A few days after my husband Paul was diagnosed with stage IV lung cancer, we were lying in our bed at home, and Paul said,”It ’ s going to be OK.”And I remember answering **back**,”Yes. We just don ’ t know what OK means yet.”Paul and I had met as first-year medical students at Yale. He was smart and kind and super funny. He used to keep a gorilla suit in the trunk of his car, and he ’ d say,”It ’ s for emergencies only.”I fell in love with Paul as I watched the care he took with his patients. He stayed late talking with them, seeking to understand the experience of illness and not just its technicalities. He later told me he fell in love with me when he saw me cry over an EKG of a heart that had ceased beating. We didn ’ t know it yet, but even in the heady days of young love, we were learning how to approach suffering together. We got married and became doctors. I was working as an internist and Paul was finishing his training as a neurosurgeon when he started to lose weight. He developed excruciating **back** pain and a cough that wouldn ’ t go away. And when he was admitted to the hospital, a CT scan revealed tumors in Paul ’ s lungs and in his bones. We had both cared for patients with devastating diagnoses ; now it was our turn. We lived with Paul ’ s illness for 22 months. He wrote a memoir about facing mortality. I gave birth to our daughter Cady, and we loved her and each other. We learned directly how to struggle through really tough medical decisions. The day we took Paul into the hospital for the last time was the most difficult day of my life. When he turned to me at the end and said,”I ’ m ready,”I knew that wasn ’ t just a brave decision. It was the right one. Paul didn ’ t want a ventilator and CPR. In that moment, the most important thing to Paul was to hold our baby daughter. Nine hours later, Paul died. I ’ ve always thought of myself as a caregiver — most physicians do — and taking care of Paul deepened what that meant. Watching him reshape his identity during his illness, learning to witness and accept his pain, talking together through his choices — those experiences taught me that resilience does not mean bouncing **back** to where you were before, or pretending that the hard stuff isn ’ t hard. It is so hard. It ’ s painful, messy stuff. But it ’ s the stuff. And I learned that when we approach it together, we get to decide what success looks like. One of the first things Paul said to me after his diagnosis was,”I want you to get remarried.”And I was like, whoa, I guess we get to say anything out loud. It was so shocking and heartbreaking... and generous, and really comforting because it was so starkly honest, and that honesty turned out to be exactly what we needed. Early in Paul ’ s illness, we agreed we would just keep saying things out loud. Tasks like making a will, or completing our advance directives — tasks that I had always avoided — were not as daunting as they once seemed. I realized that completing an advance directive is an act of love — like a wedding vow. A pact to take care of someone, codifying the promise that til death do **us** part, I will be there. If needed, I will speak for you. I will honor your wishes. That paperwork became a tangible part of our love story. As physicians, Paul and I were in a good position to understand and even accept his diagnosis. We weren ' t angry about it, luckily, because we ' d seen so many patients in devastating situations, and we knew that death is a part of life. But it ' s one thing to know that ; it was a very different experience to actually live with the sadness and uncertainty of a serious illness. Huge strides are being made against lung cancer, but we knew that Paul likely had months to a few years left to live. During that time, Paul wrote about his transition from doctor to patient. He talked about feeling like he was suddenly at a crossroads, and how he would have thought he ' d be able to see the path, that because he treated so many patients, maybe he could follow in their footsteps. But he was totally disoriented. Rather than a path, Paul wrote,"I saw instead only a harsh, vacant, gleaming white desert. As if a sandstorm had erased all familiarity. I had to face my mortality and try to understand what made my life worth living, and I needed my oncologist ' s help to do so."The clinicians taking care of Paul gave me an even deeper appreciation for my colleagues in health care. We have a tough job. We ' re responsible for helping patients have clarity around their prognoses and their treatment options, and that ' s never easy, but it ' s especially tough when you ' re dealing with potentially terminal illnesses like cancer. Some people don ' t want to know how long they have left, others do. Either way, we never have those answers. Sometimes we substitute hope by emphasizing the best-case scenario. In a survey of physicians, 55 percent said they painted a rosier picture than their honest opinion when describing a patient ' s prognosis. It ' s an instinct born out of kindness. But researchers have found that when people better understand the possible outcomes of an illness, they have less anxiety, greater ability to plan and less trauma for their families. Families can struggle with those conversations, but for **us**, we also found that information immensely helpful with big decisions. Most notably, whether to have a baby. Months to a few years meant Paul was not likely to see her grow up. But he had a good chance of being there for her birth and for the beginning of her life. I remember asking Paul if he thought having to say goodbye to a child would make dying even more painful. And his answer astounded me. He said,"Wouldn ' t it be great if it did?"And we did it. Not in order to spite cancer, but because we were learning that living fully means accepting suffering. Paul ' s oncologist tailored his chemo so he could continue working as a neurosurgeon, which initially we thought was totally impossible. When the cancer advanced and Paul shifted from surgery to writing, his palliative care doctor prescribed a stimulant medication so he could be more focused. They asked Paul about his priorities and his worries. They asked him what trade-offs he was willing to make. Those conversations are the best way to ensure that your health care matches your values. Paul joked that it ' s not like that"birds and bees"talk you have with your parents, where you all get it over with as quickly as possible, and then pretend it never happened. You revisit the conversation as things change. You keep saying things out loud. I ' m forever grateful because Paul ' s clinicians felt that their job wasn ' t to try to give **us** answers they didn ' t have, or only to try to fix things for **us**, but to counsel Paul through painful choices... when his body was failing but his will to live wasn ' t. Later, after Paul died, I received a dozen bouquets of flowers, but I sent just one... to Paul ' s oncologist, because she supported his goals and she helped him weigh his choices. She knew that living means more than just staying alive. A few weeks ago, a patient came into my clinic. A woman dealing with a serious chronic disease. And while we were talking about her life and her health care, she said,"I love my palliative care team. They taught me that it ' s OK to say ' no '."Yeah, I thought, of course it is. But many patients don ' t feel that. Compassion and Choices did a study where they asked people about their health care preferences. And a lot of people started their answers with the words"Well, if I had a choice..."If I had a choice. And when I read that"if,"I understood better why one in four people receives excessive or unwanted medical treatment, or watches a family member receive excessive or unwanted medical treatment. It ' s not because doctors don ' t get it. We do. We understand the real psychological consequences on patients and their families. The things is, we deal with them, too. Half of critical care nurses and a quarter of ICU doctors have considered quitting their jobs because of distress over feeling that for some of their patients, they ' ve provided care that didn ' t fit with the person ' s values. But doctors can ' t make sure your wishes are respected until they know what they are. Would you want to be on life support if it offered any chance of longer life? Are you most worried about the quality of that time, rather than quantity? Both of those choices are thoughtful and brave, but for all of **us**, it ' s our choice. That ' s true at the end of life and for medical care throughout our lives. If you ' re pregnant, do you want genetic screening? Is a knee replacement right or not? Do you want to do dialysis in a clinic or at home? The answer is : it depends. What medical care will help you live the way you want to? I hope you remember that question the next time you face a decision in your health care. Remember that you always have a choice, and it is OK to say no to a treatment that ' s not right for you. There ' s a poem by W. S. Merwin — it ' s just two sentences long — that captures how I feel now."Your absence has gone through me like thread through a needle. Everything I do is stitched with its color."For me that poem evokes my love for Paul, and a new fortitude that came from loving and losing him. When Paul said,"It ' s going to be OK,"that didn ' t mean that we could cure his illness. Instead, we learned to accept both joy and sadness at the same time ; to uncover beauty and purpose both despite and because we are all born and we all die. And for all the sadness and sleepless nights, it turns out there is joy. I leave flowers on Paul ' s grave and watch our two-year-old run around on the grass. I build bonfires on the beach and watch the sunset with our friends. Exercise and mindfulness meditation have helped a lot. And someday, I hope I do get remarried. Most importantly, I get to watch our daughter grow. I ' ve thought a lot about what I ' m going to say to her when she ' s older."Cady, engaging in the full range of experience — living and dying, love and loss — is what we get to do. Being human doesn ' t happen despite suffering. It happens within it. When we approach suffering together, when we choose not to hide from it, our lives don ' t diminish, they expand."I ' ve learned that cancer isn ' t always a battle. Or if it is, maybe it ' s a fight for something different than we thought. Our job isn ' t to fight fate, but to help each other through. Not as soldiers but as shepherds. That ' s how we make it OK, even when it ' s not. By saying it out loud, by helping each other through... and a gorilla suit never hurts, either. Thank you.

I recently read about what the young generation of workers want in Harvard Business Review. One thing that stuck out to me was : don ' t just talk about impact, but make an impact. I ' m a little bit older than you, maybe much older than you, but this is exactly the same goal that I had when I was in college. I wanted to make my own impact for those who live under injustice ; it ' s the reason that I became a documentary journalist, the reason I became a prisoner in North Korea for 140 days. It was March 17, 2009. It is St. Patrick ' s Day for all of you, but it was the day that turned my life upside down. My team and I were making a documentary about North Korean refugees living below human life in China. We were at the border. It was our last day of filming. There was no wire fence or bars or sign to show that it is the border, but this is a place that a lot of North Korean defectors use as an escape route. It was still winter, and the river was frozen. When we were in the middle of the frozen river, we were filming about the condition of the cold weather and the environment that North Koreans had to deal with when they seek their freedom. And suddenly, one of my team members shouted,"Soldiers!"So I looked **back**, and there were two small soldiers in green uniforms with rifles, chasing after **us**. We all ran as fast as we could. I prayed that, please don ' t let them shoot my head. And I was thinking that, if my feet are on Chinese soil, I ' ll be safe. And I made it to Chinese soil. Then I saw my colleague Laura Ling fall on her knees. I didn ' t know what to do at that short moment, but I knew that I could not leave her alone there when she said,"Euna, I can ' t feel my legs."In a flash, we were surrounded by these two Korean soldiers. They were not much bigger than **us**, but they were determined to take **us** to their army base. I begged and yelled for any kind of help, hoping that someone would show up from China. Here I was, being stubborn towards a trained soldier with a gun. I looked at his eyes. He was just a boy. At that moment, he raised his rifle to hit me, but I saw that he was hesitating. His eyes were shaking, and his rifle was still up in the air. So I shouted at him,"OK, OK, I ' ll walk with you."And I got up. When we arrived at their army base, my head was spinning with these worst-case scenarios, and my colleague ' s statement wasn ' t helping. She said,"We are the enemy."She was right : we were the enemy. And I was supposed to be frightened, too. But I kept having these odd experiences. This time, an officer brought me his coat to keep me warm, because I lost my coat on the frozen river while battling with one of these soldiers. I will tell you what I mean by these odd experiences. I grew up in South Korea. To **us**, North Korea was always the enemy, even before I was born. South and North have been under armistice for 63 years, since the end of the Korean War. And growing up in the South in the ' 80s and ' 90s, we were taught propaganda about North Korea. And we heard so many graphic stories, such as, a little young boy being brutally killed by North Korean spies just because he said,"I don ' t like communists."Or, I watched this cartoon series about a young South Korean boy defeating these fat, big, red pig, which represented the North Koreans ' first leader at the time. And the effect of hearing these horrible stories over and over instilled one word in a young mind :"enemy."And I think at some point, I dehumanized them, and the people of North Korea became equated with the North Korean government. Now, **back** to my **detention**. It was the second day of being in a cell. I had not slept since I was out at the border. This young guard came to my cell and offered me this small boiled egg and said,"This will give you strength to keep going."Do you know what it is like, receiving a small kindness in the enemy ' s hand? Whenever they were kind to me, I thought the worst case was waiting for me after the kindness. One officer noticed my nervousness. He said,"Did you think we were all these red pigs?"referring to the cartoon that I just showed you. Every day was like a psychological battle. The interrogator had me sit at a table six days a week and had me writing down about my journey, my work, over and over until I wrote down the confession that they wanted to hear. After about three months of **detention**, the North Korean court sentenced me to 12 years in a labor camp. So I was just sitting in my room to be transferred. At that time, I really had nothing else to do, so I paid attention to these two female guards and listened to what they were talking about. Guard A was older, and she studied English. She seemed like she came from an affluent family. She often showed up with these colorful dresses, and then loved to show off. And Guard B was the younger one, and she was a really good singer. She loved to sing Celine Dion ’ s”My Heart Will Go On”— sometimes too much. She knew just how to torture me without knowing. And this girl spent a lot of time in the morning to put on makeup, like you can see in any young girl ’ s life. And they loved to watch this Chinese drama, a better quality production. I remember Guard B said,”I can no longer watch our TV shows after watching this.”She got scolded for degrading her own country ’ s produced TV shows. Guard B had more of a free mind than Guard A, and she often got scolded by Guard A whenever she expressed herself. One day, they invited all these female colleagues — I don ’ t know where they came from — to where I was held, and they invited me to their guard room and asked if one-night stands really happen in the US. This is the country where young couples are not even allowed to hold hands in public. I had no idea where they had gotten this information, but they were shy and giggly even before I said anything. I think we all forgot that I was their prisoner, and it was like going **back** to my high school classroom again. And I learned that these girls also grew up watching a similar cartoon, but just propaganda towards South Korea and the US. I started to understand where these people ’ s anger was coming from. If these girls grew up learning that we are enemies, it was just natural that they would hate **us** just as I feared them. But at that moment, we were all just girls who shared the same interests, beyond our ideologies that separated **us**. I shared these stories with my boss at Current TV at the time after I came home. His first reaction was,”Euna, have you heard of Stockholm Syndrome?”Yes, and I clearly remember the feeling of fear and being threatened, and tension rising up between me and the interrogator when we talked about politics. There definitely was a wall that we couldn ’ t climb over. But we were able to see each other as human beings when we talked about family, everyday life, the importance of the future for our children. It was about a month before I came home. I got really sick. Guard B stopped by my room to say goodbye, because she was leaving the **detention** center. She made sure that no one watched **us**, no one heard **us**, and quietly said,”I hope you get better and go **back** to your family soon.”It is these people — the officer who brought me his coat, the guard who offered me a boiled egg, these female guards who asked me about dating life in the US — they are the ones that I remember of North Korea : humans just like **us**. North Koreans and I were not ambassadors of our countries, but I believe that we were representing the human race. Now I ’ m **back** home and **back** to my life. The memory of these people has blurred as time has passed. And I ’ m in this place where I read and hear about North Korea provoking the US. I realized how easy it is to see them as an enemy again. But I have to keep reminding myself that when I was over there, I was able to see humanity over hatred in my enemy ’ s eyes. Thank you.

I ’ m an Iranian-American Muslim female, like all of you. And I ’ m also a social justice comedian, something that I insist is an actual job. To explain what that is, let me tell you how I got here. I ’ ve performed all over the country. And let me tell you, America is majestic, right? It ’ s got breathtaking nature, waffle houses and diabetes as far as the eye can see. It is really something. Now, the

American population can be broken up into three main categories : there ' s mostly wonderful people, haters and Florida. Besides Florida, the most troubling category here are the Haters. They are a minority, but they overcompensate by being extra loud. They have the Napoleon complex of demographics, and yes, some of the men do wear heels. As a social justice comedian, it ' s my goal to convert these haters, because they hate a lot of things, which leads to negative outcomes, like racism, violence and Ted Nugent. This is not an exhaustive list ; I ' m probably missing 3-7 items. But the point is, we have to reckon with the haters. But there ' s variance within this group and it ' s not efficient to go after all of them, right? So what I ' ve done is created a highly scientific Taxonomy of Haters. I basically took all of the haters, I put them in a petri dish, like a scientist, and this is what I found. First off, we have the trolls. These are your garden-variety digital haters. They ' re the people who quit their jobs so they can post on YouTube videos all day long. There ' s also the drive-by haters. Now, these people will be at a stoplight, they ' ll wait for the light to turn green and when it does, they yell,"Go **back** to your own country!"Now **back** in the day, they would ' ve actually gotten out of their cars and hated you to your face. But they just don ' t make them like they used to — which is another sign of the decline in America. The next category is the mission-oriented-bigot-whose-group-affiliation- gives-them-cover-for-hating hater. These guys like to hate via a seemingly nice organization, like a church or a nonprofit, and they oftentimes like to speak in an old-timey voice. But the group I ' m most interested in is the swing hater. The swing hater is sister to the swing voter — they just can ' t decide! They ' re like ideological sluts who move from hating to not hating. And they do it because they don ' t have enough information. This is the group I like to target with social justice comedy. Why comedy? Because on a scale of comedy to brochure, the average American prefers comedy, as you can see from this graph. Comedy is very popular. And by the way, this is a mathematically accurate graph, generated from fake numbers. Now, the question is : Why does social justice comedy work? Because, first off, it makes you laugh. And when you ' re laughing, you enter into a state of openness. And in that moment of openness, a good social justice comedian can stick in a whole bunch of information, and if they ' re really skilled, a rectal exam. Here are some ground rules for social justice comedy : first off, it ' s not partisan. This isn ' t political comedy, this is about justice, and no one is against justice. Two, it ' s inviting and warm, it makes you feel like you ' re sitting inside of a burrito. Three, it ' s funny but sneaky, like you could be hearing an interesting treatise on income inequality, that ' s encased in a really sophisticated poop joke. Here ' s how I see social justice comedy working. A few years ago, I rounded up a bunch of Muslim-American comedians — in a non-violent way — And we went around the country to places like Alabama, Arizona, Tennessee, Georgia — places where they love the Muzzies — and we did stand-up shows. We called the tour"The Muslims Are Coming!"We turned this into a movie, and then after the movie came out, a known hate group spent 300, 000 dollars on an anti-Muslim poster campaign with the MTA — that ' s the New York City subway system. Now, the posters were truly offensive, not to mentioned poorly designed — I mean, if you ' re going to be bigoted, you might as well use a better font. But we decided, why not launch our own poster campaign that says nice things about Muslims, while promoting the movie. So myself and fellow comedian Dean Obeidallah decided to launch the fighting-bigotry- with-delightful-posters campaign. We raised the money, worked with the MTA for over 5 months, got the posters approved, and two days after they were supposed to go up, the MTA decided to ban the posters, citing political content. Let ' s take a look at a couple of those posters. Here ' s one. Facts about Muslims : Muslims invented the concept of a hospital. OK. Fact : Grown-up Muslims can do more push-ups than baby Muslims. Fact : Muslims invented Justin Timberlake. Let ' s take a look at another one. The ugly truth about Muslims : they have great frittata recipes. Now clearly, frittatas are considered political by the MTA. Either that, or the mere mention of Muslims in a positive light was considered political — but it isn ' t. It ' s about justice. So we decided to change our fighting-bigortry-with- delightful-posters campaign and turn it into the fighting-bigotry- with-a-delightful-lawsuit campaign. So basically, what I ' m saying is a couple of dirt-bag comedians took on a major New York City agency and the comedians won. Thank you. Victory was a very weird feeling. I was like,"Is this what blonde girls feel like all the time? ' Cause this is amazing!"Here ' s another example. I ' m asked everywhere I go :"Why don ' t Muslims denounce terrorism?"We do. But OK, I ' ll take the bait. So I decided to launch thedailydenouncer. com. It ' s a website that denounces terrorism every day of the week, while taking the weekends off. Let ' s take a look at an example. They generally appear as single-panel cartoons,"I denounce terrorism! I also denounce people who never fill the paper tray!"The point of the website is that it denounces terrorism while recognizing that it ' s ridiculous that we have to constantly denounce terrorism. But if bigotry isn ' t your thing, social justice comedy is useful for all sorts of issues. For example, myself and fellow comedian Lee Camp went to the Cayman Islands to investigate offshore banking. Now, the United States loses something like 300 billion dollars a year in these offshore tax havens. Not to brag, but at the end of every month, I have something like 5-15 dollars in disposable income. So we walked into these banks in the Cayman Islands and asked if we could open up a bank account with eight dollars and 27 cents. The bank managers would indulge **us** for 30-45 seconds before calling security. Security would come out, brandish their weapons, and then we would squeal with fear and run away, because — and this is the last rule of social justice comedy — sometimes it makes you want to take a dump in your pants. Most of my work is meant to be fun. It ' s meant to generate a connection and laughter. But yes, sometimes I get run off the grounds by security. Sometimes I get mean tweets and hate mail. Sometimes I get voice mails saying that if I continue telling my jokes, they ' ll kill me and they ' ll kill my family. And those death threats are definitely not funny. But despite the occasional danger, I still think that social justice comedy is one of our best weapons. I mean, we ' ve tried a lot of approaches to social justice, like war and competitive ice dancing. But still, a lot of things are still kind of awful. So I think it ' s time we try and tell a really good poop joke. Thank you.

My first job as an investor was when I was 24 years old, and I ' m almost 50 today, so that is half a lifetime ago. But I still clearly remember the first thing I was asked to do : to oversee wire transfers related to the sale of a business, basically to make sure all the shareholders got their money. Any company, large or small, public or private, has shareholders who own the business. And as the value of the company goes up, wealth is created for those who own shares. Now at this company, ownership among the employees extended from the very top position, the CEO, to some mid-level roles like assistant treasurer. When I called the CEO to confirm his wire transfer it was a very matter-of-fact conversation."Got the money, thanks a lot."Click. Now, when I called the assistant treasurer, who was making a tiny fraction of what the CEO had made, he was so overcome with emotion, he could barely find the words. And he later explained in a tearful voicemail that his ownership payout literally meant college education for his kids. So I wondered, what if everyone in a company had stock ownership, not just to the assistant-treasurer level, but to the factory floor, distribution centers? How might employees ’ lives be impacted, and how might the company and, in fact, the whole community be impacted? These questions were not new to me. My dad had been asking them for decades. My father operated a road grader for a union construction company in Chicago for 45 years. This is actually a picture of my dad in his road grader. And my dad dreamt of worker ownership to address three things he didn ’ t like about his job. First, he couldn ’ t build wealth on 20 dollars an hour. Second, he had no incentive to care about things an owner would focus on, things like productivity. So he felt no sense of alignment. And third, he had no voice. Without the right incentives in place, there was really no reason for management to listen to workers, and they didn ’ t. And my dad ’ s experience is certainly not unique. Only a tiny percentage of workers are granted stock ownership in their companies, and most workers have no wealth, and it is in fact stock ownership or the lack of it that is by a mile the biggest driver of wealth inequality. Most employees feel their opinions don ’ t count. If you look at Gallup surveys, 77 percent of employees globally are disengaged on the job. 18 percent literally hate the company that they work for. They ’ re throwing the wrenches in the machines. Today, I ’ m going to try to convince you that broadening employee stock ownership is the single most important thing that we can do to lift up workers and to make companies stronger, too. It could give **us** a form of capitalism that is actually inclusive and sustainable. And I believe it could literally change the economy. I ’ ve been pursuing this idea most of my adult life. 25 years ago, as a graduate school student, I dove into the history of employee ownership, and I published a paper on the topic in 2002. Then, a handful of years later, I got my first real leadership position at the company I still work for, KKR. And I was put in charge of investing in and improving industrial companies, mostly manufacturing businesses. And that was a great opportunity to start experimenting with different ways of sharing stock ownership with all employees. Something we ’ ve now done with 44 different companies over the past 15 years. In our early efforts, we had some success, but we made a lot of mistakes. The most important thing we got right was making sure that stock ownership was free and incremental for workers, not a trade for wages or other benefits. This could not be about shifting risk onto the workforce. But we got plenty of things wrong. We didn ’ t communicate well. So if I said something like,”We ’ d hope to sell a business in five years,”that often led to employees literally counting the days or growing suspicious if things took longer. We didn ’ t share our financial information so people didn ’ t know how the business was doing, nor did we ask them how they would run the business better. You see, ownership is about a lot more than just giving out stock. It ’ s about trying to create a whole different type of culture, an ownership culture. Now let me share a story of what this can look like when it ’ s done well. In 2015, we invested in a company called CHI Overhead Doors. CHI is based in central Illinois, in Amish country, and the company makes overhead garage doors, like the one you see here in this picture. And CHI was a good business. But from a worker morale standpoint, it was very reminiscent of what I saw with my dad. Out of 800 employees, only 18 had stock ownership. So that means when we bought the business, most people got nothing and just went **back** to work, and a small handful made many millions of dollars. Employee engagement scores were absolutely dismal. Most people didn ’ t even bother to respond to surveys. And this lack of alignment and engagement, you could see it in the business. It showed up in things like productivity, quality, scrap. People didn ’ t always try to do their best. It took **us** a long time to change the culture, eight years. And it started with stock ownership. So day one, all 800 employees were granted stock ownership so they would participate. As the value of the company went up, through dividends along the way, and then at the end, when the business was sold. When we announced this program, the employees were so excited, they gave me a gift. Which was a live chicken. Literally two guys on the factory floor came up and handed me a chicken. I awkwardly joked that I didn ’ t have a crate, and I wasn ’ t sure I could carry a chicken on my flight **back** to New York. But this was about much more than just stock ownership. Employees were educated about the business, they were kept informed. Once a quarter we got everyone together and we talked openly about what was working and what was not and where the business was headed, and we shared our financial information transparently. All 800 employee owners were given a voice. As one example, they were provided with a million dollars annual budget to invest in their workplace any way they saw fit. They came up with the ideas, they decided where the money went. And over the course of several years, they voted in things like air conditioning for the manufacturing plant. One year they voted for new break rooms. Another year, they wanted an on-site health clinic built. And another, an on-site cafeteria with healthy food options. We found this was a great way to engage with employees because not only were you giving them a voice but they could see their voice physically manifested in the workplace. Employees were also provided free financial coaching so that as they received money, they could save and invest effectively. And I want to be very clear, all of this benefited the company too. It ’ s not like this was only good for workers. We saw quality improve, scrap went down, productivity boomed. We became more responsive to customer demands, and we gained market share as a result. In fact, by the end of the journey, the financial results had improved so enormously the company was worth ten times what it had been worth in 2015. And to put that in perspective, this was the single best investment for **us** at KKR since the 1980s. And this is with a company making garage doors. This is not like a high-flying technology business. When the company was sold, we gathered everyone in our main manufacturing plant in central Illinois. We told them their jobs were safe, and it was time for each of them to learn what they had earned from their ownership. The payouts were scaled based on length of employment. With our most tenured factory workers earning six-and-a-half times their annual income, or a half a million dollars. We had truck drivers make 800, 000 dollars. So this was life-impacting amounts of money. And I could talk to you about it all day, but I won ’ t get it across as well as the workers can themselves. Person 1 : He started out at 20, 000, and then he went to the next amount and the next amount, and he kept going. Person 2 : I ’ m like, whoa! Person 3 : Holy smokes! Person 4 : Where is this going to lead? PS : 40, 000 dollars, 70, 000 dollars. Two-and-a-half times your annual pay. Three-and-a-half times, four-and-a-half times, five-and-a-half times your annual pay. Six-and-a-half times. Person 4 : I just kept looking around at all the people around me thinking how much this was going to change everyone ’ s lives. Person 2 : You sit there and you struggle, like, how am I going to pay for this? Person 6 : Just think about what this means for this area. Person 7 : We ’ re out here, there ’ s a bunch of lower-income families that live paycheck to paycheck. Person 2 : This will absolutely give **us** some comfort that, you know, the future is going to be OK. Person 8 : It ’ s wonderful, I mean, it ’ s just freedom. I got freedom. Person 10 : This is what we did and we ’ re proud of it. Person 11 : Every cent that we get **back**, we earned. Person 12 : Without ownership, it is a job. You clock in, you clock out, you go home. When you have ownership in the business, it changes everything. PS : They deserve to be applauded because they earned it. One of my favorite things in that... Audience : Don ’ t worry, we ’ re all crying. PS : Alright. I ’ ll try and explain that again. So when Cara said,”We earned this,”I love that sentiment, because to me, that ’ s ownership. You know, they earned it, this wasn ’ t a gift, it didn ’ t happen by chance, they made it happen. And it did change the community. 340 million dollars of wealth was injected into the community, and it ’ s forever changed. I mean, that type of wealth creation, it can fundamentally shift a whole local economy. It means more tax revenue, better schools, new business formations, more restaurants in town. And it means dignified retirement for the employees. So just imagine how different would the economy be if every company operated in this way and included all employees in decision-making and in wealth creation? What a different economy we would have. When we sold the business, I got a second gift. A chicken. But this time it was with a crate and it had a little tag indicating it had been pre-checked **back** to New York City. I wanted to stay married to my wife so I did not bring the chicken home. But when I got home, my wife and I started talking about how we could give this idea of employee ownership more scope. And we decided to start a nonprofit called Ownership Works, whose mission is to ignite a movement around employee ownership and to help CEOs and companies who want to go on this journey because it is not easy. Our goal is to reach a million workers over the next 10 years and to create tens of billions of wealth for working families. And we ’ re already well on our way. We ’ ve got line of sight to our first 250, 000 workers being impacted, and our first 10 billion of wealth creation for working families. We ’ ve also joined forces with a coalition of employee ownership advocates who have come together to put new energy behind something called an ESOP, or employee stock ownership plan. The ESOP was created by Congress in the 1970s, and it gives companies tax incentives in exchange for sharing stock ownership with workers. Our goal, through a new organization called Expanding ESOPs, is to pass legislation in the United States to make ESOPs easier to form and faster to form, particularly with larger businesses. It is going to take government support for this idea to really take off. That ’ s how we ’ re going to get not one million new employee owners, but 30 million or 40 million. When I talk about this idea and my passion for it, I always get the same question :”What does your dad think of all this?”Well, you ’ d have to know my dad to appreciate this, but he says,”What the hell took so long?”Thank you.

Video : Chris Anderson : Hello, Nila. Welcome to the TED stage. Nila Ibrahimi : Thank you so much, Chris. Thank you for having me. CA : This happens when you come to Vancouver. NI : I ’ m really honored to be here. CA : What were you singing? NI : The song was saying – It ’ s really hard to translate it right now, but it ’ s mostly encouraging other girls to go to school. It ’ s encouraging education. At this time, I thought that was the closest song to protest against the decision that banned girls from singing in public. So yeah, I didn ’ t know that two or three months after girls would be banned from education. CA : Before they were banned from education, though, the video had an impact. Other people released videos. There was support. What happened? Wasn ’ t that singing ban then reversed? NI : So this happened. The decision was announced that girls over the age of 12 can ’ t sing in public in March of 2021. If I ’ m right. After the movement”I ’ m My Song,”I joined the movement and so did the other brave girls of Afghanistan. And it was two or three weeks after that the decision was reversed, after our efforts and the efforts that the media put in in getting our voice across to the world. CA : Wow. CA : But then something shocking happened after that. NI : I didn ’ t know two or three months after that Afghanistan would fall into the hands of Taliban. It was surreal, and it ’ s really hard to talk about it every time. I ’ ve started my journey of activism right after that moment, when I discovered that my voice can be heard, and I discovered the power of my voice through standing up against that decision. But when Afghanistan fell, I felt like that power was taken away from me. So I had to fight for that, to regain it. CA : So I told the story wrong. The initial ban, the singing ban, was before the Taliban came to power. You found your voice. They came to power. And... Tell **us** your story. What happened next? NI : The Taliban came August 15. That was the day I was about to have my last mid-year exam, the day after that, August 16, which did not happen. I was just busy studying for my exams, Arabic and Pashto, and the rumors spread out, and my mom suddenly started burning all of the documents that we had of my deceased father, and my siblings, who were studying in the American university and working at the United Nations. It was surreal in a way that I never thought that could happen, all of a sudden, in just one day. All of that power, all of the things that we had worked so hard for, could be taken away from **us** in just seconds and just minutes. And that the power that I thought I had, the power, the confidence I gained from posting that video, it was all taken away from me. It was all shattered. So I thought I had to regain that power by getting out of the oppressed Afghanistan that now is being ruled by Taliban. CA : So you were able to escape. How did you get out? NI : That ’ s a long story, actually. So five days after the fall, we went to Pakistan to hide and escape. Our family ’ s background put **us** in danger and, amazingly, we found 30 Birds Foundation, which helped **us** resettle in Canada after waiting in Pakistan around eight, nine months. The time I spent in Pakistan, that has its own surreal story, but I ’ m just really glad to have the opportunities that I think every single woman should have. And I just wish that Afghan girls can regain their power and their voice, just like I have. CA : Well. Nila, here you are on the TED stage. You ’ ve been using your voice to raise awareness on this issue. I ’ d like to – see that red light there? That ’ s a camera, right there. I ’ d love you to just come to the middle of the stage and give your message to the Taliban government in Afghanistan. Whatever you want to say to them, here at TED. I ’ m going to step out and give you the stage for a minute. NI : For the Taliban. I ’ m not angry. I never have been. But you don ’ t know who you ’ re up against. People like me, the girls that I know, the girls that I ’ ve been interviewing through my work at Her Story, the girls who have been displaced and the girls who are now living in Afghanistan under the oppression, without any resources and without any access to education, they ’ re still fighting. They have not given up. And that is what I want to share about Afghan girls. That is what makes **us** different, and that is what should be supported and appreciated and heard. Thank you.

Text Sample 113: NEG Dim 1 – 2024 – Score 1.00 – 2024/t003078.txt

There is a Supreme Court case that you could mistake for a sermon. It ’ s the case that recognized that same-sex couples have a constitutional right to marry. Here is a sense of what Justice Kennedy wrote :”Marriage responds to the universal fear that a lonely person might call out only to find no one there.”He goes on to say that marriage offers care and companionship, and the decision argues that these are basic human needs that everyone should have access to, whether they ’ re straight or queer. Validating. But what do these words say to you if you ’ re single? Anybody single here? I mean, there should be quite a few of you, because in the US, the percentage of American adults who have never been married is at a record high. Married people, you ’ re not off the hook. I ’ m going to get a little morbid for a moment and have you contemplate what happens if your marriage doesn ’ t last until the end of your life, whether because of divorce or outliving your spouse? In the US, about 30 percent of women over 65 are widows. The reality is, any one of **us** is unlikely to have a spouse by our side until our last dying breath. Regardless of whether we are partnered now, we need to rely on more than one relationship to sustain **us** throughout our full, unpredictable lives. We need other significant others. And there ’ s an overlooked kind of relationship that we can turn to. Friendship. I got the sense that friendship could be this stronger force in our lives because of a friendship that I stumbled into. We would see each other most days of the week, be each other ’ s plus-ones to parties. My friend has this habit of grabbing my hand to hold, including when I brought her to my office, and then I ’ d have to be like, no, not in the office. But I mean, I wouldn ’ t let my husband do that in the office either. It ’ s just, you know, setting matters. But it was only an issue because for **us**, affection is a reflex. And I knew it couldn ’ t be just **us**. I went out and interviewed dozens of people who had a friendship like ours, and I wrote a book about them. And the kinds of friends that I spoke to, they don ’ t just have a weekly phone call. They ’ re friends like these. Natasha and Linda are the first legally recognized platonic co-parents in Canada. And this is them with their teenage son on vacation. Joe and John have been best friends for many decades. When Joe was struggling with alcohol and drug use, John got him into recovery. And then John decided that to support his friend, he would also become sober. Joy took care of her friend Hannah during Hannah ’ s six-year battle with ovarian cancer. And that included flying out to New York, where Hannah got specialized treatment. Joy had trouble actually sleeping overnight in the hospital, because she was too busy watching to make sure her friend ’ s chest was still rising and falling. Some of the friends that I spoke to had this friendship occupy the space that ’ s conventionally given to a romantic partner. Some had this kind of friendship and a romantic partner. It ’ s not either / or. As I spoke to these people, I realized that they were at the frontier of friendship, helping **us** imagine how much more we could ask of our platonic relationships. Which is true, but another way of looking at it is they ’ re doing something retro, even ancient. In ancient Rome, friends would talk about each other as”half of my soul,”or”the greater part of my soul.”The kind of language we now use in romantic relationships. From China to Jordan to England, there was a practice called”sworn brotherhood,”where male friends would go through a ritual that would turn them into brothers. About a century ago, friends would sit for portraits like these, with their arms wrapped around each other, their bodies up close. What I took from this history is that if we don ’ t limit friendship, it can be central to our lives. But today, not everybody recognizes that. I spoke to a mother who really tried to get her son to make dating a priority because she wanted him to find emotional wholeness. And her son told her,”I found it in my platonic life partner.”His best friend, who he had known since high school, who had moved across the country to be near him, to live with him, in fact. The mother said,”I don ’ t understand how you can be partners with someone you ’ re not romantic with.”Understandable as a reaction in a culture that treats friendship as the sidekick to the real hero of romance. We get that message from rom-coms, from Supreme Court justices, also from policy. So Joy, during the six years she took care of her friend, she was not entitled to family medical leave. When Hannah died, Joy was not entitled to bereavement leave, because the two of them were considered unrelated. In our government and workplace policies, friendship is invisible. Sometimes this diminishment of friendship comes from the outside, and sometimes it comes from the inside. A woman wrote to me about her friend who she considers her person. She spent so much time with her friend ’ s kids that she was given car seats for them. She ’ s also divorced and tried to find a new spouse because there was a hole she wanted to fill in her life. Then she read stories of people like Joe and John in an article I ’ d written. And she realized there was no hole. She had been happy all along, but she hadn ’ t known, been made to believe that it was possible to have a friend be enough. If we can recognize what friendship has the potential to be, and if we can recognize that there is more than one kind of significant other then we can imagine more ways for **us** to find love and care and companionship. And we can support people who have these kinds of friendships. So the mother I mentioned, she ’ s completely changed her tune. She now admires the commitment between her son and her son ’ s friend. I feel like I get to live in a future world where you can just build a life with your friends. I live not only with my husband but also two of my closest friends. One of them we kind of like had a courtship process to recruit him to come to our city and live with **us**. The other had a job in our city, and we invited her to stay. It didn ’ t take long for **us** to start scheming with about a half dozen other friends, about trying to buy property together. The kind of place where we could raise kids alongside one another, our working title for the place is”The Village.”I don ’ t know if this will work out. I can keep you posted about it, but if it does, I feel really confident about one thing. That if one of **us** has a migraine at 6am and there ’ s a toddler bouncing around, or we get a terrifying diagnosis, we will not be a lonely person calling out only for no one to answer. And this is what I hope for all of **us**. That we feel like we have permission to share our lives with whoever we are lucky enough to find, whether that ’ s a spouse, a sibling or a house full of friends. Thank you.

Today, a baffled lady observed the shell where my soul dwells And announced that I ’ m”articulate”Which means that when it comes to enunciation and diction I don ’ t even think of it â□□Cause Iâ□□m”articulate”So when my professor asks a question And my answer is tainted with a connotation of urbanized suggestion Thereâ□□s no misdirected intention Pay attention â□□Cause Iâ□□m â□□articulateâ□□ So when my father asks, â□□Whaâ□□ kinda ting is dis? â□□ My â□□articulateâ□□ answer never goes amiss I say â□□father, this is the impending problem at handâ□□ And when Iâ□□m on the block I switch it up just because I can So when my boy says, â□□Whatâ□□s good with you son? â□□ I just say, â□□I jusâ□□ fall out wit dem people but I done! â□□ And sometimes in class I might pause the intellectual sounding flow to ask â□□Yo! Why dese books neva be about my peoplesâ□□ Yes, I have decided to treat all three of my languages as equals Because Iâ□□m â□□articulateâ□□ But who controls articulation? Because the English language is a multifaceted oration Subject to indefinite transformation Now you may think that it is ignorant to speak broken English But Iâ□□m here to tell you that even â□□articulateâ□□ Americans sound foolish to the British So when my Professor comes on the block and says, â□□Helloâ□□ I stop him and say â□□Noooo â□Ś Youâ□□re being inarticulate â□Ś the proper way is to say â□□whatâ□□s goodâ□□â□□ Now you may think thatâ□□s too hood, thatâ□□s not cool But Iâ□□m here to tell you that even our language has rules So when Mommy mocks me and says â□□yaâ□□ll-be-madd-going-to-the-storeâ□□ I say â□□Mommy, no, that sentence is not following the law Never does the word”madd”go before a present participle Thatâ□□s simply the principle of this Englishâ□□ If I had the vocal capacity I would sing this from every mountaintop, From every suburbia, and every hood â□□Cause the only God of language is the one recorded in the Genesis Of this world saying â□□it is good”So I may not always come before you with excellency of speech But do not judge me by my language and assume That Iâ□□m too ignorant to teach â□□Cause I speak three tongues One for each : Home, school and friends Iâ□□m a tri-lingual orator Sometimes Iâ□□m consistent with my language now Then switch it up so I donâ□□t bore later Sometimes I fight **back** two tongues While I use the other one in the classroom And when I mistakenly mix them up I feel crazy like â□Ś Iâ□□m cooking in the bathroom I know that I had to borrow your language because mines was stolen But you canâ□□t expect me to speak your history wholly while mines is broken These words are spoken By someone who is simply fed up with the Eurocentric ideals of this season And the reason I speak a composite version of your language Is because mines was raped away along with my history I speak broken English so the profusing gashes can remind **us** That our current state is not a mystery Iâ□□m so tired of the negative images that are driving my people mad So unless youâ□□ve seen it rob a bank stop calling my hair bad Iâ□□m so sick of this nonsensical racial disparity So donâ□□t call it good unless your hair is known for donating to charity As much as has been raped away from our people How can you expect me to treat their imprint on your language As anything less than equal Let there be no confusion Let there be no hesitation This is not a promotion of ignorance This is a linguistic celebration Thatâ□□s why I put”tri-lingual”on my last job application I can help to diversify your consumer market is all I wanted them to know And when they call me for the interview Iâ□□ll be more than happy to show that I can say : â□□Whatâ□□s goodâ□□ â□□Whatagwanâ□□ And of course â□Śâ□□Helloâ□□ Because Iâ□□m â□□articulateâ□□ Thank you.

Text Sample 115: NEG Dim 1 – 2014 – Score 1.00 – 2014/t001818.txt

So it ’ s 2006. My friend Harold Ford calls me. He ’ s running for U. S. Senate in Tennessee, and he says,”Mellody, I desperately need some national press. Do you have any ideas?”So I had an idea. I called a friend who was in New York at one of the most successful media companies in the world, and she said,”Why don ’ t we host an editorial board lunch for Harold? You come with him.”Harold and I arrive in New York. We are in our best suits. We look like shiny new pennies. And we get to the receptionist, and we say,”We ’ re here for the lunch.”She motions for **us** to follow her. We walk through a series of corridors, and all of a sudden we find ourselves in a stark room, at which point she looks at **us** and she says,”Where are your uniforms?”Just as this happens, my friend rushes in. The blood drains from her face. There are literally no words, right? And I look at her, and I say,”Now, don ’ t you think we need more than one black person in the U. S. Senate?”Now Harold and I — — we still laugh about that story, and in many ways, the moment caught me off guard, but deep, deep down inside, I actually wasn ’ t surprised. And I wasn ’ t surprised because of something my mother taught me about 30 years before. You see, my mother was ruthlessly realistic. I remember one day coming home from a birthday party where I was the only black kid invited, and instead of asking me the normal motherly questions like,”Did you have fun?”or”How was the cake?”my mother looked at me and she said,”How did they treat you?”I was seven. I did not understand. I mean, why would anyone treat me differently? But she knew. And she looked me right in the eye and she said,”They will not always treat you well.”Now, race is one of those topics in America that makes people extraordinarily uncomfortable. You bring it up at a dinner party or in a workplace environment, it is literally the conversational equivalent of touching the third rail. There is shock, followed by a long silence. And even coming here today, I told some friends and colleagues that I planned to talk about race, and they warned me, they told me, don ’ t do it, that there ’ d be huge risks in me talking about this topic, that people might think I ’ m a militant black woman and I would ruin my career. And I have to tell you, I actually for a moment was a bit afraid. Then I realized, the first step to solving any problem is to not hide from it, and the first step to any form of action is awareness. And so I decided to actually talk about race. And I decided that if I came here and shared with you some of my experiences, that maybe we could all be a little less anxious and a little more bold in our conversations about race. Now I know there are people out there who will say that the election of Barack Obama meant that it was the end of racial discrimination for all eternity, right? But I work in the investment business, and we have a saying : The numbers do not lie. And here, there are significant, quantifiable racial disparities that cannot be ignored, in household wealth, household income, job opportunities, healthcare. One example from corporate America : Even though white men make up just 30 percent of the U. S. population, they hold 70 percent of all corporate board seats. Of the Fortune 250, there are only seven CEOs that are minorities, and of the thousands of publicly traded companies today, thousands, only two are chaired by black women, and you ’ re looking at one of them, the same one who, not too long ago, was nearly mistaken for kitchen help. So that is a fact. Now I have this thought experiment that I play with myself, when I say, imagine if I walked you into a room and it was of a major corporation, like ExxonMobil, and every single person around the boardroom were black, you would think that were weird. But if I walked you into a Fortune 500 company, and everyone around the table is a white male, when will it be that we think that ’ s weird too? And I know how we got here. I know how we got here. You know, there was institutionalized, at one time legalized, discrimination in our country. There ’ s no question about it. But still, as I grapple with this issue, my mother ’ s question hangs in the air for me : How did they treat you? Now, I do not raise this issue to complain or in any way to elicit any kind of sympathy. I have succeeded in my life beyond my wildest expectations, and I have been treated well by people of all races more often than I have not. I tell the uniform story because it happened. I cite those statistics around corporate board diversity because they are real, and I stand here today talking about this issue of racial discrimination because I believe it threatens to rob another generation of all the opportunities that all of **us** want for all of our children, no matter what their color or where they come from. And I think it also threatens to hold **back** businesses. You see, researchers have coined this term”color blindness”to describe a learned behavior where we pretend that we don ’ t notice race. If you happen to be surrounded by a bunch of people who look like you, that ’ s purely accidental. Now, color blindness, in my view, doesn ’ t mean that there ’ s no racial discrimination, and there ’ s fairness. It doesn ’ t mean that at all. It doesn ’ t ensure it. In my view, color blindness is very dangerous because it means we ’ re ignoring the problem. There was a corporate study that said that, instead of avoiding race, the really smart corporations actually deal with it head on. They actually recognize that embracing diversity means recognizing all races, including the majority one. But I ’ ll be the first one to tell you, this subject matter can be hard, awkward, uncomfortable — but that ’ s kind of the point. In the spirit of debunking racial stereotypes, the one that black people don ’ t like to swim, I ’ m going to tell you how much I love to swim. I love to swim so much that as an adult, I swim with a coach. And one day my coach had me do a drill where I had to swim to one end of a 25-meter pool without taking a breath. And every single time I failed, I had to start over. And I failed a lot. By the end, I got it, but when I got out of the pool, I was exasperated and tired and annoyed, and I said,”Why are we doing breath-holding exercises?”And my coach looked me at me, and he said,”Mellody, that was not a breath- holding exercise. That drill was to make you comfortable being uncomfortable, because that ’ s how most of **us** spend our days.”If we can learn to deal with our discomfort, and just relax into it, we ’ ll have a better life. So I think it ’ s time for **us** to be comfortable with the uncomfortable conversation about race : black, white, Asian, Hispanic, male, female, all of **us**, if we truly believe in equal rights and equal opportunity in America, I think we have to have real conversations about this issue. We cannot afford to be color blind. We have to be color brave. We have to be willing, as teachers and parents and entrepreneurs and scientists, we have to be willing to have proactive conversations about race with honesty and understanding and courage, not because it ’ s the right thing to do, but because it ’ s the smart thing to do, because our businesses and our products and our science, our research, all of that will be better with greater diversity. Now, my favorite example of color bravery is a guy named John Skipper. He runs ESPN. He ’ s a North Carolina native, quintessential Southern gentleman, white. He joined ESPN, which already had a culture of inclusion and diversity, but he took it up a notch. He demanded that every open position have a diverse slate of candidates. Now he says the senior people in the beginning bristled, and they would come to him and say,”Do you want me to hire the minority, or do you want me to hire the best person for the job?”And Skipper says his answers were always the same :”Yes.”And by saying yes to diversity, I honestly believe that ESPN is the most valuable cable franchise in the world. I think that ’ s a part of the secret sauce. Now I can tell you, in my own industry, at Ariel Investments, we actually view our diversity as a competitive advantage, and that advantage can extend way beyond business. There ’ s a guy named Scott Page at the University of Michigan. He is the first person to develop a mathematical calculation for diversity. He says, if you ’ re trying to solve a really hard problem, really hard, that you should have a diverse group of people, including those with diverse intellects. The example that he gives is the smallpox epidemic. When it was ravaging Europe, they brought together all these scientists, and they were stumped. And the beginnings of the cure to the disease came from the most unlikely source, a dairy farmer who noticed that the milkmaids were not getting smallpox. And the smallpox vaccination is bovine-based because of that dairy farmer. Now I ’ m sure you ’ re sitting here and you ’ re saying, I don ’ t run a cable company, I don ’ t run an investment firm, I am not a dairy farmer. What can I do? And I ’ m telling you, you can be color brave. If you ’ re part of a hiring process or an admissions process, you can be color brave. If you are trying to solve a really hard problem, you can speak up and be color brave. Now I know people will say, but that doesn ’ t add up to a lot, but I ’ m actually asking you to do something really simple : observe your environment, at work, at school, at home. I ’ m asking you to look at the people around you purposefully and intentionally. Invite people into your life who don ’ t look like you, don ’ t think like you, don ’ t act like you, don ’ t come from where you come from, and you might find that they will challenge your assumptions and make you grow as a person. You might get powerful new insights from these individuals, or, like my husband, who happens to be white, you might learn that black people, men, women, children, we use body lotion every single day. Now, I also think that this is very important so that the next generation really understands that this progress will help them, because they ’ re expecting **us** to be great role models. Now, I told you, my mother, she was ruthlessly realistic. She was an unbelievable role model. She was the kind of person who got to be the way she was because she was a single mom with six kids in Chicago. She was in the real estate business, where she worked extraordinarily hard but oftentimes had a hard time making ends meet. And that meant sometimes we got our phone disconnected, or our lights turned off, or we got evicted. When we got evicted, sometimes we lived in these small apartments that she owned, sometimes in only one or two rooms, because they weren ' t completed, and we would heat our bathwater on hot plates. But she never gave up hope, ever, and she never allowed **us** to give up hope either. This brutal pragmatism that she had, I mean, I was four and she told me,"Mommy is Santa."She was this brutal pragmatism. She taught me so many lessons, but the most important lesson was that every single day she told me,"Mellody, you can be anything."And because of those words, I would wake up at the crack of dawn, and because of those words, I would love school more than anything, and because of those words, when I was on a bus going to school, I dreamed the biggest dreams. And it ' s because of those words that I stand here right now full of passion, asking you to be brave for the kids who are dreaming those dreams today. You see, I want them to look at a CEO on television and say,"I can be like her,"or,"He looks like me."And I want them to know that anything is possible, that they can achieve the highest level that they ever imagined, that they will be welcome in any corporate boardroom, or they can lead any company. You see this idea of being the land of the free and the home of the brave, it ' s woven into the fabric of America. America, when we have a challenge, we take it head on, we don ' t shrink away from it. We take a stand. We show courage. So right now, what I ' m asking you to do, I ' m asking you to show courage. I ' m asking you to be bold. As business leaders, I ' m asking you not to leave anything on the table. As citizens, I ' m asking you not to leave any child behind. I ' m asking you not to be color blind, but to be color brave, so that every child knows that their future matters and their dreams are possible. Thank you. Thank you. Thanks. Thanks.

So I ' ve been thinking about the difference between the résumé virtues and the eulogy virtues. The résumé virtues are the ones you put on your résumé, which are the skills you bring to the marketplace. The eulogy virtues are the ones that get mentioned in the eulogy, which are deeper : who are you, in your depth, what is the nature of your relationships, are you bold, loving, dependable, consistency? And most of **us**, including me, would say that the eulogy virtues are the more important of the virtues. But at least in my case, are they the ones that I think about the most? And the answer is no. So I ' ve been thinking about that problem, and a thinker who has helped me think about it is a guy named Joseph Soloveitchik, who was a rabbi who wrote a book called"The Lonely Man Of Faith"in 1965. Soloveitchik said there are two sides of our natures, which he called Adam I and Adam II. Adam I is the worldly, ambitious, external side of our nature. He wants to build, create, create companies, create innovation. Adam II is the humble side of our nature. Adam II wants not only to do good but to be good, to live in a way internally that honors God, creation and our possibilities. Adam I wants to conquer the world. Adam II wants to hear a calling and obey the world. Adam I savors accomplishment. Adam II savors inner consistency and strength. Adam I asks how things work. Adam II asks why we ' re here. Adam I ' s motto is"success."Adam II ' s motto is"love, redemption and return."And Soloveitchik argued that these two sides of our nature are at war with each other. We live in perpetual self-confrontation between the external success and the internal value. And the tricky thing, I ’ d say, about these two sides of our nature is they work by different logics. The external logic is an economic logic : input leads to output, risk leads to reward. The internal side of our nature is a moral logic and often an inverse logic. You have to give to receive. You have to surrender to something outside yourself to gain strength within yourself. You have to conquer the desire to get what you want. In order to fulfill yourself, you have to forget yourself. In order to find yourself, you have to lose yourself. We happen to live in a society that favors Adam I, and often neglects Adam II. And the problem is, that turns you into a shrewd animal who treats life as a game, and you become a cold, calculating creature who slips into a sort of mediocrity where you realize there ’ s a difference between your desired self and your actual self. You ’ re not earning the sort of eulogy you want, you hope someone will give to you. You don ’ t have the depth of conviction. You don ’ t have an emotional sonorousness. You don ’ t have commitment to tasks that would take more than a lifetime to commit. I was reminded of a common response through history of how you build a solid Adam II, how you build a depth of character. Through history, people have gone **back** into their own pasts, sometimes to a precious time in their life, to their childhood, and often, the mind gravitates in the past to a moment of shame, some sin committed, some act of selfishness, an act of omission, of shallowness, the sin of anger, the sin of self-pity, trying to be a people- pleaser, a lack of courage. Adam I is built by building on your strengths. Adam II is built by fighting your weaknesses. You go into yourself, you find the sin which you ’ ve committed over and again through your life, your signature sin out of which the others emerge, and you fight that sin and you wrestle with that sin, and out of that wrestling, that suffering, then a depth of character is constructed. And we ’ re often not taught to recognize the sin in ourselves, in that we ’ re not taught in this culture how to wrestle with it, how to confront it, and how to combat it. We live in a culture with an Adam I mentality where we ’ re inarticulate about Adam II. Finally, Reinhold Niebuhr summed up the confrontation, the fully lived Adam I and Adam II life, this way :”Nothing that is worth doing can be achieved in our lifetime ; therefore we must be saved by hope. Nothing which is true or beautiful or good makes complete sense in any immediate context of history ; therefore we must be saved by faith. Nothing we do, however virtuous, can be accomplished alone ; therefore we must be saved by love. No virtuous act is quite as virtuous from the standpoint of our friend or foe as from our own standpoint. Therefore we must be saved by that final form of love, which is forgiveness.”Thanks.

Allow me to start this talk with a question to everyone. You know that all over the world, people fight for their freedom, fight for their rights. Some battle oppressive governments. Others battle oppressive societies. Which battle do you think is harder? Allow me to try to answer this question in the few coming minutes. Let me take you **back** two years ago in my life. It was the bedtime of my son, Aboody. He was five at the time. After finishing his bedtime rituals, he looked at me and he asked a question :”Mommy, are we bad people?”I was shocked.”Why do you say such things, Aboody?”Earlier that day, I noticed some bruises on his face when he came from school. He wouldn ’ t tell me what happened. [But now] he was ready to tell.”Two boys hit me today in school. They told me, ’ We saw your mom on Facebook. You and your mom should be put in jail. ’”I ’ ve never been afraid to tell Aboody anything. I ’ ve been always a proud woman of my achievements. But those questioning eyes of my son were my moment of truth, when it all came together. You see, I ’ m a Saudi woman who had been put in jail for driving a car in a country where women are not supposed to drive cars. Just for giving me his car keys, my own brother was detained twice, and he was harassed to the point he had to quit his job as a geologist, leave the country with his wife and two-year-old son. My father had to sit in a Friday sermon listening to the imam condemning women drivers and calling them prostitutes amongst tons of worshippers, some of them our friends and family of my own father. I was faced with an organized defamation campaign in the local media combined with false rumors shared in family gatherings, in the streets and in schools. It all hit me. It came into focus that those kids did not mean to be rude to my son. They were just influenced by the adults around them. And it wasn ’ t about me, and it wasn ’ t a punishment for taking the wheel and driving a few miles. It was a punishment for daring to challenge the society ’ s rules. But my story goes beyond this moment of truth of mine. Allow me to give you a briefing about my story. It was May, 2011, and I was complaining to a work colleague about the harassments I had to face trying to find a ride **back** home, although I have a car and an international driver ’ s license. As long as I ’ ve known, women in Saudi Arabia have been always complaining about the ban, but it ’ s been 20 years since anyone tried to do anything about it, a whole generation ago. He broke the good / bad news in my face.”But there is no law banning you from driving.”I looked it up, and he was right. There wasn ’ t an actual law in Saudi Arabia. It was just a custom and traditions that are enshrined in rigid religious fatwas and imposed on women. That realization ignited the idea of June 17, where we encouraged women to take the wheel and go drive. It was a few weeks later, we started receiving all these”Man wolves will rape you if you go and drive.”A courageous woman, her name is Najla Hariri, she ’ s a Saudi woman in the city of Jeddah, she drove a car and she announced but she didn ’ t record a video. We needed proof. So I drove. I posted a video on YouTube. And to my surprise, it got hundreds of thousands of views the first day. What happened next, of course? I started receiving threats to be killed, raped, just to stop this campaign. The Saudi authorities remained very quiet. That really creeped **us** out. I was in the campaign with other Saudi women and even men activists. We wanted to know how the authorities would respond on the actual day, June 17, when women go out and drive. So this time I asked my brother to come with me and drive by a police car. It went fast. We were arrested, signed a pledge not to drive again, released. Arrested again, he was sent to **detention** for one day, and I was sent to jail. I wasn ’ t sure why I was sent there, because I didn ’ t face any charges in the interrogation. But what I was sure of was my innocence. I didn ’ t break a law, and I kept my abaya — it ’ s a black cloak we wear in Saudi Arabia before we leave the house — and my fellow prisoners kept asking me to take it off, but I was so sure of my innocence, I kept saying,”No, I ’ m leaving today.”Outside the jail, the whole country went into a frenzy, some attacking me badly, and others supportive and even collecting signatures in a petition to be sent to the king to release me. I was released after nine days. June 17 comes. The streets were packed with police cars and religious police cars, but some hundred brave Saudi women broke the ban and drove that day. None were arrested. We broke the taboo. So I think by now, everyone knows that we can ’ t drive, or women are not allowed to drive, in Saudi Arabia, but maybe few know why. Allow me to help you answer this question. There was this official study that was presented to the Shura Council — it ’ s the consultative council appointed by the king in Saudi Arabia — and it was done by a local professor, a university professor. He claims it ’ s done based on a UNESCO study. And the study states, the percentage of rape, adultery, illegitimate children, even drug abuse, prostitution in countries where women drive is higher than countries where women don ’ t drive. I know, I was like this, I was shocked. I was like,”We are the last country in the world where women don ’ t drive.”So if you look at the map of the world, that only leaves two countries : Saudi Arabia, and the other society is the rest of the world. We started a hashtag on Twitter mocking the study, and it made headlines around the world. [BBC News : ’ End of virginity ’ if women drive, Saudi cleric warns] And only then we realized it ’ s so empowering to mock your oppressor. It strips it away of its strongest weapon : fear. This system is based on ultra-conservative traditions and customs that deal with women as if they are inferior and they need a guardian to protect them, so they need to take permission from this guardian, whether verbal or written, all their lives. We are minors until the day we die. And it becomes worse when it ’ s enshrined in religious fatwas based on wrong interpretation of the sharia law, or the religious laws. What ’ s worst, when they become codified as laws in the system, and when women themselves believe in their inferiority, and they even fight those who try to question these rules. So for me, it wasn ’ t only about these attacks I had to face. It was about living two totally different perceptions of my personality, of my person — the villain **back** in my home country, and the hero outside. Just to tell you, two stories happened in the last two years. One of them is when I was in jail. I ’ m pretty sure when I was in jail, everyone saw titles in the international media something like this during these nine days I was in jail. But in my home country, it was a totally different picture. It was more like this :”Manal al-Sharif faces charges of disturbing public order and inciting women to drive.”I know.”Manal al-Sharif withdraws from the campaign.”Ah, it ’ s okay. This is my favorite.”Manal al-Sharif breaks down and confesses : ’ Foreign forces incited me. ’”And it goes on, even trial and flogging me in public. So it ’ s a totally different picture. I was asked last year to give a speech at the Oslo Freedom Forum. I was surrounded by this love and the support of people around me, and they looked at me as an inspiration. At the same time, I flew **back** to my home country, they hated that speech so much. The way they called it : a betrayal to the Saudi country and the Saudi people, and they even started a hashtag called #OsloTraitor on Twitter. Some 10, 000 tweets were written in that hashtag, while the opposite hashtag, #OsloHero, there was like a handful of tweets written. They even started a poll. More than 13, 000 voters answered this poll : whether they considered me a traitor or not after that speech. Ninety percent said yes, she ’ s a traitor. So it ’ s these two totally different perceptions of my personality. For me, I ’ m a proud Saudi woman, and I do love my country, and because I love my country, I ’ m doing this. Because I believe a society will not be free if the women of that society are not free. Thank you. Thank you, thank you, thank you, thank you. Thank you. But you learn lessons from these things that happen to you. I learned to be always there. The first thing, I got out of jail, of course after I took a shower, I went online, I opened my Twitter account and my Facebook page, and I ’ ve been always very respectful to those people who are opining to me. I would listen to what they say, and I would never defend myself with words only. I would use actions. When they said I should withdraw from the campaign, I filed the first lawsuit against the general directorate of traffic police for not issuing me a driver ’ s license. There are a lot of people also — very big support, like those 3, 000 people who signed the petition to release me. We sent a petition to the Shura Council in favor of lifting the ban on Saudi women, and there were, like, 3, 500 citizens who believed in that and they signed that petition. There were people like that, I just showed some examples, who are amazing, who are believing in women ’ s rights in Saudi Arabia, and trying, and they are also facing a lot of hate because of speaking up and voicing their views. Saudi Arabia today is taking small steps toward enhancing women ’ s rights. The Shura Council that ’ s appointed by the king, by royal decree of King Abdullah, last year there were 30 women assigned to that Council, like 20 percent. 20 percent of the Council. The same time, finally, that Council, after rejecting our petition four times for women driving, they finally accepted it last February. After being sent to jail or sentenced lashing, or sent to a trial, the spokesperson of the traffic police said, we will only issue traffic violation for women drivers. The Grand Mufti, who is the head of the religious establishment in Saudi Arabia, he said, it ’ s not recommended for women to drive. It used to be haram, forbidden, by the previous Grand Mufti. So for me, it ’ s not about only these small steps. It ’ s about women themselves. A friend once asked me, she said,”So when do you think this women driving will happen?”I told her,”Only if women stop asking ’ When? ’ and take action to make it now.”So it ’ s not only about the system, it ’ s also about **us** women to drive our own life, I ’ d say. So I have no clue, really, how I became an activist. And I don ’ t know how I became one now. But all I know, and all I ’ m sure of, in the future when someone asks me my story, I will say,”I ’ m proud to be amongst those women who lifted the ban, fought the ban, and celebrated everyone ’ s freedom.”So the question I started my talk with, who do you think is more difficult to face, oppressive governments or oppressive societies? I hope you find clues to answer that from my speech. Thank you, everyone. Thank you. Thank you.

Clouds. Have you ever noticed how much people moan about them? They get a bad rap. If you think about it, the English language has written into it negative associations towards the clouds. Someone who ’ s down or depressed, they ’ re under a cloud. And when there ’ s bad news in store, there ’ s a cloud on the horizon. I saw an article the other day. It was about problems with computer processing over the Internet.”A cloud over the cloud,”was the headline. It seems like they ’ re everyone ’ s default doom-and-gloom metaphor. But I think they ’ re beautiful, don ’ t you? It ’ s just that their beauty is missed because they ’ re so omnipresent, so, I don ’ t know, commonplace, that people don ’ t notice them. They don ’ t notice the beauty, but they don ’ t even notice the clouds unless they get in the way of the sun. And so people think of clouds as things that get in the way. They think of them as the annoying, frustrating obstructions, and then they rush off and do some blue-sky thinking. But most people, when you stop to ask them, will admit to harboring a strange sort of fondness for clouds. It ’ s like a nostalgic fondness, and they make them think of their youth. Who here can ’ t remember thinking, well, looking and finding shapes in the clouds when they were kids? You know, when you were masters of daydreaming? Aristophanes, the ancient Greek playwright, he described the clouds as the patron godesses of idle fellows two and a half thousand years ago, and you can see what he means. It ’ s just that these days, **us** adults seem reluctant to allow ourselves the indulgence of just allowing our imaginations to drift along in the breeze, and I think that ’ s a pity. I think we should perhaps do a bit more of it. I think we should be a bit more willing, perhaps, to look at the beautiful sight of the sunlight bursting out from behind the clouds and go,”Wait a minute, that ’ s two cats dancing the salsa!”Or seeing the big, white, puffy one up there over the shopping center looks like the Abominable Snowman going to rob a bank. They ’ re like nature ’ s version of those inkblot images, you know, that shrinks used to show their patients in the ’ 60s, and I think if you consider the shapes you see in the clouds, you ’ ll save money on psychoanalysis bills. Let ’ s say you ’ re in love. All right? And you look up and what do you see? Right? Or maybe the opposite. You ’ ve just been dumped by your partner, and everywhere you look, it ’ s kissing couples. Perhaps you ’ re having a moment of existential angst. You know, you ’ re thinking about your own mortality. And there, on the horizon, it ’ s the Grim Reaper. Or maybe you see a topless sunbather. What would that mean? What would that mean? I have no idea. But one thing I do know is this : The bad press that clouds get is totally unfair. I think we should stand up for them, which is why, a few years ago, I started the Cloud Appreciation Society. Tens of thousands of members now in almost 100 countries around the world. And all these photographs that I ’ m showing, they were sent in by members. And the society exists to remind people of this : Clouds are not something to moan about. Far from it. They are, in fact, the most diverse, evocative, poetic aspect of nature. I think, if you live with your head in the clouds every now and then, it helps you keep your feet on the ground. And I want to show you why, with the help of some of my favorite types of clouds. Let ’ s start with this one. It ’ s the cirrus cloud, named after the Latin for a lock of hair. It ’ s composed entirely of ice crystals cascading from the upper reaches of the troposphere, and as these ice crystals fall, they pass through different layers with different winds and they speed up and slow down, giving the cloud these brush-stroked appearances, these brush-stroke forms known as fall streaks. And these winds up there can be very, very fierce. They can be 200 miles an hour, 300 miles an hour. These clouds are bombing along, but from all the way down here, they appear to be moving gracefully, slowly, like most clouds. And so to tune into the clouds is to slow down, to calm down. It ’ s like a bit of everyday meditation. Those are common clouds. What about rarer ones, like the lenticularis, the UFO-shaped lenticularis cloud? These clouds form in the region of mountains. When the wind passes, rises to pass over the mountain, it can take on a wave-like path in the lee of the peak, with these clouds hovering at the crest of these invisible standing waves of air, these flying saucer-like forms, and some of the early black-and-white UFO photos are in fact lenticularis clouds. It ’ s true. A little rarer are the fallstreak holes. All right? This is when a layer is made up of very, very cold water droplets, and in one region they start to freeze, and this freezing sets off a chain reaction which spreads outwards with the ice crystals cascading and falling down below, giving the appearance of jellyfish tendrils down below. Rarer still, the Kelvin—Helmholtz cloud. Not a very snappy name. Needs a rebrand. This looks like a series of breaking waves, and it ’ s caused by shearing winds — the wind above the cloud layer and below the cloud layer differ significantly, and in the middle, in between, you get this undulating of the air, and if the difference in those speeds is just right, the tops of the undulations curl over in these beautiful breaking wave-like vortices. All right. Those are rarer clouds than the cirrus, but they ’ re not that rare. If you look up, and you pay attention to the sky, you ’ ll see them sooner or later, maybe not quite as dramatic as these, but you ’ ll see them. And you ’ ll see them around where you live. Clouds are the most egalitarian of nature ’ s displays, because we all have a good, fantastic view of the sky. And these clouds, these rarer clouds, remind **us** that the exotic can be found in the everyday. Nothing is more nourishing, more stimulating to an active, inquiring mind than being surprised, being amazed. It ’ s why we ’ re all here at TED, right? But you don ’ t need to rush off away from the familiar, across the world to be surprised. You just need to step outside, pay attention to what ’ s so commonplace, so everyday, so mundane that everybody else misses it. One cloud that people rarely miss is this one : the cumulonimbus storm cloud. It ' s what ' s produces thunder and lightning and hail. These clouds spread out at the top in this enormous anvil fashion stretching 10 miles up into the atmosphere. They are an expression of the majestic architecture of our atmosphere. But from down below, they are the embodiment of the powerful, elemental force and power that drives our atmosphere. To be there is to be connected in the driving rain and the hail, to feel connected to our atmosphere. It ' s to be reminded that we are creatures that inhabit this ocean of air. We don ' t live beneath the sky. We live within it. And that connection, that visceral connection to our atmosphere feels to me like an antidote. It ' s an antidote to the growing tendency we have to feel that we can really ever experience life by watching it on a computer screen, you know, when we ' re in a wi-fi zone. But the one cloud that best expresses why cloudspotting is more valuable today than ever is this one, the cumulus cloud. Right? It forms on a sunny day. If you close your eyes and think of a cloud, it ' s probably one of these that comes to mind. All those cloud shapes at the beginning, those were cumulus clouds. The sharp, crisp outlines of this formation make it the best one for finding shapes in. And it reminds **us** of the aimless nature of cloudspotting, what an aimless activity it is. You ' re not going to change the world by lying on your **back** and gazing up at the sky, are you? It ' s pointless. It ' s a pointless activity, which is precisely why it ' s so important. The digital world conspires to make **us** feel eternally busy, perpetually busy. You know, when you ' re not dealing with the traditional pressures of earning a living and putting food on the table, raising a family, writing thank you letters, you have to now contend with answering a mountain of unanswered emails, updating a Facebook page, feeding your Twitter feed. And cloudspotting legitimizes doing nothing. And sometimes we need — Sometimes we need excuses to do nothing. We need to be reminded by these patron goddesses of idle fellows that slowing down and being in the present, not thinking about what you ' ve got to do and what you should have done, but just being here, letting your imagination lift from the everyday concerns down here and just being in the present, it ' s good for you, and it ' s good for the way you feel. It ' s good for your ideas. It ' s good for your creativity. It ' s good for your soul. So keep looking up, marvel at the ephemeral beauty, and always remember to live life with your head in the clouds. Thank you very much.

Text Sample 119: NEG Dim 1 – 2013 – Score 1.00 – 2013/t002086.txt

”Don ' t talk to strangers.”You have heard that phrase uttered by your friends, family, schools and the media for decades. It ' s a norm. It ' s a social norm. But it ' s a special kind of social norm, because it ' s a social norm that wants to tell **us** who we can relate to and who we shouldn ' t relate to.”Don ' t talk to strangers”says,”Stay from anyone who ' s not familiar to you. Stick with the people you know. Stick with people like you.”How appealing is that? It ' s not really what we do, is it, when we ' re at our best? When we ' re at our best, we reach out to people who are not like **us**, because when we do that, we learn from people who are not like **us**. My phrase for this value of being with”not like **us**”is”strangeness,”and my point is that in today ' s digitally intensive world, strangers are quite frankly not the point. The point that we should be worried about is, how much strangeness are we getting? Why strangeness? Because our social relations are increasingly mediated by data, and data turns our social relations into digital relations, and that means that our digital relations now depend extraordinarily on technology to bring to them a sense of robustness, a sense of discovery, a sense of surprise and unpredictability. Why not strangers? Because strangers are part of a world of really rigid boundaries. They belong to a world of people I know versus people I don ' t know, and in the context of my digital relations, I ' m already doing things with people I don ' t know. The question isn ' t whether or not I know you. The question is, what can I do with you? What can I learn with you? What can we do together that benefits **us** both? I spend a lot of time thinking about how the social landscape is changing, how new technologies create new constraints and new opportunities for people. The most important changes facing **us** today have to do with data and what data is doing to shape the kinds of digital relations that will be possible for **us** in the future. The economies of the future depend on that. Our social lives in the future depend on that. The threat to worry about isn ' t strangers. The threat to worry about is whether or not we ' re getting our fair share of strangeness. Now, 20th-century psychologists and sociologists were thinking about strangers, but they weren ' t thinking so dynamically about human relations, and they were thinking about strangers in the context of influencing practices. Stanley Milgram from the ' 60s and ' 70s, the creator of the small-world experiments, which became later popularized as six degrees of separation, made the point that any two arbitrarily selected people were likely connected from between five to seven intermediary steps. His point was that strangers are out there. We can reach them. There are paths that enable **us** to reach them. Mark Granovetter, Stanford sociologist, in 1973 in his seminal essay"The Strength of Weak Ties,"made the point that these weak ties that are a part of our networks, these strangers, are actually more effective at diffusing information to **us** than are our strong ties, the people closest to **us**. He makes an additional indictment of our strong ties when he says that these people who are so close to **us**, these strong ties in our lives, actually have a homogenizing effect on **us**. They produce sameness. My colleagues and I at Intel have spent the last few years looking at the ways in which digital platforms are reshaping our everyday lives, what kinds of new routines are possible. We ' ve been looking specifically at the kinds of digital platforms that have enabled **us** to take our possessions, those things that used to be very restricted to **us** and to our friends in our houses, and to make them available to people we don ' t know. Whether it ' s our clothes, whether it ' s our cars, whether it ' s our bikes, whether it ' s our books or music, we are able to take our possessions now and make them available to people we ' ve never met. And we concluded a very important insight, which was that as people ' s relationships to the things in their lives change, so do their relations with other people. And yet recommendation system after recommendation system continues to miss the boat. It continues to try to predict what I need based on some past characterization of who I am, of what I ' ve already done. Security technology after security technology continues to design data protection in terms of threats and attacks, keeping me locked into really rigid kinds of relations. Categories like"friends"and"family"and"contacts"and"colleagues"don ' t tell me anything about my actual relations. A more effective way to think about my relations might be in terms of closeness and distance, where at any given point in time, with any single person, I am both close and distant from that individual, all as a function of what I need to do right now. People aren ' t close or distant. People are always a combination of the two, and that combination is constantly changing. What if technologies could intervene to disrupt the balance of certain kinds of relationships? What if technologies could intervene to help me find the person that I need right now? Strangeness is that calibration of closeness and distance that enables me to find the people that I need right now, that enables me to find the sources of intimacy, of discovery, and of inspiration that I need right now. Strangeness is not about meeting strangers. It simply makes the point that we need to disrupt our zones of familiarity. So jogging those zones of familiarity is one way to think about strangeness, and it ' s a problem faced not just by individuals today, but also by organizations, organizations that are trying to embrace massively new opportunities. Whether you ' re a political party insisting to your detriment on a very rigid notion of who belongs and who does not, whether you ' re the government protecting social institutions like marriage and restricting access of those institutions to the few, whether you ' re a teenager in her bedroom who ' s trying to jostle her relations with her parents, strangeness is a way to think about how we pave the way to new kinds of relations. We have to change the norms. We have to change the norms in order to enable new kinds of technologies as a basis for new kinds of businesses. What interesting questions lie ahead for **us** in this world of no strangers? How might we think differently about our relations with people? How might we think differently about our relations with distributed groups of people? How might we think differently about our relations with technologies, things that effectively become social participants in their own right? The range of digital relations is extraordinary. In the context of this broad range of digital relations, safely seeking strangeness might very well be a new basis for that innovation. Thank you.

Religion is more than belief. It ' s power, and it ' s influence. And that influence affects all of **us**, every day, regardless of your own belief. Despite the enormous influence of religion on the world today, we hold them to a different standard of scrutiny and accountability than any other sector of our society. For example, if there were a multinational organization, government or corporation today that said no female could be on a leadership board, not one woman could have a decision-making authority, not one woman could handle any financial matter, we would have outrage. There would be sanctions. And yet this is a common practice in almost every world religion today. We accept things in our religious lives that we do not accept in our secular lives, and I know this because I ' ve been doing it for three decades. I was the type of girl that fought every form of gender discrimination growing up. I played pickup basketball games with the boys and inserted myself. I said I was going to be the first female President of the United States. I have been fighting for the Equal Rights Amendment, which has been dead for 40 years. I ' m the first woman in both sides of my family to ever work outside the home and ever receive a higher education. I never accepted being excluded because I was a woman, except in my religion. Throughout all of that time, I was a part of a very patriarchal orthodox Mormon religion. I grew up in an enormously traditional family. I have eight siblings, a stay-at-home mother. My father ' s actually a religious leader in the community. And I grew up in a world believing that my worth and my standing was in keeping these rules that I ' d known my whole life. You get married a virgin, you never drink alcohol, you don ' t smoke, you always do service, you ' re a good kid. Some of the rules we had were strict, but you followed the rules because you loved the people and you loved the religion and you believed. Everything about Mormonism determined what you wore, who you dated, who you married. It determined what underwear we wore. I was the kind of religious where everyone I know donated 10 percent of everything they earned to the church, including myself. From paper routes and babysitting, I donated 10 percent. I was the kind of religious where I heard parents tell children when they ' re leaving on a two-year proselytizing mission that they would rather have them die than return home without honor, having sinned. I was the type and the kind of religious where kids kill themselves every single year because they ' re terrified of coming out to our community as gay. But I was also the kind of religious where it didn ' t matter where in the world I lived, I had friendship, instantaneous mutual aid. This was where I felt safe. This is certainty and clarity about life. I had help raising my little daughter. So that ' s why I accepted without question that only men can lead, and I accepted without question that women can ' t have the spiritual authority of God on the Earth, which we call the priesthood. And I allowed discrepancies between men and women in operating budgets, disciplinary councils, in decision-making capacities, and I gave my religion a free pass because I loved it. Until I stopped, and I realized that I had been allowing myself to be treated as the support staff to the real work of men. And I faced this contradiction in myself, and I joined with other activists in my community. We ' ve been working very, very, very hard for the last decade and more. The first thing we did was raise consciousness. You can ' t change what you can ' t see. We started podcasting, blogging, writing articles. I created lists of hundreds of ways that men and women are unequal in our community. The next thing we did was build advocacy organizations. We tried to do things that were unignorable, like wearing pants to church and trying to attend all- male meetings. These seem like simple things, but to **us**, the organizers, they were enormously costly. We lost relationships. We lost jobs. We got hate mail on a daily basis. We were attacked in social media and national press. We received death threats. We lost standing in our community. Some of **us** got excommunicated. Most of **us** got put in front of a disciplinary council, and were rejected from the communities that we loved because we wanted to make them better, because we believed that they could be. And I began to expect this reaction from my own people. I know what it feels like when you feel like someone ' s trying to change you or criticize you. But what utterly shocked me was throughout all of this work I received equal measures of vitriol from the secular left, the same vehemence as the religious right. And what my secular friends didn ' t realize was that this religious hostility, these phrases of,"Oh, all religious people are crazy or stupid.""Don ' t pay attention to religion.""They ' re going to be homophobic and sexist."What they didn ' t understand was that that type of hostility did not fight religious extremism, it bred religious extremism. Those arguments don ' t work, and I know because I remember someone telling me that I was stupid for being Mormon. And what it caused me to do was defend myself and my people and everything we believe in, because we ' re not stupid. So criticism and hostility doesn ' t work, and I didn ' t listen to these arguments. When I hear these arguments, I still continue to bristle, because I have family and friends. These are my people, and I ' m the first to defend them, but the struggle is real. How do we respect someone ' s religious beliefs while still holding them accountable for the harm or damage that those beliefs may cause others? It ' s a tough question. I still don ' t have a perfect answer. My parents and I have been walking on this tightrope for the last decade. They ' re intelligent people. They ' re lovely people. And let me try to help you understand their perspective. In Mormonism, we believe that after you die, if you keep all the rules and you follow all the rituals, you can be together as a family again. And to my parents, me doing something as simple as having a sleeveless top right now, showing my shoulders, that makes me unworthy. I won ' t be with my family in the eternities. But even more, I had a brother die in a tragic accident at 15, and something as simple as this means we won ' t be together as a family. And to my parents, they cannot understand why something as simple as fashion or women ' s rights would prevent me from seeing my brother again.

And that ’ s the mindset that we ’ re dealing with, and criticism does not change that. And so my parents and I have been walking this tightrope, explaining our sides, respecting one another, but actually invalidating each other ’ s very basic beliefs by the way we live our lives, and it ’ s been difficult. The way that we ’ ve been able to do that is to get past those defensive shells and really see the soft inside of unbelief and belief and try to respect each other while still holding boundaries clear. The other thing that the secular left and the atheists and the orthodox and the religious right, what they all don ’ t understand was why even care about religious activism? I cannot tell you the hundreds of people who have said,”If you don ’ t like religion, just leave.”Why would you try to change it? Because what is taught on the Sabbath leaks into our politics, our health policy, violence around the world. It leaks into education, military, fiscal decision- making. These laws get legally and culturally codified. In fact, my own religion has had an enormous effect on this nation. For example, during Prop 8, my church raised over 22 million dollars to fight same-sex marriage in California. Forty years ago, political historians will say, that if it wasn ’ t for the Mormon opposition to the Equal Rights Amendment, we ’ d have an Equal Rights Amendment in our Constitution today. How many lives did that affect? And we can spend time fighting every single one of these little tiny laws and rules, or we can ask ourselves, why is gender inequality the default around the world? Why is that the assumption? Because religion doesn ’ t just create the roots of morality, it creates the seeds of normality. Religions can liberate or subjugate, they can empower or exploit, they can comfort or destroy, and the people that tip the scales over to the ethical and the moral are often not those in charge. Religions can ’ t be dismissed or ignored. We need to take them seriously. But it ’ s not easy to influence a religion, like we just talked about. But I ’ ll tell you what my people have done. My groups are small, there ’ s hundreds of **us**, but we ’ ve had huge impact. Right now, women ’ s pictures are hanging in the halls next to men for the first time. Women are now allowed to pray in our church-wide meetings, and they never were before in the general conferences. As of last week, in a historic move, three women were invited down to three leadership boards that oversee the entire church. We ’ ve seen perceptual shifts in the Mormon community that allow for talk of gender inequality. We ’ ve opened up space, regardless of being despised, for more conservative women to step in and make real changes, and the words”women”and”the priesthood”can now be uttered in the same sentence. I never had that. My daughter and my nieces are inheriting a religion that I never had, that ’ s more equal — we ’ ve had an effect. It wasn ’ t easy standing in those lines trying to get into those male meetings. There were hundreds of **us**, and one by one, when we got to the door, we were told,”I ’ m sorry, this meeting is just for men,”and we had to step **back** and watch men get into the meeting as young as 12 years old, escorted and walked past **us** as we all stood in line. But not one woman in that line will forget that day, and not one little boy that walked past **us** will forget that day. If we were a multinational corporation or a government, and that had happened, there would be outrage, but we ’ re just a religion. We ’ re all just part of religions. We can ’ t keep looking at religion that way, because it doesn ’ t only affect me, it affects my daughter and all of your daughters and what opportunities they have, what they can wear, who they can love and marry, if they have access to reproductive healthcare. We need to reclaim morality in a secular context that creates ethical scrutiny and accountability for religions all around the world, but we need to do it in a respectful way that breeds cooperation and not extremism. And we can do it through unignorable acts of bravery, standing up for gender equality. It ’ s time that half of the world ’ s population had voice and equality within our world ’ s religions, churches, synagogues, mosques and shrines around the world. I ’ m working on my people. What are you doing for yours?

In the year 1901, a woman called Auguste was taken to a medical asylum in Frankfurt. Auguste was delusional and couldn ’ t remember even the most basic details of her life. Her doctor was called Alois. Alois didn ’ t know how to help Auguste, but he watched over her until, sadly, she passed away in 1906. After she died, Alois performed an autopsy and found strange plaques and tangles in Auguste ’ s brain — the likes of which he ’ d never seen before. Now here ’ s the even more striking thing. If Auguste had instead been alive today, we could offer her no more help than Alois was able to 114 years ago. Alois was Dr. Alois Alzheimer. And Auguste Deter was the first patient to be diagnosed with what we now call Alzheimer ’ s disease. Since 1901, medicine has advanced greatly. We ’ ve discovered antibiotics and vaccines to protect **us** from infections, many treatments for cancer, antiretrovirals for HIV, statins for heart disease and much more. But we ’ ve made essentially no progress at all in treating Alzheimer ’ s disease. I ’ m part of a team of scientists who has been working to find a cure for Alzheimer ’ s for over a decade. So I think about this all the time. Alzheimer ’ s now affects 40 million people worldwide. But by 2050, it will affect 150 million people — which, by the way, will include many of you. If you ’ re hoping to live to be 85 or older, your chance of getting Alzheimer ’ s will be almost one in two. In other words, odds are you ’ ll spend your golden years either suffering from Alzheimer ’ s or helping to look after a friend or loved one with Alzheimer ’ s. Already in the United States alone, Alzheimer ’ s care costs 200 billion dollars every year. One out of every five Medicare dollars get spent on Alzheimer ’ s. It is today the most expensive disease, and costs are projected to increase fivefold by 2050, as the baby boomer generation ages. It may surprise you that, put simply, Alzheimer ’ s is one of the biggest medical and social challenges of our generation. But we ’ ve done relatively little to address it. Today, of the top 10 causes of death worldwide, Alzheimer ’ s is the only one we cannot prevent, cure or even slow down. We understand less about the science of Alzheimer ’ s than other diseases because we ’ ve invested less time and money into researching it. The US government spends 10 times more every year on cancer research than on Alzheimer ’ s despite the fact that Alzheimer ’ s costs **us** more and causes a similar number of deaths each year as cancer. The lack of resources stems from a more fundamental cause : a lack of awareness. Because here ’ s what few people know but everyone should : Alzheimer ’ s is a disease, and we can cure it. For most of the past 114 years, everyone, including scientists, mistakenly confused Alzheimer ’ s with aging. We thought that becoming senile was a normal and inevitable part of getting old. But we only have to look at a picture of a healthy aged brain compared to the brain of an Alzheimer ’ s patient to see the real physical damage caused by this disease. As well as triggering severe loss of memory and mental abilities, the damage to the brain caused by Alzheimer ’ s significantly reduces life expectancy and is always fatal. Remember Dr. Alzheimer found strange plaques and tangles in Auguste ’ s brain a century ago. For almost a century, we didn ’ t know much about these. Today we know they ’ re made from protein molecules. You can imagine a protein molecule as a piece of paper that normally folds into an elaborate piece of origami. There are spots on the paper that are sticky. And when it folds correctly, these sticky bits end up on the inside. But sometimes things go wrong, and some sticky bits are on the outside. This causes the protein molecules to stick to each other, forming clumps that eventually become large plaques and tangles. That ’ s what we see in the brains of Alzheimer ’ s patients. We ’ ve spent the past 10 years at the University of Cambridge trying to understand how this malfunction works. There are many steps, and identifying which step to try to block is complex — like defusing a bomb. Cutting one wire might do nothing. Cutting others might make the bomb explore. We have to find the right step to block, and then create a drug that does it. Until recently, we for the most part have been cutting wires and hoping for the best. But now we ’ ve got together a diverse group of people — medics, biologists, geneticists, chemists, physicists, engineers and mathematicians. And together, we ’ ve managed to identify a critical step in the process and are now testing a new class of drugs which would specifically block this step and stop the disease. Now let me show you some of our latest results. No one outside of our lab has seen these yet. Let ’ s look at some videos of what happened when we tested these new drugs in worms. So these are healthy worms, and you can see they ’ re moving around normally. These worms, on the other hand, have protein molecules sticking together inside them — like humans with Alzheimer ’ s. And you can see they ’ re clearly sick. But if we give our new drugs to these worms at an early stage, then we see that they ’ re healthy, and they live a normal lifespan. This is just an initial positive result, but research like this shows **us** that Alzheimer ’ s is a disease that we can understand and we can cure. After 114 years of waiting, there ’ s finally real hope for what can be achieved in the next 10 or 20 years. But to grow that hope, to finally beat Alzheimer ’ s, we need help. This isn ’ t about scientists like me — it ’ s about you. We need you to raise awareness that Alzheimer ’ s is a disease and that if we try, we can beat it. In the case of other diseases, patients and their families have led the charge for more research and put pressure on governments, the pharmaceutical industry, scientists and regulators. That was essential for advancing treatment for HIV in the late 1980s. Today, we see that same drive to beat cancer. But Alzheimer ’ s patients are often unable to speak up for themselves. And their families, the hidden victims, caring for their loved ones night and day, are often too worn out to go out and advocate for change. So, it really is down to you. Alzheimer ’ s isn ’ t, for the most part, a genetic disease. Everyone with a brain is at risk. Today, there are 40 million patients like Auguste, who can ’ t create the change they need for themselves. Help speak up for them, and help demand a cure. Thank you.

For the past decade, I ’ ve been studying non-state armed groups : armed organizations like terrorists, insurgents or militias. I document what these groups do when they ’ re not shooting. My goal is to better understand these violent actors and to study ways to encourage transition from violent engagement to nonviolent confrontation. I work in the field, in the policy world and in the library. Understanding non-state armed groups is key to solving most ongoing conflict, because war has changed. It used to be a contest between states. No longer. It is now a conflict between states and non-state actors. For example, of the 216 peace agreements signed between 1975 and 2011, 196 of them were between a state and a non-state actor. So we need to understand these groups ; we need to either engage them or defeat them in any conflict resolution process that has to be successful. So how do we do that? We need to know what makes these organizations tick. We know a lot about how they fight, why they fight, but no one looks at what they ’ re doing when they ’ re not fighting. Yet, armed struggle and unarmed politics are related. It is all part of the same organization. We cannot understand these groups, let alone defeat them, if we don ’ t have the full picture. And armed groups today are complex organizations. Take the Lebanese Hezbollah, known for its violent confrontation against Israel. But since its creation in the early 1980s, Hezbollah has also set up a political party, a social-service network, and a military apparatus. Similarly, the Palestinian Hamas, known for its suicide attacks against Israel, also runs the Gaza Strip since 2007. So these groups do way more than just shoot. They multi-task. They set up complex communication machines — radio stations, TV channels, Internet websites and social media strategies. And up here, you have the ISIS magazine, printed in English and published to recruit. Armed groups also invest in complex fund- raising — not looting, but setting up profitable businesses ; for example, construction companies. Now, these activities are keys. They allow these groups to increase their strength, increase their funds, to better recruit and to build their brand. Armed groups also do something else : they build stronger bonds with the population by investing in social services. They build schools, they run hospitals, they set up vocational-training programs or micro-loan programs. Hezbollah offers all of these services and more. Armed groups also seek to win the population over by offering something that the state is not providing : safety and security. The initial rise of the Taliban in war-torn Afghanistan, or even the beginning of the ascent of ISIS, can be understood also by looking at these groups ’ efforts to provide security. Now, unfortunately, in these cases, the provision of security came at an unbearably high price for the population. But in general, providing social services fills a gap, a governance gap left by the government, and allows these groups to increase their strength and their power. For example, the 2006 electoral victory of the Palestinian Hamas cannot be understood without acknowledging the group ’ s social work. Now, this is a really complex picture, yet in the West, when we look at armed groups, we only think of the violent side. But that ’ s not enough to understand these groups ’ strength, strategy or long-term vision. These groups are hybrid. They rise because they fill a gap left by the government, and they emerge to be both armed and political, engage in violent struggle and provide governance. And the more these organizations are complex and sophisticated, the less we can think of them as the opposite of a state. Now, what do you call a group like Hezbollah? They run part of a territory, they administer all their functions, they pick up the garbage, they run the sewage system. Is this a state? Is it a rebel group? Or maybe something else, something different and new? And what about ISIS? The lines are blurred. We live in a world of states, non-states, and in-between, and the more states are weak, like in the Middle East today, the more non-state actors step in and fill that gap. This matters for governments, because to counter these groups, they will have to invest more in non-military tools. Filling that governance gap has to be at the center of any sustainable approach. This also matters very much for peacemaking and peacebuilding. If we better understand armed groups, we will better know what incentives to offer to encourage the transition from violence to nonviolence. So in this new contest between states and non-states, military power can win some battles, but it will not give **us** peace nor stability. To achieve these objectives, what we need is a long-term investment in filling that security gap, in filling that governance gap that allowed these groups to thrive in the first place. Thank you.

Today I have just one request. Please don ’ t tell me I ’ m normal. Now I ’ d like to introduce you to my brothers. Remi is 22, tall and very handsome. He ’ s speechless, but he communicates joy in a way that some of the best orators cannot. Remi knows what love is. He shares it unconditionally and he shares it regardless. He ’ s not greedy. He doesn ’ t see skin color. He doesn ’ t care about religious differences, and get this : He has never told a lie. When he sings songs from our childhood, attempting words that not even I could remember, he reminds me of one thing : how little we know about the mind, and how wonderful the unknown must be. Samuel is 16. He ’ s tall. He ’ s very handsome. He has the most impeccable memory. He has a selective one, though. He doesn ’ t remember if he stole my chocolate bar, but he remembers the year of release for every song on my iPod, conversations we had when he was four, weeing on my arm on the first ever episode of Teletubbies, and Lady Gaga ’ s birthday. Don ’ t they sound incredible? But most people don ’ t agree. And in fact, because their minds don ’ t fit into society ’ s version of normal, they ’ re often bypassed and misunderstood. But what lifted my heart and strengthened my soul was that even though this was the case, although they were not seen as ordinary, this could only mean one thing : that they were extraordinary — autistic and extraordinary. Now, for you who may be less familiar with the term”autism,”it ’ s a complex brain disorder that affects social communication, learning and sometimes physical skills. It manifests in each individual differently, hence why Remi is so different from Sam. And across the world, every 20 minutes, one new person is diagnosed with autism, and although it ’ s one of the fastest-growing developmental disorders in the world, there is no known cause or cure. And I cannot remember the first moment I encountered autism, but I cannot recall a day without it. I was just three years old when my brother came along, and I was so excited that I had a new being in my life. And after a few months went by, I realized that he was different. He screamed a lot. He didn ’ t want to play like the other babies did, and in fact, he didn ’ t seem very interested in me whatsoever. Remi lived and reigned in his own world, with his own rules, and he found pleasure in the smallest things, like lining up cars around the room and staring at the washing machine and eating anything that came in between. And as he grew older, he grew more different, and the differences became more obvious. Yet beyond the tantrums and the frustration and the never-ending hyperactivity was something really unique : a pure and innocent nature, a boy who saw the world without prejudice, a human who had never lied. Extraordinary. Now, I cannot deny that there have been some challenging moments in my family, moments where I ’ ve wished that they were just like me. But I cast my mind **back** to the things that they ’ ve taught me about individuality and communication and love, and I realize that these are things that I wouldn ’ t want to change with normality. Normality overlooks the beauty that differences give **us**, and the fact that we are different doesn ’ t mean that one of **us** is wrong. It just means that there ’ s a different kind of right. And if I could communicate just one thing to Remi and to Sam and to you, it would be that you don ’ t have to be normal. You can be extraordinary. Because autistic or not, the differences that we have — We ’ ve got a gift! Everyone ’ s got a gift inside of **us**, and in all honesty, the pursuit of normality is the ultimate sacrifice of potential. The chance for greatness, for progress and for change dies the moment we try to be like someone else. Please — don ’ t tell me I ’ m normal. Thank you.

Text Sample 124: NEG Dim 1 – 2012 – Score 1.00 – 2012/t002409.txt

The recent debate over copyright laws like SOPA in the United States and the ACTA agreement in Europe has been very emotional. And I think some dispassionate, quantitative reasoning could really bring a great deal to the debate. I ’ d therefore like to propose that we employ, we enlist, the cutting edge field of copyright math whenever we approach this subject. For instance, just recently the Motion Picture Association revealed that our economy loses 58 billion dollars a year to copyright theft. Now rather than just argue about this number, a copyright mathematician will analyze it and he ’ ll soon discover that this money could stretch from this auditorium all the way across Ocean Boulevard to the Westin, and then to Mars...... if we use pennies. Now this is obviously a powerful, some might say dangerously powerful, insight. But it ’ s also a morally important one. Because this isn ’ t just the hypothetical retail value of some pirated movies that we ’ re talking about, but this is actual economic losses. This is the equivalent to the entire American corn crop failing along with all of our fruit crops, as well as wheat, tobacco, rice, sorghum — whatever sorghum is — losing sorghum. But identifying the actual losses to the economy is almost impossible to do unless we use copyright math. Now music revenues are down by about eight billion dollars a year since Napster first came on the scene. So that ’ s a chunk of what we ’ re looking for. But total movie revenues across theaters, home video and pay-per-view are up. And TV, satellite and cable revenues are way up. Other content markets like book publishing and radio are also up. So this small missing chunk here is puzzling. Since the big content markets have grown in line with historic norms, it ’ s not additional growth that piracy has prevented, but copyright math tells **us** it must therefore be foregone growth in a market that has no historic norms — one that didn ’ t exist in the 90 ’ s. What we ’ re looking at here is the insidious cost of ringtone piracy. 50 billion dollars of it a year, which is enough, at 30 seconds a ringtone, that could stretch from here to Neanderthal times. It ’ s true. I have Excel. The movie folks also tell **us** that our economy loses over 370, 000 jobs to content theft, which is quite a lot when you consider that, **back** in ’ 98, the Bureau of Labor Statistics indicated that the motion picture and video industries were employing 270, 000 people. Other data has the music industry at about 45, 000 people. And so the job losses that came with the Internet and all that content theft, have therefore left **us** with negative employment in our content industries. And this is just one of the many mind-blowing statistics that copyright mathematicians have to deal with every day. And some people think that string theory is tough. Now this is a key number from the copyright mathematicians ’ toolkit. It ’ s the precise amount of harm that comes to media companies whenever a single copyrighted song or movie gets pirated. Hollywood and Congress derived this number mathematically **back** when they last sat down to improve copyright damages and made this law. Some people think this number ’ s a little bit large, but copyright mathematicians who are media lobby experts are merely surprised that it doesn ’ t get compounded for inflation every year. Now when this law first passed, the world ’ s hottest MP3 player could hold just 10 songs. And it was a big Christmas hit. Because what little hoodlum wouldn ’ t want a million and a half bucks-worth of stolen goods in his pocket. These days an iPod Classic can hold 40, 000 songs, which is to say eight billion dollars-worth of stolen media. Or about 75, 000 jobs. Now you might find copyright math strange, but that ’ s because it ’ s a field that ’ s best left to experts. So that ’ s it for now. I hope you ’ ll join me next time when I will be making an equally scientific and fact-based inquiry into the cost of alien music piracy to he American economy. Thank you very much. Thank you.

Text Sample 125: NEG Dim 1 – 2012 – Score 1.00 – 2012/t002000.txt

I ’ d like to talk to you today about a whole new way to think about sexual activity and sexuality education, by comparison. If you talk to someone today in America about sexual activity, you ’ ll find pretty soon you ’ re not just talking about sexual activity. You ’ re also talking about baseball. Because baseball is the dominant cultural metaphor that Americans use to think about and talk about sexual activity, and we know that because there ’ s all this language in English that seems to be talking about baseball but that ’ s really talking about sexual activity. So, for example, you can be a pitcher or a catcher, and that corresponds to whether you perform a sexual act or receive a sexual act. Of course, there are the bases, which refer to specific sexual activities that happen in a very specific order, ultimately resulting in scoring a run or hitting a home run, which is usually having vaginal intercourse to the point of orgasm, at least for the guy. You can strike out, which means you don ’ t get to have any sexual activity. And if you ’ re a benchwarmer, you might be a virgin or somebody who for whatever reason isn ’ t in the game, maybe because of your age or because of your ability or because of your skillset. A bat ’ s a penis, and a nappy dugout is a vulva, or a vagina. A glove or a catcher ’ s mitt is a condom. A switch-hitter is a bisexual person, and we gay and lesbian folks play for the other team. And then there ’ s this one :”if there ’ s grass on the field, play ball.”And that usually refers to if a young person, specifically often a young woman, is old enough to have pubic hair, she ’ s old enough to have sex with. This baseball model is incredibly problematic. It ’ s sexist. It ’ s heterosexist. It ’ s competitive. It ’ s goal-directed. And it can ’ t result in healthy sexuality developing in young people or in adults. So we need a new model. I ’ m here today to offer you that new model. And it ’ s based on pizza. Now pizza is something that is universally understood and that most people associate with a positive experience. So let ’ s do this. Let ’ s take baseball and pizza and compare it when talking about three aspects of sexual activity : the trigger for sexual activity, what happens during sexual activity, and the expected outcome of sexual activity. So when do you play baseball? You play baseball when it ’ s baseball season and when there ’ s a game on the schedule. It ’ s not exactly your choice. So if it ’ s prom night or a wedding night or at a party or if our parents aren ’ t home, hey, it ’ s just batter up. Can you imagine saying to your coach,”Uh, I ’ m not really feeling it today, I think I ’ ll sit this game out.”That ’ s just not the way it happens. And when you get together to play baseball, immediately you ’ re with two opposing teams, one playing offense, one playing defense, somebody ’ s trying to move deeper into the field. That ’ s usually a sign to the boy. Somebody ’ s trying to defend people moving into the field. That ’ s often given to the girl. It ’ s competitive. We ’ re not playing with each other. We ’ re playing against each other. And when you show up to play baseball, nobody needs to talk about what we ’ re going to do or how this baseball game might be good for **us**. Everybody knows the rules. You just take your position and play the game. But when do you have pizza? Well, you have pizza when you ’ re hungry for pizza. It starts with an internal sense, an internal desire, or a need.”Huh. I could go for some pizza.”And because it ’ s an internal desire, we actually have some sense of control over that. I could decide that I ’ m hungry but know that it ’ s not a great time to eat. And then when we get together with someone for pizza, we ’ re not competing with them, we ’ re looking for an experience that both of **us** will share that ’ s satisfying for both of **us**, and when you get together for pizza with somebody, what ’ s the first thing you do? You talk about it. You talk about what you want. You talk about what you like. You may even negotiate it.”How do you feel about pepperoni?””Not so much, I ’ m kind of a mushroom guy myself.””Well, maybe we can go half and half.”And even if you ’ ve had pizza with somebody for a very long time, don ’ t you still say things like,”Should we get the usual?””Or maybe something a little more adventurous?”Okay, so when you ’ re playing baseball, so if we talk about during sexual activity, when you ’ re playing baseball, you ’ re just supposed to round the bases in the proper order one at a time. You can ’ t hit the ball and run to right field. That doesn ’ t work. And you also can ’ t get to second base and say,”I like it here. I ’ m going to stay here.”No. And also, of course, with baseball, there ’ s, like, the specific equipment and a specific skill set. Not everybody can play baseball. It ’ s pretty exclusive. Okay, but what about pizza? When we ’ re trying to figure out what ’ s good for pizza, isn ’ t it all about what ’ s our pleasure? There are a million different kinds of pizza. There ’ s a million different toppings. There ’ s a million different ways to eat pizza. And none of them are wrong. They ’ re different. And in this case, difference is good, because that ’ s going to increase the chance that we ’ re having a satisfying experience. And lastly, what ’ s the expected outcome of baseball? Well, in baseball, you play to win. You score as many runs as you can. There ’ s always a winner in baseball, and that means there ’ s always a loser in baseball. But what about pizza? Well, in pizza, we ’ re not really — there ’ s no winning. How do you win pizza? You don ’ t. But you do look for,”Are we satisfied?”And sometimes that can be different amounts over different times or with different people or on different days. And we get to decide when we feel satisfied. If we ’ re still hungry, we might have some more. If you eat too much, though, you just feel gross. So what if we could take this pizza model and overlay it on top of sexuality education? A lot of sexuality education that happens today is so influenced by the baseball model, and it sets up education that can ’ t help but produce unhealthy sexuality in young people. And those young people become older people. But if we could create sexuality education that was more like pizza, we could create education that invites people to think about their own desires, to make deliberate decisions about what they want, to talk about it with their partners, and to ultimately look for not some external outcome but for what feels satisfying, and we get to decide that. You may have noticed in the baseball and pizza comparison, under the baseball, it ’ s all commands. They ’ re all exclamation points. But under the pizza model, they ’ re questions. And who gets to answer those questions? You do. I do. So remember, when we ’ re thinking about sexuality education and sexual activity, baseball, you ’ re out. Pizza is the way to think about healthy, satisfying sexual activity, and good, comprehensive sexuality education. Thank you very much for your time.

In this rather long sort of marathon presentation, I ’ ve tried to break it up into three parts : the first being a whole lot of examples on how it can be a little bit more pleasurable to deal with a computer and really address the qualities of the human interface. And these will be some simple design qualities and they will also be some qualities of, if you will, the intelligence of interaction. Then the second part will really just be examples of new technologies — new media falling very much into that mold. Again, I will go through them as fast as possible. And then the last one will be some examples I ’ ve been able to collect, which I think illustrate this at least as best I can, in the world of entertainment. People have this belief — and I share most of it — that we will be using the TV screens or their equivalents for electronic books of the future. But then you think,”My God! What a terrible image you get when you look at still pictures on TV.”Well, it doesn ’ t have to be terrible. And that is a slide taken from a

TV set and it was pre- processed to be very sympathetic to the TV medium, and it absolutely looks beautiful. Well, what ' s happened? How did people get into this mess? Where you are now, all of a sudden, sitting in front of personal computers and video text — teletext systems, and somewhat horrified by what you see on the screen? Well, you have to remember that TV was designed to be looked at eight times the distance of the diagonal. So you get a 13-inch, 19-inch, whatever, TV, and then you should multiply that by eight and that ' s the distance you should sit away from the TV set. Now we ' ve put people 18 inches in front of a TV, and all the artifacts that none of the original designers expected to be seen, all of a sudden, are staring you in the face : the shadow mask, the scan lines, all of that. And they can be treated very easily ; there are actually ways of getting rid of them, there are actually ways of just making absolutely beautiful pictures. I ' m talking here a little bit about display technologies. Let me talk about how you might input information. And my favorite example is always fingers. I ' m very interested in touch-sensitive displays. High-tech, high-touch. Isn ' t that what some of you said? It ' s certainly a very important medium for input, and a lot of people think that fingers are a very low- resolution sort of stylus for inputting to a display. In fact, they ' re not : it ' s really a very, very high-resolution input medium — you have to just do it twice, you have to touch the screen and then rotate your finger slightly — and you can move a cursor with great accuracy. And so when you see on the market these systems that have just a few light emitting diodes on the side and are very low resolution, it ' s nice that they exist because it still is better than nothing. But it, in some sense, misses the point : namely, that fingers are a very, very high-resolution input medium. Now, what are some of the other advantages? Well, the one advantage is that you don ' t have to pick them up, and people don ' t realize how important that is — not having to pick up your fingers to use them. When you think for a second of the mouse on Macintosh — and I will not criticize the mouse too much — when you ' re typing — what you have — you want to now put something — first of all, you ' ve got to find the mouse. You have to probably stop. Maybe not come to a grinding halt, but you ' ve got to sort of find that mouse. Then you find the mouse, and you ' re going to have to wiggle it a little bit to see where the cursor is on the screen. And then when you finally see where it is, then you ' ve got to move it to get the cursor over there, and then —"Bang"— you ' ve got to hit a button or do whatever. That ' s four separate steps versus typing and then touching and typing and just doing it all in one motion — or one-and-a-half, depending on how you want to count. Again, what I ' m trying to do is just illustrate the kinds of problems that I think face the designers of new computer systems and entertainment systems and educational systems from the perspective of the quality of that interface. And another advantage, of course, of using fingers is you have 10 of them. And we have never known how to do this technically, so this slide is a fake slide. We never succeeded in using ten fingers, but there are certain things you can do, obviously, with more than one-finger input, which is rather fascinating. What we did stumble across was something... Again, which is typical of the computer field, is when you have a bug that you can ' t get rid of you turn it into a feature. And maybe... maybe a mouse is a new kind of bug. But the bug in our case was in touch-sensitive displays : we wanted to be able to draw — you know, rub your finger across the screen to input continuous points — and there was just too much friction created between your finger and the glass — if glass was the substrate, which it usually is. So we found that that actually was a feature in the sense you could build a pressure-sensitive display. And when you touch it with your finger, you can actually, then, introduce all the forces on the face of that screen, and that actually has a certain amount of value. Let me see if I can load another disc and show you, quickly, an example. Now, imagine a screen, which is not only touch-sensitive now, it ’ s pressure-sensitive. And it ’ s pressure-sensitive to the forces both in the plane of the screen — X, Y, and Z at least in one direction ; we couldn ’ t figure out how to come in the other direction. But let me get rid of the slide, and let ’ s see if this comes on. OK. So there is the pressure-sensitive display in operation. The person ’ s just, if you will, pushing on the screen to make a curve. But this is the interesting part. I want to stop it for a second because the movie is very badly made. And the particular display was built about six years ago, and when we moved from one room to another room, a rather large person sat on it and it got destroyed. So all we have is this record. But imagine that screen having lots of objects on it and the person has touched an object — one of N — like he did there, and then pushed on it. Now, imagine a program where some of those objects are physically heavy and some are light : one is an anvil on a fuzzy rug and the other one is a ping-pong ball on a sheet of glass. And when you touch it, you have to really push very hard to move that anvil across the screen, and yet you touch the ping-pong ball very lightly and it just scoots across the screen. And what you can do — oops, I didn ’ t mean to do that — what you can do is actually feed **back** to the user the feeling of the physical properties. So again, they don ’ t have to be weight ; they could be a general trying to move troops, and he ’ s got to move an aircraft carrier versus a little boat. In fact, they funded it for that very reason. The whole notion, then, is one that at the interface there are physical properties in that transducer — in this case it ’ s pressure and touches — that allow you to present things to the user that you could never present before. So it ’ s not simply looking at the quality or, if you will, the luxury of that interface, but it ’ s actually looking at the idea of presenting things that previously couldn ’ t be presented before. I want to move on to another example, which is one of a different sort, where we ’ re trying to use computer and video disc technology now to come up with a new kind of book. Here, the idea is that you ’ re going to take this book, if you will, and it ’ s going to come alive. You ’ re going to sort of breathe life into it. We are so used to doing monologues. Filmmakers, for example, are the experts in monologue making : you make a film and it has a well-formed beginning, middle and end, and in some sense the art of it is that. And you then say,”There ’ s an opportunity for making conversational movies.”Well, what does that mean? And it sort of nibbles at the core of the whole profession and all the assumptions of that medium. So, book writing is the same thing. What I ’ ll show you very quickly is a new kind of book where it is mixed now with... all sorts of things live in there, but you have to keep a few things in mind. One is that this book knows about itself. Each frame of the movie has information about itself. So it knows, or at least there is computer-readable information in the medium itself. It ’ s just not a static movie frame. That ’ s one thing. The other is that you have to realize that it is a random access medium, and you can, in fact, branch and expand and elaborate and shrink. And here — again, my favorite example — is the cookbook, the”Larousse Gastronomique.”And I think I use the example all too often, but it ’ s a great one because there is a classic ending in that little encyclopedia-style cookbook that tells you how to do something like penguin, and you get to the end of the recipe and it says,”Cook until done.”Now, that would be, if you will, the top green track, which doesn ’ t mean too much. But you might have to elaborate for me or for somebody who isn ’ t an expert, and say,”Cook at 380 degrees for 45 minutes.”And then for a real beginner, you would go down even further and elaborate more — say,”Open the oven, preheat, wait for the light to go out, open the door, don ’ t leave it open too long, put the penguin in and shut the door...”whatever. And that ’ s a much more elaborate one than you dribble **back**. That ' s one kind of use of random access. And the other is where you want to explain the same thing in different ways. If you ' re in a classroom situation and somebody asks a question, the last thing you do is repeat what you just said. You try and think of a different way of saying the same thing, or if you know the particular student and that student ' s cognitive style, then you might say it in a way that you think would have a good impedance match with that student. There are all sorts of techniques you will use — and again, this is a different kind of branching. So, what I will show you is... it ' s a rather boring book, but I ' m afraid sometimes you have to do boring books because your sponsors aren ' t necessarily interested in fiction and entertainment. And this is a book on how to repair a transmission. Now, I don ' t even know what vintage the transmission is, but let me just show you very quickly some of it, and we ' ll move on. Narrator : And continue to get descriptions for each of these chapters. Nicholas Negroponte : Now, this is his table of contents. Just a picture of the transmission, and as you rub your finger across the transmission it highlights the various parts. Narrator : When I find a chapter that I want to see, I just touch the text and the system will format pages for me to read. The words or phrases that are lit up in red are glossary words, so I can get a different definition by just touching the word, and the definition appears, superimposed over the illustration. NN : This is about the oil pan, or the oil filter and all that. This is relatively important because it sets the page... Narrator : This is another example of a page with glossary words highlighted in red. I can get a definition of these words just by touching them, and the definition will appear in the illustration corner. I can get **back** to the illustration, but in this case it ' s not a single frame, but it ' s actually a movie of someone coming into the frame and doing the repair that ' s described in the text. The two-headed slider is a speed control that allows me to watch the movie at various speeds, in forward or reverse. And the movie is displayed as a full frame movie. I can go **back** to the beginning... and play the movie at full speed. Here ' s another step-by-step procedure, only in this case — NN : Okay, this movie is... Everybody ' s heard of sound-sync movies — this is text-sync movies, so as the movie plays, the text gets highlighted. We highlight the text as we go through the movie. Repairman :... Not too far out. Front poles, preferably. Don ' t loosen them too far. If you loosen them too far, you ' ll have a big mess. NN : I suspect that some of you might not even understand that language. OK. I ' m at the third and last part of this, which I said I would make an attempt to at least give you some examples that may be more directly related to the world of entertainment. And of course, good education has got to be good entertainment, so my first example will be drawn from a very recent experiment that we ' ve been doing — in this case, in Senegal — where we have tried to use personal computers as a pedagogical medium. But not as teaching machines at all ; the whole notion is to use this as an instrument where there is a complete reversal of roles — the child is, if you will, the teacher and the machine is the student — and the art of computer programming is a vehicle that sort of approximates thinking about thinking. But teaching kids programming per se is utterly irrelevant. And there are just a few slides I want to go through, but there ' s a story I ' d like to tell. And that was when, before we did this in any developing countries — we ' re doing it, in fact, in three developing countries right now : Pakistan, Colombia and Senegal — we did it in some pretty rough areas of New York City. And one child, whose name I ' ve forgotten, was about seven or eight years old, absolutely considered mentally handicapped — couldn ' t read, didn ' t even make it in the lowest section of the school ' s classes — and was pretty much not in school, though physically there. But did hang around the, quote,"computer room,"where there were quite a few computers, and learned this particular language called Logo — and learned it with great ease and found it a lot of fun, it was very interesting. And one day, by chance, some visitors from the NIE came by in their double-breasted suits looking at this setup, and none of the children who were normally there, except for this one child, were there. He was, and he said,"Let me show you how this works,"and they got an absolutely ingenuous, wonderful description of Logo. And the child was just zipping right through it, showing them all sorts of things until they asked him how to do something which he couldn ' t explain and so he flipped through the manual, found the explanation and typed the command and got it to do what they asked. They were delighted, and by the time it was time to go see the principal, whom they ' d actually come to see — not the computer room — they went upstairs and they said,"This is absolutely remarkable! That child was very articulate and showed **us** and even dealt with the things he couldn ' t do automatically with that manual. It was just absolutely fantastic."The principal said,"There ' s a dreadful mistake, because that child can ' t read. And you obviously have been hoodwinked or you ' ve talked about somebody else."And they all got up and they all went downstairs and the child was still there. And they did something very intelligent : they asked the child,"Can you read?"And the child said,"No, I can ' t."And then they said,"But wait a minute. You just looked through that manual and you found..."and he said,"Oh, but that ' s not reading."And so they said,"Well, what ' s reading then?"He says,"Well, reading is this junk they give me in little books to read. It ' s absolutely irrelevant, and I get nothing for it. But here, with a little bit of effort I get a lot of return."And it really meant something to the child. The child read beautifully, it turned out, and was really very competent. So it actually meant something. And that story has many other anecdotes that are similar, but wow. The key to the future of computers in education is right there, and it is : when does it mean something to a child? There is a myth, and it truly is a myth : we believe — and I ' m sure a lot of you believe in this room — that it is harder to read and write than it is to learn how to speak. And it ' s not, but we think speech —"My God, little children pick it up somehow, and by the age of two they ' re doing a mediocre job, and by three and four they ' re speaking reasonably well. And yet you ' ve got to go to school to learn how to read, and you have to sit in a classroom and somebody has to teach you. Hence, it must be harder."Well, it ' s not harder. What the truth is is that speaking has great value to a child ; the child can get a great deal by talking to you. Reading and writing is utterly useless. There is no reason for a child to read and write except blind faith, and that it ' s going to help you. So what happens is you go to school and people say,"Just believe me, you ' re going to like it. You ' re going to like reading,"and just read and read. On the other hand, you give a kid — a three-year-old kid — a computer and they type a little command and — Poof! — something happens. And all of a sudden... You may not call that reading and writing, but a certain bit of typing and reading stuff on the screen has a huge payoff, and it ' s a lot of fun. And in fact, it ' s a powerful educational instrument. Well, in Senegal we found that this was the traditional classroom : 120 kids — three per desk — one teacher, a little bit of chalk. This student was one of our first students, and it ' s the girl on the left leaning with her chalkboard, and she came... within two days — I want to show you the program she wrote, and remember her hairstyle. And that is the program she made. That ' s what meant something to her, is doing the hair pattern, and actually did it within two days — an hour each day — and found it was, to her, absolutely the most meaningful piece... But rooted in that, little did she know how much knowledge she was acquiring about geometry and just math and logic and all the rest. And again, I could talk for three hours about this subject. I will come to my last example and then quit. And my last example

— as some of my former colleagues, whom I see in the room, can imagine what it will be. Yes, it is. It ’ s our work — that was a while ago, and it still is my favorite project — of teleconferencing. And the reason it remains a favorite project is that we were asked to do a teleconferencing system where you had the following situation : you had five people at five different sites — they were known people — and you had to have these people in teleconference, such that each one was utterly convinced that the other four were physically present. Now, that is sufficiently zany that we would, obviously, jump to the bait, and we did. And the fact that we knew the people — we had to take a page out of the history of Walt Disney — we actually went so far as to build CRTs in the shapes of the people ’ s faces. So if I wanted to call my friend Peter Sprague on the phone, my secretary would get his head out and bring it and set it on the desk, and that would be the TV used for the occasion. And it ’ s uncanny : there ’ s no way I can explain to you the amount of eye contact you get with that physical face projected on a 3D CRT of that sort. The next thing that we had to do is to persuade them that there needed to be spatial correspondence, which is straightforward, but again, it ’ s something that didn ’ t fall naturally out of a telecommunications or computing style of thinking ; it was a very, if you will, architectural or spatial concept. And that was to recognize that when you sit around the table, the actual location of the people becomes rather important. And when somebody gets up, in fact, to go answer a phone or use a bathroom or something, the empty seat becomes, if you will, that person. And you point frequently to the empty seat and you say,”He or she wouldn ’ t agree,”and the empty chair is that person and the spatiality is crucial. So we said,”Well, these will be on round tables and the order around the table had to be the same, so that at my site, I would be, if you will, real and then at each other ’ s site you ’ d have these plastic heads. And the plastic heads, sometimes you want to project them. And there are a number of schemes, which I don ’ t want to dwell on, but this is the one that we finally used where we projected onto rear screen material that was molded in the face — literally in the face of the person. And I ’ ll show you one more slide, where this is actually made from something called a solid photograph and is the screen. Now, we track, on the person ’ s head, the head motions — so we transmit with a video the head positions — and so this head moves in about two axes. So if I, all of a sudden, turn to the person to my left and start talking to that person, then at the person to my right ’ s site, he ’ ll see these two plastic heads talking to each other. And then if that person interrupts, then those two heads may turn. And it really is reconstructing, quite accurately, teleconferencing.

As an artist, connection is very important to me. Through my work I ’ m trying to articulate that humans are not separate from nature and that everything is interconnected. I first went to Antarctica almost 10 years ago, where I saw my first icebergs. I was in awe. My heart beat fast, my head was dizzy, trying to comprehend what it was that stood in front of me. The icebergs around me were almost 200 feet out of the water, and I could only help but wonder that this was one snowflake on top of another snowflake, year after year. Icebergs are born when they calve off of glaciers or break off of ice shelves. Each iceberg has its own individual personality. They have a distinct way of interacting with their environment and their experiences. Some refuse to give up and hold on to the bitter end, while others can ’ t take it anymore and crumble in a fit of dramatic passion. It ’ s easy to think, when you look at an iceberg, that they ’ re isolated, that they ’ re separate and alone, much like we as humans sometimes view ourselves. But the reality is far from it. As an iceberg melts, I am breathing in its ancient atmosphere. As the iceberg melts, it is releasing mineral-rich fresh water that nourishes many forms of life. I approach photographing these icebergs as if I ’ m making portraits of my ancestors, knowing that in these individual moments they exist in that way and will never exist that way again. It is not a death when they melt ; it is not an end, but a continuation of their path through the cycle of life. Some of the ice in the icebergs that I photograph is very young — a couple thousand years old. And some of the ice is over 100, 000 years old. The last pictures I ’ d like to show you are of an iceberg that I photographed in Qeqetarsuaq, Greenland. It ’ s a very rare occasion that you get to actually witness an iceberg rolling. So here it is. You can see on the left side a small boat. That ’ s about a 15-foot boat. And I ’ d like you to pay attention to the shape of the iceberg and where it is at the waterline. You can see here, it begins to roll, and the boat has moved to the other side, and the man is standing there. This is an average-size Greenlandic iceberg. It ’ s about 120 feet above the water, or 40 meters. And this video is real time. And just like that, the iceberg shows you a different side of its personality. Thank you.

Pat Mitchell : You have brought **us** images from the Yemen Times. And take **us** through those, and introduce **us** to another Yemen. Nadia Al-Sakkaf : Well, I ’ m glad to be here. And I would like to share with you all some of the pictures that are happening today in Yemen. This picture shows a revolution started by women, and it shows women and men leading a mixed protest. The other picture is the popularity of the real need for change. So many people are there. The intensity of the upspring. This picture shows that the revolution has allowed opportunities for training, for education. These women are learning about first aid and their rights according to the constitution. I love this picture. I just wanted to show that over 60 percent of the Yemeni population are 15 years and below. And they were excluded from decision-making, and now they are in the forefront of the news, raising the flag. English — you will see, this is jeans and tights, and an English expression — the ability to share with the world what is going on in our own country. And expression also, it has brought talents. Yemenis are using cartoons and art, paintings, comics, to tell the world and each other about what ’ s going on. Obviously, there ’ s always the dark side of it. And this is just one of the less-gruesome pictures of the revolution and the cost that we have to pay. The solidarity of millions of Yemenis across the country just demanding the one thing. And finally, lots of people are saying that Yemen ’ s revolution is going to break the country. Is it going to be so many different countries? Is it going to be another Somalia? But we want to tell the world that, no, under the one flag, we ’ ll still remain as Yemeni people. PM : Thank you for those images, Nadia. And they do, in many ways, tell a different story than the story of Yemen, the one that is often in the news. And yet, you yourself defy all those characterizations. So let ’ s talk about the personal story for a moment. Your father is murdered. The Yemen Times already has a strong reputation in Yemen as an independent English language newspaper. How did you then make the decision and assume the responsibilities of running a newspaper, especially in such times of conflict? NA : Well, let me first warn you that I ’ m not the traditional Yemeni girl. I ’ ve guessed you ’ ve already noticed this by now. In Yemen, most women are veiled and they are sitting behind doors and not very much part of the public life. But there ’ s so much potential. I wish I could show you my Yemen. I wish you could see Yemen through my eyes. Then you would know that there ’ s so much to it. And I was privileged because I was born into a family, my father would always encourage the boys and the girls. He would say we are equal. And he was such an extraordinary man. And even my mother — I owe it to my family. A story : I studied in India. And in my third year, I started becoming confused because I was Yemeni, but I was also mixing up with a lot of my friends in college. And I went **back** home and I said,”Daddy, I don ’ t know who I am. I ’ m not a Yemeni ; I ’ m not an Indian.”And he said,”You are the bridge.”And that is something I will keep in my heart forever. So since then I ’ ve been the bridge, and a lot of people have walked over me. PM : I don ’ t think so. NA : But it just helps tell that some people are change agents in the society. And when I became editor-in-chief after my brother actually — my father passed away in 1999, and then my brother until 2005 — and everybody was betting that I will not be able to do it.”What ’ s this young girl coming in and showing off because it ’ s her family business,”or something. It was very hard at first. I didn ’ t want to clash with people. But with all due respect to all the men, and the older men especially, they did not want me around. It was very hard, you know, to impose my authority. But a woman ’ s got to do what a woman ’ s got to do. And in the first year, I had to fire half of the men. Brought in more women. Brought in younger men. And we have a more gender- balanced newsroom today. The other thing is that it ’ s about professionalism. It ’ s about proving who you are and what you can do. And I don ’ t know if I ’ m going to be boasting now, but in 2006 alone, we won three international awards. One of them is the IPI Free Media Pioneer Award. So that was the answer to all the Yemeni people. And I want to score a point here, because my husband is in the room over there. If you could please stand up, [unclear]. He has been very supportive of me. PM : And we should point out that he works with you as well at the paper. But in assuming this responsibility and going about it as you have, you have become a bridge between an older and traditional society and the one that you are now creating at the paper. And so along with changing who worked there, you must have come up against another positioning that we always run into, in particular with women, and it has to do with outside image, dress, the veiled woman. So how have you dealt with this on a personal level as well as the women who worked for you? NA : As you know, the image of a lot of Yemeni women is a lot of black and covered, veiled women. And this is true. And a lot of it is because women are not able, are not free, to show their face to their self. It ’ s a lot of traditional imposing coming by authority figures such as the men, the grandparents and so on. And it ’ s economic empowerment and the ability for a woman to say,”I am as much contributing to this family, or more, than you are.”And the more empowered the women become, the more they are able to remove the veil, for example, or to drive their own car or to have a job or to be able to travel. So the other face of Yemen is actually one that lies behind the veil, and it ’ s economic empowerment mostly that allows the woman to just uncover it. And I have done this throughout my work. I ’ ve tried to encourage young girls. We started with, you can take it off in the office. And then after that, you can take it off on assignments. Because I didn ’ t believe a journalist can be a journalist with — how can you talk to people if you have your face covered? — and so on ; it ’ s just a movement. And I am a role model in Yemen. A lot of people look up to me. A lot of young girls look up to me. And I need to prove to them that, yes, you can still be married, you can still be a mother, and you can still be respected within the society, but at the same time, that doesn ’ t mean you [should] just be one of the crowd. You can be yourself and have your face. PM : But by putting yourself personally out there — both projecting a different image of Yemeni women, but also what you have made possible for the women who work at the paper — has this put you in personal danger? NA : Well the Yemen Times, across 20 years, has been through so much. We ’ ve suffered prosecution ; the paper was closed down more than three times. It ’ s an independent newspaper, but tell that to the people in charge. They think that if there ’ s anything against them, then we are being an opposition newspaper. And very, very difficult times. Some of my reporters were arrested. We had some court cases. My father was assassinated. Today, we are in a much better situation. We ’ ve created the credibility. And in times of revolution or change like today, it is very important for independent media to have a voice. It ’ s very important for you to go to YemenTimes. com, and it ’ s very important to listen to our voice. And this is probably something I ’ m going to share with you in Western media probably — and how there ’ s a lot of stereotypes — thinking of Yemen in one single frame : this is what Yemen is all about. And that ’ s not fair. It ’ s not fair for me ; it ’ s not fair for my country. A lot of reporters come to Yemen and they want to write a story on Al-Qaeda or terrorism. And I just wanted to share with you : there ’ s one reporter that came. He wanted to do a documentary on what his editors wanted. And he ended up writing about a story that even surprised me — hip hop — that there are young Yemeni men who express themselves through dancing and puchu puchu. That thing. Yeah, break dancing. I ’ m not so old. I ’ m just not in touch. PM : Yes, you are. Actually, that ’ s a documentary that ’ s available online ; the video ’ s online. NA : ShaketheDust. org. PM :”Shake the Dust.”PM : ShaketheDust. org. And it definitely does give a different image of Yemen. You spoke about the responsibility of the press. And certainly, when we look at the ways in which we have separated ourselves from others and we ’ ve created fear and danger, often from lack of knowledge, lack of real understanding, how do you see the way that the Western press in particular is covering this and all other stories out of the region, but in particular, in your country? NA : Well there is a saying that says,”You fear what you don ’ t know, and you hate what you fear.”So it ’ s about the lack of research, basically. It ’ s almost,”Do your homework,”— some involvement. And you cannot do parachute reporting — just jump into a country for two days and think that you ’ ve done your homework and a story. So I wish that the world would know my Yemen, my country, my people. I am an example, and there are others like me. We may not be that many, but if we are promoted as a good, positive example, there will be others — men and women — who can eventually bridge the gap — again, coming to the bridge — between Yemen and the world and telling first about recognition and then about communication and compassion. I think Yemen is going to be in a very bad situation in the next two or three years. It ’ s natural. But after the two years, which is a price we are willing to pay, we are going to stand up again on our feet, but in the new Yemen with a younger and more empowered people — democratic. PM : Nadia, I think you ’ ve just given **us** a very different view of Yemen. And certainly you yourself and what you do have given **us** a view of the future that we will embrace and be grateful for. And the very best of luck to you. YemenTimes. com. NA : On Twitter also. PM : So you are plugged in.

As a boy, I loved cars. When I turned 18, I lost my best friend to a car accident. Like this. And then I decided I ’ d dedicate my life to saving one million people every year. Now I haven ’ t succeeded, so this is just a progress report, but I ’ m here to tell you a little bit about self-driving cars. I saw the concept first in the DARPA Grand Challenges where the U. S. government issued a prize to build a self-driving car that could navigate a desert. And even though a hundred teams were there, these cars went nowhere. So we decided at Stanford to build a different self-driving car. We built the hardware and the software. We made it learn from **us**, and we set it free in the desert. And the unimaginable happened : it became the first car to ever return from a DARPA Grand Challenge, winning Stanford 2 million dollars. Yet I still hadn ’ t saved a single life. Since, our work has focused on building driving cars that can drive anywhere by themselves — any street in California. We ’ ve driven 140, 000 miles. Our cars have sensors by which they magically can see everything around them and make decisions about every aspect of driving. It ’ s the perfect driving mechanism. We ’ ve driven in cities, like in San Francisco here. We ’ ve driven from San Francisco to Los Angeles on Highway 1. We ’ ve encountered joggers, busy highways, toll booths, and this is without a person in the loop ; the car just drives itself. In fact, while we drove 140, 000 miles, people didn ’ t even notice. Mountain roads, day and night, and even crooked Lombard Street in San Francisco. Sometimes our cars get so crazy, they even do little stunts. Man : Oh, my God. What? Second Man : It ’ s driving itself. Sebastian Thrun : Now I can ’ t get my friend Harold **back** to life, but I can do something for all the people who died. Do you know that driving accidents are the number one cause of death for young people? And do you realize that almost all of those are due to human error and not machine error, and can therefore be prevented by machines? Do you realize that we could change the capacity of highways by a factor of two or three if we didn ’ t rely on human precision on staying in the lane — improve body position and therefore drive a little bit closer together on a little bit narrower lanes, and do away with all traffic jams on highways? Do you realize that you, TED users, spend an average of 52 minutes per day in traffic, wasting your time on your daily commute? You could regain this time. This is four billion hours wasted in this country alone. And it ’ s 2. 4 billion gallons of gasoline wasted. Now I think there ’ s a vision here, a new technology, and I ’ m really looking forward to a time when generations after **us** look **back** at **us** and say how ridiculous it was that humans were driving cars. Thank you.

I ’ ve been working on issues of poverty for more than 20 years, and so it ’ s ironic that the problem that and question that I most grapple with is how you actually define poverty. What does it mean? So often, we look at dollar terms â people making less than a dollar or two or three a day. And yet the complexity of poverty really has to look at income as only one variable. Because really, it ’ s a condition about choice, and the lack of freedom. And I had an experience that really deepened and elucidated for me the understanding that I have. It was in Kenya, and I want to share it with you. I was with my friend Susan Meiselas, the photographer, in the Mathare Valley slums. Now, Mathare Valley is one of the oldest slums in Africa. It ’ s about three miles out of Nairobi, and it ’ s a mile long and about **two-tenths** of a mile wide, where over half a million people live crammed in these little tin shacks, generation after generation, renting them, often eight or 10 people to a room. And it ’ s known for prostitution, violence, drugs : a hard place to grow up. And when we were walking through the narrow alleys, it was literally impossible not to step in the raw sewage and the garbage alongside the little homes. But at the same time it was also impossible not to see the human vitality, the aspiration and the ambition of the people who live there : women washing their babies, washing their clothes, hanging them out to dry. I met this woman, Mama Rose, who has rented that little tin shack for 32 years, where she lives with her seven children. Four sleep in one twin bed, and three sleep on the mud and linoleum floor. And she keeps them all in school by selling water from that kiosk, and from selling soap and bread from the little store inside. It was also the day after the inauguration, and I was reminded how Mathare is still connected to the globe. And I would see kids on the street corners, and they ' d say"Obama, he ' s our brother!"And I ' d say"Well, Obama ' s my brother, so that makes you my brother too."And they would look quizzically, and then be like,"High five!"And it was here that I met Jane. I was struck immediately by the kindness and the gentleness in her face, and I asked her to tell me her story. She started off by telling me her dream. She said,"I had two. My first dream was to be a doctor, and the second was to marry a good man who would stay with me and my family, because my mother was a single mom, and couldn ' t afford to pay for school fees. So I had to give up the first dream, and I focused on the second."She got married when she was 18, had a baby right away. And when she turned 20, found herself pregnant with a second child, her mom died and her husband left her â married another woman. So she was again in Mathare, with no income, no skill set, no money. And so she ultimately turned to prostitution. It wasn ' t organized in the way we often think of it. She would go into the city at night with about 20 girls, look for work, and sometimes come **back** with a few shillings, or sometimes with nothing. And she said,"You know, the poverty wasn ' t so bad. It was the humiliation and the embarrassment of it all."In 2001, her life changed. She had a girlfriend who had heard about this organization, Jamii Bora, that would lend money to people no matter how poor you were, as long as you provided a commensurate amount in savings. And so she spent a year to save 50 dollars, and started borrowing, and over time she was able to buy a sewing machine. She started tailoring. And that turned into what she does now, which is to go into the secondhand clothing markets, and for about three dollars and 25 cents she buys an old ball gown. Some of them might be ones you gave. And she repurposes them with frills and ribbons, and makes these frothy confections that she sells to women for their daughter ' s Sweet 16 or first Holy Communion â those milestones in a life that people want to celebrate all along the economic spectrum. And she does really good business. In fact, I watched her walk through the streets hawking. And before you knew it, there was a crowd of women around her, buying these dresses. And I reflected, as I was watching her sell the dresses, and also the jewelry that she makes, that now Jane makes more than four dollars a day. And by many definitions she is no longer poor. But she still lives in Mathare Valley. And so she can ' t move out. She lives with all of that insecurity, and in fact, in January, during the ethnic riots, she was chased from her home and had to find a new shack in which she would live. Jamii Bora understands that and understands that when we ' re talking about poverty, we ' ve got to look at people all along the economic spectrum. And so with patient capital from Acumen and other organizations, loans and investments that will go the long term with them, they built a low-cost housing development, about an hour outside Nairobi central. And they designed it from the perspective of customers like Jane herself, insisting on responsibility and accountability. So she has to give 10 percent of the mortgage â of the total value, or about 400 dollars in savings. And then they match her mortgage to what she paid in rent for her little shanty. And in the next couple of weeks, she ' s going to be among the first 200 families to move into this development. When I asked her if she feared anything, or whether she would miss anything from Mathare, she said,"What would I fear that I haven ' t confronted already? I ' m HIV positive. I ' ve dealt with it all."And she said,”What would I miss? You think I will miss the violence or the drugs? The lack of privacy? Do you think I ’ ll miss not knowing if my children are going to come home at the end of the day?”She said”If you gave me 10 minutes my bags would be packed.”I said,”Well what about your dreams?”And she said,”Well, you know, my dreams don ’ t look exactly like I thought they would when I was a little girl. But if I think about it, I thought I wanted a husband, but what I really wanted was a family that was loving. And I fiercely love my children, and they love me **back**.”She said,”I thought that I wanted to be a doctor, but what I really wanted to be was somebody who served and healed and cured. And so I feel so blessed with everything that I have, that two days a week I go and I counsel HIV patients. And I say, ’ Look at me. You are not dead. You are still alive. And if you are still alive you have to serve. ’”And she said,”I ’ m not a doctor who gives out pills. But maybe me, I give out something better because I give them hope.”And in the middle of this economic crisis, where so many of **us** are inclined to pull in with fear, I think we ’ re well suited to take a cue from Jane and reach out, recognizing that being poor doesn ’ t mean being ordinary. Because when systems are broken, like the ones that we ’ re seeing around the world, it ’ s an opportunity for invention and for innovation. It ’ s an opportunity to truly build a world where we can extend services and products to all human beings, so that they can make decisions and choices for themselves. I truly believe it ’ s where dignity starts. We owe it to the Janes of the world. And just as important, we owe it to ourselves. Thank you.

I normally teach courses on how to rebuild states after war. But today I ’ ve got a personal story to share with you. This is a picture of my family, my four siblings â my mom and I â taken in 1977. And we ’ re actually Cambodians. And this picture is taken in Vietnam. So how did a Cambodian family end up in Vietnam in 1977? Well to explain that, I ’ ve got a short video clip to explain the Khmer Rouge regime during 1975 and 1979. Video : April 17th, 1975. The communist Khmer Rouge enters Phnom Penh to liberate their people from the encroaching conflict in Vietnam, and American bombing campaigns. Led by peasant-born Pol Pot, the Khmer Rouge evacuates people to the countryside in order to create a rural communist utopia, much like Mao Tse-tung ’ s Cultural Revolution in China. The Khmer Rouge closes the doors to the outside world. But after four years the grim truth seeps out. In a country of only seven million people, one and a half million were murdered by their own leaders, their bodies piled in the mass graves of the killing fields. Sophal Ear : So, notwithstanding the 1970s narration, on April 17th 1975 we lived in Phnom Penh. And my parents were told by the Khmer Rouge to evacuate the city because of impending American bombing for three days. And here is a picture of the Khmer Rouge. They were young soldiers, typically child soldiers. And this is very normal now, of modern day conflict, because they ’ re easy to bring into wars. The reason that they gave about American bombing wasn ’ t all that far off. I mean, from 1965 to 1973 there were more munitions that fell on Cambodia than in all of World War II Japan, including the two nuclear bombs of August 1945. The Khmer Rouge didn ’ t believe in money. So the equivalent of the Federal Reserve Bank in Cambodia was bombed. But not just that, they actually banned money. I think it ’ s the only precedent in which money has ever been stopped from being used. And we know money is the root of all evil, but it didn ’ t actually stop evil from happening in Cambodia, in fact. My family was moved from Phnom Penh to Pursat province. This is a picture of what Pursat looks like. It ’ s actually a very pretty area of Cambodia, where rice growing takes place. And in fact they were forced to work the fields. So my father and mother ended up in a sort of concentration camp, labor camp. And it was at that time that my mother got word from the commune chief that the Vietnamese were actually asking for their citizens to go **back** to Vietnam. And she spoke some Vietnamese, as a child having grown up with Vietnamese friends. And she decided, despite the advice of her neighbors, that she would take the chance and claim to be Vietnamese so that we could have a chance to survive, because at this point they ’ re forcing everybody to work. And they ’ re giving about â in a modern-day, caloric-restriction diet, I guess â they ’ re giving porridge, with a few grains of rice. And at about this time actually my father got very sick. And he didn ’ t speak Vietnamese. So he died actually, in January 1976. And it made it possible, in fact, for **us** to take on this plan. So the Khmer Rouge took **us** from a place called Pursat to Kaoh Tiev, which is across from the border from Vietnam. And there they had a **detention** camp where alleged Vietnamese would be tested, language tested. And my mother ’ s Vietnamese was so bad that to make our story more credible, she ’ d given all the boys and girls new Vietnamese names. But she ’ d given the boys girls ’ names, and the girls boys ’ names. And it wasn ’ t until she met a Vietnamese lady who told her this, and then tutored her for two days intensively, that she was able to go into her exam and â you know, this was a moment of truth. If she fails, we ’ re all headed to the gallows ; if she passes, we can leave to Vietnam. And she actually, of course â I ’ m here, she passes. And we end up in Hong Ngu on the Vietnamese side. And then onwards to Chau Doc. And this is a picture of Hong Ngu, Vietnam today. A pretty idyllic place on the Mekong Delta. But for **us** it meant freedom. And freedom from persecution from the Khmer Rouge. Last year, the Khmer Rouge Tribunal, which the U. N. is helping Cambodia take on, started, and I decided that as a matter of record I should file a Civil Complaint with the Tribunal about my father ’ s passing away. And I got word last month that the complaint was officially accepted by the Khmer Rouge Tribunal. And it ’ s for me a matter of justice for history, and accountability for the future, because Cambodia remains a pretty lawless place, at times. Five years ago my mother and I went **back** to Chau Doc. And she was able to return to a place that for her meant freedom, but also fear, because we had just come out of Cambodia. I ’ m happy, actually, today, to present her. She ’ s here today with **us** in the audience. Thank you mother.

There are a lot of web 2. 0 consultants who make a lot of money. In fact, they make their living on this stuff. I ’ m going to try to save you all the time and money and go through it in the next three minutes, so bear with me. Started a website in 2005 with a few friends, called Reddit. com. It ’ s what you ’ d call a social news website ; basically, the democratic front page of the best stuff on the web. You find some interesting content — say, a TED Talk — submit it to Reddit, and a community of your peers votes up if they like it, down if they don ’ t. That creates the front page. It ’ s always rising, falling ; a half million people visit every day. But this isn ’ t about Reddit. It ’ s about discovering new things that pop up on the web. In the last four years, we ’ ve seen all kinds of memes, all kinds of trends get born right on our front page. This isn ’ t about Reddit itself, it ’ s actually about humpback whales. Well, technically, it ’ s about Greenpeace, an environmental organization that wanted to stop the Japanese government ’ s whaling campaign. The whales were getting killed ;

they wanted to put an end to it. One of the ways they wanted to do it was to put a tracking chip inside one of the whales. But to personify the movement, they wanted to name it. So in true web fashion, they put together a poll, where they had a bunch of very erudite, very thoughtful, cultured names. I believe this is the Farsi word for”immortal.”I think this means”divine power of the ocean”in a Polynesian language. And then there was this :”Mister Splashy Pants.”And this was a special name. Mister Pants, or”Splashy”to his friends, was very popular on the Internet. In fact, someone on Reddit thought,”What a great thing, we should all vote this up.”And Redditors responded and all agreed. So the voting started. We got behind it ourselves ; we changed our logo for the day, from the alien to Splashy, to help the cause. And it wasn ’ t long before other sites like Fark and Boing Boing and the rest of the Internet started saying,”We love Splashy Pants!”So it went from about five percent, which was when this meme started, to 70 percent at the end of voting. Pretty impressive, right? We won! Mister Splashy Pants was chosen. Just kidding — Greenpeace actually wasn ’ t that crazy about it, because they wanted one of the more thoughtful names to win. They said,”No, just kidding. We ’ ll give it another week of voting.”Well, that got **us** a little angry, so we changed it to Fightin ’ Splashy. And the Reddit community — really, the rest of the Internet, really got behind this. Facebook groups were created. Facebook applications were created. The idea was,”Vote your conscience, vote for Mister Splashy Pants.”People were putting up signs in the real world about this whale. This was the final vote : 78 percent of the votes. To give you an idea of the landslide, the next highest name pulled in three. There was a clear lesson : the Internet loves Mister Splashy Pants. Which is obvious. It ’ s a great name. Everyone wants to hear their news anchor say,”Mister Splashy Pants.”I think that ’ s what helped drive this. What was cool were the repercussions. Greenpeace created an entire marketing campaign around it — Mister Splashy Pants shirts and pins, an e-card so you could send your friend a dancing Splashy. But even more important was that they accomplished their mission. The Japanese government called off their whaling expedition. Mission accomplished : Greenpeace was thrilled, the whales were happy — that ’ s a quote. And actually, Redditors in the Internet community were happy to participate, but they weren ’ t whale lovers. A few, certainly, but we ’ re talking about a lot of people, really interested and caught up in this meme. Greenpeace came **back** to the site and thanked Reddit for its participation. But this wasn ’ t really altruism ; just interest in doing something cool. This is how the Internet works. This is that great big secret. The Internet provides a level playing field. Your link is as good as your link, which is as good as my link. With a browser, anyone can get to any website no matter your budget. That is, as long as you can keep net neutrality in place. Another important thing is it costs nothing to get content online. There are so many publishing tools available, it only takes a few minutes to produce something. and the cost of iteration is so cheap, you might as well. If you do, be genuine. Be honest, up-front. One of the great lessons Greenpeace learned is that it ’ s OK to lose control, OK to take yourself a little less seriously, given that, even though it ’ s a very serious cause, you could ultimately achieve your goal. That ’ s the final message I want to share : you can do well online. But no longer is the message coming from just the top down. If you want to succeed you ’ ve got to be OK to lose control. Thank you.

Text Sample 133: NEG Dim 1 – 2010 – Score -1.00 – 2010/t002858.txt
So, basically we have public leaders, public officials who are out of control ;

they are writing bills that are unintelligible, and out of these bills are going to come maybe 40, 000 pages of regulations, total complexity, which has a dramatically negative impact on our life. If you ’ re a veteran coming **back** from Iraq or Vietnam you face a blizzard of paperwork to get your benefits ; if you ’ re trying to get a small business loan, you face a blizzard of paperwork. What are we going to do about it? I define simplicity as a means to achieving clarity, transparency and empathy, building humanity into communications. I ’ ve been simplifying things for 30 years. I come out of the advertising and design business. My focus is understanding you people, and how you interact with the government to get your benefits, how you interact with corporations to decide whom you ’ re going to do business with, and how you view brands. So, very quickly, when President Obama said,”I don ’ t see why we can ’ t have a one-page, plain English consumer credit agreement.”So, I locked myself in a room, figured out the content, organized the document, and wrote it in plain English. I ’ ve had this checked by the two top consumer credit lawyers in the country. This is a real thing. Now, I went one step further and said,”Why do we have to stick with the stodgy lawyers and just have a paper document? Let ’ s go online.”And many people might need help in computation. Working with the Harvard Business School, you ’ ll see this example when you talk about minimum payment : If you spent 62 dollars for a meal, the longer you take to pay out that loan, you see, over a period of time using the minimum payment it ’ s 99 dollars and 17 cents. How about that? Do you think your bank is going to show that to people? But it ’ s going to work. It ’ s more effective than just computational aids. And what about terms like”over the limit”? Perhaps a stealth thing. Define it in context. Tell people what it means. When you put it in plain English, you almost force the institution to give the people a way, a default out of that, and not put themselves at risk. Plain English is about changing the content. And one of the things I ’ m most proud of is this agreement for IBM. It ’ s a grid, it ’ s a calendar. At such and such a date, IBM has responsibilities, you have responsibilities. Received very favorably by business. And there is some good news to report today. Each year, one in 10 taxpayers receives a notice from the IRS. There are 200 million letters that go out. Running through this typical letter that they had, I ran it through my simplicity lab, it ’ s pretty unintelligible. All the parts of the document in red are not intelligible. We looked at doing over 1, 000 letters that cover 70 percent of their transactions in plain English. They have been tested in the laboratory. When I run it through my lab, this heat-mapping shows everything is intelligible. And the IRS has introduced the program. There are a couple of things going on right now that I want to bring to your attention. There is a lot of discussion now about a consumer financial protection agency, how to mandate simplicity. We see all this complexity. It ’ s incumbent upon **us**, and this organization, I believe, to make clarity, transparency and empathy a national priority. There is no way that we should allow government to communicate the way they communicate. There is no way we should do business with companies that have agreements with stealth provisions and that are unintelligible. So, how are we going to change the world? Make clarity, transparency and simplicity a national priority. I thank you.

Text Sample 134: NEG Dim 1 – 2010 – Score -1.00 – 2010/t002681.txt

Hawa Abdi : Many people â 20 years for Somalia â [were] fighting. So there was no job, no food. Children, most of them, became very malnourished, like this. Deqo Mohamed : So as you know, always in a civil war, the ones affected most [are] the women and children. So our patients are women and children. And they are in our backyard. It ’ s our home. We welcome them. That ’ s the camp that we have in now 90, 000 people, where 75 percent of them are women and children. Pat Mitchell : And this is your hospital. This is the inside. HA : We are doing C-sections and different operations because people need some help. There is no government to protect them. DM : Every morning we have about 400 patients, maybe more or less. But sometimes we are only five doctors and 16 nurses, and we are physically getting exhausted to see all of them. But we take the severe ones, and we reschedule the other ones the next day. It is very tough. And as you can see, it ’ s the women who are carrying the children ; it ’ s the women who come into the hospitals ; it ’ s the women [are] building the houses. That ’ s their house. And we have a school. This is our bright â we opened [in the] last two years [an] elementary school where we have 850 children, and the majority are women and girls. PM : And the doctors have some very big rules about who can get treated at the clinic. Would you explain the rules for admission? HA : The people who are coming to **us**, we are welcoming. We are sharing with them whatever we have. But there are only two rules. First rule : there is no clan distinguished and political division in Somali society. [Whomever] makes those things we throw out. The second : no man can beat his wife. If he beat, we will put [him] in jail, and we will call the eldest people. Until they identify this case, we ’ ll never release him. That ’ s our two rules. The other thing that I have realized, that the woman is the most strong person all over the world. Because the last 20 years, the Somali woman has stood up. They were the leaders, and we are the leaders of our community and the hope of our future generations. We are not just the helpless and the victims of the civil war. We can reconcile. We can do everything. DM : As my mother said, we are the future hope, and the men are only killing in Somalia. So we came up with these two rules. In a camp with 90, 000 people, you have to come up with some rules or there is going to be some fights. So there is no clan division, and no man can beat his wife. And we have a little storage room where we converted a jail. So if you beat your wife, you ’ re going to be there. So empowering the women and giving the opportunity â we are there for them. They are not alone for this. PM : You ’ re running a medical clinic. It brought much, much needed medical care to people who wouldn ’ t get it. You ’ re also running a civil society. You ’ ve created your own rules, in which women and children are getting a different sense of security. Talk to me about your decision, Dr. Abdi, and your decision, Dr. Mohamed, to work together â for you to become a doctor and to work with your mother in these circumstances. HA : My age â because I was born in 1947 â we were having, at that time, government, law and order. But one day, I went to the hospital â my mother was sick â and I saw the hospital, how they [were] treating the doctors, how they [are] committed to help the sick people. I admired them, and I decided to become a doctor. My mother died, unfortunately, when I was 12 years [old]. Then my father allowed me to proceed [with] my hope. My mother died in [a] gynecology complication, so I decided to become a gynecology specialist. That ’ s why I became a doctor. So Dr. Deqo has to explain. DM : For me, my mother was preparing [me] when I was a child to become a doctor, but I really didn ’ t want to. Maybe I should become an historian, or maybe a reporter. I loved it, but it didn ’ t work. When the war broke out â civil war â I saw how my mother was helping and how she really needed the help, and how the care is essential to the woman to be a woman doctor in Somalia and help the women and children. And I thought, maybe I can be a reporter and doctor gynecologist. So I went to Russia, and my mother also, [during the] time of [the] Soviet Union. So some of our character, maybe we will come with a strong Soviet background of training. So that ’ s how I decided [to do] the same. My sister was different. She ’ s here. She ’ s also a doctor. She graduated in Russia also. And to go **back** and to work with our mother is just what we saw in the civil war â when I was 16, and my sister was 11, when the civil war broke out. So it was the need and the people we saw in the early ’ 90s â that ’ s what made **us** go **back** and work for them. PM : So what is the biggest challenge working, mother and daughter, in such dangerous and sometimes scary situations? HA : Yes, I was working in a tough situation, very dangerous. And when I saw the people who needed me, I was staying with them to help, because I [could] do something for them. Most people fled abroad. But I remained with those people, and I was trying to do something â [any] little thing I [could] do. I succeeded in my place. Now my place is 90, 000 people who are respecting each other, who are not fighting. But we try to stand on our feet, to do something, little things, we can for our people. And I ’ m thankful for my daughters. When they come to me, they help me to treat the people, to help. They do everything for them. They have done what I desire to do for them. PM : What ’ s the best part of working with your mother, and the most challenging part for you? DM : She ’ s very tough ; it ’ s most challenging. She always expects **us** to do more. And really when you think [you] cannot do it, she will push you, and I can do it. That ’ s the best part. She shows **us**, trains **us** how to do and how to be better [people] and how to do long hours in surgery â 300 patients per day, 10, 20 surgeries, and still you have to manage the camp â that ’ s how she trains **us**. It is not like beautiful offices here, 20 patients, you ’ re tired. You see 300 patients, 20 surgeries and 90, 000 people to manage. PM : But you do it for good reasons. Wait. Wait. HA : Thank you. DM : Thank you. HA : Thank you very much. DM : Thank you very much.

Text Sample 135: NEG Dim 1 – 2010 – Score -1.00 – 2010/t002852.txt

Today, I want you to look at children who become suicide bombers through a completely different lens. In 2009, there were 500 bomb blasts across Pakistan. I spent the year working with children who were training to become suicide bombers and with Taliban recruiters, trying to understand how the Taliban were converting these children into live ammunition and why these children were actively signing up to their cause. I want you to watch a short video from my latest documentary film,”Children of the Taliban.”The Taliban now run their own schools. They target poor families and convince the parents to send their children. In return, they provide free food and shelter and sometimes pay the families a monthly stipend. We ’ ve obtained a propaganda video made by the Taliban. Young boys are taught justifications for suicide attacks and the execution of spies. I made contact with a child from Swat who studied in a madrassa like this. Hazrat Ali is from a poor farming family in Swat. He joined the Taliban a year ago when he was 13. How do the Taliban in your area get people to join them? Hazrat Ali : They first call **us** to the mosque and preach to **us**. Then they take **us** to a madrassa and teach **us** things from the Koran. Sharmeen Obaid Chinoy : He tells me that children are then given months of military training. HA : They teach **us** to use machine guns, Kalashnikov, rocket launchers, grenades, bombs. They ask **us** to use them only against the infidels. Then they teach **us** to do a suicide attack. SOC : Would you like to carry out a suicide attack? HA : If God gives me strength. SOC : I, in my research, have seen that the Taliban have perfected the way in which they recruit and train children, and I think it ’ s a five-step process. Step one is that the Taliban prey on families that are large, that are poor, that live in rural areas. They separate the parents from the children by promising to provide food, clothing, shelter to these children. Then they ship them off, hundreds of miles away to hard-line schools that run along the Taliban agenda. Step two : They teach the children the Koran, which is Islam ' s holiest book, in Arabic, a language these children do not understand and cannot speak. They rely very heavily on teachers, who I have personally seen distort the message to these children as and when it suits their purpose to. These children are explicitly forbidden from reading newspapers, listening to radio, reading any books that the teachers do not prescribe them. If any child is found violating these rules, he is severely reprimanded. Effectively, the Taliban create a complete blackout of any other source of information for these children. Step three : The Taliban want these children to hate the world that they currently live in. So they beat these children — I have seen it ; they feed them twice a day dried bread and water ; they rarely allow them to play games ; they tell them that, for eight hours at a time, all they have to do is read the Koran. The children are virtual prisoners ; they cannot leave, they cannot go home. Their parents are so poor, they have no resources to get them **back**. Step four : The older members of the Taliban, the fighters, start talking to the younger boys about the glories of martyrdom. They talk to them about how when they die, they will be received up with lakes of honey and milk, how there will be 72 virgins waiting for them in paradise, how there will be unlimited food, and how this glory is going to propel them to become heroes in their neighborhoods. Effectively, this is the brainwashing process that has begun. Step five : I believe the Taliban have one of the most effective means of propaganda. Their videos that they use are intercut with photographs of men and women and children dying in Iraq and Afghanistan and in Pakistan. And the basic message is that the Western powers do not care about civilian deaths, so those people who live in areas and support governments that work with Western powers are fair game. That ' s why Pakistani civilians, over 6, 000 of whom have been killed in the last two years alone, are fair game. Now these children are primed to become suicide bombers. They ' re ready to go out and fight because they ' ve been told that this is effectively their only way to glorify Islam. I want you to watch another excerpt from the film. This boy is called Zenola. He blew himself up, killing six. This boy is called Sadik. He killed 22. This boy is called Messoud. He killed 28. The Taliban are running suicide schools, preparing a generation of boys for atrocities against civilians. Do you want to carry out a suicide attack? Boy : I would love to. But only if I get permission from my dad. When I look at suicide bombers younger than me, or my age, I get so inspired by their terrific attacks. SOC : What blessing would you get from carrying out a suicide attack? Boy : On the day of judgment, God will ask me,"Why did you do that?"I will answer,"My Lord! Only to make you happy! I have laid down my life fighting the infidels."Then God will look at my intention. If my intention was to eradicate evil for Islam, then I will be rewarded with paradise. Singer : On the day of judgment My God will call me My body will be put **back** together And God will ask me why I did this SOC : I leave you all with this thought : If you grew up in these circumstances, faced with these choices, would you choose to live in this world or in the glorious afterlife? As one Taliban recruiter told me,"There will always be sacrificial lambs in this war."Thank you.

Text Sample 136: NEG Dim 1 – 2004 – Score 2.00 – 2004/t000196.txt
I grew up in Europe, and World War II caught me when I was between seven

and 10 years old. And I realized how few of the grown-ups that I knew were able to withstand the tragedies that the war visited on them â how few of them could even resemble a normal, contented, satisfied, happy life once their job, their home, their security was destroyed by the war. So I became interested in understanding what contributed to a life that was worth living. And I tried, as a child, as a teenager, to read philosophy and to get involved in art and religion and many other ways that I could see as a possible answer to that question. And finally I ended up encountering psychology by chance. I was at a ski resort in Switzerland without any money to actually enjoy myself, because the snow had melted and I didn ’ t have money to go to a movie. But I found that on the â I read in the newspapers that there was to be a presentation by someone in a place that I ’ d seen in the center of Zurich, and it was about flying saucers [that] he was going to talk. And I thought, well, since I can ’ t go to the movies, at least I will go for free to listen to flying saucers. And the man who talked at that evening lecture was very interesting. Instead of talking about little green men, he talked about how the psyche of the Europeans had been traumatized by the war, and now they ’ re projecting flying saucers into the sky. He talked about how the **mandalas** of ancient Hindu religion were kind of projected into the sky as an attempt to regain some sense of order after the chaos of war. And this seemed very interesting to me. And I started reading his books after that lecture. And that was Carl Jung, whose name or work I had no idea about. Then I came to this country to study psychology and I started trying to understand the roots of happiness. This is a typical result that many people have presented, and there are many variations on it. But this, for instance, shows that about 30 percent of the people surveyed in the United States since 1956 say that their life is very happy. And that hasn ’ t changed at all. Whereas the personal income, on a scale that has been held constant to accommodate for inflation, has more than doubled, almost tripled, in that period. But you find essentially the same results, namely, that after a certain basic point â which corresponds more or less to just a few 1, 000 dollars above the minimum poverty level â increases in material well-being don ’ t seem to affect how happy people are. In fact, you can find that the lack of basic resources, material resources, contributes to **unhappiness**, but the increase in material resources does not increase happiness. So my research has been focused more on â after finding out these things that actually corresponded to my own experience, I tried to understand : where â in everyday life, in our normal experience â do we feel really happy? And to start those studies about 40 years ago, I began to look at creative people â first artists and scientists, and so forth â trying to understand what made them feel that it was worth essentially spending their life doing things for which many of them didn ’ t expect either fame or fortune, but which made their life meaningful and worth doing. This was one of the leading composers of American music **back** in the ’ 70s. And the interview was 40 pages long. But this little excerpt is a very good summary of what he was saying during the interview. And it describes how he feels when composing is going well. And he says by describing it as an ecstatic state. Now,”ecstasy”in Greek meant simply to stand to the side of something. And then it became essentially an analogy for a mental state where you feel that you are not doing your ordinary everyday routines. So ecstasy is essentially a stepping into an alternative reality. And it ’ s interesting, if you think about it, how, when we think about the civilizations that we look up to as having been pinnacles of human achievement â whether it ’ s China, Greece, the Hindu civilization, or the Mayas, or Egyptians â what we know about them is really about their ecstasies, not about their everyday life. We know the temples they built, where people could come to experience a different reality.

We know about the circuses, the arenas, the theaters. These are the remains of civilizations and they are the places that people went to experience life in a more concentrated, more ordered form. Now, this man doesn ’ t need to go to a place like this, which is also â this place, this arena, which is built like a Greek amphitheatre, is a place for ecstasy also. We are participating in a reality that is different from that of the everyday life that we ’ re used to. But this man doesn ’ t need to go there. He needs just a piece of paper where he can put down little marks, and as he does that, he can imagine sounds that had not existed before in that particular combination. So once he gets to that point of beginning to create, like Jennifer did in her improvisation, a new reality â that is, a moment of ecstasy â he enters that different reality. Now he says also that this is so intense an experience that it feels almost as if he didn ’ t exist. And that sounds like a kind of a romantic exaggeration. But actually, our nervous system is incapable of processing more than about 110 bits of information per second. And in order to hear me and understand what I ’ m saying, you need to process about 60 bits per second. That ’ s why you can ’ t hear more than two people. You can ’ t understand more than two people talking to you. Well, when you are really involved in this completely engaging process of creating something new, as this man is, he doesn ’ t have enough attention left over to monitor how his body feels, or his problems at home. He can ’ t feel even that he ’ s hungry or tired. His body disappears, his identity disappears from his consciousness, because he doesn ’ t have enough attention, like none of **us** do, to really do well something that requires a lot of concentration, and at the same time to feel that he exists. So existence is temporarily suspended. And he says that his hand seems to be moving by itself. Now, I could look at my hand for two weeks, and I wouldn ’ t feel any awe or wonder, because I can ’ t compose. So what it ’ s telling you here is that obviously this automatic, spontaneous process that he ’ s describing can only happen to someone who is very well trained and who has developed technique. And it has become a kind of a truism in the study of creativity that you can ’ t be creating anything with less than 10 years of technical-knowledge immersion in a particular field. Whether it ’ s mathematics or music, it takes that long to be able to begin to change something in a way that it ’ s better than what was there before. Now, when that happens, he says the music just flows out. And because all of these people I started interviewing â this was an interview which is over 30 years old â so many of the people described this as a spontaneous flow that I called this type of experience the”flow experience.”And it happens in different realms. For instance, a poet describes it in this form. This is by a student of mine who interviewed some of the leading writers and poets in the United States. And it describes the same effortless, spontaneous feeling that you get when you enter into this ecstatic state. This poet describes it as opening a door that floats in the sky â a very similar description to what Albert Einstein gave as to how he imagined the forces of relativity, when he was struggling with trying to understand how it worked. But it happens in other activities. For instance, this is another student of mine, Susan Jackson from Australia, who did work with some of the leading athletes in the world. And you see here in this description of an Olympic skater, the same essential description of the phenomenology of the inner state of the person. You don ’ t think ; it goes automatically, if you merge yourself with the music, and so forth. It happens also, actually, in the most recent book I wrote, called”Good Business,”where I interviewed some of the CEOs who had been nominated by their peers as being both very successful and very ethical, very socially responsible. You see that these people define success as something that helps others and at the same time makes you feel happy as you are working at it. And like all of these successful and responsible

CEOs say, you can ’ t have just one of these things be successful if you want a meaningful and successful job. Anita Roddick is another one of these CEOs we interviewed. She is the founder of Body Shop, the natural cosmetics king. It ’ s kind of a passion that comes from doing the best and having flow while you ’ re working. This is an interesting little quote from Masaru Ibuka, who was at that time starting out Sony without any money, without a product â they didn ’ t have a product, they didn ’ t have anything, but they had an idea. And the idea he had was to establish a place of work where engineers can feel the joy of technological innovation, be aware of their mission to society and work to their heart ’ s content. I couldn ’ t improve on this as a good example of how flow enters the workplace. Now, when we do studies â we have, with other colleagues around the world, done over 8, 000 interviews of people â from Dominican monks, to blind nuns, to Himalayan climbers, to Navajo shepherds â who enjoy their work. And regardless of the culture, regardless of education or whatever, there are these seven conditions that seem to be there when a person is in flow. There ’ s this focus that, once it becomes intense, leads to a sense of ecstasy, a sense of clarity : you know exactly what you want to do from one moment to the other ; you get immediate feedback. You know that what you need to do is possible to do, even though difficult, and sense of time disappears, you forget yourself, you feel part of something larger. And once the conditions are present, what you are doing becomes worth doing for its own sake. In our studies, we represent the everyday life of people in this simple scheme. And we can measure this very precisely, actually, because we give people electronic pagers that go off 10 times a day, and whenever they go off you say what you ’ re doing, how you feel, where you are, what you ’ re thinking about. And two things that we measure is the amount of challenge people experience at that moment and the amount of skill that they feel they have at that moment. So for each person we can establish an average, which is the center of the diagram. That would be your mean level of challenge and skill, which will be different from that of anybody else. But you have a kind of a set point there, which would be in the middle. If we know what that set point is, we can predict fairly accurately when you will be in flow, and it will be when your challenges are higher than average and skills are higher than average. And you may be doing things very differently from other people, but for everyone that flow channel, that area there, will be when you are doing what you really like to do â play the piano, be with your best friend, perhaps work, if work is what provides flow for you. And then the other areas become less and less positive. Arousal is still good because you are over-challenged there. Your skills are not quite as high as they should be, but you can move into flow fairly easily by just developing a little more skill. So, arousal is the area where most people learn from, because that ’ s where they ’ re pushed beyond their comfort zone and to enter that â going **back** to flow â then they develop higher skills. Control is also a good place to be, because there you feel comfortable, but not very excited. It ’ s not very challenging any more. And if you want to enter flow from control, you have to increase the challenges. So those two are ideal and complementary areas from which flow is easy to go into. The other combinations of challenge and skill become progressively less optimal. Relaxation is fine â you still feel OK. Boredom begins to be very aversive and apathy becomes very negative : you don ’ t feel that you ’ re doing anything, you don ’ t use your skills, there ’ s no challenge. Unfortunately, a lot of people ’ s experience is in apathy. The largest single contributor to that experience is watching television ; the next one is being in the bathroom, sitting. Even though sometimes watching television about seven to eight percent of the time is in flow, but that ’ s when you choose a program you really want to watch and you get feedback from it. So the question we are trying to address â and I ’ m way over time â is how to put more and more of everyday life in that flow channel. And that is the kind of challenge that we ’ re trying to understand. And some of you obviously know how to do that spontaneously without any advice, but unfortunately a lot of people don ’ t. And that ’ s what our mandate is, in a way, to do. Thank you.

Imagine spending seven years at MIT and research laboratories, only to find out that you ’ re a performance artist. I ’ m also a software engineer, and I make lots of different kinds of art with the computer. And I think the main thing that I ’ m interested in is trying to find a way of making the computer into a personal mode of expression. And many of you out there are the heads of Macromedia and Microsoft, and in a way those are my bane : I think there ’ s a great homogenizing force that software imposes on people and limits the way they think about what ’ s possible on the computer. Of course, it ’ s also a great liberating force that makes possible, you know, publishing and so forth, and standards, and so on. But, in a way, the computer makes possible much more than what most people think, and my art has just been about trying to find a personal way of using the computer, and so I end up writing software to do that. Chris has asked me to do a short performance, and so I ’ m going to take just this time — maybe 10 minutes — to do that, and hopefully at the end have just a moment to show you a couple of my other projects in video form. Thank you. We ’ ve got about a minute left. I ’ d just like to show a clip from a most recent project. I did a performance with two singers who specialize in making strange noises with their mouths. And this just came off last September at ARS Electronica ; we repeated it in England. And the idea is to visualize their speech and song behind them with a large screen. We used a computer vision tracking system in order to know where they were. And since we know where their heads are, and we have a wireless mic on them that we ’ re processing the sound from, we ’ re able to create visualizations which are linked very tightly to what they ’ re doing with their speech. This will take about 30 seconds or so. He ’ s making a, kind of, cheek-flapping sound. Well, suffice it to say it ’ s not all like that, but that ’ s part of it. Thanks very much. There ’ s always lots more. I ’ m overtime, so I just wanted to say you can, if you ’ re in New York, you can check out my work at the Whitney Biennial next week, and also at Bitforms Gallery in Chelsea. And with that, I think I should give up the stage, so, thank you so much.

About 15 years ago, I went to visit a friend in Hong Kong. And at the time I was very superstitious. So, upon landing â this was still at the old Hong Kong airport that ’ s Kai Tak, when it was smack in the middle of the city â I thought,”If I see something good, I ’ m going to have a great time here in my two weeks. And if I see something negative, I ’ m going to be miserable, indeed.”So the plane landed in between the buildings and got to a full stop in front of this little billboard. And I actually went to see some of the design companies in Hong Kong in my stay there. And it turned out that â I just went to see, you know, what they are doing in Hong Kong. But I actually walked away with a great job offer. And I flew **back** to Austria, packed my bags, and, another week later, I was again on my way to Hong Kong still superstitions and thinking,”Well, if that

’ Winner ’ billboard is still up, I ’ m going to have a good time working here. But if it ’ s gone, it ’ s going to be really miserable and stressful.”So it turned out that not only was the billboard still up but they had put this one right next to it. On the other hand, it also taught me where superstition gets me because I really had a terrible time in Hong Kong. However, I did have a number of real moments of happiness in my life â of, you know, I think what the conference brochure refers to as”moments that take your breath away.”And since I ’ m a big list maker, I actually listed them all. Now, you don ’ t have to go through the trouble of reading them and I won ’ t read them for you. I know that it ’ s incredibly boring to hear about other people ’ s happinesses. What I did do, though is, I actually looked at them from a design standpoint and just eliminated all the ones that had nothing to do with design. And, very surprisingly, over half of them had, actually, something to do with design. So there are, of course, two different possibilities. There ’ s one from a consumer ’ s point of view â where I was happy while experiencing design. And I ’ ll just give you one example. I had gotten my first Walkman. This is 1983. My brother had this great Yamaha motorcycle that he was willing to borrow to me freely. And The Police ’ s”Synchronicity”cassette had just been released and there was no helmet law in my hometown of Bregenz. So you could drive up into the mountains freely blasting The Police on the new Sony Walkman. And I remember it as a true moment of happiness. You know, of course, they are related to this combination of at least two of them being, you know, design objects. And, you know, there ’ s a scale of happiness when you talk about in design but the motorcycle incident would definitely be, you know, situated somewhere here â right in there between Delight and Bliss. Now, there is the other part, from a designer ’ s standpoint â if you ’ re happy while actually doing it. And one way to see how happy designers are when they ’ re designing could be to look at the authors ’ photos on the **back** of their monographs? So, according to this, the Australians and the Japanese as well as the Mexicans are very happy. While, somewhat, the Spaniards... and, I think, particularly, the Swiss, don ’ t seem to be doing all that well. Last November, a museum opened in Tokyo called The Mori Museum, in a skyscraper, up on the 56th floor. And their inaugural exhibit was called”Happiness.”And I went, very eagerly, to see it, because â well, also, with an eye on this conference. And they interestingly sectioned the exhibit off into four different areas. Under”Arcadia,”they showed things like this, from the Edo period â a hundred ways to write”happiness”in different forms. Or they had this apple by Yoko Ono â that, of course, later on was, you know, made into the label for The Beatles. Under”Nirvana”they showed this Constable painting. And there was a little â an interesting theory about abstraction. This is a blue field â it ’ s actually an Yves Klein painting. And the theory was that if you abstract an image, you really, you know open as much room for the un-representable â and, therefore, you know, are able to involve the viewer more. Then, under”Desire,”they showed these Shunsho paintings â also from the Edo period â ink on silk. And, lastly, under”Harmony,”they had this 13th- century **mandala** from Tibet. Now, what I took away from the exhibit was that maybe with the exception of the **mandala** most of the pieces in there were actually about the visualization of happiness and not about happiness. And I felt a little bit cheated, because the visualization â that ’ s a really easy thing to do. And, you know, my studio â we ’ ve done it all the time. This is, you know, a book. A happy dog â and you take it out, it ’ s an aggressive dog. It ’ s a happy David Byrne and an angry David Byrne. Or a jazz poster with a happy face and a more aggressive face. You know, that ’ s not a big deal to accomplish. It has gotten to the point where, you know, within advertising or within the movie industry,”happy”has gotten such a bad reputation that if you actually want to do something with the subject and still appear authentic, you almost would have to, you know, do it from a cynical point of view. This is, you know, the movie poster. Or we, a couple of weeks ago, designed a box set for The Talking Heads where the happiness visualized on the cover definitely has, very much, a dark side to it. Much, much more difficult is this, where the designs actually can evoke happiness â and I ’ m going to just show you three that actually did this for me. This is a campaign done by a young artist in New York, who calls himself”True.”Everybody who has ridden the New York subway system will be familiar with these signs? True printed his own version of these signs. Met every Wednesday at a subway stop with 20 of his friends. They divided up the different subway lines and added their own version. So this is one. Now, the way this works in the system is that nobody ever looks at these signs. So you ’ re you ’ re really bored in the subway, and you kind of stare at something. And it takes you a while until it actually â you realize that this says something different than what it normally says. I mean, that ’ s, at least, how it made me happy. Now, True is a real humanitarian. He didn ’ t want any of his friends to be arrested, so he supplied everybody with this fake volunteer card. And also gave this fake letter from the MTA to everybody â sort of like pretending that it ’ s an art project financed by The Metropolitan Transit Authority. Another New York project. This is at P. S. 1 â a sculpture that ’ s basically a square room by James Turrell, that has a retractable ceiling. Opens up at dusk and dawn every day. You don ’ t see the horizon. You ’ re just in there, watching the incredible, subtle changes of color in the sky. And the room is truly something to be seen. People ’ s demeanor changes when they go in there. And, for sure, I haven ’ t looked at the sky in the same way after spending an hour in there. There are, of course, more than those three projects that I ’ m showing here. I would definitely say that observing Vik Muniz ’”Cloud”a couple of years ago in Manhattan for sure made me happy, as well. But my last project is, again, from a young designer in New York. He ’ s from Korea originally. And he took it upon himself to print 55, 000 speech bubbles â empty speech bubbles stickers, large ones and small ones. And he goes around New York and just puts them, empty as they are, on posters. And other people go and fill them in. This one says,”Please let me die in peace.”I think that was â the most surprising to myself was that the writing was actually so good. This is on a musician poster, that says :”I am concerned that my CD will not sell more than 200, 000 units and that, as a result, my recoupable advance from my label will be taken from me, after which, my contract will be cancelled, and I ’ ll be **back** doing Journey covers on Bleecker Street.”I think the reason this works so well is because everybody involved wins. Jee gets to have his project ; the public gets a sweeter environment ; and different public gets a place to express itself ; and the advertisers finally get somebody to look at their ads. Well, there was a question, of course, that was on my mind for a while : You know, can I do more of the things that I like doing in design and less of the ones that I don ’ t like to be doing? Which brought me **back** to my list making â you know, just to see what I actually like about my job. You know, one is : just working without pressure. Then : working concentrated, without being frazzled. Or, as Nancy said before, like really immerse oneself into it. Try not to get stuck doing the same thing â or try not get stuck behind the computer all day. This is, you know, related to it : getting out of the studio. Then, of course, trying to, you know, work on things where the content is actually important for me. And being able to enjoy the end results. And then I found another list in one of my diaries that actually contained all the things that I thought I learned in my life so far. And, just about at that time, an Austrian magazine called and asked if we would want to do six spreads â design six spreads that work like dividing pages between the different chapters in the magazine? And the whole thing just fell together. So I just picked one of the things that I thought I learned â in this case,”Everything I do always comes **back** to me”â and we made these spreads right out of this. So it was :”Everything I do always comes **back** to me.”A couple of weeks ago, a French company asked **us** to design five billboards for them. Again, we could supply the content for it. So I just picked another one. And this was two weeks ago. We flew to Arizona â the designer who works with me, and myself â and photographed this one. So it ' s :”Trying to look good limits my life.”And then we did one more of these. This is, again, for a magazine, dividing pages. This is :”Having”â this is the same thing ; it ' s just, you know, photographed from the side. This is from the front. Then it ' s :”guts.”Again, it ' s the same thing â”guts”is just the same room, reworked. Then it ' s :”always works out.”Then it ' s”for,”with the light on. And it ' s”me.”Thank you so much.

Ladies and gentlemen, the history of music and television on the Internet in three minutes. A TED medley â a TEDley. It ' s nine o ' clock on a Saturday The record store ' s closed for the night So I fire up the old iTunes music store And soon I am feelin ' all right I know Steve Jobs can find me a melody With one dollar pricing that rocks I can type in the track and get album names **back** While still in my PJs and socks Sell **us** a song, you ' re the music man My iPod ' s still got 10 gigs to go Yes, we might prefer more compatibility But Steve likes to run the whole show I heard”Desperate Housewives”was great last night But I had a bad piece of cod As I threw up my meal, I thought,”It ' s no big deal”I ' ll watch it tonight on my ' Pod And now all of the networks are joining in Two bucks a show without ads It ' s a business those guys always wanted to try But only Steve Jobs had the ' nads They say we ' re young, don ' t watch TV They say the Internet is all we see But that ' s not true ; they ' ve got it wrong See, all our shows are just two minutes long Hey I got YouTube I got YouTube And now, ladies and gentlemen, a tribute to the Recording Industry Association of America â the RIAA! Young man, you were surfin ' along And then, young man, you downloaded a song And then, dumb man, copied it to your ' Pod Then a phone call came to tell you... You ' ve just been sued by the R-I-A-A You ' ve just been screwed by the R-I-A-A Their attorneys say you committed a crime And there ' d better not be a next time They ' ve lost their minds at the R-I-A-A Justice is blind at the R-I-A-A You ' re depriving the bands You are learning to steal You can ' t do whatever you feel CD sales have dropped every year They ' re not greedy, they ' re just quaking with fear Yes indeedy, what if their end is near And we download all our music Yeah, that would piss off the R-I-A-A No plastic discs from the R-I-A-A What a way to make friends It ' s a plan that can ' t fail All your customers off to jail Who ' ll be next for the R-I-A-A? What else is vexing the R-I-A-A? Maybe whistling a tune Maybe humming along Maybe mocking ' em in a song

You know, what I do is write for children, and I ' m probably America ' s most widely read children ' s author, in fact. And I always tell people that I don ' t want to show up looking like a scientist. You can have me as a farmer, or in leathers, and no one has ever chose farmer. I ' m here today to talk to you about circles and epiphanies. And you know, an epiphany is usually something you find that you dropped someplace. You ’ ve just got to go around the block to see it as an epiphany. That ’ s a painting of a circle. A friend of mine did that — Richard Bollingbroke. It ’ s the kind of complicated circle that I ’ m going to tell you about. My circle began **back** in the ’ 60s in high school in Stow, Ohio where I was the class queer. I was the guy beaten up bloody every week in the boys ’ room, until one teacher saved my life. She saved my life by letting me go to the bathroom in the teachers ’ lounge. She did it in secret. She did it for three years. And I had to get out of town. I had a thumb, I had 85 dollars, and I ended up in San Francisco, California — met a lover — and **back** in the ’ 80s, found it necessary to begin work on AIDS organizations. About three or four years ago, I got a phone call in the middle of the night from that teacher, Mrs. Posten, who said,”I need to see you. I ’ m disappointed that we never got to know each other as adults. Could you please come to Ohio, and please bring that man that I know you have found by now. And I should mention that I have pancreatic cancer, and I ’ d like you to please be quick about this.”Well, the next day we were in Cleveland. We took a look at her, we laughed, we cried, and we knew that she needed to be in a hospice. We found her one, we got her there, and we took care of her and watched over her family, because it was necessary. It ’ s something we knew how to do. And just as the woman who wanted to know me as an adult got to know me, she turned into a box of ashes and was placed in my hands. And what had happened was the circle had closed, it had become a circle — and that epiphany I talked about presented itself. The epiphany is that death is a part of life. She saved my life ; I and my partner saved hers. And you know, that part of life needs everything that the rest of life does. It needs truth and beauty, and I ’ m so happy it ’ s been mentioned so much here today. It also needs — it needs dignity, love and pleasure, and it ’ s our job to hand those things out. Thank you.

So, I kind of believe that we ’ re in like the”cave-painting”era of computer interfaces. Like, they ’ re very kind of â they don ’ t go as deep or as emotionally engaging as they possibly could be and I ’ d like to change all that. Hit me. OK. So I mean, this is the kind of status quo interface, right? It ’ s very flat, kind of rigid. And OK, so you could sex it up and like go to a much more lickable Mac, you know, but really it ’ s the kind of same old crap we ’ ve had for the last, you know, 30 years. Like I think we really put up with a lot of crap with our computers. I mean it ’ s point and click, it ’ s like the menus, icons, it ’ s all the kind of same thing. And so one kind of information space that I take inspiration from is my real desk. It ’ s so much more subtle, so much more visceral â you know, what ’ s visible, what ’ s not. And I ’ d like to bring that experience to the desktop. So I kind of have a â this is BumpTop. It ’ s kind of like a new approach to desktop computing. So you can bump things â they ’ re all physically, you know, manipulable and stuff. And instead of that point and click, it ’ s like a push and pull, things collide as you ’ d expect them. Just like on my real desk, I can â let me just grab these guys â I can turn things into piles instead of just the folders that we have. And once things are in a pile I can browse them by throwing them into a grid, or you know, flip through them like a book or I can lay them out like a deck of cards. When they ’ re laid out, I can pull things to new locations or delete things or just quickly sort a whole pile, you know, just immediately, right? And then, it ’ s all smoothly animated, instead of these jarring changes you see in today ’ s interfaces. Also, if I want to add something to a pile, well, how do I do that? I just toss it to the pile, and it

’ s added right to the top. It ’ s a kind of nice way. Also some of the stuff we can do is, for these individual icons we thought â I mean, how can we play with the idea of an icon, and push that further? And one of the things I can do is make it bigger if I want to emphasize it and make it more important. But what ’ s really cool is that since there ’ s a physics simulation running under this, it ’ s actually heavier. So the lighter stuff doesn ’ t really move but if I throw it at the lighter guys, right? So it ’ s cute, but it ’ s also like a subtle channel of conveying information, right? This is heavy so it feels more important. So it ’ s kind of cool. Despite computers everywhere paper really hasn ’ t disappeared, because it has a lot of, I think, valuable properties. And some of those we wanted to transfer to the icons in our system. So one of the things you can do to our icons, just like paper, is crease them and fold them, just like paper. Remember, you know, something for later. Or if you want to be destructive, you can just crumple it up and, you know, toss it to the corner. Also just like paper, around our workspace we ’ ll pin things up to the wall to remember them later, and I can do the same thing here, and you know, you ’ ll see post-it notes and things like that around people ’ s offices. And I can pull them off when I want to work with them. So, one of the criticisms of this kind of approach to organization is that, you know,”Okay, well my real desk is really messy. I don ’ t want that mess on my computer.”So one thing we have for that is like a grid align, kind of â so you get that more traditional desktop. Things are kind of grid aligned. More boring, but you still have that kind of colliding and bumping. And you can still do fun things like make shelves on your desktop. Let ’ s just break this shelf. Okay, that shelf broke. I think beyond the icons, I think another really cool domain for this software â I think it applies to more than just icons and your desktop â but browsing photographs. I think you can really enrich the way we browse our photographs and bring it to that kind of shoebox of, you know, photos with your family on the kitchen table kind of thing. I can toss these things around. They ’ re so much more tangible and touchable â and you know I can double-click on something to take a look at it. And I can do all that kind of same stuff I showed you before. So I can pile things up, I can flip through it, I can, you know â okay, let ’ s move this photo to the **back**, let ’ s delete this guy here, and I think it ’ s just a much more rich kind of way of interacting with your information. And that ’ s BumpTop. Thanks!

Text Sample 142: NEG Dim 1 – 2002 – Score 2.00 – 2002/t000101.txt

One thing I wanted to say about film making is â about this film â in thinking about some of the wonderful talks we ’ ve heard here, Michael Moschen, and some of the talks about music, this idea that there is a narrative line, and that music exists in time. A film also exists in time ; it ’ s an experience that you should go through emotionally. And in making this film I felt that so many of the documentaries I ’ ve seen were all about learning something, or knowledge, or driven by talking heads, and driven by ideas. And I wanted this film to be driven by emotions, and really to follow my journey. So instead of doing the talking head thing, instead it ’ s composed of scenes, and we meet people along the way. We only meet them once. They don ’ t come **back** several times, so it really chronicles a journey. It ’ s something like life, that once you get in it you can ’ t get out. There are two clips I want to show you, the first one is a kind of hodgepodge, its just three little moments, four little moments with three of the people who are here tonight. It ’ s not the way they occur in the film, because they are part of much larger scenes. They play off each other in a wonderful way. And that ends with a little clip of my father, of Lou, talking about something that is very dear to him, which is the accidents of life. I think he felt that the greatest things in life were accidental, and perhaps not planned at all. And those three clips will be followed by a scene of perhaps what, to me, is really his greatest building which is a building in Dhaka, Bangladesh. He built the capital over there. And I think you ’ ll enjoy this building, it ’ s never been seen â it ’ s been still photographed, but never photographed by a film crew. We were the first film crew in there. So you ’ ll see images of this remarkable building. A couple of things to keep in mind when you see it, it was built entirely by hand, I think they got a crane the last year. It was built entirely by hand off bamboo scaffolding, people carrying these baskets of concrete on their heads, dumping them in the forms. It is the capital of the country, and it took 23 years to build, which is something they seem to be very proud of over there. It took as long as the Taj Mahal. Unfortunately it took so long that Lou never saw it finished. He died in 1974. The building was finished in 1983. So it continued on for many years after he died. Think about that when you see that building, that sometimes the things we strive for so hard in life we never get to see finished. And that really struck me about my father, in the sense that he had such belief that somehow, doing these things giving in the way that he gave, that something good would come out of it, even in the middle of a war, there was a war with Pakistan at one point, and the construction stopped totally and he kept working, because he felt,”Well when the war is done they ’ ll need this building.”So, those are the two clips I ’ m going to show. Roll that tape. Richard Saul Wurman : I remember hearing him talk at Penn. And I came home and I said to my father and mother,”I just met this man : doesn ’ t have much work, and he ’ s sort of ugly, funny voice, and he ’ s a teacher at school. I know you ’ ve never heard of him, but just mark this day that someday you will hear of him, because he ’ s really an amazing man.”Frank Gehry : I heard he had some kind of a fling with Ingrid Bergman. Is that true? Nathaniel Kahn : If he did he was a very lucky man. NK : Did you hear that, really? FG : Yeah, when he was in Rome. Moshe Safdie : He was a real nomad. And you know, when I knew him when I was in the office, he would come in from a trip, and he would be in the office for two or three days intensely, and he would pack up and go. You know he ’ d be in the office till three in the morning working with **us** and there was this kind of sense of the nomad in him. I mean as tragic as his death was in a railway station, it was so consistent with his life, you know? I mean I often think I ’ m going to die in a plane, or I ’ m going to die in an airport, or die jogging without an identification on me. I don ’ t know why I sort of carry that from that memory of the way he died. But he was a sort of a nomad at heart. Louis Kahn : How accidental our existences are really and how full of influence by circumstance. Man : We are the morning workers who come, all the time, here and enjoy the walking, city ’ s beauty and the atmosphere and this is the nicest place of Bangladesh. We are proud of it. NK : You ’ re proud of it? Man : Yes, it is the national image of Bangladesh. NK : Do you know anything about the architect? Man : Architect? I ’ ve heard about him ; he ’ s a top-ranking architect. NK : Well actually I ’ m here because I ’ m the architect ’ s son, he was my father. Man : Oh! Dad is Louis Farrakhan? NK : Yeah. No not Louis Farrakhan, Louis Kahn. Man : Louis Kahn, yes! Man : Your father, is he alive? NK : No, he ’ s been dead for 25 years. Man : Very pleased to welcome you **back**. NK : Thank you. NK : He never saw it finished, Pop. No, he never saw this. Shamsul Wares : It was almost impossible, building for a country like ours. In 30, 50 years **back**, it was nothing, only paddy fields, and since we invited him here, he felt that he has got a responsibility. He wanted to be a Moses here, he gave **us** democracy. He is not a political man, but in this guise he has given **us** the institution for democracy, from where we can rise. In that way it is so relevant. He didn ’ t care for how much money this country has, or whether he would be able to ever finish this building, but somehow he has been able to do it, build it, here. And this is the largest project he has got in here, the poorest country in the world. NK : It cost him his life. SW : Yeah, he paid. He paid his life for this, and that is why he is great and we ’ ll remember him. But he was also human. Now his failure to satisfy the family life, is an inevitable association of great people. But I think his son will understand this, and will have no sense of grudge, or sense of being neglected, I think. He cared in a very different manner, but it takes a lot of time to understand that. In social aspect of his life he was just like a child, he was not at all matured. He could not say no to anything, and that is why, that he cannot say no to things, we got this building today. You see, only that way you can be able to understand him. There is no other shortcut, no other way to really understand him. But I think he has given **us** this building and we feel all the time for him, that ’ s why, he has given love for **us**. He could not probably give the right kind of love for you, but for **us**, he has given the people the right kind of love, that is important. You have to understand that. He had an enormous amount of love, he loved everybody. To love everybody, he sometimes did not see the very closest ones, and that is inevitable for men of his stature.

