seated at my desk, when one of my students, who is deaf, approached me and said that heâd like to join the military. I said, âAh, sorry. You canât. You ’ re deaf. â Then I caught myself. It struck me that all along I had been told no, I canât, and now I was perpetuating that same message to the next generation, to my own student. That realization had a large impact that really resonated with me. Now, the second thing that happened, my friend had just moved to Israel. Did you know that in Israel they accept deaf people into the military? How can deaf people be in the military, right? Could this really be true? Come on! Well, I went to Israel last summer to see for myself. I interviewed 10 deaf Israeli soldiers, all of those video interviews and questions Iâve compiled, and the findings, Iâll share with you later. Thirdly, CSUN here, my alma mater, had recently started up an Army ROTC program. ROTC, which stands for Reserve Officer Training Corps,

allows students working on their college majors to concurrently participate in the ROTC program. Upon graduation, ROTC students have a military career ready and waiting for them. So if one joined the army, one could commission as a second lieutenant. That ' s generally the ROTC program here at CSUN. Having learned that, I was intrigued. I already had a profession as a teacher, but I went ahead anyway and sent an email off to the program, explaining that I was a teacher of the deaf, wondering if I could take a few classes with them and perhaps share their lessons with my students. I got an email response back, and surprisingly, it was the first time that I wasn ' t told,"Sorry, no, you canâ□□t. Youâ□□re deaf."It said,"Well, that ' s interesting. I think maybe we can work something out and you can take a few classes with us."This was unprecedented. So naturally, I was shocked. Although I was teaching, I decided I had to grab the opportunity right away and get my foot in the door. Altogether, that ' s how it transpired. Now, with all my life experiences, having talked with all the people I had, and given everything Iâ□□ve read, I decided to write a research paper called â□□Deaf in the Military. â□□ I ' ll share with you what those 98 pages entail. Here in America, weâ□□ve actually had deaf soldiers serving in the past. In fact, during the Texas War of Independence, there was a key character named Deaf Smith, who made a large contribution to that war effort. For the American Civil War, Gallaudet University actually has archived a list of deaf soldiers in that war from the North and the South, showing that deaf soldiers were even fighting against each other. During World War II, there are a few rare examples of deaf people who made it into the military at that time and were able to serve their country as well. History **illustrates** the fact that America has had deaf soldiers, in contrast to today. In my paper, I also discuss the deaf Israeli soldiers. I learned that they serve in non-combat roles. The deaf soldiers are not on the front lines engaged in fire, but rather, are behind the lines serving in supportive roles. There are a plethora of **various** non-combat jobs accessible to the deaf : intelligence, computer technology, map drawing, supply, military dog training â□□ the list goes on. The communication between deaf Israeli soldiers and other soldiers who are hearing is carried out with the same approaches deaf people in general use with the hearing public on a daily basis. You can use your voice, lip-read, gestures, sometimes another soldier knows sign language and that can be utilized, pen and paper, texts, computers, emails â□□ seriously, thereâ□□s no magic wand necessary. It ' s the same thing we do every day. Interpreters are used there primarily for boot camp training. For the average work, itâ□□s not necessary to have an interpreter by your side. The Israeli Army is comprised of small groups. Each of these units with deaf soldiers have developed their own way of communicating with each other, so thereâ□□s no need for interpreters. The top picture is of one soldier I met. The bottom photo is of Prime Minister Begin with a deaf soldier in Israel. Another part of my paper touches on disabled soldiers in the US Military. Obviously, military work can be dangerous and involve injury. One example here is Captain Luckett. Due to an explosion, he lost his leg. Heâ□□s recovered and currently has a prosthetic leg. Now that heâ□□s strong, he ' s back in combat, still fighting in Afghanistan. Itâ□□s **remarkable**. And guess what? Heâ□□s not the only one. There are 40 other soldiers like him, amputees who are serving in combat zones. Incredible. Also, we have a blind soldier here. While he was in Iraq, an explosion from a suicide car bomber destroyed his eyesight. Heâ□□s recovered and hasnâ□□t left the army. The army has retained him on active duty, and heâ□□s currently running a hospital for wounded soldiers. I also found out online about another soldier, who is deaf in one ear. Heâ□□s developed civil programs in Iraq, one of which actually started a school for the deaf in Iraq. All of this is incredible. But I am going to ask all of you : If the US Military can retain their disabled soldiers, why canâ□□t they accept disabled citizens as well? Moreover, out of all the US Military jobs, 80 % are non-combat positions. There are many jobs that we in the Deaf community can do. If I were to be in the military, Iâ□□d like to do intelligence work. But there is an array of other things we can do, such as mechanics, finance, medicine, etc. So to summarize, Iâ□□ve presented three premises to support my argument, the first being, Israeli defense openly accepts deaf soldiers. If you have the qualities and skills required, theyâ□□ll take you. Secondly, the US Military has accommodations for retaining their disabled soldiers. And lastly, 80 % of occupations in the military are non-combat. Now, can we Deaf Americans serve our country? Yes! Of course! Absolutely, without a doubt! Now Iâ□□ll explain a bit about my experience in the Army ROTC, which began last fall. I have been involved with that thus far and itâ□□s still going on now. Really, I need to preface this by saying that this is the first time my battalion had ever had a deaf cadet. They had never experienced that before. So of course, they were taken aback, wondering, initially, how I would do this or that, how would we communicate and such, which is a natural reaction, considering that many of them had never interacted with a deaf person prior to me. Plus, I was taken aback by this â□□ it was the real thing, the army. I had to learn a whole new world, full of military jargon, with its own culture and everything. So we started out slow, getting to know each other and learning how to work together, progressively. For example, on the first day of class, I had no uniform. So I showed up in regular clothes, while the other cadets were all in uniform. I found out that every morning at 5:30, there was physical training, PT. On Fridays, there would be field training â□□ labs â□□ off-campus, and occasionally, we would have weekend training at a military base. So I showed up, ready, each morning at 5 : 30, with all the cadets in uniform and me in civilian clothes. They told me, â□□Hey, you know, you don ’ t need to work out. You can just simply take classes. â□□ I told them I wanted to, anyway. They acknowledged that, and I continued to show up every morning to train. When Friday came, I asked if I could do the field training. I was told no, just stick with class. I insisted that I wanted to try. Somewhat reluctantly, they let me attend the lab, but only as an observer ; I would only be allowed to sit and watch, not participate. Alright, so, I showed up on Friday, and watched as the cadets learned marching drill commands, like how to stand at attention, how to properly salute, and all the basics. I had to ask again if I could join. Finally, I got the go-ahead. I went to get in formation. I figured I better stand in the second line, so I could watch what the cadets were doing in the row ahead of me. But the officer who opened the door for me to join the ROTC program spotted me in the back and said, â□□Hey! Uh-uh. I want you in the front. You want