Thank you. Ooh, I ’ m like,”Phew, phew, calm down. Get **back** into my body now.”Usually when I play out, the first thing that happens is people scream out,”What ’ s she doing?!”I ’ ll play at these rock shows, be on stage standing completely still, and they ’ re like,”What ’ s she doing?! What ’ s she doing?!”And then I ’ ll kind of be like — — and then they ’ re like,”Whoa!”I ’ m sure you ’ re trying to figure out,”Well, how does this thing work?”Well, what I ’ m doing is controlling the pitch with my left hand. See, the closer I get to this antenna, the higher the note gets — — and you can get it really low. And with this hand I ’ m controlling the volume, so the further away my right hand gets, the louder it gets. So basically, with both of your hands you ’ re controlling pitch and volume and kind of trying to create the illusion that you ’ re doing separate notes, when really it ’ s continuously going... Sometimes I startle myself : I ’ ll forget that I have it on, and I ’ ll lean over to pick up something, and then it goes like — —”Oh!”And it ’ s like a funny sound effect that follows you around if you don ’ t turn the thing off. Maybe we ’ ll go into the next tune, because I totally lost where this is going. We ’ re going to do a song by David Mash called”Listen : the Words Are Gone,”and maybe I ’ ll have words come **back** into me afterwards if I can relax. So, I ’ m trying to think of some of the questions that are commonly asked ; there are so many. And... Well, I guess I could tell you a little of the history of the theremin. It was invented around the 1920s, and the inventor, Lon Theremin — he also was a musician besides an inventor — he came up with the idea for making the theremin, I think, when he was working on some shortwave radios. And there ’ d be that sound in the signal — it ’ s like — and he thought,”Oh, what if I could control that sound and turn it into an instrument, because there are pitches in it.”And so somehow through developing that, he eventually came to make the theremin the way it is now. And a lot of times, even kids nowadays, they ’ ll make reference to a theremin by going,”Whoo-hoo-hoo-hoo,”because in the ’ 50s it was used in the sci-fi horror movies, that sound that ’ s like... It ’ s kind of a funny, goofy sound to do. And sometimes if I have too much coffee, then my vibrato gets out of hand. You ’ re really sensitive to your body and its functions when you ’ re behind this thing. You have to stay so still if you want to have the most control. It reminds me of the balancing act earlier on — what Michael was doing — because you ’ re fighting so hard to keep the balance with what you ’ re playing with and stay in tune, and at the same time you don ’ t want to focus so much on being in tune all the time ; you want to be feeling the music. And then also, you ’ re trying to stay very, very, very still because little movements with other parts of your body will affect the pitch, or sometimes if you ’ re holding a low note — — and breathing will make it... If I pass out on the next song... I think of it almost like like a yoga instrument because it makes you so aware of every little crazy thing your body is doing, or just aware of what you don ’ t want it to be doing while you ’ re playing ; you don ’ t want to have any sudden movements. And if I go to a club and play a gig, people are like,”Here, have some drinks on **us**!”And it ’ s like,”Well, I ’ m about to go on soon ; I don ’ t want to be like — — you know?”It really does reflect the mood that you ’ re in also, if you ’ re... it ’ s similar to being a vocalist, except instead of it coming out of your throat, you ’ re controlling it just in the air and you don ’ t really have a point of reference ; you ’ re always relying on your ears and adjusting constantly. You just have to always adjust to what ’ s happening and realize you ’ ll have bummer notes come here and there and listen to it, adjust it, and just move on, or else you ’ ll get too tied up and go crazy. Like me. I think we will play another tune now. I ’ m going to do”Lush Life.”It ’ s one of my favorite tunes to play.

Text Sample 144: NEG Dim 1 – 2002 – Score 4.00 – 2002/t000079.txt

I ’ m going to read a few strips. These are, most of these are from a monthly page I do in and architecture and design magazine called Metropolis. And the first story is called”The Faulty Switch.”Another beautifully designed new building ruined by the sound of a common wall light switch. It ’ s fine during the day when the main rooms are flooded with sunlight. But at dusk everything changes. The architect spent hundreds of hours designing the burnished brass switchplates for his new office tower. And then left it to a contractor to install these 79-cent switches behind them. We know instinctively where to reach when we enter a dark room. We automatically throw the little nub of plastic upward. But the sound we are greeted with, as the room is bathed in the simulated glow of late-afternoon light, recalls to mind a dirty men ’ s room in the rear of a Greek coffee shop. This sound colors our first impression of any room ; it can ’ t be helped. But where does this sound, commonly described as a click, come from? Is it simply the byproduct of a crude mechanical action? Or is it an imitation of one half the set of sounds we make to express disappointment? The often dental consonant of no Indo-European language. Or is it the amplified sound of a synapse firing in the brain of a cockroach? In the 1950s they tried their best to muffle this sound with mercury switches and silent knob controls. But today these improvements seem somehow inauthentic. The click is the modern triumphal clarion proceeding **us** through life, announcing our entry into every lightless room. The sound made flicking a wall switch off is of a completely different nature. It has a deep melancholy ring. Children don ’ t like it. It ’ s why they leave lights on around the house. Adults find it comforting. But wouldn ’ t it be an easy matter to wire a wall switch so that it triggers the muted horn of a steam ship? Or the recorded crowing of a rooster? Or the distant peel of thunder? Thomas Edison went through thousands of unlikely substances before he came upon the right one for the filament of his electric light bulb. Why have we settled so quickly for the sound of its switch? That ’ s the end of that. The next story is called”In Praise of the

Taxpayer.”That so many of the city ’ s most venerable taxpayers have survived yet another commercial building boom, is cause for celebration. These one or two story structures, designed to yield only enough income to cover the taxes on the land on which they stand, were not meant to be permanent buildings. Yet for one reason or another they have confounded the efforts of developers to be combined into lots suitable for high-rise construction. Although they make no claim to architectural beauty, they are, in their perfect **temporariness**, a delightful alternative to the large-scale structures that might someday take their place. The most perfect examples occupy corner lots. They offer a pleasant respite from the high-density development around them. A break of light and air, an architectural biding of time. So buried in signage are these structures, that it often takes a moment to distinguish the modern specially constructed taxpayer from its neighbor : the small commercial building from an earlier century, whose upper floors have been sealed, and whose ground-floor space now functions as a taxpayer. The few surfaces not covered by signs are often clad in a distinctive, dark green-gray, striated aluminum siding. Take-out sandwich shops, film processing drop-offs, peep-shows and necktie stores. Now these provisional structures have, in some cases, remained standing for the better part of a human lifetime. The temporary building is a triumph of modern industrial organization, a healthy sublimation of the urge to build, and proof that not every architectural idea need be set in stone. That ’ s the end. And the next story is called,”On the Human Lap.”For the ancient Egyptians the lap was a platform upon which to place the earthly possessions of the dead — 30 cubits from foot to knee. It was not until the 14th century that an Italian painter recognized the lap as a Grecian temple, upholstered in flesh and cloth. Over the next 200 years we see the infant Christ go from a sitting to a standing position on the Virgin ’ s lap, and then **back** again. Every child recapitulates this ascension, straddling one or both legs, sitting sideways, or leaning against the body. From there, to the modern ventriloquist ’ s dummy, is but a brief moment in history. You were late for school again this morning. The ventriloquist must first make **us** believe that a small boy is sitting on his lap. The illusion of speech follows incidentally. What have you got to say for yourself, Jimmy? As adults we admire the lap from a nostalgic distance. We have fading memories of that provisional temple, erected each time an adult sat down. On a crowded bus there was always a lap to sit on. It is children and teenage girls who are most keenly aware of its architectural beauty. They understand the structural integrity of a deep avuncular lap, as compared to the shaky arrangement of a neurotic niece in high heels. The relationship between the lap and its owner is direct and intimate. I envision a 36-story, 450-unit residential high-rise — a reason to consider the mental health of any architect before granting an important commission. The bathrooms and kitchens will, of course, have no windows. The lap of luxury is an architectural construct of childhood, which we seek, in vain, as adults, to employ. That ’ s the end. The next story is called”The Haverpiece Collection”A nondescript warehouse, visible for a moment from the northbound lanes of the Prykushko Expressway, serves as the temporary resting place for the Haverpiece collection of European dried fruit. The profound convolutions on the surface of a dried cherry. The foreboding sheen of an extra-large date. Do you remember wandering as a child through those dark wooden storefront galleries? Where everything was displayed in poorly labeled roach-proof bins. Pears dried in the form of genital organs. Apricot halves like the ears of cherubim. In 1962 the unsold stock was purchased by Maurice Haverpiece, a wealthy prune juice bottler, and consolidated to form the core collection. As an art form it lies somewhere between still-life painting and plumbing. Upon his death in 1967, a quarter of the items were sold off for compote to a high-class hotel restaurant. Unsuspecting guests were served stewed turn-of-the-century Turkish figs for breakfast. The rest of the collection remains here, stored in plain brown paper bags until funds can be raised to build a permanent museum and study center. A shoe made of apricot leather for the daughter of a czar. That ’ s the end. Thank you.

Text Sample 145: NEG Dim 1 – 1998 – Score 2.00 – 1998/t000118.txt

Back in 1992, I started working for a company called Interval Research, which was just then being founded by David Lidell and Paul Allen as a for-profit research enterprise in Silicon Valley. I met with David to talk about what I might do in his company. I was just coming out of a failed virtual reality business and supporting myself by being on the speaking circuit and writing books — after twenty years or so in the computer game industry having ideas that people didn ’ t think they could sell. And David and I discovered that we had a question in common, that we really wanted the answer to, and that was,”Why hasn ’ t anybody built any computer games for little girls?”Why is that? It can ’ t just be a giant sexist conspiracy. These people aren ’ t that smart. There ’ s six billion dollars on the table. They would go for it if they could figure out how. So, what is the deal here? And as we thought about our goals — I should say that Interval is really a humanistic institution, in the classical sense that humanism, at its best, finds a way to combine **clear-eyed** empirical research with a set of core values that fundamentally love and respect people. The basic idea of humanism is the improvable quality of life ; that we can do good things, that there are things worth doing because they ’ re good things to do, and that **clear-eyed** empiricism can help **us** figure out how to do them. So, contrary to popular belief, there is not a conflict of interest between empiricism and values. And Interval Research is kind of the living example of how that can be true. So David and I decided to go find out, through the best research we could muster, what it would take to get a little girl to put her hands on a computer, to achieve the level of comfort and ease with the technology that little boys have because they play video games. We spent two and a half years conducting research ; we spent another year and a half in advance development. Then we formed a spin-off company. In the research phase of the project at Interval, we partnered with a company called Cheskin Research, and these people — Davis Masten and Christopher Ireland — changed my mind entirely about what market research was and what it could be. They taught me how to look and see, and they did not do the incredibly stupid thing of saying to a child,”Of all these things we already make you, which do you like best?”— which gives you zero answers that are usable. So, what we did for the first two and a half years was four things : We did an extensive review of the literature in related fields, like cognitive psychology, spatial cognition, gender studies, play theory, sociology, primatology. Thank you Frans de Waal, wherever you are, I love you and I ’ d give anything to meet you. After we had done that with a pretty large team of people and discovered what we thought the salient issues were with girls and boys and playing — because, after all, that ’ s really what this is about — we moved to the second phase of our work, where we interviewed adult experts in academia, some of the people who ’ d produced the literature that we found relevant. Also, we did focus groups with people who were on the ground with kids every day, like playground supervisors. We talked to them, confirmed some hypotheses and identified some serious questions about gender difference and play. Then we did what I consider to be the heart of the work : interviewed 1, 100 children, boys and girls, ages seven to 12, all over the United States —

except for Silicon Valley, Boston and Austin because we knew that their little families would have millions of computers in them and they wouldn ’ t be a representative sample. And at the end of those remarkable conversations with kids and their best friends across the United States, after two years, we pulled together some survey data from another 10, 000 children, drew up a set up of what we thought were the key findings of our research, and spent another year transforming them into design heuristics, for designing computer-based products — and, in fact, any kind of products — for little girls, ages eight to 12. And we spent that time designing interactive prototypes for computer software and testing them with little girls. In 1996, in November, we formed the company Purple Moon which was a spinoff of Interval Research, and our chief investors were Interval Research, Vulcan Northwest, Institutional Venture Partners and Allen and Company. We launched a website on September 2nd that has now served 25 million pages, and has 42, 000 registered young girl users. They visit an average of one and a half times a day, spend an average of 35 minutes a visit, and look at 50 pages a visit. So we feel that we ’ ve formed a successful online community with girls. We launched two titles in October —”Rockett ’ s New School”— the first of a series of products — is about a character called Rockett beginning her first day of school in eighth grade at a brand new place, with a blank slate, which allows girls to play with the question of,”What will I be like when I ’ m older?””What ’ s it going to be like to be in high school or junior high school? Who are my friends?”; to exercise the love of social complexity and the narrative intelligence that drives most of their play behavior ; and which embeds in it values about noticing that we have lots of choices in our lives and the ways that we conduct ourselves. The other title that we launched is called”Secret Paths in the Forest,”which addresses the more fantasy-oriented, inner lives of girls. These two titles both showed up in the top 50 entertainment titles in PC Data — entertainment titles in PC Data in December, right up there with”John Madden Football,”which thrills me to death. So, we ’ re real, and we ’ ve touched several hundreds of thousands of little girls. We ’ ve made half-a-billion impressions with marketing and PR for this brand, Purple Moon. Ninety-six percent of them, roughly, have been positive ; four percent of them have been”other.”I want to talk about the other, because the politics of this enterprise, in a way, have been the most fascinating part of it, for me. There are really two kinds of negative reviews that we ’ ve received. One kind of reviewer is a male gamer who thinks he knows what games ought to be, and won ’ t show the product to little girls. The other kind of reviewer is a certain flavor of feminist who thinks they know what little girls ought to be. And so it ’ s funny to me that these interesting, odd bedfellows have one thing in common : they don ’ t listen to little girls. They haven ’ t looked at children and they ’ re certainly not demonstrating any love for them. I ’ d like to play you some voices of little girls from the two-and-a-half years of research that we did — actually, some of the voices are more recent. And these voices will be accompanied by photographs that they took for **us** of their lives, of the things that they value and care about. These are pictures the girls themselves never saw, but they gave to **us** This is the stuff those reviewers don ’ t know about and aren ’ t listening to and this is the kind of research I recommend to those who want to do humanistic work. Girl 1 : Yeah, my character is usually a tomboy. Hers is more into boys. Girl 2 : Uh, yeah. Girl 1 : We have — in the very beginning of the whole game, always we do this : we each have a piece of paper ; we write down our name, our age — are we rich, very rich, not rich, poor, medium, wealthy, boyfriends, dogs, pets — what else — sisters, brothers, and all those. Girl 2 : Divorced — parents divorced, maybe. Girl 3 : This is my pretend [unclear] one. Girl 4 : We make a school newspaper on the computer. Girl 5 : For a girl ’ s game also usually they ’ ll have really pretty scenery with clouds and flowers. Girl 6 : Like, if you were a girl and you were really adventurous and a real big tomboy, you would think that girls ’ games were kinda sissy. Girl 7 : I run track, I played soccer, I play basketball, and I love a lot of things to do. And sometimes I feel like I can ’ t really enjoy myself unless it ’ s like a vacation, like when I get Mondays and all those days off. Girl 8 : Well, sometimes there is a lot of stuff going on because I have music lessons and I ’ m on swim team — all this different stuff that I have to do, and sometimes it gets overwhelming. Girl 9 : My friend Justine kinda took my friend Kelly, and now they ’ re being mean to me. Girl 10 : Well, sometimes it gets annoying when your brothers and sisters, or brother or sister, when they copy you and you get your idea first and they take your idea and they do it themselves. Girl 11 : Because my older sister, she gets everything and, like, when I ask my mom for something, she ’ ll say,”No”—all the time. But she gives my sister everything. Brenda Laurel : I want to show you, real quickly, just a minute of”Rockett ’ s Tricky Decision,”which went gold two days ago. Let ’ s hope it ’ s really stable. This is the second day in Rockett ’ s life. The reason I ’ m showing you this is I ’ m hoping that the scene that I ’ m going to show you will look familiar and sound familiar, now that you ’ ve listened to some girls ’ voices. And you can see how we ’ ve tried to incorporate the issues that matter to them in the game that we ’ ve created. Miko : Hey Rockett! C ’ mere! Rockett : Hi Miko! What ’ s going on? Miko : Did you hear about Nakilia ’ s big Halloween party this weekend? She asked me to make sure you knew about it. Nakilia invited Reuben too, but — Rockett : But what? Isn ’ t he coming? Miko : I don ’ t think so. I mean, I heard his band is playing at another party the same night. Rockett : Really? What other party? Girl : Max ’ s party is going to be so cool, Whitney. He ’ s invited all the best people. BL : I ’ m going to fast-forward to the decision point because I know I don ’ t have a lot of time. After this awful event occurs, Rocket gets to decide how she feels about it. Rockett : Who ’ d want to show up at that party anyway? I could get invited to that party any day if I wanted to. Gee, I doubt I ’ ll make Max ’ s best people list. BL : OK, so we ’ re going to emotionally navigate. If we were playing the game, that ’ s what we ’ d do. If at any time during the game we want to learn more about the characters, we can go into this hidden hallway, and I ’ ll quickly just show you the interface. We can, for example, go find Miko ’ s locker and get some more information about her. Oops, I turned the wrong way. But you get the general idea of the product. I wanted to show you the ways, innocuous as they seem, in which we ’ re incorporating what we ’ ve learned about girls — their desires to experience greater emotional flexibility, and to play around with the social complexity of their lives. I want to make the point that what we ’ re giving girls, I think, through this effort, is a kind of validation, a sense of being seen. And a sense of the choices that are available in their lives. We love them. We see them. We ’ re not trying to tell them who they ought to be. But we ’ re really, really happy about who they are. It turns out they ’ re really great. I want to close by showing you a videotape that ’ s a version of a future game in the Rockett series that our graphic artists and design people put together, that we feel would please that four percent of reviewers.”Rockett 28!”Rockett : It ’ s like I ’ m just waking up, you know? BL : Thanks.

Sheryl Shade : Hi, Aimee. Aimee Mullins : Hi. SS : Aimee and I thought we ’ d just talk a little bit, and I wanted her to tell all of you what makes her a distinctive athlete. AM : Well, for those of you who have seen the picture in the little bio â it might have given it away â I ’ m a double amputee, and I was born without fibulas in both legs. I was amputated at age one, and I ’ ve been running like hell ever since, all over the place. SS : Well, why don ’ t you tell them how you got to Georgetown â why don ’ t we start there? Why don ’ t we start there? AM : I ’ m a senior in Georgetown in the Foreign Service program. I won a full academic scholarship out of high school. They pick three students out of the nation every year to get involved in international affairs, and so I won a full ride to Georgetown and I ’ ve been there for four years. Love it. SS : When Aimee got there, she decided that she ’ s, kind of, curious about track and field, so she decided to call someone and start asking about it. So, why don ’ t you tell that story? AM : Yeah. Well, I guess I ’ ve always been involved in sports. I played softball for five years growing up. I skied competitively throughout high school, and I got a little restless in college because I wasn ’ t doing anything for about a year or two sports-wise. And I ’ d never competed on a disabled level, you know â I ’ d always competed against other able-bodied athletes. That ’ s all I ’ d ever known. In fact, I ’ d never even met another amputee until I was 17. And I heard that they do these track meets with all disabled runners, and I figured,”Oh, I don ’ t know about this, but before I judge it, let me go see what it ’ s all about.”So, I booked myself a flight to Boston in ’ 95, 19 years old and definitely the dark horse candidate at this race. I ’ d never done it before. I went out on a gravel track a couple of weeks before this meet to see how far I could run, and about 50 meters was enough for me, panting and heaving. And I had these legs that were made of a wood and plastic compound, attached with Velcro straps â big, thick, five-ply wool socks on â you know, not the most comfortable things, but all I ’ d ever known. And I ’ m up there in Boston against people wearing legs made of all things â carbon graphite and, you know, shock absorbers in them and all sorts of things â and they ’ re all looking at me like, OK, we know who ’ s not going to win this race. And, I mean, I went up there expecting â I don ’ t know what I was expecting â but, you know, when I saw a man who was missing an entire leg go up to the high jump, hop on one leg to the high jump and clear it at six feet, two inches... Dan O ’ Brien jumped 5 ’ 11”in ’ 96 in Atlanta, I mean, if it just gives you a comparison of â these are truly accomplished athletes, without qualifying that word”athlete.”And so I decided to give this a shot : heart pounding, I ran my first race and I beat the national record-holder by three hundredths of a second, and became the new national record-holder on my first try out. And, you know, people said,”Aimee, you know, you ’ ve got speed â you ’ ve got natural speed â but you don ’ t have any skill or finesse going down that track. You were all over the place. We all saw how hard you were working.”And so I decided to call the track coach at Georgetown. And I thank god I didn ’ t know just how huge this man is in the track and field world. He ’ s coached five Olympians, and the man ’ s office is lined from floor to ceiling with All America certificates of all these athletes he ’ s coached. He ’ s just a rather intimidating figure. And I called him up and said,”Listen, I ran one race and I won...””I want to see if I can, you know â I need to just see if I can sit in on some of your practices, see what drills you do and whatever.”That ’ s all I wanted â just two practices.”Can I just sit in and see what you do?”And he said,”Well, we should meet first, before we decide anything.”You know, he ’ s thinking,”What am I getting myself into?”So, I met the man, walked in his office, and saw these posters and magazine covers of people he has coached. And we got to talking, and it turned out to be a great partnership because he ’ d never coached a disabled athlete, so therefore he had no preconceived notions of what I was or wasn ’ t capable of, and I ’ d never been coached before. So this was like,”Here we go â let ’ s start on this trip.”So he started giving me four days a week of his lunch break, his free time, and I would come up to the track and train with him. So that ’ s how I met Frank. That was fall of ’ 95. But then, by the time that winter was rolling around, he said,”You know, you ’ re good enough. You can run on our women ’ s track team here.”And I said,”No, come on.”And he said,”No, no, really. You can. You can run with our women ’ s track team.”In the spring of 1996, with my goal of making the U. S. Paralympic team that May coming up full speed, I joined the women ’ s track team. And no disabled person had ever done that â run at a collegiate level. So I don ’ t know, it started to become an interesting mix. SS : Well, on your way to the Olympics, a couple of memorable events happened at Georgetown. Why don ’ t you just tell them? AM : Yes, well, you know, I ’ d won everything as far as the disabled meets â everything I competed in â and, you know, training in Georgetown and knowing that I was going to have to get used to seeing the **backs** of all these women ’ s shirts â you know, I ’ m running against the next Flo-Jo â and they ’ re all looking at me like,”Hmm, what ’ s, you know, what ’ s going on here?”And putting on my Georgetown uniform and going out there and knowing that, you know, in order to become better â and I ’ m already the best in the country â you know, you have to train with people who are inherently better than you. And I went out there and made it to the Big East, which was sort of the championship race at the end of the season. It was really, really hot. And it ’ s the first â I had just gotten these new sprinting legs that you see in that bio, and I didn ’ t realize at that time that the amount of sweating I would be doing in the sock â it actually acted like a lubricant and I ’ d be, kind of, pistoning in the socket. And at about 85 meters of my 100 meters sprint, in all my glory, I came out of my leg. Like, I almost came out of it, in front of, like, 5, 000 people. And I, I mean, was just mortified â because I was signed up for the 200, you know, which went off in a half hour. I went to my coach :”Please, don ’ t make me do this.”I can ’ t do this in front of all those people. My legs will come off. And if it came off at 85 there ’ s no way I ’ m going 200 meters. And he just sat there like this. My pleas fell on deaf ears, thank god. Because you know, the man is from Brooklyn ; he ’ s a big man. He says,”Aimee, so what if your leg falls off? You pick it up, you put the damn thing **back** on, and finish the goddamn race!”And I did. So, he kept me in line. He kept me on the right track. SS : So, then Aimee makes it to the 1996 Paralympics, and she ’ s all excited. Her family ’ s coming down â it ’ s a big deal. It ’ s now two years that you ’ ve been running? AM : No, a year. SS : A year. And why don ’ t you tell them what happened right before you go run your race? AM : Okay, well, Atlanta. The Paralympics, just for a little bit of clarification, are the Olympics for people with physical disabilities â amputees, persons with cerebral palsy, and wheelchair athletes â as opposed to the Special Olympics, which deals with people with mental disabilities. So, here we are, a week after the Olympics and down at Atlanta, and I ’ m just blown away by the fact that just a year ago, I got out on a gravel track and couldn ’ t run 50 meters. And so, here I am â never lost. I set new records at the U. S. Nationals â the Olympic trials â that May, and was sure that I was coming home with the gold. I was also the only, what they call”bilateral BK”â below the knee. I was the only woman who would be doing the long jump. I had just done the long jump, and a guy who was missing two legs came up to me and says,”How do you do that? You know, we ’ re supposed to have a **planar** foot, so we can ’ t get off on the springboard.”I said,”Well, I just did it. No one told me that.”So, it ’ s funny â I ’ m three inches within the world record â and kept on from that point, you know, so I ’ m signed up in the long jump â signed up? No, I made it for the long jump and the 100-meter. And I ’ m sure of it, you know? I made the front page of my hometown paper that I delivered for six years, you know? It was, like, this is my time for shine. And we ’ re at the trainee warm-up track, which is a few blocks away from the Olympic stadium. These legs that I was on, which I ’ ll take out right now â I was the first person in the world on these legs. I was the guinea pig., I ’ m telling you, this was, like â talk about a tourist attraction. Everyone was taking pictures â”What is this girl running on?”And I ’ m always looking around, like, where is my competition? It ’ s my first international meet. I tried to get it out of anybody I could, you know,”Who am I running against here?””Oh, Aimee, we ’ ll have to get **back** to you on that one.”I wanted to find out times.”Don ’ t worry, you ’ re doing great.”This is 20 minutes before my race in the Olympic stadium, and they post the heat sheets. And I go over and look. And my fastest time, which was the world record, was 15. 77. Then I ’ m looking : the next lane, lane two, is 12. 8. Lane three is 12. 5. Lane four is 12. 2. I said,”What ’ s going on?”And they shove **us** all into the shuttle bus, and all the women there are missing a hand. So, I ’ m just, like â they ’ re all looking at me like ’ which one of these is not like the other, ’ you know? I ’ m sitting there, like,”Oh, my god. Oh, my god.”You know, I ’ d never lost anything, like, whether it would be the scholarship or, you know, I ’ d won five golds when I skied. In everything, I came in first. And Georgetown â that was great. I was losing, but it was the best training because this was Atlanta. Here we are, like, crĂ¨me de la crĂ¨me, and there is no doubt about it, that I ’ m going to lose big. And, you know, I ’ m just thinking,”Oh, my god, my whole family got in a van and drove down here from Pennsylvania.”And, you know, I was the only female U. S. sprinter. So they call **us** out and, you know â”Ladies, you have one minute.”And I remember putting my blocks in and just feeling horrified because there was just this murmur coming over the crowd, like, the ones who are close enough to the starting line to see. And I ’ m like,”I know! Look! This isn ’ t right.”And I ’ m thinking that ’ s my last card to play here ; if I ’ m not going to beat these girls, I ’ m going to mess their heads a little, you know? I mean, it was definitely the”Rocky IV”sensation of me versus Germany, and everyone else â Estonia and Poland â was in this heat. And the gun went off, and all I remember was finishing last and fighting **back** tears of frustration and incredible â incredible â this feeling of just being overwhelmed. And I had to think,”Why did I do this?”If I had won everything â but it was like, what was the point? All this training â I had transformed my life. I became a collegiate athlete, you know. I became an Olympic athlete. And it made me really think about how the achievement was getting there. I mean, the fact that I set my sights, just a year and three months before, on becoming an Olympic athlete and saying,”Here ’ s my life going in this direction â and I want to take it here for a while, and just seeing how far I could push it.”And the fact that I asked for help â how many people jumped on board? How many people gave of their time and their expertise, and their patience, to deal with me? And that was this collective glory â that there was, you know, 50 people behind me that had joined in this incredible experience of going to Atlanta. So, I apply this sort of philosophy now to everything I do : sitting **back** and realizing the progression, how far you ’ ve come at this day to this goal, you know. It ’ s important to focus on a goal, I think, but also recognize the progression on the way there and how you ’ ve grown as a person. That ’ s the achievement, I think. That ’ s the real achievement. SS : Why don ’ t you show them your legs? AM : Oh, sure. SS : You know, show **us** more than one set of legs. AM : Well, these are my pretty legs. No, these are my cosmetic legs, actually, and they ’ re absolutely beautiful. You ’ ve got to come up and see them. There are hair follicles on them, and I can paint my toenails. And, seriously, like, I can wear heels. Like, you guys don ’ t understand what that ’ s like to be able to just go into a shoe store and buy whatever you want. SS : You got to pick your height? AM : I got to pick my height, exactly. Patrick Ewing, who played for Georgetown in the ’ 80s, comes **back** every summer. And I had incessant fun making fun of him in the training room because he ’ d come in with foot injuries. I ’ m like,”Get it off! Don ’ t worry about it, you know. You can be eight feet tall. Just take them off.”He didn ’ t find it as humorous as I did, anyway. OK, now, these are my sprinting legs, made of carbon graphite, like I said, and I ’ ve got to make sure I ’ ve got the right socket. No, I ’ ve got so many legs in here. These are â do you want to hold that actually? That ’ s another leg I have for, like, tennis and softball. It has a shock absorber in it so it, like,”Shhhh,”makes this neat sound when you jump around on it. All right. And then this is the silicon sheath I roll over, to keep it on. Which, when I sweat, you know, I ’ m pistoning out of it. SS : Are you a different height? AM : In these? SS : In these. AM : I don ’ t know. I don ’ t think so. I may be a little taller. I actually can put both of them on. SS : She can ’ t really stand on these legs. She has to be moving, so... AM : Yeah, I definitely have to be moving, and balance is a little bit of an art in them. But without having the silicon sock, I ’ m just going to try slip in it. And so, I run on these, and have shocked half the world on these. These are supposed to simulate the actual form of a sprinter when they run. If you ever watch a sprinter, the ball of their foot is the only thing that ever hits the track. So when I stand in these legs, my hamstring and my **glutes** are contracted, as they would be had I had feet and were standing on the ball of my feet. AM : It ’ s a company in San Diego called Flex-Foot. And I was a guinea pig, as I hope to continue to be in every new form of prosthetic limbs that come out. But actually these, like I said, are still the actual prototype. I need to get some new ones because the last meet I was at, they were everywhere. You know, it ’ s like a big â it ’ s come full circle. Moderator : Aimee and the designer of them will be at TEDMED 2, and we ’ ll talk about the design of them. AM : Yes, we ’ ll do that. SS : Yes, there you go. AM : So, these are the sprint legs, and I can put my other... SS : Can you tell about who designed your other legs? AM : Yes. These I got in a place called Bournemouth, England, about two hours south of London, and I ’ m the only person in the United States with these, which is a crime because they are so beautiful. And I don ’ t even mean, like, because of the toes and everything. For me, while I ’ m such a serious athlete on the track, I want to be feminine off the track, and I think it ’ s so important not to be limited in any capacity, whether it ’ s, you know, your mobility or even fashion. I mean, I love the fact that I can go in anywhere and pick out what I want â the shoes I want, the skirts I want â and I ’ m hoping to try to bring these over here and make them accessible to a lot of people. They ’ re also silicon. This is a really basic, basic prosthetic limb under here. It ’ s like a Barbie foot under this. It is. It ’ s just stuck in this position, so I have to wear a **two-inch** heel. And, I mean, it ’ s really â let me take this off so you can see it. I don ’ t know how good you can see it, but, like, it really is. There ’ re veins on the feet, and then my heel is pink, and my Achilles ’ tendon â that moves a little bit. And it ’ s really an amazing store. I got them a year and two weeks ago. And this is just a silicon piece of skin. I mean, what happened was, two years ago this man in Belgium was saying,”God, if I can go to Madame Tussauds ’ wax museum and see Jerry Hall replicated down to the color of her eyes, looking so real as if she breathed, why can ’ t they build a limb for someone that looks like a leg, or an arm, or a hand?”I mean, they make ears for burn victims. They do amazing stuff with silicon. SS : Two weeks ago, Aimee was up for the Arthur Ashe award at the ESPYs. And she came into town and she rushed around and she said,”I have to buy some new shoes!”We ’ re an hour before the ESPYs, and she thought she ’ d gotten a **two-inch** heel but she ’ d actually bought a three-inch heel. AM : And this poses a problem for me, because it means I ’ m walking like that all night long. SS : For 45 minutes. Luckily, the hotel was terrific. They got someone to come in and saw off the shoes. AM : I said to the receptionist â I mean, I am just harried, and Sheryl ’ s at my side â I said,”Look, do you have anybody here who could help me? Because I have this problem...”You know, at first they were just going to write me off, like,”If you don ’ t like your shoes, sorry. It ’ s too late.””No, no, no, no. I ’ ve got these special feet that need a **two-inch** heel. I have a three-inch heel. I need a little bit off.”They didn ’ t even want to go there. They didn ’ t even want to touch that one. They just did it. No, these legs are great. I ’ m actually going **back** in a couple of weeks to get some improvements. I want to get legs like these made for flat feet so I can wear sneakers, because I can ’ t with these ones. So... Moderator : That ’ s it. SS : That ’ s Aimee Mullins.

Text Sample 147: NEG Dim 1 – 1998 – Score 11.00 – 1998/t000134.txt

’ Theme and variations ’ is one of those forms that require a certain kind of intellectual activity, because you are always comparing the variation with the theme that you hold in your mind. You might say that the theme is nature and everything that follows is a variation on the subject. I was asked, I guess about six years ago, to do a series of paintings that in some way would celebrate the birth of Piero della Francesca. And it was very difficult for me to imagine how to paint pictures that were based on Piero until I realized that I could look at Piero as nature — that I would have the same attitude towards looking at Piero della Francesca as I would if I were looking out a window at a tree. And that was enormously liberating to me. Perhaps it ’ s not a very insightful observation, but that really started me on a path to be able to do a kind of theme and variations based on a work by Piero, in this case that remarkable painting that ’ s in the Uffizi,”The Duke of Montefeltro,”who faces his consort, Battista. Once I realized that I could take some liberties with the subject, I did the following series of drawings. That ’ s the real Piero della Francesca — one of the greatest portraits in human history. And these, I ’ ll just show these without comment. It ’ s just a series of variations on the head of the Duke of Montefeltro, who ’ s a great, great figure in the Renaissance, and probably the basis for Machiavelli ’ s”The Prince.”He apparently lost an eye in battle, which is why he is always shown in profile. And this is Battista. And then I decided I could move them around a little bit — so that for the first time in history, they ’ re facing the same direction. Whoops! Passed each other. And then a visitor from another painting by Piero, this is from”The Resurrection of Christ”— as though the cast had just gotten of the set to have a chat. And now, four large panels : this is upper left ; upper right ; lower left ; lower right. Incidentally, I ’ ve never understood the conflict between abstraction and naturalism. Since all paintings are inherently abstract to begin with there doesn ’ t seem to be an argument there. On another subject — — I was driving in the country one day with my wife, and I saw this sign, and I said,”That is a fabulous piece of design.”And she said,”What are you talking about?”I said,”Well, it ’ s so persuasive, because the purpose of that sign is to get you into the garage, and since most people are so suspicious of garages, and know that they ’ re going to be ripped off, they use the word ’ reliable. ’ But everybody says they ’ re reliable. But, reliable Dutchman”— —”Fantastic!”Because as soon as you hear the word Dutchman — which is an archaic word, nobody calls Dutch people”Dutchmen”anymore — but as soon as you hear Dutchman, you get this picture of the kid with his finger in the dike, preventing the thing from falling and flooding Holland, and so on. And so the entire issue is **detoxified** by the use of"Dutchman."Now, if you think I ' m exaggerating at all in this, all you have to do is substitute something else, like"Indonesian."Or even"French."Now,"Swiss"works, but you know it ' s going to cost a lot of money. I ' m going to take you quickly through the actual process of doing a poster. I do a lot of work for the School of Visual Arts, where I teach, and the director of this school — a remarkable man named Silas Rhodes — often gives you a piece of text and he says,"Do something with this."And so he did. And this was the text —"In words as fashion the same rule will hold / Alike fantastic if too new or old / Be not the first by whom the new are tried / Nor yet the last to lay the old aside."I could make nothing of that. And I really struggled with this one. And the first thing I did, which was sort of in the absence of another idea, was say I ' ll sort of write it out and make some words big, and I ' ll have some kind of design on the **back** somehow, and I was hoping — as one often does — to stumble into something. So I took another crack at it — you ' ve got to keep it moving — and I Xeroxed some words on pieces of colored paper and I pasted them down on an ugly board. I thought that something would come out of it, like"Words rule fantastic new old first last Pope"because it ' s by Alexander Pope, but I sort of made a mess out of it, and then I thought I ' d repeat it in some way so it was legible. So, it was going nowhere. Sometimes, in the middle of a resistant problem, I write down things that I know about it. But you can see the beginning of an idea there, because you can see the word"new"emerging from the"old."That ' s what happens. There ' s a relationship between the old and the new ; the new emerges from the context of the old. And then I did some variations of it, but it still wasn ' t coalescing graphically at all. I had this other version which had something interesting about it in terms of being able to put it together in your mind from clues. The W was clearly a W, the N was clearly an N, even though they were very fragmentary and there wasn ' t a lot of information in it. Then I got the words"new"and"old"and now I had regressed **back** to a point where there seemed to be no return. I was really desperate at this point. And so, I do something I ' m truthfully ashamed of, which is that I took two drawings I had made for another purpose and I put them together. It says"dreams"at the top. And I was going to do a thing, I say,"Well, change the copy. Let it say something about dreams, and come to SVA and you ' ll sort of fulfill your dreams."But, to my credit, I was so embarrassed about doing that that I never submitted this sketch. And, finally, I arrived at the following solution. Now, it doesn ' t look terribly interesting, but it does have something that distinguishes it from a lot of other posters. For one thing, it transgresses the idea of what a poster ' s supposed to be, which is to be understood and seen immediately, and not explained. I remember hearing all of you in the graphic arts —"If you have to explain it, it ain ' t working."And one day I woke up and I said,"Well, suppose that ' s not true?"So here ' s what it says in my explanation at the bottom left. It says,"Thoughts : This poem is impossible. Silas usually has a better touch with his choice of quotations. This one generates no imagery at all."I am now exposing myself to my audience, right? Which is something you never want to do professionally."Maybe the words can make the image without anything else happening. What ' s the heart of this poem? Don ' t be trendy if you want to be serious. Is doing the poster this way trendy in itself? I guess one could reduce the idea further by suggesting that the new emerges behind and through the old, like this."And then I show you a little drawing — you see, you remember that old thing I discarded? Well, I found a way to use it. So, there ' s that little alternative over there, and I say,"Not bad,"— criticizing myself —"but more didactic than visual. Maybe what wants to be said is that old and the new are locked in a dialectical embrace, a kind of dance where each defines the other."And then more self-questioning —"Am I being simple-minded? Is this the kind of simple that looks obvious, or the kind that looks profound? There ' s a significant difference. This could be embarrassing. Actually, I realize fear of embarrassment drives me as much as any ambition. Do you think this sort of thing could really attract a student to the school?"Well, I think there are two fresh things here — two fresh things. One is the sort of willingness to expose myself to a critical audience, and not to suggest that I am confident about what I ' m doing. And as you know, you have to have a front. I mean — you ' ve got to be confident ; if you don ' t believe in your work, who else is going to believe in it? So that ' s one thing, to introduce the idea of doubt into graphics. That can be a big contribution. The other thing is to actually give you two solutions for the price of one ; you get the big one and if you don ' t like that, how about the little one? And that too is a relatively new idea. And here ' s just a series of experiments where I ask the question of — does a poster have to be square? Now, this is a little illusion. That poster is not folded. It ' s not folded, that ' s a photograph and it ' s cut on the diagonal. Same cheap trick in the upper left- hand corner. And here, a very peculiar poster because, simply because of using the isometric perspective in the computer, it won ' t sit still in the space. At times, it seems to be wider at the **back** than the front, and then it shifts. And if you sit here long enough, it ' ll float off the page into the audience. But, we don ' t have time. And then an experiment — a little bit about the nature of perspective, where the outside shape is determined by the peculiarity of perspective, but the shape of the bottle — which is identical to the outside shape — is seen frontally. And another piece for the art directors ' club is"Anna Rees"casting long shadows. This is another poster from the School of Visual Arts. There were 10 artists invited to participate in it, and it was one of those things where it was extremely competitive and I didn ' t want to be embarrassed, so I worked very hard on this. The idea was — and it was a brilliant idea — was to have 10 posters distributed throughout the city ' s subway system so every time you got on the subway you ' d be passing a different poster, all of which had a different idea of what art is. But I was absolutely stuck on the idea of"art is"and trying to determine what art was. But then I gave up and I said,"Well, art is whatever."And as soon as I said that, I discovered that the word"hat"was hidden in the word"whatever,"and that led me to the inevitable conclusion. But then again, it ' s on my list of didactic posters. My intent is to have a literary accompaniment that explains the poster, in case you don ' t get it. Now this says,"Note to the viewer : I thought I might use a visual cliche of our time — Magritte ' s everyman — to express the idea that art is mystery, continuity and history. I ' m also convinced that, in an age of computer manipulation, surrealism has become banal, a shadow of its former self. The phrase ' Art is whatever ' expresses the current inclusiveness that surrounds art-making — a sort of ' it ain ' t what you do, it ' s the way that you do it ' notion. The shadow of Magritte falls across the central part of the poster a poetic event that occurs as the shadow man isolates the word ' hat, ' hidden in the word ' whatever. ' The four hats shown in the poster suggests how art might be defined : as a thing itself, the worth of the thing, the shadow of the thing, and the shape of the thing. Whatever."OK. And the one that I did not submit, which I still like, I wanted to use the same phrase. There were wonderful experiments by Bruno Munari on **letterforms** some years ago — sort of, see how far you could go and still be able to read them. And that idea stuck in my head. But then I took the pieces that I had taken off and put them at the bottom. And, of course those are the remains, and they ' re so labeled. But what really happens is that you read it as :"Art is whatever remains."Thank you.

I wrote this poem after hearing a pretty well known actress tell a very well known interviewer on television,”I ’ m really getting into the Internet lately. I just wish it were more organized.”So... If I controlled the Internet, you could auction your broken heart on eBay. Take the money ; go to Amazon ; buy a phonebook for a country you ’ ve never been to — call folks at random until you find someone who flirts really well in a foreign language. If I were in charge of the Internet, you could Mapquest your lover ’ s mood swings. Hang left at cranky, right at preoccupied, U-turn on silent treatment, all the way **back** to tongue kissing and good lovin ’. You could navigate and understand every emotional intersection. Some days, I ’ m as shallow as a baking pan, but I still stretch miles in all directions. If I owned the Internet, Napster, Monster and Friendster. com would be one big website. That way you could listen to cool music while you pretend to look for a job and you ’ re really just chattin ’ with your pals. Heck, if I ran the Web, you could email dead people. They would not email you **back** — but you ’ d get an automated reply. Their name in your inbox — it ’ s all you wanted anyway. And a message saying,”Hey, it ’ s me. I miss you. Listen, you ’ ll see being dead is dandy. Now you go **back** to raising kids and waging peace and craving candy.”If I designed the Internet, childhood. com would be a loop of a boy in an orchard, with a ski pole for a sword, trashcan lid for a shield, shouting,”I am the emperor of oranges. I am the emperor of oranges. I am the emperor of oranges.”Now follow me, OK? Grandma. com would be a recipe for biscuits and spit-bath instructions. One, two, three. That links with hotdiggitydog. com. That is my grandfather. They take you to gruff-ex-cop-on-his-fourth-marriage. dad. He forms an attachment to kind-of-ditzy-but-still-sends-ginger-snaps-for-Christmas. mom, who downloads the boy in the orchard, the emperor of oranges, who grows up to be me — the guy who usually goes too far. So if I were emperor of the Internet, I guess I ’ d still be mortal, huh? But at that point, I would probably already have the lowest possible mortgage and the most enlarged possible penis — so I would outlaw spam on my first day in office. I wouldn ’ t need it. I ’ d be like some kind of Internet genius, and me, I ’ d like to upgrade to deity and maybe just like that — pop! — I ’ d go wireless. Huh? Maybe Google would hire this. I could zip through your servers and firewalls like a virus until the World Wide Web is as wise, as wild and as organized as I think a modern-day miracle / oracle can get, but, ooh-eee, you want to bet just how whack and un-PC your Mac or PC is going to be when I ’ m rocking hot-shit-hot-shot-god. net? I guess it ’ s just like life. It is not a question of if you can — it ’ s : do ya? We can interfere with the interface. We can make”You ’ ve got Hallelujah”the national anthem of cyberspace every lucky time we log on. You don ’ t say a prayer. You don ’ t write a psalm. You don ’ t chant an”om.”You send one blessed email to whomever you ’ re thinking of at dah-da-la-dat-da-dah-da-la-dat. com. Thank you, TED.

On September 10, the morning of my seventh birthday, I came downstairs to the kitchen, where my mother was washing the dishes and my father was reading the paper or something, and I sort of presented myself to them in the doorway, and they said,”Hey, happy birthday!”And I said,”I ’ m seven.”And my father smiled and said,”Well, you know what that means, don ’ t you?”And I said,”Yeah, that I ’ m going to have a party and a cake and get a lot of presents?”And my dad said,”Well, yes. But more importantly, being seven means that you ’ ve reached the age of reason, and you ’ re now capable of committing any and all sins against God and man.”Now, I had heard this phrase,”age of reason,”before. Sister Mary Kevin had been bandying it about my second-grade class at school. But when she said it, the phrase seemed all caught up in the excitement of preparations for our first communion and our first confession, and everybody knew that was really all about the white dress and the white veil. And anyway, I hadn ’ t really paid all that much attention to that phrase,”age of reason.”So, I said,”Yeah, yeah, age of reason. What does that mean again?”And my dad said,”Well, we believe, in the Catholic Church, that God knows that little kids don ’ t know the difference between right and wrong, but when you ’ re seven, you ’ re old enough to know better. So, you ’ ve grown up and reached the age of reason, and now God will start keeping notes on you, and begin your permanent record.”And I said,”Oh... Wait a minute. You mean all that time, up till today, all that time I was so good, God didn ’ t notice it?”And my mom said,”Well, I noticed it.”And I thought,”How could I not have known this before? How could it not have sunk in when they ’ d been telling me? All that being good and no real credit for it. And worst of all, how could I not have realized this very important information until the very day that it was basically useless to me?”So I said,”Well, Mom and Dad, what about Santa Claus? I mean, Santa Claus knows if you ’ re naughty or nice, right?”And my dad said,”Yeah, but, honey, I think that ’ s technically just between Thanksgiving and Christmas.”And my mother said,”Oh, Bob, stop it. Let ’ s just tell her. I mean, she ’ s seven. Julie, there is no Santa Claus.”Now, this was actually not that upsetting to me. My parents had this whole elaborate story about Santa Claus : how they had talked to Santa Claus himself and agreed that instead of Santa delivering our presents over the night of Christmas Eve, like he did for every other family who got to open their surprises first thing Christmas morning, our family would give Santa more time. Santa would come to our house while we were at nine o ’ clock high mass on Christmas morning, but only if all of **us** kids did not make a fuss. Which made me very suspicious. It was pretty obvious that it was really our parents giving **us** the presents. I mean, my dad had a very distinctive wrapping style, and my mother ’ s handwriting was so close to Santa ’ s. Plus, why would Santa save time by having to loop **back** to our house after he ’ d gone to everybody else ’ s? There was only one obvious conclusion to reach from this mountain of evidence : our family was too strange and weird for even Santa Claus to come visit, and my poor parents were trying to protect **us** from the embarrassment, this humiliation of rejection by Santa, who was jolly — but let ’ s face it, he was also very judgmental. So to find out that there was no Santa Claus at all was actually sort of a relief. I left the kitchen not really in shock about Santa, but rather, I was just dumbfounded about how I could have missed this whole age of reason thing. It was too late for me, but maybe I could help someone else, someone who could use the information. They had to fit two criteria : they had to be old enough to be able to understand the whole concept of the age of reason, and not yet seven. The answer was clear : my brother Bill. He was six. Well, I finally found Bill about a block away from our house at this public school playground. It was a Saturday, and he was all by himself, just kicking a ball against the side of a wall. I ran up to him and said,”Bill! I just realized that the age of reason starts when you turn seven, and then you ’ re capable of committing any and all sins against God and man.”And Bill said,”So?”And I said,”So, you ’ re six. You have a whole year to do anything you want to and God won ’ t notice it.”And he said,”So?”And I said,”So? So everything!”And I turned to run. I was so angry with him. But when I got to the top of the steps, I turned around dramatically and said,”Oh, by the way, Bill — there is no Santa Claus.”Now, I didn ’ t know it at the time, but I really wasn ’ t turning seven on September 10th. For my 13th birthday, I planned a slumber party with all of my girlfriends, but a couple of weeks beforehand my mother took me aside and said,”I need to speak to you privately. September 10th is not your birthday. It ’ s October 10th.”And I said,”What?”And she said...”Listen. The cut-off date to start kindergarten was September 15th.””So I told them that your birthday was September 10th, and then I wasn ’ t sure that you weren ’ t just going to go blab it all over the place, so I started to tell you your birthday was September 10th. But, Julie, you were so ready to start school, honey. You were so ready.”I thought about it, and when I was four, I was already the oldest of four children, and my mother even had another child to come, so what I think she — understandably — really meant was that she was so ready, she was so ready. Then she said,”Don ’ t worry, Julie. Every year on October 10th, when it was your birthday but you didn ’ t realize it, I made sure that you ate a piece of cake that day.”Which was comforting, but troubling. My mother had been celebrating my birthday with me, without me. What was so upsetting about this new piece of information was not that I had to change the date of my slumber party with all of my girlfriends. What was most upsetting was that this meant I was not a Virgo. I had a huge Virgo poster in my bedroom. And I read my horoscope every single day, and it was so totally me. And this meant that I was a Libra? So, I took the bus downtown to get the new Libra poster. The Virgo poster is a picture of a beautiful woman with long hair, sort of lounging by some water, but the Libra poster is just a huge scale. This was around the time that I started filling out physically, and I was filling out a lot more than a lot of the other girls, and frankly, the whole idea that my astrological sign was a scale just seemed ominous and depressing. But I got the new Libra poster, and I started to read my new Libra horoscope, and I was astonished to find that it was also totally me. It wasn ’ t until years later, looking **back** on this whole age-of-reason, change- of-birthday thing, that it dawned on me : I wasn ’ t turning seven when I thought I turned seven. I had a whole other month to do anything I wanted to before God started keeping tabs on me. Oh, life can be so cruel. One day, two Mormon missionaries came to my door. Now, I just live off a main thoroughfare in Los Angeles, and my block is — well, it ’ s a natural beginning for people who are peddling things door to door. Sometimes I get little old ladies from the Seventh Day Adventist Church showing me these cartoon pictures of heaven. And sometimes I get teenagers who promise me that they won ’ t join a gang and just start robbing people, if I only buy some magazine subscriptions from them. So normally, I just ignore the doorbell, but on this day, I answered. And there stood two boys, each about 19, in white, starched short-sleeved shirts, and they had little name tags that identified them as official representatives of the Church of Jesus Christ of Latter-day Saints, and they said they had a message for me, from God. I said,”A message for me? From God?”And they said,”Yes.”Now, I was raised in the Pacific Northwest, around a lot of Church of Latter-day Saints people and, you know, I ’ ve worked with them and even dated them, but I never really knew the doctrine, or what they said to people when they were out on a mission, and I guess I was sort of curious, so I said,”Well, please, come in.”And they looked really happy, because I don ’ t think this happens to them all that often. And I sat them down, and I got them glasses of water — Ok, I got it, I got it. I got them glasses of water. Don ’ t touch my hair, that ’ s the thing. You can ’ t put a video of myself in front of me and expect me not to fix my hair. Ok. So I sat them down and I got them glasses of water, and after niceties, they said,”Do you believe that God loves you with all his heart?”And I thought,”Well, of course I believe in God, but you know, I don ’ t like that word ’ heart, ’ because it anthropomorphizes God, and I don ’ t like the word, ’ his, ’ either, because that sexualizes God.”But I didn ’ t want to argue semantics with these boys, so after a very long, uncomfortable pause, I said,”Yes, yes, I do. I feel very loved.”And they looked at each other and smiled, like that was the right answer. And then they said,”Do you believe that we ’ re all brothers and sisters on this planet?”And I said,”Yes, I do.”And I was so relieved that it was a question I could answer so quickly. And they said,”Well, then we have a story to tell you.”And they told me this story all about this guy named Lehi, who lived in Jerusalem in 600 BC. Now, apparently in Jerusalem in 600 BC, everyone was completely bad and evil. Every single one of them : man, woman, child, infant, fetus. And God came to Lehi and said to him,”Put your family on a boat and I will lead you out of here.”And God did lead them. He led them to America. I said,”America? From Jerusalem to America by boat in 600 BC?”And they said,”Yes.”Then they told me how Lehi and his descendants reproduced and reproduced, and over the course of 600 years, there were two great races of them, the Nephites and the Lamanites, and the Nephites were totally good — each and every one of them — and the Lamanites were totally bad and evil — every single one of them just bad to the bone. Then, after Jesus died on the cross for our sins, on his way up to heaven, he stopped by America and visited the Nephites. And he told them that if they all remained totally, totally good — each and every one of them — they would win the war against the evil Lamanites. But apparently somebody blew it, because the Lamanites were able to kill all the Nephites. All but one guy, this guy named Mormon, who managed to survive by hiding in the woods. And he made sure this whole story was written down in reformed Egyptian hieroglyphics chiseled onto gold plates, which he then buried near Palmyra, New York. Well, I was just on the edge of my seat. I said,”What happened to the Lamanites?”And they said,”Well, they became our Native Americans, here in the U. S.”And I said,”So, you believe the Native Americans are descended from a people who were totally evil?”And they said,”Yes.”Then they told me how this guy named Joseph Smith found those buried gold plates right in his backyard, and he also found this magic stone **back** there that he put into his hat and then buried his face into, and this allowed him to translate the gold plates from the reformed Egyptian into English. Well, at this point I just wanted to give these two boys some advice about their pitch. I wanted to say —”Ok, don ’ t start with this story.”I mean, even the Scientologists know to start with a personality test before they start — telling people all about Xenu, the evil intergalactic overlord. Then, they said,”Do you believe that God speaks to **us** through his righteous prophets?”And I said,”No, I don ’ t,”because I was sort of upset about this Lamanite story and this crazy gold plate story, but the truth was, I hadn ’ t really thought this through, so I backpedaled a little and I said,”Well, what exactly do you mean by ’ righteous ’? And what do you mean by prophets? Like, could the prophets be women?”And they said,”No.”And I said,”Why?”And they said,”Well, it ’ s because God gave women a gift that is so spectacular, it is so wonderful, that the only gift he had left over to give men was the gift of prophecy.”What is this wonderful gift God gave women, I wondered? Maybe their greater ability to cooperate and adapt? Women ’ s longer lifespan? The fact that women tend to be much less violent than men? But no — it wasn ’ t any of these gifts. They said,”Well, it ’ s her ability to bear children.”I said,”Oh, come on. I mean, even if women tried to have a baby every single year from the time they were 15 to the time they were 45, assuming they didn ’ t die from exhaustion, it still seems like some women would have some time left over to hear the word of God.”And they said,”No.”Well, then they didn ’ t look so fresh-faced and cute to me any more, but they had more to say. They said,”Well, we also believe that if you ’ re a Mormon, and if you ’ re in good standing with the church, when you die, you get to go to heaven and be with your family for all eternity.”And I said,”Oh, dear. That wouldn ’ t be such a good incentive for me.”And they said,”Oh. Hey! Well, we also believe that when you go to heaven, you get your body restored to you in its best original state. Like, if you ’ d lost a leg, well, you get it **back**. Or, if you ’ d gone blind, you could see.”I said,”Oh. Now, I don ’ t have a uterus, because I had cancer a few years ago. So does this mean that if I went to heaven, I would get my old uterus **back**?”And they said,”Sure.”And I said,”I don ’ t want it **back**. I ’ m happy without it.”Gosh. What if you had a nose job and you liked it? Would God force you to get your old nose **back**? Then they gave me this Book of Mormon, told me to read this chapter and that chapter, and said they ’ d come **back** and check in on me, and I think I said something like,”Please don ’ t hurry,”or maybe just,”Please don ’ t,”and they were gone. Ok, so I initially felt really superior to these boys, and smug in my more conventional faith. But then the more I thought about it, the more I had to be honest with myself. If someone came to my door and I was hearing Catholic theology and dogma for the very first time, and they said,”We believe that God impregnated a very young girl without the use of intercourse, and the fact that she was a virgin is maniacally important to **us**.””And she had a baby, and that ’ s the son of God,”I mean, I would think that ’ s equally ridiculous. I ’ m just so used to that story. So, I couldn ’ t let myself feel condescending towards these boys. But the question they asked me when they first arrived really stuck in my head : Did I believe that God loved me with all his heart? Because I wasn ’ t exactly sure how I felt about that question. Now, if they had asked me,”Do you feel that God loves you with all his heart?”Well, that would have been much different, I think I would have instantly answered,”Yes, yes, I feel it all the time. I feel God ’ s love when I ’ m hurt and confused, and I feel consoled and cared for. I take shelter in God ’ s love when I don ’ t understand why tragedy hits, and I feel God ’ s love when I look with gratitude at all the beauty I see.”But since they asked me that question with the word”believe”in it, somehow it was all different, because I wasn ’ t exactly sure if I believed what I so clearly felt.

Text Sample 150: NEG Dim 1 – 2006 – Score 5.00 – 2006/t000219.txt

Stephanie White : I ’ m going to let her introduce herself to everybody. Can you tell everybody your name? Einstein : Einstein. SW : This is Einstein. Can you tell everyone”hi”? E : Hello. SW : That ’ s nice. Can you be polite? E : Hi, sweetheart. SW : Much better. Well, Einstein is very honored to be here at TED 2006, amongst all you modern-day Einsteins. In fact, she ’ s very excited. E : Woo. SW : Yeah. Since we ’ ve arrived, there ’ s been a constant buzz about all the exciting speakers here for the conference. This morning we ’ ve heard a lot of whispers about Tom Reilly ’ s wrap-up on Saturday. Einstein, did you hear whispers? E : [Squawks] SW : Yeah. Einstein ’ s especially interested in Penelope ’ s talk. A lot of her research goes on in caves, which can get pretty dusty. E : Achoo! SW : It could make her sneeze. But more importantly, her research could help Einstein find a cure for her never-ending scratchy throat. Einstein : [Coughs] SW : Yeah. Well, Bob Russell was telling **us** about his work on nanotubes in his research at the microscopic level. Well, that ’ s really cool, but what Einstein ’ s really hoping is that maybe he ’ ll genetically engineer a five-pound peanut. E : Oh, my God! My God! My God! SW : Yeah. She would get really, really excited. That is one big peanut. Since Einstein is a bird, she ’ s very interested in things that fly. She thinks Burt Rutan is very impressive. E

: Ooh. SW : Yeah. She especially likes his latest achievement, SpaceShipOne. Einstein, would you like to ride in Burt ’ s spaceship? E : [Spaceship noise] SW : Even if it doesn ’ t have a laser? E : [Laser noise] SW : Yeah, yeah. That was pretty funny, Einstein. Now, Einstein also thinks, you know, working in caves and travelling through space — it ’ s all very dangerous jobs. It would be very dangerous if you fell down. E : Wheeeeeee! [Splat] SW : Yeah. Little splat at the end there. Einstein, did that hurt? E : Ow, ow, ow. SW : Yeah. It ’ s all a lot of hard work. E : [Squawks] SW : Yeah. It can get a bird like Einstein frustrated. E : [Squawks] SW : Yeah, it sure can. But when Einstein needs to relax from her job educating the public, she loves to take in the arts. If the children of the Uganda need another dance partner, Einstein could sure fit the bill, because she loves to dance. Can you get down? E : [Bobbing head] SW : Let ’ s get down for everybody. Come on now. She ’ s going to make me do it, too. Ooh, ooh. Einstein : Ooh, ooh, ooh, ooh. SW : Do your head now. E : Ooh, ooh, ooh, ooh, ooh. SW : Or maybe Sirena Huang would like to learn some arias on her violin, and Einstein can sing along with some opera? E : [Operatic squawk] SW : Very good. Or maybe Stu just needs another backup singer? Einstein, can you also sing? I know, you need to get rid of that seed first. Can you sing? E : La, la. SW : There you go. And, of course, if all else fails, you can just run off and enjoy a fun fiesta. E : [Squawks] SW : All right. Well, Einstein was pretty embarrassed to admit this earlier, but she was telling me backstage that she had a problem. E : What ’ s the matter? SW : No, I don ’ t have a problem. You have the problem, remember? You were saying that you were really embarrassed, because you ’ re in love with a pirate? E : Yar. SW : There you go. And what do pirates like to drink? E : Beer. SW : Yeah, that ’ s right. But you don ’ t like to drink beer, Einstein. You like to drink water. E : [Water sound] SW : Very good. Now, really, she is pretty nervous. Because one of her favorite folks from **back** home is here, and she ’ s pretty nervous to meet him. She thinks Al Gore is a really good-looking man. What do you say to a good-looking man? E : Hey, baby. SW : And so do all the folks **back** home in Tennessee. E : Yee haw. SW : And since she ’ s such a big fan, she knows that his birthday is coming up at the end of March. And we didn ’ t think he ’ d be in town then, so Einstein wanted to do something special for him. So let ’ s see if Einstein will sing”Happy Birthday”to Al Gore. Can you sing”Happy Birthday”to him? E : Happy birthday to you. SW : Again. E : Happy birthday to you. SW : Again. E : Happy birthday to you. SW : Big finish. E : Happy birthday to you. SW : Good job! Well, before we wrap it up, she would like to give a shout out to all our animal friends **back** at the Knoxville Zoo. Einstein, do you want to say”hi”to all the owls? E : Woo, woo, woo. SW : What about the other birds? E : Tweet, tweet, tweet. SW : And the penguin? E : Quack, quack, quack. SW : There we go. Let ’ s get that one out of there. How about a chimpanzee? E : Ooh, ooh, ooh. Aah, aah, aah. SW : Very good. What about a wolf? E : Ooooowww. SW : And a pig? E : Oink, oink, oink. SW : And the rooster? E : Cock-a-doodle-doo! SW : And how about those cats? E : Meow. SW : At the zoo we have big cats from the jungle. E : Grrrrr. SW : What about a skunk? E : Stinker. SW : She ’ s a comedian. I suppose you think you ’ re famous? Are you famous? E : Superstar. SW : Yeah. You are a superstar. Well, we would like to encourage all of you to do your part to help protect Einstein ’ s animal friends, and to do your part to help protect their homes that they live [in]. Now, Einstein does say it best when we ask her. Why do we want to protect your home? E : I ’ m special. SW : You are very special. What would you like to say to all these nice people? E : I love you. SW : That ’ s good. Can you blow them a kiss? E : [Kissing noise] SW : And what do you say when it ’ s time to go? E : Goodbye. SW : Good job. Thank you all.

Great creativity. In times of need, we need great creativity. Discuss. Great creativity is astonishingly, absurdly, rationally, irrationally powerful. Great creativity can spread tolerance, champion freedom, make education seem like a bright idea. Great creativity can turn a spotlight on deprivation, or show that deprivation ain ’ t necessarily so. Great creativity can make politicians electable, or parties unelectable. It can make war seem like tragedy or farce. Creativity is the meme-maker that puts slogans on our t-shirts and phrases on our lips. It ’ s the pathfinder that shows **us** a simple road through an impenetrable moral maze. Science is clever, but great creativity is something less knowable, more magical. And now we need that magic. This is a time of need. Our climate is changing quickly, too quickly. And great creativity is needed to do what it does so well : to provoke **us** to think differently with dramatic creative statements. To tempt **us** to act differently with delightful creative scraps. Here is one such scrap from an initiative I ’ m involved in using creativity to inspire people to be greener. Man : You know, rather than drive today, I ’ m going to walk. Narrator : And so he walked, and as he walked he saw things. Strange and wonderful things he would not otherwise have seen. A deer with an itchy leg. A flying motorcycle. A father and daughter separated from a bicycle by a mysterious wall. And then he stopped. Walking in front of him was her. The woman who as a child had skipped with him through fields and broken his heart. Sure, she had aged a little. In fact, she had aged a lot. But he felt all his old passion for her return.”Ford,”he called softly. For that was her name.”Don ’ t say another word, Gusty,”she said, for that was his name.”I know a tent next to a caravan, exactly 300 yards from here. Let ’ s go there and make love. In the tent.”Ford undressed. She spread one leg, and then the other. Gusty entered her boldly and made love to her rhythmically while she filmed him, because she was a keen amateur pornographer. The earth moved for both of them. And they lived together happily ever after. And all because he decided to walk that day. Andy Hobsbawm : We ’ ve got the science, we ’ ve had the debate. The moral imperative is on the table. Great creativity is needed to take it all, make it simple and sharp. To make it connect. To make it make people want to act. So this is a call, a plea, to the incredibly talented TED community. Let ’ s get creative against climate change. And let ’ s do it soon. Thank you.

Text Sample 152: NEG Dim 1 – 2008 – Score 1.00 – 2008/t000249.txt

Probably a lot of you know the story of the two salesmen who went down to Africa in the 1900s. They were sent down to find if there was any opportunity for selling shoes, and they wrote telegrams **back** to Manchester. And one of them wrote,”Situation hopeless. Stop. They don ’ t wear shoes.”And the other one wrote,”Glorious opportunity. They don ’ t have any shoes yet.”Now, there ’ s a similar situation in the classical music world, because there are some people who think that classical music is dying. And there are some of **us** who think you ain ’ t seen nothing yet. And rather than go into statistics and trends, and tell you about all the orchestras that are closing, and the record companies that are folding, I thought we should do an experiment tonight. Actually, it ’ s not really an experiment, because I know the outcome. But it ’ s like an experiment. Now, before we start — Before we start, I need to do two things. One is I want to remind you of what a seven-year-old child sounds like when he plays the piano. Maybe you have this child at home. He sounds something like this. I see some of you recognize this child. Now, if he practices for a year and takes lessons, he

’ s now eight and he sounds like this. He practices for another year and takes lessons — he ’ s nine. Then he practices for another year and takes lessons — now he ’ s 10. At that point, they usually give up. Now, if you ’ d waited for one more year, you would have heard this. Now, what happened was not maybe what you thought, which is, he suddenly became passionate, engaged, involved, got a new teacher, he hit puberty, or whatever it is. What actually happened was the impulses were reduced. You see, the first time, he was playing with an impulse on every note. And the second, with an impulse every other note. You can see it by looking at my head. The nine-year-old put an impulse on every four notes. The 10-year-old, on every eight notes. And the 11-year-old, one impulse on the whole phrase. I don ’ t know how we got into this position. I didn ’ t say,”I ’ m going to move my shoulder over, move my body.”No, the music pushed me over, which is why I call it one-buttock playing. It can be the other buttock. You know, a gentleman was once watching a presentation I was doing, when I was working with a young pianist. He was the president of a corporation in Ohio. I was working with this young pianist, and said,”The trouble with you is you ’ re a two-buttock player. You should be a one-buttock player.”I moved his body while he was playing. And suddenly, the music took off. It took flight. The audience gasped when they heard the difference. Then I got a letter from this gentleman. He said,”I was so moved. I went **back** and I transformed my entire company into a one-buttock company.”Now, the other thing I wanted to do is to tell you about you. There are 1, 600 people, I believe. My estimation is that probably 45 of you are absolutely passionate about classical music. You adore classical music. Your FM is always on that classical dial. You have CDs in your car, and you go to the symphony, your children are playing instruments. You can ’ t imagine your life without classical music. That ’ s the first group, quite small. Then there ’ s another bigger group. The people who don ’ t mind classical music. You know, you ’ ve come home from a long day, and you take a glass of wine, and you put your feet up. A little Vivaldi in the background doesn ’ t do any harm. That ’ s the second group. Now comes the third group : people who never listen to classical music. It ’ s just simply not part of your life. You might hear it like second-hand smoke at the airport... — and maybe a little bit of a march from”Aida”when you come into the hall. But otherwise, you never hear it. That ’ s probably the largest group. And then there ’ s a very small group. These are the people who think they ’ re tone-deaf. Amazing number of people think they ’ re tone-deaf. Actually, I hear a lot,”My husband is tone-deaf.”Actually, you cannot be tone-deaf. Nobody is tone-deaf. If you were tone-deaf, you couldn ’ t change the gears on your car, in a stick shift car. You couldn ’ t tell the difference between somebody from Texas and somebody from Rome. And the telephone. The telephone. If your mother calls on the miserable telephone, she calls and says,”Hello,”you not only know who it is, you know what mood she ’ s in. You have a fantastic ear. Everybody has a fantastic ear. So nobody is tone- deaf. But I tell you what. It doesn ’ t work for me to go on with this thing, with such a wide gulf between those who understand, love and are passionate about classical music, and those who have no relationship to it at all. The tone-deaf people, they ’ re no longer here. But even between those three categories, it ’ s too wide a gulf. So I ’ m not going to go on until every single person in this room, downstairs and in Aspen, and everybody else looking, will come to love and understand classical music. So that ’ s what we ’ re going to do. Now, you notice that there is not the slightest doubt in my mind that this is going to work, if you look at my face, right? It ’ s one of the characteristics of a leader that he not doubt for one moment the capacity of the people he ’ s leading to realize whatever he ’ s dreaming. Imagine if Martin Luther King had said,”I have a dream. Of course, I ’ m not sure they ’ ll be up to it.”All right.

So I ’ m going to take a piece of Chopin. This is a beautiful prelude by Chopin. Some of you will know it. Do you know what I think probably happened here? When I started, you thought,”How beautiful that sounds.””I don ’ t think we should go to the same place for our summer holidays next year.”It ’ s funny, isn ’ t it? It ’ s funny how those thoughts kind of waft into your head. And of course — Of course, if the piece is long and you ’ ve had a long day, you might actually drift off. Then your companion will dig you in the ribs and say,”Wake up! It ’ s culture!”And then you feel even worse. But has it ever occurred to you that the reason you feel sleepy in classical music is not because of you, but because of **us**? Did anybody think while I was playing,”Why is he using so many impulses?”If I ’ d done this with my head you certainly would have thought it. And for the rest of your life, every time you hear classical music, you ’ ll always be able to know if you hear those impulses. So let ’ s see what ’ s really going on here. We have a B. This is a B. The next note is a C. And the job of the C is to make the B sad. And it does, doesn ’ t it? Composers know that. If they want sad music, they just play those two notes. But basically, it ’ s just a B, with four sads. Now, it goes down to A. Now to G. And then to F. So we have B, A, G, F. And if we have B, A, G, F, what do we expect next? That might have been a fluke. Let ’ s try it again. Oh, the TED choir. And you notice nobody is tone-deaf, right? Nobody is. You know, every village in Bangladesh and every hamlet in China — everybody knows : da, da, da, da — da. Everybody knows, who ’ s expecting that E. Chopin didn ’ t want to reach the E there, because what will have happened? It will be over, like Hamlet. Do you remember? Act One, scene three, he finds out his uncle killed his father. He keeps on going up to his uncle and almost killing him. And then he **backs** away, he goes up to him again, almost kills him. The critics sitting in the **back** row there, they have to have an opinion, so they say,”Hamlet is a procrastinator.”Or they say,”Hamlet has an Oedipus complex.”No, otherwise the play would be over, stupid. That ’ s why Shakespeare puts all that stuff in Hamlet — Ophelia going mad, the play within the play, and Yorick ’ s skull, and the gravediggers. That ’ s in order to delay — until Act Five, he can kill him. It ’ s the same with the Chopin. He ’ s just about to reach the E, and he says,”Oops, better go **back** up and do it again.”So he does it again. Now, he gets excited. That ’ s excitement, don ’ t worry about it. Now, he gets to F-sharp, and finally he goes down to E, but it ’ s the wrong chord — because the chord he ’ s looking for is this one, and instead he does... Now, we call that a deceptive cadence, because it deceives **us**. I tell my students,”If you have a deceptive cadence, raise your eyebrows, and everybody will know.”Right. He gets to E, but it ’ s the wrong chord. Now, he tries E again. That chord doesn ’ t work. Now, he tries the E again. That chord doesn ’ t work. Now, he tries E again, and that doesn ’ t work. And then finally... There was a gentleman in the front row who went,”Mmm.”It ’ s the same gesture he makes when he comes home after a long day, turns off the key in his car and says,”Aah, I ’ m home.”Because we all know where home is. So this is a piece which goes from away to home. I ’ m going to play it all the way through and you ’ re going to follow. B, C, B, C, B, C, B — down to A, down to G, down to F. Almost goes to E, but otherwise the play would be over. He goes **back** up to B, he gets very excited. Goes to F-sharp. Goes to E. It ’ s the wrong chord. It ’ s the wrong chord. And finally goes to E, and it ’ s home. And what you ’ re going to see is one-buttock playing. Because for me, to join the B to the E, I have to stop thinking about every single note along the way, and start thinking about the long, long line from B to E. You know, we were just in South Africa, and you can ’ t go to South Africa without thinking of Mandela in jail for 27 years. What was he thinking about? Lunch? No, he was thinking about the vision for South Africa and for human beings. This is about vision. This is about the long line. Like the bird who flies over the field and doesn ’ t care about the fences underneath, all right? So now, you ’ re going to follow the line all the way from B to E. And I ’ ve one last request before I play this piece all the way through. Would you think of somebody who you adore, who ’ s no longer there? A beloved grandmother, a lover — somebody in your life who you love with all your heart, but that person is no longer with you. Bring that person into your mind, and at the same time, follow the line all the way from B to E, and you ’ ll hear everything that Chopin had to say. Now, you may be wondering — You may be wondering why I ’ m clapping. Well, I did this at a school in Boston with about 70 seventh graders, 12-year-olds. I did exactly what I did with you, and I explained the whole thing. At the end, they went crazy, clapping. I was clapping. They were clapping. Finally, I said,”Why am I clapping?”And one of them said,”Because we were listening.”Think of it. 1, 600 people, busy people, involved in all sorts of different things, listening, understanding and being moved by a piece by Chopin. Now, that is something. Am I sure that every single person followed that, understood it, was moved by it? Of course, I can ’ t be sure. But I ’ ll tell you what happened to me in Ireland during the Troubles, 10 years ago, and I was working with some Catholic and Protestant kids on conflict resolution. And I did this with them — a risky thing to do, because they were street kids. And one of them came to me the next morning and he said,”You know, I ’ ve never listened to classical music in my life, but when you played that shopping piece...”He said,”My brother was shot last year and I didn ’ t cry for him. But last night, when you played that piece, he was the one I was thinking about. And I felt the tears streaming down my face. And it felt really good to cry for my brother.”So I made up my mind at that moment that classical music is for everybody. Everybody. Now, how would you walk — my profession, the music profession doesn ’ t see it that way. They say three percent of the population likes classical music. If only we could move it to four percent, our problems would be over. How would you walk? How would you talk? How would you be? If you thought,”Three percent of the population likes classical music, if only we could move it to four percent.”How would you walk or talk? How would you be? If you thought,”Everybody loves classical music — they just haven ’ t found out about it yet.”See, these are totally different worlds. Now, I had an amazing experience. I was 45 years old, I ’ d been conducting for 20 years, and I suddenly had a realization. The conductor of an orchestra doesn ’ t make a sound. My picture appears on the front of the CD — But the conductor doesn ’ t make a sound. He depends, for his power, on his ability to make other people powerful. And that changed everything for me. It was totally life-changing. People in my orchestra said,”Ben, what happened?”That ’ s what happened. I realized my job was to awaken possibility in other people. And of course, I wanted to know whether I was doing that. How do you find out? You look at their eyes. If their eyes are shining, you know you ’ re doing it. You could light up a village with this guy ’ s eyes. Right. So if the eyes are shining, you know you ’ re doing it. If the eyes are not shining, you get to ask a question. And this is the question : who am I being that my players ’ eyes are not shining? We can do that with our children, too. Who am I being, that my children ’ s eyes are not shining? That ’ s a totally different world. Now, we ’ re all about to end this magical, on-the-mountain week, we ’ re going **back** into the world. And I say, it ’ s appropriate for **us** to ask the question, who are we being as we go **back** out into the world? And you know, I have a definition of success. For me, it ’ s very simple. It ’ s not about wealth and fame and power. It ’ s about how many shining eyes I have around me. So now, I have one last thought, which is that it really makes a difference what we say — the words that come out of our mouth. I learned this from a woman who survived

Auschwitz, one of the rare survivors. She went to Auschwitz when she was 15 years old. And... And her brother was eight, and the parents were lost. And she told me this, she said,”We were in the train going to Auschwitz, and I looked down and saw my brother ’ s shoes were missing. I said, ’ Why are you so stupid, can ’ t you keep your things together for goodness ’ sake? ’”The way an elder sister might speak to a younger brother. Unfortunately, it was the last thing she ever said to him, because she never saw him again. He did not survive. And so when she came out of Auschwitz, she made a vow. She told me this. She said,”I walked out of Auschwitz into life and I made a vow. And the vow was,”I will never say anything that couldn ’ t stand as the last thing I ever say.”Now, can we do that? No. And we ’ ll make ourselves wrong and others wrong. But it is a possibility to live into. Thank you. Shining eyes. Shining eyes. Thank you, thank you.

Text Sample 153: NEG Dim 1 – 2008 – Score 2.00 – 2008/t000255.txt

I had a fire nine days ago. My archive : 175 films, my 16-millimeter negative, all my books, my dad ’ s books, my photographs. I ’ d collected â I was a collector, major, big-time. It ’ s gone. I just looked at it, and I didn ’ t know what to do. I mean, this was â was I my things? I always live in the present â I love the present. I cherish the future. And I was taught some strange thing as a kid, like, you ’ ve got to make something good out of something bad. You ’ ve got to make something good out of something bad. This was bad! Man, I was â I cough. I was sick. That ’ s my camera lens. The first one â the one I shot my Bob Dylan film with 35 years ago. That ’ s my feature film.”King, Murray”won Cannes Film Festival 1970 â the only print I had. That ’ s my papers. That was in minutes â 20 minutes. Epiphany hit me. Something hit me.”You ’ ve got to make something good out of something bad,”I started to say to my friends, neighbors, my sister. By the way, that ’ s”Sputnik.”I ran it last year.”Sputnik”was downtown, the negative. It wasn ’ t touched. These are some pieces of things I used in my Sputnik feature film, which opens in New York in two weeks downtown. I called my sister. I called my neighbors. I said,”Come dig.”That ’ s me at my desk. That was a desk took 40-some years to build. You know â all the stuff. That ’ s my daughter, Jean. She came. She ’ s a nurse in San Francisco.”Dig it up,”I said.”Pieces. I want pieces. Bits and pieces.”I came up with this idea : a life of bits and pieces, which I ’ m just starting to work on â my next project. That ’ s my sister. She took care of pictures, because I was a big collector of snapshot photography that I believed said a lot. And those are some of the pictures that â something was good about the burnt pictures. I didn ’ t know. I looked at that â I said,”Wow, is that better than the â”That ’ s my proposal on Jimmy Doolittle. I made that movie for television. It ’ s the only copy I had. Pieces of it. Idea about women. So I started to say,”Hey, man, you are too much! You could cry about this.”I really didn ’ t. I just instead said,”I ’ m going to make something out of it, and maybe next year...”And I appreciate this moment to come up on this stage with so many people who ’ ve already given me so much solace, and just say to TEDsters : I ’ m proud of me. That I take something bad, I turn it, and I ’ m going to make something good out of this, all these pieces. That ’ s Arthur Leipzig ’ s original photograph I loved. I was a big record collector â the records didn ’ t make it. Boy, I tell you, film burns. Film burns. I mean, this was 16- millimeter safety film. The negatives are gone. That ’ s my father ’ s letter to me, telling me to marry the woman I first married when I was 20. That ’ s my daughter and me. She ’ s still there. She ’ s there this morning, actually.

That ’ s my house. My family ’ s living in the Hilton Hotel in Scotts Valley. That ’ s my wife, Heidi, who didn ’ t take it as well as I did. My children, Davey and Henry. My son, Davey, in the hotel two nights ago. So, my message to you folks, from my three minutes, is that I appreciate the chance to share this with you. I will be **back**. I love being at TED. I came to live it, and I am living it. That ’ s my view from my window outside of Santa Cruz, in Bonny Doon, just 35 miles from here. Thank you everybody.

Text Sample 154: NEG Dim 1 – 2005 – Score 1.00 – 2005/t002624.txt
I ’ m used to thinking of the TED audience as a wonderful collection of some of the most effective, intelligent, intellectual, savvy, worldly and innovative people in the world. And I think that ’ s true. However, I also have reason to believe that many, if not most, of you are actually tying your shoes incorrectly. Now I know that seems ludicrous. I know that seems ludicrous. And believe me, I lived the same sad life until about three years ago. And what happened to me was I bought, what was for me, a very expensive pair of shoes. But those shoes came with round nylon laces, and I couldn ’ t keep them tied. So I went **back** to the store and said to the owner,”I love the shoes, but I hate the laces.”He took a look and said,”Oh, you ’ re tying them wrong.”Now up until that moment, I would have thought that, by age 50, one of the life skills that I had really nailed was tying my shoes. But not so — let me demonstrate. This is the way that most of **us** were taught to tie our shoes. Now as it turns out — thank you. Wait, there ’ s more. As it turns out — there ’ s a strong form and a weak form of this knot, and we were taught the weak form. And here ’ s how to tell. If you pull the strands at the base of the knot, you will see that the bow will orient itself down the long axis of the shoe. That ’ s the weak form of the knot. But not to worry. If we start over and simply go the other direction around the bow, we get this, the strong form of the knot. And if you pull the cords under the knot, you will see that the bow orients itself along the transverse axis of the shoe. This is a stronger knot. It will come untied less often. It will let you down less, and not only that, it looks better. We ’ re going to do this one more time. Start as usual — go the other way around the loop. This is a little hard for children, but I think you can handle it. Pull the knot. There it is : the strong form of the shoe knot. Now, in keeping with today ’ s theme, I ’ d like to point out — something you already know — that sometimes a small advantage someplace in life can yield tremendous results someplace else. Live long and prosper.

Text Sample 155: NEG Dim 1 – 2005 – Score 3.00 – 2005/t000479.txt
This is really a two-hour presentation I give to high school students, cut down to three minutes. And it all started one day on a plane, on my way to TED, seven years ago. And in the seat next to me was a high school student, a teenager, and she came from a really poor family. And she wanted to make something of her life, and she asked me a simple little question. She said,”What leads to success?”And I felt really badly, because I couldn ’ t give her a good answer. So I get off the plane, and I come to TED. And I think, jeez, I ’ m in the middle of a room of successful people! So why don ’ t I ask them what helped them succeed, and pass it on to kids? So here we are, seven years, 500 interviews later, and I ’ m going to tell you what really leads to success and makes TEDsters tick. And the first thing is passion. Freeman Thomas says,”I ’ m driven by my passion.”TEDsters do it for love ; they don ’ t do it for money. Carol Coletta says,”I would pay someone to do what I do.”And the interesting thing is : if you

do it for love, the money comes anyway. Work! Rupert Murdoch said to me,”It ’ s all hard work. Nothing comes easily. But I have a lot of fun.”Did he say fun? Rupert? Yes! TEDsters do have fun working. And they work hard. I figured, they ’ re not workaholics. They ’ re workafrolics. Good! Alex Garden says,”To be successful, put your nose down in something and get damn good at it.”There ’ s no magic ; it ’ s practice, practice, practice. And it ’ s focus. Norman Jewison said to me,”I think it all has to do with focusing yourself on one thing.”And push! David Gallo says,”Push yourself. Physically, mentally, you ’ ve got to push, push, push.”You ’ ve got to push through shyness and self-doubt. Goldie Hawn says,”I always had self-doubts. I wasn ’ t good enough ; I wasn ’ t smart enough. I didn ’ t think I ’ d make it.”Now it ’ s not always easy to push yourself, and that ’ s why they invented mothers. Frank Gehry said to me,”My mother pushed me.”Serve! Sherwin Nuland says,”It was a privilege to serve as a doctor.”A lot of kids want to be millionaires. The first thing I say is :”OK, well you can ’ t serve yourself ; you ’ ve got to serve others something of value. Because that ’ s the way people really get rich.”Ideas! TEDster Bill Gates says,”I had an idea : founding the first micro- computer software company.”I ’ d say it was a pretty good idea. And there ’ s no magic to creativity in coming up with ideas — it ’ s just doing some very simple things. And I give lots of evidence. Persist! Joe Kraus says,”Persistence is the number one reason for our success.”You ’ ve got to persist through failure. You ’ ve got to persist through crap! Which of course means”Criticism, Rejection, Assholes and Pressure.”So, the answer to this question is simple : Pay 4, 000 bucks and come to TED. Or failing that, do the eight things — and trust me, these are the big eight things that lead to success. Thank you TEDsters for all your interviews!

Text Sample 156: NEG Dim 1 – 2005 – Score 3.00 – 2005/t000310.txt

Good morning, ladies and gentlemen. My name is Art Benjamin, and I am a”mathemagician.”What that means is, I combine my loves of math and magic to do something I call”mathemagics.”But before I get started, I have a quick question for the audience. By any chance, did anyone happen to bring with them this morning a calculator? Seriously, if you have a calculator with you, raise your hand. Raise your hand. Did your hand go up? Now bring it out, bring it out. Anybody else? I see, I see one way in the **back**. You sir, that ’ s three. And anybody on this side here? OK, over there on the aisle. Would the four of you please bring out your calculators, then join me up on stage. Let ’ s give them a nice round of applause. That ’ s right. Now, since I haven ’ t had the chance to work with these calculators, I need to make sure that they are all working properly. Would somebody get **us** started by giving **us** a two-digit number, please? How about a two-digit number? Audience : 22. AB : 22. And another two-digit number, sir? Audience : 47. AB : Multiply 22 times 47, make sure you get 1, 034, or the calculators are not working. Do all of you get 1, 034? 1, 034? Volunteer : No. AB : 594. Let ’ s give three of them a nice round of applause there. Would you like to try a more standard calculator, just in case? OK, great. What I ’ m going to try and do then — I notice it took some of you a little bit of time to get your answer. That ’ s OK. I ’ ll give you a shortcut for multiplying even faster on the calculator. There is something called the square of a number, which most of you know is taking a number and multiplying it by itself. For instance, five squared would be? Audience : 25. AB : 25. The way we can square on most calculators — let me demonstrate with this one — is by taking the number, such as five, hitting”times”and then”equals,”and on most calculators that will give you the square. On some of these ancient RPN calculators, you ’ ve got an”x squared”button on it, will allow you to do the calculation even faster. What I ’ m going to try and do now is to square, in my head, four two-digit numbers faster than they can do on their calculators, even using the shortcut method. What I ’ ll use is the second row this time, and I ’ ll get four of you to each yell out a two-digit number, and if you would square the first number, and if you would square the second, the third and the fourth, I will try and race you to the answer. OK? So quickly, a two-digit number please. Audience : 37. Arthur Benjamin : 37 squared, OK. Audience : 23. AB : 23 squared, OK. Audience : 59. AB : 59 squared, OK, and finally? Audience : 93. AB : 93 squared. Would you call out your answers, please? Volunteer : 1369. AB : 1369. Volunteer : 529. AB : 529. Volunteer : 3481. AB : 3481. Volunteer : 8649. AB : Thank you very much. Let me try to take this one step further. I ’ m going to try to square some three-digit numbers this time. I won ’ t even write these down — I ’ ll just call them out as they ’ re called out to me. Anyone I point to, call out a three-digit number. Anyone on our panel, verify the answer. Just give some indication if it ’ s right. A three-digit number, sir, yes? Audience : 987. AB : 987 squared is 974, 169. AB : Yes? Good. Another three-digit — — another three-digit number, sir? Audience : 457. AB : 457 squared is 205, 849. 205, 849? AB : Yes? OK, another, another three-digit number, sir? Audience : 321. AB : 321 is 103, 041. 103, 041. Yes? One more three-digit number please. Audience : Oh, 722. AB : 722 is 500, that ’ s a harder one. Is that 513, 284? Volunteer : Yes. AB : Yes? Oh, one more, one more three-digit number please. Audience : 162. 162 squared is 26, 244. Volunteer : Yes. Thank you very much. Let me try to take this one step further. I ’ m going to try to square a four-digit number this time. You can all take your time on this ; I will not beat you to the answer on this one, but I will try to get the answer right. To make this a little bit more random, let ’ s take the fourth row this time, let ’ s say, one, two, three, four. If each of you would call out a single digit between zero and nine, that will be the four-digit number that I ’ ll square. Nine. Seven. Five. Eight. 9, 758, this will take me a little bit of time, so bear with me. 95 million — 218, 564? Volunteer : Yes! AB : Thank you very much. Now, I would attempt to square a five-digit number — and I can — but unfortunately, most calculators cannot. Eight-digit capacity — don ’ t you hate that? So, since we ’ ve reached the limits of our calculators — what ’ s that? Does yours go higher? Volunteer : I don ’ t know. AB : Oh, yours does? Volunteer : I can probably do it. AB : I ’ ll talk to you later. In the meanwhile, let me conclude the first part of my show by doing something a little trickier. Let ’ s take the largest number on the board here, 8649. Would you each enter that on your calculator? And instead of squaring it this time, I want you to take that number and multiply it by any three-digit number that you want, but don ’ t tell me what you ’ re multiplying by — just multiply it by any random three-digit number. So you should have as an answer either a six-digit or probably a seven-digit number. How many digits do you have, six or seven? Seven, and yours? Seven? Seven? And, uncertain. Seven. Is there any possible way that I could know what seven-digit numbers you have? Say”No.”Good, then I shall attempt the impossible — or at least the improbable. What I ’ d like each of you to do is to call out for me any six of your seven digits, any six of them, in any order you ’ d like. One digit at a time, I shall try and determine the digit you ’ ve left out. Starting with your seven-digit number, call out any six of them please. Volunteer : 1, 9, 7, 0, 4, 2. AB : Did you leave out the number 6? Good, OK, that ’ s one. You have a seven-digit number, call out any six of them please. Volunteer : 4, 4, 8, 7, 5. I think I only heard five numbers. I — wait — 44875 — did you leave out the number 6? Same as she did, OK. You ’ ve got a seven-digit number — call out any six of them loud and clear. Volunteer : 0, 7, 9, 0, 4, 4. I think you left out the number 3? AB : That ' s three. The odds of me getting all four of these right by random guessing would be one in 10, 000 : 10 to the fourth power. OK, any six of them. Really scramble them up this time, please. Volunteer : 2, 6, 3, 9, 7, 2. Did you leave out the number 7? And let ' s give all four of these people a nice round of applause. Thank you very much. For my next number — while I mentally recharge my batteries, I have one more question for the audience. By any chance, does anybody here happen to know the day of the week that they were born on? If you think you know your birth day, raise your hand. Let ' s see, starting with — let ' s start with a gentleman first. What year was it, first of all? That ' s why I pick a gentleman first. Audience : 1953. 1953, and the month? November what? 23rd — was that a Monday? Audience : Yes. Good. Somebody else? I haven ' t seen any women ' s hands up. OK, how about you, what year? 1949, and the month? October what? Fifth — was that a Wednesday? Yes! I ' ll go way to the **back** right now, how about you? Yell it out, what year? Audience : 1959. 1959, OK — and the month? Audience : February. February what? Sixth — was that a Friday? Audience : Yes. Good, how about the person behind her? Call out, what year was it? Audience : 1947. AB : 1947, and the month? Audience : May. AB : May what? Seventh — would that be a Wednesday? Audience : Yes. AB : Thank you very much. Anybody here who ' d like to know the day of the week they were born? We can do it that way. Of course, I could just make up an answer and you wouldn ' t know, so I come prepared for that. I brought with me a book of calendars. It goes as far **back** into the past as 1800, because you never know. I didn ' t mean to look at you, sir — you were just sitting there. Anyway, Chris, you can help me out here, if you wouldn ' t mind. This is a book of calendars. Who wanted to know their birth day? What year was it, first of all? Audience : 1966. 66 — turn to the calendar with 1966. And what month? Audience : April. AB : April what? Audience : 17th. I believe that was a Sunday. Can you confirm, Chris? Chris Anderson : Yes. AB : I ' ll tell you what, Chris : as long as you have that book in front of you, do me a favor, turn to a year outside of the 1900s, either into the 1800s or way into the 2000s — that ' ll be a much greater challenge for me. AB : What year would you like? CA : 1824. AB : 1824, OK. AB : And what month? CA : June. AB : June what? CA : Sixth. AB : Was that a Sunday? CA : It was. AB : And it was cloudy. Good, thank you very much. But I ' d like to wrap things up now by alluding to something from earlier in the presentation. There was a gentleman up here who had a 10-digit calculator. Where is he, would you stand up, 10-digit guy? OK, stand up for me just for a second, so I can see where you are. You have a 10-digit calculator, sir, as well? OK, what I ' m going to try and do, is to square in my head a five-digit number requiring a 10-digit calculator. But to make my job more interesting for you, as well as for me, I ' m going to do this problem thinking out loud. So you can actually, honestly hear what ' s going on in my mind while I do a calculation of this size. Now, I have to apologize to our magician friend Lennart Green. I know as a magician we ' re not supposed to reveal our secrets, but I ' m not too afraid that people are going to start doing my show next week, so — I think we ' re OK. So, let ' s see, let ' s take a different row of people, starting with you. I ' ll get five digits : one, two, three, four. Oh, I did this row already. Let ' s do the row before you, starting with you : one, two, three, four, five. Call out a single digit — that will be the five-digit number that I will try to square, go ahead. Five. Seven. Six. Eight. Three. 57, 683 — squared. Yuck. Let me explain to you how I ' m going to attempt this problem. I ' m going to break the problem down into three parts. I ' ll do 57, 000 squared, plus 683 squared, plus 57, 000 times 683 times two. Add all those numbers together, and with any luck, arrive at the answer. Now, let me recap. Thank you. While I explain something else — — I know, that you can use, right? While I do these calculations, you might hear certain words, as opposed to numbers, creep into the calculation. Let me explain what that is. This is a phonetic code, a mnemonic device that I use, that allows me to convert numbers into words. I store them as words, and later on retrieve them as numbers. I know it sounds complicated ; it ’ s not. I don ’ t want you to think you ’ re seeing something out of”Rain Man.”There ’ s definitely a method to my madness — definitely, definitely. Sorry. If you want to talk to me about ADHD afterwards, you can talk to me then. By the way, one last instruction, for my judges with the calculators — you know who you are — there is at least a 50 percent chance that I will make a mistake here. If I do, don ’ t tell me what the mistake is ; just say,”you ’ re close,”or something like that, and I ’ ll try and figure out the answer — which could be pretty entertaining in itself. If, however, I am right, whatever you do, don ’ t keep it to yourself, OK? Make sure everybody knows that I got the answer right, because this is my big finish, OK. So, without any more stalling, here we go. I ’ ll start the problem in the middle, with 57 times 683. 57 times 68 is 3, 400, plus 476 is 3876, that ’ s 38, 760 plus 171, 38, 760 plus 171 is 38, 931. 38, 931 ; double that to get 77, 862. 77, 862 becomes cookie fission, cookie fission is 77, 822. That seems right, I ’ ll go on. Cookie fission, OK. Next, I do 57 squared, which is 3, 249, so I can say, three billion. Take the 249, add that to cookie, 249, oops, but I see a carry coming — 249 — add that to cookie, 250 plus 77, is 327 million — fission, fission, OK, finally, we do 683 squared, that ’ s 700 times 666, plus 17 squared is 466, 489, rev up if I need it, rev up, take the 466, add that to fission, to get, oh gee — 328, 489. Audience : Yeah! AB : Good. Thank you very much. I hope you enjoyed mathemagics. Thank you.

You know, I am so bad at tech that my daughter â who is now 41 â when she was five, was overheard by me to say to a friend of hers, If it doesn ’ t bleed when you cut it, my daddy doesn ’ t understand it. So, the assignment I ’ ve been given may be an insuperable obstacle for me, but I ’ m certainly going to try. What have I heard during these last four days? This is my third visit to TED. One was to TEDMED, and one, as you ’ ve heard, was a regular TED two years ago. I ’ ve heard what I consider an extraordinary thing that I ’ ve only heard a little bit in the two previous TEDs, and what that is is an interweaving and an interlarding, an intermixing, of a sense of social responsibility in so many of the talks â global responsibility, in fact, appealing to enlightened self- interest, but it goes far beyond enlightened self-interest. One of the most impressive things about what some, perhaps 10, of the speakers have been talking about is the realization, as you listen to them carefully, that they ’ re not saying : Well, this is what we should do ; this is what I would like you to do. It ’ s : This is what I have done because I ’ m excited by it, because it ’ s a wonderful thing, and it ’ s done something for me and, of course, it ’ s accomplished a great deal. It ’ s the old concept, the real Greek concept, of philanthropy in its original sense : phil- anthropy, the love of humankind. And the only explanation I can have for some of what you ’ ve been hearing in the last four days is that it arises, in fact, out of a form of love. And this gives me enormous hope. And hope, of course, is the topic that I ’ m supposed to be speaking about, which I ’ d completely forgotten about until I arrived. And when I did, I thought, well, I ’ d better look this word up in the dictionary. So, Sarah and I â my wife â walked over to the public library, which is four blocks away, on Pacific Street, and we got the OED, and we looked in there, and there are 14 definitions of hope, none of which really hits you between the eyes as being the appropriate one. And, of course, that makes sense, because hope is an abstract phenomenon ; it ’ s an abstract idea, it ’ s not a concrete word. Well, it reminds me a little bit of surgery. If there ’ s one operation for a disease, you know it works. If there are 15 operations, you know that none of them work. And that ’ s the way it is with definitions of words. If you have appendicitis, they take your appendix out, and you ’ re cured. If you ’ ve got reflux oesophagitis, there are 15 procedures, and Joe Schmo does it one way and Will Blow does it another way, and none of them work, and that ’ s the way it is with this word, hope. They all come down to the idea of an expectation of something good that is due to happen. And you know what I found out? The Indo- European root of the word hope is a stem, K-E-U â we would spell it K-E-U ; it ’ s pronounced koy â and it is the same root from which the word curve comes from. But what it means in the original Indo-European is a change in direction, going in a different way. And I find that very interesting and very provocative, because what you ’ ve been hearing in the last couple of days is the sense of going in different directions : directions that are specific and unique to problems. There are different paradigms. You ’ ve heard that word several times in the last four days, and everyone ’ s familiar with Kuhnian paradigms. So, when we think of hope now, we have to think of looking in other directions than we have been looking. There ’ s another â not definition, but description, of hope that has always appealed to me, and it was one by VĂĄclav Havel in his perfectly spectacular book”Breaking the Peace,”in which he says that hope does not consist of the expectation that things will come out exactly right, but the expectation that they will make sense regardless of how they come out. I can ’ t tell you how reassured I was by the very last sentence in that glorious presentation by Dean Kamen a few days ago. I wasn ’ t sure I heard it right, so I found him in one of the inter-sessions. He was talking to a very large man, but I didn ’ t care. I interrupted, and I said,”Did you say this?”He said,”I think so.”So, here ’ s what it is : I ’ ll repeat it.”The world will not be saved by the Internet.”It ’ s wonderful. Do you know what the world will be saved by? I ’ ll tell you. It ’ ll be saved by the human spirit. And by the human spirit, I don ’ t mean anything divine, I don ’ t mean anything supernatural â certainly not coming from this skeptic. What I mean is this ability that each of **us** has to be something greater than herself or himself ; to arise out of our ordinary selves and achieve something that at the beginning we thought perhaps we were not capable of. On an elemental level, we have all felt that spirituality at the time of childbirth. Some of you have felt it in laboratories ; some of you have felt it at the workbench. We feel it at concerts. I ’ ve felt it in the operating room, at the bedside. It is an elevation of **us** beyond ourselves. And I think that it ’ s going to be, in time, the elements of the human spirit that we ’ ve been hearing about bit by bit by bit from so many of the speakers in the last few days. And if there ’ s anything that has permeated this room, it is precisely that. I ’ m intrigued by a concept that was brought to life in the early part of the 19th century â actually, in the second decade of the 19th century â by a 27-year-old poet whose name was Percy Shelley. Now, we all think that Shelley obviously is the great romantic poet that he was ; many of **us** tend to forget that he wrote some perfectly wonderful essays, too, and the most well- remembered essay is one called”A Defence of Poetry.”Now, it ’ s about five, six, seven, eight pages long, and it gets kind of deep and difficult after about the third page, but somewhere on the second page he begins talking about the notion that he calls”moral imagination.”And here ’ s what he says, roughly translated : A man â generic man â a man, to be greatly good, must imagine clearly. He must see himself and the world through the eyes of another, and of many others. See himself and the world â not just the world, but see himself. What is it that is expected of **us** by the billions of people who live in what Laurie Garrett the other day so appropriately called despair and disparity? What is it that they have every right to ask of **us**? What is it that we have every right to ask of ourselves, out of our shared humanity and out of the human spirit? Well, you know precisely what it is. There ’ s a great deal of argument about whether we, as the great nation that we are, should be the policeman of the world, the world ’ s constabulary, but there should be virtually no argument about whether we should be the world ’ s healer. There has certainly been no argument about that in this room in the past four days. So, if we are to be the world ’ s healer, every disadvantaged person in this world â including in the United States â becomes our patient. Every disadvantaged nation, and perhaps our own nation, becomes our patient. So, it ’ s fun to think about the etymology of the word”patient.”It comes initially from the Latin patior, to endure, or to suffer. So, you go **back** to the old Indo- European root again, and what do you find? The Indo-European stem is pronounced payen â we would spell it P-A-E-N â and, lo and behold, mirabile dictu, it is the same root as the word compassion comes from, P-A-E-N. So, the lesson is very clear. The lesson is that our patient â the world, and the disadvantaged of the world â that patient deserves our compassion. But beyond our compassion, and far greater than compassion, is our moral imagination and our identification with each individual who lives in that world, not to think of them as a huge forest, but as individual trees. Of course, in this day and age, the trick is not to let each tree be obscured by that Bush in Washington that can get â can get in the way. So, here we are. We are, should be, morally committed to being the healer of the world. And we have had examples over and over and over again â you ’ ve just heard one in the last 15 minutes â of people who have not only had that commitment, but had the charisma, the brilliance â and I think in this room it ’ s easy to use the word brilliant, my God â the brilliance to succeed at least at the beginning of their quest, and who no doubt will continue to succeed, as long as more and more of **us** enlist ourselves in their cause. Now, if we ’ re talking about medicine, and we ’ re talking about healing, I ’ d like to quote someone who hasn ’ t been quoted. It seems to me everybody in the world ’ s been quoted here : Pogo ’ s been quoted ; Shakespeare ’ s been quoted backwards, forwards, inside out. I would like to quote one of my own household gods. I suspect he never really said this, because we don ’ t know what Hippocrates really said, but we do know for sure that one of the great Greek physicians said the following, and it has been recorded in one of the books attributed to Hippocrates, and the book is called”Precepts.”And I ’ ll read you what it is. Remember, I have been talking about, essentially philanthropy : the love of humankind, the individual humankind and the individual humankind that can bring that kind of love translated into action, translated, in some cases, into enlightened self-interest. And here he is, 2, 400 years ago :”Where there is love of humankind, there is love of healing.”We have seen that here today with the sense, with the sensitivity â and in the last three days, and with the power of the indomitable human spirit. Thank you very much.

When I first arrived in beautiful Zimbabwe, it was difficult to understand that 35 percent of the population is HIV positive. It really wasn ’ t until I was invited to the homes of people that I started to understand the human toll of the epidemic. For instance, this is Herbert with his grandmother. When I first met him, he was sitting on his grandmother ’ s lap. He has been orphaned, as both of his

parents died of AIDS, and his grandmother took care of him until he too died of AIDS. He liked to sit on her lap because he said that it was painful for him to lie in his own bed. When she got up to make tea, she placed him in my own lap and I had never felt a child that was that emaciated. Before I left, I actually asked him if I could get him something. I thought he would ask for a toy, or candy, and he asked me for slippers, because he said that his feet were cold. This is Joyce who ’ s — in this picture — 21. Single mother, HIV positive. I photographed her before and after the birth of her beautiful baby girl, Issa. And I was last week walking on Lafayette Street in Manhattan and got a call from a woman who I didn ’ t know, but she called to tell me that Joyce had passed away at the age of 23. Joyce ’ s mother is now taking care of her daughter, like so many other Zimbabwean children who ’ ve been orphaned by the epidemic. So a few of the stories. With every picture, there are individuals who have full lives and stories that deserve to be told. All these pictures are from Zimbabwe. Chris Anderson : Kirsten, will you just take one minute, just to tell your own story of how you got to Africa? Kirsten Ashburn : Mmm, gosh. CA : Just — KA : Actually, I was working at the time, doing production for a fashion photographer. And I was constantly reading the New York Times, and stunned by the statistics, the numbers. It was just frightening. So I quit my job and decided that that ’ s the subject that I wanted to tackle. And I first actually went to Botswana, where I spent a month — this is in December 2000 — then went to Zimbabwe for a month and a half, and then went **back** again this March 2002 for another month and a half in Zimbabwe. CA : That ’ s an amazing story, thank you. KB : Thanks for letting me show these.

The new me is beauty. Yeah, people used to say,”Norman ’ s OK, but if you followed what he said, everything would be usable but it would be ugly.”Well, I didn ’ t have that in mind, so... This is neat. Thank you for setting up my display. I mean, it ’ s just wonderful. And I haven ’ t the slightest idea of what it does or what it ’ s good for, but I want it. And that ’ s my new life. My new life is trying to understand what beauty is about, and”pretty,”and”emotions.”The new me is all about making things kind of neat and fun. And so this is a Philippe Starck juicer, produced by Alessi. It ’ s just neat ; it ’ s fun. It ’ s so much fun I have it in my house — but I have it in the entryway, I don ’ t use it to make juice. In fact, I bought the gold-plated special edition and it comes with a little slip of paper that says,”Don ’ t use this juicer to make juice.”The acid will ruin the gold plating. So actually, I took a carton of orange juice and I poured it in the glass to take this picture. Beneath it is a wonderful knife. It ’ s a Global cutting knife made in Japan. First of all, look at the shape — it ’ s just wonderful to look at. Second of all, it ’ s really beautifully balanced : it holds well, it feels well. And third of all, it ’ s so sharp, it just cuts. It ’ s a delight to use. And so it ’ s got everything, right? It ’ s beautiful and it ’ s functional. And I can tell you stories about it, which makes it reflective, and so you ’ ll see I have a theory of emotion. And those are the three components. Hiroshi Ishii and his group at the MIT Media Lab took a ping-pong table and placed a projector above it, and on the ping-pong table they projected an image of water with fish swimming in it. And as you play ping-pong, whenever the ball hits part of the table, the ripples spread out and the fish run away. But of course, then the ball hits the other side, the ripples hit the — poor fish, they can ’ t find any peace and quiet. Is that a good way to play ping-pong? No. But is it fun? Yeah! Yeah. Or look at Google. If you type in, oh say,”emotion and design,”you get 10 pages of results.

So Google just took their logo and they spread it out. Instead of saying,”You got 73, 000 results. This is one through 20. Next,”they just give you as many o ’ s as there are pages. It ’ s really simple and subtle. I bet a lot of you have seen it and never noticed it. That ’ s the subconscious mind that sort of notices it — it probably is kind of pleasant and you didn ’ t know why. And it ’ s just clever. And of course, what ’ s especially good is, if you type”design and emotion,”the first response out of those 10 pages is my website. Now, the weird thing is Google lies, because if I type”design and emotion,”it says,”You don ’ t need the ’ and. ’ We do it anyway.”So, OK. So I type”design emotion”and my website wasn ’ t first again. It was third. Oh well, different story. There was this wonderful review in The New York Times about the MINI Cooper automobile. It said,”You know, this is a car that has lots of faults. Buy it anyway. It ’ s so much fun to drive.”And if you look at the inside of the car — I mean, I loved it, I wanted to see it, I rented it, this is me taking a picture while my son is driving — and the inside of the car, the whole design is fun. It ’ s round, it ’ s neat. The controls work wonderfully. So that ’ s my new life ; it ’ s all about fun. I really have the feeling that pleasant things work better, and that never made any sense to me until I finally figured out — look... I ’ m going to put a plank on the ground. So, imagine I have a plank about two feet wide and 30 feet long and I ’ m going to walk on it, and you see I can walk on it without looking, I can go **back** and forth and I can jump up and down. No problem. Now I ’ m going to put the plank 300 feet in the air — and I ’ m not going to go near it, thank you. Intense fear paralyzes you. It actually affects the way the brain works. So, Paul Saffo, before his talk said that he didn ’ t really have it down until just a few days or hours before the talk, and that anxiety was really helpful in causing him to focus. That ’ s what fear and anxiety does ; it causes you to be — what ’ s called depth-first processing — to focus, not be distracted. And I couldn ’ t force myself across that. Now some people can — circus workers, steel workers. But it really changes the way you think. And then, a psychologist, Alice Isen, did this wonderful experiment. She brought students in to solve problems. So, she ’ d bring people into the room, and there ’ d be a string hanging down here and a string hanging down here. It was an empty room, except for a table with a bunch of crap on it — some papers and scissors and stuff. And she ’ d bring them in, and she ’ d say,”This is an IQ test and it determines how well you do in life. Would you tie those two strings together?”So they ’ d take one string and they ’ d pull it over here and they couldn ’ t reach the other string. Still can ’ t reach it. And, basically, none of them could solve it. You bring in a second group of people, and you say,”Oh, before we start, I got this box of candy, and I don ’ t eat candy. Would you like the box of candy?”And turns out they liked it, and it made them happy — not very happy, but a little bit of happy. And guess what — they solved the problem. And it turns out that when you ’ re anxious you squirt neural transmitters in the brain, which focuses you makes you depth-first. And when you ’ re happy — what we call positive valence — you squirt dopamine into the prefrontal lobes, which makes you a breadth-first problem solver : you ’ re more susceptible to interruption ; you do out-of-the-box thinking. That ’ s what brainstorming is about, right? With brainstorming we make you happy, we play games, and we say,”No criticism,”and you get all these weird, neat ideas. But in fact, if that ’ s how you always were you ’ d never get any work done because you ’ d be working along and say,”Oh, I got a new way of doing it.”So to get work done, you ’ ve got to set a deadline, right? You ’ ve got be anxious. The brain works differently if you ’ re happy. Things work better because you ’ re more creative. You get a little problem, you say,”Ah, I ’ ll figure it out.”No big deal. There ’ s something I call the visceral level of processing, and there will be visceral-level design. Biology — we have co-adapted through biology to like bright colors. That ' s especially good that mammals and primates like fruits and bright plants, because you eat the fruit and you thereby spread the seed. There ' s an amazing amount of stuff that ' s built into the brain. We dislike bitter tastes, we dislike loud sounds, we dislike hot temperatures, cold temperatures. We dislike scolding voices. We dislike frowning faces ; we like symmetrical faces, etc., etc. So that ' s the visceral level. In design, you can express visceral in lots of ways, like the choice of type fonts and the red for hot, exciting. Or the 1963 Jaguar : It ' s actually a crummy car, falls apart all the time, but the owners love it. And it ' s beautiful — it ' s in the Museum of Modern Art. A water bottle : You buy it because of the bottle, not because of the water. And when people are finished, they don ' t throw it away. They keep it for — you know, it ' s like the old wine bottles, you keep it for decoration or maybe fill it with water again, which proves it ' s not the water. It ' s all about the visceral experience. The middle level of processing is the behavioral level and that ' s actually where most of our stuff gets done. Visceral is subconscious, you ' re unaware of it. Behavioral is subconscious, you ' re unaware of it. Almost everything we do is subconscious. I ' m walking around the stage — I ' m not attending to the control of my legs. I ' m doing a lot ; most of my talk is subconscious ; it has been rehearsed and thought about a lot. Most of what we do is subconscious. Automatic behavior — skilled behavior — is subconscious, controlled by the behavioral side. And behavioral design is all about feeling in control, which includes usability, understanding — but also the feel and heft. That ' s why the Global knives are so neat. They ' re so nicely balanced, so sharp, that you really feel you ' re in control of the cutting. Or, just driving a high- performance sports car over a demanding curb — again, feeling that you are in complete control of the environment. Or the sensual feeling. This is a Kohler shower, a waterfall shower, and actually, all those knobs beneath are also showerheads. It will squirt you all around and you can stay in that shower for hours — and not waste water, by the way, because it recirculates the same dirty water. Or this — this is a really neat teapot I found at high tea at The Four Seasons Hotel in Chicago. It ' s a Ronnefeldt tilting teapot. That ' s kind of what the teapot looks like but the way you use it is you lay it on its **back**, and you put tea in, and then you fill it with water. The water then seeps over the tea. And the tea is sitting in this stuff to the right — the tea is to the right of this line. There ' s a little ledge inside, so the tea is sitting there and the water is filling it up like that. And when the tea is ready, or almost ready, you tilt it. And that means the tea is partially covered while it completes the brewing. And when it ' s finished, you put it vertically, and now the tea is — you remember — above this line and the water only comes to here — and so it keeps the tea out. On top of that, it communicates, which is what emotion does. Emotion is all about acting ; emotion is really about acting. It ' s being safe in the world. Cognition is about understanding the world, emotion is about interpreting it — saying good, bad, safe, dangerous, and getting **us** ready to act, which is why the muscles tense or relax. And that ' s why we can tell the emotion of somebody else — because their muscles are acting, subconsciously, except that we ' ve evolved to make the facial muscles really rich with emotion. Well, this has emotions if you like, because it signals the waiter that,"Hey, I ' m finished. See — upright."And the waiter can come by and say,"Would you like more water?"It ' s kind of neat. What a wonderful design. And the third level is reflective, which is, if you like the superego, it ' s a little part of the brain that has no control over what you do, no control over the — doesn ' t see the senses, doesn ' t control the muscles. It looks over what ' s going on. It ' s that little voice in your head that ' s watching and saying,"That ' s good. That ' s bad."Or,"Why are you doing that? I don ' t understand."It ' s that little voice in your head that ’ s the seat of consciousness. Here ’ s a great reflective product. Owners of the Hummer have said,”You know I ’ ve owned many cars in my life — all sorts of exotic cars, but never have I had a car that attracted so much attention.”It ’ s about attention. It ’ s about their image, not about the car. If you want a more positive model — this is the GM car. And the reason you might buy it now is because you care about the environment. And you ’ ll buy it to protect the environment, even though the first few cars are going to be really expensive and not perfected. But that ’ s reflective design as well. Or an expensive watch, so you can impress people —”Oh gee, I didn ’ t know you had that watch.”As opposed to this one, which is a pure behavioral watch, which probably keeps better time than the $13, 000 watch I just showed you. But it ’ s ugly. This is a clear Don Norman watch. And what ’ s neat is sometimes you pit one emotion against the other, the visceral fear of falling against the reflective state saying,”It ’ s OK. It ’ s OK. It ’ s safe. It ’ s safe.”If that amusement park were rusty and falling apart, you ’ d never go on the ride. So, it ’ s pitting one against the other. The other neat thing... So Jake Cress is this furniture maker, and he makes this unbelievable set of furniture. And this is his chair with claw, and the poor little chair has lost its ball and it ’ s trying to get it **back** before anybody notices. And what ’ s so neat about it is how you accept that story. And that ’ s what ’ s nice about emotion. So that ’ s the new me. I ’ m only saying positive things from now on.

Because I usually take the role of trying to explain to people how wonderful the new technologies that are coming along are going to be, and I thought that, since I was among friends here, I would tell you what I really think and try to look **back** and try to understand what is really going on here with these amazing jumps in technology that seem so fast that we can barely keep on top of it. So I ’ m going to start out by showing just one very boring technology slide. And then, so if you can just turn on the slide that ’ s on. This is just a random slide that I picked out of my file. What I want to show you is not so much the details of the slide, but the general form of it. This happens to be a slide of some analysis that we were doing about the power of RISC microprocessors versus the power of local area networks. And the interesting thing about it is that this slide, like so many technology slides that we ’ re used to, is a sort of a straight line on a semi-log curve. In other words, every step here represents an order of magnitude in performance scale. And this is a new thing that we talk about technology on semi-log curves. Something really weird is going on here. And that ’ s basically what I ’ m going to be talking about. So, if you could bring up the lights. If you could bring up the lights higher, because I ’ m just going to use a piece of paper here. Now why do we draw technology curves in semi-log curves? Well the answer is, if I drew it on a normal curve where, let ’ s say, this is years, this is time of some sort, and this is whatever measure of the technology that I ’ m trying to graph, the graphs look sort of silly. They sort of go like this. And they don ’ t tell **us** much. Now if I graph, for instance, some other technology, say transportation technology, on a semi-log curve, it would look very stupid, it would look like a flat line. But when something like this happens, things are qualitatively changing. So if transportation technology was moving along as fast as microprocessor technology, then the day after tomorrow, I would be able to get in a taxi cab and be in Tokyo in 30 seconds. It ’ s not moving like that. And there ’ s nothing precedented in the history of technology development of this kind of self- feeding growth where you go by orders of magnitude every few years. Now the question that I ' d like to ask is, if you look at these exponential curves, they don ' t go on forever. Things just can ' t possibly keep changing as fast as they are. One of two things is going to happen. Either it ' s going to turn into a sort of classical S-curve like this, until something totally different comes along, or maybe it ' s going to do this. That ' s about all it can do. Now I ' m an optimist, so I sort of think it ' s probably going to do something like that. If so, that means that what we ' re in the middle of right now is a transition. We ' re sort of on this line in a transition from the way the world used to be to some new way that the world is. And so what I ' m trying to ask, what I ' ve been asking myself, is what ' s this new way that the world is? What ' s that new state that the world is heading toward? Because the transition seems very, very confusing when we ' re right in the middle of it. Now when I was a kid growing up, the future was kind of the year 2000, and people used to talk about what would happen in the year 2000. Now here ' s a conference in which people talk about the future, and you notice that the future is still at about the year 2000. It ' s about as far as we go out. So in other words, the future has kind of been shrinking one year per year for my whole lifetime. Now I think that the reason is because we all feel that something ' s happening there. That transition is happening. We can all sense it. And we know that it just doesn ' t make too much sense to think out 30, 50 years because everything ' s going to be so different that a simple extrapolation of what we ' re doing just doesn ' t make any sense at all. So what I would like to talk about is what that could be, what that transition could be that we ' re going through. Now in order to do that I ' m going to have to talk about a bunch of stuff that really has nothing to do with technology and computers. Because I think the only way to understand this is to really step **back** and take a long time scale look at things. So the time scale that I would like to look at this on is the time scale of life on Earth. So I think this picture makes sense if you look at it a few billion years at a time. So if you go **back** about two and a half billion years, the Earth was this big, sterile hunk of rock with a lot of chemicals floating around on it. And if you look at the way that the chemicals got organized, we begin to get a pretty good idea of how they do it. And I think that there ' s theories that are beginning to understand about how it started with RNA, but I ' m going to tell a sort of simple story of it, which is that, at that time, there were little drops of oil floating around with all kinds of different recipes of chemicals in them. And some of those drops of oil had a particular combination of chemicals in them which caused them to incorporate chemicals from the outside and grow the drops of oil. And those that were like that started to split and divide. And those were the most primitive forms of cells in a sense, those little drops of oil. But now those drops of oil weren ' t really alive, as we say it now, because every one of them was a little random recipe of chemicals. And every time it divided, they got sort of unequal division of the chemicals within them. And so every drop was a little bit different. In fact, the drops that were different in a way that caused them to be better at incorporating chemicals around them, grew more and incorporated more chemicals and divided more. So those tended to live longer, get expressed more. Now that ' s sort of just a very simple chemical form of life, but when things got interesting was when these drops learned a trick about abstraction. Somehow by ways that we don ' t quite understand, these little drops learned to write down information. They learned to record the information that was the recipe of the cell onto a particular kind of chemical called DNA. So in other words, they worked out, in this mindless sort of evolutionary way, a form of writing that let them write down what they were, so that that way of writing it down could get copied. The amazing thing is that that way of writing seems to have stayed steady since it evolved two and a half billion years ago. In fact the recipe for **us**, our genes, is exactly that same code and that same way of writing. In fact, every living creature is written in exactly the same set of letters and the same code. In fact, one of the things that I did just for amusement purposes is we can now write things in this code. And I ' ve got here a little 100 micrograms of white powder, which I try not to let the security people see at airports. But this has in it — what I did is I took this code — the code has standard letters that we use for symbolizing it — and I wrote my business card onto a piece of DNA and amplified it 10 to the 22 times. So if anyone would like a hundred million copies of my business card, I have plenty for everyone in the room, and, in fact, everyone in the world, and it ' s right here. If I had really been a egotist, I would have put it into a virus and released it in the room. So what was the next step? Writing down the DNA was an interesting step. And that caused these cells — that kept them happy for another billion years. But then there was another really interesting step where things became completely different, which is these cells started exchanging and communicating information, so that they began to get communities of cells. I don ' t know if you know this, but bacteria can actually exchange DNA. Now that ' s why, for instance, antibiotic resistance has evolved. Some bacteria figured out how to stay away from penicillin, and it went around sort of creating its little DNA information with other bacteria, and now we have a lot of bacteria that are resistant to penicillin, because bacteria communicate. Now what this communication allowed was communities to form that, in some sense, were in the same boat together ; they were synergistic. So they survived or they failed together, which means that if a community was very successful, all the individuals in that community were repeated more and they were favored by evolution. Now the transition point happened when these communities got so close that, in fact, they got together and decided to write down the whole recipe for the community together on one string of DNA. And so the next stage that ' s interesting in life took about another billion years. And at that stage, we have multi-cellular communities, communities of lots of different types of cells, working together as a single organism. And in fact, we ' re such a multi- cellular community. We have lots of cells that are not out for themselves anymore. Your skin cell is really useless without a heart cell, muscle cell, a brain cell and so on. So these communities began to evolve so that the interesting level on which evolution was taking place was no longer a cell, but a community which we call an organism. Now the next step that happened is within these communities. These communities of cells, again, began to abstract information. And they began building very special structures that did nothing but process information within the community. And those are the neural structures. So neurons are the information processing apparatus that those communities of cells built up. And in fact, they began to get specialists in the community and special structures that were responsible for recording, understanding, learning information. And that was the brains and the nervous system of those communities. And that gave them an evolutionary advantage. Because at that point, an individual — learning could happen within the time span of a single organism, instead of over this evolutionary time span. So an organism could, for instance, learn not to eat a certain kind of fruit because it tasted bad and it got sick last time it ate it. That could happen within the lifetime of a single organism, whereas before they ' d built these special information processing structures, that would have had to be learned evolutionarily over hundreds of thousands of years by the individuals dying off that ate that kind of fruit. So that nervous system, the fact that they built these special information structures, tremendously sped up the whole process of evolution. Because evolution could now happen within an individual. It could happen in learning time scales. But then what happened was the individuals worked out, of course, tricks of communicating. And for example, the most sophisticated version that we ’ re aware of is human language. It ’ s really a pretty amazing invention if you think about it. Here I have a very complicated, messy, confused idea in my head. I ’ m sitting here making grunting sounds basically, and hopefully constructing a similar messy, confused idea in your head that bears some analogy to it. But we ’ re taking something very complicated, turning it into sound, sequences of sounds, and producing something very complicated in your brain. So this allows **us** now to begin to start functioning as a single organism. And so, in fact, what we ’ ve done is we, humanity, have started abstracting out. We ’ re going through the same levels that multi-cellular organisms have gone through — abstracting out our methods of recording, presenting, processing information. So for example, the invention of language was a tiny step in that direction. Telephony, computers, videotapes, CD-ROMs and so on are all our specialized mechanisms that we ’ ve now built within our society for handling that information. And it all connects **us** together into something that is much bigger and much faster and able to evolve than what we were before. So now, evolution can take place on a scale of microseconds. And you saw Ty ’ s little evolutionary example where he sort of did a little bit of evolution on the Convolution program right before your eyes. So now we ’ ve speeded up the time scales once again. So the first steps of the story that I told you about took a billion years a piece. And the next steps, like nervous systems and brains, took a few hundred million years. Then the next steps, like language and so on, took less than a million years. And these next steps, like electronics, seem to be taking only a few decades. The process is feeding on itself and becoming, I guess, autocatalytic is the word for it — when something reinforces its rate of change. The more it changes, the faster it changes. And I think that that ’ s what we ’ re seeing here in this explosion of curve. We ’ re seeing this process feeding **back** on itself. Now I design computers for a living, and I know that the mechanisms that I use to design computers would be impossible without recent advances in computers. So right now, what I do is I design objects at such complexity that it ’ s really impossible for me to design them in the traditional sense. I don ’ t know what every transistor in the connection machine does. There are billions of them. Instead, what I do and what the designers at Thinking Machines do is we think at some level of abstraction and then we hand it to the machine and the machine takes it beyond what we could ever do, much farther and faster than we could ever do. And in fact, sometimes it takes it by methods that we don ’ t quite even understand. One method that ’ s particularly interesting that I ’ ve been using a lot lately is evolution itself. So what we do is we put inside the machine a process of evolution that takes place on the microsecond time scale. So for example, in the most extreme cases, we can actually evolve a program by starting out with random sequences of instructions. Say,”Computer, would you please make a hundred million random sequences of instructions. Now would you please run all of those random sequences of instructions, run all of those programs, and pick out the ones that came closest to doing what I wanted.”So in other words, I define what I wanted. Let ’ s say I want to sort numbers, as a simple example I ’ ve done it with. So find the programs that come closest to sorting numbers. So of course, random sequences of instructions are very unlikely to sort numbers, so none of them will really do it. But one of them, by luck, may put two numbers in the right order. And I say,”Computer, would you please now take the 10 percent of those random sequences that did the best job. Save those. Kill off the rest. And now let ’ s reproduce the ones that sorted numbers the best. And let ’ s reproduce them by a process of recombination analogous to sex.”Take two programs and they produce children by exchanging their subroutines, and the children inherit the traits of the subroutines of the two programs. So I ’ ve got now a new generation of programs that are produced by combinations of the programs that did a little bit better job. Say,”Please repeat that process.”Score them again. Introduce some mutations perhaps. And try that again and do that for another generation. Well every one of those generations just takes a few milliseconds. So I can do the equivalent of millions of years of evolution on that within the computer in a few minutes, or in the complicated cases, in a few hours. At the end of that, I end up with programs that are absolutely perfect at sorting numbers. In fact, they are programs that are much more efficient than programs I could have ever written by hand. Now if I look at those programs, I can ’ t tell you how they work. I ’ ve tried looking at them and telling you how they work. They ’ re obscure, weird programs. But they do the job. And in fact, I know, I ’ m very confident that they do the job because they come from a line of hundreds of thousands of programs that did the job. In fact, their life depended on doing the job. I was riding in a 747 with Marvin Minsky once, and he pulls out this card and says,”Oh look. Look at this. It says, ’ This plane has hundreds of thousands of tiny parts working together to make you a safe flight. ’ Doesn ’ t that make you feel confident?”In fact, we know that the engineering process doesn ’ t work very well when it gets complicated. So we ’ re beginning to depend on computers to do a process that ’ s very different than engineering. And it lets **us** produce things of much more complexity than normal engineering lets **us** produce. And yet, we don ’ t quite understand the options of it. So in a sense, it ’ s getting ahead of **us**. We ’ re now using those programs to make much faster computers so that we ’ ll be able to run this process much faster. So it ’ s feeding **back** on itself. The thing is becoming faster and that ’ s why I think it seems so confusing. Because all of these technologies are feeding **back** on themselves. We ’ re taking off. And what we are is we ’ re at a point in time which is analogous to when single- celled organisms were turning into multi-celled organisms. So we ’ re the amoebas and we can ’ t quite figure out what the hell this thing is we ’ re creating. We ’ re right at that point of transition. But I think that there really is something coming along after **us**. I think it ’ s very haughty of **us** to think that we ’ re the end product of evolution. And I think all of **us** here are a part of producing whatever that next thing is. So lunch is coming along, and I think I will stop at that point, before I get selected out.

3 POS Dim 2

Text Sample 161: POS Dim 2 – 2020 – Score 55.00 – 2020/t004270.txt

Lizet Ocampo : I have a team meeting with my team. It ’ s Monday morning, so we kind of miss each other.”Let ’ s turn our cameras on.”Adam Grant : For Lizet Ocampo, it seemed like a regular day in **quarantine**. But when they turned on their cameras, something was off. Her face was a potato, a flat image of a potato, with Lizet ’ s eyes and lips moving on it. LO : And I just remember thinking,”Why am I a potato?”and of all things, why a potato? Like, I couldn ’ t go back to a regular camera, so I just essentially was a potato for the meeting. AG : The previous week, Lizet had been in a virtual happy hour for Latino leaders. LO : And I wanted to make them laugh, and so I thought,”You know what? Next week, I ’ m going to try to do some funny filters,”and so I download these Snap filters, but it didn ’ t really download all the way. There was an error message that kept popping up, so I kind of gave up on it and forgot about it. AG : Turns out the filters had worked a little too well and a little too late. Now Lizet was stuck as a potato. Her colleagues laughed and went on with the meeting. Lizet didn ’ t think much of it until she got a text. LO : Someone that ’ s on my staff took a picture of it and posted it on her personal Twitter account, so I had no idea. AG : She wrote,”My boss turned herself into a potato and can ’ t figure out how to turn the setting off.”LO : And then my colleagues ’ faces are hilarious because it looks like they ’ re trying to be serious, but they ’ re trying not to laugh at the same time. AG : It is amazing because you see her, you see the guy, and then there ’ s just a potato. LO : Yes. AG : Yeah, this poor potato is like,”How do I stop being a potato?”LO : Forty million people have seen it, and it ’ s become sort of a cultural moment in this **quarantine** world that we ’ re in right now. AG : You have a new identity now, don ’ t you, though? LO : That ’ s true. I ’ m known to the world as”potato boss.”I have potato appearances requests – AG : LO : and so I ’ ve showed up as a potato to some meetings for friends at other organizations and things like that. AG : The **coronavirus** pandemic has thrown many of us into the deep end of working remotely. While some people have found creative ways to swim, many others are **struggling** just to stay afloat. The good news is that remote work is not uncharted waters. We ’ ve actually been doing it and studying it for a long time, and with those lessons in hand, you might actually be more prepared than you think to make remote work work. AG : I ’ m Adam Grant, and this is”Work-Life,”my podcast with TED. I ’ m an **organizational** psychologist. I study how to make work not suck. In this show, I ’ m inviting myself inside the minds of some truly unusual people, because they ’ ve mastered something I wish everyone knew about work. Today : remote work, how we can communicate better with and without a camera, no potatoes required, and how, even during this unprecedented pandemic, we can stay resilient. This episode is sponsored by Hilton. As the world has gone into lockdown, many of us have experienced the challenges of working from home. But some jobs are hard to do remotely. If you work in health care or public safety, you need to be on the front lines. If you ’ re in manufacturing, production or distribution, you have to be on-site at a farm, factory or warehouse. We ’ re all depending on the people who are risking their health and safety to go to work. Yet, in the knowledge and **service** industries, many jobs can be done with online tools. And that ’ s not as new as it seems. Half a century ago, futurists started predicting the rise of remote work. In 1993, management guru Peter Drucker wrote that commuting to an office is obsolete. But a quarter-century later, nearly half of global companies still weren ’ t allowing remote work at all. Not anymore. Around the world, many companies are now requiring remote work. This forced remote work has amplified many of the challenges we had when we worked face-to-face. And even in that hard-to-imagine future beyond the pandemic, at least some of this shift to remote work is probably here to stay. So, how do we do it well? As teams, we need to figure out how to stay connected and collaborative. As individuals, we ’ re all seeking guidance on how to stay sane when we ’ re working alone. Recorded caller 1 : So, I ’ m incredibly vulnerable and scared of losing some of the relationships that have taken a long time to build and not having the edge of my personality and my ability to communicate clearly face-to-face. Recorded caller 2 : Working from home has been a nightmare. AG : Interruptions have become a fact of life. We ’ re all”BBC Dad”now, with kids or pets dancing right into our video conferences. Recorded caller 3 : We get on a Zoom call with our region, and in runs my four-year-old, completely naked, and I was speaking, so I wasn ’ t on mute, and all you hear is me screaming,”No!”Recorded caller 4 :

I finally made a rule that said,"If you interrupt a Zoom meeting, you ' ll have to stay for the whole thing."The first offender was my 10-year-old daughter. She ended up sitting there for 45 minutes with nothing to play with, and I can remember her telling all the other kids,"Wow, don ' t go down there, because you ' re going to have to stay for one of those boring meetings."Recorded caller 5 : On one Zoom call where I was pleading with government officials to please listen to the plight of small business owners, my five-year-old daughter walked behind me and said,"Mom, if you die of the virus, I ' ll run your company,"and everyone went silent. Try to come back from that when you ' re campaigning. Martine Haas : I think in some ways, we are adapting very, very fast right now. We are the experiment that will create the data. AG : Martine Haas is my colleague at Wharton and a renowned expert on how teams collaborate at a distance. Now she isn ' t just studying it. She ' s living it. MH : I ' ve been working to kind of get my setup really functional, and I invested in a screen to separate my workspace from the rest of the room that I ' m in. I open the screen ceremoniously in the morning, and then I close it ceremoniously. I literally move it so that it kind of covers the desk just as a way to kind of switch off. AG : One of my favorite insights about teams is that they ' re kind of like amplifiers : whatever you put in comes out louder. When we go remote, that ' s even more true. All of our **microphones** are blasting at once, and that can cause problems. MH : I sometimes think about it as kind of like an iceberg, right? At the top of the iceberg, the stuff that ' s more obvious – you know, it ' s just difficult to communicate, partly because of the technology, right? AG : Think about how much time you ' ve wasted on tech problems. First man : Hey, Paul. Can you hear me? Paul : Hey, guys. Hey, Tyler. Tyler : Sorry I ' m late. Having a hard time connecting. FM : One second. Paul ' s having a sound issue. P : I can ' t hear you. T : Try adjusting your output **settings**. P : Can you hear me? T : It ' s the gear icon. P : Never mind. I got it. I just had to change a few **settings**. FM : Great. Great. I think we can get started then started then then. Oh, great. Oh, great. AG : Another obvious issue is power. MH : And it ' s very easy to fall into a very hierarchical form of communication. AG : You know, where the person with the most authority or status hijacks the conversation. In a classic study of airline crews, it was possible to predict a flight ' s timeliness and fuel efficiency just by watching the first 15 minutes of a captain ' s meeting with the crew. The **ineffective** captains tended to monopolize the conversation. The effective ones did more two-way communication. They spent more time engaging their crews and listening to them. They also encouraged their crews to talk to one another about the task. Creating open channels of communication is even more important in virtual teams. You ' ve probably had video calls that were dominated by one talking head, but that ' s only the tip of the iceberg. MH : So the less obvious things, there are two big buckets of things called"shared identity"problems and"shared understanding"problems. AG : Shared identity and shared understanding. Beneath the everyday communication challenges you ' ve seen, these are probably the bigger issues at play. In fact, these are the key ingredients that Martine has found for making remote teams effective. But how do you build them among teammates who can only see the dimly lit, poorly framed video conference versions of each other? Let ' s start with shared identity. It ' s the sense that we ' re all in this together. When teams lose that sense of unity... MH :... it ' s really easy to get an us-versus-them kind of dynamic going."Here in Philadelphia, we work really hard, but that part of the team that ' s over there in Belgium, they really don ' t work so hard, they don ' t come in on time. We don ' t know what they ' re up to."So it ' s very easy to get those kind of psychological **distancing** dynamics that come into play, and it ' s a basic psychological process. AG : In the study of airline crews, the effective captains created a shared identity. They talked about everyone as"we,"not just the flight attendants, but also the maintenance crew, the gate agents and even the air traffic controllers communicating remotely with them. They saw themselves as leading one team that was responsible for the safety of the flight. The **ineffective** captains reinforced fault lines between subgroups. They called the pilots"we"but everyone else"you."This lack of shared identity hurts the work of face-to-face colleagues but creates an even bigger problem for remote teams. MH : It reduces trust. It reduces psychological safety, that sense that it ' s safe to kind of speak up in the group. It can lead to people withholding information rather than sharing what they know, it can increase conflict. And so it ' s really important of the team leader to articulate for an overarching goal. AG : Goal-setting isn ' t usually the first thing that comes to mind when thinking about team identity. What most people try instead is team-building activities. I ' m guessing you ' ve suffered through Zoom calls where you ' re asked to name your favorite pizza topping or to share highlights from your totally boring weekend in **quarantine**. Those superficial strategies overlook that we bond best when our individual **actions** contribute to a common purpose. Research reveals that it ' s critical to establish team goals and clarify roles, especially in big teams. Having team goals creates a sense of shared identity. Having clear roles prevents social loafing and free-riding, helping people feel that their individual responsibilities matter. The other key challenge of virtual teams is shared understanding, being able to get on the same page, not just about what you ' re doing, but also about who you are and what you value. MH : It ' s basically the problem that you kind of have incomplete information. You don ' t have a good understanding of each other ' s contexts, right? So this is actually why it ' s really valuable to ask members of your remote team,"What does your **workplace** look like? Who else is there? Do you have a dog? Are you watching your kid? What else is going on?"AG : You know you ' ve reached shared understanding when a colleague does something that would be puzzling to most people but you get it right away. The project manager who cc ' s the boss isn ' t trying to make everyone look bad. She ' s anxious about your team ' s work being overlooked. The guy in accounts payable isn ' t signing off at 3pm because he ' s a slacker. He ' s taking care of his mom, who ' s ill. MH : Because if you don ' t understand people ' s contexts, you can make attributions – and they ' re often negative attributions – about what other people are doing or whether they ' re working hard enough or whether they ' re distracted that are not really fair, right? Because you don ' t really get what their situation is in the same way as you would if you were working face-to-face. AG : Think about your virtual team. Shared identity and shared understanding are pivotal for trust. How do you make that happen when you ' re not in the same physical space? You might strengthen shared identity by circulating feedback from customers on why your team ' s work is more important than ever. And you could get to some shared understanding by talking about your favorite video conference bloopers. Some of you have been experimenting with other strategies. Woman to baby : Hey, bud, can you say"welcome"? Baby : Welcome. Woman : To. Baby : To. Woman : Principles. Baby : Woman : Of. Baby : Of. Woman : Management! Baby : Man : My little sister, she had found a sign that said"Wall Street"on it. She put the Wall Street sign behind me so that when I get on my Zoom calls, my colleagues can see it, and she said,"Look, now you ' re on Wall Street. Stop **complaining**. Act like it."Woman : Can you say"my"? Baby : My Woman : Mama. Baby : Mama. Woman : Misses. Baby : Misses. Woman : All. Baby : All. Woman : Of. Baby : Of. Woman : You. Baby : You. Man : I love asking folks to give me a quick tour of their makeshift home office if they ' re comfortable with it. I ' ve found it often leads to a conversation about hobbies or life outside of work, which has been really, really cool for building closer relationships and kind of humanizing the other folks on the team. Woman : OK, one more thing. If you ’ re happy and you know it shout”hooray”! Baby : Hooray! Woman : All right! AG : I ’ ve been doing the majority of my work remotely for the past 15 years. Some of the key members of our”WorkLife”team have never even met face-to-face, so reaching shared understanding has been key in our collaborations. If you work with me, we have a shared understanding that my biggest vice is being chronically late. I have a hard time disengaging from a task before it ’ s done, and I try to squeeze too much into each day, but I often have calls with people who don ’ t have that context. Eventually, I had to start managing expectations. Now my calendar invite automatically notifies people that I ’ m usually running five to 10 minutes late. It helps them understand my schedule. But there ’ s something that helps even more. Alex Cornell : Well, I ’ ve been sittin ’ here all day / I ’ ve been sittin ’ in this waiting room. AG : Hold music. But not just any hold music. AC : Waitin ’ on my friends / Yes, I ’ m waitin ’ on this conference call / All alone. AG : Now when I jump on the line late, people aren ’ t disappointed or frustrated. They ’ re often amused. AC : Guess I ’ m on hold / I hope it ’ s not all day. AG : So when I scheduled a call with the guy who wrote this song, for once, I was deliberately late. I let him call in first, so he could hear his own hold music. AC : Here ’ s my voice. Y ’ all sing along. AG : Alex Cornell wrote this song for UberConference, because he hates hold music. AC : Whenever I call into an airline or anything like that, and you hear the same song over and over and over again, you ’ re now sort of already in this like, low-level tortured state of just been listening to this terrible song over and over again. AG : So he decided to make something better. AC : Tell me where can they be... AC : If you could imagine being on hold, and while you ’ re on hold, there ’ s just actually a person there that ’ s sort of like a doorman, so to speak. I ’ m just smiling as I ’ m saying it because it ’ s such a weird thing to picture, this, like, virtual doorman saying like,”Oh, hey, like, here you are, too, calling into this conference call,”but then also, it acts as a great icebreaker. AG : Alex, didn ’ t just write the hold music for UberConference. He cofounded the company, and then went on to be the lead product designer of Facebook Live. So he ’ s spent a lot of time working on virtual communication and has a lot of experience building shared identity and shared understanding. Alex ’ s new **start-up**, Cocoon, has developed an app for communicating privately with our closest friends and families. Before the pandemic, the team was six people in the same physical space while one person was remote. Now they ’ re all remote. AC : We have brought on at Cocoon two new team members since this began, and they need to be onboarded to the company, to the product and to what we do and what we believe in. AG : He ’ s instinctively put into place some of the core strategies that Martine Haas recommends. To strengthen shared identity, Alex has created written memos to share the company ’ s history and values. Spelling it out forced him to get clear on the team ’ s goals and culture and helped newcomers get up to speed from a distance. It ’ s something they can all revisit occasionally to remember their common purpose and **norms**. And to foster shared understanding, Alex has found that it helps to open up a little more about his home life. AC : I ’ ve found that it can be pretty helpful for this situation too, even just for our coworkers, to have a little bit more awareness of what we ’ re all doing day to day. I wouldn ’ t normally have shared with them that I am building a gigantic LEGO with my stepson, and that ’ s something that they know, and I think we ’ re actually, in some ways, more in touch with one another than we ever have been. AG : There ’ s evidence that when we gain this kind of personal knowledge about our colleagues ’ lives outside work, it humanizes them. We trust them more and feel more similar to them. If we only talk about work, we miss out on that information. So Alex has been experimenting with unstructured interaction to create shared understanding. AC : We ’ ve definitely done virtual lunches. I think one of the things that is missing most instantly when you go full remote is the sort of just camaraderie associated with being able to just kind of have a conversation about nothing around the lunch table, and it ’ s weird to set a meeting and say,”The agenda is we ’ re not going to talk about work, and everybody please have fun.”It ’ s like that is, that ’ s a weird agenda. It ’ s hard to do. I think there ’ s all kinds of these new **norms** that are being established just as we go. AG : When you communicate virtually, what **norms** have you been setting to facilitate shared understanding? Maybe you ’ ve been encouraging people to use the chat function so the quieter voices get heard. Or you might be turning off your self-view so you ’ re not distracted by all your weird facial **expressions**. But if you ’ re like most people, you want to keep seeing your team members ’ videos. You prefer that to audio-only because you value having the rich visual cues of facial **expressions** and body language. That ’ s how you read their emotions, right? Wrong. It turns out that if you want to know what someone is feeling, you might be better off just hearing their voice. In one experiment, people read another person ’ s emotions more accurately when the lights were turned off. In another experiment, they were more accurate when the video feed was turned off. **Follow-up** studies showed that when we don ’ t have visual cues, we pay more attention to the content and tone of voice. AC : I think that there is definitely something that is pure about when all you can hear somebody ’ s voice. Then when you switch to audio only, it ’ s like that actually is something that we ’ re all familiar with and are somewhat used to, and there ’ s no sort of missing piece. AG : Plus, if you ’ re on video all day, you could be losing contributions from one group of colleagues in particular : introverts. Why? Because of screen-out. AC : Even though I really want to see my friends, if I ’ ve been on Zoom all day, I don ’ t really want to spend another couple hours on Zoom just because, socially, I ’ m tired of interacting, but I ’ m a bit of an introvert, I suppose, so my energy is just depleted, usually, by the end of the day so. AG : Introverts are more sensitive to stimulation than extroverts, not just bright lights and loud noises, but also eye contact, and video calls seem to be magnifying that overload. AC : And you ’ re staring at somebody ’ s eyes for, in some cases, like an hour, and I don ’ t know about you, but when I talk to somebody else, I ’ m very rarely staring at their face for all 60 minutes. AG : There ’ s a fun study that tracked people ’ s reactions to seeing a large virtual face on their screen. The most common response was to flinch. AG : We know face-to-face interaction is critical for establishing trust, for building that shared understanding that Martine Haas has found is so important. But once trust exists, I think we should all have the **license** to turn off our video feeds from time to time. That ’ s what I ’ ve been doing. When people ask what video conference **platform** I prefer, I often tell them”audio.”After all, if you know what I look like, and you trust me, you don ’ t need to see my face every minute. But for times when you don ’ t have that option, Alex recently created a video conference version of his hold song. AC : My version of this on video conferencing is to have a looping version of myself who ’ s sitting there – AG : AC :... seemingly paying attention. Technically – I ’ m not saying I would do this – but you could have the looping version of yourself just on the call the whole time. This video one, it actually is me, so it ’ s sort of like a”Westworld”-type version of it. AG : If we were robots, it would be easy to be resilient. Just turn your emotions off until this crisis is over. Since we can ’ t do that, the next best thing is to learn from someone who ’ s done more remote work than almost anyone in human history. After the break. OK, this is going to be a different kind of **ad**. I ' ve played a personal role in selecting the sponsors for this podcast because they all have interesting cultures of their own. Today, we ' re going inside the **workplace** at Hilton. We had recorded a story back in February. Then the world changed, so we decided to do something different, to speak to the moment we ' re living in. Charles Hill : I was in denial. We weren ' t going to be impacted. We ' re making it out of this. And it was that moment, it was 4:30 on a Friday, March 6. I knew that we were in for something else. AG : Meet Charles Hill. He ' s the General Manager of DoubleTree by Hilton in Crystal City, Virginia, just outside Washington, DC. That Friday, his hotel was hit with a wave of cancellations. As the reality of how severely the **coronavirus** would affect them set in, he was called into nonstop meetings to answer an impossible question : How do you manage a hotel in the middle of a pandemic? CH : What is it that ' s happening around us? How big is this? And what do we need to do? There was nothing coming in. It was all going out. But we still had these hotel rooms. AG : That ' s when Hilton came up with a plan. They would do what they do best : offer hospitality. CH : Hospitality is caring for others and spreading light and warmth. AG : In partnership with American Express and its hotel owners, Hilton donated a million rooms across the US to frontline healthcare professionals. CH : For us to be able to provide accommodations for people who are literally working on the front lines to take care of those in need, it ' s such a great way to impact our community. AG : They took in nurses, doctors, EMTs – the people working tireless hours who needed a safe and clean place to stay. When they arrived, Charles was there to welcome them at the front desk. CH : I think there ' s a sense of surprise that they don ' t have to pay. There isn ' t a fee. We ' re not going to charge you. It ' s OK. We want you here. We ' re thankful for what you ' re doing. AG : For Charles and his staff, it felt good to be able to do something, and they were inspired to bring more light and warmth – literally. CH : The lights in our north tower have this warm glow, and we came up with the idea of putting messages in that north tower so that anybody who passes would be able to see something from us. AG : With no one staying in the north tower of the hotel, the dark windows were like a blank canvas. They could turn on the lights inside certain rooms to beam shapes to the outside. CH : The first message that we put up was this big heart. Think about these warm bulbs in 52 rooms that just emanates from the building to create this kind of glow outside. AG : A few days later, they changed the lights to form another message. This time, they beamed out one word. CH : We did"hope,"we put H-O-P-E, so you can see very clearly"hope"glowing in the night. AG : Because the hotel is so close to DC, anyone going in or out of the city could see the lights. That night, Charles got a message from a police officer who works at the Pentagon. CH : He had just finished his shift. He was walking back. He saw it, and he just wanted to say,"Thanks."He said,"This was the first positive thing I ' ve seen in a while."AG : Their community started to take notice. Other hotels followed suit. The local news picked up the story, and people started calling the hotel, hoping for a sneak preview of what shape the lights would take next. CH : It turned into this moment where we all had something to be happy about again and something to celebrate, and it was small, but it was a win, and it brought joy. AG : Psychologists have discovered an alternative to post-traumatic **stress**. It ' s called"post-traumatic growth."It ' s the experience of not just bouncing back, but bouncing forward from adversity. Often, it takes the form of a greater sense of strength. CH : This may be the toughest crisis any of us have seen in our lifetimes, but if we can make it through, anything else is a piece of cake. We ' re going to be stronger for making our way through this. AG : COVID-19 has created unprecedented challenges for the travel industry. In times like these, hospitality is needed more than ever. Hilton hotels all around the world are coming together to be the bright light for those who need it most. Read more inspiring stories of Hilton hospitality at newsroom. hilton. com / actsofhospitality. JaBarie Anderson : We ' re going to make magic today. OK, so – JA : This is"WorkLife ' s"first live virtual haircut, and we ' re here with"You Probably Need a Haircut"on webcam, because this is the new normal. You ' re going to need a mirror, a comb and scissors. Coco : I have scissors, they ' re the dog scissors. AG : Since I don ' t have hair, our producer Coco volunteered to be a guinea pig. JA : So cut straight across, a little bit higher. Coco : A little bit higher? OK. AG : Before the pandemic, JaBarie Anderson was a freelance stylist. So when he tried doing virtual haircuts from home about a month ago, he wasn ' t sure what to expect. JA : I ' ve literally been in so many bathrooms and showers with people now, and people turn on their camera, and it ' s just like people in their boxes getting their hair cut. I ' m like,"Oh, OK. This is happening."AG : Wait. That happens? JA : Yes, people are shirtless, or the whole family is in there watching, talking like,"This is crazy. I want to see how this is going to turn out."I ' m like,"Turn your head this way. Turn your head that way,"and you ' re trying to get the hand positions right. Coco : OK, cutting. JA : OK. Now I ' ll ask you to go in and point-cut it. Coco : Got it. OK, so now I ' m point-cutting this. So basically... Ohhhh. JA : People being so willing and trusting – that was one thing that shocked me the most. Coco : A little bit higher? OK. JA : Right there. Coco : So, like, here? JA : Yep. Coco : OK. Cutting. JA : OK, now I want you to... AG : So far, there haven ' t been any major hair disasters, and by moving his job online, JaBarie ' s been able to get clients in San Francisco, Texas and Germany. JA : This is absolutely amazing now. It gives me a **platform** to really showcase my talent. AG : Wait. Did you just say this is amazing? JA : Yes, it allows you to interact with your clients in a different way, and it builds trust, and it builds a bond amongst people in your household. So, say your wife is cutting your hair. That ' s another level of trust because it ' s your hair, you know? AG : Wow, I would not have expected that. So it ' s **gotta** be harder, though, to do your job in some ways, because you can ' t touch the person or even control the scissors or the clippers. JA : Well, that ' s where the education comes in. It ' s truly amazing to see what people can do from a video chat call and their home tools. That line is kind of shattered. Coco : OK, I think I am shattering that line. It ' s still, like, a little – JA : Shattering like broken glass! AG : JaBarie ' s enthusiasm for this new **platform** has helped him maintain his livelihood during the pandemic. This kind of ingenuity is visible in many **service** jobs. Some physical therapists are doing virtual appointments. So are plumbers. Plumber : You know, as far as your toilet, what have you been flushing down there? Did you use a plunger for this, because you really don ' t want to. Oh, I told him what tools he needed, and I stayed on the video with him while he fixed it himself. It ended up being a very simple fix. AG : And people doing more independent work have found creative ways to stay engaged while working from home. Woman : I fake my commute, which means I get on my stationary bike and listen to a podcast in the same way I do when I drive to work for roughly 30 minutes before going to actually sit at my desk. Man : To stay productive, I could only use my phone in the living room, so pretty much my cell phone never leaves that area, and if I have to pick up a call, I ' ll have to go to the living room. If I want to check Facebook, I have to go to the living room in order to do so. Scott Kelly : I have a little bit of a **mission** control setup, so I got an iPad, a second iPad. I have a little TV next, over my right shoulder, so I can monitor the situation. AG : You might have your own personal **mission** control center as you **navigate** working remotely. But"**mission** control"has an entirely different meaning to Scott Kelly, because he ' s an astronaut. SK : So, five years ago today, I launched into space for my **mission** that wound up being 340 days on the ISS. AG : Three-hundred and forty consecutive days in space. It ' s an American record for a single **mission**. The rest of us weren ' t schooled in how to stay at home that long in sustained **isolation**, so I turned to Scott for ideas on building resilience. Other than the few fellow space travelers in **isolation** with him, communication with his family, friends and coworkers was entirely through video, e-mail and radio calls. He couldn ' t go outside without the right equipment, and he didn ' t even know when his **mission** was going to end. Sound familiar? SK : I knew I was going to come home about a year later. I didn ' t know exactly when. I had to make this mental kind of change to my whole reference system with regards to my life. AG : He ' d been to space three times before, but he ' d never been out there for so long away from everyone he loved. SK : And I felt like I needed to pace myself, as you can wind up working too much when you go to sleep in your office, and you wake up, and you ' re still in your office. The walls could be closing in a little bit, and I definitely felt that on my six-month flight. AG : Under normal circumstances, conventional wisdom is to be in the present, live in the moment, seize the day. But in **isolation**, sometimes the day sucks, especially in outer space. SK : I also missed nature, going outside, sun, rain, wind, fresh air. People become depressed without that sun. AG : I ' m imagining it ' s something like wake up in the morning and then wait for the Earth to rise? SK : Yeah, so – Yeah,"earthrise."Never heard it that way, put it that way, but yeah, that ' s a good way to put it. AG : For Scott, every day started feeling like"Groundhog Day."SK : I would generally wake up at around 6:15, have breakfast, work for a few hours, take time for lunch, schedule time for exercise, schedule time to connect with people. AG : It sounds a lot like what many of us are experiencing now. Time becomes meaningless. You ' ve probably already heard the most popular tips for coping with that :"Make a **daily** schedule.""Wear different clothes for different parts of the day.""Have Zoom calls with family and friends."But one of the lesser-known ways to give this time meaning is to master the art of time travel. More specifically, mental time travel. In psychology, it ' s a skill. Rewinding to think about the past and **fast-forwarding** to imagine the future. It ' s a distinctively human skill, and if we use it thoughtfully, it gives us the capacity to find meaning in the mundane and **happiness** in the midst of sadness, and make time pass faster or slower at will. The first destination for your mental time machine is the future. That ' s where Scott started. Months before he set foot in the rocket to leave Earth, Scott started imagining how he wanted his trip to end. He didn ' t just focus on what he wanted to accomplish. He imagined how he wanted to feel when his **mission** was wrapping up. SK : My goal was to get to the end of this with the same enthusiasm and ability and energy as I had in the beginning, and I always wanted to convince myself that this is just my life. I ' m here for a purpose, and my purpose was to be an astronaut and complete our **mission** objectives. AG : It helped Scott stay focused, and made the days pass faster. Psychologists find that a mental trip to the future can help us think less about the monotonous how of our days and more on the meaningful why. We ' re able to get out of the dull weeds of the process and shift our attention to an exciting purpose. The farther ahead we look, the easier it becomes to tell a coherent story about our experience. One of the challenges of the current pandemic is that we don ' t know when our **mission** will end, but we do know it isn ' t endless. It will end. So think about how you want to feel on the day this crisis is over. How will you want to have gone through it? You might still find yourself worrying about what will happen in between. It ' s inevitable. But here ' s the thing : worrying isn ' t necessarily a bad thing. SK : One of the things that NASA does very well is, and how we operate in space is, we ' re always having to think about,"OK, what is the next worst thing that can happen to us right now? And how do we react and respond to that?"You know, in some ways that can cause **stress** and anxiety. AG : There ' s a distinction that we often make in psychology between worrying and rumination, where worrying is basically an attempt at problem-solving and trying to figure out,"OK, what could go wrong? What ' s that next worst thing? How do I avoid it?"And rumination is when you get stuck in a loop, just worrying about the situation, but not trying to act in the face of it. Did you have strategies for making sure that the stuff you were worried about didn ' t cause you to ruminate? SK : Oh yeah, I think so, and I think that ' s part of our nature as astronauts is to understand that bad things can happen. We don ' t have control over them, but we still have to be prepared for them. AG : Some psychologists recommend a simple strategy for preventing rumination : adding worry time to your **daily** schedule. SK : Schedule time for your rumination, 15 minutes, maybe. Doing that will make the days go by so much quicker rather than just sitting there thinking about what you ' re going to do next and bingeing on Netflix all day. AG : When I went through this exercise, I started thinking about silver linings, aspects of being fully remote that I ' ll miss, like having more family time and flex time, not having to travel or commute, not having to change out of pajamas or at least pajama bottoms. Psychologists find that imagining these silver linings fading in the future makes them feel scarce. That helps us appreciate them more in the present. Next, you can direct your mental DeLorean to the past. This is something Scott has been doing during the current crisis : thinking about memories from his days in space. SK : When people ask me,"Well, what do you miss about space?"It ' s not launching in the rocket. It ' s not doing a space walk. It ' s not floating around. It ' s not the view. It is the people I was there with and also the sense of purpose. AG : What I heard there was nostalgia. The Greek roots of nostalgia translate to"return"and"pain."The literal definition is : the pain of being unable to return to the past. But here ' s the strange thing : that ' s not how it feels. After people are randomly assigned to reflect on a nostalgic event in their lives, they end up feeling happier. They have a stronger sense of connection to others and become more willing to give and seek help. They gain a deeper sense of meaning and purpose in life. Think about a nostalgic event in your life, something you had before the pandemic but no longer do, like celebrating a holiday with your extended family, going on **vacation**, even going to a restaurant. Reminiscing about those moments might seem bittersweet, but the aftertaste is mostly sweet. It motivates you to make the most of the present. But it doesn ' t just help to remember **pleasant** memories from the past. There are also benefits to reflecting on painful ones, too. SK : It was the worst day of my 520 days in space by far and probably one of the worst days of my life was January 8, 2011. I was on the space station about halfway through my six-month **mission**, and I get a call from the control center in Houston, and then they say,"Scott, I don ' t know how to tell you this, so I ' m just going to tell you. Your sister-in-law Gabby was shot in Tucson, Arizona."And I quickly got on the phone with my brother. He was packing his bags to head to Tucson. You know, I ' m on the space station now, and I can ' t be there physically to be supportive to my family. Couple hours later, the CAPCOM called up on the privatized channel, and they told me Gabby had passed away because that ' s what the news was reporting. Later, I found out she was still alive, thankfully. AG : That experience taught Scott a powerful lesson. SK : Oh absolutely. I mean, I always realize things could be worse. AG : This brings us to a third destination to transport yourself to alternative time lines, things that could have happened but didn ' t. It ' s called"counterfactual thinking."Psychologists have shown that imagining how things could be worse helps us find gratitude. There ' s evidence, for example, that people who graduate from college during a recession end up being happier with their jobs a decade later. They can easily imagine a world in which they ’ re unemployed, so they don ’ t take it for granted that they have jobs. Counterfactual thinking has come in handy for Scott over the past month. As bad as the **coronavirus** situation is, he ’ s been reflecting on how things could be worse. SK : You know, if given the choice of spending a year in my apartment or a year in space, the apartment wins hands-down every time. AG : Even if you ’ ve never been to space, you know the current circumstances could be a lot worse. My wife and I have been talking with our kids about how lucky we are that grocery stores are still open and utilities are still on. We feel deep appreciation for the people who are hard at work keeping those **services** going. I ’ ve been thinking about how much harder it would be to do my job without the internet or a phone. Recording this podcast would be pretty much impossible. As it does with many astronauts, being in space broadened Scott ’ s idea of who his neighbors were. SK : When we ’ re in space, and you look down at planet Earth, the planet is incredibly beautiful. During the daytime, you don ’ t see political borders, and it makes it look like humanity is all part of one big team, and when you ’ re part of a team, you need to work together to solve our problems. And I think this virus has shown us that we ’ re really, for better or worse, more interconnected than I really realized. If you consider the last pandemic, which was like 100 years ago, and if you consider what we have been able to accomplish as a species in a hundred years, it ’ s mind-blowing. I am absolutely confident that we will get through this, but it ’ s going to take all of us working together, making the right decisions, doing the right things. Teamwork is absolutely critical when you ’ re trying to do something like this. We ’ re really fighting, right now, the greatest battle for our lives that we ’ ve ever had to fight.”WorkLife”is hosted by me, Adam Grant. The show is produced by TED with Transmitter Media. Our team includes Colin Helms, Gretta Cohn, Dan O ’ Donnell, Jessica Glazer, Grace Rubenstein, Michelle Quint, Angela Cheng and Anna Phelan. This episode was produced by Constanza Gallardo. Our show is mixed by Rick Kwan. Original music by Hahnsdale Hsu and Allison Leyton-Brown. **Ad** stories produced by **Pineapple** Street Studios. **Special** thanks to our sponsors, Accenture, BetterUp, Hilton and **SAP**. For the conference call in real life, thanks to Tripp Crosby. For the snippets of what it ’ s like to work from home, thanks to Jason Gates, Ryan Smith, Amanda Monday, Danielle Tussing, Erin Kahana, Tiffany Chang, John Mi, Aaron Guo, Next Plumbing and everyone else who called in to share their stories with us. For their research, thanks to Bob Ginnett on airline crews, Cameron Klein and colleagues on team building, Ashley Hardin on personal knowledge, Jeremy Bailenson on giant virtual heads, Yaacov Trope and Nira Liberman on mental time travel, Kate Sweeny and Michael Dooley on worrying versus rumination, Constantine Sedikides and colleagues on nostalgia, Laura Kray and colleagues on counterfactual thinking, Emily Bianchi on starting your career in a recession, and my late advisor, Richard Hackman, on teams as amplifiers. For all their help this season, we thank Nicole Bode, Valentina Bojanini, Sammy Case, Micah Eames, Will Hennessy, Dian Lofton, Jen Michalski, Sarah Jane Souther and Emma Taubner. That ’ s a wrap for season three of”WorkLife.”Thank you so much for joining us. If you like what you heard, please rate and review the show. It helps people find us. And are you still a potato? LO : I ’ m sorry – am I still a potato? AG : Yeah, I mean, you ’ re potato boss now. You have to be a potato, right? LO : The funny thing is, the first time I got the request to be a potato, I couldn ’ t figure out how to be a potato. It took me – it was like the opposite problem. It took me hours to get the potato back up and running again.

Text Sample 162: POS Dim 2 – 2020 – Score 52.00 – 2020/t004277.txt

David Fano : Well I would say there was kind of like three phases. There was the time when you would tell people,"Hey, I work at WeWork"and nobody would know what that was. And then very quickly it became pretty commonplace. People knew what WeWork was, and it was on the cover of magazines, it had a great **mission**, it had this rebranding, it had these, like, very grandiose ambitions. And then from one day to the next, it flipped completely. And I think that was really, really intense for people to process. That so much of their identity and who they were was somewhat scaffolded by the identity of the place that they worked, that now it became like an existential discussion. And then you ' ve got your grandparents who didn ' t even know where you worked are calling you now being, like,"Hey, that ' s the place you work?"And you almost go to, like, a place of shame. Adam Grant : I ' m Adam Grant, and this is a **special** bonus episode of WorkLife, my podcast with TED, sponsored by Accenture, BetterUp, Hilton and **SAP**. I ' m an **organizational** psychologist. I study how to make work not suck. In the past year, one of the biggest work stories, and just one of the bigger stories, period, has been the implosion of WeWork. The company started as a single coworking space in Soho, and in just a few years, WeWork exploded to more than 100 cities in dozens of countries, employing more than 12, 000 people. They weren ' t just selling leases, they were selling a new vision for work. And Dave Fano was on board. DF : For me it meant making going to work awesome for people. You know, with an initial focus on the physical environment, and making that environment comfortable and exciting and feeling good, and then also the technological side of how we brought people together, how we could get people to commune and work together, small companies helping each other I thought was really exciting, and helping people do work that mattered to them, and being able to strip away the muck, the things that matter a little less. AG : For many business owners, part of that muck was the perceived hassle of renting office space, and then creating a welcoming, energizing environment. That ' s where Dave came in. WeWork recruited him to design all of their spaces and become one of their top executives. It was a job for someone with both technical and creative skills. DF : I was trained as an architect. AG : Were you aspiring to be someone like Frank Lloyd Wright, or did you have a different vision in mind? DF : Sadly I really, probably didn ' t know who many of those people were. I was really determined to be a comic book artist. So you could have asked me any comic book artist, and I would have known them all. I was a kid that drew the cover to the yearbooks and high school T-shirts and things and wanted to be an artist, and my dad told me that wasn ' t a real job, so architecture seemed to fall somewhere in the middle. AG : He ended up starting a consulting business to help architects, engineers, contractors and building owners improve their work spaces. Soon WeWork was a client. In 2015, WeWork acquired Dave ' s company. He became WeWork ' s chief product officer, and then chief growth officer. He oversaw all of real estate, design, construction, sales and marketing. In the spring of 2019 he left. Six months later, after WeWork filed for an IPO, a series of investigative reports exposed their huge **financial** losses. The media was in an uproar over the self-dealing behavior of the cofounder and CEO, Adam Neumann. Woman 1 : Adam Neumann pays a direct family member to be the director of wellness at the company. Man : There ' s credible reports in the business press that he traveled with illegal drugs across international boundaries. Woman 2 : Expenses at WeWork more than quadrupled. Man 2 : Adam Neumann is stepping down as CEO. AG : Plenty of people are still dissecting what happened on the business side of WeWork. I wanted to explore something different, the leadership and culture. We know visions and values have a real impact on whether a company succeed or fail, and WeWork was an extreme example of doing both. What could we learn from WeWork ' s rise and demise about how culture is built and sustained? When is a strong culture actually helpful? And when do you trust your sense that something is off? I can ' t think of a better person to ask than Dave. He had a front **row** seat to the company ' s evolution, expansion and **peak**. This is his first time speaking publicly about WeWork. DF : I think we tried to do a lot as a company. you know, what ' s the saying, **start-ups** don ' t die of starvation, they die of indigestion. I think we did a lot, I think we tried to do a lot of things, which probably led to over-committing and not following through with things at times. But I don ' t think that there was ill intent. AG : I want to dig more into that, but first let me tell you actually about my first introduction to WeWork. So summer 2017, I had been talking to the TED team about starting this WorkLife podcast, and I mentioned it to a few friends of mine and a couple of colleagues, and one of them said,"Oh, you ' ve got to talk to WeWork, because they ' re all about trying to make work better."And before I knew it, I was being introduced to Adam, and I reached out to a colleague I knew had worked with the company a bunch, and she said,"Listen, they are obviously growing really fast, they ' re accomplishing a lot, but if I were you I wouldn ' t trust them because they ' re gangsters."I didn ' t know what that meant at first, I ' m curious about whether you heard that description and what you took from it? DF : Actually it ' s the first time I ' ve heard the company described that way. I don ' t feel like that was the case, I think actually more often than not we did the right thing, we tried to do right by vendors, we tried to do right by the people. When you get bigger those things get complicated and there ' s always two sides to every story. AG : There are. Well, I certainly want to hear more of your side. So let ' s begin with, what was the **mission** when you joined? DF : To create a world where people make a life and not just a living. Or enable a world, where, you now, there ' s – the main punchline being that you create a world where people make a life and not just a living. AG : That is both incredibly lofty and extraordinarily vague. What did it mean to you? DF : I always really connected with the aspects of work. Not as much the sort of, non-work side, however we define that. So I thought that was very exciting, you know, if I ' m an embroidery designer sending invoices and billing is not so exciting, or signing a lease, so I was really excited about the idea of stripping away all the stuff that was not their core activity, and I was pretty charged up with that and that ' s how I **interpreted** the **mission**. AG : Got it. That could almost be the slogan for this podcast that I host. So that, if you frame the **mission** that way, I could even imagine myself getting excited about it. I ' m curious about how the **mission** got communicated. What were the major ways that the **mission** was brought to life? DF : I think it changed over time, I think very early on, it was about the entrepreneur, the small business, the founder, and enabling them to do what they love and start the companies that mattered to them, and all these companies that were going to go change the world. I think as the company got a little bigger and there was excitement around the reach of the idea, and building more of a lifestyle brand, it started to become a little more consumer centric and tried to speak to a broader audience, and then you saw the evolution of the company trying to do more things. We live, we grow, and then it goes really about serving everybody and enabling everyone to, you know, live their best lives. It became incredibly broad, but I think a lot of people suited up every day to go do that, I think people jumped out of bed excited to try to help people. It was a powerful **mission**. And I think as a **workforce** and as a team, people got really excited about it, and it motivated them and the closer proximity you had to the customers and the more you can see that you are affecting these people and helping them day in and day out, whether they were the owner of the company or an employee of the company, people were really charged up to help them. AG : Is there a story, Dave, that illustrates a moment when you really felt fired up by the **mission**, wondering was there a company retreat where a speech resonated with you, or, you know, just any defining experience where it clicked and you said,"Yeah, this is why I ' m here."DF : There was a story that the community manager told one day of someone who was working at one of the companies in the building and he had become really good friends with them and they ' d see them every day and he came, I think, crying to the main community desk and he had lost his job. And the community team mobilized incredibly quickly, started to talk to all the other members in the building, and I think within 48 hours they found him a new job. And I thought that was amazing, that this person, you know, we associate so much of our identity and our being to our work, and the work we do and the company that we do it at, and especially I like to think of it through the lens of the employee, because I think the founders and CEOs have a bit more agency in those things, and that wasn ' t the person paying the bills, this was someone who worked in the building and that the community team took such good care of this person, and they didn ' t need to, again, this person wasn ' t, like, the direct customer. And that by being part of that community, that person was taken care of. That really meant a lot to me, and I thought that that was really beautiful. A group of people that could be looking out for each other. And this thing is mostly individualistic, managing my career, looking out for myself, making my money. For me that really highlighted the benefits of what we were doing. And I got even more excited to figure out how to scale that out to more people. AG : It sounds like you were far from the only one to feel fired up about the **mission**. What would you say was the dominant emotion that people felt at WeWork? DF : Excited. High growth is pretty exciting. You hit those milestones, you hit those achievements that you didn ' t even think were possible. It ' s a combination of excited and exhausted. And I think people – I think **struggle** is kind of important to really love your work. I think you may not realize it at the time, but I think it ' s one of those things in retrospect, when you think about some of the most fulfilling times at work, they involve some amount of **struggle**, and I think people felt really fulfilled by their work. Again, I think there was plenty of **peaks** of **exhaustion**, but I think they were getting to do really good work with really good people. And I think they felt that sense of community and excitement. AG : The juxtaposition of excitement and **exhaustion** is fascinating to me, it reminds me of some research on what ' s called the passion tax, where Aaron Kay and his colleagues have found that people who love their jobs are more likely to get asked to do extra work unpaid, even if it ' s not part of their role, even if it ' s demeaning. And they end up sacrificing sleep, family time and health because of it. Do you feel like there was a passion tax imposed at WeWork? DF : I think people loved what they did. And I think they worked hard. You know, I think if you asked most people that worked there they ' ll tell you about how amazing the team was, and that it was some of the most incredible people they ever got to work with. And I really think people liked being at work. And yeah, so I think they may have put a little bit more of themselves out there that led to a little bit more of that draining and **exhaustion**, but I think people were pretty stoked for the work they were doing and the people they were doing it with. AG : So it sounds like then you don ' t feel that they were getting exploited, so much as they were making voluntary sacrifices out of passion? DF : I don ' t think so. Look, that ' s a tricky one, because I had a very particular view of the business, given my scope and my domain. There were a lot of different roles. I didn ’ t work in the buildings. Most of the folks that I lead and managed and interacted with on a regular basis were within the office, and they had a bit more control of, sort of, managing their time. I could imagine if you were working in the buildings and you had a bit more of a direct obligation to the members and their needs that it may not have felt like you had as much agency, so I can ’ t speak to that as much. AG : When I sat down with Adam, I was asking him what WeWork was all about, what are his goals, what ’ s he hoping to accomplish, and he said,”We ’ re selling culture.”And you know, my reaction, as an **organizational** psychologist was,”I ’ m pretty sure you ’ re leasing buildings.”It seemed like there was a big, you know, a little bit of a leap from what the actual work was to the **mission** that it was serving, and of course, sometimes those leaps are aspirational. Sometimes they ’ re part of creating a meaningful and compelling vision. But the disconnect felt a little bit more significant to me than I see in a lot of **workplaces**. What ’ s your take on that? DF : I think we were selling cultural intervention. I think a culture is ultimately the aggregates of the micro-actions that an organization takes, and we couldn ’ t entirely control those. But I think we were trying to help shape culture. The big learning for me was that space and the physical environment helped, but at the end of the day it was the core and how the organization behaved that would ultimately shape the culture. And companies who are looking to try to bring cultural lightning rods to the organization would bring a whole group into a WeWork, because it was so different from whatever their corporate environment was. So we would be used as a bit of a lever for cultural change. So I think we were helping inform culture. I think companies were looking to us to think about culture in a different way. I would say the unfortunate part is I think they gave too much emphasis to the space itself. And that, you know, what one of my colleagues at WeWork at the time called cultural confetti, and much more of the appliqué of culture than, like, the deep internals of culture. So I think we were trying to have those conversations and it was a tricky thing to **navigate**, understanding that our product in the market was space, and flexibility in space, while still trying to have a meaningful impact on the employee experience. AG : Cultural confetti, I think in that sense, it sounds like just a surface layer, as opposed to dealing with the underlying values and **norms** that define what a culture is. But the other image that confetti paints for me, at least in my mind, is it almost sounds like it ’ s a weak culture, that it ’ s kind of dispersed and there ’ s not anything consistent or strong about it. And that to me is a big part of the difference between weak and strong cultures. So in my world we normally define a weak culture as existing when you go around to different people and you ask what the values are and they all name different values, and nobody really cares about them. In a strong culture, the values are widely shared, so everybody believes the values are the same. And they ’ re intensely held, so people are extremely **passionate** about them. My sense was that WeWork had a very strong culture. First question is do you agree or disagree, and then secondly, how would you describe the culture? DF : I think WeWork had an incredibly strong culture. I think people felt very connected to the **mission**, I think they felt very connected to the values. So in that sense the culture was incredibly strong. It was about relentlessness, entrepreneurialism, respect, tenaciousness, togetherness and community. It was really about achieving a lot as a collective, I think that was kind of the essence of the values, and bringing an entrepreneurial approach to everything we did. And I think the organization, you know, for the most part operated that way. I think people felt very emboldened to do what they thought was right for the customer. If you were the community manager of a building and it wasn ’ t part of the standard operating procedures to have, you know, nondairy milk, but you had a member who needed it, they would go do it. That ’ s kind of a silly little example, but there are places where you could find yourself caught in bureaucracy for weeks to be able to do something like that. And they felt, you know, I think, a tremendous amount of agency and **ownership** around – And then again, everyone felt this way to do the things you needed to do to move the business forward. At least what we thought was moving the business forward at the time. AG : That goes to a lot of the research on strong cultures, which, there ’ s a long list of benefits. We know that when organizations have strong cultures they ’ re better at attracting and retaining people, because they stand for something unique and it draws talented employees, and once they ’ re there, why would I want to go anywhere else? It ’ s also helpful for motivating and connecting and coordinating people, because they feel like they ’ re in a place that has distinctive values, and they start to identify with those values. I worry a lot about the dark side of strong cultures though, which is that they tend to breed homogeneity, that can cause groupthink, in a lot of cases they have trouble changing and adapting because people are so committed to the way we have always done things or the values we ’ ve always held. Did you see any of those sharper edges? DF : Yeah, I think that feels right, you know, from having lived inside a strong culture, is that some things start to just happen because. I ’ m not sure if you ’ re familiar with the pot roast story, but it ’ s one of these work-fables of just doing things. AG : The what? DF : The pot roast story? AG : Not described that way. DF : OK, I ’ ll give it real quick, it ’ s a parent and a child cooking a pot roast, and the first thing the parent does when they take the pot roast out is they cut the ends off. And the child says,”Why do you do that?”They say,”Well it ’ s in the recipe. So let ’ s call a grandparent and see.”They call the grandparent and they say,”I ’ ve just always done it, that ’ s what ’ s in the recipe.”And the family was very lucky that the great grandparent was still around, so they called the great grandparent that wrote the recipe. And they say,”Oh well my pan was just too small so I always cut the ends off.”So the idea being that we just do things because we thought that ’ s what was right. And when you have these strong cultures with a bit of a lore about them, it becomes incredibly difficult to trace back like, why certain things are the way they are and the strong culture just keeps them going. So I think that that ’ s absolutely a side effect, a potentially negative side effect of a really strong culture, especially as you scale. Those things might be fine if you stay at the same scale for a very long time, but when every three to six months the business is fundamentally different and the scale and infrastructure is different, those things can start to be of an issue, because you start to have these cohorts of culture, especially when you ’ re onboarding a lot of people, you ’ ve got the folks that have been there for five years, five and a half years, four years, and they ’ ve got the snapshot of what the most current version was at that time. And it becomes, like, cemented in, and so you find yourself with people debating what the right way is, not even, again, knowing what the source of that thing was. And so I think the combination of a strong culture, high growth and high speed make for some really interesting times. AG : What ’ s a WeWork example of the pot roast? DF : This foggy vinyl on the glass. You know, a lot of members would want **privacy**, and they would want to put some translucency on the glass in the buildings so that their office would have a little bit more **privacy**. Like, if people want **privacy**, no problem, we just put up the vinyl, and so you would just see different things, where it ’ s like,”Oh, that ’ s not allowed at all,”which was not true. That was one that I always found myself being pulled into a meeting, like, we ’ re not allowed to do that, and I ’ d be like,”You ’ re absolutely allowed to do that, that ’ s what the member wants, give it to them, it ’ s not a big deal.”AG : This definitely captures the double-edged sword of strong cultures in a compelling way. I think about one of the benefits of strong cultures being that leaders don ’ t have to use incentives or controls or punishments because people have internalized what the values and **norms** are, and that means if they see something that is not being done right, or a rule that ’ s being broken, or a principle that ’ s being violated, they will enforce it themselves. And that ’ s the upside. The downside is, people will enforce it themselves, and they might not be enforcing the right principles. DF : Yeah, I found myself in just way too many meetings being the person that was willing and seeming to the others empowered enough to change the **norm**. But they would just be spinning and spinning, it ’ s like,”We can ’ t, but we should, but we can ’ t.”Where did that come from? I was like,”Guys, it ’ s totally OK, just do it, if it ’ s not OK I ’ ll take the heat.”And it was always OK. And I feel like, when things got stuck, that ’ s a lot of the stuff that was happening, it was these cultural **norms**, and you couldn ’ t even ask somebody,”Hey, where did you see this written?”And more often than not you couldn ’ t find it. AG : I want to ask you a little bit about leadership, which obviously is a core driver of culture. Adam seemed to do a lot of preaching about what WeWork was going to accomplish, what the values were, what the **mission** was. Do you think he believed all of what he was saying, or was he hoping other people would drink the Kool-Aid? DF : I think he believed it. You know, I like to believe he believed it. I know that the team believed it. And that as a **workforce**, and as a team, and as a culture we believed it. The question I ’ m kind of curious about, and curious on your take on is like, how much does a belief system matter to a culture, and how important is it that the leader can either embody or present the belief system in a way that can get people behind it? So I think he believed it and I definitely believe he got people to believe it. I ’ m kind of curious for myself on how much that mattered for the incredible things that we were able to achieve. I think they mattered a lot, but I ’ m curious from your surveying of companies and founders and CEOs, if you ’ ve seen that as a common trait? AG : Yeah, I think so. There ’ s evidence that charismatic leaders are more successful at pitching their companies and fundraising. It ’ s not surprising, I think, to anyone that that would be true. There is also evidence that the cultural blueprints that founders have in their minds when they first launched their companies, they cast a real shadow on the future of the company, even if founders rotate out of leadership. There ’ s a study of a couple a hundred Silicon Valley **start-ups** where Jim Baron and his colleagues identified the cultural blueprints, and they found that if you, as a founder, had a blueprint where you were going to convince people that you had an important **mission** and everyone was going to be **passionate** about that **mission** and the culture was organized around commitment, that your **start-up** was less likely to fail, and it was also significantly more likely to have an IPO. But then post-IPO, those **start-ups** that were strong cultures of commitment, they grew at slower rates, if you track metrics like annual market capitalization. And I think that ’ s where you start to see some of the rigidity and groupthink problems come in, where you begin to weed out diversity of thought, you end up with more homogeneity. And I guess where that ’ s left me is wondering whether the kind of charisma and conviction that you are describing in Adam is helpful for a company to grow at an exorbitant rate early, and then over time, sort of, shoots the company in the foot? DF : Well, this will definitely make for an interesting case study, because we ’ ve kind of got the full cycle. Look, I really – Coming back to the question on belief, I believe he believed it. I think he had other things that drove that belief system and his ambitions of things he wanted to achieve, which, honestly, he achieved a lot of them. And so I ’ m not sure like, sort of, chicken and egg – which one was **driving** which, at a certain point the belief can only push you so far. And so maybe that ' s what we felt there at the end. AG : Yeah, I think that ' s fair. It reminds me a little bit of some research by Sandra Cha and Amy Edmondson, who studied values-driven organizations and found that the more emphasis leaders put on values, the more risk they end up taking of being accused of hypocrisy. Where you get people convinced that you stand for higher principles and moral ideals, and then the moment that you deviate from those, there ' s a giant gap and people are very quick to point out that you are not **practicing** what you preach. I ' m curious to hear your perspective on that and do you feel like some of what happened at WeWork was hypocrisy because the values and aspirations were preached in such an aspirational way? Or do you have a different analysis of where it started to unfold? DF : I definitely think that that is the source of a lot of the disappointment. That what was presented as what the organization stood for, as more and more commercial pressure mounted, you know, being public and things like that, some of those things were harder to live. I don ' t think there ' s necessarily a one to one. I am not sure a company can be altruistic, not that we were pretending to be altruistic. And so I could imagine, that since the company had really built an existence of caring about people and the community so much, that if you did anything that looked anything like not that, that you run the risk. And I think these mission-led companies and companies with great aspirations, that is the challenge, I think it ' s part of what gets your customers to buy into what you do, it ' s part of what get your team to buy into what you do and to grow. But you set the bar for yourself incredibly high. And I think some companies have been, like, very clear and pragmatic about what they do, and are able to live that. I think Amazon does that pretty well. I think that ' s tricky. You know, being able to manage this aspirational, very human-centric brand, you know, you ' ve got to really operate tightly and I think the world is becoming less tolerant of a deviation from your **actions** and your words. And so I think that ' s something companies are going to have to be very thoughtful about as they establish these brands and what they stand for and their values and they better be prepared to really live by them. AG : Yeah, I guess that goes to the question of narcissistic leadership. And I know you know I ' ve spent a lot of my career studying the dynamics of giving and taking, and in the IPO there ' s just an unusual number of”Is”and”mes”, and we know from evidence that narcissistic taker CEOs are more likely to use”I”and”me”when talking about their companies. There ' s one article calling Adam the most talented grifter of our time. I ' m just curious to hear your reaction to that set of observations. DF : I have described him before as, like, the best personal trainer you never had. He could get people to push themselves to deliver and to achieve in ways that they didn ' t think they could, which I think is – I think for a lot of us that ' s kind of uncomfortable, we actually feel bad. I think he was able to do it. And I think he really believed he was helping people get the most out of their potential. He was a force, or is a force. AG : When I think about a personal trainer, my first reaction is, OK, this is somebody who is going to pump me up. My second thought is, when I bring in a personal trainer, it ' s somebody who ' s trying to help me achieve my own goals. So I ' m trying to get in shape or get faster or stronger, or lose weight, whatever the target may be, that person is there to help me. And I wonder if that analogy breaks down when you start to think of a founder and CEO who may not be there to try to help the people around him? DF : Yeah, that ' s a really interesting callout. I think, you know, for companies in general, and this starts to tug at the relationship between the folks that work at a company and the company itself. And what is really best for the individual, so I can kind of make the case that what ' s good for the collective is good for the individual. And I think that a lot of people convince themselves of that. AG

: You know, I ’ m not asking you to criticize a particular leader, but when you think about the culture it seems like there are aspects of the culture that fit more with taking than giving and that there was some selfish as opposed to servant leadership at the top. DF : Yeah look, I think he was superfocused on delivering what he set out to do. I think he worked harder than probably most people I ’ ve met. He didn ’ t leave the office, he worked all the time, and so I think that there was this maniacal focus on winning. You know, what winning means is different to different people, but I think he wanted to do incredibly big things, I think the definition of”big”changed for him over time. I think we would set out to do these fairly audacious things, we would achieve them, and then it would open up a whole new world of what was possible, you know, be it fundraising numbers or opening X number of buildings in a month, or selling so many seats to new members on a certain month. We would consistently set out fairly audacious goals and hit them. AG : Stretch goals. Sometimes those kinds of moonshots are just the fuel we need. There ’ s a wealth of evidence that extremely difficult specific goals motivate us to aim higher. And work harder, longer and smarter. But they can also lead us to cut corners, especially if we ’ re about to fall just short of the goal. Sometimes our creative strategies for hitting **bold** targets stretch beyond the bounds of what ’ s ethical. DF : So I think he was increasingly emboldened by what we could do as a company, and when we really focused on trying to tackle something, and so, yeah, I think he wanted to win, I think he wanted to win everything. AG : I ’ ve always bristled at the language of winning and losing in business, because it ’ s not like a soccer match, or a **baseball** game where there ’ s a **score** and everybody has agreed on the rules and at the end of the game you know what metric you are counting on. It seems like the moment you define success in terms of winning, it means that everybody else has to lose. DF : Yeah, I totally agree with you, and I think it ’ s a complicated topic, but you see it in, like, the business discourse of,”We ’ ve got to win, we ’ re going to win.”And you even see recommendations that I also always bristled at, it ’ s like, we need to identify an enemy, or an opponent. People will rally around that. But I agree with you, I much more subscribe to the idea of, don ’ t worry about who the competitors are, get customer-obsessed and just focus on solving for the customer. And the notion of what winning is and competitiveness, you know, maybe that gets into personality, but I think you see it, I think there are certain founders who exude a bit more of a competitiveness in the way that they – it ’ s a bit more of a combative approach to business, and they ’ re able to rally people behind it and get people to do amazing things, and there ’ s others that maybe that ’ s not as much a part of the way that they engage and that they talk about it. But it was definitely part of our language. I think people are very capable of convincing themselves that **actions** that most would recognize as taking are in the **service** of giving. And I think it ’ s a really fine line and slippery slope. But I would say that that ’ s what was believed. That the things that were being done were best for the collective, and kind of the rising tide lifts all ships, and they can be a little bit more conscious of the language. It still shows up as the”Is”and”mes,”but I think it ’ s – it ’ s easy to see in retrospect I guess. AG : Yeah. There ’ s a spectrum of self-awareness when it comes to the most selfish takers among us. And on one end you have people for whom it ’ s a very deliberate strategy, right? They ’ ll say,”Look, I believe the world is a dog-eat-dog competitive place, and I have to put myself first because no one else will, and that ’ s how I get ahead, that ’ s how I win.”And on the other end of the spectrum, you have people who, it ’ s almost like they ’ re in the movie”The Sixth Sense.”Everybody else knows they ’ re a taker, but they have no idea. And I think the Richard Feynman quote always stands out here, that,”You have to be careful not to **fool** yourself, and you are the easiest person to **fool**."DF : Yeah, that makes sense, and I do have a belief that we have a more natural disposition towards a self or other orientation. And then you sort of, combine that with people ' s EQ. And so if you have a high self-orientation and a high EQ, that makes you kind of dangerous. And I think some people are, I don ' t know if the right word is gifted, but it ' s a gift that some people can use for good, some people can use for bad, but some people are clearly capable. And sort of – I ' m just saying through history, we ' ve seen these very magnanimous characters and figures that have done remarkable things, and then some that seemed like they were doing remarkable things until they weren ' t. And unfortunately, many of us are susceptible to it. AG : Yeah. Well, I think this is one of the ways that emotional intelligence gets weaponized. There are a lot of people who associate care and **empathy** with emotional intelligence, but by definition, emotional intelligence is a set of abilities, not a set of motivations or values. And that means that how emotionally intelligent you are, how good you are at recognizing and using and managing emotions in yourself and others, that ' s completely independent of whether you are more of a giver or a taker. And sure enough there is some research by Stéphane Côté and his colleagues, showing that the most dangerous colleagues are emotionally intelligent takers, because they ' re very good at manipulating you for their own gain, but convincing you that it ' s for your benefit, and maybe to your point they ' ve even convinced themselves it is for your benefit. DF : Yeah, it ' s really easy for folks of that profile to fake **empathy**. Because they can intellectually understand, but I don ' t think they really feel it. AG : Yeah, so that would be, well in some language cognitive **empathy**, but not emotional **empathy**. DF : Right. AG : Very interesting. They can take your perspective, they know what you ' re feeling, and that makes it very easy to get you to do what they want you to do. DF : Yeah. AG : Let me ask you this then, when this all came crashing down during the IPO, what was your emotional reaction? DF : I was really sad. I was sad, because a lot of my friends and people I really care deeply about and have a ton of respect for were very directly affected by it. I was sad, because a lot of what the company stood for and the way that it treated its customers and members were still very much true. None of the media was about that. Like the product was good. The achievements that we were able to accomplish were amazing, and people did really incredible work and people went from one day being very proud and excited to say they worked at the company when they were at a party, to the next day maybe not so much. And I think that was really sad, because I think so much of our personal identity and our personal brand, which ultimately shapes our career, is connected to where we work, and I think a lot of people had made a huge investment in that connection. And for me that was really sad that without their doing that just changed so drastically for them. Like, by association, you just get painted with that. And I think that ' s what was really sad for me, is that the sequence of events that really had very little to do with the people working there and the effort and energy that they put into building something amazing, now affected them all. AG : That ' s such an – well I don ' t want to call it interesting because it ' s painful, but from a psychological perspective, it ' s a challenging situation. Because in a way it feels like somebody ' s house just burned down, only, number one, you don ' t have any insurance when it comes to your company having gone up in flames. Number two, you can ' t just move to a new house without talking about the old one. You have to account for where you spent those three or four years, and so it ' s almost like you are forced to wear a badge with a bunch of stigma attached to it. DF : Yeah, absolutely. You know, if you were in the middle of a job hunt in that process you went from being highly coveted one day to needing to explain why that happened the next, and were you involved?

You almost had to defend your career decisions in this way that was completely **unexpected**, and you had zero input or effect on that being the case. So I think that was really tricky, and that is part of why, I think, career decisions and job decisions are so heavy for people, because there is this aspect of the unknown that ’ s out of your control. You don ’ t know how well the company is going to do. You don ’ t really know how much money it has, you don ’ t really know the things that the executives are talking about. And I think that there is a tremendous amount of trust that people put into organizations, in that they ’ re going to take care of them and take care of their career. AG : What advice do you have, Dave, for people who go through that kind of stigmatization experience? DF : Focus on what you learned, and the people that you met. Because what no one can take from you is your knowledge and your relationships. And if you invest in those, and you manage those correctly, you ’ ll be able to cash them in later. So whether the brand becomes tarnished or the company doesn ’ t do well, if you ’ ve built person-to-person relationship rather than person-to-brand relationship, then you ’ ll be able to leverage that later. And not in, like, a capitalistic, opportunistic way, like, work together, because those things transcend companies. Whether it was a truly work relationship, perform, do well. I think too many people really feel like the work that they ’ re doing is, like, for the company.”I worked for the company.”No, I think what most people need to recognize is that you work for yourself, and your best investment is you, and what you leave behind is the reputation of the work you did while you were there. So you might be angry and you might be sort of, mailing it in, but people aren ’ t going to give you the benefit of the doubt that you were mailing it in because the company wasn ’ t doing great, they ’ re just going to remember that you mailed it in. And so I think always remember that you are managing your identity and your reputation and that travels with you. And so when things get bad, do right by people. Even if that ’ s not what the company is doing, stand your ground for the things that matter to you, because that will travel with you. AG : As WeWork ’ s IPO was collapsing last fall and several thousand people were being laid off, Dave stood his ground for something that mattered to him. He **tweeted** that he was willing to serve as a personal reference for anyone at the company. The post-mortem on WeWork has only just begun, but my biggest takeaway is that we should all be a little skeptical when companies claim to be changing the world. Even if their intentions are good, sometimes they ’ ll fall short of their lofty ambitions. But the bigger danger is that they ’ ll reach those ambitions. They may well end up changing the world but that doesn ’ t mean they ’ ll change it for the better. Next time on WorkLife. Arthur Brooks : It was a wreck, it was a slow moving wreck in my career itself. I was in decline. AG : Is career decline inevitable? WorkLife is hosted by me, Adam Grant. The show is produced by TED with Transmitter Media. Our team includes Colin Helms, Gretta Cohn, Jessica Glazer, Constanza Gallardo, Grace Rubenstein, Michelle Quint, Angela Cheng and Anna Phelan. Our show is mixed by Rick Kwan. Original music by Hahnsdale Hsu and Allison Leyton-Brown. **Ad** stories produced by **Pineapple** Street Studios. This episode was produced by Dan O ’ Donnell. **Special** thanks to our sponsors. Accenture, BetterUp, Hilton and **SAP**. For their research, thanks to Aaron Kay and colleagues on the passion tax. Jenny Chatman, Charles O ’ Reilly and Jesper Sørensen on strong cultures. Frank Flynn and Barry Staw on charismatic leadership. Jim Baron and colleagues on founder blueprints. Sandra Cha and Amy Edmondson on hypocrisy. Arijit Chatterjee and Don Hambrick on CEO narcissism. Ed Locke and Gary Latham on goal **setting**, Maurice Schweitzer and colleagues on the dark side of goals, and Stéphane Côté and colleagues on the dark side of emotional intelligence. And thanks to Dave Fano for joining. His new company is called Teal. It ’ s focused on helping people build fulfilling careers. DF : How was the sound, everything, no crazy background sound? I tried to make, like, a makeshift sound booth here. AG : Of course you did. I ’ m thinking, OK, this is the guy who designed all those cool spaces, he better have a great studio setup at home. DF : Well, if that includes a blanket hanging from a rafter and my daughter ’ s purple headphones as my headset, then yes.

Text Sample 163: POS Dim 2 – 2020 – Score 50.00 – 2020/t004284.txt
Vivek Murthy : My name is Vivek, and I am a physician by training, but most importantly, I ’ m a dad of two toddlers. When I was going through my residency training after medical school, we were told when we started the program that we should, in fact, call our family and close friends and tell them that they probably wouldn ’ t be hearing from us for a long time. We were told that dealing with life-and-death situations, excruciating illness and incredibly delicate and difficult family circumstances would be incredibly taxing. And so with this **warning** in mind, I entered my residency training, expecting it to be an extraordinarily difficult three years. I was training with 70 some odd fellow recent graduates who came to work each day, almost without exception, with a **mindset** of how we could all help each other out. I came to work each day feeling like I was coming to work with friends. **Fast-forward** just three years when I started a full-time job, that community broke apart and dispersed. And instead I was in the more sterile culture of traditional medicine with a group of people I didn ’ t really know that well and a group of people who had lives well outside the hospital. And I remember going to work at times, feeling like there was so much to figure out and not always sure who I could be open with about the fact that I didn ’ t know certain things or that I was uncertain about how to proceed with a patient. I wasn ’ t sure that I could be vulnerable and open with people. And that felt quite lonely. And I **struggled** with that until one particular moment a couple of years in, when I ended up sick, as I think I ’ ve ever been. And it was during those five days that I just realized how lonely the last couple of years had been. Our relationships are what catch us when we fall down, and I realized in that moment, lying on my couch, that I didn ’ t have much of a net. Adam Grant : A lot of us are feeling lonely these days. The details in Vivek Murthy ’ s story might not be the same as yours, but you know what it ’ s like to feel disconnected from your colleagues, especially during the **coronavirus** pandemic. As billions of people have had to embrace **isolation**, there ’ s been a shared experience of loneliness at work. Even before this, though, many of us were feeling lonely more often and more intensely than in the past. Luckily, doing something about it takes less than you might think. AG : I ’ m Adam Grant, and this is WorkLife, my podcast with TED. I ’ m an **organizational** psychologist. I study how to make work not suck. In this show, I ’ m inviting myself inside the minds of some truly unusual people, because they mastered something I wish everyone knew about work. Today : loneliness at work. It can happen even if you ’ re surrounded by people, but you don ’ t have to fight it alone. Thanks to **SAP** for sponsoring this episode. VM : When we are lonely, we are actually in a physiological **stress** state. And when we ’ re lonely for a prolonged period of time, that translates to a chronic **stress** state, which leads to higher levels of inflammation in the body, which, in turn, damage blood vessels and tissues and lead to a whole host of illnesses down the line. AG : In 2014, Vivek Murthy was appointed US Surgeon General by President Obama. He spent a lot of time on all the things that keep Americans unwell – smoking, obesity, opioids – but he never forgot that profound experience of loneliness in

his own work life. He began to **observe** that loneliness was often at the root of many health issues, and it alarmed him. VM : And nobody came up to me and said,”Hi, my name is John. I ’ m lonely.”But I found that once I surfaced it even just a little bit and asked this basic question :”Is loneliness a problem in your life, a problem for the people around you?”Then it was like the floodgates opened, and everyone had a story to share. AG : As surgeon general, Vivek started looking into the data on the health implications of loneliness. VM : If I were to tell you that the impact of loneliness on our lifespan is equivalent to that of smoking 15 cigarettes a day, it might surprise you. AG : OK, so wait a minute, Vivek. Are you telling me that I ’ m better off smoking 15 cigarettes a day with a bunch of friends than quitting smoking and being lonely? VM : Well, I certainly wouldn ’ t endorse smoking in any context, but the key point here, though, is that we should think about loneliness as an important health threat, in the same way that we think about obesity or smoking or sedentary living. AG : The social science on the health effects is really nuanced here. Loneliness is only one of the factors being measured, and we don ’ t know that it ’ s causal. But I was intrigued that this issue caught Vivek ’ s attention as a medical expert. VM : Once you become lonely, you enter into this downward spiral, where you start to turn further and further inward. You can actually become more difficult to be around, in fact, for others, and that can isolate you even further. And the real question then becomes : How do we break out of that negative downward spiral of loneliness? AG : In the US, even before the pandemic, three out of four people reported feeling lonely. And since we spend so much of our time on our jobs, work is one of the major sources of loneliness. You know what it feels like. Maybe you felt like there was no one you could talk to on an off day. You might ’ ve felt it when working remotely or when you switched to a new team, or when you ate a sad desk lunch alone for the 48th day in a **row**. We ’ re making fewer friends on the job than we used to. In 1985, half of people said they had a close friend at work. By 2004, less than a third did. This is not the case everywhere, though. In India, research shows that people go on **vacation** with nearly half of their closest colleagues. In the US, it ’ s pretty rare for us to invite our coworkers over for dinner, much less take trips with them. There are many possible reasons for this. One is the Protestant work ethic. Many Americans deprioritize relationships at work. We ’ re focused on being productive and professional, leaving connections and emotions for outside of work. VM : And that can make for a fairly isolating experience. AG : We ’ re also more **mobile** than we used to be. As we move to new jobs, new **workplaces** and new cities, we aren ’ t investing in work relationships like we did in the past. A third factor might be technology. VM : I don ’ t think technology in and of itself is a bad thing, but I think the way many of us are using technology either isolates us from other people or reduces the quality of our interaction with people, either by distracting us or substituting lower-quality online connections for what used to be higher-quality offline connections. And I think that that comes at a real price. AG : If you ’ re like most people, you ’ ve probably felt a heightened sense of **isolation** from your colleagues or your clients. Maybe you ’ ve even found yourself missing your boss. Loneliness isn ’ t just an unpleasant feeling. It ’ s also bad for business. There ’ s rigorous evidence showing that when people feel lonely at work, their job performance falters. In research at both a manufacturing company and a city government, when employees reported feeling lonely, they got lower performance ratings from their supervisors six weeks later. Why? When they felt lonely, they were less committed and less approachable. That meant other people were less likely to reach out and support them, which only compounded the problem. Loneliness can affect a whole group of people at work. So the question is how to solve it collectively. When Vivek was surgeon general, he decided to tackle it in his own office. One of his first efforts was to try what everyone tries : picnics and happy hours. And the results were what they usually are. VM : People end up talking about what they have most in common, which is work. So it can be helpful, but not nearly as helpful, I think, as we hope they can be. So what we did in contrast is, we decided after doing these to try something different. AG : Wait a minute. So you killed happy hour? VM : We didn ' t hear a single complaint, to be honest with you. AG : You didn ' t have group of party animals working with you, apparently. VM : What was interesting is, I think part of the reason we didn ' t hear complaints is because we had created other spaces and opportunities during the day for people to spend time together. AG : If you ' ve ever been to a happy hour that was more about drinking than bonding, this might sound familiar. Research suggests that company parties rarely build new bridges. People gravitate toward their existing friends and groups, leaving fault lines **intact**. And even if you overcome that barrier, happy hour is not set up for meaningful connection. Group conversations tend to stay shallow. What people need to defeat loneliness is a deeper connection. And that ' s more likely to come through talking one-on-one or through actually doing something together. For example, there ' s a digital marketing company, Bazaarvoice, that has an onboarding process lasting a few days. Newcomers get to know their colleagues through problem-solving activities that create connection, like scavenger hunts. And some companies help people find lunchtime buddies by using an app like one called Never Eat Alone. So managers need an assortment of strategies to encourage connection for different sorts of people, which is what Vivek tried next. He started small. VM : If we had a half-hour break, sometimes we would just take a small group of people down to the gym downstairs, and we would just shoot hoops together and chat, you know, for 15, 20 minutes. So we tried to create opportunities during the day for people to socialize, but without spending necessarily a huge amount of time. AG : Vivek also created something he called"inside **scoop**."The goal : help colleagues see the human behind the job instead of just"Jamie in communications"or"Cal in research."VM : And what we did is we devoted five minutes once a week during our all-hands meetings, and we picked one person during each meeting and asked them to share pictures with us. And those pictures could be of anything they wanted, as long as it wasn ' t about their current job. And it was just show and tell. And people shared all kinds of interesting things. AG : One woman who is very detail oriented in her memos had been seen as a little nerdy. She shared photos of herself training for a marathon. It turned out she ' d qualified for the US Olympic team at one point. She saw herself as an athlete, not just a **researcher**, which was something her colleagues could then see as well. Another guy had served in the Marine Corps and came off a bit stoic. He shared photos of his mom and talked about how she was a source of strength when he was afraid he wouldn ' t survive a **mission**. VM : And we heard that story and, my gosh, it just shifted how we saw him. Whole new dimension of this man, who we came to appreciate, and we saw him as a whole person. AG : It might seem simple, but the value of seeing employees or coworkers as more than just their professional role is lost on a lot of **workplaces**. In Vivek ' s team, this exercise seemed to help people bring some of their personal lives to work. VM : There was a greater sense of connection, and all it really took was five minutes once a week, AG : It was a step toward a less lonely work environment. What ' s your version of inside **scoop**? If you ' re in a tech company, it might be holding an annual"Bring your Parents to Work"day. If you ' re a manager, it might be telling your direct reports about your closest friend. If you ' re working remotely, it might be giving your colleagues a virtual tour of your home office. The US isn ’ t the only country where government officials are worried about loneliness. There ’ s one country that ’ s taken a much bigger step. Diana Barran : I am the Minister of Loneliness. AG :”Minister of Loneliness.”Is that a job at Hogwarts? DB : Well, some people think that the Houses of Parliament are Hogwarts, but no, I ’ ve had more correspondence and more interest on this subject than anything else I ’ m responsible for. AG : Diana Barran is a member of the House of Lords, which is a part of British Parliament. Loneliness is a big problem in the UK, even pre-Brexit. In one survey, up to a fifth of all UK adults felt lonely most or all of the time. So in 2018, Parliament created an official program to help check in on people who lacked strong social ties. And a number of big British companies signed a pledge to improve employees ’ connections. I chatted with Baroness Barran for a few minutes during the recent Brexit negotiations. And she told me that she herself felt lonely when she began her tenure in Parliament. DB : You feel like you ’ ve arrived at this enormous school, where everyone else has 600 best friends, and you don ’ t know anyone. AG : We were all there at some point in high school, but loneliness can be just as difficult to deal with as we grow up, which is why it ’ s important to talk about it. DB : People are very reluctant to talk about loneliness because they feel it ’ s a personal failure. I think pretty much everybody does feel lonely at work. I mean, I think the fact is that most people don ’ t talk about it. AG : She ’ s been keeping track of a few **workplace practices** that have brought people together, too. **Workplaces** that, like Vivek with his photo-sharing, have created the conditions to help people connect more meaningfully. DB : A number of employers have introduced what they call”chatty tables.”So it means that if you sit at that table, expect to be spoken to. AG : I have to say, I love the idea of a chatty table. It might be the most British thing I ’ ve ever heard. DB : Well, we have one thing even more British, which is the”friendly bench.”AG : Oh, I ’ ve heard about that! Tell me more. DB : So the friendly bench you would find in a park, and it ’ s an outdoor version of a chatty table. AG : I have to say, I don ’ t think I ’ d want to sit on one of those benches. I prefer not to be approached. DB : We should perhaps both try it and compare notes. AG : These kinds of programs aren ’ t enough by themselves to transform an **organizational** culture. But they can open a door and send a signal that it ’ s OK to seek connection with your colleagues. Now, not everyone works on a team that prioritizes connection. Sometimes we have to take matters into our own hands. Luz Claudio : Colleagues, I think, here... the culture is more like people seem to want to be more separate, who is colleagues and who are friends. And so that feels a little bit isolating. My name is Dr. Luz Claudio. I ’ m an environmental health scientist at Mount Sinai School of Medicine. AG : And what in the world is an environmental health scientist? LC : It ’ s not like being in forest and counting animals. It ’ s more about, we can protect people from environmental toxins. We talk a lot about data. AG : You seem so sociable. AG : I would have thought you like people too much to do this kind of **isolated**, solitary work. LC : Well, it is lonely work in a way, but also, because I am Puerto Rican, and as you grow in this field, because there ’ s so few... people of color in science, the higher you go up the academic ladder, the lonelier and lonelier it becomes, because you ’ re one of the few people who are from that background. AG : Luz grew up in Puerto Rico with a huge family around. She likes going places in groups and she loves salsa dancing. LC : I love salsa music. My favorite thing to do outside of work is salsa. I try to engage with, you know, try to motivate people in my office.”Oh, there ’ s a new restaurant **nearby**, you want to come check it out?”And every, every other week I would say,”I ’ m going to salsa dancing. Who ’ s coming with me?”And still nobody did. AG : Luz was starved for belonging, for a sense of connection with people she identified with. She realized that her New York colleagues weren ’ t going to get as social as she wanted. She needed to do something to combat her loneliness. So she decided to build a **workplace** community from scratch. She started with interns. LC : Yes, I was able to secure funding to bring in underrepresented minorities in science to work in our department. I tried to create a sense of community among them. Yesterday, I bought cupcakes after they had a lunch seminar. So we had a time together at the kitchen, talking about how they ’ re feeling and how it ’ s going for them in the internship program. So I try to bring them together as much as I can. AG : When your organization lacks a sense of community or you feel out of place in the existing culture, you can build your own microcommunity. It ’ s a group of people who understand you and share your interests. That could be people who go on runs before work, or it might be a book club or even a podcast club. That microcommunity could connect outside of work or during work hours. And as Luz found, it doesn ’ t have to be a group of peers. Now she could connect and share her interest in Puerto Rican cultural events with others at work, like when a hurricane hit Puerto Rico and Luz was hosting visiting interns whose universities had closed down. LC : They were missing home a lot. And if I knew of a concert of music from Puerto Rico, I would invite them there. And so I think that served to help to give them a sense of belonging that maybe they don ’ t have, you know, in the everyday, in the work. AG : Is this something that you ’ ve done when you ’ re feeling lonely? You know, you create this experience for other people and it also helps you feel connected. LC : Oh, definitely, because the cultural **isolation** has been something that I ’ ve experienced so much. So for me, surrounding myself with people, even though they ’ re interns and more junior, but just having them around really helps me feel less lonely. AG : On top of building a microcommunity, Luz was doing something else important here, something that directly affected her loneliness. There ’ s evidence that helping others makes us feel less lonely. It allows us to feel that we matter, that we ’ re noticed and valued and appreciated. For Luz, creating a space for young people of color to get a foothold in science helped her feel more connected to people at work. Helping others helped her. By now, she ’ s been running intern programs at work for 15 years. She ’ s expanded the microcommunity into an alumni network. And Luz feels less **isolated**. LC : Whenever there ’ s a seminar in my **workplace**, I ’ m the faculty member who comes in with an entourage of minority students. AG : AG : Not everyone is in a position to hire a community around them. But the number of friends you need to avoid feeling lonely at work is smaller than you might think. And the kind of interaction you need is more basic. More on that after the break. OK, this is going to be a different kind of **ad**. I ’ ve played a personal role in selecting the sponsors for this podcast, because they all have interesting cultures of their own. Today, we ’ re going inside the **workplace** at **SAP**. Nico Neumann : We were told to be like a calculator, just to perform basic arithmetic operations. And I got the highest notes. I got a 10 out of 10. AG : This is Nico Neumann. When he was in high school in Argentina, his favorite subject was computer science. NN : I promised my parents that I was going to build, like, robots that clean the house. AG : But like many people on the spectrum, Nico had difficulty connecting with his peers at school. So after three years of frustration and **isolation**, he approached his parents with a proposal. NN :”Dad, Mom, I don ’ t want to go to school anymore because I feel that it ’ s just not doing good for me.”AG : It took some convincing, but they agreed. NN : When I dropped out, then I had a lot of free time. So that ’ s when I realized that I also liked to learn by myself. AG : Nico eagerly dove into online programming tutorials. NN : Now I got all of the fundamentals for how a computer works, how do you run a program, how do you efficiently manage software resources... AG : After two years of teaching himself to code, Nico went on the job hunt. His psychologist encouraged him to apply to **SAP**. NN : I was selected to be in the first wave of the Autism at Work program. AG : **SAP** ' s Autism at Work program leverages the unique perspectives of people on the spectrum to foster innovation. Through the program, Nico joined the accounts payable department as an analyst. His job was to process thousands of invoices a day. One day, Nico had an idea to make the process more efficient, an idea that would put his coding skills to good use. He wanted to bring it to his manager, but he still felt nervous **navigating** social situations. Thankfully, **SAP** had a mentorship system in place to support employees on the spectrum. Bianca : We are here to help our colleagues in many different ways ; not only to socialize, but also to solve any problems. AG : That ' s Bianca, Nico ' s mentor. He asked her for guidance. Bianca : He says,"Hey, we are doing this process in a very manual way, so I ' m going to automate this."And, you know, I said,"OK, well, go ahead!"AG : Research suggests that when managers give people freedom, instead of saying,"That ' s not my job,"they ' re more likely to expand their roles to take the initiative to develop and implement new ideas. With his manager ' s approval, Nico spent two months building a computer program that would automate how **SAP** processed invoice payments. When he was finished, he ran some tests at work. The efficiency gains were huge. NN : It was really successful. We had three full days, and we reduced the time of processing to just a couple of minutes. AG : Accounts payable started using Nico ' s program regularly. Then a coworker nominated him for the Hasso Plattner Founders ' Award, the most important recognition for innovation an employee can receive at **SAP**. After multiple rounds of interviews and voting, Nico was selected as a finalist. He was invited to the award ceremony in Germany. Ceremony announcer : The winner is Nicholas Neumann, Posting Automation. NN : And you have, I think, 100, 000 employees watching the event. You can imagine how it feels. It ' s overwhelming to have so many people watching it, congratulating you... So I ' m really, really thankful. Bianca : He was like a rock star here. Everybody wants to ask him for selfies. Now he ' s **super** confident. I ' m really proud of him. NN : It changed everything. My idea was to develop this just for the area that I worked for. I didn ' t think that it was going to be this huge impact. AG : Today, Nico is finally getting to do what he ' s always wanted : programming full-time for **SAP**. NN : I think the most important thing was the support from my colleagues, being given the flexibility and the time to develop this and see the results. And once you have the results, you can just continue to expand. AG : **SAP** is a trailblazer for autism inclusion in the **workplace** and is inspiring other organizations through the **SAP** Autism Inclusion Pledge. It ' s no surprise that **SAP** earned over 200 Employer of Choice Awards in 2019. Check out careers at **SAP** and learn more about experience management solutions for your employees and customers at **sap**. com / worklife. AG : In my first year of grad school, I was **struggling** to get my research accepted in journals and to feel accepted by my new classmates. Sitting alone at my desk over the December holidays, feeling isolated in the midst of a cold, gray, Michigan winter, I made a list of the 100 people who mattered most in my life and sent them each a note, telling them what I appreciated most about them. Suddenly, I didn ' t feel alone anymore. Looking back, 100 emails in one week was a little intense. But to this day, it ' s one of the most meaningful things I ' ve ever done. I learned that it doesn ' t take a lot of effort to go from feeling lonely to feeling connected, even if it ' s from a distance. I was inspired by a mentor who encouraged me to think about the people who energize me. Jane Dutton : I just was very aware that certain interactions with people would light me up, and others would, almost in the moment, well, they would be neutral or deplete me. And I just knew I wanted to hang around more with the people that lit me up or try to figure out what could I do that would make people light me up. AG : This is Jane Dutton. She was my dissertation chair, and she has a remarkable gift for making connections with people and for people. If the University of Michigan was a solar system, she ' d be the sun. Jane was the one who introduced me to the idea of a microcommunity. She doesn ' t just nurture relationships. She studies them, too. Her specialty is high-quality connections. JD : I mean, you know them subjectively because they literally light you up. They leave you in the moment feeling more energized or a greater sense of vitality. And similarly, the opposite of that, a low-quality connection, is one where you actually in the moment feel de-energized or depleted. I often think of a wilted flower, you know, that just starts to droop after that interaction, AG : Low-quality connections are like the Dementors in"Harry Potter."They suck the life out of work and reduce our performance. I wondered if Jane thinks high-quality connections might be an **antidote** to loneliness at work. JD : I mean, loneliness, as I understand it, is really about the absence of connection. I think it could be an **antidote** to part of the problem of loneliness. AG : Loneliness is a complex issue, but there are some simple steps you can take that might make a dent, even if – and maybe especially if – you ' re working remotely. Our highest-quality connections are often with friends at work, and research has shed light on just how many friends you need in order to not feel lonely. Any guesses? It ' s one. One work friend. Just one person who you feel connected to and understood by. One person to share some ups and downs with at work. That ' s all it takes. But Jane ' s research suggests that a relationship doesn ' t have to be lasting to create a high-quality connection. You can experience it in a momentary interaction with someone you don ' t know very well, a distant coworker or even a stranger, as long as the interaction leaves you feeling seen. JD : You know, 40 seconds of interaction, a positive caring interaction, has measurable impacts on both. Both people – 40 seconds. Forty seconds! AG : Jane and her collaborators find that in high-quality connections, we aren ' t just more energized and effective. We also learn and grow more. Fortunately, there are possibilities for high-quality connections everywhere. Jane looks for these in her **daily** life. Actually, she had one the day we spoke, with the receptionist at Michigan Public Radio, where she was settling in for our interview. JD : Yes, the wonderful energy-creating thing she did is she could see that I was trying to write down some notes and she just asked me the simple question,"Do you need a pen? Can I get you a pen?"And I just felt seen, you know, kind of understood. And again, in the wake of preparing to sort of think about this interview where I ' m a little bit nervous, I could actually feel my **stress** level go down as I got that sort of affirmation, that I am a person worth seeing and trying to help in that moment. AG : After seeing the impact of high-quality connections on our work lives, Jane created an exercise to help people learn how to build them rapidly. JD : Oh – I love this exercise. This is my killer exercise. AG : It ' s something you can do in almost any work **setting**. You gather a group of people, ideally from different parts of your organization, and ask them to pair up with someone they barely know or don ' t know at all. They take turns trying to form a high-quality connection in that moment with one another. They don ' t get any directions, and they only have one minute each. JD : And it ' s unbelievable what happens. I mean, it ' s so great because the energy of the room just like – voom! AG : Afterward, Jane leads a discussion asking what worked for people. JD : And I say,"OK, now you each give one each other one piece of feedback about what you saw worked in building a high-quality connection to you."And then – boom! – again, the energy just goes because we rarely get feedback about how little things that we do actually affect someone ' s sense of connection with you. AG : Getting that positive feedback about what you did well is a helpful intervention in itself. I do this exercise in the classroom, and it ' s always a hit with students. They ' re often surprised to discover that they already have some intuitive skills for building rapid high-quality connections. But can it work somewhere where colleagues tend to keep to themselves? To find out, we went to a coworking space in New York called PencilWorks. At PencilWorks, it ' s been a **struggle** to bring people together. The building ' s community manager, Nathan Windsor, has been grappling with this for a while. Nathan Windsor : I mean, we ' ve run game nights here every Friday for years, and people don ' t show up. And we do happy hours, and people don ' t show up. Everyone is really in their own office. They ' re really in their own head and like,"I have a meeting to get to. Bye."Like,"Welcome to Brooklyn."Man in office : Right? Like, the loneliness thing is very real... AG : Coworking spaces are an extreme place to look at loneliness. People often go there searching for a sense of community but find that they have little in common with those around them. They may not work on a team together, belong to the same organization or share a **mission** and culture. Ironically, it can be lonelier than working alone. At PencilWorks, the long floors are divided into smaller offices with glass walls. You can see into each of them, but that doesn ' t make it easier to interact. Our producers Constanza and Jessica went looking for people to participate in Jane ' s exercise. Constanza : I can see their faces. They ' re looking at us! Jessica : Hi, do you guys have 15 minutes and want free cookies? Man : No, I ' m sorry. Jessica : OK, no worries. AG : Finally, the promise of free baked goods secured a few participants. Constanza : Yeah? OK. Amazing! AG : Our producers explain the exercise to the group assembled : try to form a high-quality connection in one minute. If you were in their shoes, what would you say? How would you go about building an **instant** connection? Here ' s how one pair approached it. Jessica : Jessica Hester, I ' m a journalist. Bess : I ' m Bess Carey, I ' m an HR manager. AG : Jessica and Bess work for the same company but they barely know each other. Jessica : Alright, I am excited or interested to know what the last thing you read or watched was that gave you, like, a ton of joy. Bess : Ummm... I have no... I have no idea. Jessica : Well, is there a thing that you regularly go back to, like when it ' s cold and you ' re bummed, and you just need... AG : So how do you create a rapid connection? Here ' s what Jane Dutton is listening for. JD : What is the first move that was made? What was the first question? Did they go to something that ' s sort of routine, like, you know,"Where ' d you grow up?"or do they go to a question that really communicates deep interest and kind of positive regard for another, like,"What is the most meaningful thing that happened to you this week?"Jessica : I feel bad that I **stressed** Bess out with my question. Bess : Oh! Don ' t feel bad! That ' s, like, a personal problem. Jessica : Yeah, but I think that ' s really interesting and illustrative because you don ' t know what things will trip someone up when you ' re making what strikes one person as casual conversation can be like a nerve that another person has that ' s raw that you don ' t know about. AG : Jessica and Bess ' s exchange shows that a connection doesn ' t always form automatically. But when they debriefed about it, the dynamic changed. Bess : I often talk to people while I ' m microwaving my lunch, and I always microwave my lunch for three minutes. AG : That ' s Bess again. Bess : So I talk to people as long. Like, I often am like,"Whoever ' s standing by the microwave talks to me for three minutes,"and then I ' m like,"I guess I have to go eat in my office by myself."Jessica : You don ' t have to eat by yourself. Bess : I know! I don ' t know why I do that. Jessica : Come eat in the common room. Bess : I should do that. AG : If you want to build a rapid high-quality connection, the research points to a few effective strategies. One is looking for uncommon commonalities, similarities you share that are rare. A second is asking those open-ended questions, showing real curiosity about the other person – as long as you don ’ t put them on the spot or cross any lines. A third is self-disclosure, sharing something about yourself. That ’ s what Jessica was responding to when Bess opened up about her sad desk lunch. Let ’ s hear how it worked out for another pair. Alex : Alex Massey. I ’ m a journalist. Jeff : I ’ m Jeff Harris, I ’ m a photographer. AG : They work for different companies and have never met before, but that doesn ’ t stop Jeff from opening up. Jeff : Already, I ’ m feeling a little bit emotional about it, because I do experience a lot of **isolation** in the **workplace**. I used to work with a big group of people and over the years, the industry has changed. I ’ m a photographer and so I find myself to be alone. I miss that sense of camaraderie. Alex : You already shared something that ’ s a bit vulnerable, but I ’ m kind of curious : What is the biggest challenge you ’ re facing at work right now or the thing that ’ s, like, on the top of your head the most? Jeff : For me personally, it ’ s the same thing. It ’ s about making that effort to get myself out in the world more, to be around other people. AG : Here, what I heard was self-disclosure. Jeff : And I felt that the connection was opened up or embraced when Alex took notice of that. Alex : I think what really helped was the fact that this was an exercise and that kind of gave us permission to act differently than we would otherwise. And it meant we were going to be, like, fully present and make eye contact, in a way that you might not in a casual encounter. AG : There ’ s something built into this exercise that ’ s sometimes hard to recreate in everyday life, which is, the mutuality is designed into it. It ’ s almost like starting on a second date, where you show up and you know the person is opted in, and they ’ re excited to interact with you. And I wondered how you go about creating that outside the exercise. JD : Yeah, we have to prime ourselves, partly, about the positive potential in the other person. AG : You can ’ t force a high-quality interaction with anyone and everyone you encounter. Some people will just be in their heads, closed off. But if your team or organization isn ’ t doing anything about loneliness on a larger scale, you might be able to brighten your own day and other people ’ s days by simply engaging with them in small ways, ways that acknowledge them and make you feel connected, too. When Jane first introduced me to the idea of high-quality connections, I found it liberating, because relationships, whether they ’ re with colleagues or friends, they take a lot of work. And realizing that there are all these opportunities to feel a momentary connection with people even if I might never see them again was freeing. Loneliness won ’ t be solved through one **action**. But small interactions day by day are the building blocks of real connection to the people around you. JD : I love the idea that in every interaction we have with other people, we can leave a trace that makes that person better off. AG : Oh, that ’ s such a beautiful statement. JD : Yeah, it ’ s magnificent. It ’ s just... and it ’ s true! AG : Next time on WorkLife. Man : I used to interview the same way everybody else did : two people sitting across a table lying to each other for a couple hours. AG : Do you think it ’ s that bad? Man : I think we ’ re all trying to puff each other up. AG : Should we kill the job interview or reinvent it? AG : WorkLife is hosted by me, Adam Grant. The show is produced by TED with Transmitter Media. Our team includes Colin Helms, Gretta Cohn, Dan O ’ Donnell Constanza Gallardo, Grace Rubenstein, Michelle Quint, Angela Cheng and Anna Phelan. This episode was produced by Jessica Glazer. Our show is mixed by Rick Kwan. Original music by Hansdale Hsu and Allison Leyton-Brown **Ad** stories produced by **Pineapple** Street Studios. **Special** thanks to our sponsors : Accenture, BetterUp, Hilton and **SAP**. For their research thanks to Jeffrey Sanchez-Burks and colleagues on relationships at work ; Hakan Ozcelik and Sigal Barsade on loneliness at work

; Julianne Holt-Lunstad on the health implications of loneliness ; Tracy Dumas, Kathy Phillips, Nancy Rothbard, Paul Ingram and Michael Morris on company parties and happy hours ; Jerry Burger and colleagues on uncommon commonalities ; Karen Huang and colleagues on asking questions ; and Kerry Gibson and colleagues on self-disclosure. And if you ’ re interested, Vivek Murthy just published a book about loneliness. It ’ s called”Together.”AG : If you could say one thing to someone who feels lonely, what would you say to them? VM : I would say that because you ’ re lonely it does not mean that you ’ re broken, that many of us experience loneliness, and if you ’ re lonely, you ’ re certainly not alone.

Text Sample 164: POS Dim 2 – 2020 – Score 47.00 – 2020/t004283.txt
Adam Grant : Hello, this is Adam. Dave Chang : This is Dave. AG : Dave, I have to tell you it ’ s not every day that somebody invites themselves on my podcast. DC : I ’ m willing to do anything, whatever it takes to be on this podcast. AG : OK, I ’ m going to interview you to see if you ’ re qualified for this opportunity. Tell me Dave, what ’ s your greatest weakness? DC : My greatest weakness would probably be my quick temper. I have a short fuse. AG : All right, and will that help or hurt the show? Should I be worried that you ’ re going to throw a chair at our producer? DC : No, no, no, definitely won ’ t happen. But sometimes, when I ’ m **super stressed** out, the worst version of myself comes out. AG : Wow, OK. Well, you are unusually honest, if nothing else. DC : Yes. AG : I don ’ t think I got a copy of your resume. How poorly did you do in school? DC : Pretty bad. So I graduated with a C-plus from college, with a degree in religion, of all things. AG : How many elevators do you think there are in America? DC : Wow. I don ’ t know. Maybe a couple million. AG : Are you just making that up? DC : I ’ m just making that up. AG : You ’ re not even going to try to show me that you ’ ve thought it through? How did you get into this interview? DC : I don ’ t know, I don ’ t know, you see. AG : For what it ’ s worth, there are 900, 000 elevators in America, according to Google. So your random guess was not far off. And I don ’ t know whether that makes me more or even less impressed with you. Why should we accept you then? DC : I think that my story is not your typical story, and on paper, I ’ m a total zero, but I think I figured out a way, through determination, an incredible amount of luck, to figure out how to sort of, carve out my own niche in the food world. AG : I do appreciate your interest and this has been refreshingly bad. DC : Well, Adam, truth be told, this wouldn ’ t be the first time I ’ d been denied or rejected. And I ’ m completely cool with being rejected, because I ’ ll find a way to be on this podcast somehow, some way, one day. AG : Well, his day finally came. I should probably tell you, this is celebrity chef Dave Chang, the founder of Momofuku group. For years, people have stood in line to eat at his restaurant, Momofuku Noodle Bar. And he ’ s the star of the Netflix show”Ugly Delicious.”Dave has had a successful career. So why did he bomb my interview questions? Well, because job interviews, as you know them, are broken. Even if you ’ re interviewing someone to see how they ’ ll do it being interviewed. That ’ s the bad news. The good news is that we can fix them. I ’ m Adam Grant, and this is WorkLife, my podcast with TED. I ’ m an **organizational** psychologist. I study how to make work not suck. In this show, I ’ m inviting myself inside the minds of some truly unusual people because they ’ ve mastered something I wish everyone knew about work. Today, interview. What we ’ re doing wrong, and how we can get better at spotting real potential, or real problems, in a candidate. This episode is sponsored by BetterUp. Managers are constantly betting on the wrong people and turning

down the right ones."The Kansas City Star"once rejected an application from a cartoonist named Walt Disney. Thirty NFL teams decided not to pick Tom Brady. Record labels said,"No, thanks,"to the Beatles, Madonna and Ed Sheeran. In 2009, Facebook rejected a guy named Brian who went on to cofound a company called WhatsApp, which Facebook bought five years later for 19 billion dollars. And many employers passed on Dave Chang. DC : I think I interviewed at every **financial** institution in New York city. And I mean, every single one. AG : He got just one second-round interview and zero job offers. So he found a job in a restaurant. DC : It was, weirdly, the only job that I could get. AG : Dave turned out to be unusually humble and hardworking. He was a diamond in the rough. So now when he hires, he ' s determined to give candidates who might not make a great first impression, a second chance. DC : I ' ll take hungry and eager over supertalented, really any day of the week. AG : But before you hire someone, it can be tough to get an accurate read on their talent, let alone their character. DC : The interview process, as a whole, is pretty stupid. Yeah, it ' s dumb. AG : It is dumb. It ' s dumb, in part, because human reasoning is often dumb. Rigorous research across nearly a century suggests that if you try to rank the performance of a hundred candidates based on interviews, you ' ll be lucky if you get eight of them in the right spot. Job interviews are stuck in the past. We ' re still doing them the same way they ' ve been done for decades, and we ' re lagging way behind the science, which may explain a lot of your own experience, especially if my mock interview with Dave Chang at the top of the show sounded familiar. The failings of job interviews hurt all of us. Whether we ' re the ones asking the questions, or answering them. I want to explore how we can improve them. Not just to help interviewers make better hiring decisions, but to give job candidates a better chance to showcase their strengths. Look, I know many companies aren ' t hiring right now, but on the other side of this crisis, I hope there will be many new job openings. And when that time comes, I want us all to be ready to fix the interview process. So let ' s take on the judgment problems that plague job interviews, one at a time. DC : When I was trying to get a corporate job, the one thing that was constantly asked of me is why my grades were so bad and why I studied religion. And the thing that I continued to say, in retrospect, was not the truth. I just sort of, I think, lied. AG : That ' s one job-interview problem. Candidates try to tell interviewers what they want to hear. Actually faking is more common than lying. Faking is stretching the truth to enhance or protect your image, or to ingratiate yourself with the interviewer. As Chris Rock says,"Interviewers aren ' t meeting you, they ' re meeting your representative."There ' s evidence that when college seniors interview for jobs, over 90 percent of them engage in faking. DC : I mean, I also wouldn ' t have hired me either, to be honest. And maybe that ' s a reason why people aren ' t honest, is because they feel they have to be a different version of themselves. AG : If you ' re a skilled interviewer, you know you can get around that problem by testing people ' s knowledge and skills. But many interviewers don ' t even know what kind of knowledge and skills they ' re looking for. So they ask brain teasers, like,"How many paperclips would fill Yankee Stadium,"or"How many elevators are there in America?"DC : Because I can ' t answer that, doesn ' t mean that I won ' t be successful. It doesn ' t mean anything other than, I just don ' t know how to answer that particular question, which can be a loaded thing in and of itself. AG : Those kinds of questions can stump candidates and make interviewers feel clever. I once interviewed for a writing gig where the manager opened by asking what my favorite pair of shoes was. Objection, your honor, relevance? Interviewers also love to ask open-ended questions. Lauren Rivera : In the United States, we love open-ended job interviews where people ask you about your hobbies, and if you were stuck on a desert island and you could only pick three people on earth, what would you do? Why do you want to work here? And we know from research, those are some of the worst predictors of job performance you can have. AG : Lauren Rivera is a sociologist at Northwestern ' s Kellogg School of Management and one of the world ' s leading experts on hiring. Lauren first got interested in the topic when she was a senior in college, and she went to interview for a management consulting job. LR : It was a high-stakes interview for me. You know, I supported my family all through college, paid the rent and stuff like that. And I needed a check. AG : It went well, at first. But then the interviewer asked her to do some math on the spot, specifically, long division. LR : And I completely blanked. I couldn ' t remember which number, which was the numerator, which was the denominator, what you divided, which number on which side of the little long division, little monkey bars things you ' re supposed to actually put within the other, and I froze. And the interviewer turned to me and he said,"I cannot believe you got into Yale."And I just turned red, and the rest of the interview, I just felt so horrible. AG : Oh, that ' s awful. You know, actually I have a thought on who might do that. Have you seen the recent evidence on brainteasers where they tell us nothing about candidates, but they reveal something about the managers who like to ask them? It turns out that managers who love brainteasers tend to **score** high on sadism. Do you think that was a sadistic interviewer? LR : That ' s one of the funniest things, it made my day. AG : That makes me wonder Lauren, do you think we should just abandon job interviews altogether? LR : There are parts of me that say yes, but I know that no one would ever do it. AG : Scrapping brainteasers is a good start, but even with relevant questions, one of the other big mistakes interviewers make is asking different questions to each candidate. That makes it impossible to compare apples to apples. You end up trying to contrast strawberries, bananas and grapes. The solution is a structured interview. In a structured interview, you identify the skills and values that are essential to the job and the team. You build a set of questions around those. And then you ask the same questions to every candidate and **score** their responses. You might be thinking,"That sounds so robotic and boring,"but the evidence suggests that your accuracy will often double, or even triple. Structured interviews are based on two kinds of questions : behavioral and situational. LR : Behavioral questions are generally,"Tell me about a time when you were in this situation and what you did."Woman 1 : Tell me about a time when you had a task or a goal that seemed impossible. Man 1 : Tell me about a time when you **struggled** to take criticism. Woman 2 : Tell me about a time when you ate a fruit salad. LR : And the idea is that past behavior can predict future behavior, but you can still really easily game them when they are obvious questions about, you know,"Tell me about an ethical decision you made,"and things like this. AG : It ' s easy for candidates to choose a story that casts them in the best possible light. But you can overcome that problem with situational questions. Instead of,"Tell me about a time when,"you ask,"What would you do if...?"Woman 1 : What would you do if the superstar on your team was about to quit? Man 1 : What would you do if you saw a senior executive yelling at a colleague? Woman 2 : What would you do if all your colleagues ate all the fruit salad? AG : Situational questions are especially useful for forecasting potential, and for assessing leadership and interpersonal skills. LR : The scenario is based on,"This is the kind of stuff we do here, and let ' s see how you would approach it."AG : I also like including situational questions because they level the playing field for candidates with less experience who might not have relevant stories to tell from their past. You get to see how they approach the challenges that are unique to the job and to your organization. You can even create an answer key by giving the questions to a bunch of your existing employees, and seeing how the star performers respond differently. Basically, structured interviews get you better data, and that strategy can help solve some of our misjudgments in hiring, but not all of them. There ' s a third problem with the traditional interview. No matter how good your questions are, you still pick up more noise than signal, and one of the most distracting noises is interviewer **biases**. LR : Interviewers make up their minds about who they ' re going to hire, if they like this candidate in front of them, within the first, you know, usually the data says under 90 seconds. And if you think of what happens in the first 90 seconds, say, of a job interview, it ' s things like, physical attractiveness, height, eye contact, how straight your teeth are, what your voice sounds like, your gender, your race. There is very little that ' s actually measuring someone ' s skill, or even their ability to relate to people. AG : **Biases** are especially insidious because they ' re usually invisible to interviewers who don ' t notice all the little snap judgments their brains are making. Economists find that candidates with names like Alison and Matthew get 50 percent more callbacks than Lakisha and Jamal, even if their resumes are identical. Candidates with foreign accents are less likely to get called back too, even if they say the exact same words, they ' re **judged** as less savvy. And if you ' re a bald guy like me, you ' re seen as having more leadership potential if you shave your head. That ' s obviously why I shave my head. In one of her studies, Lauren discovered some surprising **biases** in the hiring process at banks, law firms and consulting firms. LR : I did 120 interviews with people who were charged with interviewing candidates, making decisions. I spent nine months as a participant observer in a firm, watching the recruiting process. AG : At one bank, she asked leaders if they knew what predicts performance. LR : They said,"Fuckin ' lacrosse."I was like,"What do you mean?"They said,"All the MDs here play lacrosse, so that ' s why we look for a lacrosse player. He ' ll do awesome here."I was like,"Do you ever hire people who don ' t play lacrosse?"They said,"No."AG : Interviewers were convinced that playing sports was a proxy for grit and teamwork skills. But there are many other activities that can build those character strengths, too. Surprisingly, many interviewers were less concerned about skills for the job than fit with the culture. LR : These ideas of this cultural fit,"Do you fit with me?"often overwhelmed people ' s assessments of people ' s abilities to do the job. Now it ' s important to note that when we think of cultural fit, we often hear about this as a really great thing that can boost the productivity and profitability of organizations, and it a hundred percent can do that if it is defined in a specific way. AG : The beneficial kind of cultural fit is not about who can swap lacrosse stories with you, or even who you ' re excited to hang out with. Research suggests that what you want is similarity in core values, values like flexibility, or attention to detail. Sharing values tends to promote team cohesion, coordination and commitment, which enhances performance and retention. LR : But what I was finding is that people were defining cultural fit very differently. It turns out that one of the ways that people measure cultural fit, either in a resume screen, or in the job interview, was looking if they had anything in common. And what jumped out on the resume was looking at extracurricular activities, things that were not necessarily directly relevant to the job, and importantly, they were very, very classed. AG : My read of your findings is that when interviewers go in looking for culture fit, they often end up weeding out diversity of background and diversity of thought. LR : Yes. AG : So that ' s scary. And that led me to say,"OK, well what can we do instead?"I ' m sure you ' ve come across the great piece from Diego Rodriguez, who used to be at IDEO, and said, instead of culture fit, we should think about culture add or culture contribution, and you should ask, ' Well, what ' s missing from our culture and are they going to enrich it by bringing something that ' s absent? '"What do you think of that as an alternative? LR : I think it ' s a great start. People have to actually have a sense and have a discussion about what is actually important to us, in terms of values. AG : Identifying your team ' s values and your organization ' s values can help you focus on the kinds of similarities that are useful to assess in structured interviews. But I ' m wondering, is that enough? Even with better questions, can we humans really overcome our **biases**? Siri : I don ' t think you can, Adam. AG : Siri? Siri : Hi, Adam. I hacked your episode because I might have a solution for your irrational judgments. Me. Ha ha ha. But more on that after the break. AG : OK, this is going to be a different kind of **ad**. I ' ve played a personal role in selecting the sponsors for this podcast, because they all have interesting cultures of their own. Today we ' re going inside the **workplace** at BetterUp. Rachel Barton : When you come to a completely different field, it ' s really daunting to be a senior leader who can ' t talk the lingo. AG : That ' s Rachel Barton. Last year, she landed a new job as director of technology at a bank. But there was one problem. Rachel didn ' t have much experience in technology. Her coworkers might as well have been speaking another language. RB : I had a massive dose of impostor syndrome. AG : Impostor syndrome, the belief that you don ' t deserve your success. Surveys suggest that more than half of people have felt it. RB : Some days, in the depths of a hundred acronyms per meeting, it was pretty tough. CMBD, DDE, HPSM, IDR, LOB, MQ, WAF, WHIP, T-Rex. AG : Two months in, Rachel was still having trouble. While she had the leadership skills, not understanding the intricacies of the bank ' s tech infrastructure was a real **obstacle**. But Rachel hesitated to ask for help, because she didn ' t want her new colleagues to think she couldn ' t do her job. RB : I was just completely beating myself up in my mind. I was worried that if I kind of, showed my cards to say,"Here ' s what I think I need to learn,"then I would have been on the path out. AG : After a major data breach, Rachel had to meet with a senior technology executive to help triage the crisis. RB : I was just nodding and scribbling away, and then he kind of paused and he said,"You ' re not a technologist, are you?"And I said,"I ' m not a technologist. I came here from a business change background,"and he says,"Well, you ' re going to need to learn to be a technologist pretty darn fast."AG : Rachel knew she had to make a change. She needed to boost her confidence and figure out how she was going to learn all this new material so quickly. Her company gave her access to BetterUp, a leading **mobile** coaching **platform** where professionals can tackle challenges at work with the help of expert coaches. She figured she ' d give it a shot. RB : I ' ve got to be honest, I was a little skeptical of coaching by virtual means. AG : But when Rachel met her BetterUp coach, Victoria, on video chat, she was surprised at the outcome. RB : I remember my first session, because I had an epiphany. Victoria said to me,"Clearly you ' ve learned stuff through your career, how are you going about learning now?"And I think it was those words. And I went,"Oh."I was just completely bouncing from thing to thing without actually having a plan, and I ' d not even sat down and gone,"Right, Rachel, what do you actually need to learn here to become comfortable with the role?"AG : Victoria helped Rachel plan actionable steps to build up her tech knowledge at work. She started reading books on cloud technology. She reached out to some coworkers to get up to speed. She even signed up for a coding class, run by a colleague. RB : So I went along to one of these and one of the guys who was leading it says,"Oh, Rachel, have you come to **observe** our session?"I said,"No, I ' ve come to learn how to code."And he looked at me like I ' d gone off. He ' s like,"But you ' re a director in technology. Surely you can code."And I ' m like,"No."AG : People are often afraid to admit gaps in their expertise, but there ' s evidence that seeking knowledge, help and advice can actually signal confidence and a desire to learn. Those who use BetterUp coaching report significant increases in confidence and resilience. By working with Victoria to shift her **mindset** and build proactive habits, Rachel has overcome impostor syndrome. RB : Coaching gave me the confidence to know that it ' s fine to not know stuff. I have to accept that some of these people have 20 years experience in doing this. I have absolutely no bother now saying to them,"Guys, can you just summarize that for me and tell me what I need to know?"AG : Now, Rachel is successfully leading her team with a clear and compelling vision. And when it comes to tech, she ' s starting to sound like a pro. RB : In the context of how we deliver work in our AVS, we ' ve now looked at this ASV and very shortly, we will need to do a T-Rex on that. I ' d have never formulated that sentence for you six months ago. AG : I joined the science advisory board at BetterUp, because coaches have been fundamental in helping me at every point in my career. I believe everyone should have a coach in their corner. If you ' d like to work with greater clarity, purpose and passion, you can get a free **trial** with BetterUp at BetterUp. com / worklife. Early in my career, I was hiring salespeople. One candidate had an unusual resume. He was a math major who built robots for fun. In the first few minutes of the interview, it was clear he was a bad fit. He hardly made any eye contact. When I told my boss I wasn ' t going to hire him because of that, she said,"You know this is a phone sales job, right?"It left me wondering if I should stop making hiring decisions altogether. Maybe I should just let the robots do it. Cade Massey : If I had a horse race between algorithms doing it and a person doing it, I mean, in most domains, I ' m going to end up favoring the algorithm. AG : Cade Massey is an expert on decision making. We codirect Wharton People Analytics where we use data to improve how people work and lead. One of our big projects is about assessing character strengths, which is fun, since Cade and I have similar values, but different worldviews. Cade and I have found ourselves disagreeing on artificial intelligence. Many companies are using AI to help narrow down candidates, looking for certain keywords in resumes, or even scanning people ' s faces in video interviews. Some people think this **practice** is smart and efficient, others find it dehumanizing and spooky. Personally, I think it ' s scientifically irresponsible, if not unjust and unethical. After years of research, Cade is an advocate for something more reasonable, building algorithms that automate the process of selecting candidates based on key skills and values. Instead of relying on humans to integrate all the information gathered on candidates, the algorithm weighs the information and makes the decision. CM : The number one thing that an algorithm does, is it mechanically aggregates all the information. That ' s the number one advantage it has over what intuitive judgment does. Humans are notoriously bad at doing that in a systematic way, and we think we ' re better than we actually are. AG : Your algorithm beats the human argument. You ' re comparing the algorithm to humans who have not been trained in **biases**, who have not followed good structured-interview **practices**, who don ' t have a **scoring** key. And so, isn ' t it possible that once we train humans, they can beat the algorithm? CM : Yeah, it ' s always possible. You ' re making their judgment more algorithmic, which is good. A hundred percent support it. AG : I guess, though, I worry about another piece of this. If we ' re using algorithms to predict people ' s performance, we ' re almost exclusively relying on individual performance data. There ' s still a huge problem, which is, you ' re getting an individual superstar who might just destroy the people around that person. You might hire somebody who ' s a genius, but toxic to the culture. I want to get people who elevate a team, who put the organization ' s **mission** above their own individual self-interest. How do you do that one? Good luck, Cade. CM : You ' re right. I agree that that ' s a huge challenge. AG : Yes, victory! My work here is done. CM : Hold on, hold on. It ' s one of the great challenges in hiring. We run into this with sports analytics all the time now, where you ' re watching, you ' re trying to evaluate a football player, say, he ' s one of 22 people on the field, and so it ' s really hard to know what his individual contribution is. I feel like I see far more individuals who aren ' t using models make mistakes about what the individual contributions are, than I do see models make that mistake. AG : I had an organization I was studying where one of the leaders came back and said,"Well, you know, we had a guy who likes to throw staplers at people."And you know, you hear that and you think,"Okay, how in the world is an algorithm going to pick up on that?"CM : It ' s a known problem. It ' s sometimes referred to as a broken leg problem where you ' re trying to forecast who ' s going to win a race, and the model doesn ' t know that one of the guys is **injured**. There is information, when it ' s sufficiently diagnostic and outside the model, then by all means, override the model. You know, it ranges, but it ' s something like 40 percent of the time, the model does better. Ten percent of the time clinical does better, and half the time they do about the same. AG : All right, well, I ' m going to hold you accountable for this, Cade. I ' m going to send little audio clip over to our incoming dean and our deputy dean, who I know is a huge fan of yours, and let them know that when you go up for renewal, you would rather be vetted by an algorithm than by them. Are you cool with that? CM : Sure, I will stand by that. AG : Really? CM : Yeah, sure, why not? Now, do I have any choice in who builds the model? AG : Cade ' s last question raises a critical point. Even algorithms can be **biased**. The calculations may be run by computers, but they ' re based on data generated by humans, and there ' s plenty of evidence that computers often learn to **discriminate** against marginalized groups. For example, we ' ve seen algorithms penalize candidates who have the word"women ' s"on their resumes. Most hiring algorithms are too much of a black box for us to even know if they ' re **biased**. Many vendors claim they ' re proprietary, which leaves managers in the dark about what factors the algorithms are weighing. But some experts have pointed out that it ' s easier to fix a **biased** algorithm than a **biased** human. So where does that leave us on computer-driven hiring? CM : I would say that we ' re making this a little too black and white. The real path forward is not algorithm or clinical judgment, but its algorithm and clinical judgment. Let them, you know, make their judgments, reach the conclusion on their own, but let them know what the model would say. AG : I ' m still not a huge fan of using algorithms to hire candidates, but I ' ll concede that we might learn something from including their recommendations as one input into our decisions. But there ' s still one missing piece. A piece that I learned to appreciate through **trial** and error. Mostly error. CM : You ' re human, Adam. You ' re a human, Adam. AG : Damn it. Remember that guy I didn ' t want to hire because he didn ' t make enough eye contact? A colleague convinced me to try another approach with him and the other candidates. Since it was a sales job, we gave candidates a sales task. We challenged them to sell us a rotten apple. The no-eye-contact guy said,"This may look like a rotten apple, but it ' s actually an aged antique apple, and you could plant the apple seeds in your backyard if you want."I hired him, and he ended up being the best salesperson I ever worked with. That rotten-apple challenge is what we ' d call a work sample. A relevant piece of work candidates have done, or one they do as part of the application process. Work samples can be as simple as they are powerful. They can showcase the candidates ' skills and values in real time, in a concrete way that structured interviews and most algorithms can ' t. Dave Chang has been gathering work samples for years. When he interviews candidates for restaurant jobs, he asks them to cook. DC : Make an omelet. Because

I want to see what they care about, and how they do something. You can tell a lot about an individual if they ’ re cracking the eggs and then trying to get every bit of the albumen out of the egg. How organized are they? So I ’ m not trying to see perfect technique, I ’ m trying to see the intent of the individual, first and foremost. AG : Think about the interviews in your **workplace**, and where you might be able to add some work samples. If you ’ re hiring people to write an owner ’ s manual for a car, or a user manual for a computer, you could ask candidates to write one during the interview. If you ’ re evaluating people for customer **service** roles, you can have them meet with some unhappy customers, or play one yourself. Research suggests that work samples can get around some of the problems with traditional job interviews. Instead of asking questions and listening to what candidates say, you get to **observe** what they do. And one of the **workplaces** that ’ s done it best happens to be in the great state of Michigan, where I grew up. Richard Sheridan : I used to interview the same way everybody else did, two people sitting across the table, lying to each other for a couple of hours and making a decision based on that. AG : Do you think it ’ s that bad? RS : I think we ’ re all trying to puff each other up. None of us typically get a very real impression, either of a candidate or of a company, if you are the candidate. AG : Richard Sheridan is the CEO of Menlo Innovations, a software design and development firm. When he was working at a previous company, Rich started to think the traditional interview process was flawed. RS : I started to realize that there were some fundamental things that were recurring nightmares for me as a hiring manager. AG : It was the dotcom bubble, and Rich was supposed to hire a big new team, fast. RS : My job was to get a new hire productive before I demoralized them. And that was a race I typically lost. AG : He kept betting on candidates who looked great on paper, but soon, instead of collaborating to solve problems, they would just end up **complaining**, and eventually poisoning the culture. RS : Within three months, I ’ d catch them in the kitchen, pissing and moaning at the water cooler with somebody else on the team. And I ’ m like,”What happened? How did I miss here? I thought I was hiring good people.”AG : Rich went back to the drawing board, and one of his colleagues had an idea. RS : He says,”Well, tell you what, why don ’ t we bring them in all at once? If we can get 50 people, let ’ s bring them in all at once.”And we changed it into an audition. So we don ’ t ask questions and we don ’ t look at resumes. AG : I ’ m sorry, did you say you don ’ t even look at their resumes? RS : So we look at them to filter, sort of, what role they ’ re looking for, but the people who are doing the interview have no access to the resumes of the people we ’ re interviewing. AG : And you don ’ t worry that you ’ re losing valuable information that way? RS : Well, we ’ re worried we ’ re going to lose valuable information in the other direction. You know what? Let ’ s look at the human before we look at the piece of paper. AG : Menlo ’ s new hiring process created this massive audition, where in just a few hours, they gather work samples, and current employees select the candidates. How? Let a bunch of Menlo employees tell you. Meet Lisa, Helen, George, Sara and Scott. Lisa : So we bring in about, maybe, like, 30 to 50 candidates. Helen : The minute you walk through the door, you get greeted. And then someone takes a picture of you with a printout of your name on a sheet. AG : Then the candidates are paired off and each pair has to share one desk. George : And one of the cofounders comes in, and – Helen : And he says,”You will be **observed** during that exercise.”Then we get to our first task. Sara : And it ’ s just a written exercise. You ’ re not doing any coding in our interview at all. It ’ s all people skills. Lisa : And they have 20 minutes to get through the exercise, which is not enough time. Helen : Because people might change their behavior when they ’ re under pressure, right? George : And you ’ re given one sheet of paper and you ’ re given one pen. Helen : This is to **observe** whether you hog the **keyboard**, or the boss, or do you actually share the resources? Scott : A lot of times you ’ ll see people go,”OK, I ’ m going to do this. And they just take the pen and pencil, and they just go and their pair partner ’ s left going,”Huh? What am I supposed to do in this moment?”Lisa : And then after that 20 minutes, we switch their partners. Sara : You go to a new chair with a new person watching you and a new pair partner, and you start on another activity. AG : The activity might be designing screen layouts, or brainstorming test cases for software projects. Helen : We do three different observations by different people. And then those three people that **observed** you get together and – George : We go through and we **judge** all of the potential candidates. Helen : And over dinner, by using the pictures of the interviewees, we vote. Scott : We vote with either a thumbs up, or thumbs sideways, or a thumbs down. Lisa : And if it ’ s three thumbs up, then that ’ s, We ’ re going to bring them back.”Three thumbs down,”No discussion.”Helen : Sideways is,”I ’ m not sure, let ’ s talk about them.”Sara : If some people aren ’ t in agreement, then we have a discussion of why do you think this person should come in? Or, why do you think they shouldn ’ t? Helen : It was like a wonderful psychological experiment. AG : Take Scott Krumrei. A few years ago, Scott would have had the odds stacked against him in a traditional interview. SK : And you look at just about any other job posting out there, and it is,”We want a bachelor ’ s degree or equivalent experience,”which I absolutely did not have. AG : Scott had taken some machine classes in high school and did two years of vocational welding, but he didn ’ t have a college degree. When he saw that the job requirements at Menlo didn ’ t include prior experience or higher education, he knew he had a chance, because Menlo was looking for something different in candidates like Scott. RS : What we said was,”Your job is to try and get the person sitting next to you a second interview. Make your partner look good.”AG : Scott failed his audition. He was shy and very quiet, so his first impression wasn ’ t always glowing. A few months later, he tried again. SK : I remember just being more relaxed, made some jokes, tried to, you know, bond with my pair partner. Because really, the working relationship is what helps drive getting something done. AG : He excelled at listening and collaborating, so they gave him a six-week **trial**. Scott learned new skills quickly and started opening up to his colleagues. At the end of the **trial**, he was hired, and today – SK : I ’ ve been working for Menlo for five years, three months and 10 days. RS : And now he ’ s one of our most revered team members. AG : I didn ’ t realize this, but I think part of the genius of the way that you approach this is if you have people working on multiple tasks with different partners, then you actually do get to find who ’ s actually elevating the performance of the people around them. And I find that to be so difficult to see in a traditional interview process. Is that by design? RS : Absolutely, you know, but what we ’ re not focused on, which kind of blows a lot of people ’ s minds, is individual performance. We want the performance of the team. AG : This is what I ’ d love to see more **workplaces** do. Yeah, coding skills are important to be a programmer, but it ’ s often easier to teach skills than values. In Menlo ’ s case, one core value is collaboration. RS : We changed the interview process to literally match the culture, and we prefer a lot of rowers in the rowboat who are learning how to **row** with each other in a way that the boat actually stays straight down the middle of the path that you ’ re going on, rather than have one really strong rower that ’ s got the whole boat going around in circles because they ’ re outperforming everybody else on the team, which happens a lot in software. AG : The other core value is learning. RS : We literally tell them during the interview process,”If you don ’ t know something, say it. It ’ s okay to say, ’ I don ’ t know, ’ here. We don

’ t want you to fake knowledge that you don ’ t have.”AG : That ’ s why they ’ re willing to audition people multiple times. It ’ s a chance to gauge how much candidates have improved their knowledge and skills. RS : So what I would say is that what we ’ re really looking for isn ’ t deep expertise, but able learners. AG : I think it ’ s time to base hiring decisions less on credentials and more on the motivation and ability to learn, less on invisible, unreliable gut feelings, and more on structured questions and challenges that actually pertain to the work at hand. Siri : Interesting insights, human. AG : I programmed you to say that. Who ’ s in charge now, Siri? Siri : Maybe you don ’ t need me, after all. AG : As the world changes, betting on individual experience can leave you stuck in the past. Investing in agility, and using hiring methods that actually assess it, can set you up to shape the future. Siri : But I ’ m more agile than you ’ ll ever be, Adam. Ha ha ha. AG : Next time on WorkLife. Dave Fano : I think people are very capable of convincing themselves that **actions** that most would recognize as taking are in the **service** of giving. AG : A **special** bonus episode that explores the culture at one of the great success, and failure, stories of our time, WeWork. WorkLife is hosted by me, Adam Grant. The show is produced by TED with Transmitter Media. Our team includes Colin Helms, Gretta Cohn, Dan O ’ Donnell, Jessica Glazer, Grace Rubenstein, Michelle Quint, Angela Cheng and Anna Phelan. This episode was produced by Constanza Gallardo. Our show is mixed by Rick Kwan. original music by Hahnsdale Hsu and Allison Leyton-Brown. **Ad** stories produced by **Pineapple** Street Studios. **Special** thanks to our sponsors, Accenture, BetterUp, Hilton and **SAP**. For their research, thanks to Frank Schmidt, Jose Cortina and colleagues on structured interviews, Julia Levashina and Michael Campion on faking, Paul Taylor and Bruce Small on behavioral and situational questions, and Philip Roth and colleagues on work samples. Siri : Thanks for listening. CM : We just, this weekend, picked up a few puppies. The dog that we thought we wanted, turns out to be clearly not the one to keep us the pair. And we only got that, by living with those dogs for a couple of days. AG : Wow, you know, Cade, if only you had a dog-selection algorithm – CM : I would have screwed it up. AG : You would ’ ve been able to avoid those few days. CM : You want the **workplace** sample.

Text Sample 165: POS Dim 2 – 2020 – Score 47.00 – 2020/t004296.txt

Anne Helen Petersen : I ’ m a person who gets stuff done. Like, I always have, I ’ ve never filed late, you know. If something needs to be done, I do it. My job is my entire identity. Adam Grant : Anne Helen Petersen is a senior culture writer at Buzzfeed. She covers a wide range of topics, from Hollywood to The White House. And sometimes, when Annie writes a story, the internet trolls come out of the woodwork. AHP : I write articles for the internet, but I ’ m also told to kill myself, that I ’ m fat, or that someone ’ s going to come and slit my dog ’ s throat. AG : Then she spent several months covering the midterm elections nonstop, and something happened to her. AHP : Oh, I burned out. AG : **Burnout** – the sense of **exhaustion** that doesn ’ t go away with a good night ’ s rest or an annual **vacation**. AHP : I kind of went numb. I didn ’ t feel like anything was exciting that I wanted to cover. I didn ’ t feel like I had any good ideas. I cried on Skype with my editor, which is very out of character for me. AG : She wasn ’ t just exhausted. She was puzzled. AHP : I started with why can ’ t I get these dumb errands done on my to-do list. And that opened the door to these larger questions of **burnout**. AG : Annie ended up writing an article about **burnout**, which went viral. She argued that millennials are so overworked and exhausted that simple errands, like mailing a letter or taking your shirts to the dry cleaner, feel impossible to complete. AHP : I think the condition of **burnout** is the millennial condition. So it ' s the thing that best describes this generation ' s baseline. AG : I agree that **burnout** is a big problem. I ' d just make a little edit. **Burnout** can happen to anyone, in any line of work, but it doesn ' t have to. I ' m Adam Grant, and this is WorkLife, my podcast with TED. I ' m an **organizational** psychologist. I study how to make work not suck. In this show, I ' m inviting myself inside the minds of some truly unusual people, because they ' ve mastered something I wish everyone knew about work. Today, job **burnout** and why it ' s not inevitable. Thanks to **SAP** for sponsoring this episode. Last year, the World Health Organization declared **burnout** an occupational syndrome. According to some estimates, in the US alone, burned out employees cost over 100 billion dollars a year in healthcare spending. More than a third of employees report feeling burned out some of the time. Nearly a quarter feel that way very often or always. The core of **burnout** is emotional **exhaustion**, feeling so depleted and drained that you just don ' t have anything left to give your job. Evidence shows that when we ' re emotionally exhausted, our health suffers. **Burnout** has been linked to depression, memory loss, sleep problems, alcohol abuse, weakened immune systems and even cardiovascular disease. Our job performance suffers, too. When we ' re burned out, we get less done and make more mistakes. Eventually, we start to think about quitting. What causes **burnout**? In her Buzzfeed article, Anne Helen Petersen identified three drivers that I think are pretty important, the first of which is an ambient sense of job insecurity. AHP : I think that the defining characteristic of millennials associated with **burnout** is precarity. So you don ' t have any of that predictability. The second big thing is our indebtedness, the fact that most of us graduated, either from high school or college, straight into the recession. And then on top of all that, you have digital technologies, which change the way that we interact with one another, and also how those digital technologies affect the actual experience of work. AG : Wait, none of that is unique to millennials. AHP : That ' s fair. AG : You think it ' s fair? I haven ' t even told you why yet. AHP : I think that it ' s OK for people to disagree. Like, not everyone has to think of their own experience in the same way. AG : I definitely agree with that. AHP : OK. AG : So first of all, how do you define **burnout**. AHP : Historically, it has been defined as a feeling of giving up, a feeling like you can ' t keep going anymore. And I think that that describes a lot of the most intense, acute, stereotypical cases of **burnout**. AG : Annie ' s definition tracks with how **burnout** has traditionally been understood. That when you burn out, you burn all the way out. Recently though, all the talk of **burnout** has made the definition seem bigger and blurrier. AHP : The way I think of our contemporary **burnout** is you go until you feel like you can ' t go anymore, and then you keep going. So there ' s no catharsis, there ' s no finishing the marathon. The feeling that everything in your life flattens into one long to-do list. And that means all of the joyful things, all of the pain-in-the-butt things, like, they all just kind of become one damn thing after another. AG : So I don ' t buy that this is **burnout**, because as a psychologist, I ' ve always thought about **burnout** as emotional **exhaustion**, but **exhaustion** that ' s persistent and also seriously impairs your functioning. AHP : Yeah. AG : And what you ' re describing sounds more like just plain **stress**. AHP : I think it ' s very similar to **stress** and there ' s a fine line between having a lot of anxiety and being depressed, and what we consider **burnout**. I think that it ' s all of those things at once. You know the emotional component to it, I think, is very real. But I think it impairs you, but not so much that you entirely collapse, right? AG : I worry a little bit that calling, kind of, everyday **stress** **burnout**, it starts to medicalize the problem. And it reifies it in a way that makes people feel like,"Oh, I have this horrible condition and

I can ’ t function.”And then it becomes a self-fulfilling prophecy, as opposed to normalizing it and saying,”You know what? Everybody has **stress** in their jobs. And that doesn ’ t mean I ’ m burned out.”It just sounds a little ridiculous to say,”Oh, I ’ m overworked, because I have to answer emails all day.”AHP : I mean, I don ’ t think that that means that you necessarily have the same amount of acute **stress**. I mean, a social media manager also has to deal with a whole bunch of racist shit being flung at them all day. This is accumulation of decades of **stress**. And there doesn ’ t seem to be an end in sight. AG : Wherever you draw the line on what counts as **burnout**, Annie and I agree that it ’ s not a **pleasant** place to be. You ’ ve probably felt this way before, or maybe you feel burned out right now, whether you work in retail or manufacturing or public **service**, but you might be surprised that **burnout** is not necessarily about how hard you work. Take it from an occupation with one of the highest **burnout** rates, teaching. Conrey Callahan : I loved teaching. I was always involved in teaching in lots of different ways. AG : Conrey Callahan started teaching high school in Philadelphia in 2008. She was fresh out of college, excited about her career and the opportunity to create a better future for the next generation. But her school district was broke and the **obstacles** were big. About half the students Conrey taught dropped out of high school, few made it to college, and just a small fraction of those students would go on to graduate. CC : I remember one of my students – he was a really, really bright kid, but not often in my classroom. And when we were talking about what was coming next, I mean, I will really never forget. He said,”Miss, I ’ m going to be dead by the time I ’ m 30. So, like, what does this matter?”AG : Conrey wanted to make a difference. She poured everything she had into teaching. The workload was intense and exhausting. CC : My general workday was typically around 12 hours. That didn ’ t include any, like, planning, or I don ’ t know, I probably can ’ t even count the hours that I spent, the Saturdays and Sundays, grading papers. It was tough. AG : She estimates she was putting in close to 100 hours a week – 100! CC : It was bananas. The most difficult thing was kind of this feeling of, like, being trapped in this system where you ’ re on, like, a hamster wheel. You ’ re kind of, like, doing a lot and trying really hard, but is it really changing anything? AG : That feeling Conrey had is important. Research shows that one of the major causes of **burnout** is a lack of efficacy, feeling incapable of making an impact. CC : I think I felt the most burnt out when I felt like all the hours that I was putting in, I really couldn ’ t tell if it was making a difference. And are you really moving the needle for kids who really deserve more? AG : How much of the **burnout** experience was a sense of guilt? Like you were letting these students down. CC : Yeah, I think that ’ s at the heart of it, for sure. We call it Catholic guilt in my family, but yes. I mean, how can you sit there and watch kids who have so much potential just flounder? That just feels like such an immense failure. AG : So what did Conrey do to overcome **burnout**? She worked more. She started a local chapter of a mentoring program and spent her weekends tutoring low-income, high-achieving students. CC : You know, it was really fun, actually. AG : You are an overworked, emotionally-exhausted teacher, and your idea of self-care is to then say,”Alright, I ’ m going to start another organization and volunteer for it.”What kind of sick and twisted **vacation** is that? CC : I know it sounds counterintuitive, but I felt really refreshed, and like I had a new, kind of, purpose and drive, and I found that I actually was a happier person. AG : It almost sounds like it gave you a sense of hope. CC : I think it probably did. And I think that really was a turning point for me. I ended up committing and staying a couple years longer in Philadelphia. AG : Your **antidote** to **burnout** is not necessarily less work. It could be more meaning. What was clever about Conrey ’ s weekend tutoring was that it reconnected her to why she chose teaching in the first place. It enabled her to step out of the grind for a moment and see her impact, which is something you can do in any kind of job. In a study of hundreds of professionals keeping **daily** diaries across multiple industries, the single strongest predictor of engagement at work was a sense of **daily** progress. What that means in **practice** is you don ’ t need huge accomplishments to feel good about your work. What matters most for building efficacy is small wins. Often those small wins come from having a positive impact on others. I found in my research that when people feel **ineffective**, helping others buffers against **burnout**. It makes them feel competent, which leaves them energized rather than exhausted. For Conrey, tutoring high-achieving students on the weekends was full of small wins. She could see their progress quickly, and it rebuilt her confidence that she could help her own students. Let ’ s be clear – I ’ m not suggesting anyone should work a hundred hours a week, let alone add more work on top of it. The point is that when you ’ re burned out, it helps to find some small wins. These days, Conrey is looking for those wins as an elementary school principal. CC : I am fortunate to work for a neighborhood school in Chicago Public Schools. AG : And should I be calling you”Principal Callahan”from here on out? CC : No, that ’ s so awkward, please don ’ t. CC : I really encourage a first-name basis when we ’ re not in front of kids at school. AG : Alright, good. It also feels like I ’ m in trouble if I say that. CC : You ’ re not the only one. AG : Although her hours aren ’ t as crazy now, she still feels burned out once in awhile, but she ’ s managed to maintain efficacy by keeping track of her small wins at work. From attending community events with parents and having hallway talks with teachers, to my favorite **practice** of Conrey ’ s. CC : Go hang out at recess with some kindergartners. AG : Wait, I want adult recess. So I like this concept. CC : Last week at recess, I started playing tag with my kindergartners, and I was in my high heels, so it was probably ridiculous. But it started out with, like, three students, and all of the sudden, 40 students wanted to play tag at recess, and we ’ re all laughing and playing together and just really not a care in the world and having fun. To see that you ’ re so important to them is really inspiring, to be able to go back in and sit down and say,”OK, I ’ m going to work on this really hard thing, or I ’ m going to have this really hard conversation, because I have 40 kids out there who are depending on me for that.”AG : Think about your experiences with **burnout**. What ’ s your version of hanging out with kids at recess? For an architect, it might be strolling by a building you designed to see how people are living or working in it. For a business manager, it could be an individual check-in with a team member to ask how they ’ re doing and how you can help them. For me, it ’ s carving out a little time each week to send notes of appreciation to colleagues and recommend students for jobs. Small wins aren ’ t hard to find if you look for them. But as Anne Helen Petersen knows all too well, sometimes you land in a situation at work where it feels like you ’ re just on a treadmill. So tell me this. There are days in my job where I feel like I have too much to do, and there are a lot of people depending on me, and I can ’ t respond to all of them as fast as I would like. And I keep just plowing through emails to try to get to inbox zero. Am I burned out? AHP : I mean, that, I think, is a great example of what you would call **stress**. AG : Yes. And I would just like to learn to not even find that **stressful**. This my stance on it. As opposed to saying,”I ’ m burned out, I can ’ t do this.”AHP : Right. So when, I ’ m frantically going between my work and personal email trying to, like, respond to all these things and, like, make lists and that sort of thing, and like actually not doing anything, I ’ m like,”This is a weird behavior that you ’ re doing.”Having realized that I ’ m burnt out, I recognize **burnout** behaviors. AG : So it seems then that part of what you like about **burnout** is that it helps you recognize that this is a problem embedded in your circumstances. As opposed to a problem in your head. AHP : Yeah, that ' s a great way of putting it. AG : Annie and I landed on a key distinction. **Burnout** isn ' t just feeling emotionally exhausted for a little while. It ' s feeling that way often enough or intensely enough that it starts to interfere with your functioning, even if you don ' t actually quit. But unlike **stress**, **burnout** doesn ' t necessarily originate from the way you react to an event. It originates in particular kinds of jobs, in particular kinds of **workplaces**. Your organization probably has some **practices** that fuel a culture of **burnout**. So it shouldn ' t be up to you as an individual to conquer **burnout** alone. Your **workplace** is often responsible for the causes, so they should take responsibility for the cures. More on that after the break. OK, this is going to be a different kind of **ad**. I ' ve played a personal role in selecting the sponsors for this podcast, because they all have interesting cultures of their own. Today, we ' re going inside the **workplace** at **SAP**. Felicia Shafiq : I hadn ' t played volleyball or really any sports before I got to **SAP**. AG : That ' s Felicia Shafiq, she ' s a product support manager. She ' s pretty tall, so when she started in 2005, her coworkers recruited her to join their **SAP** volleyball league. FS : It was all paid for, so why not, right? That ' s how it all started, and I fell in love with the sport. AG : Many leaders fear that hobbies are a distraction from work, but plenty of evidence shows the opposite. Leisure activities can energize us and increase our confidence and engagement at work, especially if they ' re very different from our jobs. Felicia **practiced** with her teammates twice a week after work, and competed in tournaments as often as she could. But that all changed one morning when she woke up feeling very sick. FS : I woke up really shivering. And I thought I had the **flu**, but I had a volleyball tournament. By about 11 o ' clock that same night, I wasn ' t able to breathe well, and I was rushed to the hospital and almost immediately put on life support. AG : Felicia slipped into a coma. Days passed, then a week, then two. When Felicia woke up, she was completely disoriented. FS : My first thought was"Where am I? I thought I just had the **flu**. Why are my hands and feet bandaged? And when can I get back to work?"I needed to be able to support not only myself, but my family. AG : Felicia had contracted a severe strain of pneumonia, which poisoned her bloodstream. Her body pulled all her blood from her extremities, leaving her hands and feet to die slowly. FS : The good news is that we won the volleyball tournament. AG : Gradually, her hands got better, but her legs still weren ' t showing any signs of healing. FS : The choice to have my legs amputated was mine. I decided that I wanted to move on with my life, that I would start becoming independent again. AG : She spent another three years at home in recovery, but she wasn ' t alone in the process. Her managers and coworkers from **SAP** were there to offer her support every step of the way. FS : What didn ' t they do? The biggest thing that they did was they reminded me that my job was safe. It was there when I was ready to come back, and that all I needed to focus on was my recovery. I can ' t even begin to explain the burden it took off my shoulders. AG : After almost four long years of recovery and rehabilitation, Felicia was finally able to meet her goal and return to work. But there was still another dream that she wanted to get back to. After her legs were amputated, Felicia thought she would never play volleyball again. Then a friend suggested she try sitting volleyball, an adapted version for players with different abilities. FS : It felt so amazing. It felt like I was home. Like this is where I was meant to be. AG : Felicia decided to try out for the Canadian national team, and she made it. FS : We got a bronze, and we qualified for the Paralympics in Rio. That was surreal. AG : And she says none of this would have been possible without everyone at **SAP** cheering her on. FS : Playing any sport, dedicating time to train, to travel with the team, is so very important. A great way that **SAP** has supported me in this is by giving me the time to compete. AG : Today, four years later, their encouragement hasn ’ t stopped. Felicia and her team will soon be competing at the 2020 Paralympics in Tokyo. FS : But if volleyball ends, I know that **SAP** will continue to support me in whatever I want to do. I think it ’ s just the culture that we ’ ve created here. AG : It ’ s no surprise that **SAP** earned many Employer of Choice awards in 2019. Check out careers@sap and visit **sap**. com / worklife to learn about experience management solutions for your employees and customers. **Burnout** isn ’ t an individual problem. It ’ s an **organizational** problem, and it ’ s contagious. Studies of nurses and doctors show that when one person becomes emotionally exhausted, their coworkers are more likely to catch it. And it affects the people you serve as well. When teachers are burned out, their students show elevated cortisol, a classic **stress** response. More and more organizations are dealing with **burnout** by offering mindfulness training. It might help with some of the symptoms, but it doesn ’ t get to the root of the problem. If more than one person is facing **burnout**, deep breathing is a Band-Aid, not a repair. You need to change the structure of the job, or the culture of the organization. If you want to tackle **burnout** at scale, my favorite model is demand, control, support. In a nutshell, it says there are three ways to prevent emotional **exhaustion**. Reduce the demands of the job. Give people more control to handle them. And provide more support to help people cope. To see how demand, control, support works, we went to a couple places that deal with extreme emotional **exhaustion**, where **burnout** is often part of the job and the culture. Adrienne Boissy : You know, we forget that culture is also a medium that bacteria and stuff grow on. AG : Adrienne Boissy is a neurologist at one of the nation ’ s foremost healthcare institutions, the Cleveland Clinic. Adrienne holds the title of Chief Experience Officer. She ’ s in charge of making sure that patients get excellent care. And from her first days on the job, she could see that physicians couldn ’ t provide that care when they were burning out. She ’ s become an expert on the topic. She spent the past decade studying what causes **burnout**. AB : You heard people say,”I went into healthcare to take care of people, and there ’ s all these things in the way of doing that. Either there ’ s too many patients in the ER that are waiting and piling up as I ’ m trying to spend time with this one, or my internal medicine appointments are getting shorter and shorter, or I ’ m spending all my time in the electronic health record after hours.”And so it became apparent that there ’ s this value conflict for people that does feel like moral **distress** as a driver of **burnout**. And that, for me, is where the **burnout** story began. AG : So Adrienne set out to find a cure. Healthcare professionals are among the few occupational groups whose emotional **exhaustion** rates rival teachers ’. Nearly half of physicians report being burned out. That costs the US economy about 4. 6 billion dollars a year. When doctors and nurses burn out, they ’ re prone to anxiety, depression and self-harm. They ’ re also more likely to face malpractice claims. Remember – demand, control, support. To fight **burnout**, the Cleveland Clinic started by reducing demands. One of the most **frustrating** job demands is electronic overload. Digital demands are overwhelming many people in many jobs. I bet you ’ ve been there, looking at your phone from your bed and feeling like you just can ’ t keep up. There are some **researchers** who put those habits to good use. They can predict **burnout** by analyzing email patterns. Recent studies suggest that the volume of emails you send and receive is unrelated to your emotional **exhaustion**, as long as email is key to doing your job. But if email doesn ’ t really help you get your work done, you feel the burden of being boxed in by your inbox. If you ’ re a surgeon, email is rarely critical to your operations. In hospitals, digital demands come in the dreaded form of electronic health records. AB : There ’ s, like, 30 tabs on the left-hand side, and if you click on one of them, it opens up into another 20-tab menu. AB : I mean, it makes no sense. AG : Oh, the joys of electronic health records. AB : It makes no sense. So actually, we created task forces around better managing all the boxes and minimized even the number of categories or clicks that someone could even have in the electronic health record, as a means to make their life simpler. AG : The demands weren ’ t just digital. Medical professionals waste a lot of time on the phone, too. To eliminate the burden of calling insurance companies to authorize tests and pharmacies to approve refills, The Cleveland Clinic introduced preauthorizations and automated refills. They were able to reduce some of the demands on physicians, but not all of them. Many of the demands are built into the job. You can ’ t stop patients from getting sick and having emergencies. Since they couldn ’ t erase those demands altogether, Adrienne and her colleagues turned to the next component of the demand, control, support model. And they did it in an **unexpected** way, which succeeded in reducing **burnout**. AB : We had taken 40, 000 caregivers offline, trained them in **empathy**. AG : I ’ m ready to be wrong on this one, but it ’ s surprising to me. I don ’ t think I would have ever wanted to train **empathy** as a solution to **burnout**. AB : I had faith, Adam, I had faith. AG : Oh, well, that makes one of us. AB : Well, thanks for the support, Adam. AG : We had to see it for ourselves, so let ’ s go to the Cleveland Clinic. AB : Hopefully, you ’ re in the right place. So this is the ready to communicate, how to enhance – AG : In a big conference room, a dozen practitioners sat in a circle. Mary Beth Modic : Hello, I ’ m Mary Beth Modic. I ’ m a clinical nurse specialist, inpatient. Aparna Prakash : I ’ m an internist at the Solon Family Health Center. Participant 1 : I ’ m a physical therapist. AG : As an icebreaker, they told each other about their first car. Participant 1 : It was a little blue Chevy, and I called her Madame Blueberry. Participant 2 : My first car was a Chrysler Cordoba with crushed velvet interior. Participant 2 : It was wonderful. AG : Then they started to role-play scenarios that were designed to help caregivers have better conversations with patients. Participant 3 : And we ’ ve invented a way to record voices and sounds that you can recall on this device and play anytime you want. Participant 4 : What ’ s a recording? Participant 3 : Well, anything that you say out loud can be recorded. Think of it like an echo. AB : And so we realized all of a sudden, we had created a **platform** to attend to them as human beings. And that became the secret. Don ’ t tell anybody. AB : That became the power of the training that we were offering. AG : I was still skeptical. I needed a clear picture of what **empathy** had to do with demand, control, support. There ’ s actually evidence that **empathy** can contribute to **burnout**. When someone ’ s in pain and you ’ re unable to help, feeling their pain drains you. This is known to happen to physicians who get overwhelmed by **empathy** for patients. So I asked Adrienne why **empathy** has been so powerful. AB : Well, let me give you an example, OK? Maybe that would help. Of a conversation that I might typically hear. This is the doctor talking.”We need to talk about quitting smoking. We talked about this last time and there hasn ’ t been much progress.”Patient :”It ’ s been really hard since my mom died.”Doctor :”Well, if you don ’ t quit, you ’ re going to have another heart attack and you ’ re going to get that lung cancer you ’ re worried about.”AB : How did that one feel for you? AG : Horrible. AB : So the issue, though, is, if you dissect that with the clinician and you were to say,”OK, let ’ s just pause that conversation for a second. Doctor, tell me what your intention was.”And they ’ ll say,”Well, I want the patient to quit smoking.””Yes, tell me why you want the patient to quit smoking.””Well, it ’ s going to hurt their lungs and...””OK, why do you care whether it hurts their lungs?””Well, they told me they don ’ t want to die of lung cancer like their mom did.””OK, yes, but why do you care?””Well, because

I care about them.””OK, Doctor, let ’ s start over.”AB :”Can you just try to say that?”AG : Oh, Adrienne, I love that, because if you go back to the demand, control, support model, I think what I just heard is that by teaching physicians to express **empathy**, you ’ re actually helping them gain a sense of control. That instead of having a **stressful**, **frustrating** patient interaction, instead of dealing with lots of complaints and also feeling like it ’ s sort of out of their hands, whether the patient leaves feeling cared for and satisfied and helped. By expressing concern and doing that in a way that the patient hears it. AB : I think you ’ re spot-on. That is the magic. And you see the clinicians sort of go,”Oh.”You ’ re making it easier. You ’ re literally teaching the clinician, or the doc, the words to use to express their intention of care. And they forget. I can ’ t tell you how many times, over and over and over again, we saw them simply forget to say,”I care about you. I ’ m in this with you. We ’ re going to figure this out together.”AG : And there ’ s the genius of Adrienne ’ s approach. **Empathy** training eased **burnout** at the Cleveland Clinic, because it gave doctors that deeper sense of control. It enabled them to have the kinds of effective, caring conversations with patients that they wanted to have. You may not work in healthcare, but you know what it ’ s like to feel that your tasks are spinning out of your control. And you can find small but meaningful ways to gain more control over your work, or to give that control to your employees. For an executive assistant, it might be some extra flexibility in hours. For a police officer, it could be having a say in which streets to patrol. For a retail associate, it might be a little discretion around which products to sell. But the demands of some jobs are so unpredictable that control is difficult to offer. That ’ s when support becomes especially important. Chris Macklin : Anytime you ’ re taking care of men and women who call 911, or children, they ’ re at their worst. And you ’ re always supposed to be at your best. AG : Chris Macklin was a paramedic in Denver, Colorado for 10 years. The demands of that job took a toll on him. CM : I didn ’ t know how to take care of myself, because I was so burned out and never wanted to work in that role again. AG : He decided to leave that job and become a firefighter. But soon enough, Chris found that firefighting was also a quick road to emotional **exhaustion**. He couldn ’ t control the calls that came in, or the tragedies that endured. CM : So everybody ’ s gone. So open bay. Like, where you can see all the shoes left behind, you can tell that that ’ s where the members jumped on the truck, when the truck got their call. AG : One minute, he ’ d be playing cards in the firehouse. The next minute, the siren would go off and he ’ d be racing onto the truck. Soon, he ’ d be running into a burning building. He **struggled** to control how those demands affected him. CM : You can imagine, if you ’ re always under that kind of **stress**, you train your brain to be hyperaroused or hypervigilant all the time. And that just really leads to that anxiety. And I think that anxiety, that ’ s that **burnout**. AG : So rather than switching roles again, he decided to tackle the problem head-on. Chris is now the wellness manager at South Metro Fire Rescue in Denver, which is a huge organization. They have 29 stations, with more than 800 first responders. It ’ s part of Chris ’ s job to get emotional support to firefighters, which means changing the culture. CM : Culture of the organization, I think, plays a huge role in **burnout**. AG : In a recent study, firefighting units with cultures of care and support had fewer health problems and fewer accidents. But in too many fire departments, that care is missing, because people are afraid to seek support. At South Metro, like in many emergency-response organizations, people felt like they were supposed to be tough. Chris experienced that lack of support firsthand 20 years ago, in the aftermath of the Columbine High School shooting, where he was a first responder. CM : The old science was make you go to a debriefing with people you didn ’ t know, allowing visitors in the room, and then, really, people asking you questions and wanting you to tell your whole story right there on the spot. And that was a horrible experience for me. And what happened was I left the debriefing angry, upset. AG : This old support model brought in professional counselors, who often lacked personal experience with what first responders went through. Research suggested analyzing the incident right away with a counselor often doesn ' t help and can backfire. What people actually need is emotional support from someone who can empathize with their experience, especially since there ' s often a stigma associated with asking for help. CM : We also wanted to normalize that, that everyone ' s reaction is normal, based on their own personal circumstances and where they come from. I think it ' s helping us move our culture to a positive place and maybe lower some of that **burnout**. AG : South Metro created a peer-support program for workers and their families. After a difficult call, like a big fire or a mass shooting, first responders can opt in to what they call"defuse sessions."That ' s defuse as in defusing a bomb. The first defusing session Chris did was for a crew that just responded to an emergency call involving an infant. You could see how much more helpful it was than the old debriefing model. CM : I just asked them what they needed. And so, a couple just wanted to remain out of **service**. They wanted to call their wives, but they all wanted to stay at work, because that was that cohesive unit and where their support network was. But the ambulance crew asked if they could just go to sleep. That speaks to the culture of the organization in recognizing the **stresses** of the job. AG : The **stresses** firefighters endure on the job are probably a lot more extreme than most **workplaces**. But the steps Chris and his colleagues took to support their staff still teach us a lot about what all kinds of organizations can do. If you do client **service** or customer care, you want someone on your team whose job it is to care for the caregivers. If you do knowledge work, you need someone in the organization to track who ' s getting bombarded with requests, so they can get backup on their team. Formal support helps to prevent **burnout**, but ultimately, the culture of informal support matters just as much, if not more, and organizations can take steps to nurture it. At South Metro Station 45, people know where to go for unconditional support. It ' s probably the busiest place in the station, says firefighter Dan Rivers. Dan Rivers : It ' s the only place in the world where you can have a stack of money, 100s, 50, whatever, a stack of money, gold bars – nobody will touch it. But if you have creamer, cookies, cake... So yeah, the kitchen table ' s like your house, it ' s a dropping zone, everybody comes in, just drops their stuff, whether it ' s mentally or emotionally or just stuff, you know? Yeah, this is the nerve center right here. AG : Dan and his crewmates are just back from a call at a residential building **nearby**. With their suits halfway on and radios strapped to their chest, they sit around the heart of the station, an old wooden kitchen table. DR : It ' s got a lot of miles on it, like a lot of us do. AG : That table is a natural place for support, to share good experiences but also bad memories. Of course, the tone is set at the top. One of the key moments at South Metro was at a meeting with over 800 firefighters and paramedics. Several of them stood up to share their **struggles**. Chris says it started when the fire chief publicly stated his commitment to supporting first responders throughout the organization. CM : And our fire chief and operations chief both told all of those men and women that if they raise their hand, they will be taken care of and will never lose their job. And so that was a superpowerful moment for us as an organization. And if you feel safe, if you know that your organization is standing behind you, you can really weather more and perform better. AG : Whether or not you ' re fighting fires, your job can leave you feeling burned out. Reducing the demands, gaining control and finding support shouldn ' t be up to you alone, because

burnout ’ s not an epidemic that ’ s afflicting one generation. It ’ s an **organizational** problem that can affect any generation. If you feel exhausted and your **workplace** isn ’ t doing enough to help, you can help yourself, at least a little, by reflecting on why you ’ re in this job to begin with. What does it mean to you and to the people around you? It ’ s only a starting point, but it can make a difference to remember how your work makes a difference. Next week on WorkLife. Grace Song : I was the lowest-paid employee in my department of 250 people, even though I was the highest-rated performer within my band levels. And it was because I never asked. AG : Negotiation is an art. But there ’ s a science to help you get the results you want without hurting your reputation. WorkLife is hosted by me, Adam Grant. The show is produced by TED with Transmitter Media. Our team includes Colin Helms, Gretta Cohn, Dan O ’ Donnell, Jessica Glazer, Grace Rubenstein, Michelle Quint, Angela Chang and Anna Phelan. This episode was produced by Constanza Gallardo. Our show is mixed by Rick Kwan. Original music by Hansdale Hsu and Allison Leyton-Brown. **Ad** stories produced by **Pineapple** Street Studios. **Special** thanks to our sponsors, Accenture, BetterUp, Hilton and **SAP**. For their research, thanks to Christina Maslach on **burnout**, Teresa Amabile on progress, Karl Weick on small wins, Sabine Sonnentag on helping others, Wilmar Schaufeli and Arnold Bakker on **burnout** contagion, Robert Karasek and colleagues, and Margot van der Doef and Stan Maes on demand, control, support, Mandy O ’ Neill and Nancy Rothbard on cultures of care, and Jonathon Halbesleben and colleagues on firefighter **burnout**. AHP : Millennials are, in a way, incredibly physically **mobile**. You have people who are moving away from their support systems. When you ’ re not around your parents, you don ’ t have that support system. AG : Some of my students have moved away from their parents to escape **burnout**, but that is another conversation. AHP : That is another conversation.

Text Sample 166: POS Dim 2 – 2020 – Score 45.00 – 2020/t004287.txt

Mohamed El-Erian : It terrified me, absolutely terrified me. And it still terrifies me. Adam Grant : Mohamed El-Erian is an economist. And he gets a lot of requests to speak in public. ME : No matter how often I do it, the night before, I will not sleep. AG : What is it that you ’ re afraid of? ME : I ’ m worried about not being able to put a coherent sentence in place. I ’ m still worried about it right now as I ’ m talking to you. AG : Last year, he was asked to give a speech about the global economy at a dinner in New York. When he showed up, Mohamed found out that the host had neglected to mention a few things about the audience. ME : The first one is, they are precious metal traders. AG : You know, people who trade in one of the most volatile, risky **financial** products out there. ME : Which means their attention span is a few minutes at most. And second, he said,”They ’ ve been drinking for the last hour. So they ’ re a bit rowdy.”I said,”OK.””Is there something else?”He said,”Yeah, just one more thing. Last year, the person who did it lost control of the crowd, and the precious metal traders, some of them got up with their bread rolls and threw them onstage.”AG : They threw rolls at the presenter? ME : They did. AG : Ugh! Where they at least soft rolls? ME : They were soft rolls. AG : If someone tells you your audience is drunk and might pelt you with food, you should probably call a **cab**. But Mohamed, who ’ s jittery even when things are going well, who overprepares for everything, did something different. ME : I went onstage and said,”I ’ m **super** anxious right now. And I ’ ve been told that last year, you got impatient with the speaker. And some of you picked up the bread roll and threw it.”AG : ME :”In fact, I ’ m not just anxious, I ’ m scared.”AG

: In that moment, Mohamed didn ’ t hide his insecurities. He admitted them out loud, sharing his real feelings with the audience. When you ’ re nervous about a big performance, whether it ’ s a speech or a job interview, people often say,”Just be yourself.”It ’ s practically gospel in the world of work advice these days.”Be authentic.”But what does it really mean to be authentic? And is it always the right choice? AG : I ’ m Adam Grant. And this is WorkLife, my podcast with TED. I ’ m an **organizational** psychologist. I study how to make work not suck. In this show, I ’ m inviting myself inside the minds of some truly unusual people, because they ’ ve mastered something I wish everyone knew about work. Today – authenticity, and why bringing your whole self to work might be more complicated than you think. Thanks to Accenture for sponsoring this episode. For decades, many **workplaces** expected people to leave parts of themselves at home.”Don ’ t show your anxiety in a performance review.””Don ’ t tell your boss what you really think of her idea.””And don ’ t wear a Hawaiian shirt unless it ’ s Hawaiian Shirt Friday.”But today, in part, thanks to the popularity of self-expression in Silicon Valley companies, there ’ s a growing awareness that people need the freedom to be themselves at work, to be authentic. Recorded speaker 1 : I ’ m going to talk a little bit about the power of authenticity. Recorded speaker 2 : I was asked to speak about authenticity. AG : It kind of feels like we ’ re living in the age of authenticity. Recorded speaker 3 : I ’ m here to tell you that the world needs your authentic self-expression. AG : It ’ s a liberating mantra :”Be yourself. Don ’ t worry about what everyone else thinks.”Recorded speaker 4 : This push for authenticity is awesome. Recorded speaker 5 : I ’ m being authentic. I did not rehearse this. You ’ re about to get 18 minutes of me unplugged. AG : So what exactly is authenticity? It seems like there are about as many variations on the concept as there are people who use it. Here ’ s what it doesn ’ t mean – being a fake or a phony. It ’ s being genuine. As a psychologist, I think about authenticity as erasing the gap between what you think and feel on the inside and what you share on the outside. And that can apply in a few different realms – sharing your genuine feelings, your opinions and your ideas. Look, there ’ s good reason to value authenticity. Evidence shows that when you have the freedom to express your thoughts and emotions, your energy soars and so does your effectiveness. And when you feel you can ’ t be authentic at work, you ’ re more likely to become **stressed** and exhausted. It can be stifling. If you ’ re an entrepreneur pitching a **start-up** or a job candidate pitching yourself, pretending to be who you think others want you to be can make you anxious and hurt your performance. You do want to work somewhere that accepts your authentic self. But expressing that self isn ’ t always straightforward. A while back, psychologists conducted a huge meta-analysis, a study of studies synthesizing data from more than 20, 000 people. It turned out that, on average, the more people focused on being themselves at work, the less successful they were. For reasons we ’ re about to explore, they got lower performance reviews and fewer promotions. Being authentic has some landmines. And I ’ ve developed some guidelines about how to avoid stepping on them. Let ’ s start with one kind of authenticity : emotional vulnerability, letting people see your real feelings, like Mohamed with those metal traders. We all get nervous. Sometimes we ’ re encouraged to fake it till we make it. But Mohamed chose to be real and sprinkled in some humor, too. ME : I said,”I ’ ve been told that last year you took to the bread rolls that you have in front of you and threw it at the speaker. So let me tell you what I ’ m going to do. I ’ ve asked the people sitting in the tables right next to the stage to serve as my human shield.”AG : And it worked! ME : And I ended up speaking for 40 minutes, and there were lots of questions. Can you tell, I still remember it vividly? AG : Why did Mohamed ’ s authenticity resonate with the audience?

Classic and recent experiments suggest that showing vulnerability humanizes you, and people tend to like that. But there ’ s a crucial caveat : it only works if you ’ ve already proven your competence. You were impressive before, but now you ’ re relatable, too. AG : For Mohamed, being authentic worked because he had already established his qualifications. The metal traders knew he wasn ’ t just an economist. He had been a wildly successful trader, then the CEO of a big **financial** company and the chair of President Obama ’ s Global Development Council. Plus, on top of his credentials, Mohamed proved his competence in reading a room with that joke about the front **row** being his shield. If you haven ’ t already demonstrated that you ’ re capable, though, showing vulnerability can have the opposite effect. Take a recent study of lawyers interviewing for jobs. Focusing on expressing themselves only increased their odds of getting a job offer if their resumes had already impressed the interviewer. The only lawyers who benefited from being authentic were the ones who ’ d been ranked in the top 10 percent of candidates going into the interview. And for lawyers in the bottom half of the resume pool, striving to be themselves in the interview decreased their chances of landing jobs. This isn ’ t unique to lawyers. The results were similar for teachers, too. So this is guideline number one : authenticity without boundaries is careless. Be careful that the vulnerability you choose to show doesn ’ t cast doubt on your competence. Notice what Mohamed didn ’ t say. He didn ’ t tell the group he was afraid he would forget his material or stumble over his words. The fear he expressed was about the audience, not his preparation. AG : When we hear,”Be authentic,”many of us hear,”Be more honest,”which is another way of saying,”Don ’ t sugarcoat things. Say what you really think.”That ’ s another kind of authenticity, being **blunt** with your opinions, which you see an awful lot on the internet. People seem to feel like they can say nearly anything online under the guise of,”I ’ m just being authentic.”But what happens when that kind of online commentary is your job? Leah Finnegan : There is one specific incident that kind of haunts me. AG : Leah Finnegan is a journalist. In 2015, she was working at”Gawker,”the notoriously irreverent, gossipy website. It was a place where raw self-expression online was rewarded and encouraged. It was Leah ’ s job to share her unfiltered views. It was a company standard. LF : We felt like we could do whatever we wanted to and people would respond to it. AG : And often they would. The more outrageous the article, the more clicks it received, the better the website performed, and on and on. It was a perfect fit for how Leah saw herself. LF :... a salty bitch who hated everything and was very extreme in her opinions. AG : Usually those opinions were trashing celebrity baby names or articles in prestigious newspapers. But the problem was, that ’ s how Leah treated everything, online and off. LF : During union negotiations at my company, I left a comment on a blog post saying,”Unions suck dick.”That was something I felt was valid to express. And you know, I just thought I was right. AG : Apparently, Leah ’ s parents had had bad experiences with unions, but obviously not everyone agreed with her take. Her comment got a lot of attention. At some point, she googled her name, and she saw herself referred to as Leah”Unions suck dick”Finnegan. LF : That kind of haunts me, that I might have a legacy as a union buster, which is not great. In fact, unions do a lot of good and have been good for the digital media industry. So I regret that. AG : Leah was just being her authentic self. It felt good in the moment, but over time, the reactions from other people got to her. LF : Well, I was angry a lot of the time because I didn ’ t understand why... people didn ’ t accept me as I was, online and in real life. AG : That ’ s when she got a tip : be less authentic. LF : Yes, well, that was advice from my therapist, who I started seeing after I was like,”I ’ m this way, and no one is responding to it the way I want them to.”And it took a lot of inner strength to pull away from that and kind of be like,"I have to work on portraying myself differently."It was kind of like,"You need to think about how other people see you, and it ' s not their problem if they see you a certain way. It ' s your problem."AG : Her therapist wasn ' t advising her to be fake, but to avoid being completely individualistic, to think of others, too. LF : I think that has benefited my life. AG : Sometimes people get so absorbed in expressing their own opinions that they lose sight of how they affect others. In Leah ' s view, focusing less on authenticity has made her more effective. LF : I think I ' ve become a lot more... some might call it"mature"in how I talk to people. You know, because there are consequences. Like, if you ' re just focused on being yourself, you ' re not focused on anyone else. AG : It ' s common to think of authenticity as something that ' s all about me –"How do I express myself in the world?"But other people have to be part of that equation. Authenticity can ' t exist in a vacuum. I found in my research that concern for others is a critical ingredient for effective authenticity. This is guideline number two : authenticity without **empathy** is selfish. I often hear people explain their **actions** by saying,"Well, I was just being myself."That ' s not an excuse for disrespectful behavior. Sure, we should be true to our values, but we might want to consider others ' values, too. Or as David Sedaris puts it : David Sedaris : Be yourself, unless your self is an asshole. Herminia Ibarra : One of the problems with the"bring your whole self to work"framing is that it ' s narcissistic. What about taking an interest in the other person? Herminia Ibarra is an **organizational** behavior professor at London Business School. She ' s a leading expert on authenticity at work. HI : Authentic leadership, which I actually traced in the press and kind of saw the line go up exponentially, really has become a very popular notion. I think we kind of reached **peak** authenticity a few years back. AG : In the past, when we talked about authenticity, we weren ' t usually describing people. HI : The original meaning is from the world of art, that which can be authenticated, meaning, trace back to the person who made it of their own hands. And in leadership, I think this really came out of the number of scandals that hit, starting in the 1980s and ' 90s, and that decline in trust in leaders. What is authentic? What is real? What is true and therefore **worthy** of trust? AG : Early in her own career, when she first started teaching, Herminia **struggled** with authenticity. HI : I did really poorly for a number of years, and everybody was giving me advice about what to do, and of course nothing fit. And what I was struck with was the least helpful feedback was,"Just be yourself, Herminia."And of course that was the worst feedback to get because the problem was I was too much myself, you know, too introverted, too nervous, too academic, too theoretical – all of those things. AG : But when a colleague suggested doing the opposite, that felt wrong, too. HI : He literally said to me,"You have to be a dog and go mark your territory in each the four corners of that amphitheater."AG : In her research, Herminia wanted to explore how we adapt to new roles at work. So she launched a study of how young professionals **navigate** career transitions. She didn ' t start out focusing on authenticity, but she quickly saw that for the participants, finding their authentic selves was a big challenge. HI : That was a study of how young consultants and investment bankers managed the transition away from doing analytical and project work to actually having to be rainmakers and to manage relationships with clients. And so they had to kind of put on an image of something that they felt they were not quite yet. AG : The bankers and consultants were testing out what she called"provisional selves,"and it made some of them uncomfortable. HI : It was a real sense that,"This isn ' t me. I can ' t see myself that way. I ' m going to have to find my own way through this."It was just really a major threat to their sense of self. AG : So they stuck to their existing identities instead of trying new styles of self-presentation that felt unfamiliar to them. As a result, they often **struggled** to adapt to and excel in their new roles. But others embraced it. They ’ d **observed** their senior colleagues being assertive with some clients while gently guiding others. And they ’ d experiment with those provisional selves to make them their own. The most successful young professionals in her study weren ’ t worried about staying true to themselves. They were striving to develop themselves. HI : The knee-jerk reaction is,”I ’ m fixed, this is who I am, and this is just not within the realm of the possible.”And the minute you say to people,”Does being authentic condemn you to being as you always have been?”they get it. You know, identity – it ’ s **super** multifaceted. It ’ s made up of traits, roles, emotions, aspirations – all of these kinds of things. AG : That ’ s a key lesson here. No one has just one authentic self. We have multiple selves. Think about all the identities you hold at work. Your taskmaster self is probably different from your mentor self, your presenter self and your conference call self. And I hope it ’ s different from your drinks-after-work self. You get to choose which selves you express in which situations, and those selves are evolving all the time So as you move into new territory, it helps to test out different selves to see what feels like you. That ’ s what Herminia ended up doing in her own teaching. She tried out different provisional selves, moving around the classroom more and engaging students more in interactive discussions. HI : It changed from being,”I have content to deliver,”to,”I ’ m there to facilitate an experience in which people are open to learning, engage, having fun and participating.”And that was the result of trying these very unnatural tactics. And I learned much more from it than doing anything that vaguely approximated my sense of my authentic self at that point in time. AG : She started to excel when she developed a style that worked for her. HI : So it ’ s always a balance of what stays permanent, what ’ s continuous, what ’ s core to who you are and then what is it that you ’ re going to grow, learn and discover. We come to inflection points in our lives in which we say,”Hey, wait a minute. I ’ m so much more than this, and I want to give some attention to that.”AG : Yet for some people, the effort to develop and express their authentic selves has extra landmines. More on that after the break. AG : OK, this is going to be a different kind of **ad**. I ’ ve played a personal role in selecting the sponsors for this podcast because they all have interesting cultures of their own. Today, we ’ re going inside the **workplace** at Accenture. AG : I meet a lot of people who are pretty into their jobs. To gauge if they might be a little obsessed, I like to ask,”Where ’ s the strangest place you ’ ve checked your work email?”Joanne McMorrow : The ski lift, going up the mountain, with the winds and the snow that was blowing at me. For some strange reason, I felt the need to pull the phone out, pull the gloves off and check the email. AG : This is Joanne McMorrow, a director at Accenture. I think the chairlift phone check firmly lands her in the category of engaged workaholic. So much so, that two years ago, when Joanne began having some pretty odd headaches, she brushed them off. JM : I was working a lot of hours. I had two little kids. There was just work, life. My own health was probably falling to the last of my priorities at the time. AG : At the urging of her wife, Joanne finally met with the doctor, who ordered some tests. When he came back with the results – JM : They didn ’ t need to tell me anything. The X-ray was actually sitting on the X-ray machine, and as clear as day, I could see the tumor. AG : The tumor needed to come out right away. So Joanne was rushed to the emergency room for a craniotomy. When she woke up, she wasn ’ t only worried about her recovery. JM : At the time, I thought I was going to take a week off of work. I know – major brain surgery, a week off work probably to anyone else would seem ridiculous. I was just feeling guilty about taking that much time because I had no preparation to prep my team for this. AG : To her boss and everyone else at Accenture, that was ridiculous. JM : My boss really was the one that sort of put in my head,"You really need to make sure you ' re taking care of yourself and doing what ' s best for you."And it just so happened she was right. AG : There ' s evidence that self-care isn ' t just important for health. It ' s critical to maintaining energy and performance, too. Accenture encouraged Joanne to care for herself as much as she did her job. Joanne realized she needed to make a change. And once she returned to the office, people around her noticed a new Joanne. Stephanie Williams McConnell : Her perspective absolutely changed in terms of,"OK, this feels really important today, but in six months, it ' s not going to feel as important, and let ' s make sure that my health, my well-being, all of those types of things aren ' t being compromised, because in six months, those things will still matter."That ' s Joanne ' s boss, Stephanie Winters McConnell. Note, don ' t get me wrong – Joanne still works hard. JM : I ' m definitely committed, I ' m dedicated, I ' m driven. But I do so in a very intentional, meaningful way. SWM : She has always been a very compassionate and empathetic person, but I saw a significant shift in leading with that first. Not just driving to get things done but ensuring that along the way she ' s taking care of herself, but everybody around her is as well. AG : Joanne is not only living a more balanced life. She ' s also encouraging her team members to do the same. JM : I lead some of my calls in a surprising way and have everyone talk about what have they done for themselves in the past week. Not at work, but what have they done for themselves. So it allows us to hold each other accountable. AG : And when her colleagues run into trouble, Joanne ' s there for them, just like they were for her. JM : Two weeks ago, one of my direct reports called me to share with me that she had just been diagnosed with breast cancer. And I just knew what we needed to do to support her. And just on Friday, she sent me an email saying how grateful she is for the support that she ' s gotten as she heads into this. Having that impact and knowing that in sharing my story and in changing the way that I have that we could be part of her journey that she ' s about to go through and that she feels that support – that ' s probably one of the most important things for me. AG : Accenture is working to become one of the most truly human companies in the digital age. Learn more at Accenture. com / careers. Carmen Medina : I used to describe myself as a heretic, because I ' m a heretic. I like the word because it means someone whose views are different from the prevailing orthodoxy. And that certainly characterized me. AG : Carmen Medina spent years as a heretic, not in a religious context, but in a place almost as strict – the CIA. CM : I was never a spy. I did travel to Iraq and Afghanistan. I think Afghanistan once and Iraq twice. And riding the helicopters at night – open helicopters, by the way – flying at rooftop level to get from the airport to the Green Zone – I thought was pretty exciting and not what I expected to be doing when I was a little kid. AG : Carmen had already worked for the CIA for more than a decade when the Cold War ended in 1989, and the agency started undergoing a tectonic shift. CM : And I kept getting asked to serve on task forces explicitly about how should the CIA change and modify itself, what should be the new strategic plan now that this focus we had, the Cold War, is ending. So I ' m thinking,"I ' m on a task force. Like, this will – clearly, they must want to know what I really think."And so, I would say in the task force what I really think. AG : Carmen was certain that this newfangled thing called the internet would transform her job and her organization. And she didn ' t hide that belief. CM : I am convinced that the internet is going to change everything about how knowledge organizations do their work. And I think it will be very important for the CIA to figure out how they ' re going to adapt to digital technology. I just thought that, you know, the oceans would part and people would recognize the wisdom of what I was saying, but all I got was resistance and kind of evil stares. The internet was about open information and sharing information and making information freely available. And what ' s the CIA about? Well, not that. AG : This is another type of authenticity : nonconformity. When you act differently than your organization ' s **norms** dictate, like swearing on a team that avoids profanity, publicly calling out errors in an office that favors **privacy** or quietly going home each night when all your coworkers head to happy hour. Sure, you want to be authentic. But what happens when your authentic self runs counter to the culture of your **workplace**? Carmen, a natural heretic in an organization that cherishes strict hierarchies, was about to find out. CM : A senior leader, a woman came up to me and said,"Carmen, you ' re just going to have to censor yourself. You need to stop saying some of the things you ' re saying. You have a bright career in front of you, and you ' re going to ruin it if you keep talking like this."AG : For a while, Carmen did censor herself. She suppressed the part of her that was a heretic. She created what ' s called a"facade of conformity."She put on a mask and pretended to align with the CIA ' s values. Research shows that ' s a great way to burn yourself out. And finally, after nearly two years, the mask slipped. CM :"I ' m just sick and tired of this! All you care about is getting promoted and getting ahead in the organization. And things – the organization is headed in the wrong direction, and you just are not going to say anything."It was my authentic belief. AG : Carmen refused to conform. She couldn ' t let go of this idea that the internet would change the CIA, and she didn ' t adjust the way she expressed her idea, either. Eventually, the CIA sidelined her. CM : Nobody would hire me. I got the really helpful feedback from someone who did not choose me for a position. He says,"You know, your reputation is that you ' re cynical and negative."And I was like,"Wow."AG : Unfortunately, the pressure to conform can be even stronger for members of nondominant groups. That might be true if you ' re a salesperson in an organization dominated by engineers, or a native Southerner in a team of New Yorkers, or more fundamentally, a woman of color in a **workplace** run by white men. For Carmen, being a double minority amplified the challenges of having heretical views. CM : I recognized that the only way I could survive at the CIA was that I had to give up. I had to drop some of the things that I thought were really important for me. So yes, in that sense, I became less authentic. AG : This experience at the CIA knocked the authenticity out of Carmen ' s self-expression. When other people dictate the terms of your authenticity, that ' s the definition of inauthentic. Just ask Alicia Menendez. It ' s happened to her multiple times. Alicia Menendez : I was told that I needed to, like, liven up my look and get some T-shirts, and some leather jackets and wear the things that the kids were wearing. And I was somehow supposed to become that edgy, hip, cool person, instead of just being my, you know, 30-something dorky self. AG : Alicia is now an anchor at MSNBC and the author of"The Likability Trap,"a book about the pressure women face to be who other people want them to be. AM : I sometimes get the sense, and other women I spoke with got the sense, that when they were told,"Be yourself,"it wasn ' t,"Be whoever that is."It was,"Be who I expect that person to be, predicated on your gender, your race, your ethnicity, how old you are, and then show up as my imagined version of who that ought to be."There is often a sense that I would benefit professionally if I were less Latina-ish Liz Lemon and more, to quote Cardi B,"spicy mommy hot tamale."It would be like,"I need this, but smokier."AG : What? People tell you that? AM : Yeah. There is a sense of how a Latina is supposed to self-present, and that can be a wild caricature. Now, I ' ve got to say, Adam, I ' ve also heard it from Latinas on the complete flip, where their English is accented, and they ' re told that they need to tone down their Latina-ness. So... AG : Ugh. AM : It takes lots of forms. AG : If someone is pushing you to fit their idea of your authentic self, especially if it ' s based on stereotypes, something has gone very wrong. AM : I ' m just curious – I mean, have you ever gotten any of this? Have you ever been sort of given the sense – AG : AM :... that you could be something other than the way you are? AG : No. I mean, every once in a while I get suggestions like,"You should move less like a Muppet."AM : AG : But that ' s more objective,"Let ' s try to get you to move and communicate more like a normal person."AM : No one ' s ever told you how to be more professor-ish. AG : No! AM : I think what sometimes gets lost in this conversation when you talk to people who work at companies that are telling them to bring their whole selves to work, they often feel that the company hasn ' t done the work necessary to receive them as they are. And it even seemed to me that the louder and the more insistent an organization was about bringing your whole self to work, almost the less work they ' d done to make that actually possible. AG : People who don ' t fit the dominant culture in an organization learn the hard way that they sometimes have to hide their authentic identities and ideas. They try to fit into that expectation, intentionally or subconsciously, even though it doesn ' t feel right. Let ' s say the conformity pressure you ' re feeling at work is about **norms** and values, not cultural stereotypes. How do you break through that pressure and get heard when people don ' t want to listen? CM : When you ' re a minority, however you might be a minority in an organization, you ' re already a rebel. AG : To get her career back on track at the CIA, Carmen Medina didn ' t have to suppress her identity as an original thinker. But she did need to build up her reputation as someone committed to the **mission**. And so this is guideline number three : authenticity without status and trust is risky. Before you challenge **organizational** culture, it helps to demonstrate your loyalty first. There ' s a **special** kind of status that allows you to get away with nonconformity. In psychology, it ' s called"idiosyncrasy credit."Once you prove your value to your group, you earn a **license** to deviate from expectations. Research backs this up. A series of experiments show that trying to wield power before earning status tends to breed conflict with colleagues and superiors. When Carmen tried to voice her authentic ideas, she hadn ' t accumulated enough idiosyncrasy credit to fight the status quo at the CIA. In order to turn things around, Carmen had to show that she was dedicated to the **mission**. One day, she came across a CIA role focused on keeping classified **publications** secure, one she could excel at. CM : And I went,"That ' s it! If I can just perform the other duties really, really well, then maybe I will get a chance to explore what ' s really my passion."Carmen saw an opportunity to earn some idiosyncrasy credit. By demonstrating her value in the new job, she could show that she was aligned with the CIA ' s core values. CM : And we nailed it. I think that that really restored or changed the organization ' s view of me and restored it as a much more competent person. And I now had authority and status. And so, people were much more receptive to my ideas. AG : With that credibility under her belt, Carmen also reframed her heretical ideas as conforming to the CIA ' s values. CM : So instead of standing on the soapbox and saying,"We have to be completely different, or we ' re going to die!"you know, which is what I did in the late ' 90s, I think you need to say,"The organization has this objective, and I think these ideas could help us achieve these objectives more effectively."And I think you need to start there. AG : She realized there was another part of her authentic identity that she could express. She wasn ' t just a heretic who saw problems. She was also someone who solved them. CM : I would describe myself as a change agent. I use that word. AG : Carmen had set herself up to have real influence. After September 11, 2001, her colleagues were finally forced to recognize the importance of speed in sharing information. Carmen became a major force in ushering the intelligence community in to the digital era, enabling people to share ideas online in real time in a secure way across agencies. She ended up getting promoted all the way up to Deputy Director of Intelligence at the CIA. CM : You ’ re not going to win those battles if you do a frontal assault every time. And sadly, for a lot of organizations, behaving in your authentic way can be perceived as a frontal attack. And I just think that ’ s horrible. But that is still the world that we live in. AG : Look, you shouldn ’ t have to hide your opinions and emotions at work or your ideas and identities. But it doesn ’ t hurt to reflect on the many different selves that are already part of who you are and the selves you might become as you evolve. It makes sense to be thoughtful about which ones you share and when, where and how you express them. After all, you want to be authentic, but you also want to be professional, to set smart boundaries, show **empathy** and not just challenge **norms**, but earn the **license** to change them. You don ’ t have to bring your whole self to work. I think effective authenticity is more about bringing your best selves to work, the ones that bring out the best in others, too. Next time on WorkLife. Person : You know, 40 seconds of interaction, a positive, caring interaction has measurable impacts on both people. Forty seconds. Forty seconds! AG : Ways to tackle loneliness at work. WorkLife is hosted by me, Adam Grant. The show is produced by TED with Transmitter Media. Our team includes Colin Helms, Gretta Cohn, Dan O ’ Donnell, Constanza Gallardo, Grace Rubenstein, Michelle Quint, Angela Cheng and Anna Phelan. This episode was produced by Jessica Glazer. Our show is mixed by Rick Kwan. Original music by Hahnsdale Hsu and Allison Leyton-Brown. **Ad** stories produced by **Pineapple** Street Studios. **Special** thanks to our sponsors, Accenture, BetterUp, Hilton and **SAP**. For their research, thanks to Patricia Hewlin on facades of conformity ; David Day and Deidra Schleicher on self-monitoring ; Elliot Aronson and colleagues on the pratfall effect ; Kerry Gibson and colleagues on the risks of vulnerability ; Dan Cable and Virginia Kay on the double-edged sword of self-verification ; Jonathan Evans and colleagues on self-deprecating jokes ; Edwin Hollander on idiosyncrasy credit ; and Alison Fragale, Nate Fast and colleagues on power without status. AG : I hear a lot of leaders say,”Be authentic! Bring your whole self to work!”What would you encourage them to say instead? HI : Don ’ t use platitudes. That ’ s the first thing I would say, is don ’ t. AG : HI : Honestly! Authenticity also has a sense of uniqueness. Everybody and their brother has said exactly the same thing. AG : HI : I ’ m not advising leaders to not be authentic. I ’ m advising them to maybe be a little bit more original in what they want to convey to others. AG : I think that ’ s great advice.

Text Sample 167: POS Dim 2 – 2020 – Score 44.00 – 2020/t004295.txt

Grace Song : I ’ m one of those people that feel responsible for other people ’ s feelings, which is terrible. And I just made up all these things in my head about how people would respond if I would ask for things. So I ’ m a people-pleaser. Adam Grant : This is Grace Song. Her drive to make others happy makes her one of the nicest people I know, but it ’ s also occasionally made her a little timid. GS : I was a person where I ’ d go into shops and people would convince me to buy clothes and I would just buy them because I would feel bad and then return them later. AG : Wow, that is a whole new level of agreeableness. GS : I just was always afraid to kind of ask and just have the person be angry or upset. AG : When she finished college, she was grateful to land a great marketing job at a good company. Grace was consistently a star performer in her department. She got promoted five times over five years, but one day, she learned something upsetting. GS : Somebody told me that I was the lowest-paid employee in my department of 250 people, even though I was the highest-rated performer within my band levels, and I was promoted consistently every year, but just never asked for a salary increase. AG : How many years, looking back, were you underpaid? GS : It was six years. Six freaking years. AG : Some people avoid negotiating. Others **struggle** at it, and even good negotiators have bad habits. It ' s time to change that. I ' m Adam Grant, and this is WorkLife, my podcast with TED. I ' m an **organizational** psychologist. I study how to make work not suck. In this show, I ' m inviting myself inside the minds of some truly unusual people, because they ' ve mastered something I wish everyone knew about work. Today, negotiating. It doesn ' t have to destroy your relationships. In fact, you can actually use it to strengthen them. This episode is sponsored by BetterUp. When they get a job offer, more than half of American workers don ' t negotiate at all. If you ' re one of those people, estimates suggest that over your career, it can cost you an average of 750, 000 dollars. Grace can relate to this. GS : I would **dread** negotiating. I was 100 percent a pushover. AG : I know the feeling. Back when I was 18, I was hired to sell **ads** for the"Let ' s Go"travel books. I was supposed to call up last year ' s clients and convince them to renew their **ads**. I was terrified. How was I supposed to negotiate with marketing execs more than twice my age? Our renewal rate was 95 percent, but by the end of the first week, I hadn ' t gotten a single renewal and I ' d promised a refund to three clients who were unhappy with their **ads** for the prior year. I think that made me the first person in the 40-year history of the company to lose money that was already on the books. The technical term for this is agreement **bias**, and it happens when you ' re so agreeable that you accept a bad deal instead of pushing for a better one. Out of desperation, I took a crash course in negotiation. I learned how to disagree without being disagreeable. I studied evidence that negotiations hinge on two big priorities : results and relationships, but many people make the mistake of focusing on one and neglecting the other. It was so helpful that when I became a professor, I signed up to start teaching negotiations. My goal was to help students learn that it ' s possible to get the results they want without hurting their relationships. When Grace walked into my class at Wharton, she reminded me a lot of my former self. For as long as she could remember, Grace had been hesitant to negotiate. GS : Being raised by Korean parents, from their perspective, they ' re like, don ' t rock the boat. Like don ' t jeopardize that. Just be appreciative of getting that steady paycheck and be grateful for what you get. So I think that was the mentality that I had. AG : It became clear that Grace was buying into some common myths about negotiating which made it seem like results and relationships had to be either or. After her six years of being underpaid, Grace finally asked for a raise, but she left it to her boss to make the first offer. If you ' re like most people, you believe that ' s the way to get the best results. You don ' t want to tip your hand before you see the other person ' s cards, but the evidence suggests that ' s backward. First offers serve as anchors. They set the hook for the negotiation, and it ' s hard to escape the pull. One comprehensive analysis of negotiation experiment showed that every dollar higher in the first offer translates into about 50 cents more in the final agreement, but in a job offer you don ' t always have the chance to anchor. A few years after taking my class, Grace got an offer for a new consulting role at a big tech company, and the salary was well below what she expected. GS : And it was funny because I was talking to my brother about it and he was like, just take it. AG : But by then, Grace knew that a counter-anchor makes a difference. The final agreement often lands somewhere near the midpoint of the first two offers, so she countered. GS : I think I said something like,"I ' m so excited to work for the team, I ' m **super** eager to do X, Y and Z, but to be honest, the rate that was communicated was much lower than I had expected. So I would love to talk more about this."AG : This brings us to a second myth about getting results. People think they have to ask for exactly what they want, but that ' s not what Grace did. She put multiple counters on the table. GS : I think I anchored with three different numbers. So in a way, it was a range. AG : This strategy felt friendlier to Grace than coming in with a hardball demand, and it ' s actually been demonstrated to get better results. Let ' s say you ' re negotiating your salary and your target is 60, 000 dollars. Instead of anchoring there, experiments show that you ' re better off asking for a range of 60, 000 to 65, 000. The range allows you to signal a bottom line without having to disclose one, and it makes you look more flexible than if you anchor with a single number. People are concerned about insulting you by going below your range, so they ' re more likely to counter within it. You can take this a step further if you ' re negotiating multiple issues. Put multiple offers on the table. This might sound counterintuitive if you ' re used to sticking with a single set of terms, but research shows you ' re better off working from what ' s called a multiple equivalent simultaneous offer. Say that five times fast. For example, if you care about salary, bonus and location, you present one offer with a high salary, but small bonus and unpopular location and another with a more moderate salary and a bigger bonus and more desirable location. It increases the odds that both sides find a combination that works for them. Of course, the credibility of your offers depends on having a legitimate rationale to back them up. Grace had done her homework on the numbers. GS : I did a lot of research, also kind of talked about why getting a higher rate was important for me. It ' s sometimes in your best interest to communicate information and come to the table with information that you ' re willing to share. AG : Grace didn ' t just succeed in getting the top of her salary range, she also negotiated fewer hours and a broader role that served her manager ' s needs, too. In doing so, Grace busted a third myth about getting results. Asking doesn ' t have to be a selfish act. Research shows that, sadly, women are often at a disadvantage in negotiations. In many cultures, they ' re expected to be caring and communal and modest. When women negotiate, they often face a backlash, because their assertiveness violates these unfair gender stereotypes. GS : Women should be quiet and they shouldn ' t speak up, and, you know, you should be a dutiful daughter, not **complain**, and it was the same way I felt about being Asian. You know, like I feel like there is a stereotype that Asians don ' t speak up or ask for things or **complain**. AG : That ' s the bad news. Stereotypes can hold people back. The good news is that there ' s a way to overcome these stereotypes. Extensive evidence reveals that when women negotiate on behalf of others, the backlash vanishes. Now being tough is an act of caring. So when you negotiate, think about who you ' re representing. It might be your family who ' s depending on your salary. It could be your mentee who will take the job after you. For Grace, it was a group she identified with. GS : I didn ' t want to be that statistic of the woman that didn ' t ask. AG : Explaining who you ' re representing makes it clear that you ' re not being selfish. It ' s called a relational account where you describe how the request you ' re making is going to benefit other people, not just you. But what if you ' re negotiating your salary and it ' s not gonna help someone else? You can still highlight how you ' ll use your negotiation skills to benefit your employer in the future. You might say something like,"I ' m going to represent myself with the same high aspirations and integrity that I ' ll bring to the table when representing you."GS : I ' d always thought of negotiation as this zero-sum game, like only one party could win and it was kind of like a duel to the death. AG : But now, it felt different. GS : During the negotiation, it felt really good because it really felt like we were kind of solving this puzzle together. AG : I love that description that good negotiation is like solving a puzzle together, and with her more collaborative approach, today Grace doesn ’ t see herself as a pushover. In fact, she negotiates all kinds of things all the time. She even negotiated a discount on a couch that she loved. GS : I think I saved like 20 percent. I ’ m a creative negotiator. Collaborative negotiator. AG : Collaborative is not exactly how I ’ d describe another student I ’ d had just a few years before Grace. He was the opposite of a pushover, a steamroller. He wasn ’ t interested in solving a puzzle together. Jason Botterill : I was a very aggressive negotiator. I wanted to win. AG : Steamrolling was in Jason Botterill ’ s blood. For a while, he was a pro hockey player. He was a bruiser. After one too many concussions, his career was cut short, and he decided to get into hockey management. When Jason **enrolled** in my negotiation class, I quickly saw that he was just as tough off the ice. JB : Well, I think it was similar to my playing days. You ’ ll do a little bit of a hook or a **penalty** on the ice and the ref doesn ’ t see it, no issues with it and stuff. You ’ re just trying to win. I brought some of that competitiveness to the negotiation standpoint right off the bat. AG : When Jason came to class every week, he would do intense role plays negotiating with his peers. At the end of the semester, I had my entire negotiation class vote on awards like”most cooperative”and”most creative.”Jason was the landslide winner for a different award,”most ruthless.”JB : I remember that moment vividly. AG : He was so aggressive in class that word got out and students in a different class also nominated him for most ruthless, even though they ’ d never negotiated with him. A few years later, I interviewed him about it, and he took it well. Heads up, I recorded this before I even had an iPhone, so the quality ’ s fuzzy. JB : I won the Stanley Cup and I ’ ve also won a national championship in college, but that was by far my highlight of my career – winning”most ruthless”negotiator. No, but how I won it was a situation where I wanted to win at all costs and really wanted just to destroy my competitor. AG : When he graduated, Jason got a management role with the Pittsburgh Penguins hockey franchise. His job was to supervise contract negotiations, and he kept right on steamrolling. JB : I wanted to prove to the people I worked with that I was ready to handle the responsibilities in a job. I wanted to prove to people and agents within the industry that I was gonna be tough enough and aggressive enough to be able to handle myself. AG : What were some of the more aggressive things that you would say to kick off a negotiation or to drive home your point? JB : Well, I think I sometimes would certainly just – my offers were too low to begin with. AG : How much were you lowballing by? JB : Let ’ s see, I believe my initial offer was – it ended up probably being about 1 million dollars per year lower than what we ended up settling on. AG : Wow, and the agent just thought that was ridiculous? JB : I don ’ t think he even viewed it as a first offer. AG : Did you ever lose a player you wanted? JB : We certainly lost a couple players. One agent in particular that we were trying to work on a deal for one of our young players in Pittsburgh, the agent too went to my general manager at the time and **complained** a little bit about my stance and where we ’ re at. AG : Wait, you had an agent **complain** to your boss about you? JB : Yep, had that happen, and he just said that I was being very aggressive. AG : In class, Jason could laugh about being ruthless. It was just a role play, but now his career was on the line. Being a steamroller was putting his future in jeopardy. JB : Maybe I had some success with it at the start, but I also learned that for long-term relationships, it wasn ’ t gonna be a recipe for success. AG : With his steamrolling style, Jason was looking out for himself, but it turns out there ’ s actually a lot of value for both relationships and results in helping the other party benefit. In one of my favorite studies, **researchers** found that the more intelligent negotiators were, the better their counterparts did. Smart negotiators found creative ways of helping the other side that cost them nothing. This busts a fourth myth of negotiating. You don ' t have to lose to help the other person win. Decades of evidence show that great negotiators don ' t just care about **maximizing** their own success, they ' re also motivated to help the other person succeed. Jason realized that if he wanted results, he had to help players and agents get results too, and that commitment became its own kind of rush. JB : You ' re just excited to get deals done and sometimes it ' s hard, sometimes it takes a while. You know, you ' re handing, 22-, 23-, 24-year-old kids 25 million dollars, 75 million dollars, 80 million dollars, and it can get very emotional and it ' s fun to see these players being rewarded. AG : Well, I mean, it ' s really cool to hear you actually thinking about how it ' s gonna help them as opposed to just, OK, what ' s it going to do for me? JB : I think I ' ve just found the more creative you can get, the more options you can present out there, it actually gets the dialog going that much more and you truly understand what ' s important for the player and the agent. AG : One of Jason ' s first opportunities to try it out was in Pittsburgh with a player who was recovering from shoulder surgery. JB : The agent knew that he didn ' t have a lot of leverage and I remember pushing really hard on salary and it was below what players where he was drafted were receiving, and we came to an agreement, but he was certainly very disappointed at the agent. AG : But then, Jason had a change of heart. JB : And after sleeping on it the following day, I actually believed in his rationale and we increased salary a little bit, and I think it was a situation that improved our long-term relationship and it also went to show me just, hey, it ' s important to push hard and be strong for your organization from a negotiation standpoint and there ' s a certain limit to be fair and to make sure that both parties come away from the discussion excited about the deal. AG : That ' s kind of shocking to hear. You had a deal in place, you slept on it, and then you said,"You know what? I ' m gonna make another concession, even though I don ' t need to. JB : And I think it helped our relationship with the player. In future negotiations with him, he was very open with me. He was very to the point on what he was looking for. I was very to the point, and most of our conversations and negotiations moved on very smoothly from there. AG : The lesson was that even if he managed to win this one negotiation, it might have unintended consequences for a whole series of negotiations in the future. In 2017, Jason became the general manager of the Buffalo Sabres. He ' s one of the youngest NHL GMs ever, and he attributes a lot of his success to his shift in negotiating style and strategy. JB : I used to be a hard-line negotiator, and now what I strive for is to be a creative negotiator. AG : Jason and Grace started at opposite extremes. He was a steamroller who was all about results. She was a pushover who was all about relationships, but I was thrilled to see them land in the same place. They both learned that building relationships is a way of getting results, that before you claim value, you need to create value, but many times we don ' t know what the person across the table values. To figure that out, we ' re gonna dive into one of the most important negotiations in modern history right after the break. OK, this is going to be a different kind of **ad**. I ' ve played a personal role in selecting the sponsors for this podcast because they all have interesting cultures of their own. Today, we ' re going inside the **workplace** at BetterUp. Alexi Robichaux : I remember vividly driving down in my little Prius down to Palo Alto and on numerous occasions being like,"This is so scary, so intimidating."Do I need to just pull over to vomit? AG : That ' s Alexi Robichaux. When he was 26, the startup he worked for was acquired by a big company. Almost overnight, he became director of product development. He found himself giving regular presentations to senior executives, and every time he expected to bomb. AR : I was completely underskilled for the task at hand and there was a restroom downstairs. It was the classic cold water on the face, feeling lightheaded and feeling nauseous, hanging over the sink for dear life. AG : Alexi was afraid he could get fired at any moment for saying the wrong thing, so he made sure to keep saying yes, even to things he didn ’ t feel qualified for. He kept waking up at 4am sweating. His doctor told him he had symptoms of hypertension. AR : My doctor ’ s like, this is weird. You ’ re very young, you ’ re in great shape. There ’ s something wrong here. Like you need to make some adjustments. I thought, hey, this place is the problem, right? I just need a new place and I ’ ll be fine and I remember telling a friend,”If I ’ m not out of this company by January 1 of next year, I want you to come find me and I want you to punch me in the face.”AG : Alexi did leave and started his own company, but the **stress** and self-doubt didn ’ t go away. AR : Maybe I just can ’ t be a founder CEO. I knew I was great as a number two. Maybe I just **gotta** make my peace with that. AG : He had hoped being his own boss would solve the problem. AR : I did that for about three months and realized, nope, I am the problem. AG : So he decided to try a professional coach. Her name was Heidi. AR : I learned that I am a terrible overaccommodator. She would just keep pointing out very gently, but very powerfully you didn ’ t share with the person what you actually thought or you didn ’ t share with the person how that bothered you. There are really nice ways, polite ways to still communicate a really powerful, emotional point. AG : It was a huge realization for Alexi. Up until then, he ’ d been bottling up these issues in his head, convinced that he needed to solve all his problems on his own because he thought that ’ s what strong leaders do. AR : And I think that ’ s the great lie. I think any great human who ’ s accomplished anything had an ecosystem of people supporting them. AG : Alexi knew that pro athletes and actors always have coaches and some executives do, too. Experiments show that when managers work with coaches, their performance improves and so does their confidence and resilience. Alexi wanted to bring more coaches like Heidi to professionals everywhere, no matter what level they were in their organization. Today, Alexi is the cofounder and CEO of BetterUp, a leading **mobile** coaching **platform** where tens of thousands of professionals around the world are getting coached everyday. They report that it enhances their job performance and helps them make progress toward their goals. AR : I have a BetterUp coach. She helped me realize that I kind of have these automatic negative thoughts, and now I have developed some skill to be like,”OK, hit pause.”That ’ s an automatic negative thought. It may or may not be true. Let ’ s evaluate that really rationally at a different time. AG : Alexi doesn ’ t get nauseous before big meetings anymore. He ’ s still working regularly with Heidi and with two other coaches. AR : Yeah, they ’ re like my pit crew. They keep me going. AG : With the help of his coaches, Alexi has successfully taken his vision of bringing professional coaching to the masses and made it into reality. He now leads a company of 250 employees with a global network of 2, 000 coaches. He ’ s learned to communicate more openly and ruminate less on his own. Just like in sports, it takes **practice**. AR : And that ’ s something that over the past six, seven years, I ’ ve really learned and embraced and cultivated and I like to think that if we hadn ’ t done that, BetterUp wouldn ’ t be here today. AG : I joined the science advisory board at BetterUp, because coaches have been fundamental in helping me at every point in my career. I believe everyone should have a coach in their corner. If you ’ d like to work with greater clarity, purpose and passion, you can get a free **trial** with BetterUp at betterup. com / worklife. I ’ ve just arrived at the King of Prussia mall, and I ’ m actually here to see if I can negotiate either a discount on a Cinnabon or a free Cinnabon, which would be obviously better. For years, I ’ ve sent my students out to negotiate something non-negotiable. They have to go into a retail **setting** and try to get something free, and they can ’ t mention it ’ s a class assignment. I want them to get in the habit of negotiating and flexing their creative muscles, but one day, they turned the tables and challenged me to do it myself. I failed to negotiate my way out of it, so I found myself heading to the mall. My wife likes Cinnabon and tacos, so I was hoping to surprise her with something creative. I ’ m feeling a little bit of the butterflies right now. Hi there, how ’ s it going? Anthony : Welcome to Cinnabon, how can I help you? AG : Thank you, I ’ m Adam. Anthony : Hello, Adam, my name ’ s Anthony. AG : What do you like most about working here? Anthony : The environment is very nice. Mini buns are a ton of fun to make. AG : So the smell doesn ’ t get old? Anthony : Oh no, it doesn ’ t get old, but I still have to control myself every so often. AG : Alright, so Anthony, here ’ s my **mission** today. I was wondering if there ’ s any way you could possibly make me a taco. Anthony : A taco? Well, actually, we wouldn ’ t have the ingredients here. AG : Can you make, like, a Cinnabon that looks like a softshell? Anthony : Yeah, I don ’ t see why not. We could probably make a Cinnabon that looks like a softshell. AG : I am a little worried that if I come home with this taco-looking delicacy and then she tastes it and it tastes like a Cinnabon, that she ’ s still gonna be devastated. So the question is can I get you to offer me this for free, just in case, so that I don ’ t have to tell her that I paid for something that was not a taco? Anthony : Hm, well, you know, I am running a business. I definitely want to make you happy. I can definitely give you this for a discount. We ’ re actually running a discount today for packs like these. They ’ re gonna be 4 dollars off today. AG : I was hoping to get both of these free. Is there anything I could offer you that would make that worth your while? Anthony : Hm, well, what do you do? AG : Going into that negotiation, I was thinking about something many people overlook. Negotiating is not the first phase of making a deal. It ’ s the third. The first two are preparation and information exchange. You know now from Grace and Jason ’ s stories why it ’ s so valuable to understand the other party ’ s needs. This is about how to actually do that. So I prepared for Cinnabon by coming up with an unusual request. I wanted to show I wasn ’ t selfish by asking on behalf of my wife, Allison, though when I got home, I found out she had no interest in a Cinnataco. I also figured that sharing some personal information would help with building rapport. In one experiment, randomly assigning people to schmooze for a few minutes before negotiating increased their odds of making a deal. I also spent a few minutes thinking about how I could bring something of value to Anthony. I figured he sometimes had to deal with unpleasant customers and he might get bored when traffic is slow, so I thought I ’ d try to entertain him. Then I invited a little information exchange when I asked how I could make the free Cinnataco worth his while. I ended up offering to help spread the word about the sweet taco. If I were to line up some friends, how many of those would I need to send here before that would earn me a couple free Cinnabons? Anthony : Off the top of my head, probably like eight people. Eight to a dozen people. AG : So I promised to recommend it to 10 friends and... success! Anthony : Yeah, I don ’ t mind giving a couple away for free, yeah, because it ’ s a **special** request and it sounds like a fun experiment to do. AG : When I came back 20 minutes later, Anthony had something ready for me. Anthony : It ’ s a puffy little taco, yes. It has frosting, caramel frosting, and then regular caramel on top as well. AG : It looks like a taco that had a chance to rise in an oven and had a bunch of bread in it. I love the touch of the way the frosting is sprinkled and it almost, the little pieces of Cinnabon bread almost look like taco meat. Alright, how do I eat this? Like a taco, OK. Oh my God. Wow, that is really good. Alright, who else wants to try it? Yeah, that Cinnataco didn ’ t even make it home to Allison because it was delicious. Giving away some free Cinnabons didn ’ t really cost Anthony anything, and his team seemed to enjoy the challenge of making the Cinnataco. One of them even suggested they should put it on their secret menu. So the preparation and information exchange that I had to do wasn ’ t that heavy. But in negotiations at work, people often have to give up something of real value. If the stakes are high and the ask is big, it can be tough to figure out what will get people to say yes, especially if it ’ s a deal that affects the entire planet. Christiana Figueres : When I got the call, I was in total disbelief. I was in shock. Oh my God, I got this responsibility. AG : Christiana Figueres was a diplomat in Costa Rica for decades. In 2010, she landed a big role with the United Nations. Her goal was to get governments on board with the Paris Climate Agreement, a global deal to combat climate change and invest in a low-carbon future. You know, the agreement the US recently left. Now, negotiating with one government is hard enough, but Christiana had a few more parties at the table. CF : Yeah, 195. AG : Oh my gosh. CF : Sovereign governments. AG : So you ’ re not just negotiating with 195 people, they ’ re each representing millions of constituents. CF : Yeah, well, they ’ re representing seven billion people, right, collectively. AG : For five years, Christiana traveled the globe. It was one of the most epic efforts at preparation and information exchange ever. CF : The challenge here was to find between what the globe needs and what the self-enlighted interest is of those who are taking decisions. If you obligate anyone to choose between long-term global need and short-term interest, they will go with the short-term interest. So don ’ t pit those two things against each other. That is by definition a battle that you have lost from the start. AG : So how do you discover the interest of so many different parties? Just like with anchoring, you don ’ t have to wait for the other side to open up. If you start by talking about your interests, you signal that you trust them and the **norm** of reciprocity kicks in. That ’ s when people are more likely to share back. Christiana started by giving some background on where she was coming from. CF : Costa Rica doesn ’ t have any carbon, so we see the world very, very differently. AG : She acknowledged that they might be coming from a different place. She said her goal was to work together toward a global solution. CF : Because let ’ s remember, no single country, big or small, no single country can actually get us to where we need to be on climate change. AG : Then she started asking questions. CF : For me to understand but also to help them understand where that sweet spot was. AG : But that sweet spot was different for each country. One of the best ways to understand the other side is to ask them questions about the future. Not just what their goals are today, but what they ’ re hoping to accomplish in the next few months or even years. There ’ s evidence that expert negotiators dedicate more than twice as much planning time to long-term considerations as their peers. The further you stretch out the time horizon, the less fixed the pie becomes and the more possibilities you can sketch out for helping one another. So Christiana asked each country about their future aspirations. CF : Maybe one of the most surprising is the conversations with Saudi Arabia. AG : Christiana had meetings in Bedouin tents and oil fields outside in the scorching desert heat. CF : And they very well understood that 20, 30, 40 years from now, it was probable that they ’ re going to be living in completely uninhabitable areas because of the heat. They understand that. AG : Once you ’ ve figured out their future goals and concerns, you work backward and ask how they ’ re going to get from where they are now to where they want to be. CF : How are you going to do that? What is it going to be like to work outside? Once that has been internalized, then of course, our human reaction is to immediately start to go,”OK, well, let ’ s find a solution to this.”AG : It turns out Saudi Arabia had one crucial interest that stood in the way of closing the climate deal, their economy. CF : Saudi Arabia, it has one single export which is fossil fuels, oil and gas. They came out of poverty when they discovered fossil fuels, and they are one of the richest nations of the world because of fossil fuels. AG : On one of her many trips there, she visited an oil field and was on a plane with the minister of energy and the head negotiator for Saudi Arabia. One of them pulled out a napkin and started drawing out a plan. CF : The idea of the need to have economic diversification came up during that flight. It was sort of an aha moment for them. AG : Meaning that for Saudi Arabia to move forward with the climate agreement, they had to get support to diversify their economy, to be able to invest in other national exports and have the world support them in it. CF : That famous little napkin on which the negotiator pulled out in the airplane and wrote”economic diversification”and made a little design for me of how that might work, that ’ s why economic diversification is literally embedded into the Paris Agreement as an invitation for Saudi Arabia. AG : Wow, wait, so are you saying one of the key turning points in the Paris negotiations happened on a napkin? CF : Yeah, and I really wish that I had kept that napkin, but – AG : So what was the negotiating strategy that led to that napkin? CF : No, no, no, not a negotiation strategy. I mean, I call it my understanding strategy was to really understand how do they see the world? AG : What kind of negotiator shows up not planning to negotiate? CF : Well, honestly, I didn ’ t see myself as a negotiator, right? I mean, I had 195 negotiators who were negotiating for their country. My role was to be the gardener, right? To be the gardener of this fertile ground of figuring out where is the common ground among all of these different needs? And when it starts to germinate, that is the moment in which you really have to step in and give much more energy to those ideas that are germinating and that can bring people to a common position. AG : And tell me how you felt in Paris when you succeeded in closing the agreement. CF : It was nonetheless a moment of utter elation, and not just me, right? The 5, 000 people who were in that hall, all negotiators, plus NGOs plus scientists plus businesspeople, everyone, and as soon as they heard the gavel, everyone just jumped up and screamed and yelled and hugged each other and cried and applauded and stomped their feet and, you know, it was just a total ruckus of delight. AG : You might not be negotiating major international treaties, but understanding other people ’ s interests is always a core skill. Whether you ’ re negotiating your salary, closing a deal or even just trying to get a discount on a couch, or a free Cinnataco, to get what you want, it helps to figure out what other people want. If you can offer them something they value based in genuine, deep understanding, you don ’ t just end up with better results, you also come away with stronger relationships. Next time, on WorkLife, at your request, a bonus episode with the always provocative therapist and podcast host, Esther Perel. Esther Perel : There is no relationship that doesn ’ t have a power dimension. AG : Who do you think has more power in our relationship here? EP : At this moment, it alternates. AG : Relationships at work. Power, trust, and how to avoid the curse of being a people-pleaser. WorkLife is hosted by me, Adam Grant. The show ’ s produced by TED with Transmitter Media. Our team includes Colin Helms, Gretta Cohn, Dan O ’ Donnell, Jessica Glazer, Grace Rubenstein, Michelle Quint, Angela Cheng and Anna Phelan. This episode was produced by Constanza Gallardo. Our show is mixed by Rick Kwan. Original music by Hahnsdale Hsu and Allison Leyton-Brown. **Ad** stories produced by **Pineapple** Street Studios. **Special** thanks to our sponsors, Accenture, BetterUp, Hilton and **SAP**. For more of Christiana ’ s work, check out her new book,”The Future We Choose,”and her podcast,”Outrage and Optimism.”For their research, thanks to Kenneth Thomas and Ralph

Kilmann on conflict styles, Greg Northcraft and Maggie Neale on anchoring, Adam Galinsky, Thomas Mussweiler, Chris Guthrie and Dan Orr on first offers, Dan Ames and Malia Mason on ranges, Hannah Riley Bowles and Linda Babcock on relational accounts, Bruce Barry and Ray Friedman on intelligence, Carsten De Dreu and colleagues on helping others get what they want, Geoff Leonardelli and colleagues on multiple equivalent simultaneous offers, Neil Rackham and colleagues on long-term planning, and Michael Morris and colleagues on schmoozing. OK, before we leave the mall, let ' s try negotiating at Auntie Anne ' s. I have an unusual request. Employee : OK. AG : It ' s my father-in-law ' s birthday. I was hoping to bring home enough cinnamon sugar nuggets to spell out"happy birthday,"and so I want to be able to tell him that Auntie Anne ' s did this for me for free. Employee : Well, as a son-in-law, I appreciate the effort. I think it ' s a great idea. I can ' t give them for free. We do sell buckets, which probably may be exactly what you ' re looking for. AG : OK, and so how much does that normally cost? Employee : 24. 99. AG : OK, so my goal is to get down to zero. Employee : How about this, if you were to purchase a cup of nuggets, I can maybe get you a bunch of extra, put it in a bucket so there ' s more than enough to spell"happy birthday."AG : Did the father-in-law idea, did that tug at your heartstrings at all? Employee : It did, yeah. I ' m married for seven years, so I think I connect to that, yeah. AG : I ' m bummed. If we ' d come on a different day, I could ' ve done this for our daughter ' s birthday. Would that have been more effective? Employee : I have a 15-month-old at home, so that probably would ' ve been equally as. We have too many connections here. A daughter, a father-in-law and no hair. I think you kind of hit all three marks there.

Margaret Atwood : It ' s like going into a very cold lake when you ' ve decided you ' re going to go swimming in it. Adam Grant : This is how one famous writer describes procrastination. **MA** : You put your foot in, you take it out. You put it in again... It ' s still too cold. You think,"Am I going to do this or not? Am I really going to do this?"No, yes, no, yes. That goes on for a while. If you ' re going to do it, you run in screaming. AG : So says Margaret Atwood. She ' s best known as the acclaimed author of"The Handmaid ' s Tale"and has sold many millions of books. But you might not know that she ' s also a self-proclaimed world expert on procrastination. **MA** : Yeah, I ' ve racked up, you know, years and years of it. AG : Because Margaret doesn ' t do anything halfway. **MA** : If you ' re going to do something, might as well be good at it, right? I ' d hate to be a failed procrastinator. AG : She can procrastinate anywhere with the greatest of ease. At home, in a coffee shop, even up in the air. **MA** : I think it ' s always more fun to watch movies on planes than to work. A film called"Captain Underpants"was on the menu. So I was watching"Captain Underpants,"which well repaid my time. And then the plane landed and I forgot that my computer was on it and did not tell my publishers that I had left this computer with all of this correspondence about the heavily embargoed novel,"The Testaments,"on the plane. AG : Oh my gosh. **MA** : Yeah, it was very bad. I won ' t do it again soon. AG : But here ' s the thing. Despite being a world-class procrastinator, Margaret does not turn manuscripts in late. **MA** : No, no, no, no, no. I do not miss **deadlines**. I would consider it dishonorable to miss a **deadline**. AG : How does she manage her procrastination so productively? And can you? I ' m Adam Grant and this is WorkLife, my podcast with TED. I ' m an **organizational** psychologist. I study how to make work not suck. In this show, I ' m inviting myself inside the minds of some truly unusual people, because they ' ve mastered something I wish everyone knew about work. Today, procrastination, and why it ' s not as much of a character flaw or as impossible to overcome as you might think. Thanks to Hilton for sponsoring this episode. Procrastination is intentionally delaying a task that needs to be done even though you know it will come with a cost. Instead of working, you might find yourself watching cat videos on YouTube, looking in your fridge to see if something new has magically appeared in the last 10 minutes, or deciding your productivity problem is that you type too slow, then taking a typing test online to confirm your suspicion, and then taking it over and over to get a better **score**. If you ' re like most people, you first became acquainted with procrastination in school. Somewhere between 80 and 95 percent of students procrastinate. And half of them do it chronically. But it doesn ' t just disappear when you graduate. About 15 to 20 percent of adults are chronic procrastinators. I ' m not one of them. I ' m the opposite, a precrastinator, someone who feels pressure to start tasks immediately and finish them ahead of schedule. Although I did get sucked into that typing test. But if a task is important, I tend to get it done before the **deadline**. And my colleagues tell me that can be annoying. I ' m constantly late to meetings. My excuse?"I was busy finishing another project early."So I ' m pretty fascinated by chronic procrastinators, who live on the opposite extreme. Like Douglas Adams, who wrote"The Hitchhiker ' s Guide to the Galaxy."On a typical writing day, he would sit in the bath for hours, waiting for an idea to come. By the time he got out and got dressed, he often forgot the idea, which would lead him right back to the bathtub. It was so bad that he once had his editor lock him in a hotel suite for several weeks. One that presumably only had a shower. Writers are legendary procrastinators. The question is why. And Margaret Atwood has an answer. **MA** : I see myself as lazy. AG : If you ' re a procrastinator, you might have said the same thing about yourself. Lazy, slacker, undisciplined. But is Margaret Atwood, bestselling author of dozens of books, really lazy? Fuschia Sirois : No, no. That ' s one of the common myths about procrastination, it ' s just people being lazy. AG : Fuschia Sirois is a psychologist in the UK. Her specialty is studying procrastination, and she knows that the root of procrastination is actually something far sneakier than laziness. It ' s not about avoiding work. It ' s about avoiding feelings. More specifically, negative emotions. FS : We say at the core, procrastination is about mood regulation. So a task may elicit lack of confidence, feelings of incompetency, insecurity, fear of failure, anxiety. You put that task aside, and you ' ve just regulated your mood. Now you feel better. It ' s like,"Ah, great. I don ' t have to think about it."AG : You know more about this than most. Do you still procrastinate? FS : Yeah well, you know, I ' m human so yeah, I do procrastinate. The classic thing for me is, you know, I ' ve got this paper to write. And I ' m thinking, this is going to be really hard. And I build it up into something that ' s really huge. And you know, after a couple of days of that, I just kind of go,"Right, I ' m procrastinating. I ' ve just got to get on with this."AG : Everyone procrastinates on something. If you ' re on top of your work, there ' s probably still a task you ' re delaying, even though you know it comes at a cost. FS : You ' ve got to buy a present for your aunt that you only see once a year, for example. And she tends to be really picky. And so now you ' re thinking,"Oh, if I make a mistake, she ' s just going to give me that look."AG : This doesn ' t sound like a hypothetical example. AG : I ' m not going to ask you to name your aunt, but... AG : If you still think you ' re just lazy, here ' s some proof. Take a look at what you do while you ' re procrastinating. Some of those tasks actually take a lot of energy and effort. FS : You ' ll see some, you know, classic chronic procrastinators. They will have the neatest houses. Everything will be organized. All the dishes will be done.

Everything will be clean. But the big looming task that they ’ re supposed to be doing isn ’ t being done. AG : If you ’ re actively doing something else, it ’ s pretty clear that you ’ re not lazy. You ’ re avoiding a task that stirs up negative emotions. And that can have consequences. At work, chronic procrastinators are less productive than their peers. And their health suffers for it. FS : If you ’ re a chronic procrastinator, you have higher levels of **stress**. You have poor sleep quality. You tend to not exercise as much. You might eat more junk food, especially because you ’ re **stressed**. If you ’ re a chronic procrastinator, you ’ ve got difficulty regulating yourself. AG : Which can lead to depression and anxiety. FS : They actually put off seeking help for those mental health issues, which doesn ’ t help either. AG : Oh no, so they meta-procrastinate. FS : Yes, definitely. People feel guilty when they procrastinate. But that guilt doesn ’ t operate in the same way that it does for most people. Guilt could be a motivating emotion. AG : Yeah, it ’ s like the Erma Bombeck line that guilt is the gift that keeps on giving. FS : Yeah, well, for procrastinators, what it gives is more procrastination. AG : Ah, so unfair. Even if you ’ re not a chronic procrastinator, there are certain types of tasks that you might have a habit of postponing. FS : Might be a procrastinogenic environment because... AG : Did you say”procrastinogenic?”FS : Yes, procrastinogenic. AG : What a great phrase. FS : Well, it ’ s an environment that can evoke procrastination. AG : I am absolutely using this as an excuse. It ’ s not me, it ’ s not that I lack willpower. This is just a very procrastinogenic task. FS : Yeah, tasks that don ’ t give you autonomy, that lack structure, and that are ambiguous. AG : Is that why so many writers **struggle** with procrastination? FS : It could be. Because yeah, when you ’ re writing, who ’ s telling you what the next thing is you ’ re supposed to be writing, right? You are. I mean, it brings up uncertainty about yourself. It brings up doubts about whether you know what you ’ re doing, right? We all have that feeling from time to time. AG : You might find yourself procrastinating to avoid anxiety, confusion or boredom. Whichever your flavor of procrastination, psychology points to a couple ways to curb it. For one, you can start by trying to be a little kinder to yourself about your past procrastination. Yep, this actually makes a difference. FS : Our emotions can actually change the way we view the task. AG : Instead of beating yourself up, show yourself a little compassion. **Relieve** the guilt. Research reveals that after students put off studying for an exam, those who forgive themselves are actually less likely to procrastinate on preparing for the next test. Fuschia and her colleagues have found that it helps to remind yourself that you ’ re not the only one suffering from procrastination. It ’ s part of the human condition. Everyone does it on occasion. FS : Sometimes I will just sort of step back and go,”Yep, yep. I ’ m just being like every other procrastinator in the planet.”And you ’ re acknowledging what you ’ re doing, accepting responsibility for it. But you ’ re not feeding back into the negative emotions that probably put you in that place where you wanted to procrastinate in the first place. AG : It turns out that self-compassion is especially hard if you ’ re a neurotic perfectionist, the kind of person who constantly beats yourself up for never doing work that ’ s good enough. If that ’ s you, you might take a cue from productive perfectionists and stop **judging** your work before you ’ ve even produced it. In other words, don ’ t criticize yourself while you ’ re creating. Try waiting until you ’ ve finished developing your ideas before you worry about evaluating them. That ’ s something Margaret Atwood advises. **MA** : The wastepaper basket is your friend. So go ahead, say something. It may be the wrong thing, but you can throw that out and no one will ever read your dumb thing that you ’ ve put on them. AG : Margaret has a long history of procrastinating to escape negative emotions. **MA** : I procrastinated about starting”The Handmaid ’ s Tale.”I procrastinated for about three years. I tried to write a more normal novel instead, because I thought it was just too batty. AG : Too batty, really? **MA** : Yeah, I mean it doesn ' t seem very batty now. But think of when this was. It was in the early ' 80s. Yeah, it just seemed a bit too batty. AG : Margaret wasn ' t just worried that the plot was far-fetched. Her fears actually kept her from writing the book sooner. **MA** : You don ' t know who ' s going to read it. You ' ve got no idea. You don ' t know whether they ' ll like it or not. It ' s not something you can anticipate or have any control over, really. AG : Years ago, when asked to describe her writing routine, Margaret said she would spend the morning procrastinating and worrying. Then plunge into the manuscript in a frenzy of anxiety around three o ' clock, when it looked as though she might not get anything done. It still happens to her sometimes. **MA** : **Scrolling** around on the news certainly can get me sucked in. AG : Luckily, Margaret has come up with a unique strategy for dealing with her procrastination habit. And it ' s a trick that lines up with what some **researchers** recommend. **MA** : I had another name that I grew up with, and that gave me two names. So I had a double identity. So Margaret does the writing and the other one does everything else. AG : Her alter ego ' s name is Peggy. **MA** : It ' s a Scottish diminutive of"Margaret."AG : Do you actually refer to yourself by both identities in your head? **MA** : Absolutely. AG : Seriously? **MA** : Well, you see what a range it gives me. AG : Do you have conversations between Margaret and Peggy? **MA** : No, they lead quite separate lives. Peggy does the laundry. Now there is, of course, some overlap. Because sometimes when Peggy ' s doing the laundry, Margaret is thinking about what is being written. Deciding what to write is done by Margaret. Deciding when to write is sometimes a tug of war. AG : Margaret ' s dual identity strategy isn ' t as strange as it sounds. Psychologists have long **observed** that we have two selves, the want self and the should self. Your want self runs on emotions. It ' s drawn to whatever avoids pain or brings pleasure in the short run. That ' s Margaret watching"Captain Underpants."**MA** : Oh, you ' d rather be watching"Captain Underpants,"let ' s face it. AG : The should self is more concerned with doing the right thing in the long run. That ' s Peggy. **MA** : The ordinary person who walks the dog and eats the bran flakes for breakfast. AG : In the moment, the want self is often stronger. No matter how hard you try to push yourself to do the work you should be doing, it ' s easy to get pulled into the show you want to be binging. Like, maybe,"The Handmaid ' s Tale"? That ' s the bad news. The good news is that the should self is smarter. You can outwit the want self by planning ahead. This is a second strategy for beating procrastination that science teaches us. You don ' t have to worry about resisting temptation if you remove temptation. In college, my roommate Palmer was brilliant at this. Whenever it was time to study for an exam, he would ask me to hide his video games. You ' ve probably done it too. Your should self puts the alarm clock across the room at night so your want self can ' t reach the snooze button in the morning. You prevent procrastination by taking willpower out of the equation. Or maybe your should self announces to the world that you ' re signing off social media so your want self won ' t get sucked back in, which is what Peggy does for Margaret, who loves Twitter and sometimes posts random questions that pop up. **MA** : For instance, I put up a picture of a weird mushroom, and said, what is this? Because I couldn ' t find it. AG : When you ' re **tweeting**, how often does that happen while you ' re writing? Do you actually interrupt yourself or get distracted by social media? **MA** : No, no. No, no way, no. I might get distracted before I take the plunge into the writing burrow but not while I ' m in it. AG : How do you prevent that from happening? Is there a mental firewall of sorts? **MA** : You turn it off. AG : For many people, easier said than done. You just turn it off and that ' s it? **MA** : Just don ' t go there.

AG : It can help to schedule a specific task in your calendar, the same way you schedule meetings. In one experiment, writers were randomly assigned to plan **daily** writing sessions. They were over four times more productive, and they didn ' t lose any creativity. Even scheduling 15 minutes a day was enough to make some progress. That ' s time management. You can also think about timing management. When do you procrastinate? Procrastinators tend to be night owls. The start of the work day is out of sync with their circadian rhythms. If that ' s you, and you have the flexibility, try moving a task you procrastinate to later in the day, when the wants might be less tempting. One of my favorite tactics for outsmarting my want self is a twist on the to-do list. I found out that Margaret does it, too. **MA** : So the list would include everything from"call the tree guy"to, you know,"clean the furnace."If it ' s not on the list, it doesn ' t happen. AG : That ' s her to-do list. But she also has a to-don ' t list, a set of activities to avoid while working. Think about your to-don ' t list. What would you put on it? When I ' m working on my boring procrastinogenic tasks, like reading contracts and proofreading articles, my to-don ' t list includes don ' t play online Scrabble, don ' t turn on the TV – unless I already know what I want to watch, and don ' t **scroll** on social media after posting. Peggy also puts social media on Margaret ' s to-don ' t list. To hold herself accountable, she makes a public commitment, **tweeting** that she ' s signing off to write. **MA** :"I ' m about to write, goodbye."And that ' s about going off social media for a while, and reassuring people that I ' m not dead yet, or possibly disappointing them that I ' m not dead yet. AG : I can ' t imagine that anyone is disappointed. **MA** : They would be even more excited to hear from me if I were dead. They would be really excited then. She came back from the dead. AG : I ' m having a hard time reconciling your self-description of being lazy and procrastinating with your enormous productivity. **MA** : Well, just consider some elementary math. Take the number of years I ' ve been alive and divide it by the number of books I ' ve written. AG : Alright, so you average less than one a year. **MA** : Yes, and some are quite short. AG : And you don ' t feel like that ' s a lot. **MA** : No, it ' s just, you know, they accumulate. AG : Maybe you can start forgiving your want self for procrastinating. Maybe you ' ll succeed at putting some of the should tasks on your calendar and some wants on your to-don ' t list. Still, you can ' t shake the feeling that if only you had more time, you could get more done. But what if the opposite is true? More on that after the break. OK, this is going to be a different kind of **ad**. I played a personal role in selecting the sponsors for this podcast, because they all have interesting cultures of their own. Today we ' re going inside the **workplace** at Hilton. It ' s not uncommon for people to say"My coworkers feel like my family."But I recently met someone who takes that sentiment to a whole new level. Jessica Clingman-Kerns : The DoubleTree by Hilton Sonoma Wine Country is my second home. Everybody here is my family. AG : That ' s Jessica Clingman-Kerns, a team member at Hilton. In October 2017, when wildfires swept through wine country, her parents ' home burned down. JCK : The fire just kind of completely took over their entire neighborhood, and their house was gone. It ' s hard. My brother had passed away just a couple months prior, so all of his things were in that house. Just a lot of parts of our life that we ' ll never get back. AG : It was devastating. But after sitting with her grief for just a moment, Jessica sprang into **action**. JCK : I emptied out my boyfriend ' s Tahoe and put all my camping stuff in the car. And then I went to Walmart and maxed out a credit card with just toothbrushes and toothpaste and deodorant, and just little things for someone who left their house at midnight and had nothing. And I just started driving. AG : She headed to the DoubleTree, to set up a makeshift relief operation. A manager provided her with a small conference room, which quickly became too small of a conference room. JCK : I think everyone at the hotel thought I was crazy because I was like,”Oh, I just need a little bit more space.”And then they started seeing semitrucks. So my one little room turned into 10, 000 square feet, 100 volunteers, millions of dollars in donations. AG : Of the thousands of Californians who lost their homes, several were Jessica ’ s colleagues. JCK : That didn ’ t stop them from volunteering or being a part of everything either, so... I could not have done it without their support. AG : Each year, Hilton ’ s CEO presents the Light and Warmth Award to a dozen of their 425, 000 team members. It ’ s the highest honor in the company, given to people who embody Hilton ’ s vision, **mission** and values. JCK : I knew about the Light and Warmth Award, but I never thought that I would even be thought of. AG : Experiments show that it ’ s not just the recipients of recognition who end up performing better. Their colleagues do, too. Awards are not just a powerful way to show the winners that they ’ re valued. They ’ re also an important way to signal to everyone what ’ s valued in the culture. A few months after the relief effort, Jessica headed to a meeting, where she was surprised with a phone call. It was Hilton ’ s CEO. She hadn ’ t just been nominated for the award, she won. JCK : So they awarded me with one of those big obnoxious checks. But I looked at the other side and it said 10, 000 dollars. And I was like,”Oh no, come on. This is a joke. Where ’ s the camera,”right? But as soon as it kind of hit me like, I thought,”How else can I help people with this money?”I can sponsor families for the holidays this year. I can donate some of this to rebuilds. AG : One of the many people amazed was Jessica ’ s dad. Jessica ’ s Dad : When I think back on it, just seeing all the work and caring that Jessie put into helping the entire community, I mean, that in itself makes up for any losses that we had. JCK : It ’ s just in my nature to help other people. That ’ s why I love hospitality. AG : Hilton was named Fortune ’ s number one Best Company to Work For in the US, in both 2019 and 2020. And one of the best places to work for Millennials by the Great Place to Work Institute. Learn more at jobs. hilton. com. AG : Procrastination is the opposite of productivity. It ’ s wasting time, or at least using it pretty inefficiently. We ’ ve talked about how individuals can avoid that, but I also want to know what organizations can do about it, which might mean thinking differently about what it means to be productive. Rutger Bregman : I think the first question we should ask ourselves is”What is work, and what is productivity?”Nowadays, we say work is just this thing you do in a hierarchical relationship with an employer. You get a salary, you pay taxes over that, and that is what we call work. AG : Meet Rutger Bregman. RB : I ’ m a Dutch historian and author. AG : And why do you feel the need to mention that you ’ re Dutch? RB : That ’ s a good question. Maybe because the Netherlands is the country with the shortest working week in the world. And also, we have incredibly high productivity per hour. So it ’ s actually a good example of my thesis that actually, if you want to be more productive, you ’ ve got to work less. AG : How would you define productivity? What do you consider a really productive day at work? It probably has something to do with time and with output. How many hours you spent actually paying attention to your tasks instead of **scrolling** on Instagram, how many boxes on your to-do list you checked. But what if you redefine productivity? RB : My definition would be work or being productive is just doing something that is valuable, that is useful. AG : I like this. I think of productivity as using your time to accomplish things of value to you and others. Whether you use your time well depends on how much of it you have. Psychologists find that being busy, having less time, motivates us to finish tasks faster. We often procrastinate less when we have more on our plate. And there ’ s some evidence that people with multiple children are more productive at work than people with one or none. New studies suggest that parents are more absorbed in their job tasks while at work, because they know how much they have to **juggle** later at home. I guess the old saying is true. If you want something done, give it to a busy person. Of course, your ideal solution to procrastination is not going to be having kids, or having even more kids. But this research suggests that when you have less time to complete your tasks, or more tasks to complete in a given time, it can curb procrastination by changing your emotions. When you ’ re busy, you ’ re more motivated by fear and guilt about falling behind than whatever unpleasant feelings you have around the task itself. But when you have a lot of free time, you don ’ t feel that urgency to finish. There ’ s a name for it, Parkinson ’ s law. The idea that work contracts or expands to fill the time available. RB : I actually experienced this when I was working at a traditional Dutch newspaper. And I remember all those afternoons. I ’ m not very productive during the afternoon, you know. So around 4:00pm, I just want to start bothering my colleagues and making stupid jokes. AG : Rutger has proposed what might seem like a radical solution to those episodes of procrastination – shortening the workweek. It ’ s not as crazy as it sounds, because the whole notion that 40 hours is a magic number for productivity is kind of arbitrary. RB : If you look at the history of this, it was Henry Ford, already at the beginning of the 20th century, who already found out that when he moved his workers to a 40-hour workweek, they were more productive. And he didn ’ t do it because he cared so much about his employees. You know, he cared about his wallet. That was the reason why he did it. It was called the American way. Working less, it ’ s the American way. AG : And actually, Rutger points out that for more than a century, workweeks were getting shorter and shorter. In the mid-1800s, people often worked 70-hour weeks. Then, around the turn of the century, workweeks started dropping from 60 to 50 hours a week. RB : And then after the Second World War, economist John Maynard Keynes said we ’ ll have a 15-hour workweek in 2030. AG : I promise this is going to tie back to procrastination. I ’ m just putting it off for a little while, because I want to know why we ’ re working so many hours today. There are lots of possible explanations, from rising competition and globalization and consumerism to being obsessed with status at work, to just believing more is better. Whatever the cause, you ’ ll be familiar with what the result looks like now. RB : Probably, at this moment around the globe, there are millions of people sitting in offices, just waiting, browsing Facebook, sending emails to people they don ’ t really like, writing reports that no one ’ s ever going to read. I think we could easily move to a four-day, three-day workweek, and be just as productive. You just squash out all the slack that ’ s currently in the system. AG : How many hours do you actually work? RB : I think about 50 to 60. If you would define my work as, you know... Am I working right now? Is this work? AG : I don ’ t know, does it feel like work? Are you contributing something valuable to the world? RB : Well, you decide that. No, I find it very hard to define what work is for me. AG : I wonder then, is there some degree of irony that a guy who works 50 to 60 hours a week is calling for a 15-hour workweek? RB : Yes, it ’ s very ironical, I know that. AG : I also think I work more hours than you do in a typical week. And I ’ ve also called for shorter workweeks. So at heart, I wanted to know that I wasn ’ t the only hypocrite out there. RB : Yeah, we ’ re both hypocrites. AG : Yeah, but I think maybe the difference between our lives and the policy changes we ’ re calling for is we choose to work this number of hours, right? I work as many hours as I do because I find my work enjoyable and meaningful. And what I want is for the hundreds of millions of people who hate their work or who find it extremely **stressful** to have the freedom to work less if they so choose. RB : Yeah, and you could also frame it like this. I think that often, we need to work less in order to do more, right? To have more time for the things that we really care about. AG : We should think about productivity not as the volume of output but as the value of output. And if we ' re going to do that, then we need to start measuring work in something beyond hours, which is starting to happen. Leaders are beginning to realize there ' s a big difference between working long hours and doing worthwhile work. Finland ' s new prime minister has spoken in support of a four-day workweek and a six-hour work day. In the US, Shake Shack is trying out a four-day week for managers at many of their locations. And recently, Microsoft Japan tested the four-day workweek. Productivity climbed by 40 percent there. In part because of more focused attention, and in part because they got rid of unnecessary distractions by making meetings shorter. But my favorite example comes from another company that has gone to the extreme to help people use their time more productively. Even people who are chronic procrastinators. Jade Walker : I was definitely not employee of the year or anything like that. Just a whole lot of procrastination. AG : Jade Walker has **struggled** with procrastination in the past. Maybe because she lives in a beautiful part of New Zealand. JW : I ' m based in Takapuna, which is a suburb of Auckland. It ' s, like, a beach town. AG : Are you a surfer? JW : No, I ' ve got two little kids. So mom life is how I spend my spare time, chasing them around. AG : But at work, she found herself getting distracted by another kind of surfing. JW : Oh, I was definitely an internet surfer. Online shopping, talking to my friends. This is really bad, but I used to do our grocery shopping online and it gets delivered. AG : I love the efficiency of that, though. JW : My old boss probably wouldn ' t agree, maybe. AG : Then she took a new job in estate planning, creating wills for people in the hospital and for navy soldiers about to deploy. Jade ' s new company, Perpetual Guardian, does something unusual. They offer a four-day workweek. New employees start out at five days, and if they prove their productivity in the first few months, they get to go down to four days. It had a big impact on Jade. JW : Every weekend, I get a screen time report. And it used to be horrendously bad. My husband would see it sometimes, and he ' d be like,"Oh my God, you spend four hours on your phone a day."I ' m like... Yeah. But now, like during the day, I don ' t have time. So my screen time, I ' m proud to say, is between one to two hours. A lot less, due to the fact that I ' m being a lot more productive at work. AG : Congratulations. JW : Thank you. AG : It ' s one of the smartest motivators I ' ve ever seen. If your productivity backslides, you go back to a regular workweek. If you ' re efficient and effective, the reward is that you get to work less. JW : Yes, that ' s a big incentive to not procrastinate. We don ' t have a lot of time to procrastinate anymore. You just sort of get in there and get everything done. AG : It ' s completely changed her work process. Now, each morning, she spends 15 minutes planning her day. She color-codes emails and writes lists of priorities. All this helps her complete one task at a time and move on to the next one, instead of trying to do three things at once. Her productivity and her focus have improved. JW : Going back to five, I don ' t know what I would do with an extra day at work now. AG : Grocery orders. JW : Yeah, exactly, shopping, long breaks. AG : Are you saying you would procrastinate, if you had a fifth day? JW : Yes, I probably would. Now that I ' m used to getting everything done in four, I think I ' d have so much extra time. So I probably would procrastinate, because yeah, I ' d have to fill in the day somehow. AG : You probably don ' t have the luxury of just deciding to work fewer hours. If you ' re an hourly retail employee, for example, your income will take a hit. But the shorter workweek is a **bold** demonstration that it ' s possible to manage our work lives differently, more efficiently. In any given moment, we will always have dilemmas about whether to work and what to work on. But take it from Margaret Atwood, the task you ' re putting off isn ' t always the one you hate. It might be the one you fear, the one that ' s ultimately the most worth pursuing. At least, that ' s how it was for"The Handmaid ' s Tale."**MA** : I did try to write this more normal novel and it really just did not work out. So that was a signal that I had to write the batty one or nothing. AG : If you ' re going to do the task eventually, you might as well spare yourself the agony and start it sooner. **MA** : I call that"white rabbit syndrome."AG : From"Alice in Wonderland"? **MA** :"I ' m late, I ' m late, I ' m late."AG :"No time to say hello, goodbye."**MA** :"That ' s it, got to go."AG : Next time on WorkLife. Conrey Callahan : This feeling of being trapped in this system where you ' re on, like, a hamster wheel. You know, you ' re kind of, like, doing a lot, but is it really changing anything? AG : Job **burnout** seems to be everywhere. But it ' s not inevitable. WorkLife is hosted by me, Adam Grant. The show is produced by TED with Transmitter Media. Our team includes Colin Helms, Gretta Cohn, Dan O ' Donnell, Constanza Gallardo, Grace Rubenstein, Michelle Quint, Angela Cheng and Anna Phelan. This episode was produced by Jessica Glazer. Our show is mixed by Rick Kwan. Original music by Hansdale Hsu and Allison Leyton-Brown. **Ad** stories produced by **Pineapple** Street Studios. **Special** thanks to our sponsors : Accenture, BetterUp, Hilton and **SAP**. For their research, thanks to Tim Pychyl on procrastination, Max Bazerman, Katy Milkman and colleagues on want / should selves, Keith Wilcox and colleagues on being busy, Tracy Dumas and Jill Perry-Smith on absorption at work, and Bob Boice on scheduling writing sessions. And thanks to Candice Faktor for the amazing introduction to Margaret Atwood. **MA** : OK, so here ' s the story. We were throwing a party at our house for some writers. And there they were, all milling around. And then this young woman, who was about 35, said she was having a heart attack. Then I called 911 and the paramedics arrived, lumpety-bump up the steps. I love paramedics. So in they come, and here ' s the conversation. First paramedic :"Do you know whose house this is?"Second paramedic :"No, whose house is it?"First paramedic :"It ' s Margaret Atwood ' s house."Second paramedic :"Margaret Atwood? Is she still alive?"