to be a soldier? You ’ ve got to learn the commands just like the rest of them. Youâ□□re not going to follow other people. Learn it yourself! â□□ I thought,”Wow. Heâ□□s viewing me like any person, giving dignity to who I am.”I was impressed by that. So as the weeks went by, I still didnâ□□t have a uniform. I asked if it would be possible to get one, but I was told it wasn ’ t. So I continued on that way, until one day, I was informed that Iâ□□d be getting a uniform.”Please!”I said, â□□Really? Why? What changed? â□□ I was told, â□□We see your motivation, you show up every morning, dedicated, and always gave a 110 % effort. â□□ They wanted to give me the uniform. It was **remarkable**. We went to the warehouse to get my uniform. I assumed Iâ□□d just get a uniform and a pair of boots, nothing more. But they filled two duffel bags chock-full of gear : helmet, ammo vest, shovel, sleeping bag â□□ the whole nine yards. I was astonished. And I have to tell you, each morning that I get up and put on my uniform, I feel privileged. Itâ□□s truly an honor to wear the uniform. So, moving along, when it came time to train at the garrison base, at first, I was told I couldnâ€™t go. There was concern on the ROTC ’ s part that if the interpreter were to get injured during the training, it would be a liability issue. So we had to figure out all those issues and confusion, but we worked it out, and in the end, they let me go. That ’ s how events were unfolding ; I was permitted to do more and more. Once, at the garrison base, during one of the training days, a huge Chinook helicopter with its tandem rotors landed right down to us, forcefully spinning exhilaration in the air. All of us cadets were supposed to be getting on board. Everyone was geared up and ready. However, the cadre had decided I wasnâ€™t going to be able to ride the Chinook. They were afraid if the pilot shouted out orders, how would I be able to follow the instructions? Iâ€™d potentially cause a disruption. So I had to stand aside, while the others were filing toward the helicopter. I could see the cadre huddled up, discussing, mulling it over. At the last minute, one of them said, â€œCome on! Get on the helicopter! â€ I rushed over and got in. It was such a thrill. And that was the spirit of learning about and supporting one another that carried over. And since then, Iâ€™ve been involved in everything they do, without any separation. This is where my passion lies. I love them. Iâ€™ll show you some pictures here. Bruin Battalion, Bravo Company â€" thatâ€™s the name of the group I belong to. The cadre are the officers and sergeants who oversee the ROTC program. In the beginning, you can see, it was a bit of an awkward phase. But once they learned more about me and what Iâ€™m capable of doing, there ’ s been tremendous support and unity. The cadets, my fellow peers â€" well, when you train and sweat together, you feel the bond of camaraderie right away. A brother- or sisterly cohesiveness makes them like family. In training and military science classes, we learn theories of warfare, how to lead soldiers, how to do reconnaissance, strategies, how to knock out a bunker and land navigation, where youâ€™re finding your way out in the mountains. As far as accommodations, Iâ€™ve been provided with interpreters through the National Center on Deafness, NCOD, here at CSUN. And I really have to thank them, because it ’ s hard to find interpreters who are willing to wake up at 4:30 in the morning, or sometimes even 3:30 in the morning. That ’ s the officer who emailed me back, saying I think you can have a few classes with us. That ’ s Lieutenant Mendoza. Thatâ€™s my interpreter there, before class starts. This is a picture from last fall, when we were new to training. This is Lieutenant Colonel Phelps, this being his name sign. He ’ s the commanding officer of the entire Bruin Battalion. Every time I see him walk by, itâ€™s rather inspiring. I mean, the way he presents himself, you can see heâ€™s the epitome of a soldier. Plus, he doesn ’ t view me as a deaf person. He looks at my skills and capabilities instead. Heâ€™s really pushed for me, and I respect him for all that. Thatâ€™s me during one of the exercises. This is that Chinook helicopter I almost didnâ€™t get on. Every cadet has a mentor. My mentor is Cinatl. Heâ€™s a really sharp soldier. He teaches me all the finer points and how to execute them ideally. This top picture is when a group of us went to Las Vegas to compete in a test, to see if we could match the German **troops** ’ physical training standards. It involved swimming, timed sprints, marksmanship and numerous fitness events. I passed them and satisfied the requirements to be awarded the gold German Armed Forces Proficiency Badge right here. This is one of the sergeants, Sergeant Richardson. I love this guy. He doesn ’ t take baloney from any of us cadets. Here I am one morning, when we trekked seven and a half miles with a 40-pound rucksack in less than two hours. Here are a few of my fellow cadets. I ’ ve been with them long enough that Iâ€™ve developed name signs for them. On the right, here, is Trinidad. I gave him this name sign because he ’ s always very sarcastic. He ’ s a veteran, having served in Iraq and Afghanistan. The female is Frigo, whose nickname is”Refrigerator,”hence her name sign. Weâre always competing intellectually in class. The cadet on the end is Jarvy. He ’ s a top athlete. I ’ ve given him this sign because of the scar he has here. Do you know who this is? This is the Chairman of the Joint Chiefs of Staff. He is the highest-ranking military officer and principal military advisor to President Obama and Secretary of Defense Gates. He gave a talk at UCLA to a full house. Afterwards, I lined up to shake his hand. Having done so, I greeted him, âItâs a great pleasure to meet you. â I signed and my interpreter voiced for me. Admiral Mullen turned to the interpreter and said, âItâs nice to meet you, â addressing the interpreter, who refrained to clarify. He seemed a little confused and just quickly moved on to shake hands with the rest of the soldiers. So Iâm not sure whether he really knew that I ’ m deaf or not. So everythingâs been moving along, gung-ho, full speed ahead, until two weeks ago, when something occurred. Well, the ROTC has four levels. Iâm currently doing the first two levels, which finishes up this May. The third level will begin in the fall. But in order to move up, you need to pass a medical exam. Obviously, Iâm deaf, so Iâd fail a hearing test. So we sat down, and I was told that if I wanted to continue to the third level, I couldnât do any of the PT workouts in the morning, nor the Friday lab field trainings, nor the army base trainings. My uniform, I would have to give back as well. I could take the classes, audit them, and thatâs all. It really hit me. It was a huge blow. Many of the officers and cadets have empathized with this sudden shock of disappointment, and are wondering why this has to be the case. Colonel Phelps has tried to speak with the higher-ups in the chain of command and explain to them that Iâm one of the top cadets, having passed all the events and receiving high marks on my exams. But their response is unwavering : policy is policy, and if youâre deaf, youâre disqualified. I know that the cadre has tried to find **various** ways. They found out that there ’ s a deaf cadet at The Citadel, a military college in South Carolina. That particular cadet will be completing his fourth year there and graduating this May. Yet, he ’ s in the same predicament that I ’ m in â unable to join the army because heâs deaf. Yet, all of my fellow cadets and the officers have told me not to give up ; the policy must change. I was advised to talk with my congressman. And I ’ ve brought this issue to Henry Waxman, the district congressman here in LA, to get the **ball** rolling with his advocacy for my cause. However, I need your help and support to lobby. All of us, you know? If you remember back in US history, African-Americans were told they couldnât join the military, and now they serve. Women as well were banned, but now they ’ ve been allowed. The military has and is changing. Today is our time. Now itâs our turn. Hooah!