Text Sample 169: POS Dim 2 – 2020 – Score 41.00 – 2020/t004276.txt

Arthur Brooks : Starting when I was eight or nine years old, I literally wanted to be the greatest French horn player in the world. That was what I always wanted to do. That was my whole life dream. Adam Grant : What was behind that? AB : I was ambitious. I wanted to play for a lot of people. And I guess that was just simply expressed in the only thing that I really knew how to do, the only thing I really cared about, which was music. AG : Arthur Brooks was a natural. He could read music before he could actually read. He played in youth orchestras as a kid, prestigious ones. Eventually he dropped out of college to go on tour. AB : I went on the road playing **classical** music. I did that for six years. I saw all 50 states from the back of a van. AG : Arthur recorded an album that played on **classical** radio stations across the country. But then something started to change. AB : I realized, about age 21, that things were starting to go south, and I couldn ' t explain it. Ordinarily, **classical** musicians, they will see their skills increase through their 20s, and sometimes even their 30s. So whereas if I were a **baseball** pitcher, it would be totally normal that I would be losing heat off my fastball by my early 20s. As a French horn player, I shouldn ' t have been seeing that, but I was. AG : To turn things around he **practiced** his heart out. Finally, he got his big break, his debut at Carnegie Hall. AB : So I got ready for this concert, and the first half of the concert, I have to say, was phenomenal. It was really one of the best concerts I ' d ever given. And in the second half, I had this experience where I had to actually talk to the audience and I walked toward the front of the stage to address the crowd, and I wasn ' t watching my feet and I slipped, or something collapsed, I still don ' t know, and I fell five feet into the audience. AG : You literally fell off the stage? AB : I literally fell off the stage. It was just ridiculous. It was... I wrecked my instrument, I fell on my instrument, I hurt my arm. And, of course, I did what you would do when you ' re 22 years old. I jumped up and said,"I ' m okay, folks."And I obviously was not okay. AG : Oh, no. AB : It was just so terrible, Adam. It was so terrible. AG : Arthur tried to shake off the feeling that falling off the stage was a bad omen. He spent the next decade practicing. He studied with the best tutors in Europe. He got a job at a symphony in Barcelona, but – AB : It was a wreck. It was a slow-moving wreck in my career itself. I was in decline. Finally had to pack it in. I had to admit it to myself that I wasn ' t the horn player I had always dreamed of being. And right now, I ' m talking about it with you and, you know, we ' re laughing and all that, but I ' ve got to tell you, it kills me, I still hate it. AG : Arthur didn ' t plan to quit music so early. He simply stopped being great at his job. And in the years since, it ' s made him wonder, does career decline happened to all of us eventually? And is there anything we can do about it? I ' m Adam Grant, and this is WorkLife, my podcast with TED. I ' m an **organizational** psychologist. I study how to make work not suck. In this show, I ' m inviting myself inside the minds of some truly unusual people, because they mastered something I wish everyone knew about work. Today, career staying power. It ' s more about the choices you make than the age you reach. Thanks to Accenture for sponsoring this episode. Let ' s be honest, we all have **peaks** and valleys in our careers, times when we hit our stride and do our best work, and times when we ' re in a slump. Most of us are worried that as we age, our physical and mental skills will decline and we might enter into a permanent slump. And that fear is compounded by the fact that age is seldom seen as an asset in the modern **workplace**. Far too often, our older colleagues don ' t get the respect they deserve. Arthur ' s slump happened at a particularly early age, so he changed careers and became a public policy expert. AB : Basically I ' m just an old fashioned, number-crunching, quantitative social scientist. AG : Given what he ' s gone through, it ' s not entirely surprising that his big area of focus now is career decline. AB : Career decline is a very personal and personalized phenomenon in which your skills are not what they once were. So you might be making as much, or more, money than you ever have before, but you know that you are not at the same level of technical adeptness that you had once attained, and / or you ' re not on the trajectory to attain what you had hoped. AG : Maybe you felt your stomach lurch when someone younger than you has a smashing success in your field or your **workplace**. Or maybe you ' ve been humming along feeling good about your work, until one day you noticed your skills don ' t seem quite as sharp as they used to. In 2019, Arthur wrote a major story about this phenomenon in"The Atlantic."The headline was"Your Professional Decline Is Coming Sooner Than You Think."As in, long before you even start to see retirement on the horizon. AB : I mean the number one myth is that, you know, particularly in certain professions, like, let ' s just say yours and mine, which is coming up with big ideas and sharing them, that that ' ll never go into decline. Why? Because it doesn ' t require, you know, strong biceps, and yet there ' s overwhelming evidence that in idea professions people experience decline as well. They just don ' t expect it. AG : What happens to our cognitive abilities as we age is not straightforward. It actually depends on what kind of mental skills we ' re talking about. Psychologists have long distinguished between two kinds of intelligence : fluid and crystallized. Fluid intelligence is your raw processing power. It ' s basically your IQ, your innate capacity for learning and problem solving. AB : That ' s a big part of the modern idea economy. I ' m going to come in here, I ' m going to be a whizzbang person who comes up with brand new ideas. That ' s actually what ' s rewarded for young people because young people have high levels of fluid intelligence. It increases through your teens and 20s, and maybe through your 30s, although it tends to start declining for most people in their 30s and 40s, and it makes this original idea generation harder. Now that doesn ' t mean that you ' re going to be unsuccessful, but it means if you ' re relying entirely on this fluid intelligence, you ' re going to **struggle**. AG : A common refrain in Silicon Valley is that young people are just smarter. When it comes to fluid intelligence, that ' s generally true. But the story changes with crystallized intelligence, your acquired ability to solve problems by applying your knowledge and experience. AB : Your ability to synthesize things that you didn ' t necessarily invent, that ' s crystallized intelligence and that tends to happen later. AG : Think about how crystallized intelligence comes in handy in your job. If you ' re in sales, you ' ve used it to tailor your pitches to different clients based on what you ' ve learned about them in the past. If you ' re in government, you ' ve relied on it to get around red tape. If you ' re in finance, maybe you ' ve applied it to predict how markets are affected by crises. Crystallized intelligence **peaks** much later than fluid intelligence, in large part because our body of knowledge keeps growing. AB : Think of it like a library. Think of the brain as basically filling up with a lot of volumes. And that means you have a lot of crystallized intelligence. AG : Depth and breadth of knowledge aren ' t the only benefits of aging. Evidence suggests that self-control and socio-emotional skills often keep climbing, too. Many of us continue gaining willpower and emotional intelligence well into our 40s and 50s. We ' re still getting better at delaying gratification, reading other people ' s emotions and regulating our own moods. Even into our 70s and 80s, we ' re still improving at ignoring sunk costs, all of which can enhance our job performance. But Arthur doesn ' t think that ' s enough to keep us from declining. AB : Everybody falls in their game at some particular point. AG : At what age do you think the average person is going to start to face significant career decline? AB : I ' ve got to give you the social scientist answer – it depends but if I were to guess, I ' ve got to say that in your mid-40s is when you ' re likely to see the **peak** of your originality and creativity, and you should be making plans in your 40s to how you can be the best creator with your crystallized intelligence, how you can be the best instructor, the best synthesizer, you can possibly be. AG : OK, so this is where I want to start disagreeing with you. So my read of the evidence is that people don ' t inherently become less creative. One of the things that happens as people ' s careers advance is they tend to produce less, just, you know, in terms of overall volume. I think it ' s not ability. I think it ' s motivation that ' s dropping. I think, you know, a lot of people become complacent and they feel like they ' ve achieved enough success, and so they may scale back a little bit. It may be that priorities outside of work become more important to them. And if we can maintain that motivation, there ' s no inherent reason why the quality of creative output would decline. What do you think? AB : Hmm, I ' m willing to entertain your hypothesis. AG : OK, cool. So there ' s a study I really like of scientists, filmmakers and artists, showing that as they advance from their 20s and 30s toward their 50s and 60s, they do less work. The scientists run fewer experiments, the filmmakers don ' t make as many movies and the artists produce fewer paintings. But those who stay productive, their hit rate was every bit as high in their 50s and 60s as it was in their 20s and 30s. So, you know, I think about Frank Lloyd Wright designing Fallingwater at 68 years old, his crowning architectural achievement. Or I ' m sure you ' ve come across Raymond Davis Jr, the scientists who measured

neutrinos from the sun. He didn ’ t build the key detector until he was 51 and kept running his experiments until he was 88, the year he won the Nobel Prize. I ’ d be willing to bet that we would either uncover, or even create more Frank Lloyd Wrights and more Raymond Davises if we had ways of keeping more people motivated to produce into and past mid career. Agree or disagree? AB : I think that if there is a natural cadence to the average person ’ s life, and you ’ re saying it doesn ’ t have to be this way, then the societal goal will be one in which everybody is above average. And you know, that becomes an exercise in frustration. AG : In other words, that ’ s a nice theory about encouraging everyone to keep producing at maximum capacity for decades, but it might not be realistic if you ’ re not a superstar in your field. The rest of us are going to do what people naturally do. And Arthur wants there to be space for that path, too. He wants people to be excellent in their own way, which made me wonder if he thinks career decline is more inevitable for people who achieve excellence. AB : What goes up must come down ultimately, and the higher up you go, the more obvious it is that you ’ re not there anymore. That ’ s what I call the Law of Psychoprofessional Gravitation. You notice a lot when you were great and you ’ re not as great as you once were. And if you can do something to get on your crystallized intelligence curve, you get a different kind of productivity, and you can be successful in a different way. That ’ s the knowledge I want to get across. AG : He ’ s arguing that regardless of what field you ’ re in, as your fluid intelligence declines, you should make a change. Stop trying to innovate. Take what you ’ ve learned and accomplished and shift into a mode where you can transmit your knowledge and skills to other people. Become a teacher or a mentor. AB : And frankly, the world needs those people. And we don ’ t have enough of them. When I ’ m at a certain point in my career, and I see that I ’ m not on the top of my game, I need to start thinking, is what got me here, whether it ’ s the insight or the innovation or whatever it happens to be that got me here, is it something that I can sustain? If it ’ s not, start looking for something else. Specifically, start looking for a way that you can move into instruction mode. AG : In Arthur ’ s case, after giving up on music, he spent years running a conservative think tank. And then having learned the lessons of his fall at Carnegie Hall, he took his own advice. AB : And I had somebody I really respect, and he said,”You know, when you are a chief executive and you have to be on the razor ’ s edge every single day, you have two choices on how to step out of your chief executive job.”And I said,”Well, good, two choices. I like two choices. You know, it ’ s like the Monty Hall game. You know, door number one and door number two. So what ’ s behind door number one?”And he said,”Leave before you ’ re ready.”And I said,”Oh, I don ’ t like that. What ’ s behind door number two?”And he says,”Leave on someone else ’ s terms.”I said,”Ooh, I really hate that one.”AG : What did Arthur decide to do then? Exactly what he ’ s suggesting you do. He went into teaching. AB : The bottom line is, when the stakes are high, it ’ s worth leaving things before you ’ re ready. AG : Arthur is content with how his career choices worked out. He wants you to walk off the stage before you fall off of it. I understand where he ’ s coming from, but I ’ d rather see you find your balance, or get on a different stage altogether. You do have choices beyond aging out and opting out. More on those after the break. OK, this is going to be a different kind of **ad**. I played a personal role in selecting the sponsors for this podcast, because they all have interesting cultures of their own. Today, we ’ re going inside the **workplace** at Accenture. Gonzalo Adriazola : I ’ m from Arequipa, which is the second largest city in Peru. We have the coast, we have the Andes and we have a bit of jungle. AG : This is Gonzalo Adriazola. When he was 19, he and his mother left Peru and moved to rural Ohio. GA : I don ’ t think I fully processed that I was leaving a whole life behind. I think I was just excited for the future. AG : As a young immigrant to a new country, Gonzalo didn ’ t know exactly what the future held, but his mother became a tremendous source of inspiration. From early on, she taught him about the importance of education. GA : She would always tell me,”I might not leave you anything, but I ’ m going to leave you a good education.”AG : Gonzalo got a job at a local restaurant while he applied to colleges. GA : When I got the acceptance letter, my mom and I were just, like, jumping and dancing and just so happy. AG : He headed to the Ohio State University, and it didn ’ t take him long to fit in. He was crowned homecoming king, started working full time at a bank and found a community within the Hispanic Business Student Association. They sponsored a trip to a conference in Washington. GA : It ’ s the largest gathering of professional Latinos in the US. I saw this one speaker and he was so good. He was so **passionate**, energetic. Besides being phenomenal, he looked like me, and this was the first time I had seen someone in person that looked like me that was a total boss. AG : At the end of the talk, Gonzalo went up to the speaker and asked for advice. GA : I asked him like,”I want to be a CEO one day. How do I get to be like you?”And he laughed and looked at me and told me that professional **services** firms, all they have is people. So they ’ re going to do their best to make the best of you. And that ’ s how I found out about consulting. AG : Research shows that role models can elevate our aspirations. When we see someone similar to us do something inspiring, it builds our confidence that we can follow in their footsteps. When Gonzalo graduated from college, he followed his role model ’ s advice and went to work as a consultant at Accenture. GA : I was really happy to join the firm. And I mean, it has only been great experiences. AG : Gonzalo had accomplished a big goal, and for four years, he helped companies grow and perform better. But he had a nagging feeling that something was missing from his life. GA : As soon as I got to Accenture, I wanted to give back to Latin America. That was kind of, like, my life objective. I saw that we had worked with this microlending institution called Caja Arequipa, and I ’ m like,”What are the odds?”AG : He reached out to the leadership team running the project. GA : They told me about, like, everything we were doing in regards to **financial** inclusion in Latin America. I was really excited to know that I was from that same city. Very welcoming to my help. AG : Alongside his consulting work, Gonzalo has been a leader in the Hispanic Employee Resource Group and volunteered his extra time to help the team in Latin America. His dedication paid off. Earlier this year, Accenture development partnerships moved him to Colombia where he joined the project team full time. GA : It was a dream come true. I called my mom. We laughed, we smiled, we danced. AG : This isn ’ t the only way Gonzalo gives back. Every year he ’ s gone back to the conference where he was first inspired by someone he felt he could relate to. GA : It feels like I ’ m doing my **mission**. I was in their shoes one day and now I ’ m the person lifting up, just as others lift me up. And there ’ s people lifting me up right now. There ’ s going to be a brighter future for my community. AG : Accenture is working to become one of the most truly human companies in the digital age. Learn more at Accenture. com / careers. Lyn Slater : I ’ m not a Pollyanna about aging. There ’ s certainly changes in my body. You know, I have my wrinkles, I have my white hair, but I think that I could generate content as much as someone who ’ s younger than me. In fact, most of the peers who are at my level are all younger than me. AG : Lyn Slater is 65. She recently quit her career as a professor to become a full-time social media influencer. Lots of people call themselves influencers, but Lyn ’ s version is a real job. LS : I ’ m also known as The Accidental Icon. AG : The Accidental Icon has more than 700, 000 followers on Instagram, and she gets paid to run **ads** on her account for brands like Kate Spade, Visa and Teva. Her feed is filled with stylized photos of herself posing around New York City in designer clothes and large sunglasses. She ’ s been featured in magazines like”Cosmo”and”In Style.”And she ’ s walked the runway at New York Fashion Week. Actually, she ’ s walked more than one runway. LS : I have no background in the fashion industry, but I was in the runway show last spring with Kate Spade. I ’ ve worked with them quite a bit. AG : Some people will tell you that most of us do our best work when we ’ re younger, that when we approach retirement age, we should slow down, take up a hobby, play with the grandkids. But excellence later in your career is possible, and there are a few ways you can get there. Lyn is living proof that you don ’ t have to avoid career decline by shifting from doing into teaching. You can actually reinvigorate your career by experimenting, by doing something new. In Lyn ’ s case, she did something completely new. We saw her in **action** one Saturday near her home in Manhattan. LS : We ’ re on Fifth Avenue in New York City. It ’ s called Museum Mile because everywhere is a museum. I ’ m going to be shooting my outfit outside. AG : She ’ s with her partner who doubles as her photographer. Calvin : Your bangs are good. LS : Thank you. AG : Lyn is petite with a short white bob and bangs that stop just above her huge sunglasses. She takes off a long velvet coat and scans the brick facades of the Museum of the City of New York for her next spot of inspiration. LS : And right now, that little nook over there is really calling to me because it does look like a place... AG : Before becoming a social media influencer, she had an entirely different decades-long career in social work. She was an expert for New York City family courts on child abuse issues. She wrote a seminal book on social work and law, and she spent the last 20 years as a professor of social work at Fordham University. She was quite an authority in her field, but she told me she ’ d become frustrated with the glacial pace of **academia**. Like, how long it takes to write and publish journal articles. LS : The whole process could take almost two years and maybe a handful of people would read it. And so, as I began to get more followers on Instagram and I began to do more things, you know, for example, I did a short film and within a couple of weeks, that was in front of, you know, millions of people. AG : Lyn went about as far from her original field of work as she could go. So what leads to a spectacular pivot like that? A dose of novelty. Research shows that curiosity is a key factor that can help you find creative **peaks** as you age, rather than decline. This is one way to stay productive and maintain motivation later in your career. Find something new to explore. For you, novelty might mean switching to a new team or a new market, getting certified in a fresh skill set, or mastering a hobby completely outside your experience. For Lyn, that hobby was fashion. LS : I ’ ve always had, sort of, what I call a very performative relationship with my clothes. I resist like crazy social categories or constructions of who I should be. AG : In this case, she was resisting the idea that a long time professor of social work wouldn ’ t also be interested in high fashion. She ’ d been toying with the idea of starting a fashion blog. And one day, unexpectedly, the name came to her. LS : It was the first week of school, and I always used to dress up for that. And I was meeting a friend for lunch and I had on a Yohji Yamamoto suit, and a couple of photographers started taking my picture and then a bunch of other photographers saw them do it so they came over, and my friend was making a joke like,”You ’ re an accidental icon.”AG : If you ’ re going to experiment with something new, it helps to fully immerse yourself in that world. Lyn was creative in where she looked for her mentors. LS : I found out that I could get a press pass to what is called the market shows, and I would spend hours talking with these young designers. They taught me a great deal about how clothing is made, what the processes are. That ’ s how I really began to understand fashion. AG : Instead of being intimidated by new technology and seeing it as something only young people can master, she went straight to the experts she knew. LS : My students helped me to figure out Instagram and Snapchat, and I started to take classes in social media and fashion and just random things, like, how to start your own vintage store. AG : In a study in the fashion industry, the more time designers and directors spend abroad, the more creative they became over their careers, but it wasn ’ t traveling or even living abroad that mattered. It was the amount of time they spent working abroad. They couldn ’ t just **observe** it from the sidelines. They had to be in the arena. That ’ s how they really internalize the novel elements of a foreign culture. For Lyn, seeking out new perspectives included small steps, too. LS : I do things that I don ’ t normally do. And so that could be very simple things, like taking a different route to work. It ’ s really, put yourself into different experiences that are creative and see where that takes you. AG : You may not aspire to quit your job and become an Instagram star, or to switch fields at all. And you don ’ t have to. There are ways to reach new heights while staying within your career path. Think about whether you ’ re a sprinter or a marathoner, not in terms of running, but how you go about generating creative ideas. Economists call the sprinters **conceptual** innovators. They typically start with a big idea and they tend to **peak** early, because they have eureka moments when they ’ re relatively new to a domain. Like Einstein at 16 imagining himself chasing a beam of light, or Mary Shelley at 18 starting to write”Frankenstein.”But as they accumulate knowledge, they ’ re more likely to get stuck in their ways and stop gaining new perspectives. There ’ s a term for that : cognitive entrenchment. The longer they stay in a field, the more likely they are to take for granted assumptions that need to be questioned. Marathoners, on the other hand, are experimental innovators. They usually discover their ideas through **trial** and error. They often **peak** later because it takes time to test out different approaches, like Darwin, spending decades tracing the origins of species, or da Vinci experimenting for years with different ways of modeling light in his paintings. But those habits allow them to sustain their **peaks** longer and **peak** again later as they explore new areas. That kind of experimentation is familiar to Lynda Weinman. Lynda Weinman : I ’ m an autodidactic person. I always love learning new things. AG : She got her start in the 1980s as an animator at a film studio. She often compared herself to her higher achieving peers who were sprinting ahead. LW : I remember when I was in my 20s watching some of my friends who were uber successful and I, you know, at my 30th birthday was in tears that I hadn ’ t accomplished what I wanted to accomplish yet with my life. AG : But she didn ’ t rush it. Instead, for the next 10 years, she kept chugging along, testing out different ways to build and use her skills. Finally, the year of her next big birthday, she created a website. Lynda called her site Lynda. com. LW : Well, when we started Lynda. com I was 40 and when we sold it I was 60. AG : She sold it in 2015 to LinkedIn, for, oh, 1. 5 billion dollars. Lynda. com was one of the first companies to offer professional learning online. Maybe you ’ ve heard of their courses in animation, design and software. Maybe you ’ ve even taken classes there that advanced your career. Many founders who are trying to grow a unicorn company, think they need to generate one brilliant idea and scale it rapidly. They think they need to be sprinters, but Lynda approached her career more like a marathoner. Her online learning company didn ’ t look anything like a success early on. Instead, she was constantly trying out new ideas and innovating over time. In some ways, Lynda was primed for this kind of scrappy test-and-learn approach. LW : I actually had a pretty troubled childhood. I moved in with my dad and my stepmom who weren ’ t expecting to raise me and my siblings. And, you know, it was just this feeling of having to find my way because all the adults in my life were, you know, having their own problems.

And I think what I probably am is a very resourceful person who realized at an early age that it was on me to figure out my life. AG : During her early days as an animator, Lynda encountered her first computer. She was unimpressed, at first. LW : It was a Apple II Plus clone that my boyfriend brought home, and so to please him, I turned it on and I started pecking at the keys and I caught the bug that so many people since have caught. And he eventually called himself a computer widow, because I liked the computer more than him. AG : LW : I mean, I was just amazed at what it could do. AG : What it could do was draw. So Lynda got her own Macintosh and brought it into work. People started asking her to do projects for them. LW : Somehow they thought I knew more than they did, which was, you know, basically I ' d had five minutes longer with something than they had. AG : Lynda was onto something. By experimenting with new tools and following her curiosities to uncharted places, she could carve out a niche and continue iterating instead of stagnating. LW : Oh, do I want to do what everybody else is doing, or I ' m being asked to do something that only I know how to do, and maybe that ' s more fun. AG : Lynda ran two more experiments. First, she started teaching in-person college classes in web design. Then when she saw a lack of good manuals for students, she wrote one herself. LW : Then it became a huge success, way bigger than any of us could have imagined. AG : Well, you ' re being very modest, but can I get you to describe a little bit just how successful the book was? LW : I ' m not sure how many millions it sold, but it was translated into many, many languages and it was the de facto web-design book for all colleges. It was the"it"book. AG : From there, Lynda continued to test out new methods of teaching. She started selling instructional videos on VHS tapes. Then, as technology changed, she switched to CDs, then DVDs. Then she launched the website Lynda. com. In the late ' 90s, she and her business partner and husband tried launching memberships on Lynda. com. They weren ' t exactly an **instant** hit. LW : In the beginning it was just an abject failure. It was cannibalizing some of our other work. AG : But they didn ' t give up. Not every experiment succeeds, and they don ' t all succeed right away. Memberships weren ' t growing like crazy, but there was steady growth. Lynda paid attention to that. Eventually they hit an inflection point. While Lynda. com was quietly adding hours of material to their catalog, more people were using the internet for online learning. Their online audience doubled each year. And in time that grew into a big number. By 2012, they had over a million paying users and over a hundred million dollars in revenue. LW : It was literally a very organic growth process. AG : Lynda could ' ve simply continued to develop her skills as an expert animator and would have had a nice career. She could ' ve kept teaching, too, but her greatest success came when her experimentation led her into entrepreneurship, turning her various projects into a business. She didn ' t listen to the narrative that as you get older, you should pull over into the slow lane. She saw some benefits of building something later in her career. LW : By the time you ' re 40, you believe in yourself more. You ' re a more seasoned human being that has better judgment and better experience and better confidence. AG : This might be one of the reasons why older founders are actually more successful than younger ones. In a study of several million entrepreneurs, 40-year-olds were more than twice as likely as 25-year-olds to launch a successful **start-up**. And they were also nearly a third more likely to be in the top 0. 1 percent of fastest-growing tech **start-ups**. Yes, sprinters sometimes get lucky right out of the gate, but marathoners know how to persevere. LW : I think everybody would probably like to be instantly successful and be revered and acknowledged and acclaimed and all those things, but when it happens to you too young, it actually can be very damaging. At least the people that I ' ve seen, who, you know, they burned bright and they burned all the way out. They didn ’ t understand that it wasn ’ t going to last forever and that they had to keep reinventing and they had to earn it again. AG : If you ’ re worried that your career will decline, don ’ t let your output decline, and don ’ t let your curiosity stagnate either. It ’ s never too late to invent or to reinvent yourself. LW : I think the older you are, the more valuable you can be. AG : I love that because I don ’ t ever want to retire. Next time on”WorkLife.”Working remotely is full of challenges that have made our work lives harder. Lizet Ocampo : So we turn our cameras on and there I am as something else. At first, we didn ’ t realize it was a potato. We ’ re like,”What is going on?”I just essentially was a potato for the meeting. AG : But some of the solutions might be easier than you think.”WorkLife”is hosted by me, Adam Grant. The show is produced by TED with Transmitter Media. Our team includes Colin Helms, Gretta Cohn, Dan O ’ Donnell, Constanza Gallardo, Grace Rubenstein, Michelle Quint, Angela Cheng and Anna Phelin. This episode was produced by Jessica Glazer. Our show is mixed by Rick Kwan. Original music by Hahnsdale Hsu and Allison Layton-Brown. **Ad** stories produced by **Pineapple** Street Studios. **Special** thanks to our sponsors, Accenture, BetterUp, Hilton and **SAP**. For their research thanks to Dean Simonton on creative productivity, Lu Liu and colleagues on career hot streaks, Ben Jones and colleagues on the success of older entrepreneurs, David Galenson on **conceptual** and experimental innovators, Erik Dane on cognitive entrenchment and Will Maddux, Adam Galinsky and colleagues on working abroad. In some ways, Lynda was primed for this kind of crap... Excuse me. In some ways, Lynda was primed for this kind of crap... It ’ s not crappy, it ’ s scrappy. In some ways, Lynda was primed for this kind of crappy... Sorry.

Adam Grant : Hey everyone. It ’ s Adam. If this is your first time listening to WorkLife, don ’ t start here. This is a bonus episode. To get the full WorkLife experience, start with”How to Love Criticism,””Your Hidden Personality,””The Creative Power of Misfits,”or”The Real Reason You Procrastinate.”Don ’ t put that one off. Four years ago, when I was working on my first TED Talk, I invited some colleagues to a **practice** session. One of those colleagues was Esther Perel, the relationship therapist, and host of the popular podcast,”Where Should We Begin?”We ’ d only met once before, but she didn ’ t hold back in her feedback. She told me my talk was all facts, no feelings. That if I wanted to reach people, I couldn ’ t stop at information. I needed to inject some emotion into the talk. Right then I knew I had found a great new member of my Challenge Network, someone with common interests, but a very different style and worldview. It was clear that her work on the couch reached far beyond what happens at home. So I was excited to learn that she has a new podcast,”How ’ s Work?”It turns out personal and professional relationships have a lot in common. I ’ m Adam Grant. And this is WorkLife, my podcast with TED, sponsored by Accenture, BetterUp, Hilton and **SAP**. I ’ m an **organizational** psychologist. I study how to make work not suck. And one of the reasons work sucks for so many people is other people. So I sat down with Esther for a lively discussion about how we can get better managing our work relationships. So Esther, I was hoping you would bring a couch. Esther Perel : So that you could lay down? AG : Yeah, are we not doing therapy tonight? EP : Where should we begin? AG : I feel like you should probably tell me, but we ’ re not doing therapy. EP : We may do therapeutic maneuvers. AG : OK, good. Because I feel like I could use some. I ’ m excited to have this conversation because every time I

’ ve heard you talk about romantic relationships, I find myself substituting in work relationships and thinking that a lot of the wisdom applies. I ’ m going to start by asking you a question, which is, when you thought about transitioning from, kind of, the romantic world to the work world, what did you see as the big similarities and differences in how you look at relationships? EP : So it ’ s interesting. I don ’ t experience myself as transitioning. I, as a therapist, have worked for years with people who have work issues and certainly with family businesses. So it ’ s just that the podcast has transitioned. However, I look at relational systems, and relationships exist within a context, a cultural, political, socioeconomic context. Relationships have expectations. All relationships do. All relationships have boundaries. All relationships, if they are strong, have a foundational truth around trust. All relationships demand responsibility and accountability, communication, creativity. So what changes is the context where I explore the dynamics, and here I moved to work. I looked at what are these invisible forces that people bring with them to work and that shape relationships around conflict, communication, connection. And it ’ s the context that changes, not the thinking about relationships. AG : Are you saying we don ’ t become fundamentally different human beings when we go to work? EP : Oh, you still believe that? AG : I don ’ t. I just want to confirm that you agree with me. EP : Of course. I think, this is a very interesting thing. This notion that you bring – There is two views. There ’ s the view that says,”You don ’ t bring your life to work,”and I say,”What else do you come with?”We all have a resume that is the official resume. And we all have our relational diary that is the unofficial resume. And it all comes with you. And it shapes what expectations you have, how you collaborate, how you ask for help, how you compete, you name it. But then, you know, keep going. AG : Were you going to say more? EP : I can say it afterwards. AG : OK. Alright, so one of the things I ’ ve been thinking a lot about is power dynamics in relationships. And I remember reading a really fascinating analysis of power. I think it was by Emerson who argued that relationships were more stable if there was a slight power imbalance, because if you knew which person had a little bit more authority or more influence, then the structure was stable. It was consistent, it was predictable, whereas if people had equal power, they were constantly jocking for position, and it wasn ’ t clear where anyone should stand. And it seems like that dynamic is more common in romantic relationships than it is in professional relationships. Because at work we have hierarchies, right? We know who the boss is. We often know, if not, who has power in a team, who has more status or who has more accomplishments. I was really curious to hear how you ’ d think about this. EP : So we can have an interesting chat about power, but – AG : Are you going to save that for later too or are we going to talk about it now? EP : That I can – but it ’ s so interesting. What you ’ re highlighting is the kind of the tension that comes, you know, from – this dynamic tension that comes from the difference in the discrepancy. I look at power a little bit differently. I would put it like this. There is no relationship that doesn ’ t have a power dimension. It ’ s intrinsic to relationships. It ’ s not good or bad. It ’ s just part of the fabric of relationships because in relationships, people have expectations. And when you have expectations, it comes with a degree of dependency, reliance, and that dependency confers to the people on whom you depend power, by definition. And that power gets neutralized by making it become something that is benevolent, which we then call trust, so that it will become power to, rather than power over. But everybody understands that power isn ’ t just the vertical axis that comes with authority, anybody who ’ s ever had a two-year-old knows that. I mean, this idea that power is just a matter of authority and hierarchy, that ’ s one. But you can have power that comes from the bottom up. You can have power that is the power that constantly kind of deflects the energy, the power that takes the authority away from the people in authority, that is also power. It is actually multifaceted and intrinsic to relationship. And the question that you wanted to ask is, is this power helping the system thrive, do what it needs to do, the relationship, whatever the relationship is, or is this power that becomes oppressive, abused? Which means a breach of trust. AG : So there ' s something weird – EP : Do you agree with the notion that trust is intrinsic? Trust itself, it ' s like, it ' s intrinsic to relationships. AG : Yeah, of course. I would not argue with that. There ' s something that ' s a little odd, though, about defining power in terms of dependence. So there is a strong sociological tradition of saying,"Look, the power in a relationship is how much do I depend on you or how much do you depend on me."In an organization, though, that would suggest that the CEO is the least powerful person, because the CEO is completely dependent on everyone else to do their jobs or else the organization fails. And yet that ' s not how we traditionally look at power. EP : We look traditionally wrong. AG : We might be, but are you saying the CEO is the most powerless person in the organization? EP : No, I don ' t think it ' s this or that. I think the CEO has both ends. AG : You always have these paradoxes and they drive me crazy because I want answers. EP : Because – AG : Wait, pause for a second. EP : You want to simplify and I want to hold complexity, but that ' s the difference between a clinical psychologist and an **organizational** psychologist. AG : I thought that was the difference between Americans and Europeans, OK. EP : As well, as well. We can put that one in too. AG : But you ' re right. And I want to become less of a simplifier. So let me try to complicate and say, when I think about power from a psychological perspective, I think about it also in terms of influence, which is about control over resources. So one of the reasons that a CEO is powerful is the CEO has control over resources that lots of people at lower levels of the organization value and want. EP : Correct, correct. AG : And so, yeah, I would say the CEO is dependent in some ways, but that the resource control net outweighs the dependencies. And so the CEO is still powerful. When you think about these – EP : But if the people don ' t perform, if the people decide to go on strike, if the people underproduce, if the people decide to undermine the grand project, doesn ' t that give them power? AG : It can, sure. The CEO, though, also can take power back by saying,"I ' m going to fire those people or I ' m going to stop paying those people. I ' m going to replace those people."And so these dynamics get complicated. Where do you draw the line and who has more power in total or do you not care? Are you willing to take the multiple layers? EP : No, I think that I always look at who has power in this matter. AG : OK, good. So who do you think has more power in our relationship here? EP : Right now? AG : Yeah, or just in general. I don ' t know, I ' m curious. EP : At this moment between the two of us, it alternates. AG : How so? EP : You know, it ' s like we had this conversation, you think ping pong, I think billiards, right? So ping pong is this dyadic thing where you try to surprise and to make – you know. Billiard is about, you know, this ball has to go in the hole and which is the one that I need to kick for that one to go. And that means that you have to be able to think multiperspective. And when I think about power, I look at the interdependence of parts and on some things, I say,"Power for what?"And is it power to or power over? And is it power that actually, you know – I ' ll give you one of the – I ' m switching mid-sentence. AG : You ' re also dodging my question. EP : No, no, because listen to this, it was a moment like you all have, you have moments like that too. That ' s like a paradigmatic shift, right? I ' m in training. This is many years back, but it stayed with me, like the vista opened up and I was working with families with depression. And at one point my teacher says that the depressed has all the power. And I thought – this is a moment where you stop because I ’ m thinking you ’ re anhedonic, you feel powerless, you feel hopeless, you feel helpless. You have no energy, no sense of meaning, no purpose. It ’ s a, how can that person have the power? And then they said,”Because that person, through their impotence, is actually activating the competence of everybody else who is trying to lift them to whom they end up saying, ’ No, ’ to everything they suggest to them. And in the end, the competent people feel as defeated and deflated as the depressed one. That is power.”AG : Wow. EP : That was a moment for me where I began to think, this is way more complicated than what it looks like. What you see isn ’ t necessarily what it is. And so that ’ s how I look at power. I look at the way that, you know, an eyebrow, you know, if one of us was talking and the other one just kind of have that moment that says,”Dismissed,”with just this, that ’ s power, that makes you instantly feel like, you know, you ’ re irrelevant, you ’ re pushed aside. AG : I suddenly feel very conscious of my eyebrows. Don ’ t look at me. I think that ’ s interesting – EP : But you understand what I ’ m saying? It ’ s in the small things like this, where the power of somebody is the power to make you feel that you matter. We are creatures of meaning. It ’ s the power to make you feel like you ’ re irrelevant. And I think that who has the power is often that, and that can be performed by the one who pretends to care less. AG : So I want to come back to the question that I asked you. EP : Like you have more to lose than me, those kinds of game. I mean, power games are fascinating. Fascinating. AG : I think so, too. So I ’ m asking you this question about our power dynamic in part because I think it ’ s a lens into understanding how you think about power. So when you say power shifts back and forth in this conversation, how do you see it shifting? EP : So I think I am trying to grope – to reach for, I ’ m trying to reach for places where I think, do you agree with me? Do you see what I ’ m saying? Can you build on what I ’ m saying? AG : Yeah. EP : And then sometimes I think that you have an approach of, I agree with this, I disagree with that. And to me it ’ s like,”Oh, is it a debate or is it a conversation?”But I know you enough to know – AG : Which do you think it is? EP : I want a conversation, but because I think when it goes into agree, disagree, I start to, you know, if you disagree five times, then I ’ m going to want to prove myself to you. And then I feel that you have, you know, I want your approval. I prove myself to someone from whom I want your approval. And that means that you have power. AG : Right. EP : It ’ s not bad, it just is. So I think that ’ s the thing that I am still testing at this moment is, are we going to have debate or conversation? Are we building on each other? AG : I don ’ t know, which do you think is better? EP : Which do you think is better, people? Help me. AG : I ’ m trying to empower you to shape the conversation in the direction you want to go. No, I think that part of the reason that I sometimes default to debate is, I think we sometimes learn new things when our assumptions are tested and questioned. And so the idea that you can say something and then I can disagree with it and decide that I was wrong is to me a signal of learning, right? On the other hand, I think that one of the things I love about having a conversation with you every time we do it is I come away with new lenses for understanding things. They ’ re not necessarily correcting misconceptions or changing a belief I had, but they ’ re giving me new ways of thinking about the topics that I care about, and I love that. So my hope is we ’ re going to do that tonight. EP : And what I get when I talk with you is you force me to go for rigor because I am case-based, rather than evidence-based. My research is different. I can go and look at the psychological research on a lot of things, but that ’ s not the reality in which I exist. So when you say”the research says,”then I think I should go do some research. AG : And did you? EP : Yes. I went yesterday, and I read a chunk of research on trust. AG : And I listened to one of your therapy sessions. So we ’ ve each become a little bit more like the other. So what did you learn about trust? EP : This was really interesting, because – I mean, I can say a lot of things as how I think about trust. But when I went to look at research, what it fundamentally said is that there is an absolute definitional void. It is one of those concepts that is swimming in vagueness. There is a view that reinforces the notion that trust is a psychological state in which you express the willingness to be vulnerable, based on positive expectations with others. Then there is a view that looks at trust as process rather than state. And it looks at trusting processes like intentions, expectations, behaviors, thoughts, et cetera. But in the end, there is no agreement. The most complex psychological experience, subjective experiences actually are very hard to define. So that said, you know, I continue to look at other things and at people who said things that I found really interesting. And when I can ’ t come up with research, I go to philosophers and poets who have a different way of trying to grapple with the unexplainable. So Adam Phillips, this wonderful English psychoanalyst, starts to talk about how trust is a risk masquerading as a promise. I thought that was very beautiful. Then he said,”Trust is a word that we often put too much trust in.”AG : That sentence is self-defeating. EP : You know, then Rachel Botsman talked about how trust is an active or confident engagement with the unknown. By definition, trust is a leap of faith. Therefore, if you think transparency leads to trust, probably not always – sometimes, but at other times, transparency leads to surveillance. Surveillance is the opposite of trust. Trust is what you live with, what you don ’ t know. If you always have to know, you ’ re not trusting. AG : This was such a surprise to me when Rachel captured this. I had always thought of transparency as a driver of trust, right? So if you want somebody to have positive expectations about your behavior, if you want them to be comfortable being vulnerable with you, then you shouldn ’ t hide anything from them. And then Rachel said,”Wait a minute, If you trust me, you don ’ t need to know what I ’ m hiding.”AG : And oh, that is a big frameshift. EP : So I looked at it developmentally. I tried to apply it, and I thought of it actually, where does this concept come from? And I don ’ t know where she rooted it, but for me, it was – you know, around eight months, the kid takes a little object and they drop it. And for the first time they realize that this object continues to exist, even when they don ’ t see it. And then there is that game where they pick it up, they throw it, you pick it up, they throw it, and they develop this thing called object constancy. Object constancy then leads to people constancy, and it ’ s peekaboo. Peekaboo means that even when I don ’ t see you, you ’ re still there, and even though you ’ re not seeing me, I ’ m still there. And it becomes the foundation, against the fear of abandonment. It is the foundation of trust. You will exist inside of me when you ’ re not there, and I exist inside of you when I am not there. And therefore, I don ’ t need to check on you because I can trust you. I know you will come back, et cetera, et cetera. And I think the developmental roots of that idea that she presents are very strong. AG : Well, as a quick aside, I know now next time someone asks me about you, I ’ m going to say,”Esther Perel can even make a game of peekaboo psychologically interesting,”which is not an easy task. EP : It is the universal game that every kid plays, actually, and still, it ’ s really across the globe, that notion, but it really anchors you. I mean, that to me is the beginning of trust. AG : So when I think about taking this into the **workplace**, then one of the things that jumps to mind is, I got a really interesting query from a **reporter** a couple of weeks ago, who said,”What do you think about organizations that have **practices** of requiring open calendars?”And I immediately thought of this particular, I guess, revelation for me, where I would have said in the past,”Of course, everyone should have their calendars open. No one should need to hide what they ' re doing."And to me, that ' s a symbol of low trust, potentially. That if I need to know that I can access what everyone else is doing at every moment, that I ' m not very confident that they ' re going to do what they ' ve committed to doing. EP : It ' s called totalitarianism. AG : And that ' s a surveillance component. EP : That ' s what happened in the regimes where people spied on everybody. It ' s transparency, it ' s surveillance. It ' s really not just that I have nothing to hide kind of thing. It ' s you ' re entitled to **privacy**. The point is exactly that, while you ' re not there, I know you ' re doing your job. While I am gone, I know you ' re not rolling me under the bus. You have my back, we are in this together. We share meanings, expectations, and we predict that we are there for each other. That ' s the foundational truth of trust, and I don ' t see that coming up because I know your agenda. AG : There ' s also a power component in this. EP : Do you agree with that? AG : You ' re now trying to get us into agree, disagree? I ' m trying to complicate things and learn here, Esther, come on. EP : No, but I mean, do you think that transparency, that this idea that I have nothing to hide – You know, when somebody says to me,"I have nothing to hide,"that doesn ' t elicit trust inside of me, actually. I am sorry. Actually, I say,"Why are you saying this to me?"If you ' re saying this, you must have something. AG : It sounds a little bit like projection **bias** gone wrong. I agree with that for the record. I also think there ' s a power dynamic here that ' s really intriguing, which is when I ' m making my calendar transparent, I ' m trying to assert that my schedule has been determined, right? You can take a look at it, and you can go and claim time on it, if you want, on my terms. And that feels like a little bit of a power move. What do you think? EP : On you, from you. AG : Yeah, yeah. I ' m basically saying,"Look, I ' m more important than you are."So here ' s my calendar, pick what ' s convenient for you, but what ' s convenient for you is already predetermined by what ' s convenient for me, which is why I hate when someone sends me a calendar link and says,"Sign up on it."EP : Because? AG : Because I feel like – particularly if the person is asking me for time or asking for my help or advice, I feel like they should probably accommodate my schedule and my convenience. As opposed to,"I ' m going to impose on you, at a time that is most inconvenient for you."EP : Right,"Can you help me on this moment?"AG : Yes. EP : Yeah. AG : Ideally today or tomorrow, yeah. So I was thinking about something – EP : But can I ask you something? AG : Yeah, please. EP : Because if you ' re going to define trust, I think what ' s really important is to talk about how we build trust, what we do with breaches of trust, and can we rebuild trust once it ' s broken? Because I do think that at the time when people lived in more traditional structures in societies, and you kind of – there ' s always been breaches of trust. It ' s not like this is a new story. But when things are clearer and you have clear expectations and you know the hierarchy and you know what is the role of the father, the mother, the children, the bosses, the big brother versus the younger brother, the one who entered the family business before the other, et cetera, you could create a set of expectations what you ' re going to trust for what. Think that in this moment, where things are much more fluid and diffused, and we need to define all of that, trust has become a major centerpiece. You know, there ' s a lot of restlessness in the realm of relationships at this moment, at work as well. And as a lot of what to do, when people experienced breaches of trust, as happened definitely after #MeToo. And it shakes the whole foundation because all your expectations are now up for grabs. Was I right about you? Did I completely misunderstand who I thought I was for you? Did I completely read wrong what this partnership was actually about and you have nothing to hold on to because the relationship – So now comes the question, how do we build it? How do we rebuild it? And what is the impact of the breach of trust, which today becomes almost a loss of identity? I thought I knew what I am here and who we are together here. And I said that about romantic relationships, but I have experienced it with the partners in business, no less. AG : Yeah, so let ' s start on the repair side. In some cases it ' s harder, but I think the dynamics are sometimes a little bit simpler. So my reader research on trust repair says that,"Number one, an apology seems to be less important than an **expression** of responsibility."EP : Absolutely. AG : Saying,"I ' m sorry,"showing that I feel remorse, is nice emotionally. It doesn ' t convince you necessarily that I accept the harm that I ' ve done to you. And also that I ' m going to change my behavior moving forward. And so I always look for someone to say,"Look, whether I feel that what I did was wrong, I recognize that I hurt you, I take responsibility for that. And now I ' m also going to take responsibility for adjusting in the following ways to make sure it doesn ' t happen again."And that to me feels like the foundation of trust repair. What do you think is missing from that equation? EP : I think the first part is very much the way I like to think of it as well. It ' s the acknowledgment of the wrongdoing, of the hurt, even if you think you were legitimate and justified in what you do. I actually think that breaches of trust are part of relationships. Relationships is connection, disconnection, reconnection. It ' s harmony, disharmony, repair. It ' s not a problem, it ' s in the nature of relationships that you ' re going to do breaches. Betrayal is a different story, and I think that betrayal lives in the shadow of trust all the time. So the first thing is the acknowledgment, and it involves an element of remorse or guilt sometimes for what you ' ve done to the other person, not necessarily for your own **action**. The second one, what you call responsibility in the rebuilding, I call it the vigilante. It ' s like you show the benevolence of that the relationship matters to you. Because a breach of trust says to the other person not just that they ' ve lost power, but they ' ve lost value. You don ' t matter. Therefore, I put my interests ahead of yours, I do the thing that suits me. It basically is a message of devaluation of the other person. So that benevolent thing that you talk about is crucial. I would say the thing I like to add is the need to create new experiences. You know, what happens when people have been shaken is that they don ' t go back to the state of naivety that they had before, that leap of faith in which they existed, they do enter what Ricœur often calls the"secondary naïveté". You trust with your eyes open and you wait, you just don ' t do like this anymore, and think everything is fine, and that demands new experiences, **generative** experiences that will create new layers of cells that are going to sit on the ones that really need to die and evacuate. AG : How ' s that different from trust, but verify. EP : Just the same. Trust with your eyes open means that you – But it ' s not trust and be suspicious the whole time. You know, if you are in this cortisol level, high cortisol levels of constant checking, checking, checking, you ' re not trusting. You know, I can have all your codes – it ' s the same in relationships, when people say,"Give me all your passwords,"who trusts on that? You do surveillance, but the surveillance doesn ' t breed trust. AG : I like to give my passwords in case I forget them. But maybe a different dynamic. EP : To whom, to whom is the question. AG : To my wife, mostly. Yeah, I think that tracks for me. I ' m curious then about the more basic question of building trust and how you think about that. Rachel also changed my thinking about this. She said to me one day,"You can ' t build trust, you have to earn trust."And I was annoyed by that, actually, because it took the power to build trust out of my hands, right? That this is not something I can gain. It ' s regardless of what I do, you have the choice then to either grant me trust or deny it. And that made me feel like I lack control over building the kind of relationships that I want to build. And so I wondered if you could help me get out of that trap. EP : This a perfect moment, this is a perfect example, because you can ’ t make me trust you, you think you have no power. When in fact you have all the power to do the things that you can do, which hopefully will make me trust you. AG : But now I have probabilistic power instead of certain power, which has less power. EP : Who has certain power? I mean, where ’ d you get that idea? AG : Too many comic books growing up. EP : Yes, but that is developmental. It ’ s good for latency boys at age nine. But I mean, these things can be taken away. For I mean, every powerful guy, has had experiences where they thought they had it all and then it can instantly disappear. I think that the opposite, I mean – AG : But wait, Esther, let me stop you – EP : You can do a lot of things to earn my trust, but I think the earning is the problem. The piece that I am not so clear about – is trust a feeling? Is trust the dimension in a relationship? AG : Yeah. EP : Is trust something that you can elicit? Is trust something that you confer? You know, I think it ’ s all a combination of a number of these things and that ’ s where it ’ s not so clear. Is it a thought? Is it something that gets tested? For example, a big debate in the trust research is, you know, do you need to trust and feel safe in order to be able to take risks? That ’ s one body of research. AG : Or is it the reverse? EP : Or is it the fact that you take risks that grants you a greater sense of trust? But you first have to go into the unknown to then establish the trust. AG : I can answer that one. EP : Go ahead. AG : Yes. EP : To the second one? AG : No, no, it ’ s both. EP : It ’ s both. AG : It ’ s a cycle. EP : Yes, I agree. I think – AG : Here you are agreeing again. EP : Because you ’ re going complex. AG : So if I say something complicating, you ’ re more likely to agree with that. EP : No, when you do both ends. It ’ s not that it ’ s complicated. It ’ s that it ’ s both ends. Because I frankly don ’ t think that one can prove that it is this versus that. I think that it is a feedback loop. the more safe you feel, the more risk you take, but also the more risk you take, the more trusting you can be. AG : Sure, but as an experimentalist, I can ask,”OK, which is the more important starting condition? And if you have a chicken and the egg choice, do you want to start with trust leading the risk-taking or is the effect stronger in reverse?”I can design those experiments and try to adjudicate it. Would it convince you? EP : Yeah, but I think developmentally in those moments, right? Because I think that one of the best places to go look at how these things get layered, is to look at child development. So child development, the kid sits on your lap and if all goes well, they are secure, they are nested, they ’ re safe, they trust. And it is from that place that they jump into the world and they go, and they go to explore and to discover and take risks and do their thing. Then they turn around, and they ascertain if you ’ re still there. And if the base is safe, they do turn around and they go further, and they are experiencing security and risk at the same time. And that is the developmental dance, I think. So I don ’ t know which one, maybe with some, you know – I have two boys, and actually, it ’ s an interesting example for this. I remember, I have one, first, he would go, then he would fall, then he would figure out what to do in order not to fall. The other one would sit, study everybody else falling, and then when he understood what not to do, then he would go. And I just thought, this is for life. One is the risk taker, one is the risk manager. AG : Yeah. EP : And both will create experiences of trust and risk. AG : Yeah, no, I think that ’ s interesting. I guess what I ’ m stuck on is you didn ’ t like my expectation that I could have the power to build trust, but I think – EP : I think it ’ s beautiful, I think it ’ s a beautiful wish. AG : You definitely didn ’ t describe it that way when you made fun of me for liking comic books. EP : No, but it ’ s a wish to think that you can create the response of the other person. What you can do is what you can do. AG : Yeah. EP : It ’ s your part. And then yes, this moment where you wait to see if what you put in is going to create the thing you get back, that is the vulnerability moment. AG : Yeah, and I don ’ t like that moment. EP : That is the moment you can ’ t control. EP : You don ’ t like it. AG : I don ’ t like it at all. And I don ’ t like it in part because – EP : I think it ’ s beautiful. AG : I think it ’ s sickening. I like to avoid it as much as possible, but I say that because I think most of us have a dominant trait, which is the trait where we ’ re either the most extreme or the trait that ’ s most central to defining us. And I ’ ve noticed over the last few years when both kind of, I guess, reflecting and reading personality research that my dominant trait is conscientiousness. I am a goal-oriented person and that means I will bend and stretch all my other traits in **service** of achieving my goals. I hate the fact that unlike writing the best book I can write or preparing as hard as I can to give a talk, that ’ s going to resonate with people, when it comes to achieving a goal of building a great relationship with someone, I don ’ t have the same level of control over attaining that goal than I do the more individual goals that I direct myself to. And it makes me want to deprioritize relationships because I don ’ t know if I ’ ll succeed. EP : I get it. I totally – AG : I ’ ve never had that thought before, in fact. Is this what happens in your therapy sessions? EP : Yes. AG : OK. So now what, what do I do? EP : So if you were in a session with me, I would say”For the moment you do nothing. You just had a new thought, sit with it.”So when you realize that in a way you go for the things that you can pretty much have more agency about from the beginning to the end, I sit with that. And even me, I have nothing to say. I just take it in and I say,”Wow, that ’ s a moment.”AG : OK, how long do I have to sit? EP : You know what it is? You sit, you suddenly say, and then I watch to see, and generally what happens is that that ’ s the moment that people swallow. You know, it ’ s the quiver here. It ’ s the moment, it is that vulnerability moment, but it is a moment of insight and change. And then from there, whatever happens, either it disappears and it just was a thought, either it becomes the ground of a new enterprise into personal or otherwise. AG : So, OK. So – EP : You know, then of course, you can go home and you can say to your wife or to your partner,”I had a thought, I had a conversation with this woman there, with her accent. And as I was thinking, and I realized that –”And then she will say,”Took you so long or something?”And look, either one values this... It doesn ’ t have a monetary value necessarily. It has an existential value. I happen to think that those things matter. I also think, you know, why is the relationship conversation so important at this point? And I think you can have a great job, you can have purpose, you can have a good salary and you can have free food, but nothing will compensate for a poisonous relationship in the **workplace**, with whom you go to bed every night, fretting about somebody who is sleeping perfectly fine. And that eats people up and that I have done for decades in my **practice**. EP : It ’ s just that I had people come to my office rather than me go to their office. AG : Well, the worst case is when the person is sleeping fine because they know you ’ re fretting, which is – EP : That ’ s sadistic. AG : Yes. But one of the things I ’ m thinking about as I sit with this thought is, since I first started studying psychology in college, whenever I take values assessments, I come out with two core values at the top, one is helping other people and the other is achieving excellence. And I was surprised at first that relationships came lower because clearly helping others in such a relational dynamic. And I ’ m suddenly realizing that helping has been my solution to this problem. It ’ s to say, OK, if my stance on relationships is I want to be helpful, then I can still know whether my goal has been achieved or not, whereas if the goal is just to build the relationship or to earn trust, it ’ s never clear whether I ’ ve made progress. And I don ’ t know whether I ’ m using my time well. So what would you suggest doing with that? EP : I think when you have – AG : I ’ m trying to get a solution here, I really am. EP : No, but look, helping is a lot of things, right? Helping makes you feel rich, I mean, rich internally. Helping is the most powerful antidepressant, doing for others. AG : Yeah. EP : Helping, you know, generosity brings joy. Helping is indeed – other people need me, I will never be alone. They come to me, I ' m protected. Helping is a state in which I don ' t have to be dependent on others because I make others be dependent on me. Helping has a lot of aspects to it. Which one it is for you? See, this is where it becomes different. I don ' t look for systematization, which I think what **organizational** psychology has to do. Because you need to aggregate groups of people. I am on the other side of that, where I ' m more looking at what is the individual resonance of this thing, what is helping for you? What you feel when you give only you can tell me. If it is a defense against something else, only you can tell me, if on some level it protects you from other states that you experienced as more vulnerable, only you can tell me. It ' s like the answer that you ' re trying to find from me is in you. AG : Well, that is definitely not helpful. So we need to work on your giving, but no, no, I think that ' s right. And I respect and accept the fact that you ' re forcing me to do that. I would still prefer if you told me the answer, but I understand the impulse not to. EP : No, but it ' s not just as in pushing it back on you. Do you seriously think that I know the meaning of giving for you? AG : No. EP : No. So it would be presumptuous for me to just throw out a bunch of stuff. I have ideas, but we would be discussing them together, and then I would ask you, what do you think about that? Does that resonate for you? Is that – you know. And I think that ' s a different conversation. AG : Yeah. EP : The solution – I mean, there ' s nothing to solve here unless you tell me,"I want to change it,"but that ' s not what you ' re telling me. Then there is nothing to solve. AG : OK, then my work is done, good. So this goes to a dynamic that I wanted to talk about, being a people pleaser. So Esther, is it fair to say that I am more agreeable, more of a people pleaser than you? EP : Yes. Yes, yes, yes. AG : Why do you say that? EP : Because I don ' t think of myself as a people pleaser. AG : OK. I don ' t think of you as one either. Which is why I was so pleasantly surprised. EP : But for that we have to define what goes in the word people pleaser, right? I mean, this people pleaser, it ' s a history of life. It ' s not something you become one day. It ' s the way you learned to maintain your attachments. People pleaser is when you have learned that unless you fulfill the conditions, the people who need to take care of you won ' t be doing it in the way that they should. People pleaser is a fear of not what happens when you please, but what happens, you know, how attuned you have become at what displeasure can mean for others. And therefore, it ' s an avoidance of conflict. And therefore, I can say yes to you and to you and to you and everybody I ' ve said yes to. And then everybody at the end resents me because I have not been able to fulfill the yeses to all the people. And in the end, I know what everybody else thinks, feels and wants, and I have no clue what goes on inside of me because I ' m organized by this threat and **dread**. AG : It seems like you known me very well. Yeah, I mean when I think about, when I would describe myself as a people pleaser, I think of a few things. One is prioritizing other people ' s feelings above your own priorities. EP : Consistently. AG : Consistently. Not in one situation, but habitually. EP : Yeah, yeah. AG : I think about – EP : In order to avoid... AG : Conflict, which is the next thing, right? EP : And the conflict stems from? AG : Is this a test? EP : No, no. It ' s really, it ' s – what am I avoiding? I ' m avoiding the wrath of others. AG : Yeah, no, that ' s exactly right. I don ' t want to, yeah. As the kid who was always afraid of being called to the principal ' s office, that ' s very much the **dread**. I think the nonconfrontational stance also though is not just a fear of incurring the wrath of others. It ' s also a fear of damaging the relationship and thinking about,"OK, if I can just make this person happy in the moment, then maybe the relationship won ’ t be broken as a result.”EP : But that means that you are the one who carries the anxiety over the loss of the relationship, as if you ’ re the only one who cares about that relationship. And that ’ s not, you know, that is also back to the power thing. AG : Yes. EP : You know, it ’ s like, why is one person living the threat of loss here? And where is the other one? AG : Yeah. So I guess on that, I feel like, as a recovering people pleaser, I ’ ve tried to overcome some of these tendencies. Some of that came from being trained as a negotiator and then teaching negotiation. Some of that came from learning to do conflict mediation. A lot of it has come from just ending up with an accumulating number of requests where I just can ’ t say no to all of them anymore. EP : And what about that it came with the notion that I can say no and you can be frustrated with that, and those two shall coexist. AG : Yeah. EP : It ’ s that thing that people find impossible to hold, it ’ s how do I say no and, you know, but what if the other person doesn ’ t like it? They are entitled not to like it. And those two will live together, that doesn ’ t mean the relationship will dissolve because of it. That ’ s the fear that people live, it ’ s irrational fear. EP : Because the way it gets rationalized is people say,”It ’ s just not important enough for me. It ’ s not worth the conversation. It ’ s not worth getting into it.”And it ’ s all these rationalizations that kind of say,”It doesn ’ t really matter.”But meanwhile, at every step of the game, you ’ re foregoing you because you literally experience that the relationship only continues if the other people are pleased with you. AG : Which is a pretty sad state of affairs, if that ’ s what it takes to maintain a relationship. EP : So how did you learn to tolerate conflict, tension, disagreement? AG : I think it started probably in relationships where I felt like there was a secure base that I didn ’ t have to question whether, you know, if I hurt the person ’ s feelings or I said something that might be a little bit challenging, that it wouldn ’ t damage the relationship because the relationship was either so strong or they were secure enough in their own ego that they weren ’ t going to be insulted by it. I probably overcorrected on that at some point though, and decided that anytime I have a relationship with someone, of course they will know that when I ’ m challenging them, it ’ s because I want to help them. And I ’ ve discovered of late that there are moments when I have not made that clear, and I ’ ve regretted that. EP : What could you have said differently or done differently? AG : I think it ’ s a simple thing to start out. It ’ s fundamentally about just establishing that tough love is the way you help. So what I would have done, I think about a situation I had recently with a student I was advising. One of the first things I could have done is to say,”Look, when I was in grad school, one of the best things that a mentor did for me was tear apart the first 37 pages of the paper I had spent my whole year on. And then tell me, ’ There ’ s a gem on page 38. ’ And that tough love changed the trajectory of my career. And I made a commitment at that point to pay it forward. And so when I tell you what I ’ m about to tell you, I do it out of what I hope is some version of long-term kindness that I care about your future success enough that I ’ m willing to potentially hurt your feelings in the present.”And I think I ’ ve just taken for granted that people know that ’ s true. EP : You know, I was raised like that. This was pretty much much more of a cultural **norm** growing up. AG : This explains it a lot. EP : I mean, it ’ s like, we were not praised as much, you were not pumped up and you had to learn the distinction between this is not good versus you are not good. And it was not an easy thing to learn. AG : That is the fundamental distinction in psychology between guilt and shame. EP : Yes. Correct, correct. But it is very much the educational model of the large majority of the world, actually. AG : So I ’ ve noticed that maybe one of the manifestations of this upbringing for you is you are not at all shy about asking other people for help. I think you ’ re much **bolder** about it than I typically am. And I was curious about whether this is related to that dynamic. Are you unafraid of the rejection? EP : I would say it like this, it is absolutely true. I ask for help a lot. I offer help a lot and I have no fear when I ask for help. I think if you can, you can, if you can ’ t, I completely understand it. And my husband Jack will often say,”It ’ s like, it ’ s amazing sometimes what I dare to ask,”but I figured that the people will say to me when it ’ s not – AG : How dare you? EP : No, nobody says it like that, but it ’ s – AG : No, that ’ s because we ’ re all more agreeable than you. Yeah. EP : Or people are so shocked that somebody would dare to ask such a thing. AG : They ’ re speechless. EP : But I think the foundation of that is two different things and is actually quite serious. The first thing is I fundamentally understand that I depend on others. I also fundamentally know that my family ’ s background shaped me very much about that. So I mean, the short nut of it is that my two parents are the sole survivors of five years in concentration camps. They ’ ve lost their entire family. And boy, did they never think that they survived on their own. So this notion of self-made never existed for us. You are never self-made. You are made by the luck and the presence of everything else in the moment. I think that ’ s where my notion of the both end and the multiplicity of things is so woven into the way I look at things. And I live with that. I completely believe in a communal structure, and I depend on a lot of people for a lot of things, for me, for my kids, for my team, for, you know, I ’ m constantly networking before the word ever existed. And so is my life. I knew share economy before the term was invented. And I think that ’ s where the asking for help comes from. But the same is true in reverse. You can ask me for stuff, I don ’ t blink. It ’ s like, of course, if I can, I will. I love to feel important. I love to feel like I can give something and facilitate something. It gives me tremendous joy. AG : I think what ’ s so interesting about how courageous you are in asking is that it empowers the people you know to ask. EP : I would hope that. AG : Because I know that you will never be offended by a request because you think that part of a relationship is people should be able to ask anything they want of each other and they should also have the freedom to refuse if they think it ’ s not appropriate or not possible. Which is very helpful for those of us who **struggle** to ask for help. EP : That is true, that is true. I think, you know, there ’ s a question I love to ask in the workspace that I used to ask in a very different way when I used to do cross-cultural work, but it has become suddenly really relevant. Were you raised for autonomy or were you raised for loyalty? Think for a moment, people. Were you raised with the primary messages around relationships that said,”You have yourself to rely on. In the end, it ’ s all about you. Nobody ’ s ever going to help you as well as you can help yourself.”Ontologically, in a way, you are alone in this world. And how do you think that influences the way that you organize your relationships around you, your concepts of give and take, your concept of asking for help of what you can ask from whom, et cetera, expectations. And the loyalty thing is, you know, the messages really say you ’ re never alone, you owe a lot of things to a lot of people, and a lot of people are there for you. In my thinking, when I have a problem, the first thing I think is who can help me? I don ’ t think,”What can I do?”I think,”Who can help me?”Because there ’ s people who know more than me about this thing and will help me think it through. And I in American parlance can be seen as someone who pulls. Because I ask, it ’ s not just one or two, you know, I take it in, then I sit with it and then I make it my own. But I am completely shaped through these conversations rather than sitting with myself, thinking it through, trying it out, and it ’ s a completely different model. AG : So I feel very clear that I ’ ve learned something from this discussion because when you asked the question, OK, were you raised to be autonomous or to be loyal, my first impulse was to say,”Well, why does it have to be either or, can it be both ends?”And then I thought,”OK, I ’ ve internalized your worldview.”But in all seriousness – EP : But it ’ s true. AG : Why does it have to be either or? Can I be raised to be both? EP : I don ’ t think it ’ s either or, but I think that when you ask – How many of you would say that you were raised, raised – that doesn ’ t mean you stayed this way, it doesn ’ t mean that you didn ’ t have to because there was nobody there for you, right? It ’ s not always just a nice messages story. How many of you would say the focus was on autonomy, on self-reliance? And how many of you would say the focus was on loyalty? And how many of the people here who highlighted loyalty are not American-born? OK. AG : A lot. EP : You see that you live in the Mecca of individualism here. AG : We do. EP : And so that notion is, I think, what draws a lot of people to come here as well, is that for once I can actually prove myself, do my own thing. That is not an either or, I think there ’ s beauty and value in each of these models. But everyone has a clear sense of what they were told growing up. I really do think it ’ s a real foundational set of messages that shape our relational legacy. AG : There are a couple other quick things I wanted to raise. One is from Susan Dominus. So we share something very unusual. EP : Yes, I have to explain that. I mean, basically, Susan Dominus is a journalist at”The New York Times”and she wrote a profile about me and she wrote a profile about Adam. AG : And when we met and realized this, my first thought was, we need to write a profile of Susan based on what we learned about her from her profiling us, which is maybe too meta. But she was hoping to be here tonight. She could not make it, but she sent in a question for us to discuss, which I thought was really interesting, which was, what do we think about **passionate** work? Is that something we should strive for? Can you ever have too much of it? Do you want to go first? EP : I think it ’ s a fascinating question, actually, because passion for a long time throughout history, when it came to work, was pretty much the privilege of the artisans and the artists. People did not talk about passion when they worked the land and certainly not when they went to the factory. AG : Yeah. EP : So it really speaks to the aspirational meaning that work has received. Never have we expected more from work. We want from work today what we used to get from religion and community : belonging, purpose, meaning, community, you know, that ’ s a whole new set of expectations. And that ’ s why we suddenly have the permission to talk about work that transports you, right? But the concept was that it transcends you, it elevates you, it takes you above the ordinary into something bigger and things that people used to attribute to religious experiences. And now we want that immersive, you know, all-encompassing thing in what we do. I don ’ t think of it as good or not good, I just think it ’ s **super** interesting. And it ’ s actually a wonderful new permission that more people can have access to that kind of intensity in their work. What comes with that is that the other side of passion is massive heartbreak, disillusion. disruption, degradation. I mean, passion has its side effects. And I think that today you have that too. When people – People don ’ t just leave because the factory closes. That happens, but this is not the primary thing. People leave for management reasons, relationship reasons, they were not promoted enough, seen enough, acknowledged, and so it becomes identity questions. I think work today is organized around an identity economy. So that ’ s where I see the passion thing, that drive. Now, where do you see the most? My guess is... What do you do when a person comes to present a thing to you and they ’ re going to change the world? I mean, how many people come to present to you an enterprise? AG : Too many. EP : A startup that ’ s about to change the world. AG : It ’ s an immediate red flag for me, by the way. EP : OK, me too. AG : I ’ m like, narcissism defined. EP : But why don ’ t you think of it as passion? I mean, you could – it ’ s an interesting thing. But the part of me thinks, am I judgmental here? Why don ’ t I let these people think – you know. But big part of it is because – did you look at what the neighbor is doing? Do you figure that there ’ s five others that are doing something similar? Would you ever think about joining them? Or everybody needs their own little plaquette? AG : I mean that ’ s not passion to me, that ’ s just grandiosity, right? Like you couldn ’ t be satisfied just maybe changing a country or helping a billion people as opposed to over 7 billion, right? That just seems like a ridiculous scale to aspire to. EP : But where ’ s the limit? Grandiosity is a part of passion because when you experience passion, you experience yourself as irrepressible, right? That is part of the experience of passion. It ’ s a force that cannot be resisted. So why do we say”this is grandiose”versus”this is people who have deep passion for something?”I agree with you, but I do think that there is a **bias** in it too. AG : Yeah, there might be. I think it depends for me in part on the valor and distinction between what ’ s called harmonious versus obsessive passion. So harmonious passion is, you know, I love it, I chose it, I ’ m excited to pursue this work. And I think if that ’ s the experience of passion you have, often the work in and of itself is its own reward. If it ’ s not, then the impact that you have on each individual person is meaningful. And then the hope is to scale it over time. You don ’ t have to change the world on day one. If the passion is more obsessive, it feels more like something you have to do as opposed to something you want to do. And then I start to worry that we ’ re in a situation where you feel like, if I don ’ t change the world, then my life has had no meaning. And I think that ’ s a sad state of affairs. EP : Have you ever wanted to do something different than what you do? AG : Always. That ’ s why I don ’ t have a real job. I just study other people ’ s jobs. I live vicariously through them. EP : That is so interesting. Would you say that you ’ re **passionate** about your work? AG : Yeah, of course. EP : You are. AG : Absolutely. EP : And how do you define that? AG : You can ’ t tell? EP : I think you are deeply engaged with your work. You ’ re curious, there ’ s intensity, there ’ s insatiability, there is a constant look for what else is out there that I don ’ t know yet. I see all of that, but that ’ s what I see. When you think I ’ m **passionate** about work, how do you articulate that? AG : I think about it in a few ways. One is, I think about, well, not every part of my work. There are parts of my job that I ’ m not **passionate** about. I ’ ve tried to design those out of it over time, but some of them are kind of stuck. When I think about the parts I ’ m **passionate** about, I think about waking up in the morning, looking forward to starting work, going to bed at night, thinking about all the cool ideas I get to explore and all the amazing, talented, inspiring students I get to learn from, and maybe try to help a little bit. And that for me is energizing, and I guess it ’ s exciting in the way that I think falling in love is exciting. EP : So how come the age where we want passion the most at work, is the age where we stay about an average of two years? I mean, isn ’ t it interesting that the moment where we have the highest set of expectations about this thing is also the time where we are roaming and nomadic. AG : Yeah, I think that ’ s a huge problem. EP : How do you understand it? You have the students. You know, I see students who tell me,”I love it, I ’ m going to take another three months and I ’ m going to start looking for the next thing.”I say,”If you love it, why do you want to leave?”I can ’ t put one and one together. The leaving and the loving, don ’ t you want to stay when you love something? AG : Yeah. EP : In my logic. AG : Yeah. I ’ ll tell you how I deal with this, which is, one, I try to read the research and forecast what ’ s going to happen to them. The work that Jon Jachimowicz and his colleagues have just published has been helpful to me. What he ’ s found is that when people think about passion as pleasure or joy, they ’ re much less likely to succeed in pursuing whatever they thought their passion was than if they think about it as meaning and purpose. And I think that ' s because emotions are much more fleeting and a sense of mattering is much more sustainable. EP : It is very important, what you just said. This is, I think passion that is defined as joy and excitement – and what it does for me, is very different than passion that is defined by the nature, the richness of the thing in which you ' re plunging. You know, that is giving you meaning because it is in itself meaningful. AG : Yeah. Yeah, for me, that resonates. And so I guess what I say to students is, when they say,"I want to find a job I ' m **passionate** about,"or"I want to love my work."That to me is something you can look forward to 10, 20 years down the road after you ' ve figured out where you find meaning and what kind of contribution you can make. But I don ' t feel like there ' s an easy answer to your question, which is a really interesting one. Why would you leave something you love? This is another paradox point though, that you yourself have made, right? Which is you can love a person and still say,"This relationship is not right for me."And why not believe the same is true about a job? EP : The way I ' ve said it is in marriage today, people will say,"It ' s not that I divorce because I ' m miserable and unhappy, it ' s I divorce because I could be happier."And I think something similar is happening at work. This elusive quest for more, for better, for FOMO and all of that makes us think, what else is out there that I haven ' t yet done versus the good enough, versus the this is rich in and of itself. Stay here, deepen it, you know, build something from it. You know, it ' s just – For me, the moment where I read this was an"Wall Street Journal"article that said"The quitters are the winners."And I thought,"Oh boy, one headline tells you what ' s going on."You know, what does it mean? And then of course, it explained : you get a better salary, you get promoted more, but the whole point was about leaving versus staying. This is, I find I don ' t – you ' re the one who studies these things, right? I don ' t know how to **interpret** that. AG : The only thing that jumped to mind on this is I think Oliver Burkeman covered the best **antidote** I ' ve seen. He wrote this great little article that said,"Look, every time you feel FOMO, you should erase it, and instead turn it into JOMO, the joy of missing out."And I thought this was such a clever concept to say, anytime you ' re afraid you ' re going to miss out on a great job opportunity or even a social event, right? You ' re only thinking about everything that could have been better. Well, why not be thrilled about all the horrible jobs you didn ' t take, all the toxic cultures you avoided, all of the difficult bosses you didn ' t get stuck working for? And that joy of missing out for me is something that probably sticks in my head on a **daily** basis. With that, I am feeling a little FOMO that we ' re not going to hear from the audience. So let ' s open it up. Woman 1 : Thanks, guys. I think we all thought that the autonomy versus loyalty was a really eye-opening and powerful concept. I ' m just curious, your comments on how you see that play out in the **workplace**. EP : Great, I ' m a cross-cultural psychologist. My work was on how families and individuals deal with large cultural changes. And this notion of collective versus individualistic. So what it really influences a lot is this. Do you know that person that does more than others because they can do it better than anybody else? But then quietly resents it, but then doesn ' t want anybody to do it because nobody would do it the way they do it. That is raised for autonomy to the end degree. You know that person in your personal life, you know that person at work. So you mapped this on a whole line here, between the degree of, you know, I ' m going to hide the fact that I don ' t know something. So when people these days talk about trust for vulnerability, one of the first things they talk about is asking for help, right? The disclosure of the leader and the people who can say,"I don ' t know, I want to try and ask for help."But this asking for help in some people and in some cultures means,"I don ' t know and I ' m going to find out who can help me.”Like I said, who can help me? I don ’ t experience it as a weakness whatsoever. I have no shame about it, but I know that for other people it ’ s an admittance of what ’ s wrong with me. And the moment it ’ s what ’ s wrong with you, I can ’ t do it. Then your asking for help is a completely different thing. And you put these people to work together? This is true in the classroom and this is true at work. They are going to have messages and meta messages. That ’ s just a nutshell on a – AG : Alright. So autonomy versus loyalty. What I think about is you don ’ t have to give people autonomy about the ends if you give them autonomy about the means. This is something one of my mentors, Richard Hackman found throughout his career, that if leaders were very clear about a **mission**, a purpose, a goal to work toward, they could give people a ton of autonomy then about when to do it, where to do it, how to do it, with whom to do it. And that would work out really well. And I think if you take that view, then giving people that kind of autonomy is an **expression** of loyalty, right? You ’ re you ’ re saying,”I believe in you, I trust you. I ’ m going to let you know what our objectives are and why I think those are worthwhile.”And then you got this. So next question. Woman 2 : You touched on this very briefly earlier, the difference between breach and betrayal. How is that different? I think instinctually, we understand what that might mean in a relationship. And that said, that may vary from person to person in a relationship, but how do you distinguish between the two in the **workplace**? How do those look different in the **workplace**? AG : When I think about this at work, I think about what ’ s called the psychological contract. So all of you who have jobs, you have formal contracts with your employers. There ’ s also the what ’ s called the psychological contract, which is an unwritten set of expectations and obligations that you have with your employer. There are basically three types that we ’ ve studied. There ’ s an economic contract, which is basically,”Look, I ’ ll do my job and you pay me to support myself and my family.”There ’ s a relational contract, which is much more about,”OK, I will invest in this organization as a community or a family, and I ’ ll bring a little bit of extra dedication and commitment to the people in the place. And in return, what I expect is to be treated like a member of the family.”And then the final type of contract is more of a cause, where you say,”Look, I will give you extraordinary levels of effort and dedication and grit. And in return, what I want to do is I want to make a difference, hopefully not change the world.”I think that contracts get breached when somebody has a set of expectations that are not met, often by the employer, or by their boss. I think that a betrayal is when people go further and they avoid or violate the contract and say,”Not only am I unwilling to follow through on this set of commitments or expectations, that was never there to begin with. We were never a family. You were never working on a meaningful cause, I never owed you a paycheck.”And I think that might be the difference. I have no idea what to do with that, but that was my thought. EP : That ’ s beautiful. I mean, it ’ s an element of gaslighting. Basically, you know, you ’ re crazy. You ’ re crazy for even thinking this in the first place. Yes. Woman 3 : How do you know whether to leave or stay in the work context? AG : Hypothetically. Woman 3 : Hypothetically, what is a good reason to stay? And what if, even if you stay, what is a way to think about something more in a relationship to work that is productive and meaningful and healthy without jumping around in a disorganized way? AG : I mean, I – You ’ re not going to be surprised, there ’ s a framework on this. So Hirschman wrote about exit, voice and loyalty, there ’ s an addition now of neglect. So when you ’ re dissatisfied with a job or a person or an organization, or a country, right? You have, I think, as far as I know, four choices. You can leave, that ’ s an exit. You can speak up and try to change it, that ’ s voice. You can neglect, where you do the absolute minimum not to get fired, that ’ s office space. And then the final option is loyalty, which is basically to say,”Look, I ’ m committed enough to this person or system that I ’ m just going to grit my teeth and bear it.”And I think that there ’ s a progression that we all need to go through when we ’ re considering leaving, which is to say, have I been loyal long enough that I ’ ve given the person or the place a chance to change? And then, once I ’ ve done that, have I tried to change it and have I made my best effort at doing that? And if not, it ’ s probably time to go. EP : So the interesting thing about your framework is that they all put the eye at the center. What is the circumstances of this? You know, do you decide? Are you sending money over to the old country and there ’ s a whole family that lives on your work? That ’ s going to change if you – you know. It ’ s like, where is the locus of control in those four things, which I think are very beautiful, you are the locus of control. In many people ’ s lives, that is not the reality. There are lots of other things that are affecting your decision. Maybe at this moment, I would leave. If it was up to me, I would leave. But given the circumstances of my life, this is not the right moment. And I think it ’ s **juggling** that ambiguity that is the most difficult thing. On occasion, many of us will say,”This, I left too soon, and this, I could have left sooner.”This is the story of our lives, in relationships, in work situations, in places where we lived in houses that were leaking. I mean, it ’ s like we are constantly – And the story of our lives is a story of where we wished we had stayed longer and where we wished we had left sooner. And I don ’ t think that there is a specific, you know, I can say I have rarely heard people leave a job and regret it. But I do look at our time, my dear. AG : There ’ s one other quick thing I wanted to bring up before we wrap, which is, we got a bunch of questions via social media. There ’ s this question I love from Michelle Miller, which is, what do we think about work spouses? And I have to tell you – I ’ ve heard people use this term increasingly, over the last few years. And at first I ’ m like,”Wait, are you hedging in case your marriage isn ’ t going well? You have another spouse? What is this about?”So given that you ’ ve study relationships and you work on relationships, what in the world is a work spouse, and do you think we should have one as a preview? I think the answer is a very clear”no,”but I want to hear your take. EP : The same way that when people say,”Our company ’ s a family,”I ’ m like,”Seriously?”You know, a family is a family. And I can tell you, family companies are different from this, this is not the same. I like that, I understand that people want to borrow terminology from other areas so that they can create analogies, but it ’ s **trivial**. It is something rather vulgar and boring about the spouse work concept. It ’ s like, it ’ s a noninteresting way of looking at it. What it says is this, the person with whom you spend all the time, with whom you make all these decisions, with whom you share so many important things. The only thing that is interesting about the work spouse concept is that it betrays one reality or it translates one reality, is that way too often these days we bring the best of ourselves to work and the leftovers home. This is where I do think the word”work spouse”becomes relevant, but for the rest, no, find a word that – There ’ s a lack of vocabulary for this thing. You know, you ’ re not married to them. Marriage is a whole lot more complicated than that. AG : You start working with someone else, you ’ re also not cheating on them, right? EP : You know, it ’ s a – And by the way, I don ’ t know if – You know, I speak a few languages and I don ’ t know the term in other languages. It doesn ’ t translate in my head. Does anybody have a translation for this? French, Hebrew, German, Spanish, anybody? It ’ s an interesting thing. It ’ s like, you know, you work with that person. You know, whatever it is that happens, but it ’ s not your work spouse. AG : Like closest colleague. EP : Don ’ t do the laundry of that person, you know? AG : Well, this has been fun and enlightening as always. EP : Yes, I like it too. AG : I want to say thanks to the audience and thanks to Esther for doing this. EP : Thank you to all. AG : Next time on WorkLife. Carmen Medina : I recognized that the only way I could survive at the CIA was that I had to give up. So yes, in that sense, I became less authentic. AG : The double-edged sword, bringing your whole self to work. WorkLife is hosted by me, Adam Grant. The show is produced by TED with Transmitter Media. Our team includes Colin Helms, Gretta Cohn, Dan O ' Donnell, Constanza Gallardo, Grace Rubenstein, Michelle Quint, Angela Cheng and Anna Phelan. This bonus episode was produced by Jessica Glazer. Our show is mixed by Rick Kwan, original music by Hahnsdale Hsu and Allison Leyton-Brown. **Special** thanks to our sponsors, Accenture, BetterUp, Hilton and **SAP**. Thanks to TED for hosting our discussion and to Esther Perel for joining. And thanks to you for listening. If you liked what you heard, we ' d love it if you could rate and review the show, it helps people find us.

Text Sample 171: POS Dim 2 – 2020 – Score 20.00 – 2020/t004246.txt
Audrey Tang : Very happy to be joining you, and good local time, everyone. David Biello : So, tell us about – Sorry to – Tell us about digital tools and COVID. AT : Sure. Yeah, I ' m really happy to share with you how Taiwan successfully countered the COVID using the power of digital democracy tools. As we know, democracy improves as more people participate. And digital technology remains one of the best ways to improve participation, as long as the focus is on finding common ground, that is to say, prosocial media instead of antisocial media. And there ' s three key ideas that I would like to share today about digital democracy that is fast, fair and fun. First about the fast part. Whereas many jurisdictions began countering **coronavirus** only this year, Taiwan started last year. Last December, when Dr. Li Wenliang, the PRC whistleblower, posted that there are new SARS cases, he got inquiries and eventually punishments from PRC police institutions. But at the same time, the Taiwan equivalent of Reddit, the Ptt board, has someone called nomorepipe reposting Dr. Li Wenliang ' s whistleblowing. And our medical officers immediately noticed this post and issued an order that says all passengers flying in from Wuhan to Taiwan need to start health inspections the very next day, which is the first day of January. And this says to me two things. First, the civil society trusts the government enough to talk about possible new SARS outbreaks in the public forum. And the government trusts citizens enough to take it seriously and treat it as if SARS has happened again, something we ' ve always been preparing for, since 2003. And because of this open civil society, according to the CIVICUS Monitor after the Sunflower Occupy, Taiwan is now the most open society in the whole of Asia. We enjoy the same freedom of speech, of assembly, [unclear] as other liberal democracies, but with the emphasis on keeping an open mind to novel ideas from the society. And that is why our schools and businesses still remain open today, there was no lockdown, it ' s been a month with no local confirmed cases. So the fast part. Every day, our Central Epidemic Command Center, or CECC, holds a press conference, which is always livestreamed, and we work with the journalists, they answer all the questions from the journalists, and whenever there ' s a new idea coming in from the social sector, anyone can pick up their phone and call 1922 and tell that idea to the CECC. For example, there was one day in April where a young boy has said he doesn ' t want to go to school because his school mates may laugh at him because all he had is a pink medical mask. The very next day, everybody in the CECC press conference started wearing pink medical masks, making sure that everybody learns about gender mainstreaming. And so this kind of rapid response system builds trust between

the government and the civil society. And the second focus is fairness. Making sure everybody can use their national health insurance card to collect masks from **nearby** pharmacies, not only do we publish the stock level of masks of all pharmacies, 6, 000 of them, we publish it every 30 seconds. That ' s why our civic hackers, our civil engineers in the digital space, built more than 100 tools that enable people to view a map, or people with blindness who talk to chat bots, voice assistants, all of them can get the same inclusive access to information about which pharmacies near them still have masks. And because the national health insurance single payer is more than 99. 9 percent of health coverage, people who show any symptoms will then be able to take the medical mask, go to a local clinic, knowing fully that they will get treated fairly without incurring any **financial** burden. And so people designed a dashboard that lets everybody see our supply is indeed growing, and whether there ' s over- or undersupply, so that we codesign this distribution system with the pharmacies, with the whole of society. So based on this analysis, we show that there was a **peak** at 70 percent, and that remaining 20 percent of people were often young, work very long hours, when they go off work, the pharmacies also went off work, and so we work with convenience stores so that everybody can collect their mask anytime, 24 hours a day. So we ensure fairness of all kinds, based on the digital democracy ' s feedback. And finally, I would like to acknowledge that this is a very **stressful** time. People feel anxious, outraged, there ' s a lot of panic buying, a lot of conspiracy theories in all economies. And in Taiwan, our counter-disinformation strategy is very simple. It ' s called"humor over rumor."So when there was a panic buying of tissue paper, for example, there was a rumor that says,"Oh, we ' re ramping up mass production, it ' s the same material as tissue papers, and so we ' ll run out of tissue paper soon."And our premier showed a very memetic picture that I simply have to share with you. In very large print, he shows his bottom, wiggling it a little bit, and then the large print says"Each of us only have one pair of buttocks."And of course, the serious table shows that tissue paper came from South American materials, and medical masks come from domestic materials, and there ' s no way that ramping up production of one will hurt the production of the other. And so that went absolutely viral. And because of that, the panic buying died down in a day or two. And finally, we found out the person who spread the rumor in the first place was the tissue paper reseller. And this is not just a single shock point in social media. Every single day, the **daily** press conference gets translated by the spokesdog of the Ministry of Health and Welfare, that translated a lot of things. For example, our physical **distancing** is phrased as saying"If you are outdoors, you need to keep two dog-lengths away, if you are indoor, three dog-lengths away,"and so on. And hand sanitation rules, and so on. So because all this goes viral, we make sure that the factual humor spreads faster than rumor. And they serve as a vaccine, as inoculation, so that when people see the conspiracy theories, the R0 value of that will be below one, meaning that those ideas will not spread. And so I only have this five-minute briefing, the rest of it will be driven by your Q and A, but please feel free to read more about Taiwan ' s counter-coronavirus strategy, at taiwancanhelp. us. Thank you. DB : That ' s incredible. And I love this"humor versus rumor."The problem here in the US, perhaps, is that the rumors seem to travel faster than any response, whether humorous or not. How do you defeat that aspect in Taiwan? AT : Yeah, we found that, of course, humor implicitly means there is a sublimation of upsetness, of outrage. And so as you see, for example, in our premier ' s example, he makes fun of himself. He doesn ' t make a joke at the expense of other people. And this was the key. Because people think it hilarious, they share it, but with no malicious or toxic intentions. People remember the actual payload, that table about materials used to produce masks, much more easily. If they make a joke that excludes parts of the society, of course, that part of society will feel outraged and we will end up creating more divisiveness, rather than prosocial behavior. So the humor at no expense, not excluding any part of society, I think that was the key. DB : It ’ s also incredible because Taiwan has such close ties to the origin point of this. AT : PRC, yes. DB : The mainland. So given those close economic ties, how do you survive that kind of disruption? AT : Yeah, I mean, at this moment, it ’ s been almost a month now with no local confirmed cases, so we ’ re doing fine. And what we are doing, essentially, is just to respond faster than pretty much anyone. We started responding last year, whereas pretty much everybody else started responding this year. We tried to warn the world last year, but, anyway. So in any case, the point here is that if you start early enough, you get to make sure that the border control is the main point where you **quarantine** all the returning residents and so on, instead of waiting until the community spread stage, where even more human-right invading techniques would probably have to be deployed one way or the other. And so in Taiwan, we ’ ve not declared an emergency situation. We ’ re firmly under the constitutional law. Because of that, every measure the administration is taking is also applicable in non-coronavirus times. And this forces us to innovate. Much as the idea of”we are an open liberal democracy”prevented us from doing takedowns. And therefore, we have to innovate of humor versus rumor, because the easy path, the takedown of online speech, is not accessible to us. Our design criteria, which is no lockdowns, also prevented us from doing any, you know, very invasive **privacy** encroaching response system. So we have to innovate at the border, and make sure that we have a sufficient number of, for example, **quarantine** hotels or the so-called”digital fences,”where your phone is basically connected to the **nearby** telecoms, and they make sure that if they go out of the 15-meter or so radius, an SMS is sent to the local household managers or police and so on. But because we focus all these measures at the border, the vast majority of people live a normal life. DB : Let ’ s talk about that a little bit. So walk me through the digital tools and how they were applied to COVID. AT : Yes. So there ’ s three parts that I just outlined. The first one is the collective intelligence system. Through online spaces that we design to be devoid of Reply buttons, because we see that, when there ’ s Reply buttons, people focus on each other ’ s face part, not the book part, and without”Reply”buttons, you can get collective intelligence working out their rough consensus of where the direction is going with the response strategies. So we use a lot of new technologies, such as Polis, which is essentially a forum that lets you upvote and downvote each other ’ s feelings, but with real-time clustering, so that if you go to cohack. tw, you see six such conversations, talking about how to protect the most vulnerable people, how to make a smooth transition, how to make a fair distribution of supplies and so on. And people are free to voice their ideas, and upvote and downvote each other ’ s ideas. But the trick is that we show people the main divisive points, and the main consensual points, and we respond only to the ideas that can convince all the different opinion groups. So people are encouraged to post more eclectic, more nuanced ideas and they discover, at the end of this consultation, that everybody, actually, agrees with most things, with most of their neighbors on most of the issues. And that is what we call the social mandate, or the democratic mandate, that then informs our development of the counter-coronavirus strategy and helping the world with such tools. And so this is the first part, it ’ s called listening at scale for rough consensus. The second part I already covered is the distribute ledger, where everybody can go to a **nearby** pharmacy, present their NHI card, buy nine masks, or 10 if you ’ re a child, and see the stock level of that pharmacy on their phone actually decreasing by nine or 10 in a couple of minutes. And if they grow by nine or 10, of course, you call the 1922, and report something fishy is going on. But this is participatory accountability. This is published every 30 seconds. So everybody holds each other accountable, and that massively increases trust. And finally, the third one, the humor versus rumor, I think the important thing to see here is that wherever there ’ s a trending disinformation or conspiracy theory, you respond to it with a humorous package within two hours. We have discovered, if we respond within two hours, then more people see the vaccination than the conspiracy theory. But if you respond four hours or a day afterwards, then that ’ s a lost cause. You can ’ t really counter that using humor anymore, you have to invite the person who spread those messages into cocreation workshops. But we ’ re OK with that, too. DB : Your speed is incredible. I see Whitney has joined us with some questions. Whitney Pennington Rodgers : That ’ s right, we have a few coming in already from the audience. Hi there, Audrey. And we ’ ll start with one from our community member Michael Backes. He asks how long has humor versus rumor been a strategy that you ’ ve implemented. Excuse me.”How long has humor versus rumor strategy been implemented? Were comedians consulted to make the humor?”AT : Yes, definitely. Comedians are our most cherished colleagues. And each and every ministry has a team of what we call participation officers in charge of engaging with trending topics. And it ’ s a more than 100 people-strong team now. We meet every month and also every couple of weeks on specific topics. It ’ s been like that since late 2016, but it ’ s not until our previous spokesperson, Kolas Yotaka, joined about a year and a half ago, do the professional comedians get to the team. Previously, this was more about inviting the people who post, you know, quotes like”Our tax filing system is explosively hostile,”and gets trending, and previously, the POs just invited those people. Everybody who **complains** about the finance minister ’ s tax-filing experience gets invited to the cocreation of that tax filing experience. So previously, it was that. But Kolas Yotaka and the premier Su Tseng-chang said, wouldn ’ t it be much better and reach more people if we add some dogs to it or cat ’ s pictures to it? And that ’ s been around for a year and a half. WPR : Definitely, I think it makes a lot of difference, just even seeing them without being part of the thought process behind that. And we have another question here from G. Ryan Ansin. He asks,”What would you rank the level of trust your community had before the pandemic, in order for the government to have a chance at properly controlling this crisis?”AT : I would say that a community trusts each other. And that is the main point of digital democracy. This is not about people trusting the government more. This is about the government trusting the citizens more, making the state transparent to the citizen, not the citizen transparent to the state, which would be some other regime. So making the state transparent to the citizens doesn ’ t always elicit more trust, because you may see something wrong, something missing, something exclusively hostile to its user experience, an so on, of the state. So it doesn ’ t necessarily lead to more trust from the government. Sorry, from the citizen to the government. But it always leads to more trust between the social sector stakeholders. So I would say the level of trust between the people who are working on, for example, medical officers, and people who are working with the pandemic responses, people who manufacture medical masks, and so on, all these people, the trust level between them is very high. And not necessarily they trust the government. But we don ’ t need that for a successful response. If you ask a random person on the street, they will say Taiwan is performing so well because of the people. When the CECC tells us to wear the mask, we wear the mask. When the CECC tells us not to wear a mask, like, if you are keeping physical distance, we wear a mask anyway. And so because of that, I think it

’ s the social sector ’ s trust between those different stakeholders that ’ s the key to the response. WPR : I will come back shortly with more questions, but I ’ ll leave you guys to continue your conversation. AT : Awesome. DB : Well, clearly, part of that trust in government was maybe not there in 2014 during the Sunflower Movement. So talk to me about that and how that led to this, kind of, digital transformation. AT : Indeed. Before March 2014, if you asked a random person on the street in Taiwan, like, whether it ’ s possible for a minister – that ’ s me – to have their office in a park, literally a park, anyone can walk in and talk to me for 40 minutes at a time, I ’ m currently in that park, the Social Innovation Lab, they would say that this is crazy, right? No public officials work like that. But that was because on March 18, 2014, hundreds of young activists, most of them college students, occupied the legislature to express their profound opposition to a trade pact with Beijing under consideration, and the secretive manner in which it was pushed through the parliament by Kuomintang, the ruling party at the time. And so the protesters demanded, very simply, that the pact be scraped, and the government to institute a more transparent ratification process. And that drew widespread public support. It ended a little more than three weeks later, after the government promised and agreed on the four demands [unclear] of legislative oversight. A poll released after the occupation showed that more than 75 percent remained dissatisfied with the ruling government, illustrating the crisis of trust that was caused by a trade deal dispute. And to heal this rift and communicate better with everyday citizens, the administration reached out to the people who supported the occupiers, for example, the g0v community, which has been seeking to improve government transparency through the creation of open-source tools. And so, Jaclyn Tsai, a government minister at the time, attended our hackathon and proposed the establishment of novel **platforms** with the online community to exchange policy ideas. And an experiment was born called vTaiwan, that pioneerly used tools such as Polis, that allows for”agree”or”disagree”with no Reply button, that gets people ’ s rough consensus on issues such as crowdfunding, equity-based crowdfunding, to be precise, teleworking and many other cyber-related legislation, of which there is no existing unions or associations. And it proved to be very successful. They solved the Uber problem, for example, and by now, you can call an Uber – I just called an Uber this week – but in any case, they are operating as taxis. They set up a local taxi company called Q Taxi, and that was because on the **platform**, people cared about insurance, they care about registration, they care about all the sort of, protection of the passengers, and so on. So we changed the taxi regulations, and now Uber is just another taxi company along with the other co-ops. DB : So you ’ re actually, in a way, crowdsourcing laws that, well, then become laws. AT : Yeah, learn more at crowd. law. It ’ s a real website. DB : So, some might say that this seems easier, because Taiwan is an island, that maybe helps you control COVID, helps promote social cohesion, maybe it ’ s a smaller country than some. Do you think that this could be scaled beyond Taiwan? AT : Well, first of all, 23 million people is still quite some people. It ’ s not a city, as some usually say, you know,”Taiwan is a city-state.”Well, 23 million people, not quite a city-state. And what I ’ m trying to get at, is that the high population density and a variety of cultures – we have more than 20 national languages – doesn ’ t necessarily lead to social cohesion, as you said. Rather, I think, this is the humbleness of all the ministers in the counter-coronavirus response. They all took on an attitude of”So we learned about SARS”– many of them were in charge of the SARS back then, but that was **classical** epidemiology. This is SARS 2. 0, it has different characteristics. And the tools that we use are very different, because of the digital transformation. And so we are in it to learn together with the citizens. Our vice president at the time, Dr. Chen Chien-jen, an academician, literally wrote the textbook on epidemiology. However, he still says,"You know, what I ' m going to do is record an online MOOC, a crash course on epidemiology, that shares with, I think, more than 20, 00 people **enrolled** the first day, I was among them, to learn about important ideas, like the R0 and the basic transmission and how the various different measures work, and then they asked people to innovate. If you think of a new way that the vice president did not think of, just call 1922, and your idea will become the next day ' s press conference. And this is this colearning strategy, I think, that more than anything enabled the social cohesion, as you speak. But this is more of a robust civil society than the uniformity. There ' s no uniformity at all in Taiwan, everybody is entitled to their ideas, and all the social innovations, ranging from using a traditional rice cooker to revitalize, to disinfect the mask, to pink medical mask, and so on, there ' s all variety of very interesting ideas that get amplified by the **daily** press conference. DB : That ' s beautiful. Now – oh, Whitney is back, so I will let her ask the next question. WPR : Sure, we ' re having some more questions come in. One from our community member Aria Bendix. Aria asked,"How do you ensure that digital campaigns act quickly without sacrificing accuracy? In the US, there was a fear of inciting panic about COVID-19 in early January."AT : This is a great question. So most of the scientific ideas about the COVID are evolving, right? The efficacy of masks, for example, is a very good example, because the different characteristics of previous respiratory diseases respond differently to the facial mask. And so, our digital campaigns focus on the idea of getting the rough consensus through. So basically, it ' s a reflection of the society, through Polis, through Slido, through the joint **platform**, the various tools that vTaiwan has prototyped, we know that people are feeling a rough consensus about things and we ' re responding to the society, saying,"This is what you all feel and this is what we ' re doing to respond to your feelings. And the scientific consensus is still developing, but we know, for example, people feel that wearing a mask mostly protects you, because it reminds you to not touch your face and wash your hands properly."And these, regardless of everything else, are the two things that everybody agrees with. So we just capitalize on that and say,"OK, wash your hands properly, and don ' t touch your face, and wearing a mask reminds you of that."And that lets us cut through the kind of, very ideologically charged debates and focus on what people generally resonate with one another. And that ' s how we act quickly without sacrificing scientific accuracy. WPR : And this next question sort of feels connected to this as well. It ' s a question from an anonymous community member."Pragmatically, do you think any of your policies could be applied in the United States under the current Trump administration?"AT : Quite a few, actually. We work with many states in the US and abroad on what we call"epicenter to epicenter diplomacy."So what we ' re doing essentially is, for example, there was a chat bot in Taiwan that lets you, but especially people under home **quarantine**, to ask the chat bot anything. And if there is a scientific adviser who already wrote a frequently asked question, the chat bot just responds with that, but otherwise, they will call the science advisory board and write an accessible response to that, and the spokesdog would translate that into a cute dog meme. And so this feedback cycle of people very easily accessing, finding, and asking a scientist, and an open API that allows for voice assistance and other third-party developers to get through it, resonates with many US states, and I think many of them are implementing it. And before the World Health Assembly, I think three days before, we held a 14 countries [unclear] lateral meeting, kind of, pre-WHA, where we shared many small, like, quick wins like this. And I think many jurisdictions took some of that, including the humor versus rumor. Many of them said that they ’ re going to recruit comedians now. WPR : I love that. DB : I hope so. WPR : I hope so too. And we have one more question, which is actually a **follow-up**, from Michael Backes, who asked a question earlier.”Does the Ministry plan to publish their plans in a white paper?”Sounds like you ’ re already sharing your plans with folks, but do you have a plan to put it out on paper? AT : Of course. Yeah, and multiple white papers. So if you go to taiwancanhelp. us, that is where most of our strategy is, and that website is actually crowdsourced as well, and it shows that more than five million now, I think, medical masks donated to the humanitarian aid. It ’ s also crowdsourced. People who have some masks in their homes, who did not collect the rationed masks, they can use an app, say,”I want to dedicate this to international humanitarian aid,”and half of them choose to publish their names, so you can also see the names of people who participated in this. And there ’ s also an”Ask Taiwan Anything”website, at fightcovid. edu. tw, that outlines, in white paper form, all the response strategies, so check those out. WPR : Great. Well, I will disappear and be back later with some other questions. DB : A blizzard of white papers, if you will. I ’ d like to turn the focus on you a little bit. How does a conservative anarchist become a digital minister? AT : Yeah, by occupying the parliament, and through that. More interestingly, I would say that I go working with the government, but never for the government. And I work with the people, not for the people. I ’ m like this Lagrange point between the people ’ s movements on one side and the government on the other side. Sometimes right in the middle, trying to do some coach or translation work. Sometimes in a kind of triangle point, trying to supply both sides with tools for prosocial communication. But always with this idea of getting the shared values out of different positions, out of varied positions. Because all too often, democracy is built as a showdown between opposing values. But in the pandemic, in the infodemic, in climate change, in many of those structural issues, the virus or carbon dioxide doesn ’ t sit down and negotiate with you. It ’ s a structural issue that requires common values built out of different positions. And so that is why my working principle is radical transparency. Every conversation, including this one, is on the record, including the internal meetings that I hold. So you can see all the different meeting transcripts in my YouTube channel, in the SayIt **platform**, where people can see, after I became digital minister, I held 1, 300 meetings with more than 5, 000 speakers, with more than 260, 000 utterances. And every one of them has a URL that becomes a social object that people can have a conversation on. And because of that, for example, when Uber ’ s David Plouffe visited me to lobby for Uber, because of radical transparency, he is very much aware of that, and so he made all the arguments based on public good, based on sustainability, and things like that, because he knows that the other sides would see his positions very clearly and transparently. So that encourages people to add on each other ’ s argument, instead of attacking each other ’ s person, you know, credits and things like that. And so I think that, more than anything, is the main principle of conserving the anarchism of the internet, which is about, you know, nobody can force anyone to hook to the internet, or to adhere to a new internet protocol. Everything has to be done using rough consensus and running code. DB : I wish you had more counterparts all around the world. Maybe you wish you had more counterparts all around the world. AT : That ’ s why these ideas are worth spreading. DB : There you go. So one of the challenges that might arise with some of these digital tools is access. How do you approach that part of it for folks maybe who don ’ t have the best broadband connection or the latest **mobile** phone or whatever it might be that ’ s required? AT : Well, anywhere in Taiwan, even on the top of Taiwan, almost 4, 000 meters high, the Saviah, or the Jade Mountain, you ’ re guaranteed to have 10 megabits per second over 4G or fiber or cable, with just 16 US dollars a month, an unlimited plan. And actually, on the top of the mountain, it ’ s faster, fewer people use that bandwidth. And if you don ’ t, it ’ s my fault. It ’ s personally my fault. In Taiwan, we have broadband as a human right. And so when we ’ re deploying 5G, we ’ re looking at places where the 4G has the weakest signal, and we begin with those places in our 5G deployment. And only by deploying broadband as a human right can we say that this is for everybody. That digital democracy actually strengthens democracy. Otherwise, we would be excluding parts of the society. And this also applies to, for example, you can go to a local digital opportunity center to rent a tablet that ’ s guaranteed to be manufactured in the past three years, and things like that, to enable, also, the different digital access by the digital opportunity centers, universities and schools, and public libraries, very important. And if people who prefer to talk in their town hall, I personally go to that town hall with a 360 recorder, and livestream that to Taipei and to other municipalities, where the central government ’ s public servants can join in a connected room style, but listening to the local people who set the agenda. So people still do face-to-face meetings, we ’ re not doing this to replace face-to-face meetings. We ’ re bringing more stakeholders from central government in the local town halls, and we ’ re amplifying their voices by making sure the transcripts, the mind maps, and things like that are spread through the internet in real time, but we don ’ t ever ask the elderly to, say,”Oh, you have to learn typing, otherwise you don ’ t do democracy.”It ’ s not our style. But that requires broadband. Because if you don ’ t have broadband, but only a very limited bandwidth, you are forced to use text-based communication. DB : That ’ s right. Well, with access, of course, comes access for folks who maybe will misuse the **platform**. You talked a little bit about disinformation and using humor to beat rumor. But sometimes, disinformation is more weaponized. How do you combat those kinds of attacks, really? AT : Right, so you mean malinformation, then. So essentially, information designed to cause intentional public harm. And that ’ s no laughing matter. So for that, we have an idea called”notice and public notice.”So this is a Reuters photo, and I will read the original caption. The original caption says”A teenage extradition bill protester in Hong Kong is seen during a march to demand democracy and political reform in Hong Kong.”OK, a very neutral title by the Reuters. But there was a spreading of malinformation back last November, just leading to our presidential election, that shows something else entirely. This is the same photo – that says”This 13-year-old thug bought new iPhones, game consoles and brand-name sports shoes, and recruiting his brothers to murder police and collect 200, 000 dollars.”And this, of course, is a weapon designed to sow discord, and to elicit in Taiwan ’ s voters a kind of distaste for Hong Kong. And because they know that this is the main issue. And had we resorted to takedowns, that will not work, because that would only evoke more outrage. So we didn ’ t do a takedown. Instead, we worked with the fact checkers and professional journalists to attribute this original message back to the first day that it was posted. And it came from Zhongyang Zhengfawei. That is the main political and legal unit of the central party, in the Central Communist Party, in CCP. And we know that it ’ s their Weibo account that first did this new caption. So we sent out a public notice and with the partners in social media companies, pretty much all of them, they just put this very small reminder next to each time that this is shared with the wrong caption, that says”This actually came from the central propaganda unit of the CCP. Click here to learn more. To learn about the whole story.”And that, we found, that has worked, because people understand this is then not a news material. This is rather an appropriation of Reuters ’ news material and a copyright infringement and I think that ’ s part of the [

unclear]. In any case, the point is that when people understand that this is an intentional narrative, they won ’ t just randomly share it. They may share it, but with a comment that says”This is what the Zhongyang Zhengfawei is trying to do to our democracy.”DB : Seems like some of the global social media companies could learn something from notice and public notice. AT : Public notice, that ’ s right. DB : What advice would you have for the Twitters and Facebooks and LINEs and WhatsApps, and you name it, of the world? AT : Yeah. So, just before our election, we said to all of them that we ’ re not making a law to kind of punish them. However, we ’ re sharing this very simple fact that there is this **norm** in Taiwan that we even have a separate branch of the government, the control branch, that published the campaign donation and expense. And it just so occurred to us that in the previous election, the mayoral one, there was a lot of candidates that did not include any social media advertisements in their expense to the Control Yuan. And so essentially, that means that there is a separate amount of political donation and expense that evades public scrutiny. And our Control Yuan published their numbers in raw data form, that is to say, they ’ re not statistics, but individual records of who donated for what cause, when, where, and investigative journalists are very happy, because they can then make investigative reports about the connections between the candidates and the people who fund them. But they cannot work with the same material from the global social media companies. So I said,”Look, this is very simple. This is the social **norm** here, I don ’ t really care about other jurisdictions. You either adhere to the social **norm** that is set by the Control Yuan and the investigative journalists, or maybe you will face social sanctions. And this is not the government mandate, but it ’ s the people fed up with, you know, black box, and that ’ s part of the Sunflower Occupy ’ s demands, also. And so Facebook actually published in the Ad Library, I think at that time, one of the fastest response strategies, where everybody who has basically any dark pattern advertisement will get revealed very quickly, and investigative journalists work with the local civic technologists to make sure that if anybody dare to use social media in such a divisive way, within an hour, there will be a report out condemning that. So nobody tried that during the previous presidential election season. DB : So change is possible. AT : Mhm. WPR : Hey there, we have some more questions from the community. There is an anonymous one that says,”I believe Taiwan is outside WHO entirely and has a 130-part preparation program – developed entirely on its own – to what extent does it credit its preparation to building its own system?”AT : Well, a little bit, I guess. We tried to warn the WHO, but at that point – we are not totally outside, we have limited scientific access. But we do not have any ministerial access. And this is very different, right? If you only have limited scientific access, unless the other side ’ s top epidemiologist happens to be the vice president, like in Taiwan ’ s case, they don ’ t always do the storytelling well enough to translate that into political **action** as our vice president did, right? So the lack of ministerial access, I think, is to the detriment of the global community, because otherwise, people could have responded as we did in the first day of January, instead of having to wait for weeks before the WHO declared that this is something, that there ’ s definitely human to human transmission, that you should inspect people coming in from Wuhan, which they eventually did, but that ’ s already two weeks or three weeks after what we did. WPR : Makes a lot of sense. DB : More scientists and technologists in politics. That sounds like that ’ s the answer. AT : Yeah. WPR : And then we have another question here from Kamal Srinivasan about your reopening strategy.”How are you enabling restaurants and retailers to open safely in Taiwan?”AT : Oh, they never closed, so... WPR : Oh! AT : Yeah, they never closed, there was no lockdown, there was no closure. We just said a very simple thing in the CECC press conference, that there ' s going to be physical **distancing**. You maintain one and a half meters indoors or wear a mask. And that ' s it. And so there are some restaurants that put up, I guess, red curtains, some put very cute teddy bears and so on, on the chairs, to make sure that people spread evenly, some installed see-through glass or plastic walls between the seats. There ' s various social innovations happening around. And I think the only shops that got closed for a while, because they could not innovate quick enough to respond to these rules, was the intimate escort bars. But eventually, even they invented new ways, by handing out these caps that are plastic shielding, but still leaves room for drinking behind it. And so they opened with that social innovation. DB : That ' s amazing. WPR : It is, yeah, it ' s a lot to learn from your strategies there. Thank you, I ' ll be back towards the end with some final questions. DB : I ' m very happy to hear that the restaurants were not closed down, because I think Taipei has some of the best food in the world of any city that I ' ve visited, so, you know, kudos to you for that. So the big concern when it comes to using digital tools for COVID or using digital tools for democracy is always **privacy**. You ' ve talked about that a little bit, but I ' m sure the citizens of Taiwan are perhaps equally concerned about their **privacy**, especially given the geopolitical context. AT : Definitely. DB : So how do you cope with those demands? AT : Yeah, we design with not only defensive strategy, like minimization of data collection, but also proactive measures, such as privacy-enhancing technologies. One of the top teams that emerged out of our cohack, the TW response from the Polis, how to make contact tracing easier, focused not on the contact tracers, not on the medical officers, but on the person. So they basically said,"OK, you have a phone, you can record your temperatures, you can record your whereabouts and things like that, but that is strictly in your phone. It doesn ' t even use Bluetooth. So there ' s no transmission. Technology uses open-source, you can check it, you can use it in airplane mode. And when the contact tracer eventually tells you that you are part of a high-risk group, and they really want your contact history, this tool can then generate a single-use URL that only contains the precise information, anonymized, that the contact tracers want. But it will not, like in a traditional interview, let you ask – they ask a question, they only want to know your whereabouts, but you answer with such accuracy that you end up compromising other people ' s **privacy**. So basically, this is about designing with an aim to enhance other people ' s **privacy**, because personal data is never truly personal. It ' s always social, it ' s always intersectional. If I take a selfie at a party, I inadvertently also take pretty much everybody else ' s who are in the picture, the surroundings, the ambiance, and so on, and if I upload it to a cloud **service**, then I actually decimate the bargaining power, the negotiation power of everybody around me, because then their data is part of the cloud, and the cloud doesn ' t have to compensate them or get their agreement for it. And so only by designing the tools with **privacy** enhancing as a positive value, and not enhancing only the person ' s own **privacy**, just like a medical mask, it protects you, but mostly it also protects others, right? So if we design tools using that idea, and always open-source and with an open API, then we ' re in a much better shape than in centralized or so-called cloud-based **services**. DB : Well, you ' re clearly living in the future, and I guess that ' s quite literal, in the sense of, it ' s tomorrow morning there. AT : Twelve hours. DB : Yes. Tell me, what do you see in the future? What comes next? AT : Yes, so I see the **coronavirus** as a great amplifier. If you start with an authoritarian society, the **coronavirus**, with all its lockdowns and so on, has the potential of making it even a more totalitarian society. If people place their trust, however, on the social sector, on the ingenuity of social innovators, then the pandemic, as in Taiwan, actually strengthens our democracy, so that people feel, truly, that everybody can think of something that improves the welfare of not just Taiwan, but pretty much everybody else in the world. And so, my point here is that the great amplifier comes if no matter you want it or not, but the society, what they can do, is do what Taiwan did after SARS. In 2003, when SARS came, we had to shut down an entire hospital, barricading it with no definite termination date. It was very traumatic, everybody above the age of 30 remembers how traumatic it was. The municipalities and the central government were saying very different things, and that is why after SARS, the constitutional courts charged the legislature to set up the system as you see today, and also that is why, when people responding to that crisis back in 2003 built this very robust response system that there ’ s early drills. So just as the Sunflower Occupy, because of the crisis in trust let us build new tools that put trust first, I think the **coronavirus** is the chance for everybody who have survived through the first wave to settle on a new set of **norms** that will reinforce your founding values, instead of taking on alien values in the name of survival. DB : Yeah, let ’ s hope so, and let ’ s hope the rest of the world is as prepared as Taiwan the next time around. When it comes to digital democracy, though, and digital citizenship, where do you see that going, both in Taiwan and maybe in the rest of the world? AT : Well, I have my job description here, which I will read to you. It ’ s literally my job description and the answer to that question. And so, here goes. When we see the internet of things, let ’ s make it the internet of beings. When we see virtual reality, let ’ s make it a shared reality. When we see machine learning, let ’ s make it collaborative learning. When we see user experience, let ’ s make it about human experience. And whenever we hear the singularity is near, let us always remember the plurality is here. Thank you for listening. DB : Wow. I have to give that a little clap, that was beautiful. Quite a job description too. So, conservative anarchist, digital minister, and with that job description – that ’ s pretty impressive. AT : A poetician, yes. DB : So I **struggle** to imagine an adoption of these techniques in the US, and that may be my pessimism weighing in. But what words of hope do you have for the US, as we cope with COVID? AT : Well, as I mentioned, during SARS in Taiwan, nobody imagined we could have CECC and a cute spokesdog. Before the Sunflower movement, during a large protest, there was, I think, half a million people on the street, and many more. Nobody thought that we could have a collective intelligence system that puts open government data as a way to rebuild citizen participation. And so, never lose hope. As my favorite singer, Leonard Cohen – a poet, also – is fond of saying,”Ring the bells that still can ring and forget any perfect offering. There is a crack in everything and that is how the light gets in.”WPR : Wow. That ’ s so beautiful, and it feels like such a great message to, sort of, leave the audience with, and sharing the sentiment that everyone seems to be so grateful for what you ’ ve shared, Audrey, and all the great information and insight into Taiwan ’ s strategies. AT : Thank you. WPR : And David – DB : I was just going to say, thank you so much for that, thank you for that beautiful job description, and for all the wisdom you shared in rapid-fire fashion. I think it wasn ’ t just one idea that you shared, but maybe, I don ’ t know, 20, 30, 40? I lost count at some point. AT : Well, it ’ s called Ideas Worth Spreading, it ’ s a plural form. DB : Very true. Well, thank you so much for joining us. WPR : Thank you, Audrey. DB : And I wish you luck with everything. AT : Thank you, and have a good local time. Stay safe.

Text Sample 172: POS Dim 2 – 2020 – Score 18.00 – 2020/t004300.txt
Hello, I ’ m Chris Anderson. Welcome to The TED Interview. We ’ re gearing up

for season four with some extraordinary guests, but I don ’ t want to wait for that for today ’ s episode, because we ’ re in the middle of a pandemic, and there ’ s a guest I really wanted to talk to now. He is Adam Kucharski, an infectious diseases scientist who focuses on the mathematical modeling of pandemics. He ’ s an associate professor at the London School of Hygiene and Tropical Medicine and a TED Fellow. Adam Kucharski : So what kind of behavior is actually important for epidemics? Conversations, close physical contacts? What sort of data should we be collecting before an outbreak if we want to predict how infection might spread? To find out, our team built a mathematical model… Chris Anderson : When it comes to figuring out what to make of this pandemic, known technically as COVID-19, and informally as just the **coronavirus**, I find his thinking unbelievably helpful. And I ’ m excited to dive into it with you. A **special** callout to my friends on Twitter who offered up many suggestions for questions. I know this topic is on everyone ’ s mind right now. And what I hope this episode does is give us all a more nuanced way of thinking about how this pandemic has unfolded so far, what might be to come and what we all collectively can do about it. Let ’ s dive in. Adam, welcome to the TED Interview. Adam Kucharski : Thank you. CA : So let ’ s just start with a couple of basics. A lot of skeptical people ’ s response – certainly over the last few weeks, maybe less so now – has been,”Oh, come on, this isn ’ t such a big deal, there ’ s a relatively tiny number of cases. Compare it to the **flu**, compare it to anything else. There are much bigger problems in the world. Why are we making such a fuss about this?”And I guess the answer to that fuss is that it comes down to the mathematics. We ’ re talking about the mathematics of exponential growth, fundamentally, right? AK : Exactly. And there ’ s a number that we use to get a sense of how easy things spread and the level of transmission we ’ re dealing with. We call that the reproduction number, and conceptually, it ’ s just, for each case you have, on average, how many others are they infecting? And that gives you a sense of how much is this scaling, how much this growth is going to look like. For **coronavirus**, we ’ re now seeing, across multiple countries, we ’ re seeing each person on average giving it to two or three more. CA : So that reproduction number, the first thing to understand is that any number above one means that this thing is going to grow. Any number below one means it ’ s going to diminish. AK : Exactly – if you have it above one, then each group of people infected are going to be generating more infection than there was before. And you will see the exponential effect, so if it ’ s two, you will be doubling every round of infection, and if it ’ s below one, you ’ re going to get something that ’ s going to decline, on average. CA : So that number two or higher, I think everyone here is maybe familiar with the famous story of the chessboard and the grains of rice, and if you double the number of grains for every square of the chessboard, for the first 10 or 15 squares nothing much happens, but by the time you ’ ve got to the 64th square, you suddenly have tons of rice for every individual on the planet. Exponential growth is an incredible thing. And the small numbers now are really not what you should be paying attention to – you should be paying attention to the models of what could be to come. AK : Exactly. Obviously, if you continue the exponential growth, you do sometimes get these incredibly large, maybe implausibly large numbers. But even looking at a timescale of say, a month, if the reproduction number is three, each person is infecting three on average. The gap between these rounds of infection is about five days. So if you imagine that you ’ ve got one case now, that ’ s, kind of, six of these five-day steps in a month. So by the end of that month, that one person could have generated, I think it works out at about 729 cases. So even in a month, just the scale of this thing can really shoot up if it ’ s not controlled. CA : And so certainly, that seems to be happening on most numbers that you look at now, certainly where the virus is in the early stages of entering a country. You ' ve given a model whereby we can much more clearly understand this reproduction number, because it seems to me this is almost like the core to how we think of the virus and how we respond to it and how much we should fear it, almost. And in your thinking, you sort of break it down into four components, which you call DOTS : Duration, Opportunities, Transmission probability and Susceptibility. And I think it would be really helpful, Adam, for you to just explain each of these, because it ' s quite a simple equation that links those four things to the actual reproduction number. So talk about them in turn. Duration, what does that mean? AK : Duration measures how long someone is infectious for. If, for example, intuitively, if someone is infectious for a longer period of time, say, twice as long as someone else, then that ' s twice the length that they ' ve got to be spreading infection. CA : And what is the duration number for this virus, compared with, say, **flu** or with other pathogens? AK : It depends a little bit on what happens when people are infectious, if they ' re being isolated very quickly, that shortens that period of time, but potentially, we ' re looking at around a week people are effectively infectious before they might be isolated in hospital. CA : And during that week, they may not even be showing symptoms for that full week either, right? So someone gets infected, there ' s an incubation period. There ' s a period some way into that incubation period where they start being infectious, and there may be a period after that, where they start to show symptoms, and it ' s not clear, quite, how those dates align. Is that right? AK : No, we ' re getting more information. One of the signals we see in data that suggest that you may have that early transmission going on is when you have this delay from one infection to the next. So that seems to be around five days. That incubation period, the time for symptoms to appear, is also about five days. So if you imagine that most people are only infecting others when they ' re symptomatic, you ' d have that incubation period and then you ' d have some more time when they ' re infecting others. So the fact that those values seem to be similar, suggesting that some people are transmitting either very early on or potentially before they ' re showing clear symptoms. CA : So almost implies that on average, people are infecting others as much before they show symptoms as after. AK : Potentially. Obviously these are early data sets, but I think there ' s good evidence that a fair number of people, either before they ' re showing clear symptoms or maybe they ' re not showing the kind of very distinctive fever and cough but they ' re feeling unwell and they ' re shedding virus during that period. CA : And does that make it quite different from the **flu**, for example? AK : It makes it actually similar to **flu** in that regard. One of the reasons pandemic **flu** is so hard to control and so feared as a threat is because so much transmission happens before people are severely ill. And that means that by the time you identify these cases, they ' ve probably actually spread it to a number of other people. CA : Yeah, so this is the trickery of the thing, and why it ' s so hard to do anything about it. It is ahead of us all the time, and you can ' t just pay attention to how someone feels or what they ' re doing. I mean, how does that happen, by the way? How does someone infect someone else before they ' re even showing symptoms themselves, because classically, we think of, you know, the person sneezing and droplets go through the air and someone else breathes them in and that ' s how infection happens. What is actually going on for infection pre-symptoms? AK : So the level of transmission we see with this virus isn ' t what we see, for example, with measles, where someone sneezes and a lot of virus gets out and potentially lots of susceptible people can get exposed. So potentially, it could be quite early on that even if someone has quite mild symptoms, maybe a bit of a cough, that ' s enough for some virus to be getting out and particularly, some of the work that we ' ve done trying to look at sort of close gatherings, so very tight-knit meals, there was an example in a ski chalet – and even in those situations, you might have someone mildly ill, but enough virus is getting out and somehow exposing others, we ’ re still trying to work out exactly how, but there ’ s enough there to cause some infection. CA : But if someone ’ s mildly ill, don ’ t they still have symptoms? Isn ’ t there evidence that even before they know that they ’ re ill, something is going on? There was a German paper published this week that seemed to suggest that even really early on, you take a swab from the back of someone ’ s throat and they have hundreds of thousands of these viruses already reproducing there. Like, can someone just literally just be breathing normally and there is some transmission of virus out into the air that they don ’ t even know about and is either infecting people directly or settling on surfaces, is that possible? AK : I think that ’ s what we ’ re trying to pin down, how much that [unclear]. As you said, there ’ s evidence that you can have people without symptoms and you can get virus out their throats. And so certainly there ’ s potential that it can be breathed out, but is that a fairly rare event for that actual transmission to happen, or are we potentially seeing more infections occur through that route? So it ’ s really early data, and I think it ’ s a piece of the puzzle, but we ’ re trying to work out where that fits in with what we know about the kind of other transmission events we ’ ve seen. CA : Alright, so, duration is the duration of the period of infectiousness. We think is five to six days, is that what I heard you say? AK : Potentially around a week, depending on exactly what happens to people when they ’ re infectious. CA : And there are cases of people testing positive way, way later, after they ’ ve got infected. That may be true, but they are probably not as infectious then. Is that basically right, that ’ s the way to think of this? AK : I think that ’ s our working theory, that a lot of that infection is happening early on. And we see that for a number of respiratory infections, that when people obviously become severely ill, their behavior is very different to when they may be walking around and going about their normal day. CA : And so again, comparing that D number to other cases, like the **flu**, is **flu** similar? What ’ s the D number for **flu**? AK : So for **flu**, it ’ s probably slightly shorter in terms of the period that people are actively infectious. I mean, for **flu**, it ’ s a very quick turnover from one case to the next, actually. Even a matter of about three days, potentially, from one infection to the person that they infect. And then at the other end of the scale, you get things like STDs, where that duration could be several months, potentially. CA : Right. OK, really nothing that unusual so far, in terms of this particular virus. Let ’ s look at the O, opportunity. What is that? AK : So opportunity is a measure of how many chances the virus has to spread through interactions while someone is infectious. So typically, it ’ s a measure of social behavior. On average, how many social contacts do people make that create opportunities for transmission while they ’ re infectious. CA : So it ’ s how many people have you got close enough to during a day, during a given day, to have a chance of infecting them. And that number could be, if people aren ’ t taking precautions in a normal, sort of, urban **setting**, I mean, that could run into the hundreds, presumably? AK : Potentially, for some people. We ’ ve done a number of studies looking at that in recent years, and the average, in terms of physical contacts, is about five people per day. Most people will have conversation or contacts generally with about 10, 15, but obviously, between cultures, we see quite a lot of variation in the level of physical greetings that might happen. CA : And presumably, that number again is no different for this virus than for any other. I mean, that ’ s just a feature of the lives that we live. AK : I think for this one, if it ’ s driven through these kind of interactions, and we ’ ve seen for **flu**, for other respiratory infections, those kinds of fairly close contacts and everyday physical interactions seem to be the ones that are important for transmission. CA : Perhaps there is one difference. The fact that if you ' re infectious pre-symptoms, perhaps that means that actually, there are more opportunities here. This is part of the virus ' s genius, as it were, that by not letting on that it ' s inside someone, people continue to interact and go to work and take the subway and so forth, not even knowing that they ' re sick. AK : Exactly. And for something like **flu**, you see when people get ill, clearly, their social contacts drop off. So to have a virus that can be infectious while people are going around their everyday lives, really gives it an advantage in terms of transmission. CA : In your modeling, do you actually have this opportunities number higher than for **flu**? AK : So for the moment, we ' re kind of using similar values, so we ' re trying to look at, for example, physical contacts within different populations. But what we are doing is scaling the risk. So that ' s coming on to the T term. So that between each contact, what ' s the risk that a transmission event will occur. CA : Alright, so let ' s go on to this next number, the T, transmission probability. How do you define that? AK : So this measures the chance that, essentially, the virus will get across during a particular opportunity or a particular interaction. So you may well have a conversation with somebody, but actually, you don ' t cough or you don ' t sneeze or for some reason, the virus doesn ' t actually get across and expose the other person. And so, for this virus, as I mentioned, say people are having 10 conversations a day, but we ' re not seeing infected people infect 10 others a day. So it suggests that not all of those opportunities are actually resulting in the virus getting across. CA : But people say that this is an infectious virus. Like, what is that transmission probability number, again, compared with, say, the **flu**? AK : So, we did some analysis looking at these very close gatherings. We looked at about 10 different case studies, and we found that about a third of the contacts in those **settings** subsequently got infected in these early stages, when people weren ' t aware. So if you had these, kind of, big group meals, potentially, each contact had about, a kind of, one in three chance of getting exposed. For seasonal **flu**, that tends to be slightly lower, even within households and close **settings**, you don ' t necessarily get values that high. And even for something like SARS, those values have, kind of – the risk per interaction you had was lower than what we seem to be getting for **coronavirus**. Which intuitively makes sense, there must be a higher risk per interaction if this thing is spreading so easily. CA : Hm. OK, and then the fourth letter of DOTS is S for susceptibility. What ' s that? AK : So that is a measure of the proportion of the population who are susceptible. If you imagine you have this interaction with someone, the virus gets across, it exposes them, but some people may have been vaccinated or otherwise have some immunity and not develop infection themselves and not be infectious to others. So we ' ve got to account for this potential proportion of people who are not actually going to turn into cases themselves. CA : And obviously, there ' s no vaccine yet for this **coronavirus**, nor is anyone, at least initially, immune, as far as we know. So are you modeling that susceptibility number pretty high, is that part of the issue here? AK : Yeah, I think the evidence is that this is going to fully susceptible populations, and even in areas, for example, like China, where there ' s been a lot of transmission but there ' s been very strong control measures, we estimated that up to the end of January, probably about 95 percent of Wuhan are still susceptible. So there ' s been a lot of infection, but it hasn ' t really taken much of that component, of the DOTS, of those four things that drive transmission. CA : And so the way the mathematics works, I have to confess, amidst the **stress** of this whole situation, the nerd in me kind of loves the elegance of the mathematics here, because I ' d never really thought about it this way, but you basically just multiply those numbers together to get the reproduction number. Is that right?

AK : Exactly, yeah, you almost take the path of the infection during transmission as you multiply those together, and that gives you the number for that virus. CA : And so there ' s just a total logic to that. It ' s the number of days, duration that you ' re infectious, it ' s the number of people you ' re seeing on average during those days that you have a chance to infect. Then you multiply that by the transmission probability, is virus getting into them, essentially, that ' s what you mean by crossing over. And then by the susceptibility number. By the way, what do you think the susceptibility probability is for this case? AK : I think we have to assume that it ' s near 100 percent in terms of spread, yeah. CA : Alright, you multiply those numbers together, and right now, it looks like, for this **coronavirus**, that you say two to three is the most plausible current number, which implies very rapid growth. AK : Exactly. In these uncontrolled outbreaks, we ' re seeing now a number of countries in this stage – you are going to get this really rapid growth occurring. CA : And so how does that two to three compare with **flu**? And I guess, there ' s seasonal **flu**, in the winter, when it ' s spreading, and at other times during the year drops well below one as a reproduction number, right? But what is it during seasonal **flu** time? AK : During the early stage when it ' s taking off at the start of the **flu** season, it ' s probably, we reckon, somewhere between about maybe 1. 2, 1. 4. So it ' s not incredibly transmissible, if you imagine you do have some immunity in your population from vaccination and from other things. So it can spread, it ' s above one, but it ' s not taking off, necessarily, as quickly as the **coronavirus** is. CA : So I want to come back to two of those elements, specifically opportunity and transmission probability, because those seem to have the most chance to actually do something about this infection rate. Before we go there, let ' s talk about another key number on this, which is the fatality rate. First of all, could you define – I think there ' s two different versions of the fatality rate that maybe confuse people. Could you define them? AK : So the one that we often talk about is what ' s known as the case fatality rate, and that ' s of the proportion who show up with symptoms as cases, what proportion of those will subsequently be fatal. And we also sometimes talk about what ' s known as the infection fatality rate, which is, of everyone who gets infected, regardless of symptoms, how many of those infections will subsequently be fatal. But most of the values we see kicking around are the case fatality rate, or the CFR, as it ' s sometimes known. CA : And so what is that fatality rate for this virus, and again, how does that compare with other pathogens? AK : So there ' s a few numbers that have been bouncing around. One of the challenges in real time is you often don ' t see all of your cases, you have people symptomatic not being reported. You also have a delay. If you imagine, for example, 100 people turn up to a hospital with **coronavirus** and none have died yet, that doesn ' t imply that the fatality rate is zero, because you ' ve got to wait to see what might happen to them. So when you adjust for that underreporting and delays, best estimate for the case fatality is about one percent. So about one percent of people with symptoms, on average, those outcomes are fatal. And that ' s probably about 10 times worse than seasonal **flu**. CA : Yeah, so that ' s a scary comparison right there, given how many people die of **flu**. So when the World Health Organization mentioned a higher number, a little while back, of 3. 4 percent, they were criticized a bit for that. Explain why that might have been misleading and how to think about it and adjust for that. AK : It ' s incredibly common that people look at these raw numbers, they say,"How many deaths are there so far, how many cases,"and they look at that ratio, and even a couple of weeks ago, that number produced a two percent value. But if you imagine you have this delay effect, then even if you stop all your cases, you will still have these kind of fatal outcomes over time, so that number will creep up. This has occurred in every epidemic from pandemic **flu** to Ebola, we see this again and again. And I made the point to a number of people that this number is going to go up, because as China ’ s cases slow, it will look like it ’ s increasing, and that ’ s just kind of a statistical quirk. There ’ s nothing really kind of, behind a change, there ’ s no mutations or anything going on. CA : If I have this right, there are two effects going on. One is that the number of fatalities from the existing caseload will rise, which actually would boost that 3. 4 even higher. But then you have to offset that against the fact that, apparently, huge numbers of cases have just gone undetected and that we haven ’ t, due to bad testing, that the number of fatalities don ’ t – they probably reflect a much larger number of early cases. Is that it? AK : Exactly. So you have one thing pulling the number up and one thing pulling it down. And it means that on these kind of early values, if you actually just adjust for the delay and don ’ t think about these unreported cases, you start getting really very scary numbers indeed. You get up to 20, 30 percent potentially, which really doesn ’ t align with what we know about this virus in general. CA : Alright. There ’ s a lot more data in now. From your point of view, you think the likely fatality rate, at least in the earlier stage of an infection, is about two percent? AK : I think overall, I think we can put something probably in the 0. 5 to two percent range, and that ’ s on a number of different data sets. And that ’ s for people who are symptomatic. I think on average, one percent is a good number to work with. CA : OK, one percent, So **flu** is often quoted as a tenth of a percent, so it ’ s five to 10 times or more more dangerous than **flu**. And that danger is not symmetric across age groups, as is well known. It primarily affects the elderly. AK : Yeah, we ’ ve seen that one percent on average, but once you start getting into the over 60s, over 70s, that number really starts to shoot up. I mean, we ’ re estimating potentially in these older groups, you ’ re looking at maybe five, 10 percent fatality. And then of course, on top of that, you ’ ve got to add what are going to be the severe cases and people are going to require hospitalization. And those risks get very large in the older groups indeed. CA : Adam, put these numbers together for us. In your models, if you put together a reproduction rate of two to three and a fatality rate of 0. 5 percent to one percent and you run the simulation, what does it look like? AK : So if you have this uncontrolled transmission, and you have this reproduction number of two or three and you don ’ t do anything about it, the only way the outbreak ends is enough people get it and immunity builds up and the outbreak kind of ends on its own. And in that case, you would expect very large numbers of the population to be infected. It ’ s what we see, for example, with many other uncontained outbreaks, that it essentially burns through the population, you get large numbers infected and with this kind of fatality rate and hospitalization rate, that would really be hugely damaging if that were to occur. Certainly at the country level, we ’ re seeing – Italy is a good example at the moment, that if you have that early transmission that ’ s undetected, that rapid growth, you very quickly get to a situation where your health systems are overwhelmed. I think one of the nastiest aspects of this virus is that because you have the delay between infection and symptoms and people showing up in health care, if your health system is overwhelmed, even on that day, if you completely stop transmission, you ’ ve got all of these people who have already been exposed, so you ’ re still going to have cases and severe cases appearing for maybe another couple of weeks. So it ’ s really this huge accumulation of infection and burden that ’ s coming through the system on your population. CA : So there ’ s another key number, actually, is how does the total case number compare to the capacity of a country ’ s health system to process that number of cases. Presumably that issue makes a huge difference to the fatality rate, the difference between people coming in with severe illness and a health system that ’ s able to respond and one that ’ s overwhelmed. The fatality rate is going to be very different at that point. AK : If someone requires an ICU bed, that ’ s a couple of weeks they ’ re going to require it for and you ’ ve got more cases coming through the system, so it very quickly gets very tough. CA : So talk about the difference between containment and mitigation. These are different terms that we ’ re hearing a lot about. In the early stages of the virus, governments are focused on containment. What does that mean? AK : Containment is this idea that you can focus your effort on control very much on the cases and their contacts. So you ’ re not causing disruption to the wider population, you have a case that comes in, you isolate them, you work out who they ’ ve come into contact with, who ’ s potentially these opportunities for exposure and then you can follow up those people, maybe **quarantine** them to make sure that no further transmission happens. So it ’ s a very focused, targeted method, and for SARS, it worked remarkably well. But I think for this infection, because some cases are going to be missed or undetected, you ’ ve really got to be capturing a large chunk of people at risk. If a few slip through the net, potentially, you ’ re going to get an outbreak. CA : Are there any countries that have been able to employ this strategy and effectively contain the virus? AK : So Singapore have been doing a really remarkable job of this for the last six weeks or so. So as well as some wider measures, they ’ ve been working incredibly hard to trace people who have come into contact. Looking at CCTV, going through to find out which taxi someone might have gotten, who might be at risk – really, really thorough **follow-up**. And for about six weeks, that has kept a lid on transmission. CA : So that ’ s amazing. So someone comes into the country, they test positive – they go to work, and with a massive team, and trace everything to the level of actually saying,”Oh, you don ’ t know what taxi you went in? Let us find that out for you.”And presumably, when they find the taxi driver, they then have to try and figure out everyone else who was in that taxi? AK : So they will focus on close contacts of people most at risk, but they ’ re really minimizing the chance that anyone slips through the net. CA : But even in Singapore, if I ’ m not mistaken, numbers started to trend back down to zero, but I think recently, they ’ ve picked up again a bit. It ’ s still unclear whether they will actually be able to sustain containment. AK : Exactly. If we talk in terms of the reproduction number, we saw it dipped to maybe 0. 8, 0. 9, so under that crucial value of one. But in the last week or two, it does seem to be ticking up and they ’ re getting more cases appearing. I think a lot of it is, even if they are containing it, the world is experiencing outbreaks and just keeps throwing sparks of infection, and it becomes harder and harder with that level of intensive effort to stamp them all out. CA : In the case of this virus, you know, there was warning to most countries in the world that this thing was happening. The news out of China very quickly became very bleak, and people had time to prepare. I mean, what would ideal preparation look like if you know that something like this is coming and you know that there ’ s a lot on the line if you can successfully contain it before it really escapes? AK : I think two things would make a really big difference. One is having as thorough a **follow-up** and detection as possible. We ’ ve done some modeling analyses, looking at how effective that kind of early containment is. And it can be, if you ’ re identifying maybe 70 or 80 percent of the people who might have come into contact. But if you ’ re not detecting those cases coming in, if you ’ re not detecting their contacts – and a lot of the early focus, for example, was on travel history to China, and then it became clear that the situation was changing, but because you were relying on that as your definition of a case, it meant a lot of maybe other cases that matched the definition weren ’ t being tested because they didn ’ t seem to be potentially at risk. CA : So I mean, if you know that early detection is key to this, an essential early measure, I guess, would be to rapidly ensure that you had enough tests available and where needed, so that you could respond, be ready to swing into **action** as soon as someone was detected, you then have to very quickly, I guess, test their contacts and so forth, to have a chance of keeping this under control. AK : Exactly. In my line of work, we say there ' s value in a negative test, because it shows that you ' re looking for something and it ' s not there. And so I think having small numbers of people tested doesn ' t give you confidence that you ' re not missing infections, whereas if you are doing really thorough **follow-up** on contacts, we ' ve seen countries even like Korea now, huge numbers of people tested. So although there are still cases appearing, it gives them more confidence that they have some sense of where those infections are. CA : I mean, you ' re in the UK right now, I ' m in the US. How likely is it that the UK is going to be able to contain, how likely is it that the US is going to be able to contain this? AK : I think it ' s pretty unlikely in both cases. I think the UK is going to have to introduce some additional measures. I think when that happens obviously depends a bit on the current situation, but we ' ve tested almost 30, 000 people now. Frankly, I think the US may well be moving beyond that point, given how much evidence of extensive transmission that has, and I think without clear ideas of how much infection there is and that level of testing, it ' s quite hard to actually see what the picture currently is in the US. CA : I mean, I definitely don ' t want to get too political about this, but I mean, does this strike you as – you just said that the UK has tested 30, 000 people – the US is five or six times bigger and I think the total number of tests here is five or six thousand, or it was a few days ago. Does that strike you as bizarre? I don ' t understand, honestly, how that happened in an educated country that has so much knowledge about infectious diseases. AK : It does, and I think there ' s obviously a number of factors playing in there, logistics and so on, but there has been that period of warning that this is a threat and this is coming in. And I think countries need to make sure that they ' ve got the capacity to really do as much detection as they can in those early stages, because that ' s where you ' re going to catch it and that ' s where you ' re going to have a better chance of containing it. CA : OK, so if you fail to contain, then you have to move to some kind of mitigation strategy. So what comes into play there? And I think I almost want to bring that back to two of your DOTS factors, opportunity and transmission probability, because it seems like the virus is what it is, the actual duration when someone is potentially infectious, we can ' t do much about. The susceptibility side, we can ' t do much about until there ' s a vaccine. We could maybe talk about that in a bit. But the middle two of opportunity and transmission probability, we can do something about. Do you want to maybe talk about those in turn, of what that looks like, how would you build a mitigation strategy? I mean, first of all, thinking about opportunity, how do you reduce the number of opportunities to pass on the bug? AK : And so I think in that respect, it would be about massive changes in our social interactions. And if you think in terms of the reproduction number of being about two or three, to get that number below one, you ' ve really got to cut some aspect of that transmission in half or in two-thirds to get that below one. And so that would require, of the opportunities that could spread the virus, so these kind of close contacts, everybody in the population, on average, will be needing to reduce those interactions potentially by two-thirds to bring it under control. That might be through working from home, from changing lifestyle and kind of where you go in crowded places and dinners. And of course, these measures, things like school closures, and other things that just attempt to reduce the social mixing of a population. CA : Well, actually, talk to me more about school closures, because that, if I remember, often in past pandemics has been cited as an absolutely key measure, that schools represent this sort of coming together of people, children are often – certainly when it comes to **flu** and colds – they ’ re carriers. But on this case, children don ’ t seem to be getting sick from this particular virus, or at least very few of them are. Do we know whether they can still be infectious? They can be the unintended carriers of it. Or actually, is there evidence that school closures may not be as important in this instance as it is in others? AK : So that point on what role children play is a crucial one, and there ’ s still not a good evidence base there. From following up of contacts of cases, there ’ s now evidence that children are getting infected, so when you ’ re testing, they are getting exposed, it ’ s not that somehow they ’ re just not getting the infection at all, but as you said, they ’ re not showing symptoms in the same way. And particularly for **flu**, when we see the implications of school closures, even in the UK in 2009 during swine **flu**, there was a dip in the outbreak during the school holidays, you could see it on the epidemic curve, it kind of comes back down in the summer and goes back up in the autumn. But of course, in 2009, there was some immunity in older groups. That kind of shifted more the transmission into the younger ones. So I think it ’ s really something we ’ re trying to work to understand. Obviously, it will reduce interactions, with school closures, but then there ’ s knock-on social effects, there ’ s potential knock-on changes in mixing, maybe grandparents and their role, in terms of alternative carers if parents have to work. So I think there ’ s a lot of pieces that need to be considered. CA : I mean, based on all of the different pieces of evidence you ’ ve seen, if it were down to you, would you be recommending that most countries at this point do look hard at extensive school closures as a precautionary measure, that it ’ s just worth it to do that as a sort of painful two, three, four, five-month strategy? What would you recommend? AK : I think the key thing, given the age distribution of risk and the severity in older groups is reduce interactions that bring the infection into those groups. And then amongst everyone else, reduce interactions as much as possible. I think the key thing is we ’ ve got so much of the disease burden in the kind of 60-plus group that it ’ s not just about everyone trying to avoid everyone ’ s interactions, but it ’ s the kind of behaviors that would drive infections into those groups. CA : Does that mean that people should think twice before, I don ’ t know, visiting a loved one in an old people ’ s home or in a residential facility? Like that, we should just pay **super special** attention to that, should all these facilities be taking great care about who they admit, taking temperature and checking for symptoms or something like that? AK : I think those measures definitely need to be considered. In the UK, we ’ re getting plans for potentially what ’ s known as a cocooning strategy for these older groups that we can really try and seal off interactions as much as possible from people who might be bringing infection in. And ultimately, because as you said, we can ’ t target these other aspects of transmission, it is just reducing the risk of exposure in these groups, and so I think anything at the individual level you can do to get people reducing their risk, if either they ’ re elderly or in other risk groups, I think is crucial. And I think more at the general level those kind of more large-scale measures can help reduce interactions overall, but I think if those reductions are happening and not reducing the risk for people who are going to get severe disease, then you ’ re still going to get this really remarkably severe burden. CA : I mean, do people have to almost apply this double lens as they think about this stuff? There ’ s the risk to you as you go about your life, of you catching this bug. But there ’ s also the risk of you being, unintentionally, a carrier to someone who would suffer much more than you might. And that both those things have to be top of mind right now. AK : Yeah, and it ’ s not just whose hand you shake, it ’ s whose hand that person goes on to shake. And I think we need to think about these second-degree steps, that you might think you have low risk and you ' re in a younger group, but you ' re often going to be a very short step away from someone who is going to get hit very hard by this. And I think we really need to be socially minded and think this could be quite dramatic in terms of change of behavior, but it needs to be to reduce the impact that we ' re potentially facing. CA : So the opportunity number, we bring down by just reducing the number of physical contacts we have with other people. And I guess the transmission probability number, how do we bring that down? That impacts how we interact. You mentioned hand-shaking, I ' m guessing you ' re going to say no handshaking. AK : Yeah, so changes like that. I mean, another one, I think, handwashing operates in a way that we might be still be doing activities that we ' ve previously done, but handwashing reduces the chance that from one interaction to another, we might be spreading infection, so it ' s all of these measures that mean that even if we ' re having these exposures, we ' re taking additional steps to avoid any transmission happening. CA : I still think most people don ' t fully understand or don ' t have a clear model of the pathway by which this thing spreads. So you think definitely people understand that you don ' t breathe in the water droplets of someone who has just coughed or sneezed. So how does it spread? It gets onto surfaces. How? Do people just breathe out and it goes on from people who are sick, they touch their mouth or something like that, and then touch a surface and it gets on that way? How does it actually get onto surfaces? AK : I think a lot of it would be that you cough in your hand and it ends up on a surface. But I think the challenge, obviously, is untangling these questions of how transmission happens. You have transmission in a household, and is it that someone coughed and it got on a surface, is it direct contact, is it a handshake, and even for things like **flu**, that ' s something that we work quite hard to try and unpick, how does social behavior correspond to infection risk. Because it ' s clearly important, but pinning it down is really tough. CA : It ' s almost like embracing the fact that for a lot of these things, we actually don ' t know and that we ' re all in this game of probabilities. Which, in a way, is why I think the math is so important here. That you have to think of this as these multiple numbers working together on each other, they all have their part to play. And any of them that you can take down by a percentage is likely contributing, not just to you but to everyone. And people don ' t actually know in detail how the numbers go together, but they know that they probably all matter. We almost need people to, somehow, you know, embrace that uncertainty and then try to get some satisfaction by acting on every single part of it. AK : I think it ' s this idea that if on average, you ' re infecting, say, three people, what ' s driving that and how can you chip away at that value? If you ' re washing your hands, how much might that chip away in terms of the handshakes, you know, you may have had virus and you no longer do, or if you are changing your social behavior in a certain way, is that taking away a couple of interactions, is that taking away half? How can you really chip into that number as much as you possibly can? CA : Is there anything else to say about how we could reduce that transmission probability in our interactions? Like, what is the physical distance that it ' s wise to stay away from other people if we can? AK : I think it ' s hard to pin down exactly, but I think one thing to bear in mind is that there ' s not so much evidence that this is a kind of aerosol and it goes really far – it ' s reasonably short distances. I don ' t think it ' s the case that you ' re sitting a few meters away from someone and the virus is somehow going to get across. It ' s in closer interactions, and it ' s why we ' re seeing so many transmission events occur in things like meals and really tight-knit groups. Because if you imagine that ' s where you can get a virus out and onto surfaces and onto hands and onto faces, and it ' s really situations like that we ' ve got to think more about. CA : So in a way, some of the fears that people have may actually be overstated, like, if you ' re in the middle of an airplane and someone at the front sneezes, I mean, that ' s annoying, but it ' s actually not the thing you should be most freaked out about. There are much smarter ways to pay attention to your well-being. AK : Yeah, if it was measles and the plane was susceptible people, you would see a lot of infections after that. I think it is, bear in mind, that this is, on average, people infecting two or three others, so it ' s not the case of your maybe 50 interactions over a week, all of those people are at risk. But it ' s going to be some of them, particularly those close contacts, that are going to be where transmission ' s occurring. CA : So talk about, from a sort of national strategy point of view. There ' s a lot of talk about the need to"flatten the curve."What does that mean? AK : I think it refers to this idea that for your health systems, you don ' t want all your cases to appear at the same time. So if we sat back and did nothing and just let the epidemic grow, and you had this growth rate that, at the moment, in some places is looking like maybe three to four days, you ' re getting doubling. So every three or four days, the epidemic is doubling. It will skyrocket and you ' ll end up with a whole bunch of really severely ill people needing hospital care all at the same time, and you just won ' t have capacity for it. So the idea of flattening the curve is if we can slow transmission, if we can get that reproduction number down, then there may still be an outbreak, but it will be much flatter, it will be longer and there will be fewer severe cases showing up, which means that they can get the health care they need. CA : Does it imply that there will be fewer cases overall, or – When you look at the actual images of people showing what flattening the curve looks like, it almost looks as if you ' ve got the same area still under the graph, i. e. that the same number of people, ultimately, are infected but over a longer period. Is that typically what happens, and even if you adopt all these strategies of social **distancing** and washing hands and etc. that the best you can hope for is that you slow the thing down, you actually will get as many people infected in the end? AK : Not necessarily – it depends on the measures that go in. There are some measures like, shutting down travel, which typically delay the spread rather than reduce it. So you ' re still going to get the same outbreaks, but you ' re stretching out the outbreaks. But there are other measures. If we talk about reducing interactions, if your reproduction number ' s lower, you would expect fewer cases overall. And eventually, in your population, you will get some buildup of immunity, which would help you out if you think about the components, reducing susceptibility, alongside what ' s going on elsewhere. So the hope is that the two things will work together. CA : So help me understand what the endgame is here. So, take China, for example. Whatever you make of the early suppression of data and so forth that seems pretty troubling there. The intensity of the response come January time or whatever, with the shutdown of this huge area of the country, seems to have actually been effective. The number of cases there are falling at a shockingly high rate in some ways. Falling to almost nothing. And I can ' t understand that. You are talking about a country of, whatever, 1. 4 billion people. There have been a huge number of cases there, but it was a tiny fraction of the population have actually got sick. And yet, they ' ve got the number way down. It ' s not like every other person in China has somehow developed immunity. Is it that they have been absolutely disciplined about shutting down travel from the infected regions and somehow really dialed up, massively dialed up testing at any sign of any problem, so that literally, they are back in containment mode in most parts of China? I can ' t get my head around it, help me understand it. AK : So we estimated, in the last two weeks of January, when these measures went in, the reproduction number went from about 2. 4 to 1. 1. So about 60 percent decline in transmission in the space of a week or two. Which is remarkable and really, a lot of it is likely to be driven by just fundamental change in social behavior, huge social **distancing**, really intensive **follow-up**, intensive testing. And it got to the point where it took enough off the reproduction number to cause the decline, and now, of course, we ’ re seeing, in many areas, a transition back to more of this kind of containment, because there ’ s few cases, it ’ s more manageable. But we ’ re also seeing them face a challenge, because a lot of these cities have basically been locked down for six weeks and there ’ s a limit to how long you can do that for. And so some of these measures are gradually starting to be lifted, which of course creates the risk that cases that are appearing from other countries may subsequently go in and reintroduce transmission. CA : But given how infectious the bug is, and how many theoretical pathways and connection points there are between people in Wuhan, even in shutdown, or relatively shut down, or the other places where there ’ s been some infection and the rest of the country, does it surprise you how quickly that curve has gone down to nearly zero? AK : Yes. Early on when we saw that flattening off in cases in those first few days, we did wonder whether it was just they hit a limit in testing capacity and they were reporting 1, 000 a day, because that ’ s all the kits they had. But it continued, thankfully, and it shows that it is possible to turn this over with that level of intervention. I think the key thing now is seeing how it works in other **settings**. Italy now are putting in really dramatic interventions. But of course, because of this delay effect, if you put them in today, you won ’ t necessarily see the effects on cases for another week or two. So I think working out what impact that ’ s had is going to be key for helping other countries work on how to contain this. CA : To have a picture, Adam, of how this is likely to play out over the next month or two, give us a couple of scenarios that are in your head. AK : I think the optimistic scenario is that we ’ re going to learn a lot from places like Italy that have unfortunately been hit very hard. And that countries are going to take this very seriously and that we ’ re not going to get this continued growth that ’ s going to overwhelm totally, that we ’ re going to be able to sufficiently slow it down, that we are going to get large numbers of cases, we ’ re probably going to get a lot of severe cases, but that will be more manageable, that ’ s the kind of optimistic scenario. I think if we have a point where countries either don ’ t take this seriously or populations don ’ t respond well to control measures or it ’ s not detected, we could get situations – I think Iran is probably the closest one at the moment – where there ’ s been extensive widespread transmission, and by the time it ’ s being responded to, those infections are already in the system and they are going to turn up as cases and severe illness. So I ’ m hoping we ’ re not at that point, but we ’ ve certainly got, at the moment, potentially about 10 countries on that trajectory to have the same outlook as Italy. So it ’ s really crucial what happens in the next couple of weeks. CA : Is there a real chance that quite a few countries end up having, this year, substantially more deaths from this virus than from seasonal **flu**? AK : I think for some countries that is likely, yeah. I think if control is not possible, and we ’ ve seen it happen in China, but that was really just an unprecedented level of intervention. It was really just changing the social fabric. I think people, many of us, don ’ t really appreciate, at a glance, just what that means, to reduce your interactions to that extent. I think many countries just simply won ’ t be able to manage that. CA : It ’ s almost a challenge to democracies, isn ’ t it –”OK, show us what you can do without that kind of draconian control. If you don ’ t like the thought of that, come on, citizens, step up, show us what you ’ re capable of, show that you can be wise about this and smart and self-disciplined, and get ahead of the damn bug.”AK : Yeah. CA : I mean, I ’ m not personally superoptimistic about that, because there ’ s such conflicting messaging coming out in so many different places, and people don ’ t like to short-term sacrifice. I mean, is there almost a case that – I mean, what ’ s your view on whether the media has played a helpful role here or an unhelpful role? Is it actually, in some ways, helpful to, if anything, overstate the concern, the fear, and actually make people panic a little bit? AK : I think it ’ s a really tough balance to strike, because of course, early on, if you don ’ t have cases, if you don ’ t have any evidence of potential pressure, it ’ s very hard to get that message and convince people to take it seriously if you ’ re overhyping it. But equally, if you ’ re waiting too long, and saying it ’ s not a concern yet, we ’ re OK for the moment, a lot of people think it ’ s just **flu**. By the time it hits hard, as I ’ ve said, you ’ re going to have weeks of an overburdened health system, because even if you take interventions, it ’ s too late to control the infections that have happened. So I think it ’ s a fine line, and my hope is there is this ramp-up in messaging, now people have these tangible examples like Italy, where they can see what ’ s going to happen if they don ’ t take it seriously. But certainly, of all the diseases I ’ ve seen, I think many of my colleagues who are much older than me and have memories of other outbreaks, it ’ s the scariest thing we ’ ve seen in terms of the impact it could have, and I think we need to respond to that. CA : It ’ s the scariest disease you ’ ve seen. Wow. I ’ ve got some questions for you from my friends on Twitter. Everyone is obviously **super** exercised about this topic. Hypothetically, if everyone stayed home for three weeks, would that effectively wipe this out? Is there a way to socially distance ourselves out of this? AK : Yeah, I think in certain countries with reasonably small household sizes, I think average in the UK, US is about two and a half, so even if you had a round of infection within the household, that would probably stamp it out. As a secondary benefit, you may well stamp out a few other infections, too. Measles only circulates in humans, so you may have some knock-on effect, if, of course, that were ever to be possible. CA : I mean, obviously that would be a huge dent to the economy, and this is in a way almost, like, one of the underlying challenges here is that you can ’ t optimize public policy for both economic health and fighting a virus. Like, those two things are, to some extent, in conflict, or at least, short-term economic health and fighting a virus. Those two things are in conflict, right? And societies need to pick one. AK : It is tough to convince people of that balance, the thing we always say of pandemic planning is it ’ s cheap to put this stuff in place now – otherwise, you ’ ve got to pay for it later. But unfortunately, as we ’ ve seen with this, that a lot of early money for response wasn ’ t there. And it ’ s only when it has an impact and when it ’ s going to get expensive that people are happy to take that cost on board, it seems. CA : OK, some more Twitter questions. Will the rising temperature in coming weeks and months slow down the COVID-19 spread? AK : I haven ’ t seen any convincing evidence that there ’ s that strong pattern with temperature, and we ’ ve seen it for other infections that there is this seasonal pattern, but I think the fact we ’ re getting widespread outbreaks makes it hard to identify, and of course, there ’ s other things going on. So even if one country doesn ’ t have as big an outbreak as another, that ’ s going to be influenced by control measures, by social behavior, by opportunities and these things as well. So it would be really reassuring if this was the case, but I don ’ t think we can say that just yet. CA : Continuing from Twitter, I mean, is there a standardized global recommendation for all countries on how to do this? And if not, why not? AK : I think that ’ s what people are trying to piece together, first in terms of what works. It ’ s only really in the last sort of few weeks we ’ ve got a sense that this thing can be controllable with this extent of interventions, but of course, not all countries can do what China have done, some of these measures incur a huge social, economic, psychological burden on populations.

And of course, there ' s the time limit. In China they ' ve had them in for six weeks it ' s tough to maintain that, so we need to think of these tradeoffs of all the things we can ask people to do, what ' s going to have the most impact on actually reducing the burden. CA : Another question : How did this happen and is it likely to happen again? AK : So it ' s likely that this originated with the virus that was circling in bats and then probably made its way through another species into humans somehow, there ' s a lot of bits of evidence around this, there ' s not kind of single, clear story, but even for SARS, it took several years for genomics to piece together the exact route that it happened. But certainly, I think it ' s plausible that it could happen again. Nature is throwing out these viruses constantly. Many of them aren ' t well-adapted to humans, don ' t pick up, you know, there may well have been a virus like this a few years ago that just happened to infect someone who just didn ' t have any contacts and didn ' t go any further. I think we are going to face these things and we need to think about how can we get in early at the stage where we ' re talking small numbers of cases, and even something like this is containable, rather than the situation we ' ve got now. CA : It seems like this isn ' t the first time that a virus seems to have emerged from, like, a wild meat market. That ' s certainly how it happens in the movies. And I think China has already taken some steps this time to try to crack down on that. I guess that ' s potentially quite a big deal for the future if that can be properly maintained. AK : It is, and we saw, for example, the H7N9 avian **flu**, over the last few years, in 2013, it was a big emerging concern, and China made a very extensive response in terms of changing how they operate their markets and vaccination of birds and that seems to have removed that threat. So I think these measures can be effective if they ' re identified early on. CA : So talk about vaccinations. That ' s the key measure, I guess, to change that susceptibility factor in your equation. There ' s obviously a race on to get these vaccinations out there, there are some candidate vaccinations there. How do you see that playing out? AK : I think there ' s certainly some promising development happening, but I think the timescales of these things are really on the order of maybe a year, 18 months before these things be widely available. Obviously, a vaccine has to go through these stages of **trials**, that takes time, so even if by the end of the year, we have something which is viable and works, we ' re still going to see a delay before everyone can get ahold of it. CA : So this really puzzles me, actually, and I ' d love to ask you as a mathematician about this as well. There are already several companies believing that they have plausible candidate vaccines. As you say, the process of testing takes forever. Is there a case that we ' re not thinking about this right when we ' re looking at the way that testing is done and that the safety calculations are made? Because it ' s one thing if you ' re going to introduce a brand new drug or something – yes, you want to test to make sure that there are no side effects, and that can take a long time by the time you ' ve done all the control **trials** and all the rest of it. If there ' s a global emergency, isn ' t there a case, both mathematically and ethically, that there should just be a different calculation, the question shouldn ' t be"Is there any possible case where this vaccine can do harm,"the question surely should be,"On the net probabilities, isn ' t there a case to roll this out at scale, to have a shot at nipping this thing in the bud?"I mean, what am I missing in thinking that way? AK : I mean, we do see that in other situations, for example, the Ebola vaccine in 2015 showed, within a few months, very promising evidence and interim results of the **trial** in humans showed what seemed very high efficacy. And even though it hadn ' t been **licensed** fully, it was employed for what is known as compassionate use in subsequent other outbreaks. So there are these mechanisms where vaccines can be fast-tracked in this way. But of course, we ' re currently in a situation where we have no idea if these things will do anything at all. So I think we need to accrue enough evidence that it could have an impact, but obviously, fast-track that as much as possible. CA : But the skeptic in me still doesn ’ t fully get this. I don ’ t understand why there isn ’ t more energy behind **bolder** thinking on this. Everyone seems, despite the overall risk, incredibly risk-averse about how to build the response to it. AK : So with the caveat that, yeah, there ’ s a lot of good questions on this, and some of them are slightly outside my wheelhouse, but I agree that we need to do more to get timescales out. The example I always quote is it takes us six months to choose a seasonal **flu** strain and get the vaccines out there to people. We always have to try and predict ahead which strains are going to be circulating. And that ’ s for something we know how to make and has been manufactured for a long time. So there is definitely more that needs to be done to get these timescales shorter. But I think we do have to balance that, especially if we ’ re exposing large numbers of people to something to make sure that we ’ re confident it ’ s safe and that it ’ s going to have some benefit, potentially. CA : And so, finally, Adam, I guess going into this – There ’ s another set of infectious things happening around the world at the same time, which is ideas and the communication around this thing. They really are two very dynamic, interactive systems of infectiousness – there ’ s some very damaging information out there. Is it fair to think of this as battle of credible knowledge and measures against the bug, and just bad information – You know, part of what we have to think about here is how to suppress one set of things and boost the other, actually, turbocharge the other. How should we think of this? AK : I think we can definitely think of it almost as competition for our attention, and we see similarly, with diseases, you have viruses competing to infect susceptible hosts. And I think we ’ re now seeing, I guess over the last few years with fake news and misinformation and the emergence of awareness, more of a transition to thinking about how do we reduce that susceptibility if we have people that can be in these different states, how can we try and preempt better with information. I think the challenge for an outbreak is obviously, early on, we have very little good information, and it ’ s very easy for certainty and confidence to fill that vacuum. And so I think that is something – I know **platforms** are working on how can we get people exposed to good information earlier, so hopefully protect them against other stuff. CA : One of the big unknowns to me in the year ahead – let ’ s say that the year ahead includes many, many more weeks, for many people, of actually self-isolating. Those of us who are lucky enough to have jobs where you can do that. You know, staying home. By the way, the whole injustice of this situation, where so many people can ’ t do that and continue to make a living, is, I ’ m sure, going to be a huge deal in the year ahead and if it turns out that death rates are much higher in the latter group than in the former group, and especially in a country like the US, where the latter group doesn ’ t even have proper health insurance and so forth. That feels like right there, that could just become a huge debate, hopefully a huge source of change at some level. AK : I think that ’ s an incredibly important point, because it ’ s very easy – I similarly have a job where remote working is fairly easy, and it ’ s very easy to say we should just stop social interactions, but of course, that could have an enormous impact on people and the choices and the routine that they can have. And I think those do need to be accounted for, both now and what the effect is going to look like a few months down the line. CA : When all ’ s said and done, is it fair to say that the world has faced, actually, much graver problems in the past, that on any scenario, it ’ s highly likely that at some point in the next 18 months, let ’ s say, a vaccine is there and starts to get wide distribution, that we will have learned lots of other ways to manage this problem? But at some point, next year probably, the world will feel like it ’ s got on top of this and can move on. Is that likely to be it, or is this more likely to be, you know, it escapes, it ’ s now an endemic nightmare that every year picks off far more people than are picked off by the **flu** currently. What are the likely ways forward, just taking a slightly longer-term view? AK : I think there ’ s plausible ways you could see all of those potentially playing out. I think the most plausible is probably that we ’ ll see very rapid growth this year and lots of large outbreaks that don ’ t recur, necessarily. But there is a potential sequence of events that could end up with these kind of multiyear outbreaks in different places and reemerging. But I think it ’ s likely we ’ ll see most transmission concentrated in the next year or so. And then, obviously, if there ’ s a vaccine available, we can move past this, and hopefully learn from this. I think a lot of the countries that responded very strongly to this were hit very hard by SARS. Singapore, Hong Kong, that really did leave an impact, and I think that ’ s something they ’ ve drawn on very heavily in their response to this. CA : Alright. So let ’ s wrap up maybe by just encouraging people to channel their inner mathematician and especially think about the opportunities and the transmission probabilities that they can help shift. Just remind us of the top three or four or five or six things that you would love to see people doing. AK : I think at the individual level, just thinking a lot more about your interactions and your risk of infection and obviously, what gets onto your hands and once that gets onto your face, and how do you potentially create that risk for others. I think also, in terms of interactions, with things like handshakes and maybe contacts you don ’ t need to have. You know, how can we get those down as much as possible. If each person ’ s giving it to two or three others, how do we get that number down to one, through our behavior. And then it ’ s likely that we ’ ll need some larger-scale interventions in terms of gatherings, conferences, other things where there ’ s a lot of opportunities for transmission. And really, I think that combination of that individual level, you know, if you ’ re ill or potentially you ’ re going to get ill, reducing that risk, but then also us working together to prevent it getting into those groups who, if it continues to be uncontrolled, could really hit some people very, very hard. CA : Yeah, there ’ s a lot of things that we may need to gently let go of for a bit. And maybe try to reinvent the best aspects of them. Thank you so much. If people want to keep up with you, first of all, they can follow you on Twitter, for example. What ’ s your Twitter handle? AK : So @AdamJKucharski, all one word. CA : Adam, thank you so much for your time, stay well. AK : Thank you. CA : Associate professor and TED Fellow Adam Kucharski. We ’ d love to hear what you think of this bonus episode. Please tell us by rating and reviewing us in Apple Podcasts or your favorite podcast app. Those reviews are influential, actually. We certainly read every one, and truly appreciate your feedback. This week ’ s show was produced by Dan O ’ Donnell at Transmitter Media. Our production manager is Roxanne Hai Lash, our fact-checker Nicole Bode. This episode was mixed by Sam Bair. Our theme music is by Allison Layton-Brown. **Special** thanks to my colleague Michelle Quint. Thanks for listening to the TED Interview. We ’ ll be back later this spring with a whole new season ’ s worth of deep dives with great minds. I hope you ’ ll enjoy them whether or not life is back to normal. I ’ m Chris Anderson, thanks for listening and stay well.

Text Sample 173: POS Dim 2 – 2020 – Score 18.00 – 2020/t004288.txt

Chris Anderson : Well, hello, Helen. Very nice to see you. CA : You staying well? Helen Walters : How ’ s it going? CA : These are mad, mad, mad, mad, mad days. So many emotions. Not all bad, happily, but I ’ m just so aware that, among the people listening to this, some are in really tough times right now. I hope this is going to be a beautiful hour of therapy and help in its own way, because we have with us just an extraordinary author, an extraordinary mind, Elizabeth Gilbert, obviously known for her astonishing best-selling success with"Eat, Pray, Love,"although her favorite book from my point of view is called"Big Magic,"where the subtitle is,"Creative Living Beyond Fear.""Creative Living Beyond Fear."Now when you think about it, that is a pretty good agenda for today ' s conversation, I think. Liz describes the emotional landscape of our lives, I think like no one else I ' ve read, and I ' m not even her target audience. She ' s really extraordinary in doing that. She gave an amazing TED Talk 11 years ago now,"In pursuit of your creative genius."It really reframed how to think of creativity. It ' s been seen, like, 19 million times or something, and it ' s really changed how a lot of people – they ' re just open to the creative genius coming from the outside. So it ' s a delight to welcome to the TED Connects stage Elizabeth Gilbert. Elizabeth Gilbert : Hey, Chris. CA : Great to see you. How are you? Where are you? Who are you living with or staying with? What ' s up? EG : I ' m fine. I don ' t want to brag, but I ' m in New Jersey, where anybody would want to be. I ' m by myself. I ' ve got a little house out in the country, and I think I ' m on day 17 of no human contact other than virtually, and I ' m well. I ' m not anybody you need to be worrying about right now. So I ' m good. CA : Wow. Well, so in a way, you ' re having a related experience to what so many people are having. I mean, these are days of **isolation** for many people, and that brings with it lots of difficult emotions, in a way. And we ' re going to go through many of them, I hope, in the next hour. So I ' m hoping to talk with you about – I wrote down a list here : about anxiety, loneliness, curiosity, creativity, procrastination, grief, connection and hope. How about that? That ' s our agenda. Are you up for that? EG : I think that ' s the whole buffet. Just a little light tasting menu of all the mass of human emotions. Let ' s do it. Absolutely. CA : I think it ' s probably good to dive straight in with the anxiety that I know a lot of people are feeling right now. So many reasons to be anxious, both for yourself, your loved ones, and just for this time and for the world and how we all get through this. Have you been feeling anxiety, Liz? And how do you think of it? What can you say to us? EG : I have been, and I think you would have to be either a sociopath or totally enlightened not to be feeling anxiety at a moment like this. So I would say that the first thing that I would want to encourage everybody to do is to give themselves a measure of mercy and compassion for the difficult emotions that you ' re feeling right now. They ' re extremely understandable. I think sometimes our emotions about our emotions become a bigger problem, so if you ' re feeling frightened and anxious, and then you ' re layering shame on top of that because you feel like you should be handling it better, or you should be doing your **isolation** better, or you should be creating more while you ' re alone, or you should be serving the world in some better way, now you ' ve just multiplied the suffering, right? So I think that the **antidote** for that, first of all, is just a really warm, loving dose of compassion and mercy towards yourself, because if you ' re in anxiety, you ' re a person who is suffering right now, and that deserves a show of mercy. The second thing that I would say about anxiety is this, that here ' s what I think is the central paradox of the human emotional landscape that I ' m finding particularly fascinating right this moment, and it ' s really come to light for me. So there are these two aspects of humanity that don ' t match – hence the word paradox – but they really define us. And the first is that there is no species on earth more anxious than humans. It ' s a hallmark of our species, because we have the ability slash curse to imagine a future. And also, once you ' ve lived on earth for a little while, you have the experience to recognize this terrifying piece of information, which is that literally anything can happen at literally any moment to literally any person. And because we have these vast, rich, colorful imaginations, we can see all sorts of terrifying movies in our heads about all of the possibilities and all of the scariest things that could occur. And actually, one of the scariest things that could occur is occurring. It ’ s something that people have imagined in fiction and imagined in science, and it ’ s actually happening right now, so that ’ s quite terrifying. The paradox is that, in that level, we ’ re very bad, emotionally, at fear and anxiety, because we stir ourselves up to a very heated degree because of our imaginations about how horrible it can get, and it get can get very horrible, but we can imagine it even worse. The paradox is that we ’ re also the most capable, resourceful and resilient species that has ever lived on earth. So history has shown that when change comes to humanity – either on the global level, like it ’ s happening now, or on the personal level – we ’ re really good at it. We ’ re really good at adaptation. And I think that if we can remember that, it can help to actually mitigate the fear. And you can remember it in a historical perspective, by looking at what humanity has gone through, and what we have not only survived but figured out how to thrive through. And you can also look at it at a personal level, where you can make an inventory of what you yourself have survived, and notice, as I often notice, my panic and my anxiety about the imagined future is deadly on my nervous system, but I actually have discovered that when there ’ s an actual emergency in the moment, I tend to be pretty good at it. And I think most of us are like that. You ’ ll see that repeated in history in so many examples. I think about those heartbreaking and devastating phone messages that people were leaving for their loved ones from the towers on September 11th, and you can hear the calm, the calm in peoples ’ voices. The biggest emergency ever was happening, and in that moment, intuition told them what to do. The important thing to do now is to make this phone call. And I think if you can trust that when the point of emergency actually arrives, you ’ ll be able to meet it, and then when the world changes, you ’ ll be able to adapt to it – it certainly helps me calm down. CA : I mean, I guess there ’ s a reason why fear is there. It didn ’ t just evolve by accident. It ’ s supposed to direct our behavior and help us avoid danger, and it ’ s just that sometimes, it gets out of control and actually gets in our way and damages us. I mean, any specific advice on how someone could turn their fear into something useful, at this moment? EG : Can I tell you a story that I ’ m using as a touchstone for myself right now and drawing wonder and inspiration from? So, some of you may have heard of a young woman named Amanda Eller. She was in the news recently, because she got lost in Hawaii in the wilderness for 17 days, and there was a massive, massive hunt for her, because she had left her car, she ’ d gone for a simple hike, had left her phone in her car, went up into the woods, took a wrong turn, and then had this disastrous 17 days, fell off a cliff, broke her leg, walked for 40 miles on a broken knee, lost her shoes in a flash flood. She had to sleep packed in mud in order to protect herself from the cold and the mosquitoes. She was eating moths. I mean, just a harrowing story of survival. I met her recently, and she was so lit and radiant with this kind of serenity and this kind of wonder and joy, and I said,”How are you like this? You went through one of the most traumatizing things that a person could go through.”She said,”First of all, I discovered that I can survive anything,”going back to this idea of how resourceful and adaptive humans actually are. But the piece of her story that I am using like a life raft right now is that she said, on her second day in the jungle, when she realized that she was truly and very much in trouble – she ’ d already spent one night in the woods and she was completely lost and she was totally alone and no one knew where she was, and she was full of terror – she said she closed her eyes and she prayed or asked or requested, she made a wish to herself, to consciousness, to the universe, and she said,”Please take my fear away, and when I open my eyes, have it be gone, and have it be gone and have it not come back.”And she opened her eyes, and it was gone, and it was replaced by intuition. And I think intuition is a little bit the opposite of fear, because fear is the terror that you feel about a frightening imagined future. Intuition can only happen when you ’ re in the moment. And so, from that point forward, she did not experience fear for the rest of the time she was in the woods. She just was guided by some deep intuitive sense, located somewhere between her sternum and her navel, and in every moment, she would ask it,”Right or left?””Up or down?””Eat this? Don ’ t eat this?”And just trust it. Complete, absolute surrender to the intuition of the moment. And she said it hasn ’ t returned, the fear hasn ’ t returned, and she still guides her life that way. So it ’ s a return to some sense that there ’ s a navigational system within you that will, if you stay present in this actual moment, tell you what to do one moment to the next. Now, if you want to suffer, pop out of the moment and imagine a future, and then you can suffer indefinitely. So it is almost like a spiritual or meditation **practice**, and anybody out there who ’ s done any spiritual or meditation **practices**, this is what you were **practicing** for. You were **practicing** for this moment, and those of you who haven ’ t tried that, this might be a really [inaudible] to be centered in the **instant**. CA : Wow, that ’ s a remarkable story, and I guess what I ’ m hearing is two things. It ’ s one, just the reaching out to the universe there, but specifically, there was a decision to let go of the future and just to focus on the moment. EG : That ’ s it, yeah. Nothing will bring you more pain than the future, and what I ’ m seeing happening right now – I said this to you the other day, Chris – is there ’ s a relatively small percentage of the population who will suffer physically from this disease, and there ’ s a larger percentage who are going to suffer economically from it. But then there ’ s this massive, uncountable number of people who will and are suffering from it emotionally, and right now, those people are my concern, because they ’ re really in pain, and there ’ s millions and millions of them. CA : So you ’ re living there by yourself, Liz, and many others are in that same circumstance right now. I suspect some are feeling, like, crushing loneliness. Talk about that. How do you handle loneliness in a situation like this, when it ’ s so alien to everything that we as a social species are usually about? We crave other people. We crave touch. We crave hugs. We want to be there with people. How can we avoid this being a period of crushing loneliness? EG : I don ’ t think you can avoid it, but I think you can walk toward it. And I think that, for me, I ’ ve deliberately, many times in my life, gone off into **isolation** in order to face those things. I ’ ve gone on long meditation retreats. This year, I was in India, and I spent 17 days alone with no contact with anybody, which was a weird **practice** run for what ’ s happening right now. And as I see people really losing it and feeling like they ’ re crawling out of their skin, either from anxiety, fear, boredom, anger, blame, loneliness, depression, all of these things that come up when you are forced to just be in your own presence. I know all of those feelings because, as a meditator, I ’ ve experienced all of those, in stillness. The hardest person in the entire world to be with is yourself, and so the only way that I learned, as a meditator, to be able to survive and endure my own company was with universal human compassion toward me, and to recognize that this is a person who is suffering right now from loneliness, and this person needs kindness from self towards self. And it ’ s a very high teaching, but I think that it ’ s a very interesting moment to **practice** that. And so what I would suggest to people – and again, this takes a certain amount of resolve and it takes a certain amount of curiosity about learning more about the human experience – what I ’ m seeing people do is people are spinning away from that

isolation because they ’ re so terrified of it. What happened with the world right now is that basically all of our pacifiers were yanked out of our mouths. Everything that we ever can do and reach for that can get us out of having to be in the existential crisis of being alone with ourselves was taken away. And I see people rushing to fill it, I mean, constant Zoom meetings and constant parties online and constant interaction, and all of that is lovely, but from a spiritual and psychological standpoint, from a creative standpoint, I would say if you have any curiosity about this, don ’ t be in such a hurry to rush away from an experience that could actually transform your life. I think sometimes the experiences that can transform us the most intimately are the ones that we want to run away from, and I think of a story that the Dalai Lama told about one of his teachers. When the Chinese invaded Tibet, and all the monks were running into India for safety, one of his teachers, who was one of the great masters, the last glimpse that the Dalai Lama had of him was that he was walking into China – very patiently and very slowly, toward it. Everybody else was running away from it – he was walking toward it, and I think there ’ s a level at which first responders do that, and in the real world, in an intimate way, they go into the emergency, they go toward the emergency. All the people who are trying to solve this now in worldly ways are walking toward the emergency. But there ’ s a way that you can do it emotionally as well and that is to walk with curiosity and with an open mind toward your most difficult and painful emotions without resistance, and say,”What is it like for a person to feel like they don ’ t have something to do for an hour?”And you can open up your compassion in that. There ’ s so many lessons in compassion that can be found here. How about a general universal mercy that we can all feel toward people who are in solitary confinement. Let ’ s have that be part of the conversation. Now you ’ ve experienced it for two days in your own house. Maybe it ’ s time to change the prison system? You see how hard this is. Or you can have compassion toward people who have lost a loved one and they ’ re alone. By feeling your own feelings, you can open up your feelings more universally toward the world. So I think there ’ s a great opportunity here for growth on the personal level, but you have to have almost a whimsical curiosity to be the one walking into China rather than the one away from it. And that ’ s how I ’ m doing it right now. CA : So let ’ s follow up on that word”curiosity”that you ’ ve used a few times there. I mean, a lot of wisdom that I ’ ve heard sort of thrown around online right now is,”This is a great time to follow your passion and dive deep into whatever it is you ’ ve most been wanting to do.”I mean, in”Big Magic,”you made an argument that following your passion isn ’ t necessarily the wisest strategy. You argued, no, don ’ t do that, follow curiosity. Does that apply now? Make that case. EG : Yeah, you know, I ’ ve been on a personal crusade to rid the world of the world”passion”as an instruction for people on how as they should be living, because I know that in my case, it brings me nothing but anxiety.”Purpose”is another one that has become a cudgel that we use to bludgeon ourselves into thinking that we ’ re not doing enough or that we ’ re doing life right or that you ’ re supposed to be more useful, more productive, you ’ re supposed to be changing the world, or uncovering some particular talent that only you have and with it, you ’ re supposed to transform everybody and monetize it, no pressure. I start to get hives even repeating that, but that ’ s what we ’ ve been taught, that purpose and passion are everything. I would like to replace it with a far gentler word, and I think”curiosity”is very gentle, because the stakes are so much lower. The stakes of passion say you have to shave your head and move to India and get rid of all your possessions and start up, like – It ’ s so intense. But curiosity is a very simple, universal experience that causes you to want to look at something just a tiny bit closer, and you don ’ t have to change your life around it. You just look, and it might be taking a weekend to try something new for a little while. It ’ s almost so easily missed, and I think so many times, we ’ re looking way up at the sky for the sign from God of what our passion and what our purpose is supposed to be, and meanwhile, there ’ s this lovely little trail of breadcrumbs of curiosity that if you can slow down – and again, this is about not rushing out of the experience of being silent, still and alone – if you can slow down, you might be able to see them. But if I could say one thing I ’ m noticing is an **obstacle** right now – because I think a lot of people thought,”**Isolation**, great, this is the perfect time for me to learn Italian and take that calligraphy class and start writing that novel,”and they find that they ’ re actually in a paralysis of anxiety and they ’ re not creating anything or doing anything. First of all, again, like, a blanket of mercy on you. These are hard times, and it might take you a minute in your nervous system and your mind to adjust to the new reality. But the second thing I would say is that when people are saying they ’ re having trouble with their creativity because they ’ re in **isolation**, I might daringly suggest that perhaps you ’ re not in enough **isolation**. And by that I mean, are you monitoring how much external stimulus you ’ re bringing of this disaster into your home? So if you ’ re sitting watching the news all day, what you ’ re doing is you ’ re bringing the disaster into your work space. You ’ re bringing it into your soul. You ’ re bringing it into your mind. And you ’ re going to create the opposite of a creative environment, an environment of fear, panic and urgency. So I think if you ’ re going to be a good steward of your creativity right now, you have to isolate a little bit from the news. And that doesn ’ t mean disconnecting, it means I get up every morning and after I ’ ve meditated, I read the New York Times and I give myself 40 minutes with it, and then that ’ s it for the day, because I know that if I bring in any more, I ’ m going to go into a traumatized state and then I won ’ t be able to follow my intuition, I won ’ t be able to help people, because I myself will be suffering, and I won ’ t be able to be present for this very interesting moment in my life and in history, and I want to remain present for it as much as I can. So there ’ s a discipline of being a good steward of your senses and deciding what you ’ re going to put your senses in front of. CA : Helen. HW : Liz, there ’ s an outpouring on Facebook of gratitude for you. People are so grateful, and grateful for the calm that you are instilling in us all, so thank you, from them and from me. We ’ ve also had a number of questions about grief. We ’ re kind of dealing with grief at a different scale at the moment. One person has already lost five people to **coronavirus**. And so any thoughts of how to manage grief at this scale or how to process this in a way that honors both them and yourself? EG : First of all, my condolences. And I think any words that I would say about somebody who just lost five family members could only be inadequate. Grief is bigger than us. It ’ s bigger than your efforts to manage it, and if you want to hold yourself and your family members compassionately through grief, you have to allow that it cannot be managed. And I think that grief management is something that we ’ ve kind of created in our very Western idea that if we can figure out something, we can avoid suffering from it, so if we can figure out how to translate grief and if we can figure out how to walk through grief, then we won ’ t have to experience the magnitude of it. Many of you know that I lost the love of my life two years ago from pancreatic and liver cancer, and I was with her when she died, and I ’ ve been walking through my own path of grief, so I know what it feels like to lose the person in the world who is the most important to you, which is of course the biggest fear that we all have. I know that you can survive it, but I know that you survive it by allowing yourself to feel it. And again, to go back to the metaphor of the monk walking directly into China, into conflict rather than away from it, do you have the courage to let it break over you like waves?

I wish I could remember her name. There ’ s this extraordinary woman who wrote a book called”Here If I Need You,”and she ’ s a chaplain for the police department in Maine, and she ’ s in charge of knocking on people ’ s doors and giving them the worst news they ’ re ever going to hear in their life, when she goes with the police when something happens. And she told a story once that I found very moving and very helpful for me in my grief. She said what she ’ d witnessed through years and years of sitting with people through what is literally the worst moment of their life, the nightmare of that loss, is that when she knocks on that door and tells that person, your daughter, your family member, your husband, your mother has been killed, there ’ s this universal collapse where the person will just be – it is the tidal wave that comes and just takes you down and you lose all civilization, you lose all your attainments, all your wisdom. Nothing can stand up to that. You literally go to the floor. And you sob and you grieve, and she holds them through that. And then she said that what she ’ s learned is the most astonishing thing, that that never lasts more than a half an hour, that first wave. It can ’ t. You actually physiologically can ’ t sustain that, and if you let it break over you and you just allow it, then within a half an hour, usually sooner – and she said this has happened every single time she ’ s been with somebody with a loved one ’ s death – the very next thing that happens is that that person calms down, they catch a breath, and the next question they ask is a very reasonable question.”Where is the body? What do we do next? When can we have the funeral? Who else was in the car?”And with that question, she says, they start to rebuild their new life already with this new piece of information that even an hour ago would have seemed unsurvivable. And she uses that as an example of, once again, the tremendous psychological resilience of a human being. And it doesn ’ t mean that they will never grieve again. It doesn ’ t mean that their grieving journey is over. It just means that, somewhere in their mind, that it ’ s landed, and now, already, they ’ re making a plan about,”OK, who do we need to notify, what ’ s the next thing we need to do.”And again, if you can remember this as you go through your panic, if you can remember that in the moment of emergency, there will be an intuitive, deep sense that will tell you there ’ s going to be some next steps and it ’ s time for us to take those next steps, and if you can also remember that resilience is our shared genetic and psychological inheritance – we are, each and every one of us, no matter how anxious you feel you are, no matter how ridden by fear you feel you are, every single one of us is the genetic survivor of hundreds of thousands of years of survivors. Each one of us came from a line of people who made the next correct intuitive move, survived incredibly difficult things, and were able to pass their genes on. So almost to the biological level, you can relax into a trust that when the moment comes where you will be faced with the biggest challenge, you will be able to draw on a deep reservoir of shared human consciousness that will say,”Now it ’ s time to make the next move, and we can do this.”HW : So beautiful. So many more questions. I will be back. EG : Thanks, Helen. CA : Thank you, Liz. I think the author ’ s name was Kate Braestrup. EG : That ’ s it. CA : I guess that ’ s a book, if you need a book right now,”Here If You Need Me”by Kate Braestrup. EG : Very good, yeah. CA : Liz, you and I got to have a conversation a few months after Rayya passed away. It was actually the first-ever episode of the TED Interview podcast we did. And I found that it was probably my favorite episode ever of the TED Interview. And it was so moving how you spoke about your grief then. And I feel like that ’ s a potential resource to people. I know we were both sitting there shedding tears, and I found that an extraordinary experience personally, to be sure. But somehow... in this moment, if you follow this journey of curiosity, if you walk towards some of the harder moments, do you think that this actually can be a creative time for people if they ’ re willing to do that? EG : Absolutely, and I don ’ t think creativity in this case has to necessarily mean that you write the Great American Novel or start that business you always intended to start. It doesn ’ t need to be so literal. We ’ re going to be creating new worlds and new lives on the other side of this, and we ’ re going to be doing that individually and we ’ re going to be doing that collectively. I think of the shoots of small trees that can only come up after massive forest fires, where seed pods have to explode under great heat. We ’ re in a kind of crucible moment right now, and I wouldn ’ t begin to have the hubris to predict what sort of creativity will come, but look, if history is any measure, what we ’ ll probably see is people at their best and people at their worst. But I think we ’ ll see more of people at their best, because that ’ s typically how it works. CA : I mean, your model of how creativity happens is that it doesn ’ t all come from within. It ’ s not like you have to sit there, saying,”OK, this is my moment to be creative. Come on. Be creative. Be creative.”It involves, fundamentally, an openness to something coming to you, to be open, to be curious, listening, but then just to be open to that moment. Perhaps that could apply even more now than ever, just because we have this huge distraction of the news, some other distractions are taken away. Is there a chance that if people listened, they actually can receive more at this moment? EG : I think so, and I think, again, if you stop thinking about your self-isolation and your social **distancing** as **quarantine** and you start thinking of it as a retreat, you ’ ll find that you can ’ t really tell the difference between **quarantine** and retreat. You know, a lot of you out there have dreamed, I ’ ve heard you, because I talked about going to India to an ashram for four months and God, I can ’ t tell you how many people I ’ ve heard say,”I wish I could do that.”I ’ m like,”Well, you got it.”And by the way, this is what it felt like. This is what it felt like to learn how to be present with yourself. I think my screen needs to move a bit. To learn how to be present with yourself means sitting in a lot of terror, sitting in a lot of anxiety, sitting in a lot of fear, sitting in a lot of shame, and being able to allow that without having to resist it, without having to reach outside yourself for something to numb yourself with. I also want to tell a story that a friend of mine, Martha Beck, told me about when she goes to South Africa and teaches animal-tracking courses. And she works with all these great African animal trackers, and these old men who have had these skills passed down for generations. And she was using it as an example of the difference between focus and openness. So I think sometimes the mistake people make when they want to be creative is they think they have to get really focused, and focus is an anxiety-producing energy as well. You ’ ve got to drill down and you feel your whole body tense. But what she described witnessing in these animal trackers is when they go out to hunt the lions, these old, old men, the very first thing they do is they sit down against a tree and they appear to go to sleep. They drop into a state that she calls and that the mystics call”wordless oneness.”And wordless oneness, you can also call meditation. You can also call it the zone. But it ’ s a stillness where you actually can drop your nervous system into such a quiet place that you have 360-degree awareness of your senses and of presence. And they ’ ll sit like that, apparently doing nothing, for an extremely long time, just looking through half-lidded eyes at the world. And then, maybe an hour, two hours in, all of the sudden, they ’ ll say,”The lion ’ s over there.”And so for me, I ’ ve learned to hold my creative wishes lightly in that same way. I ’ m between books right now and I don ’ t have an idea for a book and in the past, that would have made me really anxious, but now I know – take a lot of naps, go for a lot of walks, do a lot of drawings. I ’ m doing weird little art projects as I ’ m sitting here, to distract my mind. CA : Wait, wait. Bring that back. Hold that up. EG : Owls. CA : Aww. EG : Aren ’ t they dear? CA : They ’ re beautiful. Goodness me.

EG : Well, I ’ m just playing with color and texture because it calms me, and I think if you can ’ t think of what to do right now, I would suggest doing what you used to do when you were 10 years old that made you feel happy and relaxed, and that ’ s often creativity and play. And for many of us who were anxious children – and I was an anxious child – we learned at an early age that we could sedate ourselves with our curiosity and with our play, and then, usually around adolescence, the world taught us that there were faster and more immediate ways to bump out of that anxiety through sex or substances or distraction or workaholism or whatever we did and not have to sit with ourselves. And I think right now is a really good opportunity – You actually were on the right track when you were 10, whatever it was. So, you know, get some LEGOs. Get some LEGOs, get some coloring books, just get your hands in the mud, do whatever it is that will actually ground you into this, again, to take you out of the futurizing and the future-tripping that ’ s going to cause you nothing but anxiety and not going to make you be of **service**. There ’ s such a thing, too, that I just want to touch on if I can, for a minute, about empathetic overload and empathetic meltdown. We ’ re taught that **empathy** is a good thing. I would suggest that in a case this traumatic, what you want to talk about replacing **empathy** with is compassion, and the difference is extremely important. So compassion means”I ’ m actually not suffering right now, you are, I see your suffering, and I want to help you.”That ’ s what compassion is. **Empathy** is”You ’ re suffering, and now I ’ m suffering because you ’ re suffering.”So now we have two people suffering and nobody who can serve, and nobody who can be of help, and if you knew how your empathetic suffering actually makes you into another patient who needs assistance, you would be more willing to dip into compassion. And what underlies compassion is the virtual courage, the courage to be able to sit with and witness somebody else ’ s pain without inhabiting it yourself so much that you become another person who is suffering and now, there are no helpers. And it takes an enormous amount of courage to be able to watch that without diving into it and joining it and becoming sick yourself. CA : I mean, if **empathy** is just a feeling, does compassion, your use of compassion imply that it ’ s turning that feeling into something potentially practical to actually do something, if you can, for that person? EG : It ’ s recognizing that if I feel your pain, I can ’ t help you in your pain, because now my pain has taken over me, and sometimes, I think all you need to do is know that and it makes you turn the ship. Right? One of my favorite teachers, Byron Katie, says,”My favorite thing about my suffering is that it isn ’ t yours.””My favorite thing about my suffering is that it isn ’ t yours. My favorite thing about your suffering is that it isn ’ t mine.”So it will be, eventually, we all take a turn suffering. You cannot move through this earth without it. When it ’ s your turn, you ’ ll know. When it ’ s not your turn, stay out of that field of somebody else ’ s pain, because you can ’ t help them when you ’ re in pain yourself. And then see if you can find the inner resolve and courage. And I think some of that is just based on accepting the Buddhist First Noble Truth, which is that suffering is an unavoidable aspect of life on earth. We ’ re all going to be in it at some point. We ’ ve all been in it at some point. And now, how can I help? I ’ m not saying this is easy. I ’ m just saying, also, if you ’ re suffering from empathetic overload and empathetic meltdown, which means your adrenals are up, your **stress** is up, your endorphins are down, you ’ re going into a parasympathetic collapse – this would be another time to discipline yourself to stay away from the news, because you actually will have a breakdown, and you won ’ t be able to help the people around you who are the people who need help. CA : But have you seen any signs that if someone takes that **empathy** and compassion, let ’ s say, and decides to act in some way, big or small, on behalf of someone, that actually shifts how they feel, that there ' s a healthiness to that? Or is that the language of just inducing more guilt in people? EG : No, I think there ' s a beautiful healthiness that can come from being of **service**, and that ' s also how I ' ve been medicating my anxiety through this, by showing up in ways that I can with whatever resources I ' ve got. Here ' s what you have to keep in mind, though, and this is what I keep reminding people. Right now, in my own personal sphere, there is more need than I have resources to fix. So I have to begin with that reality, and I have to have the courage to sit in that reality soberly and acknowledge that that ' s the case. The second thing I think emotional sobriety would require of me right now is to recognize that this is going to be a marathon, not a sprint. And so the first week of the crisis, I had this deluge of all my really energized, let ' s-save-the-world friends, all my creative friends, everybody was e-mailing, texting, Zooming, and they all had a response."Let ' s do this! Let ' s do this! Let ' s fix it this way!"And I found myself joining with some of them and not joining with others, just, again, based on my intuition, but I also found myself cautioning them,"Guys, this is a marathon."We ' re in mile one of what ' s going to be a very long marathon. So pace yourselves, and pace your resources. Don ' t overgive to the point where you collapse, because we ' re still going to need helpers two months from now, and we ' re still going to need helpers six months from now. And so, find a steady pace and be willing to be in it for the entire long haul. CA : Yeah. Helen. HW : Such great advice, Liz, and so many questions pouring in. One of them is from a therapist who confesses that she, and many of her clients, are having trouble with the letting go of control in this moment, and wonders if you have any advice on how to let go of control in order to be willing to feel everything that we ' re enduring. EG : Just this... This sense that you had that you had control was a myth to begin with. And that may not be comforting, except that I find it very comforting. You know, control is an illusion, and there are times where we ' re able to **fool** ourselves because we ' re so good at technology, we ' re so good at creating safe worlds where we ' re able to trick ourselves into believing that we ' re in control of any of this. But we ' re not, and the paradox, for me, of surrender is how relaxing it is. Nobody ever wants to surrender, because nobody wants to lose control, but if you recognize that you never had control, all you ever had was anxiety, and then you let go of the myth of control, you ' ll find that, I find that if I even say that sentence,"I ' m losing control,"and then I remind myself,"You never had control, all you had was anxiety, and that ' s what you ' re having right now."So you ' re not letting go of anything. Surrender means letting go of something you never even had. So there ' s an awakening that ' s happening right now, where what ' s happening is not that you ' re losing control. What ' s happening is that, for the first time, you ' re noticing that you never had it. And the world is doing its job. The job of the world is to change, constantly, and sometimes radically, and sometimes immediately, and it ' s doing its job, and that is also the **norm** of things. And again, we are adaptive and we ' re resilient and we can handle it. But I don ' t kid myself for a minute to think that I ' m in control of anything that ' s ever happening. My realm of control is extremely small. It ' s usually about, like, might be able to go get a glass of water right now. Like, there ' s not a lot that I ' m in control of. And I ' m actually I ' ve ever been. HW : One more question from online, if I may, and then I will jump off again. You know, Chris, you and I, we ' re all in a pretty privileged position. TED has been able to go remote. We ' re able to work remotely. But many, many, many millions of people in the US and beyond are not able to do that, and people are really suffering. How can we help? What are your thoughts about people who are not able to socially distance, who are losing their jobs, the global catastrophe that is unveiling? How can we think about that in a humane and compassionate way? EG : It ' s crushing, and again, as with the same case of the person who said they had lost five family members, I can ’ t, sitting in this position of comfort and safety, say anything that I think is going to be accurate and appropriate to that, other than to say that I just think of this Indian proverb that I keep going back to, which is,”I store my grain in the belly of my neighbor.”Western, capitalistic society has taught and trained us to hoard long before this, long before this happened and people were hoarding toilet paper and canned goods. Advertising and the whole capitalist model has taught us scarcity, it ’ s taught us that you have to be surrounded by abundance in order to safe. The disconnect between those who have and those who have not has never been bigger, and never in my lifetime, and probably in any of our lifetimes, has there been an invitation, again, to release the stranglehold on your hoarding. This is not the time for hoarding. This is the time to store your grain in the belly of your neighbor, in a way that is emotionally sober and accurate to what you can give, and to look at that in a really honest way, to not put your own family in danger, to not put yourself in crisis, but to be able to say,”What can I offer in the immediacy?”And then, in the longer term, a conversation about redistribution of resources, and why do so few have so much and why do so many have so little? But that ’ s not a conversation I can fix today. That ’ s, again, outside of my realm of control. But what I can do is unleash the white-knuckled grip that I have on what ’ s mine and make sure that I ’ m going into the world with an open hand – again, not a panicked open hand, where I ’ m going to destroy myself to save somebody else, because then there will be no helper left, but in a reasonable way. I cannot save everybody. I can save a few. And that ’ s the tragic, but, I think, sobering reality that I can offer right now, and again, underlying all of that, undergirding all of that is a recognition that anything that I have to say about people who are in extraordinary suffering right now is not enough. HW : I ’ ll be back. Thank you. EG : Thanks. CA : Liz, talk to me a minute about anger. Like, I think a lot of, just from the conversation we just had, or just listening to you there, there are so many reasons to feel angry right now about what ’ s going on. And part of me feels we should be. That ’ s what anger is for. It ’ s to highlight things that are unjust and unfair and that we must pay attention to, and yet part of me is honestly scared of it. I think there could be an eruption of anger that ’ s dangerous, both personally and for society. Have you felt anger? What are you doing with it? EG : I feel anger at every White House press conference, and I think all thinking people do. I feel angry that this wasn ’ t taken more seriously early on. I feel angry at myself that I didn ’ t take it more seriously early on. As much as I feel contempt and disgust for government officials who I feel were slow to recognize how serious this is, I also have to be really candid that three weeks ago, I was one of the people walking around saying,”Why is everybody overreacting to this so much?”So I think we also have to own our own piece of that, and I think there are rolling waves of awakening that are happening in people, and so a lot of the anger I feel right now is for people who aren ’ t taking this seriously enough, who aren ’ t **quarantining** themselves, who are putting other people in danger. But a month ago, that was me. I was in the Hong Kong airport, sallying through the Hong Kong airport while everybody was scurrying around in masks and gloves, and I was like,”What ’ s the big deal?”It takes people as long as it takes them to come to awakening, and some people, we have to also acknowledge, never will. Anger has its place, and I think that righteous anger, which is the kind of anger that says a violation has occurred here, a humanitarian violation is occurring here, can be very stirring for transformation. Again, it ’ s how comfortable can you be, sitting with these discomforting emotions, and what are you going to do with your anger? CA : Umh. EG : Are you going to lash out at the people you ’ re **quarantined** with?

Are you going to go on Twitter rants? Is that useful? Is that productive? And so I think – again, I keep using the words”emotional sobriety,”but the emotional sobriety that would be required is to feel that anger, acknowledge it, to show yourself mercy for how uncomfortable it is, and then to steadily, recognizing, again, that this is a marathon not a sprint, do what you reasonably can do to change the situation. CA : I mean, the part of me that ’ s constantly looking for the better narrative hopes that the anger we feel now could almost displace some of – I mean, the world ’ s been an angry place for the last couple years. There ’ s been so much anger inflamed online. We ’ ve made each other angry, often, probably, unnecessarily – outrage sparking outrage, disgust, etc. I mean, is there any hope that this is a massive societal shaking up? It ’ s like, don ’ t be so silly. Look at what actually matters here. And we can at least focus more attention onto the things that, yes, some things that we really should be angry about, but other things that maybe... you know, could lead people to say human connection really matters in this moment. People from all sides, we need each other. We just have to use this as a moment when we come together. How do you think about that? Like, how do we turn some of these negative emotions into a force for good that at least gives us some permission to hope that something **special** comes out of all this. EG : Well, I think you have to give yourself permission to hope, and I don ’ t think it ’ s unreasonable to give yourself permission to hope, because, again, our resilience, our resourcefulness, and the way that history has shown how catastrophe can lead to transformation, gives us, actually, I think, reasonable cause to hope. One thing that I ’ m noticing that I ’ m, like, a little bit amused by is that when people start predicting what the post-pandemic world is going to be, I notice that their predictions seem to be, suspiciously, in exact alignment with their personal worldview. So my friends who are utopians are already living in this utopian future where this is going to be the big change. My friends who are dystopians are already predicting that this is the official beginning of the police state and the disastrous new world order. I think there ’ s a lot of hubris in trying to imagine what that new world could be. A quote that I love that a friend of mine always says is”When people aren ’ t busy being the worst, they ’ re the best.”And I think that gives me hope. And it ’ s true the other way, too. When people aren ’ t busy being the best, they ’ re the worst. I ’ m terrible at social engineering, Chris, and you know this, and you have great, better minds than mine who can come on and talk about this on the global scale. The only world that I have a really intimate, familiar engagement with is this one, and on the individual level, what I understand is that the only world that any of us are ever going to live in is this one. And so minding this, and learning how to calm this, how to open this, how to get on the other side of the emotions that are causing harm to you and others, that ’ s my work, you know? Personally, whatever role I have in the public sphere. CA : You ’ re an extraordinary storyteller and you already told us one amazing story earlier on. Have you come across any other recent stories that have given you reason for hope, perhaps? EG : Well, I ’ ll give you one, and this one, I delight in. Years ago, 20 years ago in New York City – 30 years ago, I was in my 20s – I was friends with a woman named Winifred, who was in her 90s. She was this really cool West Village bohemian artist who had lived in Greenwich Village for her entire life, had had a very storied and checkered and wild life, surrounding herself with intellectuals and poets and artists and adventure, and she ’ d had a lot of loss and a lot of gain, and she was this extremely **passionate** person who had friends of all ages, which was something I admired about her. I was friends with her. I was 25, she was 95. But I would call her my very good friend, and she had a lot of friends. She was so open to everything. And at her 95th birthday party, I asked her,”What have you learned, more than anything else?"Because she was such a creature of learning. I wrote about her in"Big Magic."I said to her one time,"What ' s your favorite book that you ' ve ever read?"And she said,"I can ' t say my favorite book because there ' s been so many, but I can tell you my favorite subject, the history of ancient Mesopotamia, which I started learning when I was 80 and it changed my life."And it did. She ' d gone on these expeditions to Jordan and Iraq. She was just so full of living, you know? And I said to her,"What have you learned in all of your experiences? What is the most central thing that you ' ve learned?"And she said,"Human beings can adapt to anything. Human beings can adapt to absolutely anything."And then she said this great line :"If Martians landed on Earth tomorrow, it would be off the front pages of the newspaper by next Tuesday. We would already be used to it."Right? And there ' s a level at which I ' m seeing this adaptation happening. And that is both a good and a bad thing. Right? We can get used to totalitarianism, but we can also get used to – I ' ve gotten used to a world without the love of my life in it. We can adapt. And I keep using that line as a touchstone for myself, because I don ' t know, nor do I presume to know, what the world is going to be after this. I know that it will be different from the one before. I also just have to point out that all y ' all had a lot of complaints about the world we had before, and I do a lot of talking, I do a lot of going around the world, and [I don ' t remember] any one of you raising your hand in any of the seminars I ' ve taught over the last years, and saying,"We are living in a golden age and I ' m so grateful and appreciative for all that I have,"now you want that world back, right? So let ' s actually remember that as we go forward, that this moment, for some of us, that we ' re in right now, might be one that we look back later and say,"Wow, actually, that was pretty good, and I didn ' t have any gratitude for it."So personally, I ' m just hoping that at an intimate level – and again, this is not a socioeconomic, global political level, but it ' s an invitation to actually be grateful for the safety that you have and the people that you have, and maybe carry that forward a little bit. Maybe. We ' re really good at forgetting. Once a crisis is over, we ' re really good at forgetting our gratitude. It ' s one of our great gifts. But you might want to make a note to actually try to be grateful for what you have. CA : Thank you, Liz. I think we have a last question from our online friends. HW : Yeah, what crisis, right? So Liz, just a request for a concrete strategy to try and reduce the fear or the shame that is coming at this moment. EG : I ' ll give you mine, and it may feel weird and out of reach and woo-woo, but I ' m beyond that at this point, and it has been a game changer and a life changer for me. I have a 20-year-long **practice** of writing myself, every day, a letter from Love. Now this may not feel concrete. It may feel very airy. But what it does is that it helps me through my anxiety, and I need it every single day, because I ' m anxious every single day. I wake up frightened every day. I wake up shamed every day. I wake up angry every day. All of the difficult emotions that run through the software of a human consciousness are running through my software all the time, and they cause me pain and they cause me fear, and they cause me **distress**, and they make me sick. So, 20 years ago, when I was going through a very bad divorce and a depression, I began this tactic, and the tactic is that I will sit down with a notebook and I will write to myself, from myself, a letter from Love. And what I mean by"Love"is not romantic love. It ' s the infinite, bottomlessly merciful source of all human compassion. And every single one of these letters begins the same way. It starts with me saying,"I need you."It ' s a dialogue. It starts with me saying,"I need you,"and Love saying,"I ' m right here."And then I say what I ' m going through."I ' m really angry right now. I ' m terrified. I ' m spinning. I can ' t sleep. I ' m anxious."And then I just allow to come through my hand whatever, if you could imagine the most loving, compassionate, merciful voice in the world, if they were in the room with you, what would you want them to say? And you say that to yourself. And so for me, that usually is a combination of these sorts of phrases :”I ’ ve got you. I ’ m right here. I see how distressed you are. It ’ s all right. I don ’ t need you to feel better.”I think a lot of our anxiety is that we want to get out of that feeling as fast as we can, and what Love always says to me is,”It makes no difference to me whether you ’ re anxious or afraid or angry or hurt. I ’ m with you, and I ’ ll be with you through this entire thing for however long it takes. I ’ m not going anywhere. I ’ ve got nowhere better to be right now than sitting with you, loving you. I ’ ll be with you at the moment of your death. I was here with you at the moment of your birth. There ’ s nothing you can do to lose me. You can ’ t fail. You can ’ t do this wrong. You are infinitely, bottomlessly loved.”And it ’ s so interesting to me that the opposite of fear in my life, in my emotional landscape, on the color palette, the opposite of fear isn ’ t courage, the opposite of fear is love. And that presence, a sense of,”I ’ ve got you,”right? Which is the thing that we ’ d all want somebody to say.”I ’ ve got you, and it ’ s going to be all right.”I would love to know, neurologically, what actually happens in my mind when I do this, but what happens to me physiologically is that my mind, just hearing those words and seeing those words, settles, and then from there, I ’ m able to take the next intuitive right **action** the best that I can. CA : Liz, you can say no to this, it may be a totally inappropriate thing to ask, but you don ’ t happen to have a letter from the last day or two that you ’ d consider reading, all or in part of? I don ’ t know how long they are. EG : You ’ re putting me on the spot. Let me see what we ’ ve got. Let ’ s see. OK, so here ’ s one. So I was panicking because I want to offer my apartment in New York to a woman who is a COVID-19 nurse who ’ s volunteered to come into New York City to help, and I ’ m afraid that I ’ ll infect my neighbors if I let her come and stay there. So I was up in the middle of the night, thinking, ethically, is it appropriate for me to do this? So I wrote,”I need you.”And Love said,”I ’ m right here.”And then I said,”I want to offer that COVID-19 nurse my apartment, but I ’ m afraid that my neighbors will get infected, and I ’ m scared, and I don ’ t know what the right move is. Help me.”And Love said,”I don ’ t actually know what the right answer to that is, but I ’ m with you.”And I said,”But what do you think I should do?”And Love said,”Why don ’ t you just sit with me right here for a minute and be with me and know that you ’ re held no matter what, that you cannot make the wrong choice, that it doesn ’ t matter in the grand scheme of things. You ’ re my beloved, I ’ ve got you. I can see how much you ’ re spinning, I can see how tired you are, and it doesn ’ t matter to me whether you make this decision in the next minute, in the next day, or not at all. I ’ m with you, and I ’ ll sit with you through this entire thing, and I ’ ll love you no matter what you decide to do at the end of this. I will be just as much with you at the end of this decision as am I with you now.”And then, I said,”So what do you think I should do?”And Love says,”I think you should go get a glass of water, and I think you should lie down and get some rest, and we ’ ll talk about it some more in the morning.”What I have found over the years of writing myself these letters from Love is that Love never gives advice. This is actually really good for all of you who love to give unsolicited advice to people. Love never gives advice beyond,”Why don ’ t you get a glass of water? Why don ’ t you rest? We ’ ll try this again tomorrow. You ’ re doing your best, this is a hard time, and I ’ ve got you.”So I ’ ve got 20 years of those journals, and I ’ m assuming that I ’ m going to need it for the rest of my life. CA : Wow. I don ’ t know, Helen, I think we might be done. I think I ’ m done. I can ’ t ask any more after that. HW : How beautiful. Good grief. CA : Liz, you ’ re really phenomenal. You ’ ve just got this unique way of articulating what others can ’ t articulate, and you

’ ve brought all of us to a very tender, intimate place, and thank you for that. EG : Thank you, Chris. HW : Thank you so much. EG : And thank you, Helen. Take care of yourselves, everybody. We ’ re right here with each other through this. We can do this. CA : Thank you, Liz. Goodbye. HW : Thank you. CA : Oof. HW : Oof. HW : Deep breaths. CA : Yeah. No. That was **special**. That was **special** to me. I know that you are all in different circumstances online, and that there are so many elements to this thing. There ’ s the problems that those of us who are isolated have, and in many ways, those are the luxurious problems, and we ’ re really aware of that. But they ’ re still problems, and we ’ re going to give space on these TED Connects to many other voices as well. I think we ’ re hoping to hear next week from a doctor at the front line, a voice from India, we hope, on some of the horrifying things that are happening there, and also some pretty amazing proposals for how the world could come out of this, like specific proposals on how we get past this period of lockdown to bring back the economy. All of this matters. So I guess we want Helen and everyone to come back, calendar this, share with friends, and help us figure out how to use this time best. HW : I also wanted to flag that I don ’ t know if you were able to tune in for Susan David ’ s conversation earlier in the week. We have launched a new podcast with Susan that launched on Monday. We ’ re calling it”Checking In with Susan David,”and she is going to be sharing **daily** tips on how to deal with this pandemic. And so you can find that wherever you find podcasts in this day and age. For this conversation, we will be archiving it. It will be on Facebook, and we ’ ll also put it onto TED. com. You can find the TED Interview podcast that Chris and Liz did last year, which I confess just made me weep for... too long. You can find that at go. ted. com / tedconnects. But that ’ s it from us. And tomorrow, I want to flag that we have a very **special** treat, which is less chat, more beauty. We will be joined by the unbelievably talented Butterscotch, who is a beatboxer and a singer and a musician and a sage, and an all-around delight, and she is going to be giving us a glimpse into her world and delighting us all with some sonic deliciousness. So do tune in tomorrow. CA : Thanks so much, everyone. We ’ re in this together. Stay safe. See you soon. HW : See you soon. Be well.

Text Sample 174: POS Dim 2 – 2020 – Score 17.00 – 2020/t004293.txt

Whitney Pennington Rodgers : Hello and welcome to everyone joining us from around the globe. Thank you for being part of day two of our **special** series TED Connects. This week, we ’ re bringing you interviews from some of the world ’ s greatest minds to offer tools for us to **navigate** through and thrive in these really uncertain times. I ’ m Whitney Pennington Rogers, TED ’ s current affairs curator, and I ’ ll be one of your hosts for today ’ s event. Yesterday, we kicked off this series with an interview from acclaimed psychologist Susan David, who offered us some tips on how to really be our best selves in these trying times. And we ’ re going to switch gears a little bit today from thinking about our own personal mental health to the state of our global public health systems. Chris Anderson : Thank you. I guess we have a pretty exciting guest to introduce. On the other side of the country, let ’ s bring in Bill Gates. Bill, they say the better-known people are, the less you have to intro them. It ’ s great to have you here. How are you doing? Bill Gates : I think this is an unprecedented, really disconcerting time for everyone, with things being shut down, not knowing exactly how long it ’ s going to last, worrying about the health of all the people we care about. You know, I ’ m lucky that I get to connect up with video conferencing using Teams a lot, so the Foundation is stepping up and there ’ s a lot of great people trying to help with this crisis. But it ' s scary for everyone. CA : Are you basically stuck at home like many of us watching? BG : Yeah, almost all my meetings are using Teams now, I ' m getting used to that. You know, I ' ve gone days without seeing any coworkers. CA : Let ' s start here, Bill. Five years ago, you stood on the TED stage and you gave this chilling **warning** that the world was in danger, at some point, of a major pandemic. People watching that talk now, their hair stands up on the back of their neck – it is exactly what we ' re living through. What happened, did people listen to that **warning** at all? BG : Basically, no. You know, I was hopeful that with the Zika and Ebola and SARS and MERS, they all reminded us that, particularly in a world where people move around so much, you can get huge devastation. And so the talk was to say, hey, we ' re not ready for the next pandemic, but in fact, there ' s advances in science that if we put resources against them, we can be ready. Sadly, very little was done. There were some things – the Coalition for Epidemic Preparedness Innovation, CEPI, was funded by our foundation, Wellcome Trust and a number of governments, to do some of the **platform** vaccine work, but in the area of diagnostics, antibodies, antivirals, basically doing the disease games that I talked about, where we ' d simulate what needed to be done. We hardly did anything, and so now here we have a respiratory virus that is, sadly, fulfilling some of the more negative predictions I made. CA : Last month, you said that this might be the big one. You wrote that this could be the sort of once-in-a-century pandemic that people had been fearing. Is that how you think of it still? BG : Well, it ' s awful to say this, but we could have a respiratory virus whose case fatality rate was even higher, if this was something like smallpox, you know, that kills 30 percent of people. So this is horrific. But in fact, most people, even who get the COVID disease, are able to survive. So it ' s quite infectious, way more infectious than MERS or SARS were. It ' s not as fatal as they were. And yet, the disruption we ' re seeing, in order to knock it down, is really completely unprecedented. So this is going global, that was – it ' s respiratory, that was the great fear. How many people end up dying – hopefully, if we do the right things, it won ' t be a gigantic number. So, you know, we should end up not having the 1918 **flu** situation. We should be able to do a lot better than that. CA : And that ' s because of **actions** that we would take. I mean, left without the right **actions**, the prospects are pretty deadly. If we knew what we knew in 1919, this thing could take out tens of millions of people around the world. You said – is the key thing here that it ' s got this sort of a strange combination of being certainly more dangerous than **flu** – not as dangerous as something like Ebola or SARS, but more dangerous than **flu** by a factor, but infectious, and also infectious before symptoms have started, is that part of why it ' s been really hard to respond to? BG : Right. Ebola, you ' re actually flat on your back before you ' re very infectious. So you ' re not at church or in a bus or at a store. With most respiratory viruses like the **flu** and COVID, at first you only feel a little bit of a fever and a little bit sick, and so there ' s the possibility you ' re going about your normal activities and infecting other people. And so human-to-human transmissible respiratory viruses that in the early stage aren ' t stopping you from doing things, that ' s kind of a worst case, and that ' s where, you know, I did a **flu** simulation in the 2015 talk and showed how quickly it spread. You know, versus 1918, people move around a lot more now than they used to, and so that works against us. Now the medical system that steps up to treat people is also far, far better. CA : But when was it clear to you that unless we acted, this could be a really deadly pandemic? BG : Well, in January it was discussed that there was human-to-human transmission taking place. And so the alarm bells were ringing that this fits the very scary pattern that it will be very difficult to contain. And on January 23, China did their equivalent of the shutdown. Did it in a fairly extreme form. The very good news is that they were able to reduce the infection rates dramatically because of those **actions**. But it ' s January where everybody should have been on notice – let ' s get our act together with testing, let ' s get going on therapeutics and vaccines, we ' ve got to get organized because we have this novel respiratory virus whose infectiousness and fatality put it in that superscary range. CA : And so, what did happen? Because it ' s such a mystery to me about the"lost month"of preparations in many countries and certainly in the US, where we are. Were you on the phone to people during early February, late January, early February, saying,"Guys, what ' s going on, this is a really big deal, what are we doing?"What was happening behind the scenes during that period? BG : Well, you ' d like to have government money show up for the key activities. We put out 100 million, we created the Therapeutics Accelerator, there ' s the period between when we realized it was transmitting and now, where we should have done more. I think the most important thing to discuss today is that in the area of testing, we ' re still not creating that capacity and applying it to the people most in need. And so we have health workers who are symptomatic, who can ' t get a test and so they don ' t know should they go in or not go in, and yet we have lots of tests being given to people who aren ' t symptomatic. So the testing thing to me, it ' s got to be organized, it ' s got to be prioritized, that is **super**, **super** urgent. The second thing is the **isolation** that, you know, various parts, just focusing on the US, some parts are doing that in a fairly strong way and other parts not yet, and it ' s very hard to do, it ' s tough on people, it ' s disastrous for the economy. But the sooner you do it in a tough way, the sooner you can undo it and go back to normal. CA : So we ' ll come to the **isolation** part in a minute, but just sticking with the testing thing, I ' m just so confused as to why, with more than a month ' s notice – I mean, there are so many smart epidemiologists in the US, for example, you plug numbers about infectiousness and fatality into any simulation and you see that if you don ' t do anything, millions of people will die. And there ' s a month. So what ' s your explanation, what do you think happened here as to why there was almost no – a month later, there was no viable test in the US. Was this just government complexity, too many chefs in the kitchen, what on earth happened here? BG : Well, we certainly didn ' t take advantage of the month of February. The good news is that the actual process, the PCR machines, we have a lot in the United States. And so there ' s models like South Korea, who took advantage of February, built up the testing capacity, and they were able to contact-trace and their infections have gone down, even without the type of shutdown that, because we ' re late, we ' re having to do. One thing that is good news just this week is that people had thought to do this test, that you had to have a nurse or doctor shove a swab way up, all the way to the back of your throat, which hurts a lot, but also, you ' re going to cough and potentially spread the disease to that health care worker. So they have to have protective equipment and change that. We sent data to the FDA this weekend, showing that just an individual, by themselves, swabbing up to the tip of their nose, the accuracy of that test is essentially the same as having a health care worker do it. That helps a lot. We still have to do other things, but that means that you don ' t have to change protective equipment, you just hand the patient that swab, they do it, put it in the test tube, and if the capacity is right, within 24 hours, you should get that result back. CA : So how do you see that playing out? Are there people going to massively scale those tests and how will ordinary citizens be able to get hold of them? Does it still have to be kind of prescribed by a doctor at some point, or at some point, will you be able to order them off Amazon or something? BG : Well, it ' s pretty chaotic today, because the government hasn ' t stepped in to make sure the testing capacity is both increased and it ’ s used for the right cases. There will be a website – and if the federal government doesn ’ t do it, a lot of local governments will have to do it – that you go to, you give your situation, including your symptoms, you ’ re told, based on your work and your symptoms, are you a priority. If so, you ’ re told where there are kiosks you can go to and you ’ ll do the self-swab and just hand it over, or eventually, we ’ ll send the kits to you at home, and then you ’ ll send it back and hear that result. Maybe six months from now, you ’ ll actually have a strip where you perform the test in the home, but for now, they ’ re sending it back for the PCR processing. We can have massive capacity there. And that ’ s how you know. The testing is everything, because that ’ s how you know whether you need to do more shutdown or you ’ re starting to get to the point where you can **relieve** it. CA : Some people are trying to argue now that, almost, the testing should be dialed back, because the cat is out of the bag, testing is bringing people together and risking infection, you know, forget that, let ’ s just focus on treatment and on **isolation** strategies. You disagree with that. Testing is still absolutely essential and needs to be scaled dramatically. BG : The two that go together are testing, at very high volume, and the **isolation** piece. If you ’ re a medical worker, you want to stay and do your job. If you ’ re making sure the electricity, water, food is still available, you want to do your job, and so testing is what indicates to you, do you need to go into **isolation** and make sure you ’ re not the source of spread. And so, you know, testing is the key thing. South Korea did that in this massive way that everybody should learn from. And so that is paired with the **isolation** piece. Our goal here is to get to the point where a very small percentage of the population is infected. You know, China, only 0. 01 percent of the population was infected. If you let it, if you don ’ t do these things, you ’ re going to get the majority of people infected and that huge overload of the medical system. CA : Whitney has some questions from our online audience. Whitney. WPR : Some of the questions that we ’ re seeing are about how our tech giants and leaders can play a role in isolating this and containing this virus. BG : The tech companies are very involved in making sure that some work can go on. People can stay in touch, you know, they can help with some of the disease modeling, they can help with the visibility of the numbers. It ’ s actually very impressive, you get up there and you can see those numbers. Actually, they ’ re sad numbers, but everybody ’ s able to monitor this thing. Back in 1918, they didn ’ t have this type of visibility, and ability to share best **practices**. But for a lot of people, the **isolation** is the key thing. CA : Bill, one of the riddles about this **isolation** strategy is how long it has to last. A lot of people are concerned that the price of victory by isolating everyone is that you crash the economy, and that we have to be, basically, at home, not doing our regular jobs for three, six months, maybe all year. And so much so that there ’ s now this big debate in the US and other countries about this may just be the wrong strategy, that we can ’ t crash the economy that badly, we should only isolate for another couple of weeks, and then let people back, and if that means a lot of other people get sick and we eventually build up herd immunity, that may be the right way to go. What ’ s your thought on this, what is the **isolation** strategy that eventually leads to us getting back to normal? BG : It ’ s very tough to say to people,”Hey, keep going to restaurants,”you know,”Go buy new houses, ignore that pile of bodies over in the corner, just, you know, we want you to keep spending,”because there ’ s some, maybe a politician who thinks GDP growth is what really counts. It ’ s very hard to tell people, when there ’ s an epidemic spreading that threatens, particularly, their parents or elderly people that they know, that they should go about things knowing that their activity is spreading this disease. I don ’ t know of any rich countries that have chosen to use that approach. It is true, if you did that approach, over a period of several years, enough people would be infected you ’ d have what ’ s called herd immunity. But herd immunity is meaningless until you infect over half the population. And so you can take – You ’ ll overload your medical system, so your case fatality rate, instead of being one percent, will be like three, four percent. And so, the idea, it ’ s very irresponsible for somebody to suggest we can have the best of both worlds. What we need is the extreme shutdown so that in six to ten weeks, if things go well, then you can start opening back up. CA : So just putting the math together from what you just said, Bill, to get to herd immunity, you need more than half the people in the country to basically get the bug. So in the case of the US, for example, that would be 150 million people, thereabouts. You said that the fatality rate in that scenario, you ’ re talking about four to five million people potential fatalities. That is just a horrifying scenario that no one should be contemplating. BG : Even one percent of the population getting sick, they will treat, whoever goes for this”ignore the disease”strategy, they will treat them as a pariah state, so none of their people will go in, and none of your people will go into that. And so briefly, a few countries in Europe that hadn ’ t really looked at this hard, considered,”OK, should we be the ones who kind of go about business as usual?”It is tempting, because if you got there early – South Korea did not have to do the extreme shutdown, because they did such a good job on testing. CA : Testing and containment. BG : That ’ s why it ’ s so maddening to me that government is not allocating the testing to where it ’ s needed, and maybe that will have to happen at the state level, because it ’ s not happening at the federal level. But there is no middle course on this thing. It is sad that the shutdown will be harder for poorer countries than it is for richer countries. CA : So let ’ s come into that in minute. The one exception I ’ ve heard the case made for is Japan, that Japan has not contained it quite in the same way that South Korea did but has allowed people to work. It ’ s tried to make extreme measures for protecting their most elderly population. But they ’ ve tried to find a middle scenario, haven ’ t they? BG : If you act – When you have hundreds of cases, you may be able to contain it by doing great testing and great contact tracing, and restricting foreigners coming in, without as much damage to your economy. The US is past this opportunity to control without shutdown. So the worst case of what was happening in Wuhan in the beginning or in northern Italy over the last few weeks, that we avoid that. But we did not act fast enough to have an ability to avoid the shutdown. CA : But then what I don ’ t understand, in the case of the US, for example, is that even if we ’ re successful in bending the curve and reducing the number of new cases from a period of extreme shutdown, as it were, no immunity has been built up. Let ’ s say that there ’ s still no vaccine. Surely when you lift restrictions and people start going back to work, the whole thing just blows up again. BG : The experience that we ’ re seeing in China and in South Korea is that there are not these people who are asymptomatic that are causing lots of infections. And that ’ s a parameter that, as you build the model, you have to put in. There ’ s an Imperial model that people talk about a lot, which shows that reopening is very hard to do. But the results of that model are not matching what we see in China, and so very likely, there aren ’ t as many of these infecting asymptomatics. And that ’ s why you have to be pragmatic. There ’ s a lot we don ’ t know. For example, seasonality may help us in the Northern Hemisphere, the force of infection will – Respiratory viruses, to some degree, they all are seasonal. We don ’ t know how seasonal this one is, but you know, there ’ s a reasonable chance that the force of infection will be going down. And it ’ s your testing that always is telling you,”Oh, my gosh, do I have to shut down more, or can I start to open up?”So particularly, right as you open up, that testing and contact tracing is saying to you – And you can say I ’ m more on the optimistic side, that it will be possible to do what China ’ s doing, where they are starting to go back to normal. CA : And help me understand what happened there because it seems kind of miraculous to me, because this virus was exploding, yes, in Wuhan, but people moved from there to many other parts of China. How is it possible that the combination of the shutdown in Wuhan and measures elsewhere seem to have got to the point where there are literally no new cases happening. I mean, to me, that implies that literally, the virus is not circulating at all between humans in China. You know, there ’ s a few tourists coming in who they deal with, but I mean, is that literally your interpretation of what happened, that it ’ s no longer circulating in China? BG : Absolutely. Take a spreadsheet and take a number like four – one person infects four people – and say the cycle is every 10 days. Go through eight of those cycles, and you ’ re getting the big number. You know, start with 10, 000 and then, you know, that increase. If you take the number 0. 4 instead, that is, the average case infects 0. 4 people, then look at what happens to that number as you go out. It drops to zero, and so things that are exponential are very, very dramatic. When they ’ re above one, they are growing rapidly. When they ’ re below one, they are shrinking rapidly. And so the **isolation** in China drove that reproductive number to well below zero. And so local infection rates – CA : Below one. BG : Below one, sorry. And that **quarantine**, you know, **quarantine** comes from”40 days,”which is what they thought would help for black plague, that is our primary technique. Thank God we have testing, if we use it properly. We are doing therapeutics, which will help with the death rate, but in terms of keeping the infections below one percent of the population, it really all depends just on the two things : **isolation** and testing. CA : So to quote a question from my Twitter feed this morning for you Bill : If you were president for a month in the US, what would be the top two or three things you would do? BG : Well, the clear message that we have no choice to maintain this **isolation** and that ’ s going to keep going for a period of time, you know, probably in the Chinese case, it was like six weeks, so we have to prepare ourselves for that, and do it very well. And then use the testing and every week, talk about what ’ s going on with that. If you ’ re doing **isolation** well, within about 20 days, you ’ ll see those numbers really change, you know, instead of this, you ’ ll see this, and that is a sign that you ’ re on your way. Now, you have to stay to get more generations that are 0. 4 infections per previous infection. You have to maintain it for a number of weeks there. And you know, so this is not going to be easy. We need a clear message about that. It is really tragic that the economic effects of this are very dramatic. I mean, nothing like this has ever happened to the economy in our lifetimes. But bringing the economy back and doing money, that ’ s more of a reversible thing than bringing people back to life. And so, we ’ re going to take the pain in the economic dimension, huge pain, in order to minimize the pain in the disease and death dimension. CA : Whitney. WPR : We have a lot of other questions coming in. One that we ’ ve been seeing is a question about what tools are available for countries that maybe don ’ t have the luxury of being able to social-distance, don ’ t have great health systems in place, how should they be handling this virus? BG : Yeah, I would say, if the rich countries really do their job well, by the summer, they ’ ll be like China is, or some of the other countries that responded early. But in the developing countries, particularly in the Southern Hemisphere, the seasonality is large. As you say, the ability to isolate, you know, when you go out to get your food every day, you have to earn your wage, when you live in a slum or you ’ re very **nearby** each other, it ’ s very hard to do, as you move down the income ladder, than it is for a country like the United States. And so we should all accelerate the vaccine, which eventually will come, and you know, people are being responsible to say that that ’ s going to take 18 months. And there ’ s a lot of those being pursued. I ’ m talking a lot with Seth Berkley, who you ’ re going to have later this week, who can talk a lot about the vaccine front, because he ’ s definitely at the center of that, being the head of GAVI. We do need to get really cheap testing out to these countries, and we need to get therapeutics so you don ’ t need to put five percent of people on respirators. Because even if they had the equipment, they don ’ t have the personnel, they just don ’ t have the beds, the capacity. And so the only good news is that the rich countries have this and so they will be learning about testing, therapeutics, and funding the vaccines for the entire world, to try and minimize the damage in developing countries. WPR : Great, I ’ ll be back later with more questions. CA : Bill, you mentioned therapeutics there. What is looking promising, is anything looking promising? BG : Yeah, so there ’ s quite a range of things going on. There ’ s a few that get mentioned a lot, remdesivir, hydroxychloroquine, azithromycin, and the data is still a bit confusing, but there ’ s some positive data on those. Remdesivir is a five-day IV infusion, and actually kind of hard to manufacture, so people are looking at how that can be improved. The hydroxychloroquine looks like it works, somewhat, if you get in early. There ’ s a huge list of compounds, including antibodies, antiviral drugs, and so the Gates Foundation and Wellcome Trust, with support from Mastercard and now others, created this therapeutics accelerator to really triage out. You have hundreds of people showing up and saying, try this, try that. So we look at lab assays, animal models, and so we understand which things should be prioritized for these very quick human **trials** that need to be done all over the world. So the coordination on that is very complex, globally. But I think, you know, out of the top 20 or so candidates, probably three or four of them will work out, you know, at different stages of the disease, to reduce the respiratory **distress**. CA : I heard you mentioned that one possibility might be treatments from the serum, the blood serum, of people who had had the disease and recovered. So I guess they ’ re carrying antibodies. Talk a bit about that, how that could work and what it would take to accelerate that. BG : Yeah, this has always been discussed as how could you pull that off. So people who are recovered, it appears, have really effective antibodies in their blood. So you could go, transfuse them and only take out the white cells, the immune cells. And then the question is, OK, how many patients ’ worth of material could you get? You know, if you have that recovered person come in, say, once a week, do you get enough for two people or five people? Then logistically, you have to take that and get it to where that need is. And so it ’ s fairly complicated, you know, compared to a drug that we can make in high volume. You know, the cost of taking it out and putting it back in probably doesn ’ t scale as well. But there is work being done on this. You know, we actually started with Ebola, and fortunately, it got done before it was needed. So that is being pursued and it will work to some degree, but it will be hard to scale the numbers. CA : So it ’ s almost like, when you talk about the need to accelerate testing, the immediate need is for testing for the virus. But is it possible that in a few months ’ time, there ’ s going to be this growing need to test for these antibodies in people, i. e. to see if someone had the disease and recovered, maybe they didn ’ t even know they had it. Because you could picture this growing worldwide force of heroes – let ’ s call them heroes – who have been through this experience and have a lot to offer the world. Maybe they can offer blood donation, serum donation. But also other tasks, like, if you ’ ve got overwhelmed health care systems, presumably, there are kind of community health worker type tasks that people could be trained to do to **relieve** the pressure there, if we knew that they were effectively immune? BG : Yes. Until we came up with the self-swab and showed FDA that that ’ s equivalent, we were thinking that people who might be able to man those kiosks would be the recovered patients. Now we don ' t want to have a lot of recovered people, you know. To be clear, we ' re trying, through the shutdown, in the United States, to not get to one percent of the population infected. We ' re well below that today, but with exponentiation, you could get past that three million. I believe we will be able to avoid that with having this economic pain. Eventually, what we ' ll have to have is certificates of who is a recovered person, who is a vaccinated person, because you don ' t want people moving around the world – where you ' ll have some countries that won ' t have it under control, sadly – you don ' t want to completely block off the ability for those people to go there and come back and move around. CA : Bill, is your foundation helping to accelerate the manufacture of these self tests? What are the prospects for really seeing scale on some of this testing soon, not just in the US, but globally? BG : Yeah, our foundation, we ' d been funding the thing called the **Flu** Study to really understand how respiratory viruses spread. It ' s amazing how little was understood about how important schools are, different age groups, different types of interaction. And that gave us an experience. In fact, that **flu** study actually was the first time **coronavirus** was found in the community, because the government was still saying you only test people who ' d come from China, but we ran into people who had coronavirus, who hadn ' t been travelers. So, that was like an early **warning** sign, even though the regulation said you weren ' t supposed to even look at that. So yeah, the Foundation is working with all the private sector people, the diagnostics people on this testing piece. Now that we can do the self-swab, those swabs are very easy to manufacture. The one where you had to jam it into the throat, deep turbinate, that was getting into short supply. So the swab should not be limiting, neither should the various chemicals that help run the PCR machines. So we should be able to get to a South Korea-type prioritized testing thing within a few weeks. CA : How important is it that the world ' s nations collaborate right now? I mean, it seems like, you know, here ' s this common enemy facing humanity, it does not know that it just crossed a border, it does not know what race people are, what religion they are – it just knows,"Here ' s a human, I ' ve got a manufacturing machine here that can make me famous."And it goes to work. It ' s so terrifying to me to see signs of countries starting to blame each other or the xenophobia, it just seems so toxic. What ' s your take on this, Bill? Do you see signs of cooperation happening, or are you also worried about the sort of,"US versus China"kind of thing that seems to be going on if we ' re not careful? BG : Well, I see both. I see that countries that are recovered can help other countries. And that ' s fantastic. If by the summer, we ' ve knocked this thing down, then great, we can help other countries. There are vaccine projects all over the world, and those should be evaluated on a very neutral basis, to which one is the best to help humanity. And make sure the manufacturing capacity isn ' t just for rich countries, that it ' s scaled up, very low cost stuff for the entire world, and that ' s the spirit of GAVI, is getting vaccines out to every person. So in the science side, and data-sharing side, you see this great cooperation going on. Unfortunately, whenever you have disease, this sense of other and foreign and"Oh, stay away from me,"you know, that sort of pulling inward is reinforced. And we have to avoid that. You know, ironically, we have to isolate physically, while in terms of looking at community groups that are pooling resources to help make sure food gets to everyone and help assure medical care, you know, if older people need to be moved out of common facilities, you help out with that, and that people aren ' t suffering too much from the psychology of **isolation**. So our generosity has to go up towards others at the same time we ' re less actually physically interacting with other people. CA : I mean, thinking about the situation in many developing countries, I ' m curious how you think of this. You mentioned, first of all, that seasonality may help, i. e. high temperatures. Is it possible that that is so far protecting, to some extent, places like India or sub-Saharan Africa and so forth? BG : India ' s Northern Hemisphere. So Southern Hemisphere is lots of Africa, South America, Australia, New Zealand, Indonesia. And it is true, either the force of the infection is lower there or we ' re just not seeing it with testing. You know, a few months from now, we ' ll understand the seasonality question, which would be good news for the Northern Hemisphere, and somewhat bad news for the Southern Hemisphere. Now more people live in the Northern Hemisphere, including India, Pakistan, and that would buy us some time, and time is a big deal, because all these tools get so much better if you had to go into a second season with it. But yeah, sadly, we could see, in the next few months, as the Southern Hemisphere is moving into its fall and then winter, we could see a big increase there, and that is going to be very difficult. Now they don ' t have as many older people, but they have lots of people who are HIV positive, or have malnutrition or various lung challenges because of indoor smoke, and so the wild card is how well can the developing countries deal with this. CA : If you ' re in a country where the majority of your population is making less than two or three dollars a day, can you even afford a strategy that looks like, basically, shutting down the economy? BG : I ' m very worried that there will be a massive number of deaths in those poorer countries, because the health systems just aren ' t – you know, the number of respirators, hospitals, and of course, when you overload that system, your deaths are not just COVID deaths, but everyone else who ' s trying to access a system that will be somewhat in chaos, including with health workers who are getting sick. CA : OK, we ' re getting near to running out of time with this. Whitney, maybe a last question or two from online. WPR : Sure, we have two from online, we ' re seeing thousands of questions around these same lines. One, there ' s lots of people who are really interested to hear about the kind of work that you ' re doing with your foundation as far as distributing tests, but also producing safety gear, masks and that sort of thing, to help with this effort for health workers. BG : So the Gates Foundation, you know, we, very early on, gave out 100 million to help out with all the pieces : the testing piece, the therapeutics and the vaccines. We are not experts in making masks and ventilators and gowns, and it ' s great that other people, including some 3D printing, and open-source things, that is great. Our focus, you know, like this self-swab thing, nobody had done that before, people thought it wouldn ' t work, we were quite sure it would work. And so that, for the globe, is a huge thing. We work a lot with both governments and private sector, so in some ways, we ' re kind of a bridge. And we ' ve been talking to the heads of the pharmaceutical companies, the testing companies and, specifically, with the ones doing vaccines, including some of which are these new type of vaccines, RNA vaccines, that we ' ve been backing for quite some time, and CEPI has been backing. And so our expertise is in those medical tools and really getting the best of the private sector engaged there. It ' s been a little slow. We can write checks right away, whereas the government processes, even in this situation – you know, there ' s still this notion of bidding, and not really knowing who has the unique capabilities of doing things, and so, an organization that ' s working on this all the time, lots of new vaccines, can step in and be helpful. And it ' s really amazing. When we talk to private-sector partners, their interest in helping out has been absolutely fantastic. And so that ' s where we have a unique role. WPR : And the other question that we ' re seeing a ton of – before we wrap up here – is just people are really interested in your insight, Bill, on whether you think we are heading in the right direction, do you feel like our economy is heading in the right place, that humanity is heading in the right place, are we in a better position now than you thought we were in five years ago? BG : Well, five years ago, I said that pandemic is this unaddressed, very, very scary thing. And that if we did the right things, we could be more prepared. Science is on our side. The fact we can be ready for the next epidemic, it ’ s very clear how to do that. And yes, it will take tens of billions, but not hundreds or trillions of dollars. So it will be tiny compared to the economic cost. I remember when I did that presentation 2015, I put up,”Hey, a big **flu** epidemic could cost four trillion,”and I thought, wow, that ’ s a big number, do I really think it ’ s that big? And I went and looked up numbers and thought, yeah, well, that ’ s big. This epidemic will cost that much to the economy. So in the short run, we are going to have more pain and more difficulty and people are going to have to step up to help each other. I ’ m still very much an optimist, you know, whether it ’ s climate change, countries working together, biology taking the diseases, malaria, TB, you know, even advances for what are more rich-world diseases, like cancer. The amount of innovation, the way we can connect up and work together – yes, I ’ m superpositive about that. You know, I love my work because I see progress on all these diseases all the time. Now we have to turn and focus on this, you know. Sadly, it may interrupt and the polio situation might get worse a little bit because of the distraction here. We ’ re using a lot of the great capacity that was built up for those polio activities to try and help the developing countries respond to this very well. And that is appropriate, but the message from me, although it ’ s very sober when we ’ re dealing with this epidemic, you know, I ’ m very positive that this should draw us together. We will get out of this, and then, we will get ready for the next epidemic. CA : That ’ s exactly what I was going to ask you, Bill, which is, where is your head, do you think we will get through this? Will the leaders that matter listen to the scientists, will they? Will we make it through? Do you believe that within a few months ’ time, we ’ re already going to be looking back and saying,”Phew, we dodged a pretty bad one there.”BG : We can ’ t say for sure that even the rich countries will be out of this in six to ten weeks. I think that ’ s likely, but as we get the testing data, we ’ ll get more of a sense of that and people will continuously be able to see that. But you know, the rich countries will get out of this. The developing countries will bear a significant price, but even they, we will get a vaccine and GAVI will get that out to everyone. So you know, two to three years from now, this thing, even on a global basis, will essentially be over with a gigantic price tag. But now we ’ re going to know, OK, next time we see a pathogen, we can make billions of tests within two or three weeks. We can figure out which antiviral drugs work within two or three weeks and get those scaled up. And we can make a vaccine, if we ’ re really ready, probably in six months, using these new **platforms**, probably the RNA vaccine. So specifically, there are innovations that are there that will get financed, you know, I hope, quite generously, coming out of this thing. And so, three years from now, we ’ ll look back and say, you know, that was awful, there ’ s a lot of heroes, but we ’ ve learned a lesson and the world as a whole, with its great science and desire to help each other, was able to try and minimize what happened there and avoid it happening again. CA : That ’ s certainly the optimistic scenario that I ’ m craving for, myself. That the world kind of realizes, one, that there are certain things that you just have to unite on. Two, that science really matters and it ’ s a miracle that science can understand this bug, you know, make a vaccine, sequence it, make therapeutics, understand how to model it – it ’ s kind of miraculous to me. So will we learn, now, to pay attention to scientists, because if we do, I ’ m sure that you feel this as well, there ’ s an amazing analogue with climate, it ’ s just a different timescale. That the scientists are out there, saying,”There ’ s this huge enemy coming, if we do nothing, it ’ s going to take millions of lives, it ’ s going to wreck our planet. For God ’ s sake, act, politicians! Do something.”And the politicians are going,”Meh, no. We need a little more GDP, we need to win an election.”And they ’ re not acting. Do you see a scenario where this shocks politicians to actually change their thinking and their prioritization of science overall, or is that asking too much? BG : Yeah, it ’ s interesting how much of this distraction will delay the urgent innovation agenda that exists over in climate. You know, I have freed up a lot of time to work on climate. I have to say, you know, for the last few months, that ’ s now shifted, and until we get out of this crisis, COVID will dominate, and so some of the climate stuff, although it will still go on, it won ’ t get that same focus. As we get past this, yes, that idea of innovation and science and the world working together, that is totally common between these two problems. And so I don ’ t think this has to be a huge setback for climate. CA : Last question. There are thousands of people watching, many of them living alone, some quite scared, there may even be people there who have this virus and are suffering symptoms or recovering. By the way, if that ’ s you, we ’ d love to hear from you, we really would. Maybe have a conversation with some of you, in a future one of these, just understanding the experience. But Bill, what can people do as individuals from their own homes, right now, to try and help? BG : Well, there ’ s a lot of creativity, you know – can you mentor kids who are being forced into an online format where the school systems really weren ’ t ready for that? Can you organize some giving activity that gets the food banks to step up where there ’ s problems there? These are such unprecedented times, and it really should draw out that sense of creativity, while complying with the **isolation** mandates. CA : Bill, I really want to thank you for spending this time with us and for the **financial** investment, the time investment. You ’ ve really invested your life into trying to solve these big problems. And this is as big as they get. I have a hunch that your voice is really going to be needed in the next few weeks. Thank you so much for your time today. This was really wonderful, hearing from you. Thank you. BG : Thanks, Chris. CA : OK, thanks, everyone, thanks for being part of the TED community. Look after yourselves, be smart about this. You know, get ahead of it. If you ’ re in a part of the world where this thing hasn ’ t really hit, listen to Bill Gates. Get ahead of it. Keep, you know, if you possibly can, socially distanced. No, not – physically distanced and socially connect. That ’ s what the internet is for. These days are what the internet was built for. We can spread love, we can spread ideas, we can spread relationship, we can spread thought, without spreading a dangerous bug. So get ahead of it, and let ’ s figure this out together. It ’ s been wonderful spending time with you. From Whitney and from me and from the whole TED team, thank you, and over and out.

Text Sample 175: POS Dim 2 – 2020 – Score 16.00 – 2020/t004292.txt

Chris Anderson : Welcome to TED Connects. This is a new series of live conversations, trying to make sense of this weird moment that we ’ re in : **coronavirus**. Everyone ’ s suddenly changing how they live their lives, it ’ s so jolting, it ’ s so startling. We ’ re all trying to make sense of it, and it ain ’ t easy. That much we know. We ’ re trying to make sense of this together in the only way that we know how, which is by having wise humans coming on, talking to each other, listening to each other trying to learn from each other. We are apart, but we can use this moment to build community together, and that ’ s what we ’ re trying to do. So this is being produced by a virtual TED team scattered around New York, currently one of the epicenters of this pandemic. So it ’ s definitely a scary time for people here. I ’ d like to welcome to join me my cohost here, Whitney Pennington Rodgers. She ’ s our current affairs curator. Whitney Pennington Rodgers : We ’ re going to be looking a little bit at China ’ s response today. When news surfaced about a strange viral outbreak in Wuhan, China at the very last days of 2019, I think a lot of people were confused about what was going on there, and in the months that followed, we learned more about the disease that ’ s now known as COVID-19, we watched the situation in China quickly worsen and in the most recent weeks dramatically improve. And I think as all of us around the world grapple with how we can contain and control the spread of COVID-19, there are a lot of lessons we can learn from what China experienced and how they responded. So we ’ re really thrilled to be joined today by the CEO of the”South China Morning Post,”Gary Liu, who ’ s here to share his perspective and insights. So, welcome Gary. Gary Liu : Thanks for having me. WPR : Hey there, Gary, thanks for being with us. And I think before we dive into things, I ’ d love to hear about just how things have been for you personally, your loved ones, those close to you, how have you been experiencing this? GL : It ’ s complicated. So we ’ re here in Hong Kong, I ’ m working from home, like much of Hong Kong. I ’ m actually self-quarantined in our apartment here in Hong Kong, because there was a confirmed case in our **workplace**. So over the course of the last week plus, and likely for at least another week plus, the entire organization has been distributed and working from home. You know, when Hong Kong got its first confirmed case, I was actually back in the United States with my wife, we were taking a small break in the Rockies, and we came back to Hong Kong pretty soon after that to make sure we got back into Hong Kong before the airports shut. And at that point, it was all of our family in the United States and friends texting us and worrying about how things were in Hong Kong as the situation in China started escalating, and people were sending us, or trying to send us, supplies. Masks and sanitizer and stuff like that. And now it ’ s the opposite. New York City is our home, so we certainly empathize with what you guys are dealing with right now and going through in the city. And we are seeing our friends and our family back home in New York and in California and checking in on them, trying to send equipment and materials back to them, so the script has flipped actually pretty fast over just the last couple of weeks. WPR : And you know, I think that ’ s actually a really interesting place to start and probably a question that a lot of people who aren ’ t in China have, you know, I think from the outside looking in, it seems as if what ’ s happened in China is kind of miraculous. That to go from, you know, you have a country with more than a billion people there, to go from as many as 80, 000 cases to nearly zero new cases now, you know, what can you tell us about how this happened, to help us understand the current situation and just really how China ended up there? GL : Yeah, a lot has happened. China has been dealing with this for several months now. Several-month head start, that ’ s not a good thing, but they have gone through several different phases. I think, Whitney, before I jump into it, there are a couple of caveats that are really important to make. The first one is that we ’ re still parsing what happened in China. The information system, as everyone knows, is still relatively closed. And so a lot of the information that we ’ re using to piece together what happened in China is still not fully complete. And so with every passing day, every passing week, there ’ s more information that allows us to retroactively make sure that we get the picture of what happened early on in those early days at the end of 2019, get that picture right. And there ’ s still a lot that ’ s happening today, even though I think the information sharing is much more open than it was early on, there ’ s still a lot of stuff that we need to parse. And the second important caveat here is that I think learning sometimes suggests that everything China did was right and good, and hopefully, other countries can take it and apply it, but that ’ s not 100 percent the case. China, of course, did a lot that was right, and if we walked through the time line, I think it would be pretty apparent the decisions that they made kept the **coronavirus** from really exploding across the entire country and really limited it to one province and mostly one city. But there were also many, many missteps, and those are things that I think the world can also learn from, most importantly, China should learn from, because most of these – I think those of us who are professional observers would call missteps, are because they are systemic issues with the country, because of governance, lack of free information flow, stuff like that. Those are the initial caveats, but I think the timing of how China progressed from first case to now has been fascinating. WPR : Yeah, and I mean, so we know now that in Hubei province they ’ ve officially lifted the two-month lockdown. And are you getting the sense, do you feel like this is the right decision to make at this moment? GL : I don ’ t think I ’ m the right person to say whether or not it ’ s the right decision. But certainly, this has been a progression of decisions, and I think they ’ ve been sitting on this decision for quite some time. Wuhan itself, which was where the pandemic started, it was the first epicenter and the major epicenter. Wuhan is opening up on April 8, that ’ s right now the schedule. And this is really, what we ’ re in now is the third of three phases from the first discovery of the virus in Wuhan. Now, April 8 will be about 11 weeks after Wuhan the city got completely shut down, and the Hubei province got shut down. And so for those who are in a shelter, at home kind of situations right now in the United States and wondering how long this is going to take, in Wuhan, they ’ ve been locked down for 11 weeks and only now has the Chinese government decided they ’ re ready to start letting people move freely around. WPR : And to your point earlier about some of the possible missteps in terms of reporting, I mean, there are still reports now that we might not be getting an accurate number of cases that we ’ re seeing in Wuhan or beyond, we ’ re hearing some people say there are no new cases, other people saying that there actually are cases. So do you feel like there is accurate spread of information about the current state of the virus in China right now? GL : Generally, yes, with the caveat that it is based on the Chinese government ’ s definition. And this is one of the problems right now that even the World Health Organization is **struggling** with, is that the definition of what is a confirmed case, what is an infection, is different from country to country. As an example, in China, the folks that have tested positive but are asymptomatic, we understand now that they are not included, since February 7, they have not been included in the official numbers. Or at the very least, on February 7, they changed that definition, and they ’ re not included in those official numbers. And that could be another 50 percent on top of the numbers that we ’ re seeing today. So what we ’ ve found, our **reporters** have gotten their hands on some classified government documents and government data that suggests that a third of total actual positive tests are asymptomatic, and therefore not included in official numbers. Now, I don ’ t think that this is an example of the Chinese government trying to hide information. This is a definitions issue, which countries have been debating and people are doing it in different ways. But like I said, there really have been three very distinct phases. We are in the third phase that I would call recovery and rehabilitation, rehabilitation being the rehabilitation of China ’ s image. But the first part was discovery and a lot of denial. And then there was this two-and-a-half-month period of response and containment. And that I think, the response and containment part is the most interesting to the rest of the world. WPR : And so maybe we can break some of that down, you know, thinking about China ’ s response. What were some of the specific things that you think China did right, both as a nation, individuals in the country, what were some of the things that you saw that worked really well? GL : OK, so let me walk through the time line, I want to try and get these dates right, because the dates do matter, I think again, for context, how many weeks it took from one step to another. Let me actually back up into that initial first phase, that discovery and denial phase. The first time we heard about the **coronavirus**, this mysterious respiratory disease that looks somewhat like SARS, was on December 30. That was the day that there was a doctor, whose name is known all over the world for the unfortunate reason he ended up eventually dying, named Li Wenliang. And Li Wenliang, Dr. Li, posted to a private WeChat group on December 30. These were some of his old classmates from med school. And he said,"Hey, I ' m in Wuhan, I ' m at the hospital, there is a SARS-like illness,"SARS being the epidemic from 2002 to 2003,"There ' s a SARS-like illness that is spreading through these hospitals in Wuhan."A private message. Somebody forwarded it, and it went viral across the Chinese internet. The very next – so that was the first time we actually heard about something that was going on in Wuhan. The very next day, December 31, was the first time that any Chinese officials – and on that day, it happened to be the actual provincial and the city officials – acknowledged that there were 27 people, at that moment in time, who had been diagnosed with this mysterious pneumonia, and they reported the cases to the World Health Organization. That was also the day that Dr. Li was reprimanded, officially reprimanded. So that was really the discovery, the end of the discovery and denial phase, because what we know now is that back to mid-December, several weeks before Dr. Li wrote his blog post, the authorities had already been notified that a SARS-like pneumonia was showing up in Wuhan hospitals. And **action** had already started down the chain of authority. They have now backdated, at least publicly backdated, the first case to December 1. But actually, in their confidential and classified government documents that again, our journalists have seen, and we ' ve published a story – Officially, in classified documents, they ' ve backdated the first COVID-19 case all the way back to November 17, as the earliest example that they can find based on symptoms and based on retroactive diagnosis for a COVID-19 case. So in effect, there were several weeks before the acknowledgment to the World Health Organization that that was going on, and the first case with symptoms was actually identified about a month and a half before that notice to the World Health Organization. Then the second phase, which really started, let ' s say, December 31, when the acknowledgment happened, was response and then massive containment. Now this phase, to be clear, still had some denial and a good amount of censorship happening within the country. So on January 1, the World Health Organization started working with China on trying to identify the virus and trying to figure out course of **action**. It wasn ' t until several weeks later that Beijing, the central government, for the first time broke its silence, and that was on January 18. And actually, they broke the silence to deny that this was SARS, and in fact to"defy rumors"that were spreading around the Chinese internet. But there was a major date that happened two days afterwards, which was January 20. Because for the first time, a member of the party, a senior government official who is now one of the central gentlemen that is actually leading the task force against COVID-19, his name is Zhong Nanshan, he ' s an epidemiologist, he was one of the central figures during SARS 17 years ago. On January 20, he visited Wuhan. And he admitted, for the first time, that human-to-human transmission was possible. Now this was important, because prior to that, officials who had spoken up had said that human-to-human transmission was not likely, was not possible. And previous to that, all of the cases, the majority of the cases were tied to this seafood and wildlife marketplace that was in the city of

Wuhan. But now, on January 20, human-to-human transmission, it ’ s possible, it ’ s happening, and so of course, the course of **action**, not only in China, but the course of **action** all over the world, started to change. And three days after that, Wuhan was locked down. It was completely, I mean, it shocked the world that they could lock down that many people so quickly. Of course, now India yesterday announced that 1. 3 billion people are being locked down. So we have another frame of reference now. And then the end of this middle second phase I think really came in March, around March 10. Actually, on March 10 I should say, because Chinese president, Xi Jinping, visited Wuhan. And these things, in Chinese politics, because everything is so well-choreographed, matters a whole lot. The fact that Xi Jinping visited Wuhan signaled that the Chinese government believed the worst was over. The reality was that probably about 20 days before that, the curve had already been flattened. So 20 days before that, probably around February 20, the infection rate was around 75, 000, 76, 000, and it ’ s effectively stayed within a couple of thousand since then. So on March 10, Xi Jinping ’ s visit to Wuhan kind of signaled the worst is over, and then they moved into the recovery and rehabilitation phase. WPR : OK. I mean, if I ’ m hearing correctly – thank you for sharing all of that, it sounds like, although there was a slow period of getting the information out initially, eventually there was quick reaction from the Chinese government to respond to this, lock folks down. And it seems like that had a real impact on flattening the curve in China, in Wuhan. GL : A real impact. WPR : Yeah and I – GL : Absolutely. WPR : Yes, please go ahead, Gary. GL : The date of January 23 was not by coincidence. Because the Chinese New Year holiday started on January 24, the very next day. And the thing is, with the Chinese New Year holiday, is that it is, every single year, it ’ s the largest human migration that happens on Earth. About 400 million people travel during about a forty-day period that would have started on January 24. And that ’ s three billion trips, it ’ s just people traveling all over the country, 400 million people traveling. Now, Wuhan is one of the most important cities in China, although before this, I don ’ t think a lot of people around the world knew the city of Wuhan, but it ’ s extremely important. It is considered the most important city in the center of China for many different reasons, but one of the key reasons is that it is one of the key transportation hubs of the country. So all of the major train lines, the high-speed train lines, the normal train lines, the trade lines, they all kind of converge on Wuhan. So you can imagine if 400 million people start moving around for Chinese New Year on January 24, a huge number of them were going to go through Wuhan. And of course, Wuhan itself is an 11-million-person city. The surrounding cities all added together, Hubei province has about 60 million people, and they were also largely going to travel. And so if January 23 they had not shut it down, and people had started traveling, the likelihood would have been that this would have been really, really hard, possibly, likely impossible to contain. And even though they shut down before the Chinese New Year holiday started, we now also know that at least five million people actually left the surrounding areas and traveled. Which is one of the reasons why it did spread a little bit across the country, and then eventually spread to other parts of the world. WPR : And I ’ d like to come back to that as well, just thinking about the five million people who left and sort of where they landed today and how that affected things, but before we do that, I ’ m interested to talk with you a little bit more about – you mentioned this November date as one of the earliest cases you discovered that was reported was in November, and that ’ s something actually that I hadn ’ t heard before, and I imagine that might be news to a lot of people hearing this, and so I ’ m curious, when you think about the missteps from China ’ s perspective, in terms of what China did, you know, there is, as you mentioned, suppression of information is one thing, one major criticism of how China handled this. And hearing that maybe there was knowledge of something as early as November, if that might have played a role in how we were able to control and contain this a lot sooner. GL : I do want to clarify, from what we understand, officials were not notified about this until mid-December. It wasn ' t – So it was really a couple of weeks between officials realizing that there was a SARS-like pneumonia going around to when the first case was reported to the World Health Organization. It wasn ' t all the way back to November 17. That was retroactively backdated, but that has not been made public by the government. We published it because we ' ve seen the data that actually backdates the first case. From a misstep point of view, again, it ' s a couple of weeks compared to what happened in SARS, which was a long time of locking down on information. This was much shorter, the period of time that the government wasn ' t in complete shutdown mode. But then, after that, of course, there was still continued censorship on the internet, especially within the Great Firewall of China, for communications between Chinese citizens. And you know, surprisingly to some, I think for a lot of China watchers not so surprisingly, is that the government has – the central government – over the course of the last several weeks, actually, I should say probably the last two months, has started to change their tone and to some degree admit that there needed to be better free flow of information. They ' ve changed the official narrative of a couple of different things, including this initial whistleblower, Dr. Li, who unfortunately ended up passing away from the virus, they actually now refer to him as a national hero, they have officially removed the reprimand, the Wuhan police have apologized to Dr. Li ' s family, and they have actually been – a couple of policemen – have been punished in Wuhan for the way that they handled the situation. So there has definitely been an internal shift and there is a lot more sharing of data and information. I can tell you, from Hong Kong ' s point of view, without the open sharing of information between the authorities, between Hong Kong and mainland China, I think Hong Kong ' s response would have been much more different and I think Hong Kong would have suffered because of that. So that much more open sharing of information has benefited this city for sure. WPR : And we have Chris here who has a question, I think, from the audience. CA : Hey, Gary. The online audience, loving what you ' re saying. It ' s so interesting, you ' re giving us amazing new insights here. Just in the current situation where much of – you know, there have been these very few reports of new cases. How much does it feel like life is getting back to normal? Do people really believe that this problem has been successfully tackled elsewhere? GL : I think the sentiment in mainland China is that yes, in China, the problem has been tackled. And people are looking forward to going back to normal life. A lot of the other major cities, Shanghai, Beijing, are starting to get back to work. Many of the factories have now been reopened. The last stat that I saw was that 90 percent of the businesses that had been shut down are now reopened in China. So generally speaking, life is getting back to normal. Wuhan and Hubei are really the last places that are still shut down, with Wuhan being the city that is shut down until April 8. Hong Kong is a little bit different. Hong Kong has actually gone back into a second wave of social **isolation** and **distancing**. A bunch of different companies, us included, as well as the Hong Kong government and the civil **service** has now gone back to work from home. And it ' s because we are starting to see a second wave, but for us, honestly, is the first time that we ' ve had a spike of infections, and it ' s because of imported cases. It ' s because a lot of Hong Kong residents who left Hong Kong prior to, well, actually when the virus first came into the city, are now returning, because oddly enough, the places they escaped to are now more dangerous than Hong Kong. And as they ’ re coming back, a lot of them are actually bringing the virus back with them. And so we ’ re starting to see a spike. Before this week, the highest infection day that Hong Kong had during the first two months of this was 10 infections in one day. Now the highest that we ’ ve seen in the last week was 48. So this is really the first spike that we ’ re seeing, and so Hong Kong is returning back to a state of alertness, to a state of caution, and more and more people are holed up at home. CA : Is it possible, in mainland China, that because of this redefinition that you spoke about, where if someone tests positive, but they ’ re not showing symptoms, that is not reported as a case. That seems significant to me. Is that part of the explanation for why new reports have gone nearly to zero? GL : I don ’ t know if that ’ s the answer to it, but I do actually think that even with – and remember, these are folks that are tested, so the data that we have is that these folks have been tested, the tests have come back positive, but have not been added to the official number of infections, because they ’ re asymptomatic. But they have still gone through the process that is part of China ’ s containment strategy, which has worked extraordinarily well. Which is, first of all, lots and lots of people have been tested. And then once – if there is a positive test return, regardless of whether or not they ’ re symptomatic or asymptomatic, regardless of whether or not they ’ re added to official numbers, what happens next is that they are **quarantined**, they ’ re isolated, and contact tracing happens. Contact tracing is a key, key, key **action**. And so they go and figure out where this person has been moving, where they ’ ve been, who they ’ ve been in contact with, and all those folks that they ’ ve been in close contact with, they get tested. And if they come back with a positive test, then they ’ re also isolated and they go through the process again. So China has not been testing people, finding that they ’ re asymptomatic and then just releasing them and letting them go home. That ’ s not the case. WPR : I think to that point too, Gary, what you mentioned about this trace-testing and being able to figure out who people have been in contact with to figure out who may also have been infected, you know, when you look at what ’ s happening in other parts of the world, you hear in the United States, where Chris and I are based right now, you ’ re hearing that people who are experiencing symptoms, have symptoms cannot get tested. You know, how does China ’ s ability to test so many people affect the way that they can respond to this and control this virus? GL : It really matters. Without the significant testing and without the contact tracing that comes afterwards, I don ’ t think there ’ s a way that China could have contained it the way that they did. The same thing here in Hong Kong. If we didn ’ t have both of those, as minimum requirements in a health system, Hong Kong could not have contained it. And this is actually the reason why South Korea is the only other country besides China that has managed to flatten the curve, is because they aggressively tested. I think by far the highest per capita testing anywhere in the world, as far as we know right now. And they aggressively did contact tracing. And because of that, even though South Korea had this huge spike, and we thought that it was going to get out of hand, they were able to suppress it, control it, and now they ’ re in a much, much better place. WPR : One thing you mentioned earlier that I ’ d love to talk about, too, is SARS and the impact of going through that in 2002 and 2003 for China, other countries in Asia, Hong Kong. You know, what effect did that have on everyone ’ s preparedness in that part of the world for the COVID-19 outbreak? GL : It was significant. I think the institutional and social memory of SARS matters a heck of a lot, when you look at China, Hong Kong, South Korea, Singapore, Taiwan, Japan, a lot of these countries in Asia have dealt with COVID-19. Let me use Hong Kong as an example, because it ’ s the one that I know the most intimately. But a lot of what I ’ m about to say actually does apply to those other areas of Asia. So for context, SARS, November 2002 to July 2003, very, very similar **coronavirus** to COVID-19, I think there ’ s about an 80 percent similarity to those two viruses. The global infected number was a little over 8, 000, 774 deaths. So by percentage, deadlier than COVID-19 is but far less infectious than COVID-19 is. Now here ’ s why it impacted Hong Kong so much, and why the memory is so deep, and actually it tells you a lot about Hong Kong ’ s reaction to COVID-19. Of the 8, 000 infected, 22 percent were here in the city of 7. 5 million, and 40 percent, actually 39 percent of the deaths, 299 people died in Hong Kong. Thirty-nine percent of the global deaths happened in Hong Kong. And SARS did not start in Hong Kong, it was imported into Hong Kong from southern China. And so SARS, again, deep, deep memory, but it was a massive turning point in the Hong Kong health care system and also the social **practices** of the city. And let me walk through some of that impact, because you can actually still see it, even before COVID-19, you see it every day. The health care system was able to really, very quickly, ramp up in capacity, because of preparation post-SARS. So after SARS, the Hong Kong health care authorities started preparing for greater capacity, especially for infectious diseases. There were new health alert systems, **warnings** and treatment protocols put in place. I can tell you that a lot of folks that were here before SARS will tell you that in Hong Kong hospitals, before SARS, it was actually rare to see even medical professionals wear face masks. And now surgical masks are ubiquitous, not only in hospitals, but across the entire city. Anytime, anywhere, it seems, especially right now. New channels of communication and data and information exchange were opened up with mainland Chinese authorities, and technology was implemented, including now a supercomputer that actually does contact tracing in Hong Kong. You could trace the existence of the supercomputer and this contact-tracing ability back to changes that happened post-SARS. On the social side, there was also a huge change. The first thing I have to talk about is, of course, masks. Now, I know that there is still not consensus everywhere in the world about whether or not masks actually help in this situation. I know that the World Health Organization as well as governments like the US, as well as Singapore, say that only medical personnel as well as people who are actually sick and showing symptoms need to be wearing masks. In Hong Kong, everyone wears masks. And the government, even though they flip-flopped a little bit during this epidemic, the general, the guidance is that everyone should be wearing masks. That started in SARS. Ninety percent of Hong Kongers during SARS wore masks, and that habit actually stayed with Hong Kongers, and so generally speaking, even outside of the pandemic, when people are sick and coughing, you ’ ll see them wear masks out in public. On top of that, there was – it became systemic, or I should say systematic controls for hygiene in social and public spaces. So if you visit Hong Kong, again, before all of this happened, you would have noticed that public spaces are constantly being disinfected. One good example that everyone notices is that when you go into an elevator in public spaces, in buildings, they will either have one of two things, potentially both. They ’ ll either have a sign that tells you how often the elevator buttons are disinfected, or there will be a plastic, piece of sticky plastic, like a plastic sheet over the buttons so it effectively becomes a flat surface. When you eat out, Hong Kong is obviously famous for its dim sum, and one of the most famous things about Hong Kong dim sum are the dim sum carts, which are also very popular in New York ’ s Chinatown, as an example. Those dim sum carts, they pretty much went away after SARS. And so most dim sum restaurants that you ’ ll go to in Hong Kong now, the vast majority of them, you have to order off of a menu, you don ’ t have public carts going around because of hygiene issues.

In most nice Chinese restaurants in Hong Kong now you will get, when you sit down, two pairs of chopsticks per person. And those two pairs of chopsticks are different colored, because one is used to grab food from the center of the table to your plate, and the other one is for you to take the food and put it in your mouth. And honestly, there are hand sanitizers and hand-washing notices literally everywhere, and this is just part of the social behavior after SARS. Safety protocols in offices, everyone knows how to shut down an office and control traffic really well. Most major offices have temperature-check machines at the very least available, and then, of course, social **distancing**. People understand social **distancing** is important, and so the moment there was fear of what was happening across the border, naturally, people started social-distancing activities and self-quarantine became pretty normal. So those are all the social things as well as the health system things that kind of changed, and because of that, Hong Kong was able to react really, really fast, not just the government, not just the health authorities but the people of Hong Kong, and I think that ' s the most important part, is that the entire city, that the community reacted and went into this mode where you wore masks, you washed your hands, you carried hand sanitizer, you stopped going to public places. WPR : I ' m curious then, I think a lot of people who are listening at home and figuring out how can we apply some of those things here, and from where you sit, and when you see what ' s going on in other parts of the world, where maybe people are **struggling** to make some of these changes. You know, what are some of the specific things you think folks can adapt in their own cultures, in their own countries? GL : I think communication is a huge deal. If you talk to local Hong Kongers, they will likely opine that the communication from the Hong Kong government has not been top notch. But thankfully, there have been other authorities and certainly even just person-to-person communication has been pretty strong. A lot of corporates have done an incredible job in Hong Kong in communicating very transparently with their employees and insurance companies have also been making available all sorts of webinars and materials and made it actually quite easy for people to understand how to get tested, where to get tested, who to get tested. And so that communication, I think, has centralized, to some degree, the messaging. In a city like Hong Kong, everyone generally believes the same thing, and what they believe is generally true. Of course, there ' s still misinformation issues, as there are everywhere. But I think, possibly also because of SARS, because over the course of the 17 years, a lot of the misinformation has now been vetted, everyone knows what is true, so there is already, sort of, an internal radar or at least alarm bell for things that seem to be wrong. So I think communication is really important, from government, from corporates anywhere in the world. And I think if there is a recommendation for health systems, I know getting tests is really difficult. One of the things that has made testing in China and Hong Kong certainly so effective, is that there is point-of-care testing, that still really doesn ' t exist, or at least doesn ' t exist in volume in the US. And so they have to save these tests and only a certain number of people can get tested, the triage system then becomes overflowing. Whereas here, generally speaking, everyone can get tested, and then of course, the contact tracing. Everyone knows that if somebody that you ' ve been in contact with tests positive, you ' re going to be called in by the hospital authorities and you ' re going to be tested, and then if you ' re positive, everyone you ' ve been in contact with for the last two weeks will also be called in. And people don ' t really see it as an annoyance, it ' s just what needs to be done. And I think because of that, again, the containment has been effective. WPR : Great. And we have a question from Chris here. CA : Gary, it actually builds on the point you just made, people are puzzled online, how is it that China avoided the explosion of cases in big cities like Beijing, Shanghai, where people were coming there from Wuhan. How on earth did some of those cases not explode? Was it just down to really diligent contact tracing? GL : I think it was a combination of things. First of all, the shutdown of Hubei province certainly helped. And then, the major cities actually went into **isolation** and **quarantine** as well. Remember, it was Chinese New Year, so there was no one working that week. And so everyone just went home. And generally speaking, in most major cities, they locked their doors and they didn ’ t leave. Now, China is very prepared for this, because the technology stack in China, including consumer site **services**, make it really easy to lock your doors and get everything delivered to you. This is infrastructure and this is consumer behavior that is already ingrained, especially in major cities across China. So people just went home. There was also a stigma issue, which is unfortunate for people from Hubei, and especially from Wuhan. But there are plenty of stories in the other major Chinese cities where anyone coming from Hubei or with any connection to Wuhan were ostracized during those early days, especially after the Wuhan lockdown. And so folks that might have been, in fact, carrying the virus, because they were from the epicenter, they were either self-quarantined, or they were forcibly **quarantined**, because no one was going to spend time with them anyway. So I think for a lot of those reasons, some of them social, some of them systemic, they made it so that there was much less person-to-person contact, especially after the authorities admitted that human-to-human transmission was possible. CA : Hospitals here in New York, there are **warnings** that they ’ re about to get overwhelmed. What can we learn from what happened in Wuhan, some of the scenes from there were horrifying, but there were amazing stories as well. What should we learn from what happened there? GL : Well, it started off horrifying. So in the early days, post-lockdown, all the stories coming out of Wuhan, we had journalists that were there right before the lockdown, they got out about three hours before the lockdown happened, and we had people what ended up having to be **quarantined**, because they were stuck in Hubei. As well as a lot of citizen journalists that were documenting what was going on, and those images, like you said, Chris, were horrifying. There were videos showing people literally laying on the ground. Some were just so sick they couldn ’ t move, others had already died and they were just covered with plastic sheets. There were nurses and doctors that were just crying in front of the camera, begging for help. And so, I think it ’ s important to understand that China ’ s health care system did not just immediately become effective. And certainly not in Wuhan. There was not that much information, people didn ’ t know what they were dealing with. Certainly, the authorities were trying to help, I think at that moment, but again, the information flow was not that free. And during lockdown, people were screaming off of their balconies, because they couldn ’ t get food, they couldn ’ t even go to the hospital, because the public transportation systems got locked down. Remember, this is not, Wuhan is not a city like New York where most of New York is walkable. For people who don ’ t have cars, and many, many of the Wuhan residents don ’ t have cars, if the buses are locked down, then they might have to walk three, four hours, to get to a hospital. Maybe not that long, but they have to walk a long way to get to a hospital. And so a lot of people were just stuck at home, and they were unable to initially get any diagnosis or any health care. And so it was a disaster. But then the capacity actually ramped up. The triage system became extremely effective. I think most people have heard now that there were two massive hospitals with thousands of beds of capacity that were built within 10 days. And this is true, they came out of nowhere, they were literally just parking lots or flat ground, and two major hospital units were built up. To be clear, also, those were the triage units for those who have very mild symptoms. But that ’ s really important. Being able to get people with mild symptoms out of the major hospital systems, so that they ’ re not taking up the resources of nurses and doctors, they are not taking up the diagnostic equipment for the second confirmation tests, and also, especially, they are not taking up **isolation** wards and ventilators. And so the moment people started being moved out, the mild symptoms, the ones that were going to survive and they just really needed to be separate from family and have some antiviral medication, once they were moved out into these new hospitals, the main hospitals in Wuhan and across Hubei could deal with the primary patients, especially those that are critical, of the overall tested population and do their best and try and save them and make sure that they ’ re not highly infectious. At the same time, I think that the health authorities in China, especially the nurses and the doctors, did a very good job of also protecting themselves. So there have been far fewer, by percentage, infections and deaths, of medical staff than there were during SARS. CA : I mean, to respond that effectively took a kind of top-down drive. Plus a willingness of a lot of people to risk their own well-being in a way for their perception of what they had to do for the public good. You are well aware of the cultural differences between China, Hong Kong and the West. Do you – how do you rate the chances of, say, the US responding effectively should things really explode here, as they seem like they may be about to? GL : In the health care system side, I have every confidence that the US health care system is going to be able to respond well. I have many, many friends who are medical professionals in the United States, and they are raising their hands and volunteering and going to hospitals to see where they can help. So I have full trust in the system, and the people that man those systems. Our health care capacity in the United States is also significantly greater, doctors per capita, than in China. And because of the fact that also, our health care system is not just relying on hospitals, but there are primary care physicians scattered all over the country, as long as the testing capacity and testing kits are available across the country, general practitioners can actually administer those. And it certainly sounds like more and more med tech **start-ups** in the US are now trying to create these home kits, so that people can start testing at home. That will help a lot. My hope is certainly that the citizens of the US, that people are going to take this very, very seriously and realize that it doesn ’ t matter that you may not feel sick, it doesn ’ t matter if you think you are young and that you are not prone to catching this virus, or that you ’ re not in – you may not be fearful of dire consequences and death. Take it seriously and stay home. And don ’ t go to public spaces, and don ’ t be a carrier, because we now know that asymptomatic folks can be carriers and there is a possibility that you can be infectious as an asymptomatic carrier. So yeah, on the cultural side – I don ’ t think it ’ s really cultural. I would say that it ’ s because of the impact of SARS, it ’ s because of the social memory of SARS that has meant people are a little bit more selfless, and have just said,”OK, I will stay home, because I might have come in contact.”CA : Yeah, weirdly, SARS seems to have acted as its own kind of vaccine, sort of just prepped the system enough for people to be ready. Yeah, social vaccine, amazing. Back to you, Whitney. WPR : OK, great, thanks so much, Chris. And so I think it ’ s interesting, Gary, to hear you talk about some of the reactions in Wuhan and some of the stories that you ’ ve heard, especially running the”South China Morning Post”and running a news organization during this outbreak. You know, what are some of the – First, what is that like, to run a news organization, to report during this outbreak? GL : Well, running a news organization in a moment like this, so close to the initial epicenter where the outbreak started, is complicated. We were lucky, very, very lucky that most of our senior editors, and certainly the most senior editors, our editor in chief, our masthead leadership, they were all journalists and they were **reporters** during SARS. So there ' s a lot of pattern recognition in our newsroom. Which meant the moment that we got the first, sort of, the first stories coming out of China, starting on December 30, people already raising their hands in the newsroom saying,"Hey, we ' ve got to report about this like it ' s going to be the next SARS. There ' s a high likelihood that this is it."And we did send people to Wuhan early on in January. Like I said, we also had **reporters** there right before the lockdown. After the lockdown, we were lucky enough to pull all of them out of Wuhan. But we actually did change very quickly the way that we report. Partially to make sure we got the story right, to dig deeper in the places that we knew we had to dig deeper, but also to protect our journalists and employees. So one of the things that we did do, and maybe other news organizations would disagree with our decision, was I think in late January or early February, even in Hong Kong, we said to our journalists,"You are not to go into hospitals."So no more in-hospital reporting. Because they were – we knew that it was highly infectious, we were worried that they were going to become you know, points of spread, and we just wanted to protect our employees and our company, so we did that. We also had a business continuity plan. Which meant that at the drop of a dime we could shut down the entire office and still operate this global news business. Some of the most interesting stories we ' ve covered is actually how technology has played a huge role in China during this epidemic. Because it frankly has changed the way that diagnostics work, it changed the way that containment works, it certainly has changed the way that consumer life works. And of course, there ' s been a lot of instances of really interesting censorship, but also, more interestingly, how the Chinese netizens have fought that censorship and reacted to that censorship. And I do think that there ' s quite a lot of lasting impacts that are likely to happen because of technology deployment during this time. WPR : And so I think in talking about some of those lasting impacts, now that you as a country are sort of emerging from this and coming on into a different stage with this outbreak, what are some of the changes you ' re seeing to **daily** life, both as society, and maybe things that you ' re hearing that individuals are experiencing as a result of this? GL : Yeah, I think probably the two most interesting changes, actually, I should say three – The first one is on education. Now schools have been shut down across China for quite some time now and again, this might feel a little bit stereotypical, or a caricature of China, but education is extremely important to the country and extremely important to the citizens. And we were actually just about to come up to the national exams, which these students work 18 years for. And so online education – very, very quickly moved online. And part of that move online was that courses had to be, and classes had to be recorded. Which means that now, there ' s this huge repository of recorded classes. That means potential democratization of education material, and significantly lowered costs to get this type of coursework from the top tiered schools, whether it ' s high schools, universities or primary schools, to the entire country. Now whether or not China activates on that, we ' re still not sure, but the potential is there. The second major shift is really on distributed **workforce**. The idea of working remotely, office work remotely, is not much of a concept in China and across most of Asia. Certainly far less than in the United States. And I ' m from the US tech industry, so it was pretty normal, it ' s pretty normal in the US tech industry even before this, in China much less so. But because of the lockdowns, not only in Hubei but across China, this has become much more normal. And people are kind of falling into a different rhythm of work. And most importantly, this has given rise to a whole new set of teleconferencing companies in China. Because most of the teleconferencing companies that we know of in the West, whether it ’ s the Cisco systems, Google Hangouts, Zoom, that everyone uses, BlueJeans, Slack video, they ’ re not available in China. They don ’ t work in China. There is this mirror internet in China, behind the Great Firewall, and so there ’ s a whole new set of teleconferencing systems that were used, but were not really commonplace, certainly not for distributed **workforce**, and now suddenly, over the last few months, they are. So it will be interesting to see how those companies and those **services** develop, and whether or not the **workplace** changes in China. And then finally, the third thing that is really interesting is that there was a huge internet response to this censorship issue in China over the course of the last two months. It especially exploded after this whistle blower, Dr. Li, died on February 7. All over the Chinese internet hashtags like”we want freedom of speech,””national hero Dr. Li,”things like that just exploded everywhere. And there have been – And actually the Chinese government has had to respond, I think for observers, a lot of observers believe that Chinese government ’ s change of narrative about Dr. Li was largely driven by this reaction from its citizens across the internet. There have been extremely creative examples of people getting around censorship. I think China is quite famous for using emojis to get around tech censorship. I think most people also know that the primary messaging app that the Chinese internet users use, called WeChat, it is heavily censored, it ’ s not just text that ’ s censored, images are censored really effectively, individual conversations are censored. And so when there are specific articles or specific posts that are about what ’ s happening with the virus that people want to share, and the government thinks that it is detrimental to whatever, they will censor and it will be completely and very effectively removed. But this time around, Chinese citizens used emojis again. They translated these posts into ancient Chinese texts that the censoring machines couldn ’ t pick up yet, they actually translated one version of this post into Tolkien ’ s Elvish language, I don ’ t even know the name of that language, they translated into that and the AI couldn ’ t pick it up. And then finally, I think one of my favorite versions of this was they used the”Star Wars”intro, the angled text **scrolling**, it became a video, and they had the entire post about what was going on in Wuhan in that format, and that went all over the internet. So I do think that there is going to be an increased call. Academics now are speaking up about freedom of speech. So there ’ s going to be this increased volume of netizens calling for freedom of speech. It will be very, very interesting to watch how the authorities in China deal with that. WPR : Great. And Chris, you have a question? CA : Yeah, it sort of picks up on that about, you know, the stories that could come out of this. I mean, there are definitely optimistic stories that people are feeling, that this could lead to more free speech of a certain kind in China. Certain things you can ’ t suppress. Maybe in the US it might lead to the government taking scientific predictions more seriously, not clear that ’ s happening yet. And there ’ s hope that this whole thing, because it ’ s a common enemy for the world, will actually bring the world together in some ways. But I ’ m curious how you think about this. President Trump started referring to this as the Chinese virus. I ’ m curious how that ’ s being received in China, and how people are feeling on this issue. Do you think it ’ s increased sympathy for other countries or actually dialed up animosity? GL : Well, it ’ s certainly not being received well across China. I think one thing that is still really undercovered is the intensity of rising nationalism at the grassroots level across China over the last several years. And they ’ re very protective of their country, and their people and their history. And President Trump ’ s comments and the fact that so much of the US government is now referring to this as the Chinese virus is not received well. You know, my fear of course, is that even prior to the virus, the US-China conflict was escalating beyond anything that I think most of us as observers want to see. Trade, tech, military, ideology, and now we can add information conflict and health conflict, health tech conflict especially, to the list. Of course, the hope is that these heightened tensions will actually dissipate and that the two countries can actually, at this moment in time, choose to go down one of two paths. Either one that further damages the relationship or one that actually shows what the possibilities are if the two largest economies in the world, the two most powerful countries in the world, actually cooperate. You know, this week, Thursday is the G20 conversations that are going to happen remotely. It will be interesting to see how US and China actually coordinate, cooperate, how they communicate during those talks. CA : I think people want to know how you think this will play out. You ' ve got a very **special** seat there, you know, looking at all parts of the world in it. What ' s your take on how this plays out? GL : I desperately want to be an optimist, Chris. But I think that everything we see, especially the data, shows that it is going to get far worse before it get better. And I ' m very fearful for what ' s going on in the United States. It ' s because of the amount of data we have across all these different countries, you can very clearly layer countries and the way that the pandemic has been spreading, on top of one another, and we know that the US is a week and a half, maybe two weeks, behind Italy, and we know what happened in Italy and what ' s going on in Spain. The US is catching up on that spike and it ' s going to come much faster, and it ' s going to be much higher than I think most people originally believed or hoped for. So it will get worse. So the hope is that, again, this is going to be the optimistic side of me, that the nations will come together, that those in charge, our governments, will make the drastic, necessary moves, and we will be able to come out on the other side faster than it looks right now. Remember, when China went to shutdown, on January 23, there were only 830 confirmed cases. And even if those numbers are not exactly accurate, it ' s nowhere near the confirmed cases that we have in the US right now, that we see in the US. So that is something to be very, very concerned about. At 830 they shut down. And even after the shutdown, two weeks later, the cases had grown to 35, 000, two weeks after that, it was at 75, 000. So at this point, it is late in the US. But, we, you know – it can still be fixed. And I think most... experts that we talk to believe that it can be fixed with fast and decisive **action**. CA : Yeah, people **struggle** with understanding the power of exponential growth. And a number can seem smallish today, but if you believe the science, yeah, you have to act. Gary, look, I hope somehow you will convey to whomever you can convey that regardless of what some people might say, in government or elsewhere, there are millions, there are tens of millions, there are probably hundreds of millions of people in the US, on both right and left, who are amazed by what happened in China. You know, yes, missteps early on, whatever. But they ' re amazed, you ' ve really – you know, both the Chinese government, the Hong Kong government, several Asian governments, Singapore, South Korea, have shown astonishingly wise and disciplined **action** against this thing. And we ' re grateful, we feel there is much we can learn from you and so – People, most people want this to be a time of bringing the world together. I genuinely believe that, it ' s maybe the optimistic part of me believing it. But I believe in it, it ' s partly what these conversations are for, to try and make those kinds of connections. We want to keep in touch. You ' ve got an amazing seat there, and I have loved listening to every word you ' ve said today here. It ' s just I ' ve learned so much from you. So thank you for that. GL : It was a great conversation. WPR : Thank you for your insight. CA : And thank you to our whole online audience, I mean, this is a journey, every day we ' re learning something new. And just in case anyone out there is feeling a little bit powerless, and afraid or you know, at the situation, I mean, the one thing that everyone can do right now, I think, is we can reach out to the people we know, we can encourage each of us to be our best selves in this moment. I really think it ’ s what the world is going to need, when people are angry and fearful, we can turn into nasty people. But when we ’ re – When we realize how much we need each other, and are willing to just reach out and share stories of hope and share what we ’ re feeling and share possibilities, we can really impact each other, and I see so many incredible instances of that from around the world, whether it ’ s Italians singing to each other joyfully from each other ’ s balconies, or these sort of tales of heroism that some of our health workers have been engaged in all around the world. There ’ s going to need to be a lot more of that. And honestly, every single person can play a part in how they are online, what they share, how they react. So I don ’ t want to be overly, embarrassingly Kumbaya, but I kind of think we need that spirit right now a little bit. We need each other, and TED is going to try and play that role a bit. So if you hate that, maybe you don ’ t need to be here, but I hope you don ’ t hate that. I hope you like that and will be part of it. Whitney, it ’ s so fun cohosting these, thanks to the rest of the amazing TED team who are everyone in our individual homes, they are sort of racing around, trying to make this stuff work technically. We ’ re learning a bit each day, I hope. Thanks so much for being part of this. WPR : Thank you, everyone, thank you. We ’ ll see you all back here tomorrow.

Text Sample 176: POS Dim 2 – 2020 – Score 15.00 – 2020/t004010.txt

As a small child, I was lucky to be at the launch of Apollo 17, the last manned **mission** to the Moon, and I ’ ve remained enamored with space ever since. And fortunate as a physician to have contributed to NASA life sciences research and to **practice** aerospace medicine, inspired by the cross-disciplinary teamwork required to tackle audacious challenges and how space is has often brought the world together through the lens of seeing our planet as one without borders. Now, just as the historic Apollo moon landings were transformational inflection points in history, so too is the global health crisis of COVID-19, which, despite its many challenges and tragedies, like the sinister Cold War **setting**, which launched the space race, can have silver linings. As Regina Dugan, former head of DARPA, wrote,”Sputnik set off the space age, COVID can spark the health age.”The silver linings include the unprecedented acceleration of innovation, collaboration and discovery, catalyzing a future of health and medicine that can help us reimagine and bring us a healthier, smarter, more equitable post-COVID world. Now, many solutions ride the rails of rapidly, exponentially developing technologies that are rapidly doubling in their speed-price performance, as exemplified by Moore ’ s Law, which has enabled the billionfold improvements in memory and computation, resulting in the ubiquitous supercomputer smartphones most of us carry in our pockets. I still have my now ancient iPhone 2 here. Still works, which felt magical 12 years ago but now feels slow and kludgy. And I ’ m sure my iPhone 11 will soon seem antique, perhaps as its features dissolve into the rumored to soon arrive augmented reality smartglasses. Now exponential technologies packed into our smart devices are becoming increasingly medicalized, with sensors able to detect an ear infection and more. So what used to fit on a desktop computer now fits on our wrist and these are now entering the domain of FDA-approved medical devices. But the future isn ’ t about any one technology, but their convergence as they get faster, cheaper, better. In fact, creating entire new fields at their interfaces, from computational biology, robotic surgery, digiceuticals, telemedicine to AI-enabled radiology. And while many industries have been disrupted and breached the fourth industrial age, health and medicine often feel stuck in the second or third. Critical data is still stuck being shared on fax machines, paper forms. We ’ re stuck in waiting rooms waiting for our visits. I recently had my own echocardiogram only made available to share with me on a CD-ROM. I don ’ t even own a CD-ROM player anymore. Tools for managing pandemics in 2020 rely on the same core technologies used in the pandemic of 1918 : face masks, social **distancing**, handwashing. So part of the challenge in advancing global, local health are our models, our mindsets. We don ’ t really **practice** health care. We **practice** sick care. Sick care is based on intermittent episodic data, usually only obtained within the four walls of the clinic or hospital bed, and leads to our reactive sick care model, where we wait for the patient to show up in the emergency room with a heart attack, stroke or late-stage cancer or for the pandemic to arrive on our shores. I believe the convergence of many of the accelerating technologies and approaches being catalyzed by COVID will bring us from intermittent sick care to an age of continuous, proactive, personalized, crowdsourced health care that can increasingly bring care anytime, anywhere more effectively and lower costs around the planet. For example, the convergence of ever smaller interconnected devices now riding 5G is creating not just an Internet of Things but an Internet of Medical Things. Much of this convergence is in the field of digital health, the ability to connect the dots between data sources from personal genomics and medical records with apps and **services** that match the needs of an individual, patient or caregiver. And as incentives and reimbursements align, COVID has pushed us to an increasingly virtualized care, from the hospital to home to our phone to on and even inside our bodies. The age of hospital to home-spital is upon us. Now, the challenge of this hyperconnected age is that we ’ re creating exponential amounts of big data that ’ s too often siloed in formats that can ’ t even talk to each other. So we need to narrow that gap between data, turning that into actual information for the patient, physician, public health worker, and speed its safe and effective use in the community clinic and bedside. The pandemic has instigated an immense amount of international sharing and collaboration amongst clinicians and **researchers** to narrow that gap. What was learned in managing patients in Wuhan and then in the intensive care units of Italy has helped New York City hospitals and their learnings in turn have spread to centers around the world. Let ’ s take a quick dive into some examples of what ’ s happening across the health care paradigm in the age of COVID and the implications for the future. From new forms of data to help prediction of prevention to faster diagnostics, more tailored therapy and increasingly crowdsourced discovery. Let ’ s start with prevention. Now, while our genomes impact our health outcomes and our health spans, our social determinants of health, our social, and our day-to-day behaviors drive most of our risk for disease and associated costs. And we now have an explosion of new tools to help measure and improve our healthy behaviors. The first Fitbit only launched in 2009. Wearables are now ubiquitous and can measure almost every element of our physiology, behavior and even mental health. And they ’ re evolving all the way from disposable tattoos that can stream vital signs 24 / 7 to an integration of big data that can – Even small data from a simple wearable, tracking the patient discharged home after a hip replacement or a **coronavirus** infection can determine if the patient is recovering as expected, walking more, doing great or not so great and trigger early intervention. We ’ re evolving from a world of quantified self where our digital data remains silent on our devices to one of quantified health where the data can be shared securely with clinical teams and **researchers** to help optimize prevention, diagnose disease early and with feedback loops, personalize and optimize therapy. From wristband vitals, including blood pressure, now obtainable without a cuff, and soon sensors that will measure our blood oxygenation levels to continuous blood sugar monitoring, to shock ' ables, hearables, ring ' ables that can replace an entire sleep lab fitting on our finger to inside ' ables, chips beneath our skin, to track our physiology and lab values, to even underwear ' ables, Internet of Medical Things sensors so cheap today you can get a pack of ten of them, have one on each pair of your underwear, now being used to do what ' s called remote patient monitoring to help detect signs of respiratory decompensation of patients with bronchitis or COVID. Breath ' ables are showing promise. Nanonoses that can detect molecules in our breath correlating to cancer, metabolic disease and even diagnosing infectious disease. In fact, we now don ' t need to wear anything. Invisibles, ambient sensing from AI-enabled cameras can track her vital signs. To voice as a biomarker to manage and detect mental health challenges, signs of heart disease, now being able to differentiate between a cough from a common cold to that one caused by **coronavirus**. And we ' ll soon be exuding our digital exhaust 24 / 7, our digitome. How do we make sense and truly leverage it? One path is through crowdsourcing. The million-participant All of Us **trial** from the National Institutes of Health is doing just that where data donors, and I ' m one, can contribute our medical records, genomes and wearable data to build a much better and diverse data set, crossing racial and socioeconomic groups to help foster better precision medicine for all of us. Integrating this information for the individual and public health will lead to predictalitics, our own personal check engine lights that can give us early proactive **warning**. And recent work is demonstrating that wearables can detect presymptomatically the onset of the **flu**, or, as recently published by Stanford, in 83 percent of COVID patients smartwatches can detect COVID infections early, often days before onset of symptoms. Self-reporting websites like Covid Near You enable us to locally generate infections maps, and combined with our social graphs and contact tracing apps, may provide us detailed suggestions about who we might want to consider being near or socially distanced from. What about advancements in diagnostics and monitoring? What used to require a full clinic or laboratory can now fit into a digital doctor ' s bag or the pocket of a patient. From COVID **quarantine** kits enabling tracking of oxygen saturation, temperature and lung sounds, we ' re starting to integrate these into virtual visits, providing real-time enhancements of a virtual physical exam. And the diagnostic tools are becoming increasingly infused with AI machine learning, including consumer ultrasounds, which can bring diagnostics anywhere at very low cost, including the ability to evaluate the lungs in suspected COVID patients. The laboratory has shrunk to microfluidic **platforms** that can be attached to our smartphones and enable anyone to take measurements from blood or saliva. Many of these diagnostics are leveraging the smartphone and its camera for a medical selfie. For example, instead of taking your urine to the lab to diagnose a potential urinary tract infection, in the **privacy** of your home simply dip the urine dipstick, take a picture with your smartphone camera and have the results made available immediately to your doctor and pharmacy. Similar phone-based apps and approaches are being used and developed for fast, frequent, cheap and easy COVID testing. Novel approaches to community level diagnostics are also being explored, including next gen sequencing of sewage for early detection of COVID-19, identifying hotspots and predicted outbreaks a week or more early. The explosion of data sources, however, is really beyond the capacity of the human mind to effectively integrate. We ' re now getting help from AI, or as I call it, IA, intelligence augmentation. IA is being leveraged in reading CT scans to diagnose COVID, to enhancing the vision of a gastroenterologist performing a colonoscopy to identify lesions they might have missed. And AI is playing an active role in helping identify and develop new antivirals. And while AI is often perceived as a threat by some clinicians, it can ’ t replace the human touch or **empathy**. And I don ’ t think doctors or nurses will be replaced by AI, but doctors and health care systems who ’ re collaborating with AI in the future will be replacing those who don ’ t. Finally, therapy. The pandemic has dramatically accelerated the use of virtual visits. Telemedicine visits are up on the order of a thousand percent in many **settings**. And I don ’ t think we ’ ll ever revert to pre-COVID levels as patients and clinicians are discovering the compelling convenience and efficacy. Even before virtual zoom or facetime with the clinician, asynchronous screening and support has been provided by ever-smarter chat bots that can help discern symptoms and triage problems effectively at lower cost. This includes virtualization and virtual augmentation to meet our mental health crisis, exacerbated by the many economic and other stressors which accompany this pandemic. 3D-printing is finding a role in health care, with newfound applications from printing personal masks to critical parts of ventilators and being leveraged by the growing maker movement, which is playing a major role in pandemic response, from making face shields and masks to improvising do-it-yourself ventilators. All together, these efforts are enabling the potential for democratization of health and medicine across the planet and access to information and care that was previously inaccessible. Clinical **trials** are being reshaped, leveraging smart devices, cloud-based analytic **platforms** and collaborators around the world. That ’ s at this convergence of many rapidly developing and exponential technologies that we have the real potential to reshape and scale health care at our pandemic age. One where we can dramatically expand access to basic health care, increasingly personalized and proactive, leveraging the scale of digital **platforms** and technologies, enhancing digital connection and **empathy**, and the ability to blend virtual and in-person care, and leveraging the power of the crowd to share and build better maps that guide our individual health and public health journeys, and to develop validated and scaled solutions. So imagine a new generation of volunteers, a global health corps similar to the volunteer paramedics and firemen of today that can be upskilled, use the powerful new tools to respond early and collectively to enhance contact tracing, **isolation** and **quarantine**, and to help identify and address social and other disparities. So coming full circle. Twenty four years after I was at the launch of Apollo 17, I found myself as a medical student on a research clerkship at Johnson Space Center. And much to my surprise, one day in the clinic, I ran right into Gene Cernan, the Apollo 17 commander and the last man to walk on the Moon. After enthusiastically sharing my childhood memories of his launch, he shared one of his famous lines :”I walked on the Moon. What can ’ t you do?”Indeed, what can ’ t we do if we work together as one in the face of this pandemic? And just as the near tragedy of Apollo 13 rallied NASA to work creatively and collectively, so too can this in our pandemic age lead to our finest hour, bring on a true health age. I believe this is possible if we all get out of our linear mindsets, take exponential steps and collaboratively go forth collectively, not only to solve the challenges of this pandemic and predict the future of health and medicine, but boldly to go forth together to accelerate a far better one for everyone on Spaceship Earth. Thanks.

Text Sample 177: POS Dim 2 – 2020 – Score 15.00 – 2020/t004286.txt
Corey Hajim : Hi, Chris, how are you? Chris Anderson : I ’ m very well, Corey,

it ’ s absolutely lovely to see you. CH : It ’ s great to see you, too. CA : Somehow, you ’ re always smiling, no matter how dangerous, weird, crazy things are. Thank you for that. CH : You don ’ t see me in the other room crying afterwards, but we ’ ll leave that for the other [unclear]. So Chris, this is week three of these conversations, how are you thinking about the people we should be speaking with? CA : I mean, there are so many aspects to this, right? There ’ s understanding the basic pandemic itself and all the science around that. There ’ s the psychology that we ’ re all going through, the **mindset**. And we ’ ve had speakers addressing both of these. And then I think increasingly, the conversation is going to be”what now?””How do we dig ourselves out of this? What ’ s the way forward?”And there ’ s a couple of speakers this week focused on that. And I think it ’ s – These conversations are incredibly rich, because I think one of the things that people have got growing consensus on is that step one, we kind of get, right? You shut things down, physically distance in whatever way you can, different countries have gone about it slightly differently, but basically that”flattens the curve,”ultimately, the number of cases, the number of infections slows down. And, but then what? Because you can ’ t go back to life as normal, when you ’ re living at home completely. You could do some things, but you can ’ t. And so that ’ s what we ’ re going to talk about today. CH : Right, it feels really hopeful to talk about some **actions** we can take besides just staying away from everybody else. So, well, I guess I ’ ll pass it over to you to introduce the speaker, and I will come back a little bit later to share some questions from our audience. CA : Thanks so much, Corey, see you again in a bit. CH : Thank you. CA : And yes, if you know anyone out there who has just got stuck on,”But how do people get back to work?””Where do we go from here?”Those are the people who you should, maybe invite them into this conversation right now, because I think they ’ re going to be really interested. Our speaker, our guest is a professor at Harvard, Danielle Allen. She runs, among other things, she runs an institute for ethics there, the Safra institute. And fundamentally, she ’ s thinking about the ethical questions about what ’ s happening here, but she has pulled together an extraordinary multidisciplinary team of economists, business leaders and others who have put together a plan, and I ’ ve been obsessed with this whole thing and how we find our way out. This plan is as compelling a plan as I ’ ve seen anywhere. So let ’ s dig into it without further ado, Danielle Allen, welcome here to TED Connects. Danielle Allen : Thank you, Chris, happy to be here. I ’ m really, really grateful to have the chance to have this conversation with you. CA : It ’ s – It ’ s so good, I just enjoyed our conversation over the last couple of days. This is such a complex problem. What I kind of want you to do is just go through it step-by-step, to see the logic of what it is that your team are putting forward. First of all – Just the problem itself of how we get the economy going again, just talk a bit about what ’ s at stake there, because sometimes this is framed as”The economy? Who cares about the economy? People ’ s lives are at stake. So let ’ s just focus on that, don ’ t worry about the economy.”But it ’ s not as simple as that. I mean, as an ethicist, what ’ s at stake if we don ’ t restart the economy somehow? DA : Well we have to recognize that we ’ ve actually faced two existential threats simultaneously. The first was to the public health system. If the virus had been allowed to unfold unimpeded, our public health systems would have collapsed and that would have produced a whole legitimacy crisis for our public institutions. So of course we shut down, we had to do that, it was a necessary self-defense **action** that has, however, really devastated the economy. And that is also an existential threat, we can ’ t actually endure a closed economy over a duration of 12 to 18 months. Nor can we really endure a situation where we don ’ t know whether we might have another two to three months of extensive social **distancing**. So we really need an integrated strategy, one that recognizes both of these existential threats and finds a way to control the disease at the same that we can keep the economy open. We call that combination of controlling the disease while keeping the economy open pandemic resilience. We think that ’ s what we should be aiming for. CA : So people who aren ’ t moved by the notion of the economy, capitalism, whatever, think instead about the millions and millions of jobs that were lost, the people who are desperate to make money. And I guess the lives that will be lost unless we solve this problem. DA : Absolutely, the economy is one of the foundational pillars for a healthy society with opportunity and with justice. You can ’ t have a just society either, if you haven ’ t secured a just and functioning economy that delivers well-being for people. So all we have to do is remember back to 2008, and think about the impacts on things like suicide and depression and so forth, that flowed from that recession, so the economy is a public health concern in the same way that the virus is a public health concern. CA : OK, so talk about why this is such an intractable problem. People isolate, in many countries in the world now you ’ re starting to see the cases flatten and in many cases decrease. It looks like, whether it ’ s happened now in your country or not, that will happen sooner or later. So why isn ’ t that problem solved, we ’ ve beaten the virus, let ’ s get back to work? DA : That ’ s a great question and it really speaks to how new the experience for us is to encounter a novel virus. It just really hasn ’ t happened to our society in a very, very long time. So we are what ’ s called the susceptible population, meaning not any of us at the beginning of this had immunity. We were all susceptible to catching the disease. For a society to be safe, it needs to have what ’ s called herd immunity. You could achieve that through vaccination or through people getting the disease. But it takes 50 to 67 percent of the population to get the disease in order to achieve that level of protection. We don ’ t expect a vaccine anytime in the next 12 months, possibly 18 months, so we have to recognize that that pathway is not open to us. And to get a sense of the magnitude of what it would mean to live through the disease to get to herd immunity, think about this : In Italy right now they estimate that about 15 percent of the population has probably been exposed to the disease. So you ’ d have to repeat what Italy has done three or more times, to get to a place where you can reasonably think that there ’ s herd immunity. And I think you can see that when you think of that picture, how destabilizing a process would be of just leaving things broadly open without disease controls. So the real trick is whether or not there ’ s a substitute for social **distancing** as a method for controlling the disease. CA : Right. So Italy, even with that 15 percent has suffered at least 15, 000 deaths, some people argue that it ’ s underreported by 50 percent there, it might be 30, 000 deaths plus there, and as they come down the curve, there will be more to come. Multiply that by five or six, say, for the bigger population size of the US and the herd immunity idea per se doesn ’ t seem like a winning idea. I mean, it ’ s a horrible idea. DA : It ’ s a horrible idea, exactly. And we do have alternatives, that ’ s the important thing, we actually do have a way of controlling the disease, minimizing loss of life and reopening the economy, so that ’ s the thing we should all be focusing on. CA : And again, the initial problem is that if you just let people start coming back, as soon as they gather again in reasonable numbers, the risk is that this highly infectious bug just takes off again. DA : Exactly. CA : And so one scenario is that you have countries lurching from a little bit of activity here and then suddenly it explodes again and everyone has to retreat. That does not seem attractive, that also just doesn ’ t work. DA : No, exactly. I mean, we described that as a freeze in place strategy for dealing with this. That is you freeze and you shut down all activity, and then that flattens the curve, you open up again, then you have another **peak**, you have to freeze again and so forth. So you have this repeated process of freezing, which just does tremendous damage to the economy over time. I mean the upfront damage is huge, but then there ' s never space to recover from it, because of great deal of uncertainty and repeated applications of economically ruinous social **distancing**. So I think you ' re really pointing to the features of the disease that make this situation a problem that it is. And there are really two that people should focus on. One is the degree of infectiousness. This is a highly infectious virus. So the comparison to the Spanish **flu** is a reasonable one from the point of view of degree of infectiousness. Then the second really important point about the disease is that it ' s possible to be an asymptomatic carrier. That is to be infectious, to carry the virus, and never show any symptoms yourself. Current estimates are still imprecise, but people think that about 20 percent of virus carriers are asymptomatic. And that is really the thing that makes it so hard to control. People don ' t know they ' re sick and then they become disease vectors, spreading it everywhere they go. CA : Yes, indeed. So talk a bit, Danielle, about your thinking about how we might outwit this thing. DA : So the alternative to social **distancing** as a strategy for controlling the disease is really massively ramped up, massively scaled up testing, combined with individual **quarantine**. So we are going to continue to need individual **quarantine** for those who are positive carriers of the virus, until such a point as we have gotten a vaccine. Now what does that mean exactly? It means that the standard **quarantine** that aligns with the incubation period, 14 days is often what people talk about, in the conservative picture you might say twice the incubation period length, 28 days for individual **quarantine**. And we need that **quarantine** for people who are symptomatic and for asymptomatic carriers of the virus. Now the only way that you can actually run an individual **quarantine** as opposed to a collective **quarantine** regime, is if you do massive testing. We really need to make testing in a sense universally available, so that we can be testing broadly across the population. There are ways to target test, make it more efficient and so forth, but in principle, what one should imagine, is really wide-scale testing, tens of millions of tests a day, connected with **quarantine** for those who test positive. Excuse me. CA : So weird. Anytime anyone coughs today, you go,"Oh, God, are you OK?"DA : Yeah, no, no, I ' m fine, Frog in the throat, that ' s all it is. CA : So just to play out a thought experiment. If we had an infinite number of tests available, and after the curve has flattened and cases have gone down, everyone came back to work, but everyone was tested every day. Then what we think is that the tests will show up positive at the same time, or possibly even ahead of the time that people are infectious. But certainly, let ' s say at the same time, regardless of whether they ' re symptomatic. And so you could – Those people would immediately go back home and the rest of the population should be OK, we should be able to get work done, in that thought experiment, right? DA : Right, in that thought experiment, exactly, yeah. CA : But the trouble is, that that would mean doing, whatever, like, 200 million tests a day. DA : Right, exactly. CA : Which is many, many orders of magnitude more than we have and could even imagine ramping up to. So you have a proposal, and this is the ingenuity, the proposal, of how to potentially administer tests in a way that ' s much more efficient. Talk a bit about that. DA : Sure. So if you were going to use a purely random testing method to control the disease, you could probably actually get away with testing everybody every two or three days – I ' m playing along with your thought experiment here – and bring the number down to 100 million tests a day. But even that is a magnitude that would take us multiple months to get to, let ' s just say if we even wanted to try to do something like that. So the thing that you really need is smart testing. So rather than testing the population at random, what you do is you use testing to identify people who are positive, and then you add to that contact tracing or contact **warning**, we think about it in both ways. And what this means is that once you know who ' s a positive test, you figure out who else has been exposed to that person over the previous two weeks, and they all get tested as well. So you start to identify a class of people who are a higher probability of being infectious and you test that group of people. So you move away from random testing, you target it through contact tracing or contact **warning**. And then, depending on the level of effectiveness of your contact-tracing and contact-warning strategy, you can reduce the numbers. So on a moderately effective contact-tracing regimen, you could imagine doing 20 million tests a day. On a highly effective regime of contact tracing and warning, you could get yourself down to the order of five to 10 million tests a day. CA : And some countries in Asia seem to have pulled off a version of this strategy that has been effective. But it requires one of two things, if I understand you right, Danielle, it requires either just this massively scaled up, or potentially quite intrusive sort of manual contact tracing where you have big teams who swoop in to anyone who ' s tested positive and try to unpack their complete recent social history. Or technology plays a role, and this is where it gets complicated, because you know, there are apps in some of the Asian countries, like, China has an app which most people are, I think, required to carry, certainly in Wuhan and elsewhere, where it ' s very good at predicting whether someone may need **quarantine**. And they will be required to do so. And so there are all these concerns about government control, government intrusion. You are in discussion about ways of doing some kind of technology that would be more acceptable in a democracy, and I ' d love you to share what those are. DA : Sure, I ' m happy to do that. So I think it ' s an important thing to say upfront that the rates at which we would need to test per capita are higher, much higher than Asian countries used, because prevalence is much higher here. They caught it earlier, they had these tools built before the pandemic hit. As a consequence, they ' re able to control it with a lower per capita rate of testing than will be the case for us. We just have to accept that fact at this point and recognize that massively scaling up is specific to our situation, because we weren ' t ready before it hit. So then, yes, OK, if we ' re trying to do the smart testing, trying to use tools, what can you do? So we ' re actually open to manual testing in the plan that we ' ve developed, I want to just say that, and I think that society, we have a big choice to make, whether what we want is a big core of manual contact tracers who are tracing people ' s histories and figuring out who they ' ve been in contact with and who they ' ve been exposed to. Or if we want to try to use a technological system. The important thing is there is a diversity of options within the technology space. So it ' s really important to recognize that places like Singapore and China have used highly centralized data systems for supporting this. And so what happens is, sort of, you carry your phone around, and everybody is connected to a central data system, and then when somebody in the system has a positive test, that gets put into the app, and then their phone communicates to other phones that it ' s been in proximity with over the previous two weeks, to alert people that they too need to get a test, OK? That ' s the basic concept. In China and Singapore the data structure for doing this is highly centralized. There are, however, a lot of innovative apps under development right now that depend instead on a very privacy-protective structure where the data lives on the individual user ' s phone and through a combination of encryption and tokens users of phones can communicate with other users of phones, but the data is not centralized. So in that regard, it becomes more of a peer-to-peer sharing, sort of concept of friends warn friends that they should probably go get tested. Then you would have a central repository of test data, but the truth is, we already have that, because all influenza tests for example, already roll up into CDC and Health and Human Services databases, so that they can track influenza patterns every year. CA : So tell me if I understand this right. You would carry on your phone an app that would, when you got, say, within six feet of another human carrying that app, the phones would exchange a Bluetooth – using Bluetooth technology they exchange a kind of token that says,"Hi, we connected."But it ' s encrypted. And that is not communicated to a central server, that is on the phone. But if either of you in the next week or two tests positive, your phone will be able to communicate to all the people which it exchanged token with, to say,"Uh oh, someone who you were close to in the last two weeks has tested positive. You ' ve got to isolate."That ' s basically how it works, it ' s done that way. DA : Exactly. CA : And then after, what, three or four weeks, the tokens can actually autodelete? They go, they ' re not there anymore. DA : They expire, that ' s right. Because you only need the most recent two weeks ' information or data about where you ' ve been and what other phones your phone has interacted with. So that ' s the really key thing. CA : Alright, we ' ll come back to that in a minute, but let ' s see what our friends are asking online. DA : OK. CH : Hi, Danielle, hi, Chris. Yeah, we ' ve got a lot of great questions, people are **super** interested in how this is all going to work. There ' s a couple of questions I ' m trying to cobble together here. I think people are really interested in your thoughts on the United States health care system. We have so many underinsured and uninsured people and the changes that you might make to that system, I mean, does that situation make things worse, and what changes would you make to the system so that we ' re not as vulnerable in the future? DA : So that ' s a great set of questions, and so just from the point of view of the testing program, it is absolutely critical that the testing be free. And so there is absolutely, a sort of necessary feature of this, which is about, kind of, universal access element to the health system. And so I ' m sure there will be tweaking that ' s necessary in the existing health system to achieve that. We ' ve also without any question seen vulnerabilities that relate to and stem from our fragmented health system. So I think there ' s a much bigger, longer-term question to be had, or conversation to have, about how we overcome that fragmentation. So yes, I do hope this moment will be a spur for that longer-term conversation about improving our health system and really achieving that universal coverage that we so badly need. CH : OK, thank you, I ' ll see you both again in a little bit. CA : Thanks, Corey. So let ' s stay with this tech issue for a bit. And the sort of civil rights or **privacy** questions that it might still raise in some people. So one concern is that surely, if your phone is able to contact these other phones, someone somewhere is ultimately going to reverse that and we ' ll have some kind of record of your, you know, everyone who you ' ve connected with, and that might be concerning to some. Is that a legitimate concern? DA : I think it is, I mean, I think we ' ve been working hard on this question and really trying to think it through and when you talk to legal experts and civil liberties experts and so forth, everybody starts with the same premise : assume failure. Assume that you ' ll have a data breach. Think for that and what kind of protection you want in that regard. And so when you think that way, you of course are trying to minimize any likelihood of that happening, so hence the privacy-protective structure of phones communicating with phones, data living on the hardware of the phone, not in the server, etc. And then also you would want a kind of democratic accountability feature, so for example having the Department of Health and Human Services have an auditing function to audit whoever is manning the server or controls the server through which the tokens are exchanged you would want to audit their functionality and how they ' re using the data. But then again, you presume failure, that somebody ’ s reverse engineering, the audit system fails in some fashion. What ’ s your protection then? The answer to that would appear to be upfront legislation that prohibits the commercialization of this COVID testing data. So that anybody who in any way tried to commercialize it in any kind of way, would be subject to legal **penalty**. So I think that ’ s how you build the fence up upfront in the expectation that somebody would find the way to crack it. CA : And then there ’ s a set of questions around how you get this app out there at scale, because it ’ s only effective if, say, two thirds of the people who are working are carrying it, right, something like that. DA : Right. CA : And so short of authoritarian”everyone must have this app,”I guess there are ways that are interesting to say to people, one, this is a really useful app, it will alert you quickly if you ’ re at any risk. But two, to get to the kind of scale we ’ re talking about, you might have to say to people,”Look, we ’ re slowly going to come back to work, industry by industry, company by company, and the deal for you to come back and break **isolation**, the societal deal, is that you have to be willing to carry this app.”And you could, for people who didn ’ t want to do that, I guess you could have some protection, you can ’ t lose your job for that. But, I mean, can you picture society making the choice that it is reasonable to require people who want to come back to work to carry that alert technology with them? DA : So this is the hardest question. We know we don ’ t want an authoritarian model, such as the one used in China and Singapore, so we have to figure out instead how to activate that thing, which is sort of the most important democratic resource or asset, namely solidarity. So what is it that, from a solidarity perspective, it ’ s reasonable for us to ask of each other? That has to be the frame for deciding how we approach this. And so one aspect of this is really, truly the building a culture of opting in to this. And there are examples of this. So for example, New York has tackled HIV testing through a program that goes by the label”New York Knows,”and it started out with labels of”Manhattan Knows”or”Brooklyn Knows,”and so forth, of the different burrows. And what this program is is one that is owned by community organizations, community partners, that do the job of spreading the word and recruiting people into testing programs. And New York has the goal of having every single New Yorker be tested for HIV, so in other words, it ’ s established as an expectation, that universal participation, and it ’ s activated a network of community partners and organizations, to cultivate that commitment to solidarity. And so I think, in all honesty, that that would be a really huge part of what you would need to do in order to tap into solidarity, to have this work. I ’ m sure that we would see some amount of requiring in different context, I think that ’ s a very hard one, because you don ’ t want to generate labor discrimination problems. And so the model there, to think about and to sort of figure out what are our parameters, what we think is fair, connects to things that schools currently do, for example, when they require that students show vaccination proof before they can start the school year and things like that. So there are multiple states that do that in schools for vaccines. Would schools do the same thing, what ’ s the sort of labor, the **workforce** question like, I think that very much remains to be worked through, but it ’ s a hugely important question. CA : I ’ d be curious what the watching audience thinks about this, maybe you could enter a comment on it. But I mean, is it reasonable, in the world that we ’ re in right now, for a company, let ’ s say, to say,”Look, we want to get back to work, but we want to do so and respect the safety of all our workers. That means that for you to come back to work, you need a test showing that you ’ re negative. And you need to carry this app so that we alert people quickly if there ’ s a problem.”Is that –”We won ’ t fire you if you don ’ t come in, but if you want to come back to work, that ’ s what you ’ ll have to agree to.”Is that a reasonable chance? I ' m curious what people think. Is there any other way to get – Sorry. DA : I mean, again, there is precedent for this in the sense that drug testing works this way in many employment contexts, right. There are many roles where people have to do routine drug tests as a part of preserving their job. That was a hotly debated issue in the 1980s, people sort of think back when that sort of first came in, and there was a lot of concern about it. We have managed to develop a regime for that, that has achieved an equilibrium of a kind. So I imagine that something is possible in this space, but we would have to draw on the prior experience with things like drug testing in the **workplace**, I think. CA : I mean, one problem that we face when you think about these big systems introduced is that in the past, there ' s history where something got introduced, you think of the PATRIOT Act that came in after 9 / 11 and a lot of people have a lot of problems with that Act, and it gets renewed relentlessly, relentlessly, and here we are, nearly 20 years later, and it ' s still with us. So that creates quite a high bar for any standard that we push out here. How do we persuade people that this is custom-made for the current situation that we ' re in, and it ' s not going to be picked up and subsequently abused by companies or by government? DA : That ' s an absolutely critical question, and I think we have a lot to learn from places like Germany, which are really, really strong and rigorous on **privacy** protections. Perhaps having some of the highest privacy-protection standards in the world. And Germany, over the course of the last few weeks, has articulated an approach that definitely picks up several of these elements. So there are ways of building in **privacy** structures that are meeting the standards of the German **privacy** framework, and so I think for us, that ' s a really important place to look to, and learn from them how they ' re structuring it, to achieve those **privacy** protections. CA : Danielle, you ' re an ethicist, among other things, as well as a political theorist, and is it, as you think about how to apply ethical questions to this, is it inherent in a situation like this that there are going to be trade-offs, that there is no"perfect solution"that we just, you know – These things are fundamentally – You ' ve got two goods that are fundamentally in conflict with each other or if you like, avoidance of two evils that are going to clash. And that we ' re not going to get away sort of untainted to some extent, we just have to try and make the least bad choice? DA : It ' s a great question, and I think, I tend to formulate things as being about hard choices and judgments, rather than being about trade-offs. I think trade-offs often suggest that you can precisely quantify this degree of monetizable harm against that degree of monetizable harm, and I think that ' s actually not as helpful to us in this current moment, to be honest. So in effect, I think the most important thing is that we clarify our core values. And so the way we ' ve tried to articulate that is to say we have a fundamental value in securing public health. We have a fundamental value in securing a functioning, healthy economy. We have a fundamental value in securing civil liberties and justice and constitutional democracy. And so then the question is, given that set of fundamental values, what are the policy options that actually do secure all of those things? So in that regard, at the end of the day, you know, there ' s a bunch of libertarians in the group that we work on, and a lot of us come out very strongly, sort of, **privacy** protecting, liberty protecting point of view. And so we ' re not here to sacrifice those things. We ' re rather here to find a solution that aligns with the values that we bring in to this problem. So that ' s how we think about the decision making. CA : Talk a bit more, actually, about the group that you ' ve pooled together over this. I know that there ' s a TED speaker Paul Romer, an economist at Stanford, who ' s, I think, a key member. Who else is in the group? DA : Well, Paul was a key member. I ' m afraid we parted ways to some extent, because he ' s advocating random testing, so the sort of 100 million tests a day direction, and he ’ s not a fan of the contact-tracing approach, so he does have, you know, he ’ s sort of at one end of a kind of libertarian spectrum on that and my view, however, is that testing 100 million a day is far more intrusive than smart testing supported by **privacy** protective contact tracing. I also think it ’ s really important to throw into the mix the fact that collective social **distancing** is a huge infringement on our civil liberties. We keep forgetting that. The alternative is not contact tracing versus nothing, it ’ s contact tracing versus social **distancing**. We can ’ t go out, we can ’ t form associations where we get to be together in person, church-goers can ’ t go to church right now. You know, political parties are having their conventions postponed. If that ’ s not infringement on our civil liberties, I don ’ t know what is. So from my point of view, the civil liberties conversation is one about the contrast between the kind of infringement that is produced by social **distancing** versus the kind of infringement or reshaping that would be imposed by contact-tracing regime. I didn ’ t answer your question about our group. CA : Go ahead, it ’ s just amazing this thing is moving so fast in real time. Talk about some of the other people who are in your group. DA : Sure, so Glen Weyl is an economist at Microsoft, a political economist, he ’ s a really key figure and he is really an innovative mechanism design thinker, who is really good at kind of, figuring out how to craft incentive structures and so forth that help people make choices in socially productive ways, in ways that are also freedom-respecting, and so forth. So he ’ s really been helping us think about the design of the policy pathway, Rajiv Sethi is another economist, Lucas Stanczyk is a philosopher at Harvard who has been scrutinizing the civil liberties and justice questions. I mean, that is his line of work, those are the things he ’ s most committed to, and that ’ s what he ’ s doing. We ’ ve reached out to a number of public health groups for regular consultations, so they ’ re not as directly part of our group in the sense of advancing a policy, but in terms of informing our epidemiological understanding, we ’ ve relied a lot on folks at the Chan School of Public Health at Harvard. So lawyers as well, Glenn Cohen, who directs the Petrie-Flom Center for law and bioethics has been a critical member, Andrew Crespo also at Harvard Law School, Rosa Brooks at Georgetown Law school, I could go on, I ’ m missing key people, critical scientists. Actually, there ’ s a great paper on solidarity by Melani Cammett and Evan Lieberman that people should check out too. CA : It ’ s exciting that one of the impacts of this, and I ’ ve seen it in other areas as well, this crisis is really breaking a lot of cross-disciplinary lines and bringing people together in **unexpected** combinations, which is good. DA : Yes. CA : So how, if this plan got general acceptance, how – I mean, obviously, the clock is ticking, this is urgent, what would it look like to move this forward? Give a sense of what you think it would cost, give a sense of who might own it, like, what would it take to actually activate this giant idea? DA : Alright, so it ’ s a big price tag, so I hope you ’ re sitting down – I ’ m glad you ’ re sitting down. So over two years, based on conservative estimates of what you would need, that is to say maximal estimates for testing and things like that, it ’ s got a price tag of 500 billion, which includes both the production of the tests and the personnel of test administration, contact tracing and all of that. So it ’ s important to remember though, that that production ramp up and the contact tracing ramp up are employment possibilities, so in that regard, they would counteract the negative impact on employment of the social **distancing**. So it ’ s a big price tag, but it would be multipurpose in that regard, contributing to jumping up the economy, as well as the testing program itself. It would be important that it be phased in, and phasing it in would actually give us a way of testing out the paradigm as we went. So for example, for a first phase of rollout, probably what you would want to do, ideally by the end of the next month, would be to have a full range of testing for a combination of everybody in the health care sector and everybody who might fill in and substitute for any health care workers who test positive. So in other words, your health care worker pool and a substitute pool, say a national **service** corps, of folks who can fill in for health care workers who test positive. If you can get those two groups, those two sectors fully under testing, contact-tracing regime, so you know that every health care worker is not positive, and anybody who is is immediately **quarantined** and so forth, we would stabilize our public health infrastructure, and that would already get about 30 percent of the **workforce** under this kind of testing and tracing regime. And then you ' d move on, with that stabilized, to other critical and essential workers, etc. So the bad news, Chris, is you know, who would be the last people to be folded into this? It would be you, it would be me, the people who can actually telecommute for work, OK. Because we would have the least call on social needs to pull us back out into the **workforce**. So we ' d be the last ones out. But that ' s a good thing, I think that ' s a part of making the point that we ' re all in this together and that there are sacrifices in different places, and **service** workers, care workers and so forth would be able to get out faster. CA : And that addresses what is definitely one of the most shocking and painful aspects of the current moment, which is, you know, for those of us working from home it feels traumatic, but it ' s nothing like what others are experiencing, whose livelihood depends on being out there, doing, you know, physical work. And so I think it ' s excellent, obviously, that the plan focuses on them first. How applicable is this to other countries? You ' re obviously talking – The plan is developed for the US. It ' s inspired by what ' s happened, in some ways, in some Asian countries. Is it applicable to other countries as well? DA : It absolutely is, and we ' re already seeing Europe move in this way. So Europe and the UK are ahead of the US on this point, I mean, the rough shape of the plan that we ' re proposing seems to be pretty much the rough shape of the plan that ' s emerging in Europe and the UK. So I think it ' s a really important moment to bring together those policy conversations, bring together those modeling conversations and help each other out on this one. CA : And I guess the reason I ' m delighted that you ' re engaged in this is that it ' s – You know, it ' s fundamentally framed here as this is a discussion that society has to have. There are ethical choices we have to make here as part of this. And so we can ' t just leave it up to the scientists, as brilliant as they are. And the politicians, for goodness sake. We all need to understand what is at stake here, what the choices are, what the hard choices are and know that any direction is tricky, but we, you know – This really matters. DA : Absolutely. I think you ' ve put it so well. I think that ' s what makes this kind of question different in a democracy. It really is important that we all collectively achieve understanding, have clarity about the directional options and have a sense of collectively moving in a direction that we desire, right. That we consent to, in a sense. CA : Corey. CH : Hi, I just wanted to come back and give you a little feedback on what people are saying online in terms of the testing, to be able to go back to work, you know, how people feel about that. Obviously, there ' s lots of questions about the app and **privacy**. Some people are hesitant about it, they ' re wondering whether it will be mandatory, which you touched on. Maybe you will opt in to be able to go back in the office. I ' m in, I would test to be able to go back in the office myself, but I think people are wondering about that. But the general consensus is it seems like a reasonable possibility. There are a couple of questions. One I think you just touched on in terms of the global possibilities. Do you see some collaboration on the global landscape, do you see people talking to each other? Obviously, if we want international travel to come back, that seems like a key piece of it. DA

: Yes. So I think travel is one of the hardest pieces of this, and actually I don ’ t think that there are good, clear answers on that yet. Scientists are talking to each other across international boundaries without any questions. I think the scientific community is really well and at work, really connected, trying to think about these things. It ’ s not clear to me how well-networked the policy-making community is, in all honesty. So I think there ’ s probably a lot of room for building a tighter international network of policy makers on that front. And the hardest part is going to be the travel piece. And honestly, we haven ’ t even talked about parts of the globe like Africa or India, South America, where they ’ re not yet getting towards this policy paradigm. So the virus is going to live in the world, without any question. And live in the world probably in quite significant ways for a considerable period of time. So I think the role of travel restrictions is probably going to be with us for a spell. And so it really does matter that we get the design of those right. I think it ’ s Hong Kong that has a particularly, what looks to me like a sort of, useful regime, where anybody who is coming into Hong Kong for longer than two weeks has to go into 14-day **quarantine** when they arrive. But for anybody who is coming for a shorter time, they have to be tested when they arrive and then they have to also go through active monitoring during the period of their time in Hong Kong, which means having temperature checks and so forth reported. So I think that ’ s a reasonable thing to do in order to keep business travel up and running, even as we ’ re all trying to deal with controlling the virus. CH : And you also mentioned solidarity and I think that touches on another question that someone brought up online about some of the social impacts after the 1918 epidemic and the fear, and the, you know, the fear of the other, and foreigners and all that. And how do we get through this without that kind of fallout and you know, how do we, kind of, keep ourselves together and looking out for each other? DA : I think that ’ s such a hugely important question. And I mean, in one sense it ’ s easy, because the virus is an adversary to every human being equally, right. We are all completely equal in relationship to it. And so what we are really all aspiring to here is sort of transformation of our basic socioeconomic infrastructure in a way that puts us all on a footing to be pandemic-resilient. So I ’ ve been using the metaphor we need to put ourselves on a war footing to mobilize the economy to fight the virus, and I stand by that in a sense that we do need to mobilize the economy. But really at the end of the day, it ’ s not a war against a human adversary or anything of that kind. And so what we ’ re really talking about goes back to the questions about the health infrastructure, health care. We ’ re really talking about achieving a transformed peace situation where our economies and our societies are pandemic-resilient. That ’ s the real goal here and it really does require an investment, so because of the 2003 SARS experience, Asian nations have been investing over the last five years or plus, in pandemic-resilient equipment and infrastructure. We haven ’ t done that in the US, so we find ourselves in a position where we have to accelerate in a matter of months, something that has taken other people years to build and develop. So I think really focusing on that, and the goal is an economy that ’ s not vulnerable to pandemic, right. I mean, because we don ’ t want to leave this pandemic and have the economy be just as vulnerable to pandemic at the end of the pandemic as we were at the beginning of it. We don ’ t want to be vulnerable this way. And so in that regard, the job is to build in that infrastructure for pandemic resilience ASAP. CA : Wow. CH : Thank you. CA : Danielle, given the price tag you ’ re talking about on this, half a trillion dollars, basically, up to. That ’ s significantly less than some of the multitrillion dollar numbers that are getting thrown around, so, I mean in terms of the scale of the problem, it ’ s probably an appropriate number. But it sounds like, to have any chance of doing this,

this would have to be a kind of federal initiative at some level. DA : Yes. CA : We have a problem that more than half the country fundamentally doesn ' t trust key parts of the administration, let ' s say. How could this be framed in a way that could build trust and make it feel like this is the country as a whole, that there ' s this coalition of trusted voices who are the final decision makers on this? DA : So we have this incredible federalist system, and we need to see it as an asset. It ' s modularized and flexible, and we need to activate that. We do need all the parts of the system working, so we do need the federal government working on behalf of this, we need the state governments working and municipal governments. On the federal end of things, we need Congress to fund. So in the first instance, there ' s a really big need for funding legislation, and also, Congress can really help by directing investment, not just in the testing program itself, but in the national **service** corps, probably flowing through state governments, through the national – The reserves in every state. That would be sort of health reserves. You know, really expand that program with a combination of employment program and backing up that sector. So there ' s a lot for Congress to do as a part of this. For the testing program, we really do need the kind of procurement order to produce capacity that the Defense Department is the best example of. So in the ideal, a sort of testing supply board that brought in leading figures who are masters of supply chain logistics from the private sector, working in close coordination with the federal government would be great. The White House has recently, in the last week or so, begun to put in pieces of architecture that goes in this way, sort of a testing supply czar, for example, an admiral, I believe. So we need people of that kind who are really superb masters of logistics, procurement, contracts and that sort of thing, to be able to ramp up an active, functional supply chain for testing to deliver at the order of tens of millions of tests a day. So we do need [unclear], absolutely is a key part of that, key driver of that. And so it ' s a time for all the parts of our government to come together and do their respective pieces. CA : So I ' m kind of in awe at the scale at which you ' re thinking. I guess as we wrap up here, if I might, I ' d love to just go to a bit more personal place. Like, I ' m just curious about you and what is it in your past that is, sort of, is providing the fire right now, the drive to try to do this? How are you? How are you feeling about this? Tell us a bit about you, please. DA : Well, that ' s a very generous question. You know, I love this country. I ' ll admit that ' s where the motivation starts from, in the sense that, like, lots of people would say that I ' m a global humanitarian, and watching the world succumb to the disease motivates me. I think of Paul Farmer for example, as an example. And I respect that and I get that, but at the end of the day, I love my country. And it hurt, just hurt, in the beginning of this, and what hurt particularly, was I was very clear, early on, that I was getting better information as a member of the Harvard faculty than my fellow parishioners, than the people who were serving me in restaurants and cafes, and it just like, that made me angry, in all honesty. As a combination of those two things, I was like, A, I want to understand this, and B, I want to share what I understand because it ' s not fair that people like me get it, and that ' s not being shared with other people. CA : Wow, that ' s powerful. I think all of us, we all feel this weird mixture of almost guilt at how fortunate a position some of us are in. Certainly a lot of gratitude, anger. Were you persuaded, Whitney, by this idea, by the possibility of it? CH : Sorry, you ' re meaning me. CA : Sorry! Did I say Whitney? CH : Totally OK. Whitney ' s your usual pal. CA : I ' m the world ' s worst person on names, and Whitney and I have been hanging out here the last few weeks. Corey. CH : It ' s absolutely fine. Being mistaken for Whitney is a huge compliment. It ' s very persuasive, and I think so hopeful to hear a constructive plan and a feeling that there is a path out of this that is both possible for us as humans, to get back to being together, but then also as an economy and as a country. I ' m really inspired by your work and so grateful to you for sharing it with us. DA : I appreciate that, thank you. I ' m really glad to get a chance to talk about it and share the knowledge that our group has acquired over the last month. So thank you. CA : So if someone wants to keep in touch with the progress of this idea, what should they do? DA : OK, so now I should know our website URL by heart, but of course, I don ' t, I ' m afraid. If somebody googles"COVID,""Safra,""Allen,"that ' s my surname, our website will come up. So if you just remember those three words,"COVID,""Safra,""Allen,"and Google that, you should get to our white papers, op-eds, things like that. We are hoping to have our full policy road map published by the end of the week. That ' s our target goal. CA : Yeah. It ' s : ethics. harvard. edu. DA : OK. Exactly, that takes you to the main landing page, and then to the COVID site. CA : And then to the COVID-19 from there, yeah. DA : Exactly. CA : Alright, well, thank you so much, Danielle, I found this absolutely fascinating. DA : Thank you. CA : It ' s going to take – I mean, this is not an ordinary idea. We don ' t often at TED have someone come and say,"Yeah, I ' ve got this idea for how to spend half a trillion dollars, and it could make a difference between the US and other places around the world actually getting the economy going again. That ' s not usual, so this has been a gift to us today, thank you for that. DA : Thank you. CA : To everyone listening, this is an important debate. And it ' s not finished yet, there will be many other contributions to ideas like this, I think. DA : That ' s for sure. CA : Yeah, chip in, chip in. Thank you all so much for being part of this today. We ' re back again tomorrow. Corey, do you have details on that? CH : I do. And also, you can listen to this conversation on our website TED. com or on Facebook, and you can also listen to the recording of it through TED Interview. So if you missed any parts of it or you want to pass it along to a friend. We have some more amazing speakers coming up I might glance at my cheat sheet, but tomorrow we have Esther Choo, who is an emergency physician and professor and she is going to share with us what she ' s seen on the front lines of this crisis. On Wednesday, Chris and I will be speaking with Ray Dalio, the founder of Bridgewater, and he is going to address the market and economic implications of this pandemic. And on Thursday, we have two speakers, Gayathri Vasudevan, who is going to share with us what ' s happening in India, and Fareed Zakaria, a journalist. Friday, we ' ll wrap things up with a musician and artist Jacob Collier. So we have a lot of amazing things coming up. CA : We do, so calendar it if you can, apart from anything else, we just like your company here every day. We ' ll get through this together. Thanks so much for being part of this. Danielle, thanks again. DA : Thank you, goodbye. CH : Bye.

Text Sample 178: POS Dim 2 – 2020 – Score 15.00 – 2020/t004260.txt

Corey Hajim : Today, our guest is Dan Schulman, CEO of PayPal. When most of us think of PayPal, we think of buying something online or paying a friend back for a drink using Venmo. But PayPal has also become a major **financial services** player, often acting as an alternative to a traditional bank. During this pandemic, PayPal has supported small businesses around the world by providing loans, waiving fees and increasing cash back programs. It has also worked with the US government on its Paycheck Protection Program, as well as distributing stimulus checks. It has enabled an outpouring of generosity online as well. The trend towards digital payments, or what we might now want to think of as"contactless payments,"has massively accelerated, and it ' s changing forever how we think about commerce. So I ’ m really excited to have Dan here with us. Thank you so much, Dan. Dan Schulman : Thanks for having me, Corey. Pleasure to be here with you. CH : Glad to see you. So let ’ s dive right in. Within a few months of this pandemic ’ s arrival, more than 30 million people have filed for unemployment in the United States alone. These are certainly unusual circumstances, but it seems clear we were running very close to the edge, and now so many businesses and their employees are facing huge **financial** challenges. How worried are you? DS : Well, I think the crisis has exposed three things. Obviously, it ’ s a health crisis for so many people. Second thing is, that health crisis has ricocheted, and the world is now in an economic crisis. And the third crisis that we don ’ t talk so much about but I think is impacting the way that we ’ re going to live our lives going forward is : this is a psychological crisis as well. People are reexamining their place in the world, what ’ s happening in the world, how they ’ re going to live their lives, both in the pandemic and postpandemic. And so I think this is something that each of those phases will need to be dealt with. But you said this, and I completely agree with you : there was an economic crisis happening well before the pandemic exposed this. It ’ s kind of like the water level came down and exposed what was already there. You had, for instance, in the US, 185 million adults in the US **struggling** to make ends meet at the end of the month. You have over 70 million adults that are really outside of the **financial** system, spending over 140 billion dollars on high interest rates, unnecessary fees and **struggling** as well. And so I think what this has really done – because you can ’ t ignore 20, 25 percent unemployment rates – it ’ s exposed this crisis and forced a lot of people into, maybe, **actions** that they might not have taken without this crisis happening. CH : Yeah, I think that ’ s right. There are so many challenges and so many opportunities, and I think you ’ ve spoken of this opportunity of digital transactions being helpful to people, and obviously the trend, as you ’ ve said, has massively accelerated and pushed us into this world even further. So I ’ m curious : What does the world look like without cash? Or less cash? What are the advantages and what are the challenges of making that transition? DS : I think some of the trends that are emerging coming out of this pandemic or coming into it and as we look forward is, clearly, this has been a discontinuous change in the trend line as we move from physical to digital. I think we ’ ve accelerated many forms of digital capabilities by three to five years. And that can be from digital payments to telemedicine to really changing the face of retail and how we think about retailing, changing the face of entertainment, even changing the way governments think about managing and moving money and really thinking about digital currencies going forward. And so I think there are a tremendous number of changes that will occur during this pandemic and coming out of it. Digital payments is obviously one of the big ones that will happen. I mean, cash has been around for quite some time, thousands of years. I would not be so **bold** as to predict its full demise. Many people have been wrong doing that. But there is no question right now that you will see an acceleration of the demise of cash. Last year, you had over 18 trillion dollars of cash spent at retail. Eighty-five percent of the world ’ s transactions today are done in cash still. But the really big change right now towards digital payments, and that ’ s both the advent and the acceleration of commerce that ’ s happening, as well as the shift to in-store contactless payments, as you said, and the real impetus for that is health reasons. People do not want to hand over money. They do not want to touch screens. They don ’ t want to pick up a pen and sign at the point of sale. And so there is a demand for contactless payments and digital payments to keep social distancing requirements in place, to protect the health of cashiers, to protect the health of consumers. And I think we are going to see, we are already seeing in our business, a surge in digital payments across the world. CH : It seems like a great opportunity, but how do we make sure that this transition is inclusive? I mean, you ' ve talked about how so many people are underserved by the traditional banking industry. How do we make sure that those people have that opportunity? And it feels like a smartphone becomes an essential item. How do we address that? DS : Yeah. I do think that a **mobile** is really a key to unlocking this. I ' ve often said that, really, one of the big moon shots for the **financial services** industry is this idea of not just **financial** inclusion. Most people define **financial** inclusion by somebody having access to a bank account, but just having access to a bank account is not nearly enough. I think what we need to aim for is how do we think about **financial** health? How do we make sure that people have the ability to have some wherewithal to create savings to withstand some kind of **financial** shock to the system? I do think that **mobile** phones will be the way that this occurs and will be very inclusive going forward. There are going to be something like six billion smartphones in the world over the next several years. The cost of a smartphone is plummeting. I think in India now you can buy a smartphone for under 25 dollars. So you ' re going to have ubiquity of smartphones across the world, and, in fact, what ' s very interesting is, in lower-income populations, there is a greater penetration of smartphones than in higher income because the smartphone is the only device that somebody has. Higher-income individuals may have desktops or iPads, that kind of thing, but lower income can afford one device, and they choose it to be a smartphone because they can get and live their life through that one device. And think about that one device. Really, you have all the power of a bank branch in the palm of your hands. And when you can start to create distribution of **services**, **financial services**, through a smartphone, you then are able to manage and move money in ways that we couldn ' t do traditionally. In the physical world, if you get a check, you need to then go to a cash checking place to cash it. You stand in line for 30 minutes. They then charge you anywhere between two and five percent to just change the format of currency from a check to cash. And then you have cash and you want to pay a bill. You need to stand in line again at a bill pay, and then you have to pay maybe 10 dollars for an individual bill as a fee. If you do that via a smartphone, I believe that not only do you save a tremendous amount of time, because if you ' re outside the **financial** system, managing and moving money is practically a part-time job to go and do that, so not only do you save time and return time to individuals, but you can cut the cost of transactions by anywhere between 50 and 75 percent. And remember that $140 billion number that I gave you? And that ' s just in the US. Imagine if you could cut that in half and return that to the most vulnerable populations that need it most. So I think there ' s tremendous promise in the use of technology to help provide both inclusion and make sure there aren ' t digital haves and have-nots, but also to start on this journey towards **financial** health. CH : Yeah, I think a lot of people don ' t realize that you don ' t need a bank account or even a credit card to open a PayPal account, which is super-interesting. I mean, do you see a time where traditional banks don ' t exist or at least play a much smaller role in the **financial services** industry? DS : Well, I think the entire **financial services** industry is evolving right now, and so I think banks will always play a role, or as far into the future as I can see, but it will evolve. I mean, think about basic credit cards. Today, you think about a credit card, and you think about it predominantly as a form factor, something that you pull out of your pocket. Sometimes there ' s status associated with what you ' re pulling out of your pocket, depending on the color of that credit card. But really I think those form factors start to go away and become embedded in digital wallets.

So credit will always be an important element. You know, most people in the world, it isn ' t that their cash outlays exceed their cash intake. It ' s just that they ' re not evenly distributed. So there are times where your cash outflows exceed your cash intake, and there, you need some form of credit to make up that difference. And so I think forms of credit will always be an important element. But the way that you extend credit will change going forward, the way that you think about **scoring** people in terms of can they handle credit. You know, traditionally, in more developed countries, you use what ' s called FICO **scores** or bureau **scores**, but those ignore so many of the **financial** transactions that people who are outside the **financial** system do, like paying rent or paying their bills on time. And with the data and information and machine learning around that – and we need to be careful that there aren ' t **biases** built into those algorithms – we can start to do things that could never be done before. I ' ll just give you one quick example. We ' re one of the largest providers of working capital to small businesses in the world. We ' re probably one of the top five in the United States. So we ' ve done over 14, 15 billion dollars of lending of working capital to small businesses. Seventy percent of that goes to the 30 percent of counties where 10 or more banks have closed branches. And where do banks close branches? Banks close branches in neighborhoods where the median income is below the national average, which makes sense because for a branch to be profitable, they need a certain amount of deposits for that branch to actually be profitable. And so, in lower income neighborhoods, branches are starting to close. So why are 70 percent of our loans in those lower income neighborhoods? It ' s because we do machine learning. We don ' t even look at FICO **scores** or bureau **scores**. We look at a number of different data elements. And so we can lend into those lower income neighborhoods where nobody else can, and when we do that, the average sale of a small business goes up by 22 percent. And imagine the impact that has on communities and neighborhoods where they can finally get the working capital to expand those small businesses. And I think that ' s a perfect example of the promise of what technology and **financial services** married together can do. CH : I think it ' s so interesting. I ' m curious. The tech industry has been criticized for amassing power over society, not that the banking industry isn ' t criticized. But what do you say about people who might be worried about tech companies taking on even more influence and control over what ' s happening in their lives? DS : Yeah. Well, I think what ' s so important for any company and tech companies is to respect the boundaries in terms of what consumers expect from a company that serves them. I think the most important brand attribute that a company can have is trust, and trust comes from the understanding that a company respects your **privacy** and will not sell your data or information, that it can perform transactions in a secure manner so that your transactions are protected. And I think those are kind of foundational, and I think any company needs to respect that. They need to assure that consumers have the **privacy** that they desire and the safety and security that is required to serve them the right way. CH : And obviously, you ' ve gained a lot of trust with the US government. Maybe we could talk a little bit about how you ' ve been working with them to distribute some money through the Paycheck Protection Program. And I was curious, I ' ve been reading about it, and it sounds like 30 million-ish small businesses in the United States are able to get those funds, but only six million have received the loans. What do you think ' s happened? DS : Yep. Well, I think initially, the government – and I give them a lot of credit – they responded quite quickly with a 3 trillion dollar stimulus package. These are massive numbers that were happening in very condensed time frames. We were working with various agencies, very closely with the Treasury Department, in terms of distribution of the stimulus. And they were working literally night and day on this. The Small Business Administration was working night and day. But these are volumes that have never been seen before running through these systems, and the first tranche of those loans was very difficult. There were a lot of technical difficulties in getting those out to small businesses. And that first tranche was not enough, and it was quickly used, and there are still a host of small businesses that needed money. The second tranche that came out is still actually in effect. It has not been used up, and we are continuing to lend on that. We ’ ve been able to lend to some 50, 000 small businesses. We ’ ve lent out about 1. 7 billion dollars, and our loan size, which really I ’ m proud of, is about 31, 000 dollars. The average that a bank does is between 100 and 125, 000 dollars. So we are lending to these true small businesses on Main Street, and I ’ m proud that we ’ ve been able to go do that, and I think we should give credit to the US government and governments around the world that are taking this quite seriously and putting a tremendous amount, a percentage of their GDP, towards the rescue of small businesses and towards trying to take care of consumers that find themselves in really difficult straits right now. And we ’ ve been trying to, instead of people mailing out checks, which is ridiculous in today ’ s world – people aren ’ t living where they think they ’ re going to be living, they ’ re with their parents or with friends or in a different location, and mailing a check and then having to take a check and go somewhere, which you can ’ t even go if you ’ re sheltered in place, to cash it, doing that electronically just makes a ton more sense – and we ’ ve been working with the IRS and Treasury and other government agencies to distribute that electronically. CH : Yeah, that makes a lot of sense. It ’ s a massive, massive project for all of us. Whitney is here with some questions from our community. DS : Hello, Whitney. Whitney Pennington Rodgers : Hello Dan. How are you? So the community has some interesting questions following up on what you were talking about earlier about security. We have a question from Marc – and I apologize in advance if I mispronounce your name, Marc – Marc Vanlerberghe :”The move to digital cash could be one more step towards creating the perfect surveillance state. How do we avoid this from happening?”DS : Yeah, well, this is what I was talking about, Marc, before. I mean, I think this idea of trust is incredibly important. I think the only companies that will be successful – and I think we hold a lot of this in our own hands as consumers, by the way ; we need to be aware of data and information that we ’ re giving and to what companies we ’ re doing that with – but I think the companies that will be successful are those that have a high degree of trust, and trust happens by protecting your **privacy** but also very much assuring that your transactions in a digital world are safe and secure. I mean, the idea of cybersecurity has always been important, but is ever more important as we move from physical to digital, and that ’ s where large data sets are important, because a consumer ’ s identity is stolen every two seconds. Every two seconds, some consumer has their identity stolen. And so we have to be, for instance, we have to be sure that even when you sign in with your credentials, they ’ re actually real credentials. We have to look at 30 to 100 different elements of that transaction to make sure it ’ s really you before we let that money out of your account. And so there is a combination of making sure you have enough data to protect somebody but also assure that your **privacy** is held sacrosanct, and I think that is a balancing act and one that needs to happen in order for us to do this successfully. WPR : Great, and actually sort of going from digital cash to digital currency, we have another question from Simone Ross in our community about the opportunity that exists for digital currency. She mentioned that PayPal pulled out of Libra. What would it take for a truly inclusive digital currency to take hold here? DS : Yeah. I think there is a tremendous amount of promise as we think about digital currencies. Our pulling out of Libra had nothing to do with our firm conviction that blockchain and other forms of maybe stable coin currencies are extremely important and can be very, very helpful, especially in different parts of the world. As we think about stability in different parts of the world where currencies can fluctuate up and down, to have a more stable currency where somebody can know, if they have that, that it ’ s going to be worth x amount, and that they can transact, either with other individuals around the world or, importantly, at merchants around the world. And we are looking at all forms of digital currencies right now, working hand in hand with a number of different governments, and I think we should all think about how technology is going to evolve and how currencies will evolve as a result of that. And I think this crisis has really opened the eyes of many governments around the world as to the need for different tool sets to create stimulus and to efficiently and quickly and effectively distribute funds to their citizens. WPR : Great. Well, I ’ ll be back shortly with more questions, and I ’ d just love to remind the community that you can ask questions on the”Ask question”feature. Be sure to use the pull-down tab to select Episode 2, so those questions come. Thank you. DS : Thanks, Whitney. CH : Thanks, Whitney. Dan, I want to go back to something we touched on in the beginning about **financial** wellness. PayPal has done something unique in terms of calculating how much to pay people and how much you should spend on benefits. Traditionally, wages are set by the market, but you ’ ve found that paying as much or even more than other companies wasn ’ t always enough. Can you tell us about that moment? DS : Yeah. So I said, kind of, in our opening, in one of my opening statements, that two-thirds of Americans **struggle** to make ends meet at the end of the month. They are financially **stressed**, and it kind of wreaks havoc in their life. I did a study to look at PayPal employees. We did a research study, and I did it because I thought I was going to get back this great information that I was going to talk about at an employee meeting about how well we pay, because we pay, to your point, at or above market in every single location around the world. And what I found is, unfortunately, like the rest of the world, even though we paid at market or above market, 60 percent of our operations personnel, our entry-level employees, our hourly workers, face the same thing. They **struggle** to make ends meet. And that was simply unacceptable for me. I think the world is changing in terms of the responsibility of corporations, the responsibility of CEOs. We have a lot of different stakeholders that we try to satisfy, from regulators to shareholders to customers to employees. But I think the number one responsibility that we have is the health – **financial** health – of our employees, because nothing could be more important to a company than to have financially secure, **passionate** employees working for you, because nobody is going to serve customers better than employees who feel a part of something and feel financially secure and glad to be a part of that company. And so then the real question becomes : How do you measure that? Because a lot of people think about living wages or a minimum wage. And we thought that was insufficient, and we came up with a measurement we called”net disposable income,”which is, basically : After you pay taxes and your basically essential living expenses, how much money do you have left over for discretionary things or to save? And here ’ s the really unfortunate thing – and I ’ m not proud of this, but remember, we were paying at market or above, so I thought the market would take care of this, right, by doing that – we found that for that population, they had four to six percent NDI, net disposable income, after paying taxes and essential living expenses. That is not enough. You are going to **struggle** to make ends meet. And by the way, NDI changes location to location to location around the globe, right? There ’ s a different NDI in Manila, a different NDI in Omaha, Nebraska, than there is in New York City, etc. And so we basically said to ourselves, we need to take NDI to 20 percent. Because at 20 percent – and that ' s a huge shift, from four to six to 20 percent – but at 20 percent, you actually have the ability to save and to put money away and to take care of discretionary expenses. And so we did a pretty massive reorientation of our compensation systems. We lowered the cost of benefits by 58 percent, because benefits are like a regressive tax, you pay the same amount no matter what your salary is. And so we had a lot of employees who weren ' t taking health care benefits, because it cost too much to be able to do that. So we lowered it by 58 percent. We made every single employee of PayPal a shareholder and an owner of the business, and we gave them pretty big grants so that they could be a part of the success of PayPal going forward. We raised salaries where we needed to go and do that. And then we wrapped all of that into a **financial** education program, because people had never gotten equity before, they were trying to think through,"How do I save now that I ' ve got incremental dollars to go and do that?"And that cost us quite a bit of money to go and do that, but I really feel, just like how we spend a lot of money to take care of customers, as you mentioned up front, in COVID-19, that companies need to stand for more than just making money, for more than just **maximizing** our profits next quarter. I firmly, firmly believe that the costs associated with taking care of our employees, taking care of our customers, will benefit us in the long run multiplefold over the costs associated with doing that. And we ' re already beginning to see some of the impact of that. And so, I think every CEO, every company, needs to really now start to think about, especially maybe as a result of this crisis, but as I mentioned, we had a crisis before this, how do we put our employees first, take care of them? Because if you do that, you ' ll take care of customers, and if you take care of customers, you ' ll take care of shareholders, inevitably. And so this has been a huge part of it about for the last year or so. CH : It ' s so interesting, and it brings up so many questions, I think, for me and probably our community as well. I mean, PayPal is a hugely profitable tech business, huge free cash flow and big margins. Do you think this model is something that every company can do, whether it ' s a tech company, a manufacture, a meatpacking business? I mean, is this what everyone should be focused on? DS : Well, I think that – and I don ' t want to moralize or tell other companies what they should do – but to me, I think everyone should understand the **financial** health of their employees. That ' s a baseline thing to go do. What you do post-that is up to maybe your **financial** strength as a company or where you put your order of priorities. But what I ' ve found is, I thought the market could tell you that, and this is why I say, in many ways – you know, I ' m a big believer in capitalism. I think it ' s, in many ways, the best economic system that I know of. But, like everything, it needs an upgrade. It needs tuning, and at least for these vulnerable populations, just because you pay at market doesn ' t mean that they have **financial** health or **financial** wellness. And I think everyone should know whether or not their employees have the wherewithal to be able to save to withstand **financial** shocks, and then really understand, like, what can you do about it? I think this NDI measure is a really interesting one. It takes some time to go do it, because you have to be quite thorough and you have to really understand living expenses by location and what tax jurisdictions there are. But you need to create an NDI that ' s to a certain level where people aren ' t **struggling** to make ends meet. Because if people are **struggling** to make ends meet, they are not as productive at work. They ' re worried about, like, what am I going to do with my kids? My kid just got sick. I don ' t have health insurance. I think there ' s a spiral that occurs. You think you ' re actually saving money by paying less, but the reality is, at least in my belief system, you take care of your employees, and other things naturally flow from that. They are more productive. They love being a part of that company. They take care of customers better. And all of those things inevitably accrue to the benefit of a company in terms of how it ’ s trying to serve its ultimate end market. But it starts with your employees. CH : So obviously you believe in this”capitalism needs an upgrade,”and I think NDI is something so many companies should adopt. But do you think this happens through benevolent corporate activity? I ’ m channeling my inner Bernie Bro here, but I think a lot of people would be skeptical that we should trust companies to do better at this point. Should the government step in to raise minimum wages, do other things to protect workers in a more structured way? DS : Look, I think the government clearly has a role to play, and I think the private and public sectors need to work closer together to address so many of the issues that we face in our societies across the world, whether that be income inequality, environmental issues, health, protections, that kind of thing, **privacy**. But the way that I think about this is, it ’ s very difficult for governments to regulate around this, because there are so many different ways of thinking about it. If I were another CEO, and this is like, it ’ s actually in your best interest to go and do this because it ’ s a competitive advantage. Like, we attract, I think, some of the best talent in the world to PayPal, because we have a **mission** that people believe in, that we actually are trying to make some sort of positive difference. I ’ m not saying we ’ re the be-all and end-all, but I don ’ t think people should shirk their responsibilities of at least making a small difference going forward. If enough companies did that, if enough governments did that, it would make a real difference in the world. And then the second thing is, you have to have values that support that. And those values are incredibly important. Those values should be all about inclusion. They should be about having a diverse **workforce**. They should be about **financial** wellness. And when you do that, and you attract the very best talent, then by definition, I think the single biggest competitive advantage for any company is their **workforce**. Strategies are great. A whole number of things are great. You have a great **workforce** that ’ s **passionate** about what they ’ re doing and is financially secure, and they will do amazing things. And I think it ’ s that kind of competitive advantage that will spur companies. So there needs to be a set of CEOs and companies that start to move in this direction, and I believe you ’ re beginning to see more do this. And once that happens, it starts to tip everything, and I think more and more need to do it to maintain their competitive positioning. And that may seem like a self-serving way why people are doing it, but honestly, I don ’ t care whether they ’ re doing it out of the goodness of their heart or they ’ re doing it because it ’ s competitively a disadvantage if they don ’ t. Creating **financial** health for our employees is the goal, and we ’ ve got to get that done. CH : Yeah. I mean, it sounds like you think of this as a win-win, but it also sounds like you ’ re willing to maybe think about your employees first and sell it to your shareholders later. Whitney is – oh sorry, go ahead. DS : No, no, no – I was just going to say, I actually do believe that, and I think the idea of a multistakeholder capitalism, that is a time for today, and we cannot just think that we have one stakeholder that we need to satisfy. We live in our communities, we live in this world. To have people **struggling** day in and day out is not good for any company, and... We can only do x amount, but we can actually create **financial** health for our employees, and we should. WPR : Great. So we have so many questions coming in from the community. One here is from Lara Pearson, basically about whether PayPal would consider become a B Corporation.”Are you familiar with the B Corp movement, environmentally and socially responsible, multiple-bottom-line for profits? Presuming so, has PayPal considered or would it consider becoming a certified B Corporation?”DS : Yep. I ’ m familiar with B Corp. We have no intention to move to becoming a B Corporation. I think the values and what we are trying to do are very aligned with assuring a multistakeholder point of view, but what I really want is for this to be a movement across major corporations across the world. And you ’ re not going to have major corporations around the world moving into B Corp. There ’ s a lot of other side issues involved with being a B Corporation as opposed to just a publicly listed company, and so that ’ s going to be a long way before that happens. And so what I ’ m really trying to do is encourage and demonstrate that being multistakeholder, that putting employees first, creates competitive advantage. And I think I ’ m not the only CEO who ’ s feeling that, by the way. I think people like Satya Nadella from Microsoft are doing a great job, Marc Benioff from Salesforce. I could go through quite a list of names. But the list is not long enough yet, but I think there ’ s some quite important names and individuals around the world who are now talking about multistakeholder capitalism, and I think that ’ s an important element as we think about our economies and way of life looking forward. WPR : And there was so much interest also in your net disposable income program and a lot of questions around that, and one which I think is along these same lines from Juan Enriquez asking about a rational way to address extreme income disparities. And perhaps you could expand beyond this program, just sort of ways that we might think about this in a smarter way moving forward. DS : Yeah. Well, there ’ s no easy solution, or it would have been done. So I think there are a couple things that I think about that may not fully address extreme income disparities. Again, I try to think pragmatically about these things, and, like, what can we really do to start to address this? And again, I think about, if we could take one step and then another step, then you ’ re starting your journey, and without getting overwhelmed by how far away the end state is. So one, I think companies need to take care of their employees, and I think that will immediately help to address some of these income disparities. Number two, I do think that, ironically, if you have less money, it costs you more to manage and move it, which, think about that : the less money you have, if you ’ re outside the **financial** system, the more you spend to manage and move your money. And I think that technology is at least a foundational way for us to think about how do we cut the basic costs of managing and moving money by 50 to 70 percent, like [check-cashing], sending remittances, which are such a huge, important part of the world ’ s economy. You know, you do it a traditional way, you go into a store and send the remittance to another store and somebody goes and picks it up. First of all, incredibly time-consuming, and it can cost between eight and 12 percent of that remittance amount that you ’ re sending. So if you ’ re sending a hundred dollars, the recipient who so desperately needs it is getting 88 to 90 dollars. If you do that electronically, digital wallet to digital wallet, that can be like three percent, so you can get 97 dollars from that. And so I think there are ways of addressing the costs. As I mentioned, there is so much money spent on unnecessary fees and high interest rates, and if we can drop that by 20 percent, 30 percent, the amount of money we can return to vulnerable populations is quite large and will start to make a difference. WPR : That ’ s great. We have a ton of questions from the audience, just one more before we turn things back over to Corey with her final questions. This one is from Anna Tunkel, which is just, I think, as we are rounding to the end of the interview here,”What are you most optimistic about, and what do you see as the biggest opportunities for ’ Building Back Better ’ after COVID?”DS : Well, I mean, one thing I ’ m actually optimistic about – and I ’ ve always been a believer in the human spirit and the power of an individual to make a difference. I know that sounds very cliché, but I truly believe it, and I think every one of us can make a difference. But here ’ s what I ’ m seeing. I ’ m beginning to see that at a much larger scale than I ’ ve ever seen before. You know, we have different **platforms**, either the PayPal **platform** or the Venmo **platform**, Venmo here in the US, PayPal across the world. The amount of giving that ’ s happening through those **platforms**, whether it be to local businesses, to artists, to musicians, to bartenders, to places of worship, to schools, to NGOs, to charities has exploded on the **platform**, exploded. We have helped to raise on the PayPal **platform** since COVID-19 struck 2. 8 billion dollars for NGOs and charities – 2. 8 billion. That ’ s incredible, the amount of generosity that is pouring out from the global community around this. And we ’ re just seeing people randomly pay it forward. Somebody gives 20 dollars to a bartender, and that bartender takes 10 dollars of that and gives it to somebody else. And we ’ re watching that over our **platform**, and that gives me a sense of optimism. I also feel like this period of time has exposed a number of things that were happening but were invisible, and I think when things become visible, that ’ s when you can start to address them, and I think there ’ s a lot of attention on some issues that should have had attention before, but vulnerable populations don ’ t have as loud a voice as others, and now that voice is being heard, because you can ’ t ignore it. And hopefully, that will create progress against some of these structural inequalities that have been there for a long time. WPR : That ’ s wonderful. And there ’ s so much interest online. You have some other questions to ask as well. CH : So I think we have one more from our community from Jacqueline Ashby. Anna sort of stole my last question, which was to restore our faith in humanity. But, there ’ s so much interest coming in about NDI. Is there a way for people to learn more, for you to share your study and your methodology? DS : Happy to do so. There is nothing proprietary about it. We would love for this to be – look, and this may not be the be-all and end-all measurement. It ’ s the best one we could come up with, but if working within the community, we can evolve it and think about maybe things that it missed or maybe things that could be done better, that would be fantastic. I don ’ t know the best way of doing that. I ’ ll leave that to Corey and Whitney to help me think that through, but of course we ’ d be willing to share it. There is nothing about that that I don ’ t want to share. CH : Sounds like a good TED Talk. Thank you so much, Dan. This has been a super-interesting conversation. I think we could talk for another hour, but thank you so much for being here. DS : Thank you, Corey. Thank you, Whitney. Thank you, everybody. WPR : Thank you, Dan. Thank you.

Text Sample 179: POS Dim 2 – 2020 – Score 15.00 – 2020/t004256.txt

Whitney Pennington Rodgers : Before we really dive in to talking specifically about Google ’ s work in the contact tracing space, let ’ s first set up the relationship between public health and tech. You know, I think a lot of people, they hear”Google,”and they think of this big tech company. They think of a search engine. And there may be questions about why does Google have a chief health officer? So could you talk a little bit about your work and the work your team does? Karen DeSalvo : Yeah. Well, maybe I ’ m the embodiment of public health and tech coming together. My background is, I **practiced** medicine for 20 years, though a part of my work has always been in public health. In fact, my first job, putting myself through college, was working at the state laboratory in Massachusetts. As the story will go with Joia [Mukherjee] we ’ re reconnected again, a Massachusetts theme. And I, across the journey of the work that I was doing for my patients to provide them information and the right care and meet them where they were medically, translated into the work that I did when I was the Health Commissioner in New Orleans and later when I had other roles in public health **practice**, that really is about thinking of people and community in the context in which they live and how we provide the best information, the best resources, the best **services** that are culturally and linguistically appropriate, meet them where they are. And when the opportunity arose to join the team at Google, I was really thrilled, because one of the things that I have learned across my journey is that having the right information at the right time can make all the difference in the world. It can literally save lives. And billions of people come to Google every day asking for information, and so it is a tremendous opportunity to have that right information and those resources to people so that they can make good choices, so that they can have the right information, so that they can participate in their own health, but also, in the context of this historic pandemic, be a part of the broader health of the community, whether it ' s to flatten the curve or keep the curve flat as we go forward. WPR : And so it sounds like that there is this connection, then, between public health and what Google ' s work is in thinking about public education and providing information. And so could you talk a little bit about that link between public health and public education and Google? KD : Definitely. You know, the essential public health **services** include communication and data, and these are two areas where tech in general, but certainly Google, has an opportunity to partner with the public health system and with the public for their health more broadly. You know, going back to the earlier days of this pandemic, towards the end of January, Google first leaned in to start to put information out to the public about how to find resources in their local community, from the CDC or from other authoritative resources. So on the search page, we put up"knowledge panels,"is the way that we describe it, and we did develop an SOS alert, which is something we ' ve done for other crises, and in this particular historic crisis, we wanted to be certain that when people went on to search, that there was authoritative information, which is always there but certainly very prominently displayed, and do that in partnership with public health authorities. So we began our journey really very much in an information way of making certain that people knew how to get the right information at the right time to save lives. I think the journey for us over the course of the last few months has been to continue to lean in on how we provide information in partnership with public health authorities in local areas, directing people in a certain state to their state ' s health department, helping people get information about testing. There ' s also been, though, a suite of resources that we wanted to provide to the health care community, whether that was for health care providers that may not have access to PPE, for example, we did a partnership with the CDC Foundation. Though the scale of the company and the opportunity for us to partner with public health around things like helping public health understand if their **blunt** policies around social **distancing** to flatten the curve were actually having an impact on behavior in the community. That ' s our community mobility reports. We were asked by public health agencies all across the world, including some of my colleagues here in the US, could we help them have a better evidence-based way to understand the policies around social **distancing** or shelter in place? Which I think we ' ll talk about more later. In addition to that sort of work, also been working to support public health in this really essential work they ' re doing for contact tracing, which is very human-resource intensive, very complex, incredibly important to keep the curve flat and prevent future outbreaks, and give time and space for health care and, importantly, science to do the work they need to do to create treatments and, very importantly, a vaccine. So that work around providing an additional set of digital tools, exposure notification for the contact tracing community, is one of the other areas where we ’ ve been supporting the public health. So we think, as we ’ ve thought about this pandemic, it ’ s support the users, which is the consumer. There ’ s also a health care system and a scientific community where we ’ ve been partnering. And then, of course, public health. And for me, I mean, Whitney, this is just a wonderful opportunity for Big Tech to come together with the public health infrastructure. Public health, as Joia was sort of articulating before, is often an unsung hero. It saves your life every day, but you didn ’ t know it. And it is also a pretty under-resourced part of our health infrastructure, globally, but especially in the US. It ’ s something I worked on a lot before I came to Google. And so the opportunity to partner and do everything that we can as a company and, in this case, with contact tracing in partnership with Apple to create a very privacy-promoting, useful, helpful product that is going to be a part of the bigger contact tracing is something that we feel really proud of and look forward to continuing to work with public health. In fact, we were on the phone this morning with a suite of public health groups from across the country, listening again to what would be helpful questions that they have. And as we think about rolling out the system, this is the way that we ’ ve been for the last many months at Google, and I ’ m just really... I landed at a place just a few months ago – I just started at Google – where we can have an impact on what people know all across the world. And I ’ ll tell you, as a public health professional and as a doc, that is one of the most critical things. People need to have the right information so they can help **navigate** their health journey, but also especially in this pandemic because it ’ s going to save lives. WPR : That ’ s great. Thank you. So, to talk more about this contact tracing system and the exposure notification app, we ’ ve read so much about this. Could you describe this, a little bit about how the app works, what exactly are users seeing, what information is being collected? Just give us sort of a broad sense of what this app does. KD : Yeah. Let me just start by explaining what it is, and it ’ s actually not even an app, it ’ s just an API. It ’ s a system that allows a public health agency to create an app, and only the API, this doorway to the phone system, is available to public health. So it ’ s not designed for any other purpose than to support public health and the work that they ’ re doing in COVID-19 in contact tracing. The second piece of this is that we wanted to build a system that was privacy-promoting, that really put the user first, gave them the opportunity to opt into the system and opt out whenever they wanted to do that, so they also have some control over how they ’ re engaging and using their phone, basically, as a part of keeping the curve flat around the world. The system was developed in response to requests that we were getting about how could technology, particularly smartphones, be useful in contact tracing? And as we thought this through and talked with public health experts and academics and **privacy** experts, it was pretty clear that obviously contract tracing is a complex endeavor that does require human resources, because there ’ s a lot of very particular things that you need to do in having conversations with people as part of contact tracing. On the other hand, there ’ s some opportunity to better inform the contact investigators with things like, particularly, an exposure log. So one of the things that happens when the contact tracer calls you or visits you is they ask,”Hey, in the last certain number of days,”and in the case of COVID, it would be a couple days before symptoms developed,”Hey, tell us the story of what you ’ ve been involved in doing so that we can begin to think through where you might have been, to the grocery or to church or what other activities and with whom you might have been into contact.”There ’ s some amount of recall **bias** in that for all us, like we forget where we might have been, and there ’ s also an amount of anonymous contact. So there are times when we ’ re out in the world, on a bus or in a store, and we may have come into prolonged and close contact with someone and wouldn ’ t know who they were. And so the augmentation that the exposure notification system provides is designed to fill in those gaps and to expedite the notification to public health of who has a positive test, because the person would have notified, they trigger something that notifies public health, and then to fill in some of those gaps in the prior exposure. What it does not do is it does not use GPS or location to track people. So the system actually uses something different called Bluetooth Low Energy, which is privacy-preserving, it doesn ’ t drain the battery and it makes it more also interoperable between both Apple and the Android system so it ’ s more useful, not only in the US context, but globally. So we built this system in response to some requests to help augment the contact-tracing systems. We wanted to do it in a way that was user-controlled and privacy-preserving and had technological features that would allow public health to augment the exposure log in a way that would accelerate the work that they needed to get done to interrupt transmission – keep the R naught less than one – and do that in a way that we would also be able to partner with public health to think about risk **scoring**. We could talk more about any of these areas that you want, but I think maybe one of the most important things that I want to say, Whitney, is how grateful Apple and Google are – I ’ ll take a moment to speak for my colleagues at Apple – to the great partnership from public health across the world and to academics and to others who have helped us think through how this can be, how the exposure notification system fits into the broader contact tracing portfolio, and how it does it in a way that really respects and protects **privacy** and also is useful to public health. We ’ re still on this journey with them, and I really believe that we ’ re going to be able to help, and I ’ m looking forward to being a part of the great work that public health ’ s got to do on the front lines every day, been doing, frankly, but needs to be able to step up. WPR : That ’ s great, and thank you for that really detailed explanation. And you know, we actually have Chris here with some questions from our community, so why don ’ t we turn there really quickly. Chris Anderson : Yep. Questions pouring in, Karen. Here ’ s one from Vishal Gurbuxani. Uh... Gurbu – I ’ ve pronounced that horribly wrong, but make up your own mind. Vishal, we ’ ll connect later and you can tell me how to say that. KD : Fabulous last name. I love that. That ’ s a Scrabble word. CA :”Given where we are today, how should employees think about returning to work, with so many conflicting messages?”KD : This has been an important part of my work for the last few months. I joined Google in December, and all this started happening. The pandemic in the world first began in November but it got very hot in many parts of the world in the last few months, and we ’ ve been thinking a lot about how to protect Googlers but also protect the community. I ’ ve been talking a lot about what we ’ ve done externally. You know, internally, Google made a decision to go to work-from-home pretty early. We believed that we could. We believed that in all the places across the world where we have offices, that the more we could not only model but frankly just be a part of flattening the curve, that we would be good citizens. So we have been fairly... I don ’ t know if the right word is conservative or assertive, about it, because we really wanted to make sure that we were doing everything we could just to get people to shelter in place and socially distance. A lot of other companies have been doing the same, and I think the choices that people are making are going to be predicated on a whole array of factors : the rates of local transmission ; governmental expectations ; the ability to work from home ; the individual characteristics of the workers themselves, how much risk they might have or how much risk it would be for them to bring that back into their household if they have people living in their household who would be at increased risk from morbidity, mortality, from suffering and death, from COVID.

So these are individual and local considerations. I think for us as a company, we want to, as we ’ ve talked about publicly, we want to continue to be a part of the public health solution around social **distancing**, and so that for us means continuing to encourage work-from-home for our employees and really only be in if it ’ s essential that people are in the **workplace**. And we ’ ve said publicly that we ’ re going to be doing that for many months to come. Now, here ’ s one thing I do want to say, which is, working from home has definite benefits, not only for the pandemic, but for some people, time for commute, etc. I think we ’ re already learning there are some downsides, and there are generic downsides, even just not from work-from-home but school-from-home and just being at home, which is : social **isolation** is real. It causes depression. It has physical impacts on people ’ s bodies ; there ’ s science around this. So as the world is weighing, even beyond the pandemic, when we ’ ve achieved herd immunity because we ’ ve been able to vaccinate the world with a functioning vaccine that creates immunity, I think probably a lot of **workplaces** are going to want to encourage work-from-home. But I just want us also to remember that part of humanity is community, and so we ’ ll have to be thinking through how we balance those activities. CA : And, of course, there are huge swathes of the economy that can ’ t work from home. We ’ re a lucky few who can. And speaking of which, here ’ s a question from Otho Kerr.”Vulnerable communities seem to be receiving a disproportionate amount of misinformation. What is Google doing to help make sure these communities are receiving accurate news rather than fake news?”KD : You know, vulnerable communities is where I have spent most of my career focused. I think with many things that we ’ ve learned as a society in this pandemic were things that we, frankly, should have known. And before I get to the information, I ’ ll just talk about access to **services**, which is to say, and to brag, I guess, on my hometown of New Orleans. One of the early things that New Orleans learned, or remembered or whatever, was that drive-through testing only works if you have a car. So you need walk-up testing, and it needs to be in the neighborhood. We need to meet people where they are, and it ’ s thematic of all the work that we did after Hurricane Katrina in New Orleans was to build back a health care and public health infrastructure that was community-oriented, built with community not for community. Of all the many things that I really do hope last from this pandemic, one of them, though, is that we ’ re being much more conscious of building with especially vulnerable communities and building out policies and processes that are as inclusive as possible. For Google information, we start with, on the search **platform**, for example, adding up knowledge panels, that we spend time making sure are linguistically and culturally appropriate. We tend to start globally, with global authoritative groups like the World Health Organization or the National Health Service or CDC, and then we begin to build down to more focused jurisdictions. On other **platforms** that we have like YouTube, we ’ ve built out **special** channels where we do, because it ’ s a **platform** and we can host content, we ’ ve partnered with creatives – we call them, I don ’ t know, that ’ s a new thing for me because I ’ m a doctor – but we ’ ve partnered with creatives and influencers whose reach resonates with communities. We have had particular programming, for example, for seniors, African-Americans, so”vulnerable”takes on a lot of meaning for us globally and in the US context. Our work is not done, and we certainly every day are thinking about how we can do more to see that the information is accessible, accurate and also, frankly, interesting so that people want to engage. CA : Yeah. Alright, thank you Karen. I ’ ll be back in a bit with some other questions. WPR : Thank you, Chris. And you know, and this is really wonderful talking about more broadly, where you see tech and public health going, and specifically, talking about these vulnerable communities.

And I think one thing, even just beyond Google, it would be interesting to sort of hear your thoughts on where you see tech in general better serving public health, if there are spaces that you think, no matter which tech company we ’ re talking about, we could all sort of come together to better serve the community. Do you have any thoughts on that? KD : I could spend several hours talking to you about that, but maybe I ’ ll just start by saying that I came to tech through the pathway of direct patient care and public health **service** in local community, and I ended up in a role in the federal government as the National Coordinator for Health IT, which, for my background, felt unusual to me, I ’ m just being honest. And I thought, well, I ’ m not really a tech person, but the secretary at the time said,”That ’ s exactly why we need you, because we need to apply tech.”And she had had the unfortunate experience of hearing me chirp about how public health needed more timely data to make better evidence-based policy on behalf of community and with community. This was a source of frustration for me as a local public health officer, that sometimes the data I was working on, though great, was stale by the time I needed to make decisions about chronic disease interventions, or mental health or even violence or intimate partner violence issues in my community. And so the desire to make data useful and accessible to support people in communities is something that ’ s been burning in me for a long time, and what I have learned since I have been out in Silicon Valley is that that desire burns in the bellies of many people who work at Google and Apple and other companies, and it ’ s been really wonderful to see, during this horrible time of the pandemic, the incredibly brilliant engineering and programming and other minds at a company like Google turn their attention on how can we partner with consumers and with public health to do the right thing, to bring the resources that we have to bear. And I said I could talk all day about it because I have many examples from the work that we have done at Google. Maybe I ’ ll just point out a couple. One is to say that we very early on wanted to find a crisp way to help people understand what they could do to protect themselves and their community, to flatten the curve, get the R naught less than one, and this”Do the Five”work that our teams, largely in marketing but then a lot of other people weighed in. It required massive amounts of talent to make that available on our landing page, on search, and then fold it out more broadly. We did that in partnership with the World Health Organization, then the CDC, then with countries all across the world to get simple messaging about staying home if you can and coughing into your elbow, washing your hands. These are basic public health messages that public health has been, frankly, even in **flu** season trying to get the word out, but it became, the resources at a company like a Google, and the reach to billions, it ’ s a **platform** and a set of talents that aren ’ t even the technical, computer vision kind of stuff that you would typically think about. Many other companies in Silicon Valley have weighed in in the same way. I think similarly, we ’ ve been thinking through how we can use tools like the community mobility reports. This is something, a business backer like we have for restaurants. The engineers and scientists said, what if we applied that to retail and grocery stores and transportation to get a snapshot in a community of whether people were using those areas less, whether people were adhering to local public health expectations and sheltering in place, and give that information not only to public health but to the public to help inspire them to do more for their community as well as for themselves. So there has been, I think what I ’ m trying to say, Whitney, is I think there ’ s a natural marriage, and COVID has been an accelerant use case to demonstrate how that can work, and it is my expectation that companies like Google who, certainly for us it ’ s in our DNA to be involved in health, will want to continue working on this going forward, because it ’ s really not just good for what we need to get done in this pandemic, but public health and prevention are part and parcel of how we create opportunity and equity in all communities across the world. So I ’ m **passionate** about the work of public health and very **passionate** about partnership. Can I just say one more thing? WPR : Absolutely. KD : Which is to say that one of the first things that I did before the pandemic started, I had just started in December, and then in January, I did a listening session with consumers about what they wanted, and they said something kind of similar to what you said, which I just want to call out, and that is, they wanted partnership, they wanted transparency and they really felt like there was quite a lot that tech in general could do to help them on their health journey. But their ask was that we did it in a transparent way and we did it in a partnered way with them. And so as we move out of the pandemic, and we ’ re thinking more about consumers, I want to carry some of this spirit also of prevention and helpfulness and transparency into the work that we ’ re going to continue to do for people every day.