Text Sample 860: POS Dim 6 – 2011 – Score 5.00 – 2011/t002436.txt

The things we make have one supreme quality â they live longer than us. We perish, they survive ; we have one life, they have many lives, and in each life they can mean different things. Which means that, while we all have one biography, they have many. I want this morning to talk about the story, the biography â or rather the biographies â of one particular object, one **remarkable** thing. It doesn ’ t, I agree, look very much. It ’ s about the size of a rugby **ball**. It ’ s made of clay, and it ’ s been fashioned into a cylinder shape, covered with close writing and then baked dry in the sun. And as you can see, it ’ s been knocked about a bit, which is not surprising because it was made two and a half thousand years ago and was dug up in 1879. But today, this thing is, I believe, a major player in the politics of the Middle East. And it ’ s an object with fascinating stories and stories that are by no means over yet. The story begins in the Iran-Iraq war and that series of events that culminated in the invasion of Iraq by foreign forces, the removal of a despotic ruler and instant regime change. And I want to begin with one episode from that sequence of events that most of you would be very familiar with, Belshazzar ' s feast â because we ' re talking about the Iran-Iraq war of 539 BC. And the parallels between the events of 539 BC and 2003 and in between are startling. What you ' re looking at is Rembrandt ' s painting, now in the National Gallery in London, **illustrating** the text from the prophet Daniel in the Hebrew scriptures. And you all know roughly the story. Belshazzar, the son of Nebuchadnezzar, Nebuchadnezzar who ' d conquered Israel, sacked Jerusalem and captured the people and taken the Jews back to Babylon. Not only the Jews, he ' d taken the temple vessels. He ' d ransacked, desecrated the temple. And the great gold vessels of the temple in Jerusalem had been taken to Babylon. Belshazzar, his son, decides to have a feast. And in order to make it even more exciting, he added a bit of sacrilege to the rest of the fun, and he brings out the temple vessels. He ' s already at war with the Iranians, with the king of Persia. And that night, Daniel tells us, at the height of the festivities a hand appeared and wrote on the wall,"You are weighed in the balance and found wanting, and your kingdom is handed over to the Medes and the Persians."And that very night Cyrus, king of the Persians, entered Babylon and the whole regime of Belshazzar fell. It is, of course, a great moment in the history of the Jewish people. It ' s a great story. It ' s story we all know."The writing on the wall"is part of our everyday language. What happened next was **remarkable**, and it ' s where our cylinder enters the story. Cyrus, king of the Persians, has entered Babylon without a fight â the great empire of Babylon, which ran from central southern Iraq to the Mediterranean, falls to Cyrus. And Cyrus makes a declaration. And that is what this cylinder is, the declaration made by the ruler guided by God who had toppled the Iraqi despot and was going to bring freedom to the people. In ringing Babylonian â it was written in Babylonian â he says,"I am Cyrus, king of all the universe, the great king, the powerful king, king of Babylon, king of the four quarters of the world."They ' re not shy of hyperbole as you can see. This is probably the first real press release by a victorious army that we ' ve got. And it ' s written, as we ' ll see in due course, by very skilled P. R. consultants. So the hyperbole is not actually surprising. And what is the great king, the powerful king, the king of the four quarters of the world going to do? He goes on to say that, having conquered Babylon, he will at once let all the peoples that the Babylonians â Nebuchadnezzar and Belshazzar â have captured and enslaved go free. He ' ll let them return to their countries. And more important, he will let them all recover the gods, the statues, the temple vessels that had been confiscated. All the peoples that the Babylonians had repressed and removed will go home, and they ' ll take with them their gods. And they ' ll be able to restore their altars and to worship their gods in their own way, in their own place. This is the decree, this object is the evidence for the fact that the Jews, after the exile in Babylon, the years they ' d spent sitting by the waters of Babylon, weeping when they remembered Jerusalem, those Jews were allowed to go home. They were allowed to return to Jerusalem and to rebuild the temple. It ' s a central document in Jewish history. And the Book of Chronicles, the Book of Ezra in the Hebrew scriptures reported in ringing terms. This is the Jewish version of the same story."Thus said Cyrus, king of Persia, ' All the kingdoms of the earth have the Lord God of heaven given thee, and he has charged me to build him a house in Jerusalem. Who is there among you of his people? The Lord God be with him, and let him go up. '""Go up"â aaleh. The central element, still, of the notion of return, a central part of the life of Judaism. As you all know, that return from exile, the second temple, reshaped Judaism. And that change, that great historic moment, was made possible by Cyrus, the king of Persia, reported for us in Hebrew in scripture and in Babylonian in clay. Two great texts, what about the politics? What was going on was the fundamental shift in Middle Eastern history. The empire of Iran, the Medes and the Persians, united under Cyrus, became the first great world empire. Cyrus begins in the 530s BC. And by the time of his son Darius, the whole of the eastern Mediterranean is under Persian control. This empire is, in fact, the Middle East as we now know it, and it ’ s what shapes the Middle East as we now know it. It was the largest empire the world had known until then. Much more important, it was the first multicultural, multifaith state on a huge scale. And it had to be run in a quite new way. It had to be run in different languages. The fact that this decree is in Babylonian says one thing. And it had to recognize their different habits, different peoples, different religions, different faiths. All of those are respected by Cyrus. Cyrus sets up a model of how you run a great multinational, multifaith, multicultural society. And the result of that was an empire that included the areas you see on the screen, and which survived for 200 years of stability until it was shattered by Alexander. It left a dream of the Middle East as a unit, and a unit where people of different faiths could live together. The Greek invasions ended that. And of course, Alexander couldn ’ t sustain a government and it fragmented. But what Cyrus represented remained absolutely central. The Greek historian Xenophon wrote his book”Cyropaedia”promoting Cyrus as the great ruler. And throughout European culture afterward, Cyrus remained the model. This is a 16th century image to show you how widespread his veneration actually was. And Xenophon ’ s book on Cyrus on how you ran a diverse society was one of the great textbooks that inspired the Founding Fathers of the American Revolution. Jefferson was a great admirer â the ideals of Cyrus obviously speaking to those 18th century ideals of how you create religious tolerance in a new state. Meanwhile, back in Babylon, things had not been going well. After Alexander, the other empires, Babylon declines, falls into ruins, and all the traces of the great Babylonian empire are lost â until 1879 when the cylinder is discovered by a British Museum exhibition digging in Babylon. And it enters now another story. It enters that great debate in the middle of the 19th century : Are the scriptures reliable? Can we trust them? We only knew about the return of the Jews and the decree of Cyrus from the Hebrew scriptures. No other evidence. Suddenly, this appeared. And great excitement to a world where those who believed in the scriptures had had their faith in creation shaken by evolution, by geology, here was evidence that the scriptures were historically true. It ’ s a great 19th century moment. But â and this, of course, is where it becomes complicated â the facts were true, hurrah for archeology, but the interpretation was rather more complicated. Because the cylinder account and the Hebrew Bible account differ in one key respect. The Babylonian cylinder is written by the priests of the great god of Bablyon, Marduk. And, not surprisingly, they tell you that all this was done by Marduk.”Marduk, we hold, called Cyrus by his name.”Marduk takes Cyrus by the hand, calls him to shepherd his people and gives him the rule of Babylon. Marduk tells Cyrus that he will do these great, generous things of setting the people free. And this is why we should all be grateful to and worship Marduk. The Hebrew writers in the Old Testament, you will not be surprised to learn, take a rather different view of this. For them, of course, it can ’ t possibly by Marduk that made all this happen. It can only be Jehovah. And so in Isaiah, we have the wonderful texts giving all the credit of this, not to Marduk but to the Lord God of Israel â the Lord God of Israel who also called Cyrus by name, also takes Cyrus by the hand and talks of him shepherding his people. It ’ s a **remarkable** example of two different priestly appropriations of the same event, two different religious takeovers of a political fact. God, we know, is usually on the side of the big battalions. The question is, which god was it? And the debate unsettles everybody in the 19th century to realize that the Hebrew scriptures are part of a much wider world of religion. And it ' s quite clear the cylinder is older than the text of Isaiah, and yet, Jehovah is speaking in words very similar to those used by Marduk. And there ' s a slight sense that Isaiah knows this, because he says, this is God speaking, of course,"I have called thee by thy name though thou hast not known me."I think it ' s recognized that Cyrus doesn ' t realize that he ' s acting under orders from Jehovah. And equally, he ' d have been surprised that he was acting under orders from Marduk. Because interestingly, of course, Cyrus is a good Iranian with a totally different set of gods who are not mentioned in any of these texts. That ' s 1879. 40 years on and we ' re in 1917, and the cylinder enters a different world. This time, the real politics of the contemporary world â the year of the Balfour Declaration, the year when the new imperial power in the Middle East, Britain, decides that it will declare a Jewish national home, it will allow the Jews to return. And the response to this by the Jewish population in Eastern Europe is rhapsodic. And across Eastern Europe, Jews **display** pictures of Cyrus and of George V side by side â the two great rulers who have allowed the return to Jerusalem. And the Cyrus cylinder comes back into public view and the text of this as a demonstration of why what is going to happen after the war is over in 1918 is part of a divine plan. You all know what happened. The state of Israel is setup, and 50 years later, in the late 60s, it ' s clear that Britain ' s role as the imperial power is over. And another story of the cylinder begins. The region, the U. K. and the U. S. decide, has to be kept safe from communism, and the superpower that will be created to do this would be Iran, the Shah. And so the Shah invents an Iranian history, or a return to Iranian history, that puts him in the center of a great tradition and produces coins showing himself with the Cyrus cylinder. When he has his great celebrations in Persepolis, he summons the cylinder and the cylinder is lent by the British Museum, goes to Tehran, and is part of those great celebrations of the Pahlavi dynasty. Cyrus cylinder : guarantor of the Shah. 10 years later, another story : Iranian Revolution, 1979. Islamic revolution, no more Cyrus ; we ' re not interested in that history, we ' re interested in Islamic Iran â until Iraq, the new superpower that we ' ve all decided should be in the region, attacks. Then another Iran-Iraq war. And it becomes critical for the Iranians to remember their great past, their great past when they fought Iraq and won. It becomes critical to find a symbol that will pull together all Iranians â Muslims and non-Muslims, Christians, Zoroastrians, Jews living in Iran, people who are devout, not devout. And the obvious emblem is Cyrus. So when the British Museum and Tehran National Musuem cooperate and work together, as we ' ve been doing, the Iranians ask for one thing only as a loan. It ' s the only object they want. They want to borrow the Cyrus cylinder. And last year, the Cyrus cylinder went to Tehran for the second time. It ' s shown being presented here, put into its case by the director of the National Museum of Tehran, one of the many women in Iran in very senior positions, Mrs. Ardakani. It was a huge event. This is the other side of that same picture. It ' s seen in Tehran by between one and two million people in the space of a few months. This is beyond any blockbuster exhibition in the West. And it ' s the subject of a huge debate about what this cylinder means, what Cyrus means, but above all, Cyrus as **articulated** through this cylinder â Cyrus as the defender of the homeland, the champion, of course, of Iranian identity and of the Iranian peoples, tolerant of all faiths. And in the current Iran, Zoroastrians and Christians have guaranteed places in the Iranian parliament, something to be very, very proud of. To see this object in Tehran, thousands of

Jews living in Iran came to Tehran to see it. It became a great emblem, a great subject of debate about what Iran is at home and abroad. Is Iran still to be the defender of the oppressed? Will Iran set free the people that the tyrants have enslaved and expropriated? This is heady national rhetoric, and it was all put together in a great pageant launching the return. Here you see this out-sized Cyrus cylinder on the stage with great figures from Iranian history gathering to take their place in the heritage of Iran. It was a narrative presented by the president himself. And for me, to take this object to Iran, to be allowed to take this object to Iran was to be allowed to be part of an extraordinary debate led at the highest levels about what Iran is, what different Irans there are and how the different histories of Iran might shape the world today. It ’ s a debate that ’ s still continuing, and it will continue to rumble, because this object is one of the great declarations of a human aspiration. It stands with the American constitution. It certainly says far more about real freedoms than Magna Carta. It is a document that can mean so many things, for Iran and for the region. A replica of this is at the United Nations. In New York this autumn, it will be present when the great debates about the future of the Middle East take place. And I want to finish by asking you what the next story will be in which this object figures. It will appear, certainly, in many more Middle Eastern stories. And what story of the Middle East, what story of the world, do you want to see reflecting what is said, what is expressed in this cylinder? The right of peoples to live together in the same state, worshiping differently, freely â a Middle East, a world, in which religion is not the subject of division or of debate. In the world of the Middle East at the moment, the debates are, as you know, shrill. But I think it ’ s possible that the most powerful and the wisest voice of all of them may well be the voice of this mute thing, the Cyrus cylinder. Thank you.