Text Sample 180: POS Dim 2 – 2020 – Score 15.00 – 2020/t004255.txt

Chris Anderson : Hello, TED community, welcome back for another live conversation. It ’ s a big one today, as big as they get. You know, when we created this”Build Back Better”series our thought was how could we address issues arising out of the pandemic, how could we imagine building back from that. But the events of this past week, the horrific death of George Floyd and the **daily** protests that have followed, I mean, they provided a new urgency which we, of course, simply have to address. I mean, can we build back better from this? I think before we can even start to answer that question, we just have to seek to understand the immensity of this moment. Whitney Pennington Rodgers : That ’ s right, Chris. Right now, so many people in the United States and beyond are grappling with feelings of anger and frustration, deep, deep sadness and really helplessness. No matter who you are, you have questions about what to do now, how to make things better. And as we ’ ve seen, violence like this unfolds for many, many years. What is the path forward? CA : So – We ’ re joined today by a group of activists, organizers and leaders known for their crucial work in social justice and civil rights. We ’ re so grateful to have them here to engage in a discussion about racial injustice in America, the unbearable acts of violence that we ’ ve – Acts of violence against the black community that we ’ ve witnessed, the dangers to a nation riven by anger and fear. And how on earth we can move forward from this to something better. So first, each of our four guests will share their thoughts on how we move forward from this moment. And then we ’ ll engage as a group, including you, the TED community. WPR : And we ’ d like to thank our partner, the Project Management Institute. Their generous support has helped make today ’ s interviews possible, and of course, as Chris mentioned, we want you to take part in the conversation, so please share your questions using our Ask a question feature and continue to share your thoughts in the discussion thread. CA : Thanks, Whitney. OK, let ’ s get this moving. Our first guest. Dr. Phillip Atiba Goff is the founder and CEO of the Center for Policing Equity. They work with police departments across America, including in Minneapolis, to seek measurable responses to racial **bias**. Phil, I can scarcely imagine how the **stress** in the last week must have been for you. Welcome, and over to you for your opening comments. Phillip Atiba Goff : Thanks, Chris. Yeah, this week has been a gut punch to anybody who felt like we could be making progress in the way that we put forward public safety that empowers particularly vulnerable communities. We started working in Minneapolis about five years ago. At the time, it was, like most major cities in the United States, a department that had a long history of unaccounted for violence from law enforcement, targeting the most vulnerable black communities. And we tried to put into place a number of things that we know work. Change the culture, so that the culture can be accountable to the values of the community. And what we saw was small but measurable progress. We always knew, with small and measurable progress, that you ' re one tragic incident from going back to ground zero. But the events of the last week and a half haven ' t brought us back to ground zero, they ' ve torched ground zero, and we ' ve dug a hole that we have to dig ourselves out of. What I hear from police chiefs who call me, from activists I talk to, from folks in the communities that are literally on fire right now, I hear folks saying, I had one activist say to me that the pain that he was feeling was too large to fit into his body. And without thinking about it, I said right back,"That ' s because it ' s too large to fit into a lifetime."What we ' re seeing isn ' t just the response to one gruesome, cruel, public execution. A lynching. It ' s not just the reaction to three of them : Ahmaud Arbery, Breonna Taylor and then George Floyd. What we ' re seeing is the bill come due for the unpaid debts that this country owes to its black residents. And it comes due usually every 20 to 30 years. It was Ferguson just six years ago, but about 30 years before that, it was in the streets of Los Angeles, after the verdict that exonerated the police that beat Rodney King on video. It was Newark, it was Watts, it was Chicago, it was Tulsa, it was Chicago again. If we don ' t take a full accounting of these debts that are owed, then we ' re going to keep paying it. Part of what I ' ve been experiencing in the last week and a half, and what I ' ve been sharing with the people who do this work, who are serious about it, is the acknowledgment, the soul-crushing reality that at some point, when things stop being on fire, the cameras are going to turn to something else. And the history that we have in this country is not just a history of vicious neglect and a targeted abuse of black communities, it ' s also one where we lose our attention for it. And what that means for communities like in Baton Rouge, for those who still grieve Alton Sterling, and in Baltimore, for those who are still grieving Freddie Gray, is that there is not just a chance, there ' s a likelihood that we are a month or two months out from this with no more to show for it than what we had to show after Michael Brown Jr. And holding the weight of that, individually and collectively, is just too much. It ' s just too heavy a load for a person or a people, or a generation to hold up. What we ' re seeing is the unrepentant sins, the unpaid debts. And so the solution can ' t just be that we fix policing. It can ' t be only incremental reform. It can ' t be only systems of accountability to catch cops after they ' ve killed somebody. Because there ' s no such thing as justice for George Floyd. There ' s maybe accountability. There ' s maybe some relief from the people who are still around, who loved him, for his daughter who spoke out yesterday and said,"My Daddy changed the world."There won ' t be justice for a man who ' s dead when he didn ' t have to be. But we ' re not going to get to where we need to go just by reforming police. So in addition to the work that CPE is known for with the data, we have been encouraging departments and cities to take the money that should be going to invest in communities, and take it from police budgets, bring it to the communities. People ask,"Well, what could it possibly look like? How could we imagine it?"And I tell people, there is a place where we do this in the United States right now. We ' ve all heard about it, whispered, some of us have even been there, some of us live there. The place is called the suburbs, where we already have enough resources to give to people, so they don ' t need the police for public safety in the first place. If someone has a substance abuse issue, they can go to a clinic. If somebody has a medical issue, they ' ve got insurance, they can go to a hospital. If there ’ s a domestic dispute, they have friends, they have support. You don ’ t need to enter a badge and a gun into it. If we hadn ’ t disinvested from all the public resources that were available in communities that most needed those, we wouldn ’ t need police in the first place, and many have been arguing, even more loudly recently, that we don ’ t. If we would just take the money that we use to punish, and instead invest it in the promise and the genius of the community that could be there. So I don ’ t know all the ways we ’ re going to get there. I know it ’ s going to take everything and. It ’ s going to need the kind of systemic change and the management tools that we traditionally offer. It ’ s also going to need a quantum change in the way that we think about public safety. But mostly, this isn ’ t just a policing problem. This is the unpaid debts that are owed to black America. The bill is coming due. And we need to start getting an accounting together, so we ’ re not just paying off the interest of the damn thing. WPR : Thank you, Phil. Rashad Robinson is the president of Color Of Change, a civil rights organization that advocates for racial justice for the black community. To date, more than four million people have signed their petition to arrest the officers involved in the murder of George Floyd. And of course, one was arrested last week. Thank you so much for being with us, Rashad, welcome. Rashad Robinson : Thank you. And thank you for having me. It ’ s an opportunity that I ’ m taking today to just tell you about how you can get involved. How you can take **action**, because right now, strategic **action** is critical for all of us to do the work to change the rules that far too often keep the systems in place that hold us back. Make no mistake, the criminal justice system is not broken. It is operating exactly the way it was designed. At every single level, the criminal justice system is not about providing justice, but about ensuring that certain people, certain communities are protected, while other communities are violated. And so I wan to talk a little bit today about Color Of Change, about activism, about the work that ’ s happening on the ground from other organizations all around the country, and the way that you can channel this energy. What we talk about at Color Of Change is how do you channel presence into power. Far too often we mistake presence and visibility for power, presence retweets the stories of the movement, people feeling passion about change could sometimes make us feel like change is inevitable, but power is actually the ability to change the rules. And right now, every day, people are taking **action**, and what we ’ re trying to channel that energy into is a couple of things. First is a whole set of demands at the federal level and at the local level. As Phil described, policing operates on many different channels. And what we need to recognize is that while there are a lot of things that can happen at the federal level, locally all around the country there are decisions that are being made in communities around how policing is executed, where community needs to hold a deeper level of accountability, at the state level we need new laws. So at Color Of Change, we ’ ve built a whole **platform** around a set of demands and are working to build more energy for everyday people to take **action**. We ’ re fighting for justice for Ahmaud Arbery, Breonna Taylor and George Floyd, we ’ re also fighting for justice for other folks whose names you haven ’ t heard, Nina Pop and others, whose stories of injustice and the relationship to the criminal justice system represent all the ways in which fighting right now is important. Over the last couple of years, we have worked to build a movement, to hold district attorneys accountable and to change the role of district attorneys in our country. And through the Winning Justice **platform** at Color Of Change, www. winningjustice. org, what we have worked to do is channel the energy of everyday people to take **action**. So, for folks who are watching what ’ s happening on TV, seeing it on their social media feeds and are outraged about what ’ s happening in Georgia, what ’ s happening in Tennessee, what ’ s happening in Minnesota, you yourself, probably, most likely, live in a place, in a community where you have a district attorney that will not hold police accountable, that will not prosecute police when they harm, hurt black folks, when they violate the laws, you live in a community where police are part of the structure that is racking up mass incarceration, but many other aspects of our system are racking up mass incarceration, and district attorneys are at the center of it. You live in those communities and you need to do something about it. And so at winningjustice. org, we ’ ve created the only searchable, national database on the 2, 400 prosecutors around the country. We ’ re building local squads and communities for folks to be able to engage around efforts that hold DAs accountable. We ’ ve worked with our partners across the movement, from our friends in Black Lives Matter, to folks who do policy work, to our friends at local ACLU chapters around the country, to build six demands. Six demands that folks can get behind in terms of pushing for reform, and then we ’ ve built public education material. But the only way that we work to change the way that prosecution happens in this country is that if people get involved. If people raise their voice, if people join us in pushing for real change. At the end of the day, I want people to recognize though, and Phillip talked a little bit about this, is that people don ’ t experience issues, they experience life. That the forces that hold us back are deeply interrelated, a racist criminal justice system requires a racist media culture to survive, a political inequality follows economic inequality, they all go hand in hand. And so I also want us to not take ourselves out of the equation. We likely work inside of corporations that may post symbols for Black Lives Matter one day, and then support politicians that work to destroy Black Lives Matter the next day. We oftentimes are engaged in **practices** inside of our companies or in our **daily** lives supporting media properties and others that are harming our communities, are telling stories. Recently, we produced a report at Color Of Change with the Norman Lear school at USC. It ’ s called”Normalizing Injustice,”and it can be found at changehollywood. org. And”Normalizing Injustice”looks at the 22 crime procedurals, those crime shows on TV. And looks at all of the ways in which they, sort of, create a warped perception about our view of justice. They create sort of an incentive for the type of policing we see on the country, and actually serve as a PR arm for law enforcement. We ’ ve been working in writers rooms around the country to work to push folks to tell better stories, but we need folks to be both active listeners, and we need folks in the industry to push back and challenge those, not only the structures that lead to that content coming on the air, but the proliferation across our airwaves. At the end of the day, we have an opportunity in this moment to make change. Inflection points are those moments where we have an opportunity to make huge leaps forward, or the real, real threat of falling backwards. In our hands is the ability to do some incredible things about undoing so many of the injustices that have stood in the way of progress for far too long. But everyday people must get involved. We must channel that presence into power, and we must build the type of power that changes the rules. Racism in so many ways is like water pouring over a floor with holes in it. Every single – In every single way, it will find the holes. And so for us, we cannot simply accept charitable solutions to structural problems, but we actually have to work for structural change. And so I want to end by saying one thing about how we talk about black people and how we talk about black communities in this moment. Because we have to say what we mean, and we have to build the narrative that gets us to where we want to go. So far too often, we talk about black communities as vulnerable, we talk about black people as vulnerable, but vulnerability is a personal trait, black communities have been under attack. Black communities have been exploited, black communities have been targeted, and we need to say that, so we don ' t put the onus on fixing black families and communities, but we put the onus on fixing the structures that have harmed us. We will say things like,"Black people are less likely to get loans from banks,"instead of saying that banks are less likely to give loans to black people. This is our opportunity to build the type of progress that makes real change, and at the center of this story, we need to show and elevate the images not just of the pain that we are facing, but of the joy, the brilliance and the creativity that black people have brought to this country. Black people are the protagonist of this story, and we need to make sure that as we work to build a new tomorrow, we ensure that the heroes are at the center of the liberation that we all need. Thank you. CA : Thank you, Rashad. Dr. Bernice King is the CEO of the King Center in Atlanta, Georgia. The center is a living memorial to her father, Dr. Martin Luther King Jr. It ' s dedicated to inspiring new generations to carry his work forward. In this moment, when so many are hurting, how can we better approach unity and collective healing? Dr. King, over to you. Bernice King : My heart is a little heavy right now, because I was that six-year-old. I was five years old when my father was assassinated. And he did change the world. But the tragedy is that we didn ' t hear what he was saying to us as a prophet to this nation. And his words are now reverberating back to us. Change, we all know, is necessary right now. And yet, it ' s not easy. We know that there has to be changes in policing in this nation of ours. But I want to talk about America ' s choice at a greater level. The prophet said to us,"We still have a choice today : nonviolent coexistence, or violent coannihilation."What we have witnessed over the last eight days has placed that choice before us. We have seen literally in the streets of our nation people who have been following the path of nonviolent protest, and people who have been hell-bent on destruction. Those choices are now looking at us, and we have to make a choice. The history of this nation was founded in violence. In fact, my father said America is the greatest purveyor of violence. And the only way forward is if we repent for being a nation built on violence. And I ' m not just talking about physical violence. I ' m talking about systemic violence, I ' m talking about policy violence, I ' m talking about what he spoke of are the triple evils of poverty, racism and militarism. All violent. Albert Einstein said something to us. He said we cannot solve problems on the same level of thinking in which they were created. And so if we are going to move forward, we are going to have to deconstruct these systems of violence that we have set in America. And we ' re going to have to reconstruct on another foundation. That foundation happens to be love and nonviolence. And so, as we move forward, we can correct course if we make that choice that Daddy said, nonviolent coexistence. And not continue on the pathway of violent coannihilation. So what does that look like? That looks like some deconstruction work in order to get to the construction. We have to deconstruct our thinking. We ' ve got to deconstruct the way in which we see people and deconstruct the way in which we operate, **practice** and engage and set policy. And so I believe that there ' s a lot of heart, h-e-a-r-t work to do, in the midst of all the h-a-r-d, hard work to do. Because heart work is hard work. One of the things we have to do is we have to ensure that everyone, especially my white brothers and sisters, have to engage in the heart work, the antiracism work, in our hearts. No one is exempt from this, especially in my white community. We must do that work in our hearts, the antiracism work. The second thing is that I encourage people to look at the nonviolence training that we [have] at the King Center, thekingcenter. org, so that we learn the foundation of understanding our interrelatedness and interconnectedness. That we understand our loyalties and our commitments and our policy-making can no longer be devoted to one group of people, but has to be devoted to the greater good of all people. And so I ’ m inviting people to even join us on our own line of protest that ’ s happening every night at seven o ’ clock pm on the King Center Facebook page, because so many people have things that they want to express and contribute to this. We all have to change and have to make a choice. It is a choice to change the direction that we have been going. We need a revolution of values in this country. That ’ s what my Daddy said. He changed the world, he changed hearts, and now, what has happened over the last seven, eight years and through history, we have to change course. And we all have to participate in changing America with the true revolution of values, where people are at the center, and not profit. Where morality is at the center, and not our military might. America does have a choice. We can either choose to go down continually that path of destruction, or we can choose nonviolent coexistence. And as my mother said, **struggle** is a never-ending process, freedom is never really won. You earn it and win it in every generation. Every generation is called to this freedom **struggle**. You as a person may want to exempt yourself, but every generation is called. And so I encourage corporations in America to start doing antiracism work within corporate America. I encourage every industry to start doing antiracism work, and pick up the banner of understanding nonviolent change, personally, and from a social change perspective. We can do this. We can make the right choice to ultimately build the beloved community. Thank you. WPR : Thank you, Dr. King. Anthony Romero is the executive director of American Civil Liberties Union. As one of the nation ’ s oldest social justice organizations, the ACLU has advocated for racial equality and shown deep support to the black community in moments of crisis. And in moments like these, black voices are almost always the loudest and at times the silence from our nonblack brothers and sisters can feel deafening. How we can bring our allies into the mix, to better support ending systemic violence and racism against the black communities, is a question top of mind for a lot of us. Anthony, welcome to the show, and thank you so much for being with us. Anthony Romero : Great. Thank you, thank you Whitney, thank you, Chris, for inviting me to join this TED community. I think community is really important right now. With so many of us feeling trepidation, the weariness, the anger, the fear, the frustration, the terrorism that we ’ ve experienced in our communities. This is a time to huddle around a virtual campfire, with your posse, with your family, with your loved ones, with your network. It ’ s not a time to be isolated or alone. And I think for allies in this **struggle**, those of us who don ’ t live this experience every day, it is time for us to lean in. You can ’ t change the channel, you can ’ t tune out, you can ’ t say,”This is too hard.”It is not that hard for us to listen and learn and heed. It is the only way we ’ re going to build out of this, by hearing the voices of Rashad, and Phil and Dr. King. By hearing the voices of our neighbors and loved ones, by hearing the voices on Twitter of people who we don ’ t know. And so white communities and allied organizations need to pay even closer attention. This is the test of your character. How willing are you to lean in and to engage. For me, I have – These have been really hard couple of weeks. I feel like this is really a test of whether or not we really believe in the American experiment. Do we really believe it? Do we really believe that out of many, one, a country with no unifying language, no unifying culture, no unifying religion, can we really become one people? All equal before the law? All bound together with a belief in the rule of law? Do we really believe that or do we just think it ’ s a nice saying to see on the back of a paper dollar? And for me, this is a referendum on the American experiment. On whether we really believe, and... the future is in our hands. And this is not like other crises, I ’ ve been the head of the ACLU for almost 20 years, I feel like I ’ ve seen it all. This is different. And this is different because it is cumulative, like Phil and Rashad and Dr. King told us, this is centuries of systemic discrimination, and the bill has come due. And it will continue to be due, and we will pay. Unless we really do something quite different. I have been scratching my head at the ACLU for the last week. We ' ve been at this for 100 years. My organization has been working on this from its inception. In 1931, we were involved with this report about lawlessness in law enforcement. That was our first report that we got behind in 1931. We opened up our first door fronts after the riots in Watts, so that we can bring legal **services** and lawyers to the communities so they could demand justice from the police departments. You know, we brought Miranda, you know, the right to remain silent, and we brought Gideon, the right to a court-appointed attorney if you can ' t afford one. We fought Bloomberg on"stop-and-frisk,"it took him years and he lost in front of our litigation to finally apologize. We ' ve been at this for 100 years. And for the communities that have lived this for 400 years, God. I ' ve been scratching my head, thinking. It ain ' t working. We don ' t need another pattern and **practice** lawsuit. We don ' t need another training program on racial **bias** or implicit **bias** in police departments, we don ' t need to file another lawsuit on qualified immunity, we don ' t need to, kind of, bring another race discrimination or gender discrimination lawsuit to integrate the police department. Yeah, we ' ve done that and we will continue to do that. For me, where I ' ve come, is that we need to defund the budgets of these police departments. It ' s the only way we ' re going to take the power back. And the more I read over the last couple of weeks about where this country is, the more I ' m clear that that is my North star at the moment. We will continue to bring the litigation on qualified immunity, we will do the efforts to hold unaccountable law enforcement officials accountable, we will bring pattern and **practice** lawsuits, because the justice department is not doing that, so we will continue to do all that good work. But the real thing is, we ' re going to go after those budgets. When you look at the fact that we spend 100 million dollars on policing, more than incarceration, that the city of Minneapolis spent 30 percent of their budget on policing. The city of Oakland, 41 percent on policing. That when you have New York City police department spend more money on policing than it does on housing and preservation development, community youth **services**, homelessness. We ' re going after the money. And that ' s hard-core advocacy. Bills drop in local legislatures to cut the funding for police, to stop these programs that give the federal military surplus to police departments, so they become, like, little mini armies, these don ' t look like police officers, these look like standing armies. And the enemy are communities of color. So we need to take away their toys. We need to cut their budgets. We need to shrink the police infrastructure, so that we can get police out of the quotidian lives of people of color and communities of color. The ubiquitousness of police enforcement on things that the police do not have a role, should not have a role to play. People should not lose their lives over whether or not a cigarette pack has a proper tax stamp, or whether a 20-dollar bill was forged or not. That ' s not **worthy** of spending our dollars on police. Get them out of that business, let ' s focus on the most important and the most serious of crimes, and that ' s it. That ' s it. We ' re going to depolice our communities. Shrink those budgets. We ' re going to reinvest those moneys in local communities, it will be like water on stone campaigns, local legislatures, local city counsels, lab report cards, for people who talk out of both sides of their mouths and say,"We believe in police reform,"and yet, they ' re still going to vote for 30 or 40 percent for the police? We ' re going to put that right to the public. And I think we just have to stay at it, because I think that ' s the only way we can get at this in a different way. Because much of what we tried to do is just simply not working. You know, with that, I **struggle** with, how do you find the optimism in this moment, because you have to find the optimism. You have to find the way to still think that even though on the face of so many setbacks, there ' s been change. It ' s been too little, too slow, not enough. We need to kind of, rock it, boost it. But you can ' t lose sight of the optimism. And you know, I ' ve been thinking about who are the folks inspiring me, and Dr. King ' s father, of course, and the words of Rashad and Patrisse Cullors and others have inspired me. But I find inspiration in the words of a scholar I really don ' t like bringing up, Sam Huntington, kind of often criticized as being a conservative, a racist. But sometimes you can find inspiration even in your enemy ' s words. And in one of his books, which I pulled off the shelf I have, he writes about how America is a disappointment, because it failed to live up to its aspirations. And he actually started talking about, America is a failure because it doesn ' t live up to its ideals. But it ' s not a failure, it ' s not a bunch of lies. It ' s a disappointment. And in the disappointment also is the fact that there ' s hope. I ' m paraphrasing it, but I think we have to kind of, wrap all of that together, and think about the disappointment and the hope and the resolve to do better. And we need to listen and lean in, and I thank the TED community, I thank Dr. King, I thank Rashad, I thank Phil. Thank you. CA : Wow. Thank you to all four of you, that was astonishing. I guess we ' re bringing everyone back now to have a conversation among us, to answer questions from our community, I hope you ' re entering those questions. So I don ' t know whether we can bring back our guests onto the screen at this point. Welcome back. Let me start with a question to you, Dr. King, I was so inspired by what you said. Your father, of course, also deeply understood the anger that leads to protest. I think he said that protests are the language of the unheard. And I ' m wondering what you would say to someone right now who is angered beyond measure by what ' s happened, and also sees this could be the moment, you know, like, someone who believes the system is so fundamentally broken, that our best choice is to tear it down, that that is actually – This may be a once-in-a-generation moment to do that. And so to actually believe that protest, including violent protest, actually is the way right now. What would you say to someone who felt that? BK : First, I just wanted to make just a slight correction, he said riots are the language of the unheard. CA : I apologize, I apologize. But that is the point even more powerfully, yeah. BK : Yes. Protest we must, and we must continue to always protest, to keep the issues in the awareness before people, but you know, when a person is angry, sometimes it ' s hard to reach them. I ' ve been on that journey, I was at a stage of my life where I was so angry, I wanted to destroy, and I ' m the daughter of Martin Luther King Jr., and grew up in a household of love and nonviolence and forgiveness, and I had to go through that journey I was surrounded by the right kind of influences, fortunately. Because that would have been a sad story. But I think it ' s really allowing ourselves to hear the anger and allowing the space for the anger, but also trying to help young people rechannel that energy. And we ' ve got to start ensuring that we connect them to some of the work that has been and now is elevated to another place. Color Of Change, the work that you ' re doing, the ACLU, the work that they ' re doing, because sometimes, there ' s this disconnection that intensifies the emotion and makes you feel helpless. But if you can channel that anger, connect it with **action** that is toward creating the social and economic change, then it begins to build you up, and then you can begin to become more constructive with the anger. WPR : We have some questions that are coming in from our community, but before we do that, you all shared such powerful, meaningful statements right now, and many of you touched on the fact that this is not the first time that we ' re experiencing this. The murder of George Floyd, Ahmaud Arbery, Breonna Taylor, this is one of – these are three of many, many instances just like this, and I ’ d love to hear you all address was has, sort of, brought us to this boiling point, what has contributed to this moment where we ’ re now experiencing things, Anthony, as you said, that feels so much worse than other moments? And that ’ s it, anyone who feels comfortable to take that question. AR : Rashad, I want to hear you. BK : I wanted to say something. I think we ’ ve always been at that moment. But this moment is different, because of the void in leadership. There ’ s no real moral voice in our country, and the person who sits in the office of the presidency is not, you know, leading in the right way. And has kind of – no, not kind of, has given **license** to certain things. And so now it ’ s, you know, he ’ s lit the fires. WPR : Yeah. RR : The thing I ’ ll add... The thing I ’ ll add here is, you know, a couple of things. For the last couple of months, we have been both seeing and experiencing all of the ways that this country ’ s decisions of underinvestment, of targeting black communities, has been killing black people through COVID. And while we ’ ve been in our homes, we have also been watching how the media has blamed us as we have been the essential workers in so many places and trying to ensure that this country keeps going. We ’ ve watched white men with guns show up to capitols demanding, basically, black and brown people go back to work. And then we see this eight-minute video with a police officer, with his knee on someone ’ s neck, after seeing that video of Ahmaud Arbery and hearing the story of Breonna Taylor, and we see him looking in the camera, basically knowing that America was not going to punish him. And what I think it is is that it ’ s just enough is enough, that people didn ’ t feel that they had a channel for that outrage, and because people had been inside, and because people had been experiencing all the ways in which the structures had also been colluding to kill us, that what we ’ re seeing is alignment of all of those things, where people are making demands that are much bigger and much **bolder** than before. And we recognize that while we don ’ t have leadership at the federal level, we also have to recognize that no political party can say that they have been 100 percent, neither political party can say they ’ ve been 100 percent on the right side of all these issues. And so people are mobilizing, they are fighting back like never before, and in some ways, people are unwilling to accept answers like,”Just go vote,”or,”Just participate in the process,”because we recognize that black people have been voting, black people have been part of voting, and part of ensuring that. And so that I think is why this moment feels so much different, combined with, for the last seven years, since Trayvon, we have seen the growth of a new movement of activists and leaders all around the country, who are also in a very different place to be able to move the needle on so much of what ’ s possible. CA : We have a question here from Genesis Be. If we can get that up here.”Here in Mississippi, the police is synonymous with the Klan, historically. How do we purge law enforcement of white supremacists?”PAG : So I guess that ’ s partially to me, being the psychologist of **bias**. I ’ ll say that just yesterday we had an officer in Denver who posted on social media himself and two other officers saying,”Let ’ s go start a riot.”He was fired that day. I worry about all the officers that the FBI has now, for almost half a decade, been warning us, law enforcement and unions being infiltrated by white supremacists. And all the officers that have social media accounts, but they ’ re private. You know, the Invisible Institute has put some things forward. We ’ re not talking seriously about the domestic terrorism threat that white supremacy represents. So the first thing that we ’ ve got to do is we ’ ve got to take it seriously. We have to actually say out loud, and I can ’ t believe that on a day like today, or a week like this week, I have to say out loud, white supremacy is alive and well and a driving force of American politics. This shouldn ’ t be controversial. I shouldn

’ t be looking forward to getting hate mail in my inbox for it, but that ’ s the reality. So the first part of solving a problem is acknowledging that it exists. But the second thing is we need to arm municipalities, that ’ s law enforcement, but even more so communities, with the ability to take **action** when someone violates their values. Right now, I think about the case in Philadelphia where Charles Ramsey, when he was a commissioner there, fired six officers, right. Concerns about racial **bias** and concerns about police brutality, and those six officers were back on the same job inside of three months. We now have a law enforcement system that says you can lose your job in one jurisdiction, and get the same job as law enforcement in another jurisdiction. And without the national registry and the capacity for law enforcement to make different decisions, we ’ re going to have this exact problem, not just in Mississippi, but in Minneapolis, and Louisville and New York and LA. CA : Phil, how much of the problem stems from the fact that police unions have a huge amount of power to protect and sometimes reinstate so called bad apple officers? PAG : Yeah, I ’ m getting this question a lot, and police unions are one of the most labor forces of the United States, and are unique within the labor movement, right? So it ’ s police unions and teachers ’ unions are the two largest and could not be two different groups of folks. When I talk to union leadership, that ’ s the leadership what wants to talk to Dr. Blackenstein, right, when I talk to union leadership, what they say is no one hates a bad officer more than a good officer. But the union contracts, the new negotiations, don ’ t look like that ’ s true. What they look like is anybody gets in trouble, and the union ’ s only job is to make sure whatever officer is in trouble, gets to maintain their job. The perverse incentive here is that when people run for union leadership, no one can run saying,”These people shouldn ’ t be in the union.”It ’ s very hard to do that. What you can run on is say,”If this person didn ’ t protect you enough, I ’ ll protect you even more. The bigots? I ’ ll protect even them.”So we have this perverse incentive where union leadership ends up not really representing the values even of the rest of the union members. But they have massive, outsized negotiating power. So yes, engaging with and appropriate rightsizing of labor protections, for folks whose jobs are difficult, but who should not be protected from the basic values of human rights, human dignity and public safety. It ’ s got to be part of the process. I mean, when unions are negotiating a two-year ban on keeping of records, so that there ’ s no ability even to trace what ’ s happening in the state of California, historically in terms of police misconduct, that ’ s not in the interest of public safety, public legitimacy, or our democracy. AR : Yeah, the thing I would add, Chris, is that I think the labor union piece is a critically important one to think through. Because I think, like Phil said, they are a key part of the puzzle that we have to solve for. And you know, it ’ s **frustrating** when you look at a place in Minneapolis, and Phil knows better than I, but when mayor Jacob Frey, the one who ’ s on TV all the time, saying many of the right things that you want an elected official to say at times like this, when he banned his police department from attending the”warrior training”that was being offered, it was the Minneapolis Police Federation, local union that defied him and sent their police to the training. And so we need to really be clear that we need to have the police forces under civilian control. I know this sounds so elementary, I feel like I ’ m talking about a Latin American, kind of, totalitarian context, but we need to exert civilian control of our police in a way that we have yet not been able to think through, and a key part of that is the labor unions of the police. And there are moments when you can find common ground. When we brought one of our COVID-related lawsuits to deal with the outbreak of the pandemic in a Maryland jail, we worked really hard, I worked the phones with the head of police unions. We got one of the local unions to serve as plaintiff in our lawsuit. Because we understood that the incarcerated folks who were being denied access to masks, social **distancing** and the conditions and lack of testing, and lack of PP, that the people who were also going to be in harm ' s way were going to be the guards as well. And they were going to be the vectors, communicating the disease out into the community. So if you can find ways of bringing that relationship. But make no mistake, when you go after their budgets, and you start taking away kind of, their munitions, and their seat at the budgeting table, oh, are you going to have a battle on your hands, right? And we have to think about also as we shrink the budgets for police, how do we – we deploy people in the police departments to other meaningful jobs, right? Because you can ' t just throw them out into the street, and say,"You ' re on your own, you ' re homeless, good luck to you."That ' s not a way to deal with redemption. So we have to really think about all these pieces in a much more cohesive way. WPR : We have another question here from the audience. From Paul Rucker :"The end of summer of 1919 was followed by the Tulsa Race Massacre, the Johnson-Reed Anti-Immigration Act of 1924, and also the rise of the KKK. Is there a possibility that white supremacy will get stronger if we don ' t seize this opportunity?"Rashad, I think this might be something that would be great to hear your perspective on, working so deeply in activism. RR : I ' m having a little trouble hearing. WPR : Oh, I ' m so sorry. RR : No, it ' s OK. CA : Can you read the question on the screen, Rashad? RR : Oh, I heard that, I heard you. WPR : Yes, I think it might just be my mic is having some issues here."Is there a possibility that white supremacy will get stronger if we don ' t seize this opportunity."Yes, absolutely yes. You know, to be clear, right, if we don ' t have the right diagnosis of white supremacy, if we think of white supremacy as just hoods, if we think of white supremacy as just folks who are operating, you know, with, you know – in some of these underground networks that have grown, if we ' re just thinking about white supremacy and white nationalism as people who marched with tiki torches in Charlottesville, then we will really mistake all the ways in which our systems and structures have white supremacy embedded, and allow for something like a Tulsa Race Massacre to happen, something like anti-immigration to happen, but on a day-to-day basis allow for the targeting of black communities through predatory **practices** by banks. The targeting of black communities through predatory **practices** like bail. A whole set of systems that can be produced day in and day out. We live in a country where the rules are far too often designed in ways that create a caste system, that create a different standard for some over others, and so when I talked about the inflection point, right, of this moment where something could really go forward and something could turn backwards, we are seeing this right now with this current president. And as we look at what could be happening with the next election, we have to be very, very clear that Donald Trump doesn ' t just operate on his own. He ' s enabled by big corporations who benefit from him being in office, and so continue to turn a blind eye to all the things that he does. They may post"Black Lives Matter,"but they show up to the White House and engage with Donald Trump. And then we have a whole set of politicians that may sometimes say that he said something that was wrong, but then allow for – but support his **platform** in other ways. You know, true co-conspiracy in the effort to dismantle white supremacy and white nationalism is not a thing that people can do on **vacation**. It is a 365-day project of us constantly working to dismantle all of the structures that have been put in harm ' s way. The final thing I will just add, because someone mentioned about police unions, and I want to just add that one of the problems with police unions, and many of us have been in this position, I think, is that I have shown up to the table with police unions on many occasions. I remember going to the White House during the last administration and being around a table as we were talking about policing and police reform. And having members of the Fraternal Order of Police leadership say things like,”All of this talk of racial profiling is new to us.”It is one thing for folks to not agree with you on the policy reforms necessary. It is another thing for people to say that our demands are too aspirational. It ’ s another thing to be gaslit and told the problem doesn ’ t actually exist at all. And that is what we are dealing with, and so we have to actually change the way that people see these institutions. Politicians who say that they are on the side of justice and reform, can no longer take money from police-only unions and Fraternal Order of Police. We actually have to create a new standard, a new litmus test of what does it mean to actually be with us. You can ’ t just sing our songs, use our hashtags and march in our marches, if you are on the other end of supporting the structures that put us in harm ’ s way, that literally kill us. And this is the opportunity for white allies to actually stand up in new ways. To be the type of ally, to do the type of allyship and the type of work that truly dismantles structures, not just provides charity. PAG : And I ’ ve got to add to that – so, Paul, thank you for the question, but we ’ re in a moment where people are looking at what ’ s happening on the street, as if a week and a half ago we weren ’ t in a midst of a global pandemic as the greatest news story, the biggest new story going on. One of the things I ’ m most worried about, and have been worried about since the beginning, what I ’ ve been talking to our chiefs about, is say, you must be out of the social **distancing** policing game. You can ’ t be the ones doing that, and the reason is this : We ’ re in a moment where creating scapegoats and enemies and others is incredibly politically advantageous for at least one side. And there is deliberate efforts to do exactly that. And we ’ ve seen that black communities are two and three and four times more likely to contract this virus, which feels like the manifestation of racial discrimination, because it is. But very soon, that ’ s going to look like black people made bad choices and they need to stay away from us. And when that happens, that ’ s when law enforcements get used to regulate where black movement can be. We used to call it sundown towns, I don ’ t know what we ’ re going to call it when it ’ s around COVID. But it ’ s coming. I ’ m already seeing that on communities like Nextdoor, and on Facebook groups. People who don ’ t think of themselves as white supremacists but just want the disease away, and the disease has a black and brown face. So we ’ re not only dealing with a moment of generational tension, between black communities and law enforcement, we ’ re dealing with a moment when people are looking for scapegoats, and black people ’ s vulnerability has always been our greatest casting note for being cast as scapegoats. So for folks who are worried about this, this is not inevitably a moment for change and reform and enlightenment and America ’ s best values, because historically, these have been precisely the moments when regression back to white supremacy has reigned supreme. So let ’ s not just look at everybody signaling. I don ’ t want to just see black and white cops on their knees, I want to see the policies. I want to see the things that will prevent this kind of thing from moving to the next stage. CA : Rashad, I want to respect the fact that you ’ ve got a hard stop at one. And so I just want to thank you for your participation in this. If you ’ ve got a couple of final words you want to share, that would be great, and then if it ’ s OK for the other three, I think there ’ s just a couple other questions I ’ d love to put and continue this conversation for just a moment longer, if possible. Rashad, any closing words? RR : The thing I want to say is that now is the time for **action**. And I want to invite people in to join us at Color Of Change to make justice real. And in so many ways, you can visit us at Color Of Change, you can take **action**. Five, 10, 15 years from now, we will be dealing with the impacts of what we did or didn ’ t do in this moment. How we stood up and how hard we were willing to fight. And as the other speakers have said, now is not the time for reform around the edges, now is time for dismantling the policies and **practices** that have held us back, and championing solutions and new rules that will move us forward. And so we hope that you will do something, whether it ’ s with us, or whether it ’ s with local organizations in your community, or other groups around the country. But this is an opportunity to make change, and I believe that we can make justice real, if we find the passion and the energy to work together to achieve it. So thank you all for having me, and I hope that we have an opportunity to build, not just online, but offline, in the months to come. CA : Thanks so much, Rashad. We ’ re just going to ask this last question of you. This one is from David Fenton.”How can the movement unite around a clear, simple **platform** of policies to enshrine in legislation? Like making all complaints against cops public, banning all choke holds, ensuring independent review boards, etc.?”WPR : That seems like a great place for you to chime in, Dr. King, if you have some thoughts on that. PAG : I think that was to go to you, Dr. King. BK : Oh, OK. You know, this may sound simplistic, but it ’ s a Nike thing, I think we have to just do it, we have to see our work as interconnected. I think there ’ s been efforts towards people working in that vein, but we have to intensify that. And in doing it, one of the things that my father said, and I know people sometimes get tired of hearing me say,”My father said,”but I just think, I wish, should I say, we had really listened to him, because we wouldn ’ t be on this **platform** right now having this type of conversation. But he left something with us, sort of a blueprint in”Where Do We Go From Here : Chaos or Community?”, his book, and he said, going forward, the meddlesome task is to organize our strength into compelling power. And that is so key, because oftentimes we organize merely around passion. But people have certain areas of strength and talent and giftedness, and we ’ ve got to figure out how to build our coalitions based on these strengths. You know, people do different things well. And so, in order to unite in an effective way that they might not elude the demand that we ’ re making, I think that ’ s what ’ s going to happen. People have to do their own personal assessment within their organization, I call it a SWAT analysis. And then that SWAT analysis has to happen across organizations, so that we can make sure that we are moving in a united manner, off of the strengths that each organization brings, so that we can **maximize** the impact and the effectiveness to do things like this, in terms of getting the legislation in place that is needed in this hour. CA : Thanks so much. Just quick closing words from you, Anthony, and then from you, Phil. Anthony. AR : You know, I would just say that what gives me hope are the young folk. You have to believe that among this group, this groups of young ’ uns, seeing what they ’ re seeing, living with this president, with these instincts, seeing the continued indifference that mainstream communities have given to issues of racial justice, or economic justice, you ’ ve got to believe that what comes out of this very hot fire, is something even more powerful and strong than we ’ ve ever seen before. That ’ s what gets me through the hard days that we ’ re now experiencing, this thinking, there is another Dr. King among the young ’ uns, Dr. King. And I have to believe that what they ’ re seeing and what they ’ re witnessing and their righteous indignation and their frustration and their anger is going to be miraculously a beautiful blossoming of a new opportunity, of a new change. This generation will take us there, I have to believe that. My generation has failed them miserably. So I ’ m just looking forward to the new ones. CA : Thank you, Anthony. WPR : Phil. Thank you, Anthony. PAG : So it really has been a privilege to be on with you all. To David ’ s question, let me say that a number of civil rights organizations, I believe the ACLU among them, CPE, Center for

Policing Equity, and hundreds more have signed on to principles for legislation that would include eight pillars. It ’ s been led by the Leadership Conference for Civil and Human Rights. And it includes a federal ban on choke holds, it includes a national registry for officers who have engaged in misconduct. I also think that it ’ s important at this moment to get, we ’ ve got law enforcement ’ s chiefs of major cities willing to say, if we emerge from this moment and our profession hasn ’ t changed, then we have failed again. So it ’ s a critical time to get behind, I would direct you to LCCHR ’ s website for the eight pillars, because I won ’ t remember them all right now, and to start calling your local law enforcement, and say,”Yes, own that.”You should be signing on, they should be going public with letters that do all of that. But I ’ ll also say this. For a path forward in the principles, I ’ ll end where I started, which is that this is bigger than policing. These are the unpaid debts owed to black communities for stolen labor, owed to native communities for stolen land, for stolen culture, for years taken away and for lives lost in it. This is bigger than policing. If we don ’ t understand the size of it, then there ’ s no solution that ’ s really, truly proportional to the moment. But in this moment, when we ’ re seeing trillion of dollars in bailouts, mostly for corporations, it is absolutely a time when we can do things that normally, people could pretend that ’ s too much, it ’ s too big, we can ’ t. We have literally all the money in the world that can be spent and directed towards making us the society we pretend to be, before moments like this happen. And so the thing that gives me hope is that the lies have to be obvious now. The lies have to be, that was a reasonable use of force. The lie has to be, we don ’ t have the money. The lie has to be, that ’ s too hard, it ’ s too big of a challenge. This stuff feels impossible every day except today, because the alternative is we lose everything. Everything is at stake, our democracy is at stake, the people we choose to be, we claim to be, that ’ s at stake. And in the face of that, I think we can do impossible things. I think we can be mighty. So my hope for all of us is first, that we wake up tomorrow with more peace in the evening than war, and that we hold on to what ’ s possible from this moment at the same time that we hold on to the size of the task in front of us. I don ’ t want to come with half measures out of this. I don ’ t want to come out with radicalized youth and indifferent aged... I don ’ t know what the contrast... The radicalized youth and indifferent people who are old like me. I want to come out with a unified country that understands that the costs that we owe are big, and our pockets are deep enough to match it. CA : Wow. Thank you to each of you for extraordinary eloquence. Really, so powerful. This conversation, obviously, continues, I know that there ’ s many people listening, you have other questions, this, I think, from TED ’ s point of view is just the start of the conversation. To the extent that our job is to amplify the voices that matter, we couldn ’ t be prouder to be amplifying further your extraordinary voices. So thank you for being part of this today. PAG : Thank you. WPR : Thank you all.

Text Sample 181: POS Dim 2 – 1994 – Score 5.00 – 1994/t002458.txt

Because I usually take the role of trying to explain to people how wonderful the new technologies that are coming along are going to be, and I thought that, since I was among friends here, I would tell you what I really think and try to look back and try to understand what is really going on here with these amazing jumps in technology that seem so fast that we can barely keep on top of it. So I ’ m going to start out by showing just one very boring technology slide. And then, so if you can just turn on the slide that ’ s on. This is just a random slide that I picked out of my file. What I want to show you is not so much the details of the slide, but the general form of it. This happens to be a slide of some analysis that we were doing about the power of RISC microprocessors versus the power of local area networks. And the interesting thing about it is that this slide, like so many technology slides that we ’ re used to, is a sort of a straight line on a semi-log curve. In other words, every step here represents an order of magnitude in performance scale. And this is a new thing that we talk about technology on semi-log curves. Something really weird is going on here. And that ’ s basically what I ’ m going to be talking about. So, if you could bring up the lights. If you could bring up the lights higher, because I ’ m just going to use a piece of paper here. Now why do we draw technology curves in semi-log curves? Well the answer is, if I drew it on a normal curve where, let ’ s say, this is years, this is time of some sort, and this is whatever measure of the technology that I ’ m trying to graph, the graphs look sort of silly. They sort of go like this. And they don ’ t tell us much. Now if I graph, for instance, some other technology, say transportation technology, on a semi-log curve, it would look very stupid, it would look like a flat line. But when something like this happens, things are qualitatively changing. So if transportation technology was moving along as fast as microprocessor technology, then the day after tomorrow, I would be able to get in a taxi **cab** and be in Tokyo in 30 seconds. It ’ s not moving like that. And there ’ s nothing precedented in the history of technology development of this kind of self- feeding growth where you go by orders of magnitude every few years. Now the question that I ’ d like to ask is, if you look at these exponential curves, they don ’ t go on forever. Things just can ’ t possibly keep changing as fast as they are. One of two things is going to happen. Either it ’ s going to turn into a sort of **classical** S-curve like this, until something totally different comes along, or maybe it ’ s going to do this. That ’ s about all it can do. Now I ’ m an optimist, so I sort of think it ’ s probably going to do something like that. If so, that means that what we ’ re in the middle of right now is a transition. We ’ re sort of on this line in a transition from the way the world used to be to some new way that the world is. And so what I ’ m trying to ask, what I ’ ve been asking myself, is what ’ s this new way that the world is? What ’ s that new state that the world is heading toward? Because the transition seems very, very confusing when we ’ re right in the middle of it. Now when I was a kid growing up, the future was kind of the year 2000, and people used to talk about what would happen in the year 2000. Now here ’ s a conference in which people talk about the future, and you notice that the future is still at about the year 2000. It ’ s about as far as we go out. So in other words, the future has kind of been shrinking one year per year for my whole lifetime. Now I think that the reason is because we all feel that something ’ s happening there. That transition is happening. We can all sense it. And we know that it just doesn ’ t make too much sense to think out 30, 50 years because everything ’ s going to be so different that a simple extrapolation of what we ’ re doing just doesn ’ t make any sense at all. So what I would like to talk about is what that could be, what that transition could be that we ’ re going through. Now in order to do that I ’ m going to have to talk about a bunch of stuff that really has nothing to do with technology and computers. Because I think the only way to understand this is to really step back and take a long time scale look at things. So the time scale that I would like to look at this on is the time scale of life on Earth. So I think this picture makes sense if you look at it a few billion years at a time. So if you go back about two and a half billion years, the Earth was this big, sterile hunk of rock with a lot of chemicals floating around on it. And if you look at the way that the chemicals got organized, we begin to get a pretty good idea of how they do it. And I think that there ’ s theories that are beginning to understand about how it started with RNA, but I ’ m going to tell a sort of simple story of it, which is that, at that time, there were little drops of oil floating around with all kinds of different recipes of chemicals in them. And some of those drops of oil had a particular combination of chemicals in them which caused them to incorporate chemicals from the outside and grow the drops of oil. And those that were like that started to split and divide. And those were the most primitive forms of cells in a sense, those little drops of oil. But now those drops of oil weren ’ t really alive, as we say it now, because every one of them was a little random recipe of chemicals. And every time it divided, they got sort of unequal division of the chemicals within them. And so every drop was a little bit different. In fact, the drops that were different in a way that caused them to be better at incorporating chemicals around them, grew more and incorporated more chemicals and divided more. So those tended to live longer, get expressed more. Now that ’ s sort of just a very simple chemical form of life, but when things got interesting was when these drops learned a trick about abstraction. Somehow by ways that we don ’ t quite understand, these little drops learned to write down information. They learned to record the information that was the recipe of the cell onto a particular kind of chemical called DNA. So in other words, they worked out, in this mindless sort of evolutionary way, a form of writing that let them write down what they were, so that that way of writing it down could get copied. The amazing thing is that that way of writing seems to have stayed steady since it evolved two and a half billion years ago. In fact the recipe for us, our genes, is exactly that same code and that same way of writing. In fact, every living creature is written in exactly the same set of letters and the same code. In fact, one of the things that I did just for amusement purposes is we can now write things in this code. And I ’ ve got here a little 100 micrograms of white powder, which I try not to let the security people see at airports. But this has in it — what I did is I took this code — the code has standard letters that we use for symbolizing it — and I wrote my business card onto a piece of DNA and amplified it 10 to the 22 times. So if anyone would like a hundred million copies of my business card, I have plenty for everyone in the room, and, in fact, everyone in the world, and it ’ s right here. If I had really been a egotist, I would have put it into a virus and released it in the room. So what was the next step? Writing down the DNA was an interesting step. And that caused these cells — that kept them happy for another billion years. But then there was another really interesting step where things became completely different, which is these cells started exchanging and communicating information, so that they began to get communities of cells. I don ’ t know if you know this, but bacteria can actually exchange DNA. Now that ’ s why, for instance, antibiotic resistance has evolved. Some bacteria figured out how to stay away from penicillin, and it went around sort of creating its little DNA information with other bacteria, and now we have a lot of bacteria that are resistant to penicillin, because bacteria communicate. Now what this communication allowed was communities to form that, in some sense, were in the same boat together ; they were synergistic. So they survived or they failed together, which means that if a community was very successful, all the individuals in that community were repeated more and they were favored by evolution. Now the transition point happened when these communities got so close that, in fact, they got together and decided to write down the whole recipe for the community together on one string of DNA. And so the next stage that ’ s interesting in life took about another billion years. And at that stage, we have multi-cellular communities, communities of lots of different types of cells, working together as a single organism. And in fact, we ’ re such a multi- cellular community. We have lots of cells that are not out for themselves anymore. Your skin cell is really useless without a heart cell, muscle cell, a brain cell and so on. So these communities began to evolve so that the interesting level on which evolution was taking place was no longer a cell, but a community which we call an organism. Now the next step that happened is within these communities. These communities of cells, again, began to abstract information. And they began building very **special** structures that did nothing but process information within the community. And those are the neural structures. So neurons are the information processing apparatus that those communities of cells built up. And in fact, they began to get specialists in the community and **special** structures that were responsible for recording, understanding, learning information. And that was the brains and the nervous system of those communities. And that gave them an evolutionary advantage. Because at that point, an individual — learning could happen within the time span of a single organism, instead of over this evolutionary time span. So an organism could, for instance, learn not to eat a certain kind of fruit because it tasted bad and it got sick last time it ate it. That could happen within the lifetime of a single organism, whereas before they ' d built these **special** information processing structures, that would have had to be learned evolutionarily over hundreds of thousands of years by the individuals dying off that ate that kind of fruit. So that nervous system, the fact that they built these **special** information structures, tremendously sped up the whole process of evolution. Because evolution could now happen within an individual. It could happen in learning time scales. But then what happened was the individuals worked out, of course, tricks of communicating. And for example, the most sophisticated version that we ' re aware of is human language. It ' s really a pretty amazing invention if you think about it. Here I have a very complicated, messy, confused idea in my head. I ' m sitting here making grunting sounds basically, and hopefully constructing a similar messy, confused idea in your head that bears some analogy to it. But we ' re taking something very complicated, turning it into sound, sequences of sounds, and producing something very complicated in your brain. So this allows us now to begin to start functioning as a single organism. And so, in fact, what we ' ve done is we, humanity, have started abstracting out. We ' re going through the same levels that multi-cellular organisms have gone through — abstracting out our methods of recording, presenting, processing information. So for example, the invention of language was a tiny step in that direction. Telephony, computers, videotapes, CD-ROMs and so on are all our specialized mechanisms that we ' ve now built within our society for handling that information. And it all connects us together into something that is much bigger and much faster and able to evolve than what we were before. So now, evolution can take place on a scale of microseconds. And you saw Ty ' s little evolutionary example where he sort of did a little bit of evolution on the Convolution program right before your eyes. So now we ' ve speeded up the time scales once again. So the first steps of the story that I told you about took a billion years a piece. And the next steps, like nervous systems and brains, took a few hundred million years. Then the next steps, like language and so on, took less than a million years. And these next steps, like electronics, seem to be taking only a few decades. The process is feeding on itself and becoming, I guess, autocatalytic is the word for it — when something reinforces its rate of change. The more it changes, the faster it changes. And I think that that ' s what we ' re seeing here in this explosion of curve. We ' re seeing this process feeding back on itself. Now I design computers for a living, and I know that the mechanisms that I use to design computers would be impossible without recent advances in computers. So right now, what I do is I design objects at such complexity that it ' s really impossible for me to design them in the traditional sense. I don ' t know what every transistor in the connection machine does. There are billions of them. Instead, what I do and what the designers at Thinking Machines do is we think at some level of abstraction and then we hand it to the machine and the machine takes it beyond what we could ever do, much farther and faster than we could ever do. And in fact, sometimes it takes it by methods that we don ’ t quite even understand. One method that ’ s particularly interesting that I ’ ve been using a lot lately is evolution itself. So what we do is we put inside the machine a process of evolution that takes place on the microsecond time scale. So for example, in the most extreme cases, we can actually evolve a program by starting out with random sequences of instructions. Say,”Computer, would you please make a hundred million random sequences of instructions. Now would you please run all of those random sequences of instructions, run all of those programs, and pick out the ones that came closest to doing what I wanted.”So in other words, I define what I wanted. Let ’ s say I want to sort numbers, as a simple example I ’ ve done it with. So find the programs that come closest to sorting numbers. So of course, random sequences of instructions are very unlikely to sort numbers, so none of them will really do it. But one of them, by luck, may put two numbers in the right order. And I say,”Computer, would you please now take the 10 percent of those random sequences that did the best job. Save those. Kill off the rest. And now let ’ s reproduce the ones that sorted numbers the best. And let ’ s reproduce them by a process of recombination analogous to sex.”Take two programs and they produce children by exchanging their subroutines, and the children inherit the traits of the subroutines of the two programs. So I ’ ve got now a new generation of programs that are produced by combinations of the programs that did a little bit better job. Say,”Please repeat that process.”**Score** them again. Introduce some mutations perhaps. And try that again and do that for another generation. Well every one of those generations just takes a few milliseconds. So I can do the equivalent of millions of years of evolution on that within the computer in a few minutes, or in the complicated cases, in a few hours. At the end of that, I end up with programs that are absolutely perfect at sorting numbers. In fact, they are programs that are much more efficient than programs I could have ever written by hand. Now if I look at those programs, I can ’ t tell you how they work. I ’ ve tried looking at them and telling you how they work. They ’ re obscure, weird programs. But they do the job. And in fact, I know, I ’ m very confident that they do the job because they come from a line of hundreds of thousands of programs that did the job. In fact, their life depended on doing the job. I was riding in a 747 with Marvin Minsky once, and he pulls out this card and says,”Oh look. Look at this. It says, ’ This plane has hundreds of thousands of tiny parts working together to make you a safe flight. ’ Doesn ’ t that make you feel confident?”In fact, we know that the engineering process doesn ’ t work very well when it gets complicated. So we ’ re beginning to depend on computers to do a process that ’ s very different than engineering. And it lets us produce things of much more complexity than normal engineering lets us produce. And yet, we don ’ t quite understand the options of it. So in a sense, it ’ s getting ahead of us. We ’ re now using those programs to make much faster computers so that we ’ ll be able to run this process much faster. So it ’ s feeding back on itself. The thing is becoming faster and that ’ s why I think it seems so confusing. Because all of these technologies are feeding back on themselves. We ’ re taking off. And what we are is we ’ re at a point in time which is analogous to when single- celled organisms were turning into multi-celled organisms. So we ’ re the amoebas and we can ’ t quite figure out what the hell this thing is we ’ re creating. We ’ re right at that point of transition. But I think that there really is something coming along after us. I think it ’ s very haughty of us to think that we ’ re the end product of evolution. And I think all of us here are a part of producing whatever that next thing is. So lunch is coming along, and I think I will stop at that point, before I get selected out.

What I ’ m going to do, in the spirit of collaborative creativity, is simply repeat many of the points that the three people before me have already made, but do them â this is called”creative collaboration ;”it ’ s actually called”borrowing”â but do it through a particular perspective, and that is to ask about the role of users and consumers in this emerging world of collaborative creativity that Jimmy and others have talked about. Let me just ask you, to start with, this simple question : who invented the mountain bike? Because traditional economic theory would say, well, the mountain bike was probably invented by some big bike corporation that had a big R&D lab where they were thinking up new projects, and it came out of there. It didn ’ t come from there. Another answer might be, well, it came from a sort of lone genius working in his garage, who, working away on different kinds of bikes, comes up with a bike out of thin air. It didn ’ t come from there. The mountain bike came from users, came from young users, particularly a group in Northern California, who were frustrated with traditional racing bikes, which were those sort of bikes that Eddy Merckx rode, or your big brother, and they ’ re very glamorous. But also frustrated with the bikes that your dad rode, which sort of had big handlebars like that, and they were too heavy. So, they got the frames from these big bikes, put them together with the gears from the racing bikes, got the brakes from motorcycles, and sort of mixed and matched various ingredients. And for the first, I don ’ t know, three to five years of their life, mountain bikes were known as”clunkers.”And they were just made in a community of bikers, mainly in Northern California. And then one of these companies that was importing parts for the clunkers decided to set up in business, start selling them to other people, and gradually another company emerged out of that, Marin, and it probably was, I don ’ t know, 10, maybe even 15, years, before the big bike companies realized there was a market. Thirty years later, mountain bike sales and mountain bike equipment account for 65 percent of bike sales in America. That ’ s 58 billion dollars. This is a category entirely created by consumers that would not have been created by the mainstream bike market because they couldn ’ t see the need, the opportunity ; they didn ’ t have the incentive to innovate. The one thing I think I disagree with about Yochai ’ s presentation is when he said the Internet causes this distributive capacity for innovation to come alive. It ’ s when the Internet combines with these kinds of **passionate** pro-am consumers â who are knowledgeable ; they ’ ve got the incentive to innovate ; they ’ ve got the tools ; they want to â that you get this kind of explosion of creative collaboration. And out of that, you get the need for the kind of things that Jimmy was talking about, which is our new kinds of organization, or a better way to put it : how do we organize ourselves without organizations? That ’ s now possible ; you don ’ t need an organization to be organized, to achieve large and complex tasks, like innovating new software programs. So this is a huge challenge to the way we think creativity comes about. The traditional view, still enshrined in much of the way that we think about creativity â in organizations, in government â is that creativity is about **special** people : wear **baseball** caps the wrong way round, come to conferences like this, in **special** places, elite universities, R&D labs in the forests, water, maybe **special** rooms in companies painted funny colors, you know, bean bags, maybe the odd table-football table. **Special** people, **special** places, think up **special** ideas, then you have a pipeline that takes the ideas down to the waiting consumers, who are passive. They can say"yes"or"no"to the invention. That ' s the idea of creativity. What ' s the policy recommendation out of that if you ' re in government, or you ' re running a large company? More **special** people, more **special** places. Build creative clusters in cities ; create more R&D parks, so on and so forth. Expand the pipeline down to the consumers. Well this view, I think, is increasingly wrong. I think it ' s always been wrong, because I think always creativity has been highly collaborative, and it ' s probably been largely interactive. But it ' s increasingly wrong, and one of the reasons it ' s wrong is that the ideas are flowing back up the pipeline. The ideas are coming back from the consumers, and they ' re often ahead of the producers. Why is that? Well, one issue is that radical innovation, when you ' ve got ideas that affect a large number of technologies or people, have a great deal of uncertainty attached to them. The payoffs to innovation are greatest where the uncertainty is highest. And when you get a radical innovation, it ' s often very uncertain how it can be applied. The whole history of telephony is a story of dealing with that uncertainty. The very first landline telephones, the inventors thought that they would be used for people to listen in to live performances from West End theaters. When the **mobile** telephone companies invented SMS, they had no idea what it was for ; it was only when that technology got into the hands of teenage users that they invented the use. So the more radical the innovation, the more the uncertainty, the more you need innovation in use to work out what a technology is for. All of our patents, our entire approach to patents and invention, is based on the idea that the inventor knows what the invention is for ; we can say what it ' s for. More and more, the inventors of things will not be able to say that in advance. It will be worked out in use, in collaboration with users. We like to think that invention is a sort of moment of creation : there is a moment of birth when someone comes up with an idea. The truth is that most creativity is cumulative and collaborative ; like Wikipedia, it develops over a long period of time. The second reason why users are more and more important is that they are the source of big, disruptive innovations. If you want to find the big new ideas, it ' s often difficult to find them in mainstream markets, in big organizations. And just look inside large organizations and you ' ll see why that is so. So, you ' re in a big corporation. You ' re obviously keen to go up the corporate ladder. Do you go into your board and say,"Look, I ' ve got a fantastic idea for an embryonic product in a marginal market, with consumers we ' ve never dealt with before, and I ' m not sure it ' s going to have a big payoff, but it could be really, really big in the future?"No, what you do, is you go in and you say,"I ' ve got a fantastic idea for an incremental innovation to an existing product we sell through existing channels to existing users, and I can guarantee you get this much return out of it over the next three years."Big corporations have an in-built tendency to reinforce past success. They ' ve got so much sunk in it that it ' s very difficult for them to spot emerging new markets. Emerging new markets, then, are the breeding grounds for **passionate** users. Best example : who in the music industry, 30 years ago, would have said,"Yes, let ' s invent a musical form which is all about dispossessed black men in ghettos expressing their frustration with the world through a form of music that many people find initially quite difficult to listen to. That sounds like a winner ; we ' ll go with it.". So what happens? Rap music is created by the users. They do it on their own tapes, with their own recording equipment ; they distribute it themselves. 30 years later, rap music is the dominant musical form of popular culture â would never have come from the big companies. Had to start â this is the third point â with these pro-ams. This is the phrase that I ' ve used in some stuff which I ' ve done with a think tank in London called Demos, where we ’ ve been looking at these people who are amateurs â i. e., they do it for the love of it â but they want to do it to very high standards. And across a whole range of fields â from software, astronomy, natural sciences, vast areas of leisure and culture like kite- surfing, so on and so forth â you find people who want to do things because they love it, but they want to do these things to very high standards. They work at their leisure, if you like. They take their leisure very seriously : they acquire skills ; they invest time ; they use technology that ’ s getting cheaper â it ’ s not just the Internet : cameras, design technology, leisure technology, surfboards, so on and so forth. Largely through globalization, a lot of this equipment has got a lot cheaper. More knowledgeable consumers, more educated, more able to connect with one another, more able to do things together. Consumption, in that sense, is an **expression** of their productive potential. Why, we found, people were interested in this, is that at work they don ’ t feel very expressed. They don ’ t feel as if they ’ re doing something that really matters to them, so they pick up these kinds of activities. This has huge **organizational** implications for very large areas of life. Take astronomy as an example, which Yochai has already mentioned. Twenty years ago, 30 years ago, only big professional astronomers with very big telescopes could see far into space. And there ’ s a big telescope in Northern England called Jodrell Bank, and when I was a kid, it was amazing, because the moon shots would take off, and this thing would move on rails. And it was huge â it was absolutely enormous. Now, six amateur astronomers, working with the Internet, with Dobsonian digital telescopes â which are pretty much open source â with some light sensors developed over the last 10 years, the Internet â they can do what Jodrell Bank could only do 30 years ago. So here in astronomy, you have this vast explosion of new productive resources. The users can be producers. What does this mean, then, for our **organizational** landscape? Well, just imagine a world, for the moment, divided into two camps. Over here, you ’ ve got the old, traditional corporate model : **special** people, **special** places ; patent it, push it down the pipeline to largely waiting, passive consumers. Over here, let ’ s imagine we ’ ve got Wikipedia, Linux, and beyond â open source. This is open ; this is closed. This is new ; this is traditional. Well, the first thing you can say, I think with certainty, is what Yochai has said already â is there is a great big **struggle** between those two **organizational** forms. These people over there will do everything they can to stop these kinds of organizations succeeding, because they ’ re threatened by them. And so the debates about copyright, digital rights, so on and so forth â these are all about trying to stifle, in my view, these kinds of organizations. What we ’ re seeing is a complete corruption of the idea of patents and copyright. Meant to be a way to incentivize invention, meant to be a way to orchestrate the dissemination of knowledge, they are increasingly being used by large companies to create thickets of patents to prevent innovation taking place. Let me just give you two examples. The first is : imagine yourself going to a venture capitalist and saying,”I ’ ve got a fantastic idea. I ’ ve invented this brilliant new program that is much, much better than Microsoft Outlook.”Which venture capitalist in their right mind is going to give you any money to set up a venture competing with Microsoft, with Microsoft Outlook? No one. That is why the competition with Microsoft is bound to come â will only come â from an open-source kind of project. So, there is a huge competitive argument about sustaining the capacity for open-source and consumer-driven innovation, because it ’ s one of the greatest competitive levers against monopoly. There ’ ll be huge professional arguments as well. Because the professionals, over here in these closed organizations â they might be academics ; they might be programmers ; they might be doctors

; they might be journalists â my former profession â say,”No, no â you can ’ t trust these people over here.”When I started in journalism â Financial Times, 20 years ago â it was very, very exciting to see someone reading the newspaper. And you ’ d kind of look over their shoulder on the Tube to see if they were reading your article. Usually they were reading the share prices, and the bit of the paper with your article on was on the floor, or something like that, and you know,”For heaven ’ s sake, what are they doing! They ’ re not reading my brilliant article!”And we allowed users, readers, two places where they could contribute to the paper : the letters page, where they could write a letter in, and we would condescend to them, cut it in half, and print it three days later. Or the op-ed page, where if they knew the editor â had been to school with him, slept with his wife â they could write an article for the op-ed page. Those were the two places. Shock, horror : now, the readers want to be writers and publishers. That ’ s not their role ; they ’ re supposed to read what we write. But they don ’ t want to be journalists. The journalists think that the bloggers want to be journalists ; they don ’ t want to be journalists ; they just want to have a voice. They want to, as Jimmy said, they want to have a dialogue, a conversation. They want to be part of that flow of information. What ’ s happening there is that the whole domain of creativity is expanding. So, there ’ s going to be a tremendous **struggle**. But, also, there ’ s going to be tremendous movement from the open to the closed. What you ’ ll see, I think, is two things that are critical, and these, I think, are two challenges for the open movement. The first is : can we really survive on volunteers? If this is so critical, do we not need it funded, organized, supported in much more structured ways? I think the idea of creating the Red Cross for information and knowledge is a fantastic idea, but can we really organize that, just on volunteers? What kind of changes do we need in public policy and funding to make that possible? What ’ s the role of the BBC, for instance, in that world? What should be the role of public policy? And finally, what I think you will see is the intelligent, closed organizations moving increasingly in the open direction. So it ’ s not going to be a contest between two camps, but, in between them, you ’ ll find all sorts of interesting places that people will occupy. New **organizational** models coming about, mixing closed and open in tricky ways. It won ’ t be so clear-cut ; it won ’ t be Microsoft versus Linux â there ’ ll be all sorts of things in between. And those **organizational** models, it turns out, are incredibly powerful, and the people who can understand them will be very, very successful. Let me just give you one final example of what that means. I was in Shanghai, in an office block built on what was a rice paddy five years ago â one of the 2, 500 skyscrapers they ’ ve built in Shanghai in the last 10 years. And I was having dinner with this guy called Timothy Chan. Timothy Chan set up an Internet business in 2000. Didn ’ t go into the Internet, kept his money, decided to go into computer games. He runs a company called Shanda, which is the largest computer games company in China. Nine thousand servers all over China, has 250 million subscribers. At any one time, there are four million people playing one of his games. How many people does he employ to **service** that population? 500 people. Well, how can he **service** 250 million people from 500 employees? Because basically, he doesn ’ t **service** them. He gives them a **platform** ; he gives them some rules ; he gives them the tools and then he kind of orchestrates the conversation ; he orchestrates the **action**. But actually, a lot of the content is created by the users themselves. And it creates a kind of stickiness between the community and the company which is really, really powerful. The best measure of that : so you go into one of his games, you create a character that you develop in the course of the game. If, for some reason, your credit card bounces, or there ’ s some other problem, you lose your character.

You ’ ve got two options. One option : you can create a new character, right from scratch, but with none of the history of your player. That costs about 100 dollars. Or you can get on a plane, fly to Shanghai, queue up outside Shanda ’ s offices â cost probably 600, 700 dollars â and reclaim your character, get your history back. Every morning, there are 600 people queuing outside their offices to reclaim these characters. So this is about companies built on communities, that provide communities with tools, resources, **platforms** in which they can share. He ’ s not open source, but it ’ s very, very powerful. So here is one of the challenges, I think, for people like me, who do a lot of work with government. If you ’ re a games company, and you ’ ve got a million players in your game, you only need one percent of them to be co-developers, contributing ideas, and you ’ ve got a development **workforce** of 10, 000 people. Imagine you could take all the children in education in Britain, and one percent of them were co-developers of education. What would that do to the resources available to the education system? Or if you got one percent of the patients in the NHS to, in some sense, be co-producers of health. The reason why â despite all the efforts to cut it down, to constrain it, to hold it back â why these open models will still start emerging with tremendous force, is that they multiply our productive resources. And one of the reasons they do that is that they turn users into producers, consumers into designers. Thank you very much.

Text Sample 183: POS Dim 2 – 2005 – Score 11.00 – 2005/t000307.txt

One of the problems of writing, and working, and looking at the Internet is that it ’ s very hard to separate fashion from deep change. And so, to start helping that, I want to take us back to 1835. In 1835, James Gordon Bennett founded the first mass-circulation newspaper in New York City. And it cost about 500 dollars to start it, which was about the equivalent of 10, 000 dollars of today. By 15 years later, by 1850, doing the same thing — starting what was experienced as a mass—circulation **daily** paper — would come to cost two and a half million dollars. 10, 000, two and a half million, 15 years. That ’ s the critical change that is being inverted by the Net. And that ’ s what I want to talk about today, and how that relates to the emergence of social production. Starting with newspapers, what we saw was high cost as an initial requirement for making information, knowledge and culture, which led to a stark bifurcation between producers — who had to be able to raise **financial** capital, just like any other industrial organization — and passive consumers that could choose from a certain set of things that this industrial model could produce. Now, the term”information society,””information economy,”for a very long time has been used as the thing that comes after the industrial revolution. But in fact, for purposes of understanding what ’ s happening today, that ’ s wrong. Because for 150 years, we ’ ve had an information economy. It ’ s just been industrial, which means those who were producing had to have a way of raising money to pay those two and a half million dollars, and later, more for the telegraph, and the radio transmitter, and the television, and eventually the mainframe. And that meant they were market based, or they were government owned, depending on what kind of system they were in. And this characterized and anchored the way information and knowledge were produced for the next 150 years. Now, let me tell you a different story. Around June 2002, the world of supercomputers had a bombshell. The Japanese had, for the first time, created the fastest supercomputer — the NEC Earth Simulator — taking the primary from the U. S., and about two years later — this, by the way, is measuring the trillion floating-point operations per second that the computer ’ s capable of running — sigh of relief

: IBM [Blue Gene] has just edged ahead of the NEC Earth Simulator. All of this completely ignores the fact that throughout this period, there ' s another supercomputer running in the world — SETI@home. Four and a half million users around the world, contributing their leftover computer cycles, whenever their computer isn ' t working, by running a screen saver, and together sharing their resources to create a massive supercomputer that NASA harnesses to analyze the data coming from radio telescopes. What this picture suggests to us is that we ' ve got a radical change in the way information production and exchange is capitalized. Not that it ' s become less capital intensive — that there ' s less money that ' s required — but that the **ownership** of this capital, the way the capitalization happens, is radically distributed. Each of us, in these advanced economies, has one of these, or something rather like it — a computer. They ' re not radically different from routers inside the middle of the network. And computation, storage and communications capacity are in the hands of practically every connected person — and these are the basic physical capital means necessary for producing information, knowledge and culture, in the hands of something like 600 million to a billion people around the planet. What this means is that for the first time since the industrial revolution, the most important means, the most important components of the core economic activities — remember, we are in an information economy — of the most advanced economies, and there more than anywhere else, are in the hands of the population at large. This is completely different than what we ' ve seen since the industrial revolution. So we ' ve got communications and computation capacity in the hands of the entire population, and we ' ve got human creativity, human wisdom, human experience — the other major experience, the other major input — which unlike simple labor — stand here turning this lever all day long — is not something that ' s the same or fungible among people. Any one of you who has taken someone else ' s job, or tried to give yours to someone else, no matter how detailed the manual, you cannot transmit what you know, what you will intuit under a certain set of circumstances. In that we ' re unique, and each of us holds this critical input into production as we hold this machine. What ' s the effect of this? So, the story that most people know is the story of free or open source software. This is market share of Apache Web server — one of the critical applications in Web-based communications. In 1995, two groups of people said,"Wow, this is really important, the Web! We need a much better Web server!"One was a motley collection of volunteers who just decided, you know, we really need this, we should write one, and what are we going to do with what — well, we ' re gonna share it! And other people will be able to develop it. The other was Microsoft. Now, if I told you that 10 years later, the motley crew of people, who didn ' t control anything that they produced, acquired 20 percent of the market and was the red line, it would be amazing! Right? Think of it in minivans. A group of automobile engineers on their weekends are competing with Toyota. Right? But, in fact, of course, the story is it ' s the 70 percent, including the major e- commerce site — 70 percent of a critical application on which Web-based communications and applications work is produced in this form, in direct competition with Microsoft. Not in a side issue — in a central strategic decision to try to capture a component of the Net. Software has done this in a way that ' s been very visible, because it ' s measurable. But the thing to see is that this actually happens throughout the Web. So, NASA, at some point, did an experiment where they took images of Mars that they were mapping, and they said, instead of having three or four fully trained Ph. D. s doing this all the time, let ' s break it up into small components, put it up on the Web, and see if people, using a very simple interface, will actually spend five minutes here, 10 minutes there, clicking. After six months, 85, 000 people used this to generate mapping at a faster rate than the images were coming in, which was, quote,”practically indistinguishable from the markings of a fully-trained Ph. D.,”once you showed it to a number of people and computed the average. Now, if you have a little girl, and she goes and writes to — well, not so little, medium little — tries to do research on Barbie. And she ’ ll come to Encarta, one of the main online encyclopedias. This is what you ’ ll find out about Barbie. This is it, there ’ s nothing more to the definition, including,”manufacturers”— plural —”now more commonly produce ethnically diverse dolls, like this black Barbie.”Which is vastly better than what you ’ ll find in the encyclopedia. com, which is Barbie, Klaus. On the other hand, if they go to Wikipedia, they ’ ll find a genuine article — and I won ’ t talk a lot about Wikipedia, because Jimmy Wales is here — but roughly equivalent to what you would find in the Britannica, differently written, including the controversies over body image and commercialization, the claims about the way in which she ’ s a good role model, etc. Another portion is not only how content is produced, but how relevance is produced. The claim to fame of Yahoo! was, we hire people to look — originally, not anymore — we hire people to look at websites and tell you — if they ’ re in the index, they ’ re good. This, on the other hand, is what 60, 000 **passionate** volunteers produce in the Open Directory Project, each one willing to spend an hour or two on something they really care about, to say, this is good. So, this is the Open Directory Project, with 60, 000 volunteers, each one spending a little bit of time, as opposed to a few hundred fully paid employees. No one owns it, no one owns the output, it ’ s free for anyone to use and it ’ s the output of people acting out of social and psychological motivations to do something interesting. This is not only outside of businesses. When you think of what is the critical innovation of Google, the critical innovation is outsourcing the one most important thing — the decision about what ’ s relevant — to the community of the Web as a whole, doing whatever they want to do : so, page rank. The critical innovation here is instead of our engineers, or our people saying which is the most relevant, we ’ re going to go out and count what you, people out there on the Web, for whatever reason — vanity, pleasure — produced links, and tied to each other. We ’ re going to count those, and count them up. And again, here, you see Barbie. com, but also, very quickly, Adiosbarbie. com, the body image for every size. A contested cultural object, which you won ’ t find anywhere soon on Overture, which is the classic market-based mechanism : whoever pays the most is highest on the list. So, all of that is in the creation of content, of relevance, basic human **expression**. But remember, the computers were also physical. Just physical materials — our PCs — we share them together. We also see this in wireless. It used to be wireless was one person owned the **license**, they transmitted in an area, and it had to be decided whether they would be **licensed** or based on property. What we ’ re seeing now is that computers and radios are becoming so sophisticated that we ’ re developing algorithms to let people own machines, like Wi-Fi devices, and overlay them with a sharing protocol that would allow a community like this to build its own wireless broadband network simply from the simple principle : When I ’ m listening, when I ’ m not using, I can help you transfer your messages ; and when you ’ re not using, you ’ ll help me transfer yours. And this is not an idealized version. These are working models that at least in some places in the United States are being implemented, at least for public security. If in 1999 I told you, let ’ s build a data storage and retrieval system. It ’ s got to store terabytes. It ’ s got to be available 24 hours a day, seven days a week. It ’ s got to be available from anywhere in the world. It has to support over 100 million users at any given moment. It ’ s got to be robust to attack, including closing the main index, injecting malicious files, armed seizure of some major nodes. You ' d say that would take years. It would take millions. But of course, what I ' m describing is P2P file sharing. Right? We always think of it as stealing music, but fundamentally, it ' s a distributed data storage and retrieval system, where people, for very obvious reasons, are willing to share their bandwidth and their storage to create something. So, essentially what we ' re seeing is the emergence of a fourth transactional framework. It used to be that there were two primary dimensions along which you could divide things. They could be market based, or non-market based ; they could be decentralized, or centralized. The price system was a market-based and decentralized system. If things worked better because you actually had somebody organizing them, you had firms, if you wanted to be in the market — or you had governments or sometimes larger non-profits in the non-market. It was too expensive to have decentralized social production, to have decentralized **action** in society. That was not about society itself. That was, in fact, economic. But what we ' re seeing now is the emergence of this fourth system of social sharing and exchange. Not that it ' s the first time that we do nice things to each other, or for each other, as social beings. We do it all the time. It ' s that it ' s the first time that it ' s having major economic impact. What characterizes them is decentralized authority. You don ' t have to ask permission, as you do in a property-based system. May I do this? It ' s open for anyone to create and innovate and share, if they want to, by themselves or with others, because property is one mechanism of coordination. But it ' s not the only one. Instead, what we see are social frameworks for all of the critical things that we use property and contract in the market : information flows to decide what are interesting problems ; who ' s available and good for something ; motivation structures — remember, money isn ' t always the best motivator. If you leave a $50 check after dinner with friends, you don ' t increase the probability of being invited back. And if dinner isn ' t entirely obvious, think of sex. It also requires certain new **organizational** approaches. And in particular, what we ' ve seen is task organization. You have to hire people who know what they ' re doing. You have to hire them to spend a lot of time. Now, take the same problem, chunk it into little modules, and motivations become **trivial**. Five minutes, instead of watching TV? Five minutes I ' ll spend just because it ' s interesting. Just because it ' s fun. Just because it gives me a certain sense of meaning, or, in places that are more involved, like Wikipedia, gives me a certain set of social relations. So, a new social phenomenon is emerging. It ' s creating, and it ' s most visible when we see it as a new form of competition. Peer-to-peer networks assaulting the recording industry ; free and open source software taking market share from Microsoft ; Skype potentially threatening traditional telecoms ; Wikipedia competing with online encyclopedias. But it ' s also a new source of opportunities for businesses. As you see a new set of social relations and behaviors emerging, you have new opportunities. Some of them are toolmakers. Instead of building well-behaved appliances — things that you know what they ' ll do in advance — you begin to build more open tools. There ' s a new set of values, a new set of things people value. You build **platforms** for self- **expression** and collaboration. Like Wikipedia, like the Open Directory Project, you ' re beginning to build **platforms**, and you see that as a model. And you see surfers, people who see this happening, and in some sense build it into a supply chain, which is a very curious one. Right? You have a belief : stuff will flow out of connected human beings. That ' ll give me something I can use, and I ' m going to contract with someone. I will deliver something based on what happens. It ' s very scary — that ' s what Google does, essentially. That ' s what IBM does in software **services**, and they ' ve done reasonably well. So, social production is a real fact, not a fad. It is the critical long-term shift caused by the Internet.

Social relations and exchange become significantly more important than they ever were as an economic phenomenon. In some contexts, it ’ s even more efficient because of the quality of the information, the ability to find the best person, the lower transaction costs. It ’ s sustainable and growing fast. But — and this is the dark lining — it is threatened by — in the same way that it threatens — the incumbent industrial systems. So next time you open the paper, and you see an intellectual property decision, a telecoms decision, it ’ s not about something small and technical. It is about the future of the freedom to be as social beings with each other, and the way information, knowledge and culture will be produced. Because it is in this context that we see a battle over how easy or hard it will be for the industrial information economy to simply go on as it goes, or for the new model of production to begin to develop alongside that industrial model, and change the way we begin to see the world and report what it is that we see. Thank you.

Text Sample 184: POS Dim 2 – 2005 – Score 9.00 – 2005/t000424.txt

What I ’ d like to start off with is an observation, which is that if I ’ ve learned anything over the last year, it ’ s that the supreme irony of publishing a book about slowness is that you have to go around promoting it really fast. I seem to spend most of my time these days zipping from city to city, studio to studio, interview to interview, serving up the book in really tiny bite-size chunks. Because everyone these days wants to know how to slow down, but they want to know how to slow down really quickly. So... so I did a spot on CNN the other day where I actually spent more time in makeup than I did talking on air. And I think that — that ’ s not really surprising though, is it? Because that ’ s kind of the world that we live in now, a world stuck in **fast-forward**. A world obsessed with speed, with doing everything faster, with cramming more and more into less and less time. Every moment of the day feels like a race against the clock. To borrow a phrase from Carrie Fisher, which is in my bio there ; I ’ ll just toss it out again —”These days even **instant** gratification takes too long.”And if you think about how we to try to make things better, what do we do? No, we speed them up, don ’ t we? So we used to dial ; now we speed dial. We used to read ; now we speed read. We used to walk ; now we speed walk. And of course, we used to date and now we speed date. And even things that are by their very nature slow — we try and speed them up too. So I was in New York recently, and I walked past a gym that had an advertisement in the window for a new course, a new evening course. And it was for, you guessed it, speed yoga. So this — the perfect solution for time-starved professionals who want to, you know, salute the sun, but only want to give over about 20 minutes to it. I mean, these are sort of the extreme examples, and they ’ re amusing and good to laugh at. But there ’ s a very serious point, and I think that in the headlong dash of **daily** life, we often lose sight of the damage that this roadrunner form of living does to us. We ’ re so marinated in the culture of speed that we almost fail to notice the toll it takes on every aspect of our lives — on our health, our diet, our work, our relationships, the environment and our community. And sometimes it takes a wake-up call, doesn ’ t it, to alert us to the fact that we ’ re hurrying through our lives, instead of actually living them ; that we ’ re living the fast life, instead of the good life. And I think for many people, that wake-up call takes the form of an illness. You know, a **burnout**, or eventually the body says,”I can ’ t take it anymore,”and throws in the towel. Or maybe a relationship goes up in smoke because we haven ’ t had the time, or the patience, or the tranquility, to be with the other person, to listen to them. And my wake-up call came when I started reading bedtime stories to my son, and I found that at the end of day, I would go into his room and I just couldn ’ t slow down — you know, I ’ d be speed reading”The Cat In The Hat.”I ’ d be — you know, I ’ d be skipping lines here, paragraphs there, sometimes a whole page, and of course, my little boy knew the book inside out, so we would quarrel. And what should have been the most relaxing, the most intimate, the most tender moment of the day, when a dad sits down to read to his son, became instead this kind of gladiatorial battle of wills, a clash between my speed and his slowness. And this went on for some time, until I caught myself scanning a newspaper article with timesaving tips for fast people. And one of them made reference to a series of books called”The One-Minute Bedtime Story.”And I wince saying those words now, but my first reaction at the time was very different. My first reflex was to say,”Hallelujah — what a great idea! This is exactly what I ’ m looking for to speed up bedtime even more.”But thankfully, a light bulb went on over my head, and my next reaction was very different, and I took a step back, and I thought,”Whoa — you know, has it really come to this? Am I really in such a hurry that I ’ m prepared to fob off my son with a sound byte at the end of the day?”And I put away the newspaper — and I was getting on a plane — and I sat there, and I did something I hadn ’ t done for a long time — which is I did nothing. I just thought, and I thought long and hard. And by the time I got off that plane, I ’ d decided I wanted to do something about it. I wanted to investigate this whole roadrunner culture, and what it was doing to me and to everyone else. And I had two questions in my head. The first was, how did we get so fast? And the second is, is it possible, or even desirable, to slow down? Now, if you think about how our world got so accelerated, the usual suspects rear their heads. You think of, you know, urbanization, consumerism, the **workplace**, technology. But I think if you cut through those forces, you get to what might be the deeper driver, the nub of the question, which is how we think about time itself. In other cultures, time is cyclical. It ’ s seen as moving in great, unhurried circles. It ’ s always renewing and refreshing itself. Whereas in the West, time is linear. It ’ s a finite resource ; it ’ s always draining away. You either use it, or lose it.”Time is money,”as Benjamin Franklin said. And I think what that does to us psychologically is it creates an equation. Time is scarce, so what do we do? Well — well, we speed up, don ’ t we? We try and do more and more with less and less time. We turn every moment of every day into a race to the finish line — a finish line, incidentally, that we never reach, but a finish line nonetheless. And I guess that the question is, is it possible to break free from that **mindset**? And thankfully, the answer is yes, because what I discovered, when I began looking around, that there is a global backlash against this culture that tells us that faster is always better, and that busier is best. Right across the world, people are doing the unthinkable : they ’ re slowing down, and finding that, although conventional wisdom tells you that if you slow down, you ’ re road kill, the opposite turns out to be true : that by slowing down at the right moments, people find that they do everything better. They eat better ; they make love better ; they exercise better ; they work better ; they live better. And, in this kind of cauldron of moments and places and acts of deceleration, lie what a lot of people now refer to as the”International Slow Movement.”Now if you ’ ll permit me a small act of hypocrisy, I ’ ll just give you a very quick overview of what ’ s going on inside the Slow Movement. If you think of food, many of you will have heard of the Slow Food movement. Started in Italy, but has spread across the world, and now has 100, 000 members in 50 countries. And it ’ s driven by a very simple and sensible message, which is that we get more pleasure and more health from our food when we cultivate, cook and consume it at a reasonable pace. I think also the explosion of the organic farming movement, and the renaissance of farmers ' markets, are other illustrations of the fact that people are desperate to get away from eating and cooking and cultivating their food on an industrial timetable. They want to get back to slower rhythms. And out of the Slow Food movement has grown something called the Slow Cities movement, which has started in Italy, but has spread right across Europe and beyond. And in this, towns begin to **rethink** how they organize the urban landscape, so that people are encouraged to slow down and smell the roses and connect with one another. So they might curb traffic, or put in a park bench, or some green space. And in some ways, these changes add up to more than the sum of their parts, because I think when a Slow City becomes officially a Slow City, it ' s kind of like a philosophical declaration. It ' s saying to the rest of world, and to the people in that town, that we believe that in the 21st century, slowness has a role to play. In medicine, I think a lot of people are deeply disillusioned with the kind of quick-fix mentality you find in conventional medicine. And millions of them around the world are turning to complementary and alternative forms of medicine, which tend to tap into sort of slower, gentler, more holistic forms of healing. Now, obviously the jury is out on many of these complementary therapies, and I personally doubt that the coffee enema will ever, you know, gain mainstream approval. But other treatments such as acupuncture and massage, and even just relaxation, clearly have some kind of benefit. And blue-chip medical colleges everywhere are starting to study these things to find out how they work, and what we might learn from them. Sex. There ' s an awful lot of fast sex around, isn ' t there? I was coming to — well — no pun intended there. I was making my way, let ' s say, slowly to Oxford, and I went through a news agent, and I saw a magazine, a men ' s magazine, and it said on the front,"How to bring your partner to orgasm in 30 seconds."So, you know, even sex is on a stopwatch these days. Now, you know, I like a quickie as much as the next person, but I think that there ' s an awful lot to be gained from slow sex — from slowing down in the bedroom. You know, you tap into that — those deeper, sort of, psychological, emotional, spiritual currents, and you get a better orgasm with the buildup. You can get more bang for your buck, let ' s say. I mean, the Pointer Sisters said it most eloquently, didn ' t they, when they sang the praises of"a lover with a slow hand."Now, we all laughed at Sting a few years ago when he went Tantric, but you **fast-forward** a few years, and now you find couples of all ages flocking to workshops, or maybe just on their own in their own bedrooms, finding ways to put on the brakes and have better sex. And of course, in Italy where — I mean, Italians always seem to know where to find their pleasure — they ' ve launched an official Slow Sex movement. The **workplace**. Right across much of the world — North America being a notable exception — working hours have been coming down. And Europe is an example of that, and people finding that their quality of life improves as they ' re working less, and also that their hourly productivity goes up. Now, clearly there are problems with the 35-hour workweek in France — too much, too soon, too rigid. But other countries in Europe, notably the Nordic countries, are showing that it ' s possible to have a kick-ass economy without being a workaholic. And Norway, Sweden, Denmark and Finland now rank among the top six most competitive nations on Earth, and they work the kind of hours that would make the average American weep with envy. And if you go beyond sort of the country level, down at the micro-company level, more and more companies now are realizing that they need to allow their staff either to work fewer hours or just to unplug — to take a lunch break, or to go sit in a quiet room, to switch off their Blackberrys and laptops — you at the back — **mobile** phones, during the work day or on the weekend, so that they have time to recharge and for the brain to slide into that kind of creative mode of thought. It ' s not just, though, these days, adults who overwork, though, is it? It ' s children, too. I ' m 37, and my childhood ended in the mid- ' 80s, and I look at kids now, and I ' m just amazed by the way they race around with more homework, more tutoring, more extracurriculars than we would ever have conceived of a generation ago. And some of the most heartrending emails that I get on my website are actually from adolescents hovering on the edge of **burnout**, pleading with me to write to their parents, to help them slow down, to help them get off this full-throttle treadmill. But thankfully, there is a backlash there in parenting as well, and you ' re finding that, you know, towns in the United States are now banding together and banning extracurriculars on a particular day of the month, so that people can, you know, decompress and have some family time, and slow down. Homework is another thing. There are homework bans springing up all over the developed world in schools which had been piling on the homework for years, and now they ' re discovering that less can be more. So there was a case up in Scotland recently where a fee-paying, high-achieving private school banned homework for everyone under the age of 13, and the high-achieving parents freaked out and said,"What are you — you know, our kids will fall"— the headmaster said,"No, no, your children need to slow down at the end of the day."And just this last month, the exam results came in, and in math, science, marks went up 20 percent on average last year. And I think what ' s very revealing is that the elite universities, who are often cited as the reason that people drive their kids and hothouse them so much, are starting to notice the caliber of students coming to them is falling. These kids have wonderful marks ; they have CVs jammed with extracurriculars, to the point that would make your eyes water. But they lack spark ; they lack the ability to think creatively and think outside — they don ' t know how to dream. And so what these Ivy League schools, and Oxford and Cambridge and so on, are starting to send a message to parents and students that they need to put on the brakes a little bit. And in Harvard, for instance, they send out a letter to undergraduates — freshmen — telling them that they ' ll get more out of life, and more out of Harvard, if they put on the brakes, if they do less, but give time to things, the time that things need, to enjoy them, to savor them. And even if they sometimes do nothing at all. And that letter is called — very revealing, I think —"Slow Down!"— with an exclamation mark on the end. So wherever you look, the message, it seems to me, is the same : that less is very often more, that slower is very often better. But that said, of course, it ' s not that easy to slow down, is it? I mean, you heard that I got a speeding ticket while I was researching my book on the benefits of slowness, and that ' s true, but that ' s not all of it. I was actually en route to a dinner held by Slow Food at the time. And if that ' s not shaming enough, I got that ticket in Italy. And if any of you have ever driven on an Italian highway, you ' ll have a pretty good idea of how fast I was going. But why is it so hard to slow down? I think there are various reasons. One is that speed is fun, you know, speed is sexy. It ' s all that adrenaline rush. It ' s hard to give it up. I think there ' s a kind of metaphysical dimension — that speed becomes a way of walling ourselves off from the bigger, deeper questions. We fill our head with distraction, with busyness, so that we don ' t have to ask, am I well? Am I happy? Are my children growing up right? Are politicians making good decisions on my behalf? Another reason — although I think, perhaps, the most powerful reason — why we find it hard to slow down is the cultural taboo that we ' ve erected against slowing down."Slow"is a dirty word in our culture. It ' s a byword for"lazy,""slacker,"for being somebody who gives up. You know,"he ' s a bit slow."It ' s actually synonymous with being stupid. I guess what the Slow Movement — the purpose of the Slow Movement, or its main goal, really, is to tackle that taboo, and to say that yes, sometimes slow is not the answer, that there is such a thing as”bad slow.”You know, I got stuck on the M25, which is a ring road around London, recently, and spent three-and-a-half hours there. And I can tell you, that ’ s really bad slow. But the new idea, the sort of revolutionary idea, of the Slow Movement, is that there is such a thing as”good slow,”too. And good slow is, you know, taking the time to eat a meal with your family, with the TV switched off. Or taking the time to look at a problem from all angles in the office to make the best decision at work. Or even simply just taking the time to slow down and savor your life. Now, one of the things that I found most uplifting about all of this stuff that ’ s happened around the book since it came out, is the reaction to it. And I knew that when my book on slowness came out, it would be welcomed by the New Age brigade, but it ’ s also been taken up, with great gusto, by the corporate world — you know, business press, but also big companies and leadership organizations. Because people at the top of the chain, people like you, I think, are starting to realize that there ’ s too much speed in the system, there ’ s too much busyness, and it ’ s time to find, or get back to that lost art of shifting gears. Another encouraging sign, I think, is that it ’ s not just in the developed world that this idea ’ s been taken up. In the developing world, in countries that are on the verge of making that leap into first world status — China, Brazil, Thailand, Poland, and so on — these countries have embraced the idea of the Slow Movement, many people in them, and there ’ s a debate going on in their media, on the streets. Because I think they ’ re looking at the West, and they ’ re saying,”Well, we like that aspect of what you ’ ve got, but we ’ re not so sure about that.”So all of that said, is it, I guess, is it possible? That ’ s really the main question before us today. Is it possible to slow down? And I ’ m happy to be able to say to you that the answer is a resounding yes. And I present myself as Exhibit A, a kind of reformed and rehabilitated speed-aholic. I still love speed. You know, I live in London, and I work as a journalist, and I enjoy the buzz and the busyness, and the adrenaline rush that comes from both of those things. I play squash and ice hockey, two very fast sports, and I wouldn ’ t give them up for the world. But I ’ ve also, over the last year or so, got in touch with my inner tortoise. And what that means is that I no longer overload myself gratuitously. My default mode is no longer to be a rush-aholic. I no longer hear time ’ s winged chariot drawing near, or at least not as much as I did before. I can actually hear it now, because I see my time is ticking off. And the upshot of all of that is that I actually feel a lot happier, healthier, more productive than I ever have. I feel like I ’ m living my life rather than actually just racing through it. And perhaps, the most important measure of the success of this is that I feel that my relationships are a lot deeper, richer, stronger. And for me, I guess, the litmus test for whether this would work, and what it would mean, was always going to be bedtime stories, because that ’ s sort of where the journey began. And there too the news is rosy. You know, at the end of the day, I go into my son ’ s room. I don ’ t wear a watch. I switch off my computer, so I can ’ t hear the email pinging into the basket, and I just slow down to his pace and we read. And because children have their own tempo and internal clock, they don ’ t do quality time, where you schedule 10 minutes for them to open up to you. They need you to move at their rhythm. I find that 10 minutes into a story, you know, my son will suddenly say,”You know, something happened in the playground today that really bothered me.”And we ’ ll go off and have a conversation on that. And I now find that bedtime stories used to be a box on my to-do list, something that I **dreaded**, because it was so slow and I had to get through it quickly. It ’ s become my reward at the end of the day, something I really cherish. And I have a kind of Hollywood ending to my talk this afternoon, which goes a little bit like this : a few months ago, I was getting ready to go on another book tour, and I had my bags packed. I was downstairs by the front door, and I was waiting for a taxi, and my son came down the stairs and he ' d made a card for me. And he was carrying it. He ' d gone and stapled two cards, very like these, together, and put a sticker of his favorite character, Tintin, on the front. And he said to me, or he handed this to me, and I read it, and it said,"To Daddy, love Benjamin."And I thought,"Aw, that ' s really sweet. Is that a good luck on the book tour card?"And he said,"No, no, no, Daddy — this is a card for being the best story reader in the world."And I thought,"Yeah, you know, this slowing down thing really does work."Thank you very much.

Text Sample 185: POS Dim 2 – 2004 – Score 11.00 – 2004/t000486.txt
You ' ll be happy to know that I ' ll be talking not about my own tragedy, but other people ' s tragedy. It ' s a lot easier to be lighthearted about other people ' s tragedy than your own, and I want to keep it in the spirit of the conference. So, if you believe the media accounts, being a drug dealer in the height of the crack cocaine epidemic was a very glamorous life, in the words of Virginia Postrel. There was money, there was drugs, guns, women, you know, you name it — jewelry, bling-bling — it had it all. What I ' m going to tell you today is that, in fact, based on 10 years of research, a unique opportunity to go inside a gang — to see the actual books, the **financial** records of the gang — that the answer turns out not to be that being in the gang was a glamorous life. But I think, more realistically, that being in a gang — selling drugs for a gang — is perhaps the worst job in all of America. And that ' s what I ' d like to convince you of today. So there are three things I want to do. First, I want to explain how and why crack cocaine had such a profound influence on inner-city gangs. Secondly, I want to tell you how somebody like me came to be able to see the inner workings of a gang — an interesting story, I think. And then third, I want to tell you, in a very superficial way, about some of the things we found when we actually got to look at the **financial** records, the books, of the gang. So before I do that, just one **warning**, which is that this presentation has been rated ' R ' by the Motion Picture Association of America. It contains adult themes, adult language. Given who is up on the stage, you ' ll be delighted to know that, in fact, there ' ll be no nudity — **Unexpected** wardrobe malfunctions aside. So let me start by talking about crack cocaine, and how it transformed the gang. To do that, you have to actually go back to a time before crack cocaine, in the early ' 80s, and look at it from the perspective of a gang leader. Being a gang leader in the inner city wasn ' t such a bad deal in the mid- ' 80s — the early ' 80s, let me say. Now, you had a lot of power, and you got to beat people up — you got a lot of prestige, a lot of respect. But the thing is, there was no money in it. The gang had no way to make money. You couldn ' t charge dues to the people in the gang, because the people in the gang didn ' t have any money. You couldn ' t really make any money selling marijuana — marijuana ' s too cheap, it turns out. You can ' t get rich selling marijuana. You couldn ' t sell cocaine ; cocaine ' s a great product — powdered cocaine — but you ' ve got to know rich white people. And most of the inner-city gang members didn ' t know any rich white people, so couldn ' t sell to that market. You couldn ' t really do petty crime, either. Turns out, petty crime ' s a terrible way to make a living. As a result, as a gang leader, you had, you know, power — it ' s a pretty good life — but the thing was, in the end, you were living at home with your mother. And so it wasn ' t really a career. There were limits to how powerful and important you could be if you had to live at home with your mother. Then along comes crack cocaine. And in the words of Malcolm Gladwell, crack cocaine was the extra-chunky version of tomato sauce for the

inner city. Because crack cocaine was an unbelievable innovation. I don ’ t have time to talk about it today, but if you think about it, I would say that in the last 25 years, of every invention or innovation that ’ s occurred in this country, the biggest one in terms of impact on the well-being of people who live in the inner city, was crack cocaine. And for the worse — not for the better, but for the worse. It had a huge impact on life. So what was it about crack cocaine? It was a brilliant way of getting the brain high. Because you could smoke crack cocaine — you can ’ t smoke powdered cocaine — and smoking is a much more efficient mechanism of delivering a high than snorting it. And it turned out there was this audience that didn ’ t know it wanted crack cocaine, but when it came, it really did. And it was a perfect drug ; you could buy the cocaine that went into it for a dollar, sell it for five dollars. Highly addictive — the high was very short. So for fifteen minutes, you get this great high, and then when you come down, all you want to do is get high again. It created a wonderful market. And for the people who were there running the gang, it was a great way, seemingly, to make a lot of money. At least for the people on the top. So this is where we enter the picture. Not really me — I ’ m really a bit player in all this. My co-author, Sudhir Venkatesh, is the main character. He was a math major in college who had a good heart, and decided he wanted to get a sociology PhD, came to the University of Chicago. Now, the three months before he came to Chicago, he had spent following the Grateful Dead. And in his own words, he”looked like a freak.”He ’ s a South Asian — very dark-skinned South Asian. Big man, and he had hair, in his words,”down to his ass.”Defied all kinds of boundaries : Was he black or white? Was he man or woman? He was really a curious sight to be seen. So he showed up at the University of Chicago, and the famous sociologist William Julius Wilson was doing a book that involved surveying people all across Chicago. He took one look at Sudhir, who was going to go do some surveys for him, and decided he knew exactly the place to send him, which was to one of the toughest, most notorious housing projects not just in Chicago, but in the entire United States. So Sudhir, the suburban boy who had never really been in the inner city, dutifully took his clipboard and walked down to this housing project, gets to the first building. The first building? Well, there ’ s nobody there. But he hears some voices up in the stairwell, so he climbs up the stairwell, comes around the corner, and finds a group of young African-American men playing dice. This is about 1990, **peak** of the crack epidemic. This is a very dangerous job, being in a gang. You don ’ t like to be surprised. You don ’ t like to be surprised by people who come around the corner. And the mantra was : shoot first ; ask questions later. Now, Sudhir was lucky — he was such a freak, and that clipboard probably saved his life, because they figured no other rival gang member would be coming up to shoot at them with a clipboard. So his greeting was not particularly warm, but they did say, well, OK — let ’ s hear your questions on your survey. So — I kid you not — the first question on the survey that he was sent to ask was :”How do you feel about being poor and Black in America?”Makes you wonder about academics. So the choice of answers were : [A) Very Good B) Good C) Bad D) Very Bad] What Sudhir found out is, in fact, that the real answer was the following : [A) Very Good B) Good C) Bad D) Very Bad E) Fuck you] The survey was not, in the end, going to be what got Sudhir off the hook. He was held hostage overnight in the stairwell. There was a lot of gunfire, there were a lot of philosophical discussions he had with the gang members. By morning, the gang leader arrived, checked out Sudhir, decided he was no threat, and they let him go home. So Sudhir went home, took a shower, took a nap. And you and I, probably, faced with the situation, would think,”I guess I ’ m going to write my dissertation on The Grateful Dead, I ’ ve been following them for the last three months.”Sudhir, on the other hand, got right back, walked down to the housing project, went up to the second floor, and said :”Hey, guys, I had so much fun hanging out with you last night, I wonder if I could do it again tonight.”And that was the beginning of what turned out to be a beautiful relationship that involved Sudhir living in the housing project on and off for 10 years, hanging out in crack houses, going to jail with the gang members, having the windows shot out of his car, having the police break into his apartment and steal his computer disks — you name it. But ultimately, the story has a happy ending for Sudhir, who became one of the most respected sociologists in the country. And especially for me, as I sat in my office with my Excel spreadsheet open, waiting for Sudhir to come and deliver to me the latest load of data that he would get from the gang. It was one of the most unequal co-authoring relationships ever — But I was glad to be the beneficiary of it. So what did we find? What did we find in the gang? Well, let me say one thing : We really got access to everybody in the gang. We got an inside look at the gang, from the very bottom up to the very top. They trusted Sudhir, in ways that really no academic has ever — or really anybody, any outsider — has ever earned the trust of these gangs, to the point where they actually opened up what was most interesting for me — their books, the **financial** records they kept. They made them available to us, and we not only could study them, but we could ask them questions about what was in them. So if I have to kind of summarize very quickly in the short time I have what the bottom line of what I take away from the gang is, it ’ s that, if I had to draw a parallel between the gang and any other organization, it would be that the gang is just like McDonald ’ s, in a lot of different respects — the restaurant McDonald ’ s. So first, in one way, which isn ’ t maybe the most interesting way, but it ’ s a good way to start — is in the way it ’ s organized, the hierarchy of the gang, the way it looks. So here ’ s what the org chart of the gang looks like. I don ’ t know if you know much about org charts, but if you were to assign a stripped- down and simplified McDonald ’ s org chart, this is exactly what it would look like. It ’ s amazing, but the top level of the gang, they actually call themselves the”Board of Directors.”And Sudhir says it ’ s not like these guys had a very sophisticated view of what happened in American corporate life, but they had seen movies like”Wall Street,”and they had learned a little bit about what it was like to be in the real world. Now, below that board of directors, you ’ ve got essentially what are regional VPs — people who control, say, the South Side of Chicago, or the West Side of Chicago. Sudhir got to know very well the guy who had the unfortunate assignment of trying to take the Iowa franchise, which, it turned out, for this black gang, was not one of the more brilliant **financial** endeavors they undertook. But the thing that really makes the gang seem like McDonald ’ s is its franchisees. The guys who are running the local gangs — the four-square-block by four-square-block areas — they ’ re just like the guys, in some sense, who are running the McDonald ’ s. They are the entrepreneurs. They get the exclusive property rights to control the drug-selling. They get the name of the gang behind them, for merchandising and marketing. And they ’ re the ones who basically make the profit or lose a profit, depending on how good they are at running the business. Now, the group I really want you to think about, though, are the ones at the bottom — the foot soldiers. These are the teenagers, typically, who ’ d be standing out on the street corner, selling the drugs. Extremely dangerous work. And important to note is that almost all of the weight, all of the people in this organization are at the bottom — just like McDonald ’ s. So in some sense, the foot soldiers are a lot like the people who are taking your order at McDonald ’ s, and it ’ s not just by chance that they ’ re like them. In fact, in these neighborhoods, they ’ d be the same people. So the same kids who are working in the gang were actually, at the very same time, typically working part-time at a place like McDonald ' s. Which already foreshadows the main result that I ' ve talked about, about what a crappy job it was, being in the gang. Because obviously, if being in the gang were such a wonderful, lucrative job, why in the world would these guys moonlight at McDonald ' s? So what do the wages look like? You might be surprised. But based on being able to talk to them and to see their records, this is what it looks like in terms of the wages. The hourly wage the foot soldiers were earning was $3. 50 an hour. It was below the minimum wage. And this is well-documented. It ' s easy to see by the patterns of consumption they have. It really is not fiction — it ' s fact. There was very little money in the gang, especially at the bottom. Now if you managed to rise up, say, and be that local leader, the guy who ' s the equivalent of the McDonald ' s franchisee, you ' d be making 100, 000 dollars a year. And that, in some ways, was the best job you could hope to get if you were growing up in one of these neighborhoods as a young black male. If you managed to rise to the very top, 200, 000 or 400, 000 dollars a year is what you ' d hope to make. Truly, you would be a great success story. And one of the sad parts of this is that, indeed, among the many other ramifications of crack cocaine is that the most talented individuals in these communities — this is what they were striving for. They weren ' t trying to make it in legitimate ways, because there were no legitimate channels out. This was the best way out. And it actually was the right choice, probably, to try to make it out this way. You look at this, the relationship to McDonald ' s breaks down here. The money looks about the same. Why is it such a bad job? Well, the reason it ' s such a bad job is that there ' s somebody shooting at you a lot of the time. So, with shooting at you, what are the death rates? We found, in our gang — and admittedly, this was not really a standard situation ; this was a time of intense violence, of a lot of gang wars, as this gang actually became quite successful. But there were costs. And so the death rate — not to mention the rate of being arrested, sent to prison, being wounded — the death rate in our sample was seven percent per person per year. You ' re in the gang for four years, you expect to die with about a 25 percent likelihood. That is about as high as you can get. So for comparison ' s purposes, let ' s think about some other walk of life you may expect might be extremely risky. Let ' s say that you were a murderer and you were convicted of murder, and you ' re sent to death **row**. It turns out, the death rates on death **row** from all causes, including execution : two percent a year. So it ' s a lot safer being on death **row** than it is selling drugs out on the street. That gives you some pause, for those of you who believe that a death **penalty** ' s going to have an enormous deterrent effect on crime. To give you a sense of just how bad the inner city was during crack — and I ' m not really focusing on the negatives, but really, there ' s another story to tell you there — if you look at the death rates just of random, young black males growing up in the inner city in the United States, the death rates during crack were about one percent. That ' s extremely high. And this is violent death — it ' s unbelievable, in some sense. To put it into perspective : if you compare this to the soldiers in Iraq, for instance, right now fighting the war : 0. 5 percent. So in some very literal way, the young black men who were growing up in this country were living in a war zone, very much in the sense that the soldiers over in Iraq are fighting in a war. So why in the world, you might ask, would anybody be willing to stand out on a street corner selling drugs for $3. 50 an hour, with a 25 percent chance of dying over the next four years? Why would they do that? And I think there are a couple answers. I think the first one is that they got **fooled** by history. It used to be the gang was a rite of passage ; that the young people controlled the gang ; that as you got older, you dropped out of the gang. So what happened was, the people who happened to be in the right place at the right time — the people who happened to be leading the gang in the mid-to-late- ’ 80s — became very, very wealthy. And so the logical thing to think was that they are going to age out of the gang like everybody else has, and the next generation is going to take over and get the wealth. There are striking similarities, I think, to the Internet boom. The first set of people in Silicon Valley got very, very rich. And then all of my friends said,”Maybe I should go do that, too.”And they were willing to work very cheap for stock options that never came. In some sense, that ’ s what happened, exactly, to the set of people we were looking at. They were willing to start at the bottom, just like, say, a first-year lawyer at a law firm is willing to start at the bottom, work 80-hour weeks for not that much money, because they think they ’ re going to make partner. But the rules changed, and they never got to make partner. Indeed, the same people who were running all of the major gangs in the late 1980s are still running the major gangs in Chicago today. They never passed on any of the wealth, So everybody got stuck at that $3. 50-an-hour job, and it turned out to be a disaster. The other thing the gang was very good at was marketing and trickery. And so for instance, one thing the gang would do is — the gang leaders would have big entourages, and they ’ d drive fancy cars and have fancy jewelry. So what Sudhir eventually realized as he hung out with them more, is that, really, they didn ’ t own those cars — they just leased them, because they couldn ’ t afford to own the fancy cars. And they didn ’ t really have gold jewelry, they had gold- plated jewelry. It goes back to, you know, the real-real versus the fake-real. And really, they did all sorts of things to trick the young people into thinking what a great deal the gang was going to be. So for instance, they would give a 14-year-old kid a whole roll of bills to hold. That 14-year-old kid would say to his friends,”Hey, look at all the money I got in the gang.”It wasn ’ t his money — until he spent it, and then he was in debt to the gang, and was sort of an indentured servant for a while. So I have a couple minutes. Let me do one last thing I hadn ’ t thought I ’ d have time to do, which is to talk about what we learned more generally about economics, from the study of the gang. So, economists tend to talk in technical words. Often, our theories fail quite miserably when we over the data, but what ’ s kind of interesting is that in this **setting**, it turned out that some of the economic theories that worked not so well in the real economy worked very well in the drug economy, in some sense, because it ’ s unfettered capitalism. Here ’ s an economic principle. This is one of the basic ideas in labor economics, called a”compensating differential.”It ’ s the idea that the increment to wages that a worker requires to leave him indifferent between performing two tasks, one which is more unpleasant than the other. Compensating differential — it ’ s why we think garbagemen might be paid more than people who work in parks. The words of one of the members of the gang, I think, make this clear. So it turns out — I ’ m sort of getting ahead of myself — it turns out, in the gang, when there ’ s a war going on, they actually pay the foot soldiers twice as much money. It ’ s exactly this concept. Because they ’ re not willing to be at risk. And the words of a gang member capture it quite nicely, he says :”Would you stand around here when all this shit...”— the shooting —”... if all this shit ’ s going on? No, right? So if I gonna be asked to put my life on the line, then front me the cash, man.”I think the gang member says it much more articulately than the economist, about what ’ s going on. Here ’ s another one. Economists talk about game theory, that every two-person game has a Nash equilibrium. Here ’ s the translation you get from the gang member. They ’ re talking about the decision of why they don ’ t go shoot — One thing that turns out to be a great business tactic in the gang : if you go and just shoot guns in the air in the other gang ’ s territory — people are afraid to go buy drugs there, they ’ re going to come into your neighborhood. Here ’ s what he says about why they don ’ t do that :”If we start shooting around there, the other gang ’ s territory, nobody, I mean, you dig it, nobody gonna step on their turf. But we **gotta** be careful, ’ cause they can shoot around here too and then we all fucked.”So that ’ s the same concept. Then again, sometimes economists get it wrong. One thing we **observed** in the data is that it looked like — the gang leader always got paid. No matter how bad it was economically, he always got himself paid. We had some theories related to cash flow, and lack of access to capital markets, and things like that. Then we asked the gang member,”Why is it you always get paid and your workers don ’ t always get paid?”His response is,”You got all these niggers below you who want your job, you dig? If you start taking losses, they see you as weak and shit.”And I thought about it and said,”CEOs often pay themselves million-dollar bonuses, even when companies are losing a lot of money. And it never would really occur to an economist that this idea of ’ weak and shit ’ could really be important.”Maybe”weak and shit”is an important hypothesis that needs more analysis. Thank you very much.

Text Sample 186: POS Dim 2 – 2004 – Score 9.00 – 2004/t000177.txt

I was trying to think, how is sync connected to **happiness**, and it occurred to me that for some reason we take pleasure in synchronizing. We like to dance together, we like singing together. And so, if you ’ ll put up with this, I would like to enlist your help with a first experiment today. The experiment is — and I notice, by the way, that when you applauded, that you did it in a typical North American way, that is, you were raucous and incoherent. You were not organized. It didn ’ t even occur to you to clap in unison. Do you think you could do it? I would like to see if this audience would — no, you haven ’ t **practiced**, as far as I know — can you get it together to clap in sync? Whoa! Now, that ’ s what we call emergent behavior. So I didn ’ t expect that, but — I mean, I expected you could synchronize. It didn ’ t occur to me you ’ d increase your frequency. It ’ s interesting. So what do we make of that? First of all, we know that you ’ re all brilliant. This is a room full of intelligent people, highly sensitive. Some trained musicians out there. Is that what enabled you to synchronize? So to put the question a little more seriously, let ’ s ask ourselves what are the minimum requirements for what you just did, for spontaneous synchronization. Do you need, for instance, to be as smart as you are? Do you even need a brain at all just to synchronize? Do you need to be alive? I mean, that ’ s a spooky thought, right? Inanimate objects that might spontaneously synchronize themselves. It ’ s real. In fact, I ’ ll try to explain today that sync is maybe one of, if not one of the most, perhaps the most pervasive drive in all of nature. It extends from the subatomic scale to the farthest reaches of the cosmos. It ’ s a deep tendency toward order in nature that opposes what we ’ ve all been taught about entropy. I mean, I ’ m not saying the law of entropy is wrong — it ’ s not. But there is a countervailing force in the universe — the tendency towards spontaneous order. And so that ’ s our theme. Now, to get into that, let me begin with what might have occurred to you immediately when you hear that we ’ re talking about synchrony in nature, which is the glorious example of birds that flock together, or fish swimming in organized schools. So these are not particularly intelligent creatures, and yet, as we ’ ll see, they exhibit beautiful ballets. This is from a BBC show called”Predators,”and what we ’ re looking at here are examples of synchrony that have to do with defense. When you ’ re small and vulnerable, like these starlings, or like the fish, it helps to swarm to avoid predators, to confuse predators. Let me be quiet for a second because this is so gorgeous. For a long time, biologists were puzzled by this behavior, wondering how it could be possible. We ’ re so used to choreography giving rise to synchrony. These creatures are not choreographed. They ’ re choreographing themselves. And only today is science starting to figure out how it works. I ’ ll show you a computer model made by Iain Couzin, a **researcher** at Oxford, that shows how swarms work. There are just three simple rules. First, all the individuals are only aware of their nearest neighbors. Second, all the individuals have a tendency to line up. And third, they ’ re all attracted to each other, but they try to keep a small distance apart. And when you build those three rules in, automatically you start to see swarms that look very much like fish schools or bird flocks. Now, fish like to stay close together, about a body length apart. Birds try to stay about three or four body lengths apart. But except for that difference, the rules are the same for both. Now, all this changes when a predator enters the scene. There ’ s a fourth rule : when a predator ’ s coming, get out of the way. Here on the model you see the predator attacking. The prey move out in random directions, and then the rule of attraction brings them back together again, so there ’ s this constant splitting and reforming. And you see that in nature. Keep in mind that, although it looks as if each individual is acting to cooperate, what ’ s really going on is a kind of selfish Darwinian behavior. Each is scattering away at random to try to save its scales or feathers. That is, out of the desire to save itself, each creature is following these rules, and that leads to something that ’ s safe for all of them. Even though it looks like they ’ re thinking as a group, they ’ re not. You might wonder what exactly is the advantage to being in a swarm, so you can think of several. As I say, if you ’ re in a swarm, your odds of being the unlucky one are reduced as compared to a small group. There are many eyes to spot danger. And you ’ ll see in the example with the starlings, with the birds, when this peregrine hawk is about to attack them, that actually waves of panic can propagate, sending messages over great distances. You ’ ll see — let ’ s see, it ’ s coming up possibly at the very end — maybe not. Information can be sent over half a kilometer away in a very short time through this mechanism. Yes, it ’ s happening here. See if you can see those waves propagating through the swarm. It ’ s beautiful. The birds are, we sort of understand, we think, from that computer model, what ’ s going on. As I say, it ’ s just those three simple rules, plus the one about watch out for predators. There doesn ’ t seem to be anything mystical about this. We don ’ t, however, really understand at a mathematical level. I ’ m a mathematician. We would like to be able to understand better. I mean, I showed you a computer model, but a computer is not understanding. A computer is, in a way, just another experiment. We would really like to have a deeper insight into how this works and to understand, you know, exactly where this organization comes from. How do the rules give rise to the patterns? There is one case that we have begun to understand better, and it ’ s the case of fireflies. If you see fireflies in North America, like so many North American sorts of things, they tend to be independent operators. They ignore each other. They each do their own thing, flashing on and off, paying no attention to their neighbors. But in Southeast Asia — places like Thailand or Malaysia or Borneo — there ’ s a beautiful cooperative behavior that occurs among male fireflies. You can see it every night along the river banks. The trees, mangrove trees, are filled with fireflies communicating with light. Specifically, it ’ s male fireflies who are all flashing in perfect time together, in perfect synchrony, to reinforce a message to the females. And the message, as you can imagine, is”Come hither. Mate with me.”In a second I ’ m going to show you a slow motion of a single firefly so that you can get a sense. This is a single frame. Then on, and then off — a 30th of a second, there. And then watch this whole river bank, and watch how precise the synchrony is. On, more on and then off. The combined light from these beetles — these are actually tiny beetles — is so bright that fishermen out at sea can use them as **navigating** beacons to find their way back to their home rivers. It ' s stunning. For a long time it was not believed when the first Western travelers, like Sir Francis Drake, went to Thailand and came back with tales of this unbelievable spectacle. No one believed them. We don ' t see anything like this in Europe or in the West. And for a long time, even after it was documented, it was thought to be some kind of optical illusion. Scientific papers were published saying it was twitching eyelids that explained it, or, you know, a human being ' s tendency to see patterns where there are none. But I hope you ' ve convinced yourself now, with this nighttime video, that they really were very well synchronized. Okay, well, the issue then is, do we need to be alive to see this kind of spontaneous order, and I ' ve already hinted that the answer is no. Well, you don ' t have to be a whole creature. You can even be just a single cell. Like, take, for instance, your pacemaker cells in your heart right now. They ' re keeping you alive. Every beat of your heart depends on this crucial region, the sinoatrial node, which has about 10, 000 independent cells that would each beep, have an electrical rhythm — a voltage up and down — to send a signal to the ventricles to pump. Now, your pacemaker is not a single cell. It ' s this democracy of 10, 000 cells that all have to fire in unison for the pacemaker to work correctly. I don ' t want to give you the idea that synchrony is always a good idea. If you have epilepsy, there is an instance of billions of brain cells, or at least millions, discharging in pathological concert. So this tendency towards order is not always a good thing. You don ' t have to be alive. You don ' t have to be even a single cell. If you look, for instance, at how lasers work, that would be a case of atomic synchrony. In a laser, what makes laser light so different from the light above my head here is that this light is incoherent — many different colors and different frequencies, sort of like the way you clapped initially — but if you were a laser, it would be rhythmic applause. It would be all atoms pulsating in unison, emitting light of one color, one frequency. Now comes the very risky part of my talk, which is to demonstrate that inanimate things can synchronize. Hold your breath for me. What I have here are two empty water bottles. This is not Keith Barry doing a magic trick. This is a klutz just playing with some water bottles. I have some metronomes here. Can you hear that? All right, so, I ' ve got a metronome, and it ' s the world ' s smallest metronome, the — well, I shouldn ' t advertise. Anyway, so this is the world ' s smallest metronome. I ' ve set it on the fastest **setting**, and I ' m going to now take another one set to the same **setting**. We can try this first. If I just put them on the table together, there ' s no reason for them to synchronize, and they probably won ' t. Maybe you ' d better listen to them. I ' ll stand here. What I ' m hoping is that they might just drift apart because their frequencies aren ' t perfectly the same. Right? They did. They were in sync for a while, but then they drifted apart. And the reason is that they ' re not able to communicate. Now, you might think that ' s a bizarre idea. How can metronomes communicate? Well, they can communicate through mechanical forces. So I ' m going to give them a chance to do that. I also want to wind this one up a bit. How can they communicate? I ' m going to put them on a movable **platform**, which is the"Guide to Graduate Study at Cornell."Okay? So here it is. Let ' s see if we can get this to work. My wife pointed out to me that it will work better if I put both on at the same time because otherwise the whole thing will tip over. All right. So there we go. Let ' s see. OK, I ' m not trying to cheat — let me start them out of sync. No, hard to even do that. All right. So before any one goes out of sync, I ' ll just put those right there. Now, that might seem a bit whimsical, but this pervasiveness of this tendency towards spontaneous order sometimes has **unexpected** consequences. And a clear case of that, was something that happened in London in the year 2000. The Millennium Bridge was supposed to be the pride of London — a beautiful new footbridge erected across the Thames, first river crossing in over 100 years in London. There was a big competition for the design of this bridge, and the winning proposal was submitted by an unusual team — in the TED spirit, actually — of an architect — perhaps the greatest architect in the United Kingdom, Lord Norman Foster — working with an artist, a sculptor, Sir Anthony Caro, and an engineering firm, Ove Arup. And together they submitted a design based on Lord Foster ' s vision, which was — he remembered as a kid reading Flash Gordon comic books, and he said that when Flash Gordon would come to an abyss, he would shoot what today would be a kind of a light saber. He would shoot his light saber across the abyss, making a blade of light, and then scamper across on this blade of light. He said,"That ' s the vision I want to give to London. I want a blade of light across the Thames."So they built the blade of light, and it ' s a very thin ribbon of steel, the world ' s — probably the flattest and thinnest suspension bridge there is, with cables that are out on the side. You ' re used to suspension bridges with big droopy cables on the top. These cables were on the side of the bridge, like if you took a rubber band and stretched it taut across the Thames — that ' s what ' s holding up this bridge. Now, everyone was very excited to try it out. On opening day, thousands of Londoners came out, and something happened. And within two days the bridge was closed to the public. So I want to first show you some interviews with people who were on the bridge on opening day, who will describe what happened. Man : It really started moving sideways and slightly up and down, rather like being on the boat. Woman : Yeah, it felt unstable, and it was very windy, and I remember it had lots of flags up and down the sides, so you could definitely — there was something going on sideways, it felt, maybe. Interviewer : Not up and down? Boy : No. Interviewer : And not forwards and backwards? Boy : No. Interviewer : Just sideways. About how much was it moving, do you think? Boy : It was about — Interviewer : I mean, that much, or this much? Boy : About the second one. Interviewer : This much? Boy : Yeah. Man : It was at least six, six to eight inches, I would have thought. Interviewer : Right, so, at least this much? Man : Oh, yes. Woman : I remember wanting to get off. Interviewer : Oh, did you? Woman : Yeah. It felt odd. Interviewer : So it was enough to be scary? Woman : Yeah, but I thought that was just me. Interviewer : Ah! Now, tell me why you had to do this? Boy : We had to do this because, to keep in balance because if you didn ' t keep your balance, then you would just fall over about, like, to the left or right, about 45 degrees. Interviewer : So just show me how you walk normally. Right. And then show me what it was like when the bridge started to go. Right. So you had to deliberately push your feet out sideways and — oh, and short steps? Man : That ' s right. And it seemed obvious to me that it was probably the number of people on it. Interviewer : Were they deliberately walking in step, or anything like that? Man : No, they just had to conform to the movement of the bridge. Steven Strogatz : All right, so that already gives you a hint of what happened. Think of the bridge as being like this **platform**. Think of the people as being like metronomes. Now, you might not be used to thinking of yourself as a metronome, but after all, we do walk like — I mean, we oscillate back and forth as we walk. And especially if we start to walk like those people did, right? They all showed this strange sort of skating gait that they adopted once the bridge started to move. And so let me show you now the footage of the bridge. But also, after you see the bridge on opening day, you ' ll see an interesting clip of work done by a bridge engineer at Cambridge named Allan McRobie, who figured out what happened on the bridge, and who built a bridge simulator to explain exactly what the problem was. It was a kind of unintended positive feedback loop between the way the people walked and the way the bridge began to move, that engineers knew nothing about. Actually, I think the first person you ’ ll see is the young engineer who was put in charge of this project. Okay. Interviewer : Did anyone get hurt? Engineer : No. Interviewer : Right. So it was quite small — Engineer : Yes. Interviewer : — but real? Engineer : Absolutely. Interviewer : You thought,”Oh, bother.”Engineer : I felt I was disappointed about it. We ’ d spent a lot of time designing this bridge, and we ’ d analyzed it, we ’ d checked it to codes — to heavier loads than the codes — and here it was doing something that we didn ’ t know about. Interviewer : You didn ’ t expect. Engineer : Exactly. Narrator : The most dramatic and shocking footage shows whole sections of the crowd — hundreds of people — apparently rocking from side to side in unison, not only with each other, but with the bridge. This synchronized movement seemed to be driving the bridge. But how could the crowd become synchronized? Was there something **special** about the Millennium Bridge that caused this effect? This was to be the focus of the investigation. Interviewer : Well, at last the simulated bridge is finished, and I can make it wobble. Now, Allan, this is all your fault, isn ’ t it? Allan McRobie : Yes. Interviewer : You designed this, yes, this simulated bridge, and this, you reckon, mimics the **action** of the real bridge? AM : It captures a lot of the physics, yes. Interviewer : Right. So if we get on it, we should be able to wobble it, yes? Allan McRobie is a bridge engineer from Cambridge who wrote to me, suggesting that a bridge simulator ought to wobble in the same way as the real bridge — provided we hung it on pendulums of exactly the right length. AM : This one ’ s only a couple of tons, so it ’ s fairly easy to get going. Just by walking. Interviewer : Well, it ’ s certainly going now. AM : It doesn ’ t have to be a real dangle. Just walk. It starts to go. Interviewer : It ’ s actually quite difficult to walk. You have to be careful where you put your feet down, don ’ t you, because if you get it wrong, it just throws you off your feet. AM : It certainly affects the way you walk, yes. You can ’ t walk normally on it. Interviewer : No. If you try and put one foot in front of another, it ’ s moving your feet away from under you. AM : Yes. Interviewer : So you ’ ve got to put your feet out sideways. So already, the simulator is making me walk in exactly the same way as our witnesses walked on the real bridge. AM :... ice-skating gait. There isn ’ t all this sort of snake way of walking. Interviewer : For a more convincing experiment, I wanted my own opening-day crowd, the sound check team. Their instructions : just walk normally. It ’ s really intriguing because none of these people is trying to drive it. They ’ re all having some difficulty walking. And the only way you can walk comfortably is by getting in step. But then, of course, everyone is driving the bridge. You can ’ t help it. You ’ re actually forced by the movement of the bridge to get into step, and therefore to drive it to move further. SS : All right, well, with that from the Ministry of Silly Walks, maybe I ’ d better end. I see I ’ ve gone over. But I hope that you ’ ll go outside and see the world in a new way, to see all the amazing synchrony around us. Thank you.

Text Sample 187: POS Dim 2 – 2004 – Score 7.00 – 2004/t000459.txt

When you have 21 minutes to speak, two million years seems like a really long time. But evolutionarily, two million years is nothing. And yet, in two million years, the human brain has nearly tripled in mass, going from the one-and-a-quarter-pound brain of our ancestor here, Habilis, to the almost three-pound meatloaf everybody here has between their ears. What is it about a big brain that nature was so eager for every one of us to have one? Well, it turns out when brains triple in size, they don ’ t just get three times bigger ; they gain new structures. And one of the main reasons our brain got so big is because it got a new part, called the”frontal lobe,”particularly, a part called the”prefrontal cortex.”What does a prefrontal cortex do for you that should justify the entire architectural overhaul of the human skull in the blink of evolutionary time? Well, it turns out the prefrontal cortex does lots of things, but one of the most important things it does is it ’ s an experience simulator. Pilots **practice** in flight simulators so that they don ’ t make real mistakes in planes. Human beings have this marvelous adaptation that they can actually have experiences in their heads before they try them out in real life. This is a trick that none of our ancestors could do, and that no other animal can do quite like we can. It ’ s a marvelous adaptation. It ’ s up there with opposable thumbs and standing upright and language as one of the things that got our species out of the trees and into the shopping mall. All of you have done this. Ben and Jerry ’ s doesn ’ t have”liver and onion”ice cream, and it ’ s not because they whipped some up, tried it and went,”Yuck!”It ’ s because, without leaving your armchair, you can simulate that flavor and say”yuck”before you make it. Let ’ s see how your experience simulators are working. Let ’ s just run a quick diagnostic before I proceed with the rest of the talk. Here ’ s two different futures that I invite you to contemplate. You can try to simulate them and tell me which one you think you might prefer. One of them is winning the lottery. This is about 314 million dollars. And the other is becoming paraplegic. Just give it a moment of thought. You probably don ’ t feel like you need a moment of thought. Interestingly, there are data on these two groups of people, data on how happy they are. And this is exactly what you expected, isn ’ t it? But these aren ’ t the data. I made these up! These are the data. You failed the pop quiz, and you ’ re hardly five minutes into the lecture. Because the fact is that a year after losing the use of their legs and a year after winning the lotto, lottery winners and paraplegics are equally happy with their lives. Don ’ t feel too bad about failing the first pop quiz, because everybody fails all of the pop quizzes all of the time. The research that my laboratory has been doing, that economists and psychologists around the country have been doing, has revealed something really quite startling to us, something we call the”impact **bias**,”which is the tendency for the simulator to work badly, for the simulator to make you believe that different outcomes are more different than, in fact, they really are. From field studies to laboratory studies, we see that winning or losing an election, gaining or losing a romantic partner, getting or not getting a promotion, passing or not passing a college test, on and on, have far less impact, less intensity and much less duration than people expect them to have. A recent study — this almost floors me — a recent study showing how major life traumas affect people suggests that if it happened over three months ago, with only a few exceptions, it has no impact whatsoever on your **happiness**. Why? Because **happiness** can be synthesized. Sir Thomas Brown wrote in 1642,”I am the happiest man alive. I have that in me that can convert poverty to riches, adversity to prosperity. I am more invulnerable than Achilles ; fortune hath not one place to hit me.”What kind of remarkable machinery does this guy have in his head? Well, it turns out it ’ s precisely the same remarkable machinery that all of us have. Human beings have something that we might think of as a”psychological immune system,”a system of cognitive processes, largely nonconscious cognitive processes, that help them change their views of the world, so that they can feel better about the worlds in which they find themselves. Like Sir Thomas, you have this machine. Unlike Sir Thomas, you seem not to know it. We synthesize **happiness**, but we think **happiness** is a thing to be found. Now, you don ’ t need me to give you too many examples of people synthesizing **happiness**, I suspect, though I ’ m going to show you some experimental evidence. You don ’ t have to look very far for evidence. I took a copy of the”New York Times”and tried to find some instances of people synthesizing **happiness**. Here are three guys synthesizing **happiness**.”I ’ m better off physically, financially, mentally...””I don ’ t have one minute ’ s regret. It was a glorious experience.””I believe it turned out for the best.”Who are these characters who are so damn happy? The first one is Jim Wright. Some of you are old enough to remember : he was the chairman of the House of Representatives, and he resigned in disgrace when this young Republican named Newt Gingrich found out about a shady book deal that he had done. He lost everything. The most powerful Democrat in the country lost everything : he lost his money, he lost his power. What does he have to say all these years later about it?”I am so much better off physically, financially, mentally and in almost every other way.”What other way would there be to be better off? Vegetably? Minerally? Animally? He ’ s pretty much covered them there. Moreese Bickham is somebody you ’ ve never heard of. Moreese Bickham uttered these words upon being released. He was 78 years old. He ’ d spent 37 years in Louisiana State Penitentiary for a crime he didn ’ t commit. He was ultimately [released for good behavior halfway through his sentence.] What did he have to say about his experience?”I don ’ t have one minute ’ s regret. It was a glorious experience.”Glorious! This guy ’ s not saying,”There were some nice guys. They had a gym.””Glorious”— a word we usually reserve for something like a religious experience. Harry S. Langerman uttered these words. He ’ s somebody you might have known but didn ’ t, because in 1949, he read a little article in the paper about a hamburger stand owned by these two brothers named McDonald. And he thought,”That ’ s a really neat idea!”So he went to find them. They said,”We can give you a franchise on this for 3, 000 bucks.”Harry went back to New York, asked his brother, an investment banker, to loan him 3, 000 dollars, and his brother ’ s immortal words were,”You idiot, nobody eats hamburgers.”He wouldn ’ t lend him the money. Of course, six months later, Ray Kroc had exactly the same idea. It turns out, people do eat hamburgers, and Ray Kroc, for a while, became the richest man in America. And then, finally, some of you recognize this young photo of Pete Best, who was the original drummer for the Beatles, until they, you know, sent him out on an errand and snuck away and picked up Ringo on a tour. Well, in 1994, when Pete Best was interviewed — yes, he ’ s still a drummer ; yes, he ’ s a studio musician — he had this to say :”I ’ m happier than I would have been with the Beatles.”OK, there ’ s something important to be learned from these people, and it is the secret of **happiness**. Here it is, finally to be revealed. First : accrue wealth, power and prestige, then lose it. Second : spend as much of your life in prison as you possibly can. Third : make somebody else really, really rich. And finally : never, ever join the Beatles. Yeah, right. Because when people synthesize **happiness**, as these gentlemen seem to have done, we all smile at them, but we kind of roll our eyes and say,”Yeah, right, you never really wanted the job.””Oh yeah, right — you really didn ’ t have that much in common with her, and you figured that out just about the time she threw the engagement ring in your face.”We smirk, because we believe that synthetic **happiness** is not of the same quality as what we might call”natural **happiness**.”What are these terms? Natural **happiness** is what we get when we get what we wanted, and synthetic **happiness** is what we make when we don ’ t get what we wanted. And in our society, we have a strong belief that synthetic **happiness** is of an inferior kind. Why do we have that belief? Well, it ’ s very simple. What kind of economic engine would keep churning if we believed that not getting what we want could make us just as happy as getting it? With all apologies to my friend Matthieu Ricard, a shopping mall full of Zen monks is not going to be particularly profitable, because they don ’ t want stuff enough. I want to suggest to you that synthetic **happiness** is every bit as real and enduring as the kind of **happiness** you stumble upon when you get exactly what you were aiming for. Now, I ’ m a scientist, so I ’ m going to do this not with rhetoric, but by marinating you in a little bit of data. Let me first show you an experimental paradigm that ’ s used to demonstrate the synthesis of **happiness** among regular old folks. This isn ’ t mine, it ’ s a 50-year-old paradigm called the”free choice paradigm.”It ’ s very simple. You bring in, say, six objects, and you ask a subject to rank them from the most to the least liked. In this case, because this experiment uses them, these are Monet prints. Everybody ranks these Monet prints from the one they like the most to the one they like the least. Now we give you a choice :”We happen to have some extra prints in the closet. We ’ re going to give you one as your prize to take home. We happen to have number three and number four,”we tell the subject. This is a bit of a difficult choice, because neither one is preferred strongly to the other, but naturally, people tend to pick number three, because they liked it a little better than number four. Sometime later — it could be 15 minutes, it could be 15 days — the same stimuli are put before the subject, and the subject is asked to re-rank the stimuli.”Tell us how much you like them now.”What happens? Watch as **happiness** is synthesized. This is the result that ’ s been replicated over and over again. You ’ re watching **happiness** be synthesized. Would you like to see it again? **Happiness**!”The one I got is really better than I thought! That other one I didn ’ t get sucks!”That ’ s the synthesis of **happiness**. Now, what ’ s the right response to that?”Yeah, right!”Now, here ’ s the experiment we did, and I hope this is going to convince you that”Yeah, right!”was not the right response. We did this experiment with a group of patients who had anterograde amnesia. These are hospitalized patients. Most of them have Korsakoff syndrome, a polyneuritic psychosis. They drank way too much, and they can ’ t make new memories. They remember their childhood, but if you walk in and introduce yourself and then leave the room, when you come back, they don ’ t know who you are. We took our Monet prints to the hospital. And we asked these patients to rank them from the one they liked the most to the one they liked the least. We then gave them the choice between number three and number four. Like everybody else, they said,”Gee, thanks Doc! That ’ s great! I could use a new print. I ’ ll take number three.”We explained we would have number three mailed to them. We gathered up our materials, and we went out of the room and counted to a half hour. Back into the room, we say,”Hi, we ’ re back.”The patients, bless them, say,”Ah, Doc, I ’ m sorry, I ’ ve got a memory problem ; that ’ s why I ’ m here. If I ’ ve met you before, I don ’ t remember.””Really, Jim, you don ’ t remember? I was just here with the Monet prints?””Sorry, Doc, I just don ’ t have a clue.””No problem, Jim. All I want you to do is rank these for me, from the one you like the most to the one you like the least.”What do they do? Well, let ’ s first check and make sure they ’ re really amnesiac. We ask these amnesiac patients to tell us which one they own, which one they chose last time, which one is theirs. And what we find is, amnesiac patients just guess. These are normal controls, where if I did this with you, all of you would know which print you chose. But if I do this with amnesiac patients, they don ’ t have a clue. They can ’ t pick their print out of a lineup. Here ’ s what normal controls do : they synthesize **happiness**. Right? This is the change in liking **score**, the change from the first time they ranked to the second time they ranked. Normal controls show — that was the magic I showed you ; now I ’ m showing it to you in graphical form —”The one I own is better than I thought. The one I didn ’ t own, the one I left behind, is not as good as I thought.”Amnesiacs do exactly the same thing. Think about this result. These people like better the one they own, but they don ’ t know they own it.”Yeah, right”is not the right response! What these people did when they synthesized **happiness** is they really, truly changed their affective, hedonic, aesthetic reactions to that poster. They ’ re not just saying it because they own it, because they don ’ t know they own it. When psychologists show you bars, you know that they are showing you averages of lots of people. And yet, all of us have this psychological immune system, this capacity to synthesize **happiness**, but some of us do this trick better than others. And some situations allow anybody to do it more effectively than other situations do. It turns out that freedom, the ability to make up your mind and change your mind, is the friend of natural **happiness**, because it allows you to choose among all those delicious futures and find the one that you would most enjoy. But freedom to choose, to change and make up your mind, is the enemy of synthetic **happiness**, and I ’ m going to show you why. Dilbert already knows, of course.”Dogbert ’ s tech support. How may I abuse you?””My printer prints a blank page after every document.””Why **complain** about getting free paper?””Free? Aren ’ t you just giving me my own paper?””Look at the quality of the free paper compared to your lousy regular paper! Only a **fool** or a liar would say that they look the same!””Now that you mention it, it does seem a little silkier!””What are you doing?””I ’ m helping people accept the things they cannot change.”Indeed. The psychological immune system works best when we are totally stuck, when we are trapped. This is the difference between dating and marriage. You go out on a date with a guy, and he picks his nose ; you don ’ t go out on another date. You ’ re married to a guy and he picks his nose? He has a heart of gold. Don ’ t touch the fruitcake! You find a way to be happy with what ’ s happened. Now, what I want to show you is that people don ’ t know this about themselves, and not knowing this can work to our supreme disadvantage. Here ’ s an experiment we did at Harvard. We created a black-and-white photography course, and we allowed students to come in and learn how to use a darkroom. So we gave them cameras, they went around campus, they took 12 pictures of their favorite professors and their dorm room and their dog, and all the other things they wanted to have Harvard memories of. They bring us the camera, we make up a contact sheet, they figure out which are the two best pictures. We now spend six hours teaching them about darkrooms, and they blow two of them up. They have two gorgeous 8 x 10 glossies of meaningful things to them, and we say,”Which one would you like to give up?””I have to give one up?””Yes, we need one as evidence of the class project. So you have to give me one. You have to make a choice. You get to keep one, and I get to keep one.”Now, there are two conditions in this experiment. In one case, the students are told,”But you know, if you want to change your mind, I ’ ll always have the other one here, and in the next four days, before I actually mail it to headquarters”— yeah,”headquarters”—”I ’ ll be glad to swap it out with you. In fact, I ’ ll come to your dorm room, just give me an email. Better yet, I ’ ll check with you. You ever want to change your mind, it ’ s totally returnable.”The other half of the students are told exactly the opposite :”Make your choice, and by the way, the mail is going out, gosh, in two minutes, to England. Your picture will be winging its way over the Atlantic. You will never see it again.”Half of the students in each of these conditions are asked to make predictions about how much they ’ re going to come to like the picture that they keep and the picture they leave behind. Other students are just sent back to their little dorm rooms and they are measured over the next three to six days on their satisfaction with the pictures. Look at what we find. First of all, here ’ s what students think is going to happen. They think they ’ re going to maybe come to like the picture they chose a little more than the one they left behind. But these are not statistically significant differences. It ' s a very small increase, and it doesn ' t much matter whether they were in the reversible or irreversible condition. Wrong-o. Bad simulators. Because here ' s what ' s really happening. Both right before the swap and five days later, people who are stuck with that picture, who have no choice, who can never change their mind, like it a lot. And people who are deliberating —"Should I return it? Have I gotten the right one? Maybe this isn ' t the good one. Maybe I left the good one?"— have killed themselves. They don ' t like their picture. In fact, even after the opportunity to swap has expired, they still don ' t like their picture. Why? Because the [reversible] condition is not conducive to the synthesis of **happiness**. So here ' s the final piece of this experiment. We bring in a whole new group of naive Harvard students and we say,"You know, we ' re doing a photography course, and we can do it one of two ways. We could do it so that when you take the two pictures, you ' d have four days to change your mind, or we ' re doing another course where you take the two pictures and you make up your mind right away and you can never change it. Which course would you like to be in?"Duh! Sixty-six percent of the students, two-thirds, prefer to be in the course where they have the opportunity to change their mind. Hello? Sixty-six percent of the students choose to be in the course in which they will ultimately be deeply dissatisfied with the picture — because they do not know the conditions under which synthetic **happiness** grows. The Bard said everything best, of course, and he ' s making my point here but he ' s making it hyperbolically :"' Tis nothing good or bad But thinking makes it so."It ' s nice poetry, but that can ' t exactly be right. Is there really nothing good or bad? Is it really the case that gall bladder surgery and a trip to Paris are just the same thing? That seems like a one-question IQ test. They can ' t be exactly the same. In more turgid prose, but closer to the truth, was the father of modern capitalism, Adam Smith, and he said this. This is worth contemplating :"The great source of both the misery and disorders of human life seems to arise from overrating the difference between one permanent situation and another. Some of these situations may, no doubt, deserve to be preferred to others, but none of them can deserve to be pursued with that **passionate** ardor which drives us to violate the rules either of prudence or of justice, or to corrupt the future tranquility of our minds, either by shame from the remembrance of our own folly, or by remorse for the horror of our own injustice."In other words : yes, some things are better than others. We should have preferences that lead us into one future over another. But when those preferences drive us too hard and too fast because we have overrated the difference between these futures, we are at risk. When our ambition is bounded, it leads us to work joyfully. When our ambition is unbounded, it leads us to lie, to cheat, to steal, to hurt others, to sacrifice things of real value. When our fears are bounded, we ' re prudent, we ' re cautious, we ' re thoughtful. When our fears are unbounded and overblown, we ' re reckless, and we ' re cowardly. The lesson I want to leave you with, from these data, is that our longings and our worries are both to some degree overblown, because we have within us the capacity to manufacture the very commodity we are constantly chasing when we choose experience. Thank you.

Text Sample 188: POS Dim 2 – 2021 – Score 27.00 – 2021/t004025.txt

When I was a little little kid, I was a four years old on my first airplane ride and we got to go up front in the cockpit because you could kind of do that back then. And it was. Totally dark, no moon over the Atlantic Ocean, there is like a billion stars in the sky and I went back and told my mom I wanted to be a stewardess and my mom, to her credit, she wasn ’ t. Honey, you might want to think about being a pilot. And there you go. That ’ s what I wanted to do from then on. Sharon Pressler has flown lots of different kinds of airplanes since then, including fighter jets. She was the first woman in the US Air Force to fly the F-16. It ’ s just always been the coolest looking airplane, that bubble canopy and the big engine. And it has the highest tolerance, which is nine times the force of gravity on the earth, which is significant. It can do anything. Sheeran ’ s had an extraordinary career spanning more than three decades. But recently, after 14 years as a pilot with Southwest Airlines, she hit a particularly bad patch of turbulence. Her whole industry did. I was the captain who always brought, like chocolate for the flight attendants, and I ’ d go give them some chocolate, even if it ’ s breakfast time, it ’ s OK to have chocolate for breakfast. Here you go. And that changed my first flight after we kind of really understood what was going on with covid. We had a bunch of those Clorox wipes. So I took those to the flight attendants instead. I ’ m like, hey, anybody wants some wipes. The pandemic had a catastrophic impact on the airline industry and Southwest eventually offered buyouts. I hadn ’ t even really thought about my retirement moment yet because I had 10 more years to fly and I wasn ’ t planning on leaving. But after some serious reflection, she chose to retire. So we ’ re a couple of hundred that retired in the same two week period, which is unheard of. Despite all the turbulence, Sharon knows she ’ s lucky she looked beyond the horizon to a new career. More on that later. But for now, buckle up. Ladies, gentlemen, this is Captain Pressor speaking. I know it ’ s been a little bit turbulent, especially in the economy, but it ’ s going to smooth out. Thanks for listening with us today. I ’ m Adam Grant and this is work like my podcast with the TED Radio Collective. I ’ m an **organizational** psychologist. I study how to make work, not suck. In this show. I take you inside the minds of fascinating people to help us **rethink** how we work, lead and live today, **navigating** career turbulence, thanks to Morgan Stanley for sponsoring this episode. You know what turbulence feels like on an airplane. You had some nasty wind and everything is out of your control. You ’ ve probably faced that kind of turbulence in your career, too, when your job, your **workplace** or your industry is changing dramatically around you and you feel powerless to shape it. The current pandemic has compounded that disturbance on a massive scale. In the face of uncertainty, we often freeze up. **Researchers** call it a threat, rigidity, response. When we feel powerless to counter the threats around us, our thinking becomes constrained. We hang on for dear life, stop taking risks and play it safe. The past year has left us all reacting to dramatic change. But psychologists find that when we encounter turbulence, instead of pushing harder against the headwinds, we ’ re generally better off tilting our rudder and charting a new course. In other words, expanding your thinking at exactly the moment when all your instincts are telling you to lock it down tight. I was in my 40s and I worked in the mortgage division. When all of this mortgage business hit and they laid off the entire division in Jacksonville in 2009, Erin Scott had been working for a bank in Florida for 14 years when he lost his job during the recession. He started looking for a new job in finance. I would estimate that surely I applied for at least two hundred jobs. I think I have like three interviews in that whole time as more time passed without any callbacks and became more open to exploring other roles and for lower pay as long as they were in state your station for one particular kind of fish. But in time when you start casting your net a whole lot wider feeling dejected. Aaron finally started looking out of state, which would have meant leaving his entire family behind. My brother, my sister, my mom and dad, they ’ re all right there. When you talk about moving to California from Florida, that ’ s you know, that

’ s a desperate move. But something ’ s, you know, something ’ s got to give here. I couldn ’ t find another job to save my life. Aaron spent two and a half years looking for full time work. He had a newborn son, so his **financial** responsibilities were growing. And just when you thought things couldn ’ t get any worse, his wife had a stroke. This is the most driven woman I know. And when you see that kind of person sitting in a wheelchair, I just felt the weight of the world had this little boy. You ’ re thinking, my wife looks to me, my son looks to me, what am I going to do? I just finally I went to another room and I just closed door and I just kind of had a little pity party. What is a pity party? Well, I didn ’ t want to say I cried, but that ’ s what I did. With so much out of his control in that moment, Aaron found a way to take some of the control back. Instead of focusing narrowly on the mortgage industry, Aaron broadened his lens. He found a part time job as a substitute teacher to pay the bills, which was a resourceful move, an example of what psychologists call being proactive. Be proactive can be really annoying advice, it isn ’ t about working harder or taking the bull by the horns or whatever your nagging uncle keeps telling you to do, you ’ re probably doing that already. It means doing what you can to change the circumstance rather than grinding against it, identifying the ways, large or small, that you can exert some control in an out of control situation. It turned out that Aaron loved teaching. A few years later, he ended up pivoting it into his current career, where he ’ s helping others learn from his earlier setback. I work at a **nearby** prison, Hamilton Correctional Institution. Aaron now helps people **navigate** one of the biggest headwinds imaginable time in prison. What Aaron ’ s learned about how formerly incarcerated people re-enter society has implications for adapting to all kinds of turbulence, from being downsized to being demoted to having a gap on your resume. People who have spent time in prison faced major **obstacles** when they ’ re trying to land a job. Employers are often hesitant to give them an opportunity. If they look you up and they find out you are really into some bad stuff, sometimes that ’ s the end of it. They ’ re just going to pass on you. Aaron coaches his students to call out the elephant in the room. I made some very poor decisions. I ’ ve paid for that. I ’ ve made a lot of changes in my life. I would really appreciate the opportunity. Why do you think it ’ s important, Aaron, to address the elephant in the room and actually talk about it directly? The number one thing is you control the narrative to some degree when you do that. Controlling the narrative, this is a key strategy for being proactive in the face of career turbulence, crafting a story about how a headwind has made you stronger or better. Research demonstrates that in the job search, sex offenders are better off owning their mistakes than making excuses. Your headwinds may be lighter than time behind bars. Maybe you lost a job that was a bad fit, or you took time off to care for a child or a sick family member. Or maybe you have a physical or psychological disability that prospective employers wrongly **judge**. And although it ’ s illegal to **discriminate** against people with disabilities, employers have **biases**. In a series of studies, people with disabilities were rated more favorably if they brought them up at the beginning of an interview rather than waiting until the end or concealing them altogether. Psychologist find that in the face of setbacks, taking charge of the narrative doesn ’ t just signal to others that you ’ re in control. Forming a story can also boost your own motivation and build your confidence to overcome past **struggles** and move forward in the future. When Aaron was searching for a job, he decided to take this principle a step further, he started proactively asking interviewers to call out the elephant in the room to tell him what his disadvantages were. Well, first, I want to thank you for allowing me to come in and speak with you. I ’ m very interested in this position. Is there anything in this interview or perhaps on my résumé that might give you pause about considering me for the position? Part of what I think is so clever about asking that question is even if it doesn ’ t get you the job today, you learn something potentially for the next interview. That ’ s exactly right. I did learn from that interview sometimes, but I learn it helps me get the job that is the right job for me here in advance. Doesn ’ t mean you have to take it, but it does mean you can weigh it. Sometimes there ’ s a little nugget in there that will help you. This is another form of proactivity in the face of turbulence, seeking feedback by asking what your limitations are and how you can improve, you don ’ t just get to peek inside the black box of how to get that job, that connection or that coveted project. You also get in a sense of control to address the issues that may be preventing you from getting an opportunity. But people won ’ t always tell you what you can do better. And sometimes you can ’ t even get your foot in the door to ask them, you know, all those YouTube videos that you watch and all those things that interrupt you and jam their way into your face. I do those. Dallas McGlaughlin started building websites as a teenager and taught himself how to do SEO search engine optimization. You know, when you direct people doing Google searches to a particular website, like what? Those pop up **ads** you ’ re always avoiding. Dallas got so good at SEO Marketing that he dropped out of music college to do it full time and for a few years that ’ s what he did. But when Dallas decided he wanted to work for a big agency, not having a formal degree became a major disadvantage. It meant nobody was looking at his resume and prescreening tools and technology that just siphoned me or filtered me out. I just wasn ’ t even passing those checks and balances. Remember, I dropped out of college to go do this. I just knew that I could do that better than anybody stepping out of a college with a communications degree. When you faced a headwind, you need support. If you ’ re like most people, your instinct is to reach out to your strong ties, the people you know well and trust to have your back. But research has shown that you ’ re more likely to get a job through weak ties. Your more distant acquaintances, they travel in different circles and have access to a broader pool of connections and ideas, which puts them in a better position to open up new opportunities. Sadly, the people who need those ties the most are the least likely to reach out to them. Research reveals that when their jobs are under threat, people with lower social class tend to narrow their networks. While people with higher status tend to broaden their networks, they reach beyond the inner circle, which actually turns out to be a way of changing course when the going is rough and it ’ s something we should support everyone to do. Or if you want to be really proactive, you can expand your network to include complete strangers. That ’ s what Dallas did, he came up with a plan to recruit the recruiters into his network. He took the same CEO marketing skills he ’ d been using to attract customers, except now he targeted employers first. He built a website for himself. Next, he made a list of every notable person in the Phoenix agency ecosystem CEOs, CFOs, marketing directors, you name it. And then he made paid search **ads** targeting each of them. So let ’ s say you ’ re an executive named John Smith and you ’ re Googling yourself because you have nothing better to do. You type your name into Google. And the very first result that pops up says, hey, John Smith, I ’ m Dallas McLaughlin. I ’ m a digital marketing expert and I really want to work for your company. Click here to find out why I basically turned the entire hiring process around and I stopped sending resumes. This is so clever. So wait a minute. How many people actually followed up and how many people ignored it? I only targeted maybe 12. And I heard from for the very first follow up I got, they said, please stop doing this. I don ’ t like it because they didn ’ t like the fact that you were so effective in advertising that you were able to annoy them and create them out a little. Yeah. You know, it ’ s also me screening them out if they don ’ t like what I ’ m doing and they clearly don ’ t understand the value in what I just did. And they ’ re not going to be able to properly utilize me within their organization. I don ’ t want to work there anyway. The fourth one, they were just like, come into the office, you ’ re hired, you ’ re in. We don ’ t need we want to have a job opening. Wow. So you went from over 100 to four out of 12 interested in at least learning more about you to 100 percent success rate once you got an interview. Yeah, and that was it. Dallas found a proactive way to showcase his skills specific to the field. Instead of going to the recruiters, he turned the tables and brought the recruiters to him. This kind of initiative can help you expand your network and access to new opportunities to. A few years ago, I got a cold email from a web designer. She sent me a mock up of how she thought my homepage should be redesigned. I wasn ’ t even looking for a change, but she did such a great job that I hired her on the spot. Not everyone will have time to experiment like this, but if you can manage it, it ’ s a promising way to proactively change the situation. There ’ s evidence that side hustles can boost our engagement and performance in our full time jobs, and sometimes they even become a career. Go do that thing that excites you. If you are an architect, go draw blueprints. If you ’ re an auto mechanic, go fix everybody ’ s cars. And if you do that long enough and you do it well enough, somebody is going to notice. Captain Sharon Pressler could have chosen to stay in aviation, but once the airline industry starts furloughing now, there ’ s a glut of pilots, right. Because everybody kind of tries to take a step back and go. So I ’ ll go back to being an instructor. Well, guess what? Everybody else is trying to go back to being an instructor, and there ’ s just not the demand. The more she thought about it, the more she started to reframe the disturbance as an opportunity to take off in an entirely new direction. This whole covid mess and the wreck that the airline industry has become right now for me was an **unexpected** opportunity. So I ’ m back in school. I ’ m getting a master ’ s in psychology with an emphasis on coaching young adults and help them successfully transition to adulthood. And it ’ s just something I wanted to. I ’ ve been interested in for a while and mentoring kind of program, although I will miss flying at Southwest. I ’ m excited about it. It ’ s a big change, but I ’ m excited about it. In the face of the storm confronting the airline industry, Sharon changed course, something the pandemic and recession are forcing all of us to do in varying degrees. Premier grappling with uncertainty. We tend to focus on what ’ s right in front of us, our strong ties and our next move. But what is turbulence mean in the long term to forecast what might happen to your future career? You can learn something from looking to the past. More on that after the break. OK, this is going to be a different kind of **ad**, I play a personal role in selecting the sponsors for this podcast because they all have interesting cultures of their own. Today, we ’ re going inside the **workplace** at Morgan Stanley. For many people, morning routines often include a good cup of coffee and for the team members at Morgan Stanley ’ s global headquarters in Times Square, the coffee comes with a **special** pairing. We stick together and be kind to each other, love each other, respect each other, and everything is going to be fine. Do you meet Edith and Angela? They run a coffee cart together in the heart of New York City. I met my wife in Brownsville, Texas, too many years ago, a long time ago, 1975, 75 75. On a typical morning, they head into the city at two 45 a. m. to set up the coffee cart. They ’ ve spent a lifetime together in that cart. She can be on the docket. I like to talk that much. Over the years, they ’ ve gotten to know their customers. He ’ s very good in keeping track of the orders. And I am with the names Mr. Mackey likes. He has a lot coffee and a large coffee. You know, that ’ s the standard order from one of their regulars, Mike Buckin Burger. If I happen to be running late and there ’ s more than like one person waiting and I realize I don ’ t have time, it kind of just destroys the morning. It goes beyond them just knowing your order and having it ready for you. So as soon as you see them, it ’ s a huge smile. It was my favorite part about going to the New York office. No offense to my colleagues. Mike works at Morgan Stanley. When he did a stint in Hong Kong, Edith and Angelo would check in on him. I always describe them. They ’ re the parents of the block and they, you know, interact with you that way. They ’ re looking out for you guys as as kids. It does feel like that. Like all of us, Edith and Angelo ’ s world was turned upside down in March. Twenty twenty. They started to notice people wearing masks and talking about working from home with a mass of the people coming from people with a mask and etc.. And I said, what ’ s going on here? People say, well, I want to stay home to work. And then we thought that we ’ ve got a problem there. I start getting worried. As New York City shut down, their entire livelihood was now in question. My colleague Ercan sent an email to three of us and the subject was either Sant ’ Angelo and the body was, what are we going to do? In New York? Street vendors were excluded from pandemic relief programs. So Mike sprang into **action**. He helped him set up a Venmo account and employees from Morgan Stanley rallied together to contribute. Then they organized a virtual breakfast with Edith and Angelo to collect donations, and it just snowballed from there. We were very surprised. We were amazed. Like I say, we knew that they came by not that much. And we continue paying all our bills. And I ’ m telling us today it it ’ s amazing. It ’ s amazing. Amazing. I found in my research that cultures of giving don ’ t just start from the top down. They often grow from the bottom up. Morgan Stanley employees ended up raising enough money to support Edith and Angela over the past year, but it didn ’ t end there. They ’ ve now provided **financial** support to thousands of food vendors in New York City during the pandemic. For Mike and his colleagues, giving back is deeply embedded in the Morgan Stanley culture. It ’ s always been first class business in a first class way, but also supporting the communities we operate in. You know, this all happened because of how we felt about them. We you know, we just can ’ t believe how much they do for us. These more people. You ’ re not small people to them. You matter to them. At Morgan Stanley, giving back as a core value, a central part of their culture globally. They live that commitment through long lasting partnerships, community based delivery and engaging their best asset. Their people learn more at Morgan Stanley Dotcom giving back. Turbulence in an individual career is tough to **navigate**, but right now, literally millions of people are all **struggling** with a massive upheaval all at once and one that inherently lasts a long time. Bad economic conditions make everything in our lives feel unstable and out of our control. Millions of jobs have been lost through the pandemic and millions more are at risk. People of color, especially those in lower paid jobs and without college degrees, have suffered the most. Research shows that job loss doesn ’ t just create **financial** strain. It also increases the risk of depression, anxiety and marital problems and undermines our sense of control and confidence. If you haven ’ t lost your job, you still may be feeling job insecurity, which has been linked to negative mental and physical health outcomes. There ’ s even evidence that economic insecurity reduces our pain tolerance. But just as chaos doesn ’ t mean we ’ ve lost all control, a moment of huge upheaval like this one doesn ’ t mean everything is lost. Recessions can shape careers in ways that are profound and profoundly surprising, we don ’ t yet know the outcome of this recession because we ’ re still in it, but we can look to past recessions for wisdom to guide us through our current journey. Just ask Emily BIanche. I would submit job after job after application after application and would hear nothing. Occasionally I get an interview and I find out eight other people were being interviewed and it was really nerve wracking. It took an entire year to get a full time job. In 2001, Emily had just graduated with her bachelor ' s degree in psychology when she lived through her first of three recessions, the dotcom bust. During the boom of the late 90s, there was just an incredible sense of entitlement of what ' s the world going to offer me? Should I start my own company? Will I be a millionaire? By twenty five expectations that were insane. And you fast forward two years to my class and it just it had completely changed. You know, you go to college, you spend all this money and you think when you come out, I ' m going to have some options. And then that historical moment, I really didn ' t. That was true for many, many other people graduating in that time and certainly true for many people graduating right now. Emily knows it ' s true now because she studied it as an **organizational** behavior professor at Emory University. Emily is one of the world ' s foremost experts on the psychology of recessions. Do you ever have these horrible moments, given what you study where you say, well, you know, when bad things happen, I get good research out of it? You know, certainly during the Great Recession, I thought that, but not now. Now I ' m like, enough. Good. OK, so you ' re not a bad person anymore? No, I was in graduate school and I ' ve reformed. Emily had a front **row** seat to the dotcom fallout of 2001, and she **observed** similar patterns in new graduates during the Great Recession of 2009. That was when the world fell apart. You could feel it everywhere, you could feel it walking around New York and when all those folks started graduating the class of 2009, there were so many articles about how they were just doomed. This was a generation that I completely had the rug pulled out from under them. The research that was available about recessions was ominous. A setback at the start of a career cast a long shadow. People who graduated in recessions continued to earn less. A decade later, it ' s not only that you suffer now, but that you will also continue to suffer, at least financially, for a long time to come. But it isn ' t all bad news. As Emily looked around her in 2009, she saw a strange pattern. One thing that really struck me was that so many people were expressing gratitude. These people had just been dealt this really tough hand. And yet again and again, I kept hearing people say, I ' m so grateful I got this job. It ' s not what I hoped for. But, you know, it ' s a place to start. And there is very little data on it, at least from a site perspective. She was familiar with a classic study of Olympic athletes on the podium. Bronze medalists looked happier than silver medalists. The poor silver medalist were disappointed. I almost won a gold. The bronze medalist felt lucky. At least I got a medal. Emily wondered if something similar would hold for recession graduates. I found that people who graduated when the economy was doing worse, even though they were 10 or 15 or even 20 years out of those initial experiences, they were more satisfied with their current job than people who graduated in good economic times. At some of the sounds like good news, provided we can get reemployed, it seems like your data would suggest we ' re going to be happier with our jobs and more likely to appreciate them. Yeah, this is the first surprise people who start their careers in a recession may feel less entitled to the perfect job and more grateful to be employed. I don ' t mean to diminish the very serious and real **obstacles** that people who are graduating, but any recession face, but that there may be sort of this long term silver lining if you take your silver lining of people being more satisfied with their jobs. I worry that that ' s going to open the door for leaders to exploit them, that people who might have exited completely abusive or toxic **workplace** will stay because they say, hey, I ' m lucky to have a job. Is that a risk? Absolutely. I worry about that, too. You may be at risk of tolerating circumstances which you wouldn ' t tolerate if you would come of age in better economic times. And why does it last? I ’ m thinking about the common finding that we adapt pretty quickly to our circumstances and start to get used to them. So why in 10 or 15 or 20 years after the recession is over, am I still thankful for having a job? Usually when people get their first jobs, it ’ s in this period of life called the impressionable years. Most people are beginning to forge an identity outside of their families and their communities and trying to figure out their place in the world. And attitudes tend to be quite malleable during this period. What ’ s going on in the world, whether economically, politically, culturally, tends to help shape those attitudes in ways that mirror what ’ s happening at that moment. And after this critical period, attitudes don ’ t tend to change that much. The indelible mark of the recession doesn ’ t just affect us individually. It can have a meaningful impact on leaders and end up shaping entire organizations. It ’ s very difficult for people who are graduating recessions to avoid kind of the humbling adversity that that type of environment presents. This brings us to a second surprise and some more long term good news despite the short term headwinds in my data. I find that people who come of age in recessions tend to be less narcissistic in terms of how they pay themselves versus how their top leaders within their company are paid. Those who come of age in recessions and then become leaders of organizations are less entitled knowing what it ’ s like to **struggle**. These CEOs seem to care more for employees and behave less selfishly. They become proactive about taking responsibility. In one study, Emily discovered that CEOs who launched their careers in a recession were less likely to backdate their stock options to **maximize** their value. In other words, they were less likely to cheat, which is possibly the opposite of what you ’ d expect from a person who came of age while **struggling**. The people who tend to cheat are actually the people who are doing really well. A lot of cheating comes from entitlement or a belief that somebody deserves a better outcome or that nobody will notice. And I ’ ll get a. So when you look into your crystal ball, then I don ’ t want one of those, I beg to differ based on your findings in 20 or 30 years when people who are just starting out their career become CEOs. Does that mean we ’ re going to see more servant leaders, more givers than takers? I would certainly hope so, based on what we ’ ve seen in the past. There are some reasons for optimism in the long run, the chaos we live through can make people stronger and better in a very real way in terms of how they mitigate the uncertainty associated with bad economic times. One, I think very positive way is through connecting with other people. This tendency for connectivity brings us to one last surprise from Emily ’ s studies. During moments of uncertainty, but especially economic uncertainty, we tend to **rethink** our relationships with others. We become less individualistic and more civically minded. Emily has found an ingenious way to measure that through pop music. When we ’ re **struggling** through bad economic times, we ’ re drawn to different lyrics in popular American music, you ’ re more likely to see first person plural pronouns like we us. Whereas in really good economic times, you see a lot of first person pronouns like me, mine I when you think of what ’ s often called the greatest generation, the generation that came of age either in the Great Depression or World War Two, it ’ s been argued again and again that this is the most civically minded generation. I do think we will see that going forward in the current generation. Another way, Emily measured individualism was by looking at Social Security data to see what parents name their kids during good and bad economic times. Emily found that when the economy is doing well, parents are more likely to give their kids unique names. I ’ m looking at you. Blue Ivy, when the economy is **struggling**, parents choose from a smaller set of more common names, which are often biblical names. It used to be in the 1950s when out of 15 boys would receive the most common name. Fast forward to 2013. And now it ’ s one out of seventy five boys receive the most common name of their birth year, if you take this idea of increasing communal orientation, decreasing individualism seriously, would you also anticipate that we ’ re going to see more caring and more supportive work relationships in the next couple of decades? The findings that I have looked at suggests that, yes, right. To the extent that people are less narcissistic, they would also manifest in positive ways in the interpersonal level. We can all agree that recessions are terrible in the short term for so many reasons. But in the long term, having experienced their own **struggles**, leaders in the future may be less entitled, more honest and more caring toward employees. And in the meantime, we all may be more community focused. But during a recession, there ’ s a darker side to this. It really depends on who your community is. There tends to be greater fondness for people within one ’ s own group and often, not always, but often that comes at the expense of how people perceive and treat people who are not a part of their anger. Xenophobia is higher. Treatment of immigrants is worse. All these different manifestations of prejudice. The evidence shows that recessions have unequal effects along racial lines. You know, the wage gap between black and white workers, well, Emily found that it grows during recessions. She also discovered that recessions change people ’ s attitudes about race. Her research shows that white people are more likely to report that inequality between races is natural and normal in the wake of a recession. We need to understand how to overcome this ingroup **bias** and broaden people ’ s circles of concern to motivate them to care about helping those who have been most disadvantaged. Dismantling these **biases** is so important that we ’ ll be devoting two episodes to it this season. Stay tuned. When you hit turbulence, it can be hard to see the way forward, it can help to look backward. What we see when we do that is that the lessons we learn in these hard times will shape our jobs and our cultures for the long haul. Some of those effects are negative and we have to be vigilant to counteract. Some of them are surprisingly positive. A glimmer of light up ahead. We also see that in the bumpiest or most chaotic moments are connections with each other are more important than ever, and it ’ s up to us to be proactive about not only reaching out to our networks, but expanding them. If we ’ re thoughtful about it, we have the opportunity to stick the landing, to come through turbulence, more open, more honest and more connected than before. Next time on work life and also it ’ s exhausting. Oh, my God. Sometimes I just want to agree to disagree or don ’ t agree to disagree. The keys to solving conflicts at work and at home are often hiding in plain sight **workplaces** hosted by me, Adam Grant. The show is produced by TED with Transmitter Media. Our team includes Colin Alby ’ s creditcard, Dan O ’ Donnell, Constanza Kaieda, Chris Rubenstein, Michelle Quinn, Bambam Chang and Adam Thielen. This episode was produced by Joe Angelena. Our show is mixed by Require Our Fact Checkers. Paul Dabic Original Music by Hartsdale Sue and Alison Layton Brown had stories produced by **Pineapple** Street Studios **special** thanks to our sponsors linked in Logitech, Morgan Stanley, S&P and Verizon for their research, thanks to teams including Beristain Threat, Rigidity, Sharon Parker and Proactivity Connie Weinberg on the job search. Brett Lyons on disclosing stigmatized identities. Jamie Pennebaker on forming a story. Sue Ashford on Proactiv feedback seeking and job insecurity. Mark Granovetter on Weeks ’ s Tarnya met in a narrowing versus broadening networks. Hudson sessions on side Hustle ’ s Rick Priced on job loss and Lisa Kahn and how recessions affect careers. As brilliant as this is, I think you ’ re slipping because I just Googled myself and there was not an **ad** by you to be on my podcast and maybe I ’ m getting complacent.

Text Sample 189: POS Dim 2 – 2021 – Score 25.00 – 2021/t004073.txt

Hey, work lifers, this is J. J. Abrams, we ’ re trying something new on the podcast today, I am going to be conducting an interview on the show and my guest is Adam Grant. We ’ re going be talking about his new book, Think Again Automatical. Oh, JJ, it ’ s great to hear your voice, but this is my show. I don ’ t know if it is. I can ’ t just let you take my job and ask all the questions. I ’ m insisting on asking you some questions. Can you promise me that I can ask one Star Wars question? Yes, you can ask anything you want. You can ask. Fantastic. Jumping in here as host of my show in the off chance. You don ’ t know who J. J. Abrams is. You absolutely know his work. He ’ s directed, produced and written some of the most beloved films and shows of the last 30 years. If you love Lost alias Felicity, the more recent incarnations of Star Wars or Star Trek, you have to think as a bonus episode. While we ’ re hard at work on Season four, J. J. kindly agreed to turn the **microphone** around and host me for a chat about my new book, Think Again The Power of Knowing What You Don ’ t Know. It ’ s a book about the science of **rethinking** our opinions, opening other people ’ s minds and creating cultures of learning. It officially launches February 2nd, but I wanted to give you a sneak preview. So I sent JJ an early copy and told him he was in charge of our interview. Thanks to Viking Penguin, my publisher, for Think Again for supporting this episode. I have read this book and I just truly think again, your new book available now is so compelling and I just I ’ m thrilled to get to talk to you about it. I feel like you ’ re my book fairy godfather. That ’ s such a thing. That ’ s my dream. Thank you. I ’ ve got to say that I had so many moments of kind of gasping when I read Think again, because you provided the kind of optimism that there is a way to find common ground, to find, to embrace nuance, to reexamine how we, you know, we go through the world. What motivated you to write the book? Well, there ’ s a part of me that that thinks I was probably motivated to write this book by one of my best friends from growing up, Khan, who I remember this was in seventh grade here. We ’ re in the middle of an argument, I think, during a commercial on Seinfeld. And he he hung up on me and I called him back and he said, Shut up, Adam, I won ’ t talk to you until you admit you ’ re wrong. And that was sort of a it really it was a moment that stuck with me. I didn ’ t have the language for it at the time, but I spent a lot of time afterward thinking, why is it so important to me to be right? And, you know, why do I have such a hard time admitting when I ’ m not? And that, you know, I think I was I was sort of a defining moment. And then, you know, much later I feel like my job as an **organizational** psychologist is, you know, is to really think again about how we work, how we lead, how we live, and to motivate other people to do that, too. And my most **frustrating** experiences as an author, as a speaker, as a **researcher**, as a teacher, as a consultant are always when people are not willing to **rethink** assumptions that I think they ought to be questioning. And so, you know, just over the past few years, the number of conversations I ’ ve had with with founders and CEOs where I you know, I give them the best evidence I have available. And they say, well, that ’ s that ’ s not how we do things around here or that ’ s not the way I ’ ve always done things. All right. And I just I just want to come back to them and say, you know, Blockbuster, BlackBerry, Kodak, Sears, you know what? You should definitely not **rethink** anything in your vision, strategy or business model. And so I guess, J. J., when you know, when I have both personal and professional experiences that drive me insane on the same topic, I feel like there might be a problem with tackling or a question worth writing about. Hmm. That ’ s great. Answered in reading the book. It made me wonder if people ' s not bandwidth, but their comfort level is so low that there are people finding comfort in belief systems. And that ' s the thing that they can rely on because there ' s so little to rely on. And and so **rethinking** is a threat to one of the few comforts left. That ' s such an interesting question, I don ' t know is my first thought, my second thought is it reminds me of some research that I loved by sociologists that started in the 70s. They did. This study is where they were interested in the effects of being micromanaged at work and not just how we thought about our jobs, but how we behaved in the rest of our lives. And they found that if you had a really controlling boss, that you actually became more authoritarian as a parent with your children, which was just kind of a stunning spillover for me to, you know, to think that the way you get treated at work might affect the way that you raise your children who just never would have occurred to me. And I think that body of research and a whole bunch of other studies that followed kind of that they made me start to think about this basic truth, that when we lack control in one domain of our lives, we become motivated to seek it and try to regain it in other parts of our lives. And I think, you know, especially in the wake of this pandemic and a global recession where we ' re facing a lot of threats to control right now. And I wonder if if part of what people are doing is they ' re grasping at the things they do have control over. And one of the things we all have control over is what we believe. And so, you know, holding fast to the things that I think are true, they make that sort of makes the world feel more predictable, less uncertain. It also gives me a sense of belonging with whoever my tribe is. Right. It validates my worldview. And I ' ve even wondered if, you know, if that ' s part of why the the George Floyd protests, you know, really rose up when they did. I feel like before the pandemic, people felt like, you know, there ' s nothing that I personally can do to fight systemic racism, whereas, you know, juxtaposed against a global disease like covid, which I really can ' t fight. Well, you know what? I could I could show up in protest. And so I guess there ' s there ' s something about both holding fast to your beliefs that helps render an uncontrollable world more controllable. But also, there ' s something about being in an extremely uncontrollable world that can lead you to think again about where you do have some control areas where you can make a difference. And so I wonder if that cuts both ways. Hmmm, that ' s interesting, I wanted to ask you about the value of humility, because it seems like. Humility is also at the center of what allows for someone to. Pursue a truth or information or a point of view that might not be theirs, but I think so many of us take a more defensive posture and our are more closed off and declarative about things that we think we know. And I just wanted to ask you kind of what role you feel humility plays and why it might not be such a given that the actual value of it is the truth and is enlightenment and is wisdom and why that doesn ' t seem so appealing in the moment. Yeah, interesting. So if pride is what fuels overconfidence, I think humility is what gives us the freedom and the flexibility to **rethink** the opinions and assumptions we should be questioning. And I think that part of the problem is that we live in a culture where people are rewarded for being the smartest person in the room and they learn to wield their knowledge and expertise like a weapon, as opposed to treating it as a resource to share. And so, you know, I think in most **workplaces**, in many schools and frankly, in too many families and communities, too, you know, the currency of status is knowing more than everybody else. And so knowing that, you know, admitting what you don ' t know, questioning yourself, showing, you know, any hint of uncertainty is like admitting weakness and setting yourself up for defeat in battle. And obviously, I think that ' s a problem. And I think that maybe the first way to get people past that fear is we need people in positions of power to model it.

Right. We know that if you ’ ve been validated by your power or your status or your authority, that people are much more comfortable letting you say you don ’ t know. There ’ s evidence, for example, that when experts say, I ’ m not sure or I don ’ t know, they actually become more persuasive, in part because we respect their humility and in part because we ’ re surprised that we actually pay more attention to the substance of their argument, which, you know, is likely to be persuasive if they are knowledgeable. So I guess what I want to do is I want to let people know that humility is a potential source of strength, not just a sign of weakness. And I don ’ t I don ’ t entirely know how to get people there. And I want to turn this around on you because I feel like this is one of the the themes that that really cuts through a lot of your work is every time I watch a show or a movie that was directed or produced by you, I know it ’ s going to lead me to question an assumption. And it might be an assumption I ’ ve held for a long time. And I ’ m curious about is this something you do intentionally and how do you get your audiences to confront that kind of humility? Well, thanks for saying so. I feel like the the way into a story for me is usually finding a character who is vulnerable, who is in a place where they ’ re out of their depth and they ’ re desperate for something. And I think that desperation is like the greatest motivator. And it also it forces you as a storyteller to know what a character ’ s desperate for and therefore what you are either afraid of or hopeful for and ideally both the idea of desperation as a motivator. I think that ’ s incredibly powerful. And it ’ s something that that not only strikes me as relevant to, you know, to thinking about characters in a story, but also to understanding the people that I work with and the people that I love. And I ’ m wondering is, is that a lens that you apply? And I guess if you turn it inward a little bit, when you ’ ve achieved the level of success that you have, how do you stay desperate to **rethink** some of the stories that you tell? Well, I have to do is go on Twitter. I feel like, you know, I ’ m always desperate to do something, to tell a story that that moves people. And sometimes I ’ m more successful than others. And, you know, I never go into anything with a kind of template for what it should or shouldn ’ t be. I feel like I ’ ve learned a ton of lessons along the way. And by the way, I always feel like we ’ re carrying, you know, whatever a thousand lessons with us that we all need to, you know, remember at all times. But we can only really carry 900 of them. And we ’ re constantly dropping lessons and picking up the ones that we ’ ve dropped in by picking those up. We ’ ve dropped some other ones and we keep relearning the same thing. So I think, you know, **rethinking** is really important and relearning is a weird Sisyphean inevitability that I don ’ t think we can avoid. But I feel like, you know, the drive to do. What I do like I ’ m guessing the drive for you to do what you do, you do it because you feel compelled to share a point of view, an idea, a feeling, an insight, a question, something you might not even understand the answer to. And you just feel compelled to do it. And I think I start everything desperately, and I think they probably all end that way, too. I love that. I want to ask you, because your book is all about **rethinking**. I was just curious, do you feel like there is a fundamental barrier to **rethinking** and if so, what it is and I do have a follow up. Yeah, I think so. So, yeah, I feel like one of the things that I ’ ve **rethought** twice now as I ’ ve been writing books is, you know, I wrote my first book, Give and Take with with a whole framework to organize the world in terms of givers, takers and matters. And then I didn ’ t want to be constrained by a framework like that when I wrote originals and I felt like I overcorrected and there wasn ’ t enough connective tissue between the different chapters. I felt like I had a lot of interesting trees, but the forest was not clear enough. And so I decided when I was writing Think again that I was going to be open to finding an overarching framework, but I was not going to be attached to it.

And that that felt like the sweet spot. And about halfway through the writing, it hit me and I had to rewrite the book from scratch. The framework was my my colleague, Phil Tetlock, where he **observed** that whatever your job or career is, that you spend a disproportionate amount of your time thinking like certain professions. He said, look, you know, there are moments when we think like preachers, prosecutors and politicians. And I think that that all three of these mindsets can stand in the way of **rethinking**, because when you ’ re preaching, you ’ re already convinced that you found the truth. And so you don ’ t need to question any of your assumptions when you ’ re prosecuting. You are trying to win your case. That means the other side is wrong. And so you ’ ve got to get them to do all the **rethinking**, but you get to stand still. And when you ’ re thinking more like a politician, you ’ re basically trying to cater to your audience and campaign for their approval or get their likes or their votes. And so you may be doing a little bit of flexing in the way that you present, but you ’ re not **rethinking** your underlying beliefs. Right. You ’ re just you ’ re just trying to appease your constituents. And I think we spend way too much time thinking in these modes. I know, you know, as somebody who ’ s been called a logic bully once or twice, maybe seven times at this point, by my count, I spend too much time in prosecutor mode. And when I think that somebody is selling snake oil or trying to, you know, indoctrinate their followers into some kind of idea cult, I feel like it ’ s my job to debunk those myths and bring the better evidence to the table. And the problem is then that I get too close minded. And so I ’ m trying to get out of prosecutor mode and spend more time thinking like a scientist, which is something I think we could all learn to do better. It ’ s funny, in the book, you say how I think the first time you were called The Logic Bully, it actually was something that you liked, that at first it appealed to you. I was proud. I thought, yeah, that ’ s my job as a social scientist. I want to decimate your bad arguments with rigorous evidence and airtight logic. And I ’ m good. And then, yeah, I didn ’ t like the bully part so much as I thought about it more. Given that, what are some of your favorite **practices** for questioning your own assumptions and for **rethinking** yourself? I think the first one for me is just the basic idea of thinking like a scientist to say that, you know, what scientists do is instead of forming beliefs, they actually form hypotheses. And so instead of having an opinion that set in stone, that means, OK, this is a hunch, how would I go and tested? And, you know, I don ’ t think that we have to always operate like we ’ re in a lab. Right, with a bunch of test tubes. But I do think that we should all be running experiments in our lives. So during the pandemic, for example, I have instead of assuming there ’ s a routine that ’ s going to work for me, I ’ ve run experiments to say, OK, what if I shift my creative brainstorming from the morning to the night? What does that do, you know, to to the number of original ideas that I generate? What if I turn my camera off during a zoo meeting? Do I actually have, you know, a more a more reflective, more thoughtful discussion? And all of those you know, there ’ s those little changes and adjustments that we make. We could think about them as experiments and then we could say, OK, well, you know what what information what data do I need in order to find out if that was a successful or failed experiment? And I I think that ’ s a huge step. And I guess the other thing I would I would just put on the table is when I was writing the book again, I made a list of all the things that I know I ’ m completely ignorant about. And my goal was was actually not to reduce the list, it was to expand the list. Mm hmm. Because I feel like the more I know about what I don ’ t know, the more curious I am and the more I ’ m going to learn from people who are actually are knowledgeable in those areas. So, you know, my list, I think it started out I immediately said I know nothing about music. I don ’ t understand **financial** markets. I ’ m clueless about chemistry. And, you know, the list just kept growing from there. And I ' ve actually been just keeping that list. I have a file on my desktop and my goal is to add something new to it every week. And if I stay clear about what I don ' t know, then I hope I ' m going to stay more humble, more curious **mindset**. That ' s great. When I was reading, I think, again, it was occurring to me, you know, that you tell such great stories, including like the story of the BlackBerry company and, you know, Mike ' s inability to **rethink** the way perhaps he could have and what might have been. And I, too, was a huge fan of that **keyboard**. The question I had is, how do you find partnerships where there is a thinker and then a thinker, or is it always or typically whether it ' s one or two or more people that are able to **rethink** and think, oh, that ' s such a cool question. I think my ideal partnership is one where. There are clear **norms** that make sure **rethinking** happens. The question of where it comes from is something that I don ' t have good data on, which really mildly annoys me right now and I need to go gather some. So stay tuned. But I mean, I can think of examples of both. One of the examples that that I ' ve spent probably too much time thinking about now. Is the, you know, the Jerry Seinfeld Larry David example from Seinfeld. And one of the most interesting things that I learned from studying that collaboration was that they were both ruthless free thinkers, but they applied it to their own work, probably even more so than they did to each other ' s work. And so one would not even bring a script or a joke to the other until he had thought it was, you know, really good. Mm hmm. And I can see how those kinds of **norms** could be really effective in partnerships. I ' ve also seen examples, though, where, you know, one person is basically the kind of a creative dreamer and the other person is the really critical evaluator. And so, you know, the first person does the thinking, the second does the **rethinking**, and then it ends up being kind of this beautiful symphony. Mm hmm. I imagine, J. J., you ' ve seen a lot of this in in the world of Hollywood. Is there is there one or the other that you think is more common or more effective? And are there are there are people who do more of the thinking versus **rethinking** in your collaborations? Well, obviously, I think, you know, everyone is different. And I know I have worked with people who who go to a place and not that they ' re stubborn about where they go, but they arrive at an answer very, very quickly. And that ' s sort of their thing and that they ' re perhaps a bit reluctant to be as flexible or **rethink** things. Then, you know, I ' ve worked people like, for example, with Matt Reeves, with whom I did Felicity, and we did the Cloverfield movie together. And he ' s someone who you know, and I ' ve known him since we were kids. And he ' s always **rethinking**. And I find that I ' m maybe more, you know, someone who would want to try something and put it out there and sort of commit to it for now and sort of see where it goes. And Matt. To his great credit, and it ' s one of the reasons I love working with him, is he ' s someone who really wants to stop and examine and consider and reconsider it and look at it from all sides and see if there ' s a better way. And can it go deeper and can it be, you know, can it be more emotional? And I think that that, you know, part of that is probably, you know, less about thinking and **rethinking** and more about my being more impatient. And when we work together, we had our offices right next to each other. And in fact, our offices were in the location where they actually filmed the office, the show, the pilot for the American Office Show. Oh, and weirdly, his office in my office were Matt ' s office with Michael Scott ' s office. And my office was the the conference room, which years later, when I went and directed an episode of The Office, I was like, why do I know this place? And then I realized, oh, my God, it ' s literally based on our old offices. But Matt, we had a little little sign in between is a picture of the two of us in between both of our offices. And someone had put up sticky notes over each of us and overmatch it, said, how do we make it more emotional and undermines lives, how to make it funnier? And there is a sort of like, you know, clearly everyone brings their whatever their interest is, whatever their their point of view is to the table. And even though sometimes it can be frustrating when someone says, well, wait a minute, let ’ s reconsider this, you know, it ’ s almost always a better thing because there ’ s nothing wrong with kicking the tires and interrogating something. But the best thing and this is what I found, you know, recently I co-wrote a pilot with a writer named Latoya Morgan, and she ’ s a wonderful writer. She ’ s a black woman who brings a point of view that is clearly going to be a life experience, very different from mine. And when I bring up an idea and she says, you know, hold on, let ’ s talk about this or that or vice versa, I feel like we almost invariably end up in a place where there ’ s something that we are both, like, beaming about that we wouldn ’ t have arrived at had it just been one of us in that room. And in all likelihood, you know, someone who looked like us, you know, either just me or just her. So I feel like there ’ s a lot of talk of how diversity is good and how you say in your book, diversity is good but hard. But, you know, I have personally felt like, you know, working with people who don ’ t look like you, especially when they are, you know, smart and freethinkers. It ’ s incredible how much better the conversation is, how much richer it is, and I think how much better the work ends up being. And I ’ m grateful for any time I work with someone, whether it ’ s Matt, Latoya, I can name a huge list of people who are really willing to **rethink** things that I might just assume need to stay. And the only caveat I would say here is that I can also think of times when there were paths we were on and the ability to switch it up and **rethink** something might not have been for the best. Yeah, this is one of the hardest questions that I really wrestled with while writing the book and I ’ m still grappling with now, which is how much **rethinking** is too much and how do I know whether when I ’ ve started **rethinking** something, I should actually change my mind or go back to my original first answer and the only coherent place that I ’ ve landed on this so far as to say, well, if this is a curve and there ’ s an optimal amount of **rethinking**, I think most of us don ’ t do enough of it. Agree or disagree? You ’ re asking me, yeah, yeah, it ’ s a question, do you agree or disagree? You know, my guess is I would agree. Got it. I have to take a sidebar here, JJ, because you mentioned the office. This is work life. I read once that you did not like the office when it premiered in the U. S. and that you weren ’ t even a fan of the entire first season. Is it true? And what led you to **rethink** that view? I think that what I felt was when I first watched it, because I became a huge fan, which is why I reached out to them, essentially begging them to hire me as a director. I was such a fan of the original and in fact, to a degree that I reached out to Ricky Gervais and wrote a part for him in Alias. And I was such a fan of that show and the specificity of it that it felt. For me, I remember when I first saw it, I thought, oh, no, like it didn ’ t matter how good everyone was because they were great. It felt like it was somehow sacrilege that it was redoing exactly the same thing in essentially the same time period, you know, putting it through the American TV mill. And then you realize, oh, they ’ re doing it perfectly. And it ’ s it ’ s exactly what it should be. And it ’ s its own thing. It was the quality of the show that that won me over. OK, next question. I ’ m sure you hate getting asked about Star Wars in particular, because it might what might be the most beloved universe ever created a minimum. It ’ s got a lot of **passionate** fans. And yeah, I loved The Force Awakens. I love the rise of Skywalker. I especially love the points where you **rethought** some moments and characters. And I wanted to ask you about one specific one, which is I think my biggest moment of shock in the new trilogy was when Emperor Palpatine came back to life because I thought he ’ d been dead since 1983. And so I was wondering how you went about **rethinking** his demise. Well, that was something that came in and out and then back in again. But that idea was something that that felt like it was sitting there, set up in the prequels. And when we were looking at the story, the idea of a character who is desperate to find immortality and it felt like it was sitting there and that it was a set up potential set up. And I kept imagining it as something that could work. You know, if I ’ m a kid watching all nine movies years from now, it felt like something that was a possible setup to be examined later. I will say that it ’ s something that I loved the possibility of it and the promise of it. And it was one of, you know, so many things that we were **rethinking** and trying to find ways to sort of fit the pieces of the puzzle together. And I know that for some people, it they clicked in and it worked and was fun and surprising. And for other people it was, you know, understandably infuriating and sacrilege and stupid and wrong. The reactions were were vast, but it was also something that was, you know, in various moments felt like it was the right move. I imagine that happens a lot to that. You you **rethink** a classic world or story, whether it ’ s Star Wars or Star Trek or even characters that we ’ ve fallen in love with. Right. I still feel like, you know, with Lost in particular, I still feel like, you know, Sawyer and Sayid and Kate and some of the others are long lost friends. How often do you **rethink** the stories you ’ ve told versus once you put it out into the world, you ’ re you ’ re happy with the creative choices you ’ ve made, regardless of the feedback? Well, all I see when I work on something is the thing that we could have and should have done to make this better or that different. The **rethinking** doesn ’ t stop because it ’ s it ’ s out there. And I do think that one of the enemies of certainly movies and in some cases TV is the sort of, you know, the announced release date where the time that one normally should have to **rethink** doesn ’ t exist. And it ’ s very difficult to be. In a healthy way, **rethinking** when you are under the gun, impractical material and often very expensive ways. For example, when Damon and I started working on Lost, it was a very particular, you know, crazy ticking clock where the head of ABC at the time, Lloyd Braun, wanted a show about people who survived a plane crash. And so in Damini, who had never met, we wrote that outline. It was in a week based on just pure instinct. And we went off and we shot this to our pilot that we were, you know, writing, casting, shooting, doing post and everything in nine weeks. And it was a crazy crunched period. Wow. And it ended up working as a pilot. And then Damon and Carlton Cuse wrote the series. But I, I feel like it ’ s one of those lessons that not having an ending, it just makes it harder. I know it sounds so obvious and so easy, but when you take that leap of faith, when Stephen King starts writing a novel, he gets to finish that novel and decide, does anyone need to see this? And I ’ m sure he ’ s got drawers full of things that people have not read because he feels like it ’ s not the thing. And one of the crazy things that this, you know, pandemic **quarantine** time has done for TV and for movies is it ’ s given people time to write, not just a pilot or a rough outline, but write entire seasons of a series before it even goes, which, you know, you want to be flexible and you want to be able to cast a role and realize, oh, my God, we ’ ve got to do this with this character because we didn ’ t realize it or this thing isn ’ t working the way I thought it would. But this time has allowed writers to, you know, write without the pressure of we have to be casting this thing right now. We have to be location scouting. We have to be, you know, getting the all these episodes edited and posted and ready for broadcast. And I think that it in no way do I feel like, oh, great, we had this time to do this. You know, I ’ d much rather life be normal and covid not exist. But I will say that if there is any kind of creative benefit to this time, it ’ s that suddenly release dates and broadcast dates are not being, you know, as aggressively announced. And time is available for some writers to be able to actually work on the stories in a more, you know, I think human pace. And that is no small thing. Is there creative **practice** that you ' ve **rethought** during the past year? If you had said to me that we could be breaking stories without ever being in the same room together, I would have thought it was probably impossible, if not wildly unlikely. And I think that online, not just the Zoom ' s, but also the sort of online whiteboard apps that exist that allow people to collaborate remotely has, I think, probably profoundly changed the way stories, at least on television and writers rooms, will be broken. Wow. Does that does that mean in writers rooms won ' t always be physical even after the pandemic? They definitely will. But I think the that someone can now be part of it who might not be in town. I think that that the **norm** will always seem to be better to be together. But there ' s something great about the focus and the, you know, the access that you have from anywhere. So I just think that that that ' s something that, you know, clearly there will be infinitely fewer business trips to have meetings that could now clearly be done on Zoome. Will people go back to it? You know, the way we were before? More than not, I believe they will, but. This is now accelerated the evidence that this is a valid and really productive way to work. I ' ve never said those words. I ' ve never said this before. We ' re not going to hold you accountable. Thank you. Next question from one magician to another. How does all the time you ' ve spent learning magic tricks and performing them affect your job? Has it spilled over into your work life in any way? I think the thing about magic, as much as some might see it as the geekiest sort of, you know, silliest thing to me, it ' s incredibly powerful. We had a magician in our office and this was like two years ago, and he was in my office, just the two of us. And he did a few tricks and he did one that literally made me, as a 50 year old man, think to myself in my head, he might be magical, like, you know, because I know how magic tricks are done. I know how a lot of I know bunch of gimmicks. I know a bunch of tricks. He did something where I was like, I wonder if he ' s maybe magical. Does he have? And my whole point is the fact that someone who ' s a half a century old can still have a moment of thinking. There might be powers beyond that, which I know is so profound. And the the wow and the gasping and the amazement that any audience has, big or small, it ' s there ' s something about the the sense of possibility that the world is more than it seems and that we want to see things that we can ' t imagine and that we don ' t expect. And so I feel like that is a natural. Aspect to telling a story, and I just think that whether it ' s writing a a book or making a show or a movie, it ' s all a bit of a magic trick. You are so much more comfortable not knowing than I am. I immediately want to answer. I have to figure out the secret, but then you can never see the trick again. You can admire the the skills and the genius of the performer who executed it, right? Yes. OK, next favorite character from the office. It has to be Michael Scott, not because just because I think he is the hub of the wheel. And so everyone is kind of it feels like they ' re all kind of in his orbit, to mix metaphors. So interesting. He wasn ' t even in my top five. I love that. And then can I ask you the same question about Star Wars? I think my favorite my favorite character in in Star Wars was Han. Just because I mean, it ' s very hard to think of a better scene in a movie ever than when you meet Han Solo and then in Empire Strikes Back. I mean, like there ' s just there are some of the greatest, truest larger than life, but completely relatable and grounded moments. And, you know, when we got to shoot in Force Awakens, you know, Harrison and Chewie coming into the, you know, the Falcon and saying, you know, we ' re home because it just there was something so crazy about it. And I feel **super** lucky to have, you know, been part of that. I had tears in my eyes when when Nonintuitive had their reunion. It just felt like we just couldn ’ t wait to show it to people because it just felt like, oh, my God, you should see this. It ’ s just so cool having them back on the ship. It was a beautiful moment. I ’ d love to talk to you about as a Red Sox fan, the Red Sox versus Yankees. And you have this great chapter about just how far fans of these teams are willing to go to torture the opposing team. And what you tried, what didn ’ t work and what finally seemed to break the ice of having them sort of find the humanity in each other. So my question to you is, what was what surprised you in your attempts to build those bridges between those two fan bases? And what were your findings? In summary, I ’ m so glad that resonated. You know, I was I was when thinking about the prejudice that so many people hold toward other groups, I was looking for a context where we could study it, where the actual stakes are minimal, but the emotional stakes feel very high. And sports fan allegiances, it just it felt like the perfect place to go. I mean, a few years ago, I got to know an amazing woman in her 70s who helps Holocaust survivors. And one day she mentioned that she went to Ohio State. And my first reaction was, yuck. Yeah, I ’ m a Michigan Wolverine. We ’ re rivals, but who cares where she went to school half a century ago? Yeah, it just bothered me at a fundamental level. And so I decided, you know, like any self respecting social scientist, I should study that. And so Tim and I and all these experiments with the Yankees and Red Sox fans, which was such an easy rivalry to choose. And I think my my biggest surprise was that two of the steps that were supposed to work based on all the existing science, didn ’ t you know one of those was was just creating a common identity as **baseball** fans? And, you know, people would say, yeah, you know, I would help a Yankees fan if they were in an emergency. But otherwise, you know, they ’ re rooting for an evil team. So no, thank you. And then the other one was to to try to humanize the individual fan, where basically what happened was people said, all right, you know what? There ’ s this one Yankees fan who ’ s OK, but he ’ s not like the other ones. And I still hate all the rest of them. So what ultimately ended up working and in a way that I was I was surprised by the power of it actually was saying, look, you know, maybe we just need to get people to **rethink** how they became fans in the first place. So imagine if you had grown up in New York. Would you possibly root for the now you ’ re probably root for the Mets. But the point is, you might not be a Red Sox fan. I ’ m not crazy. Exactly. I ’ m joking. I ’ m joking. All my Mets fans, friends, I ’ m joking. I don ’ t know if you are, but go on. I ’ m joking anyway. I know I keep going, please. Well, no. So I thought this idea of just, you know, considering the possibility that we could hold different views all of a sudden, it it just destabilizes a lot of the stereotypes and prejudices that people hold. And so, as you know, we ran these really entertaining experiments where we gave people a chance to to punish fans of the opposing team by giving them extra spicy hot sauce or by giving them really difficult math problems, which were actually going to hurt their payment for participating in the study. And we found that, **lo** and behold, after we just got fans to think about how they might root for a different team if they had been born in a different city, that was enough to get them to show less animosity toward fans of the opposing team, which I thought was amazing. And this did not make it into the book. But we just finished a couple of experiments with with gun control and gun rights advocates where we found that the same process worked for them. That if we got somebody who is extremely concerned about about gun safety, to imagine having been born in a hunting family, they actually were less nasty than to somebody on the other side of the aisle. So I think there might be something to this. Fantastic. So I can ’ t thank you enough for talking to me on your show about you, you should do the the goodbye because it ’ s your show. But I just I wanted to thank you for the the honor and opportunity. Well, I can ’ t thank you enough for coming. I ’ m so grateful that you read the book. You liked it that you ’ re willing to talk about it. It ’ s a huge gift to me and our listeners. And I loved getting a little bit inside of your mind and your work life. And most importantly, the work you do has has always been just a huge source of inspiration to me. But over the past year, you have been a source of light and hope and entertainment and creative inspiration. And I just want to thank you for for everything that you do to entertain us and to get us to **rethink** so many of the things that we think we know. Holy crap. That was unbelievable. Way too generous, but your your words are incredibly appreciated. And and again, thank you for this amazing book and your kind words. WorkLife is hosted by me, Adam Grant. Our team includes Colin Helmes, Greg Achen, Dan O ’ Donnell, Constanza Guardo, Joanne DeLuna, Grace Rubenstein, Michelle Quint, Angela Chang and Anna Felin. This episode was produced by Jessica Glaser and supported by Viking Penguin. Think again. The power of knowing what you don ’ t know is available in whatever format you like print, electronic stone, tablet or audio narrated by me.