Text Sample 861: POS Dim 6 – 2013 – Score 6.00 – 2013/t002003.txt

When I first began recording wild soundscapes 45 years ago, I had no idea that ants, insect larvae, sea anemones and viruses created a sound signature. But they do. And so does every wild habitat on the planet, like the Amazon rainforest you ’ re hearing behind me. In fact, temperate and tropical rainforests each produce a vibrant animal orchestra, that instantaneous and organized expression of insects, reptiles, amphibians, birds and mammals. And every soundscape that springs from a wild habitat generates its own unique signature, one that contains incredible amounts of information, and it ’ s some of that information I want to share with you today. The soundscape is made up of three basic sources. The first is the geophony, or the nonbiological sounds that occur in any given habitat, like wind in the trees, water in a stream, waves at the ocean shore, movement of the Earth. The second of these is the biophony. The biophony is all of the sound that ’ s generated by organisms in a given habitat at one time and in one place. And the third is all of the sound that we humans generate that ’ s called anthrophony. Some of it is controlled, like music or theater, but most of it is chaotic and incoherent, which some of us refer to as noise. There was a time when I considered wild soundscapes to be a worthless **artifact**. They were just there, but they had no significance. Well, I was wrong. What I learned from these encounters was that careful listening gives us incredibly valuable tools by which to evaluate the health of a habitat across the entire spectrum of life. When I began recording in the late ’ 60s, the **typical** methods of recording were limited to the fragmented capture of individual species like birds mostly, in the beginning, but later animals like mammals and amphibians. To me, this was a little like trying to understand the magnificence of Beethoven ’ s Fifth Symphony by abstracting the sound of a single violin player out of the context of the orchestra and hearing just that one part. Fortunately, more and more institutions are implementing the more holistic models that I and a few of my colleagues have introduced to the field of soundscape ecology. When I began recording over four decades ago, I could record for 10 hours and capture one hour of usable material, good enough for an album or a film soundtrack or a museum installation. Now, because of global warming, resource extraction, and human noise, among many other factors, it can take up to 1, 000 hours or more to capture the same thing. Fully 50 percent of my archive comes from habitats so radically altered that they ’ re either altogether silent or can no longer be heard in any of their original form. The usual methods of evaluating a habitat have been done by visually counting the numbers of species and the numbers of individuals within each species in a given area. However, by comparing data that ties together both density and diversity from what we hear, I ’ m able to arrive at much more precise fitness outcomes. And I want to show you some examples that typify the possibilities unlocked by diving into this universe. This is Lincoln Meadow. Lincoln Meadow ’ s a three-and-a-half-hour drive east of San Francisco in the Sierra Nevada Mountains, at about 2, 000 meters altitude, and I ’ ve been recording there for many years. In 1988, a logging company convinced local residents that there would be absolutely no environmental impact from a new method they were trying called”selective logging,”taking out a tree here and there rather than clear-cutting a whole area. With permission granted to record both before and after the operation, I set up my gear and captured a large number of dawn choruses to very strict protocol and calibrated recordings, because I wanted a really good baseline. This is an example of a spectrogram. A spectrogram is a graphic illustration of sound with time from left to right across the page — 15 seconds in this case is represented — and frequency from the bottom of the page to the top, lowest to highest. And you can see that the signature of a stream is represented here in the bottom third or half of the page, while birds that were once in that meadow are represented in the signature across the top. There were a lot of them. And here ’ s Lincoln Meadow before selective logging. Well, a year later I returned, and using the same protocols and recording under the same conditions, I recorded a number of examples of the same dawn choruses, and now this is what we ’ ve got. This is after selective logging. You can see that the stream is still represented in the bottom third of the page, but notice what ’ s missing in the top two thirds. Coming up is the sound of a woodpecker. Well, I ’ ve returned to Lincoln Meadow 15 times in the last 25 years, and I can tell you that the biophony, the density and diversity of that biophony, has not yet returned to anything like it was before the operation. But here ’ s a picture of Lincoln Meadow taken after, and you can see that from the perspective of the camera or the human eye, hardly a stick or a tree appears to be out of place, which would confirm the logging company ’ s contention that there ’ s nothing of environmental impact. However, our ears tell us a very different story. Young students are always asking me what these animals are saying, and really I ’ ve got no idea. But I can tell you that they do express themselves. Whether or not we understand it is a different story. I was walking along the shore in Alaska, and I came across this tide pool filled with a colony of sea anemones, these wonderful eating machines, relatives of coral and jellyfish. And curious to see if any of them made any noise, I dropped a hydrophone, an underwater microphone covered in rubber, down the mouth part, and immediately the critter began to absorb the microphone into its belly, and the tentacles were searching out of the surface for something of nutritional value. The static-like sounds that are very low, that you ’ re going to hear right now. Yeah, but watch. When it didn ’ t find anything to eat — I think that ’ s an expression that can be understood in any language. At the end of its breeding cycle, the Great Basin Spadefoot toad digs itself down about a meter under the hard-panned desert soil of the American West, where it can stay for many seasons until conditions are just right for it to emerge again. And when there ’ s enough moisture in the soil in the spring, frogs will dig themselves to the surface and gather around these large, vernal pools in great numbers. And they vocalize in a chorus that ’ s absolutely in sync with one another. And they do that for two reasons. The first is competitive, because they ’ re looking for mates, and the second is cooperative, because if they ’ re all vocalizing in sync together, it makes it really difficult for predators like coyotes, foxes and owls to single out any individual for a meal. This is a spectrogram of what the frog chorusing looks like when it ’ s in a very healthy pattern. Mono Lake is just to the east of Yosemite National Park in California, and it ’ s a favorite habitat of these toads, and it ’ s also favored by U. S. Navy