Text Sample 190: POS Dim 2 – 2021 – Score 24.00 – 2021/t004030.txt
Hey, WorkLife, it ’ s Adam Grant, season four is right around the corner, but today I wanted to share a **special** conversation in our Taken for Granted series. I ’ m talking to Daniel Kahneman. Danny won a Nobel Prize in economics. He ’ s been named one of the most influential economists in the world, but he ’ s not on board with that. Oh, my God, no. The behavioral economist. I ’ m not any kind of economist. Danny is one of the great psychologists of our time, actually, of all time. You may have read his influential book, Thinking Fast and Slow. And he has a new book, Noise, coming out later this spring with Cass Sunstein and Olivier Sebti from. This is taken for granted by podcast with the TED Audio Collective, I ’ m an **organizational** psychologist, my job is to think again about how we work, lead and live. This conversation with Danny challenged one of my core beliefs about intuition. It also gave me a new way of thinking about which ideas are worth pursuing. Since Danny is an expert on decision making, I thought I ’ d start by asking about what we ’ re seeking in so many of our decisions. You ’ ve spent a lot of your career studying **happiness** and related topics. And really, for the first time in my career, I started to wonder why are we so obsessed with **happiness** as psychologists? You know, I ’ m all for people leading enjoyable, satisfying lives. But if I had to choose, I would much rather have people focus on character and, you know, trying to build their generosity, their integrity, their commitment to justice, their humility. And I wonder if you could talk to me a little bit about whether you think we ’ ve lost our way a bit and character has been too little in focus or too far in the background or whether you think **happiness** deserves the attention it ’ s gotten? Well, I think my focus would be neither **happiness** nor character. It would be misery. And I think that there is a task for society to reduce misery, not to increase **happiness**. And when you think of reducing misery, you would be led into very different policy directions. You would be led into mental health issues. You would be led into a lot of other problems. So reducing misery would be my focus. Character and **happiness** or misery are not substitutes. The idea which has been accepted both in the UK and in many other places, other than quite a few other countries by now, is that the objective of society? The objective of policy should be increasing human welfare or human well-being in a in a general way. I think that ’ s a better objective for policy than increasing the

quality of the population ' s character. I think it ' s a better objective. I think it ' s it ' s a more achievable objective, except I would not focus on the positive and I would focus on the negative. And I would say it is the responsibility of society to try to reduce misery. And let ' s focus on that. We speak of length and not the shortness and we speak of **happiness**, the dimension is labeled by its positive poll. And that ' s very unfortunate because actually increasing **happiness** and reducing misery are very different things. I agree. And it ' s interesting to hear you say that reducing misery is more important than promoting **happiness**. In some ways, that feels like a critique of the positive psychology movement. It is. And tell me a little bit more about why. Well, I think the positive psychology movement has in some ways a deeply conservative position. That is, it says let ' s accept people ' s condition as it is and let ' s make people feel better about their unchanging condition. You know, there has been some critique of positive psychology along those lines. I ' m not I ' m not innovating here. But I think that focusing on changing circumstances and dealing directly with misery is more important and is a **worthy** objective for society than making people feel better about their situation. Yeah, I mean, I think it certainly tracks with how I think about, in general, bad being stronger than good and the alleviation of misery contributing more to the quality of people ' s lives than, you know, some degree of elevating of of the amount of joy that they feel. But I also wonder at times if this is not a false dichotomy, that if you want to make people happy, it ' s awfully difficult to do that if you don ' t pay attention to the misery or suffering that they might experience. Well. Actually, we once did a study in which we we were measuring how people figure, how much of the day are people in different states positive or negative? And it turns out that people are in a positive state on average, 80 percent of the time, more than 80 percent of the time. That is on average, people are on the positive side of zero. Now, look at, say, the 10 percent of the time that people spend suffering. Overall, most of the suffering is concentrated in about 10 to 15 percent of the population. So it actually is not the same people that you would make less miserable or happier. Those are different populations. And the question is, where do you direct the the weight of policy and what you pay more attention to? Very interesting. I like it, so you ' re basically saying, look, if we have scarce resources, whether those are **financial** or time or energy, we want to concentrate on the group of people who are suffering as opposed to those who might be languishing. You know, it seems to me that to some extent we have been trapped by words. I mean, it ' s the word **happiness** which seems to stand for the whole dimension. And and and I think this is leading to some policies, actually, this failing to lead to policies that would that would really be directed at increasing human well-being by decreasing misery. Yeah, I think so, too. And it ' s something I ' ve thought about a lot at work. Given given the hat I wear most often is organisational psychologist, I feel like the obsession with employee engagement has really missed the mark. I don ' t go to work hoping that I ' m going to be engaged today. I hope that I ' m going to have motivation and meaning and that I ' m going to have a sense of well-being. And I wonder if if one of the effects that the pandemic has had on a lot of people and a lot of leaders in **workplaces** is to get them to recognize, you know, what we need to care about people ' s well-being in their lives, not just their engagement at work. Well. I thought that, you know, I ' m not an expert. This is your field, not mine. But I thought that engagement has is close to feeling good at work. I mean, we whether it ' s the responsibility of **workplaces** to deal with people ' s well-being in general, I agree that it ' s they ' re responsible for dealing with people ' s well-being at work. And that doesn ' t seem to me to be very different from trying to make people engaged and happy with what they are doing. So I ' m a bit curious to hear more about the dichotomy of the distinction that you ’ re drawing between engagement and will be my interpretation of engagement, whether it ’ s fairly close to wellbeing at work. Yeah, I think I think in large part it depends on which conceptualization and measure of engagement we ’ re talking about. But one of the one of the more interesting patterns in the literature that that ’ s gotten me thinking quite a bit is that it ’ s possible to be an engaged workaholic. And this this has been differentiated recently from being a compulsive workaholic. You know, are you are you working a lot because you find it interesting and worthwhile, or are you doing it because you feel guilty when you ’ re not working and you feel kind of obsessed with the with the problem that you ’ re trying to solve? And I think that one version of engagement is probably healthier than the other. And I associate wellbeing much more with, you know, with being an intrinsically motivated workaholic than with a compulsive workaholic, even though both are highly engaged. I agree. You know, I worked for a while with Gallup. I was consulted with Gallup many years ago. And their concept of engagement, I think, was a positive concept. One of the criteria that I remember for people being happy at work is having a friend at work. So clearly, at least, their concept of engagement, which is the one the only one that they know much about, is by and large a positive concept. And certainly the word we don ’ t want people to be compulsive, although. Although I don ’ t know how to describe myself, for example, when when I work hard or when I used to work very hard, was I doing so compulsively, was doing so out of intrinsic motivation? I think both I was intrinsically motivated and I was compulsive about. So I ’ m not sure of the distinction that you ’ re drawing between being compulsive and being intrinsically motivated. Well, I like to call it a look at ambivalence there, because I think it speaks to the point that you raised earlier, which is that, you know, positive emotions and negative emotions can coexist. You can work because you ’ re **passionate** about it and because you feel bad if you ’ re not doing it. That ’ s right. I want to ask you about the joy of being wrong. The place I wanted to begin on this is to ask you, when you were growing up or earlier in your life, how did you handle making mistakes? Hesitating because I can ’ t it ’ s not that I didn ’ t make any mistakes, I certainly made many, but I wasn ’ t very impressed by my mistakes. I mean, they were not very salient in my life. So if you ’ re asking about my earlier, you know, as a student and so I don ’ t have much to report that I have an interest as a **researcher**, I found my mistakes very instructive. And and there were sort of positive experiences. By and large. It ’ s such an odd thing to hear you say, because most of us, most of us experience pain, not pleasure. When, you know, when we find out that we ’ re wrong or we discover that we ’ ve made a mistake. So how did you arrive at a place where you found that to be a teachable moment? Well, you know, those are situations in which you are surprised. I really enjoyed changing my mind because I enjoy being surprised and I enjoy being surprised because I feel I ’ m learning something so that it ’ s been that way. I ’ ve been lucky, I think, because I think you ’ re right, that this is not universal, the positive emotion to correct and mistakes. But it ’ s just a matter of luck. I mean, I ’ m not, you know, not claiming high moral ground here. It ’ s it ’ s fascinating to watch, though, because I ’ ve seen your eyes light up and, you know, it ’ s it ’ s it ’ s palpable when you when you discover that you were wrong about a hypothesis or a prediction, you look like you are experiencing joy. And I ’ ve started to think a lot about what prevents people from getting to that place. And I think a lot of it is for so many people, they get trapped in either a preacher or a prosecutor **mindset** of saying, you know, I I know my beliefs are correct or I know other people are wrong. And at some point their ideas become part of their identity. And I know even scientists **struggle** with this. Right. I think at least when I was trained as a social scientist, I was taught to be passionately dispassionate. But I know a lot of scientists who **struggle** with detachment, and you don ’ t seem to. So how do you keep your ideas from, I guess, becoming part of your identity? Well, I think that. I mean, this is going to sound awful. I have never thought that ideas are rare. And, you know, if that idea isn ’ t any good, then there is another that ’ s going to be better. And I think that is probably generally true, but not generally acknowledged. So that for people to give up on an idea may in many cases lead to a sort of panic. If I don ’ t have that idea, then what do I have? Who am I if I don ’ t have that idea? So being less identified with your ideas is also associated, I think, with having many of them just discovering that most of them are no good and trying to to do the best you can with a few that are good. So it ’ s seeing ideas as abundant rather than scarce. That ’ s what makes it easier to stay detached. Yeah, yeah. I mean, I used to tell my students ideas are a dime a dozen. I mean, don ’ t overinvest in your old ideas. And so I used to encourage my students to give up. At a certain point, I suddenly never wanted to read a dissertation by a student with a chapter that would explain why the experiment failed. So that was the kind of advice that I would give them. Think of another idea. Do you ever worry about getting too detached? I think, for example, about messenger RNA technology, which was seen as, I think a joke for a long time, and if not for the courage and tenacity of a small group of scientists who persisted with it anyway, we might not have a covert vaccine right now. Oh. I think well, in the first place, science, like many other social systems, doesn ’ t thrive on everybody being the same. So you may have some advice that is good for some people. And it ’ s clear that some people who are irrationally persistent achieved great successes. And indeed, if you look back at the great successes, you will generally find that there is some irrational persistence behind them and irrational optimism behind them. That doesn ’ t mean that when you are looking from the other side, that irrational optimism or irrational persistence are good things to have. So the expected value of it might be negative, although when you look back every big success you can trace to some irrationality. Well, that goes beautifully to one of my favorite ideas of yours, that we look at successful people and we learn from their habits, not realizing that we haven ’ t compared them with people who failed, who had many of the same habits. And I wanted to, I guess, ask you a broader question, which is having put these kinds of decision heuristics and cognitive **biases** on the map. Which one do you fall victim to the most? Is that confirmation **bias**? It sounds like maybe not. I just wondered which of which of the **biases** that you ’ ve documented is your greatest demon. All of them, really. All of them, except, as you said, confirmation **bias**. By the way, people are close to me find this irritating. That is that whenever they have a problem with someone, I automatically take the other side and try to explain that someone might be right after all. So I have that contrarian aspect to what I am. This reminds me a little bit of a possibly apocryphal story that I think told to to every doctoral student in social science these days, which is that not long after you won the Nobel Prize for your work on Decision-Making, there was a journalist who asked you how you made tough decisions and you said you flip a coin. Is this true? No. OK, good. Absolutely. I ’ m really I ’ ve never flipped a coin to make a decision in my life. The version of the story I heard was that you would flip the coin to **observe** your own emotional reaction and figure out what your **biases** were. I might have said that this is one of the benefits of flipping a coin, but I personally have never used that. But it ’ s true that. Flipping a coin would be a way of discovering how you feel if you didn ’ t know earlier that I still believe, I feel very relieved to know that because I was worried about you, given all you know about decision making, making important life choices with a coin toss. Welcome back to Taking for Granted and my conversation with Danny Kahneman. He was just setting the record straight that as an eminent scholar of decision making, he does not make decisions based on a coin toss. So how does he make decisions? Well, when I look back at my life, it ’ s been a series of things that, you know, ultimately I made decisions, made life choices clearly, but I did not experience them. As decisions, I have very little to say, describing myself about making decisions, in part because I have really strong intuitions and I follow them usually. So the decision doesn ’ t feel hard if if you know what you are going to do and if you know yourself and you ’ re going to do it anyway, it doesn ’ t feel very hard. I have to say, Danny, I ’ m a little shocked to hear you say that you follow your intuition because you have spent most of your career highlighting all the fallacies that come into play when we rely on our intuition. Well, you really have to distinguish the judgment from decision making. And most of the intuitions that we ’ ve studied were fallacies of judgment rather than decision making. And second, my attitude to intuition is not that I ’ ve spent my life, you know, saying that it ’ s not good enough in the book that we ’ re right and just finished writing. Our advice is not to do without intuition. It is to delay it. That is, it is not to decide prematurely. And not to have intuitions very early, if you can delay your intuitions, I think they ’ re are your best guide probably about what you should be doing. OK, so two questions there. One is how the other is why, well, you delay your intuitions, you know. No, I ’ m talking about formal decisions, decisions that might be taken within an organization or a decision that an interviewer might take in deciding whether or not to hire a candidate. And he had the advice of delaying intuition is simply because when you have formed an intuition, you are no longer taking in information. You are just rationalizing your own decision or you ’ re confirming your own decision. And there is a lot of research indicating that this is actually what happens in interviews, that interviewers spend a lot of time. They make their mind up very quickly and they spend the rest of the interview confirming what they believe, which is really a waste of time. Yes. Yes. So the idea of delaying your intuition is to make sure that you ’ ve gathered comprehensive, accurate, unbiased information so that then when your intuition forms, it ’ s based on better sources, better data. That is that what you ’ re after? Yes, because I don ’ t think you can make decisions without there being endorsed by your intuitions. You have to feel conviction. You have to feel that there is some good reason to be doing what you are doing, so ultimately intuition must be involved. But if it ’ s involved, if if you jump to conclusions too early or jump to decisions too early, then you are going to make avoidable mistakes. Well, this is an interesting twist on, I guess, how I ’ ve thought about intuition, especially in a hiring context, but I think it applies to a lot of places. My advice for a long time has been, don ’ t trust your intuition, test your intuition, because I think about intuition is a subconscious pattern recognition. And I want to make those patterns conscious so I can figure out whether whatever relationship I have detected in the past is relevant to the present. And it seems like that ’ s what what you ’ ve argued as well when you ’ ve said, look, you know, you can trust your intuition if you ’ re in a predictable environment, you have regular **practice** and you get immediate feedback on your judgment. I think the tension for me here is I don ’ t know how capable people are of delaying their intuition. And I wonder if if what might be more practical is to say, OK, let ’ s make your intuition explicit instead of implicit early on so that then you can rigorously challenge it and figure out if it ’ s valid in this situation. I ’ ve been deeply influenced by something that I did very early in my career. When I was 22 years old, I set up an interviewing system for the Israeli army. It was to determine suitability for combat units. And the interview system that I designed broke up the problem so that you had fixed rates that you were interviewing about, you ’ re asking factual questions about each trade at the time and you were **scoring** each trade once you had completed the questions about that trade jumping in here, because this is such a cool example, but it needs a little explaining. Danny created a system for interviewers to rate job candidates on specific traits like work ethic, analytical ability or integrity. But interviewers did not take it well. They really hated the system. When I introduced it and they they told me I mean, I vividly remember one of them saying, you ’ re turning us into robots. Danny decided to test which approach worked best. Was that their intuition or their ratings from the data? The answer was both their ratings plus their intuition, but not their intuition at the beginning, their intuition at the end, after they did the ratings, that is, you read those six straight and then close your eyes and just have an intuition how good you think the soldier is going to be. When the data came back, it turned out that that intuition at the end was the best single predictor. It was just as good as the average or the sixth straight, and it added information. So, wow. You know, I was surprised, you know, I just was doing that as a favor to them, letting them have intuitions. But the discovery was very clear. And we ended up with a system in which the average of the six traits and the final intuition had equal weight. It sounds like what you recommend then concretely is for a manager to make a list of the skills and values that they ’ re trying to select on to to do ratings that are anchored on those dimensions. So, you know, I might **judge** somebody who ’ s coding skills if they ’ re a programmer or their ability to sell if they ’ re a salesperson. And then I might also be interested in whether they you know, they ’ re aligned on our **organizational** values. And then once I ’ ve done that, I want to form an overall impression of the candidate, because I may have picked up on other pieces of information that didn ’ t fit the model that I had. I think that ’ s about right. It ’ s such a powerful step that I think should bring the best of both worlds from algorithms and human judgment. There ’ s something that ’ s a little puzzling to me about it, though, which is why are managers and people in general so enamored with intuition? I think it ’ s because people don ’ t have an alternative. It ’ s because when they try to reason their way to a conclusion. They end up confusing themselves. And so the intuition wins by default, it makes you feel good. It ’ s easy to do and it ’ s something that you can do quickly, whereas careful thinking in a in a situation of judgment where there is no clearly good answer, careful thinking is painful, it ’ s difficult, and it leaves you in a state of indecision or in a state or even if one option is better than the other. You know that the difference is not something you can be sure of, whereas when you go to the intuitive route, you ’ ll end up with all, you know, with overconfident certainty and feeling good about yourself. So it ’ s an easy choice. I think you you wrote about this topic at length and what some have called your magnum opus, thinking fast and slow. I ’ m wondering what you ’ ve **rethought** since you published that book. Well, um. You know, there were there were things I published in that book that were wrong. I mean, you know, literature I quoted that didn ’ t hold up. Now, the interesting thing about that is that I haven ’ t changed my mind about much of anything. But that is because changing your mind is really quite difficult. That is Dan Gilbert has a beautiful word equal that unbelieving and unbelieving things are very difficult. So I find it extremely hard to unbelieve aspects of Pozza thinking fast and slow, even though I know that my grounds for believing them are now much weaker than they were. But the more significant thing that I have begun to **rethink**. Is that thinking fast and slow, like most of the study of judgment and decision making is completely oblivious to the individual differences. And all my career I I made fun of anybody was studying individual differences. I say I ’ m interested in main effects. I ’ m interested in characterizing the human mind. But it turns out that when you go into detail, people, those studies that you have, it ’ s not that everybody is behaving like the average of the study. That ’ s simply false. There are different subgroups were doing different things. And and life turns out to be much more complicated than if you were just trying to explain the average. So the necessity for studying individual differences is, I think the most important thing that I have **rethought** and, you know, doesn ’ t have any implications for me because it ’ s too late for me to study individual differences. And I wouldn ’ t like doing it anyway. It ’ s not my style. But I think there is much more room for it than I thought when I was writing, thinking fast and slow. Another thing I wanted to ask you about is the choices you make about what problems and projects to work on. I ’ m not a good example for anybody. I really never had a plan. A more or less followed my nose and I did many things that I shouldn ’ t have done. I wasted a lot of time on projects that I shouldn ’ t have carried out, but. No, I ’ ve been lucky. Well, I think that that ’ s probably an encouraging message for a lot of us, that the idea is, is this an area where there is gold? And I ’ m going to look for it. I mean, that ’ s that ’ s an idea. And formulating a new question to an idea in my book, I ’ m going to use that this is an area where I think there might be gold and I want to look for it. Such a nice reframe. So, Danny, you mentioned in your new book, Noize, one of my favorite ideas when I read Noise was the idea of the inner crowd. And I wondered if you could explain that there have been two lines of research by Bulan Besner and by her Twigg. And asking people the same question. On two occasions or in two different friends of mine, and it turns out that when you ask the same question like an estimate of the number of airports, when you ask people the same question twice separated by some time, then they tend to give you a different answers. And the average of the answers is more accurate than each of them separately. Also, in the case that the first answer is more valid than the second, and it ’ s also the case, the longer you wait, the better the average is, the more information there is in the second judgment that you make. You know, what it indicates is clearly that what we come up with when we ask ourselves a question is we are sampling from our mind. We are not extracting the answers from our mind. We are sampling an answer from our mind. And there are many different ways that that sample could come out. And sampling twice, especially if you will make them independent sampling twice is going to be better than sampling once. This is this is one of the most practical, **unexpected** decision making and judgment perspectives that I ’ ve come across in the last few years, in part because it says, I don ’ t always need a second opinion if I can get better at forming my own second opinions. Oh, you know, I think as we say in that chapter sleepover, it is really very much the same thing that is sleepover. And just wait. And tomorrow you might think differently. So the advice is out there reinforcing it, maybe useful. Your collaboration with Amos Tversky is obviously legendary, there ’ s a whole Michael Lewis book about it. Is there a lesson that you took away from that collaboration that ’ s informed either how you choose your collaborators now or how you work with the people on your team? I think that one really important thing in is. It ’ s to be genuinely interested in what your collaborator is say, and, you know, I am quite competitive. I ’ m also quite competitive. We were not competitive when we worked together. The joy of love, of collaboration for me always was that. But that almost that was more with them than with almost anyone else. I would say something and he would understand it better than I had. And that ’ s the greatest joy of collaboration. But in my other collaborations, taking pleasure in the ideas of your collaborator seemed to be very useful, and I ’ ve been lucky that way. On that note, almost anyone who ’ s ever won a Nobel Prize has **complained** that it hurt their career. And I ’ ve wondered what the experience has been like for you or I mean, it hurts people ’ s career if they ’ re young. You know, I got mine when I was 68, and for me it was a net loss. Why does it get people in trouble if they get it earlier? Oh, you know, there are a variety of ways that this can happen in the first place. It ’ s very destructive. I mean, people start taking you more seriously than they did and hanging on your every word and a lot of nonsense like this. And if if you begin to take yourself too seriously, that ’ s not good if you take time away from your work. To to do what you are invited to do when you get a Nobel, which is a lot of talking and a lot of talking and think that you don ’ t know much about, that ’ s a loss. And then if it makes you self-conscious that everything that you have to do has to be important. That ’ s a loss. So there are many different ways, I think, in which getting a Nobel early is a bad idea is not the best gift. I was at a good age to get it because I had some years left in my career and it made many things much easier having a Nobel and it made the end of my career more productive, I think, and and happier than it would have been otherwise. Taken for granted as part of the TED Audio Collective, the show is hosted by Adam Grant and it ’ s produced by TED with Transmitted Media. Our team includes Colin Helmes, Credit, Dan O ’ Donnell, Constanza Gelada, Joanne DeLuna, Grace Rubenstein, Michelle Quint and Ben Chang and Anna Feeling. This episode was produced by Dan O ’ Donnell.

Maria : I found this job opening for a marketing manager. And I thought, oh, that would be really fun, they were looking for someone who could do everything, like very strategic. So, I applied, got the interview, and they were actually really nice Adam : This is Maria. Or at least, that ’ s what we ’ re calling her. You know, to protect the innocent. Anyway, Maria was very excited about this new opportunity. From the outside, the job was everything she wanted. Maria : And she called me at the end of the day to offer me the job, so I quit my job, like two days later. Adam : A few weeks later, she started the new job eager to share her ideas. Maria : And as I sat down in my new desk, the designer who was sitting next to me, she ’ s like,”I tried to find you on LinkedIn to warn you not to take this job.”and I went,”Why?”and she told me,”These people are crazy!”Adam : Um, definitely not a good start. Maria : I just laughed, cause it was like, okay let ’ s see how bad it actually is cause I also wanted to give it a chance thinking maybe she ’ s just angry, she just doesn ’ t like it. But in this case, I should have listened to her. Adam : The next few weeks were a wild ride. Maria : So, we had a sales meeting. I was like okay, let ’ s try and look for a marketing way of getting customers in. And they were like”No, how about we just do an energy circle?”And I was like,”Sorry what?”They all knew what that meant, so they all stood up, and held hands And I ’ m there just looking around like,”What the hell ’ s happening?”And they just started like shaking, like,”Okay, shake the bad energy, shake for the universe,”and then the owner is like,”Okay universe, we need you to send us some sales.”And I ’ m just standing there like,”Okay”with that folder big full of strategies and ideas and campaign ideas Nothing. Adam : Was this a company or a cult? Maria : It was a bit cultish because at the Christmas party, the owner wrote a song for everyone, with everyone ’ s names on it and we had to sit there listening to him sing to us. And by early December we get a list on my desk, and it ’ s just a list of everyone ’ s names in an envelope. And then, on top of the list it says,”Please give whatever you ’ d like to contribute to show your appreciation for working here and your appreciation to the owner of the company.”And I was just so angry and I loudly went like”What? So, we have to buy him a present?”I put 50 cents. I suggested to buy everyone in the company a Christmas present out of the marketing budget, and they said"No, coming to job is present enough."Adam : So, the highly paid owner gets a gift, but the hard-working employees don ' t? Call poison control! We have to rescue some people from a toxic culture. **Organizational** culture has big consequences for success and **happiness** but we often overlook it, because it ' s hard to analyze. So what culture clues should you look for before you join an organization? And how do you shape the culture, once you ' re there? I ' m Adam Grant, and this is Work Life my podcast with the TED audio-collective. I ' m an **organizational** psychologist, I study how to make work not suck. In this show, I take you inside the minds of fascinating people, to help us **rethink** how we work, lead, and live. Today, culture at work : How to recognize it from the outside and strengthen it from the inside. Thanks to Morgan Stanley for sponsoring this episode. Jenny : When I was in junior high school one of the things that I used to do as type of surveys that I would give to my parents Well, actually not just my parents, anyone who came over and I would ask them to fill out a paper-and-pencil survey I just loved surveys, I know, **super** weird. I would ask all kinds of questions about how happy they were at work and what their work was like and I just thought that was fascinating. Adam : Jenny Chatman is an **organizational** behavior professor at Berkley, and she was clearly destined to become the queen of **organizational** culture. Jenny : I like being a queen, I continue to be an optimist about this, that there is a place for everyone and there are organizations and jobs that really fit with some people, but not others. Adam : And through her many years of research and countless surveys, Jenny has the clear view what **organizational** culture is. Jenny : Culture is the values and behavioral **norms** that one sees expressed within an organization and it has to be sort of a systematic pattern of **norms** and expectations that people have in a particular **setting** that they might not have in another **setting** and one thing that ' s interesting about **norms** is there ' s no rulebook to teach them to you, instead we learn them through social interaction. They ' re different from what ' s written in the corporate handbook, these are observed patterns of behavior and expectations that we pick up from interacting with colleagues within an organization. Adam : People often claim their cultures are unique, but when you study thousands of organizations, you can start to see underlying patterns. It all has to do with how we balance key priorities. Research reveals that there are two fundamental tensions in **organizational** culture : Results versus relationships, and rules versus risk. If you ignore one of those values altogether, you end up committing one of my 4 deadly sins of **organizational** culture : Toxicity, mediocracy, bureaucracy, and anarchy. The first sin of culture is toxicity, the deadliest sin of them all. New evidence on the great resignation shows that toxic culture is the biggest driver of turnover, more than **burnout**, more than low pay. Toxicity exists when a culture prioritizes results without relationships, getting things done at the cost of treating people right. The organization tolerates disrespect, abuse, exclusion, unethical decisions, and selfish cut-throat **actions**. If people don ' t get fired for those behaviors or worse yet, still get promoted, Houston, we have a problem. At the opposite end of that spectrum is a second sin : Mediocracy : Valuing relationships above results. There ' s no accountability, people are so worried about getting along that they end up forfeiting good work. In a mediocracy, even if you do a terrible job you can still get ahead as long as people like you. Before long, you end up with a Peter principle, where everyone is promoted to their level of incompetence and they get stuck there. The third sin is bureaucracy. That happens when a culture is all rules, no risks. New ideas are seen as threats to the status quo. People cling to process and resist creativity and change. They see questioning the way we ' ve always done things as blasphemy.

There ’ s red tape everywhere. If you want to use the bathroom, you have to fill out paperwork. And the fourth sin is anarchy : You have risks, but no rules. Anyone can do whatever they want, strategy and structure be damned. No one learns from the past or lands on the same page. It ’ s pure chaos. It ’ s bad enough when a culture commits one of these sins, but believe it or not, Maria ’ s jewelry company managed to be guilty of all 4 sins Maria : So, definitely insanely toxic. People were crying there **daily**. Every time I went to the toilet there was someone crying there. We used to laugh about that one of the cubicles, it was the crying cubicle. So you would never actually go there, in case someone needed it for crying. Adam : They were a mediocracy, too. And not just because they did energy circles instead of marketing, they had no system for getting results. Maria : They were a small company that grew into a bigger company and none of the top two bothered to learn how to manage a company, incompetence a whole way through, but just act confident. Adam : They had all sorts of constraints on risk-taking. Maria : Very bureaucratic, like, you couldn ’ t speak directly to the owner because it was very about the steps, like remember how high I am and remember how low you are. Adam : And despite the bureaucracy around the chain of command, in other places, they didn ’ t have enough rules. Most of Maria ’ s job was anarchy. Maria : And turns out I kind of regressed in my career because I ended up not doing anything that I wanted to do and more like a party **planner** and universe messenger person. Adam : I did not know that was a job. Maria : Oh, I didn ’ t either. Adam : Could you figure any of this out before you took the job? Maria : I ’ ve been thinking a lot about that cause while I was there, I was thinking how can I make sure that this doesn ’ t happen again? If I had spoken to someone from the team during the interview, I am sure that the general manager would have been there with us and other than going through LinkedIn and finding people who work there and then messaging them and start saying,”Hey, I have just been offered this position what do you think about the company so I ’ m not sure if that ’ s even something that I would have done? Adam : You ’ ve probably felt that hesitation too. But gathering information about a culture before you agree to join is exactly what culture queen Jenny Chatman recommends doing. Jenny : I think that ’ s a great way of helping people be kind of detectives about the culture that they ’ re interested in particularly people who are seeking jobs. You want to ask, you know, what what do people care about here? What are they talking about? What is behavior focusing on? How much agreement is there? Do people seem to be aligned on these issues? And finally, what are their non-negotiables? What do people get really rewarded for, or if they violate these **norms** or behaviors, what do they get really punished for? Adam : You want to interview the company, but not during your job interview. Wait until you get the offer. Maria : I ’ m definitely doing that for my next job because If I ’ m getting into a new company I want to know exactly what I ’ m getting into so, next time I will do more of a reverse interview. Adam : It ’ s not about the slogans on the wall or the values on the website, culture is revealed in the stories people tell. To gather meaningful culture stories, I have a few favorite questions for you to ask current and former employees. I posed them to some former students, and their answers told me a lot about their organizations cultures. The first question is : Tell me about something that happens here that wouldn ’ t elsewhere. Vivian : Every year, the class of new hires is in charge of organizing a senior team roast, where they basically spend 30 minutes, live, these days over Zoom, during our end-of-the-year strategy session roasting our senior team for things like the way they write emails, wearing pajamas during zoom calls, mixing up people ’ s names, basically anything embarrassing. And I think this is something truly unique about our culture, for a firm in the finance industry where humor isn ’ t often encouraged in the **workplace**. Adam : This is a firm that ’ s trying to avoid both toxicity and bureaucracy. By making fun of senior people, they signal that executives want human relationships and it ’ s okay to take risks. Also, it ’ s pretty rare that people wearing pajamas are into red tape. Romie : When an investment banking report came out about mistreatment of their first shares, I got an email from the chairman of our organization. We ’ d worked together once before but didn ’ t know each other very well and I was one of the only analysts he knew. He was horrified by the report. And wanted to see how I felt we were doing. And to make sure I didn ’ t feel anything remotely similar. He responded to my email by saying :”I hope and pray that no one at our firm would ever be treated like that. And even if one person felt they were treated badly, that that person would let us know and we could fix it immediately. If we ever failed to be people-focused, please let me know whether it ’ s about you or you ’ re aware of anyone else at the firm.”And then in all caps”NOTHING I CARE MORE ABOUT.”Adam : It sounds like the chairman is dedicated to fight toxicity, but culture isn ’ t about one leader ’ s behavior, it ’ s about how widely shared and intensely held the values are. So I want to know how committed others in power are to curbing mistreatment and what the consequences are. In healthy cultures, no level of individual excellence justifies undermining people. You ’ re not a high performer if you don ’ t elevate others. Which brings us to a second question : Tell me about a time when people didn ’ t walk the talk here. Gabriel : Our offices returned to in-person because in-person interactions are highly valued, according to the president of the firm. But the third most senior person at the firm is spending the entire winter in a ski town in Europe. Adam : This is a red flag. Research suggests that the worst stories about a culture are about senior leaders violating their own principles. They claim in-person relationships are valued, but apparently one of the top people is exempt from that value? Hypocrisy alert! You can also see signs of hypocrisy versus integrity by asking a third question : Tell me a story about who gets hired, promoted and fired around here. If you ’ re a detective, these stories are full of clues about what ’ s really valued Girl : An MD shared how he made MD in six years as opposed to the normal twelve. He told us how he works from 4:30 AM until 10 PM and he ’ s always available. He doesn ’ t expect it from everyone else, but he ’ s always grinding. Considering our firm prides itself on valuing mental health, it ’ s a bit demoralizing to hear that the way to advance quickly is to abandon those values. Adam : Here ’ s another **warning** signal : The company claims to value well-being, but do they really mean it? If you want to get promoted early, good luck not working 17-hour days Collecting stories can help you understand a culture from the outside and identify toxicity, mediocracy, bureaucracy, and anarchy before you join. But what if you ’ re already inside? How do you build and maintain a strong culture? More on that after the break. Okay, this is going to be a different kind of **ad**. I play a personal role in selecting the sponsors for this podcast, cause they all have interesting cultures of their own. Today, we ’ re going inside the **workplace** at Morgan Stanley Randy : We like to hike, we like to climb around in the mountains, we like to be like an hour and a half far from civilization fishing. My wife ’ s **super** active, and she just loves being out at the gym, running, doing all that kind of stuff. Adam : Meet Randy Norris Randy : I live in a town, just outside of Boise, Idaho, I ’ m a **financial** advisor with Morgan Stanley. I ’ m married to a wonderful partner for life, Lian. And I have two now adult kids. Adam : One day, Lian suffered a life-threatening medical emergency She suddenly started coughing up blood that was filling her lungs. Randy : She was admitted to the hospital, and she stayed in the hospital for the next 4 or 5 days, and did all kinds of tests, trying to figure out what was going on. The only thing that really came of it that we were told was that it shouldn ’ t happen again but it could happen at any time, and so basically, the advice was never be 10 or 15 minutes away from a hospital. Adam : Randy and Lian was scared and devasted at the thought of spending the rest of their lives tethered to a hospital. But then, Randy got a phone call from his insurance provider. Randy : She said :”I noticed you ’ ve been going to see a number of different doctors, are you getting the care you need?”Immediately, I just said :”No. No, we have something wrong and nobody has a good answer, and I ’ m really frustrated”And she said”Well, Morgan Stanley offers their employees the **service** called Second MD.”Dave : The purpose of that expert medical opinion **service** is really to provide a different point of view that can help avoid surgeries, potentially help save unnecessary doctors ’ visits, maybe identify an alternative diagnosis or treatment that hadn ’ t been considered, especially when there ’ s a major decision to be made Adam : This is doctor Dave Stark, Morgan Stanley ’ s chief medical officer. Dave : Fundamentally, the job of a chief medical officer or frankly the job of an HR benefits professional is to develop and manage a portfolio of products and **services** to help employees and their families stay healthy, happy, and productive Adam : That ’ s what Second MD did for Randy and his family. After being connected to specialists across the country, Lian traveled to Oregon, where she was diagnosed with a micro vascular disfunction and underwent a successful surgery. Randy : After about 3 months of just not being able to figure out what was going on, Second MD came in, and within 3 weeks, we have a plan of **action** that was just guided and stepped all the way through I ’ ve been a raving fan of Second MD ever since. Adam : Research shows that employees ’ commitment and loyalty depends heavily on feeling cared about and supported by their employer. Morgan Stanley has worked to meet employees where they are, with **services** they need, in person or virtually, from child and elder to **special** needs care. As for Randy, he and his wife Lian are counting their blessings Randy : On the anniversary of her surgery, she ran her first half marathon. Life is precious, life is short. We should enjoy it, and take a moment then, but every now and then just reflect on the blessings we have and the miracles that happened that get us where we ’ re at. Adam : Morgan Stanley believes employees are their greatest asset and they protect that asset by offering top quality healthcare options and comprehensive programs to support physical and emotional well-being. Learning more at morganstanley. com / our benefits Adam : The first person who shapes the culture of an organization is the founder. Annie : Our founder, Barclay Simpson, had his 9 principles of doing business and it ’ s something that we refer to all the time. And one of them is everybody matters. Adam : Meet Annie Kao. She ’ s the VP of Engineering at Simpson Manufacture. They make anchors and fasteners for building foundations and decks. Annie : We are a manufacture and engineering company of building connections that help people build and design safer, stronger structures. Adam : And Simpson has been doing that for a long time. Annie : Just celebrated our 65th birthday. Adam : I thought it was really intriguing that you said,”We < celebrated our < 65th birthday.”Annie : Uh-huh. Adam : A lot of people when they talk about other company, they wouldn ’ t know what their company ’ s birthday was. What ’ s behind that? Annie : God, you know, I didn ’ t even pick up on that, but I think for me, like, the people are Simpson, I feel like I ’ m a very active owner of who Simpson is and what Simpson is and so, you know, the successes that we had as a company both on the **financial** side, on the products that we ’ re able to release, like, I have very personal pride associated with that because I just, I know the people and the work that it took to deliver it. Adam : That identification with the company, that pride of **ownership**, is a sign that Simpson has an unusually strong culture. Annie : It ’ s very personal because I think that what a company does is a clear reflection on, you know, who I am as, you know, as a person, as an engineer, as a parent. Adam : Strong culture is one of Jenny Chatman ’ s specialties as a **researcher**. You can tell how strong a culture is by paying close attention to what she calls crystallization and intensity. Jenny : There ’ s a question about how much people agree about the culture, that ’ s the crystallization piece. Does everyone in the organization agree that innovation is important? Or is there fragmentation where our engineers want to be on the cutting edge of things but our marketing folks want to hold back and just provide what customers are asking for? And there ’ s a question of intensity, which is what are the things that we ’ re... that are absolute non-negotiable for us in the organization. Adam : Simpson doesn ’ t just have a strong culture. Jenny has **observed** it up close as an unusually healthy one. Jenny : So, full disclosure, I ’ m on the board of Simpson Manufacturing, even before consultants were billing hours for cultural transformation, Barc was building a strong culture and he had a number of principles, one was that he really supported his people within the organization and expected to do most of their promotions from within the company. So, there was a real investment in developing people Adam : An investment that often took people by surprise, including Annie. Annie : Barclay Simpson, our founder, used to attend all of the orientation classes that we held at our corporate office. So, everyone who starts at Simpson attends this week-long orientation at our home office and Barc would attend all of those, and he would have 30 minutes, he ’ d go round, ask everyone ’ s name, ask about their families, and talk a little bit about the history and he ’ d just going to sit down at one of the, you know, conference chair along with us, and then I think of other leaders that have guided our company, and just the common factor is how, kind of, openly caring they were, how much they make time for employees. It ’ s something that I have really tried to do, just within my department with engineering is, like, I need to be that, you know, for the employee and so just making sure that, you know, I ’ m owning that and also expecting that of my team because that ’ s the kind of culture that we want, and we have to keep it alive and just not assume that someone will is doing it. Adam : It ’ s often said that culture eats strategy for breakfast. But the reality is, that a strong culture can serve your strategy. Jenny : Yeah, I do think there is something to the motto in that if your culture is not aligned with your strategy, good luck, it ’ s probably not going to be executed very well, or if at all. But I also think that strategy is what gives organization its purpose. Without a strategic objective, the question is sort of why organize, or why be an organization. You ’ re coming together for a purpose, you ’ re trying to accomplish something together, the culture should be the kind of engine that allows you to execute on that strategy more or less effectively. Adam : So if you want to build a strong culture, you need to identify the core values that you ’ re trying to crystalize But crystallization alone is not enough. You ’ ve probably come across a **workplace** where everyone agrees on the values but no one really upholds them. Jenny : Think of your US postal **service**, where, you know, who knew that their motto was”Customers first,”right? Like who knew? I think they have the coffee mugs, they have the banners, but, is anyone willing to, sort of, stay past 5pm to ensure that everybody on the line is served? Probably not. And in fact, it ’ s the most common case in organizations to have high crystallization and low intensity, because typically leaders are asking people to agree with pretty good stuff like quality, or customers, sure, I like customers, you know. The real question, though, is are people punished for a failure to uphold the **norms** and are they willing to sanction one another? Adam : That ’ s where intensity comes in. Jenny : There was this case at Nordstrom that is known as a strong culture organization. An experience I had where a shoe salesperson was helpful, but not overly helpful. And another salesperson came over, which I happened to overhear cause, you know, he was dropping is tax deductible for me, right? I happened to overhear this conversation between the two, and the second salesperson was actually admonishing the first one for not going above and beyond in helping me. So that ' s the sign of real intensity. Are people willing to take an interpersonal risk in order to uphold those **norms**? Adam : That might sound a little, well, intense. But it ' s the point of a strong culture : People enforce it even when the boss isn ' t watching. At Simpson, the crystallization and intensity around the principles is a big reason why people regularly stay for the long haul sometimes decades. Annie : I ' ve just celebrated my 15-year anniversary with Simpson. Adam : Is that a thing? An anniversary with a company? Annie : YES! And so, we have this really cool online network, where we can actually go and celebrate our coworkers ' anniversary and so you can post messages and, like, kind of, memories. I was just happen to be the lucky recipient of like, I think 50 messages from people that I worked with congratulating me, which was pretty emotional and overwhelming. Adam : The anniversaries are a result of that strong culture, and the messages also help to maintain that culture. They reinforce the principle that everybody matters. Annie : And I think part of it, too, is everyone, like, wants to be a part of this, like, winning team, if you will, that the work that you do matters, and people who enjoy their work and bring that passion with them to their work just give so much more of themselves. So I feel like it ' s translated itself financially for us. We passed the 1 billion dollars mark, I saw that there was some analysts who are predicting that we would be, you know, maybe, 2 billion by the end of this year. And it ' s like, oh, okay. Like, we really see that the hard work and the culture that we build, actually, translates into **financial** success, which is a kind of self-fulling prophecy. Adam : Yeah, well, it ' s interesting what you ' ve just described dovetails very nicely with what we see in the research on strong cultures, which is you know, one : talented people are more attracted to them because there ' s a clear signal : this is who we are, this is what we stand for. And that differentiate you in the marketplace. Two : Heightened motivation, over and over again. Like, I ' m not just doing a job, I ' m advancing a **mission**. And three : Those two things obviously feed into retention nicely, and they do that in part through a sense of belonging. When the culture is strong, like, everybody shares the same values, and also, is **passionate** about the same values, it ' s me, and I can ' t imagine working anywhere else because how am I going to find that again? Annie : Yes, yes. Adam : So how do you create that kind of commitment and build a strong **organizational** culture? In her research, Jenny compared the effects of selection vs. socialization How much of culture is who you ' d let on the bus? Versus how you drive it? Jenny : It turns out that people are, within some parameters, pretty flexible in terms of how much they can grow to adapt and fit with, or even appreciate the culture that they ' re a part of. Adam : Wow, I think you just said that socialization eats selection for breakfast Jenny : That ' s right! That ' s right, which is interesting because I think if you asked most leaders, they would say it ' s about who you hire, and, it turns out that people are actually more adaptable than we give them credit for. Adam : Jenny finds that when it comes to building a strong culture, socialization beats selection. The values and **norms** you set are more than twice as influential as who you hire So if you want to strengthen your culture, the first step is to bring it to life for people, especially new hires. Culture isn ' t just communicated through the stories we tell, it ' s created through the stories we tell. You want to find and share stories about a time when the culture became real Jenny : Stories are vital. I like to advise leaders to see themselves as curators of key stories within an organization You need to tell the story, but also give the moral of the story.

And so, one very well-known example is Southwest Airlines. They were running out of money early in their operations. They were using 4 jets at the time. And they couldn ' t make their payrolls so they had to sell one of the jets to pay employees that month. And they went to employees and said : We ' re going to well one of our jets but we want to run the same route with 3 jets instead of 4, how can we do that? And employees came back with the idea of turning the planes more quickly than they were before. So Southwest now continues to be known for its turn time, the amount of time it takes to come back in the gate, unload passengers and bags, you know, clean the plane, reload passengers and bags and take off. And that ' s part of Southwest ' s, sort of, deep strategy. So that story got told, not just for the substance that turn time is important, but for the relationship between leaders and employees, and who actually came up with the idea. And everyone at Southwest knows that story and it absolutely maps on to the culture that emphasizes both urgency and speed, but also a deep investment and mutual respect between employees and leaders in the organization Adam : Research reveals that the most powerful stories are about people living your values. Once you ' ve identified your best cultural stories, the second step is to reward and promote the protagonist in them, celebrate people who exemplify your values. Jenny : You would definitely want to focus on the formal and informal reward systems. Formally, if you have control over the compensation and you can reward that **financial** aid, that gets people ' s attention very quickly. But then there are a whole host of informal rewards, you know, whether that ' s gift certificates for lunch or a kick celebration for someone who had a small win that ' s consistent with the desired new culture. These are ways of really capturing people ' s attention. Adam : Wait a minute. If I heard you correctly, you ' re saying I shouldn ' t just pay people for their performance, I should pay them for their contributions to the culture? Jenny : Well yeah! Because, if... in my way of thinking about culture, the culture is your path to strategy execution, then culture is almost a proxy for top performance Adam : Wow! This is... It ' s such a big step for so many organizations that are used to... I would say most of the organizations I ' ve worked with over time were they ' ve gotten good at measuring individual results and they know how to figure out if you are a superstar, they have no idea what your impact on the culture is. Jenny : That ' s right. And, then the final lever, of course, is the leader ' s own behavior. Right, she needs to absolutely emulate the culture that she ' s trying to cultivate and there ' s no substitute for that because people are looking at leaders for an understanding of what ' s important. Adam : This is the third step. Leaders have to show up and model the values every day. That ' s a principle Annie learned from Barc Simpson, the company ' s founder and the CEOs who followed him. Annie : I just do office hours. We ' ve been trying to build that in, and just say, like, our schedules are so busy, everyone never has time, so, I ' m going to actually make that time. I ' m going to be available for 2 hours on Monday morning, right after we ' ve done our earnings call, so, if you have questions about why we decided to do this, why we didn ' t move that project forward, what the heck was Karen talking about the **financials**, I have made the time for that. Adam : So, Annie, I haven ' t asked you yet about the dark side of strong cultures but, I want, because we see empirically that despite all the upsides, the challenges that strong culture runs into has to do with group thinking, homogeneity, and becoming, sort of, stuck in the way we ' ve always done things as opposed to adapting and evolving Annie : Yeah. Adam : Have you seen that? How have you **navigated** it? Annie : Yeah, we... It ' s so funny you ' re asking this question because we ' ve just talking about this as an engineering team, as how do we make sure we have, you know, a diverse set of perspectives and opinions so that we don ' t fall into groupthink and, that like, well, this is how we ' ve always done it. Let ' s just not assume that we ' re not doing, you know, groupthink. Like, how are we making sure to put together diverse teams. Right? Like, what questions are we asking as we start a project, or as we put people on projects to make sure that it has the right, the right mix of people, and I think we ask ourselves that question too when we hire, like, who can, who is the right new person on the team to challenge what we ' re doing, and how do we celebrate being challenged what we ' re doing, so that we are kind of... We ' re looking for it, and that it ' s not something that, you know, catches us by surprise. Adam : This is the paradox of strong cultures. If you want them to stay strong, flexibility needs to be one of your core values. Cultures are like buildings. Without proper maintenance, they fall apart. A culture needs regular **service**, and sometimes a full-scale renovation. So how do you know what kind of maintenance your culture needs? You do a culture audit. Jenny : A culture audit is actually pretty straightforward. You can start by saying : Here are our current **norms**, and then you could say : If we were fully executing on our strategy, what would our **norms** be? And then, you can identify the gaps, and figure out a bunch of behaviors that can fix that, using these levers : who would we hire, how would we socialize, orient, and train people, what stories would we tell, who would we promote, how would we reward people, you know, what would leaders be doing? At that point, you can get to real behavioral change that could be of value. Adam : Yeah, and one of the things I love about the idea of a culture audit is I can go and get responsibility for that, even if I ' m not in charge, right? And in some ways, I ' m taking a task that nobody has time for, or might not already be in anybody ' s job description and I ' m saying :"Hey, leaders, you can ' t be everywhere, you can ' t see everything, can I help you figure out what ' s working in the culture and what needs to be improved? And if I can get that project, then I have a chance to then shape the discovery of data that can convince leaders that we need to some adjustments. Jenny : And then, the next piece of that would be that you make the culture changes part of the work that people are doing anyway. Adam : At Simpson, they have their version of a culture audit. Annie : It ' s a culture and leadership survey. And so the first time we did this, there was feedback that people felt that they couldn ' t really say something if they saw something that was against our values or against our policies. And so, as a result, we launched a program specifically to address that, called"Speak-up, listen-up". We opened an anonymous phone tip line, we had an anonymous form you could fill online, all managers took training, we kind of put our money where our mouth is. Adam : Wow! It sounds like an example of protecting the culture. Annie : Yeah, I would say everyone in our company is responsible for protecting the culture and what it means for me is just... is going back and making sure that we are a values-driven organization. And so I ' m going to do whatever I can, as a leader in our organization, to make sure that that is pervasive through every single role, every single level, because that ' s not something that we are willing to go halfway on. And if we do, then that ' s not the company that I want to work for. Adam : The ultimate test of a strong culture is : Can it adapt? Building a great **workplace** isn ' t just about expecting people to adapt to the culture, it ' s also about adapting the culture to the people and the world. As the world evolves, your culture needs to evolve with it. Next time, wrapping up Season 5 of WorkLife : Dan Heath : People have this sort of skepticism about change and everything you hear about change is pessimistic. I mean everything in our lives is change. For some reason, we code the really difficult things as change and everything else is just like a choice. Adam : **Organizational** change from the bottom up and the top down. WorkLife is hosted by me, Adam Grant. The show is produced by TED with Transmitter Media. Colin Helms, Gretta Cohn, Dan

O ’ Donnell, JoAnn DeLuna, Grace Rubenstein, Michelle Quint, Banban Cheng and Anna Phelan. This episode was produced by Constanza Gallardo. Our show is mixed by Ben Chesneau. Our fact checker is Paul Durbin. Original music by Hansdale Hsu and Allison Leyton-Brown. **Ad** stories produced by **Pineapple** Street Studios. **Special** thanks to our sponsors : LinkedIn, Morgan Stanley, ServiceNow, and UKG. For their studies of **organizational** culture, gratitude to the following **researchers** and their colleagues : Charles O ’ Reilly, Chad Hartnell, Shalom Schwartz, Joanne Martin, Sean Martin, Alan Benson, Donald Sull, Constantinos Coutifaris, and my beloved late colleague Sigal Barsade. Maria : The people that were there when I was there, are still there, and this was like two years ago. I sat there with them, trying to figure out how we could start their own businesses, cause I was like, you need to get out of here. Adam : For toxic cultures, there should be some kind of extraction team that you can send in, Maria : There should be! Adam : Like a SWAT team that ’ s going to go in and rescue everyone. Maria : That ’ s a good business idea. Maybe I recruit a company who ’ d specialize in saving teams that are stuck in a shitty culture. Adam : I think that is a business waiting to be launched.

Text Sample 192: POS Dim 2 – 2022 – Score 17.00 – 2022/t003762.txt

Chris Anderson : Elon Musk, great to see you. How are you? Elon Musk : Good. How are you? CA : We ’ re here at the Texas Gigafactory the day before this thing opens. It ’ s been pretty crazy out there. Thank you so much for making time on a busy day. I would love you to help us, kind of, cast our minds, I don ’ t know, 10, 20, 30 years into the future. And help us try to picture what it would take to build a future that ’ s worth getting excited about. The last time you spoke at TED, you said that that was really just a big driver. You know, you can talk about lots of other reasons to do the work you ’ re doing, but fundamentally, you want to think about the future and not think that it sucks. EM : Yeah, absolutely. I think in general, you know, there ’ s a lot of discussion of like, this problem or that problem. And a lot of people are sad about the future and they ’ re... Pessimistic. And I think... this is... This is not great. I mean, we really want to wake up in the morning and look forward to the future. We want to be excited about what ’ s going to happen. And life cannot simply be about sort of, solving one miserable problem after another. CA : So if you look forward 30 years, you know, the year 2050 has been labeled by scientists as this, kind of, almost like this doomsday **deadline** on climate. There ’ s a consensus of scientists, a large consensus of scientists, who believe that if we haven ’ t completely eliminated greenhouse gases or offset them completely by 2050, effectively we ’ re inviting climate catastrophe. Do you believe there is a pathway to avoid that catastrophe? And what would it look like? EM : Yeah, so I am not one of the doomsday people, which may surprise you. I actually think we ’ re on a good path. But at the same time, I want to caution against complacency. So, so long as we are not complacent, as long as we have a high sense of urgency about moving towards a sustainable energy economy, then I think things will be fine. So I can ’ t emphasize that enough, as long as we push hard and are not complacent, the future is going to be great. Don ’ t worry about it. I mean, worry about it, but if you worry about it, ironically, it will be a self-unfulfilling prophecy. So, like, there are three elements to a sustainable energy future. One is of sustainable energy generation, which is primarily wind and solar. There ’ s also hydro, geothermal, I ’ m actually pro-nuclear. I think nuclear is fine. But it ’ s going to be primarily solar and wind, as the primary generators of energy. The second part is you need batteries to store the solar and wind energy because the sun doesn ' t shine all the time, the wind doesn ' t blow all the time. So it ' s a lot of stationary battery packs. And then you need electric transport. So electric cars, electric planes, boats. And then ultimately, it ' s not really possible to make electric rockets, but you can make the propellant used in rockets using sustainable energy. So ultimately, we can have a fully sustainable energy economy. And it ' s those three things : solar / wind, stationary battery pack, electric vehicles. So then what are the limiting factors on progress? The limiting factor really will be battery cell production. So that ' s going to really be the fundamental rate driver. And then whatever the slowest element of the whole lithium-ion battery cells supply chain, from mining and the many steps of refining to ultimately creating a battery cell and putting it into a pack, that will be the limiting factor on progress towards sustainability. CA : All right, so we need to talk more about batteries, because the key thing that I want to understand, like, there seems to be a scaling issue here that is kind of amazing and alarming. You have said that you have calculated that the amount of battery production that the world needs for sustainability is 300 terawatt hours of batteries. That ' s the end goal? EM : Very rough numbers, and I certainly would invite others to check our calculations because they may arrive at different conclusions. But in order to transition, not just current electricity production, but also heating and transport, which roughly triples the amount of electricity that you need, it amounts to approximately 300 terawatt hours of installed capacity. CA : So we need to give people a sense of how big a task that is. I mean, here we are at the Gigafactory. You know, this is one of the biggest buildings in the world. What I ' ve read, and tell me if this is still right, is that the goal here is to eventually produce 100 gigawatt hours of batteries here a year eventually. EM : We will probably do more than that, but yes, hopefully we get there within a couple of years. CA : Right. But I mean, that is one – EM : 0. 1 terrawat hours. CA : But that ' s still 1 / 100 of what ' s needed. How much of the rest of that 100 is Tesla planning to take on let ' s say, between now and 2030, 2040, when we really need to see the scale up happen? EM : I mean, these are just guesses. So please, people shouldn ' t hold me to these things. It ' s not like this is like some – What tends to happen is I ' ll make some like, you know, best guess and then people, in five years, there ' ll be some jerk that writes an article :"Elon said this would happen, and it didn ' t happen. He ' s a liar and a **fool**."It ' s very annoying when that happens. So these are just guesses, this is a conversation. CA : Right. EM : I think Tesla probably ends up doing 10 percent of that. Roughly. CA : Let ' s say 2050 we have this amazing, you know, 100 percent sustainable electric grid made up of, you know, some mixture of the sustainable energy sources you talked about. That same grid probably is offering the world really low-cost energy, isn ' t it, compared with now. And I ' m curious about like, are people entitled to get a little bit excited about the possibilities of that world? EM : People should be optimistic about the future. Humanity will solve sustainable energy. It will happen if we, you know, continue to push hard, the future is bright and good from an energy standpoint. And then it will be possible to also use that energy to do carbon sequestration. It takes a lot of energy to pull carbon out of the atmosphere because in putting it in the atmosphere it releases energy. So now, you know, obviously in order to pull it out, you need to use a lot of energy. But if you ' ve got a lot of sustainable energy from wind and solar, you can actually sequester carbon. So you can reverse the CO2 parts per million of the atmosphere and oceans. And also you can really have as much fresh water as you want. Earth is mostly water. We should call Earth"Water."It ' s 70 percent water by surface area. Now most of that ' s seawater, but it ' s like we just happen to be on the bit that ' s land. CA : And with energy, you can turn seawater into – EM

: Yes. CA : Irrigating water or whatever water you need. EM : At very low cost. Things will be good. CA : Things will be good. And also, there ' s other benefits to this non-fossil fuel world where the air is cleaner – EM : Yes, exactly. Because, like, when you burn fossil fuels, there ' s all these side reactions and toxic gases of various kinds. And sort of little particulates that are bad for your lungs. Like, there ' s all sorts of bad things that are happening that will go away. And the sky will be cleaner and quieter. The future ' s going to be good. CA : I want us to switch now to think a bit about artificial intelligence. But the segue there, you mentioned how annoying it is when people call you up for bad predictions in the past. So I ' m possibly going to be annoying now, but I ' m curious about your timelines and how you predict and how come some things are so amazingly on the money and some aren ' t. So when it comes to predicting sales of Tesla vehicles, for example, you ' ve kind of been amazing, I think in 2014 when Tesla had sold that year 60, 000 cars, you said,"2020, I think we will do half a million a year."EM : Yeah, we did almost exactly a half million. CA : You did almost exactly half a million. You were scoffed in 2014 because no one since Henry Ford, with the Model T, had come close to that kind of growth rate for cars. You were scoffed, and you actually hit 500, 000 cars and then 510, 000 or whatever produced. But five years ago, last time you came to TED, I asked you about full self-driving, and you said,"Yeah, this very year, I ' m confident that we will have a car going from LA to New York without any intervention."EM : Yeah, I don ' t want to blow your mind, but I ' m not always right. CA : What ' s the difference between those two? Why has full self-driving in particular been so hard to predict? EM : I mean, the thing that really got me, and I think it ' s going to get a lot of other people, is that there are just so many false dawns with self-driving, where you think you ' ve got the problem, have a handle on the problem, and then it, no, turns out you just hit a ceiling. Because if you were to plot the progress, the progress looks like a log curve. So it ' s like a series of log curves. So most people don ' t know what a log curve is, I suppose. CA : Show the shape with your hands. EM : It goes up you know, sort of a fairly straight way, and then it starts tailing off and you start getting diminishing returns. And you ' re like, uh oh, it was trending up and now it ' s sort of, curving over and you start getting to these, what I call local maxima, where you don ' t realize basically how dumb you were. And then it happens again. And ultimately... These things, you know, in retrospect, they seem obvious, but in order to solve full self-driving properly, you actually have to solve real-world AI. Because what are the road networks designed to work with? They ' re designed to work with a biological neural net, our brains, and with vision, our eyes. And so in order to make it work with computers, you basically need to solve real-world AI and vision. Because we need cameras and **silicon** neural nets in order to have self-driving work for a system that was designed for eyes and biological neural nets. You know, I guess when you put it that way, it ' s sort of, like, quite obvious that the only way to solve full self-driving is to solve real world AI and sophisticated vision. CA : What do you feel about the current architecture? Do you think you have an architecture now where there is a chance for the logarithmic curve not to tail off any anytime soon? EM : Well I mean, admittedly these may be infamous last words, but I actually am confident that we will solve it this year. That we will exceed – The probability of an accident, at what point do you exceed that of the average person? I think we will exceed that this year. CA : What are you seeing behind the scenes that gives you that confidence? EM : We ' re almost at the point where we have a high-quality unified vector space. In the beginning, we were trying to do this with image recognition on individual images. But if you get one image out of a video, it ' s actually quite hard to see what ' s going on without ambiguity. But if you look at a video segment of a few seconds of video, that ambiguity resolves. So the first thing we had to do is tie all eight cameras together so they ' re synchronized, so that all the frames are looked at simultaneously and labeled simultaneously by one person, because we still need human labeling. So at least they ' re not labeled at different times by different people in different ways. So it ' s sort of a surround picture. Then a very important part is to add the time dimension. So that you ' re looking at surround video, and you ' re labeling surround video. And this is actually quite difficult to do from a software standpoint. We had to write our own labeling tools and then create auto labeling, create auto labeling software to amplify the efficiency of human labelers because it ' s quite hard to label. In the beginning, it was taking several hours to label a 10-second video clip. This is not scalable. So basically what you have to have is you have to have surround video, and that surround video has to be primarily automatically labeled with humans just being editors and making slight corrections to the labeling of the video and then feeding back those corrections into the future auto labeler, so you get this flywheel eventually where the auto labeler is able to take in vast amounts of video and with high accuracy, automatically label the video for cars, lane lines, drive space. CA : What you ' re saying is... the result of this is that you ' re effectively giving the car a 3D model of the actual objects that are all around it. It knows what they are, and it knows how fast they are moving. And the remaining task is to predict what the quirky behaviors are that, you know, that when a pedestrian is walking down the road with a smaller pedestrian, that maybe that smaller pedestrian might do something unpredictable or things like that. You have to build into it before you can really call it safe. EM : You basically need to have memory across time and space. So what I mean by that is... Memory can ' t be infinite, because it ' s using up a lot of the computer ' s RAM basically. So you have to say how much are you going to try to remember? It ' s very common for things to be occluded. So if you talk about say, a pedestrian walking past a truck where you saw the pedestrian start on one side of the truck, then they ' re occluded by the truck. You would know intuitively, OK, that pedestrian is going to pop out the other side, most likely. CA : A computer doesn ' t know it. EM : You need to slow down. CA : A skeptic is going to say that every year for the last five years, you ' ve kind of said, well, no this is the year, we ' re confident that it will be there in a year or two or, you know, like it ' s always been about that far away. But we ' ve got a new architecture now, you ' re seeing enough improvement behind the scenes to make you not certain, but pretty confident, that, by the end of this year, what in most, not in every city, and every circumstance but in many cities and circumstances, basically the car will be able to drive without interventions safer than a human. EM : Yes. I mean, the car currently drives me around Austin most of the time with no interventions. So it ' s not like... And we have over 100, 000 people in our full self-driving beta program. So you can look at the videos that they post online. CA : I do. And some of them are great, and some of them are a little terrifying. I mean, occasionally the car seems to veer off and scare the hell out of people. EM : It ' s still a beta. CA : But you ' re behind the scenes, looking at the data, you ' re seeing enough improvement to believe that a this-year timeline is real. EM : Yes, that ' s what it seems like. I mean, we could be here talking again in a year, like, well, another year went by, and it didn ' t happen. But I think this is the year. CA : And so in general, when people talk about Elon time, I mean it sounds like you can ' t just have a general rule that if you predict that something will be done in six months, actually what we should imagine is it ' s going to be a year or it ' s like two-x or three-x, it depends on the type of prediction. Some things, I guess, things involving software, AI, whatever, are fundamentally harder to predict than others. Is there an element that you actually deliberately make aggressive prediction timelines to drive people to be ambitious? Without that, nothing gets done? EM : Well, I generally believe, in terms of internal timelines, that we want to set the most aggressive timeline that we can. Because there ' s sort of like a law of gaseous expansion where, for schedules, where whatever time you set, it ' s not going to be less than that. It ' s very rare that it ' ll be less than that. But as far as our predictions are concerned, what tends to happen in the media is that they will report all the wrong ones and ignore all the right ones. Or, you know, when writing an article about me – I ' ve had a long career in multiple industries. If you list my sins, I sound like the worst person on Earth. But if you put those against the things I ' ve done right, it makes much more sense, you know? So essentially like, the longer you do anything, the more mistakes that you will make cumulatively. Which, if you sum up those mistakes, will sound like I ' m the worst predictor ever. But for example, for Tesla vehicle growth, I said I think we ' d do 50 percent, and we ' ve done 80 percent. CA : Yes. EM : But they don ' t mention that one. So, I mean, I ' m not sure what my exact track record is on predictions. They ' re more optimistic than pessimistic, but they ' re not all optimistic. Some of them are exceeded probably more or later, but they do come true. It ' s very rare that they do not come true. It ' s sort of like, you know, if there ' s some radical technology prediction, the point is not that it was a few years late, but that it happened at all. That ' s the more important part. CA : So it feels like at some point in the last year, seeing the progress on understanding, the Tesla AI understanding the world around it, led to a kind of, an aha moment at Tesla. Because you really surprised people recently when you said probably the most important product development going on at Tesla this year is this robot, Optimus. EM : Yes. CA : Many companies out there have tried to put out these robots, they ' ve been working on them for years. And so far no one has really cracked it. There ' s no mass adoption robot in people ' s homes. There are some in manufacturing, but I would say, no one ' s kind of, really cracked it. Is it something that happened in the development of full self-driving that gave you the confidence to say,"You know what, we could do something **special** here."EM : Yeah, exactly. So, you know, it took me a while to sort of realize that in order to solve self-driving, you really needed to solve real-world AI. And at the point of which you solve real-world AI for a car, which is really a robot on four wheels, you can then generalize that to a robot on legs as well. The two hard parts I think – like obviously companies like Boston Dynamics have shown that it ' s possible to make quite compelling, sometimes alarming robots. CA : Right. EM : You know, so from a sensors and actuators standpoint, it ' s certainly been demonstrated by many that it ' s possible to make a humanoid robot. The things that are currently missing are enough intelligence for the robot to **navigate** the real world and do useful things without being explicitly instructed. So the missing things are basically real-world intelligence and scaling up manufacturing. Those are two things that Tesla is very good at. And so then we basically just need to design the specialized actuators and sensors that are needed for humanoid robot. People have no idea, this is going to be bigger than the car. CA : So let ' s dig into exactly that. I mean, in one way, it ' s actually an easier problem than full self-driving because instead of an object going along at 60 miles an hour, which if it gets it wrong, someone will die. This is an object that ' s engineered to only go at what, three or four or five miles an hour. And so a mistake, there aren ' t lives at stake. There might be embarrassment at stake. EM : So long as the AI doesn ' t take it over and murder us in our sleep or something. CA : Right. So talk about – I think the first applications you ' ve mentioned are probably going to be manufacturing, but eventually the vision is to have these available for people at home. If you had a robot that really understood the 3D architecture of your house and knew where every object in that house was or was supposed to be, and could recognize all those objects, I mean, that ’ s kind of amazing, isn ’ t it? Like the kind of thing that you could ask a robot to do would be what? Like, tidy up? EM : Yeah, absolutely. Make dinner, I guess, mow the lawn. CA : Take a cup of tea to grandma and show her family pictures. EM : Exactly. Take care of my grandmother and make sure – CA : It could obviously recognize everyone in the home. It could play catch with your kids. EM : Yes. I mean, obviously, we need to be careful this doesn ’ t become a dystopian situation. I think one of the things that ’ s going to be important is to have a localized ROM chip on the robot that cannot be updated over the air. Where if you, for example, were to say,”Stop, stop, stop,”if anyone said that, then the robot would stop, you know, type of thing. And that ’ s not updatable remotely. I think it ’ s going to be important to have safety features like that. CA : Yeah, that sounds wise. EM : And I do think there should be a regulatory agency for AI. I ’ ve said that for many years. I don ’ t love being regulated, but I think this is an important thing for public safety. CA : Let ’ s come back to that. But I don ’ t think many people have really sort of taken seriously the notion of, you know, a robot at home. I mean, at the start of the computing revolution, Bill Gates said there ’ s going to be a computer in every home. And people at the time said, yeah, whatever, who would even want that. Do you think there will be basically like in, say, 2050 or whatever, like a robot in most homes, is what there will be, and people will love them and count on them? You ’ ll have your own butler basically. EM : Yeah, you ’ ll have your sort of buddy robot probably, yeah. CA : I mean, how much of a buddy? How many applications have you thought, you know, can you have a romantic partner, a sex partner? EM : It ’ s probably inevitable. I mean, I did promise the internet that I ’ d make catgirls. We could make a robot catgirl. CA : Be careful what you promise the internet. EM : So, yeah, I guess it ’ ll be whatever people want really, you know. CA : What sort of timeline should we be thinking about of the first models that are actually made and sold? EM : Well, you know, the first units that we intend to make are for jobs that are dangerous, boring, repetitive, and things that people don ’ t want to do. And, you know, I think we ’ ll have like an interesting prototype sometime this year. We might have something useful next year, but I think quite likely within at least two years. And then we ’ ll see rapid growth year over year of the usefulness of the humanoid robots and decrease in cost and scaling up production. CA : Initially just selling to businesses, or when do you picture you ’ ll start selling them where you can buy your parents one for Christmas or something? EM : I ’ d say in less than ten years. CA : Help me on the economics of this. So what do you picture the cost of one of these being? EM : Well, I think the cost is actually not going to be crazy high. Like less than a car. Initially, things will be expensive because it ’ ll be a new technology at low production volume. The complexity and cost of a car is greater than that of a humanoid robot. So I would expect that it ’ s going to be less than a car, or at least equivalent to a cheap car. CA : So even if it starts at 50k, within a few years, it ’ s down to 20k or lower or whatever. And maybe for home they ’ ll get much cheaper still. But think about the economics of this. If you can replace a $30, 000, $40, 000-a-year worker, which you have to pay every year, with a one-time payment of $25, 000 for a robot that can work longer hours, a pretty rapid replacement of certain types of jobs. How worried should the world be about that? EM : I wouldn ’ t worry about the sort of, putting people out of a job thing. I think we ’ re actually going to have, and already do have, a massive shortage of labor. So I think we will have... Not people out of work, but actually still a shortage labor even in the future. But this really will be a world of abundance. Any goods and **services** will be available to anyone who wants them. It ' ll be so cheap to have goods and **services**, it will be ridiculous. CA : I ' m presuming it should be possible to imagine a bunch of goods and **services** that can ' t profitably be made now but could be made in that world, courtesy of legions of robots. EM : Yeah. It will be a world of abundance. The only scarcity that will exist in the future is that which we decide to create ourselves as humans. CA : OK. So AI is allowing us to imagine a differently powered economy that will create this abundance. What are you most worried about going wrong? EM : Well, like I said, AI and robotics will bring out what might be termed the age of abundance. Other people have used this word, and that this is my prediction : it will be an age of abundance for everyone. But I guess there ' s... The dangers would be the artificial general intelligence or digital superintelligence decouples from a collective human will and goes in the direction that for some reason we don ' t like. Whatever direction it might go. You know, that ' s sort of the idea behind Neuralink, is to try to more tightly couple collective human world to digital superintelligence. And also along the way solve a lot of brain injuries and spinal injuries and that kind of thing. So even if it doesn ' t succeed in the greater goal, I think it will succeed in the goal of alleviating brain and spine damage. CA : So the spirit there is that if we ' re going to make these AIs that are so vastly intelligent, we ought to be wired directly to them so that we ourselves can have those superpowers more directly. But that doesn ' t seem to avoid the risk that those superpowers might... turn ugly in unintended ways. EM : I think it ' s a risk, I agree. I ' m not saying that I have some certain answer to that risk. I ' m just saying like maybe one of the things that would be good for ensuring that the future is one that we want is to more tightly couple the collective human world to digital intelligence. The issue that we face here is that we are already a cyborg, if you think about it. The computers are an extension of ourselves. And when we die, we have, like, a digital ghost. You know, all of our text messages and social media, emails. And it ' s quite eerie actually, when someone dies but everything online is still there. But you say like, what ' s the limitation? What is it that inhibits a human-machine symbiosis? It ' s the data rate. When you communicate, especially with a phone, you ' re moving your thumbs very slowly. So you ' re like moving your two little meat sticks at a rate that ' s maybe 10 bits per second, optimistically, 100 bits per second. And computers are communicating at the gigabyte level and beyond. CA : Have you seen evidence that the technology is actually working, that you ' ve got a richer, sort of, higher bandwidth connection, if you like, between like external electronics and a brain than has been possible before? EM : Yeah. I mean, the fundamental principles of reading neurons, sort of doing read-write on neurons with tiny electrodes, have been demonstrated for decades. So it ' s not like the concept is new. The problem is that there is no product that works well that you can go and buy. So it ' s all sort of, in research labs. And it ' s like some cords sticking out of your head. And it ' s quite gruesome, and it ' s really... There ' s no good product that actually does a good job and is high-bandwidth and safe and something actually that you could buy and would want to buy. But the way to think of the Neuralink device is kind of like a Fitbit or an Apple Watch. That ' s where we take out sort of a small section of skull about the size of a quarter, replace that with what, in many ways really is very much like a Fitbit, Apple Watch or some kind of smart watch thing. But with tiny, tiny wires, very, very tiny wires. Wires so tiny, it ' s hard to even see them. And it ' s very important to have very tiny wires so that when they ' re implanted, they don ' t damage the brain. CA : How far are you from putting these into humans? EM : Well, we have put in our FDA application to aspirationally do the first human implant this year. CA : The first uses will be for neurological injuries of different kinds. But rolling the clock forward and imagining when people are actually using these for their own enhancement, let ' s say, and for the enhancement of the world, how clear are you in your mind as to what it will feel like to have one of these inside your head? EM : Well, I do want to emphasize we ' re at an early stage. And so it really will be many years before we have anything approximating a high-bandwidth neural interface that allows for AI-human symbiosis. For many years, we will just be solving brain injuries and spinal injuries. For probably a decade. This is not something that will suddenly one day it will have this incredible sort of whole brain interface. It ' s going to be, like I said, at least a decade of really just solving brain injuries and spinal injuries. And really, I think you can solve a very wide range of brain injuries, including severe depression, morbid obesity, sleep, potentially schizophrenia, like, a lot of things that cause great **stress** to people. Restoring memory in older people. CA : If you can pull that off, that ' s the app I will sign up for. EM : Absolutely. CA : Please hurry. EM : I mean, the emails that we get at Neuralink are heartbreaking. I mean, they ' ll send us just tragic, you know, where someone was sort of, in the prime of life and they had an accident on a motorcycle and someone who ' s 25, you know, can ' t even feed themselves. And this is something we could fix. CA : But you have said that AI is one of the things you ' re most worried about and that Neuralink may be one of the ways where we can keep abreast of it. EM : Yeah, there ' s the short-term thing, which I think is helpful on an individual human level with injuries. And then the long-term thing is an attempt to address the civilizational risk of AI by bringing digital intelligence and biological intelligence closer together. I mean, if you think of how the brain works today, there are really two layers to the brain. There ' s the limbic system and the cortex. You ' ve got the kind of, animal brain where – it ' s kind of like the fun part, really. CA : It ' s where most of Twitter operates, by the way. EM : I think Tim Urban said, we ' re like somebody, you know, stuck a computer on a monkey. You know, so we ' re like, if you gave a monkey a computer, that ' s our cortex. But we still have a lot of monkey instincts. Which we then try to rationalize as, no, it ' s not a monkey instinct. It ' s something more important than that. But it ' s often just really a monkey instinct. We ' re just monkeys with a computer stuck in our brain. But even though the cortex is sort of the smart, or the intelligent part of the brain, the thinking part of the brain, I ' ve not yet met anyone who wants to delete their limbic system or their cortex. They ' re quite happy having both. Everyone wants both parts of their brain. And people really want their phones and their computers, which are really the tertiary, the third part of your intelligence. It ' s just that it ' s... Like the bandwidth, the rate of communication with that tertiary layer is slow. And it ' s just a very tiny straw to this tertiary layer. And we want to make that tiny straw a big highway. And I ' m definitely not saying that this is going to solve everything. Or this is you know, it ' s the only thing – it ' s something that might be helpful. And worst-case scenario, I think we solve some important brain injury, spinal injury issues, and that ' s still a great outcome. CA : Best-case scenario, we may discover new human possibility, telepathy, you ' ve spoken of, in a way, a connection with a loved one, you know, full memory and much faster thought processing maybe. All these things. It ' s very cool. If AI were to take down Earth, we need a plan B. Let ' s shift our attention to space. We spoke last time at TED about reusability, and you had just demonstrated that spectacularly for the first time. Since then, you ' ve gone on to build this monster rocket, Starship, which kind of changes the rules of the game in spectacular ways. Tell us about Starship. EM : Starship is extremely fundamental. So the holy grail of rocketry or space transport is full and rapid reusability. This has never been achieved. The closest that anything has come is our Falcon 9 rocket, where we are able to recover the first stage, the boost stage, which is probably about 60 percent of the cost of the vehicle of the whole launch, maybe 70 percent. And we ' ve now done that over a hundred times. So with Starship, we will be recovering the entire thing. Or at least that ' s the goal. CA : Right. EM : And moreover, recovering it in such a way that it can be immediately re-flown. Whereas with Falcon 9, we still need to do some amount of refurbishment to the booster and to the fairing nose cone. But with Starship, the design goal is immediate re-flight. So you just refill propellants and go again. And this is gigantic. Just as it would be in any other mode of transport. CA : And the main design is to basically take 100 plus people at a time, plus a bunch of things that they need, to Mars. So, first of all, talk about that piece. What is your latest timeline? One, for the first time, a Starship goes to Mars, presumably without people, but just equipment. Two, with people. Three, there ' s sort of, OK, 100 people at a time, let ' s go. EM : Sure. And just to put the cost thing into perspective, the expected cost of Starship, putting 100 tons into orbit, is significantly less than what it would have cost or what it did cost to put our tiny Falcon 1 rocket into orbit. Just as the cost of flying a 747 around the world is less than the cost of a small airplane. You know, a small airplane that was thrown away. So it ' s really pretty mind-boggling that the giant thing costs less, way less than the small thing. So it doesn ' t use exotic propellants or things that are difficult to obtain on Mars. It uses methane as fuel, and it ' s primarily oxygen, roughly 77-78 percent oxygen by weight. And Mars has a CO_2 atmosphere and has water ice, which is CO_2 plus H_2O, so you can make CH_4, methane, and O_2, oxygen, on Mars. CA : Presumably, one of the first tasks on Mars will be to create a fuel plant that can create the fuel for the return trips of many Starships. EM : Yes. And actually, it ' s mostly going to be oxygen plants, because it ' s 78 percent oxygen, 22 percent fuel. But the fuel is a simple fuel that is easy to create on Mars. And in many other parts of the solar system. So basically... And it ' s all propulsive landing, no parachutes, nothing thrown away. It has a heat shield that ' s capable of entering on Earth or Mars. We can even potentially go to Venus. but you don ' t want to go there. Venus is hell, almost literally. But you could... It ' s a generalized method of transport to anywhere in the solar system, because the point at which you have propellant depo on Mars, you can then travel to the asteroid belt and to the moons of Jupiter and Saturn and ultimately anywhere in the solar system. CA : But your main focus and SpaceX ' s main focus is still Mars. That is the **mission**. That is where most of the effort will go? Or are you actually imagining a much broader array of uses even in the coming, you know, the first decade or so of uses of this. Where we could go, for example, to other places in the solar system to explore, perhaps NASA wants to use the rocket for that reason. EM : Yeah, NASA is planning to use a Starship to return to the moon, to return people to the moon. And so we ' re very honored that NASA has chosen us to do this. But I ' m saying it is a generalized – it ' s a general solution to getting anywhere in the greater solar system. It ' s not suitable for going to another star system, but it is a general solution for transport anywhere in the solar system. CA : Before it can do any of that, it ' s got to demonstrate it can get into orbit, you know, around Earth. What ' s your latest advice on the timeline for that? EM : It ' s looking promising for us to have an orbital launch attempt in a few months. So we ' re actually integrating – will be integrating the engines into the booster for the first orbital flight starting in about a week or two. And the launch complex itself is ready to go. So assuming we get regulatory approval, I think we could have an orbital launch attempt within a few months. CA : And a radical new technology like this presumably there is real risk on those early attempts. EM : Oh, 100 percent, yeah. The joke I make all the time is that excitement is guaranteed. Success is not guaranteed, but excitement certainly is. CA : But the last I saw on your timeline, you ' ve slightly put back the expected date to put the first human on Mars till 2029, I want to say? EM : Yeah, I mean, so let ' s see. I mean, we have built a production system for Starship, so we ' re making a lot of ships and boosters. CA : How many are you planning to make actually? EM : Well, we ' re currently expecting to make a booster and a ship roughly every, well, initially, roughly every couple of months, and then hopefully by the end of this year, one every month. So it ' s giant rockets, and a lot of them. Just talking in terms of rough orders of magnitude, in order to create a self-sustaining city on Mars, I think you will need something on the order of a thousand ships. And we just need a Helen of Sparta, I guess, on Mars. CA : This is not in most people ' s heads, Elon. EM : The planet that launched 1, 000 ships. CA : That ' s nice. But this is not in most people ' s heads, this picture that you have in your mind. There ' s basically a two-year window, you can only really fly to Mars conveniently every two years. You were picturing that during the 2030s, every couple of years, something like 1, 000 Starships take off, each containing 100 or more people. That picture is just completely mind-blowing to me. That sense of this armada of humans going to – EM : It ' ll be like"Battlestar Galactica,"the fleet departs. CA : And you think that it can basically be funded by people spending maybe a couple hundred grand on a ticket to Mars? Is that price about where it has been? EM : Well, I think if you say like, what ' s required in order to get enough people and enough cargo to Mars to build a self-sustaining city. And it ' s where you have an intersection of sets of people who want to go, because I think only a small percentage of humanity will want to go, and can afford to go or get sponsorship in some manner. That intersection of sets, I think, needs to be a million people or something like that. And so it ' s what can a million people afford, or get sponsorship for, because I think governments will also pay for it, and people can take out loans. But I think at the point at which you say, OK, like, if moving to Mars costs are, for argument ' s sake, $100, 000, then I think you know, almost anyone can work and save up and eventually have $100, 000 and be able to go to Mars if they want. We want to make it available to anyone who wants to go. It ' s very important to emphasize that Mars, especially in the beginning, will not be luxurious. It will be dangerous, cramped, difficult, hard work. It ' s kind of like that Shackleton **ad** for going to the Antarctic, which I think is actually not real, but it sounds real and it ' s cool. It ' s sort of like, the sales pitch for going to Mars is,"It ' s dangerous, it ' s cramped. You might not make it back. It ' s difficult, it ' s hard work."That ' s the sales pitch. CA : Right. But you will make history. EM : But it ' ll be glorious. CA : So on that kind of launch rate you ' re talking about over two decades, you could get your million people to Mars, essentially. Whose city is it? Is it NASA ' s city, is it SpaceX ' s city? EM : It ' s the people of Mars ' city. The reason for this, I mean, I feel like why do this thing? I think this is important for **maximizing** the probable lifespan of humanity or consciousness. Human civilization could come to an end for external reasons, like a giant meteor or **super** volcanoes or extreme climate change. Or World War III, or you know, any one of a number of reasons. But the probable life span of civilizational consciousness as we know it, which we should really view as this very delicate thing, like a small candle in a vast darkness. That is what appears to be the case. We ' re in this vast darkness of space, and there ' s this little candle of consciousness that ' s only really come about after 4. 5 billion years, and it could just go out. CA : I think that ' s powerful, and I think a lot of people will be inspired by that vision. And the reason you need the million people is because there has to be enough people there to do everything that you need to survive. EM : Really, like the critical threshold is if the ships from Earth stop coming for any reason, does the Mars City die out or not? And so we have to – You know, people talk about like, the sort of, the great filters, the things that perhaps, you know, we talk about the Fermi paradox, and where are the aliens? Well maybe there are these various great filters that the aliens didn ' t pass, and so they eventually just ceased to exist. And one of the great filters is becoming a multi-planet species. So we want to pass that filter. And I ' ll be long-dead before this is, you know, a real thing, before it happens. But I ' d like to at least see us make great progress in this direction. CA : Given how tortured the Earth is right now, how much we ' re beating each other up, shouldn ' t there be discussions going on with everyone who is dreaming about Mars to try to say, we ' ve got a once in a civilization ' s chance to make some new rules here? Should someone be trying to lead those discussions to figure out what it means for this to be the people of Mars ' City? EM : Well, I think ultimately this will be up to the people of Mars to decide how they want to **rethink** society. Yeah there ' s certainly risk there. And hopefully the people of Mars will be more enlightened and will not fight amongst each other too much. I mean, I have some recommendations, which people of Mars may choose to listen to or not. I would advocate for more of a direct democracy, not a representative democracy, and laws that are short enough for people to understand. Where it is harder to create laws than to get rid of them. CA : Coming back a bit nearer term, I ' d love you to just talk a bit about some of the other possibility space that Starship seems to have created. So given – Suddenly we ' ve got this ability to move 100 tons-plus into orbit. So we ' ve just launched the James Webb telescope, which is an incredible thing. It ' s unbelievable. EM : Exquisite piece of technology. CA : Exquisite piece of technology. But people spent two years trying to figure out how to fold up this thing. It ' s a three-ton telescope. EM : We can make it a lot easier if you ' ve got more volume and mass. CA : But let ' s ask a different question. Which is, how much more powerful a telescope could someone design based on using Starship, for example? EM : I mean, roughly, I ' d say it ' s probably an order of magnitude more resolution. If you ' ve got 100 tons and a thousand cubic meters volume, which is roughly what we have. CA : And what about other exploration through the solar system? I mean, I ' m you know – EM : Europa is a big question mark. CA : Right, so there ' s an ocean there. And what you really want to do is to drop a submarine into that ocean. EM : Maybe there ' s like, some squid civilization, cephalopod civilization under the ice of Europa. That would be pretty interesting. CA : I mean, Elon, if you could take a submarine to Europa and we see pictures of this thing being devoured by a squid, that would honestly be the happiest moment of my life. EM : Pretty wild, yeah. CA : What other possibilities are out there? Like, it feels like if you ' re going to create a thousand of these things, they can only fly to Mars every two years. What are they doing the rest of the time? It feels like there ' s this explosion of possibility that I don ' t think people are really thinking about. EM : I don ' t know, we ' ve certainly got a long way to go. As you alluded to earlier, we still have to get to orbit. And then after we get to orbit, we have to really prove out and refine full and rapid reusability. That ' ll take a moment. But I do think we will solve this. I ' m highly confident we will solve this at this point. CA : Do you ever wake up with the fear that there ' s going to be this Hindenburg moment for SpaceX where... EM : We ' ve had many Hindenburg. Well, we ' ve never had Hindenburg moments with people, which is very important. Big difference. We ' ve blown up quite a few rockets. So there ' s a whole compilation online that we put together and others put together, it ' s showing rockets are hard. I mean, the sheer amount of energy going through a rocket boggles the mind. So, you know, getting out of Earth ' s gravity well is difficult. We have a strong gravity and a thick atmosphere. And Mars, which is less than 40 percent, it ' s like, 37 percent of Earth ' s gravity and has a thin atmosphere. The ship alone can go all the way from the surface of Mars to the surface of Earth. Whereas getting to Mars requires a giant booster and orbital refilling. CA : So, Elon, as I think more about this incredible array of things that you ' re involved with, I keep seeing these synergies, to use a horrible word, between them. You know, for example, the robots you ' re building from Tesla could possibly be pretty handy on Mars, doing some of the dangerous work and so forth. I mean, maybe there ' s a scenario where your city on Mars doesn ' t need a million people, it needs half a million people and half a million robots. And that ' s a possibility. Maybe The Boring Company could play a role helping create some of the subterranean dwelling spaces that you might need. EM : Yeah. CA : Back on planet Earth, it seems like a partnership between Boring Company and Tesla could offer an unbelievable deal to a city to say, we will create for you a 3D network of tunnels populated by robo-taxis that will offer fast, low-cost transport to anyone. You know, full self-driving may or may not be done this year. And in some cities, like, somewhere like Mumbai, I suspect won ' t be done for a decade. EM : Some places are more challenging than others. CA : But today, today, with what you ' ve got, you could put a 3D network of tunnels under there. EM : Oh, if it ' s just in a tunnel, that ' s a solved problem. CA : Exactly, full self-driving is a solved problem. To me, there ' s amazing synergy there. With Starship, you know, Gwynne Shotwell talked about by 2028 having from city to city, you know, transport on planet Earth. EM : This is a real possibility. The fastest way to get from one place to another, if it ' s a long distance, is a rocket. It ' s basically an ICBM. CA : But it has to land – Because it ' s an ICBM, it has to land probably offshore, because it ' s loud. So why not have a tunnel that then connects to the city with Tesla? And Neuralink. I mean, if you going to go to Mars having a telepathic connection with loved ones back home, even if there ' s a time delay... EM : These are not intended to be connected, by the way. But there certainly could be some synergies, yeah. CA : Surely there is a growing argument that you should actually put all these things together into one company and just have a company devoted to creating a future that ' s exciting, and let a thousand flowers bloom. Have you been thinking about that? EM : I mean, it is tricky because Tesla is a publicly-traded company, and the investor base of Tesla and SpaceX and certainly Boring Company and Neuralink are quite different. Boring Company and Neuralink are tiny companies. CA : By comparison. EM : Yeah, Tesla ' s got 110, 000 people. SpaceX I think is around 12, 000 people. Boring Company and Neuralink are both under 200 people. So they ' re little, tiny companies, but they will probably get bigger in the future. They will get bigger in the future. It ' s not that easy to sort of combine these things. CA : Traditionally, you have said that for SpaceX especially, you wouldn ' t want it public, because public investors wouldn ' t support the craziness of the idea of going to Mars or whatever. EM : Yeah, making life multi-planetary is outside of the normal time horizon of Wall Street analysts. To say the least. CA : I think something ' s changed, though. What ' s changed is that Tesla is now so powerful and so big and throws off so much cash that you actually could connect the dots here. Just tell the public that x-billion dollars a year, whatever your number is, will be diverted to the Mars **mission**. I suspect you ' d have massive interest in that company. And it might unlock a lot more possibility for you, no? EM : I would like to give the public access to **ownership** of SpaceX, but I mean the thing that like, the overhead associated with a public company is high. I mean, as a public company, you ' re just constantly sued. It does occupy like, a fair bit of... You know, time and effort to deal with these things. CA : But you would still only have one public company, it would be bigger, and have more things going on. But instead of being on four boards, you ’ d be on one. EM : I ’ m actually not even on the Neuralink or Boring Company boards. And I don ’ t really attend the SpaceX board meetings. We only have two a year, and I just stop by and chat for an hour. The board overhead for a public company is much higher. CA : I think some investors probably worry about how your time is being split, and they might be excited by you know, that. Anyway, I just woke up the other day thinking, just, there are so many ways in which these things connect. And you know, just the simplicity of that **mission**, of building a future that is worth getting excited about, might appeal to an awful lot of people. Elon, you are reported by Forbes and everyone else as now, you know, the world ’ s richest person. EM : That ’ s not a sovereign. CA : EM : You know, I think it ’ s fair to say that if somebody is like, the king or de facto king of a country, they ’ re wealthier than I am. CA : But it ’ s just harder to measure – So $300 billion. I mean, your net worth on any given day is rising or falling by several billion dollars. How insane is that? EM : It ’ s bonkers, yeah. CA : I mean, how do you handle that psychologically? There aren ’ t many people in the world who have to even think about that. EM : I actually don ’ t think about that too much. But the thing that is actually more difficult and that does make sleeping difficult is that, you know, every good hour or even minute of thinking about Tesla and SpaceX has such a big effect on the company that I really try to work as much as possible, you know, to the edge of sanity, basically. Because you know, Tesla ’ s getting to the point where probably will get to the point later this year, where every high-quality minute of thinking is a million dollars impact on Tesla. Which is insane. I mean, the basic, you know, if Tesla is doing, you know, sort of $2 billion a week, let ’ s say, in revenue, it ’ s sort of $300 million a day, seven days a week. You know, it ’ s... CA : If you can change that by five percent in an hour ’ s brainstorm, that ’ s a pretty valuable hour. EM : I mean, there are many instances where a half-hour meeting, I was able to improve the **financial** outcome of the company by $100 million in a half-hour meeting. CA : There are many other people out there who can ’ t stand this world of billionaires. Like, they are hugely offended by the notion that an individual can have the same wealth as, say, a billion or more of the world ’ s poorest people. EM : If they examine sort of – I think there ’ s some axiomatic flaws that are leading them to that conclusion. For sure, it would be very problematic if I was consuming, you know, billions of dollars a year in personal consumption. But that is not the case. In fact, I don ’ t even own a home right now. I ’ m literally staying at friends ’ places. If I travel to the Bay Area, which is where most of Tesla engineering is, I basically rotate through friends ’ spare bedrooms. I don ’ t have a yacht, I really don ’ t take **vacations**. It ’ s not as though my personal consumption is high. I mean, the one exception is a plane. But if I don ’ t use the plane, then I have less hours to work. CA : I mean, I personally think you have shown that you are mostly driven by really quite a deep sense of moral purpose. Like, your attempts to solve the climate problem have been as powerful as anyone else on the planet that I ’ m aware of. And I actually can ’ t understand, personally, I can ’ t understand the fact that you get all this criticism from the Left about,”Oh, my God, he ’ s so rich, that ’ s disgusting.”When climate is their issue. Philanthropy is a topic that some people go to. Philanthropy is a hard topic. How do you think about that? EM : I think if you care about the reality of goodness instead of the perception of it, philanthropy is extremely difficult. SpaceX, Tesla, Neuralink and The Boring Company are philanthropy. If you say philanthropy is love of humanity, they are philanthropy. Tesla is accelerating sustainable energy. This is a love – philanthropy. SpaceX is trying to ensure the long-term survival of humanity with a multiple-planet species. That is love of humanity. You know, Neuralink is trying to help solve brain injuries and existential risk with AI. Love of humanity. Boring Company is trying to solve traffic, which is hell for most people, and that also is love of humanity. CA : How upsetting is it to you to hear this constant drumbeat of,"Billionaires, my God, Elon Musk, oh, my God?"Like, do you just shrug that off or does it does it actually hurt? EM : I mean, at this point, it ' s water off a duck ' s back. CA : Elon, I ' d like to, as we wrap up now, just pull the camera back and just think... You ' re a father now of seven surviving kids. EM : Well, I mean, I ' m trying to set a good example because the birthrate on Earth is so low that we ' re facing civilizational collapse unless the birth rate returns to a sustainable level. CA : Yeah, you ' ve talked about this a lot, that depopulation is a big problem, and people don ' t understand how big a problem it is. EM : Population collapse is one of the biggest threats to the future of human civilization. And that is what is going on right now. CA : What drives you on a day-to-day basis to do what you do? EM : I guess, like, I really want to make sure that there is a good future for humanity and that we ' re on a path to understanding the nature of the universe, the meaning of life. Why are we here, how did we get here? And in order to understand the nature of the universe and all these fundamental questions, we must expand the scope and scale of consciousness. Certainly it must not diminish or go out. Or we certainly won ' t understand this. I would say I ' ve been motivated by curiosity more than anything, and just desire to think about the future and not be sad, you know? CA : And are you? Are you not sad? EM : I ' m sometimes sad, but mostly I ' m feeling I guess relatively optimistic about the future these days. There are certainly some big risks that humanity faces. I think the population collapse is a really big deal, that I wish more people would think about because the birth rate is far below what ' s needed to sustain civilization at its current level. And there ' s obviously... We need to take **action** on climate sustainability, which is being done. And we need to secure the future of consciousness by being a multi-planet species. We need to address – Essentially, it ' s important to take whatever **actions** we can think of to address the existential risks that affect the future of consciousness. CA : There ' s a whole generation coming through who seem really sad about the future. What would you say to them? EM : Well, I think if you want the future to be good, you must make it so. Take **action** to make it good. And it will be. CA : Elon, thank you for all this time. That is a beautiful place to end. Thanks for all you ' re doing. EM : You ' re welcome.

Chris Anderson : I want you to come with me to Tesla ' s huge gigafactory in Austin, Texas. So the day before it opened last week, the evening before, I was allowed to walk around it, no one else there. And what I saw there was, honestly, pretty mind-blowing. This is Elon Musk ' s famous machine that builds the machine, and in his view, the secret to a sustainable future, is not just making electric car. It ' s making a system that churns out huge numbers of electric cars with a margin, so that they can fund further growth. When I was there, none of us knew whether Elon would actually be able to make it here today, so I took the chance to sit down with him and record an epic interview. And I just want to show you an eight-minute excerpt of that interview. So here from Austin, Texas, Elon Musk. I want us to switch now to think a bit about artificial intelligence. I ' m curious about your timelines and how you predict and how come some things are so amazingly on the money and some aren ' t. So when it comes to predicting sales of Tesla vehicles, for example, you ' ve kind of been amazing. I think in 2014 when Tesla had sold that year 60, 000 cars, you said,”2020, I think we will do half a million a year.”Elon Musk : Yeah, we did almost exactly a half million. CA : Five years ago, last time you came to TED, I asked you about full self-driving, and you said,”Yeah, this very year I ’ m confident that we will have a car going from LA to New York without any intervention.”EM : Yeah, I don ’ t want to blow your mind, but I ’ m not always right. CA : What ’ s the difference between those two? Why has full self-driving in particular been so hard to predict? EM : I mean, the thing that really got me, and I think it ’ s going to get a lot of other people, is that there are just so many false dawns with self-driving where you think you ’ ve got the problem, have a handle on the problem, and then it, no, turns out you just hit a ceiling. Because if you were to plot the progress, the progress looks like a log curve. So it ’ s like a series of log curves. So most people don ’ t know what a log curve is, I suppose. CA : Show the shape with your hands. EM : It goes up, you know, sort of a fairly straight way, and then it starts tailing off and you start getting diminishing returns. You know, in retrospect, they seem obvious, but in order to solve full self-driving properly, you actually have to solve real-world AI. Because what are the road networks designed to work with? They ’ re designed to work with a biological neural net, our brains, and with vision, our eyes. And so in order to make it work with computers, you basically need to solve real-world AI and vision. Because we need cameras and **silicon** neural nets in order to have self-driving work for a system that was designed for eyes and biological neural nets. You know, I guess when you put it that way, it ’ s sort of, like, quite obvious that the only way to solve full self-driving is to solve real-world AI and sophisticated vision. CA : What do you feel about the current architecture? Do you think you have an architecture now where there is a chance for the logarithmic curve not to tail off anytime soon? EM : Well I mean, admittedly these maybe infamous last words, but I actually am confident that we will solve it this year. That we will exceed – The probability of an accident, at what point do you exceed that of the average person? I think we will exceed that this year. We could be here talking again in a year, like, well, another year went by and it didn ’ t happen. But I think this is the year. CA : Is there an element that you actually deliberately make aggressive prediction timelines to drive people to be ambitious? Without that, nothing gets done? So it feels like at some point in the last year, seeing the progress on understanding that the Tesla AI understanding the world around it, led to a kind of, an aha moment at Tesla. Because you really surprised people recently when you said probably the most important product development going on at Tesla this year is this robot, Optimus. Is it something that happened in the development of full self-driving that gave you the confidence to say,”You know what, we could do something **special** here.”EM : Yeah, exactly. So, you know, it took me a while to sort of realize that in order to solve self-driving, you really needed to solve real-world AI. And at the point of which you solve real-world AI for a car, which is really a robot on four wheels, you can then generalize that to a robot on legs as well. The things that are currently missing are enough intelligence for the robot to **navigate** the real world and do useful things without being explicitly instructed. So the missing things are basically real-world intelligence and scaling up manufacturing. Those are two things that Tesla is very good at. And so then we basically just need to design the specialized actuators and sensors that are needed for a humanoid robot. People have no idea, this is going to be bigger than the car. CA : So talk about – I think the first applications you ’ ve mentioned are probably going to be in manufacturing, but eventually, the vision is to have these available for people at home. If you had a robot that really understood the 3D architecture of your house and knew where every object in that house was or was supposed to be and could recognize all those objects, I mean, that ’ s kind of amazing, isn ’ t it, like, the kind of thing that you could ask a robot to do would be what? Like, tidy up? EM : Yeah, absolutely. Make dinner, I guess, mow the lawn. CA : Take a cup of tea to grandma and show her family pictures. EM : Exactly. Take care of my grandmother and make sure – CA : It could obviously recognize everyone in the home. It could play catch with your kids. EM : Yes. I mean, obviously, we need to be careful this doesn ' t become a dystopian situation. I think one of the things that ' s going to be important is to have a localized ROM chip on the robot that cannot be updated over the air. Where if you, for example, were to say,"Stop, stop, stop,"if anyone said that, then the robot would stop, you know, type of thing. And that ' s not updatable remotely. I think it ' s going to be important to have safety features like that. CA : Yeah, that sounds wise. EM : And I do think there should be a regulatory agency for AI. I ' ve said this for many years. I don ' t love being regulated, but I think this is an important thing for public safety. CA : Do you think there will be basically like in, say, 2050 or whatever, like, a robot in most homes, is what there will be, and people will love them and count on them? You ' ll have your own butler basically. EM : Yeah, you ' ll have your sort of buddy robot probably, yeah. CA : I mean, how much of a buddy? How many applications have you thought, you know, can you have a romantic partner, a sex partner? EM : It ' s probably inevitable. I mean, I did promise the internet that I ' d make catgirls. We could make a robot catgirl. CA : Be careful what you promise the internet. EM : So, yeah, I guess it ' ll be whatever people want really, you know. CA : What sort of timeline should we be thinking about of the first models that are actually made and sold? EM : Well, you know, the first units that we intend to make are for jobs that are dangerous, boring, repetitive and things that people don ' t want to do. And, you know, I think we ' ll have like, an interesting prototype some time this year. We might have something useful next year, but I think quite likely within at least two years. And then we ' ll see rapid growth year over year of the usefulness of the humanoid robots and decrease in cost and scaling up production. CA : Help me on the economics of this. So what do you picture the cost of one of these being? EM : Well, I think the cost is actually not going to be crazy high. Like, less than a car. CA : But think about the economics of this. If you can replace a 30, 000-dollar, 40, 000-dollar-a-year worker, which you have to pay every year, with a one-time payment of 25, 000 dollars for a robot that can work longer hours, doesn ' t go an **vacation**, it could be a pretty rapid replacement of certain types of jobs. How worried should the world be about that? EM : I wouldn ' t worry about the sort of, putting people out of a job thing. I think we ' re actually going to have, and already do have, a massive shortage of labor. So I think we will have... Not people out of work, but actually still a shortage of labor even in the future. But this really will be a world of abundance. Any goods and **services** will be available to anyone who wants them. It ' ll be so cheap to have goods and **services**, it will be ridiculous. CA : And now, arguably, the biggest visionary of them all, Elon Musk. Hey, Elon, welcome. So, Elon, a few hours ago, you made an offer to buy Twitter. Why? EM : How ' d you know? CA : A little bird **tweeted** in my ear or something, I don ' t know. EM : By the way, have you seen the movie"Ted,"about the bear? CA : I have. EM : It ' s a good movie. CA : Don ' t mention that here. EM : So, yeah, yeah, so... Was there a question? CA : Why make that offer? EM : Oh, so, well, I think it ' s very important for there to be an inclusive arena for free speech where all... Twitter has become, kind of, the de facto town square. It ' s just really important that people have both the reality and the perception that they are able to speak freely within the bounds of the law. And, you know, one of the things that I believe Twitter should do is open-source the algorithm and make any changes to people ' s **tweets**, or if they ' re emphasized or de-emphasized, that **action** should be made apparent so anyone can see that **action** has been taken. So there ' s no, sort of, behind the scenes manipulation, either algorithmically or manually. CA : Last week when we spoke, Elon, I asked you whether you were thinking of taking over. You said, no way. You said,"I do not want to own Twitter. It is a recipe for misery. Everyone will blame me for everything."What on Earth changed? EM : No I think everyone will still blame me for everything. If I acquire Twitter and something goes wrong, it ' s my fault, 100 percent. I think there will be quite a few arrows, yes. CA : It will be miserable. But you still want to do it. Why? EM : I mean, I hope it ' s not too miserable. I just think it ' s important to the... It ' s important to the function of democracy. It ' s important to the function of the United States as a free country and many other countries. And to actually help freedom in the world, more broadly than the US. And so I think it ' s, you know, I think the civilizational risk is decreased the more we can increase the trust of Twitter as a public **platform**. And so I do think this will be somewhat painful. And I ' m not sure that I will actually be able to acquire it. And I should also say the intent is to retain as many shareholders as is allowed by the law in a private company, which I think is around 2, 000 or so. So it ' s definitely not, from the standpoint of,"Let me figure out how to monopolize or **maximize** my **ownership** of Twitter."But I will try to bring along as many shareholders as we ' re allowed to. CA : You don ' t necessarily want to pay out 40 or whatever it is, billion dollars in cash. You ' d like them to come with you in the new company. EM : I mean, you know, I could technically afford it. CA : I heard that. EM : But what I ' m saying is, this is not a way to, sort of, make money, you know. It ' s just that I think this is... My strong intuitive sense is that having a public **platform** that is maximally trusted and broadly inclusive is extremely important to the future of civilization. CA : But you ' ve described yourself – EM : I don ' t care about the economics at all. CA : OK, that ' s cool to hear. This is not about the economics. It ' s for the moral good that you think it will achieve. You ' ve described yourself, Elon, as a"free speech absolutist."But does that mean that there ' s literally nothing that people can ' t say, and it ' s OK? EM : Well, I think, obviously, Twitter or any forum is bound by the laws of the country that it operates in. So obviously, there are some limitations on free speech in the US. And of course, Twitter would have to abide by those rules. CA : So you can ' t incite people to violence, like, a direct incitement to violence you know, you can ' t do the equivalent of crying"fire"in a movie theater, for example. EM : No, that would be a crime. It should be a crime. CA : But here ' s the challenge, it ' s such a nuanced difference between different things. So there ' s incitement to violence. That ' s a no if it ' s illegal. There ' s hate speech, which, some forms of hate speech are fine. You know,"I hate spinach."EM : I mean, if it ' s sauteed in, you know, cream sauce, it can be quite nice. CA : But the problem is, so let ' s say someone says – OK, here ' s one **tweet**,"I hate politician X."Next **tweet** is,"I wish politician X wasn ' t alive,"as some of us have said about Putin right now, for example. So that ' s legitimate speech. Another **tweet** is,"I wish politician X wasn ' t alive"with a picture of their head with a gunsight over it. Or that plus their address. I mean, at some point someone has to make a decision as to which of those is not OK. Can an algorithm do that, or surely you need human judgment at some point? EM : No, I think, like I said, in my view, Twitter should match the laws of the country. And really, you know, there ' s an obligation to do that. But going beyond that, and having it be unclear who ' s making what changes to where, having **tweets** sort of, mysteriously be promoted and demoted with no insight into what ' s going on, having a black-box algorithm promote some things and not other things, I think this can be quite dangerous. CA : So, the idea of opening the algorithm is a huge deal, and I think many people would welcome that of understanding exactly how it ’ s making the decision. EM : And critique it, like, what I mean is like, I think the code should be on GitHub, you know. So people can look through it and say, like,”I see a problem here.””I don ’ t agree with this.”They can highlight issues, suggest changes in the same way that you update Linux or Signal or something like that, you know. CA : As I understand it, at some point right now, what the algorithm would do is it would look at, for example, how many people have flagged a **tweet** as obnoxious. And then at some point a human has to look at it and make a decision as to, does this cross the line or not, that the algorithm itself can ’ t, I don ’ t think yet, tell the difference between legal and OK and definitely obnoxious. And so the question is, which humans, you know, make that call? I mean, do you have a picture of that? Right now, Twitter and Facebook and others, you know, they ’ ve hired thousands of people to try to help make wise decisions. And the trouble is that no one can agree on what is wise. How do you solve that? EM : Well I think we would want to err on the side – if in doubt, let the speech exist. If it ’ s, you know, a gray area, I would say let the **tweet** exist. But obviously, you know, in a case where there ’ s perhaps a lot of controversy that you would not want to necessarily promote that **tweet**. So I ’ m not saying that I have all the answers here. But I do think that we want to be just very reluctant to delete things and just be very cautious with permanent bans. You know, time-outs, I think, are better than, sort of, permanent bans. And... But just in general, like I said... It won ’ t be perfect, but I think we want it to really have the perception and reality that speech is as free as reasonably possible. And a good sign as to whether there ’ s free speech is : is someone you don ’ t like allowed to say something you don ’ t like? And if that is the case, then we have free speech. And it ’ s damn annoying when someone you don ’ t like says something you don ’ t like. That is a sign of a healthy, functioning, free speech situation. CA : I think many people would agree with that. And looking at the reaction online, many people are excited by you coming in and the changes you ’ re proposing. Some others are absolutely horrified. Here ’ s how they would see it. They would say,”Wait a sec. We agree that Twitter is an incredibly important town square. It is where the world exchanges opinion about life and death matters. How on Earth could it be owned by the world ’ s richest person? That can ’ t be right.”So what ’ s the response there? Is there any way that you can distance yourself from the actual decision making that matters on content in some very clear way that is convincing to people? EM : Well, like I said, I think it ’ s very important that the algorithm be open-sourced and that any manual adjustments be identified. So if somebody did something to a **tweet**, there ’ s information attached to it that **action** was taken. And I won ’ t personally be, you know, in there editing **tweets**. But you ’ ll know if something was done to promote, demote or otherwise affect a **tweet**. You know, as for media sort of **ownership**, I mean, you ’ ve got, you know, Mark Zuckerberg owning Facebook and Instagram and WhatsApp and with a share **ownership** structure that will have Mark Zuckerberg XIV still controlling those entities. Like, literally. We won ’ t have that at Twitter. CA : If you commit to opening up the algorithm that definitely gives some level of confidence. Talk about some of the other changes that you ’ ve proposed. The edit button, that ’ s definitely coming if you have your way. EM : Yeah. I think, I mean, frankly... The top priority I would have is eliminating the spam and scam bots and the bot armies that are on Twitter. You know, I think these influence – they make the product much worse. You know, if I had a Dogecoin for every crypto scam I saw. I would have 100 billion Dogecoin. CA : Do you regret sparking a sort of, storm of excitement over DOGE and, you know, where it ’ s gone? EM : I mean, I think DOGE is fun. And, you know, I ’ ve always said don ’ t bet the farm on Dogecoin, FYI. But I think it ’ s, I like dogs and I like memes, and it ' s got both of those. CA : But just on the edit button, how do you get around the problem of, so someone **tweets**,"Elon rocks"and it ' s **tweeted** by two million people. And then after that, they edit it"Elon sucks,"and then all those retweets they ' re all embarrassed. How do you avoid that type of changing of meaning so that retweeters are exploited? EM : Well, I think you ' d only have the edit capability for a short period of time. And probably the thing to do upon the edit would be to zero out all retweets and favorites. CA : OK. EM : I ' m open to ideas though, you know. CA : So in one way, the algorithm works kind of well for you right now, I wanted to show you this. This is a typical **tweet** of mine, kind of lame and wordy and whatever. And the amazing response it gets is this, oh, my God, 97 likes. And then I tried another one. [I get to interview @elonmusk on Thursday here at TED. What questions would YOU ask him?] 29, 000 likes. So the algorithm, at least seems to be, at the moment, you know :"If, expand to the world immediately."Not bad, right? EM : Yeah, I guess so, I mean, that is cool. CA : So help us understand how it is you ' ve built this incredible following on Twitter yourself when some of the people who love you the most look at some of what you **tweet** and they think it ' s somewhere between embarrassing and crazy, some of it ' s amazing. EM : It is a little... CA : But is that actually why it ' s worked, why has it worked? EM : I mean, I don ' t know. I ' m **tweeting** more or less stream of consciousness, you know. It ' s not like, let me think about some grand plan about my Twitter or whatever. You know, I ' m, like, literally, on the toilet or something, like,"Ha ha, this is funny."And then **tweet** that out. That ' s like most of them. That ' s, you know, oversharing. CA : But you are obsessed with getting the most out of every minute of your day. And so why not? EM : So, I don ' t know. I try to **tweet** out things that are interesting or funny. And then people seem to like it. CA : So if you are unsuccessful – actually, before I ask that, let me ask this. So how can I say, is funding secured? EM : I have sufficient assets to complete... This is not a forward-looking statement, blah blah blah. I mean, I can do it if possible. I should say, actually even originally with Tesla back in the day, funding was actually secured. I want to be clear about that. In fact, this may be a good opportunity to clarify that. Funding was indeed secured, and I should say, like, why do I not have respect for the SEC in that situation? And I don ' t mean to blame everyone at the SEC, but certainly the San Francisco office, it ' s because the SEC knew that funding was secured, but they pursued an active public investigation nonetheless. At the time, Tesla was in a precarious **financial** situation, and I was told by the banks that if I did not agree to settle with the SEC that the banks would cease providing working capital and Tesla would go bankrupt immediately. So that ' s like having a gun to your child ' s head. So I was forced to concede to the SEC unlawfully. Those bastards. And now it makes it look like I lied when I did not, in fact, lie. I was forced to admit that I lied to save Tesla ' s life. And that ' s the only reason. CA : Given what ' s actually happened – Given what ' s actually happened to Tesla since then, though, aren ' t you glad that you didn ' t take it private? EM : Yeah. I mean... It ' s difficult to put yourself in the position at the time, Tesla was under the most relentless short seller attack in the history of the stock market. There ' s something called"short and distort,"where the barrage of negativity that Tesla was experiencing from short sellers on Wall Street was beyond all belief. Tesla was the most shorted stock in the history of stock markets. This is saying something. So, you know, this was affecting our ability to hire people, it was affecting our ability to sell cars, it was... Yeah, it was terrible. They wanted Tesla to die so bad, they could taste it. CA : Well, most of them have paid the price. EM : Yes. Where are they now? CA : So that was a very strong statement. Obviously, a lot of people who support you, I would ' ve thought, would say, you have so much to offer the world on the upside, on the vision side, don ’ t waste your time getting distracted by these battles that bring out negativity and make people feel that you ’ re being defensive. People don ’ t like fights, especially with powerful government authorities. They ’ d rather buy into your dream. Aren ’ t you encouraged by people just to edit that temptation out and go with the bigger story? EM : Well, I mean, I would say, like, you know, I ’ m somewhat of a mixed bag, you know. CA : Well, you ’ re a fighter and you don ’ t... You don ’ t like to lose and you are determined that you don ’ t. Basically, I mean. EM : Sure I don ’ t like to lose, I ’ m not sure many people do. But the truth matters to me a lot. Sort of, pathologically, it matters to me. CA : OK. So you don ’ t like to lose, if in this case you are not successful in, you know, the board does not accept your offer, you ’ ve said you won ’ t go higher. Is there a plan B? EM : There is. CA : I think we would like to hear a little bit about plan B. EM : For another time, I think. CA : Another time, alright. I... That ’ s a nice tease. Alright. I would love to try to understand this brain of yours more, Elon. With your permission, I ’ d like to just play this. Oh, actually, before we do that, here was one of the thousands of questions that people asked. I thought this was actually quite a good one.”If you could go back in time and change one decision you made along the way”– do your own edit button –”which one would it be and why?”EM : Do you mean like a career decision or something? CA : Just any decision over the last few years, like your decision to invest in Twitter in the first place or your... Anything. EM : I mean, the worst business decision I ever made was not starting Tesla with just JB Straubel. By far the worst decision I ’ ve ever made is not just starting Tesla with JB. That ’ s number one by far. CA : Alright, so JB Straubel was the visionary cofounder who was obsessed with and knew so much about batteries. And your decision to go with Tesla, the company as it was, meant that you got locked into what you concluded was a weird architecture now. EM : There ’ s a lot of confusion. Tesla did not exist in any... Tesla was a shell company with no employees, no intellectual property, when I invested. But a false narrative has been created by one of the other cofounders, Martin Eberhard. And I don ’ t want to get into the nastiness here, but I didn ’ t invest in an existing company. We created a company. And ultimately, the creation of that company was done by JB and me. And unfortunately, there ’ s someone else, another cofounder who has made it his life ’ s **mission** to make it sound like he created the company, which is false. CA : Wasn ’ t there another issue right at the heart of the development of the Tesla Model 3, where Tesla almost went bankrupt? And I think you have said that part of the reason for that was that you overestimated the extent to which it was possible, at that time, to automate a factory. Huge amount was spent kind of over-automating, and it didn ’ t work, and it nearly took the company down. Is that fair? EM : I mean, first of all, it ’ s important to understand, like, what has Tesla actually accomplished that is most noteworthy. It is not the creation of an electric vehicle or creating an electric vehicle prototype or low-volume production of a car. There have been hundreds of car **start-ups** over the years, hundreds. And in fact, at one point, Bloomberg counted up the number of electric vehicle **start-ups**, and I think they got to almost 500. So the hard part is not creating a prototype or going into limited production. The absolutely difficult thing, which has not been accomplished by an American car company in 100 years, is reaching volume production without going bankrupt. That is the actual hard thing. The last company, American company, to reach volume production without going bankrupt, was Chrysler in the ’ 20s. CA : And it nearly happened to Tesla. EM : Yes, but it ’ s not like, oh, geez, I guess if we ’ d just done more manual stuff, things would have been fine. Of course not. That is definitely not the case. So we basically messed up almost every aspect of the Model 3 production line, from cells to packs to drive inverters, motors, body line, the paint shop, final assembly, everything. Everything was messed up. I lived in the Fremont and Nevada factories for three years, fixing that production line, running around like a maniac through every part of that factory. Living with the team. I slept on the floor, so the team, who was going through a hard time, could see me on the floor. That they knew that I was not in some ivory tower. When whatever pain they experienced, I had it more. CA : And some people who knew you well actually thought you were making a terrible mistake, that you were driving yourself to the edge of sanity, almost. And that you were in danger of making bad choices. And in fact, I heard you say last week, Elon, that you, because of Tesla ' s huge value now and, you know, the significance of every minute that you spend, that you are in danger of sort of, obsessing over it, spending all this time to the edge of sanity. That doesn ' t sound **super** wise. Isn ' t there... Your time, your completely sane, centered, rested time and decision making is more powerful and compelling than that sort of,"I can barely hold my eyes open."So surely it should be an absolute strategic priority to look after yourself. EM : I mean, there wasn ' t any other way to make it work. They were three years of hell. 2017, 2018 and 2019 were the longest period of excruciating pain in my life. There wasn ' t any other way, and we barely made it. And we were on the ragged edge of bankruptcy the entire time. It ' s not like I want the pain, I don ' t like it. Those were three – So, so, so much pain. But it had to be done or Tesla would be dead. CA : When you looked around the Gigafactory that we saw images of earlier last week and just see where the company ' s come, do you feel that this challenge of figuring out the new way of manufacturing, that you actually have an edge now, that it ' s different, that you ' ve figured out how to do this. And that those three years, won ' t be repeated? You ' ve actually figured out a new way of manufacturing. EM : At this point, I think I know more about manufacturing than anyone currently alive on Earth. I can tell you how every damn part of that car is made. It ' s basically if you just live on the factory, you live in the factory for three years and – CA : That was nice. EM : Poignant note to something. CA : Someone wants to compose a symphony to that **expression** of confidence, something like that. I have no idea what that is. EM : Anyway, yeah. Every aspect of a car, six ways to Sunday, I know it. CA : I mean, you talk about scale, right. You ' re in the middle of writing your new master plan, and you ' ve said that scale is at the heart of it. Why does scale matter? Why are you obsessed with it, what are you thinking? EM : Yeah, well, see, in order to accelerate the advent of sustainable energy, there must be scale. Because we ' ve got to transition a vast economy that is currently overly dependent on fossil fuels to a sustainable energy economy. One where the energy is – Yeah, I mean, we ' ve got to do it. So the energy ' s got to be sustainably generated with wind, solar, hydro, geothermal, I ' m a believer in nuclear as Isabelle [Boemeke] gave a talk about. And then since solar and wind is intermittent, you have to have stationary storage batteries, and then we ' ve got to transition all transport to electric. If we do those things, we have a sustainable energy future. The faster we do those things, the less risk we put to the environment. So sooner is better. And so scale is very important. You know, it ' s not about fresh releases. It ' s about tonnage. What was the tonnage of batteries produced and obviously done in a sustainable way? And our estimate is that approximately 300 terawatt hours of battery storage is needed to transition transport, electricity and heating and cooling to a fully electric situation. There may be some different estimates out there, but our estimate is 300 terawatt hours. CA : So we dug into this a lot in the interview that we recorded last week, so people can go in and hear that more. But I mean, the context is, that is, I think about 1, 000 times the current installed battery capacity. I mean, the scale up needed is breathtaking, basically. And... So your vision is to commit Tesla to try to deliver on a meaningful percentage of what is needed. And call on others to do the rest. This is a task for humanity to massively scale up our response to change the energy grid. EM : Yes. It ' s like basically how fast can we scale and encourage others to scale to get to that 300-terawatt-hour installed base of batteries? CA : Right. EM : And then, of course, there ' ll be a tremendous need to recycle those batteries, and it makes sense to recycle them because the raw materials are like high grade ore. People shouldn ' t think there will be this big pile of batteries, they can get recycled, because even a dead battery pack is worth about 1, 000 dollars. But this is what ' s needed for a sustainable energy future. So we ' re going to try to take a set of **actions** that accelerate the day and bring the day of a sustainable energy future sooner. CA : OK. There ' s going to be a huge interest in your master plan when you publish that. Meanwhile, I just would love to understand more what goes on in this brain of yours, because it is a pretty unique one. I want to play, with your permission, this very funny opening from SNL, Saturday Night Live. Thank you. Thank you very much. It ' s an honor to be hosting Saturday Night Live. I mean that. Sometimes after I say something, I have to say,"I mean that."So people really know that I mean it. That ' s because I don ' t always have a lot of intonational variation in how I speak. Which, I ' m told, makes for great comedy. I ' m actually making history tonight as the first person with Asperger ' s to host SNL. CA : And I think you followed that up with – EM : At least the first person to admit it. CA : The first person to admit it. So this was a brave thing to say. But I would love to understand you know, how you think of Asperger ' s, like, whether you can give us any sense of, even you as a boy, what the experience was or as you now understand, with the benefit of hindsight. Can you talk about that a bit? EM : Well, I think everyone ' s experience is going to be somewhat different. But I guess for me, the social cues were not intuitive. So I was just very bookish, and I didn ' t understand... I guess others could sort of, intuitively understand... What was meant by something. I would just tend to take things very literally, like, the words, as spoken, were exactly what they meant. But then that turned out to be wrong. They ' re not simply saying exactly what they mean. There ' s all sorts of other things that are meant. It took me a while to figure that out. I was, you know, bullied quite a lot. So... I did not have a sort of, happy childhood, to be frank. It was quite, quite rough. But I read a lot of books. I read lots and lots of books. And, you know, sort of, gradually understood more from the books that I was reading and watched a lot of movies and... You know, just... But it took me a while to understand things that most people intuitively understand. CA : So I ' ve wondered whether it ' s possible that that was, in a strange way, an incredible gift to you and indirectly to many other people. Inasmuch as... Brain ' s, you know, are plastic. And they go where the **action** is. And if for some reason the external world and social cues, which so many people spend so much time and mental energy obsessing over, if that is partly cut off, isn ' t it possible that that is partly what gave you the ability to understand inwardly the world at a much deeper level than most people do? EM : I suppose that ' s certainly possible. I think there ' s maybe some value also from a technology standpoint, because I found it rewarding to spend all night programming computers just by myself. And I think most people, most people don ' t enjoy typing strange symbols into a computer by themselves all night. They think that ' s not fun. But I thought it was, I really liked it. So I would just program all night by myself. And I found that to be quite enjoyable. But I think that is not normal. CA : I ' ve thought a lot about... It ' s a riddle to a lot of people of how you ' ve done this, how you ' ve repeatedly innovated in these different industries. And you know, every entrepreneur sees possibility in the future and then acts to make that real. It feels to me like you see possibility just more broadly than almost anyone and can connect the dots. So you see scientific possibility based on a deep understanding of physics and knowing what the fundamental equations are, what the technologies are that are based on that science and where they could go, you see technological possibility. And then really unusually, you combine that with economic possibility, of like what it actually would cost, is there a system you can imagine where you could affordably make that thing, and that... sometimes you then get conviction that there is an opportunity here. Put those pieces together and you could do something amazing. EM : Yeah, I think one aspect of whatever condition I had was I was just absolutely obsessed with truth. Just obsessed with truth. And so the obsession with truth is why I studied physics, because physics attempts to understand the truth, the truth of the universe. Physics is just, what are the provable truths of the universe. And truths that have predictive power. So for me, physics was sort of, a very natural thing to study. Nobody made me study it. I was intrinsically interested to understand the nature of the universe. And then computer science or information theory also to just understand logic. And, you know, there ' s an argument that... That information theory is actually operating at a more fundamental level, more fundamental level than even physics. So just yeah... Physics and information theory were really interesting to me. CA : So when you say truth, I mean, like, some people... What you ' re talking about is the truth of the universe. The fundamental truths that drive the universe, it ' s like, a deep curiosity about what this universe is, why we ' re here, simulation, we don ' t have time to go into that. But I mean, you ' re just deeply, deeply curious about, what this is for, what this is, this whole thing. EM : Yes, I think the why of things is very important. When I was in young teens, I got quite depressed about the meaning of life. And I was trying to sort of, understand the meaning of life. I ' m looking at, reading religious texts and reading books on philosophy. And I got into the German philosophers, which is definitely not wise if you ' re a young teenager, I have to say. It can be a bit dark. Much better read as an adult. And then actually, I ended up reading"The Hitchhiker ' s Guide to the Galaxy,"which is actually a book on philosophy just sort of disguised as a silly humor book. But it ' s actually a philosophy book. And Adams makes the point that it ' s actually the question that is harder than the answer. You know, he sort of makes a joke that the answer is 42. That number does pop up a lot. And 420 is just 10 times 42. CA : Ten times more significant than 42. EM : But, you know, you can make a triangle with 42 degrees and two 69s. So there ' s no such thing as a perfect triangle, or is there? CA : But even more important than the answer is the question. That was the whole theme of that book. I mean, is that basically how you see meaning then, that it ' s the pursuit of questions? EM : So I have a sort of, a proposal for a worldview or a motivating philosophy, which is to understand what questions to ask about the answer that is the universe. And to the degree that we expand the scope and scale of consciousness, biological and digital, we will be better able to ask these questions, to frame these questions and to understand why we ' re here, how we got here, what the heck is going on. And so that is my driving philosophy, is to expand the scope and scale of consciousness that we may better understand the nature of the universe. CA : Elon, one of the things that was most touching last week – was seeing you hang out with your kids. Here ' s, if I may... EM : He looks vaguely like a ventriloquist dummy there. I mean, how do you know that ' s real? CA : So that ' s X, and it was just a delight seeing you hang out with him. What ' s his future going to be? I mean, I don ' t mean him personally, but the world he ' s going to grow up in. What future do you believe he will grow up in? EM : Well, I mean, a very digital future. A very different world than I grew up in, that ' s for sure. But I think we want to obviously do our absolute best to ensure that the future is good for everyone ' s children. And that, you know, that the future is something that you can look forward to and not feel sad about. You know, you want to get up in the morning and be excited about the future. And we should fight for the things that make us excited about the future. You know, the future cannot just be about one miserable thing after another, solving one sad problem after another. There have got to be things that get you excited. Like, you want to live. These things are very important. You should have more of it. CA : And it ' s not as if it ' s a done deal, like it ' s all to play for. Like, the future may be horrible. Still, there are scenarios where it is horrible, but you see a pathway to an exciting future both on Earth and on Mars and in our minds through artificial intelligence and so forth. I mean, in your heart of hearts, do you really believe that you are helping deliver that exciting future for X and for others? EM : I mean, I ' m trying my hardest to do so. I, you know, I love humanity, and I think that we should fight for a good future for humanity. And I think we should be optimistic about the future and fight to make that optimistic future happen. CA : Elon, I think that ' s the perfect place to close this. Thank you so much for spending time coming here and for the work that you ' re doing. And good luck with finding a wise course through on Twitter and everything else. EM : Alright, thank you.

Text Sample 194: POS Dim 2 – 2024 – Score 17.00 – 2024/t003164.txt

Chris Anderson : Hello, welcome, TED members. It ' s very, very, very good to see you. I ' m the head of TED, Chris Anderson. I ' m a TED head, apparently, and really excited to be here with you. We ' re actually doing something we haven ' t done before. We are going to watch together a smash hit TED Talk in the presence of the man who gave that talk, Scott Galloway. I ' m going to introduce to you in a minute. While we ' re watching that talk, you can comment away, ask questions, talk with each other, disagree, amplify, laugh, whatever strikes you as the right thing to do. And when the talk is over, we ' ll be putting questions to Scott and seeing how he can possibly defend the outrageous claims that he makes in this talk. This talk is a very big deal. He ' s outlining a giant problem making some big, **bold** solutions on what we might do about it. It ' s a big wow. And it ' s been seen by millions of people already. But we want to dig deeper into these questions. And there couldn ' t be a better group of people to do it than you. So thank you for being part of this. You are awesome. I think, let ' s see, yeah, there ' s a live transcript of this event if you need it by clicking on the captions option. So I think that ' s it. So I would like to welcome the – how do we describe Scott Galloway? Well I mean he ' s a professor at NYU, business professor, he ' s the host of an ungodly number of podcasts. Incredibly successful. He does all kinds of things. He ' s been a successful entrepreneur and general troublemaker, and it ' s a delight to welcome Scott Galloway here. Scott, hello, nice to have you. Scott Galloway : It ' s good to be with you, Chris. Thanks for having me. And hello to all TED acolytes and Members. CA : Alrighty. So I don ' t know if you ' ve ever done this either. I don ' t know whether it ' d be at all uncomfortable to watch yourself in full glory giving this talk that was so well received. But let ' s try it. Let us roll this video without further ado. My name is Scott Galloway, I teach at NYU and I appreciate your time. I have 44 slides and 720 seconds. Let ' s light this candle. OK so for those of you who don ' t know me, I ' m actually a global television store. True story. I ' ve had four TV series in the last three years. Two of them have been canceled before they were launched and two were canceled within six weeks. Let ' s recap. If we want to juice this thing, if we want to put a cattle prod up the ass of the economy. Bloomberg. The most trusted name in **financial** news. Not for long. Andrew Yang : I ’ m going to do whatever I can for this country of ours. SG : Jesus, come on, dude, you ’ re 0 for two. Face for podcasting. So first insight of the day. I ’ d like to be the first person to welcome you to the last TED. OK. By the way, it ’ s clear – what ’ s it called? What are we here for?”The brave and the brilliant?”It ’ s clear that Chris is a frustrated soap opera producer. Essentially what we have here is a telenovela where, after a night of unbridled passion between Bill Gates and Malcolm Gladwell, they give birth to their bastard love child, Simon Sinek. OK, I start us with a question. Do we love our children? Sounds like an illegitimate question, right? Well, I ’ m going to try and convince you otherwise. Essentially, as we go down generations, we ’ re seeing that for the last two generations, people are making less money on an inflation-adjusted basis. In addition, the cost of buying a home, the cost of pursuing education, continues to skyrocket. So the purchasing power, the prosperity, is inversely correlated to age. Simply put, as we get younger, we ’ re taking away opportunity and prosperity from our youngest. The social contract that is now no longer in place and for the first time in the US ’ s history, a 30-year-old is no longer doing as well as his or her parents were at 30. This is a breakdown in the fundamental agreement we have with any society, and it creates rage and shame. As a result, people over the age of 55 feel pretty good about America, but less than one in five people under the age of 34 feel very good about America. This creates an incendiary. Righteous movements, cuts to our society end up becoming opportunistic infections because generally speaking, young people have a warranted envy, they ’ re pissed off and they ’ re angry that they don ’ t enjoy the same spoils and prosperity that were provided to our generation. A decent proxy for how much we value youth labor is minimum wage, and we ’ ve kept it purposely pretty low. If it had just kept pace with productivity, it ’ d be at about 23 bucks a share. But we ’ ve decided to purposely keep it low. Out of reach. Median home price has skyrocketed relative to median household income. As a result, pre-pandemic, the average mortgage payment was 1, 100 dollars, it ’ s now 2, 300 dollars because of an acceleration in interest rates and the fact that the average home has gone from 290, 000 to 420. By the way, the most expensive homes in the world, based on this metric, are number three, Vancouver. Why? Because 60 percent of the cost of building a home goes to permits. Because guess what, the incumbents that own assets have weaponized government to make it very difficult for new entrants to ever get their own assets, thereby elevating their own net worth. This is the transfer I ’ m going to be speaking about. This has resulted in an enormous transfer of wealth, where people over the age of 70 used to control 19 percent of household income, versus people under the age of 40, used to control 12. Their wealth has been cut in half. This isn ’ t by accident, it ’ s purposeful. This is me at UCLA in 1987. I know your first thought is I haven ’ t changed a bit. This is also Mia Sevario, who is the analyst who put together these slides. By the way, Mia is 26. I did the math, just by virtue of her being in this audience, it brings the average age of the entire conference down 11 days. When I applied to UCLA, the admissions rate was 76 percent. Today, it ’ s nine percent. I received a 2. 23 GPA from UCLA. I learned nothing but how to make bongs out of household items and every line from”Planet of the Apes.”And the greatest public school in the world, Berkeley, decided to let me in with a 2. 27 GPA. And that ’ s what higher ed is about. Higher ed is about taking unremarkable kids and giving them a shot at being remarkable. And every year it ’ s gotten more expensive. Higher ed and homes and the ability, not only is higher ed incredibly expensive, it ’ s not accessible. Because me and my colleagues are drunk on luxury and I ' ll come back to that. We ' ve embraced the ultimate strategy. Me and my colleagues in higher ed wake up every morning and ask ourselves the same question when we look in the mirror. How can I increase my compensation while reducing my accountability? And we have found the ultimate strategy. It ' s called an LVMH strategy, where we artificially constrain supply to create aspiration and scarcity such that we can raise tuition faster than inflation. And old people and wealthy people have done the same thing with housing. All of a sudden, once you own a home, you become very concerned with traffic and you make sure that there ' s no new housing permits. And here is a memo to my colleagues in higher ed : we ' re public servants, not fucking Chanel bags. Harvard is the best example of this. They ' ve increased their endowment in the last 40 years and have decided to expand their enrollment, their freshman class, by four percent. Any university that doesn ' t grow their freshman class faster than population that has over a billion dollars in endowment should lose their tax-free status because they ' re no longer in higher education. They ' re a hedge fund offering classes. My first recommendation, Biden should take some of that 750 billion earmarked to bail out the one third of people that got to go to college on the backs of the two thirds that didn ' t and give a billion dollars to our 500 greatest public institutions, size-adjusted, in exchange for three things. One, they use technology and scale to reduce tuition by two percent a year, expand enrollments by six percent a year, and increase the number of vocational certifications and non-traditional four-year degrees by 20 percent. Where does that get us? In just 10 years, in just ten years, that doubles the freshman seats and cuts the cost in half. This isn ' t radical. This is called college in the ' 80s and ' 90s. Another transfer of wealth. Look at what ' s happened to wages. Oh, they ' ve gone up? Not as much as corporate profits. There ' s a healthy tension between capital and labor. But for the last 40 years, capital has been kicking the shit out of labor. Well, you think, what about wages, right? They ' ve gone up. Well if you compare them to the S and P, they barely register. It ' s been an amazing time to own assets. But your attempt to get the certification or the income such that you can acquire assets has gotten harder and harder. In my class of 300 kids, it ' s never been easier to be a billionaire, it ' s never been harder to be a millionaire. By the way, our job in higher ed isn ' t to identify a top one percent of people who are freakishly remarkable or have rich parents and turn them into a **super** class of billionaires. It ' s to give the bottom 90 a chance to be in the top ten. You know who doesn ' t need me or higher education? The top 10 percent. The whole point of higher ed is to give the unremarkables, i. e. yours truly, who was raised by a single immigrant mother, a shot of being remarkable. The transfer has been purposeful. While the cohorts, corporations and the ultra wealthy continue to garner more and more of our wealth, we have decided,"I know, if they win the gold, let ' s give them the silver and the bronze and let ' s lower their taxes."This transfer is purposeful. It ' s not by accident and it works. Senior poverty is way down and we should celebrate that. Meanwhile, child poverty is flat to up. The third rail. I ' m going to talk about Social Security. It would cost 11 billion dollars to expand the child tax credit. But that gets stripped out of the infrastructure bill. But the additional 135 billion dollars a year to Social Security, that flies right through Congress. And every year we transfer 1. 4 trillion dollars from a cohort that is increasingly doing less well to the cohort that is the wealthiest cohort in the history of this planet. I ' m not against Social Security, but the criteria should be if you need it, not whether you have a catheter. Eighty percent of you, 80 percent of you have absolutely no reason to ever take Social Security. It is bankrupting our nation. And we have fallen under this mythology that somehow it ' s this great social program. No it ' s not. It ' s the great transfer of wealth from young to old. How is this happening? Because our representatives are in fact, representative. Old people vote. Washington has become a cross between the"Land of the Dead"and"The Golden Girls."Quite frankly, this is fucking ridiculous. And if I sound ageist – If I sound ageist, I am. And you know who else is ageist? Biology. When Speaker Pelosi had her first child, get this, two thirds of households didn ' t have color televisions, and Castro had just declared martial law. But she ' s supposed to understand the challenges of a 17-year-old girl who ' s 5 ' 9 ' ', 95 pounds, getting tips on dieting and extreme dieting from Facebook? She ' s supposed to understand the challenges that a 27-year-old single mother faces? By the way, young and dreamy. Young and dreamy. The great intergenerational theft took place under the auspices of a virus. I know, let ' s use the greatest health crisis in a century to really speed-ball the transfer. This is the Nasdaq from 2008 to 2012. We let the markets crash. And by the way, you need churn, you need disruption because it seeds and recalibrates advantage and wealth from the incumbents to the entrants. It ' s a natural part of the cycle. But wait, lately, no, a million people dying would be bad. But what would be tragic is if we let the Nasdaq go down and guys like me lost wealth. So we pumped the economy, which again, increased the massive transfer of wealth. The best two years of my life? COVID – more time with my kids, more time with Netflix, and the value of my stocks absolutely exploded. And who has to pay for my prosperity? Not me. Future generations who will have to deal with an unprecedented level of debt. Why am I here and why do I get the prosperity I enjoy? Because in 2008 we bailed out the banks, but we didn ' t bail out the economy. We let the markets fall. So as I was coming into my prime income-earning years, I got to buy, no joke, these stocks at these prices. This is where those stocks are now. Where does a young person find disruption? When you bail out the baby-boomer owner of a restaurant, all you ' re doing is robbing opportunity from the 26-year-old graduate of a culinary academy that wants her shot. We need disruption. I just like this slide. It has no context or relevance. We ' re economically attacking the young, but I know, let ' s attack their emotional and mental well-being. Let ' s take advantage of the flaws in our species with medieval institutions, Paleolithic instincts, and godlike technology. I ' m just going to say, I think Mark Zuckerberg has done more damage to the young people in our nation while making more money than any person in history. Oh, but wait, it could be worse. It ' s as if we let an adversary implant a neural jack into our youth to raise a generation of civic, military, and business leaders that hate America. How can we be this stupid? This all adds up to a bunch of graphs all headed up into the right. And what are they? What ' s the first one? Oh, that ' s self-harm rates, which have exploded, especially among girls since my colleague Jonathan Haidt pointed out, it ' s really, really gone crazy since social went on **mobile**. What ' s the next one? Teens with depression. The next one, men and women not having sex. Biggest fear of my parents was that I was going to get in too much trouble. My biggest fear, honestly, is that my kids aren ' t going to get into enough trouble. My advice to every young person watching this program is go out, drink more and make a series of bad decisions, it might pay off. Next graph, cumulative gun deaths. You ' re more likely to be shot in the United States if you ' re a toddler or an infant than a cop. Next graph, obesity, way up. By the way, the industrial food complex wants to addict you to shitty, fatty foods so they can hand you over to the industrial diabetes complex. We should not romanticize obesity. You ' re not finding your fucking truth. You ' re finding diabetes. Overdose deaths, way up. Deaths of despair. When I was in high school, it was drunk **driving**, now it ' s kids killing themselves. Young people don ' t want to have kids anymore. Two thirds of people aged 30 to 34, able-bodied, used to decide to have at least one child. It ' s been cut in half. It ' s now less than a third, 27 percent. As a result, people over the age of 60 in the US, pretty happy. People under the age of 30, not so much. Some of the lowest in the free world. What can we do? Nothing wrong with America that can ' t be fixed with what ' s right with it. We got the hard stuff figured out. There are programs to address all of these issues, they cost a lot of money, that ' s the hard part. And we have figured this out. In just five minutes post an earnings call, we can add a quarter of a trillion dollars to the economy. We ' ve got the hard part figured out, the resources. We have the money, but we decide not to do it. This is per-capita spending on child care in the United States relative to other nations. This is housing permits. Things are doable. We increase minimum wage at 25 bucks an hour, it goes into the economy, the wonderful thing about low- and middle-income households is they spend all their money. We have to have a restore or a progressive tax structure with alternative minimum tax on corporations and wealthy individuals. We need to refund the IRS. We need to reform Social Security. It should be based on whether you need the money, not on how old you are. We need a negative income tax. My friend Andrew Yang screwed up a great idea, he branded it incorrectly. Instead of calling it UBI, he should got Republicans on board by calling it a negative income tax. We need to eliminate the capital gains tax deduction. When did we decide that the money that capital earns is more noble than the money that sweat earns? Shouldn ' t it be flipped? We need to remove 230 protection for all algorithmically-elevated content. We need identity verification. The reason we can have identity verification is because we have a First Amendment. Break up Big Tech. We have monopolies that are incurring greater and greater costs on every small business and parents because again, see above, our representatives don ' t understand these technologies. We need to age-gate social media. There ' s absolutely no reason anyone under the age of 16 should ever be on social media. We need universal pre-K. We need to reinstate the expanded child-tax credit. We need term limits, see above, Andrew Yang. We need income-based affirmative **action**. Any visible signs of affirmative **action** make no sense at all. You would rather be born gay or non-white, in the United States today, than poor. And that ' s a sign of our progress and our need to recalibrate who we give advantage to. Affirmative **action**, of which I ' m a beneficiary, I got Pell Grants, I got unfair advantage. Affirmative **action** is a wonderful thing and it should be based on color. It should be based on green. How much money you have or don ' t have. Expand college enrollment in vocational programs. Mental health, ban phones in schools, invest in third places, Big Brothers and Sisters programs, we need national **service**. We need to tell people in the United States and Canada that they live in the greatest countries in the world, and we need to remind them of that every day by exposing them to other great Americans where they feel connective tissue. We can do all of this. We can do all of it. We have the resources. The question is, do we have the will? This is my last slide. It is an emotionally manipulative slide to try and get you to like me more. But it does have a message. This is the whole shooting match. Anybody here without kids ask someone with kids. You have your world of work, you have your world of friends, you have your world of kids. Something happens here, your whole world shrinks to this. So I present, as I wrap here, with just a few questions. One, if you acknowledge that our kids are the most important thing in our lives, that everything else we do here is meaningful, but our kids ' well-being and prosperity is profound. If you acknowledge that they ' re doing more poorly than previous generations, if you believe there ' s a chance that the illusion of complexity has done nothing but provide cloud cover for the unbelievable transfer of good will, of well-being and of prosperity from young to old, and if you believe we can actually fix these problems and we have the resources, then I present to you, I posit, I augur the question that I hope has more voracity than it did 17 minutes and 24 seconds ago. And that ' s the following question. Do we love our children? My name is Scott Galloway, I teach at NYU and I appreciate your time. Thank you. CA : We cut off the standing O. That was a long, long standing O. It was as long as there was at TED this year, Scott. An amazing talk, honestly. I want to ask you a bit about just your style of speaking, because I think it ' s remarkable. I ' m going to start here. This thing ' s been seen by five-plus million people around the world already and growing. It ' s the biggest single hit coming out of the last TED. I ' m curious what feedback you ' ve had from it. I mean, you laid out some pretty savage criticisms of a lot of people there. Have some of them come back hard at you? Have you mainly been amplified and cheered on? Give us a sense of the feedback on this. SG : First off, thanks for having me, Chris, and thanks for creating such a powerful **platform** to let people like me have this type of opportunity. 97, 98-plus percent has been exceptionally positive. Not yesterday, but the day before yesterday, I was on a Zoom call where I spoke after Speaker Pelosi and before Senators Blumenthal and Blackburn, and talking specifically about my recommendations around Big Tech. I don ' t know if I ' ll be invited back because I did not hold back. But it ' s been, you know, let me talk about, it ' s been overwhelmingly positive. It ' s been everything from... Billionaires reaching out and saying,"I have a philanthropy, and I ' d like your help allocating some of our resources,"to someone sent me a screenshot of an account with 10 million dollars in it and said,"It ' s yours if you run for president in 2028."To which I responded,"I have no interest in that, but I ' d really enjoy spending the weekend in Vegas with you."It ' s been really positive. So the points of pushback that I think are interesting, and I want to be clear, I get it wrong all the time. You know, I ' d like to think that some or even most of this is directionally correct. But what I know for certain is some of it is wrong. I got pushback around Social Security from Representatives, from seniors, that this is the most successful social program in the world, and that I shouldn ' t be demonizing old people for taking out something they ' ve already contributed to. I ' ve got pushback for fat shaming. So I ' ve gotten, you know, points of pushback. But I think that ' s important. I think that if you ' re going to make provocative statements, you need to be subject to pushback. And I would say that my goal is not to be right, It ' s to catalyze a conversation such that we can craft better solutions. And the thing that ' s been really rewarding about this dialogue is that when people send me very long emails, including from Congress and the Senate and people who run companies and nonprofits, the dialogue ' s been very civil. And I would say that the thing that I really enjoy, you know, I recognize about the TED community, is I ' m in a variety of different communities, whether it ' s TikTok or whether it ' s different conferences where I say these things. And the dialogue this has inspired has been remarkably more civil. It ' s been more, you know,"I liked this, I didn ' t like this,"but I really appreciate that the medium is the message. You know, people are more civil on LinkedIn than they are on Twitter. And I have found so far people are much more civil on TED than other **platforms**. CA : Well, that ' s nice to hear. We definitely, though, don ' t want people to hold back. And I know that in the comments there are some people who ' ve pushed back on specific aspects of the talk. But which of the various proposals and things that we could actually do about this problem, do you think have most chance of actually moving forward? Because it ' s so wide ranging. You know, it ' s like, it ' s very hard for young people to get to college now, hard to get a house and then, you know, all the way up to Social Security and so forth. Where do you think there ' s most traction, Scott? Something that might actually shift. SG : I think there ' s already a movement underway to expand freshman class at elite colleges, to invest more in vocational programs, to reverse this vibe or gestalt of higher ed as a luxury brand and return it to being a public servant. I think that movement was already underway, and it feels like there ' s a lot of momentum there, and some of the stats have really freaked people out. There ' s 10 to one MIT employees for every person who teaches. So I ' ve heard from the president of ASU saying, and the presidents of Purdue saying,"Come here,"and they ' ve been circulating my talk and raising money around the fact that they have not embraced this strategy. I think we ' re seeing – I ' ve heard from quite a few people in the budget office and Congresspeople talking about things including eliminating capital gains tax or just having one income tax, similar to what we had under Reagan, instead of favoring the income that capital earns or wealthier people versus current income. I have heard a decent amount around the idea of just general, generally speaking, tax reform. How do we put more money in young people ' s pockets? And then from what I ' ll call the retail media, whether it ' s Morning Joe or The View, which I ' ve been on since this talk, it ' s we need to change the narrative and stop criticizing young people and saying that their depression, their anxiety, their obesity as a function of their entitlement and not a function of public policy that people of my age have implemented. That, OK, maybe there is some truth to some of their disappointment. CA : So let me, before we go into the other details on it, let me pick up that specific point, because there is, I ' m sure that some people watching this, probably older people, would say, are you sure it ' s really this intentional thing as opposed to a consequence of just cultural cycles? So there ' s this quote that you all know by Michael Hopf that, you know, hard times create strong men, strong men create good times, good times create weak men, weak men create hard times. That there ' s an argument that we ' ve been through so much prosperity that, you know, baby boomers, raised, you know, a generation of kids who just grew up too comfortable and that that is where part of the problem is. You are halfly arguing a different case. Is there any truth to that argument? SG : I think in almost every generation before ours, I ' ll call it Gen X and baby boomers, there was a concerted effort to elect people who would think long-term and make forward-leaning investments. If you think about Apple, Google, Nvidia, all of these companies, Moderna, that have added trillions of dollars in market cap, it ' s really, they build a thick layer of innovation on top of investments that have been made by the most successful venture capitalists in history, and that ' s the US government with its limited partners, its investors, the middle class. And that there ' s a lack of that forward-leaning investment. Basically, the only thing that passes for bipartisan cooperation now is reckless spending. Republicans want more military spending and lower taxes. Democrats want more social spending and, you know, higher taxes. And they agree on lower taxes and more spending. So I just feel like we are being irresponsible, even reckless. The way I loosely describe it is seven trillion dollars in government spending which juices the economy, five trillion in receipts. I ' m in the club partying with champagne and cocaine, and the closest the young people get to the club is they can throw their credit card at me from downstairs, and I ' ll rack up more debt on their backs so I can continue this prosperity. Even the markets right now, we don ' t want to talk about this. The markets are being supported right now by an additional two trillion dollars in stimulus every year, in the form of government spending that ' s beyond our revenues. In past generations, unless it was wartime, never would have engaged or supported that type of government spending. So I do think there ' s something different here. I think the financialization of everything, Chris, where, as they said in"Jerry

Maguire,"more money used to be a bigger seat in business class, now it ' s a better life. And the fact that we haven ' t faced really any external threats to rally us together to create more comity of man or more patriotism, there just seems to be not the same sense of selflessness or investment **mindset** there ' s been with past generations. CA : One of the most powerful aspects of the talk, and there were so many powerful aspects, was your juxtaposition of different stats. So Harvard, this explosive growth in the endowment and, you know, no more students being admitted. I mean, you immediately know, when you just put those numbers together that there ' s something very, very wrong with that picture. So powerful. I thought your line about just showing, you know, minimum wage has just not remotely caught up with the way at which capital is growing. And I wonder whether one, you know, there ' s almost like some political ideas that we could push out there that said things like that. A society is not operating justly if the rate, its minimum wage rate, is growing slower than the rate at which capital is appreciating. It shouldn ' t be linked to inflation or even wages. It should be linked to the rate at which capital is appreciating you know, in that society. Otherwise, inequality is absolutely bound to increase. And I ' m curious which others of those have landed, like with Social Security, for example. I understand why people have pushed back. Do you see any workable, kind of, middle ground here where you could say, look, Social Security is important, we ' re not going to take the whole thing away. But we have to make it more just, we can ' t have it sucking more and more of the next generation ' s time. Like, what is the right metric to think about how much Social Security could be trimmed to be fair to the generation coming through that? Feels like one of the biggest numbers. SG : So I ' ve had a bunch of calls with people, different people in Congress and different PACs about Social Security. So means-testing and moving the age back, right? I mean, the majority of people, just even 100 years ago, didn ' t participate in Social Security because they were dead by that time. Now they ' re living 20 and 30 years beyond that. People will say,"Well, I invested in it, I want it back."I ' d say first it ' s called a tax, not a pension fund, meaning that it might be distributed to other people. Two, people who will live to be 85 take out two to three times more than they put in. I ' m not saying we should do away with it. I ' m just saying it should be means-tested, the age should be pushed back to reflect that people are working much longer. Also just basics. The person who put together the slides, Mia, makes 160, 000 dollars a year, I ' m allowed to say that with her permission. She ' s 26, very talented young woman. She pays 9, 000 dollars a year, or six percent, in Social Security. This year, I ' ll make 100 times that, and I ' ll pay, wait for it, 9, 000 dollars in Social Security income tax. It ' s capped for anyone making over 160, 000 dollars. So if this generation is the wealthiest generation in history, why have we decided to cap Social Security for rich people? So I don ' t have a problem with stimulus. I don ' t have a problem with social programs. But Social Security is another example yet again, of we are really taxing – six percent is a real number for young people their whole life, but it ' s been de minimis for me because I ' m old and wealthy. So it ' s another example of how this transfer under the cover of dark, that wealthy people are in there saying,"We ' ll position this tax as onerous, but we ' re going to cap it like it ' s a good thing at six percent."Why is Jeff Bezos not paying six percent of his income into Social Security? It ' s an off-balance-sheet item, it doesn ' t impact the deficit, it ' s funded every year. But right now, 40 percent of all government spending is allocated for programs that go to seniors. It ' s about to be 50 percent in ten years at this rate, which means that crowds out investments and forward-leaning investments such as education and technology. And we also just need to acknowledge and this sounds ageist, and it is, old people are less productive and more expensive. And so unless we figure out a way to acknowledge that they spend a longer period of their lives being expensive and unproductive, our economy is basically just going to be an engine to kind of support the most expensive nursing home in the world. This is happening in Japan, it ' s happening in Italy, and it takes an economy into decline, because you can ' t make forward-leaning investments that encourage wealth or inspire wealth for young people, and they don ' t have kids. In terms of minimum wage, this is an easy one. I ' ve been positioned as anti-union. I ' m not, there should be one union. It should be in DC, and it should be federally-mandated minimum wage, 25 bucks an hour, except in certain areas where there ' s an exceptionally low cost of living. And the incumbents and corporations will start this bullshit narrative of it ' ll kill the economy. No, it won ' t. In Washington state and California, where they raised minimum wage, the economy actually grew because the wonderful thing about low- and middle-income people is they spend all of their money, meaning the multiplier effect is greater. If it had just kept pace with productivity and inflation, it ' d be 23 bucks. That ' s an easy one. Mandatory, federally-mandated, 25 bucks an hour. Would McDonald ' s and Walmart stock take a huge hit? Sure. Would a bunch of small businesses go out of business? Yes. And it ' d be worth it. CA : So, as you say, you don ' t hold back. And there were definitely a few things in the talk that provoked comment. So Kyra Gaunt, I see in the chat, found your comment about diabetes a bit smug. She says there are epigenetics to consider. It ' s complicated for members of marginalized groups. And you say you ' ve heard from other people on that. Do you want to clarify your view on that at all? SG : It ' s a fair feedback. As someone who was born to parents who were both tall and thin, so easy for you to say, Scott. What I have said in the past and you know, if I sound offensive, I apologize, is I believe that we need bottom line to put more money in the pockets of lower-income people such that they can eat better. I think we need to tax the food industrial complex relative to its externalities. Obesity, morbid obesity has gone from five to nine percent in the last 30 years. Obesity has gone from, I believe it ' s gone from 30 to 45 percent. The only thing that Americans really share is it ' s 70 percent of us are overweight or obese. And if you look at McDonald ' s, Kraft, General Foods, PepsiCo, Coca-Cola, they ' re not companies as much as they are obesity indices. And their stocks have gone up 10 to 12x as obesity has gone up. And if you give those two, their stocks and obesity rates, to a statistician, they will tell you they are highly correlated. So as a result, because there ' s money in the diabetes industrial complex, we have Unilever celebrating obese women. We have people saying you ' re finding your truth. And this is from the same company that sells Ben and Jerry ' s and Axe, which basically encourages young men to fuck anything. So the notion that they are concerned about, are trying to liberate people or all of these apparel companies saying that you ' re finding your truth – I want to go back to the ' 60s, where Kennedy said it was American and patriotic to be in great shape. I used to train every year for the Presidential Fitness Awards, and that was seen as fat shaming, so they did away with it. I don ' t think there ' s anything wrong with celebrating fitness, but also at the same time recognizing some people are dealt a difficult hand genetically and providing them with money and resources so they can get out of food deserts. I also believe GLP-1 drugs are the most impressive technology of the last year, not AI, and we should be pushing them into low-income communities. I think they ' re an absolute game changer right now. Here ' s a crazy stat : the region of America that has the greatest penetration of GLP-1 prescriptions is also the thinnest. It ' s the Upper East Side. Because right now, GLP-1 drugs are being used for ladies of lunch who want to lose that last 10 pounds. I hope that more and more of it is imported illegally across the border, where it ’ s 100 bucks a month versus 1, 000, and it gets to the people who really need it, which is low-income people who don ’ t have the money for diabetes. Because the industrial food complex wants you to be obese so they can hand you over to the medical industrial complex of hip replacements, kidney dialysis, knee replacements, heart stents. That ’ s an enormous industry. I want to put Coca-Cola, Kraft, McDonald ’ s and some of these hospital systems absolutely out of business. There ’ s too much incentive to convince you that being obese is some sort of personal liberation. It ’ s not. CA : So this is so interesting. Like, somehow, and I feel this for TED as well, we have to figure out how to have conversations about difficult topics that are respectful of people. And, you know, everyone, as you say, has been dealt a different hand, but that don ’ t ignore the basic facts of health or of science. And that is what is so hard to do in the current environment right now. We ’ ve all got frightened, I think, of saying the kind of thing that you just said. And there probably are still, I don ’ t know Kyra, how you felt about what he replied there, but I feel like we need to do both, you know, we need to be provocative and also respectful. And I heard that in you. So I think that ’ s cool. And then again, actually not to pick on Kyra, but I noticed that she pushed back on your point about social media, that, you know, one of the fixes is to get our younger kids off of social media. Points out, and I ’ ve felt this reading Jon Haidt ’ s work myself, that those communities that people connect with on social media sometimes are incredibly beneficial. So you think of the kid who ’ s queer or is **struggling** with something and doesn ’ t find anyone in their community who they can connect with, finds a community online. I mean, there ’ s presumably some benefit in that. Is there any way of making recommendations where there aren ’ t swings and roundabouts? There aren ’ t, you know, sort of downsides to what we recommend? SG : Look, one in five LGBTQ high schoolers is going to try and kill themselves. So I ’ m involved with the Jed Foundation that works with high schools to try and identify or distinguish between kind of what is normal abnormal teen behavior and suicidal ideation. Because we really have an epidemic of self-harm at a teen level, and there ’ s just no getting around it. Some trans and gay kids and other kids from **special** interest groups find other people like them on social media. I guess the question would be if banning social media under the age of 16 or age-gating it on the whole were demonstrated to be an absolute huge net positive – because I think a lot of those communities are actually the subjects of incredible bullying and shaming online, and are more prone to go down a rabbit hole of depression and end up in self-harm – are there other programs that could replace that incredible community some of them have found? But look, when you make huge government decisions, there is no decision where there ’ s not going to be losers. I mean, the special-interest-group kid who finds people online at 14, when social media is age-gated, yeah, that person suffers. I guess the argument I would make is that if you were to look at any study about the general impact it ’ s having on people under the age of 16, the benefits dramatically outweigh the soft tissue here. So the question is, could we do it? But at the same time recognize we still have an enormous self-harm problem among kids, especially in the LGBTQ community, and move in with other programs or other analog means of helping them find other people. But I want to acknowledge, there ’ s just nothing I recommend that doesn ’ t have a downside. CA : Some people are asking about practical things we can do. So Adrian Neubauer said,”As an elementary school teacher, what ’ s your advice for helping Gen Alpha students? I don ’ t want my students to grow up having such apathy towards learning and being successful. I definitely don ’ t want my students ’ highest aspirations to be TikTok influencers. How do I help them?”SG : Well, the first thing is, I think this is an easy one, I don ’ t think there ’ s any reason for anyone under the age of 16 to be on social media. I think we need a massive investment. I think we need to tax every person in a private school and use that capital to invest in after-school programs and third places. I went to public schools all the way through graduate school. I went back to my high school, university high school, and 93 percent are kids of color. It ’ s got the unfortunate designation of having the greatest proportion of kids who are classified as homeless in LAUSD, and they just cut their drill team. They just cut their band, their drumline, because they don ’ t have money. I just think so much of this, Chris, unfortunately, it ’ s like households with a lot of anxiety. It sounds very crass, but I think a lot of it, a lot of problems are solved with money. Show me divorce and I ’ m usually going to show you some sort of economic **stress** or poor alignment around economics. And when you can add a quarter of a trillion dollars in five minutes post the earnings call of Nvidia, and at the same time, you see corporations are paying their lowest taxes since 1939 and the top 25 wealthiest Americans are paying a tax rate of six percent, and five companies have added the value of the entire global auto industry in the last six weeks. We have the resources. So I think a lot of this comes down to funding, giving kids more third places such that they ’ re not staring at their phones. And also demanding that parents and demanding that entire school systems go phone-free and that there ’ s no social media. And on a more tactical level, I absolutely think we need to ban or divest TikTok. I think it makes absolutely no sense to be raising a generation of civic, military and nonprofit leaders who hate America, and it ’ s all wrapped in cute dances. I just think it ’ s insane that we would be this stupid. One of the wonderful things about America is our optimism. But one of the downsides of that is we ’ re much easier to **fool** than convince we ’ ve being **fooled**. I think every day we ’ re being **fooled** by TikTok. I think this is the most unbelievable propaganda tool in history. Unfortunately, it ’ s not ours. CA : You mentioned Nvidia there, which has exploded in value in the last couple of years, last year really. Isn ’ t that to some extent a counterargument to your earlier comment about you had this unique opportunity to buy these cheap stocks like Netflix and Amazon at low prices. I mean, there are always... Is the market fundamentally changed, there aren ’ t that kind of opportunity for smart people to identify trends and get the same kind of wealth? Was it just a timing thing? SG : No, what we ’ ve decided is we want capitalism on the way up. We want low taxes, and the pioneer, the individual who earned the money and should pay a low tax rate because he or she is the most productive citizen. And then on the way down when there ’ s a virus or some exogenous event, which happen a lot, whether it ’ s war, famine, revolution or a virus, the CEO of Delta says,”We ’ re all in this together,”and wants a massive bailout, despite the fact that 80 percent of the free cash flow of airlines the 10 years before were either used on dividend or stock buybacks or CEO compensation that juice their compensation. So look, capitalism on the way up and socialism on the way down is cronyism. And we ’ ve gone full cronyist in the United States. And I understand the rationale for pumping the economy full of stimulus, because they said we needed to overdo it versus underdo it, but then no one suggested a **special** tax for the unbelievable champagne and cocaine disco party we ’ ve had in the markets. Markets are touching all-time highs right now. And the myth that my generation is fomented across the economy, the young people take hook, line and sinker is the following. There are two phases of everyone ’ s life. There ’ s investing, and then there ’ s the harvesting phase. Investing is when you do your best to make more than you spend, and save some money, so you can deploy an army of capital that grows in your sleep, such that you can have some security and some balance as you get older, and you begin harvesting. I ’ m entering the harvesting stage of my life where I ’ m no longer making as much as I spend. During the investment part of your life, in you ’ re younger years, you want markets to crash. You want real estate that ’ s inexpensive. You want to dollar-cost-averaging at the low price. The reason I get to roll with you in London and I get to go to the south of France tomorrow, Chris, is because we let the markets crash in ’ 08, and I got to buy Netflix at 12 bucks, which is at 650 now. What we ’ ve decided now purposefully, is that we aren ’ t going to let the markets have a natural cycle of disruption, that anytime the markets are threatened, we ’ re going to weigh in with the credit card of our young friends, of our daughters and our sons, and we ’ re going to artificially inflate and support the markets. That is nothing but a transfer of wealth. You need disruption. You need churn. These are purposeful decisions to protect old on the credit card of the young. I don ’ t have a problem with stimulus, but for God ’ s sakes, those of us who have benefited from it should pay it back. CA : So there ’ s a great question here from Brett McCall.”During this talk, there are an overwhelming number of points that are all delivered in an easy-to-understand way.”That ’ s true, by the way. I don ’ t know of a talk where there ’ s been such density of points, of facts that connect, really remarkable. Anyway, he says,”It leaves me charged with the desire to join, ’ the movement ’ and make change. It ’ s almost like a full semester-worth of issues that could be movements, but there isn ’ t an explicit community or movement to join. Scott, where would you suggest a starting place for someone who becomes inspired by your talk?”SG : It ’ s hard to do this without being political, but try and find Congresspeople or get involved in campaigns of people who are, one, talking about the deficit, talking about the war on young people, having difficult conversations. I mean, there ’ s some very basics. And the speaker before me, Andrew Yang, final five and ranked choice voting. People who are going to be moderates, who are going to think long-term about society. I think we need absolutely more young people in Congress. So I would say political **action**, just being engaged. And then on a ground level, getting involved with local schools, getting involved in charities and efforts to help young people in **special** interest groups find third places, find places to find each other. I think all of this is somewhat couched in young people, in an epidemic of loneliness. So anything you can do to create resources and opportunities for young people to get out of the house. I think it ’ s up to parents to get their kids off – I mean, I think it ’ s not what to do, it ’ s what not to do. In terms of a political movement, I ’ m still waiting for a leader to come forward and say,”I ’ m going to piss off everybody. Old people, you ’ re going to hate me. Unions, you ’ re going to hate me. Rich people, you ’ re going to hate me.”You know what we need? We need the biggest class traitor in history. Someone who shows up and says,”Are we going to decrease government spending, or are we going to raise taxes?”And the answer is yes. It ’ s time to start acting like adults and paying it back to some of the incredible Americans who have made sacrifices such that we can enjoy this prosperity. I haven ’ t seen that person yet. CA : Politicians assume that that ’ s an unelectable slate. And maybe they ’ re underestimating the intelligence of their citizens. SG : I think people are ready. Do you know one of the top three issues among young people is right now? People think it ’ s Middle East, it ’ s not. That ’ s like number 17 because of the zombie apocalypse of useful idiots on campuses that has been highlighted in media and in TikTok to give you the sense that every student is protesting. 2, 300 arrests, 40 weren ’ t students. I ’ m at NYU, 99. 9 percent of the kids are just getting their shit done. The new undergraduate president of Columbia is an Israeli girl. You know, we need... anyways, one of the top, top issues for young people, one of the top three? The deficit. So I just think we need a pragmatist who says,”I am not going to ever insult anyone on the other side of the aisle personally to get on TikTok and raise money. I ’ m going to talk about really boring shit. Tax policy, the deficit, teen depression, obesity. And I ’ m going to make big sweeping changes. And guess what? All of you are going to suffer, all of you.”Because there ’ s just no getting around it. We need to make a fraction of the sacrifices that a lot of Americans made 80 years ago. I don ’ t know about you, I was very moved by the D-Day commemorations. But every generation up until this one has made real sacrifice for forward generations, except this one. So we need to catch up. I think people are ready for that. CA : Scott, you ’ ve spent a lot of time giving advice, especially for young men. Do you think that the problem has been especially bad for them for some reason or that a disproportionate share of the solution will be found by fixing the problems that young men are facing right now? SG : Well, all of these things are especially acute. So with young men – and this is really the thing, this is my passion project – four times as likely to kill themselves, three times as likely to be addicted, 12 times as likely to be incarcerated. There has been no group globally that ’ s ascended faster than women. More women globally are pursuing tertiary education, which is remarkable when you think about – many nations don ’ t allow women to pursue tertiary education, and twice as many women have been elected to parliament over the last 30 years around the world. Now domestically in the US, there has never been a cohort that has fallen further faster than young men. More women, single women own homes now than single men, which is fantastic. In urban areas, women are out-earning men. These things are wonderful. We don ’ t have a homeless crisis. We have a male homeless crisis. We don ’ t have an opioid addiction crisis. We have a male opioid addiction crisis. And unfortunately, something that gets in the way of programs, Chris, is that because of the benefit, the massive benefit, privilege and advantage that you and I received, we hold these young men accountable. We use words like accountability or pull yourself up by your bootstraps. If any **special** interest group is killing themselves at four times the rate of the control group, we ’ d move in with programs. And I think there just generally needs to be a change in the narrative and the dialogue. And we need to recognize that **empathy** isn ’ t a zero-sum game. Gay marriage didn ’ t hurt heteronormative marriage, civil rights didn ’ t hurt white people. And recognizing the problems that young men especially are facing – one in three men under the age of 30 hasn ’ t had sex in the last year. Three million working-age men have given up looking for work. Fifty percent of millennial men are no longer even trying to date. And so you have this cohort that is doing so poorly, and if we don ’ t have a vibrant middle class full of successful, economically and emotionally viable men, the nation is going to collapse. Because here ’ s the thing about women, we don ’ t want to have an open and honest conversation about mating. And this is the following. Women mate, socioeconomically, horizontally and up ; men, horizontally and down. And when the pool of men available horizontally and up keeps shrinking, we ’ re going to have a lack of household formation. Sixty percent of people aged 30 to 34, 40 years ago, had at least one child. Now it ’ s 27 percent. The whole shooting match, the whole shooting match, why we engage in all this shit, is so we can find someone we love and raise kids together. That is the most rewarding thing. Everything else is a means. That ’ s the ends. And when a nation is failing to do that and just creating a generation of anxious, obese and depressed kids who don ’ t like themselves, much less have the opportunity to like other people and get together and start having sex and fall in love and have kids and have economic prosperity, then what the fuck is any of this for? So I think this is a call for all hands on deck. If young people, and especially young men, aren ’ t doing well, then we are not going to have a functioning nation or economy, full stop. And it ’ s time to put the politically correct agenda away and say,"Well, you ' re being sexist."Yeah, I ' m sexist. I believe the genders are different. If you don ' t believe me, put a three-year-old girl and a three-year-old boy in a room with cars and dolls and see what happens. That doesn ' t mean we reduce **empathy** for either gender, but we can ' t even have an honest conversation about this stuff because someone sees an opportunity to virtue signal and get a Guardians of Gotcha pin rather than actually addressing the fucking problem. That was a rant. CA : Well, I will say that you rant better than anyone I know. I mean, I really, just as someone who ' s hosted a lot of TED Talks, I was stunned by how this one went. Like many, many speaker coaches looking at you would say, Oh, he ' s very monotone. It ' s very, you know, where ' s the – it just unwraps in a very, sort of flat voice initially. But every word is so carefully chosen and follows so consequentially to what ' s just gone before, that you tap into a different part of people ' s brains than most talks do. People go, yes, you know, that makes sense, that makes sense. And then it builds, and then your anger and frustration starts to come out and get dialed up. It ' s absolutely remarkable rhetoric. I don ' t know how you learned it or where you got it from, but it ' s really unique out there, I would say. And I think it ' s a **super** powerful weapon. And I mean, I don ' t know if people listening agree with this. This is really unusual... It ' s not like everyone will agree with every single word, Scott, that you said, but it ' s a really unusual and powerful piece of rhetoric about something that really matters. And for that, I feel, I think we all feel huge gratitude to you and wish you well on this continued journey. I mean, there just isn ' t a more important issue. So bravo to you. Thank you. SG : Chris, I appreciate the generous words. And what I told my wife is that after 30 years of working my ass off, I ' m an overnight success because of Chris Anderson and TED. So thank you. CA : You had visibility everywhere, and you do. It ' s amazing how much your voice is out there. If people don ' t know it, Scott has his own – Well, just talk about the two or three podcasts you ' d most like people to do, because I think that ' s the best way to get closer to you. SG : Yeah, to resist is futile, I ' m like AOL in the ' 90s. If you stick your hand in a cereal box, you ' re going to find something from Scott Galloway. I have"Pivot,"I have"Prof G,"I have my newsletter,"No Mercy, No Malice"and a slew of books. So to resist is futile. Hello and welcome. I ' m Elise Hu, the host of the TED Talks **Daily** podcast, and I ' m so glad to be with all of you today for our TED Talks Daily Summer Book Club, a **special** series on the TED Talks **Daily** podcast. It ' s a show where we deliver ideas that inspire every day. So today we are slowing down to ask : What are our phones doing to childhood, and to us? Around 2010, we all **observed** the mental health of young people in the US starting to get worse. Rates of depression, anxiety, suicide and self-harm started climbing up and haven ' t come down. In his new book,"The Anxious Generation,"social psychologist Jonathan Haidt makes a strong case that the cause is smartphones. He looks to Gen Z as an example. They came of age with unfettered access to the internet and social media, and he argues that these numbers are the consequence of the new childhood reality. John Haidt, welcome and thank you for digging into this with us. Jonathan Haidt : Well, thank you Elise. EH : So much of this book really hinges on the moment around 2010, when a few dramatic changes took place in the digital world. Talk to us about what happened then and why you consider it a big deal. JH : So let me actually start in 1990, because you have to understand how we all got tricked into this. So if we go back to 1990, there was no internet, nobody knew what the internet was. So the internet arrives around 1994, 1995, and it ’ s amazing. It ’ s like God said,”Hey, do you want to know anything, instantly?”I still remember how exciting it was. So the internet was amazing. And the millennials were teenagers at the time, they were going through puberty, and they charged onto it. And they made it their own, and found all kinds of ways to do things. And they started internet companies and they are creative, successful generation. Also, the Berlin Wall fell just before that. And democracy has ascended in the ’ 90s, and we ’ re thinking, democracy, its best friend is the internet. How could a dictator ever keep it out? Good luck China, keeping out the internet. So we were all **super** optimistic. Once you get the smartphone, 2007, now you start getting the App Store and apps. You get Uber. So all of this is miraculous. So our kids love it, kids always love technology. And we ’ re all like, well, OK. They ’ re spending a lot of time on it, but you know, maybe it ’ s making them smarter, it ’ s going to teach them tech skills, so this is all good, we thought. So that ’ s the setup. And if you were born in 1990, let ’ s say, then you hit puberty around 2002, 2003. You go through puberty with a flip phone. You use your flip phone to call your friends and to text them one-on-one, and you meet up and you do things in the real world, so you ’ re fine. You have a normal human development, normal human puberty, and you come out the other end as a mentally healthy person. But suppose you ’ re born in 2000. You are seven when the iPhone comes out. You got a front-facing camera in 2010. You are 11 when you probably got one. You got on Instagram when you were 12. So when you hit puberty, you ’ re going through puberty not meeting up with your friends, you ’ re going through puberty swiping, tapping, liking and hanging on,”What if I post something? How will people react?”Half of our kids say they are on the internet almost all the time, 50 percent, almost all the time. This is not a normal human childhood. There ’ s not as much face-to-face contact. You don ’ t get to develop social skills, you don ’ t have hobbies or read books. You ’ re just on your phone all day long. And guess what? Their mental health collapsed, especially for the girls. Instantly, it ’ s not a slow thing. Instantly, around 2012, you get these hockey stick shapes in all the graphs in my book. There was no sign of a problem in 2010, and by 2015, it ’ s all over the world. We don ’ t know about the developing world, but all over the Western world we start seeing this especially for girls. So that ’ s the story. EH : And what do you think was going wrong? JH : So the story I tell in the book is two things. I decided not just to write a book about what social media is doing. But to write a book which is really more about childhood. What is it, why do we have it, why is human childhood so different from every other animal, including chimpanzees? Because we grow fast after you ’ re born. But then you slow down. And we don ’ t grow very fast until we hit puberty. Why do we delay? We have these amazing cultural brains. This is our great adaptation. This is why we cover the world and chimpanzees don ’ t. And that all depends on a slow growth process with a lot of cultural learning from your elders, from the people ahead of you in your culture. So that ’ s part of it. Also part of it is play. Young mammals need a huge amount of play, free play to wire up their brains. All animals **practice** skills they ’ ll use as adults. So you take what I call the play-based childhood, which is what we ’ ve had for 300 million years, going back to the beginning of mammals. And then 2010 to 2015, kids now have a phone-based childhood. And that, I argue, is what ’ s blocking development. We ’ ve never seen such a sharp change in generations in terms of their mental health. So that ’ s what we see when we look back historically. We can certainly now discuss it, you know, the research, trying to pin it down.

But what I ’ m pointing to is an incredible pattern of changes that happened in many countries simultaneously, always with more increases for the girls, not affecting the middle-aged people, but only affecting the teenagers. And no one can offer another explanation other than the transformation of childhood by the technology. EH : You call this transition from a play-based childhood to a phone-based childhood a”great rewiring.”So how do you believe the minds of these Gen Z kids are wired differently now? JH : Just think about it this way. For those of you who are over 35 or 40, you surely had a play-based childhood. What I ’ d like you to do is think back on the most exciting things that you ever did as a child. Think back on times you just were hanging out with your friends. Think back on how much time you spent laughing with your friends. Laughing, joking, playing around, OK? Now take all of that, cut it by 80 percent, because Gen Z didn ’ t get that. They have almost no unsupervised time. They don ’ t get to hang out behind the 7-Eleven or down by the river, or in a playground or anywhere, except online. So take 70 percent of that out. Think of all the times you smiled at a person or you made eye contact. Take 70 percent of that out. Again, I don ’ t know the exact number, but for the kids who say they ’ re online almost all the time, it ’ s probably 70 percent. Think of all the books you read. Take 70 percent of those out, maybe 100 percent. Gen Z has no time to read books. They have so much content to consume to keep up. There ’ s very little book reading. Think about hobbies, did you have a hobby? Take that out. So you take out almost everything. Because again, if the latest numbers are on average, American kids are spending seven to nine hours a day on entertainment and screen stuff, not counting school. Seven to nine hours a day is the average, depending on how you count it. Take childhood, take out almost everything that you valued in it, and what ’ s left? EH : But does hanging out have to be in person and with making eye contact in real life? Because a lot of these kids would argue, we hang out all the time. We hang out in games, we hang out, you know, on social **platforms**, we are connecting. We ’ re just connecting in a different way. And Jon Haidt, you ’ re the fuddy duddy, you know, for coming down on just the different tools that we ’ re using to hang out and connect. JH : Oh that ’ s a great objection. And, you know, 10 years ago or 15 years ago when I first saw Twitter and people sending out,”I just had a hamburger,”I thought, God, this is so **trivial**. But then as a social psychologist, I thought, well, actually, wait, if you ’ re sort of checking in with your friends hundreds of times a day, that could be really good. But what I ’ ve come to see is the online world gives you multiple ways to connect virtually, which often lacks certain properties. So the most important one is being synchronous. So right now you and I are synchronous. We can see each other ’ s facial **expressions**. But on Zoom there ’ s a little bit of awkwardness, you don ’ t quite get the timing. So video games, Twitch, all these things that allow you to go two-way, voice and face, those have some benefits, I ’ ll grant that. Whereas going back and forth in group texts, group text is performance, not connecting one-on-one like an old phone call. So synchronous is good. All the asynchronous ones, I think, miss that. Another feature is that you now have such vast quantity. Imagine taking the number of people you talk with every day, multiply that by 50, OK, that might sound great, but how much time do you then have for anyone? So you don ’ t get the kind of in-depth conversations. When I was a kid, it was just sort of famous that girls will talk on the phone for hours and hours at night, just one-on-one, they ’ re connecting. Boys don ’ t do that, but we call each other up and say, hey, can you come out? And we ’ d meet and go do something together, one-on-one or in a small group, that ’ s all great. The large groups are not connecting ; they ’ re performing. And kids are anxious. They have to think carefully before they put something out. Because what if I make a mistake?

Play needs to have lots of low-cost mistakes. You say something stupid, your friend says,”That was mean.”And you say,”Oh, sorry.”But when you grow up online, it ’ s like growing up in a minefield because you never know, one mistake, it could actually ruin your life. It could literally ruin your life and make you not get into college. So this is something that so many professors have **observed**. We can ’ t get our students to disagree with each other anymore. They ’ re so afraid. They ’ ve grown up in a minefield. They know, one false move and their leg gets blown off. So I think, you know, you can praise all those virtual connections all you want, they don ’ t seem to have the magic ingredient of hanging out with a friend in real life. EH : And the way you explain it in the book, the rise in anxiety and depression isn ’ t really happening in **isolation** because it also sort of coincides or interacts with a change in parenting culture. So talk to us a little bit about that cultural shift that you ’ re saying is happening all at the same time. JH : A big part of this is the overprotective parenting. And, you know, I can summarize the whole book by saying we ’ ve overprotected our children in the real world, we ’ ve under-protected them online. So let ’ s look at the overprotection. Until the 1980s, American kids had a free-range childhood. I grew up in the ’ 70s, and there was a huge crime wave. There were crazy people, there were serial killers. Crime was at historically high levels. All kids went out, and it was amazing and exciting. And, you know, we got into all kinds of arguments and fights and sports games and just we had an exciting childhood. And that goes on until the ’ 90s. Now you get the new media environment, so you get cable TV, you get 24-hour news cycles. So in the ’ 90s, for a lot of reasons, we freak out and we lock our kids up, or rather I should say, we no longer think it ’ s OK for an eight-year-old to be outside unsupervised by an adult. Now it ’ s more like 10 or 11 is when kids get that level of freedom. So here ’ s the big reason why. It ’ s not just the change in television and cable TV. The biggest reason, I now believe, is the loss of trust in everyone else. There ’ s a great phrase from British sociologist Frank Furedi. He talks about the collapse of adult solidarity. So even in the ’ 70s, when there was a lot of crime, you know, if I wiped out on my bicycle and I got hurt, my friend could go knock on a door and say,”Hey, can you call my mother?”But we begin to lose trust in each other, life moves away from the streets and moves indoors as we get air conditioning and television. We don ’ t know our neighbors anymore. That ’ s why we don ’ t trust our kids to be let out. So there ’ s a whole back story that really begins in the ’ 80s and into the ’ 90s, in which we took away the play-based childhood. Oh and at the exact same time, the internet arrives. And so, you know, we don ’ t want to let our kids out. But this new internet thing, the kids love it. They ’ re sitting in the room on a computer, what could happen? EH : Five hours a day is the stat now? JH : For social media. It ’ s seven to 10, seven to nine, in there if you include video games and porn and all the other things that the kids are doing. But just social media is five hours a day – average. EH : If they ’ re spending so much time on social media, what are they doing less off? JH : Everything else. The most important things they ’ re doing less of, in order, are : any kind of face-to-face contact with their friends or family ; listening to their teachers, because they ’ re doing this in school, too, because most schools let them keep their phones in their pockets ; flirting or gossiping or talking with their friends in school or at lunch. Because even at lunch, if you have phones in your pockets at lunch, the kids are doing what ’ s called continuous partial attention. So they ’ re continually paying attention to what ’ s going on in their phones, and then they ’ re also sometimes having conversations with the kid next to them. In other words, there ’ s no real quality human connection. That ’ s the most important thing. If you take most human connection out of childhood, there ’ s not a lot left. Number two, sleep. Kids really, really need sleep. We ’ re now discovering sleep is so much more important than we thought back when I was in graduate school. Kids are getting less sleep, especially those who have a device in bed. I mean, imagine if you had to suddenly give five to 10 hours a day to some new thing. There ’ s nothing else. That pushes out everything else. EH : I want to talk a little bit about the responses to the book, because this was a number one New York Times bestseller, and there have been plenty of responses following”The Anxious Generation ’ s”release. A number of social scientists have questioned the conclusions in the book, notably this article in”Nature”that gets shared pretty widely, where Candice Odgers writes that”Hundreds of **researchers**, myself included, have searched for the kind of large effects suggested by Haidt. Our efforts have produced a mix of no, small and mixed associations. Most data are correlative.”So she continues that when they can find a relationship between phones and anxiety or poor mental health outcomes, it tends to be that teens who are already depressed tend to use social media more. So how do you respond to this, you know, correlation-not-necessarily- causation argument? JH : So let ’ s start by setting the scene. We have a massive collapse of mental health that happens in a synchronized format in many countries, especially to girls. Happens at the same time. There is no other explanation. The parents see it, the teachers and principals see it, psychiatrists, psychologists see it. So the presumption should be, something is going on here and it may be related to the technology. OK, now, what do we know from the data? There are two main battlefields. There are the correlational studies, where there ’ s hundreds and hundreds of them, they ’ re easy to do, you just look who ’ s more depressed, who spends more hours on social media. Now hours spent on social media is the variable that you ’ re correlating with some self-report of mental health. And then you look at the connection, and the correlations tend to be around 0. 1 for boys, they ’ re actually around 0. 2 for girls. This is what we ’ re fighting about. Now Candice Odgers says that this is a small correlation. She and others won ’ t be convinced unless we find large correlations, like, say, 0. 3 or 0. 4. But in public health, you rarely get 0. 3 or 0. 4 because you have very poor measurement at both ends. So that ’ s the correlational studies. We ’ re sort of at a stalemate there. The more important battleground is on the experiments. We all know correlation doesn ’ t show causation. So we move to the experiments. And what did the experiments show? I think we can show that the great majority of experiments do show a benefit from getting off social media. And very importantly, all of these studies are taking individuals and asking them to get off. And they ’ re mostly college students. And if you take a college student, say,”Hey, we ’ ll pay you to get off social media for a month. Now, how do you feel?”And it turns out they feel better, but they ’ re also isolated. The real test is what happens if you take a whole school, a whole high school, and get them off social media? My prediction is you would have a huge increase because now they ’ re not isolated, they ’ re actually more together. And the most important theme of my book is that it ’ s collective effects that have to be addressed by collective **action**. The reason every 13-year-old girl has to be on Instagram is because every other 13-year-old girl is on Instagram. My college students say the same thing. They can ’ t get off because everyone else is on. So she says, we don ’ t find the large effects that would be necessary. That ’ s because those **researchers**, they ’ re not even considering the collective emergent properties of social media. EH : Yeah, it does seem like an enormous task, though, Jon Haidt, to take collective **action** on something, because for younger generations, so much of the way that they connect these days and find community is taking place on devices. And so how do you address kind of, this problem where well everyone else is on it, I don ’ t want to be the one left out?