jet pilots, who train in their fighters flying them at speeds exceeding 1, 100 kilometers an hour and altitudes only a couple hundred meters above ground level of the Mono Basin, very fast, very low, and so loud that the anthrophony, the human noise, even though it ’ s six and a half kilometers from the frog pond you just heard a second ago, it **masked** the sound of the chorusing toads. You can see in this spectrogram that all of the energy that was once in the first spectrogram is gone from the top end of the spectrogram, and that there ’ s breaks in the chorusing at two and a half, four and a half, and six and a half seconds, and then the sound of the jet, the signature, is in yellow at the very bottom of the page. Now at the end of that flyby, it took the frogs fully 45 minutes to regain their chorusing synchronicity, during which time, and under a full moon, we watched as two coyotes and a great horned owl came in to pick off a few of their numbers. The good news is that, with a little bit of habitat restoration and fewer flights, the frog populations, once diminishing during the 1980s and early ’ 90s, have pretty much returned to normal. I want to end with a story told by a beaver. It ’ s a very sad story, but it really **illustrates** how animals can sometimes show emotion, a very controversial subject among some older biologists. A colleague of mine was recording in the American Midwest around this pond that had been formed maybe 16, 000 years ago at the end of the last ice age. It was also formed in part by a beaver dam at one end that held that whole ecosystem together in a very delicate balance. And one afternoon, while he was recording, there suddenly appeared from out of nowhere a couple of game wardens, who for no apparent reason, walked over to the beaver dam, dropped a stick of dynamite down it, blowing it up, killing the female and her young babies. Horrified, my colleagues remained behind to gather his thoughts and to record whatever he could the rest of the afternoon, and that evening, he captured a **remarkable** event : the lone surviving male beaver swimming in slow circles crying out inconsolably for its lost mate and offspring. This is probably the saddest sound I ’ ve ever heard coming from any organism, human or other. Yeah. Well. There are many facets to soundscapes, among them the ways in which animals taught us to dance and sing, which I ’ ll save for another time. But you have heard how biophonies help clarify our understanding of the natural world. You ’ ve heard the impact of resource extraction, human noise and habitat destruction. And where environmental sciences have typically tried to understand the world from what we see, a much fuller understanding can be got from what we hear. Biophonies and geophonies are the signature voices of the natural world, and as we hear them, we ’ re endowed with a sense of place, the true story of the world we live in. In a matter of seconds, a soundscape reveals much more information from many perspectives, from quantifiable data to cultural inspiration. Visual capture implicitly frames a limited frontal perspective of a given **spatial** context, while soundscapes widen that scope to a full 360 degrees, completely enveloping us. And while a picture may be worth 1, 000 words, a soundscape is worth 1, 000 pictures. And our ears tell us that the whisper of every leaf and creature speaks to the natural sources of our lives, which indeed may hold the secrets of love for all things, especially our own humanity, and the last word goes to a jaguar from the Amazon. Thank you for listening.

Text Sample 862: POS Dim 6 – 2013 – Score 6.00 – 2013/t002089.txt
I ' m almost like a crazy evangelical. I ' ve always known that the age of design is upon us, almost like a rapture. If the day is sunny, I think,"Oh, the gods have had a good design day."Or, I go to a show and I see a beautiful piece by an artist, particularly beautiful, I say he ' s so good because he clearly looked to design to understand what he needed to do. So I really do believe that design is the highest form of creative expression. That ' s why I ' m talking to you today about the age of design, and the age of design is the age in which design is still cute furniture, is still posters, is still fast cars, what you see at MoMA today. But in truth, what I really would like to explain to the public and to the audiences of MoMA is that the most interesting chairs are the ones that are actually made by a robot, like this beautiful chair by Dirk Vander Kooij, where a robot deposits a toothpaste-like slur of recycled refrigerator parts, as if he were a big candy, and makes a chair out of it. Or good design is digital fonts that we use all the time and that become part of our identity. I want people to understand that design is so much more than cute chairs, that it is first and foremost everything that is around us in our life. And it ' s interesting how so much of what we ' re talking about tonight is not simply design but interaction design. And in fact, interaction design is what I ' ve been trying to insert in the collection of the Museum of Modern Art for a few years, starting not very timidly but just pointedly with works, for instance, by Martin Wattenberg — the way a machine plays chess with itself, that you see here, or Lisa Strausfeld and her partners, the Sugar **interface** for One Laptop Per Child, Toshio Iwai ' s Tenori-On musical instruments, and Philip Worthington ' s Shadow Monsters, and John Maeda ' s Reactive Books, and also Jonathan Harris and Sep Kamvar ' s I Want You To Want Me. These were some of the first acquisitions that really introduced the idea of interaction design to the public. But more recently, I ' ve been trying really to go even deeper into interaction design with examples that are emotionally really suggestive and that really explain interaction design at a level that is almost undeniable. The Wind Map, by Wattenberg and Fernanda Vigas, I don ' t know if you ' ve ever seen it — it ' s really fantastic. It looks at the territory of the United States as if it were a wheat field that is procured by the winds and that is really giving you a pictorial image of what ' s going on with the winds in the United States. But also, more recently, we started acquiring video games, and that ' s where all hell broke loose in a really interesting way. There are still people that believe that there ' s a high and there ' s a low. And that ' s really what I find so intriguing about the reactions that we ' ve had to the anointment of video games in the MoMA collection. We ' ve — No, first of all, New York Magazine always gets it. I love them. So we are in the right quadrant. We are in the Highbrow — that ' s daring, that ' s courageous — and Brilliant, which is great. Timidly, we ' ve been higher on the **diagonal** in other situations, but it ' s okay. It ' s good. It ' s good. It ' s good. But here comes the art critic. Oh, that was fantastic. So the first was Jonathan Jones from The Guardian."Sorry, MoMA, video games are not art."Did I ever say they were

art? I was talking about interaction design. Excuse me.”Exhibiting Pac-Man and Tetris alongside Picasso and Van Gogh”— They ’ re two floors away. —”will mean game over for any real understanding of art.”I ’ m bringing in the end of the world. You know? We were talking about the rapture? It ’ s coming. And Jonathan Jones is making it happen. So the same Guardian rebuts,”Are video games art : the debate that shouldn ’ t be. Last week, Guardian art critic blah blah suggested that games cannot qualify as art. But is he right? And does it matter?”Thank you. Does it matter? You know, it ’ s like once again there ’ s this whole problem of design being often misunderstood for art, or the idea that is so diffuse that designers want to aspire to, would like to be called, artists. No. Designers aspire to be really great designers. Thank you very much. And that ’ s more than enough. So my knight in shining armor, John Maeda, without any prompt, came out with this big declaration on why video games belong in the MoMA. And that was fantastic. And I thought that was it. But then there was another wonderfully pretentious article that came out in The New Republic, so pretentious, by Liel Leibovitz, and it said,”MoMA has mistaken video games for art.”Again.”The museum is putting Pac-Man alongside Picasso.”Again.”That misses the point.”Excuse me. You ’ re missing the point. And here, look, the above question is put bluntly :”Are video games art? No. Video games aren ’ t art because they are quite thoroughly something else : code.”Oh, so Picasso is not art because it ’ s oil paint. Right? So it ’ s so fantastic to see how these feathers that were ruffled, and these reactions, were so vehement. And you know what? The International Cat Video Film Festival didn ’ t have that much of a reaction. I think this was truly fantastic. We were talking about dancing ponies, but I was really jealous of the Walker Arts Center for putting up this festival, because it ’ s very, very wonderful. And there ’ s this Flaubert quote that I love :”I have always tried to live in an ivory tower, but a tide of shit is beating at its walls, threatening to undermine it.”I consider myself the tide of shit. You know, we have to go through that. Even in the 1930s, my colleagues that were trying to put together an abstract art show had all of these works stopped by the customs officers that decided they were not art. So it ’ s happened before, and it will happen in the future, but right now I can tell you that I am so, so proud to be able to call Pac-Man part of the MoMA collection. And the same with, for instance, Tetris, original version, the Soviet one. And you know, the amount of work — yeah, Alexey Pajitnov was working for the Soviet government and that ’ s how he developed Tetris, and Alexey himself reconstructed the whole game and even gave us a simulation of the cathode ray tube that makes it look slightly bombed. And it ’ s fantastic. So behind these acquisitions is an enormous amount of work, because we ’ re still the Museum of Modern Art, so even when we tackle popular culture, we tackle it as a form of interaction design and as something that has to go into the collection at MoMA, therefore, has to be researched. So to get to choosing Eric Chahi ’ s wonderful Another World, amongst others, we put together a panel of experts, and we worked on this acquisition, and it ’ s mostly myself and Kate Carmody and Paul Galloway. We worked on it for a year and a half. So many people helped us — designers of games, you might know Jamin Warren and his collaborators at Kill Screen magazine, and you know, Kevin Slavin. You name it. We bugged everybody, because we knew that we were ignorant. We were not real gamers enough, so we had to really talk to them. And so we decided, of course, to have Sim City 2000, not the other Sim City, that one in particular, so the criteria that we developed along the way were really strong, and were not only criteria of selection. They were also criteria of exhibition and of preservation. That ’ s what makes this acquisition more than a little game or a little joke. It ’ s truly a way to think of how to preserve and show **artifacts** that will more and more become part of our lives in the future. We live today, as you know very well, not in the digital, not in the physical, but in the kind of minestrone that our mind makes of the two. And that ' s really where interaction lies, and that ' s the importance of interaction. And in order to explain interaction, we need to really bring people in and make them realize how interaction is part of their lives. So when I talk about it, I don ' t talk only about video games, which are in a way the purest form of interaction, unadulterated by any kind of function or finality. I also talk about the MetroCard vending machine, which I consider a masterpiece of interaction. I mean, that **interface** is beautiful. It looks like a burly MTA guy coming out of the tunnel. You know, with your mitt you can actually paw the MetroCard, and I talk about how bad ATM machines usually are. So I let people understand that it ' s up to them to know how to judge interaction so as to know when it ' s good or when it ' s bad. So when I show The Sims, I try to make people really feel what it meant to have an interaction with The Sims, not only the fun but also the responsibility that came with the Tamagotchi. You know, video games can be truly deep even when they ' re completely mindless. I ' m sure that all of you know Katamari Damacy. It ' s about rolling a **ball** and picking up as many objects as you can in a finite amount of time and hopefully you ' ll be able to make it into a planet. I ' ve never made it into a planet, but that ' s it. Or, you know, Vib-Ribbon was not distributed here in the United States. It was a PlayStation game, but mostly for Japan. And it was one of the first video games in which you could choose your own music. So you would put into the PlayStation, you would put your own CD, and then the game would change alongside your music. So really fantastic. Not to mention Eve Online. Eve Online is an artificial universe, if you wish, but one of the diplomats that was killed in Benghazi, not Ambassador Stevens, but one of his collaborators, was a really big shot in Eve Online, so here you have a diplomat in the real world that spends his time in Eve Online to kind of test, maybe, all of his ideas about diplomacy and about universe-building, and to the point that the first announcement of the bombing was actually given on Eve Online, and after his death, several parts of the universe were named after him. And I was just recently at the Eve Online fan festival in Reykjavk that was quite amazing. I mean, we ' re talking about an experience that of course can seem weird to many, but that is very educational. Of course, there are games that are even more educational. Dwarf Fortress is like the holy grail of this kind of massive multiplayer online game, and in fact the two Adams brothers were in Reykjavk, and they were greeted by a standing ovation by all the Eve Online fans. It was amazing to see. And it ' s a beautiful game. So you start seeing here that the aesthetics that are so important to a museum collection like MoMA ' s are kept alive also by the selection of these games. And you know, Valve — you know, Portal — is an example of a video game in which you have a certain type of violence which also leads me