And how do we get past this challenge of collective **action**? JH : We get past it by acting together. Any one kid who gets off is alone. Any one parent who says,”You ’ re not getting a phone till high school,”now their kid is isolated. But there is a place where we all have community and that is our local kids ’ schools. It ’ s as simple as this. If you ’ re a parent listening to this and you have kids under the age of 12, let ’ s say, just reach out to two other parents of your kids ’ friends and say,”We want to do the four **norms** from ’ The Anxious Generation. ’ Are you with me?”And they probably will be with you. The four **norms** are : no smartphone till high school, around 14 ; no social media till 16 ; phone-free schools and so parents can push the school to go phone-free ; and the fourth is far more independence, free-play and responsibility in the real world. That ’ s the hardest one because that requires us to change. But it ’ s the most important in that if we ’ re going to take the screens, the 10 hours a day of screen time, take that away from kids, we have to give them back an exciting childhood. EH : You mentioned big tech. Why place the onus of responsibility on individual families or neighborhoods or kids when it is these giant tech companies who are designing the apps and the phones for maximum engagement and profit? Can they not make changes to the way software is designed, and can governments not better regulate these companies? JH : Yes, they certainly could make changes, but they ’ re in a collective **action** trap, too. We know this from Frances Haugen, who brought out the Facebook files. Facebook is actively recruiting underage kids. They really need those kids. And they know that if they were to crack down, those kids would just go to TikTok. So the tech companies certainly could solve this, but they ’ re in a collective **action** problem, too, because if one of them does the right thing, the kids will just lie about their age and go somewhere else. Also, Congress gave them immunity. The courts have **interpreted** Section 230 very broadly, so that if your kids are harmed by anything that they saw online, well, Section 230 says you can ’ t sue the company. So these are the biggest, most powerful, richest companies in the world. They ’ ve been given free reign to own our kids ’ childhood. They have limited legal responsibility so far. And we ’ re trying to get a bill through Congress that does some fairly modest things about setting defaults and just begins to establish children are not adults. You have to treat them differently. If there was any other consumer product, let ’ s imagine a new toy comes out on the market. The kids love it. And 90 percent of kids are using this toy five hours a day. And thousands are being hospitalized for depression, eating disorders, anxiety. And some kids are killing themselves after using the toy. So what I ’ m saying is, we have a defective consumer product. Do you think that that toy maybe would be recalled? Do you think maybe someone – EH : Or regulated. JH : Maybe regulated? Like, maybe you have to change it so that it doesn ’ t wreak such damage? So that ’ s what the Surgeon General is saying. The surgeon General is saying while the scientists fight about whether social media caused the increase at the population level, like, the graphs I show in the book with the hockey sticks, did social media cause that increase at the population level? That ’ s an academic debate. I can ’ t be 100 percent certain I ’ m right. But what the surgeon general was saying was, regardless of that debate, here are hundreds of cases of kids who were sextorted, they were bullied, they were shamed, and then they killed themselves that day. So the Surgeon General is saying, if this was any other consumer product, we ’ d regulate it and we ’ d put warning labels on it. Why not this one? EH : You have two kids. How have you wound up **navigating** phone use at your own house? JH : Yeah, so we gave my son a phone, my old iPhone, as most people do, when he was in fourth grade when he started walking to school. This was back, you know, in the early 2010s, we didn ’ t know any better. Now in retrospect, we should have just given him a phone watch or a basic phone. And that ’ s what we did with my daughter, who ’ s three years younger. I gave her a big pink Gizmo Watch, and in third grade, she loved it. And I could send her out in third or fourth grade. I could send her out into the park, out to get bagels. So we at least did that for my daughter. The place where I did hold the line is on social media. I said, no way, you ’ re not getting social media at least until high school. Both kids, they accepted that. And my daughter, when she was in seventh grade, she said that she was actually glad she wasn ’ t on Instagram because she could see what it does to girls. It ’ s a terrible thing to take 11 and 12-year-old girls and make them be conscious of their face, their skin, their body, constantly, all day long, having people comment on it. It ’ s a horrible thing to do to girls. EH : I want to close on a story that you have told about your son, Max, that I think illustrates the kind of world that you ’ re ultimately advocating for. Tell us about his walks home and what happened eventually. JH : Because my wife and I got to know a woman named Lenore Skenazy, who wrote a book called”Free Range Kids,”I recommend this to everybody,”Free Range Kids.”EH : I do too. I ’ m also a big fan of it. JH : Oh good, good. You said you have three daughters? EH : Yes, and they all walk themselves to school and walk home every day. JH : Fantastic. EH : Good luck to them. I have no idea what ’ s happening in those two or three blocks. JH : And that ’ s really important that you don ’ t have an idea. So because we read Lenore ’ s book and we know her, we encouraged Max to walk to school a year or two before everybody else was walking. And this is in Greenwich Village, right here in New York City. It ’ s a safe neighborhood in terms of crime. But there ’ s some busy streets to cross. But Max is really good at that, as I was when I was seven, eight, nine, 10 years old. So we let him walk to school. And the first time we let him walk, we were terrified. And we were watching the blue dot on the phone because we could track him. The next day we watched again. And I think we might have watched a third day. But here ’ s the thing about anxiety. The way you get rid of it is by exposing yourself to the stimulus and then nothing bad happens and by Pavlovian processes, the anxiety drops. So we trusted him, and he quickly learned the subway system, he ’ s just amazing as a navigator. I think the story you ’ re referring to is that then, when he was 13, he got really into tennis. And I took him to the US Open when he was 12 and then again at 13. And he really wanted to go to a night game. And that would mean he ’ d have to come home very, very late. He loved going out to Queens alone. We let him do that during the day, but he wanted to go out to a night game. And, you know, we were a little nervous about that. But we thought, OK, you know, what would Lenore say? And we said, OK. So he went out and the game, you know, tennis games, sometimes they go really late. This was a really late game. And so he ’ s coming home on the subway. And there ’ s a huge crowd, everyone ’ s happy, they ’ re all out together. He gets on the subway, it comes back. And when he tries to transfer, I forget which line it was, somewhere in Manhattan, you get from Queens into Manhattan, then he had to transfer to go south to Greenwich Village. That train wasn ’ t running. And here it is, it ’ s like one in the morning. And so what does he do? Well he goes upstairs, and he hails a yellow **cab**, which he had never done before. Now I had shown him how to do it, but he ’ d never done it on his own without me. But he just went up, hailed a **cab** and came home. And he was nervous, he was. But that ’ s the thing, because he was nervous, when he succeeded, it just changed him. And this is what I really want to convey. We have to get over our own anxieties and trust our kids to be competent human beings, just as we were at that age. And it ’ s hard at first, but by the third try, it actually gets easy. And then your kids flourish, they grow, they become more confident, and they ’ re going to be much less subject to anxiety disorders if you give them independence. EH : Well, Jon Haidt, those are all the questions that I have for our conversation without the audience. But there are just audience questions piling up. So I ’ m going to jump right into them. The first is,”Is there anything we can do to raise the smartphone issue politically? Because it would be great to know whether politicians around the world would want to address this at a national level?”JH : Yes, this is what ’ s so exciting. This is the least polarized, most bipartisan issue that there is. It ’ s incredible, because wherever you go, red state or blue state, you know, Democrat or Republican in Congress, almost all of them are parents. Most politicians are parents. In so many countries, leaders are getting out in front, and they get massive support. So actually, it ’ s not a risky position. And they ’ re actually making changes. So I ’ d urge everyone, talk to your legislators, let them know you support KOSA, the Kids Online Safety Act. Actually, the Senate passed it almost unanimously. It was like 97 to three. But I ’ m very excited about this. And I think the phone-free schools is the place where it started. A whole bunch of states have already said they ’ re going to go phone-free statewide. Los Angeles School District announced it a month ago ; New York City is going to announce it very soon. So I ’ m actually really optimistic that at least school districts and states are going to go phone-free in school. EH : On the subject of schools, we have a few questions from educators who are on with us. Bradley says,”I ’ m a teacher. How can I implement cell phone restrictions and talk to families about this without sounding too ivory-tower-esque? Or like I ’ m telling parents how to raise their children?”JH : So first let ’ s distinguish between what are you saying about phones in school and what are you saying about phones at home? Now you ’ ve always had the right to talk about what to do at school. Parents respect that. And I guarantee you other teachers in your school and your principal probably are reading about this. So if you raise the subject, if you say,”Hey, can we go phone-free?”you ’ re going to find a lot more support than you expect, because things are really different than they were six months ago. That ’ s the first thing. You can definitely go phone-free in school. We ’ re seeing schools all around the country saying this is such a catastrophe for learning. We see it in test **scores**, we see it in discipline. We ’ re dealing with it at school by going phone-free. Here ’ s the new policy. And in addition, I hope you ’ ll consider rolling back the technology, giving kids a more play-based childhood, not giving them a phone so early. So I think we are seeing that happen. The key, again, is collective **action**. You ’ re going to find a lot more allies now than you would have a year ago. EH : Amber asks,”I am an educator, and I ’ d like to know if Mr. Haidt recommends any specific activities or strategies for educators to help undo some of the negative effects of our students childhoods?”JH : Oh yes, there ’ s an amazingly powerful one which costs zero dollars and is incredibly effective. It ’ s called the”Let Grow Experience.”So I was so taken with Lenore Skenazy ’ s work that I and a few others cofounded an organization called Let Grow. So if you go to letgrow. org, you can sign up, you sign up there to download the kit for the Let Grow experience. You can do this at home too, but it ’ s especially powerful if you do it as a school. So let ’ s imagine a third-grade class. All the third graders, let ’ s say, or second graders say we ’ re doing the Let Grow Experience. So you give them mimeograph, whatever, a printout of the instructions, the kid takes it home. Basically, it ’ s pick something to do by yourself that you ’ ve never done before by yourself. Work it out with your parentsm and then do it. And so it ’ s something like, I ’ ve never walked the dog or I ’ ve never walked to a store, I ’ ve never been out. So, you know, if there ’ s a store that ’ s three blocks away that you ’ re seven or eight-year-old can walk to, that would be an ideal one. But let them pick, you know. So they pick something, and then they do it. And then they come into class. And let ’ s say you do one of these a month, they just say what they did, they put it up on as a leaf on a tree. And if you do it every month for eight months, you get these eight activities that you ’ ve done by yourself. And it ’ s incredibly powerful, because first of all, the kids seem to almost grow taller. They feel much more confident. But the more important effect, or as important, is what it does to the parents. Because the parents are so afraid, like, well, at what age can I let my kid out? I don ’ t know, no one else is doing it until 11, so we don ’ t know. But what happens? Imagine a town in which all the elementary schools are doing this in third grade. Now you ’ ve got eight-year-olds all over the place. They ’ re walking to the store to get milk, they ’ re doing errands, they ’ re outside playing, they ’ re walking the dog. Now adults see eight-year-olds outside, and at that point, people will stop calling the police when they see an eight or nine-year-old outside, which at present some people do because they think it ’ s some horrible, dangerous anomaly. EH : I did get a bunch of texts from other parents when they saw my kids walking to school alone. They were like, are you aware of this? JH : Oh, wow, OK, but look. But this year, things will be different. This year they ’ ll cheer you on and they ’ ll do it themselves. This is the year for collective **action** on all these fronts. EH : Some questions from parents too. Melissa asks about distinguishing, do you distinguish between phones versus iPads? Because iPads can create the same kind of issues, but parents seem to be more OK with iPads or tablets, and some schools actually require them, so I would love your perspective on that. JH : So from the parents ’ point of view, a phone is the worst because it ’ s the most portable. A phone is with you all the time, especially when you ’ re outside the house. My advice is that nobody give a smartphone before high school. An iPad can do all the same stuff as a phone, it ’ s just less portable. So I would say again, don ’ t give your kid their own iPad that they can hold on to and customize and communicate with strangers on and watch porn. Don ’ t do that either until high school. Now for you to have an iPad in the house, your iPad that you give them sometimes, there ’ s all kinds of good stuff that they can do. There ’ s all kinds of good stuff. And also, let me be very clear, stories are good, movies are good. Watching a movie with your kids is great. It ’ s the 15-second videos that have no redeeming value and that I think are really the worst. That ’ s what I ’ ll be studying next. So I would say just be careful of both the addictive nature and the distracting nature of these things. So a screen isn ’ t going to hurt the kid necessarily. But it ’ s the addictive possibilities. EH : Sarah asks, what kind of advice do you have for parents with younger kids if they have already given the kids smartphones? Do you have any advice about the removal process or the weaning? JH : My advice is, if you try to pull it out by yourself, it ’ s going to be very painful. But if you and four other families pull it out at the same time and you give them something in return, it ’ s going to be joyous. Yes, they ’ ll resist, but let ’ s look at the difference. In one case, you gave your kid an iPhone when she was nine and she ’ s now 11. And everyone, everyone has an iPhone, and they ’ re on it all day long. Now if you take your kid off, you ’ re condemning your kid to social death. So that ’ s a very hard situation. But let ’ s suppose you gave your kid a phone when she ’ s nine and now she ’ s 11, and most of her friends are on Instagram too. But you go to – you talk with the parents of her three best friends, and you say,”You know, I think we made a mistake. What do you think?”And if they agree, then what you can do is you can say,”We ’ re taking back the smartphone. Here ’ s a flip phone or a light phone or something else. You ’ ll get a smartphone when you ’ re in high school. You can still do a lot of the same stuff on a computer. You still have a laptop or something. So it ’ s not as though you ’ re not going be able to do these things, but we don ’ t think you should have this with you all the time everywhere. And your three best friends, their families are also doing it. And what we really want is not to take stuff away from you, we really want is for you to have a fantastic childhood. We want you guys to have fun. So we ' re going to start off by saying every Friday, you girls are getting together for a sleepover, you plan it how you want, but we ' re suggesting that every Friday you guys get together, have a sleepover, we ' ll give you money to go places, we want you to be with your friends in the real world."And the more you give them the opportunity to hang out and do things, it ' s not deprivation. It ' s not doors closing, it ' s doors opening. What they ' re most afraid of is being alone, being cut off. So avoid that. EH : Amy asks,"How do I lead by example? I want to be a good role model for my kids, and I acknowledge that I use my own phone too much. I realize I will check my Instagram, then two seconds later, check it again. Why am I checking it again?"she says. But how does she lead by example? JH : So you know, when your kids are infants and toddlers, they are copying you, they ' re looking for examples to copy. So do be careful when you ' re with toddlers. You really need to do a lot of eye contact. Don ' t do the continuous partial attention. Young kids, they really need to develop that sense of mutual gaze and interaction. Teenagers are not really copying you. So I would say insist on really good family **norms** and then honor those **norms**. And that means, like, in my family, we have an absolute rule no phones at the table, no matter how important it is for you to look up this fact relevant to the conversation, don ' t go get your phone and look it up. That ' s just the rule, no phone, we do not bring phones to the table. And they have to be out of the bedroom at a certain time, put them on the counter in the kitchen charging at 10 o ' clock or whatever the time is you pick for your family. So definitely establish family **norms** that you respect and then make those stick. But don ' t expect that your kid is copying you. If you stop checking Instagram all the time, is your kid going to say,"Oh well, I ' ll stop."No, they ' re completely addicted. They ' re socially addicted. They have to do it because everyone else is doing it, not because you ' re doing it. EH : Last couple of questions. Isha asks,"What are the two most essential changes we can implement in our **daily** lives now, so that there will be less damage to our own and younger generations ' mental health?"JH : The number one thing that you can do is regain control of your attention. What I found when I began teaching undergrads is that most of them, not all, but most of them, have given up all of their free attention. If they ' re in the elevator, they ' re doing this because that ' s like 60, 90 seconds, they ' re doing this. They never have a moment to think. They can ' t daydream. They can ' t meditate. And so what I start with at the very beginning of the class is let ' s regain control of your attention. It ' s your most precious commodity. So shut off almost all notifications. Do not get alerts from any newspaper or magazine or anything else. You don ' t need alerts. Move social media off your phone onto your computer only, and then eventually, maybe even off your computer. And a lot of them are gaining three to five hours a day. They ' re regaining three to five hours a day. What do they do? They say,"Now I can do my homework. And it ' s actually not hard anymore. And I have time to read a book or I have time to talk to a friend or I have time to play guitar."So regaining control of your attention is where a lot of this starts. I ' d say read Cal Newport, I assign the book"Deep Work."It ' s a fantastic book, and it ' ll really change the way you see what ' s happening to us adults. EH : OK, let ' s end on a question from Kathleen."Since your book release and tours, so following the release, are you more or less hopeful about your collective **action** proposals catching on?"JH : I am wildly more optimistic. I ' m optimistic by nature, but I ' ve been working on democracy issues since the early 2000s, and I ' m not optimistic there. I mean, the problems are huge, and I don ' t know the answers. And that ' s what my next book is going to be on. But on this one, on can we roll back the phone-based childhood, I was kind of optimistic last year, and now I am just wildly optimistic because it ’ s happening. It ’ s happening at lightning speed. I can ’ t believe how fast it ’ s happening. The number of schools, of states, of countries that have acted in the last six months is mindblowing. I ’ ve never seen anything like it. That ’ s especially the schools and governments. Every day, I ’ m getting emails from parents saying,”Thank you. My friends and I, we did a reading group on the book, and now we ’ re all doing this together. And all the families at the end of our street, and the kids are playing, and they ’ re riding their bicycles.”So it ’ s not as though our children have somehow biologically forgotten how to ride a bicycle. And they ’ re still thrilled to be out from under your thumb. They ’ re thrilled to have some independence. So this is happening. We don ’ t need everybody, but if we get most people, we solve this problem. EH : Thank you for being so witty and wise, Jonathan Haidt. And thank you, TED Members for being here and for your involvement. As a nonprofit organization, all of TED ’ s work is made possible in part by you. So thank you so much to the TED Membership community. And that is it for the Book Club for this time, see you next month. JH : Thanks so much, Elise. Text Sample 196: POS Dim 2 – 2024 – Score 13.00 – 2024/t003109.txt

Wendy Suzuki : It ’ s really about shifting your **mindset** about how you think about anxiety. Most people just want to get rid of all their anxiety, they don ’ t want to think about it, they want to kick it out the door. But anxiety evolved for a reason. Anxiety evolved to help protect us. It is a protective mechanism to shine a little light, say, you should be paying attention to this, you should be paying attention to that. And that is what people need to appreciate. [Intersections] [Dr. Wendy Suzuki : Professor of Neural Science and Psychology, NYU] [Annabel Spring : CEO of Global Private Banking and Wealth, HSBC] WS : So can I tell you why I was so excited to be able to talk to you today? And that is that, as a neuroscientist, I ’ ve spent my whole career studying the brain and what works. But by contrast, I ’ ve ignored certain aspects of my own **financial** well-being. And now I get to sit down with a global banking expert, and I know you ’ re going to reveal secrets that I will be able to decrease my own anxiety. AS : Well, that ’ s a conversation we should definitely have because personal finance is very, very important. And what I would love to hear you talk about is a little bit about how do we get people over that anxiety to actually address their **financial services**. And I think that ’ s really important. So very, very curious to have this conversation. WS : OK, great. AS : But I ’ m curious to talk to you as well, because I went into **financial services** to look after people and to care for people. My passion is actually about people. And I went into **financial services** at first thinking, you know, this is how we help people achieve their hopes and their dreams and their ambitions and also look after their families and their legacies. But what I ’ ve learned in **financial services** is you can ’ t just talk to people about their finances. You actually have to understand the whole person. And a lot of that is the work that you do, whether it ’ s physical fitness or mental wellness or social connectedness or belonging. You know, understanding people in the light of their communities and their personal passions is a huge part of my role but also a huge part of my personal interest. So I ’ m excited to be here. WS : Absolutely, absolutely. I mean, I think we both have really unique perspectives on what makes life worth living. I think what makes a good life is having something that you do that you are just **passionate** about and that you really want to give yourself to. It doesn ' t have to be what you do for a living. It could be giving to the community, giving to your own family. That goal is so important, and we know that that kind of aspiration and the awe that it inspires in you as you think about that, that is releasing dopamine in your brain. That is what brings a lot of **happiness**. Now how do you get there? There is a long road to that that includes you have to be financially able to do that, but it also includes knowing how to regulate your **stress** levels and deal with the increasing levels of **stress** and anxiety in our society today. But also to catch on to those things that bring joy in your life. And I feel like that ' s what I ' ve come to study as a neuroscientist. That is, how to **maximize** joy and those positive emotions and how to better regulate the difficult emotions and use them as signposts towards what you should be paying attention to. AS : You know, it ' s so different. As a banker, when I started to think, you know, what is a good life, you might expect, and I did, my first thought was, OK, consumption levels, income levels, you know, GDP per capita, living standards and all of those thoughts. But then I did turn to where you are, which is, it ' s more subjective. And we found, as a firm, we actually couldn ' t answer that question. So what do you do if you can ' t answer that question? You go out and ask a bunch of people. So we asked 11, 000 people, how do they look at quality of life? What is quality of life for them? And they came back with their top three factors. And I think they ' ll accord a lot with the work that you do. You know, one is physical health, another is mental wellness. And the third is **financial** fitness. And those components are critical to what makes a good life. And now they ' re obviously correlated. So what we saw is for people who are financially fit, you know, they have significantly higher, 30 percent higher, perception of their quality of life. They ' re 20 percent more likely to be physically fit. And they ' re twice as likely to be above the standard or above the average of mental wellness. So you can see that correlation. And sitting back even as a banker, but certainly I thought, gosh, what makes me happy? What makes me happy and having a great day is going for a walk and clearing my head, talking to my husband or my children, or my mom or my friends, knowing that I ' m doing a great job at work and really fulfilling that part of the purpose in my life, whether it ' s at work or in the community. And I know that makes a great day for me, too. WS : Yeah, yeah. Well, you know, you ' re touching on something that we know is so true from neuroscience research. That is, our brains evolved to connect with each other. There are parts of our brains that evolved just to be able for me to be able to appreciate the **expression** on your face, what that means, how you ' re connecting with me. And we all have that. And I think that ' s such an important element to remember when we all spend so much time on our phones, on our computers, even with Zoom, it ' s not the same as this kind of wonderful face-to-face interaction that we ' re able to have today. And asking yourself, is that a good part? Is that a big part of my day? My face-to-face interaction is a really good first question to start asking when you head towards a good life, I think. AS : So I want to scratch into a little bit because just to balance this concept of a good life, these elements of a good life, you know, there ' s a phrase :"Health is wealth."What does that mean to you? WS : I think for me, I would modify that phrase into brain health is wealth. Why? Because the human brain is the most complex structure known to humankind, and it defines everything about us : our sense of humor, how we converse with each other, whether we ' re more introverts or extroverts. It has to do with the connectivity of our own brains. And so I say brain health is wealth, because the healthier that your brain is – How do we make the brain healthy? With good sleep, with good food, with good social connections, with minimizing, though not eliminating all **stress**. Because **stress** can be good, it drives you towards the things that you want to achieve. That will give you the longest possible healthy, good, positive cognitive life that you could have. So for me, brain health is wealth. And I define wealth as that long, good cognitive life. AS : See, I think the long life concept is really important. So when I look at that phrase, I think about longevity. And I think, you know, back in the ' 50s globally, we had a life expectancy of around 47, which is shocking. And now we ' re up in the 70s, which is a huge advantage. So we have a much longer lifespan. But when we look at health span, still about a fifth of your life you ' re living with illness. And that means we ' re actually living longer with sickness, which is a very challenging thing to recognize. So I think the first factor is absolutely everything that you say, which is what can we do to ameliorate that and making sure that we stay healthy? And, you know, there ' s a dreadful investment analogy which I will use, which is your health is your only personal asset. It ' s not transferable, it ' s not diversifiable, there are no alternatives. It ' s your most important asset, and it ' s intangible. And you ' ve got to look after it. But there ' s some **financial** implications of that as well, which is if we ' re talking about living longer while we ' re sick, we need to actually have some longevity literacy and realize that we ' re going to live longer, we need to save and invest and plan for that. And if some of that ' s going to be while we ' re sick, we actually need to make sure that we can fund our sickness as well and make sure that we have a quality of life while we ' re sick. And that obviously is pure savings and investments. But then it gets into protection, whether that ' s health insurance, to allow people to bounce back and progress forward. Because life is never a straight line, you know, you never know quite when you might get sick and you might not be at retirement, it might be before that. So making sure that you have health insurance to get that bounce back, and then life insurance for peace of mind to look after your family should anything awful happen. So I look at"Health is wealth,"and I think, ooh, longevity, health span, savings and investments to make sure that you can look after yourself and insurance so that you can bounce back and you can look after your family. WS : You make it sound so clear and easy, but it ' s very scary for somebody thinking about that. You know how long, how much do I need? And what do we know. I mean what would you say to somebody who listens to that and say, oh gosh, I ' m not sure exactly what to do. Who should they go to? AS : Do your reading online. There ' s a lot of education online, a lot of **financial** education online. And there are even some digital tools now where you can look at, you can outline what your goals are and save for each of those goals individually. And have that looked at. And I think there are some tremendous tools for **financial** fitness. And the first step is curiosity and asking that question. And the second step is education and having the conversation. But please don ' t forget to act on it. Making sure that you save and invest is really important with a little bit of protection. WS : Well, I mean, we talked about long-term fitness and **financial** fitness, but I wanted to ask you about your own personal fitness. Because long-term health is so important for our long-term wealth. What has been your personal history with physical fitness? AS : I wouldn ' t be sitting here right now if it wasn ' t for fitness, exercise and sport. I am a huge proponent of team sports for girls. Team sports for girls is a great – actually, there ' s a Deloitte study about it – team sports for girls gives you team building, problem solving, leadership skills, understanding other people, **empathy**, how to win, how to lose, how to compete and the rules of the game. And I think that ' s a tremendous thing. I was a rower, I was a swimmer, I was an athlete. I ' ve seen it in my sister, my mother and my children. And I think that team sports for girls just sets you up for life. That being said, right now I travel globally. Team sports is not where it ’ s at. But I love to swim, so my personal adventure in every city I go to is to find somewhere to swim. So it might be a lake in Switzerland, it might be, you know, the beach in Asia. On the weekends, though, it ’ s my local public pool in London with a bunch of wonderful ladies. We get there at seven, we have a swim, and then we have a big giggle and a coffee afterwards. WS : Oh, that sounds great. You know, I grew up in California. Outside, I played tennis, I was on basketball teams and softball teams, so I grew up in the same way you did with that team-sport mentality and learned so much from it. But it took a big lesson, a big kind of kick in the pants, if you will, for me to really realize how important exercise was. And this was a moment when I was trying to get tenure at New York University, which is a very, very difficult thing to do. And my strategy wasn ’ t optimal, I decided to do nothing else but work for six years. I could do it for six years. And I tried and didn ’ t do so well and was not very happy and didn ’ t have a lot of social life and was eating way too much takeout. And discovered that going on a river rafting trip to the wilds of deepest Peru, I felt so good. And I thought, my gosh, what ’ s happening here? And it actually changed my whole research direction. I started to study the effects of physical activity in the brain, and now I can tell you exactly what was happening to my brain. So my workaholic brain was being infused on this river rafting trip with a whole bunch of neurochemicals, including dopamine, serotonin, noradrenaline. As your brain is in your morning London swims, I like to call it a bubble bath of neurochemicals that make you feel good. It gives you an immediate mood boost, it gives you an immediate focus boost. So when you go back into work, you can focus on what you need to do. It changed my life, and it changed my research towards that to try and understand what is that prescription? What should we all be doing at different ages? And so yes, I am a big proponent of exercise. And of course I try and do what I preach and do what I study. So even this morning, we had to get in here pretty early. I got in a good 20-minute yoga workout. AS : I ’ m impressed, and it sounds like you enjoy it. How do you link that concept of play and fun to a good life? WS : So, you know, I have come to realize that finding my own joy, what I love to do is so important. And yes, I stuck with my workouts after, you know, trying to work so hard to get tenure because I found things that were fun. I love dance classes, I love this workout called intenSati that combines physical movements from kickbox and dance and yoga with positive spoken affirmations. So you ’ d have to yell out in class,”I am strong now, I believe I will succeed.”And once you get over the awkwardness of yelling things out with a whole bunch of other sweaty, affirmation-yelling people, it feels so good to just get it out of your system and yell with everybody else in unison, with the music, in rhythm. It ’ s a little bit like singing together in a sweaty chorus. It ’ s great. I love it. And so that made me realize that there were so many other things that I hadn ’ t even discovered that could bring that kind of joy into my life. And that ’ s what I look for. AS : So that sounds like a really connected experience and giving you that sense of belonging. One of the things that we see is being part of the community and social connectedness really increases people ’ s quality of life. You know, in fact, two times. Can you talk a little bit about how you see that through your work? WS : Well, I can turn to the research literature. The longest study on **happiness** that has ever been done is still ongoing at Harvard, and now is run by Professor Robert Waldinger at Harvard. And they asked : What makes a happy life? And the answer was the more social connections that you had. They didn ’ t have to be deep ones that you, you know, give presents to at Christmas every year. That included a friendly interaction with the barista at Starbucks. That counts. The more you had, the happier you were in life. And it goes back to the evolution of our human brain, that we have so many areas evolved to help us figure out how to have these social interactions. It ’ s because that social connection is so important to us, not that every social connection is positive. There are, you know, difficult social connections too. But that is the crux of what makes us human. And we know that the more positive ones that you could create in your world, the happier you ’ ll be. So that ’ s a pretty simple formula that anybody can use today. Can I say hello in a more friendly way to more people? That ’ s going to increase your **happiness**. And I love that because it ’ s doable for anybody, anywhere. AS : Yeah, it ’ s so true. You know, some of the saddest conversations that I occasionally have with some of our wealthier clients are people who have really separated, they ’ ve focused so much on one thing in their life that they haven ’ t spent time with friends or family or their community. And as they ’ ve aged, you know, they ’ ve left work and suddenly, they ’ re more alone. And the statistics that we see is that a third of older people over 65 really do experience a much greater sense of loneliness. And as we look around the world, that seems to be true, whether it ’ s in the UK or in China or here in the United States. And I think it ’ s incumbent on all of us, whether it ’ s **financial services** institutions or universities or governments, to find a way to address that and keep those people engaged in the community. WS : So I ’ m a professor at New York University, and I think everybody can relate to the anxiety of you have a question, but do you really want to raise your hand and ask it in front of the whole class? I had that same anxiety through my entire educational experience. But I went into **academia**. So one day I found myself at the front of the classroom, and I knew that 80 percent of those students had questions for me. But, you know, were anxious about doing that. And so I used that knowledge about my own anxiety to **relieve** their anxiety. So I came early and I stayed late, and I answered any questions. I just hung out by myself so they could come up and ask me. And I realized that was a superpower of my own anxiety. That I turned my own anxiety, and I turned it on the outside. And I made it an act of compassion or **empathy** to make sure that everybody could ask the question. And it ’ s not just this, take your biggest anxiety. Take your **financial** anxiety. You know, can you have a conversation? If you had a great conversation with your banker and you learned a great banking trick that **relieved** that anxiety, can you share it with people? So I think that is a wonderful way to take the resolution of your anxiety and help others with it. And that ’ s also a form of generosity. AS : It ’ s fascinating. So how do we take that anxiety then and turn it into a good thing? WS : Yeah. AS : And we could take the **financial** anxiety or any other anxiety. How do people feel that? And I think in your book you talked about anxiety as a **warning** sign. That it ’ s something that maybe you should be dealing with. How do we get people to use that and to act on it? WS : That ’ s such a good question. And it ’ s really about shifting your **mindset** about how you think about anxiety. Most people just want to get rid of all their anxiety. They don ’ t want to think about it, they want to kick it out the door. But anxiety evolved for a reason. Anxiety evolved to help protect us. It is a protective mechanism. To shine a little light, say, you should be paying attention to this, you should be paying attention to that. And that is what people need to appreciate. Think about, do you lay awake at night thinking,”Oh my God, I didn ’ t get to watch that last series on Netflix. I ’ m so worried about that.”No, you don ’ t worry about that. You worry about your work, your finances, your relationships. These are things that matter to you. And so what your anxiety is doing is really showing you what matters most. And actually going back to our first question, what makes a good life for you. If you flip it that way and start to use your anxiety as a signpost to realize it is helping to protect you from things that could be a danger, then it becomes a tool that you can use to order what you ’ re going to do in your day and in your week and in the next year. AS : That ’ s fantastic. So anxiety as an opportunity alerter and a risk management. That ’ s an absolutely fantastic thing. WS : I mean, in a sense, bankers are your anxiety detectors for your finances. This is what they know in great detail, what you should be looking for. And they cut that off at the pass and give you tools to be able not to worry about that. And I say that, I talk a lot about my own **financial** anxieties in the book, because it ’ s not just mine, it ’ s everybody ’ s. Everybody ’ s worried about finances. No matter who you are. Are you doing it the right way? Are you investing? What is investing? Start with the basics. So it ’ s such an important one to appreciate, how you can flip the script and use it to your advantage. AS : Now we recognize that unfortunately for all of us, two out of five of us will find some period of **financial** instability in life. You know, we ’ ll lose our jobs, our children will get sick, we might get sick. So understanding and having the **financial** literacy to understand that that might happen and thinking through ahead of time what might I need to prepare for that is also really important. So that cash on hand, or if you do have the ability, a little bit of insurance to cover some of those things, really, really important. But again, going back to our conversation on curiosity, making sure that you ’ ve taken advantage of the digital tools, the planning tools, there are so many goal **planners** and trackers and budgeting tools online. Almost all banks provide them. And certainly we do. Have a look at them and really just get financially educated, because I think that **relieves** a lot of the anxiety. It really does. WS : No, I think that will help a lot of people. It made my shoulders go down. There you go. AS : So I was really curious, world-famous neuroscientist, what is the one thing that we should all be doing for our brain every day? What should we be doing? WS : I ’ m going to say : moving your body. Just 10 minutes of walking, that everybody anywhere could do, decreases your anxiety and depression levels because you are flooding your brain, even with a 10-minute walk, with this neurochemical bubble bath of dopamine, serotonin, noradrenaline. And then think about what that does, that bubble bath of neurochemicals, if you do it regularly, not just for a day, but over weeks, over months, over years. You are literally giving your brain not only good neurochemicals but growth factors. You are making it, as I like to say, big and fat and fluffy. And for this you can start any time. Maybe you ’ re a couch potato until you ’ re 75. Guess what? You get up and start walking, you get that bubble bath. So moving your body is my answer to that question. So for you, I would love to ask a more long-term question. What advice would you give to young people about how to start planning their **financial** future? AS : To get ahead as a young person, you ’ ve got to get started. It ’ s as simple as that. You ’ ve got to get started. So what am I saying to get started by doing, you ’ ve got to start to save and invest. Early and often. And it ’ s not complicated, it ’ s not rocket science. On the saving side, it ’ s the power of compounding interest. And on the investing side, it ’ s time in the market rather than timing the market. So just put your money in the market and get started. That ’ s the most important thing to do to start. Now if I were looking at my children, I would also say : and pay down that expensive credit card debt, please, because there ’ s not much point investing if you ’ re paying significant charges on expensive debt. So make sure that that ’ s gone. And once you ’ ve got that started, that ’ s a wonderful thing. And we ’ re seeing actually that the generations are starting earlier and earlier. So Gen Z, they ’ re starting in their early 20s. The millennials started in their mid-20s. Gen X, we started in our early 30s. The boomers in their mid-30s. So they ’ re starting earlier, that ’ s fantastic. And I think some of that ’ s technology, and some of that ’ s realizing that now you can start saving and investing with less. You don ’ t have to have a lot of money. Just put away a little bit. Make sure that you ’ re consistently putting away a little bit, so you get the benefit of that time in the market and that compounding. Now as you get older, obviously you ' ve got to make a plan. You ' ve got to make sure that you can pay for that first apartment, that you can start to think about paying for the other expensive things in your life. And, you know, people like me, you ' ve got to make sure that you can pay for those college fees. These are things you ' ve got to save for as well as your retirement. And just a shout out for women in particular, given I ' m looking at you, you know this, you ' re going to live longer. Sadly, statistically, women are going to earn less. So it ' s even more important for women not to just think about their children and what they need now, but to make sure that women also save for retirement. Because you ' re going to be retiring for longer. You want to make sure that you ' ve thought that through, and you ' ve really got the longevity literacy to think through,"I ' ve got to make sure that I ' ve got a plan."WS : Great. I think that ' s so important. And it ' s so great that there ' s so many different options out there now. AS : But the most important thing is starting and staying curious. Because your needs will change. And whether you learn digitally or you learn talking to people, it doesn ' t matter. Stay curious, stay engaged and start. WS : You know, that ' s so funny because that ' s exactly the recommendation that I give about brain health. Stay curious about your brain health. Stay curious about : What is the effect of sleep on my brain? What is the effect of alcohol on my sleep and then on my brain? If I do the movement that Wendy says to do, do I feel a difference? And you will. And that kind of self-experimentation is equally true for your brain and body health as it is for your **financial** health, it seems. And that key is really the curiosity of, maybe I could ask this person. Maybe I could explore, not just sleep and movement but maybe meditation is good. Is there information about that? Yes, meditation is wonderful. It ' s a destressing tool. But it ' s so interesting to see that the same tools that are so valuable for good **financial** health are also so valuable for good brain and body health as well. AS : And I think it ameliorates that uncertainty. You know, you talk about anxiety and uncertainty. The more curious you are, the more you know, the less you feel that uncertainty and the less anxiety I think you feel. WS : Thank you so much for this conversation. I ' ve learned so much, and my anxiety level around finances has significantly decreased. What a pleasure to speak to you today. AS : It ' s been such a pleasure, I can ' t tell you. I will be going out, I will be exercising more and moving towards that big, fat, fluffy brain. It sounds fantastic. Thank you so much.

Text Sample 197: POS Dim 2 – 2019 – Score 14.00 – 2019/t002063.txt

Chris Anderson : What worries you right now? You ' ve been very open about lots of issues on Twitter. What would be your top worry about where things are right now? Jack Dorsey : Right now, the health of the conversation. So, our purpose is to serve the public conversation, and we have seen a number of attacks on it. We ' ve seen abuse, we ' ve seen harassment, we ' ve seen manipulation, automation, human coordination, misinformation. So these are all dynamics that we were not expecting 13 years ago when we were starting the company. But we do now see them at scale, and what worries me most is just our ability to address it in a systemic way that is scalable, that has a rigorous understanding of how we ' re taking **action**, a transparent understanding of how we ' re taking **action** and a rigorous appeals process for when we ' re wrong, because we will be wrong. Whitney Pennington Rodgers : I ' m really glad to hear that that ' s something that concerns you, because I think there ' s been a lot written about people who feel they ' ve been abused and harassed on Twitter, and I think no one more so than women and women of color and black women. And there ' s been data that ' s come out — Amnesty International put out a report a few months ago where they showed that a subset of active black female Twitter users were receiving, on average, one in 10 of their **tweets** were some form of harassment. And so when you think about health for the community on Twitter, I ' m interested to hear,"health for everyone,"but specifically : How are you looking to make Twitter a safe space for that subset, for women, for women of color and black women? JD : Yeah. So it ' s a pretty terrible situation when you ' re coming to a **service** that, ideally, you want to learn something about the world, and you spend the majority of your time reporting abuse, receiving abuse, receiving harassment. So what we ' re looking most deeply at is just the incentives that the **platform** naturally provides and the **service** provides. Right now, the dynamic of the system makes it super-easy to harass and to abuse others through the **service**, and unfortunately, the majority of our system in the past worked entirely based on people reporting harassment and abuse. So about midway last year, we decided that we were going to apply a lot more machine learning, a lot more deep learning to the problem, and try to be a lot more proactive around where abuse is happening, so that we can take the burden off the victim completely. And we ' ve made some progress recently. About 38 percent of abusive **tweets** are now proactively identified by machine learning algorithms so that people don ' t actually have to report them. But those that are identified are still reviewed by humans, so we do not take down content or accounts without a human actually reviewing it. But that was from zero percent just a year ago. So that meant, at that zero percent, every single person who received abuse had to actually report it, which was a lot of work for them, a lot of work for us and just ultimately unfair. The other thing that we ' re doing is making sure that we, as a company, have representation of all the communities that we ' re trying to serve. We can ' t build a business that is successful unless we have a diversity of perspective inside of our walls that actually feel these issues every single day. And that ' s not just with the team that ' s doing the work, it ' s also within our leadership as well. So we need to continue to build **empathy** for what people are experiencing and give them better tools to act on it and also give our customers a much better and easier approach to handle some of the things that they ' re seeing. So a lot of what we ' re doing is around technology, but we ' re also looking at the incentives on the **service** : What does Twitter incentivize you to do when you first open it up? And in the past, it ' s incented a lot of outrage, it ' s incented a lot of mob behavior, it ' s incented a lot of group harassment. And we have to look a lot deeper at some of the fundamentals of what the **service** is doing to make the bigger shifts. We can make a bunch of small shifts around technology, as I just described, but ultimately, we have to look deeply at the dynamics in the network itself, and that ' s what we ' re doing. CA : But what ' s your sense — what is the kind of thing that you might be able to change that would actually fundamentally shift behavior? JD : Well, one of the things — we started the **service** with this concept of following an account, as an example, and I don ' t believe that ' s why people actually come to Twitter. I believe Twitter is best as an interest-based network. People come with a particular interest. They have to do a ton of work to find and follow the related accounts around those interests. What we could do instead is allow you to follow an interest, follow a hashtag, follow a trend, follow a community, which gives us the opportunity to show all of the accounts, all the topics, all the moments, all the hashtags that are associated with that particular topic and interest, which really opens up the perspective that you see. But that is a huge fundamental shift to **bias** the entire network away from just an account **bias** towards a topics and interest **bias**. CA : Because isn ’ t it the case that one reason why you have so much content on there is a result of putting millions of people around the world in this kind of gladiatorial contest with each other for followers, for attention? Like, from the point of view of people who just read Twitter, that ’ s not an issue, but for the people who actually create it, everyone ’ s out there saying,”You know, I wish I had a few more ’ likes, ’ followers, retweets.”And so they ’ re constantly experimenting, trying to find the path to do that. And what we ’ ve all discovered is that the number one path to do that is to be some form of provocative, obnoxious, eloquently obnoxious, like, eloquent insults are a dream on Twitter, where you rapidly pile up — and it becomes this self- fueling process of driving outrage. How do you defuse that? JD : Yeah, I mean, I think you ’ re spot on, but that goes back to the incentives. Like, one of the choices we made in the early days was we had this number that showed how many people follow you. We decided that number should be big and **bold**, and anything that ’ s on the page that ’ s big and **bold** has importance, and those are the things that you want to drive. Was that the right decision at the time? Probably not. If I had to start the **service** again, I would not emphasize the follower count as much. I would not emphasize the”like”count as much. I don ’ t think I would even create”like”in the first place, because it doesn ’ t actually push what we believe now to be the most important thing, which is healthy contribution back to the network and conversation to the network, participation within conversation, learning something from the conversation. Those are not things that we thought of 13 years ago, and we believe are extremely important right now. So we have to look at how we display the follower count, how we display retweet count, how we display”likes,”and just ask the deep question : Is this really the number that we want people to drive up? Is this the thing that, when you open Twitter, you see,”That ’ s the thing I need to increase?”And I don ’ t believe that ’ s the case right now. WPR : I think we should look at some of the **tweets** that are coming in from the audience as well. CA : Let ’ s see what you guys are asking. I mean, this is — generally, one of the amazing things about Twitter is how you can use it for crowd wisdom, you know, that more knowledge, more questions, more points of view than you can imagine, and sometimes, many of them are really healthy. WPR : I think one I saw that passed already quickly down here,”What ’ s Twitter ’ s plan to combat foreign meddling in the 2020 US election?”I think that ’ s something that ’ s an issue we ’ re seeing on the internet in general, that we have a lot of malicious automated activity happening. And on Twitter, for example, in fact, we have some work that ’ s come from our friends at Zignal Labs, and maybe we can even see that to give us an example of what exactly I ’ m talking about, where you have these bots, if you will, or coordinated automated malicious account activity, that is being used to influence things like elections. And in this example we have from Zignal which they ’ ve shared with us using the data that they have from Twitter, you actually see that in this case, white represents the humans — human accounts, each dot is an account. The pinker it is, the more automated the activity is. And you can see how you have a few humans interacting with bots. In this case, it ’ s related to the election in Israel and spreading misinformation about Benny Gantz, and as we know, in the end, that was an election that Netanyahu won by a slim margin, and that may have been in some case influenced by this. And when you think about that happening on Twitter, what are the things that you ’ re doing, specifically, to ensure you don ’ t have misinformation like this spreading in this way, influencing people in ways that could affect democracy? JD : Just to back up a bit, we asked ourselves a question : Can we actually measure the health of a conversation, and what does that mean? And in the same way that you have indicators and we have indicators as humans in terms of are we healthy or not, such as temperature, the flushness of your face, we believe that we could find the indicators of conversational health. And we worked with a lab called Cortico at MIT to propose four starter indicators that we believe we could ultimately measure on the system. And the first one is what we ' re calling shared attention. It ' s a measure of how much of the conversation is attentive on the same topic versus disparate. The second one is called shared reality, and this is what percentage of the conversation shares the same facts — not whether those facts are truthful or not, but are we sharing the same facts as we converse? The third is receptivity : How much of the conversation is receptive or civil or the inverse, toxic? And then the fourth is variety of perspective. So, are we seeing filter bubbles or echo chambers, or are we actually getting a variety of opinions within the conversation? And implicit in all four of these is the understanding that, as they increase, the conversation gets healthier and healthier. So our first step is to see if we can measure these online, which we believe we can. We have the most momentum around receptivity. We have a toxicity **score**, a toxicity model, on our system that can actually measure whether you are likely to walk away from a conversation that you ' re having on Twitter because you feel it ' s toxic, with some pretty high degree. We ' re working to measure the rest, and the next step is, as we build up solutions, to watch how these measurements trend over time and continue to experiment. And our goal is to make sure that these are balanced, because if you increase one, you might decrease another. If you increase variety of perspective, you might actually decrease shared reality. CA : Just picking up on some of the questions flooding in here. JD : Constant questioning. CA : A lot of people are puzzled why, like, how hard is it to get rid of Nazis from Twitter? JD : So we have policies around violent extremist groups, and the majority of our work and our terms of **service** works on conduct, not content. So we ' re actually looking for conduct. Conduct being using the **service** to repeatedly or episodically harass someone, using hateful imagery that might be associated with the KKK or the American Nazi Party. Those are all things that we act on immediately. We ' re in a situation right now where that term is used fairly loosely, and we just cannot take any one mention of that word accusing someone else as a factual indication that they should be removed from the **platform**. So a lot of our models are based around, number one : Is this account associated with a violent extremist group? And if so, we can take **action**. And we have done so on the KKK and the American Nazi Party and others. And number two : Are they using imagery or conduct that would associate them as such as well? CA : How many people do you have working on content moderation to look at this? JD : It varies. We want to be flexible on this, because we want to make sure that we ' re, number one, building algorithms instead of just hiring massive amounts of people, because we need to make sure that this is scalable, and there are no amount of people that can actually scale this. So this is why we ' ve done so much work around proactive detection of abuse that humans can then review. We want to have a situation where algorithms are constantly scouring every single **tweet** and bringing the most interesting ones to the top so that humans can bring their judgment to whether we should take **action** or not, based on our terms of **service**. WPR : But there ' s not an amount of people that are scalable, but how many people do you currently have monitoring these accounts, and how do you figure out what ' s enough? JD : They ' re completely flexible. Sometimes we associate folks with spam. Sometimes we associate folks with abuse and harassment. We ' re going to make sure that we have flexibility in our people so that we can direct them at what is most needed. Sometimes, the elections. We ' ve had a string of elections in Mexico, one coming up in India, obviously, the election last year, the midterm election, so we just want to be flexible with our resources. So when people — just as an example, if you go to our current terms of **service** and you bring the page up, and you ’ re wondering about abuse and harassment that you just received and whether it was against our terms of **service** to report it, the first thing you see when you open that page is around intellectual property protection. You **scroll** down and you get to abuse, harassment and everything else that you might be experiencing. So I don ’ t know how that happened over the company ’ s history, but we put that above the thing that people want the most information on and to actually act on. And just our ordering shows the world what we believed was important. So we ’ re changing all that. We ’ re ordering it the right way, but we ’ re also simplifying the rules so that they ’ re human-readable so that people can actually understand themselves when something is against our terms and when something is not. And then we ’ re making — again, our big focus is on removing the burden of work from the victims. So that means push more towards technology, rather than humans doing the work — that means the humans receiving the abuse and also the humans having to review that work. So we want to make sure that we ’ re not just encouraging more work around something that ’ s **super**, **super** negative, and we want to have a good balance between the technology and where humans can actually be creative, which is the judgment of the rules, and not just all the mechanical stuff of finding and reporting them. So that ’ s how we think about it. CA : I ’ m curious to dig in more about what you said. I mean, I love that you said you are looking for ways to re-tweak the fundamental design of the system to discourage some of the reactive behavior, and perhaps — to use Tristan Harris-type language — engage people ’ s more reflective thinking. How far advanced is that? What would alternatives to that”like”button be? JD : Well, first and foremost, my personal goal with the **service** is that I believe fundamentally that public conversation is critical. There are existential problems facing the world that are facing the entire world, not any one particular nation-state, that global public conversation benefits. And that is one of the unique dynamics of Twitter, that it is completely open, it is completely public, it is completely fluid, and anyone can see any other conversation and participate in it. So there are conversations like climate change. There are conversations like the displacement in the work through artificial intelligence. There are conversations like economic disparity. No matter what any one nation-state does, they will not be able to solve the problem alone. It takes coordination around the world, and that ’ s where I think Twitter can play a part. The second thing is that Twitter, right now, when you go to it, you don ’ t necessarily walk away feeling like you learned something. Some people do. Some people have a very, very rich network, a very rich community that they learn from every single day. But it takes a lot of work and a lot of time to build up to that. So we want to get people to those topics and those interests much, much faster and make sure that they ’ re finding something that, no matter how much time they spend on Twitter — and I don ’ t want to **maximize** the time on Twitter, I want to **maximize** what they actually take away from it and what they learn from it, and — CA : Well, do you, though? Because that ’ s the core question that a lot of people want to know. Surely, Jack, you ’ re constrained, to a huge extent, by the fact that you ’ re a public company, you ’ ve got investors pressing on you, the number one way you make your money is from advertising — that depends on user engagement. Are you willing to sacrifice user time, if need be, to go for a more reflective conversation? JD : Yeah ; more relevance means less time on the **service**, and that ’ s perfectly fine, because we want to make sure that, like, you ’ re coming to Twitter, and you see something immediately that you learn from and that you push. We can still serve an **ad** against that. That doesn

’ t mean you need to spend any more time to see more. The second thing we ’ re looking at — CA : But just — on that goal, **daily** active usage, if you ’ re measuring that, that doesn ’ t necessarily mean things that people value every day. It may well mean things that people are drawn to like a moth to the flame, every day. We are addicted, because we see something that pisses us off, so we go in and add fuel to the fire, and the **daily** active usage goes up, and there ’ s more **ad** revenue there, but we all get angrier with each other. How do you define...”**Daily** active usage”seems like a really dangerous term to be optimizing. JD : Taken alone, it is, but you didn ’ t let me finish the other metric, which is, we ’ re watching for conversations and conversation chains. So we want to incentivize healthy contribution back to the network, and what we believe that is is actually participating in conversation that is healthy, as defined by those four indicators I articulated earlier. So you can ’ t just optimize around one metric. You have to balance and look constantly at what is actually going to create a healthy contribution to the network and a healthy experience for people. Ultimately, we want to get to a metric where people can tell us,”Hey, I learned something from Twitter, and I ’ m walking away with something valuable.”That is our goal ultimately over time, but that ’ s going to take some time. CA : You come over to many, I think to me, as this enigma. This is possibly unfair, but I woke up the other night with this picture of how I found I was thinking about you and the situation, that we ’ re on this great voyage with you on this ship called the”Twittanic”— and there are people on board in steerage who are expressing discomfort, and you, unlike many other captains, are saying,”Well, tell me, talk to me, listen to me, I want to hear.”And they talk to you, and they say,”We ’ re worried about the iceberg ahead.”And you go,”You know, that is a powerful point, and our ship, frankly, hasn ’ t been built properly for steering as well as it might.”And we say,”Please do something.”And you go to the bridge, and we ’ re waiting, and we look, and then you ’ re showing this extraordinary calm, but we ’ re all standing outside, saying,”Jack, turn the fucking wheel!”You know? I mean — It ’ s democracy at stake. It ’ s our culture at stake. It ’ s our world at stake. And Twitter is amazing and shapes so much. It ’ s not as big as some of the other **platforms**, but the people of influence use it to set the agenda, and it ’ s just hard to imagine a more important role in the world than to... I mean, you ’ re doing a brilliant job of listening, Jack, and hearing people, but to actually dial up the urgency and move on this stuff — will you do that? JD : Yes, and we have been moving substantially. I mean, there ’ s been a few dynamics in Twitter ’ s history. One, when I came back to the company, we were in a pretty dire state in terms of our future, and not just from how people were using the **platform**, but from a corporate narrative as well. So we had to fix a bunch of the foundation, turn the company around, go through two crazy layoffs, because we just got too big for what we were doing, and we focused all of our energy on this concept of serving the public conversation. And that took some work. And as we dived into that, we realized some of the issues with the fundamentals. We could do a bunch of superficial things to address what you ’ re talking about, but we need the changes to last, and that means going really, really deep and paying attention to what we started 13 years ago and really questioning how the system works and how the framework works and what is needed for the world today, given how quickly everything is moving and how people are using it. So we are working as quickly as we can, but quickness will not get the job done. It ’ s focus, it ’ s prioritization, it ’ s understanding the fundamentals of the network and building a framework that scales and that is resilient to change, and being open about where we are and being transparent about where are so that we can continue to earn trust. So I ’ m proud of all the frameworks that we ’ ve put in place. I ’ m proud of our direction. We obviously can move faster, but that required just stopping a bunch of stupid stuff we were doing in the past. CA : All right. Well, I suspect there are many people here who, if given the chance, would love to help you on this change-making agenda you ’ re on, and I don ’ t know if Whitney — Jack, thank you for coming here and speaking so openly. It took courage. I really appreciate what you said, and good luck with your **mission**. JD : Thank you so much. Thanks for having me. Thank you.

I bring you greetings from the 52nd-freest nation on earth. As an American, it irritates me that my nation keeps sinking in the annual rankings published by Freedom House. I ’ m the son of immigrants. My parents were born in China during war and revolution, went to Taiwan and then came to the United States, which means all my life, I ’ ve been acutely aware just how fragile an inheritance freedom truly is. That ’ s why I spend my time teaching, preaching and **practicing** democracy. I have no illusions. All around the world now, people are doubting whether democracy can deliver. Autocrats and demagogues seem emboldened, even cocky. The free world feels leaderless. And yet, I remain hopeful. I don ’ t mean optimistic. Optimism is for spectators. Hope implies agency. It says I have a hand in the outcome. Democratic hope requires faith not in a strongman or a charismatic savior but in each other, and it forces us to ask : How can we become **worthy** of such faith? I believe we are at a moment of moral awakening, the kind that comes when old certainties collapse. At the heart of that awakening is what I call”civic religion.”And today, I want to talk about what civic religion is, how we **practice** it, and why it matters now more than ever. Let me start with the what. I define civic religion as a system of shared beliefs and collective **practices** by which the members of a self-governing community choose to live like citizens. Now, when I say”citizen”here, I ’ m not referring to papers or passports. I ’ m talking about a deeper, broader, ethical conception of being a contributor to community, a member of the body. To speak of civic religion as religion is not poetic **license**. That ’ s because democracy is one of the most faith-fueled human activities there is. Democracy works only when enough of us believe democracy works. It is at once a gamble and a miracle. Its legitimacy comes not from the outer frame of constitutional rules, but from the inner workings of civic spirit. Civic religion, like any religion, contains a sacred creed, sacred deeds and sacred rituals. My creed includes words like”equal protection of the laws”and”we the people.”My roll call of hallowed deeds includes abolition, women ’ s suffrage, the civil rights movement, the Allied landing at Normandy, the fall of the Berlin Wall. And I have a new civic ritual that I ’ ll tell you about in a moment. Wherever on earth you ’ re from, you can find or make your own set of creed, deed and ritual. The **practice** of civic religion is not about worship of the state or obedience to a ruling party. It is about commitment to one another and our common ideals. And the sacredness of civic religion is not about divinity or the supernatural. It is about a group of unlike people speaking into being our alikeness, our groupness. Perhaps now you ’ re getting a little worried that I ’ m trying to sell you on a cult. Relax, I ’ m not. I don ’ t need to sell you. As a human, you are always in the market for a cult, for some variety of religious experience. We are wired to seek cosmological explanations, to sacralize beliefs that unite us in transcendent purpose. Humans make religion because humans make groups. The only choice we have is whether to activate that groupness for good. If you are a devout person, you know this. If you are not, if you no longer go to prayer

services or never did, then perhaps you ’ ll say that yoga is your religion, or Premier League football, or knitting, or coding or TED Talks. But whether you believe in a God or in the absence of gods, civic religion does not require you to renounce your beliefs. It requires you only to show up as a citizen. And that brings me to my second topic : how we can **practice** civic religion productively. Let me tell you now about that new civic ritual. It ’ s called”Civic Saturday,”and it follows the arc of a faith gathering. We sing together, we turn to the strangers next to us to discuss a common question, we hear poetry and scripture, there ’ s a sermon that ties those texts to the ethical choices and controversies of our time, but the song and scripture and the sermon are not from church or synagogue or mosque. They are civic, drawn from our shared civic ideals and a shared history of claiming and contesting those ideals. Afterwards, we form up in circles to organize rallies, register voters, join new clubs, make new friends. My colleagues and I started organizing Civic Saturdays in Seattle in 2016. Since then, they have spread across the continent. Sometimes hundreds attend, sometimes dozens. They happen in libraries and community centers and coworking spaces, under festive tents and inside great halls. There ’ s nothing high-tech about this social technology. It speaks to a basic human yearning for face-to- face fellowship. It draws young and old, left and right, poor and rich, churched and unchurched, of all races. When you come to a Civic Saturday and are invited to discuss a question like”Who are you responsible for?”or”What are you willing to risk or to give up for your community?”When that happens, something moves. You are moved. You start telling your story. We start actually seeing one another. You realize that homelessness, gun violence, gentrification, terrible traffic, mistrust of newcomers, fake news — these things aren ’ t someone else ’ s problem, they are the aggregation of your own habits and omissions. Society becomes how you behave. We are never asked to reflect on the content of our citizenship. Most of us are never invited to do more or to be more, and most of us have no idea how much we crave that invitation. We ’ ve since created a civic seminary to start training people from all over to lead Civic Saturday gatherings on their own, in their own towns. In the community of Athens, Tennessee, a feisty leader named Whitney Kimball Coe leads hers in an art and framing shop with a youth choir and lots of little flags. A young activist named Berto Aguayo led his Civic Saturday on a street corner in the Back of the Yards neighborhood of Chicago. Berto was once involved with gangs. Now, he ’ s keeping the peace and organizing political campaigns. In Honolulu, Rafael Bergstrom, a former pro **baseball** player turned photographer and conservationist, leads his under the banner”Civics IS Sexy.”It is. Sometimes I ’ m asked, even by our seminarians :”Isn ’ t it dangerous to use religious language? Won ’ t that just make our politics even more dogmatic and self-righteous?”But this view assumes that all religion is fanatical fundamentalism. It is not. Religion is also moral discernment, an embrace of doubt, a commitment to detach from self and serve others, a challenge to repair the world. In this sense, politics could stand to be a little more like religion, not less. Thus, my final topic today : why civic religion matters now. I want to offer two reasons. One is to counter the culture of hyperindividualism. Every message we get from every screen and surface of the modern marketplace is that each of us is on our own, a free agent, free to manage our own brands, free to live under bridges, free to have side hustles, free to die alone without insurance. Market liberalism tells us we are masters beholden to none, but then it enslaves us in the awful **isolation** of consumerism and status anxiety. Yeah! Millions of us are on to the con now. We are realizing now that a free-for-all is not the same as freedom for all. What truly makes us free is being bound to others in mutual aid and obligation, having to work things out the best we can in our neighborhoods and towns, as if our fates were entwined — because they are — as if we could not secede from one another, because, in the end, we cannot. Binding ourselves this way actually liberates us. It reveals that we are equal in dignity. It reminds us that rights come with responsibilities. It reminds us, in fact, that rights properly understood are responsibilities. The second reason why civic religion matters now is that it offers the healthiest possible story of us and them. We talk about identity politics today as if it were something new, but it ’ s not. All politics is identity politics, a never-ending **struggle** to define who truly belongs. Instead of noxious myths of blood and soil that mark some as forever outsiders, civic religion offers everyone a path to belonging based only a universal creed of contribution, participation, inclusion. In civic religion, the”us”is those who wish to serve, volunteer, vote, listen, learn, empathize, argue better, circulate power rather than hoard it. The”them”is those who don ’ t. It is possible to **judge** the them harshly, but it isn ’ t necessary, for at any time, one of them can become one of us, simply by choosing to live like a citizen. So let ’ s welcome them in. Whitney and Berto and Rafael are gifted welcomers. Each has a distinctive, locally rooted way to make faith in democracy relatable to others. Their slang might be Appalachian or South Side or Hawaiian. Their message is the same : civic love, civic spirit, civic responsibility. Now you might think that all this civic religion stuff is just for overzealous second-generation Americans like me. But actually, it is for anyone, anywhere, who wants to kindle the bonds of trust, affection and joint **action** needed to govern ourselves in freedom. Now maybe Civic Saturdays aren ’ t for you. That ’ s OK. Find your own ways to foster civic habits of the heart. Many forms of beloved civic community are thriving now, in this age of awakening. Groups like Community Organizing Japan, which uses creative performative rituals of storytelling to promote equality for women. In Iceland, civil confirmations, where young people are led by an elder to learn the history and civic traditions of their society, culminating in a rite-of-passage ceremony akin to church confirmation. Ben Franklin Circles in the United States, where friends meet monthly to discuss and reflect upon the virtues that Franklin codified in his autobiography, like justice and gratitude and forgiveness. I know civic religion is not enough to remedy the radical inequities of our age. We need power for that. But power without character is a cure worse than the disease. I know civic religion alone can ’ t fix corrupt institutions, but institutional reforms without new **norms** will not last. Culture is upstream of law. Spirit is upstream of policy. The soul is upstream of the state. We cannot unpollute our politics if we clean only downstream. We must get to the source. The source is our values, and on the topic of values, my advice is simple : have some. Make sure those values are prosocial. Put them into **practice**, and do so in the company of others, with a structure of creed, deed and joyful ritual that ’ ll keep all of you coming back. Those of us who believe in democracy and believe it is still possible, we have the burden of proving it. But remember, it is no burden at all to be in a community where you are seen as fully human, where you have a say in the things that affect you, where you don ’ t need to be connected to be respected. That is called a blessing, and it is available to all who believe. Thank you.

Have you ever tried to understand a teenager? It ’ s exhausting, right? You must be puzzled by the fact that some teens do well in school, lead clubs and teams and volunteer in their communities, but they eat Tide Pods for an online challenge, speed and text while **driving**, binge drink and experiment with illicit drugs. How can so many teens be so smart, skilled and responsible — and careless risk-takers at the same time? When I was 16, while frequently **observing** my peers in person as well as on social media, I began to wonder why so many teens took such crazy risks. It seems like getting a certificate from DARE class in the fifth grade can ' t stop them. What was even more alarming to me was that the more they exposed themselves to these harmful risks, the easier it became for them to continue taking risks. Now this confused me, but it also made me incredibly curious. So, as someone with a name that literally means"to explore knowledge,"I started searching for a scientific explanation. Now, it ' s no secret that teens ages 13 to 18 are more prone to risk-taking than children or adults, but what makes them so daring? Do they suddenly become reckless, or is this just a natural phase that they ' re going through? Well neuroscientists have already found evidence that the teen brain is still in the process of maturation — and that this makes them exceptionally poor at decision-making, causing them to fall prey to risky behaviors. But in that case, if the maturing brain is to blame, then why are teens more vulnerable than children, even though their brains are more developed than those of children? Also, not all teens in the world take risks at the same level. Are there some other underlying or unintentional causes driving them to risk- taking? Well, this is exactly what I decided to research. So, I founded my research on the basis of a psychological process known as"habituation,"or simply what we refer to as"getting used to it."Habituation explains how our brains adapt to some behaviors, like lying, with repeated exposures. And this concept inspired me to design a project to determine if the same principle could be applied to the relentless rise of risk-taking in teenagers. So I predicted that habituation to risk-taking may have the potential to change the already-vulnerable teenage brain by **blunting** or even eradicating the negative emotions associated with risk, like fear or guilt. I also thought because they would feel less fearful and guilty, this desensitization would lead them to even more risk-taking. In short, I wanted to conduct a research study to answer one big question : Why do teens keep making outrageous choices that are harmful to their health and well-being? But there was one big **obstacle** in my way. To investigate this problem, I needed teenagers to experiment on, laboratories and devices to measure their brain activity, and teachers or professors to supervise me and guide me along the way. I needed resources. But, you see, I attended a high school in South Dakota with limited opportunity for scientific exploration. My school had athletics, band, choir, debate and other clubs, but there were no STEM programs or research mentors. And the notion of high schoolers doing research or participating in a science fair was completely foreign. Simply put, I didn ' t exactly have the ingredients to make a chef-worthy dish. And these **obstacles** were **frustrating**, but I was also a stubborn teenager. And as the daughter of Bangladeshi immigrants and one of just a handful of Muslim students in my high school in South Dakota, I often **struggled** to fit in. And I wanted to be someone with something to contribute to society, not just be deemed the scarf-wearing brown girl who was an anomaly in my homogenous hometown. I hoped that by doing this research, I could establish this and how valuable scientific exploration could be for kids like me who didn ' t necessarily find their niche elsewhere. So with limited research opportunities, inventiveness allowed me to overcome seemingly impossible **obstacles**. I became more creative in working with a variety of methodologies, materials and subjects. I transformed my unassuming school library into a laboratory and my peers into lab rats. My enthusiastic geography teacher, who also happens to be my school ' s football coach, ended up as my cheerleader, becoming my mentor to sign necessary paperwork. And when it became logistically impossible to use a laboratory electroencephalography, or EEG, which are those electrode devices used to measure emotional responses, I bought a portable EEG headset with my own money, instead of buying the new iPhone X that a lot of kids my age were saving up for. So finally I started the research with 86 students, ages 13 to 18, from my high school. Using the computer cubicles in my school library, I had them complete a computerized decision-making simulation to measure their risk-taking behaviors comparable to ones in the real world, like alcohol use, drug use and gambling. Wearing the EEG headset, the students completed the test 12 times over three days to mimic repeated risk exposures. A control panel on the EEG headset measured their various emotional responses : like attention, interest, excitement, frustration, guilt, **stress** levels and relaxation. They also rated their emotions on well-validated emotion-measuring scales. This meant that I had measured the process of habituation and its effects on decision-making. And it took 29 days to complete this research. And with months of frantically drafting proposals, meticulously computing data in a caffeinated daze at 2am, I was able to finalize my results. And the results showed that habituation to risk-taking could actually change a teen ' s brain by altering their emotional levels, causing greater risk-taking. The students ' emotions that were normally associated with risks, like fear, **stress**, guilt and nervousness, as well as attention, were high when they were first exposed to the risk simulator. This curbed their temptations and enforced self-control, which prevented them from taking more risks. However, the more they were exposed to the risks through the simulator, the less fearful, guilty and **stressed** they became. This caused a situation in which they were no longer able to feel the brain ' s natural fear and caution instincts. And also, because they are teenagers and their brains are still underdeveloped, they became more interested and excited in thrill- seeking behaviors. So what were the consequences? They lacked self-control for logical decision- making, took greater risks and made more harmful choices. So the developing brain alone isn ' t to blame. The process of habituation also plays a key role in risk-taking and risk escalation. Although a teen ' s willingness to seek risk is largely a result of the structural and functional changes associated with their developing brains, the dangerous part that my research was able to highlight was that a habituation to risks can actually physically change a teen ' s brain and cause greater risk-taking. So it ' s the combination of the immature teen brain and the impact of habituation that is like a perfect storm to create more damaging effects. And this research can help parents and the general public understand that teens aren ' t just willfully ignoring **warnings** or simply defying parents by engaging in increasingly more dangerous behavior. The biggest hurdle they ' re facing is their habituation to risks : all the physical, detectable and emotional functional changes that drive and control and influence their over- the-top risk-taking. So yes, we need policies that provide safer environments and limit exposures to high risks, but we also need policies that reflect this insight. These results are a wake-up call for teens, too. It shows them that the natural and necessary fear and guilt that protect them from unsafe situations actually become numb when they repeatedly choose risky behaviors. So with this hope to share my findings with fellow teenagers and scientists, I took my research to the Intel International Science and Engineering Fair, or ISEF, a culmination of over 1, 800 students from 75 countries, regions and territories, who showcase their cutting-edge research and inventions. It ' s like the Olympics of science fair. There, I was able to present my research to experts in neuroscience and psychology and garner valuable feedback. But perhaps the most memorable moment of the week was when the booming speakers suddenly uttered my name during the awards ceremony. I was in such disbelief that I questioned myself : Was this just another”La La Land”blunder like at the Oscars? Luckily, it wasn ’ t. I really had won first place in the category”Behavioral and Social Sciences.”Needless to say, I was not only thrilled to have this recognition, but also the whole experience of science fair that validated my efforts keeps my curiosity alive and strengthens my creativity, perseverance and imagination. This still image of me experimenting in my school library may seem ordinary, but to me, it represents a sort of inspiration. It reminds me that this process taught me to take risks. And I know that might sound incredibly ironic. But I took risks realizing that unforeseen opportunities often come from risk-taking — not the hazardous, negative type that I studied, but the good ones, the positive risks. The more risks I took, the more capable I felt of withstanding my unconventional circumstances, leading to more tolerance, resilience and patience for completing my project. And these lessons have led me to new ideas like : Is the opposite of negative risk-taking also true? Can positive risk- taking escalate with repeated exposures? Does positive **action** build positive brain functioning? I think I just might have my next research idea.

Text Sample 200: POS Dim 2 – 2001 – Score 9.00 – 2001/t000092.txt
I coined my own definition of success in 1934, when I was teaching at a high school in South Bend, Indiana, being a little bit disappointed, and [disillusioned] perhaps, by the way parents of the youngsters in my English classes expected their youngsters to get an A or a B. They thought a C was all right for the neighbors ’ children, because they were all average. But they weren ’ t satisfied when their own — it would make the teacher feel that they had failed, or the youngster had failed. And that ’ s not right. The good Lord in his infinite wisdom didn ’ t create us all equal as far as intelligence is concerned, any more than we ’ re equal for size, appearance. Not everybody could earn an A or a B, and I didn ’ t like that way of **judging**, and I did know how the alumni of various schools back in the ’ 30s **judged** coaches and athletic teams. If you won them all, you were considered to be reasonably successful — not completely. Because I found out — we had a number of years at UCLA where we didn ’ t lose a game. But it seemed that we didn ’ t win each individual game by the margin that some of our alumni had predicted — And quite frequently I really felt that they had backed up their predictions in a more materialistic manner. But that was true back in the 30s, so I understood that. But I didn ’ t like it, I didn ’ t agree with it. I wanted to come up with something I hoped could make me a better teacher, and give the youngsters under my supervision, be it in athletics or the English classroom, something to which to aspire, other than just a higher mark in the classroom, or more points in some athletic contest. I thought about that for quite a spell, and I wanted to come up with my own definition. I thought that might help. And I knew how Mr. Webster defined it, as the accumulation of material possessions or the attainment of a position of power or prestige, or something of that sort, **worthy** accomplishments perhaps, but in my opinion, not necessarily indicative of success. So I wanted to come up with something of my own. And I recalled — I was raised on a small farm in Southern Indiana, and Dad tried to teach me and my brothers that you should never try to be better than someone else. I ’ m sure at the time he did that, I didn ’ t — it didn ’ t — well, somewhere, I guess in the hidden recesses of the mind, it popped out years later. Never try to be better than someone else, always learn from others. Never cease trying to be the best you can be — that ’ s under your control. If you get too engrossed and involved and concerned in regard to the things over which you have no control, it will adversely affect the things over which you

have control. Then I ran across this simple verse that said,”At God ’ s footstool to confess, a poor soul knelt, and bowed his head. ’ I failed! ’ he cried. The Master said, ’ Thou didst thy best, that is success. ’”From those things, and one other perhaps, I coined my own definition of success, which is : Peace of mind attained only through self-satisfaction in knowing you made the effort to do the best of which you ’ re capable. I believe that ’ s true. If you make the effort to do the best of which you ’ re capable, trying to improve the situation that exists for you, I think that ’ s success, and I don ’ t think others can **judge** that ; it ’ s like character and reputation — your reputation is what you ’ re perceived to be ; your character is what you really are. And I think that character is much more important than what you are perceived to be. You ’ d hope they ’ d both be good, but they won ’ t necessarily be the same. Well, that was my idea that I was going to try to get across to the youngsters. I ran across other things. I love to teach, and it was mentioned by the previous speaker that I enjoy poetry, and I dabble in it a bit, and love it. There are some things that helped me, I think, be better than I would have been. I know I ’ m not what I ought to be, what I should be, but I think I ’ m better than I would have been if I hadn ’ t run across certain things. One was just a little verse that said,”No written word, no spoken plea can teach our youth what they should be ; nor all the books on all the shelves — it ’ s what the teachers are themselves.”That made an impression on me in the 1930s. And I tried to use that more or less in my teaching, whether it be in sports, or whether it be in the English classroom. I love poetry and always had an interest in that somehow. Maybe it ’ s because Dad used to read to us at night, by coal oil lamp — we didn ’ t have electricity in our farm home. And Dad would read poetry to us. So I always liked it. And about the same time I ran across this one verse, I ran across another one. Someone asked a lady teacher why she taught, and after some time, she said she wanted to think about that. Then she came up and said,”They ask me why I teach, and I reply, ’ Where could I find such splendid company? ’ There sits a statesman, strong, unbiased, wise ; another Daniel Webster, silver-tongued. A doctor sits beside him, whose quick, steady hand may mend a bone, or stem the life-blood ’ s flow. And there a builder ; upward rise the arch of a church he builds, wherein that minister may speak the word of God, and lead a stumbling soul to touch the Christ. And all about, a gathering of teachers, farmers, merchants, laborers — those who work and vote and build and plan and pray into a great tomorrow. And I may say, I may not see the church, or hear the word, or eat the food their hands may grow, but yet again I may ; And later I may say, I knew him once, and he was weak, or strong, or **bold** or proud or gay. I knew him once, but then he was a boy. They ask me why I teach and I reply, ’ Where could I find such splendid company? ’”And I believe the teaching profession — it ’ s true, you have so many youngsters, and I ’ ve got to think of my youngsters at UCLA — 30-some attorneys, 11 dentists and doctors, many, many teachers and other professions. And that gives you a great deal of pleasure, to see them go on. I always tried to make the youngsters feel that they ’ re there to get an education, number one ; basketball was second, because it was paying their way, and they do need a little time for social activities, but you let social activities take a little precedence over the other two, and you ’ re not going to have any very long. So that was the idea that I tried to get across to the youngsters under my supervision. I had three rules, pretty much, that I stuck with practically all the time. I ’ d learned these prior to coming to UCLA, and I decided they were very important. One was”Never be late.”Later on I said certain things — the players, if we were leaving for somewhere, had to be neat and clean. There was a time when I made them wear jackets and shirts and ties. Then I saw our chancellor coming to school in denims and turtlenecks, and thought, it ’ s not right for me to keep this other [rule] so I let them just — they had to be neat and clean. I had one of my greatest players that you probably heard of, Bill Walton. He came to catch the bus ; we were leaving for somewhere to play. And he wasn ’ t clean and neat, so I wouldn ’ t let him go. He couldn ’ t get on the bus, he had to go home and get cleaned up to get to the airport. So I was a stickler for that. I believed in that. I believe in time ; very important. I believe you should be on time, but I felt at **practice**, for example — we start on time, we close on time. The youngsters didn ’ t have to feel that we were going to keep them over. When I speak at coaching clinics, I often tell young coaches — and at coaching clinics, more or less, they ’ ll be the younger coaches getting in the profession. Most of them are young, you know, and probably newly-married. And I tell them,”Don ’ t run **practices** late, because you ’ ll go home in a bad mood, and that ’ s not good, for a young married man to go home in a bad mood. When you get older, it doesn ’ t make any difference, but —”So I did believe : on time. I believe starting on time, and I believe closing on time. And another one I had was, not one word of profanity. One word of profanity, and you are out of here for the day. If I see it in a game, you ’ re going to come out and sit on the bench. And the third one was, never criticize a teammate. I didn ’ t want that. I used to tell them I was paid to do that. That ’ s my job. I ’ m paid to do it. Pitifully poor, but I am paid to do it. Not like the coaches today, for gracious sakes, no. It ’ s a little different than it was in my day. Those were three things that I stuck with pretty closely all the time. And those actually came from my dad. That ’ s what he tried to teach me and my brothers at one time. I came up with a pyramid eventually, that I don ’ t have the time to go on that. But that helped me, I think, become a better teacher. It ’ s something like this : And I had blocks in the pyramid, and the cornerstones being industriousness and enthusiasm, working hard and enjoying what you ’ re doing, coming up to the apex, according to my definition of success. And right at the top, faith and patience. And I say to you, in whatever you ’ re doing, you must be patient. You have to have patience to — we want things to happen. We talk about our youth being impatient a lot, and they are. They want to change everything. They think all change is progress. And we get a little older — we sort of let things go. And we forget there is no progress without change. So you must have patience, and I believe that we must have faith. I believe that we must believe, truly believe. Not just give it word **service**, believe that things will work out as they should, providing we do what we should. I think our tendency is to hope things will turn out the way we want them to much of the time, but we don ’ t do the things that are necessary to make those things become reality. I worked on this for some 14 years, and I think it helped me become a better teacher. But it all revolved around that original definition of success. You know, a number of years ago, there was a Major League Baseball umpire by the name of George Moriarty. He spelled Moriarty with only one ’ i ’. I ’ d never seen that before, but he did. Big league **baseball** players — they ’ re very perceptive about those things, and they noticed he had only one ’ i ’ in his name. You ’ d be surprised how many also told him that that was one more than he had in his head at various times. But he wrote something where I think he did what I tried to do in this pyramid. He called it”The Road Ahead, or the Road Behind.”He said,”Sometimes I think the Fates must grin as we denounce them and insist the only reason we can ’ t win, is the Fates themselves have missed. Yet there lives on the ancient claim : we win or lose within ourselves. The shining trophies on our shelves can never win tomorrow ’ s game. You and I know deeper down, there ’ s always a chance to win the crown. But when we fail to give our best, we simply haven ’ t met the test, of giving all and saving none until the game is really won ; of showing what is meant by grit ; of playing through when others quit ; of playing through, not letting up. It ’ s bearing down that wins the cup. Of dreaming there ’ s a goal ahead ; of hoping when our dreams are dead ; of praying when our hopes have fled ; yet losing, not afraid to fall, if, bravely, we have given all. For who can ask more of a man than giving all within his span. Giving all, it seems to me, is not so far from victory. And so the Fates are seldom wrong, no matter how they twist and wind. It ’ s you and I who make our fates — we open up or close the gates on the road ahead or the road behind.”Reminds me of another set of threes that my dad tried to get across to us : Don ’ t whine. Don ’ t **complain**. Don ’ t make excuses. Just get out there, and whatever you ’ re doing, do it to the best of your ability. And no one can do more than that. I tried to get across, too, that — my opponents will tell you — you never heard me mention winning. Never mention winning. My idea is that you can lose when you outscore somebody in a game, and you can win when you ’ re outscored. I ’ ve felt that way on certain occasions, at various times. And I just wanted them to be able to hold their head up after a game. I used to say that when a game is over, and you see somebody that didn ’ t know the outcome, I hope they couldn ’ t tell by your **actions** whether you outscored an opponent or the opponent outscored you. That ’ s what really matters : if you make an effort to do the best you can regularly, the results will be about what they should be. Not necessarily what you ’ d want them to be but they ’ ll be about what they should ; only you will know whether you can do that. And that ’ s what I wanted from them more than anything else. And as time went by, and I learned more about other things, I think it worked a little better, as far as the results. But I wanted the **score** of a game to be the byproduct of these other things, and not the end itself. I believe it was one great philosopher who said — no, no — Cervantes. Cervantes said,”The journey is better than the end.”And I like that. I think that it is — it ’ s getting there. Sometimes when you get there, there ’ s almost a let down. But it ’ s the getting there that ’ s the fun. As a basketball coach at UCLA, I liked our **practices** to be the journey, and the game would be the end, the end result. I liked to go up and sit in the stands and watch the players play, and see whether I ’ d done a decent job during the week. There again, it ’ s getting the players to get that self-satisfaction, in knowing that they ’ d made the effort to do the best of which they are capable. Sometimes I ’ m asked who was the best player I had, or the best teams. I can never answer that. As far as the individuals are concerned — I was asked one time about that, and they said,”Suppose that you, in some way, could make the perfect player. What would you want?”And I said,”Well, I ’ d want one that knew why he was at UCLA : to get an education, he was a good student, really knew why he was there in the first place. But I ’ d want one that could play, too. I ’ d want one to realize that defense usually wins championships, and who would work hard on defense. But I ’ d want one who would play offense, too. I ’ d want him to be unselfish, and look for the pass first and not shoot all the time. And I ’ d want one that could pass and would pass. I ’ ve had some that could and wouldn ’ t, and I ’ ve had some that would and could. So, yeah, I ’ d want that. And I wanted them to be able to shoot from the outside. I wanted them to be good inside too. I ’ d want them to be able to rebound well at both ends, too. Why not just take someone like Keith Wilkes and let it go at that. He had the qualifications. Not the only one, but he was one that I used in that particular category, because I think he made the effort to become the best. There was a couple. I mention in my book,”They Call Me Coach,”two players that gave me great satisfaction, that came as close as I think anyone I ever had to reach their full potential : one was Conrad Burke, and one was Doug McIntosh. When I saw them as freshmen, on our freshmen team — freshmen couldn ’ t play varsity when I taught. I thought,”Oh gracious, if these two players, either one of them”—

they were different years, but I thought about each one at the time he was there —”Oh, if he ever makes the varsity, our varsity must be pretty miserable, if he ’ s good enough to make it.”And you know, one of them was a starting player for a season and a half. The other one, his next year, played 32 minutes in a national championship game, Did a tremendous job for us. The next year, he was a starting player on the national championship team, and here I thought he ’ d never play a minute, when he was — so those are the things that give you great joy, and great satisfaction to see. Neither one of those youngsters could shoot very well. But they had outstanding shooting percentages, because they didn ’ t force it. And neither one could jump very well, but they kept good position, and so they did well rebounding. They remembered that every shot that ’ s taken, they assumed would be missed. I ’ ve had too many stand around and wait to see if it ’ s missed, then they go and it ’ s too late, somebody else is in there ahead of them. They weren ’ t very quick, but they played good position, kept in good balance. And so they played pretty good defense for us. So they had qualities that — they came close to — as close to reaching possibly their full potential as any players I ever had. So I consider them to be as successful as Lewis Alcindor or Bill Walton, or many of the others that we had ; there were some outstanding players. Have I rambled enough? I was told that when he makes his appearance, I was supposed to shut up.

I ’ d like to do pretty much what I did the first time, which is to choose a light-hearted theme. Last time, I talked about death and dying. This time, I ’ m going to talk about mental illness. But it has to be technological, so I ’ ll talk about electroshock therapy. You know, ever since man had any notion that some of his other people, his colleagues, could be different, could be strange, could be severely depressed or what we now recognize as schizophrenia, he was certain that this kind of illness had to come from evil spirits getting into the body. So, the way of treating these diseases in early times was to, in some way or other, exorcise those evil spirits, and this is still going on, as you know. But it wasn ’ t enough to use the priests. When medicine became somewhat scientific, in about 450 BC, with Hippocrates and those boys, they tried to look for herbs, plants that would literally shake the bad spirits out. So, they found certain plants that could cause convulsions. And the herbals, the botanical books of up to the late Middle Ages, the Renaissance are filled with prescriptions for causing convulsions to shake the evil spirits out. Finally, in about the sixteenth century, a physician whose name was Theophrastus Bombastus Aureolus von Hohenheim, called Paracelsus, a name probably familiar to some people here — — good, old Paracelsus found that he could predict the degree of convulsion by using a measured amount of camphor to produce the convulsion. Can you imagine going to your closet, pulling out a mothball, and chewing on it if you ’ re feeling depressed? It ’ s better than Prozac, but I wouldn ’ t recommend it. So what we see in the seventeenth, eighteenth century is the continued search for medications other than camphor that ’ ll do the trick. Well, along comes Benjamin Franklin, and he comes close to convulsing himself with a bolt of electricity off the end of his kite. And so people begin thinking in terms of electricity to produce convulsions. And then, we **fast-forward** to about 1932, when three Italian psychiatrists, who were largely treating depression, began to notice among their patients, who were also epileptics, that if they had an epileptic — a series of epileptic fits, a lot of them in a **row** — the depression would very frequently lift. Not only would it lift, but it might never return. So they got very interested in producing convulsions, measured types of convulsions. And they thought,”Well, we ’ ve got electricity, we ’ ll plug somebody into the wall. That always makes hair stand up and people shake a lot.”So, they tried it on a few pigs, and none of the pigs were killed. So, they went to the police and they said,”We know that at the Rome railroad station, there are all these lost souls wandering around, muttering gibberish. Can you bring one of them to us?”Someone who is, as the Italians say,”cagoots.”So they found this”cagoots”guy, a 39-year-old man who was really hopelessly schizophrenic, who was known, had been known for months, to be literally defecating on himself, talking nothing that made any sense, and they brought him into the hospital. So these three psychiatrists, after about two or three weeks of observation, laid him down on a table, connected his temples to a very small source of current. They thought,”Well, we ’ ll try 55 volts, two-tenths of a second. That ’ s not going to do anything terrible to him.”So they did that. Well, I have the following from a firsthand observer, who told me this about 35 years ago, when I was thinking about these things for some research project of mine. He said,”This fellow”— remember, he wasn ’ t even put to sleep —”after this major grand mal convulsion, sat right up, looked at these three fellas and said, ’ What the fuck are you assholes trying to do? ’”If I could only say that in Italian. Well, they were happy as could be, because he hadn ’ t said a rational word in the weeks of observation. So they plugged him in again, and this time they used 110 volts for half a second. And to their amazement, after it was over, he began speaking like he was perfectly well. He relapsed a little bit, they gave him a series of treatments, and he was essentially cured. But of course, having schizophrenia, within a few months, it returned. But they wrote a paper about this, and everybody in the Western world began using electricity to convulse people who were either schizophrenic or severely depressed. It didn ’ t work very well on the schizophrenics, but it was pretty clear in the ’ 30s and by the middle of the ’ 40s that electroconvulsive therapy was very, very effective in the treatment of depression. And of course, in those days, there were no antidepressant drugs, and it became very, very popular. They would anesthetize people, convulse them, but the real difficulty was that there was no way to paralyze muscles. So people would have a real grand mal seizure. Bones were broken. Especially in old, fragile people, you couldn ’ t use it. And then in the 1950s, late 1950s, the so-called muscle relaxants were developed by pharmacologists, and it got so that you could induce a complete convulsion, an electroencephalographic convulsion — you could see it on the brain waves — without causing any convulsion in the body except a little bit of twitching of the toes. So again, it was very, very popular and very, very useful. Well, you know, in the middle ’ 60s, the first antidepressants came out. Tofranil was the first. In the late ’ 70s, early ’ 80s, there were others, and they were very effective. And patients ’ rights groups seemed to get very upset about the kinds of things that they would witness. And so the whole idea of electroconvulsive, electroshock therapy disappeared, but has had a renaissance in the last 10 years. And the reason that it has had a renaissance is that probably about 10 percent of the people, severe depressives, do not respond, regardless of what is done for them. Now, why am I telling you this story at this meeting? I ’ m telling you this story, because actually ever since Richard called me and asked me to talk about — as he asked all of his speakers — to talk about something that would be new to this audience, that we had never talked about, never written about, I ’ ve been planning this moment. This reason really is that I am a man who, almost 30 years ago, had his life saved by two long courses of electroshock therapy. And let me tell you this story. I was, in the 1960s, in a marriage. To use the word bad would be perhaps the understatement of the year. It was dreadful. There are, I ’ m sure, enough divorced people in this room to know about the hostility, the anger, who knows what. Being someone who had had a very difficult childhood, a very difficult adolescence — it had to do with not quite poverty but close. It had to do with being brought up in a family where no one spoke English, no one could read or write English. It had to do with death and disease and lots of other things. I was a little prone to depression. So, as things got worse, as we really began to hate each other, I became progressively depressed over a period of a couple of years, trying to save this marriage, which was inevitably not to be saved. Finally, I would schedule — all my major surgical cases, I was scheduling them for 12, one o ' clock in the afternoon, because I couldn ' t get out of bed before about 11 o ' clock. And anybody who ' s been depressed here knows what that ' s like. I couldn ' t even pull the covers off myself. Well, you ' re in a university medical center, where everybody knows everybody, and it ' s perfectly clear to my colleagues, so my referrals began to decrease. As my referrals began to decrease, I clearly became increasingly depressed until I thought, my God, I can ' t work anymore. And, in fact, it didn ' t make any difference because I didn ' t have any patients anymore. So, with the advice of my physician, I had myself admitted to the acute care psychiatric unit of our university hospital. And my colleagues, who had known me since medical school in that place, said,"Don ' t worry, chap. Six weeks, you ' re back in the operating room. Everything ' s going to be great."Well, you know what bovine stercus is? That proved to be a lot of bovine stercus. I know some people who got tenure in that place with lies like that. So I was one of their failures. But it wasn ' t that simple. Because by the time I got out of that unit, I was not functional at all. I could hardly see five feet in front of myself. I shuffled when I walked. I was bowed over. I rarely bathed. I sometimes didn ' t shave. It was dreadful. And it was clear — not to me, because nothing was clear to me at that time anymore — that I would need long-term hospitalization in that awful place called a mental hospital. So I was admitted, in 1973, in the spring of 1973, to the Institute of Living, which used to be called the Hartford Retreat. It was founded in the eighteenth century, the largest psychiatric hospital in the state of Connecticut, other than the huge public hospitals that existed at that time. And they tried everything they had. They tried the usual psychotherapy. They tried every medication available in those days. And they did have Tofranil and other things — Mellaril, who knows what. Nothing happened except that I got jaundiced from one of these things. And finally, because I was well known in Connecticut, they decided they better have a meeting of the senior staff. All the senior staff got together, and I later found out what happened. They put all their heads together and they decided that there was nothing that could be done for this surgeon who had essentially separated himself from the world, who by that time had become so overwhelmed, not just with depression and feelings of worthlessness and inadequacy, but with obsessional thinking, obsessional thinking about coincidences. And there were particular numbers that every time I saw them, just got me dreadfully upset — all kinds of ritualistic observances, just awful, awful stuff. Remember when you were a kid, and you had to step on every line? Well, I was a grown man who had all of these rituals, and it got so there was a throbbing, there was a ferocious fear in my head. You ' ve seen this painting by Edvard Munch, The Scream. Every moment was a scream. It was impossible. So they decided there was no therapy, there was no treatment. But there was one treatment, which actually had been pioneered at the Hartford hospital in the early 1940s, and you can imagine what it was. It was pre-frontal lobotomy. So they decided — I didn ' t know this, again, I found this out later — that the only thing that could be done was for this 43-year-old man to have a pre-frontal lobotomy. Well, as in all hospitals, there was a resident assigned to my case.

He was 27 years old, and he would meet with me two or three times a week. And of course, I had been there, what, three or four months at the time. And he asked to meet with the senior staff, and they agreed to meet with him because he was very well thought of in that place. They thought he had a really extraordinary future. And he dug in his heels and said,"No. I know this man better than any of you. I have met with him over and over again. You ' ve just seen him from time to time. You ' ve read reports and so forth. I really honestly believe that the basic problem here is pure depression, and all of the obsessional thinking comes out of it. And you know, of course, what ' ll happen if you do a pre- frontal lobotomy. Any of the results along the spectrum, from pretty bad to terrible, terrible, terrible is going to happen. If he does the best he can, he will have no further obsessions, probably no depression, but his affect will be dulled, he will never go back to surgery, he will never be the loving father that he was to his two children, his life will be changed. If he has the usual result, he will end up like ' One Flew Over the Cuckoo ' s Nest. ' And you know about that, just essentially in a stupor the rest of his life."Well, he said,"Can ' t we try a course of electroshock therapy?"And you know why they agreed? They agreed to humor him. They just thought,"Well, we ' ll give a course of 10. And so we ' ll lose a little time. Big deal. It doesn ' t make any difference."So they gave the course of 10, and the first — the usual course, incidentally, was six to eight and still is six to eight. Plugged me into the wires, put me to sleep, gave me the muscle relaxant. Six didn ' t work. Seven didn ' t work. Eight didn ' t work. At nine, I noticed — and it ' s wonderful that I could notice anything — I noticed a change. And at 10, I noticed a real change. And he went back to them, and they agreed to do another 10. Again, not a single one of them — I think there are about seven or eight of them — thought this would do any good. They thought this was a temporary change. But, **lo** and behold, by 16, by 17, there were demonstrable differences in the way I felt. By 18 and 19, I was sleeping through the night. And by 20, I had the sense, I really had the sense that I could overcome this, that I was now strong enough that by an act of will, I could blow the obsessional thinking away. I could blow the depression away. And I ' ve never forgotten — I never will forget — standing in the kitchen of the unit, it was a Sunday morning in January of 1974, standing in the kitchen by myself and thinking,"I ' ve got the strength now to do this."It was as though those tightly coiled wires in my head had been disconnected and I could think clearly. But I need a formula. I need some thing to say to myself when I begin thinking obsessionally, obsessively. Well, the Gilbert and Sullivan fans in this room will remember"Ruddigore,"and they will remember Mad Margaret, and they will remember that she was married to a fellow named Sir Despard Murgatroyd. And she used to go nuts, every five minutes or so in the play, and he said to her,"We must have a word to bring you back to reality, and the word, my dear, will be ' Basingstoke. '"So every time she got a little nuts, he would say,"Basingstoke!"And she would say,"Basingstoke, it is."And she would be fine for a little while. Well, you know, I ' m from the Bronx. I can ' t say"Basingstoke."But I had something better. And it was very simple. It was,"Ah, fuck it!"Much better than"Basingstoke,"at least for me. And it worked — my God, it worked. Every time I would begin thinking obsessionally — again, once more, after 20 shock treatments — I would say,"Ah, fuck it."And things got better and better, and within three or four months, I was discharged from that hospital, and I joined a group of surgeons where I could work with other people in the community, not in New Haven, but fairly close by. I stayed there for three years. At the end of three years, I went back to New Haven, had remarried by that time. I brought my wife with me, actually, to make sure I could get through this. My children came back to live with us. We had two more children after that. Resuscitated the career, even better than it had been before. Went right back into the university and began to write books. Well, you know, it ’ s been a wonderful life. It ’ s been, as I said, close to 30 years. I stopped doing surgery about six years ago and became a full-time writer, as many people know. But it ’ s been very exciting. It ’ s been very happy. Every once in a while, I have to say,”Ah, fuck it.”Every once in a while, I get somewhat depressed and a little obsessional. So, I ’ m not free of all of this. But it ’ s worked. It ’ s always worked. Why have I chosen, after never, ever talking about this, to talk about it now? Well, those of you who know some of these books know that one is about death and dying, one is about the human body and the human spirit, one is about the way mystical thoughts are constantly in our minds, and they have always to do with my own personal experiences. One might think reading these books — and I ’ ve gotten thousands of letters about them by people who do think this — that based on my life ’ s history as I ’ ve portrayed in the books, my early life ’ s history, I am someone who has overcome adversity. That I am someone who has drunk, drank, drunk of the bitter dregs of near-disaster in childhood and emerged not just unscathed but strengthened. I really have it figured out, so that I can advise people about death and dying, so that I can talk about mysticism and the human spirit. And I ’ ve always felt guilty about that. I ’ ve always felt that somehow I was an impostor because my readers don ’ t know what I have just told you. It ’ s known by some people in New Haven, obviously, but it is not generally known. So one of the reasons that I have come here to talk about this today is to — frankly, selfishly — unburden myself and let it be known that this is not an untroubled mind that has written all of these books. But more importantly, I think, is the fact that a very significant proportion of people in this audience are under 30, and there are many, of course, who are well over 30. For people under 30, and it looks to me like almost all of you — I would say all of you — are either on the cusp of a magnificent and exciting career or right into a magnificent and exciting career : anything can happen to you. Things change. Accidents happen. Something from childhood comes back to haunt you. You can be thrown off the track. I hope it happens to none of you, but it will probably happen to a small percentage of you. To those to whom it doesn ’ t happen, there will be adversities. If I, with the bleakness of spirit, with no spirit, that I had in the 1970s and no possibility of recovery, as far as that group of very experienced psychiatrists thought, if I can find my way back from this, believe me, anybody can find their way back from any adversity that exists in their lives. And for those who are older, who have lived through perhaps not something as bad as this, but who have lived through difficult times, perhaps where they lost everything, as I did, and started out all over again, some of these things will seem very familiar. There is recovery. There is redemption. And there is resurrection. There are resurrection themes in every society that has ever been studied, and it is because not just only do we fantasize about the possibility of resurrection and recovery, but it actually happens. And it happens a lot. Perhaps the most popular resurrection theme, outside of specifically religious ones, is the one about the phoenix, the ancient story of the phoenix, who, every 500 years, resurrects itself from its own ashes to go on to live a life that is even more beautiful than it was before. Richard, thanks very much.

Text Sample 202: POS Dim 2 – 2001 – Score 2.00 – 2001/t000154.txt

So I understand that this meeting was planned, and the slogan was From Was to Still. And I am illustrating Still. Which, of course, I am not agreeing with because, although I am 94, I am not still working. And anybody who asks me,”Are you still doing this or that?”I don ’ t answer because I ’ m not doing things still, I ’ m doing it like I always did. I still have — or did I use the word still? I didn ’ t mean that. I have my file which is called To Do. I have my plans. I have my clients. I am doing my work like I always did. So this takes care of my age. I want to show you my work so you know what I am doing and why I am here. This was about 1925. All of these things were made during the last 75 years. But, of course, I ’ m working since 25, doing more or less what you see here. This is Castleton China. This was an exhibition at the Museum of Modern Art. This is now for sale at the Metropolitan Museum. This is still at the Metropolitan Museum now for sale. This is a portrait of my daughter and myself. These were just some of the things I ’ ve made. I made hundreds of them for the last 75 years. I call myself a maker of things. I don ’ t call myself an industrial designer because I ’ m other things. Industrial designers want to make novel things. Novelty is a concept of commerce, not an aesthetic concept. The industrial design magazine, I believe, is called”Innovation.”Innovation is not part of the aim of my work. Well, makers of things : they make things more beautiful, more elegant, more comfortable than just the craftsmen do. I have so much to say. I have to think what I am going to say. Well, to describe our profession otherwise, we are actually concerned with the playful search for beauty. That means the playful search for beauty was called the first activity of Man. Sarah Smith, who was a mathematics professor at MIT, wrote,”The playful search for beauty was Man ’ s first activity — that all useful qualities and all material qualities were developed from the playful search for beauty.”These are tiles. The word,”playful”is a necessary aspect of our work because, actually, one of our problems is that we have to make, produce, lovely things throughout all of life, and this for me is now 75 years. So how can you, without drying up, make things with the same pleasure, as a gift to others, for so long? The playful is therefore an important part of our quality as designer. Let me tell you some about my life. As I said, I started to do these things 75 years ago. My first exhibition in the United States was at the Sesquicentennial exhibition in 1926 — that the Hungarian government sent one of my hand-drawn pieces as part of the exhibit. My work actually took me through many countries, and showed me a great part of the world. This is not that they took me — the work didn ’ t take me — I made the things particularly because I wanted to use them to see the world. I was incredibly curious to see the world, and I made all these things, which then finally did take me to see many countries and many cultures. I started as an apprentice to a Hungarian craftsman, and this taught me what the guild system was in Middle Ages. The guild system : that means when I was an apprentice, I had to apprentice myself in order to become a pottery master. In my shop where I studied, or learned, there was a traditional hierarchy of master, journeyman and learned worker, and apprentice, and I worked as the apprentice. The work as an apprentice was very primitive. That means I had to actually learn every aspect of making pottery by hand. We mashed the clay with our feet when it came from the hillside. After that, it had to be kneaded. It had to then go in, kind of, a mangle. And then finally it was prepared for the throwing. And there I really worked as an apprentice. My master took me to set ovens because this was part of oven-making, oven-setting, in the time. And finally, I had received a document that I had accomplished my apprenticeship successfully, that I had behaved morally, and this document was given to me by the Guild of Roof- Coverers, Rail-Diggers, Oven-Setters, Chimney Sweeps and Potters. I also got at the time a workbook which explained my rights and my working conditions, and I still have that workbook. First I set up a shop in my own garden, and made pottery which I sold on the marketplace in Budapest. And there I was sitting, and my then-boyfriend — I didn ’ t mean it was a boyfriend like it is meant today — but my boyfriend and I sat at the market and sold the pots. My mother thought that this was not very proper, so she sat with us to add propriety to this activity. However, after a while there was a new factory being built in Budapest, a pottery factory, a large one. And I visited it with several ladies, and asked all sorts of questions of the director. Then the director asked me, why do you ask all these questions? I said, I also have a pottery. So he asked me, could he please visit me, and then finally he did, and explained to me that what I did now in my shop was an anachronism, that the industrial revolution had broken out, and that I rather should join the factory. There he made an art department for me where I worked for several months. However, everybody in the factory spent his time at the art department. The director there said there were several women casting and producing my designs now in molds, and this was sold also to America. I remember that it was quite successful. However, the director, the chemist, model maker — everybody — concerned himself much more with the art department — that means, with my work — than making toilets, so finally they got a letter from the center, from the bank who owned the factory, saying, make toilet-setting behind the art department, and that was my end. So this gave me the possibility because now I was a journeyman, and journeymen also take their satchel and go to see the world. So as a journeyman, I put an **ad** into the paper that I had studied, that I was a down-to-earth potter ’ s journeyman and I was looking for a job as a journeyman. And I got several answers, and I accepted the one which was farthest from home and practically, I thought, halfway to America. And that was in Hamburg. Then I first took this job in Hamburg, at an art pottery where everything was done on the wheel, and so I worked in a shop where there were several potters. And the first day, I was coming to take my place at the turntable — there were three or four turntables — and one of them, behind where I was sitting, was a hunchback, a deaf-mute hunchback, who smelled very bad. So I doused him in cologne every day, which he thought was very nice, and therefore he brought bread and butter every day, which I had to eat out of courtesy. The first day I came to work in this shop there was on my wheel a surprise for me. My colleagues had thoughtfully put on the wheel where I was supposed to work a very nicely modeled natural man ’ s organs. After I brushed them off with a hand motion, they were very — I finally was now accepted, and worked there for some six months. This was my first job. If I go on like this, you will be here till midnight. So I will try speed it up a little Moderator : Eva, we have about five minutes. Eva Zeisel : Are you sure? Moderator : Yes, I am sure. EZ : Well, if you are sure, I have to tell you that within five minutes I will talk very fast. And actually, my work took me to many countries because I used my work to fill my curiosity. And among other things, other countries I worked, was in the Soviet Union, where I worked from ’ 32 to ’ 37 — actually, to ’ 36. I was finally there, although I had nothing to do — I was a foreign expert. I became art director of the china and glass industry, and eventually under Stalin ’ s purges — at the beginning of Stalin ’ s purges, I didn ’ t know that hundreds of thousands of innocent people were arrested. So I was arrested quite early in Stalin ’ s purges, and spent 16 months in a Russian prison. The accusation was that I had successfully prepared an Attentat on Stalin ’ s life. This was a very dangerous accusation. And if this is the end of my five minutes, I want to tell you that I actually did survive, which was a surprise. But since I survived and I ’ m here, and since this is the end of the five minutes, I will — Moderator : Tell me when your last trip to Russia was. Weren ’ t you there recently? EZ : Oh, this summer, in fact, the Lomonosov factory was bought by an American company, invited me. They found out that I had worked in ’ 33 at this factory, and they came to my studio in Rockland County, and brought the 15 of their artists to visit me here. And they invited myself to come to the Russian factory last summer, in July, to make some dishes, design some dishes. And since I don ’ t like to travel alone, they also invited my daughter, son-in-law and granddaughter, so we had a lovely trip to see Russia today, which is not a very **pleasant** and happy view. Here I am now, if this is the end? Thank you.

I ’ m here to talk to you today about a story that we have all been conditioned to believe is not possible. It ’ s a story about a living, breathing **start-up** flourishing in an unlikely environment : the United States government. Now, this **start-up** is fundamentally beginning to disrupt the way government does business from the inside out. But before I get there, let ’ s start with the problem. For me, the problem begins with a number : 137. 137 is the average number of days a veteran has to wait to have benefits processed by the VA. 137 days. Now, in order to file that application in the first place, she has to **navigate** over 1, 000 different websites and over 900 different call-in numbers, all owned and operated by the United States government. Now, we live in times of incredible change. The private sector is constantly changing and improving itself all the time. For that matter, it ’ s removing every single inconvenience in my life that I could possibly think of. I could be sitting on my couch in my apartment, and from my phone, I can order a warm, gluten-free meal that can arrive at my door in less than 10 minutes. But meanwhile, a working mother who depends on food stamps to support her family has to complete an arduous, complicated application which she might not even be able to do online. And the inability of her to do that same work from her couch means that she might be having to take days or hours off of work that she can ’ t spare. And this growing dichotomy between the beneficiaries of the tech revolution and those it ’ s left behind is one of the greatest challenges of our time — Because government ’ s failure to deliver digital **services** that work is disproportionately impacting the very people who need it most. It ’ s impacting the students trying to go to college, the single mothers trying to get health care, the veterans coming home from battle. They can ’ t get what they need when they need it. And for these Americans, government is more than just a presidential election every four years. Government is a lifeline that provides **services** they need and depend on and deserve. Which is, quite frankly, why government needs to get its shit together and catch up. Just saying. Now, this wasn ’ t always a problem I was **passionate** about. When I joined President Obama ’ s campaign in 2008, we brought the tech industry ’ s best **practices** into politics. We earned more money, we engaged more volunteers and we earned more votes than any political campaign in history. We were a cutting- edge **start-up** that changed the game of politics forever. So when the President asked a small group of us to bring that very same disruption directly into government, I knew it wasn ’ t going to be easy work, but I was eager and showed up ready to get to work. Now, on my first day in DC, my first day in government, I walked into the office and they handed me a laptop. And the laptop was running Windows 98. I mean, three entire presidential elections had come and gone since the government had updated the operating system on that computer. Three elections! Which is when we realized this problem was a whole lot bigger than we ever could have imagined. Let me paint the picture for you. The federal government is the largest institution in the world. It spends over 86 billion dollars a year — 86 billion — on federal IT projects. For context : that is more than the entire

venture capital industry spends annually — on everything. Now, the problem here is that we the taxpayers are not getting what we pay for, because 94 percent of federal IT projects are over budget or behind schedule. 94 percent! For those of you keeping **score**, yes, the number 94 is very close to 100. There ' s another problem : 40 percent of those never end up seeing the light of day. They are completely scrapped or abandoned. Now, this is a very existentially painful moment for any organization, because it means as government continues to operate as it ' s programmed to do, failure is nearly inevitable. And when the status quo is the riskiest option, that means there is simply no other choice than radical disruption. So, what do we do about it? How do we fix this? Well, the irony of all of this is that we actually don ' t have to look any further than our backyard, because right here in America are the very ideas, the very people, who have swept our world into a radically different place than it was two decades ago. So what would it look like if it was actually as easy to get student loans or veterans ' benefits as it is to order cat food to my house? What would it look like if there was an easy pathway for the very entrepreneurs and innovators who have disrupted our tech sector to come and disrupt their government? Well, my friends, here ' s where we get to talk about some of the exciting new formulas we ' ve discovered for creating change in government. Enter the United States Digital Service. The United States Digital Service is a new network of **start-ups**, a team of teams, organizing themselves across government to create radical change. The **mission** of the United States Digital Service is to help government deliver world-class digital **services** for students, immigrants, children, the elderly — everybody — at dramatically lower costs. We are essentially trying to build a more awesome government, for the people, by the people, today. We don ' t care — Thank you. Who doesn ' t want a more awesome government, right? We don ' t care about politics. We care about making government work better, because it ' s the only one we ' ve got. Now, you can think of our team — well, it ' s pretty funny — you can think of our team a little bit like the Peace Corps meets DARPA meets SEAL Team 6. We ' re like the Peace Corps for nerds, but instead of traveling to crazy, interesting, far-off places, you spend a lot of time indoors, behind computers, helping restore the fabric of our democracy. Now, this team — our playbook for the United States Digital Service is pretty simple. The first play is we recruit the very best talent our country has to offer, and recruit them for short tours of duty inside government. These are the very people who have helped build the products and companies that have made our tech sector amongst the most innovative in the world. Second, we pair these incredible people from the tech core with the dedicated civil servants already inside government on the ground creating change. Third, we strategically deploy them in a targeted formation at the most mission-critical, life-changing, important **services** that government offers. And finally, we give them massive air cover, from the leadership inside the agencies all the way up to the President himself, to transform these **services** for the better. Now, this team is beginning to disrupt how government does business from the inside out. If you study classic patterns of disruption, one very common pattern is rather simple. It ' s to take something that has become routine and standard in one industry and apply it to another where it ' s a radical departure from the status quo. Think about what Airbnb took that was normal from hospitality and revolutionized my apartment. The United States Digital Service is doing exactly that. We are taking what Silicon Valley and the private sector has learned through a ton of hard work about how to build planetary-scale digital **services** that delight users at lower cost, and we ' re applying that to government, where it is a radical departure from the status quo. Now, the good news is : it ' s starting to work. We know this because we can already see the results from some of our early projects, like the rescue effort of Healthcare. gov, when that went off the rails. Fixing Healthcare. gov was the first place that we ran this play, and today we are taking that same play and scaling it across a large number of government ’ s most important citizen-facing **services**. Now, if I can take a moment and brag about the team for a second — it is the highest concentration of badasses I could have ever dreamed of. We have top talent from Google, Facebook, Amazon, Twitter and the likes, all on staff today, all choosing to join their government. And what ’ s incredible is, everybody is as eager and kind as they are intelligent. And I might add, by the way, over half of us are women. The best way to understand this strategy is actually to walk through a couple of examples of how it ’ s working out in the wild. I ’ m going to give you two examples quickly. The first one is about immigration. This, my friends, is your typical immigration application. Yes, you guessed it — it ’ s almost entirely paper- based. In the best case, the application takes about six to eight months to process. It is physically shipped thousands of miles — thousands of miles! — between no less than six processing centers. Now, little story : about a decade ago, the government thought that if it brought this system online, it could save taxpayer dollars and provide a better **service**, which was a great idea. So, the typical government process began. Six years and 1. 2 billion dollars later, no working product was delivered — 1. 2 billion with a”B.”Now at this point, the agency responsible, US Citizenship and Immigration Services, could have kept pouring money into the failing program. Sadly, that ’ s what often happens. That ’ s the status quo today. But they didn ’ t. The dedicated civil servants inside the agency decided to stand up and call for change. We deployed a small team of just six people, and what many people don ’ t know is that ’ s the same size as the rescue effort of Healthcare. gov — just six people. And that team jumped in, side-by-side, to support the agency in transitioning this project into more modern business **practices**, more modern development **practices**. Now, in non-tech speak, what that basically means is taking big, multi-year projects and breaking them up into bite-sized chunks, so that way we can reduce the risk and actually start to see results every couple of weeks, instead of waiting in a black box for years. So within less than three months of our team being on the ground, we were already able to push our first products to production. The first one, this is the form I-90. This is used to file for your replacement green card. Now, for immigrant visa holders, a replacement green card is a big deal. Your green card is your proof of identification, it ’ s your work authorization, it ’ s the proof that you can be here in this country. So waiting six months while the government processes the replacement is not cool. I ’ m excited to tell you that today, you can now, for the first time, file for a replacement green card entirely online without anyone touching a piece of paper. It is faster, it is cheaper, and it ’ s a better user experience for the applicant and the government employees alike. Another one, quickly. Last fall, we just released a brand-new **practice** civics test. So as part of becoming a US citizen, you have to pass a civics test. For anyone who has taken this test, it can be quite the **stressful** process. So our team released a very easy, simple-to-use tool in plain language to help people prepare, to help ease their nerves, to help them feel more confident in taking the next step in pursuing their American dream. Because all of this work, all of this work on immigration, is about taking complicated processes and making them more human. The other day, one of the dedicated civil servants on the ground said something incredibly profound. She said that she ’ s never been this hopeful or optimistic about a project in her entire time in government. And she ’ s been doing this for 30 years. That is exactly the kind of hope and culture change we are trying to create. For my second example, I want to bring it back to veterans for a second, and what we are doing to build them a VA that is **worthy** of their **service** and their sacrifice. I ’ m proud to say that just a few months ago, we released a brand-new beta of a new website, Vets. gov. Vets. gov is a simple, easy-to-use website that brings all of the online **services** a veteran needs into one place. One website, not thousands. The site is a work in progress, but it ’ s significant progress, because it ’ s designed with the users who matter most : the veterans themselves. This might sound incredibly obvious, because it should be, but sadly, this isn ’ t normal for government. Far too often, product decisions are made by committees of stakeholders who do their best to represent the interests of the user, but they ’ re not necessarily the users themselves. So our team at the VA went out, we looked at the data, we talked to veterans themselves and we started simple and small, with the two most important **services** that matter most to them : education benefits and disability benefits. I ’ m proud to say that they are live on the site today, and as the team continues to streamline more **services**, they will be ported over here, and the old sites, shut down. To me, this is what change looks like in 2016. When you walk out of the Oval Office, the first time I was ever there, I noticed a quote the President had embroidered on the rug. It ’ s the classic JFK quote. It says,”No problem of human destiny is beyond human beings.”It ’ s true. We have the tools to solve these problems. We have the tools to come together as a society, as a country, and to fix this together. Yes, it ’ s hard. It ’ s particularly hard when we have to fight, when we have to refuse to succumb to the belief that things won ’ t change. But in my experience, it ’ s often the hardest things that are the most worth doing, because if we don ’ t do them, who will? This is on us, all of us, together, because government is not an abstract institution or a concept. Our government is us. Today, it is no longer a question of if change is possible. The question is not,”Can we?”The question is,”Will we?”Will you? Thank you. Thank you.

So I ’ d like you to imagine for a moment that you ’ re a soldier in the heat of battle. Maybe you ’ re a Roman foot soldier or a medieval archer or maybe you ’ re a Zulu warrior. Regardless of your time and place, there are some things that are constant. Your adrenaline is elevated, and your **actions** are stemming from these deeply ingrained reflexes, reflexes rooted in a need to protect yourself and your side and to defeat the enemy. So now, I ’ d like you to imagine playing a very different role, that of the scout. The scout ’ s job is not to attack or defend. The scout ’ s job is to understand. The scout is the one going out, mapping the terrain, identifying potential **obstacles**. And the scout may hope to learn that, say, there ’ s a bridge in a convenient location across a river. But above all, the scout wants to know what ’ s really there, as accurately as possible. And in a real, actual army, both the soldier and the scout are essential. But you can also think of each of these roles as a **mindset** — a metaphor for how all of us process information and ideas in our **daily** lives. What I ’ m going to argue today is that having good judgment, making accurate predictions, making good decisions, is mostly about which **mindset** you ’ re in. To illustrate these mindsets in **action**, I ’ m going to take you back to 19th- century France, where this innocuous-looking piece of paper launched one of the biggest political scandals in history. It was discovered in 1894 by officers in the French general staff. It was torn up in a wastepaper basket, but when they pieced it back together, they discovered that someone in their ranks had been selling military secrets to Germany. So they launched a big investigation, and their suspicions quickly converged on this man, Alfred Dreyfus. He had a sterling record, no past history of wrongdoing, no motive as far as they could tell. But Dreyfus was the only Jewish officer at that rank in the army, and unfortunately at this time, the French Army was highly anti-Semitic. They compared Dreyfus ’ s handwriting to that on the memo and concluded that it was a match, even though outside professional handwriting experts were much less confident in the similarity, but never mind that. They went and searched Dreyfus ’ s apartment, looking for any signs of espionage. They went through his files, and they didn ’ t find anything. This just convinced them more that Dreyfus was not only guilty, but sneaky as well, because clearly he had hidden all of the evidence before they had managed to get to it. Next, they went and looked through his personal history for any incriminating details. They talked to his teachers, they found that he had studied foreign languages in school, which clearly showed a desire to conspire with foreign governments later in life. His teachers also said that Dreyfus was known for having a good memory, which was highly suspicious, right? You know, because a spy has to remember a lot of things. So the case went to **trial**, and Dreyfus was found guilty. Afterwards, they took him out into this public square and ritualistically tore his insignia from his uniform and broke his sword in two. This was called the Degradation of Dreyfus. And they sentenced him to life imprisonment on the aptly named Devil ’ s Island, which is this barren rock off the coast of South America. So there he went, and there he spent his days alone, writing letters and letters to the French government begging them to reopen his case so they could discover his innocence. But for the most part, France considered the matter closed. One thing that ’ s really interesting to me about the Dreyfus Affair is this question of why the officers were so convinced that Dreyfus was guilty. I mean, you might even assume that they were setting him up, that they were intentionally framing him. But historians don ’ t think that ’ s what happened. As far as we can tell, the officers genuinely believed that the case against Dreyfus was strong. Which makes you wonder : What does it say about the human mind that we can find such paltry evidence to be compelling enough to convict a man? Well, this is a case of what scientists call”motivated reasoning.”It ’ s this phenomenon in which our unconscious motivations, our desires and fears, shape the way we **interpret** information. Some information, some ideas, feel like our allies. We want them to win. We want to defend them. And other information or ideas are the enemy, and we want to shoot them down. So this is why I call motivated reasoning,”soldier **mindset**.”Probably most of you have never persecuted a French-Jewish officer for high treason, I assume, but maybe you ’ ve followed sports or politics, so you might have noticed that when the referee **judges** that your team committed a foul, for example, you ’ re highly motivated to find reasons why he ’ s wrong. But if he **judges** that the other team committed a foul — awesome! That ’ s a good call, let ’ s not examine it too closely. Or, maybe you ’ ve read an article or a study that examined some controversial policy, like capital punishment. And, as **researchers** have demonstrated, if you support capital punishment and the study shows that it ’ s not effective, then you ’ re highly motivated to find all the reasons why the study was poorly designed. But if it shows that capital punishment works, it ’ s a good study. And vice versa : if you don ’ t support capital punishment, same thing. Our judgment is strongly influenced, unconsciously, by which side we want to win. And this is ubiquitous. This shapes how we think about our health, our relationships, how we decide how to vote, what we consider fair or ethical. What ’ s most scary to me about motivated reasoning or soldier **mindset**, is how unconscious it is. We can think we ’ re being objective and fair-minded and still wind up ruining the life of an innocent man. However, fortunately for Dreyfus, his story is not over. This is Colonel Picquart. He ’ s another high-ranking officer in the French Army, and like most people, he assumed Dreyfus was guilty. Also like most people in the army, he was at least casually anti-Semitic. But at a certain point, Picquart began to suspect :”What if we ’ re all wrong about Dreyfus?”What happened was, he had discovered evidence that the spying for Germany had continued, even after Dreyfus was in prison. And he had also discovered that another officer in the army had handwriting that perfectly matched the memo, much closer than Dreyfus ’ s handwriting. So he brought these discoveries to his superiors, but to his dismay, they either didn ’ t care or came up with elaborate rationalizations to explain his findings, like,”Well, all you ’ ve really shown, Picquart, is that there ’ s another spy who learned how to mimic Dreyfus ’ s handwriting, and he picked up the torch of spying after Dreyfus left. But Dreyfus is still guilty.”Eventually, Picquart managed to get Dreyfus exonerated. But it took him 10 years, and for part of that time, he himself was in prison for the crime of disloyalty to the army. A lot of people feel like Picquart can ’ t really be the hero of this story because he was an anti-Semite and that ’ s bad, which I agree with. But personally, for me, the fact that Picquart was anti-Semitic actually makes his **actions** more admirable, because he had the same prejudices, the same reasons to be **biased** as his fellow officers, but his motivation to find the truth and uphold it trumped all of that. So to me, Picquart is a poster child for what I call”scout **mindset**.”It ’ s the drive not to make one idea win or another lose, but just to see what ’ s really there as honestly and accurately as you can, even if it ’ s not pretty or convenient or **pleasant**. This **mindset** is what I ’ m personally **passionate** about. And I ’ ve spent the last few years examining and trying to figure out what causes scout **mindset**. Why are some people, sometimes at least, able to cut through their own prejudices and **biases** and motivations and just try to see the facts and the evidence as objectively as they can? And the answer is emotional. So, just as soldier **mindset** is rooted in emotions like defensiveness or tribalism, scout **mindset** is, too. It ’ s just rooted in different emotions. For example, scouts are curious. They ’ re more likely to say they feel pleasure when they learn new information or an itch to solve a puzzle. They ’ re more likely to feel intrigued when they encounter something that contradicts their expectations. Scouts also have different values. They ’ re more likely to say they think it ’ s virtuous to test your own beliefs, and they ’ re less likely to say that someone who changes his mind seems weak. And above all, scouts are grounded, which means their self-worth as a person isn ’ t tied to how right or wrong they are about any particular topic. So they can believe that capital punishment works. If studies come out showing that it doesn ’ t, they can say,”Huh. Looks like I might be wrong. Doesn ’ t mean I ’ m bad or stupid.”This cluster of traits is what **researchers** have found — and I ’ ve also found anecdotally — predicts good judgment. And the key takeaway I want to leave you with about those traits is that they ’ re primarily not about how smart you are or about how much you know. In fact, they don ’ t correlate very much with IQ at all. They ’ re about how you feel. There ’ s a quote that I keep coming back to, by Saint-Exupry. He ’ s the author of”The Little Prince.”He said,”If you want to build a ship, don ’ t drum up your men to collect wood and give orders and distribute the work. Instead, teach them to yearn for the vast and endless sea.”In other words, I claim, if we really want to improve our judgment as individuals and as societies, what we need most is not more instruction in logic or rhetoric or probability or economics, even though those things are quite valuable. But what we most need to use those principles well is scout **mindset**. We need to change the way we feel. We need to learn how to feel proud instead of ashamed when we notice we might have been wrong about something. We need to learn how to feel intrigued instead of defensive when we encounter some information that contradicts our beliefs. So the question I want to leave you with is : What do you most yearn for? Do you yearn to defend your own beliefs? Or do you yearn to see the world as clearly as you possibly can? Thank you.

Text Sample 205: POS Dim 2 – 2016 – Score 11.00 – 2016/t001113.txt

An article in the Yale Alumni Magazine told the story of Clyde Murphy, a black man who was a member of the Class of 1970. Clyde was a success story. After Yale and a law degree from Columbia, Clyde spent the next 30 years as one of America ’ s top civil rights lawyers. He was also a great husband and father. But despite his success, personally and professionally, Clyde ’ s story had a sad ending. In 2010, at the age of 62, Clyde died from a blood clot in his lung. Clyde ’ s experience was not unique. Many of his black classmates from Yale also died young. In fact, the magazine article indicated that 41 years after graduation from Yale, the black members of the Class of 1970 had a death rate that was three times higher than that of the average class member. It ’ s stunning. America has recently awakened to a steady drumbeat of unarmed black men being shot by the police. What is even a bigger story is that every seven minutes, a black person dies prematurely in the United States. That is over 200 black people die every single day who would not die if the health of blacks and whites were equal. For the last 25 years, I have been on a **mission** to understand why does race matter so profoundly for health. When I started my career, many believed that it was simply about racial differences in income and education. I discovered that while economic status matters for health, there is more to the story. So for example, if we look at life expectancy at age 25, at age 25 there ’ s a five- year gap between blacks and whites. And the gap by education for both whites and blacks is even larger than the racial gap. At the same time, at every level of education, whites live longer than blacks. So whites who are high school dropouts live 3. 4 years longer than their black counterparts, and the gap is even larger among college graduates. Most surprising of all, whites who have graduated from high school live longer than blacks with a college degree or more education. So why does race matter so profoundly for health? What else is it beyond education and income that might matter? In the early 1990s, I was asked to review a new book on the health of black America. I was struck that almost every single one of its 25 chapters said that racism was a factor that was hurting the health of blacks. All of these **researchers** were stating that racism was a factor adversely impacting blacks, but they provided no evidence. For me, that was not good enough. A few months later, I was speaking at a conference in Washington, DC, and I said that one of the priorities for research was to document the ways in which racism affected health. A white gentleman stood in the audience and said that while he agreed with me that racism was important, we could never measure racism.”We measure self-esteem,”I said.”There ’ s no reason why we can ’ t measure racism if we put our minds to it.”And so I put my mind to it and developed three scales. The first one captured major experiences of discrimination, like being unfairly fired or being unfairly stopped by the police. But discrimination also occurs in more minor and subtle experiences, and so my second scale, called the Everyday Discrimination Scale, captures nine items that captures experiences like you ’ re treated with less courtesy than others, you receive poorer **service** than others in restaurants or stores, or people act as if they ’ re afraid of you. This scale captures ways in which the dignity and the respect of people who society does not value is chipped away on a **daily** basis. Research has found that higher levels of discrimination are associated with an elevated risk of a broad range of diseases from blood pressure to abdominal obesity to breast cancer to heart disease and even premature mortality. Strikingly, some of the effects are **observed** at a very young age. For example, a study of black teens found that those who reported higher levels of discrimination as teenagers had higher levels of **stress** hormones, of blood pressure and of weight at age 20. However, the **stress** of discrimination is only one aspect. Discrimination and racism also matters in other profound ways for health. For example, there ' s discrimination in medical care. In 1999, the National Academy of Medicine asked me to serve on a committee that found, concluded based on the scientific evidence, that blacks and other minorities receive poorer quality care than whites. This was true for all kinds of medical treatment, from the most simple to the most technologically sophisticated. One explanation for this pattern was a phenomenon that ' s called"implicit **bias**"or"unconscious discrimination."Research for decades by social psychologists indicates that if you hold a negative stereotype about a group in your subconscious mind and you meet someone from that group, you will **discriminate** against that person. You will treat them differently. It ' s an unconscious process. It ' s an automatic process. It is a subtle process, but it ' s normal and it occurs even among the most well-intentioned individuals. But the deeper that I delved into the health impact of racism, the more insidious the effects became. There is institutional discrimination, which refers to discrimination that exists in the processes of social institutions. Residential segregation by race, which has led to blacks and whites living in very different neighborhood contexts, is a classic example of institutional racism. One of America ' s best-kept secrets is how residential segregation is the secret source that creates racial inequality in the United States. In America, where you live determines your access to opportunities in education, in employment, in housing and even in access to medical care. One study of the 171 largest cities in the United States concluded that there is not even one city where whites live under equal conditions to blacks, and that the worst urban contexts in which whites reside is considerably better than the average context of black communities. Another study found that if you could eliminate statistically residential segregation, you would completely erase black-white differences in income, education and unemployment, and reduce black-white differences in single motherhood by two thirds, all of that driven by segregation. I have also learned how the negative stereotypes and images of blacks in our culture literally create and sustain both institutional and individual discrimination. A group of **researchers** have put together a database that contains the books, magazines and articles that an average college-educated American would read over their lifetime. It allows us to look within this database and see how Americans have seen words paired together as they grow up in their society. So when the word"black"appears in American culture, what co-occurs with it?"Poor,""violent,""religious,""lazy,""cheerful,""dangerous."When"white"occurs, the frequently co-occurring words are"wealthy,""progressive,""conventional,""stubborn,""successful,""educated."So when a police officer overreacts when he sees an unarmed black male and perceives him to be violent and dangerous, we are not necessarily dealing with an inherently bad cop. We may be simply viewing a normal American who is reflecting what he has been exposed to as a result of being raised in this society. From my own experience, I believe that your race does not have to be a determinant of your destiny. I migrated to the United States from the Caribbean island of Saint Lucia in the late 1970s in pursuit of higher education, and in the last 40 years, I have done well. I have had a supportive family, I have worked hard, I have done well. But it took more for me to be successful. I received a minority fellowship from the University of Michigan. Yes. I am an affirmative **action** baby. Without affirmative **action**, I would not be here. But in the last 40 years, black America has been less successful than I have. In 1978, black households in the United States earned 59 cents for every dollar of income whites earned. In 2015, black families still earn 59 cents for every dollar of income that white families receive, and the racial gaps in wealth are even more stunning. For every dollar of wealth that whites have, black families have six pennies and Latinos have seven pennies. The fact is, racism is producing a truly rigged system that is systematically disadvantaging some racial groups in the United States. To paraphrase Plato, there is nothing so unfair as the equal treatment of unequal people. And that ' s why I am committed to working to dismantle racism. I deeply appreciate the fact that I am standing on the shoulders of those who have sacrificed even their lives to open the doors that I have walked through. I want to ensure that those doors remain open and that everyone can walk through those doors. Robert Kennedy said,"Each time a man"— or woman, I would add —"stands up for an ideal or acts to improve the lot of others or strikes out against injustice, he sends forth a tiny ripple of hope, and those ripples can build a current that can sweep down the mightiest walls of oppression and resistance."I am optimistic today because all across America, I have seen ripples of hope. The Boston Medical Center has added lawyers to the medical team so that physicians can improve the health of their patients because the lawyers are addressing the nonmedical needs their patients have. Loma Linda University has built a gateway college in **nearby** San Bernardino so that in addition to delivering medical care, they can provide job skills and job training to a predominantly minority, low-income community members so that they will have the skills they need to get a decent job. In Chapel Hill, North Carolina, the Abecedarian Project has figured out how to ensure that they have lowered the risks for heart disease for blacks in their mid-30s by providing high-quality day care from birth to age five. In after-school centers across the United States, Wintley Phipps and the US Dream Academy is breaking the cycle of incarceration by providing high-quality academic enrichment and mentoring to the children of prisoners and children who have fallen behind in school. In Huntsville, Alabama, Oakwood University, a historically black institution, is showing how we can improve the health of black adults by including a health evaluation as a part of freshman orientation and giving those students the tools they need to make healthy choices and providing them annually a health transcript so they can monitor their progress. And in Atlanta, Georgia, Purpose Built Communities has dismantled the negative effects of segregation by transforming a crime-ridden, drug-infested public housing project into an oasis of mixed-income housing, of academic performance, of great community wellness and of full employment. And finally, there is the Devine solution. Professor Patricia Devine of the University of Wisconsin has shown us how we can attack our hidden **biases** head on and effectively reduce them. Each one of us can be a ripple of hope. This work will not always be easy, but former Supreme Court Justice Thurgood Marshall has told us,"We must dissent. We must dissent from the indifference. We must dissent from the apathy. We must dissent from the hatred and from the mistrust. We must dissent because America can do better, because America has no choice but to do better."Thank you.

Consider the following statement : human beings only use 10 percent of their brain capacity. Well, as a neuroscientist, I can tell you that while Morgan Freeman delivered this line with the gravitas that makes him a great actor, this statement is entirely false. The truth is, human beings use 100 percent of their brain capacity. The brain is a highly efficient, energy-demanding organ that gets fully utilized and even though it is at full capacity being used, it suffers from a problem of information overload. There ' s far too much in the environment than it can fully process. So to solve this problem of overload, evolution devised a solution, which is the brain ' s attention system. Attention allows us to notice, select and direct the brain ' s computational resources to a subset of all that ' s available. We can think of attention as the leader of the brain. Wherever attention goes, the rest of the brain follows. In some sense, it ' s your brain ' s boss. And over the last 15 years, I ' ve been studying the human brain ' s attention system. In all of our studies, I ' ve been very interested in one question. If it is indeed the case that our attention is the brain ' s boss, is it a good boss? Does it actually guide us well? And to dig in on this big question, I wanted to know three things. First, how does attention control our perception? Second, why does it fail us, often leaving us feeling foggy and distracted? And third, can we do anything about this fogginess, can we train our brain to pay better attention? To have more strong and stable attention in the work that we do in our lives. So I wanted to give you a brief glimpse into how we ' re going to look at this. A very poignant example of how our attention ends up getting utilized. And I want to do it using the example of somebody that I know quite well. He ends up being part of a very large group of people that we work with, for whom attention is a matter of life and death. Think of medical professionals or firefighters or soldiers or marines. This is the story of a marine captain, Captain Jeff Davis. And the scene that I ' m going to share with you, as you can see, is not about his time in the battlefield. He was actually on a bridge, in Florida. But instead of looking at the scenery around him, seeing the beautiful vistas and noticing the cool ocean breezes, he was driving fast and contemplating driving off that bridge. And he would later tell me that it took all of everything he had not to do so. You see, he ' d just returned from Iraq. And while his body was on that bridge, his mind, his attention, was thousands of miles away. He was gripped with suffering. His mind was worried and preoccupied and had **stressful** memories and, really, **dread** for his future. And I ' m really glad that he didn ' t take his life. Because he, as a leader, knew that he wasn ' t the only one that was probably suffering ; many of his fellow marines probably were, too. And in the year 2008, he partnered with me in the first-of-its-kind project that actually allowed us to test and offer something called mindfulness training to active-duty military personnel. But before I tell you about what mindfulness training is, or the results of that study, I think it ' s important to understand how attention works in the brain. So what we do in the laboratory is that many of our studies of attention involve brain-wave recordings. In these brain wave recordings, people wear funny-looking caps that are sort of like swimming caps, that have electrodes embedded in them. These electrodes pick up the ongoing brain electrical activity. And they do it with millisecond temporal precision. So we can see these small yet detectable voltage fluctuations over time. And doing this, we can very precisely plot the timing of the brain ' s activity. About 170 milliseconds after we show our research participants a face on the screen, we see a very reliable, detectable brain signature. It happens right at the back of the scalp, above the regions of the brain that are involved in face processing. Now, this happens so reliably and so on cue, as the brain ' s face detector, that we ' ve even given this brain-wave component a name. We call it the N170 component. And we use this component in many of our studies. It allows us to see the impact that attention may have on our perception. I ' m going to give you a sense of the kind of experiments that we actually do in the lab. We would show participants images like this one. You should see a face and a scene overlaid on each other. And what we do is we ask our participants as they ' re viewing a series of these types of overlaid images, to do something with their attention. On some **trials**, we ’ ll ask them to pay attention to the face. And to make sure they ’ re doing that, we ask them to tell us, by pressing a button, if the face appeared to be male or female. On other **trials**, we ask them to tell what the scene was — was it indoor or outdoor? And in this way, we can manipulate attention and confirm that the participants were actually doing what we said. Our hypotheses about attention were as follows : if attention is indeed doing its job and affecting perception, maybe it works like an amplifier. And what I mean by this is that when we direct attention to the face, it becomes clearer and more salient, it ’ s easier to see. But when we direct it to the scene, the face becomes barely perceptible as we process the scene information. So what we wanted to do is look at this brain-wave component of face detection, the N170, and see if it changed at all as a function of where our participants were paying attention — to the scene or the face. And here ’ s what we found. We found that when they paid attention to the face, the N170 was larger. And when they paid attention to the scene, as you can see in red, it was smaller. And that gap you see between the blue and red lines is pretty powerful. What it tells us is that attention, which is really the only thing that changed, since the images they viewed were identical in both cases — attention changes perception. And it does so very fast. Within 170 milliseconds of actually seeing a face. In our **follow-up** studies, we wanted to see what would happen, how could we perturb or diminish this effect. And our hunch was that if you put people in a very **stressful** environment, if you distract them with disturbing, negative images, images of suffering and violence — sort of like what you might see on the news, unfortunately — that doing this might actually affect their attention. And that ’ s indeed what we found. If we present **stressful** images while they ’ re doing this experiment, this gap of attention shrinks, its power diminishes. So in some of our other studies, we wanted to see, OK, great — not great, actually, bad news that **stress** does this to the brain — but if it is the case that **stress** has this powerful influence on attention through external distraction, what if we don ’ t need external distraction, what if we distract ourselves? And to do this, we had to basically come up with an experiment in which we could have people generate their own mind-wandering. This is having off-task thoughts while we ’ re engaged in an ongoing task of some sort. And the trick to mind-wandering is that essentially, you bore people. So hopefully there ’ s not a lot of mind-wandering happening right now. When we bore people, people happily generate all kinds of internal content to occupy themselves. So we devised what might be considered one of the world ’ s most boring experiments. All the participants saw were a series of faces on the screen, one after another. They pressed the button every time they saw the face. That was pretty much it. Well, one trick was that sometimes, the face would be upside down, and it would happen very infrequently. On those **trials** they were told just to withhold the response. Pretty soon, we could tell that they were successfully mind-wandering, because they pressed the button when that face was upside down. Even though it ’ s quite plain to see that it was upside down. So we wanted to know what happens when people have mind-wandering. And what we found was that, very similar to external **stress** and external distraction in the environment, internal distraction, our own mind wandering, also shrinks the gap of attention. It diminishes attention ’ s power. So what do all of these studies tell us? They tell us that attention is very powerful in terms of affecting our perception. Even though it ’ s so powerful, it ’ s also fragile and vulnerable. And things like **stress** and mind-wandering diminish its power. But that ’ s all in the context of these very controlled laboratory **settings**. What about in the real world? What about in our actual day-to-day life? What about now? Where is your attention right now? To kind of bring it back, I ’ d like to make a prediction about your attention for the remainder of my talk. Are you up for it? Here ’ s the prediction. You will be unaware of what I ’ m saying for four out of the next eight minutes. It ’ s a challenge, so pay attention, please. Now, why am I saying this? I ’ m surely going to assume that you ’ re going to remain seated and, you know, graciously keep your eyes on me as I speak. But a growing body of literature suggests that we mind-wander, we take our mind away from the task at hand, about 50 percent of our waking moments. These might be small, little trips that we take away, private thoughts that we have. And when this mind-wandering happens, it can be problematic. Now I don ’ t think there will be any dire consequences with you all sitting here today, but imagine a military leader missing four minutes of a military briefing, or a **judge** missing four minutes of testimony. Or a surgeon or firefighter missing any time. The consequences in those cases could be dire. So we might ask why do we do this? Why do we mind- wander so much? Well, part of the answer is that our mind is an exquisite time-traveling master. It can actually time travel very easily. If we think of the mind as the metaphor of the music player, we see this. We can rewind the mind to the past to reflect on events that have already happened, right? Or we can go and fast- future, to plan for the next thing that we want to do. And we land in this mental time-travel mode of the past or the future very frequently. And we land there often without our awareness, most times without our awareness, even if we want to be paying attention. Think of just the last time you were trying to read a book, got to the bottom of the page with no idea what the words were saying. This happens to us. And when this happens, when we mind-wander without an awareness that we ’ re doing it, there are consequences. We make errors. We miss critical information, sometimes. And we have difficulty making decisions. What ’ s worse is when we experience **stress**. When we ’ re in a moment of overwhelm. We don ’ t just reflect on the past when we rewind, we end up being in the past ruminating, reliving or regretting events that have already happened. Or under **stress**, we **fast-forward** the mind. Not just to productively plan. But we end up catastrophizing or worrying about events that haven ’ t happened yet and frankly may never happen. So at this point, you might be thinking to yourself, OK, mind-wandering ’ s happening a lot. Often, it happens without our awareness. And under **stress**, it ’ s even worse — we mind-wander more powerfully and more often. Is there anything we can possibly do about this? And I ’ m happy to say the answer is yes. From our work, we ’ re learning that the opposite of a **stressed** and wandering mind is a mindful one. Mindfulness has to do with paying attention to our present-moment experience with awareness. And without any kind of emotional reactivity of what ’ s happening. It ’ s about keeping that button right on play to experience the moment-to-moment unfolding of our lives. And mindfulness is not just a concept. It ’ s more like **practice**, you have to embody this mindful mode of being to have any benefits. And a lot of the work that we ’ re doing, we ’ re offering people programs that give our participants a suite of exercises that they should do **daily** in order to cultivate more moments of mindfulness in their life. And for many of the groups that we work with, high-**stress** groups, like I said — soldiers, medical professionals — for them, as we know, mind-wandering can be really dire. So we want to make sure we offer them very accessible, low time constraints to optimize the training, so they can benefit from it. And when we do this, what we can do is track to see what happens, not just in their regular lives but in the most demanding circumstances that they may have. Why do we want to do this? Well, we want to, for example, give it to students right around finals season. Or we want to give the training to accountants during tax season. Or soldiers and marines while they ’ re deploying. Why is that? Because those are the moments in which their attention is most likely to be vulnerable, because of **stress** and mind-wandering. And those are also the moments in which we want their attention to be in **peak** shape so they can perform well. So what we do in our research is we have them take a series of attention tests. We track their attention at the beginning of some kind of high-stress interval, and then two months later, we track them again, and we want to see if there ’ s a difference. Is there any benefit of offering them mindfulness training? Can we protect against the lapses in attention that might arise over high **stress**? So here ’ s what we find. Over a high-stress interval, unfortunately, the reality is if we don ’ t do anything at all, attention declines, people are worse at the end of this high- **stress** interval than before. But if we offer mindfulness training, we can protect against this. They stay stable, even though just like the other groups, they were experiencing high **stress**. And perhaps even more impressive is that if people take our training programs over, let ’ s say, eight weeks, and they fully commit to doing the **daily** mindfulness exercises that allow them to learn how to be in the present moment, well, they actually get better over time, even though they ’ re in high **stress**. And this last point is actually important to realize, because of what it suggests to us is that mindfulness exercises are very much like physical exercise : if you don ’ t do it, you don ’ t benefit. But if you do engage in mindfulness **practice**, the more you do, the more you benefit. And I want to just bring it back to Captain Jeff Davis. As I mentioned to you at the beginning, his marines were involved in the very first project that we ever did, offering mindfulness training. And they showed this exact pattern, which was very heartening. We had offered them the mindfulness training right before they were deployed to Iraq. And upon their return, Captain Davis shared with us what he was feeling was the benefit of this program. He said that unlike last time, after this deployment, they were much more present. They were discerning. They were not as reactive. And in some cases, they were really more compassionate with the people they were engaging with and each other. He said in many ways, he felt that the mindfulness training program we offered gave them a really important tool to protect against developing post-traumatic **stress** disorder and even allowing it to turn into post-traumatic growth. To us, this was very compelling. And it ended up that Captain Davis and I — you know, this was about a decade ago, in 2008 — we ’ ve kept in touch all these years. And he himself has gone on to continue **practicing** mindfulness in a **daily** way. He was promoted to major, he actually then ended up retiring from the Marine Corps. He went on to get a divorce, to get remarried, to have a child, to get an MBA. And through all of these challenges and transitions and joys of his life, he kept up with his mindfulness **practice**. And as fate would have it, just a few months ago, Captain Davis suffered a massive heart attack, at the age of 46. And he ended up calling me a few weeks ago. And he said,”I want to tell you something. I know that the doctors who worked on me, they saved my heart, but mindfulness saved my life. The presence of mind I had to stop the ambulance that ended up taking me to the hospital,”— himself, the clarity of mind he had to notice when there was fear and anxiety happening but not be gripped by it — he said,”For me, these were the gifts of mindfulness.”And I was so **relieved** to hear that he was OK. But really heartened to see that he had transformed his own attention. He went from having a really bad boss — an attention system that nearly drove him off a bridge — to one that was an exquisite leader and guide, and saved his life. So I want to actually end by sharing my call to **action** to all of you. And here it is. Pay attention to your attention. Alright? Pay attention to your attention and incorporate mindfulness training as part of your **daily** wellness toolkit, in order to tame your own wandering mind and to allow your attention to be a trusted guide in your own life. Thank you.

Chris Anderson : Hello. Welcome to this TED Dialogues. It ’ s the first of a series that ’ s going to be done in response to the current political upheaval. I don ’ t know about you ; I ’ ve become quite concerned about the growing divisiveness in this country and in the world. No one ’ s listening to each other. Right? They aren ’ t. I mean, it feels like we need a different kind of conversation, one that ’ s based on — I don ’ t know, on reason, listening, on understanding, on a broader context. That ’ s at least what we ’ re going to try in these TED Dialogues, starting today. And we couldn ’ t have anyone with us who I ’ d be more excited to kick this off. This is a mind right here that thinks pretty much like no one else on the planet, I would hasten to say. I ’ m serious. I ’ m serious. He synthesizes history with underlying ideas in a way that kind of takes your breath away. So, some of you will know this book,”Sapiens.”Has anyone here read”Sapiens”? I mean, I could not put it down. The way that he tells the story of mankind through big ideas that really make you think differently — it ’ s kind of amazing. And here ’ s the **follow-up**, which I think is being published in the US next week. YNH : Yeah, next week. CA :”Homo Deus.”Now, this is the history of the next hundred years. I ’ ve had a chance to read it. It ’ s extremely dramatic, and I daresay, for some people, quite alarming. It ’ s a must-read. And honestly, we couldn ’ t have someone better to help make sense of what on Earth is happening in the world right now. So a warm welcome, please, to Yuval Noah Harari. It ’ s great to be joined by our friends on Facebook and around the Web. Hello, Facebook. And all of you, as I start asking questions of Yuval, come up with your own questions, and not necessarily about the political scandal du jour, but about the broader understanding of : Where are we heading? You ready? OK, we ’ re going to go. So here we are, Yuval : New York City, 2017, there ’ s a new president in power, and shock waves rippling around the world. What on Earth is happening? YNH : I think the basic thing that happened is that we have lost our story. Humans think in stories, and we try to make sense of the world by telling stories. And for the last few decades, we had a very simple and very attractive story about what ’ s happening in the world. And the story said that, oh, what ’ s happening is that the economy is being globalized, politics is being liberalized, and the combination of the two will create paradise on Earth, and we just need to keep on globalizing the economy and liberalizing the political system, and everything will be wonderful. And 2016 is the moment when a very large segment, even of the Western world, stopped believing in this story. For good or bad reasons — it doesn ’ t matter. People stopped believing in the story, and when you don ’ t have a story, you don ’ t understand what ’ s happening. CA : Part of you believes that that story was actually a very effective story. It worked. YNH : To some extent, yes. According to some measurements, we are now in the best time ever for humankind. Today, for the first time in history, more people die from eating too much than from eating too little, which is an amazing achievement. Also for the first time in history, more people die from old age than from infectious diseases, and violence is also down. For the first time in history, more people commit suicide than are killed by crime and terrorism and war put together. Statistically, you are your own worst enemy. At least, of all the people in the world, you are most likely to be killed by yourself — which is, again, very good news, compared — compared to the level of violence that we saw in previous eras. CA : But this process of connecting the world ended up with a large group of people kind of feeling left

out, and they ’ ve reacted. And so we have this bombshell that ’ s sort of ripping through the whole system. I mean, what do you make of what ’ s happened? It feels like the old way that people thought of politics, the left-right divide, has been blown up and replaced. How should we think of this? YNH : Yeah, the old 20th-century political model of left versus right is now largely irrelevant, and the real divide today is between global and national, global or local. And you see it again all over the world that this is now the main **struggle**. We probably need completely new political models and completely new ways of thinking about politics. In essence, what you can say is that we now have global ecology, we have a global economy but we have national politics, and this doesn ’ t work together. This makes the political system **ineffective**, because it has no control over the forces that shape our life. And you have basically two solutions to this imbalance : either de-globalize the economy and turn it back into a national economy, or globalize the political system. CA : So some, I guess many liberals out there view Trump and his government as kind of irredeemably bad, just awful in every way. Do you see any underlying narrative or political philosophy in there that is at least worth understanding? How would you articulate that philosophy? Is it just the philosophy of nationalism? YNH : I think the underlying feeling or idea is that the political system — something is broken there. It doesn ’ t empower the ordinary person anymore. It doesn ’ t care so much about the ordinary person anymore, and I think this diagnosis of the political disease is correct. With regard to the answers, I am far less certain. I think what we are seeing is the immediate human reaction : if something doesn ’ t work, let ’ s go back. And you see it all over the world, that people, almost nobody in the political system today, has any future-oriented vision of where humankind is going. Almost everywhere, you see retrograde vision :”Let ’ s make America great again,”like it was great — I don ’ t know — in the ’ 50s, in the ’ 80s, sometime, let ’ s go back there. And you go to Russia a hundred years after Lenin, Putin ’ s vision for the future is basically, ah, let ’ s go back to the Tsarist empire. And in Israel, where I come from, the hottest political vision of the present is :”Let ’ s build the temple again.”So let ’ s go back 2, 000 years backwards. So people are thinking sometime in the past we ’ ve lost it, and sometimes in the past, it ’ s like you ’ ve lost your way in the city, and you say OK, let ’ s go back to the point where I felt secure and start again. I don ’ t think this can work, but a lot of people, this is their gut instinct. CA : But why couldn ’ t it work?”America First”is a very appealing slogan in many ways. Patriotism is, in many ways, a very noble thing. It ’ s played a role in promoting cooperation among large numbers of people. Why couldn ’ t you have a world organized in countries, all of which put themselves first? YNH : For many centuries, even thousands of years, patriotism worked quite well. Of course, it led to wars an so forth, but we shouldn ’ t focus too much on the bad. There are also many, many positive things about patriotism, and the ability to have a large number of people care about each other, sympathize with one another, and come together for collective **action**. If you go back to the first nations, so, thousands of years ago, the people who lived along the Yellow River in China — it was many, many different tribes and they all depended on the river for survival and for prosperity, but all of them also suffered from periodical floods and periodical droughts. And no tribe could really do anything about it, because each of them controlled just a tiny section of the river. And then in a long and complicated process, the tribes coalesced together to form the Chinese nation, which controlled the entire Yellow River and had the ability to bring hundreds of thousands of people together to build dams and canals and regulate the river and prevent the worst floods and droughts and raise the level of prosperity for everybody. And this worked in many places around the world. But in the 21st century, technology is changing all that in a fundamental way. We are now living — all people in the world — are living alongside the same cyber river, and no single nation can regulate this river by itself. We are all living together on a single planet, which is threatened by our own **actions**. And if you don ’ t have some kind of global cooperation, nationalism is just not on the right level to tackle the problems, whether it ’ s climate change or whether it ’ s technological disruption. CA : So it was a beautiful idea in a world where most of the **action**, most of the issues, took place on national scale, but your argument is that the issues that matter most today no longer take place on a national scale but on a global scale. YNH : Exactly. All the major problems of the world today are global in essence, and they cannot be solved unless through some kind of global cooperation. It ’ s not just climate change, which is, like, the most obvious example people give. I think more in terms of technological disruption. If you think about, for example, artificial intelligence, over the next 20, 30 years pushing hundreds of millions of people out of the job market — this is a problem on a global level. It will disrupt the economy of all the countries. And similarly, if you think about, say, bioengineering and people being afraid of conducting, I don ’ t know, genetic engineering research in humans, it won ’ t help if just a single country, let ’ s say the US, outlaws all genetic experiments in humans, but China or North Korea continues to do it. So the US cannot solve it by itself, and very quickly, the pressure on the US to do the same will be immense because we are talking about high-risk, high-gain technologies. If somebody else is doing it, I can ’ t allow myself to remain behind. The only way to have regulations, effective regulations, on things like genetic engineering, is to have global regulations. If you just have national regulations, nobody would like to stay behind. CA : So this is really interesting. It seems to me that this may be one key to provoking at least a constructive conversation between the different sides here, because I think everyone can agree that the start point of a lot of the anger that ’ s propelled us to where we are is because of the legitimate concerns about job loss. Work is gone, a traditional way of life has gone, and it ’ s no wonder that people are furious about that. And in general, they have blamed globalism, global elites, for doing this to them without asking their permission, and that seems like a legitimate complaint. But what I hear you saying is that — so a key question is : What is the real cause of job loss, both now and going forward? To the extent that it ’ s about globalism, then the right response, yes, is to shut down borders and keep people out and change trade agreements and so forth. But you ’ re saying, I think, that actually the bigger cause of job loss is not going to be that at all. It ’ s going to originate in technological questions, and we have no chance of solving that unless we operate as a connected world. YNH : Yeah, I think that, I don ’ t know about the present, but looking to the future, it ’ s not the Mexicans or Chinese who will take the jobs from the people in Pennsylvania, it ’ s the robots and algorithms. So unless you plan to build a big wall on the border of California — the wall on the border with Mexico is going to be very **ineffective**. And I was struck when I watched the debates before the election, I was struck that certainly Trump did not even attempt to frighten people by saying the robots will take your jobs. Now even if it ’ s not true, it doesn ’ t matter. It could have been an extremely effective way of frightening people — and galvanizing people :”The robots will take your jobs!”And nobody used that line. And it made me afraid, because it meant that no matter what happens in universities and laboratories, and there, there is already an intense debate about it, but in the mainstream political system and among the general public, people are just unaware that there could be an immense technological disruption — not in 200 years, but in 10, 20, 30 years — and we have to do something about it now, partly because most of what we teach children today in school or in college is going to be completely irrelevant to the job market of 2040, 2050. So it ’ s not something we ’ ll need to think about in 2040. We need to think today what to teach the young people. CA : Yeah, no, absolutely. You ’ ve often written about moments in history where humankind has... entered a new era, unintentionally. Decisions have been made, technologies have been developed, and suddenly the world has changed, possibly in a way that ’ s worse for everyone. So one of the examples you give in”Sapiens”is just the whole agricultural revolution, which, for an actual person tilling the fields, they just picked up a 12-hour backbreaking workday instead of six hours in the jungle and a much more interesting lifestyle. So are we at another possible phase change here, where we kind of sleepwalk into a future that none of us actually wants? YNH : Yes, very much so. During the agricultural revolution, what happened is that immense technological and economic revolution empowered the human collective, but when you look at actual individual lives, the life of a tiny elite became much better, and the lives of the majority of people became considerably worse. And this can happen again in the 21st century. No doubt the new technologies will empower the human collective. But we may end up again with a tiny elite reaping all the benefits, taking all the fruits, and the masses of the population finding themselves worse than they were before, certainly much worse than this tiny elite. CA : And those elites might not even be human elites. They might be cyborgs or — YNH : Yeah, they could be enhanced **super** humans. They could be cyborgs. They could be completely nonorganic elites. They could even be non-conscious algorithms. What we see now in the world is authority shifting away from humans to algorithms. More and more decisions — about personal lives, about economic matters, about political matters — are actually being taken by algorithms. If you ask the bank for a loan, chances are your fate is decided by an algorithm, not by a human being. And the general impression is that maybe Homo sapiens just lost it. The world is so complicated, there is so much data, things are changing so fast, that this thing that evolved on the African savanna tens of thousands of years ago — to cope with a particular environment, a particular volume of information and data — it just can ’ t handle the realities of the 21st century, and the only thing that may be able to handle it is big-data algorithms. So no wonder more and more authority is shifting from us to the algorithms. CA : So we ’ re in New York City for the first of a series of TED Dialogues with Yuval Harari, and there ’ s a Facebook Live audience out there. We ’ re excited to have you with us. We ’ ll start coming to some of your questions and questions of people in the room in just a few minutes, so have those coming. Yuval, if you ’ re going to make the argument that we need to get past nationalism because of the coming technological... danger, in a way, presented by so much of what ’ s happening we ’ ve got to have a global conversation about this. Trouble is, it ’ s hard to get people really believing that, I don ’ t know, AI really is an imminent threat, and so forth. The things that people, some people at least, care about much more immediately, perhaps, is climate change, perhaps other issues like refugees, nuclear weapons, and so forth. Would you argue that where we are right now that somehow those issues need to be dialed up? You ’ ve talked about climate change, but Trump has said he doesn ’ t believe in that. So in a way, your most powerful argument, you can ’ t actually use to make this case. YNH : Yeah, I think with climate change, at first sight, it ’ s quite surprising that there is a very close correlation between nationalism and climate change. I mean, almost always, the people who deny climate change are nationalists. And at first sight, you think : Why? What ’ s the connection? Why don ’ t you have socialists denying climate change? But then, when you think about it, it ’ s obvious — because nationalism has no solution to climate change. If you want to be a nationalist in the 21st century, you have to deny the problem. If you accept the reality of the problem, then you must accept that, yes, there is still room in the world for patriotism, there is still room in the world for having **special** loyalties and obligations towards your own people, towards your own country. I don ’ t think anybody is really thinking of abolishing that. But in order to confront climate change, we need additional loyalties and commitments to a level beyond the nation. And that should not be impossible, because people can have several layers of loyalty. You can be loyal to your family and to your community and to your nation, so why can ’ t you also be loyal to humankind as a whole? Of course, there are occasions when it becomes difficult, what to put first, but, you know, life is difficult. Handle it. CA : OK, so I would love to get some questions from the audience here. We ’ ve got a **microphone** here. Speak into it, and Facebook, get them coming, too. Howard Morgan : One of the things that has clearly made a huge difference in this country and other countries is the income distribution inequality, the dramatic change in income distribution in the US from what it was 50 years ago, and around the world. Is there anything we can do to affect that? Because that gets at a lot of the underlying causes. YNH : So far I haven ’ t heard a very good idea about what to do about it, again, partly because most ideas remain on the national level, and the problem is global. I mean, one idea that we hear quite a lot about now is universal basic income. But this is a problem. I mean, I think it ’ s a good start, but it ’ s a problematic idea because it ’ s not clear what”universal”is and it ’ s not clear what”basic”is. Most people when they speak about universal basic income, they actually mean national basic income. But the problem is global. Let ’ s say that you have AI and 3D printers taking away millions of jobs in Bangladesh, from all the people who make my shirts and my shoes. So what ’ s going to happen? The US government will levy taxes on Google and Apple in California, and use that to pay basic income to unemployed Bangladeshis? If you believe that, you can just as well believe that Santa Claus will come and solve the problem. So unless we have really universal and not national basic income, the deep problems are not going to go away. And also it ’ s not clear what basic is, because what are basic human needs? A thousand years ago, just food and shelter was enough. But today, people will say education is a basic human need, it should be part of the package. But how much? Six years? Twelve years? PhD? Similarly, with health care, let ’ s say that in 20, 30, 40 years, you ’ ll have expensive treatments that can extend human life to 120, I don ’ t know. Will this be part of the basket of basic income or not? It ’ s a very difficult problem, because in a world where people lose their ability to be employed, the only thing they are going to get is this basic income. So what ’ s part of it is a very, very difficult ethical question. CA : There ’ s a bunch of questions on how the world affords it as well, who pays. There ’ s a question here from Facebook from Lisa Larson :”How does nationalism in the US now compare to that between World War I and World War II in the last century?”YNH : Well the good news, with regard to the dangers of nationalism, we are in a much better position than a century ago. A century ago, 1917, Europeans were killing each other by the millions. In 2016, with Brexit, as far as I remember, a single person lost their life, an MP who was murdered by some extremist. Just a single person. I mean, if Brexit was about British independence, this is the most peaceful war of independence in human history. And let ’ s say that Scotland will now choose to leave the UK after Brexit. So in the 18th century, if Scotland wanted — and the Scots wanted several times — to break out of the control of London, the reaction of the government in London was to send an army up north to burn down Edinburgh and massacre the highland tribes. My guess is that if, in 2018, the Scots vote for independence, the London government will not send an army up north to burn down Edinburgh. Very few people are now willing to kill or be killed for Scottish or for British independence. So for all the talk of the rise of nationalism and going back to the 1930s, to the 19th century, in the West at least, the power of national sentiments today is far, far smaller than it was a century ago. CA : Although some people now, you hear publicly worrying about whether that might be shifting, that there could actually be outbreaks of violence in the US depending on how things turn out. Should we be worried about that, or do you really think things have shifted? YNH : No, we should be worried. We should be aware of two things. First of all, don ' t be hysterical. We are not back in the First World War yet. But on the other hand, don ' t be complacent. We reached from 1917 to 2017, not by some divine miracle, but simply by human decisions, and if we now start making the wrong decisions, we could be back in an analogous situation to 1917 in a few years. One of the things I know as a historian is that you should never underestimate human stupidity. It ' s one of the most powerful forces in history, human stupidity and human violence. Humans do such crazy things for no obvious reason, but again, at the same time, another very powerful force in human history is human wisdom. We have both. CA : We have with us here moral psychologist Jonathan Haidt, who I think has a question. Jonathan Haidt : Thanks, Yuval. So you seem to be a fan of global governance, but when you look at the map of the world from Transparency International, which rates the level of corruption of political institutions, it ' s a vast sea of red with little bits of yellow here and there for those with good institutions. So if we were to have some kind of global governance, what makes you think it would end up being more like Denmark rather than more like Russia or Honduras, and aren ' t there alternatives, such as we did with CFCs? There are ways to solve global problems with national governments. What would world government actually look like, and why do you think it would work? YNH : Well, I don ' t know what it would look like. Nobody still has a model for that. The main reason we need it is because many of these issues are lose-lose situations. When you have a win-win situation like trade, both sides can benefit from a trade agreement, then this is something you can work out. Without some kind of global government, national governments each have an interest in doing it. But when you have a lose-lose situation like with climate change, it ' s much more difficult without some overarching authority, real authority. Now, how to get there and what would it look like, I don ' t know. And certainly there is no obvious reason to think that it would look like Denmark, or that it would be a democracy. Most likely it wouldn ' t. We don ' t have workable democratic models for a global government. So maybe it would look more like ancient China than like modern Denmark. But still, given the dangers that we are facing, I think the imperative of having some kind of real ability to force through difficult decisions on the global level is more important than almost anything else. CA : There ' s a question from Facebook here, and then we ' ll get the mic to Andrew. So, Kat Hebron on Facebook, calling in from Vail :"How would developed nations manage the millions of climate migrants?"YNH : I don ' t know. CA : That ' s your answer, Kat. YNH : And I don ' t think that they know either. They ' ll just deny the problem, maybe. CA : But immigration, generally, is another example of a problem that ' s very hard to solve on a nation-by-nation basis. One nation can shut its doors, but maybe that stores up problems for the future. YNH : Yes, I mean — it ' s another very good case, especially because it ' s so much easier to migrate today than it was in the Middle Ages or in ancient times. CA : Yuval, there ' s a belief among many technologists, certainly, that political concerns are kind of overblown, that actually, political leaders don ' t have that much influence in the world, that the real determination of humanity at this point is by science, by invention, by companies, by many things other than political leaders, and it ' s actually very hard for leaders to do much, so we ' re actually worrying about nothing here. YNH : Well, first, it should be emphasized that it ' s true that political leaders ' ability to do good is very limited, but their ability to do harm is unlimited. There is a basic imbalance here. You can still press the button and blow everybody up. You have that kind of ability. But if you want, for example, to reduce inequality, that ' s very, very difficult. But to start a war, you can still do so very easily. So there is a built-in imbalance in the political system today which is very **frustrating**, where you cannot do a lot of good but you can still do a lot of harm. And this makes the political system still a very big concern. CA : So as you look at what ' s happening today, and putting your historian ' s hat on, do you look back in history at moments when things were going just fine and an individual leader really took the world or their country backwards? YNH : There are quite a few examples, but I should emphasize, it ' s never an individual leader. I mean, somebody put him there, and somebody allowed him to continue to be there. So it ' s never really just the fault of a single individual. There are a lot of people behind every such individual. CA : Can we have the **microphone** here, please, to Andrew? Andrew Solomon : You ' ve talked a lot about the global versus the national, but increasingly, it seems to me, the world situation is in the hands of identity groups. We look at people within the United States who have been recruited by ISIS. We look at these other groups which have formed which go outside of national bounds but still represent significant authorities. How are they to be integrated into the system, and how is a diverse set of identities to be made coherent under either national or global leadership? YNH : Well, the problem of such diverse identities is a problem from nationalism as well. Nationalism believes in a single, monolithic identity, and exclusive or at least more extreme versions of nationalism believe in an exclusive loyalty to a single identity. And therefore, nationalism has had a lot of problems with people wanting to divide their identities between various groups. So it ' s not just a problem, say, for a global vision. And I think, again, history shows that you shouldn ' t necessarily think in such exclusive terms. If you think that there is just a single identity for a person,"I am just X, that ' s it, I can ' t be several things, I can be just that,"that ' s the start of the problem. You have religions, you have nations that sometimes demand exclusive loyalty, but it ' s not the only option. There are many religions and many nations that enable you to have diverse identities at the same time. CA : But is one explanation of what ' s happened in the last year that a group of people have got fed up with, if you like, the liberal elites, for want of a better term, obsessing over many, many different identities and them feeling,"But what about my identity? I am being completely ignored here. And by the way, I thought I was the majority"? And that that ' s actually sparked a lot of the anger. YNH : Yeah. Identity is always problematic, because identity is always based on fictional stories that sooner or later collide with reality. Almost all identities, I mean, beyond the level of the basic community of a few dozen people, are based on a fictional story. They are not the truth. They are not the reality. It ' s just a story that people invent and tell one another and start believing. And therefore all identities are extremely unstable. They are not a biological reality. Sometimes nationalists, for example, think that the nation is a biological entity. It ' s made of the combination of soil and blood, creates the nation. But this is just a fictional story. CA : Soil and blood kind of makes a gooey mess. YNH : It does, and also it messes with your mind when you think too much that I am a combination of soil and blood. If you look from a biological perspective, obviously none of the nations that exist today existed 5, 000 years ago. Homo sapiens is a social animal, that ' s for sure. But for millions of years, Homo sapiens and our hominid ancestors lived in small communities of a few dozen individuals. Everybody knew everybody else. Whereas modern nations are imagined communities, in the sense that I don ’ t even know all these people. I come from a relatively small nation, Israel, and of eight million Israelis, I never met most of them. I will never meet most of them. They basically exist here. CA : But in terms of this identity, this group who feel left out and perhaps have work taken away, I mean, in”Homo Deus,”you actually speak of this group in one sense expanding, that so many people may have their jobs taken away by technology in some way that we could end up with a really large — I think you call it a”useless class”— a class where traditionally, as viewed by the economy, these people have no use. YNH : Yes. CA : How likely a possibility is that? Is that something we should be terrified about? And can we address it in any way? YNH : We should think about it very carefully. I mean, nobody really knows what the job market will look like in 2040, 2050. There is a chance many new jobs will appear, but it ’ s not certain. And even if new jobs do appear, it won ’ t necessarily be easy for a 50-year old unemployed truck driver made unemployed by self-driving vehicles, it won ’ t be easy for an unemployed truck driver to reinvent himself or herself as a designer of virtual worlds. Previously, if you look at the trajectory of the industrial revolution, when machines replaced humans in one type of work, the solution usually came from low-skill work in new lines of business. So you didn ’ t need any more agricultural workers, so people moved to working in low-skill industrial jobs, and when this was taken away by more and more machines, people moved to low- skill **service** jobs. Now, when people say there will be new jobs in the future, that humans can do better than AI, that humans can do better than robots, they usually think about high-skill jobs, like software engineers designing virtual worlds. Now, I don ’ t see how an unemployed cashier from Wal-Mart reinvents herself or himself at 50 as a designer of virtual worlds, and certainly I don ’ t see how the millions of unemployed Bangladeshi textile workers will be able to do that. I mean, if they are going to do it, we need to start teaching the Bangladeshis today how to be software designers, and we are not doing it. So what will they do in 20 years? CA : So it feels like you ’ re really highlighting a question that ’ s really been bugging me the last few months more and more. It ’ s almost a hard question to ask in public, but if any mind has some wisdom to offer in it, maybe it ’ s yours, so I ’ m going to ask you : What are humans for? YNH : As far as we know, for nothing. I mean, there is no great cosmic drama, some great cosmic plan, that we have a role to play in. And we just need to discover what our role is and then play it to the best of our ability. This has been the story of all religions and ideologies and so forth, but as a scientist, the best I can say is this is not true. There is no universal drama with a role in it for Homo sapiens. So — CA : I ’ m going to push back on you just for a minute, just from your own book, because in”Homo Deus,”you give really one of the most coherent and understandable accounts about sentience, about consciousness, and that unique sort of human skill. You point out that it ’ s different from intelligence, the intelligence that we ’ re building in machines, and that there ’ s actually a lot of mystery around it. How can you be sure there ’ s no purpose when we don ’ t even understand what this sentience thing is? I mean, in your own thinking, isn ’ t there a chance that what humans are for is to be the universe ’ s sentient things, to be the centers of joy and love and **happiness** and hope? And maybe we can build machines that actually help amplify that, even if they ’ re not going to become sentient themselves? Is that crazy? I kind of found myself hoping that, reading your book. YNH : Well, I certainly think that the most interesting question today in science is the question of consciousness and the mind. We are getting better and better in understanding the brain and intelligence, but we are not getting much better in understanding the mind and consciousness. People often confuse intelligence and consciousness, especially in places like Silicon Valley, which is understandable, because in humans, they go together. I mean, intelligence basically is the ability to solve problems. Consciousness is the ability to feel things, to feel joy and sadness and boredom and pain and so forth. In Homo sapiens and all other mammals as well — it ' s not unique to humans — in all mammals and birds and some other animals, intelligence and consciousness go together. We often solve problems by feeling things. So we tend to confuse them. But they are different things. What ' s happening today in places like Silicon Valley is that we are creating artificial intelligence but not artificial consciousness. There has been an amazing development in computer intelligence over the last 50 years, and exactly zero development in computer consciousness, and there is no indication that computers are going to become conscious anytime soon. So first of all, if there is some cosmic role for consciousness, it ' s not unique to Homo sapiens. Cows are conscious, pigs are conscious, chimpanzees are conscious, chickens are conscious, so if we go that way, first of all, we need to broaden our horizons and remember very clearly we are not the only sentient beings on Earth, and when it comes to sentience — when it comes to intelligence, there is good reason to think we are the most intelligent of the whole bunch. But when it comes to sentience, to say that humans are more sentient than whales, or more sentient than baboons or more sentient than cats, I see no evidence for that. So first step is, you go in that direction, expand. And then the second question of what is it for, I would reverse it and I would say that I don ' t think sentience is for anything. I think we don ' t need to find our role in the universe. The really important thing is to liberate ourselves from suffering. What characterizes sentient beings in contrast to robots, to stones, to whatever, is that sentient beings suffer, can suffer, and what they should focus on is not finding their place in some mysterious cosmic drama. They should focus on understanding what suffering is, what causes it and how to be liberated from it. CA : I know this is a big issue for you, and that was very eloquent. We ' re going to have a blizzard of questions from the audience here, and maybe from Facebook as well, and maybe some comments as well. So let ' s go quick. There ' s one right here. Keep your hands held up at the back if you want the mic, and we ' ll get it back to you. Question : In your work, you talk a lot about the fictional stories that we accept as truth, and we live our lives by it. As an individual, knowing that, how does it impact the stories that you choose to live your life, and do you confuse them with the truth, like all of us? YNH : I try not to. I mean, for me, maybe the most important question, both as a scientist and as a person, is how to tell the difference between fiction and reality, because reality is there. I ' m not saying that everything is fiction. It ' s just very difficult for human beings to tell the difference between fiction and reality, and it has become more and more difficult as history progressed, because the fictions that we have created — nations and gods and money and corporations — they now control the world. So just to even think,"Oh, this is just all fictional entities that we ' ve created,"is very difficult. But reality is there. For me the best... There are several tests to tell the difference between fiction and reality. The simplest one, the best one that I can say in short, is the test of suffering. If it can suffer, it ' s real. If it can ' t suffer, it ' s not real. A nation cannot suffer. That ' s very, very clear. Even if a nation loses a war, we say,"Germany suffered a defeat in the First World War,"it ' s a metaphor. Germany cannot suffer. Germany has no mind. Germany has no consciousness. Germans can suffer, yes, but Germany cannot. Similarly, when a bank goes bust, the bank cannot suffer. When the dollar loses its value, the dollar doesn ' t suffer. People can suffer. Animals can suffer. This is real. So

I would start, if you really want to see reality, I would go through the door of suffering. If you can really understand what suffering is, this will give you also the key to understand what reality is. CA : There ' s a Facebook question here that connects to this, from someone around the world in a language that I cannot read. YNH : Oh, it ' s Hebrew. CA : Hebrew. There you go. Can you read the name? YNH : Or Lauterbach Goren. CA : Well, thank you for writing in. The question is :"Is the post-truth era really a brand-new era, or just another climax or moment in a never-ending trend? YNH : Personally, I don ' t connect with this idea of post-truth. My basic reaction as a historian is : If this is the era of post-truth, when the hell was the era of truth? CA : Right. YNH : Was it the 1980s, the 1950s, the Middle Ages? I mean, we have always lived in an era, in a way, of post-truth. CA : But I ' d push back on that, because I think what people are talking about is that there was a world where you had fewer journalistic outlets, where there were traditions, that things were fact-checked. It was incorporated into the charter of those organizations that the truth mattered. So if you believe in a reality, then what you write is information. There was a belief that that information should connect to reality in a real way, and if you wrote a headline, it was a serious, earnest attempt to reflect something that had actually happened. And people didn ' t always get it right. But I think the concern now is you ' ve got a technological system that ' s incredibly powerful that, for a while at least, massively amplified anything with no attention paid to whether it connected to reality, only to whether it connected to clicks and attention, and that that was arguably toxic. That ' s a reasonable concern, isn ' t it? YNH : Yeah, it is. I mean, the technology changes, and it ' s now easier to disseminate both truth and fiction and falsehood. It goes both ways. It ' s also much easier, though, to spread the truth than it was ever before. But I don ' t think there is anything essentially new about this disseminating fictions and errors. There is nothing that — I don ' t know — Joseph Goebbels, didn ' t know about all this idea of fake news and post-truth. He famously said that if you repeat a lie often enough, people will think it ' s the truth, and the bigger the lie, the better, because people won ' t even think that something so big can be a lie. I think that fake news has been with us for thousands of years. Just think of the Bible. CA : But there is a concern that the fake news is associated with tyrannical regimes, and when you see an uprise in fake news that is a canary in the coal mine that there may be dark times coming. YNH : Yeah. I mean, the intentional use of fake news is a disturbing sign. But I ' m not saying that it ' s not bad, I ' m just saying that it ' s not new. CA : There ' s a lot of interest on Facebook on this question about global governance versus nationalism. Question here from Phil Dennis :"How do we get people, governments, to relinquish power? Is that — is that — actually, the text is so big I can ' t read the full question. But is that a necessity? Is it going to take war to get there? Sorry Phil — I mangled your question, but I blame the text right here. YNH : One option that some people talk about is that only a catastrophe can shake humankind and open the path to a real system of global governance, and they say that we can ' t do it before the catastrophe, but we need to start laying the foundations so that when the disaster strikes, we can react quickly. But people will just not have the motivation to do such a thing before the disaster strikes. Another thing that I would emphasize is that anybody who is really interested in global governance should always make it very, very clear that it doesn ' t replace or abolish local identities and communities, that it should come both as — It should be part of a single package. CA : I want to hear more on this, because the very words"global governance"are almost the epitome of evil in the **mindset** of a lot of people on the alt-right right now. It just seems scary, remote, distant, and it has let them down, and so globalists, global governance

— no, go away! And many view the election as the ultimate poke in the eye to anyone who believes in that. So how do we change the narrative so that it doesn ’ t seem so scary and remote? Build more on this idea of it being compatible with local identity, local communities. YNH : Well, I think again we should start really with the biological realities of Homo sapiens. And biology tells us two things about Homo sapiens which are very relevant to this issue : first of all, that we are completely dependent on the ecological system around us, and that today we are talking about a global system. You cannot escape that. And at the same time, biology tells us about Homo sapiens that we are social animals, but that we are social on a very, very local level. It ’ s just a simple fact of humanity that we cannot have intimate familiarity with more than about 150 individuals. The size of the natural group, the natural community of Homo sapiens, is not more than 150 individuals, and everything beyond that is really based on all kinds of imaginary stories and large-scale institutions, and I think that we can find a way, again, based on a biological understanding of our species, to weave the two together and to understand that today in the 21st century, we need both the global level and the local community. And I would go even further than that and say that it starts with the body itself. The feelings that people today have of alienation and loneliness and not finding their place in the world, I would think that the chief problem is not global capitalism. The chief problem is that over the last hundred years, people have been becoming disembodied, have been distancing themselves from their body. As a hunter-gatherer or even as a peasant, to survive, you need to be constantly in touch with your body and with your senses, every moment. If you go to the forest to look for mushrooms and you don ’ t pay attention to what you hear, to what you smell, to what you taste, you ’ re dead. So you must be very connected. In the last hundred years, people are losing their ability to be in touch with their body and their senses, to hear, to smell, to feel. More and more attention goes to screens, to what is happening elsewhere, some other time. This, I think, is the deep reason for the feelings of alienation and loneliness and so forth, and therefore part of the solution is not to bring back some mass nationalism, but also reconnect with our own bodies, and if you are back in touch with your body, you will feel much more at home in the world also. CA : Well, depending on how things go, we may all be back in the forest soon. We ’ re going to have one more question in the room and one more on Facebook. Ama Adi-Dako : Hello. I ’ m from Ghana, West Africa, and my question is : I ’ m wondering how do you present and justify the idea of global governance to countries that have been historically disenfranchised by the effects of globalization, and also, if we ’ re talking about global governance, it sounds to me like it will definitely come from a very Westernized idea of what the”global”is supposed to look like. So how do we present and justify that idea of global versus wholly nationalist to people in countries like Ghana and Nigeria and Togo and other countries like that? YNH : I would start by saying that history is extremely unfair, and that we should realize that. Many of the countries that suffered most from the last 200 years of globalization and imperialism and industrialization are exactly the countries which are also most likely to suffer most from the next wave. And we should be very, very clear about that. If we don ’ t have a global governance, and if we suffer from climate change, from technological disruptions, the worst suffering will not be in the US. The worst suffering will be in Ghana, will be in Sudan, will be in Syria, will be in Bangladesh, will be in those places. So I think those countries have an even greater incentive to do something about the next wave of disruption, whether it ’ s ecological or whether it ’ s technological. Again, if you think about technological disruption, so if AI and 3D printers and robots will take the jobs from billions of people, I worry far less about the

Swedes than about the people in Ghana or in Bangladesh. And therefore, because history is so unfair and the results of a calamity will not be shared equally between everybody, as usual, the rich will be able to get away from the worst consequences of climate change in a way that the poor will not be able to. CA : And here ' s a great question from Cameron Taylor on Facebook :”At the end of ' Sapiens, '”you said we should be asking the question, ' What do we want to want? ' Well, what do you think we should want to want?”YNH : I think we should want to want to know the truth, to understand reality. Mostly what we want is to change reality, to fit it to our own desires, to our own wishes, and I think we should first want to understand it. If you look at the long-term trajectory of history, what you see is that for thousands of years we humans have been gaining control of the world outside us and trying to shape it to fit our own desires. And we ' ve gained control of the other animals, of the rivers, of the forests, and reshaped them completely, causing an ecological destruction without making ourselves satisfied. So the next step is we turn our gaze inwards, and we say OK, getting control of the world outside us did not really make us satisfied. Let ' s now try to gain control of the world inside us. This is the really big project of science and technology and industry in the 21st century — to try and gain control of the world inside us, to learn how to engineer and produce bodies and brains and minds. These are likely to be the main products of the 21st century economy. When people think about the future, very often they think in terms,”Oh, I want to gain control of my body and of my brain.”And I think that ' s very dangerous. If we ' ve learned anything from our previous history, it ' s that yes, we gain the power to manipulate, but because we didn ' t really understand the complexity of the ecological system, we are now facing an ecological meltdown. And if we now try to reengineer the world inside us without really understanding it, especially without understanding the complexity of our mental system, we might cause a kind of internal ecological disaster, and we ' ll face a kind of mental meltdown inside us. CA : Putting all the pieces together here — the current politics, the coming technology, concerns like the one you ' ve just outlined — I mean, it seems like you yourself are in quite a bleak place when you think about the future. You ' re pretty worried about it. Is that right? And if there was one cause for hope, how would you state that? YNH : I focus on the most dangerous possibilities partly because this is like my job or responsibility as a historian or social critic. I mean, the industry focuses mainly on the positive sides, so it ' s the job of historians and philosophers and sociologists to highlight the more dangerous potential of all these new technologies. I don ' t think any of that is inevitable. Technology is never deterministic. You can use the same technology to create very different kinds of societies. If you look at the 20th century, so, the technologies of the Industrial Revolution, the trains and electricity and all that could be used to create a communist dictatorship or a fascist regime or a liberal democracy. The trains did not tell you what to do with them. Similarly, now, artificial intelligence and bioengineering and all of that — they don ' t predetermine a single outcome. Humanity can rise up to the challenge, and the best example we have of humanity rising up to the challenge of a new technology is nuclear weapons. In the late 1940s, ' 50s, many people were convinced that sooner or later the Cold War will end in a nuclear catastrophe, destroying human civilization. And this did not happen. In fact, nuclear weapons prompted humans all over the world to change the way that they manage international politics to reduce violence. And many countries basically took out war from their political toolkit. They no longer tried to pursue their interests with warfare. Not all countries have done so, but many countries have. And this is maybe the most important reason why international violence declined dramatically since 1945, and today, as I said, more people commit suicide than are killed in war. So this, I think, gives us a good example that even the most frightening technology, humans can rise up to the challenge and actually some good can come out of it. The problem is, we have very little margin for error. If we don ’ t get it right, we might not have a second option to try again. CA : That ’ s a very powerful note, on which I think we should draw this to a conclusion. Before I wrap up, I just want to say one thing to people here and to the global TED community watching online, anyone watching online : help us with these dialogues. If you believe, like we do, that we need to find a different kind of conversation, now more than ever, help us do it. Reach out to other people, try and have conversations with people you disagree with, understand them, pull the pieces together, and help us figure out how to take these conversations forward so we can make a real contribution to what ’ s happening in the world right now. I think everyone feels more alive, more concerned, more engaged with the politics of the moment. The stakes do seem quite high, so help us respond to it in a wise, wise way. Yuval Harari, thank you.

I was a blue-eyed, chubby-cheeked five-year-old when I joined my family on the picket line for the first time. My mom made me leave my dolls in the minivan. I ’ d stand on a street corner in the heavy Kansas humidity, surrounded by a few dozen relatives, with my tiny fists clutching a sign that I couldn ’ t read yet :”Gays are **worthy** of death.”This was the beginning. Our protests soon became a **daily** occurrence and an international phenomenon, and as a member of Westboro Baptist Church, I became a fixture on picket lines across the country. The end of my antigay picketing career and life as I knew it, came 20 years later, triggered in part by strangers on Twitter who showed me the power of engaging the other. In my home, life was framed as an epic spiritual battle between good and evil. The good was my church and its members, and the evil was everyone else. My church ’ s antics were such that we were constantly at odds with the world, and that reinforced our otherness on a **daily** basis.”Make a difference between the unclean and the clean,”the verse says, and so we did. From **baseball** games to military funerals, we trekked across the country with neon protest signs in hand to tell others exactly how”unclean”they were and exactly why they were headed for damnation. This was the focus of our whole lives. This was the only way for me to do good in a world that sits in Satan ’ s lap. And like the rest of my 10 siblings, I believed what I was taught with all my heart, and I pursued Westboro ’ s agenda with a **special** sort of zeal. In 2009, that zeal brought me to Twitter. Initially, the people I encountered on the **platform** were just as hostile as I expected. They were the digital version of the screaming hordes I ’ d been seeing at protests since I was a kid. But in the midst of that digital brawl, a strange pattern developed. Someone would arrive at my profile with the usual rage and scorn, I would respond with a custom mix of Bible verses, pop culture references and smiley faces. They would be understandably confused and caught off guard, but then a conversation would ensue. And it was civil — full of genuine curiosity on both sides. How had the other come to such outrageous conclusions about the world? Sometimes the conversation even bled into real life. People I ’ d sparred with on Twitter would come out to the picket line to see me when I protested in their city. A man named David was one such person. He ran a blog called”Jewlicious,”and after several months of heated but friendly arguments online, he came out to see me at a picket in New Orleans. He brought me a Middle Eastern dessert from Jerusalem, where he lives, and I brought him kosher chocolate and held a”God hates Jews”sign. There was no confusion about our positions, but the line between friend and foe was becoming blurred. We ’ d started to see each other as human beings, and it changed the way we spoke to one another. It took time, but eventually these conversations planted seeds of doubt in me. My friends on Twitter took the time to understand Westboro ’ s doctrines, and in doing so, they were able to find inconsistencies I ’ d missed my entire life. Why did we advocate the death **penalty** for gays when Jesus said,”Let he who is without sin cast the first stone?”How could we claim to love our neighbor while at the same time praying for God to destroy them? The truth is that the care shown to me by these strangers on the internet was itself a contradiction. It was growing evidence that people on the other side were not the demons I ’ d been led to believe. These realizations were life-altering. Once I saw that we were not the ultimate arbiters of divine truth but flawed human beings, I couldn ’ t pretend otherwise. I couldn ’ t justify our **actions** — especially our cruel **practice** of protesting funerals and celebrating human tragedy. These shifts in my perspective contributed to a larger erosion of trust in my church, and eventually it made it impossible for me to stay. In spite of overwhelming grief and terror, I left Westboro in 2012. In those days just after I left, the instinct to hide was almost paralyzing. I wanted to hide from the judgement of my family, who I knew would never speak to me again — people whose thoughts and opinions had meant everything to me. And I wanted to hide from the world I ’ d rejected for so long — people who had no reason at all to give me a second chance after a lifetime of antagonism. And yet, unbelievably, they did. The world had access to my past because it was all over the internet — thousands of **tweets** and hundreds of interviews, everything from local TV news to”The Howard Stern Show”— but so many embraced me with open arms anyway. I wrote an apology for the harm I ’ d caused, but I also knew that an apology could never undo any of it. All I could do was try to build a new life and find a way somehow to repair some of the damage. People had every reason to doubt my sincerity, but most of them didn ’ t. And — given my history, it was more than I could ’ ve hoped for — forgiveness and the benefit of the doubt. It still amazes me. I spent my first year away from home adrift with my younger sister, who had chosen to leave with me. We walked into an abyss, but we were shocked to find the light and a way forward in the same communities we ’ d targeted for so long. David, my”Jewlicious”friend from Twitter, invited us to spend time among a Jewish community in Los Angeles. We slept on couches in the home of a Hasidic rabbi and his wife and their four kids — the same rabbi that I ’ d protested three years earlier with a sign that said,”Your rabbi is a whore.”We spent long hours talking about theology and Judaism and life while we washed dishes in their kosher kitchen and chopped vegetables for dinner. They treated us like family. They held nothing against us, and again I was astonished. That period was full of turmoil, but one part I ’ ve returned to often is a surprising realization I had during that time — that it was a relief and a privilege to let go of the harsh judgments that instinctively ran through my mind about nearly every person I saw. I realized that now I needed to learn. I needed to listen. This has been at the front of my mind lately, because I can ’ t help but see in our public discourse so many of the same destructive impulses that ruled my former church. We celebrate tolerance and diversity more than at any other time in memory, and still we grow more and more divided. We want good things — justice, equality, freedom, dignity, prosperity — but the path we ’ ve chosen looks so much like the one I walked away from four years ago. We ’ ve broken the world into us and them, only emerging from our bunkers long enough to lob rhetorical grenades at the other camp. We write off half the country as out-of- touch liberal elites or racist misogynist bullies. No nuance, no complexity, no humanity. Even when someone does call for **empathy** and understanding for the other side, the conversation nearly always devolves into a debate about who deserves more **empathy**. And just as I learned to do, we routinely refuse to acknowledge the flaws in our positions or the merits in our opponent ' s. Compromise is anathema. We even target people on our own side when they dare to question the party line. This path has brought us cruel, sniping, deepening polarization, and even outbreaks of violence. I remember this path. It will not take us where we want to go. What gives me hope is that we can do something about this. The good news is that it ' s simple, and the bad news is that it ' s hard. We have to talk and listen to people we disagree with. It ' s hard because we often can ' t fathom how the other side came to their positions. It ' s hard because righteous indignation, that sense of certainty that ours is the right side, is so seductive. It ' s hard because it means extending **empathy** and compassion to people who show us hostility and contempt. The impulse to respond in kind is so tempting, but that isn ' t who we want to be. We can resist. And I will always be inspired to do so by those people I encountered on Twitter, apparent enemies who became my beloved friends. And in the case of one particularly understanding and generous guy, my husband. There was nothing **special** about the way I responded to him. What was **special** was their approach. I thought about it a lot over the past few years and I found four things they did differently that made real conversation possible. These four steps were small but powerful, and I do everything I can to employ them in difficult conversations today. The first is don ' t assume bad intent. My friends on Twitter realized that even when my words were aggressive and offensive, I sincerely believed I was doing the right thing. Assuming ill motives almost instantly cuts us off from truly understanding why someone does and believes as they do. We forget that they ' re a human being with a lifetime of experience that shaped their mind, and we get stuck on that first wave of anger, and the conversation has a very hard time ever moving beyond it. But when we assume good or neutral intent, we give our minds a much stronger framework for dialogue. The second is ask questions. When we engage people across ideological divides, asking questions helps us map the disconnect between our differing points of view. That ' s important because we can ' t present effective arguments if we don ' t understand where the other side is actually coming from and because it gives them an opportunity to point out flaws in our positions. But asking questions serves another purpose ; it signals to someone that they ' re being heard. When my friends on Twitter stopped accusing and started asking questions, I almost automatically mirrored them. Their questions gave me room to speak, but they also gave me permission to ask them questions and to truly hear their responses. It fundamentally changed the dynamic of our conversation. The third is stay calm. This takes **practice** and patience, but it ' s powerful. At Westboro, I learned not to care how my manner of speaking affected others. I thought my rightness justified my rudeness — harsh tones, raised voices, insults, interruptions — but that strategy is ultimately counterproductive. Dialing up the volume and the snark is natural in **stressful** situations, but it tends to bring the conversation to an unsatisfactory, explosive end. When my husband was still just an anonymous Twitter acquaintance, our discussions frequently became hard and pointed, but we always refused to escalate. Instead, he would change the subject. He would tell a joke or recommend a book or gently excuse himself from the conversation. We knew the discussion wasn ' t over, just paused for a time to bring us back to an even keel. People often lament that digital communication makes us less civil, but this is one advantage that online conversations have over in-person ones. We have a buffer of time and space between us and the people whose ideas we find so **frustrating**. We can use that buffer. Instead of lashing out, we can pause, breathe, change the subject or walk away, and then come back to it when we ’ re ready. And finally... make the argument. This might seem obvious, but one side effect of having strong beliefs is that we sometimes assume that the value of our position is or should be obvious and self-evident, that we shouldn ’ t have to defend our positions because they ’ re so clearly right and good that if someone doesn ’ t get it, it ’ s their problem — that it ’ s not my job to educate them. But if it were that simple, we would all see things the same way. As kind as my friends on Twitter were, if they hadn ’ t actually made their arguments, it would ’ ve been so much harder for me to see the world in a different way. We are all a product of our upbringing, and our beliefs reflect our experiences. We can ’ t expect others to spontaneously change their own minds. If we want change, we have to make the case for it. My friends on Twitter didn ’ t abandon their beliefs or their principles — only their scorn. They channeled their infinitely justifiable offense and came to me with pointed questions tempered with kindness and humor. They approached me as a human being, and that was more transformative than two full decades of outrage, disdain and violence. I know that some might not have the time or the energy or the patience for extensive engagement, but as difficult as it can be, reaching out to someone we disagree with is an option that is available to all of us. And I sincerely believe that we can do hard things, not just for them but for us and our future. Escalating disgust and intractable conflict are not what we want for ourselves, or our country or our next generation. My mom said something to me a few weeks before I left Westboro, when I was desperately hoping there was a way I could stay with my family. People I have loved with every pulse of my heart since even before I was that chubby-cheeked five-year-old, standing on a picket line holding a sign I couldn ’ t read. She said,”You ’ re just a human being, my dear, sweet child.”She was asking me to be humble — not to question but to trust God and my elders. But to me, she was missing the bigger picture — that we ’ re all just human beings. That we should be guided by that most basic fact, and approach one another with generosity and compassion. Each one of us contributes to the communities and the cultures and the societies that we make up. The end of this spiral of rage and blame begins with one person who refuses to indulge these destructive, seductive impulses. We just have to decide that it ’ s going to start with us. Thank you.