to talk about one of the biggest issues that we had to discuss when we acquired the video games, what to do with violence. Right? We had to make decisions. At MoMA, interestingly, there ' s a lot of violence depicted in the art part of the collection, but when I came to MoMA 19 years ago, and as an Italian, I said,"You know what, we need a Beretta."And I was told,"No. No guns in the design collection."And I was like,"Why?"Interestingly, I learned that it ' s considered that in design and in the design collection, what you see is what you get. So when you see a gun, it ' s an instrument for killing in the design collection. If it ' s in the art collection, it might be a critique of the killing instrument. So it ' s very interesting. But we are acquiring our critical dimension also in design, so maybe one day we ' ll be able to acquire also the guns. But here, in this particular case, we decided, you know, with Kate and Paul, that we would have no gratuitous violence. So we have Portal because you shoot walls in order to create new spaces. We have Street Fighter II, because martial arts are good. But we don ’ t have GTA because, maybe it ’ s my own reflection, I ’ ve never been able to do anything but crashing cars and shooting prostitutes and pimps. So it was not very constructive. So, I ’ m making fun of it, but we discussed this for so many days. You have no idea. And to this day, I am ambivalent, but when you have instead games like Flow, there ’ s no doubt. It ’ s like, it ’ s about serenity and it ’ s about sublime. It ’ s about experiencing what it means to be a sea creature. Then we have a few also side-scrollers — classical ones. So it ’ s quite a hefty collection. And right now, we started with the first 14, but we have several that are coming up, and the reason why we haven ’ t acquired them yet is because you don ’ t acquire just the game. You acquire the relationship with the company. What we want, what we aspire to, is the code. It ’ s very hard to get, of course. But that ’ s what would enable us to preserve the video games for a really long time, and that ’ s what museums do. They also preserve **artifacts** for posterity. In absence of the code, because, you know, video game companies are not very forthcoming in some cases, in absence of that, we acquire the relationship with the company. We ’ re going to stay with them forever. They ’ re not going to get rid of us. And one day, we ’ ll get that code. But I want to explain to you the criteria that we chose for interaction design. Aesthetics are really important. And I ’ m showing you Core War here, which is an early game that takes advantage aesthetically of the limitations of the processor. So the kind of interferences that you see here that look like beautiful barriers in the game are actually a consequence of the processor ’ s limitedness, which is fantastic. So aesthetics is always important. And so is space, the **spatial** aspect of games. You know, I feel that the best video games are the ones that have really savvy architects that are behind them, and if they ’ re not architects, bona fide trained in architecture, they have that feeling. But the **spatial** evolution in video games is extremely important. Time. The way we experience time in video games, as in other forms of interaction design, is really quite amazing. It can be real time or it can be the time within the game, as is in Animal Crossing, where seasons follow each other at their own pace. So time, space, aesthetics, and then, most important, behavior. The real core issue of interaction design is behavior. Designers that deal with interaction design behaviors that go to influence the rest of our lives. They ’ re not just limited to our interaction with the screen. In this case, I ’ m showing you Marble Madness, which is a beautiful game in which the controller is a big sphere that vibrates with you, so you have a sphere that ’ s moving in this landscape, and the sphere, the controller itself, gives you a sense of the movement. In a way, you can see how video games are the purest aspect of interaction design and are very useful to explain what interaction is. We don ’ t want to show the video games with the paraphernalia. No arcade nostalgia. If anything, we want to show the code, and here you see Ben Fry ’ s distellamap of Pac-Man, of the Pac-Man code. So the way we acquired the games is very interesting and very unorthodox. You see them here **displayed** alongside other examples of design, furniture and other parts, but there ’ s no paraphernalia, no nostalagia, only the screen and a little shelf with the controllers. The controllers are, of course, part of the experience, so you cannot do away with it. But interestingly, this choice was not condemned too vehemently by gamers. I was afraid that they would kill us, and instead they understood, especially when I told them that I was trying to apply the same stratagem that Philip Johnson applied in 1934 when he wanted to make people understand the importance of design, and he took propeller blades and pieces of machinery and in the MoMA galleries he put them on white pedestals against white walls, as if they were Brancusi sculptures. He created this strange distance, this shock, that made people realize how gorgeous formally, and also important functionally, design pieces were. I would like to do the same with video games. By getting rid of the sticky carpets and the cigarette butts and everything else that we might remember from our childhood, I want people to understand that those are important forms of design. And in a way, the video games, the fonts and everything else lead us to make people understand a wider meaning for design. One of my dream acquisitions, which has been on hold for a few years but now will come back on the front burner, is a 747. I would like to acquire it, but without owning it. I don ’ t want it to be at MoMA and possessed by MoMA. I want it to keep flying. So it ’ s an acquisition where MoMA makes an arrangement with an airline and keeps the Boeing 747 flying. And the same with the”@”sign that we acquired a few years ago. It was the first example of an acquisition of something that is in the public domain. And what I say to people, it ’ s almost as if a butterfly were flying by and we captured the shadow on the wall, and just we ’ re showing the shadow. So in a way, we ’ re showing a manifestation of something that is truly important and that is part of our identity but that nobody can have. And it ’ s too long to explain the acquisition, but if you want to go on the MoMA blog, there ’ s a long post where I explain why it ’ s such a great example of design. Along the way, I ’ ve had to burn a few chairs. You know? I ’ ve had to do away with a few concepts of design past. But I see that people are coming along, that the audiences, paradoxically, are much more responsive and much more understanding of this expansion of design than some of my colleagues are. Design is truly everywhere, and design is as important as anything, and I ’ m so glad that, because of its diversity and because of its centrality to our lives, many more people are coming to it as a profession, as a passion, and as, very simply, part of their own culture. Thank you very much.
